Process Instrumentation

Instruments for Process Automation August 2022 Supplement usa.siemens.com/pneumatics

Introduction

The Process Instrumentation Business Segment of Siemens Industry, Inc. is a leader in providing innovative solutions to process instrumentation and control challenges. It is the operational center for Siemens' process instrumentation and control business in North America. The Process Instrumentation business provides a complete line of reliable measurement and control products, including: transmitters for level, pressure, temperature, and flow; loop controllers; valve instrumentation products, regulators and relays; process protection instruments; weigh feeders and belt scales. Siemens Process Instrumentation solutions help increase productivity and plant safety, reduce time-to-market and improve product quality across the process industries, such as chemical, pharmaceutical, bio-pharmaceutical, oil & gas, water and wastewater treatment, mining, pulp & paper and refining.

This catalog supplement includes only those items manufactured in Harleysville, sold here in the US, and not covered in the Siemens Field Instruments FI 01 catalog. If you do not find the product you are looking for in this supplement, please contact our factory for more information. We will be happy to connect you with a sales representative in your area that covers the products and services that you need.

Siemens Industry Inc. Process Instrumentation 2060 Detwiler Road Suite 111 Harleysville, PA, 19438 1-(800)-365-8766

Introduction

Features & Benefits

- Universal design and choice of interchangeable NAMUR IEC 534-6 rectilinear VDI/VDE 3845 rotary mountings provide wide application flexibility
- Double-acting or single-acting service and split ranging afford application versatility in a single unit
- Non-interaction of the zero and span adjustments and CAMLOC (TM) cam locking mechanism significantly reduce calibration and setup time
- Modular design reduces inventory because it allows interchangeable spare parts
- Comes standard with 3 cams, linear, quick opening and equal % for application versatility

Description

The Series 760 Valve Positioners provide a cost effective universal approach to your valve control. Their modular concept allows all models to be built on the base pneumatic unit (Model 760P). The electro-pneumatic model (Model 760E) is created by adding an I/P transducer to the base pneumatic unit, and a wide range of accessories easily installs inside the unit.

The 760 base pneumatic unit provides cam characterization, split ranging, direct or reverse action, and single or double acting without requiring additional parts. Key design features include non-interaction of the zero and span adjustments.

Series 760 Valve Positioners include provisions for internal limit switch mounting and position feedback devices without requiring additional housings. Thus, the need to stack housings that impede access to the main enclosure are eliminated.

A spool valve is used to load the actuator for positioning in response to an input signal. A characterized cam provides mechanical feedback. There are linear, equal percentage and quick opening operation cam profiles, and a blank profile cam is available for custom applications. Rectilinear action length can range from 1/2 inch to 6 inches.

The feedback shaft and characterized cam can be replaced in the field to configure the positioner for use with either a rectilinear or rotary actuator. No additional parts are necessary to change between single or double acting actuators or direct or reverse action.

Valve Positioners Series 73 Built-In Valve Positioner

Introduction

Features & Benefits

- Single-axis, force-balance principle of operation, ensures accurate and stable positioning
- Feedback circuits direct the actuator's position, ensuring adherence to the control instrument signal
- Range spring capability accommodates a wide variety of valve strokes and instrument spans

Description

The Series 73 Built-in Valve Positioners use the full force of their air supply to drive and maintain the piston or diaphragm in a pneumatic actuator to position a valve to what is required by a control instrument, regardless of the presence of forces that change valve position.

This line of compact instruments incorporates a single-axis, force-balance principle of operation to ensure accurate and stable control valve positioning. In all cases, including bottom-loading applications, a Model 73 Built-In Valve Positioner is mounted directly on the topwork of the valve, with no external levers or other exposed mechanisms.

Each positioner receives a signal from a control instrument, and using an air supply as high as 100 psig, the positioner strokes the valve actuator to the required position.

Like all valve positioners, the Model 73 Built-In Valve Positioners have feedback circuits designed to measure the position of the actuator's piston or diaphragm. The positioner then supplies or exhausts air to bring the actuator within the required range for its corresponding control instrument.

The position of the piston or diaphragm in the valve actuator is sensed by the arount of compressive force exerted by a range spring on the valve positioner's diaphragm assembly. By selecting the appropriate range spring from the wide selection available almost any combination of valve stroke (from 1/4* to 4*) and instrument span (from 2 to 24 psi) can be obtained.

