**Safety Guidelines**

This manual contains notices which you should observe to ensure your own personal safety, as well as to protect the product and connected equipment. These notices are marked as follows according to the level of danger:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Danger</strong></td>
<td>indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.</td>
</tr>
<tr>
<td><strong>Warning</strong></td>
<td>indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.</td>
</tr>
<tr>
<td><strong>Caution</strong></td>
<td>used with the safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.</td>
</tr>
<tr>
<td><strong>Caution</strong></td>
<td>used without the safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in property damage.</td>
</tr>
<tr>
<td><strong>Notice</strong></td>
<td>indicates that unwanted events or status can occur if the relevant information is not observed.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>draws your attention to particularly important information on the product, handling the product, or to a particular part of the documentation.</td>
</tr>
</tbody>
</table>

**Qualified Personnel**

Equipment may be commissioned and operated only by qualified personnel. Qualified personnel within the meaning of the safety notices in this manual are persons who are authorized to commission, ground and identify equipment, systems and circuits in accordance with safety engineering standards.

**Correct Usage**

Please note the following:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Warning</strong></td>
<td>The device may only be used for the application cases specified in the catalog and the technical description and may only be used in combination with third-party equipment and components recommended or approved by Siemens. Startup must not take place until it is established that the machine which is to accommodate this component is conforms with the guideline 98/37 EC. Appropriate transport, and appropriate storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates perfectly and safely.</td>
</tr>
</tbody>
</table>

For your notes
Preface

This manual

The MP 370 Equipment Manual for touch panels and keyboard units is part of the SIMATIC HMI documentation. It provides operation, installation, configuration and system personnel with information concerning installation, functionality, operation and technical design of the MP 370.

Organization of the manual

The equipment manual is organized into the following chapters:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 2</td>
<td>Introduction and overview of features and functional scope of the MP 370</td>
</tr>
<tr>
<td>3 - 5</td>
<td>Commissioning and operation</td>
</tr>
<tr>
<td>6 - 7</td>
<td>Recipes and archives</td>
</tr>
<tr>
<td>8</td>
<td>System settings</td>
</tr>
<tr>
<td>9 - 12</td>
<td>Mechanical and electrical installation, dimensions, retrofitting of options as well as maintenance and upkeep of the MP 370</td>
</tr>
<tr>
<td>13</td>
<td>Information on updating the operating system.</td>
</tr>
</tbody>
</table>

Appendix

- Technical Data
- Interface Assignments
- HMI System Messages
- ESD Guidelines
Conventions

The following conventions are used throughout this manual:

Motor off  Text in the operating unit display is presented in this typewriter font.

Tag  Symbolic names representing tag values on the screen are presented in this italic typewriter font.

Screens  Functions available for selection are presented in this italic font.

ESC  The names of keys and buttons are displayed in a different font.

History

The various releases of this manual correspond to the following versions of the ProTool CS configuration software:

<table>
<thead>
<tr>
<th>Edition</th>
<th>Comment</th>
<th>ProTool Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>01/01</td>
<td>First release of the MP 370 equipment manual for touch and keyboard units</td>
<td>From V5.2 + SP3</td>
</tr>
<tr>
<td>12/01</td>
<td>New ProTool software, more screen objects, new transfer, download and communication options</td>
<td>From V6.0</td>
</tr>
<tr>
<td>09/02</td>
<td>Addition of the new MP 370 15&quot; touch panel unit.</td>
<td>From V6.0 SP2</td>
</tr>
</tbody>
</table>

The languages spoken by the SIMATIC Hotlines are generally German and English, the Authorization Hotline is also provided in French, Italian and Spanish.
SIMATIC Customer Support Online Services

The SIMATIC Customer Support provides you with additional information about SIMATIC products through online services:

- General current information can be obtained
  - in the Internet under http://www.ad.siemens.de/simatic
- Current product information and downloads which you may find useful are available:
  - in the Internet under http://www.ad.siemens.de/simatic-cs and
  - via the Bulletin Board System (BBS) in Nuremberg (SIMATIC Customer Support Mailbox) under the number +49 (911) 895-7100
    To dial the mailbox, use a modem with a capacity up to V.34 (28.8 kBaud) whose parameters are set as follows:
    - 8, N, 1, ANSI, or
    - dial via ISDN (x.75, 64 kBit).
- Your contact partner for Automation & Drives can be found in the contact partner database
  - in the Internet under http://www3.ad.siemens.de/partner/search.asp

Abbreviations

The abbreviations used in this manual have the following meaning:

AG (PLC) Programmable Logic Controller  
ANSI American National Standards Institute  
AS 511 Protocol of the PU interface to SIMATIC S5  
ASCII American Standard Code for Information Interchange  
CCFL Cold Cathode Fluorescence Lamp

A list of all the specialist terms together with their explanations is provided in the Glossary at the end of this manual.
SIMATIC HMI Documentation

Target groups
This manual is part of the SIMATIC HMI Documentation. The documentation is aimed at the following target groups:

- Beginners
- Users
- Configuration planners
- Programmers
- Service engineers

Documentation structure
The SIMATIC HMI Documentation includes the following components:

- User guides for
  - configuration software
  - runtime software
  - communication between PLC and operating unit
- Equipment manuals for the following operating units:
  - SIMATIC PC
  - MP (Multi Panel)
  - OP (Operator Panel)
  - TP (Touch Panel)
  - TD (Text Display)
  - PP (Pushbutton Panel)
- Online help for the configuration software
- Installation guides
- Quick reference manuals
The following table provides an overview of the SIMATIC HMI Documentation helpful for this manual.

<table>

Release 09/02
Introduction

Multifunctional platform

The SIMATIC Multi Panels are included in the new “Multifunctional Platform” product category. This product category is positioned in the product hierarchy between the optimized process and application components, such as operator panels and PLCs on the one hand, and industrial PCs on the other. The category is now completed by the introduction of the new unit, MP 370 15” Touch, intended for the high-end sector.

The multifunctional platform is based on the innovative standard operating system Microsoft Windows CE. It combines the robustness of the dedicated hardware solutions with the flexibility of the PC world.

Multi Panels provide the following advantages:

- High degrees of configuration efficiency,
- Simulation of the configuration on the configuration computer (no PLC required),
- Clear display and easy operation of the process by means of a Windows-based user interface,
- Large selection of predefined screen objects during configuration,
- Dynamic use of screen objects (e.g. moving objects),
- Uncomplicated and quick handling of recipes and data records in recipe screens and recipe views,
- Archiving of messages, process values and login/logout procedures,
- Creation of vector graphics using the SIMATIC ProTool CS configuration software without an external graphics editor,
- Visual Basic Script for the realization of customized functions,
- ALARM_S message procedure in connection with the SIMATIC S7,
- Downloading:
  - Automatic switchover to Download mode,
  - Transfer via MPI, PROFIBUS/DP, USB and Ethernet,
  - Serial downloading,
  - Downloading via TeleService,
- Standard connections to SIMATIC S5/DP, SIMATIC S7 and SIMATIC 505 as well as to PLCs from other manufacturers.
Positioning in the SIMATIC HMI unit landscape

The MP 370 extends the multifunctional platform product category for the upper performance range. It fulfills the high demands made on performance, display possibilities and price/performance ratio, and extend communication potential of the office-world, for example. The requirements of customers for new possibilities, e.g. in respect of downloading and data transfer functions, simpler operation and related increased acceptance when compared with CE units, were taken into account during the development of the new units and implemented. The introduction of the new touch panel unit with a 15" display means that this product category is now provided with a large-scale screen with an increased visualization area.

The MP 370 realizes the conception of multifunctionality. In addition to supporting the classic HMI applications (visualization with SIMATIC ProTool), it also supports other applications such as process diagnostics (SIMATIC ProAgent/MP), UPS, Terminal Client (SIMATIC ThinClient/MP) for the touchscreen units and Soft PLC (SIMATIC WinAC) for the MP 370 12"- unit models. In addition, the MP 370 can also be used within the scope of the OPP (Open Platform Program).

The MP 370 is available as different models with operation via touch panel or membrane keyboard according to the respective visualization tasks.

A complete overview of the functional range of the MP 370 is provided Chapter 2.

Area of use

The MP 370 enables operating statuses, current process data and faults concerning a connected PLC to be graphically displayed and the relevant machine or system to be easily monitored and operated.

The MP 370 has been conceived for easy machine operation and monitoring. It provides a realistic graphical representation of the machine or system to be monitored. They can be used, for example, in machine and apparatus construction sectors, in the printing and packing industries, in the automobile and electrical industries and in the chemical and pharmaceutical industries.

The high degree of protection (IP65 on the front side) and non-implementation of moving storage media, such as hard disks and floppy disks, ensure the MP 370 is also suitable for use in hostile industrial environments and directly on site on the respective machine.

Installation locations for the MP 370:

- Panels/Consoles
- 19" racks (keyboard units)

Connection options for external periphery units (keyboard, mouse and printer), e.g. via a USB interface, and the possible use of CF and PC boards support multifunctionality. Due to the fact that the MP 370 is equipped with high performance basic hardware and has a minimum installation depth means that it fulfills all the requirements for operation in the vicinity of the machine.
The MP 370 can be used to:

- operate and monitor the process by means of the menu system. Setpoint values or control element settings, for instance, can be modified by entering values or activating configured function keys;
- display processes, machines and systems on full-graphic, dynamic screens;
- display and edit messages and process tags e.g. in output fields, bar graphs, trend curves or status displays;
- intervene directly in the running process by input.

**Configuration using ProTool CS**

Graphics, texts, user-defined functions and operating and display elements which need to be represented on the MP 370 must first be created on a configuration computer (PC or PU) using the SIMATIC ProTool CS configuration software. In order to download the configuration to the MP 370, the configuration computer must be connected to the MP 370 (refer to “Configuration phase” in Figure 1-1). The connection can be established by a serial, an MPI/PROFIBUS-DP network, a USB or an Ethernet interface or via a standard modem path.

Once the configuration has been successfully downloaded, connect the MP 370 to the PLC. The MP 370 can then communicate with the PLC and respond according to the information configured for running the program in the PLC (refer to “Process running phase” in Figure 1-1).

### Further information

Detailed information on the technical data of the MP 370 is provided in Appendix A of this manual.

Detailed descriptions of the creation of projects for the MP 370 and configuration software functions are provided in the *ProTool Configuring Windows-based Systems* User’s Guide and in the online help for ProTool CS.

Connection of the MP 370 to the PLC is described in the *Communication for Windows-based Systems* User’s Guide.

Any new information which could not be taken into account for printing in the guides is provided in the *Readme.wri* file on the ProTool CD.
The following table summarizes the range of functions provided by the MP 370. The values specified are the maximum values which can be managed by the MP 370. These values are not accumulative, i.e. 4000 messages can be configured if no further objects are used. However, it is not possible to define 4000 messages and 300 pictures each with 400 tags simultaneously. The defined values are limited by the size of the configuration memory.

Commissioning

In this chapter

This chapter provides information on:

- Initial start-up of the MP 370 (Page 3-3)
- Recommissioning the MP 370 (Page 3-4)
- Options for download mode (Page 3-7)
- Testing the configuration on the MP 370 (Page 3-10)
- Uploading the configuration (Page 3-12)
- Backup/Restore (Page 3-14)
- License transfer ProSave (Page 3-19)
- Load application (Page 3-21)
- Service tool ProSave (Page 3-24)

Notice

In the case of the initial start-up, please observe the safety notes concerning reverse poling protection on Page 9-8.

Notice

High frequency radiation, e.g. from mobile telephones, can cause exceptional operating situations.

Caution

Always terminate the runtime software before switching off the voltage supply in order to prevent loss of data.

To terminate the runtime software, press the operating element assigned the "Exit_runtime" function in the configuration. Wait until the MP 370 start menu, namely the Loader menu (Figure 3-1, Page 3-6), appears and then switch off the power supply.
Note

During the start-up phase, it is possible to connect an external keyboard or mouse to the USB interface.

Further information

Further information on operating the MP 370 is provided in the following chapters:
- General operation of the touch unit: Chapter 4.1
- General operation of the keyboard unit: Chapter 4.2
- Operating screens and screen objects: Chapter 5
3.1 Initial Startup

Action

When the MP 370 is started up for the first time, no configuration has been loaded on it. In order to download the necessary project data and the runtime software from the configuration computer to the operating units, proceed as follows, observing the sequence.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Use a suitable standard cable to connect the MP 370 via the IF2 (serial), IF1B (MPI/PROFIBUS-DP), USB or Ethernet interfaces to the configuration computer according to the required download type. Downloading is also possible via modem. Default setting: Serial connection</td>
</tr>
<tr>
<td>2</td>
<td>Switch on the MP 370’s power supply.</td>
</tr>
<tr>
<td>3</td>
<td>When the unit is started up, it automatically switches from the Start menu to download mode. Press the CANCEL button to access the Start menu and, from there, the Windows CE Control Panel.</td>
</tr>
<tr>
<td>4</td>
<td>Check the settings defined for the interface in the download settings (serial, MPI, USB or Ethernet) and adapt them as necessary (refer to Chapter 3.4). Default setting: Serial connection</td>
</tr>
<tr>
<td>5</td>
<td>Close the Control Panel and activate download mode.</td>
</tr>
<tr>
<td>6</td>
<td>Start downloading the configuration on the configuration computer. Further settings necessary on the configuration computer for the download operation are provided in the ProTool Configuring Windows-based Systems User’s Guide. The configuration computer checks the connection to the MP 370. If the connection is not available or defective, the corresponding error message appears. If downloading from the configuration computer is terminated as a result of a compatibility conflict, the MP 370’s operating system must be replaced (refer to Chapter 13). If the connection is correct, the project data is downloaded to the MP 370. Following successful downloading, the configuration is started and the unit displays the start screen of the configuration that has just been loaded.</td>
</tr>
</tbody>
</table>

Set date/time

When the MP 370 is started up for the first time or has been disconnected from the power supply for a longer period without the backup battery being used, the date and time must be updated. Information on this is provided on Page 5-13.
3.2 Recommissioning

Purpose
During recommissioning, a configuration already loaded on the MP 370 is replaced by another. In this case, the project data is downloaded from the configuration computer to the MP 370.

The following options are available to switch the MP 370 to Download mode:
- Start downloading during the start-up phase of the MP 370 manually (Page 3-4)
- Start downloading during normal operation of the MP 370 automatically (Page 3-5)
- Start downloading during normal operation of the MP 370 via a correspondingly configured operating element (Page 8-3)

3.2.1 Start downloading manually
Start downloading during the start-up phase of the MP 370 manually:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Use a suitable standard cable to connect the MP 370 via the IF2 (serial), IF1B (MPI/PROFIBUS-DP), USB or Ethernet interfaces to the configuration computer according to the required. Downloading is also possible via modem.</td>
</tr>
<tr>
<td>2</td>
<td>Switch on the MP 370’s power supply.</td>
</tr>
<tr>
<td>3</td>
<td>Check the settings defined for the interface in the download settings (serial, MPI, USB or Ethernet) and adapt them as necessary (refer to Chapter 3.4).</td>
</tr>
<tr>
<td>4</td>
<td>Close the Control Panel and activate download mode.</td>
</tr>
<tr>
<td>5</td>
<td>Start downloading the configuration on the configuration computer. The configuration computer checks the connection to the MP 370. If the connection is not available or defective, the configuration computer issues the corresponding error message. If downloading from the configuration computer is terminated as a result of a compatibility conflict, the MP 370’s operating system must be replaced (refer to Chapter 13). If the connection is correct, the new configuration is downloaded to the MP 370. Following successful downloading, the configuration is started and the unit displays the start screen of the configuration that has just been loaded.</td>
</tr>
</tbody>
</table>
3.2.2 Start downloading automatically during normal operation

Download settings
The MP 370 can be switched to download mode automatically when in normal operation as soon as downloading is started on the configuration computer connected to it. This option is particularly recommended for the test phase involving a new configuration project because the data is transferred without having to intervene on the MP 370.

A condition for this is that the required connection is set in the Download option in the Windows CE Control Panel and the corresponding Remote Control function is activated.

A detailed description of the possible download settings is provided on Page 3-7.

Close modal dialogs
If the Remote Control option is active, the runtime is automatically shut down and the MP 370 switched to download mode. If dialogs are still open, the runtime cannot be shut down when downloading has been started on the MP 370.

In such cases, close the dialog or interrupt downloading on the configuration computer.

Recommendation
Following the start-up phase, switch the automatic download option off to prevent inadvertently switching the MP 370 to download mode in a system which is running. To do this, deactivate the Remote Control option in the download settings defined for the MP 370 (Figure 3-2, Page 3-7).
3.3 MP 370 Start Menu (Loader)

During the start-up phase, the Start menu (Loader) depicted below appears. When the runtime has ended, the following appears:

![Loader](image)

Figure 3-1 MP 370 Start menu (Loader)

Press the **Transfer** button to switch the MP 370 to download mode.

Press the **Start** button to start the runtime automatically.

Press the **Control Panel** button to access the Windows CE Control Panel (see Figure 8-1 on Page 8-5) in which various settings can be defined. The settings for the download mode options can be defined here, for example.

Press the **Taskbar** button to activate the toolbar when the Start menu is open.

It is possible to protect the Start menu from unauthorized access by assigning a password. If the password is subsequently not entered, only the **Transfer** and **Start** buttons are available. This prevents incorrect operation and increases system or machine security since settings cannot be modified.
3.4 Options for Download Mode

Overview

The following options can be set for download mode:

- Automatic switching to download mode from normal operation when data transfer is initiated from the connected configuration computer.
- Download mode can be restricted to a specific connection type so that downloading can only occur either via a serial connection, MPI/PROFIBUS-DP, USB or Ethernet connection.

Download mode settings

![Transfer Settings menu with Channel tab control](image)

Figure 3-2 Transfer Settings menu with Channel tab control

The Channel tab control in the Transfer Settings menu can be used to activate the required communication channel and the respective Remote Control option. In addition to the serial communication channel, a second channel can also be selected to download data from the configuration computer to the MP 370.

Press the Advanced button to define the Address bus parameter setting and Transmission Rate and Highest Station network parameter settings for downloading via MPI or PROFIBUS-DP. The relevant driver must be set for downloading via Ethernet.

Warning

When the Remote Control option is active, ensure that the MP 370 is not inadvertently switched to download mode from the configuration computer when in normal operation.
Notice
Deactivate the Remote Control option when selecting the communication channel if a serial printer is connected to the MP 370.

Notice
If no communication channel has been enabled using the Enable Channel option, it is not possible to download a configuration from the configuration computer to the MP 370.

Note
The bus parameters for the MPI transfer (e.g. MPI address, baud rate, etc.) are read out of the configuration currently loaded on the MP 370.

The settings for MPI transfer can be modified. To do this, stop the runtime, modify the settings and switch to download mode. When the runtime is subsequently started, the bus parameters are overwritten by values from the configuration.

Warning
In the case of Profibus-DP, modifications here may only be made for start up purposes.

Each modification of the settings for Profibus-DP, the operating units only set one corresponding standard bus parameter set. In unfavorable conditions, this can lead to faults on the DP bus.

In order to calculate the bus parameters exactly, the entire bus topology must be known.

Correct definition of the bus parameters for runtime is automatically ensured by the integrated operation of ProTool in STEP 7.

Note
Modifications must not be carried out when the runtime is in operation or the unit is in download mode.

Note
Downloading is not possible using an interface which is busy with another program.
In addition to the setting options for download mode, the *Directories* tab control can be used to specify the following paths (refer to Figure 3-3):

![Figure 3-3 Transfer Settings menu with Directories tab control](image)

*Project File*

The predefined storage location for the project file can be changed here. The internal Flash memory or external Flash cards can be set for the MP 370. During the next downloading process, the configuration is stored in the storage location specified.

*Project Backup*

The predefined storage location for the source file of your configuration can be changed here. This file can be used for restoring (uploading) the configuration. External Flash cards or network connections can be set for the MP 370. Information on uploading is provided on Page 3-12.

*Autostart application*

Path

This defines the storage location for the ProTool runtime software. This is the application with which the configuration runs under Windows CE.

Wait

It is possible to define the number of seconds the Start menu should remain on screen before the runtime is started (1 s, 3 s, 5 s, 10 s or constantly). If no runtime software is available, the unit automatically switches to download mode.

---

**Notice**

Do not change the default settings in the *Project File* and *Path* fields when working with ProTool. Otherwise, the MP 370 can no longer start the configuration.
Press the OK button or Enter key to confirm the settings currently defined for the download options. Ensure that no buttons have been selected. The Transfer Settings menu is closed and the Windows CE Control Panel is displayed.

Press the X button or ESC key to close the Transfer Settings menu and call in the Windows CE Control Panel. Any modifications made to the settings are rejected.

**Note**

If the unit is in download mode while changes are made to the download settings, the settings only take effect after the download function is restarted. This can occur when the Control Panel is selected via the Windows Start menu in order to modify the downloading properties.

### 3.5 Test the Configuration on the MP 370

**Conditions**

In order to switch the MP 370 between the operating modes OFFLINE and ONLINE, the function Change_mode must be linked to an operating element in the configuration.

**Note**

During the test phase, it is recommended to enable switching to download mode from normal operation. Further information on this is provided on Page 3-5.

**Warning**

After the test phase, do not forget to deactivate the Remote Control option to prevent inadvertently switching to download mode from the configuration computer when in normal operation.

**Testing without a PLC connected (OFFLINE mode)**

After setting the MP 370 to operating mode OFFLINE, the individual project functions can be tested without them being affected by the PLC. PLC tags are not updated in OFFLINE mode.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch the MP 370 to operating mode OFFLINE (refer to Page 8-3).</td>
</tr>
<tr>
<td>2</td>
<td>Check all the configured screens in respect of correct representation.</td>
</tr>
<tr>
<td>3</td>
<td>Check the screen hierarchy.</td>
</tr>
<tr>
<td>4</td>
<td>Check the input fields.</td>
</tr>
<tr>
<td>5</td>
<td>Test the function keys on the keyboard unit.</td>
</tr>
</tbody>
</table>
Testing with a PLC connected (ONLINE mode)

When a PLC is connected, it is possible to test the communication between the MP 370 and PLC in ONLINE mode. This includes checking that the correct data areas have been configured.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connect the MP 370 to the PLC.</td>
</tr>
<tr>
<td>2</td>
<td>Test all the items in the configuration for which communication with the PLC is necessary e.g.: messages, print functions, automatic message logging, selecting screens etc.</td>
</tr>
</tbody>
</table>

Testing on the configuration computer

The material supplied with ProTool contains a simulation program which can be used to test the configuration on the configuration computer without the necessity of connecting a PLC or MP 370. Detailed information on this is provided in the ProTool Configuring Windows-based Systems User’s Guide and in the online help to ProTool CS.

The simulation program can be started using the corresponding button in the toolbar in ProTool

or via File → Test → Start Simulator.
3.6 Uploading

Purpose
During transfer, generally only the run-capable configuration (*.fwd) which has been generated is downloaded on the MP 370. If the original project file is to be used for further development of the configuration or for fault analysis, it must remain on the configuration computer.

Not only the generated configuration can be stored on the MP 370, but also the source file (*), so that it can be retrieved (uploaded) from the MP 370 later, if necessary.

Advantage
After uploading a configuration, it can be analyzed and modified even if the original configuration computer cannot be accessed or the source file on it for the configuration is no longer available.

Conditions
The following conditions must be fulfilled in order to retrieve the source file from the run-capable project file:

- Sufficient memory space must be available on the MP 370 for the additional source file
- The storage location for the source file must be set on the MP 370 (refer to Page 3-9). The storage location can be defined separately: Network path or memory card

Note
The uploaded file is considerably larger than the run-capable configuration. The internal Flash memory is not large enough to store this file.

Transfer of the current project file from the configuration computer to the MP 370 must be performed using the Upload option. This option can be activated in ProTool CS via File → Download → Preferences.

What happens during download/uploading?
In the case of downloading including transfer of the source file, the configuration is compressed from the source format (*.pdb) and downloaded to the MP 370 as a *.pdz file. After uploading, the file is decompressed in the ProTool CS configuration software.

Following uploading, the configuration must be given a new name on the configuration computer.
Notice

The uploaded, decompressed project file can only be opened with a ProTool CS whose version number is greater than or equal to that of the configuration software with which the project was created.

ProTool CS cannot check whether the source file on the MP 370 matches the configuration actually run on it. If downloading is performed at any time without the option Upload being activated, it is possible that old project data is on the MP 370 which no longer matches the current project.

Instructions

Downloading a configuration back from the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the menu option File → Upload → Preferences in ProTool CS on the configuration computer.</td>
</tr>
<tr>
<td>2</td>
<td>Use the Upload dialog to select the required connection type between the operating unit and configuration computer and set the relevant connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Click on OK.</td>
</tr>
<tr>
<td>4</td>
<td>Switch the operating unit to download mode according to the setting in the Transfer settings configuration menu.</td>
</tr>
<tr>
<td>5</td>
<td>Start the upload function using the menu item Upload → Start in ProTool.</td>
</tr>
<tr>
<td>6</td>
<td>Enter a new name or select an existing configuration to be overwritten and click Save. The uploaded configuration is saved and automatically opened in ProTool CS.</td>
</tr>
</tbody>
</table>
3.7 Backup/Restore the Internal Flash Memory

Purpose

The functions **Backup** and **Restore** provide the following options:
- creating a copy of the entire configuration on a memory card.
- creating a copy of the entire configuration on PC (ProSave).
- copying selected objects, such as recipes and passwords, on PC (ProSave).
- restoring the stored elements in the case of a fault.
- updating the MP 370 regardless of where it is in use without the need of a configuration computer.

