Comments

"Safety Integrated" Functional Examples are functional, tested automation configurations based on A&D standard products intended for simple, quick and economic implementation of automation tasks involving safety technology. Each of these Functional Examples covers a frequently occurring subtask of a typical customer problem within safety technology.

In addition to containing a list of all of the necessary software and hardware components, and a description of their interwiring, the Functional Examples also contain tested and commented code. This enables the functions described here to be duplicated and, thus, used as a basis for individual expansions.

Important information

Safety Functional Examples are non-binding and do not claim to be complete with regard to configuration, equipment or any contingency. The Safety Functional Examples are not customer-specific solutions. They are merely intended to assist in dealing with typical problems. You are solely responsible for correct operation of the described products.

These Safety Functional Examples do not relieve you of your responsibility for safe usage, installation, operation and maintenance. By using these Safety Functional Examples you accept that Siemens is not liable for any damage beyond the liability described above. We reserve the right to make changes to these Safety Functional Examples at any time, without prior notice. If the suggestions in these Safety Functional Examples deviate from other Siemens publications (e.g. catalogs), the contents of the other document have priority.

1. Guarantee, Liability and Support

We are not liable for any of the information contained in this document.

We are not liable for any damage caused by the use of the examples, information, programs, configuration and performance data, etc. described in this Safety Functional Example, independent of the legal ground this is based upon, unless we are imperatively liable according to the product liability law due to, e.g., cases of premeditation, an act of gross negligence, injury to life, body or health, or unless the quality of a product has been guaranteed, or due to fraudulent concealment of a defect or serious breach of contract. Damages due to serious breach of contract are, however, restricted to prevalent and predictive contractual damages, in as much as premeditation or gross negligence are not existent or there is no imperative liability due to injury to life, body or health. This does not constitute a change in the burden of proof to your disadvantage.

2. Automation Function

2.1 Scope of Validity of this Functional Example

Persons near machines (e.g. in production engineering) must be suitably protected by technical equipment. The EMERGENCY-STOP control unit and protective door monitoring are widely used components for protecting persons, machines and the environment against danger.

A standard AS-i network consists of control/master, power supply unit, a yellow AS-i cable and various slaves. Only two further components are necessary for safe usage: A safety monitor and safe slaves.

Each safe slave is programmed with a factory-default code table that clearly identifies each slave for the safety monitor.

At each master prompt, correlation is checked between the code value expected by the comparator (safety monitor) and the code value actually sent by the slave. In the case of deviations or time-outs, disconnection via 2-channel OSSDs occurs on the safety monitor.

2.1 Functionality of the Functional Example

Problem

Implementation of EMERGENCY-STOP disconnection and protective door monitoring with monitored start via ASIsafe.

Solution

In this Safety Functional Example, the EMERGENCY-STOP control unit and a protective door are monitored via two channels by a K45F ASIsafe module. When the EMERGENCY-STOP is activated or the protective door is opened, the K45F ASIsafe module sends a signal to the safety monitor. The safety monitor then switches the downstream contactor with positively-driven contacts via the safe relay output according to Stop category 0 of EN 60204-1. A drive is shut down in this example. Before renewed switching-on via the start button, a check is carried out to monitor whether the contacts of the EMERGENCY-STOP control unit and the protective door are closed and whether the contactors have switched off.

EMERGENCY-STOP and Protective Door Monitoring with Monitored
Start up to SIL 3 and PL eArticle ID:
xxxxx23780092

2.3 Advantages / Customer Benefits

- Secure and non-secure data on one bus
- Simple assembly thanks to standardized AS-i technology
- Existing system can be quickly and easily expanded
- Integration of safety signals in the system diagnosis
- Failsafe PLC or special master not required
- Space-saving design thanks to compact safety combination

3. Required Components

This chapter contains an overview of the hardware and software components required for the Functional Example.

Hardware components

Table 3-1

Component	Туре	Order No. / Order Information	Quan tity	Manufacturer
Power supply	PS307 5A	6ES73071EA00-0AA0	1

4. Assembly and Wiring

This chapter describes the hardware assembly and wiring of the Functional Example.

4.1 Overview of Hardware Setup

Note The actuators of the SIRIUS position switches must be protected against external impacts.

4.2 Hardware Component Wiring

4.3 Important Hardware Component Settings

DP/AS-i LINK Advanced

Prerequisites

- The DP/AS-INTERFACE LINK Advanced is mounted and connected to the AS-i line.
- The AS-i power supply unit is connected to the AS-i line.
- The AS-i slaves are not yet connected.
- The slaves that are to be connected have default address "0" (delivery status).