- The maximum zero pressure for Model 73N24F is 15 psig for instrument pressure spans of 16 psi or greater, and 28 psig when used for spans of 12 psi or less.
- The maximum instrument pressure for Model 73N-FR is 15 psig for instrument pressure spans of 12 psi or less, and 27 psi for spans of 16 psi or greater.

Mounting Dimensions

Spring Selection

- 1. Find the valve stroke nearest the desired valve stroke.
- 2. Find the instrument input pressure span nearest the desired instrument input pressure span.
- 3. Select the proper range spring at the intersection of the valve stroke and the instrument input pressure span columns.

Introduction

Features & Benefits

- Double-acting or single-acting service accommodates installation in a variety of environments
- Field reversibility reduces downtime and simplifies maintenance
- Choice of continuously adjustable standard stroke ranging from 1/4" to 48" and continuous span and zero adjustability within range spring limits provide application versatility
- Extra high capacity pilots ensure maximum frequency response and optimum stroking speeds for all actuator sizes
- Negative feedback pilot circuit allows the positioner to operate with a push-pull gain of more than 900:1 (using 100 psig supply) with no sacrifice in stability

Description

The Model Series 74 Valve Positioners are universal positioners that provide versatility, dynamic performance, and high positioning accuracy. They use the piston or diaphragm in a pneumatic actuator to position a valve to what is required by a control instrument and hold that position, regardless of the presence of forces that change valve position. As such, supply pressure variations have little or no effect on the positioner output, which eliminates the need for a supply pressure regulator.

These valve positioners are two-stage, pilot-operated instruments. The pilot circuit activates dual-output boosters, which perform opposite actions (when one booster is supplying air, the other is exhausting air.) This "push-pull" action applies to a full differential (supply pressure to atmosphere) across the actuator to drive the valve to the position required by the control instrument signal.

Model 74 Valve Positioners can also be used for singleacting service on a spring-loaded actuator. In this case, one of the pilot-booster connections is plugged. See below for rotary-type actuators.

Specifications

Input Ranges

3-15, 3-9, 3-27, 0-15, and 0-30 psig including split ranges within these basic ranges

Valve-Stroke Ranges¹

1/4" minimum 48" maximum

Supply Pressure

Mounting Dimensions

Mounting Dimensions, Rotary Kit

The actuator extension shaft must be $0.3125" \pm 0.0010"$ and capable of withstanding 100 inch-pounds of torque (pinned assembly recommended).

Installer to drill and mount the base plate so that the appropriate feedback hole (clockwise or counter-clockwise rotation) is concentric with actuator extension shaft.

Introduction

Features & Benefits

- High signal sensitivity for demanding applications
- Simplified design ensures simplified operation
- Rugged. NEMA construction, with insensitivity to shock, vibration, and supply pressure variations accommodate operation in harsh industrial environments
- Choice of output capacities provides application versatility

Description

The Models 77 and 771 convert a DC millampere input signal to a pneumatic output signal directly proportional to the input. Their rugged design and ability to withstand shock and v bration allow them to be installed in even the harshest industrial environments.

Model 77 Current-to-Pneumatic Transducer

The Model 77 Current-to-Pneumatic Transducer, which was designed specifically for measuring circuits, converts the output of an electronic measuring device to a pneumatic signal for indication, recording, computation, or control, It can also be used to convert an electronic controller's signal to operate a final control element, such as a control valve circuit that requires a high degree of accuracy.

The Model 77 is typically used to signal a valve positioner. If it is used for direct-loading of valve actuators or other large volumes, a volume booster relay is required to minimize time lags and the effects of leakage.

Model 771 Current-to-Prieumatic Transducers

The Model 771 Current-to-Pneumatic Transducers were designed as a cost-effective valve service current-to-pneumatic transducer.

The Model 771 receives the output signal of an electronic device, such as a PID control function, and drives a control valve via the transducer until the control function is satisfied. For measuring circuits, or for control circuits requiring a higher degree of transducing accuracy, the Model 77 should be used,...

