Safety notices

This manual contains information that you should observe to ensure your own personal safety and prevent material damage. The notices referring to your personal safety are highlighted in the manual by a warning triangle; notices that relate to material damage only have no warning triangle. The notices shown below are graded according to the level of hazard (from most to least hazardous):

Danger
Indicates that death or serious injury will result if proper precautions are not taken.

Warning
Indicates that death or serious injury may result if proper precautions are not taken.

Caution
With a warning triangle, indicates that minor injury may result if proper precautions are not taken.

Caution
Without a warning triangle, indicates that material damage may result if proper precautions are not taken.

Notice
Indicates that an undesirable result or state may occur if the corresponding instructions are not observed.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A warning notice with a warning triangle indicating possible personal injury may also include a warning relating to material damage.

Qualified Personnel

The associated device/system may only be installed and operated in conjunction with this documentation. The device/system may only be commissioned and operated by qualified personnel. For the purpose of the safety notices in this documentation, “qualified personnel” are those authorized to commission, ground, and label equipment, systems, and circuits in accordance with established safety procedures.

Proper Use of Siemens Products

Please observe the following:

Warning
Siemens products are only permitted to be used for the applications specified in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. To ensure proper and safe operation of these products, they must be correctly transported, stored, set up, mounted, installed, commissioned, operated, and maintained. The permissible ambient conditions must be met. Information in the associated documentation must be observed.

Preface

SINAMICS documentation

The SINAMICS documentation is organized in the following categories:

- General documentation/catalogs
- Manufacturer/service documentation

More information

Information on the following topics is available under the link:

- Ordering documentation/overview of documentation
- Additional links to download documents
- Using documentation online (find and search in manuals/information).

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Information on how to produce individual contents for your own machine documentation based on Siemens contents is available under the link:

http://www.siemens.com/mdm

Training

Information about SITRAIN (Siemens Training on products, systems and solutions for automation) is available under the following link:

Target group

This documentation is aimed at machine manufacturers, commissioning engineers, and service personnel who use SINAMICS.

Benefits

This documentation contains the comprehensive information about parameters, function diagrams and faults and alarms required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.
Standard scope

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied.

- Other functions not described in this documentation might be able to be executed in the drive system. This does not, however, represent an obligation to supply functions of this kind when new equipment is delivered or during servicing.
- The documentation can also contain descriptions of functions that are not available in a particular product version of the drive system. The functionalities of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information on all of the product types. This documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

Search tools

The following guides are provided to help you locate information in this manual:

1. Table of contents
   - General table of contents for the complete manual (after the preface).
   - Table of contents for function diagrams (Section 2.1).
2. List of abbreviations
3. List of references
4. Index

Technical Support

Country-specific telephone numbers for technical support are provided on the Internet at:

1.1 Overview of parameters

1.1.1 Explanation of parameter list

Basic structure of parameter descriptions

The data in the following example has been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The parameter list (See Section 1.2) is structured as follows:

--- Start of example ---

<table>
<thead>
<tr>
<th>Drive object (function module)</th>
<th>BICO: Long parameter name / short parameter name</th>
<th>Calculated: CALC_MOD_REG</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: C1(x), C2(x), U, T</td>
<td>Unsigned32/Integer16</td>
<td>Dynamic index: CDS, p0170</td>

| Note: | Information which might be useful. |

--- End of example ---
### Parameter number

The parameter number is made up of a "p" or "r", followed by the parameter number and the index (optional).

Examples of representation in the parameter list:

- **p...**  Adjustable parameter (read and write parameter)
- **r...**  Display parameter (read-only)
- **p0918**  Adjustable parameter 918
- **p0099[0...3]**  Adjustable parameter 99, indices 0 to 3
- **p1001[0...n]**  Adjustable parameter 1001, indices 0 to n (n = configurable)
- **r0944**  Display parameter 944

Other examples of the notation used in the documentation:

- **p1070[1]**  Adjustable parameter 1070, index 1
- **p2098[1].3**  Adjustable parameter 2098, index 1 bit 3
- **r0945[2](3)**  Display parameter 945, index 2 of drive object 3
- **p0795.4**  Adjustable parameter 795, bit 4
- **r2129.0...15**  Display parameter 2129 with bit array (maximum 16 bits)

The following applies to adjustable parameters:

The parameter value as delivered is specified under "Factory setting" with the relevant unit in square brackets. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions or parameters:

- Execute macros
  - p0015, p0700, p1000, p1500
- Set PROFIBUS telegram (BICO interconnections)
  - p0922
- Set component lists
  - p0230, p0300, p0301, p0400
- Automatic calculation and pre-assignment
  - p0112, p0340, p0578, p3900
- Restore factory settings
  - p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square brackets.
Parameters

Overview of parameters

Note:
The parameter list can contain parameters that are not visible in the expert lists of the respective commissioning software (e.g. parameters for trace functions).