**Notice**

If the restore process is interrupted due to a power failure, the operating system is deleted. In this case, the operating system must be reloaded (refer to Chapter 13).

**Note**

If a message appears during the restore process indicating a compatibility conflict has occurred, the operating system must be reloaded.

**Note**

Close all applications before starting the backup or restore process.

**Note**

Licenses on the operating unit are not stored with a backup.

Each restore on the operating unit deletes all the licenses on it permanently. Therefore, save this data beforehand.
3.7.1 Backup/Restore on memory cards

During a backup process, the operating system, application and data are copied from the internal Flash memory to an external storage medium. The minimum size of the storage medium must be 24 Mbyte.

In the case of a restore process, the content of a Flash memory stored on an external storage medium is reloaded into the internal Flash memory. Prior to this, the MP 370’s internal Flash memory is completely cleared following confirmation.

Backup on CF card or PC card

Proceed as follows to create a backup copy of the internal Flash memory:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Deactivate the write protection on the memory card, if set.</td>
</tr>
<tr>
<td>2</td>
<td>Depending on the target medium used, insert the memory card in the required slot (Figure 11-1, Page 11-3).</td>
</tr>
<tr>
<td>3</td>
<td>Call in the Windows CE Control Panel (refer to Page 3-6) and, from there, select the Backup/Restore option depicted on the right.</td>
</tr>
<tr>
<td>4</td>
<td>Start the Backup process by using the Backup button.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm that any backup files which exist on the storage medium should be completely deleted beforehand.</td>
</tr>
<tr>
<td>6</td>
<td>When the data has been downloaded successfully, the MP 370 issues a message.</td>
</tr>
<tr>
<td>7</td>
<td>Remove the memory card.</td>
</tr>
<tr>
<td>8</td>
<td>Activate the write protection on the memory card, if available.</td>
</tr>
<tr>
<td>9</td>
<td>Label the memory card, e.g. with the date and version of the configuration saved, and keep it in a safe place.</td>
</tr>
</tbody>
</table>

Note

Insert the memory card in the relevant expansion slot before starting the Backup/Restore process:

- PC card: Slot A (storage location \Storage Card\...)
- CF card: Slot B (storage location \Storage Card2\...)

Information on the memory cards which can be used is provided on Page 11-3.
Notice

A plug-in memory card is used for Backup/Restore.

If both slots are occupied when Backup/Restore is initiated on the MP 370, the PC card (Slot A) is used first. In case of doubt, remove the memory card not to be used from the MP 370.

Restore from CF card or PC card

Proceed as follows to restore the content of the internal Flash memory:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>For security reasons, activate the write protection on the memory card, if available.</td>
</tr>
<tr>
<td>2</td>
<td>Depending on the target medium used, insert the memory card in the required slot (Figure 11-1, Page 11-3).</td>
</tr>
<tr>
<td>3</td>
<td>Call in the Windows Control Panel and select the Backup/Restore option.</td>
</tr>
<tr>
<td>4</td>
<td>Start the restore process by clicking on the Restore button.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm that the internal Flash memory and licenses should be completely deleted.</td>
</tr>
<tr>
<td>6</td>
<td>After confirmation, the operating system is reloaded and the MP 370 is automatically restarted. Finally, the remaining data is downloaded.</td>
</tr>
<tr>
<td>7</td>
<td>When the data has been downloaded successfully, the MP 370 issues a message.</td>
</tr>
<tr>
<td>8</td>
<td>Remove the memory card.</td>
</tr>
<tr>
<td>9</td>
<td>Restart the MP 370.</td>
</tr>
</tbody>
</table>

3.7.2 Backup/Restore using ProSave

In order to save the entire configuration, or even specific parts such as recipes and passwords, on a PC use the ProSave service tool. The advantage of ProSave is that the Backup/Restore can be performed via the following transfer channels without ProTool:

- Serial
- MPI / PROFIBUS-DP
- Ethernet
- USB

During a backup process, the operating system, application and data are copied from the internal Flash memory to a PC.
In the case of a restore process, the content of a Flash memory stored on the PC is reloaded into the internal Flash memory on the operating unit. Prior to this, the MP 370’s internal Flash memory is completely cleared.

**Backup using stand-alone ProSave**

Creating a backup using ProSave as a stand-alone application:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProSave on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the <em>General</em> tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Use the <em>Backup</em> tab control to select the data to be saved (<em>Recipes, Passwords or Complete Backup</em>).</td>
</tr>
<tr>
<td>4</td>
<td>Select the path in which the backup file (*.psb) should be saved.</td>
</tr>
<tr>
<td>5</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>6</td>
<td>Start the Backup process in ProSave by using the <em>Start backup</em> button.</td>
</tr>
<tr>
<td>7</td>
<td>A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly.</td>
</tr>
</tbody>
</table>

**Backup using ProSave integrated in ProTool**

Creating a backup using ProSave integrated in ProTool:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In <em>ProTool</em>, select <em>File</em> → <em>Download</em> → <em>Preferences</em> and use the <em>Set download</em> window to define the connection type with the corresponding connection parameters.</td>
</tr>
<tr>
<td>2</td>
<td>Open the <em>Backup</em> window in <em>ProTool</em> by selecting the menu items <em>File</em> → <em>Download</em> → <em>Backup</em>.</td>
</tr>
<tr>
<td>3</td>
<td>Select the data to be saved (<em>Recipes, Passwords or Complete Backup</em>).</td>
</tr>
<tr>
<td>4</td>
<td>Select the path in which the backup file (*.psb) should be saved.</td>
</tr>
<tr>
<td>5</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>6</td>
<td>Start the Backup process in ProTool by using the <em>Start backup</em> button.</td>
</tr>
<tr>
<td>7</td>
<td>A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly.</td>
</tr>
</tbody>
</table>
Restore using stand-alone ProSave

Proceed as follows to restore the content of the internal Flash memory:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start <em>ProSave</em> on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the <em>General</em> tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Use the <em>Restore</em> tab register to select the path in which the file to be restored is located.</td>
</tr>
<tr>
<td>4</td>
<td>The <em>Archive Description</em> displays the unit concerned and the type of backup data contained in the file.</td>
</tr>
<tr>
<td>5</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>6</td>
<td>Start the Restore process in ProSave by using the <em>Start restore</em> button.</td>
</tr>
<tr>
<td>7</td>
<td>A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly.</td>
</tr>
</tbody>
</table>

Restore using ProSave integrated in ProTool

Proceed as follows to restore the content of the internal Flash memory:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In <em>ProTool</em>, select <em>File</em> → <em>Download</em> → <em>Preferences</em> and use the <em>Set download</em> window to define the connection type with the corresponding connection parameters.</td>
</tr>
<tr>
<td>2</td>
<td>Open the <em>Restore window</em> in <em>ProTool</em> by selecting the menu items <em>File</em> → <em>Download</em> → <em>Restore</em>.</td>
</tr>
<tr>
<td>3</td>
<td>The <em>Archive Description</em> displays the unit concerned and the type of backup data contained in the file.</td>
</tr>
<tr>
<td>4</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>5</td>
<td>Start the Restore process in ProTool by using the <em>Start restore</em> button.</td>
</tr>
<tr>
<td>6</td>
<td>A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly.</td>
</tr>
</tbody>
</table>

**Note**

Licenses on the MP 370 are not stored with a backup. All licenses are permanently deleted following each restore on the MP 370. Therefore, save this data beforehand.
3.8 License Transfer (Authorization) Using ProSave

To protect the software, licenses supplied on a Siemens disk can be transferred to the MP 370 via a PC and enabled (e.g. ProAgent authorization).

License transfer using stand-alone ProSave

Transferring a license to the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProSave on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the General tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Select the Authorize tab control.</td>
</tr>
<tr>
<td>4</td>
<td>Select the disk drive containing the license disk.</td>
</tr>
<tr>
<td>5</td>
<td>The licenses available on the disk are displayed under Selection.</td>
</tr>
<tr>
<td>6</td>
<td>Select the required license.</td>
</tr>
<tr>
<td>7</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>8</td>
<td>Press the button depicted to transfer the license to the MP 370. The selection appears in the Installed authorizations: field.</td>
</tr>
</tbody>
</table>

Deinstalling licenses from the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProSave on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the General tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Select the Authorize tab control.</td>
</tr>
<tr>
<td>4</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>5</td>
<td>Press the Device Status button to display all the licenses installed on the MP 370. These appear in the Installed authorizations: field.</td>
</tr>
<tr>
<td>6</td>
<td>Select the license to be deinstalled.</td>
</tr>
<tr>
<td>7</td>
<td>Press the button depicted to deinstall the license from the MP 370. The selected licenses appear under Selection.</td>
</tr>
</tbody>
</table>
License transfer using ProSave integrated in ProTool

Transferring a license to the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In ProTool, select File → Download → Preferences and use the Set download window to define the connection type with the corresponding connection parameters.</td>
</tr>
<tr>
<td>2</td>
<td>Open the Authorization window in ProTool by selecting the menu items File → Download → Authorize.</td>
</tr>
<tr>
<td>3</td>
<td>Select the disk drive containing the license disk.</td>
</tr>
<tr>
<td>4</td>
<td>The licenses available on the disk are displayed under Selection.</td>
</tr>
<tr>
<td>5</td>
<td>Select the required license.</td>
</tr>
<tr>
<td>6</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>7</td>
<td>Press the button depicted to transfer the license to the MP 370. The selection appears in the Installed authorizations: field.</td>
</tr>
</tbody>
</table>

Deinstalling licenses from the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In ProTool, select File → Download → Preferences and use the Set download window to define the connection type with the corresponding connection parameters.</td>
</tr>
<tr>
<td>2</td>
<td>Open the Authorization window in ProTool by selecting the menu items File → Download → Authorize.</td>
</tr>
<tr>
<td>3</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>4</td>
<td>Press the Device Status button to display all the licenses installed on the MP 370. These appear in the Installed authorizations: field.</td>
</tr>
<tr>
<td>5</td>
<td>Select the license to be deinstalled.</td>
</tr>
<tr>
<td>6</td>
<td>Press the button depicted to deinstall the license from the MP 370. The selected license appears under Selection.</td>
</tr>
</tbody>
</table>

Note

Downloading back licenses can only be done to a disk which contained or still contains the same license.
3.9 Load Application

3.9.1 Load application using ProSave

Applications (e.g. drivers) specially developed for the MP 370 can be installed on the MP 370 using ProSave.

Normally, the driver is supplied with ProSave enabling implementation of an uninterruptible power supply and Internet Explorer.

Loading applications on the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProSave on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the General tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Select the Options tab control.</td>
</tr>
<tr>
<td>4</td>
<td>Use Selection to select the path containing the required application.</td>
</tr>
<tr>
<td>5</td>
<td>The corresponding application appears under Available Options:. Select the required application.</td>
</tr>
<tr>
<td>6</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>7</td>
<td>Press the button depicted in ProSave to transfer the application to the MP 370. The selection appears in the Installed options: field.</td>
</tr>
</tbody>
</table>

Deinstalling an application from the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProSave on the PC using the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Use the General tab register to select the required device type and connection type with corresponding connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>Select the Options tab control.</td>
</tr>
<tr>
<td>4</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>5</td>
<td>Press the Device Status button to display all the applications installed on the MP 370. These appear in the Installed options: field.</td>
</tr>
<tr>
<td>6</td>
<td>Select the application to be deinstalled.</td>
</tr>
<tr>
<td>7</td>
<td>Press the button depicted in ProSave to deinstall the application from the MP 370. The selected application appears under Available options:.</td>
</tr>
</tbody>
</table>
Load applications using ProSave integrated in ProTool

Loading applications on the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In <em>ProTool</em>, select <em>File</em> → <em>Download</em> → <em>Preferences</em> and use the <em>Set download</em> window to define the connection type with the corresponding connection parameters.</td>
</tr>
<tr>
<td>2</td>
<td>Open the <em>Options</em> window in <em>ProTool</em> by selecting the menu items <em>File</em> → <em>Download</em> → <em>Options</em>.</td>
</tr>
<tr>
<td>3</td>
<td>Use <em>Selection</em> to select the path containing the required application.</td>
</tr>
<tr>
<td>4</td>
<td>The corresponding information appears under <em>Available Options</em>:. Select the required application.</td>
</tr>
<tr>
<td>5</td>
<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>6</td>
<td>Press the button depicted in ProSave to transfer the application to the MP 370. The selection appears in the <em>Installed options</em>: field.</td>
</tr>
</tbody>
</table>

Deinstalling an application from the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In <em>ProTool</em>, select <em>File</em> → <em>Download</em> → <em>Preferences</em> and use the <em>Set download</em> window to define the connection type with the corresponding connection parameters.</td>

<td>Configure the MP 370 according to the required transfer channel and switch to download mode (Ch. 3.1 and Ch. 3.2).</td>
</tr>
<tr>
<td>4</td>
<td>Press the <em>Device Status</em> button to display all the licenses installed on the MP 370. These appear in the <em>Installed options</em>: field.</td>
</tr>
<tr>
<td>5</td>
<td>Select the application to be deinstalled.</td>
</tr>
<tr>
<td>6</td>
<td>Press the button depicted in ProSave to deinstall the application from the MP 370. The selected application appears under <em>Available options</em>:.</td>
</tr>
</tbody>
</table>
3.9.2 Load applications using Active Sync

Other applications can be loaded which can run under Windows CE with MIPS CPUs and comply with the properties of the MP 370. The installation and deinstallation of external applications and drivers can be performed using the Active Sync tool from Microsoft. The tool is not part of the material supplied by Siemens and must be obtained from Microsoft, if necessary. At the time of print, the tool could be obtained from the Microsoft homepage free of charge.

By selecting Start → Communication → PC Link in the Windows CE Start menu, the connection to the host PC, containing Active Sync, is established. In addition, data can be transferred between the PC and MP 370 in both directions by using the Internet Explorer view. Only a serial interface can be used for the connection between PC and MP 370.

---

**Note**

It cannot be guaranteed that external applications run on the MP 370 without any problems if the operating unit properties are not complied with e.g. screen resolution.

---

When applications are loaded, they are initially stored in the DRAM file system. The following memory locations are available for applications:

- Internal Flash: 5 MB
- DRAM file system: 2 MB
- Working memory: 7 MB

Files created by applications are also normally stored in the DRAM file system. The DRAM file system is deleted when the unit is switched off. Using the system settings (OP Properties → Persistent Storage → Save Files, refer to Ch. 8.3.1), however, it is possible to save the data currently available in the DRAM file system in the Flash memory. When the unit is started up, the data saved is automatically restored.

When an application is deinstalled, ensure that the files created by the application are also deleted. In this case, delete the files in the DRAM file system first in the normal Explorer and then backup the DRAM file system (OP Properties → Persistent Storage → Save Files, refer to Ch. 8.3.1).

---

**Note**

By exchanging the operating system (Chapter 13), the initial MP 370 configuration can be restored simply.
Note

*Active Sync* constantly uses the serial interface. If the interface is also required for the ProTool download, the interface must first be enabled again via Active Sync.

### 3.10 ProSave Service Tool

The *ProSave* tool is supplied together with ProTool. All the functions are provided which are necessary for the transfer of data between the configuration computer and MP 370:

- Installation and deinstallation of drivers, options and add-ons, i.e. applications and drivers independent of ProTool, such as the UPS (Page 3-21, Page 8-13)
- Data backup using Backup/Restore (Page 3-14)
- License transfer (Page 3-19)
- Operating system update (Page 13-1)

**Integrated operation**

*ProSave* is part of the material supplied with ProTool and can be automatically loaded on the configuration computer with the ProTool installation. The entire function range of ProSave is available within ProTool. In integrated operation, the ProSave dialogs are called from the project. In this way, all the necessary specifications (e.g. target device and download settings) are assumed from the project.

**Stand-alone operation**

*ProSave* can also be installed as a stand-alone application. In this case, the settings concerning the device and downloading must be defined in the ProSave user interface and match the MP 370 settings.
Operating the MP 370

In this chapter

The MP 370 is available as a touch panel version and a version with an integrated membrane keyboard. Both models can be operated by an external keyboard or mouse connected to the USB interface.

This chapter provides information on the general operating procedures of the MP 370

- as a touch panel (Page 4-2)
- as a keyboard unit (Page 4-8)
- with an external keyboard/mouse (Page 4-19)
4.1 Touch Panel Operation

Overview
This chapter describes the general operation procedures for the MP 370 touch panel model. Information on the general operation procedures for the keyboard model is provided in Chapter 4.2.

The MP 370 screen is used to observe the operating status of the machine or system being monitored and, at the same time, to intervene directly in the process running simply by touching the buttons and input fields displayed on it.

Information regarding operation of screens and screen objects is provided in Chapter 5.

4.1.1 Operating touch elements

Definition
Touch elements are contact-sensitive operating elements provided on the MP 370 screen, such as buttons, input fields and message windows. Their operation is basically no different from pressing conventional keys. Touch elements are operated by touching them lightly with a finger.

Caution
Be sure to touch only one screen element of the MP 370. Never touch more than one touch element at a time. Otherwise, an action may be unintentionally initiated.

Caution
Never use pointed or sharp instruments to operate the MP 370 to prevent damage to the plastic surface of the touch screen.

Direct key
In the case of a DP connection, buttons can be configured as direct keys in order to achieve fast keyboard operation. Fast key operation is a condition for Jogging mode (Inching mode), for example.

PROFIBUS direct keys set bits in the I/O area of a SIMATIC S7 directly from the MP 370.
Operation acknowledgement

As soon as the MP 370 detects contact has been made on a touch element, it responds with an optical and acoustic acknowledgement. An acknowledgment is independent of communication with the PLC. It is not an indication of the required action actually having been executed.

Acoustic acknowledgement

As soon as the MP 370 detects contact has been made on a touch element, it responds with an acoustic signal. This acoustic signal can be deactivated if required (Page 8-11).

Optical acknowledgement

The type of visual acknowledgement is dependent on the operating element touched:

- **Buttons**
  In the case of 3D-effect configurations, visual representation is distinguished according to the statuses *touched* and *untouched*. The figures below illustrated examples of representation by means of the Status button:

  ![Touched and Untouched Buttons](untouched.png)

  The way in which the selected field appears on the screen can be configured (line widths 1 - 10 for the focus and the color of the frame).

- **Hidden buttons**
  The focus for hidden buttons does not appear following selection (value for the focus line width is 0, default setting). If the value for the focus width is changed, the dotted outline of the button changes to a line when touched. The outlines remain visible until the focus is moved to another operating element.

- **Input fields**
  After touching an input field, the screen keyboard appears as the operation acknowledgement.

Screen keyboard

In order to enter values, the MP 370 automatically displays a screen keyboard within the ProTool configuration after touching an input field, for example. The screen keyboard is also displayed automatically if a password needs to be entered in order to activate a password protected function (also refer to Page 5-40). After completing the input, the screen keyboard is automatically hidden.
The screen keyboard can be activated in the following ways:

- The screen keyboard is always displayed during runtime as soon as the operator selects an input field (default setting).

- A button is configured with which the user can automatically activate or deactivate the appearance of the screen keyboard as necessary. This is useful, for example, when an external keyboard is connected to the operating unit rendering the screen keyboard unnecessary.

  Configure a button, call in the context menu and select the Properties dialog. In the Functions tab control, select “click” as the event and assign this event to the Use_Screen_Keyboard_On/Off function in the “Keyboard” category. During runtime, the operator can use the button to activate or deactivate the mechanism controlling the appearance of the screen keyboard.

- The screen keyboard is activated via the corresponding icon in the toolbar (refer to Chapter 4). The position of the screen keyboard can be defined in the Input Panel option in the Windows CE Control Panel.

---

**Note**

Use the Start Screen Keyboard function to display the screen keyboard permanently. The screen keyboard remains visible until it is explicitly closed by the user. It can, thus, be used for input in other applications.

---

Depending on the input field configured, the screen keyboard button provides buttons for purely numeric input or alphanumeric values.

### External USB keyboard

An external USB keyboard can be connected to the USB interface (refer to Chapter 4.3 on Page 4-19).

### Operating screen objects using buttons

Screen objects which are assigned pre-defined buttons can also be operated by buttons outside the screen object. A condition for this is that each function has been linked to the respective button in the configuration.

These functions are complied in ProTool CS within the Keyboard action for screen objects.
4.1.2 Enter numeric values

Numeric screen keyboard

In order to enter numeric values, the MP 370 automatically displays a numeric screen keyboard as depicted in Figure 4-1 directly after touching an input field on the touch screen. After completing the input, the screen keyboard is automatically hidden.

The Help key is only active when a help text has been configured for that particular input field.

![Figure 4-1 Screen keyboard for numeric input](image)

Procedure

Numeric values are entered character by character using the buttons provided on the screen keyboard. Confirm the value entered by pressing the Enter key or cancel the input by pressing ESC. The screen keyboard is closed in both cases.

Note

Limit values can be configured for numeric input fields. In this case, values entered are only accepted when they lie within the limits configured. If an attempt is made to enter a value which is outside the configured limits, it is rejected and the original value automatically reinserted. In this case, the operating unit issues a system message.

Note

On entering the first character, a tooltip appears with the lower and upper limit values related to the input window.
4.1.3 Enter alphanumeric values

Alphanumeric screen keyboard

In order to enter character strings and numeric values in hexadecimal format, the MP 370 automatically displays an alphanumeric screen keyboard directly after touching an input field on the touch screen. After completing the input, the screen keyboard is automatically hidden.

Keyboard levels

The alphanumeric screen keyboard has several levels:
- Normal level (Figure 4-2)
- Shift level
- Alt Gr level
- Shift + Alt Gr level
The Alt Gr and Shift + Alt Gr levels serve to enter special characters.
The Help key is only active when a help text has been configured for that particular input field.

Procedure

Alphanumeric values are entered character by character using the buttons provided on the screen keyboard. Confirm the value entered by pressing the Enter key or cancel the input by pressing ESC. The screen keyboard is closed in both cases.

Note

Press the button depicted twice (locking button) to activate the toolbar.
4.1.4 Navigation using buttons

It is possible to assign system key function to buttons:

- **Page_Up**
  A button is assigned the Page_Up function.

- **Page_Down**
  A button is assigned the Page_Down function.

- **Go_to_Home**
  A button is assigned the Go_to_Home function.

- **Go_to_End**
  A button is assigned the Go_to_End function.

These functions are compiled in ProTool CS within the Keyboard group.

4.1.5 Call help text

**Purpose**

Help texts consist of additional information and operating instructions provided by the configuration planner concerning messages, screens and input fields. Help text, concerning an input field for example, may provide information on permissible value ranges (refer to Figure 4-3) or, in the case of an alarm message, information related to the cause and its elimination.

![Help text](image)

Figure 4-3 Help text for an input field (example)
Procedure

- **Help on messages**
  Touch the following button in the message window, on the message page, in the message buffer or the message display.

- **Help on input fields**
  Touch the Help key on the screen keyboard. This key only appears if a configured help text exists.

- **Help on current screen**
  If the function *Display Help Text* has been assigned to a button, for example, touch that button to call in the help text configured for the current screen.

- **Help on focussed screen object**
  Press the key combination `ALT + H` either on the screen keyboard or the USB keyboard connected to call in the configured help text to the trend view which has been focussed, for example.

4.2 Operating Keyboard Units

Overview

This chapter describes the general operation procedures for the MP 370 keyboard unit. Information on the general operation procedures for the touch panel model is provided in Chapter 4.1.

The operating status of the machine or system to be monitored can be observed on the MP 370 screen and the running process directly influenced by using the integrated membrane keyboard.

Information regarding operation of screens and screen objects is provided in Chapter 5.

Keypads

The MP 370 keyboard consists of two functional blocks (Figure 4-4):

- **Function keys/Softkeys:**
  - Keys S1 to S16
  - Keys F1 to F20
- **System keys:**
  - Alphanumeric keys
  - Cursor keys
  - Control keys
4.2.1 Function keys/Softkeys

Function keys with global function assignment

A function key with global function assignment always triggers the same action on the MP 370 or in the PLC regardless of the screen currently open. These actions could include:

- Open screen
- Display current alarm messages
- Start screen printing (hardcopy)

All S and F keys can be configured with global assignments.

Function keys with local function assignment (softkeys)

A function key with local function assignment (softkey) can trigger different actions on the MP 370 or in the PLC according to the screen currently open (local significance of current screen). An icon can be configured for each softkey which can then be positioned at the edge of the screen.
All function keys can be assigned locally significant functions during configuration. Icons cannot be configured for the keys F11 to F20.

**Caution**

If a function key is pressed directly following changing screens, the corresponding function associated with the new screen can be triggered before the screen is generated.

**Note**

A two-key operation is possible for the MP 370, i.e. two keys can be pressed thus triggering two functions (refer to *Communication for Windows-based Systems User’s Guide*).

**LED assignment**

The Light Emitting Diodes (LEDs) in the function keys can be controlled from the PLC. A luminous or flashing LED can indicate to the operator which key to press according to specific situations, for example.

In order to trigger LEDs, the corresponding data areas must be set up in the PLC and specified as area pointers in the configuration. The assignment of the individual LEDs to the bits in the database must be defined by the project engineer when configuring the function keys. In this case, the bit number within the mapping area is specified for each LED.