Procedure

Working on the DP/AS-INTERFACE LINK Advanced

- 1. Switch on the AS-i power supply unit so that the DP/AS-INTERFACE LINK Advanced is in operation
- 2. Connect each AS-i slave to the AS-i line and allocate each the desired slave address.

(K45F module, address 1 or 2).

SYSTEM ASI line 1 Lifelist Change address

Change slave address

3. Adopt the actual configuration of the slave as the defined configuration in the DP/AS-INTERFACE LINK Advanced

SYSTEM AS-i line 1 Lifelist Actual -> Defined

Result: All displays for the AS-i line on the DP/AS-INTERFACE LINK Advanced are off or green, i.e. all slaves have been successfully integrated.

5. Example Code

This chapter describes which functions are implemented and how the asimon program is structured.

5.1 Description of the asimon Program

After the asimon software has been started, the start assistant is used to create a new safety monitor configuration.	Start Assistant for AS-interface safety monitor Options Diagnostics Mew configuration Open configuration Load configuration from AS-interface safety mor Attention! With this ASiMon version, functions are available which can only be used beginning with monitor version 3.04! Image: Show dialog on start-up OK Cancel
Enter a name for the configuration in the "Information monitor" tab, select the operating mode and the function range of the AS Interface safety monitor ("Basic" or "Enhanced").	Information about monitor and bus Information monitor Information monitor Information bus Diagnosis / 5 • • • • • • • • • • • • • • • • • •

In the "Information bus" tab, you must enter the AS-Interface bus addresses of the standard slaves used and the safety- oriented AS-Interface slaves in this network.	Information about monitor and bus Information monitor Information bus Diagnosis / 5 (▲) OK Address assignment Information bus Diagnosis / 5 (▲) OK Cancel Help 3 19 17 Information bus Information bus OK Cancel Help Help Help Information bus Information bus </td
In the "Diagnosis / Service" tab you can adjust the settings for "Diagnosis stop" and "Reset of error condition" as well as configure the AS-Interface bus diagnosis. Simulating slaves If less than 4 safe or standard AS-Interface slaves are connected to the AS-Interface bus, you must activate the control box "Simulate slaves". At least 4 slave addresses must be activated to ensure that the AS-Interface safety monitor functions correctly. Char	nge passv	vord	
Inter	face		•

To transfer the current asimon configuration to the connected AS-Interface safety monitor, select the **Monitor** menu and then the **PC** -> **Monitor** command.

The configuration is then transferred to the AS-Interface safety monitor. Transfer takes several seconds.

After successful completion of the data transfer to the AS-Interface safety monitor, the configuration is saved in the AS-Interface safety monitor.

After transferring a configuration to a

connected AS-Interface safety monitor, the safe configuration has to be "learned". To this end, the code tables of the safe AS-Interface slaves that are to be monitored are read in via the AS-Interface. The code table of each safe AS-Interface slave that is to be monitored is stored in the configuration log.

Learning the safe configuration

Before the safe configuration can be learned, the-AS Interface bus including all safe AS-Interface slaves that are to be monitored must be commissioned, and all safe AS-Interface slaves that are to be monitored must be switched ON. Only then can the AS-Interface safety monitor learn the code tables of all the relevant safe AS-Interface slaves.

To learn the code tables, select the "**Teach safe configuration**" in the Monitor menu and confirm the question "**Do you want to learn the code sequence**?" with **Yes**.

The code tables are then learned by the AS-Interface safety monitor. Learning takes several seconds. Progress is displayed in a window.

Once the code tables of all the safe AS-Interface slaves that are to be monitored have been successfully learned, a provisional configuration log will be immediately transferred to **asimon**. EMERGENCY-STOP and Protective Door Monitoring with Monitored

The configuration log will then be immediately transferred. Progress of the transfer of the final configuration log is displayed in a window.

The final configuration log is displayed in asimon in its own window. To illustrate that the configuration has been validated and to differentiate between a validated

and a provisional configuration log, the validation information will be displayed in Line 10.

Starting the AS-Interface safety monitor

If a valid, validated configuration is available on the AS-Interface safety monitor, you can switch the AS-Interface safety monitor from configuration mode to protection mode via the **Start** command in the **Monitor** menu. After the protection mode has been started, the status line will indicate the change to the new operating mode.

6. Evaluation according to IEC 62061 and ISO 13849-1:2006

6.1 Safety Function

Comments

- Emergency-stop is not a means of risk mitigation.
- Emergency-stop is not a "safety function"
- Emergency-stop is a "supplementary safety function"

Further considerations are based on the following safety functions:

Supplementary safety function	
SF 1	The motor must be switched off when "Emergency-stop" is actuated.