BICO: Long parameter name / short parameter name

The following abbreviations can appear in front of the parameter name:

- **BI**: Binector Input
  This parameter is used for selecting the source of a digital signal.

- **BO**: Binector Output
  This parameter is available as a digital signal for interconnection with other parameters.

- **CI**: Connector Input
  This parameter is used for selecting the source of an "analog" signal.

- **CO**: Connector Output
  This parameter is available as an "analog" signal for interconnection with other parameters.

- **CO/BO**: Connector/Binector Output
  This parameter is available as an "analog" and digital signal for interconnection with other parameters.

Note:
A connector input (CI) cannot be just interconnected with any connector output (CO, signal source).
When interconnecting a connector input using the commissioning software, only the corresponding possible signal sources are listed.
Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

The parameter list specifies the associated drive object and function module for each individual parameter.

Examples:

- p1070 CI: Main setpoint
  VECTOR
  The parameter is only available with the VECTOR drive object, regardless of which function modules have been activated.

- p1055 BI: Jog bit 0
  VECTOR
  The parameter is available with the VECTOR drive object, regardless of which function modules have been activated (i.e. it is available with every activated function module belonging to the drive object).

A parameter can belong to one, several or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

<table>
<thead>
<tr>
<th>Drive object (function module)</th>

</tbody>
</table>

**Note:**

The drive object type is used to identify the drive objects in the drive system (e.g. r0107, r0975[1]).
Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C1(x), C2(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive object state and that the change will not take effect until the object switches to another state. One or more states are possible.

The following states may be specified:

- **C1(x) Device commissioning**
  - **C1: Commissioning 1**
  - Device commissioning is in progress (p0009 > 0).
  - Pulses cannot be enabled.
  - The parameter can only be changed when the device commissioning settings (p0009 > 0) are as follows:
    - C1: Can be changed for all settings p0009 > 0.
    - C1(x): Can only be changed when the settings are p0009 = x
  - A modified parameter value does not take effect until device commissioning mode is exited with p0009 = 0.

- **C2(x) Drive object commissioning**
  - **C2: Commissioning 2**
  - Drive commissioning is in progress (p0009 = 0 and p0010 > 0).
  - Pulses cannot be enabled.
  - The parameter can only be changed when the drive commissioning settings (p0010 > 0) are as follows:
    - C2: Can be changed for all settings p0010 > 0
    - C2(x): Can only be changed when the settings are p0010 = x
  - A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.

- **U Operation**
  - **U: Run**
  - Pulses are enabled.

- **T Ready for operation**
  - **T: Ready to run**
  - The pulses are not enabled and the status "C1(x)" or "C2(x)" is not active.

**Note:**

Parameter p0009 is CU-specific (available on the Control Unit).

Parameter p0010 is drive-specific (available for each drive object).

The operating state of individual drive objects is displayed in r0002.
Calculated

Specifies whether the parameter is influenced by automatic calculations. The calculation attribute defines which activities influence the parameter. The following attributes apply:

- **CALC_MOD_ALL**
  - p0340 = 1
  - Project download with commissioning software and send from p0340 = 3
- **CALC_MOD_CON**
  - p0340 = 1, 3, 4
- **CALC_MOD_EQU**
  - p0340 = 1, 2
- **CALC_MOD_LIM_REF**
  - p0340 = 1, 3, 5
  - p0578 = 1
- **CALC_MOD_REG**
  - p0340 = 1, 3

**Note:**
For p3900 > 0, p0340 = 1 is also called automatically.
After p1910 = 1, p0340 = 3 is also called automatically.

Access level

Specifies the access level required to be able to display and change the relevant parameter. The required access level can be set using p0003. The system uses the following access levels:

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service
  Parameters with this access level are password protected.