Detailed information on LED control is provided in the *Communication for Windows-based Systems User’s Guide*. 
4.2.2 System keys

Control keys

The following control keys serve superordinated editing and control functions:

- Shift (numeric/alphanumeric)
- Backspace
- Insert/Delete
- Tabulator
- Display help text
- Escape (Terminate)
- Acknowledge
- Confirm entry
- Alt key
- Ctrl key
- Shift (special characters)
- Shift (upper/lower case)

The system keys ACK, ESC, HELP and ENTER can also be assigned functions.
Alphanumeric keys

Use the following alphanumeric keys to enter digits, letters and special characters.

![Alphanumeric keys](image)

Cursor keys

The cursor keys (Figure 4-7) are used to move the text cursor and to navigate in screens and screen objects. The functions of the keys corresponds to the cursor keys on a standard PC keyboard.

![Cursor keys](image)

The Home and End keys can also be assigned functions.
## System key function overview

Table 4-1  Functions of the system keys

<table>
<thead>

</tr>
<tr>
<td>REVERSE</td>
<td>Opens the previous tab control.¹)</td>
</tr>
<tr>
<td>ESC</td>
<td>Closes the dialog without saving.</td>
</tr>
</tbody>
</table>

¹) When the name of the tab control has the focus.

---

**Operating screen objects using function keys**

Screen objects assigned to buttons, e.g. message display, trend view representation, recipe view or status/force, can also be operated by means of function keys or softkeys. A condition for this is that each relevant function has been linked to a function key or softkey in the configuration.

These functions are complied in ProTool CS within the *Keyboard action for screen objects.*

---

### 4.2.4 Entering values

**Marking**

On selecting an input field, the entire field content is marked by changing color. After pressing a key (except a cursor key), the field content is deleted and the new input displayed.

After selecting a field, press the SHIFT key and a cursor key simultaneously to clear the marking on the field contents and enable the cursor to be moved freely within the field.
Note
To enter the hexadecimal characters A...F, switch the input keys to alphanumeric assignment.

Note
Limit values can be configured for numeric input fields. In this case, values entered are only accepted when they lie within the limits configured. If an attempt is made to enter a value which is outside the configured limits, it is rejected and the original value automatically reinserted. In this case, the keyboard unit issues a system message.

Note
On entering the first character, a tooltip appears with the lower and upper limit values related to the input window.

External USB keyboard and screen keyboard
An external USB keyboard can be connected to the USB interface (refer to Chapter 4.3 on Page 4-19).

The dialog to activate the screen keyboard, defined by the user in ProTool CS itself, continues to be offered for the keyboard unit and the screen keyboard can then be operated by an external mouse connected to the USB interface.
4.2.5 Call help text

Purpose
Help texts consist of additional information and operating instructions provided by the configuration planner concerning messages, screens and operable screen objects. Help text, concerning an input field for example, may provide information on permissible value ranges (refer to Figure 4-8) or, in the case of an alarm message, information related to the cause and its elimination.

Procedure
Proceed as follows in order to call in the configured help text e.g. for an input field:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select input field (e.g.) The input field is marked.</td>
</tr>
<tr>
<td>2</td>
<td>Call in the help text The LED in the key lights up, indicating that help text is available. Press the key to call in the help text. The configured help text is displayed in the language currently set on the MP 370. If help text is also configured for the current picture, it is displayed after pressing the key again.</td>
</tr>
<tr>
<td>3</td>
<td>Close help window ESC The help window is closed.</td>
</tr>
</tbody>
</table>
4.3 Operating Using an External Keyboard/Mouse

Overview
An external keyboard or mouse can be connected to the USB interface on the MP 370. Connection and disconnection is possible during normal operation of the MP 370 ("hot plug in/out").

Operation of the MP 370 via an external keyboard/mouse is particularly recommended during the commissioning and test phases for both keyboard units and touch panels.

Operation
Operation of the MP 370 via a mouse is only a little different from operation using the touch screen. After connecting a mouse, the mouse pointer appears on the screen.

When the mouse pointer is positioned on an operable button, for example, the mouse pointer symbol changes.

Caution
When using a keyboard unit, do not operate the integrated membrane keyboard and external USB keyboard simultaneously. Otherwise, an action may be unintentionally initiated.

Notice
USB mouse:
• Use a standard mouse.

USB keyboard:
• Use a standard keyboard with a USA/International keyboard layout.
• Operation of the configured function keys is not possible via the external keyboard.

Commercially available USB devices do not normally fulfill the higher industrial demands with regard to interference resistance and can have negative effects on the device.
Operating Screens and Screen Objects

In this chapter

Operation of the visualization processes on the MP 370 is dependent on the configuration created with the ProTool CS configuration software. This chapter provides general information on screens and on operating predefined screen objects for touch panels and keyboard units.

Information on the general operation procedures for the touch panel model is provided in Chapter 4.1. Information on the general operation procedures for the keyboard units is provided in Chapter 4.2.

5.1 Operating Screens

What is a screen?

Screens visualize the progress of processes and display specified process values. A screen contains logically related process data which the MP 370 can both display and modify by operating the individual values.

Screens display the current process status in the form of numeric values, bar graphs or trend curves for example. Dynamic screen objects enable, for instance, the current position of a production process to be tracked on the MP 370.

Screen partitions

A screen is basically composed of static and dynamic sections. The terms “static” and “dynamic” do not refer to the possibility of dynamically positioning screen partitions but to the connection to the PLC.

Static partitions, e.g. text and graphics, are not updated by the PLC. Dynamic partitions, e.g. input and output fields, trend curves and bars, are linked to the PLC and display current values constantly read in from the PLC memory. Their connection to the PLC is established by means of tags.

A summary of all the screen objects which a ProTool configuration may contain for an MP 370 is provided from Page 5-6.

The display area of a screen can be divided into various areas. These areas are either moveable (message area and message indicator) or fixed (fixed window, icons for function keys).
Fixed window

The fixed window is an area at the top of the screen. The height of the fixed window can be configured. Since the content of the fixed window is independent of the screen currently displayed, it is especially suited for displaying important process magnitudes or date and time.

An operating element configured in the fixed window is available in every screen. In the case of a touch panel, a button located in the fixed window can represent a globally effective function key.

Icons for keyboard units

Icons are graphics of a fixed size located at the bottom and sides of the keyboard unit screen. They are defined during configuration and clearly indicate the screen-specific functions of the softkeys in graphic form.

After pressing the respective softkey, S1 to S16 and F1 to F10 the function symbolized by the icon is activated either on the MP 370 or the PLC.

Message indicator

The message indicator is a configurable graphical symbol which is displayed on the screen when at least one alarm message is present or needs to be acknowledged on the MP 370.

The indicator continues to blink as long as unacknowledged messages are present.

The number (in this case 3) represents the number of alarm messages present.

The message indicator can be operated on touch panels.

Operate message indicator on touch panels:

The response of the message indicator is dependent on whether or not alarm messages are present on the MP 370 which still have to be acknowledged at the moment the indicator is touched.

- **Alarm messages to be acknowledges** (message indicator flashing):
  The alarm message window opens on touching the message indicator (Page 5-25).

- **No alarm messages to be acknowledged**:
  The alarm message window opens on touching the message indicator (Page 5-27).

Use the button illustrated to close the alarm window on touch panels in order to operate screens. The alarm message window can be opened again by touching the message indicator.

In the case of keyboard units, the messages must be acknowledged by pressing the ACK button.
Message window

System messages
The MP 370 displays internal operating statuses in the system message window. System messages indicate, for example, incorrect operations or communication faults. A summary of some of the most important system messages and explanations on how to eliminate the causes are provided in Appendix C of this manual.

Proceed as follows to close the system message window:

- **Keyboard unit:** Press the ESC key.
- **Touch panel:** Press the button illustrated.

Event messages
The MP 370 uses the event message window to display operating statuses concerning the machine or system connected to the PLC. The position of the window can be configured.

Alarm messages
The MP 370 uses the alarm message window to display faults concerning the machine or system connected to the PLC. The position of the window can be configured.

Since alarm messages indicate abnormal operating statuses, they must be acknowledged. Proceed as follows to acknowledge alarm messages:

- **Keyboard unit:** Press the ACK key.
- **Touch panel:** Press the button illustrated.

More options for displaying messages are described from Page 5-21. Detailed information regarding the message window is provided on Page 5-25.

Changing active window

Several windows can be opened simultaneously when the MP 370 is running in normal operation. Proceed as follows to change the active window:

- **Keyboard unit:** In order to operate a window, use the key combination depicted on the right to move between the basic screen area and the windows. Each time the combination is pressed, the cursor moves to the next window.
- **Touch panel:** A window becomes active after touching it.

The window in which the cursor is located is the active window. Input/Operations are possible in the active window. It is not possible to change to a window which contains no operable objects.
Select screen

The MP 370 can be used to view, edit and print screens. The relevant screen must have been selected beforehand. There are several ways in which to select a screen:

- **Function key/Button**
  Pressing a function key or button opens the corresponding screen defined in the configuration.

- **Input field**
  Enter the corresponding number of the screen to be viewed in the input field.

- **Edit messages**
  When configured, pressing the Edit button calls in the message assigned to the screen in the message window or message display, for example.

**Note on configuration**

Press the key with which the screen should be selected. Select the Select_screen_permanent function and enter a name for the screen under the Screen Name parameter. In the Field Number box, enter the Tab key sequence number of the field in which cursor should be located following a change of screens. As soon as the key is subsequently pressed, the function is triggered and the content of the Screen Name and Field Number parameters evaluated. The corresponding screen is displayed on the operating unit.
5.2 Logging On and Off from the MP 370

Purpose
Operable screen objects, such as input fields and buttons, can be assigned passwords during configuration to prevent them being modified by unauthorized personnel. Important parameters and settings can then only be modified by authorized personnel.

Information on the Password List screen object is provided on Page 5-40.

Login
In order to access password protected operating elements, it is necessary to log in on the MP 370. If an element is operated which is protected by a password, the login window automatically appears. In addition, the Logon_User function can be linked to an input field, for example, in the configuration. The user then has access to all the protected operating elements on the MP 370 for which the password is valid until logging off.

When correspondingly configured, it is also possible to log on via an input field for confidential password entry (Page 5-10). The character string entered is represented by placeholders (*).

Logoff
In order to rule out operation by unauthorized personnel, the login should not remain active on the operating unit for too long a period of time. The following options are available with which to log off from the MP 370:

- **Configured logout time expires**
  If the MP 370 is not operated by the user within a configured period (logout time), the user is automatically logged off

- **Log out of the operating unit**
  If the configuration links the function Logoff_User with an operating element, the element can be used log off from the MP 370.

**Note**
It is possible to log off by entering an incorrect password.
### 5.3 Overview of Screen Objects

A summary of the screen objects which an MP 370 configuration may contain is provided in the following table.

<table>
<thead>
<tr>
<th>Screen object</th>
<th>Use/Description</th>
</tr>
</thead>
</table>
| Text                | Texts are used in the configuration to label display and operating elements, for example. Texts cannot be modified.  
The importance of different texts within a screen can be distinguished by assigning different fonts and formats.  
Texts can be configured to cover several lines and in different languages. |
| Graphics            | Graphics can be used in the configuration, for example, to display the system or as explanatory symbols for display and operating elements which have been configured. |
| Output field        | An output field displays current values from the PLC in numeric or alphanumeric form. |
| Input field (Page 5-9) | The input field is used to enter values which are then transferred to the PLC. The values can be in numeric or alphanumeric form. Entries which lie outside the specified value range are rejected according to the limit values which have been configured.  
The input can be protected by means of a password. |
| Symbolic output field | A symbolic output field displays current values from the PLC as plain text.  
**Example:** Instead of the values 0 and 1 the symbolic output field displays the texts **Motor OFF** and **Motor ON**. |
| Selection field (Page 5-11) | Values are not entered in the selection field character by character but are selected from a text list. This enables, for example, a motor to be switched on and off by means of the entries **ON** and **OFF**. |
| Date/Time (Page 5-13) | This screen object is used to display and enter the calendar date and time. The way in which the date and time are displayed depends on the language set on the MP 370. |
| Graphic display     | The graphic display enables the dynamic positioning of graphics from external graphic programs in the project.  
**Example:** Instead of using a numeric value indicator, the fill level of a tank can be visualized by a dynamic graphic. |
### Use/Description

<table>
<thead>
<tr>
<th>Screen object</th>
<th>Use/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graphics list</td>
<td>A graphic list displays current values from the PLC in the form of a graphic. It assigns a graphic to each tag value. The value of the tag during runtime determines which graphic is selected from the list and displayed on the operating unit.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Instead of the values 0 and 1, the graphics list displays graphical representations for open and closed valves.</td>
</tr>
<tr>
<td>Graphic box</td>
<td>A graphic box enables the selection of a graphic by selecting an entry from a graphics list.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Using a graphic selection list it is possible to design the user interface as language independent, for example.</td>
</tr>
<tr>
<td>Vector graphics</td>
<td>The following vector graphic objects can be configured:</td>
</tr>
<tr>
<td></td>
<td>- Line</td>
</tr>
<tr>
<td></td>
<td>- Rectangle/Square</td>
</tr>
<tr>
<td></td>
<td>- Rounded rectangle/square</td>
</tr>
<tr>
<td></td>
<td>- Circle/Ellipse</td>
</tr>
<tr>
<td></td>
<td>- Polyline/Polygon</td>
</tr>
<tr>
<td></td>
<td>These objects are combined to form vector graphics with simple, basic geometrical shapes in your configuration. The type, color and width of the lines and their transparency, color filling, rounding radius, etc. can be configured as desired.</td>
</tr>
<tr>
<td>Button (Page 5-16)</td>
<td>A button is a virtual key on the MP 370 screen that can be assigned one or more functions, depending on the configuration. After pressing the button, the functions configured for the event press are triggered. On releasing the button, the functions configured for the event release are triggered.</td>
</tr>
<tr>
<td>Status button (Page 5-18)</td>
<td>A Status button is a display and operating element which has one of two states: <em>Touched</em> and <em>Untouched</em>. The states can be indicated by means of text or graphics. The Status button can be configured to be locking (switch function) or non-locking (keying function).</td>
</tr>
<tr>
<td>State view</td>
<td>The state view can be used to configure a warning display or to indicate the status of a unit which cannot be viewed from the MP 370 (e.g. a motor). The response of the state view can be configured.</td>

<tr>
<td>Switch (Page 5-20)</td>
<td>A switch serves to enter and display a binary status. It can only be switched on or off.</td>
</tr>
</tbody>
</table>
## Screen object

<table>
<thead>
<tr>
<th>Screen object</th>
<th>Use/Description</th>
</tr>
</thead>
</table>
| Hidden button          | A hidden button is a transparent button that is not displayed on the MP 370. If hidden buttons are located over graphics, for example, it is possible to operate part of the graphic, e.g. a motor or valve.  
After pressing the button, the functions configured for the event press are triggered. On releasing the button, the functions configured for the event release are triggered. |
| Bar                    | Bars represent values from the PLC as rectangular areas. The MP 370 thus provides a clear indication of how far the current value is from the limit values, or if a setpoint value has been reached, at a glance. Bars are often used to represent fill levels or workpiece numbers.  
Direction, scaling, bar and background color and labeling the Y-axis can be configured as required. In order to identify limit values, limit value lines can be called in. |
| Trend view             | A trend view provides a particularly clear representation of process data when displayed as a continual progression. Several different trends can be displayed simultaneously in the trend view, e.g. current and archived trend curves. |
| Slider control         | Use a slider control to enter and display numeric values in analog form. To enter values, move the slider to the required position. When used as a display element, the value is represented by the position of the slider. |
| Message view           | Special filter criteria are configured in the message view for displaying the volatile message buffer and/or message archive.                                                                                  |
| Single message view    | A single message display can provide a subset of the functionality of a message display. It can be used, for example, to simply realize a message line in a screen.                                                        |
| Status/Force           | By implementing Status/Force, the MP 370 can be used to access the connected PLC (SIMATIC S5 and SIMATIC S7) in order to read and write values directly. PLC operands can be monitored and modified without having to connect an additional programming unit or PC to the PLC.  
This facility is of special use during the testing and commissioning phases of the configuration. |
| Password list          | The password list can be used to display, enter and modify passwords on the MP 370.                                                                                                                            |
| Recipe view            | A recipe view can be used to create, save and transfer data records on the MP 370.                                                                                                                             |
| Analog display         | An analog display indicates numeric values by means of a pointer instrument.                                                                                                                                        |
5.4 Input Field

Purpose

Numeric or alphanumeric values are entered character by character in an input field. A numeric value is a number, e.g. 80 as a setpoint value for a temperature. An alphanumeric value can contain text and digits e.g. Valve_12.

Limit value check

If limit values are configured for the input field tags, the values entered are only accepted when they are within the configured limits. If an attempt is made to enter a value which is outside the configured limits, it is rejected and the original value automatically reinserted. In this case, the MP 370 issues a system message.

Display

Input fields can be configured differently according to their purpose, e.g.:

- **Numeric input field**
  to enter numeric values in decimal, hexadecimal or binary format.

- **Alphanumeric input field**
  to enter character strings. It is only possible to enter ASCII characters. They are dependent on the language selected.
• **Input field for date and time**
to enter the calendar date and time. The format is dependent on the language currently set on the MP 370. The figure below illustrates examples of input fields for date and time in US English language format.

![Date and Time Input Example](image)

• **Input field for confidential password entry**
to enter passwords confidentially. The character string entered is represented by placeholders (*). The figure below illustrates an example.

![Confidential Password Input Example](image)

**Operation**

Proceed as follows to operate an input field:

- **Keyboard unit:**
  - Select the input field required. The field content changes color when the field is accessed.
  - Use the cursor keys to position the cursor and then enter the required value.
  - Confirm the entry

or

- Discard the entry.

Also refer to Page 4-16.

- **Touch panel:**
  - Touch the input field on the MP 370 touch screen. The screen keyboard automatically appears.
  - Enter the required value.
  - Confirm the entry

or

- Discard the entry.

Also refer to Page 4-5.
5.5 Selection Field

Purpose

Values are entered in a selection field not character-by-character but are selected from a list provided (Figure 5-1).

![Selection Field in Opened State](image)

**Figure 5-1** Selection field in opened state (example)

Operation using the keyboard unit

Proceed as follows to operate a selection field on the keyboard unit:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the selection field (e.g.)</td>
<td>The selection field is marked.</td>
</tr>
<tr>
<td>2</td>
<td>Open selection list</td>
<td>The selection list opens up.</td>
</tr>
<tr>
<td>3</td>
<td>Select entry</td>
<td>Moves cursor line by line.</td>
</tr>
<tr>
<td>4</td>
<td>Apply selection</td>
<td>The selected entry becomes valid.</td>
</tr>
<tr>
<td></td>
<td>or Cancel selection</td>
<td>The selection field is closed.</td>
</tr>
</tbody>
</table>

Note

After pressing an alphanumeric key, the first list entry which begins with that letter appears.
Operation on the touch panel

Touch the selection field on the MP 370 touch screen. In this case, the selection list opens up immediately. After selecting an element from the list, the selection list is closed and the selected text appears in the list box.

If the touch screen is touched outside the pulled down selection list, the list is closed and the entry with the focus appears in the selection field.

Caution

When released, the focussed list entry is immediately accepted. Therefore, continue to press the screen with your finger while sliding it to the required entry.
5.6 Date/Time

Purpose

The screen object Date/Time displays the current values for the time and/or date. The time can be modified online if the corresponding feature is configured.

The calendar data and time values are synchronized with the operating system values or are read from the PLC. The MP 370 accesses these values, for example, to assign time stamps to message events.

Notice

Without the optionally available backup battery (Chapter 11) the MP 370 stores the system time for approx. 3 days \(^1\). If the unit is disconnected from the power supply for a longer period, the date and time must be updated following recommissioning.

Format

The format of the date and time depends on the language currently set. It corresponds to the standard international conventions:

<table>
<thead>
<tr>
<th>Language</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Date</td>
</tr>
<tr>
<td></td>
<td>long</td>
</tr>
<tr>
<td>German</td>
<td>Samstag, 25. November 2000</td>
</tr>
<tr>
<td>English (USA)</td>
<td>Saturday, November 25, 2000</td>
</tr>
<tr>
<td>Italian</td>
<td>sabato 25 novembre 2000</td>
</tr>
<tr>
<td>Spanish (traditional)</td>
<td>sábado 25 de novembre de 2000</td>
</tr>
</tbody>
</table>

The format set for Date and Time can be modified using the Regional Settings option in the Windows CE Control Panel. To do so, select the icon depicted on the right. Information on opening the Windows CE Control Panels is provided on Page 8-4.

\(^1\) The unit must have been in operation for approx. 6–8 hours, without any interruptions, beforehand.
Notice
When entering the date and time, ensure that the two values are separated by a space.

Notice
If the operating unit does not support the language specified in the configuration, the display of Date and Time will assume the format of the language currently set in the Regional Settings option under Format.

Synchronizing date/time with the PLC
The date and time in the MP 370 and PLC can be synchronized if this feature is defined in the configuration and PLC program. To do this, the PLC jobs 14 (Set Time) and 15 (Set Date) are provided. Use PLC jobs 40 and 41 to transfer the date and time from the MP 370 to the PLC.

Further information on this is available in the Communication for Windows-based Systems user’s guide.
5.7 Graphic Box

Purpose

The graphic box is an input field for symbolic values. A graphic can be selected by selecting an entry in the graphic list.

Operation using the keyboard unit

Proceed as follows to operate a graphic box on the keyboard unit.

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select graphic box (e.g.)</td>
</tr>
<tr>
<td>2</td>
<td>Open the graphic selection list</td>
</tr>
<tr>
<td>3</td>
<td>Select entry</td>
</tr>
<tr>
<td>4</td>
<td>Apply selection</td>
</tr>
<tr>
<td></td>
<td>or Cancel selection</td>
</tr>
</tbody>
</table>

Operation on the touch panel

Touch the graphic box on the MP 370 touch screen. Selection mode is activated. Scroll through the graphic selection list using the scroll bar (vertical or horizontal). Click on the required graphic to select it. The graphic is transferred.

By clicking outside the graphic frame, the graphic selection is rejected.
5.8 Buttons

Purpose
A button is a virtual key located on the MP 370 screen. Functions which have been assigned to buttons can be triggered, for example, by the following, configurable events:
- Clicking
- Pressing
- Releasing

Display
- **Labeling**
  Buttons can be labeled statically or dynamically. In the case of dynamic labeling, the text or graphic on the button changes during runtime according to the value of a configured tag.
- **Operation acknowledgement**
  As soon as the operating element detects a valid operation, it responds with a visual acknowledgement. The acknowledgement, however, does not infer that the required action is actually being executed.

Figure 5-2 illustrates examples of buttons which are pressed (right) and not pressed (left).

Figure 5-2 Example of a button

Hidden buttons
Hidden buttons are transparent buttons which may lie over graphics, for example. This enables plant parts which are graphically displayed on the MP 370 to be operated easily (e.g. a motor or valve). If a hidden button is selected on the MP 370, its contour becomes visible and remains so as long as the button is selected. The contour enables the user to detect the operable area of the button.
Operation

Proceed as follows to operate a button:

- **Keyboard unit:**
  - Select the required button, e.g. using a cursor key.
  - Press either the Enter key or the Spacebar.

- **Touch panel:**
  Touch the button on the MP 370 touch screen.

---

**Note**

**Click**

In the case of a button, a function is triggered when the pressed button is released within the contours of the button.

If the button is pressed using the mouse button or finger (when using touch panels) but moved outside the contour before releasing, the operating unit does not interpret the action as a *click* event. The action is not executed.

**Release**

In the case of a button, a function is triggered when the pressed button is released.

If the button is pressed using the mouse button or finger (when using touch panels) but moved outside, the function is triggered when the function is released.

**Press**

In the case of a button, a function is triggered as soon as the button is pressed.
5.9 Status Button

Purpose

The Status button is an operating and display element with the two states Pressed and Released. Status buttons indicate the status of a device which cannot be determined from the MP 370 (e.g. a motor). At the same time, it is also possible to change the status of the device concerned on the MP 370.

Behavior

The behavior of the Status button can be configured:

- **Switch:**
  The switch has two stable states. It toggles from one state to the other each time it is operated, and remains in the respective state until it is operated again.

- **Key:**
  The button has a fixed, stable home position. When operated, it switches to the status pressed and remains in this state as long as it is kept pressed. When released, it automatically switches back to its released position.

Functions which have been assigned to the Status button can be triggered, for example, by the following configurable events:

- Status change
- Pressing
- Releasing

If the status of a switch type Status button changes as a result of a modification of configured tags, not through operation, the corresponding function is not executed.

Display

The two indicator statuses of the types Switch and Button with acknowledgement can be assigned different texts or graphics in ProTool CS which are then displayed on the Status button during runtime.

Figure 5-3 illustrates an example of a Status button of the type Switch when pressed (left) and not pressed (right).

![Status Button Example](image)

Figure 5-3 The two statuses relate to the Status button when the Switch option is set
Operation

Proceed as follows to operate a Status button:

- **Keyboard unit:**
  - Select the Status button e.g. using a cursor key.
  - Press either the Enter key or the Spacebar.

  ![Enter key]

- **Touch panel:**
  Touch the Status button on the MP 370 touch screen.

---

**Note**

**Release**
In the case of a button, a function is triggered when the pressed button is released.

If the button is pressed using the mouse button or finger (when using touch panels) but moved outside, the function is triggered when the function is released.

**Press**
In the case of a button, a function is triggered as soon as the button is pressed.
5.10 Switch

Purpose
A switch serves for the input and output of a binary status. It can only be switched on or off. It is linked to a tag to do this. The status OFF corresponds to the value 0 (a logical FALSE) of the tag linked to the switch. All tag values other than zero (a logical TRUE) are interpreted as the status ON.