Because it's boosted output capacity minimizes time lags and the effects of leakage, the Model 771B should be used for direct-loading of valve actuators or other large volumes. If the valve actuator includes a valve positioner, a Model 771S should be used

Regulators Models 40, 41, and 42 Precision Pressure Regulators

Introduction

Features & Benefits

- Multi-stage, low-droop precision regulators maintain constant output over wide changes in flow and supply pressure
- Epoxy powder coat paint delivers improved corrosion resistance
- Wide selection of regulated pressures [1* to 450 psi] affords application versatility
- Patented Nullmatic pressure regulation system provides reliable maintenance-free operation

Description

The Models 40. 41, and 42 Precision Pressure Regulators control air pressures in applications where precise and dependable regulation is required, such as pneumatic instrument circuits, test stands, product on checking lixtures, and industrial air gages As such, they are suitable for deadend service, and flows up to a maximum of 110 scfm.

A unique, two-stage piloted design provides outstanding accuracy. Rugged construction—with no links, levers, pivots, or other friction-producing members—ensures reliable, maintenance-free operation. These features allow a regulator to maintain constant output pressure, regardless of even the w dest changes in flow or supply pressures. In fact, a regulator using a Model 40, 41, or 42 is practically a self-contained pressure controller operating its supplyplunger valve via a built-in, high gain pneumatic amplifier.

A fine-turn, precision screw is used to manually load the range spr ng, which sets the regulated pressure. When the adjusting knob is turned clockwise, the increased spring force is exerted on the top diaphragm assembly, decreasing the nozzle clearance and increas ng the pilot pressure. Because the source for pilot pressure is supply air flowing to the pilot pressure chamber through the restriction screw, the increased pilot pressure forces the exhaust diaphragm assembly downward. This act on closes the exhaust port, and contacts and moves the valve plunger, which opens the supply port. This increases the regulated output, which a so feeds back to the top diaphragm assembly. The regulator locks-up or throttles at the new output value when the leedback force of the top diaphragm assembly equals the range spring force.

A safety release valve is incorporated in the top diaphragm assembly of several models *l* operates if the regulated pressure increases 3 psig more than the set pressure and exhausts air through the atmospheric vent in the top housing. Overpressure causes the diaphragm to move upward, which opens the safety release valve

Specifications

Resolution Adjustment

Better than 0.03% of regulated output

Supply Pressure

Regulators Models 40, 41, and 42 Precision Pressure Regulators

Technical data

Air Consumption

See Graph 3

Drift Effect

See Graph 4

Exhaust-Flow Rate (at 25-psig setting)

Pressure rise of 0.25 psig will result from flow of: Model 40: 1.5 scfm Model 41: 2.4 scfm Model 42: 1.7 scfm

Maximum Flow Capacity

See Graph on page 4.4

Standard Mounting

In-line pipe or flush panel up to 1/4" thick (bushing for 3/4" thick panel is optional) Connections: (supply and outlet) Model 40: 1/4" NPT Model 41: 1/8" NPT Model 42: 1/2" NPT

Materials of Construction (materials in contact with regulated media)

Brass, stainless steel, Neoprene, aluminum, and zinc

Accessories

- P/N 2932-19 Mounting Bracket for surface mounting (Model 40 and Model 42)
- P/N 10963-73 Mounting Bracket for surface mounting (Model 41)
- P/N 3603-22 Locknut

Options

Air Loading
 Provision for supplementary air loading (100 psig max) in addition to spring loading
 Model 42: 1/4" NPT
 Model 41: 1/8" NPT
 Model 40-2: Not available
 Add [A] into the model number.
 Example: 40A15

Tapped Exhaust

Provision for piping exhaust flow away from the regulator Model 42: 1/8" NPT Model 40 & 41: Not available Add [E] into the model number. Example: 42E15

Deletion of Safety release Valve (SRV)

The SRV increases exhaust flow capacity when the regulator must exhaust large flows. Deletion of the SRV will improve drift characteristics (see Graph 4). The SRV is not available with the Seimens 41. It is standard with: Model 40: 2, 7, 15, 30, 50 & H50 pressure ranges Model 42: 15, 30, 50, H30, & H50 pressure ranges To delete the SRV, add an [X] into the model number. Example: 40X15

Regulators Models 40, 41, and 42 Precision Pressure Regulators

Technical data

Graph 1 Droop Effect

Test Procedure: Each 30-psig-range regulator was adjusted to 25 psig with 100 psig supply and no flow. Flow was increased to maximum capacity. All regulated pressure readings were taken at gauge connection in the body of the regulator.

Regulators Models 40, 41, and 42 Precision Pressure Regulators

Technical data

Graph 2 Maximum Air Flow, SCFM Delivered

Graph 3 Air Consumption

The Nullmatic regulator bleeds only the amount of air that passes through the pilot nozzle when there is no demand for output flow. The exhaust port starts to close as soon as the flow of regulated air is increased to the output, and it closes completely before the pilotplunger valve opens. Full pilot flow is then delivered to the output.