Safety function	
SF 2	The motor must be switched off when the "Protective door" is opened.

The safety functions listed above are evaluated below according to the two standards IEC 62061 and ISO 13849-1:2006.

EMERGENCY-STOP and Protective Door Monitoring with Monitored

Evaluate	3	Manufacturer specifications	9.60 * 10 ⁻⁰⁹	Manufacturer specifications	
Respond	3	Hardware error tolerance: HFT = 1 Proportion of safe failures: SFF ≥ 0.99 (99%)	9.12 * 10 ⁻¹⁰	Architecture: Basic sub- system architecture D	
Results	3 SILCL of all tasks of the safety function is at least 3. PFH_D (= 1.06 * 10 ⁻⁰⁸) of the entire supplementary safety function fulfilled SIL 3.				

6.3.2 Evaluation according to ISO 13849-1:2006

Parameters for the calculation of MTTF_{d} for "Detection 2" (Position switch) and "Responding" Contactor)

Parameter	Value	Reason	Definition
B10	_	Manufacturer specifications	
Position switches	1 * 10 ⁶		Siemens
Contactor	1 * 10 ⁶		
Proportion of hazardous failures		Manufacturer specifications	
Position switches	0.2	(20%)	
Contactor	0.73	(73%)	
d _{op}	365 days per	Assumption:	
Mean operating time in days per year	year	Actuation takes place every	
h _{op}	24 hours per	day of the year	
Mean operating time in hours per day	day		
t _{Cycle}			User
Mean time between the start of two		Assumption:	
consecutive cycles of the component			
position switches	8 hrs/cycle	There is an interval of 8	
		hours between each	
		protective door	
Contactor	8 hrs/cycle	opening/contactor actuation	
		(one shift)	

Interim results (are identical in this example for the position switch and the contactor):

Interim result	ts	Reason
MTTF _d	High	MTTF _d ≥30 years
DC	High	DC=99%
		Discrepancy evaluation for position switches; evaluation of read-
		back signals (positively driven contacts) of both contactors
Measures	Fulfilled	It is assumed that the necessary measures are taken by the
against CCF		user.
Category	4	System behavior: A single fault does not cause the loss of the
		safety function. The single fault is detected. MTTF _d : High, DC:
		High, measures against CCF: Fulfilled

Evaluation parameter

Parameter	Component	Value	Definition
PFH _D (asimon)	Safety monitor	9.60 * 10 ⁻⁰⁹	Siemens

Results

	ISO 13849-1:2006		
	PL	PFH _D	
Detect	е	2.47 * 10 ⁻⁰⁸ (from Annex K; see note)	
Evaluate	е	9.60 * 10 ⁻⁰⁹	
Respond	е	2.47 * 10 ⁻⁰⁸ (from Annex K; see note)	
Results	е	PL of all tasks of the safety function is at least e. Number of tasks is less than or equal to 3.	

Note: The $MTTF_d$ for each channel is limited to max. 100 years!

6.3.3 Summary of Safety Function 2

	IEC 62061		ISO 13849-1:2006	
	SILCL	PFH _D	PL	PFH _D
Detect	3	1.37 * 10 ⁻¹⁰	е	2.47 * 10 ⁻⁰⁸
Evaluate	3	9.60 * 10 ⁻⁰⁹	е	9.60 * 10 ⁻⁰⁹
Respond	3	9.12 * 10 ⁻¹⁰	е	2.47 * 10 ⁻⁰⁸
Results	SIL 3		PL e	

7. Contact

Technical Assistance for Low-Voltage Controls and Distribution

In person from Mon. - Fri. 8 a.m. to 5 p.m. (CET) Phone: +49 (911) -0895-5900 e-mail: <u>technical-assistance@siemens.com</u> Internet: <u>www.siemens.com/automation/support-request</u>

By fax 24 hours a day Fax: +49 (911)-895-5907

8. History

Table 0-1 History

Version	Date	Change
V1.0	09.08.2006	First issue
V2.0	23.07.2008	 Update of the order numbers of the position switches Revision of the hardware configuration overview New chapter: Evaluation according to IEC 62061 and ISO 13849-1 Update of the screenshots in chapter 5
V3.0	13.09.2013	 Revision of title and description of functionality Adjustment of Proportion of hazardous failures for contactors to 73% and resulting PFH_D values Adjustment of PFH_D value of Safety monitor to 9.60 * 10⁻⁰⁹