Behavior
Functions which have been assigned to the switch, can be triggered, for example, by the following, configurable events:
- Status change
- Switched on
- Switched off

If the switch status changes as a result of a modification of configured tags, not through operation, the corresponding function is not executed.

Display
Figure 5-4 illustrates an example of two switches with different orientation.

Operation
Proceed as follows to operate a switch:
- **Keyboard unit**:  
  - Select the required button e.g. using a cursor key. (e.g.)
  - Press either the Enter key or the Spacebar.  
- **Touch panel**:  
  Slide the sliding lever to the required position or double-click on the object.
  The switch moves to the new position.
5.11 Messages

Message categories

Messages on the MP 370 indicate events and statuses related to control processes. The MP 370 differentiates between the following message categories:

- **Event messages**
  indicate a status in the process, for example, Motor ON. Event messages are configured.

- **Alarm messages**
  indicate an equipment failure, for example, Motor temperature too high. Alarm messages are configured. Alarm messages must be acknowledged due to their critical nature.

- **HMI system messages**
  are triggered by the MP 370. They are not configured. System messages indicate, for example, incorrect operations or communication faults. A selection of important system messages is provided in Appendix C.

- **SIMATIC diagnostic events**
  provide information on the status of the SIMATIC S7 and SIMOTION. They are not configured in the ProTool CS configuration software. Refer to the S7 manual for the error number indicated on the MP 370 to determine the cause of the error.

Acknowledging alarm messages

Alarm messages must be acknowledged due to their importance. This can be done manually on the MP 370 or automatically by the PLC. The message indicator depicted continues to flash as long as queued messages still need to be acknowledged, when this feature has been configured.

The message indicator on the touch panel can be operated (refer to Page 5-2).

In order to acknowledge alarm messages on the keyboard unit manually, press the key depicted on the right. The message must not have been selected. The LED integrated in the key lights up when unacknowledged messages are present.
If several messages are displayed at the same time and the user acknowledges alarm messages, the acknowledgement acts in hierarchical sequence on the various message displays:

1. Message display with focus
2. Alarm window
3. Message line
4. Message display in basic screen

When configuring messages, it is possible to define whether the operator must acknowledge each message individually or whether the acknowledgement is valid for a group of messages (group acknowledgement). The use of group acknowledgement in respect of messages is particularly useful when they relate to the same cause, e.g. the messages for the first-up fault and the follow-up faults.

Buffering messages

All message events (arrived, departed, acknowledged) are stored in an internal volatile buffer. If a message archive has been configured, the message events are also stored in this message archive.

Display messages

The events stored in the message buffer can be displayed according to different criteria. The following predefined objects are available for display purposes:

- Message line (Page 5-25)
- Message window (Page 5-25)
- Message page (Page 5-27)
- Message buffer (Page 5-28)
- Message view
  - Message display with full functionality (Page 5-30)
  - Single message display with restricted functionality (Page 5-31)
Deleting messages

All message events concerning event and alarm messages are automatically stored in the message buffer. There are two methods of deleting message events from the message buffer:

- **Automatic deletion on buffer overflow**
  When the message buffer is no longer capable of accepting new message events, the MP 370 automatically deletes a number of message events until the configured remaining buffer capacity is reached. In this case, the oldest message events are deleted first.

- **Deletion by operating the MP 370**
  In order that message events can be deleted manually from the message buffer, the function `Delete_message_buffer` must be defined in the configuration, e.g. linked to a button or function key. In this way, the following message categories can be selected for deletion according to the configuration:
  - All messages
  - Alarm messages
  - Event messages
  - HMI system messages
  - SIMATIC diagnostic events

Print messages

When correspondingly configured, event messages can be printed out directly when the message events *Arrived* and *Departed* occur, and also alarm messages when the event *Acknowledged* occurs. System messages are not logged.

Information on setting printer parameters is provided in Chapter 8.
5.11.1 ALARM_S

Definition

ALARM_S is a message number procedure. The message identification numbers are assigned automatically by the configuration in STEP 7 or SIMOTION SCOUT. The unique assignment of the message text is made according to these numbers. The advantage here is that the message texts can be used on various operating units but only need to be entered once.

If a fault occurs, the operating unit receives the message by means of the message number. The associated message is determined and issued according to the number.

In addition to the message status (arrived, cleared, acknowledged), the PLC also stores time. This information is retained even after the message has been sent, so that individual network components (e.g. operating units) can log on later and be updated.

Configuring ALARM_S messages

ALARM_S messages are not configured in ProTool CS but in STEP 7, e.g. for S7-300/400-CPUs or in SIMOTION SCOUT. The display of ALARM_S messages can only be configured when a SIMATIC S7 PLC is used and the ProTool CS configuration software has been integrated in STEP 7.

During the configuration, it is useful to define the time of occurrence of a message in milliseconds. In contrast to this, bit messages can only be accurately defined to the second.

Detailed information on the configuration of ALARM_S messages is available in the ProAgent/MP and ProAgent/PC user guides.

Restarting S7 CPUs

Depending on the hardware configuration of the CPUs, it is possible that under certain circumstances all queued ALARM_S messages will be deleted when S7 CPUs are restarted. Older stocks of S7 300 CPUs cannot inform the operating units involved of the restart. The result of this is that messages are indicated on the operating unit as being queued although the CPU has already deleted them.

Remedy:
Disconnect the connection between the operating unit and CPU and then reconnect them again. Use the function Connect_Disconnect_PLC if configured.
5.11.2 Message line

Purpose

When a message line has been configured it is always displayed, regardless of the screen selected. The message line displays the last alarm or event message received. The message line is a permanent feature on the MP 370 and always displays the current message. If a separate window has been configured for alarm messages, the message line only receives the current event message.

Display priorities

Alarm messages always have priority over event messages. If no alarm messages are present or they have all been acknowledged, event messages are displayed.

In order to differentiate between event and alarm messages, alarm messages can be configured to flash in the display.

5.11.3 Message window

Purpose

The message window displays all messages in the respective message categories which are queued or need to be acknowledged.

It is possible to configure how the alarm messages are sorted. It is also possible to select whether the latest or oldest message is displayed first.

Alarm messages

If one of the display modes Window/Window, Window/Line or Window/Off is configured, the message window for alarm messages opens automatically as soon as an alarm message arrives. Figure 5-5 illustrates an example.

![Alarm window (example)](image-url)
Significance of the buttons

- **Help**
  - Call help text
  - Use this button to call in the help text configured for the selected message.

- **Edit**
  - Edit message
  - Use this button to trigger the function assigned to the event for the selected message.

- **ACK**
  - Acknowledge messages
  - Use this button to acknowledge messages.

Event messages

In order to be able to open the event message window by means of unit operation, the function `Display_event_message_window` must be linked to a function key or button in the configuration.

System messages

The message window for system messages opens automatically as soon as a system message arrives. The window is closed automatically after the configured duration of display has expired or by pressing ESC or .

Close alarm window manually

Proceed as follows to close the message window manually:

- **Touch panel:**
  - Press the button illustrated.

In the case of the keyboard units, the alarm window can only be closed after acknowledging all the alarm messages displayed.
5.11.4 Message page

Purpose

The message page displays all messages allocated a time stamp. It is also possible to select whether the latest or oldest message is displayed first. Open message pages are constantly updated.

Structure

In order to have access to the message page for event messages and/or alarm messages, the following functions must have been configured:

- for event messages: Display_event_message_page
- for alarm messages: Display_alarm_message_page

Figure 5-6 illustrates an example of the message page for alarm messages.

![Figure 5-6 Alarm message page (example)](image)

Information on the significance of the buttons is provided on Page 5-26.

In the case of the touch panel, the queued alarm message page can also be selected via the message indicator (Page 5-2).

It is possible to configure how the alarm messages are sorted.
5.11.5 Message buffer

Purpose

The message buffer displays all message events allocated a time stamp. It is also possible to select whether the latest or oldest message is displayed first.

Structure

In order to have access to the message buffer for event messages and/or alarm messages, the following functions must have been configured:

- for event messages: Display_event_message_buffer
- for alarm messages: Display_alarm_message_buffer

Figure 5-7 illustrates an example alarm message buffer.

</tbody>
</table>

Figure 5-7 Alarm buffer (example)

Information on the significance of the buttons is provided on Page 5-25.

The message buffer is organized so that in the case of a buffer overflow the oldest message events are overwritten ("FIFO buffer"). It is also possible to delete the entire buffer or specific message categories from time to time (Delete_message_buffer) function. This relieves the system load and provides a clearer overview of the message buffer.

Note

The data in the message buffer is volatile and is deleted when voltage is applied.

It is possible to configure how the alarm messages are sorted.
5.11.6  Message display

Purpose

Certain views are defined for messages which are queued or still to be acknowledged or for message events in the message buffer (volatile or archive) in the message indicator. Various filter criteria are available in ProTool CS for this purpose.

Filter criteria include:
- Message number
- Time
- Message states
- Message text
- Date
- Category name
- Acknowledgment group
- Diagnostics capability
- PLC

The attribute PLC is only useful when more than one PLC is configured as source of the message. In this way, the precise fault location can be displayed with date/time of the message event.

Note

Please note that the millisecond display for the time concerning the occurrence of message events is only accurate for ALARM_S messages. In the case of event and alarm messages, the milliseconds always appear with the value ooo.
Structure

The message display (Figure 5-8) can display the following messages:

- queued messages,
- archived messages,
- messages to be acknowledged,
- message events, located in the buffer,
- diagnostic events.

<table>
<thead>
<tr>
<th>No</th>
<th>Time</th>
<th>Date</th>
<th>Status</th>
<th>Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>$</td>
<td>100004</td>
<td>07:30:51</td>
<td>01/25/01 K</td>
<td>Connection has been estab</td>
</tr>
<tr>
<td>$</td>
<td>100001</td>
<td>07:30:51</td>
<td>01/25/01 K</td>
<td>Connection has been clear</td>
</tr>
<tr>
<td>$</td>
<td>110001</td>
<td>07:30:51</td>
<td>01/25/01 K</td>
<td>Change to offline mode.</td>
</tr>
<tr>
<td>$</td>
<td>240000</td>
<td>07:30:51</td>
<td>01/25/01 K</td>
<td>Demo version</td>
</tr>
</tbody>
</table>

Figure 5-8   Example of a message display

Significance of the buttons

- **Call Help text**
  Use this button to call in the help text configured for the selected message.

- **Edit Message**
  Use this button to trigger the function assigned to the event for the selected message.

- **Acknowledge messages**
  Use this button to acknowledge messages.

Message categories

In order to be able to distinguish between the different message categories, they are marked in the first column of the message display:

- ! Alarm messages
- Empty Event messages
- $ HMI system messages
- S7 SIMATIC diagnostic events

Alarm-S messages are displayed either as alarm messages or event messages. SFM messages (System Fault Messages) are displayed as alarm messages.
5.11.7 Single message display

Purpose
A single message display provides a subset of the functionality of a message display (Page 5-30). This provides a simple method with which, for example, to create a message line to display event and system messages in a screen.

Structure
The figure below provides an example of a single message display with the following columns configured:
- Date
- Time
- Message number
- Message states
- Message text

<table>
<thead>
<tr>
<th>25.01.01 14:27:06</th>
<th>110001 K</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change to operating status ‘online’</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>25.01.01 14:27:07</th>
<th>140001 K</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection discontinued: Station 2, Rack 0, Slot 0</td>
<td></td>
</tr>
</tbody>
</table>
5.12 Bar Graphs

Purpose

Bar graphs present a value in the form of a rectangular area. The MP 370 thus provides a clear indication of how far the current value is from the limit values, or if a setpoint value has been reached, at a glance. Bar graphs can be used to display fill levels or quantities, for example.

Display

It is possible to configure minimum and maximum values and the direction bar graph moves by increasing the tag value:

Figure 5-9 depicts the various states of a horizontal bar graph:
1. Value drops below the minimum value configured
2. Value lies within the configured display range
3. Value exceeds the maximum value configured
4. Value lies within the configured limit range

![Figure 5-9 Different bar states](image-url)
5.13 Trend View

Purpose

The trend view is a particularly clear form of displaying process data in a continuous manner. In the case of processes that only change slowly, the trend view can visualize events that have already occurred and provides access to, and estimate of trends in the process sequence. On the other hand, data issued concerning processes which run quickly can be easily evaluated using this form of trend view.

Configurable properties

A number of different trends can be displayed simultaneously in the trend view. The following properties are among those which can be configured for a trend graphic:

- **Trend Type**: Realtime trend or History trend
- **Triggering**: Cycle triggering or Bit triggering
- **Limit values**: Upper and lower limits
  The MP 370 displays the points at which configured limit values are reached or exceeded by changing the color of the trend display.
- **Color**: Uncertain status
  The uncertain status function highlights areas of the trend view in which communication to the unit was interrupted and, as a result, no values could be recorded.

Read line

The *read line* function is used in a trend graphic to display or hide a read line which displays Y-values associated to an X-value.

The read line can be activated by means of the Trend_view_read_mark_on_off function or the X-axis tab control of the trend view Properties dialog (default: Off). When the function is activated, a button is provided in the trend view with which to activate and deactivate the read line. The color of the read line can be configured in the *Color* tab control.

If the Display Values Table function is activated in the Value Table tab control, a table appears in the trend view containing the values of the trend curve displayed.

The read line can be operated in the trend view by means of touch, mouse (cursor), keyboard (Ctrl + Alt + cursor right/left) or button. It is also possible to configure buttons for the functions Trend_view_read_mark_forward and Trend_view_read_mark_backward. When the read line is moved, the values in the value table (when activated) are automatically updated accordingly.
Structure

Figure 5-10 illustrates an example of a trend view with a trend and buttons configured for navigating within the trend.

![Trend View Example](image)

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Start/Stop update" /></td>
<td>Interrupts the current updating process for the trend view until the button is pressed again.</td>
</tr>
<tr>
<td><img src="image" alt="Back to start" /></td>
<td>Scrolls back to the start of the trend recording.</td>
</tr>
<tr>
<td><img src="image" alt="Scroll" /></td>
<td>Shifts the trend section half a window width to the left/right.</td>
</tr>
<tr>
<td><img src="image" alt="Zoom in/out section" /></td>
<td>Expands/compresses the trend view horizontally.</td>
</tr>
</tbody>
</table>
Navigation using the keyboard unit keyboard

If no buttons have been configured in the trend view, use the operating unit keyboard to navigate in the trend view. A condition for this is that the configuration supports navigation using the keyboard.

<table>
<thead>
<tr>
<th>Keys</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTRL ENTER</td>
<td>Back to start</td>
</tr>
<tr>
<td>SHIFT ⬅️</td>
<td>Scroll back</td>
</tr>
<tr>
<td>SHIFT ⬅️</td>
<td>Scroll forward</td>
</tr>
<tr>
<td>CTRL +</td>
<td>Zoom section</td>
</tr>
<tr>
<td>CTRL +</td>
<td>Reduce section</td>
</tr>
<tr>
<td>CTRL +</td>
<td>Read line forwards</td>
</tr>
<tr>
<td>CTRL +</td>
<td>Read line backwards</td>
</tr>
</tbody>
</table>

Notice

It is not possible to interrupt the updating of the trend view using the keyboard.

Display archive data as a trend

If data stored in an archive is displayed in the trend view, it is represented as history trends, i.e. the trend data is read out of the archive and displayed according to events. Application for trends of this kind are power-on processes or temperature patterns on heating up an oven.

The trend view is not updated when the archive data changes.
5.14 Slider Control

Purpose
Use a slider control to enter and display numeric values in analog form. To enter values, move the slider to the required position. When used as a display element, the value is represented by the position of the slider.

Function
The slider control is linked to a tag. On moving the user-controlled slider, the corresponding value is written to the tag. Conversely, when the tag value is changed, the position of the moving slider is changed correspondingly, unless it being moved by the operator at that moment.

Display
The figure on the right illustrates an example of a slider for setting and displaying temperature values. The current value (in this case: 50) appears as plain text and as a bar graph.

Operation
Proceed as follows to operate a slider control:

- **Touch panel:**
  Point to the moveable slider and move it to the desired value.

- **Keyboard unit:**
  In order to operate the slider, select it using a cursor key, for example. Use the following keys to actually move the slider:

<table>
<thead>
<tr>
<th>Function</th>
<th>Keys</th>
</tr>
</thead>
<tbody>
<tr>
<td>Increase value</td>
<td>SHIFT [ \triangle ]/\hspace{1em}SHIFT [ \triangledown ]</td>
</tr>
<tr>
<td>Reduce value</td>
<td>SHIFT [ \triangledown ]/\hspace{1em}SHIFT [ \triangle ]</td>
</tr>
<tr>
<td>Increase/Decrease value in steps of 5%</td>
<td>HOME [ \triangle ]/\hspace{1em}END [ \triangledown ]</td>
</tr>
<tr>
<td>Move to maximum value/minimum value</td>
<td>FN [ HOME ]/\hspace{1em}FN [ END ]</td>
</tr>
</tbody>
</table>
Caution

In the following cases, it is possible that the value indicated by the slider control differs from the real value of the related tag:

- The value range configured for the slider control (minimum and maximum values) does not correspond with the limit values configured for the slider control tag.
- An invalid password is entered for a slider control protected by a password.
5.15 Analog Display

Purpose
An analog display indicates numeric values as a pointer instrument.

Function
The analog display is linked to a tag. When the tag value changes, the pointer position changes correspondingly. The display can be configured to include a non-return pointer. At runtime, the non-return pointer indicates the maximum value reached so far by the value being displayed. It is reset when the current window is opened.
The analog display is purely a display element. Therefore, it is not possible to enter values.

Display
Figure 5-11 illustrates an example of an analog display indicating temperatures.

![Figure 5-11 Example of a typical analog display](image)

Note on instrument scale
Any color-code differentiations configured for various scale ranges are not displayed on the MP 370.
5.16 Digital/Analog Clock

Purpose

The digital/analog clock provides the option of displaying the system time in numbers (digital) or as a clock with hands (analog). The digital display also includes the current date. The display format is language dependent. It is based on the format defined by the MP 370 operating system.

Display

The digital/analog clock is purely a display element. This means that the date and time cannot be set using the MP 370. In order to set the date and time, use the Date/Time screen object (Page 5-13).

Figure 5-12 illustrates an example of a configured analog clock.

Figure 5-12 Example of a typical analog clock
5.17 Password List

Purpose

While the system is being configured using ProTool CS, additional operating elements can be protected against unauthorized use by means of passwords. Important parameters and settings can then only be modified by authorized personnel. The password level and user name are stored with the password.

The *Report_password_change* function causes a system message to be issued when a different password is entered on the operating unit, i.e. a new user logs on. If the system messages are archived, all login and logout procedures can be established.

The *Write_user_name_to_tag* function is used to write the name of the user currently logged on into a tag of type “STRING”. If the tag is one with a PLC link, the user name also exists in the PLC and can be used for the user-dependent enabling of certain functions. User names must always be unique for the assignment. They are stored in a password file.

Password hierarchy

Hierarchically defined password levels from 0 to 9 exist for password protection purposes. When a password is assigned to an individual user or to a whole user group, the permission to execute functions at a specific level is assigned simultaneously. If, for example, a user is assigned to password level /C0052, he or she is authorized to execute functions of password levels /C0048 to /C0052.

Password level

Password level 0:
This minimum password level is assigned to functions that have no, or only a minimal effect on the course of the process. In order to trigger functions assigned to Password Level 0, no password needs to be entered.

Password levels 1 to 8:
Functions are assigned to levels 1 to 8 according to their increasing importance. Before triggering a function with a password level greater than 0, the MP 370 requests the corresponding password to be entered.

Password level 9:
Only the supervisor (system support specialist or service technician) is granted authorization to execute functions assigned to password level 9. The supervisor is authorized to access all the functions on the MP 370.
Logging in on the MP 370 (Login)

After calling a function protected by a password, the MP 370 automatically requests the entry of a password. Once entered, the password need not be entered again in order to call in other functions of this password level or lower.

When correspondingly configured, it is also possible to log in on the MP 370 via an input field for confidential password entry (Page 5-10). The character string entered is represented by placeholders (*).

Logging off from the MP 370 (Logout)

In order to rule out operation by unauthorized personnel, a password level greater than 0 should not remain active on the MP 370 over too long a period of time. The following options are available to explicitly reset passwords levels:

- **Configured logout time expires**
  If the MP 370 is not operated within the period of time configured (logout time), the current password level is automatically reset to 0.

- **Manual logout**
  If the function Logoff_user is linked to an operating element in the configuration, it can be used to reset the current password level to 0.

**Note**

It is also possible to reset the current password level to 0 by entering an incorrect password.
5.17.1 Password management

Purpose

Individual users can be entered in a password list on the MP 370 and assigned password levels according to specific responsibilities. When processing the list, conclude each field entry by pressing the Enter key. The password list contains all the passwords configured on the MP 370. The list is coded and stored on the MP 370, protected against a power failure.

Figure 5-13 illustrates an example of a password list with six entries.

<table>
<thead>
<tr>
<th>User</th>
<th>Password</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Superuser</td>
<td>100</td>
<td>9</td>
</tr>
<tr>
<td>Bayer</td>
<td>pw1</td>
<td>1</td>
</tr>
<tr>
<td>Lerp</td>
<td>pw2</td>
<td>2</td>
</tr>
<tr>
<td>Müller</td>
<td>pw3</td>
<td>3</td>
</tr>
<tr>
<td>Schmidt</td>
<td>pw4</td>
<td>4</td>
</tr>
<tr>
<td>Service</td>
<td>pw5</td>
<td>5</td>
</tr>
</tbody>
</table>

Figure 5-13 Example of a password list

View password list

Only those passwords with user names are displayed which have a password level equal to or lower than that with which the user is currently logged in. The MP 370 displays the password list entries in alphabetic order.

Creating a password

The user can only edit the password list up to the level with which he is currently logged in. All passwords used in the system must be unique. It is not possible to assign the same password to different password levels. However, there are no restrictions in assigning different passwords to the same password levels.

Deleting a password

To delete a password from the password list, overwrite the password level assigned to it with 0.
5.17.2 Export/Import password list

Purpose

If a system includes several operating units which are accessed by the same users, the same passwords must be installed on each operating unit. In order that the password list need not be re-entered on each operating unit, it can be created on one unit and then exported and imported on other units.

Note

During an import, all currently valid passwords are overwritten. The imported passwords become valid immediately.

Condition

In order to be able to export/import password lists on the MP 370, the Export_Import_Passwords function must be linked to a button or function key, for example. The file name of the password list to be exported/imported must be specified as the function parameter during configuration.

Notice

- The password list is coded. It cannot be edited with external tools.
- Do not export a password list directly after it has been modified. Exit the screen object Password List after changing it and wait with the export function until modifications have been written in the internal Flash memory.
5.18 Status/Force

Purpose

The MP 370 can be used to access the connected PLC and periphery directly to read and write values. PLC program operands can be monitored and modified easily without having to connect an additional programming unit or PC to the PLC. This option is particularly useful during the testing and commissioning phase of the configuration.

Condition

The following conditions must be fulfilled in order to be able to access operands in the PLC program directly from the MP 370:

- The connected PLC is a SIMATIC S5 or SIMATIC S7
- The configuration must contain the screen object Status/Force (Figure 5-14)

Structure

Figure 5-14 illustrates the basic structure of the screen object Status/Force. Each line represents an operand.

<table>
<thead>
<tr>
<th>Connection</th>
<th>Type</th>
<th>DB Number</th>
<th>Offset</th>
<th>Bit</th>
<th>Data Type</th>
<th>Format</th>
<th>Status Value</th>
<th>Force Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLC_1</td>
<td>E</td>
<td></td>
<td>0</td>
<td>0</td>
<td>CHAR</td>
<td>BIN</td>
<td>D000 0...</td>
<td></td>
</tr>
<tr>
<td>PLC_1</td>
<td>DB</td>
<td>10</td>
<td>10</td>
<td></td>
<td>WORD</td>
<td>DEC</td>
<td>42994</td>
<td></td>
</tr>
<tr>
<td>PLC_1</td>
<td>M</td>
<td>25</td>
<td>0</td>
<td></td>
<td>BOOL</td>
<td>HEX</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>PLC_1</td>
<td>A</td>
<td>34</td>
<td></td>
<td></td>
<td>WORD</td>
<td>DEC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 5-14 Status/Force: Example for SIMATIC S7

The column sequence may be different when using a touch panel or if a USB mouse is connected. In order, for instance, to swap the Format and Control Value columns, move the column heading Control Value onto the column heading Format.

The table indicates the significance of the individual columns and buttons.

<table>
<thead>
<tr>
<th>Column/Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Select the PLC whose address area is to be displayed and/or modified.</td>
</tr>
<tr>
<td>Type, DB number, Offset, Bit</td>
<td>Specify the address in this column.</td>
</tr>
<tr>
<td>Data type, Format</td>
<td>This column is used to change the format of the output.</td>
</tr>
<tr>
<td>Status value</td>
<td>The MP 370 uses this column to display the values of the operands read from the PLC.</td>
</tr>
</tbody>
</table>
### Function

<table>
<thead>
<tr>
<th>Column/Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Force value</td>
<td>Use this column to enter the values to be written to the operands.</td>
</tr>
<tr>
<td></td>
<td>This button is used to update the display in the column Status value. The button is locked after being pressed. None of the input fields can then be used until the button is pressed again, thus stopping the update.</td>
</tr>
<tr>
<td></td>
<td>This button is used to apply the new value specified in the column Force value. The value is then written to the PLC.</td>
</tr>
</tbody>
</table>

### Operation

Proceed as follows to operate the Status/Force screen object:

**Touch panel:**
Touch the operating element required. Either the screen keyboard is displayed or a selection list is opened, depending on the input field.