Graph 4 Drift Effect

Test Procedure: Regulators were set at 20 psig output with 100 psig air supply. Supply was turned off for one week, after which supply was turned on at time 0.

Regulators Models 40, 41, and 42 Precision Pressure Regulators

Mounting Dimensions

Regulators Model 91-HF Filter-Regulator

Introduction

Features & Benefits

- Stable output and repeatability provides constant control under variable flowrates and supply pressures.
- Corrosion-resistant construction aluminum die-castings are finished with frridite and baked epoxy paint
- Depth filter -unit comes equipped with high capacity 3 micron filter housed in drip-well
- Self-Relieving
- Low droop at high flow levels aspirator design helps maintain set pressure at higher flow levels

Tight shut-off - a soft, rubberized valve provides a positive shut-off and compensates for dirt and other foreign matter

Description

The Model 91-HF FilterRegulator is designed to provide clean, accurate air pressure to valve positioners, and other pneumatic controt equipment. The filter regulator has been proven to provide long lasting corrosion resistance in harsh industrial environments. The model 91-HF filter regulator is a quality unit that is ideal as an economical alternative for control of process applications.

The Model 91-HF is used extensively to supply air to pneumatic controllers, transmitters, transducers, valve positioners, air cylinders, and a wide range of pneumatic control systems.

Regulators Model 91-HF Filter-Regulator

Introduction

Mounting Dimensions

Regulators Model 2306 Instrument Air Filter

Introduction

Features & Benefits

- Solid brass construction delivers exceptional durability
- Natural wool filter medium provides unsurpassed coalescing action

Description

The Model 2306 instrument air filter is used to remove dirt, oil, water, and other impurities from an instrument-air supply. This highly efficient instrument-air filter uses the principle of coalescence to trap fine particles in a dripwell.

Air enters the filter through the intel connected to a cylindrical filter cartridge. After the air is filtered as it passes through the cartridge, it flows up between the cartridge and the outer housing.

As the air flows downward through the lamb's wool filtering medium, oil and water particles coalesce. The steady blow down action of the incoming air maintains high filtering efficiency by cleaning the filter cartridge continuously, while the natural force of gravity forces the coalesced materials to collect at the boltom of the dripwell.

A simple petcock permits the filter to be blown down periodically.

If accumulated dirt and scale make it necessary to replace the filter cartridge, the replacement may be effected without disturbing inlet and outlet connections by turning the housing out of the cap.

Specifications

Functional Specifications

Mounting Dimensions

1) Flow capacities at higher or lower supply pressures will vary in direct proportion to the absolute pressure.

Relays Series 61 Booster Relays

Introduction

Features & Benefits

- Force-balance principle produces a proportional output for pneumatic circuit flexibility
- Built-in stability needle vave on the 61H and 61VH minimizes piping needs
- Improved valve stroking speed for better process control
- Epoxy powder coaling provides improved corrosion resistance
- Accurate 1:1 signal relay provides pneumatic circuit design flexibility

Description

The Series 61 Booster Relays reproduce pneumatic signals in a 1:1 ratio for applications where input isolation or increased flow capacity are required. Various models are available to meet a wide range of requirements,

Valve Service

Model 61H High-Capacity Booster Relay

The Model 61H High-Capacity Booster Relay was designed to improve the stroking speed of large diaphragm valves. As such, it incorporates a stabilizing bypass needle valve between the input and output, eliminating the need for an external y piped bypass.

Model 61VH High-Capacity Booster Relay

The Model 61VH High-Capacity Booster Relay was designed for use on control valve actuators that require very fast strok ng speeds. As such, it incorporates a stabilizing bypass needle valve between the input and output, eliminating the need for an externally piped bypass.

Pneumatic Control

Model 61L Moderate Accuracy Booster Reay

The Model 61L Moderate Accuracy Booster Relay combines moderate accuracy with a moderate capacity (approximately 4.5 scfm output at 9 psi). Like the Model 61H relay, this instrument is used primarily in straight forward valvebooster applications.

Model 61F High Accuracy Booster Relay

The Model 61F High Accuracy Booster Relay via the sensitive preformed diaphragms in this relay provides greater accuracy in 1:1 transmission. Its output capacity is about 1/4 that of the Model 61L. As such, it is suitable for use in measuring circuits.