**Keyboard unit:**
The table depicts the key combinations for operation using the keyboard.

<table>
<thead>
<tr>
<th>Keys</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTRL</td>
<td>Operate button Write.</td>
</tr>
<tr>
<td>CTRL + ENTER</td>
<td>Operate button Read.</td>
</tr>
<tr>
<td>CTRL + ( )</td>
<td>Select first/last field in current line.</td>
</tr>
<tr>

<td>Select first/last field in current column.</td>
</tr>
<tr>
<td>CTRL + ALT + ▲</td>
<td>Increase width of current column.</td>
</tr>
<tr>
<td>CTRL + ALT + ▼</td>
<td>Reduce width of current column.</td>
</tr>
<tr>
<td>CTRL + INS/DEL</td>
<td>Delete current line. <strong>Alternatively:</strong> Do not select a PLC from the Connection column.</td>
</tr>
<tr>
<td>CTRL + Y / Z</td>
<td>Optimize column width.</td>
</tr>
<tr>
<td>ENTER</td>
<td>Open selection field.</td>
</tr>
</tbody>
</table>
5.19 SIMATIC HMI Symbol Library

Purpose

The SIMATIC HMI Symbol Library is a comprehensive library containing graphics from the areas of techniques and production. The library extends the possibilities of producing screens for the project in large numbers and representing aspects realistically. The following screen objects (graphics) are included, for example, in a wide range of categories:

- valves, motors, tank containers,
- conveyer belts,
- factory buildings,
- 3D ISA symbols,
- cooling and heating systems.

Settings

Using the screen editor, any object in the SIMATIC HMI Symbol Library can be inserted in the current screen and edited as required. In addition to the standard tab controls for all the screen objects (Functions, Position, Color, Attributes, Name and Enable), the SIMATIC HMI Symbol Library provides two further tab controls:

- **Symbol:**
  Selection of the required symbol.

- **Style:**
  Settings for color filling, transparency and orientation of the screen object and configuration of a tag:
  - It is possible to modify the appearance and representation of symbols and background.
  - Symbols can be mirrored and/or turned in steps of 90°.
  - The cursor can be assigned an additional lightning symbol when moving over the screen in order to emphasize to a user the configuration of a function, for example (only possible with touch panels).
  - It is possible to configure a tag for the symbol and, thus, control its color representation in accordance with falling below or exceeding limit value ranges.
Recipes

6.1 Overview

Purpose

The purpose of recipes is to transfer of quantities of related data together and synchronously from the operating unit to the PLC and back again.

Principles of operation

Using the example of the filing cabinet (Figure 6-1), the two terms Recipe and Data Record should be defined because they are important for subsequent understanding of the process.

Figure 6-1 Recipe and Data Record, using a filing cabinet as an analogy
• **Recipe**
  Recipes correspond to the individual drawers of the filing cabinet illustrated (e.g. grapefruit or lemon). The reference value fields (tags) belonging to the particular recipe are defined in each drawer. The recipes define the data structure in ProTool CS. This structure cannot be modified later on the MP 370.

• **Data record**
  Data records correspond to the filing cards in the individual drawers of the cabinet (e.g. Drink, Juice and Nectar). A data record contains the values for a recipe. Data records are created, modified and deleted on the MP 370. The data records are also stored on the MP 370. This saves storage space on the PLC.
  
  The Import/Export function provides the additional option of using external tools to edit exported data records, e.g. using Excel and then reimporting them on the MP 370.

**Example of a recipe**

An example for use of a recipe is its application on a filling station of a fruit juice system. The same filling station is used to produce orange drink, orange juice and orange nectar. The mixing ratios are different for each product. The ingredients are always the same.

Assume that a recipe called *Mixture* is created, which has the following data structure:

<table>
<thead>
<tr>
<th>Tag</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Var_2</td>
<td>l orange</td>
</tr>
<tr>
<td>Var_3</td>
<td>l water</td>
</tr>
<tr>
<td>Var_4</td>
<td>kg sugar</td>
</tr>
<tr>
<td>Var_5</td>
<td>g flavor</td>
</tr>
</tbody>
</table>

The designations *l Orange*, *g Aroma* etc. of the tags are the so called *entry names*. The entry names are also displayed on the MP 370. In this way, for example, the tag Var_2 can be identified as the tag designating the mixture component *Orange*.

The data records contain the values for the different drink types. The data records may appear as follows, for instance:

<table>
<thead>
<tr>
<th>Orange drink</th>
<th>Orange juice</th>
<th>Orange nectar</th>
</tr>
</thead>
<tbody>
<tr>
<td>l orange</td>
<td>90</td>
<td>l orange</td>
</tr>
<tr>
<td>l water</td>
<td>10</td>
<td>l water</td>
</tr>
<tr>
<td>kg sugar</td>
<td>1.5</td>
<td>kg sugar</td>
</tr>
<tr>
<td>g flavor</td>
<td>200</td>
<td>g flavor</td>
</tr>
</tbody>
</table>
### 6.2 Use of Recipes

The following section contains a description of the data flow for recipes and three application scenarios illustrating the use of recipes in the form of short, practical examples. They should provide a top level overview of the possibilities for using recipes:

- The first scenario illustrates a recipe configuration in which the data entered is not immediately transferred to the PLC. This configuration is used, for example, when it is necessary to enter data on the operating unit without interfering with an active process.

- In the second scenario, data is immediately transferred to the PLC. This configuration can be used, for example, to start up a machine and correct the positioning data online.

- The third scenario implements data record functions in order to control production automatically via a job list.

#### 6.2.1 Data flow for recipes

The diagram illustrates various possibilities concerning data flow when using recipes. The data flow between the active components operating unit (A), PLC (B) and external data medium (C) is dependent on the configuration of the recipe and the functions used.

![Data flow for recipes diagram](Figure 6-2 Data flow for recipes)
The operating unit (A) stores the recipe data records on a storage medium, e.g. Flash or hard disk. The recipe data record can be edited in a recipe view or recipe screen on the operating unit display:

- A new data record can be entered and can then, for example, be stored (2) on the storage medium and transferred (3) to the PLC (B).
- The data record can be exported to an external data medium (C), e.g. a PC. The data record is saved in CSV format, regardless of the recipe. This file can then be loaded and edited in MS Excel, for example.
- A data record can be loaded (2) from the operating unit storage medium or import (1) it as a *.CSV file from an external data medium.

A recipe data record can also be transferred (4) directly from the storage medium to the PLC or loaded from the PLC to the storage medium. In the same way, a recipe in the display can be transferred (3) to the PLC or loaded from it.

### 6.2.2 Application examples

#### Scenario 1: Enter data record

Production data must be entered on operating unit (A) without interfering in the active process. The production data should not be transferred to the PLC (B).

Enter the production data in the recipe view or recipe screen, assign a data record name and save the new data record on the operating unit storage medium.
**Scenario 2: Manual production process**

The production data should be read from the PLC (B) according to the workpiece to be processed and displayed on the operating unit screen (A) to be checked. It should be possible to correct the production data transferred online, if necessary.

---

**Notice**

This is a special application scenario because it cannot be realized on all HMI devices.

---

![Diagram of process](image)

**Figure 6-4 Process**

A reading device, e.g. connected to the PLC, reads out a bar-code from the workpiece to be edited. The data record name corresponds to the respective bar-code designation. As a result, the PLC can load the required data record from the operating unit’s storage medium. The data record appears in the display for control purposes. Modifications are immediately transferred to the PLC.
**Scenario 3: Automatic production process**

Production should be automated by means of a job list. The production data should be transferred directly to the PLC (B) either from the data medium in the operating unit (A) or from an external data medium (C). It is not necessary to show it in the display.

![Diagram of the automatic production process](image)

Figure 6-5  Process

Production can be controlled via one or more VB scripts which automatically transfer the production data records to the PLC. The process can be controlled by means of return values of the functions used.

The automatic production process can be realized using the data record functions provided: The `Import_Data_Records` function loads data records from a `.CSV` file to the data medium. The `Data_Record_DAT_to_PLC` function transfers a data record from the data medium to the PLC.
6.3 Recipe Configuration

Basic procedure

The basic steps to configuring a recipe are listed below:

1. Define the structure of the recipe:
   Assign tags to the recipe structure. These tags are provided with entries from the data records.
   Define a name for the recipe. This name is used to select the recipe in the configuration and on the MP 370.

2. Set recipe tag properties
   The following options can be configured in ProTool CS:
   - Synchronize tags
     This option defines that the data from a data record has been read from the PLC or data medium and written in the tag or read from the tags configured for the recipe. This establishes a connection between the tags configured in the recipe and the tags in the screens. When a data record is loaded, the values are written to the tags used in the screens.
   - Tags offline
     If this option is also activated, the values entered are only stored in the tags, and not transferred to the PLC. Otherwise, values entered are transferred directly to the PLC.

3. Define storage location for data records on the MP 370
   The data storage location for data records can be configured. The following settings are possible:

<table>
<thead>
<tr>
<th>Storage location</th>
<th>Setting in ProTool CS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal Flash memory</td>
<td>\Flash...</td>
</tr>
<tr>
<td>Memory card</td>
<td></td>
</tr>
<tr>
<td>• PC card</td>
<td>• \Storage Card...</td>
</tr>
<tr>
<td>• CF card</td>
<td>• \Storage Card2...</td>
</tr>
<tr>
<td>Network</td>
<td>Any path in the network, e.g.</td>
</tr>
</tbody>
</table>

Caution

Cyclical writing access is not permitted for the internal Flash memory because it reduces the service life of the Flash memory and thus the service life of the unit. Use an external memory card instead.
4. **Set download synchronization**  
   It is possible to configure whether the data records are downloaded to the PLC with or without synchronization.

5. **Creating a recipe screen**  
   Configure one or more screens in order to create, store, and download data records on the MP 370. Depending on the application, use either the recipe view or create a copy of the system, e.g. using input/output fields in recipe screens.
   
   - **Recipe view:**  
     The recipe view enables an uncomplicated, quick method of handling recipes and data records with a minimum of configuration work. Normally, they are used to process data records with smaller recipes in table form.
   
   - **Recipe screen:**  
     The operator can use recipe screens to customize the user interface for editing data records and, for example, simulating the system visually, providing graphics and individual masks for entering data records. Recipe screens are particularly recommended for data records with a relatively large number of entries.

**Further information**

Detailed information on how to create a recipe is provided in the online help to the ProTool CS configuration software and in the *ProTool Configuring Windows-based Systems* user’s guide.

**System limits**

The table provides an overview of the system limits for recipes.

<table>
<thead>
<tr>
<th>Elements</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of recipes</td>
<td>500</td>
</tr>
<tr>
<td>Data records per recipe</td>
<td>1000 (limited by storage medium)</td>
</tr>
<tr>
<td>Entries per recipe</td>
<td>1000</td>
</tr>
</tbody>
</table>
Memory requirements for data records

The memory requirements per recipe (in kByte) is calculated from the three summands D1 + D2 + D3.

D1 = [(no. of entries x 9 + tag name total length ) + 4] : 1024
D2 = [(no. of data records x 12) + 4] : 1024
D3 = [no. of data records x (data record length + N) + 4] : 1024

D1, D2 and D3 are rounded up to the next whole number.

A data record length is the sum of all the tag lengths configured for the data record in bytes. For example, a tag of the type FLOAT has a length of 4 byte.

The tag name total length is the sum of the length of all the tag names which are used in the entries.

The following applies for N:
Data record name < 13 characters: N = 12
Data record name > 12 characters: N = 40

Notice
The internal Flash memory has a maximum storage capacity of 128 kByte.

Note:
In the interest of optimizing the service life of the unit and achieving a better performance, use either the network or an external memory card to store data records.
6.4 Editing Data Records

In this chapter

This chapter provides information on how to edit data records on the MP 370. The following information is also included:

- Layout of the recipe view (Page 6-11)
- Displaying data records (Page 6-14)
- Creating new data records (Page 6-14)
- Copying data records (Page 6-15)
- Modifying data records (Page 6-16)
- Copying data records by selecting a data record name (Page 6-16)
- Renaming data records (Page 6-17)
- Deleting data records (Page 6-17)
- Reading data records from the PLC (Page 6-18)
- Downloading data records to the PLC (Page 6-18)
- Synchronizing a data record (Page 6-18)
- Editing data records in recipe screens (Page 6-19)
- Functions and PLC jobs (Page 6-23)
- Exporting/Importing data records (Page 6-25)
- Exporting, editing and importing data records (Page 6-27)
- Reaction to changing the recipe structure (Page 6-28)

Methods

Data records can be edited on the MP 370 in tables or screens:

- **Tabular editing**
  The recipe view is available for the tabular editing of data records (Page 6-11). The recipe view enables recipes and data records to be handled in an uncomplicated, quick way. Normally, they are used to process data records with smaller recipes offline. Values entered on the MP 370 are not directly transferred to the PLC when entered.

- **Editing in recipe screens**
  The project engineer can use recipe screens (Page 6-19) to customize the user interface for editing data records and, for example, simulating the system visually, providing graphics and individual masks for entering data records. This method is typically used for processing medium and large data records offline in the recipe view. The values entered on the MP 370 are only saved in the tags, but not transferred directly to the PLC on input.
6.4.1 Recipe view

Purpose

The recipe view is typically used to edit recipe data records in tabular form. This provides an uncomplicated method of displaying, creating, copying, modifying, deleting and downloading data records on the MP 370.

All descriptions on editing data records provided in this Chapter 6.4.1 relates purely to the use of the recipe view. Information on editing data records in recipe screens is provided from Page 6-19.

Display

Figure 6-6 illustrates an example of the layout of the recipe view. Some of the operating and display elements can be configured so that they are faded out on the MP 370.

![Recipe view layout example](image)

Figure 6-6 Layout of the recipe view (example)
Significance of the operating and display elements

<table>
<thead>
<tr>
<th>No.</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe&lt;br&gt;If the corresponding function is enabled in ProTool CS, it is possible to select a configured recipe in this selection field. The number of the selected recipe is displayed to the right of the selection field. This number is only relevant during the configuration. It cannot be modified on the MP 370.</td>
</tr>
<tr>
<td>2</td>
<td>Select data record&lt;br&gt;As soon as a recipe has been selected, the data records available are displayed in this field. In addition, the data record number is displayed to the right. The number field only becomes active when the input of a data record number is permitted, e.g. after changing the data record number or creating a new data record.</td>
</tr>
<tr>
<td>3</td>
<td>View/Edit entries&lt;br&gt;This table contains all the entries which are configured in the selected data record. Sorting complies to the configured sequence. The right-hand column displays the associated values.&lt;br&gt;The entry names cannot be edited on the MP 370.</td>
</tr>
<tr>
<td>4</td>
<td>Create new data record&lt;br&gt;This button initiates the creation of a new data record. The setpoint values are predefined with default values configured as start values for the respective tags.&lt;br&gt;Key combinations: <code>CTRL</code> <code>&lt;n&gt;</code></td>
</tr>
<tr>
<td>5</td>
<td>Save data record&lt;br&gt;This button is used to save the current values of the data record displayed on the MP 370 data medium. The memory location is defined in ProTool CS.&lt;br&gt;The data record is stored under the currently defined name and number.&lt;br&gt;Key combinations: <code>CTRL</code> <code>&lt;Enter&gt;</code></td>
</tr>
<tr>
<td>6</td>
<td>Delete data record&lt;br&gt;This button is used to delete the data record currently displayed for the defined recipe from the MP 370 data medium.&lt;br&gt;Key combinations: <code>CTRL</code> <code>&lt;INS&gt;</code> <code>&lt;DEL&gt;</code></td>
</tr>
<tr>
<td>7</td>
<td>Read data record from the PLC&lt;br&gt;This button is used to read the data record related to the currently set recipe from the PLC and display the values on the MP 370.&lt;br&gt;Key combinations: <code>CTRL</code> <code>&lt;PAGE UP&gt;</code></td>
</tr>
</tbody>
</table>
### No. Function

<table>
<thead>
<tr>
<th>No.</th>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
</table>
| 8   | Write data record in the PLC | This button is used to write the current data record values in the PLC.  
Key combinations: | | CTRL ⏽ |
| 9   | Status bar | The MP 370 displays the status of the current operation in this line, e.g. Downloading. |

### Other buttons

The following buttons are only visible when they have been correspondingly configured by means of an attribute in the recipe view:

| | Synchronize | This button is used to synchronize the data in a recipe view with the associated tag. Modified values are written in the corresponding tags in the table of a recipe view. Finally, all the values are read from the tags to table, which is updated accordingly. This ensures consistency between the recipe view and tags.  
The button is only enabled for use in the case or recipes with synchronized tags.  
Key combinations: | | CTRL ⏽ |
| | Save data record as | This button can be used to store a data record from a recipe screen on a storage medium under a different name, regardless of the recipe view. After pressing the button, a dialog appears in which to enter the name.  
Key combinations: | | CTRL ⏽ |

### Caution
- If the two options Synchronize Tags and Tags Offline are activated in the configuration, the values from the table are applied when values in the tables and screens are changed simultaneously.
- If the data record currently being edited in the recipe view is changed in the background (e.g. by means of a PLC job), the recipe view is not automatically updated.
Notes on operation using the keyboard unit

- **Quick selection of recipes and data records**
  When the selection field is opened up, enter the first letter of the recipe or data record to be selected to access the relevant area of long lists, thus speeding up the selection procedure.

- **Edit entries**
  If the value marked in the recipe view is to be modified, it is initially deleted by pressing one of the alphanumeric keys. This occurs with regard to all list elements in Windows. In order to prevent this, proceed as follows:
  - After selecting the value to be changed, press the Enter key.
  - Move the text cursor to the relevant position by pressing the cursor key or `SHIFT` and cursor key.
  - Insert the modifications.
  - Confirm the changes, e.g. by pressing the Enter key.

Displaying data records

Proceed as follows to display data records from the MP 370 data medium:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 1    | Select recipe
|      | Step 1 is only possible when recipe selection has been configured.
|      | • Select the selection field for the configured recipes (Position 1 in the figure on Page 6-11).
|      | • Open the selection field and mark the required recipe in the opened selection list.
|      | • Confirm the selection.
| 2    | Select data record
|      | • Select the selection field for the existing data records (Position 2 in the figure on Page 6-11).
|      | • Open the selection field and mark the required data record in the opened selection list.
|      | • Confirm the selection.
|      | The selected data record is loaded. The configured entries are displayed in table form with name and setpoint value.

Creating new data records

Proceed as follows to create new data records on the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Select recipe</td>
<td>• Select the required recipe, as described in Step 1 on Page 6-14.</td>
</tr>
<tr>
<td>2 Create data record</td>
<td>• Press the key depicted on the left. The name and number of the data record displayed are deleted. The entries in the table are assigned the configured start values.</td>
</tr>
</tbody>
</table>
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 3    | Enter data record name  
   - Enter a new data record name in the selection field for data records (Position 2 in the figure on Page 6-11).  
   - After entering the data record name, the next free data record number is automatically entered on the right. This number can be changed, if necessary. |
| 4    | Change values  
   - Enter a setpoint value for each entry configured in the table (Position 3 in the figure on Page 6-11). |
| 5    | Save data record  
   - Press the key depicted on the left. The new data record is written on the data medium.  
   - The operating unit responds with a system message if the name or number entered already exist. |

### Storage location for new data records

The data storage location for the new data record can be configured. The following settings are possible:

- Internal Flash memory
- Memory card  
  - PC card  
  - CF card
- Any path in the network

### Copying data records

In order to copy data records, save them under new names. Proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 1    | Select recipe and data record  
   - Select the required recipe and the data record to be copied as described in Steps 1 and 2 on Page 6-14. |
| 2    | Enter data record name  
   - Enter a new data record name in the selection field for data records (Position 2 in the figure on Page 6-11).  
   - After entering the data record name, the next free data record number is automatically entered on the right. This number can be changed, if necessary. |
| 3    | Save data record  
   - Press the key depicted on the left. The new data record is written on the data medium.  
   - The MP 370 responds with a system message if the name or number entered already exists. The system message contains the recipe and data record name concerned so that, if several recipe views are open, the correct data record is stored. |
Copying data records after selecting a data record name

Proceed as follows to copy an existing data record after selecting the data record name:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe and data record</td>
</tr>
<tr>
<td>2</td>
<td>Change values</td>
</tr>
<tr>
<td>3</td>
<td>Save data record as</td>
</tr>
</tbody>
</table>

- **Step 1**: Select the required recipe and data record, as described in Steps 1 and 2 on Page 6-14.
- **Step 2**: Modify the values necessary.
- **Step 3**: Press the key depicted on the left. A dialog opens containing a data record name selection field which can be edited. The selection field contains the name of the data record selected. Select the required data record name and edit it. After confirming with OK, a new data record is created under the name specified with the current values based on the previously selected data record. The newly created data record is displayed in the recipe view.

Changing data records

Proceed as follows to change existing data records:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe and data record</td>
</tr>
<tr>
<td>2</td>
<td>Change values</td>
</tr>
<tr>
<td>3</td>
<td>Save data record</td>
</tr>
</tbody>
</table>

- **Step 1**: Select the required recipe and the data record to be changed as described in Steps 1 and 2 on Page 6-14.
- **Step 2**: Change the setpoint value in the table (Position 3 in the figure on Page 6-11). The entry names cannot be edited on the MP 370.
- **Step 3**: Press the key depicted on the left. The modified data record overwrites the original data record on the data medium.

Notice

If large-scale modifications have been carried out in recipes in ProTool CS and, after downloading the modified project, the data records on the operating unit data medium deviate a great deal from the original recipe structure, it is recommended to reorganize the data medium:

- export the data records of all the recipes (refer to Page 6-25).
- delete the data records using the function *Delete_Data_Record_Memory*.
- import the data records using the function *Import_Data_Records*.

In this way, all the tags no longer used are deleted.
Renaming data records

Proceed as follows to rename existing data records:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the required recipe and the data record to be copied as described in Steps 1 and 2 on Page 6-14.</td>
</tr>
<tr>
<td>2</td>
<td>Enter a new data record name in the selection field for data records (Position 2 in the figure on Page 6-11). After entering the data record name, the next free data record number is automatically entered on the right. Reset this number to its original value.</td>
</tr>
<tr>
<td>3</td>
<td>Press the key depicted on the left. The modified data record is written on the data medium. The operating unit responds with a system message if the name or number entered already exist.</td>
</tr>
</tbody>
</table>

Deleting data records

Proceed as follows to delete data records on the MP 370 data medium:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the required recipe and the data record to be changed as described in Steps 1 and 2 on Page 6-14.</td>
</tr>
<tr>
<td>2</td>
<td>Press the key depicted on the left. The data record is deleted from the data medium after confirming a confirmation request.</td>
</tr>
</tbody>
</table>

Note

It is possible to configure the Delete_Data_Records function to directly delete individual recipes, all data records in a recipe or all recipes. To delete data records using this function, it is not necessary to configure a recipe view.

It is still possible to configure the Delete_Data_Record_From_Display function with which the currently displayed data record will be deleted.
Reading data records from the PLC

Proceed as follows to update data records in the MP 370 working memory with values from the PLC:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe</td>
</tr>
<tr>
<td>2</td>
<td>Read values</td>
</tr>
<tr>
<td>3</td>
<td>Edit data records</td>
</tr>
</tbody>
</table>

- Select the required recipe, as described in Step 1 on Page 6-14.
- Press the key depicted on the left. The current values are read from the PLC and displayed.
- The data can then be edited, e.g. values modified, saved, downloaded to PLC, etc. The MP 370 responds with a system message if downloading from the PLC is not possible because, in cases where synchronization with the PLC is configured, for example, the data mailbox is currently locked.

Downloading data records to the PLC

In order that a modified or new data record can take effect in the PLC, it must be downloaded to the PLC.

Proceed as follows to download data records to the PLC:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe and data record</td>
</tr>
<tr>
<td>2</td>
<td>Write values</td>
</tr>
</tbody>
</table>

- Select the required recipe and the data record to be downloaded as described in Steps 1 and 2 on Page 6-14.
- Press the key depicted on the left. The values are written in the PLC. The MP 370 responds with a system message if downloading to the PLC is not possible because, in cases where synchronization with the PLC is configured, for example, the data mailbox is currently locked.

Synchronizing a data record

Proceed as follows to synchronize the data in a recipe view with the associated tag:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select recipe and data record</td>
</tr>
<tr>
<td>2</td>
<td>Synchronize data record</td>
</tr>
</tbody>
</table>

- Select the required recipe and the data record to be changed as described in Steps 1 and 2 on Page 6-14.
- Press the key depicted on the left. The data record is synchronized with the tags.
6.4.2 Recipe screens

Purpose

Recipe screens are typically representations of the system. The screens provide display and operating elements with which to create, save, modify, delete and download data records. Large recipes can be split into several topic-specific screens and clearly displayed, e.g. with graphic elements.

Components for editing data records

In order to be able to edit data records in recipe screens on the MP 370 the corresponding components, e.g. input/output fields and functions, must be configured:

- **Recipe view:**
  
  Recipe screens can contain a recipe view (Page 6-11) not only to enable the easy selection of recipes and data records but also for editing data records. The configured functional range of the recipe view can vary, according to the intended purpose.
  