Model 61H is shown

Model 61FE Booster Relay

The Model 61FE Booster Relay is similar to the Model 61F; however, it also includes a 1/8° NPT connection for those appl cations where a tapped exhaust is required.

Operation

Input pressure, acting upon the effective area of the upper diaphragm, produces a force that is opposed by the output pressure exerted upon the effective area of the lower diaphragm. The opposing forces are in a direct 1:1 ratio. As such, any increase in the input pressure will depress the diaphragm assembly and open the pilot valve to admit a sufficient supply of air to the output. This re-balances the input pressure. A decrease in input pressure will cause the diaphragm assembly to lift off the exhaust port, which reduces the output and re-balances the input.

Relays Model 61H Booster Relays

Technical data

Relays 61VH Booster Relay

Technical data

Relays Series 62 Constant-Differential Relays

Introduction

Features & Benefits

- The ability to maintain constant-differential pressure drop across a built-in needle valve ensures a constant volumetric flow rate
- Maintains constant bubbling rate in liquid level applications, eliminating the problems of typical conventional bubbling systems
- The ability to produce reasonable purge rates eliminates the need for a supply regulator
- Epoxy powder coating provides improved corrosion resistance

Description

serve as air-flow controllers maintaining a constant air purge for each setting of an integral needle valve.

By maintaining a constant-differential pressure drop across a built-in needle valve (for any flow setting up to 2, 1 cu, 11, of air per hour), Series 62 Relays ensure a constant volumetric rate of flow, regardless of variations in process or supply pressure.

The constant-differential pressure across the built-in needle valve is regulated by a spring-toaded diaphragm. This diaphragm controls the action of the supply-port plunger, which automatically admits supply air to the needle valve at the required rate. Excess purge air bleeds to the atmosphere

Siemens constant-differential relays eliminate most of the problems encountered in conventional bubbling systems, because:

- Each relay holds the bubbling rate constant, thereby maintaining high measurement accuracy
- The differential pressure maintained across the needle valve is approximately 1-1/2 psi, which allows wider needle valve openings that are less subject to clogging
- Full supply pressure (up to 150 psig) is connected to the purge system for a greater margin of safety
- Ordinary air-fine impurities have no effect

In addition to the preceding advantages, the Series 62 Constant-Differential Relays ensure reasonable purge rates at all times, because they eliminate the need for a supply regulator. Another safety feature is the automatic exhaust, which bleeds off any excess air caused by the presence of foreign particles on the pilot seat of the supply-port plunger.

Specifications

Supply Pressure

Relays Series 63 Constant Differential Flow Controllers

Introduction

Features & Benefits

- Versatile and design accommodates liquids or gases and wide range of OEM needs
- Powder coating provides improved corrosion resistance

Description

The Series 63 Constant-Differential Relays are used in conjunction with an external needle vative to provide constant volume flow rates of liquids or gases over a continuously adjustable range.

For gas flow applications, compressibility must be considered if a constant mass flow is desired. Therefore, models are available for constant upstream or downstream reference pressure.

For liquids, which are not compressible, the constant volume flow will also be a constant mass flow, regardless of upstream or downstream pressures. As such, mass flow is independent of pressure changes.

The relay's needle valve determines rangeability and capacity. Four models are available.

Maximum at critical flow ¹	SCCM = 2000 Pu $\sqrt{\frac{1 \times 530}{SG}}$	SCCM = 200 Pu $\sqrt{\frac{1 \times 530}{SG} \frac{1}{T}}$
Minimum controllable flow	Approximately 1/200 of maximum	$SCCM = 8 \frac{\Delta P (Pu + Pd)}{Rv T}$
	LIQUID FLOW-CAPACITY	
Maximum	$CCM = 470 \sqrt{\frac{\Delta P}{SG}}$	$CCM = 47 \sqrt{\frac{\Delta P}{SG}}$
Minimum	Approximately 1/200 of maximum	$CCM = .06 \frac{\Delta P}{Rv}$
NEEDI	LE VALVE SIZING (With 3 psi drop across	s valve)
For any liquid	$\frac{Kn}{\sqrt{\frac{6550}{\frac{1}{SG}}}}$	
For any gas	$Kn = \frac{SCCM}{\sqrt{9000} \frac{1 \times Pn}{\overline{SG}}}$	× 530 T

Mounting Dimensions

Model	DIM. A	DIM. B
63BU	2 1/8"	3 1/4"
63BUL	2 1/8"	3 1/4"
63SU	2 3/8"	3 1/2"
63SUL	2 3/8"	3 1/2"
63BD	2 1/8"	3 1/2"
63BDL	2 1/8"	3 1/2"
63SD	2 3/8"	3 3/4"
63SDL	2 3/8"	3 3/4"

Note: Dimensions for 63D are mirrored from 63U

t) Critical flow exists when the ratio of upstream pressure (Pu) to downstream pressure (Pd) is equal to or fess than approximately 0.53

Relays Model 66 Amplifying and Reducing Relays

Introdction

Features & Benefits

- Pneumatic signal conditioning provides control circuit design flexibility
- Powder coating provides improved corrosion resistance

Description

The Model 66 Amplifying and Reducing Relays are used to increase or decrease control-circuit pressure signals.

Its input pressure, acting upon the effective area of the top diaphragm, produces a force that is balanced by the force produced by the output pressure applied over the effective area of the lower diaphragm. Any imbalance in these opposing forces will operate the plunger, increasing or decreasing air supply to the output chamber. (The amplifying or reducing ratio is fixed by the ratio of input-to-output diaphragm areas.)

An increase in input opens the pilot valve to admit supply air directly to the output. A decrease in input opens the exhaust port to exhaust air from the output.

Specifications

Function Specifications

Supply Pressure

Normal: 20 psig (140 kPa) Maximum: 80 psig (550 kPa) Minimum: 1 psi (7 kPa) above maximum required output

Range Limits

80 psig max. for input or output - whichever limits

Overrange Limits

100 psig (690 kPa) at any connection

Maximum Output Pressure

Wilhin 0.1 psi (0.7 kPa) of supply

Minimum Output Pressure

Less than 0.4 psig (3 kPa) with zero output

Ratio Accuracy

Within 1% of nornal ratio

Linearity

±1% of output span Reproducibility Within 0.02 psi (0.15 kPa) OperatingTemperature -40 10 180°F (-4010 82°C) Performance Specifications **Response Level** 0.2° H,O (5 mm H,O) Zero Error 668A6: ±0.36 psi (2.5 kPa) All Others: ±0.24 (1.5 kPa) **Flow Capacity** 2.2 scim minimum **Air Consumption** 0.12 sc/m maximum **Mechanical Specifications** Materials of Construction Brass, aluminum, stainless steel, and Neoprene

Relays Model 66 Amplifying Relay

Technical data

Relays Model 661 Amplifying Relays with Bias

Introduction

Features & Benefits

Fixed-gain force and bias adjustment mechanisms amplify pneumatic instrument signals to provide control circuit design flexibility

Description

Series 661 Amplifying Relays are lixed-gain force-balance instruments, which incorporate bias adjustment that amplify pneumatic instrument signals. For example, a 3-15 psi signal can be amplified to operate a 3-27 psi control valve.

The input pressure signal, acting upon the effect ve area of the upper diaphragm, produces a force opposed by the force produced by the output pressure applied over the effective area of the lower diaphragm and by a manually-set (constant) spring force. Any inbalance in the opposing forces will operate the plot valve to throttle supply air to change the output until rebalance is achieved.

Plus or minus biasing of the input signal is accomplished by changing the setting of the upper biasing spring, which alters the net spring force on the diaphragm assembly.

Specifications

Supply Pressure

Normal: 20 psig (140 kPa) Maximum: 80 psig (550 kPa) Minimum: 1 psi (7 kPa) above maximum required output

Range Limits

80 psig max, for input or output (whichever limits)

Overrange Limits

100 psig (690 kPa) at any connection

Minimum Output Pressure

Less than 0.1 psi (0.7 kPa)

Ratio Accuracy

Within 1% of normal ratio

Linearity

±1% of output span

Reproducibility Within 0.1% of output span Response Leve! 0 2' H₂O (5 mm H₂O) Bias Range Direct Acting: +30 psi to -15 psi (210 to -100 kPa) Flow Capacity 2.2 scfm minimum (62.3 SDM¹/M) Air Consumption 0.15 scfm maximum (4.25 SDM³/M) Ambient Teperature Limits -40 to 180° F (-40 to 82° C) Materials of Construction Brass. a uminum, sta nless steel, and Neoprene