  Information on editing data records in recipe screens is provided from Page 6-11. The instructions stipulated there generally also apply for editing data records in recipe screens. However, in this case, input is performed in the screens.
Functions:
Depending on whether a recipe view is configured in the project or not, and on the properties assigned to it, there are various functions available to transfer data records between MP 370 and PLC, e.g.:

for recipe views
- Load_Data_Record
- Save_As_Data_Record_From_Display
- Save_Data_Record_from_Display
- Delete_Data_Record_from_Display
- Synchronize_Data_Record_in_Display
- Data_Record_Display_to_PLC
- Data_Record_PLC_to_Display

for recipe screens
- Load_Data_Record
- Save_Data_Record
- Delete_Data_Record
- Data_Record_PLC_to_Tags
- Data_Record_Tags_to_PLC
- Recipe_Tags_Online_Offline

for downloading data records between data medium and PLC
- Data_Record_DAT_to_PLC
- Data_Record_PLC_to_DAT

for exporting and importing data records
- Export_Data_Records
- Import_Data_Records

Further functions for recipes:
- Delete_Data_Record_Memory
- Convert_Data_Record_Number_to_Name

More functions and PLC jobs, which are linked to the downloading of data records, are described on Page 6-23.

Note
It is possible to read in data or data records from the PLC. To do this, functions such as Data_Records_PLC_to_Tags or Data_Records_Tags_to_PLC and parameters such as Recipe number/name and Data record number/name are available in which to assign specific names.
Editing data records offline

The way in which data records are edited on the MP 370 is defined during configuration. It is typically used for the offline editing of data records in recipe screens. Values entered on the MP 370 are not directly transferred to the PLC when entered.

Proceed as follows to edit data screens in recipe screens offline:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select a data record as described on Page 6-14.</td>
</tr>
</tbody>
</table>
| 2    | Trigger reading of the selected data record from the storage medium:  
  - **With recipe view**  
    It is automatically loaded on selecting the data record.  
  - **Without recipe view**  
    Activate the operating element linked with the `Load_Data_Record` function.  
    The function parameters must have been set accordingly beforehand. |
| 3    | The data of the data record is written to the tags. |
| 4    | Edit the tags using the configured input/output fields. |
| 5    | Save the modified tags.  
  - **With recipe view**  
    Click the `Save` button. If necessary, you must first specify a new name.  
  - **Without recipe view**  
    Activate the operating element linked with the `Save_Date_Record`. The function parameters must have been set accordingly beforehand. |

Editing data records online

In order to edit data records online, the option must either be defined during configuration or the `Recipe_Tags_Online_Offline` function defined in the configuration. In the case of online editing, the values entered are transferred directly to the PLC. This method is normally used when commissioning the machine/system in order to test, run-up and position.

Proceed as follows to edit data records on the MP 370 online:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select a data record as described on Page 6-14.</td>
</tr>
</tbody>
</table>
| 2    | Trigger reading of the selected data record from the storage medium:  
  - **With recipe view**  
    It is automatically loaded on selecting the data record.  
  - **Without recipe view**  
    Activate the operating element linked with the `Load_Data_Record` function.  
    The function parameters must have been set accordingly beforehand. |
| 3    | The data of the data record is written to the tags and thus also to the PLC. |
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Edit the tags using the configured input/output fields. This will simultaneously change the values in the PLC as well.</td>
</tr>
</tbody>
</table>
| 5 | Save the modified tags.  
  - **With recipe view**  
    Click the *Save* button. If necessary, you must first specify a new name.  
  - **Without recipe view**  
    Activate the operating element linked with the `Save_Date_Record`. The function parameters must have been set accordingly beforehand. |

---

<table>
<thead>
<tr>
<th>Warning</th>
</tr>
</thead>
</table>

Warning  
When editing data records online, the entered values are transferred to the PLC without synchronization. Therefore, when changing individual values, ensure that no impermissible operating statuses occur in the machine/system.
6.4.3 Functions and PLC jobs

Functions

The following functions can be used to import and export recipe data records for editing with external tools:

- Export_Data_Records
- Import_Data_Records

They can be used to either import and export either individual data records or all data records in a recipe, according to the configured parameters.

The following functions can be used to transfer data records between the PLC and MP 370.

- Data_Record_DAT_to_PLC
- Data_Record_PLC_to_DAT

The data medium is the internal Flash memory, the memory card or any network path. Both the recipe and data record must be specified as parameters in which the values should be written.

The following functions enable data records to be transferred to the PLC which are currently being displayed in the recipe view on the operating unit.

- Data_Record_PLC_to_Display
- Data_Record_Display_to_PLC

The values from the data record tags are written directly to the addresses in the PLC.

Parameters which can be changed for recipe functions

- Return values

It is possible to configure the optional Return values parameter for various recipe functions. This parameter enables a message to be issued concerning the status of a function. Functions can be processed in succession using Change value.

Values

- 2: Function in progress
- 4: Function completed without errors
- 12: Function completed with errors

- Status message

It is possible to configure the Status message parameter for various recipe functions. This parameter defines whether a corresponding system message should appear when a function has been completed.

Values

- 1: After executing the function, a status message is issued
- 0: No status message
PLC jobs

The following two PLC jobs can be used to transfer data records between the PLC and MP 370 automatically:

- No. 69: “PLC → DAT” (read data record from PLC)
- No. 70: “DAT → PLC” (write data record in PLC)

Information on PLC jobs is provided in the Communication for Windows-based Systems User’s Guide.
6.4.4 Import/Export data records

Purpose
When the appropriate features have been configured, data records on the MP 370 can be exported as CSV files to the data medium. This feature can be used to edit data records with external tools, e.g. with a spreadsheet program or text editor and import them on the MP 370 again.

Condition
In order to export and import data records during runtime, the configuration must contain the following functions:

- `Export_Data_Records`
- `Import_Data_Records`

These functions must be linked in the ProTool CS configuration software, e.g. to a function key or button.

File format CSV
With file format CSV, the table columns (entry name and value) are separated by a separator (e.g. semicolon). Each table row (entry) is terminated by a line feed.

The example in Figure 6-6 (Page 6-11) appears as follows in CSV format for the individually exported data record `Juice`:

```
Orange;Juice
3;2
Var_2;95
Var_3;5
Var_4;0.5
Var_5;100
```

Additional information is stored in the first two lines:

- Line 1: Name of the recipe and data record
- Line 2: Number of the recipe and data record

The MP 370 interprets the information on importing the file.

Notice
When the CSV files are edited with an external text editor, the modifications are saved in text format (without control codes).
Export/Import all data records of a recipe or all recipes

When appropriately configured, all the data records in a recipe or all recipes can be imported/exported together. The CSV file for the example on Page 6-2 then appears as follows:

```
Orange;Drink;Juice;Nectar
3;1;2;3
Var_2;90;95;70
Var_3;10;5;30
Var_4;1.5;0.5;1.5
Var_5;200;100;400
```

Additional information is stored in the first two lines:
- Line 1: Name of the recipe and all the configured data records
- Line 2: Number of the recipe and all the configured data records

The MP 370 interprets the information on importing the file.

In this way, the CSV file can be used, for example, to create new data records by means of a spreadsheet program (Figure 6-7). After importing the modified file, the new data records can be used on the MP 370.

![Figure 6-7: Create data records externally (example: Microsoft Excel)](image)

If all the recipes are exported, a CSV file is created for each recipe.
Exporting, editing and importing data records

Proceed as follows in order to export data records on the MP 370 in a CSV file, edit it using with an external tool (e.g. spreadsheet program or text editor) and import it back on the MP 370:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 1    | Export data record  
Press the operating element linked with the Export_Data_Records function (e.g. function key or button).  
Depending on the parameterization, either all the data records are exported to the data medium or only the data record defined in the configuration.  
The data records are exported in the file which was configured in the parameter File Name in the function Export_Data_Records.  
• Copy the CSV file onto a transferable data medium or in a directory which can be accessed by the external tool.  |
| 2    | Edit CSV file  
• Carry out the modifications in the CSV file with an external tool, e.g. Microsoft Excel or a text editor.  
• Save the modifications on the data medium.  
• Copy the CSV file back to the original directory.  |
| 3    | Import data records  
• Activate the operating element linked with the Import_Data_Records function.  
The data records are copied in the data storage area configured for the recipe.  |

Notice

If data records should be exported and the CSV files edited on a different Windows system using a spreadsheet program (e.g. Microsoft Excel), ensure that the decimal separator and list separator are identical on the two different systems.

These settings can be modified from the Windows Start menu using: Settings → Control Panel → Language on the Numbers tab control (refer to Page 8-11).

The MP 370 is supplied with the German language options set.
6.4.5 Reaction on changing the recipe structure

Standard behavior

The following section describes the standard behavior of the MP 370 when it detects differences between the data record structure stored on the data medium and the recipe structure currently loaded on the MP 370.

Load and export data records, and write in the PLC

- The data record on the data medium contains additional tags:
  The values are rejected.
- The data record on the data medium contains values which cannot be converted to the assigned tag type:
  The configured start value for the tag is used.
- Tags are missing in the data record on the data medium:
  The configured start value for the tag is used.

Warning
The assignment is lost on changing the tag name.

Import data records

- The imported data record contains additional tags:
  The values are rejected.
- The imported data record contains values which cannot be converted to the assigned tag type:
  The configured start value for the tag is used. This occurs, for example, when the tag type has been changed in the configuration.
- Tags are missing in the imported data record:
  The configured start value for the tag is used.

Note
Export the data record after changing the recipe structure and check the exported values. Please observe the related safety notes provided on Page 6-17.
Archives

Overview

Process data can be archived on the MP 370, i.e. stored permanently and evaluated.

Different archives are possible depending on the process data stored:

- **Message archive**
  
  Message archives are used to store message events from one or more message categories (e.g. event messages/alarm messages/system messages).
  
  However, each message category can only be assigned to one specific archive.
  
  The message archive can be used, for example, to store login and logout procedures on the operating unit as system messages. In this way, it is possible to determine which user is currently logging in on an operating unit at any time.

- **Tag archive**
  
  A tag archive contains the values from one or more tags at specific points of time.
  
  However, each tag can only be assigned to one specific archive.
  
  The properties of an archive, e.g. memory location and archive size, is defined by the configuration planner in ProTool CS.

Archive file format

Each archive is stored as an individual file. Data is stored in the archive file in CSV format. This enables archived data to be processed and evaluated using external tools, e.g. with a spreadsheet program or text editor.

In file format CSV, table columns are separated by a separator (e.g. semicolon). Each table row is terminated by a line feed.

---

Notice

When the CSV files are edited with an external text editor, the modifications are saved in text format (without control codes).
Storage location

The memory location for archive files is defined during configuration. Possible targets are:

- Memory card (PC and/or CF card)
- Any path in the network

Caution

The internal Flash memory is not permissible as the memory location for archive files because cyclic archiving reduces the service life of the Flash memory and thus, that of the MP 370.

Archive functions

The following functions are available in the ProTool CS configuration software in order to be able to work with archives on the MP 370:

- **Open_archive**
  The connection between the MP 370 and all archive files is established.

- **Close_archive**
  All archive files are closed and the connection between the MP 370 and all archive files is disconnected. A memory card can then be removed or exchanges without any risks involved. Archive files queued during this time are puffered, up to a limit of 512 entries.

- **Copy_archive**
  The content of an archive is copied to another archive. This enables backup copies of archives to be produced.

- **Start_archive, Stop_archive**
  Starts or stops the archiving process in the selected archive. Normally, messages and tags are archived throughout the entire process. The function can be used to start the archiving to the specified archive by pressing an operating element on the operating unit and stopped with the *Stop_archive* function.

- **Delete_archive**
  Deletes all the entries in the selected archive.

- **Start_sequence_archive**
  Switches from the current archive to the following one. If no sequence archive has been configured, the function is not executed.

- **Archive_tag**
  Archives the status of a tag in the archive configured for the tag. This function can be used to trigger the archiving of a tag to the specified archive by pressing an operating element on the MP 370. The archive must have been started beforehand.
Evaluating message archives

The ProTool settings dialog for message archives provides the option of activating an extended data storage process. When activated, the message text, including tags and storage location, are archived. This enables a useful analysis to be made using external tools.

Note on performance using memory cards

If a network is not used when archiving on the MP 370 but an ATA-Flash or SRAM PC card is used as the archive data medium instead, the archive memory space available is limited. The archiving performance of a FLASH PC card is also very limited. FLASH modules cannot be read from or written to in fine tracks, as opposed to a hard disk. Each access to a FLASH card requires copying large sectors of the FLASH card which greatly reduces the performance.

For this reason, the MP 370 should not be used primarily for the cyclical archiving of data but rather for archiving non-cyclically occurring fault states (alarm and event messages).

The MP 370 has not been conceived for archiving tasks with more heavy demands in respect of high quantity structure or performance.

Examples of performance

The table provide examples for the maximum performance possible:

<table>
<thead>
<tr>
<th>Task</th>
<th>ATA-FLASH/SRAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recording rate [entries per second]</td>
<td>25</td>
</tr>
<tr>
<td>View of a message archive</td>
<td>5 s</td>
</tr>
<tr>
<td>(10 messages from 2,000 entries)</td>
<td></td>
</tr>
<tr>
<td>Trend view of a tag archive</td>
<td>5 s</td>
</tr>
<tr>
<td>(300 trend values from 2,000 entries)</td>
<td></td>
</tr>
</tbody>
</table>

Note:

In the case of large archives, reading in and displaying require considerably less time when several sequence archives are configured rather than one large cyclic archive. A new sequence archive is recommended following approx. 10,000 entries.
Switch off the MP 370 with memory card inserted

**Caution**
Always terminate the runtime software before switching off the voltage supply in order to prevent loss of data.

Operate the operating element linked to the *Exit_runtime* function in the configuration. Wait until the MP 370 displays the Start menu, namely the Loader menu (Figure 3-1, Page 3-6), appears and then switch off the power supply.

If the power supply is interrupted inadvertently during normal operation, the MP 370 checks the memory card after power is returned, repairing defect areas if necessary.

Remove memory card

**Caution**
Before removing the memory card, either use the operating element linked with the *Close_archive* function in the configuration or stop the runtime software. Operate the operating element linked to the *Exit_runtime* function in the configuration.

Closing the archive or terminating the runtime software may take several minutes, depending on the size and number of the archives stored.
System Settings

Overview

The general settings listed below can be modified on the MP 370:

- Language (Page 8-2)
- Operating mode (Page 8-3)
- Settings on Windows CE Control Panel (from Page 8-5)
  - Screen settings
  - Communication
  - Date/Time
  - Network
  - Unit properties
  - Language settings
  - Screen keyboard
  - Volume (touch feedback)
  - Printer
  - S7 download settings
  - Password
- Network operation (Page 8-15)
8.1 Language

Language-dependent objects

When downloading the configuration from the configuration computer, up to five languages can be loaded on the MP 370 simultaneously. The ASIA language variants are also supported. It is possible to switch between the languages, online, at any time and display language-dependent objects (texts and formats) in other languages.

The following are language-dependent, for example:

- Messages
- Screens
- Text lists
- Help texts
- Date/Time
- Decimal separating character
- Static texts

Condition

In order to change languages on the MP 370 while it is in operation, the following conditions must be fulfilled:

- The editing language must be available on the MP 370. The languages available during runtime are defined during configuration in ProTool CS under System → Language Assignment: OP Languages.
- The Language function must be linked to an operating element, e.g., to a button or a selection field.

Change language

Immediately after activating the function, all the language-dependent objects are displayed in the new language.

Two different types of language change can be configured:

1. Each time the function is activated, the MP 370 switches one language further, cyclically.

2. After activating the function, the language can be explicitly selected.
8.2 Setting an Operating Mode

Conditions for changing operating modes
In order to switch the MP 370 between the operating modes described below, the Change_mode function must be linked to an operating element in the configuration.

Operating modes
It is possible to switch between various operating modes on the MP 370 according to the configuration:

Offline mode
In this mode there is no logical connection between the MP 370 and PLC. The MP 370 can be operated but data cannot be downloaded.

Online mode
When using this mode, processes can be operated and visualized without restriction. There is a logical connection between the MP 370 and PLC or the MP 370 attempts to establish one. Online mode is the predefined operating mode each time the MP 370 is started up.

Download mode
This operating mode is used to transfer a configuration from the configuration computer to the MP 370. Further information on download mode is provided in Chapter 3.4.
8.3 Windows CE Control Panel Settings

The Windows CE Control Panel

The following settings can be defined for the system using the Windows CE Control Panel:

- Date/Time
- Network
- Device properties (e.g. brightness and calibration of touch screens)
- Language settings
- Screen saver
- Screen keyboard
- Volume (touch feedback)
- Printer
- Backup/Restore
- Transfer (download)
- UPS (option only)

Open Control Panel

Various settings can be defined after pressing the Control Panel button in the start menu. It may be necessary to enter a password.

The following possibilities are available with which to open the Control Panel (Figure 8-1, Page 8-5):

- **During the start-up phase:**
  Use the Control Panel button in the Start menu to open the Windows CE Control Panel containing the various options.

- **In normal operation:**
  - If configured, use the operating element assigned to the Start_Control_Panel function.
  - It is also possible to open the Windows CE Control Panel via the Settings item in the Windows CE Start menu.

*Keyboard unit:*
Open the Windows CE Start menu with the key combination depicted

*Touch panel:*
Press the button depicted twice (locking button) to activate the toolbar.
Figure 8-1  Windows CE Control Panel with options

Change language settings

Caution
Stop the runtime software before modifying the system settings otherwise the changes, e.g. for downloading, do not take effect.

Proceed as follows to change settings in the Windows CE Control Panel:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 1    | **Exit_runtime**  
Stop the runtime software before starting to change any system settings. |
| 2    | **Open Control Panel**  
Open the Control Panel as described on Page 8-4. |
| 3    | **Change language settings**  
Change the settings for the system in the Control Panel. |
| 4    | **Close Control Panel**  
Close the Control Panel.  
**Touch panel:**  
Press the button illustrated.  
**Keyboard unit:**  
Press the **Alt** key and use the cursor keys to select the menu item **Close.**  
Confirm the selection by pressing the **Enter** key. |
| 5    | **Restart runtime**  
Start the runtime software via the Start menu. |
8.3.1 Device properties

Purpose

The OP Properties option provides the following setting options.

- Set brightness,
- Calibrate touch screen (for touch panels),
- Display device data,
- Backup non-resistant data.

Set brightness

Figure 8-2 OP Properties option, Display tab control

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open the Display tab control (Figure 8-2) in the OP Properties option.</td>
</tr>
<tr>
<td>2</td>
<td>Use the Brightness up and Brightness down buttons to adjust the screen brightness.</td>
</tr>
<tr>
<td>3</td>
<td>In the case of the touch panel, close the settings menu using the OK button, in the case of the keyboard unit, move the focus to the tab control heading and press Enter.</td>
</tr>
</tbody>
</table>

In the case of the keyboard unit, the screen brightness can be changed outside the Windows CE Control Panel by using the following key combination:

- Increases the brightness.
- Reduces the brightness.
Note
Wait at least 10 seconds after changing the setting before switching the unit off. Otherwise, the changes will not be saved.

Calibrate touch screen

Figure 8-3  OP Properties option, Touch tab control

Purpose
Depending on the installation position and viewing angle, it is possible that a more or less strong parallax may occur when operating the touch panel screen. In order to prevent operating errors occurring as a result, the screen can be calibrated during the start-up phase and normal operation.

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open the Touch tab control (Figure 8-3, Page 8-7) in the OP Properties option.</td>
</tr>
<tr>
<td>2</td>
<td>Press the Recalibrate button to start the calibration process. Five calibration crosses appear in succession on the screen. Follow the instructions provided on the screen and touch the respective calibration cross.</td>
</tr>
<tr>
<td>3</td>
<td><strong>Apply calibration:</strong> Touch any point of the screen after the calibration process for the new calibration data to take effect. <strong>Reject calibration:</strong> Wait 30 seconds, until the seconds counter displayed has reached zero, before rejecting the new calibration data. If calibration is not performed correctly, the new values are not accepted.</td>
</tr>
<tr>
<td>4</td>
<td>Touch the OK button to close the OP Properties menu.</td>
</tr>
</tbody>
</table>
Configured function

When the Touch Calibration function has been linked to an operating element in the configuration, the touch screen can be calibrated while in normal operation. The triggering operating element can be configured so that a password must be entered to enable the touch calibration process.

The calibration process is identical with steps described for the start-up phase 2 and 3.

Persistent storage of registrations

![Persistent Storage tab control](image)

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open the Persistent Storage tab control (Figure 8-2, Page 8-6) in the OP Properties option.</td>
</tr>
<tr>
<td>2</td>
<td>Press the Save Registry button to start the storage process. The current registration settings are stored in the Flash memory.</td>
</tr>
<tr>
<td>3</td>
<td>Press the Save Files button to start the copy the files in the RAM file system to the Flash memory. When the system is restarted, the files saved are restored in the file system.</td>
</tr>
<tr>
<td>4</td>
<td>In the case of the touch panel, close the settings menu using the OK button, in the case of the keyboard unit, move the focus to the tab control heading and press Enter.</td>
</tr>
</tbody>
</table>
Display device data

*Figure 8-5  OP Properties option, Device tab control*

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open the Device tab control (Figure 8-5) in the OP Properties option.</td>
</tr>
<tr>
<td>2</td>
<td>Various device data is displayed.</td>
</tr>
<tr>
<td>3</td>
<td>Close the menu using the OK button in the case of touch panels or press the Enter button in the case of keyboard units.</td>
</tr>
</tbody>
</table>

8.3.2 Screen saver

*Figure 8-6  Screensaver option*

It is possible to define a period of time (in minutes) for automatic activation of the screen saver on the operating unit. The screen saver settings are defined in the Screensaver option of the Windows CE Control Panels (refer to Page 8-4).

The screen saver is automatically activated if the operating unit is not operated within the defined period of time.

**Note**

When the screen saver is activated, the back-lighting is automatically dimmed.
The screen saver is deactivated on pressing any key or touching the touch screen. The function assigned to that key is not triggered.

On entering the value 0, the screen saver is deactivated permanently.

**Dim back-lighting**

The brightness of the back-lighting for the screen is reduced with increasing operational use for technological reasons. In order to increase the service life of the back-lighting it is also possible to use the *Screensaver* option in the Windows CE Control Panel to set the period of time after which the back-lighting should be dimmed.

The back-lighting is automatically activated if the operating unit is not operated within the defined period of time.

The back-lighting is deactivated on pressing any key or touching the touch screen. The function assigned to that key/button is triggered.

If the value 0 is set, the back-lighting is deactivated permanently.

### 8.3.3 Communication

The name of the MP 370 can be modified here in order, for example, to identify it within a network. Further information regarding configuration of the network operation is provided from Page 8-16.

### 8.3.4 Set date/time

Enter the values to set the current date and time. The way in which these settings are modified directly in the active configuration is explained on Page 5-13.

### 8.3.5 Network

This is used to configure the network properties.

Information concerning configuration of the network operation is provided from Page 8-16.
8.3.6 Regional setting

Language-specific settings can be defined here, e.g.:

- Date and time format (refer to Page 5-13)
- Decimal separator and list separator (refer to Page 6-27)

The MP 370 is supplied with the German options set.

8.3.7 Screen keyboard

This is used to define the position and size of the screen keyboard when it appears on the MP 370. Proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the Input Panel option.</td>
</tr>
<tr>
<td>2</td>
<td>Move the screen keyboard to the required position.</td>
</tr>
<tr>
<td>3</td>
<td>To change the size, press the Start Resize button.</td>
</tr>
<tr>
<td>4</td>
<td>Store the new settings by pressing the Save button.</td>
</tr>
<tr>
<td>5</td>
<td>Close the option using the button depicted on the right or with the ESC key.</td>
</tr>
</tbody>
</table>

8.3.8 Volume

This is used to change the setting for the volume of acoustic signals and operating acknowledgement. The Volume tab control includes the following options:

- acoustic operating acknowledgement for touch operation,
- volume control

The Sounds tab control is irrelevant for runtime settings.

8.3.9 Set printer

A printer can be selected and set up at this point. Some settings are only relevant for printing a hardcopy of the screen contents and have no influence on the message logging, e.g. color or quality of graphics printing.

Information on connecting printers is provided on Page 9-15.
Adjustable options

The setting possibilities available are dependent on the printer selected:

- **Printer**
  Select the printer from the list to which the MP 370 is connected.

- **Port**
  Select the port and baud rate used by the MP 370 to transfer data to the printer, e.g. IF2: 9600.

- **Net path**
  If a network has been configured (refer to Page 8-15), enter a path for a network printer here. Select “Network” as the port.

- **Paper size**
  Select the paper size used in the printer, e.g. A4 or Letter.

- **Draft mode**
  Define the quality of the printout of graphics. If the option is activated, printout is performed in draft quality, if deactivated printout is in high quality.

- **Color**
  When a color printer is connected, this is used to define whether printing should be in color or black and white.

- **Print range**
  Define whether only the selected area should be printed or the entire contents.

- **Orientation**
  Define whether the page should be printed in Portrait or Landscape format.

- **Margins**
  The values entered here for the margins are ignored by the MP 370.

---

**Note**

If a serial printer is connected, the following settings are necessary on the printer:

- **RS 232**, whereby only the RxD, TxD and GND signals are required (refer to Appendix B),
- 8 data bits,
- 1 stop bit,
- No parity,
- Baud rate between 9600 and 57600, printer-dependent,
- XON / XOFF protocol.

---

**Default settings**

When the MP 370 is supplied, the following default settings are defined:

- **Printer**: EPSON 9 matrix printer
- **Port**: IF2
- **Baud rate**: 9600 bit/s
8.3.10 Uninterruptible Power Supply UPS

(only loadable as an option)

Figure 8-7  UPS option

To prevent the loss of data in the event of a power failure, e.g. while archiving process values/messages, a UPS can ensure a controlled shutdown of the MP 370. An external Uninterruptible Power Supply UPS detects when the power supply has failed and reports this to the operating panel via the serial interface.

The UPS driver is installed as an add-on using the ProSave tool. The associated UPS icon only appears in the Windows CE Control Panel after it has been installed via ProSave.

It is possible to define how long the power failure may continue without the runtime being shut down. The driver is suitable for the SITOP DC-UPS Module A.
8.3.11 System properties

The System Properties can be used to define the size of the memory for the DRAM file system (storage memory). It defines how much memory can be used by the applications. Values can be modified using a slider control. The standard size of a memory in the DRAM file system for applications is 6 MB.

Caution

If too much DRAM file memory is provided, ProTool runtime has too little working memory available. Therefore, in the case of incorrect settings, there is no guarantee that the runtime process can run properly.
8.4 Network Operation

Purpose
The standard MP 370 is equipped with an on-board Ethernet interface. Implementing the network function enables the MP 370 to be used for:

- archiving data via the network
- printing via a network printer
- storing recipe data records in the network
- exporting recipe data records in the network
- importing recipe data records from the network
- downloading projects
- backing up data

Notice
- The MP 370 can only be implemented in TCP/IP networks.
- The MP 370 can only access files from other units which have a TCP/IP server functionality (the MP 370 only has client functionality). It is not possible to access MP 370 files on a PC connected via Ethernet.

Condition
Within a TCP/IP network, computers are addressed by means of network names. These network names are translated from a DNS or WINS server to TCP/IP addresses. Direct addressing via TCP/IP addresses is not currently supported by the operating system. Therefore, to ensure the functionality of the MP 370 in a TCP/IP network, it is useful to employ a DNS or WINS server. Appropriate servers are available in common TCP/IP networks. Please contact your network administrator.

printing via a network printer
The MP 370 operating system does not support the direct message logging via a network printer. All other printer functions, such as hardcopy or shift log, are possible via the network without restriction.
8.4.1 Configuring the MP 370 for network operation

Overview

The MP 370 must be appropriately configured before setting into network operation. The configuration is basically divided into the following steps:

- Set computer name of the MP 370
- Configure network address
- Set login information
- Save settings

Preparation

Before beginning with the configuration, request the specific network parameters from the network administrator. The following information is of particular interest:

- Does the network use DHCP for dynamic assignment of network addresses? If not: Instigate the assignment of a new TCP/IP network address for the MP 370.
- What is the TCP/IP address of the default gateway?
- What are the DNS addresses of the name server? (if DNS is used in the network)
- Which WINS addresses has the name server? (if WINS is used in the network)

Procedure

The following instructions describe how to define the general settings step by step. Additional steps or procedures may be necessary depending on the network infrastructure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open Control Panel</td>
<td>1 Open the Control Panel as described on Page 8-4.</td>
</tr>
<tr>
<td>Set computer name of the operating unit</td>
<td>2 In order to identify the MP 370 within the network, it must be assigned a unique name (device name) within the network using the Control Panel option Communication. Apply the settings and close the dialog by pressing ENTER.</td>
</tr>
<tr>
<td>Configure network address</td>
<td>3 Use the Network option to call in the network configuration. Select an appropriate network driver in the Adapters tab control. When using operating units with an integrated Ethernet card, use Onboard LAN, with network cards, normally use the NE2000-compatible driver.</td>
</tr>
</tbody>
</table>
### System Settings

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Press the Properties button in order to configure the network characteristics of the network card used. Complete the dialog according to the network driver selected in Step 3. If the network implements DHCP, skip Step 5.</td>
</tr>
<tr>
<td>5</td>
<td>Select the tab control IP Address then option Specify an IP Address. Enter the TCP/IP address of the operating unit (e.g. 233.239.2.100), subnet mask (e.g. 255.255.255.0) and default gateway (e.g. 223.239.2.200).</td>
</tr>
<tr>
<td>6</td>
<td>Enter the name server address of the network in the tab control Name Servers. Close the dialog with ENTER or OK in order to apply the settings.</td>
</tr>
</tbody>
</table>

**Set login information**

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>In order to login correctly into the network, enter your user permissions in the Identification tab control. Enter the user name valid for the network or the network server and the associated password (max. 8 characters). If the network administrates users via domain controllers, enter the relevant domain controller name. Close the dialog with ENTER or OK in order to apply the settings.</td>
</tr>
</tbody>
</table>

**Save settings**

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Switch off the MP 370.</td>
</tr>
<tr>
<td>9</td>
<td>Before switching the operating unit on, insert the network cable in the corresponding interface so that a unique IP address can be assigned during the start-up phase.</td>
</tr>
<tr>
<td>10</td>
<td>Switch the MP 370 on again.</td>
</tr>
</tbody>
</table>

### 8.4.2 Test network

#### Procedure

It is then possible to access the network. To test it, assess the network server via the Explorer. Proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start Explorer via the Windows Start menu.</td>
</tr>
<tr>
<td></td>
<td><strong>Keyboard unit:</strong></td>
</tr>
<tr>
<td></td>
<td>Use the key combination depicted.</td>
</tr>
<tr>
<td></td>
<td><strong>Touch panel:</strong></td>
</tr>
<tr>
<td></td>
<td>Double click on the icon depicted in the screen keyboard.</td>
</tr>
<tr>
<td></td>
<td>From the Programs program group, select the Windows Explorer application.</td>
</tr>
<tr>
<td>Step</td>
<td>Procedure</td>
</tr>
<tr>
<td>------</td>
<td>-----------</td>
</tr>
</tbody>
</table>
| 2    | Use the Address input field to enter the UNC name of the directory/drive provided on the server.  
**Example:**  
The server is called: mrmbg2  
The name provided is: daten  
The resulting UNC name is: \mrmbg2\daten |
| 3    | After entering the UNC name, press the ENTER key. When all the network settings are correct, Explorer displays the files located under the directory provided on the TCP/IP server. |

**Note**  
In addition, the network program `ipconfig` are available in the operating system.

### 8.4.3 Configure network functions

**Condition**  
Before accessing the network, it must have been set up on the MP 370.

**Procedure**  
In order to be able to use the network functions in the ProTool CS configuration software, it is only necessary to specify the relevant UNC assigned names at those points where paths have been entered for files or directories.

- **Example 1: Archives**  
  If, for example, it is necessary to carry out archiving on the server in the example above (Step 2 in the table on Page 8-18), replace the predefined archive memory location `\Storage Card\ProCSVarc` by the UNC assigned name for the server, i.e. `\mrmbg2\daten\ProCSVarc`.

- **Example 2: Recipe data records**  
  In order to store recipe data records in the network, replace the predefined path name `\Flash\ProCSVdata` by the UNC assigned name for the server, i.e. `\mrmbg2\daten\ProCSVarc`. The same applies for exporting and importing recipe data records using the functions `Export_Data_Records` and `Import_Data_Records`. In this case, too, replace the parameter `File name` with the UNC assigned name for the server.
In this chapter

This chapter provides information on:

• installation of the MP 370
  – keyboard unit (Page 9-2)
  – touch panel (Page 9-4)
• electrical connections to
  – the power supply (Page 9-9)
  – the configuration computer (Page 9-12)
  – the PLC (Page 9-13)
  – the printer (Page 9-15)
  – USB keyboard/mouse (Page 9-16)

9.1 Mechanical Installation

Installation location and conditions

The MP 370 is designed for installation in the front panels of cabinets and consoles. Keyboard units are also prepared for installation in 19" cabinets and racks.

Cut a mounting cut-out in the front panel prior to installation. The thickness of the front panel must not exceed 6 mm. Additional fixation holes are not necessary due to the tensioning mechanism used.

Details regarding the installation depth and mounting cut-out are provided on:

• Touch panel: Page 10-2.
• Keyboard unit: Page 10-6.

Degree of protection

The operating unit must be installed in such a way that at least Protection Class IP54 is guaranteed. The IP65 degree of protection for the front panel can only be ensured when the seal on the front plate of the MP 370 is fitted correctly.
Notice
The NEMA 4, NEMA 12 and IP65 degrees of protection are only guaranteed when the thickness of the installation support is at least 2.5 mm.

Caution
• The operating unit must be brought to room temperature before it is started up. If condensation forms, do not switch the unit on until it is absolutely dry.
• To prevent the MP 370 from overheating during operation,
  – the angle of inclination from vertical installation may not exceed a maximum of \(\pm 35^\circ\).
  – do not expose the operating unit to direct sunlight
  – ensure that the ventilation slits in the housing remain free after installation.

Notice
The operating unit was function-tested before shipping. If a fault occurs nevertheless, please enclose a full account of the fault when returning the unit.

9.1.1 Install keyboard unit

Before installation
If the labeling of the function keys needs to be modified, replace the labeling strips before installing the MP 370. Information on this is provided on Page 10-7.

Installation in 19" cabinets/racks
Use the profiles provided by the respective cabinet or rack manufacturer to install the unit in a 19" cabinet/rack.

Installation dimensions of standard 19" cabinets:
• Width: 19" (482.6 mm)
• Height: 7 HE (310 mm)
MP 370 fixation: To the profiles using four screws
**Installation in front panels**

The keyboard unit can be fixed in the mounting cutout using either screw-type clamps or screw fittings. When fixing with screw-type clamps, no extra fixation holes are necessary in the front panel.

Screw-type clamps used in conjunction with an outer seal can achieve degree of protection IP65. Screwed supports achieve the degree of protection IP54.

Proceed as follows to install keyboard units in the front panel:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Working from the front, insert the MP 370 in the mounting cut-out prepared. Make sure the unit cannot drop out of the front panel before it has been secured.</td>
</tr>
<tr>
<td>2</td>
<td>Insert the hooks of the six screw-type clamps enclosed in the corresponding recesses in the housing of the MP 370. The individual positions are indicated in the figure by means of arrows.</td>
</tr>
<tr>
<td>3</td>
<td>Secure the MP 370 to the front panel, from the rear, using a hexagonal socket-head screw key.</td>
</tr>
</tbody>
</table>

**Caution**
- Make sure the seal is seated correctly against the front panel.
- Do not overtighten the screws to avoid damage.
9.1.2 Install touch panel

Installation in front panels

Proceed as follows to install touch panels in the front panel:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| 1    | Working from the front, insert the MP 370 in the mounting cut-out prepared.  
Make sure the unit cannot drop out of the front panel before it has been secured. |
| 2    | **MP 370 12”**:  
Insert the hooks of the eight screw-type clamps enclosed in the corresponding recesses in the housing of the MP 370 ein.  
The individual positions are indicated in the figure by means of arrows. |
**Procedure**

<table>
<thead>
<tr>
<th>Step</th>

</tr>
<tr>
<td></td>
<td>Secure the MP 370 to the front panel, from the rear, using a hexagonal socket-head screw key.</td>
</tr>
</tbody>
</table>

**Caution**

- Make sure the seal is seated correctly against the front panel.
- Do not overtighten the screws to avoid damage.
9.2 Electrical Installation

Electrical connections
The MP 370 requires electrical connections:

- to the power supply,
- to the configuration computer (PU or PC),
- to the PLC,
- to the printer.

An electrical connection to the PU/PC is only required for downloading the project data. Following the configuration and test phases, a serial printer can be connected to the MP 370 instead of the configuration computer.

EMC compatible installation
A precondition for error-free operation is an EMC hardware design of the PLC and the use of interference-proof cables. The guidelines on interference-free design of the PLCs apply equally to installation of the MP 370.

Caution

- Only shielded cables are permitted for all signal connections.
- Screw or lock all plug connections.
- Do not install signal lines in the same cable ducts as power cables.
- Siemens AG refuses to accept liability for malfunctions and damage arising from use of self-made cables or cables from other manufacturers.

Grounding connection

Connect the grounding connection of the MP 370 to the rack ground. Use the grounding screw provided and a conducting cable with a diameter of \( \geq 2.5 \text{ mm}^2 \).
Connection elements

Figure 9-1 illustrates the arrangement of the connection elements on the underside of the unit.

Reverse battery protection

Caution

The MP 370 is equipped with reverse poling protection.

Proceed as follows when commissioning:

1. Disconnect all connections to external units and remove any cards from Slot A or Slot B.
2. Connect the MP 370 to the power supply.
3. Switch on the power supply.
   If the MP 370 does not start up, the connections are probably reversed. Swap the connections over in this case.
4. When the MP 370 has been powered up, connect the configuration computer or other periphery equipment to it.
Power supply

The power supply for the MP 370 is connected at the 2-pin plug connector on the underside of the unit. Use the 2-pin terminal block supplied for this purpose. The terminal block is designed for cables with a cross-section not larger than 2.5 mm².

The figure illustrates the pin assignment of the terminal block.

![Terminal Block Diagram]

---

**Caution**

- When using a 24 V supply, make sure that the extra-low voltage is isolated safely. Use only power supply units complying with IEC 364-4-41 or HD 384.04.41 (VDE 0100, Part 410).
- Only use power supply units which meet SELV-PELV standards.
- The supply voltage must be within the specified voltage range. Voltages outside this range can cause malfunctions.

Please refer to the technical data in Appendix A for information on the power supply requirements.

---

### 9.2.1 Equipotential

**Potential differences**

Differences of potential can occur in separate system sections which lead to high equipotential flows, e.g. when cable screening is applied on both sides and grounded at two different system parts.

The cause of potential differences may be due to different mains power feed sources.
Warning

Cable screening is not designed for potential equalization. Only use lines provided for the purpose (e.g. with a 16 mm² cross-section). When setting up MPI/DP networks, ensure cables with a sufficient cross-section are used otherwise the interface hardware may be damaged or even destroyed.

Potential equalization lines

The potential differences must be reduced by the provision of potential equalization lines so that proper functioning of the electrical components installed is guaranteed.

When installing potential equalization lines, observe the following points:

- The efficiency of the potential equalization is greater the smaller the impedance of the potential equalization line is.

- If two system parts are connected by screened signal lines, whose screening is connected on both sides to the grounding/earthed conductor, the impedance of the additionally laid potential equalization lines may be maximally 10% of the screening impedance.

- The cross-section of a potential equalization line must be dimensioned for the maximum equalizing current which can flow. Experience has shown that potential equalization lines with a cross-section of 16 mm² suffice.

- Use potential equalization lines made of copper or galvanized steel. Connect the lines with the ground connection/ground conductor and protect from corrosion.

- Lay the potential equalization lines so that the area between the potential equalization line and signal lines is small (refer to the following diagram).
Figure 9-2  Equipotential
9.2.2 Connect configuration computer

Connection configuration

Figure 9-3 illustrates how to connect a configuration computer (PU or PC) to the MP 370 for downloading project data. Standard cables are available for the connections shown (refer to the ST80 catalog).

Notice

Use a host-host USB cable for the connection between MP 370 and configuration computer. Please note that only the USB driver on the ProTool CD must be installed on the configuration computer. The driver enclosed with the cable cannot be used for downloading.
9.2.3 Connect PLC

Connection configuration

Figure 9-4 illustrates the basic connection possibilities between the MP 370 and PLC. Standard cables are available for the connections shown (refer to the ST80 catalog).

1) Use only the approved cables for connection to the SIMATIC S7.
2) To enable operation using the serial interface, connect either the IF1A (RS 232/TTY) or IF1B (RS 422/485), but not both. The 1F1B interface can be configured by means of the switch (Page 9-14).
3) Any PROFIBUS-DP bus terminal

Figure 9-4 Connection configuration for PLCs
Configure interface IF1B

The IF1B interface can be configured via the switches on the rear side of the operating unit. In this case, the RTS signal is interchanged for RS485 and the RS422 receive data. By default, the RTS signal is not required by the communication peer.

The table shows the permissible switch settings.

</table>

\(^1\) State on delivery

Compressing the internal program memory with SIMATIC S5

**Warning**

With the SIMATIC S5, compression of the internal program memory on the PLC (PU “Compress” function, integrated FB COMPR) is not permitted when an operating unit is connected. Compression modifies the absolute addresses of the blocks in the program memory. Since the operating unit only reads the address list during startup, it does not detect any address modifications and subsequently accesses the wrong memory areas.

If compression is inevitable during running operations, the operating unit must be switched off before compressing.
9.2.4 Connect printer

Connection configuration

Figure 9-5 illustrates how to connect a serial printer to the MP 370. The MP 370 supports the following printer standards:

- compatible with ESC/P, 9-pin ESC/P or ESC/P2 (EPSON)
  e.g. EPSON FX850
- compatible with PCL3 (Hewlett Packard)
  HP LaserJet 5M

USB printers can still be used for PCL and Epson9 mode.

Information on printer settings is provided on Page 8-11.

Notice

- Only use a cable with braided metal screening grounded at each end for connecting the MP 370 and printer.
- Deactivate the (Page 3-7) Serial Transfer Remote Control option in the Configuration menu if a serial printer is connected to the operating unit via the IF2 interface.
- Some printers may require that the ASCII character set used in the configuration is defined on the printer as well.
Note
If a serial printer is connected, the following settings are necessary on the printer:

- RS 232, whereby only the RxD, TxD and GND signals are required (refer to Appendix B),
- 8 data bits,
- 1 stop bit,
- No parity,
- Baud rate between 9600 and 57600, printer-dependent,
- XON / XOFF protocol.

9.2.5 Connect external keyboard and mouse

Connection configuration

Figure 9-6 illustrates alternative methods of connecting a keyboard, mouse or external printer to the MP 370’s USB interface. A keyboard, mouse or printer can be connected and disconnected during normal operation.

Figure 9-6 Connection configuration for external keyboard, mouse and printer
Notice
Use a standard mouse and keyboard with a USA/International keyboard layout. Commercially available USB devices do not normally fulfill the higher industrial demands with regard to interference resistance and can have negative effects on the device.

The power consumption must not exceed 500 mA with the USB units connected.

9.2.6 Connecting an Uninterruptible Power Supply (UPS)

Connection configuration
Figure 9-7 illustrates the way to connect an uninterruptible power supply (UPS) to the MP 370.

A serial connection is only necessary when using SITOP DC-UPS Module A. The driver for detecting and configuring the UPS (Ch. 8.3.10) is contained on the ProTool CD and must be installed on the operating unit with ProSave.

UPS without a serial connection can supply a digital signal in the case of a power failure in the connected PLC. In turn, the PLC program can then inform the MP 370 that the runtime will be shut down. To do this, the PLC modifies a tag on which the Exit_runtime function is configured in ProTool.
Dimensions

In this chapter

This chapter provides information on:

- Dimensions of the MP 370 12” touch panel (Page 10-2),
- Dimensions of the MP 370 15” touch panel (Page 10-4),
- Keyboard unit dimensions (Page 10-6),
- Labeling strips for keyboard unit (Page 10-7).
10.1 MP 370 12” Touch Panel

Installation cut-out

For installation in the front panel, the touch panel requires an installation cut-out (WxH) of 310 +1 mm x 248 +1 mm. The thickness of the front panel must not exceed 6 mm.

Unit dimensions MP 370 12” touch panel

![Diagram of MP 370 12” touch panel dimensions]

Figure 10-1 Dimensions of the MP 370 12” touch panel
Notice
The following free space must be maintained following installation:
- 100 mm above the unit,
- 50 mm below the unit,
- 15 mm at the sides of the unit.
When using plug-in boards, ensure sufficient space is provided to insert or remove them.
10.2 MP 370 15” Touch Panel

Installation cut-out

For installation in the front panel, the touch panel requires an installation cut-out (WxH) of 368 $^{+1}$ mm x 290 $^{+1}$ mm. The thickness of the front panel must not exceed 6 mm.

Unit dimensions MP 370 15” touch panel

Figure 10-2 Dimensions of the MP 370 15” touch panel
Notice

The following free space must be maintained following installation:

- 100 mm above the unit,
- 50 mm below the unit,
- 15 mm at the sides of the unit.

When using plug-in boards, ensure sufficient space is provided to insert or remove them.
10.3 Keyboard Unit

Installation cut-out

For installation in the front panel, the keyboard unit requires a mounting cut-out (WxH) of 450 \(+1\) mm x 290 \(+1\) mm. The thickness of the front panel must not exceed 6 mm.

10.3.1 Unit dimensions

Figure 10-3  Keyboard unit dimensions
**Notice**
The following free space must be maintained following installation:
- 100 mm above the unit,
- 50 mm below the unit,
- 15 mm at the sides of the unit.
When using plug-in boards, ensure sufficient space is provided to insert or remove them.

---

**10.3.2 Labeling function keys**

**Labeling**
The keyboard unit function keys are labeled as follows on supply:
- F1 to F20 and
- S1 to S16.
The function keys are labeled by means of 4 labeling strips which are inserted in the unit from the rear. These strips can be exchanged in order to label the MP 370 specifically for the system.

**Exchange labeling strips**

**Warning**
When the cabinet is opened, certain parts of the system that may conduct hazardous voltage are exposed.
Proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place the unit down with the front plate at the bottom.</td>
</tr>
<tr>
<td>2</td>
<td>Remove the labeling strips already inserted.</td>
</tr>
<tr>
<td>3</td>
<td>Insert the newly labeled strips in the slots in the front plate with the inscription facing down. The individual positions are indicated in the figure by means of arrows. <strong>Caution</strong> Before inserting the strips, wait until the inscription is dry. A keyboard foil which is dirty on the inside cannot be cleaned and can only be replaced at the manufacturer’s factory.</td>
</tr>
</tbody>
</table>
Create labeling strips

Only use transparent foil to create your own labeling strips so that the LEDs in the function keys remain visible. Label the foil either with a printer or a waterproof felt-tip pen. Cut the strips according to the specifications depicted in Figure 10-4.

![Labeling strip dimensions](image)

Figure 10-4  Labeling strip dimensions

File

The ProTool CS configuration software contains formatted patterns for labeling function keys individually for various SIMATIC operating units.

The patterns for the MP 370 are stored on the ProTool installation CD under `\UTILITY\SLIDE370.DOC` in Word format. This enables labeling strips to be created for the keyboard unit without extensive design and printing operations.
In this chapter

This chapter provides information on the options available with which to retrofit the MP 370.

The following hardware options are available:

- Backup battery (Page 11-2)
- PC card / CF card (Page 11-3)

The following software option is available:

- Internet Explorer (Page 11-5)
11.1 **Hardware Options**

11.1.1 **Backup battery**

**Backup battery function**

The battery ensures that the internal hardware clock of the MP 370 continues to run even when the power supply is interrupted. The clock is buffered for approx. 3 days if no battery is provided ¹).

The battery is not part of the material supplied with the MP 370.

**Installation**

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Secure the battery by means of two cable ties on the rear side of the MP 370. The respective location in touch panels and keyboard units is indicated in the following diagram by means of arrows.</td>
</tr>
</tbody>
</table>

¹) The unit must have been in operation for approx. 6–8 hours, without any interruptions, beforehand.
Step | Procedure
--- | ---
2 | Insert the battery power feed connector in the two-pin connector strip (Position 7 in Figure 9-1 on Page 9-7). The connector is coded and thus protected against polarity reversal.

Further information

Information concerning replacing the battery, supply source and related safety notes on handling and disposing of the batteries is provided from Page 12-3.

11.1.2 PC card / CF card

Purpose

Two slots are provided, namely Slot A and Slot B (Figure 11-1) located on the rear side of the unit in which to insert changeable PC cards and Compact Flash cards. These are not part of the material supplied with the MP 370.

The interchangeable memory cards can be used, for example, to archive important process data or execute a backup/restore of the internal Flash memory (refer to Page 3-14).

Figure 11-1 Position of the slots
Cards supported

The MP 370 supports the use of all standard cards which operate with a programming voltage of 5 V (types I and II), e.g.:

- **Slot A** (PC card):
  - ATA Flash card
  - SRAM card
  - NE2000-compatible Ethernet card

- **Slot B** (Compact Flash card):
  - ATA Flash card
  - NE2000-compatible Ethernet card

Remove memory card

**Caution**
Before removing a memory card, ensure that the MP 370 does not access the card during the removal process.

Before removing the memory card, either use the operating element linked with the Close_archive function in the configuration or stop the runtime software. Operate the operating element linked to the Exit_runtime function in the configuration. Wait until the MP 370 start menu (Figure 3-1, Page 3-6) is displayed. This may take several minutes, depending on the size and number of archives stored.

Switch the MP 370 off with the memory card inserted

**Caution**
Always terminate the runtime software before switching off the voltage supply in order to prevent loss of data.

To terminate the runtime software, press the operating element assigned the Exit_runtime function in the configuration. Wait until the MP 370 displays the start menu, namely the Loader menu (Figure 3-1, Page 3-6), appears and then switch off the power supply. Changeover to the start menu may take several minutes depending on the size and number of archives stored.

If the power supply is interrupted inadvertently during normal operation, the MP 370 checks the memory card after power is returned, repairing defect areas if necessary.
11.2 Software Option

11.2.1 Internet Explorer

The Internet Explorer supplied concerns an Explorer which has been especially adapted to the Windows CE operating system with a restricted functional scope (Pocket Internet Explorer). Only small HTML pages, not larger than 100 kb, are basically suitable to be displayed.

Installation of the Internet Explorer is performed using the ProSave service tool (refer to Chapter 3.9).

Files created in Internet Explorer (e.g. Favorites) are stored in the DRAM file system. The DRAM file system is deleted when the unit is switched off. Using the system settings (OP Properties → Persistent Storage → Save Files, refer to Ch. 8.3.1), however, it is possible to save the data currently available in the DRAM file system in the Flash memory. When the unit is started up, the data saved is automatically restored.

In the case of deinstallation of the Internet Explorers, the files created from Internet Explorer must also be deleted. To do this, delete the files in the DRAM file system using the standard Explorer. Then backup the DRAM file system (OP Properties → Persistent Storage → Save Files, refer to Chapter 8.3.1).

---

Note

By updating the operating system (Chapter 13) the initial configuration can be restored simply.
Maintenance/Upkeep

Scope
The MP 370 has been designed for low maintenance operation. Maintenance of the unit is limited to:
- regular cleaning of the screen,
- regular cleaning of the keyboard foil (keyboard unit),
- changing the optional backup battery.

12.1 Clean Screen/Keyboard

12.1.1 General notes

Preparation
Clean the MP 370 screen at regular intervals and also the keyboard foil in the case of keyboard units. Use a damp cloth.

Caution
Do not clean the unit while it is turned on. This ensures that functions are not inadvertent triggered on touching the keys or the touch screen.

Cleaning agents
Only use water with washing-up liquid or a screen cleaning foam to dampen the cloth. Never spray the cleaning agent directly onto the screen but onto the cloth. Never use aggressive solvents or scouring powder.
12.1.2 Notes on the touch panel

Clean screen

If the Clean Screen function has been assigned to an operating element in the configuration, the screen can be cleaned while it is turned on. After the Clean Screen function has been started, all input via the touch screen is deactivated for a defined period of time. The remaining time is indicated by a bar graph.

Protective foil

A protective foil is available for the touch panel (refer to Catalog ST80). The protective foil is not part of the material supplied with the MP 370.

The self-adhesive foil prevents the screen being scratched and soiled. In addition, the matt surface of the foil reduces reflections.

The protective foil can be removed as necessary without leaving any adhesive residue on the screen.

Caution

Never use sharp or pointed tools to remove the protective foil, such as a knife for instance. This may cause damage to the touch screen.
12.2 Replacing the Optional Backup Battery

Backup battery function

An optional backup battery is available for the MP 370 (refer to Chapter 11). The battery ensures that the internal hardware clock continues to run even when the power supply is interrupted.

Under normal operating conditions, the battery has a service life of approx. 4 years. It is not part of the material supplied with the MP 370.

Supply source

The battery can be ordered from the Siemens spare parts service. It is shipped ready for installation with a lead and connector. Please refer to our catalog ST80 for the order number.

Before replacing

Observe the following safety notes before changing the battery:

---

Caution

- Change the battery while power is still being supplied to ensure the internal hardware clock continues to run.
- The battery must be changed by a properly qualified person.
- Before replacing the battery, refer to the ESD Guidelines in Appendix D.
Procedure

<table>

<tr>
<td>4</td>
<td>Insert the battery lead connector back into the socket. The connector is coded and thus protected against polarity reversal.</td>
</tr>
</tbody>
</table>

General notes

Please observe the following safety notes to ensure correct handling and disposal of lithium batteries:

⚠️ **Warning**

- If the lithium battery is not handled properly, there is a risk of explosion.
- Batteries
  - should never be charged
  - should not be opened
  - should not be short-circuited
  - should be safeguarded against polarity reversal
  - should not be exposed to temperatures in excess of 100 °C
  - should be protected against direct sunlight.
- Do not allow condensation to form on batteries.
- Should shipping become necessary, ensure compliance with the Dangerous Chemicals Ordinance for the carrier concerned (coding obligation).
- Treat used lithium batteries as special waste. Pack them in separate leakproof plastic bags to dispose of them.
Operating System Update

Purpose

If there is a conflict between the configuration software version and current operating system on the MP 370, downloading of a configuration from the configuration computer to the MP 370 is terminated and a compatibility conflict is indicated.

In this case, synchronize the MP 370 operating system with the version of the SIMATIC ProTool CS configuration software. The procedure is described below.

Notice

When the operating system is updated, all the existing data on the operating system is deleted, including licenses (authorizations) (see Chap. 3.8), applications (see Chap. 3.9), passwords (see Chap. 5.17) and recipes (see Chap. 6)!

13.1 Operating system update with ProSave

The ProSave service tool can be used to update the operating system. An advantage of this is that the operating system can be called in without ProTool and transferred via the following channels:

Serial
MPI/PROFIBUS-DP
USB
Ethernet
Principles of operation

After ProTool has been installed, ProSave can be activated in one of two ways:
stand-alone,
from ProTool.

If an operating system transfer should be performed using ProTool, activate ProSave within the scope of a project. The general settings (device and connection selection) need not then be entered since they are assumed from the project.

The same dialog boxes are opened in both cases.

A distinction must be made between two cases of operating system transfer:
to a target system on which an operating system already exists,
In this case, the operating system transfer can be executed without activating the Booting checkbox.
to a target system on which no operating system exists, or a non-compatible operating system exists,
In this case, the operating system transfer can be executed by activating the Booting checkbox.

The procedure for both is described below.

Operating system transfer without Booting

In the case of an operating system transfer without Booting, the configuration computer communicates with the target device by means of the target device’s operating system.

Connect the target device to the configuration computer according to the connection type selected.

Proceed as follows in order to adapt the operating system on the operating unit to the configuration software version used:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Start ProTool via the Windows Start menu and open a project or start ProSave via the Windows Start menu.</td>
</tr>
<tr>
<td>2</td>
<td>Select the menu options File → Upload → Preferences in ProTool. Select the General tab control in ProSave and activated the MP 370 operating unit. Select a connection and enter the connection parameters.</td>
</tr>
<tr>
<td>3</td>
<td>In ProTool, select the menu options File → Upload → OS Update. In ProSave, select the OS Update tab control. Deactivate the Booting checkbox if it is already activated.</td>
</tr>
<tr>
<td>4</td>
<td>In Imagepath, select the directory which contains the image file belonging to the operating unit (file extension .img). The file name contains the character string MP 370.</td>
</tr>
</tbody>
</table>
When downloading is performed successfully, there is no project data on the operating unit. The behavior of the operating unit when no project has been loaded is described in Chapter 3.1.

### Operating system transfer with Booting

In the case of an operating system transfer with Booting, ProSave communicates with the booting loader on the target device.

Connect the target device to the configuration computer.

**Notice**

The operating system transfer with Booting is only possible via the serial connection.

After starting the operating system transfer, the target device must be switched off and on again (rebooted) so that the target device establishes contact via the serial interface.

Proceed as follows in order to adapt the operating system on the operating unit to the configuration software version used:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch off the power supply to the target device.</td>
</tr>
<tr>
<td>2</td>
<td>Start ProTool via the Windows Start menu and open a project or start ProSave via the Windows Start menu.</td>
</tr>
<tr>
<td>3</td>
<td>Select the menu options File → Upload → Preferences in ProTool. Select the General tab control in ProSave and activated the MP 370 operating unit. Select a connection and enter the connection parameters.</td>
</tr>
</tbody>
</table>
### Step | Procedure
---|---
4 | In ProTool, select the menu options **File → Upload → OS Update**. In ProSave, select the **OS Update** tab control. Deactivate the **Booting** checkbox if it is already activated.
5 | In **Imagepath**, select the directory which contains the image file belonging to the operating unit (file extension .img). The file name contains the character string MP 370.
6 | Select the **Open** button. When the image file has been opened successfully, various information related to the version status appears in a screen window.
7 | Start the operating system transfer by pressing the **Update OS** button.
8 | Switch the power supply to the target device on again to start the download process. A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly. This process takes a different length of time, depending on the connection selected. A progress indicator appears during the data transfer. When the transfer is successfully completed, a message appears briefly.

When downloading is performed successfully, there is no project data on the operating unit. The behavior of the operating unit when no project has been loaded is described in Chapter 3.1.
### 13.2 Operating system update using PtUpdate

**Note**
PtUpdate must be used for an operating system update in the case of ProTool versions earlier than 6.0.

Proceed as follows in order to adapt the operating system on the MP 370 to the configuration software version used implementing PtUpdate:

<table>
<thead>
<tr>
<th>Step</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch off the MP 370’s power supply.</td>
</tr>
<tr>
<td>2</td>
<td>Connect the IF2 (serial) interface on the MP 370 to a serial interface on the configuration computer via a serial zero modem cable.</td>
</tr>
<tr>
<td>3</td>
<td>Start the PtUpdate utility program on the configuration computer. It is contained on the configuration software installation CD. It is located in the directory \Images in the device-specific subdirectory.</td>
</tr>
<tr>
<td>4</td>
<td>Select menu item File → Open and open the image file (file extension .img) appropriate for the MP 370. The image files are located in the same directory as the PtUpdate utility program. The file name contains the character string MP 370. When the image file has been opened successfully, various information related to the version status appears on the screen.</td>
</tr>
<tr>
<td>5</td>
<td>Select the menu item File → Settings. Set the interface and applicable baud rate (max. 115200) on the designated interface for the download.</td>
</tr>
<tr>
<td>6</td>
<td>Start downloading with the menu option File → Download. When the appropriate message appears on the screen, switch on the power supply for the MP 370.</td>
</tr>
</tbody>
</table>

When downloading is performed successfully, there is no project data on the MP 370. The behavior of the MP 370 when no configuration has been loaded is described in Chapter 3.1.

**Note**
When the MP 370 is switched on following an operating system update, it needs several minutes before the startup routine is completed for the first time.

Technical Data

In this Appendix

This Appendix contains the following technical data for the MP 370:

- Housing
- Processor
- Memory
- Software
- Display
- Keyboard (keyboard unit)
- Acoustic acknowledgement
- Power supply
- Backup battery (option)
- Network connection
- Ambient conditions
- Noise immunity / Noise transmission
- Approvals
### Housing

**Warning:**

Personal injury and equipment damage can occur. Personal injury and equipment damage can occur in hazardous areas if a plug connection is disconnected from the operating unit while the system is running. In hazardous areas, always switch off the power supply to the operating unit before disconnecting plugs.

**Warning:**

DO NOT DISCONNECT WHILE CIRCUIT IS LIVE UNLESS LOCATION IS KNOWN TO BE NON-HAZARDOUS.

[^3]: The UL and CSA file numbers are dependent on the production site. The numbers specified here changes according to the change of production site.

HMI System Messages

In this chapter

This chapter contains a selection of important HMI system messages for Windows-based systems. The table indicates when the messages occur and how they, or their cause, can be cleared. Not every message is relevant for each operating unit.

HMI system message parameters

The HMI system messages may contain parameters which are not decoded for the user but which are relevant in respect of the cause of an error since they provide a reference to the source code of the runtime software. These parameters are issued according to the text “Error code:”.

Notice

HMI system messages are issued in the language currently set on the operating unit.

No ProAgent diagnostics can be performed. | In order to run the project, install the ProAgent option packet.       |
| 320014   | The selected PLC cannot be evaluated for ProAgent.  
The message display configured with the Evaluate_message_display_fault function could not be found. | Check the parameters of the Evaluate_message_display_fault function.   |

1) The optional parameter %1 at the start of the message may contain an identification for the S7 connection when several S7s are in parallel operation and are connected to diagnostics equipment.

2) A WinCC channel provides the message texts via an interface. This text is issued via this message. ProTool/Pro RT has no influence on this texts.

3) The specified text comes from the component resources.

**Procedure in the case of “internal errors”**

Please proceed as follows in the case of all system messages related to “internal errors”:

1. Start up the operating unit again.
2. Download the configuration again.
3. Switch the operating unit off, stop the PLC and then restart both.
4. If the error occurs again, please contact the SIMATIC Customer Support. Make reference to the specified error number and message tags.
ESD Guidelines

What does ESD mean?

Virtually all present-day modules incorporate highly integrated MOS devices or components. For technological reasons, these electronic components are very sensitive to overvoltages and consequently therefore to electrostatic discharge:

These devices are referred to in German as Elektrostatisch Gefährdeten Bauelemente/ Baugruppen: “EGB”

The more frequent international name is:

“ESD” (Electrostatic Sensitive Device)

The following symbol on plates on cabinets, mounting racks or packages draws attention to the use of electrostatic sensitive devices and thus to the contact sensitivity of the assemblies concerned:

ESDs may be destroyed by voltages and energies well below the perception threshold of persons. Voltages of this kind occur as soon as a device or an assembly is touched by a person who is not electrostatically discharged. Devices exposed to such overvoltages cannot immediately be detected as defective in the majority of cases since faulty behavior may occur only after a long period of operation.

Precautions against electrostatic discharge

Most plastics are capable of carrying high charges and it is therefore imperative that they be kept away from sensitive components.

When handling electrostatic sensitive devices, make sure that persons, workplaces and packages are properly grounded.
Handling ESD assemblies

A general rule is that assemblies should be touched only when this cannot be avoided owing to the work that has to performed on them. Under no circumstances should you handle printed-circuit boards by touching device pins or circuitry.

You should touch devices only if

- you are grounded by permanently wearing an ESD wrist strap or
- you are wearing ESD shoes or ESD shoe-grounding protection straps in conjunction with an ESD floor.

Before you touch an electronic assembly, your body must be discharged. The simplest way of doing this is to touch a conductive, grounded object immediately beforehand – for example, bare metal parts of a cabinet, water pipe etc.

Assemblies should not be brought into contact with charge-susceptible and highly insulating materials such as plastic films, insulating table tops and items of clothing etc. containing synthetic fibers.

Assemblies should be deposited only on conductive surfaces (tables with an ESD coating, conductive ESD cellular material, ESD bags, ESD shipping containers).

Do not place assemblies near visual display units, monitors or television sets (minimum distance to screen > 10 cm).

Measuring and modifying ESD assemblies

Perform measurements on ESD assemblies only when

- the measuring instrument is grounded – for example, by means of a protective conductor – or
- the measuring head has been briefly discharged before measurements are made with a potential-free measuring instrument – for example, by touching a bare metal control cabinet.

When soldering, use only grounded soldering irons.

Shipping ESD assemblies

Always store and ship assemblies and devices in conductive packing – for example, metallized plastic boxes and tin cans.

If packing is not conductive, assemblies must be conductively wrapped before they are packed. You can use, for example, conductive foam rubber, ESD bags, domestic aluminum foil or paper (never use plastic bags or foils).

With assemblies containing fitted batteries, make sure that the conductive packing does not come into contact with or short-circuit battery connectors. If necessary, cover the connectors beforehand with insulating tape or insulating material.
Glossary

A

Acknowledgement

Acknowledgement of an alarm message on the operating unit confirms that it has been noted. After acknowledgement, the message disappears from the operating unit. Alarm messages can be acknowledged either on the operating unit or PLC. Alarm messages can be compiled into groups so that several messages can be acknowledged simultaneously.

Acknowledgement groups

During configuration, several alarm messages can be compiled to form an acknowledgement group. After acknowledging the first message, all the other messages belonging to the same group are simultaneously acknowledged. This enables, for example, acknowledgement of alarm messages for the cause of a fault and all resulting faults (group acknowledgement).

Alarm message

Provides information on the operating unit concerning operating errors on the machine or system connected to the PLC. The message text may also contain current measured values.

Since alarm messages indicate abnormal operating status, they must be acknowledged.

ALARM_S

Active message procedure by which the CPU issued messages to all the registered network participants. ALARM_S messages are configured in STEP 7.

Analog display

A screen object which displays numeric values by means of a pointer instrument.
Archive
A memory area on a data storage medium in which messages or tags can be stored. The size of the archive is defined in ProTool/Pro CS.

Area pointer
Defines a memory area in the PLC for data exchange between the PLC and operating unit.

Bar graphs
Represent values from the PLC as rectangular areas. This is a way of displaying filling levels or workpiece numbers, for example, on the operating unit.

Baud rate
Rate of speed at which data is downloaded. Baud rate is specified in Bit/s.

Blanking circuit
Switch off or dim the screen back–lighting.

Boot
A loading process which downloads the operating system in the working memory of the operating unit.

Buttons
A virtual button on the operating unit screen. Buttons on operating units with touch screens are contact sensitive.
C

Clicking

Configurable event which can trigger a function assigned to a button, for example, when the button is pressed and released (clicked) within the contour of the button. If the button is pressed using the mouse button or finger (when using touch panels) but moved outside the contour before releasing, the operating unit does not interpret the action as a click event.

Clock

Screen object which displays the system time either as digits (digitally) or in the form of a clock (analog).

Combo box

Contains a list of entries from which one can be selected on the operating unit.

Configuration

Definition of basic, system-specific settings, messages and screens using the ProTool CS configuration software.

D

Data record

A recipe containing data. A recipe can be comprised of several data records. When a data record is downloaded, all the assigned data is transferred to the PLC together and synchronously.

Direct key

Buttons can be configured as direct keys in order to achieve fast keyboard operation without any resulting communication-related delays.

Display period

Defines whether and how long a system message is displayed on the operating unit.

Download

The transfer of run-capable project data to the operating unit. Connect the operating unit to the configuration computer with a standard cable beforehand.
Download mode

Operating unit operating mode in which data can be downloaded from the configuration computer to the operating unit (also refer to Download).

Event

Functions are triggered by the arrival of defined events. Events can be configured according to the object. Events which can be configured for a button include:
- Click
- Press
- Release

Event message

Provides information on the operating unit concerning the operating statuses of the machine or system connected to the PLC. The message text may also contain current measured values.

Fixed window

Window which always appears at the top of the operating unit screen. The content of the fixed window is independent of the screen currently open.

Flash memory

Programmable memory which can be electrically deleted and written to again segment-by-segment.

Function key

Key on the operating unit to which a configurable function can be assigned. A function key with a global function assignment always initiates the same function regardless of the screen currently open. A function key with a local function assignment (softkey) can have a different function for each screen.
G

Global tag
This is a process tag linked to the PLC. Global tags have a fixed address in the PLC. The operating unit accesses this address for reading and writing purposes.

Graphic display
This enables the dynamic positioning of graphics created in external graphics programs in a project.

Graphic box
A graphic can be selected by selecting an entry in the graphic list.

Graphics list
A list in which each value relates to a tag assigned to a graphic. This enables, for example, the assigned graphic to be displayed on the operating unit output field instead of the value.

Group acknowledgement
During the configuration, each alarm message can be assigned to an acknowledgement group. When the alarm message is acknowledged, all the other alarm messages in the same group are simultaneously acknowledged.

H

Half Brightness Life
Time period after which the brightness of the lighting tube only achieves 50% of its original value.

Hardcopy
Represents a printout of the current screen content. Windows called in on top are not printed.

Help text
Configurable, additional information on messages, screens and fields. The help text concerning an alarm message can, for example, contain information on the cause of the fault and methods of elimination.
History trend
After setting a trigger bit that reads all the trend values simultaneously from the PLC, they are displayed as a history trend on the operating unit. History trends are well suited for displaying distinct changes in a trend when the progress of a trend curve is of more interest with regard to its full course (history) than to the individual values.

Icon
Pixel graphic of a fixed size, e.g. assigned to a softkey, to identify its function.

Input field
Enables the user to enter values which are subsequently downloaded to the PLC.

Invisible buttons
Buttons which are only visible during configuration, not on the operating unit. If invisible buttons are superimposed on components in the process screen, the respective components can be operated by clicking the button with the mouse or pressing them on the touch screen.

Limit value
Configurable values of a tag defining a value range. Attempts to define values outside these limits, may cause the following effects on the operating unit:

- Input field
  input is rejected
- Output field
  values are displayed in the configured color
- Trend/Bar
  values are displayed in the configured color

Local tag
A tag without a link to the PLC. Local tags are only available on the operating unit.
Logout time
Configurable interval of time after which the password level is reset to zero when the operating unit is not used.

M
Message arrival
Time at which a message was triggered by the PLC or operating unit.

Message buffer
Memory area in the operating unit in which message events can be stored in chronological order as they arrive. Event messages and alarm messages are stored in separate message buffers.

Message departure
Time at which a message was withdrawn by the PLC.

Message events
These are stored in chronological order in the operating unit message archive. Message events consist of:
- Message arrival
- Message acknowledgement
- Message departure

Message indicator
A configurable graphical symbol displayed on the operating unit when at least one alarm message is present.

Message logging
Printout of messages parallel to their display on the operating unit display.

Message view
A screen object with configurable filter criteria which is used to display the volatile message buffer or message archive.
Multi Panel

Multi-purpose, configurable operating unit with graphic display and Windows CE operating system for operating and monitoring machines and systems.

N

Normal operation

Operating unit operating mode in which messages are displayed and screens can be operated.

O

Object

Is a component part of a screen or message. Depending on the object type, objects serve to display or enter texts and values on the operating unit.

Operator Panel

Configurable operating unit for operating and monitoring machines and systems. Operation is via buttons.

Output field

Displays current values from the PLC on the operating unit.

P

Password

A character string which must be entered on the operating unit before a protected function can be activated. Each password is assigned to a defined password level.

Password level

The rights to use operating units can be specifically restricted to certain users and user groups. To do this, the individual functions and operating elements are assigned to hierarchically defined password levels. The password level linked to the password allocates the rights to execute functions on the operating unit belonging to that level or lower.
Password list
A screen object for entering passwords related to different authorization levels.

PCL
Hewlett Packard printer language (Printer Control Language).

PLC
General term for units and systems with which the operating unit communicates (e.g. SIMATIC S7 or PC).

PLC job
PLC jobs can be used by the PLC to trigger functions on the operating unit, e.g. display a screen.

Power-up test
Checks the status of the CPU and memory each time the power is switched on.

Press
Configurable event which may trigger a function assigned to a button, for example, as the button is pressed.

Print screen
Printout of a copy of the screen contents.

Process screen
The display of process values and process progress on the operating unit in the form of screens, which may contain graphics, texts and values.

Programmable controller
PLC from the SIMATIC S5 series (e.g. AG S5-115U/135U).

Programmable system
PLC from the SIMATIC S7 series (SIMATIC S7-200/300/400).
Glossary

ProSave
A service tool which provides all the functions which are necessary for the transfer of data between the configuration computer and operating unit.

ProTool
Full-graphic configuration software for configuring text displays, text–based and graphics operator panels as well as units from the Windows CE range, such as TP170/OP170/MP270/MP370.

ProTool CS
General name for the three configuration software variants ProTool/Pro CS, ProTool and ProTool/Lite.

ProTool/Lite
Full-graphic configuration software for configuring text displays and text–based operator panels as well as Windows-based 6” units such as TP170 A.

ProTool/Pro CS
Full-graphic configuration software for configuring the entire SIMATIC HMI product range and Windows-based systems.

Q
Queued messages
Messages which have been detected as having been received by the operating unit (message event Arrived) but for which the message event Departed has still not occurred.

R
Recipe
A combination of tags to a fixed data structure. The data structure configured can be assigned data on the operating unit and is then referred to as a data record. The use of recipes ensures that when a data record is downloaded, all the assigned data is transferred to the PLC together and synchronously.
Recipe view

Screen object to create, edit, store and download data records.

Release

Configurable event, e.g. for a button, which triggers a function as soon as the pressed button is released.

If the button is pressed using the mouse button or finger (when using touch panels) but moved outside, the function is triggered when the function is released.

Remaining buffer

Configurable size of the message buffer. In the case of a buffer overflow, the operating unit deletes message events until the configured remaining buffer capacity is reached.

RS232

Standard interface for serial data transmission with defined voltage levels. Sender and receiver are electrically connected.

RS485

Standard interface for serial data transmission with very high transmission rates.

Runtime software

The program visualization software SIMATIC ProTool/Pro RT with which the project created using ProTool CS can be run on your Windows-based system.

S

Screen

A screen displays all the logically related process data on the operating unit, whereby the individual values can be modified. Screens are composed of static and dynamic parts. Static parts refer to text and graphics, dynamic parts to input and output fields.

Screen keyboard

A virtual keyboard which appears on the operating unit screen. This enables values to be entered without a keyboard actually being connected, in the case of a touch panel for example.
Selection field

Contains a list of entries from which one can be selected on the operating unit.

SIMATIC HMI Symbol Library

Comprehensive library containing graphics from the areas of technology and production. Extends the ProTool library.

Slider controls

Screen object for entering and displaying numeric values in analog form.

Softkey

Function key on the operating unit with a local function assignment. The function triggered by a softkey varies according to the screen currently open.

Start screen

The first screen which automatically appears after the operating unit has started up.

State view

The State view is a configurable display element. Depending on the configuration, it can signal a warning or the status of a unit which cannot be viewed from the operating unit.

Status button

A status button is a display and operating element with two possible states: ON and OFF, i.e. touched and untouched. Both states can be configured for display with text or graphics, which then label the status button.

Status/Force tag

Screen object which enables direct read and write access from the operating unit to individual address areas in the connected SIMATIC S5 or SIMATIC S7.

STEP 7

Programming software for SIMATIC S7, SIMATIC C7 and SIMATIC WinAC.
Superuser

A user with permissions to trigger functions of the highest password level. The superuser has access to all the operating unit functions.

Switch

A screen object for entering and displaying a binary status. A switch can only be in the status on or off.

System message

Provides information on the operating unit concerning internal statuses of the operating unit and PLC.

Trend curve

Curve type by which just one curve value is read from the PLC per cycle or trigger resulting in a curve display. If the configured number of measured values is not achieved, each new value overwrites the oldest value. Trend curves are especially suited to displaying continual progress.

Trend curve graphic

A screen object for displaying the continual progress of process data. Several different trend curves can be shown in the trend curve display simultaneously.

Trend view

Screen object providing a clear, continuous display of process data. Several different curves can be displayed simultaneously in the trend curve display, e.g. in the form of trend curves or history trends.