**Note:**
Parameter p0003 is CU-specific (available on the Control Unit).
**Data type**

The information on the data type can consist of the following two items (separated by a slash):

- **First item**
  Data type of the parameter.
- **Second item (for binector or connector input only)**
  Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

- **I8** Integer8 8-bit integer
- **I16** Integer16 16-bit integer
- **I32** Integer32 32-bit integer
- **U8** Unsigned8 8 bits without sign
- **U16** Unsigned16 16 bits without sign
- **U32** Unsigned32 32 bits without sign
- **Float** FloatingPoint32 32-bit floating-point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when BICO interconnections are established:

<table>
<thead>
<tr>
<th>BICO input parameter</th>
<th>CI parameter</th>
<th>BI parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Unssigned32/Integer16</td>
<td>Unssigned32/Integer32</td>
</tr>
<tr>
<td>CO: Unsigned8</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CO: Unsigned16</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CO: Integer16</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CO: Unsigned32</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CO: Integer32</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CO: FloatingPoint32</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>BO: Unsigned8</td>
<td>–</td>
<td>–</td>
</tr>
<tr>
<td>BO: Unsigned16</td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

Legend:  
- x: BICO interconnection permitted  
- -: BICO interconnection not permitted  

\(^1\) Exception:

BICO input parameters with data type "Unsigned32/FloatingPoint32" can also be interconnected with the following BICO output parameters, although these are not of the "FloatingPoint32" data type:

- CO: r8850, CO: r8860, CO: r2050, CO: r2060
Dynamic index

For parameters with a dynamic index [0…n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

This field can contain the following information:

- "CDS, p0170" (Command Data Set, CDS count)
  
  Example:
  
  p1070[0] → main setpoint [command data set 0]
  p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
- "EDS, p0140" (Encoder Data Set, EDS count)
- "MDS, p0130" (Motor Data Set, MDS count)
- "PDS, p0120" (Power unit Data Set, PDS count)
- "p2615" (traversing blocks count)
Parameters

Overview of parameters

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

Example:

Function diagram: 3060.3  3060: Function diagram number
3: Signal path (optional)

P group (refers only to access via BOP (Basic Operator Panel))

Specifies the functional group to which the parameter belongs. The required parameter group can be set via p0004.

Note:

Parameter p0004 is CU-specific (available on the Control Unit).

Unit, unit group, and unit selection

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be switched over.

Example:

Unit group: 7_1, unit selection: p0505

The parameter belongs to unit group 7_1 and the unit can be switched over using p0505.

All the potential unit groups and possible unit selections are listed below.

SINAMICS G130/G150 List Manual (LH2), 01/2012, A5E03263479A
**Overview of parameters**

### Parameter values

<table>
<thead>
<tr>
<th>Min</th>
<th>Maximum value of the parameter [unit]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max</td>
<td>Value when shipped [unit]</td>
</tr>
</tbody>
</table>

In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0]. A different value may be displayed for certain parameters (e.g. p1800) during first commissioning.

**Reason:**

The setting for these parameters is determined by the operating environment of the Control Unit (e.g. depending on the device type, macro, or power unit).

---

**Note:**

For SINAMICS G130/G150, the macros and their settings are provided in the following documentation:

SINAMICS G130/G150 Operating Instructions

---

### Not for motor type

Specifies for which motor type this parameter has no significance.

- ASM: Induction motor
- FEM: Separately excited synchronous motor
- PEM: Permanent-magnet synchronous motor
- REL: Reluctance motor / SIEMOSYN motor

---

### Scaling

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100%
Parameters

Overview of parameters

**Expert list**

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

1: Parameter is available in the expert list.

0: Parameter is not available in the expert list.

**Notice:**

Users assume full responsibility for using parameters marked "Expert list: 0" (parameter does not exist in the expert list).

These parameters and their functionalities have not been tested and no further user documentation is available for them (e.g., description of functions). Moreover, no support is provided for these parameters by "Technical Support" (hotline).

**Description**

Explanation of the function of a parameter.

**Values**

List of the possible values of a parameter.

**Recommendation**

Information about recommended settings.

**Index**

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) for indexed adjustable parameters:

- **Min, Max:**
  The adjustment range and unit apply to all indices.

- **Factory setting:**
  When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

  When the indices have different factory settings, they are all listed individually with the unit.
Bit array

For parameters with bit arrays, the following information is provided about each bit:

- Bit number and signal name
- Meaning with signal states 0 and 1
- Function diagram (optional)
  
  The signal is shown on this function diagram.

Dependency

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

See also: List of other relevant parameters to be considered.

Safety notices

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

Danger

The description of this safety notice can be found at the beginning of this manual (see Safety notices).

Warning

The description of this safety notice can be found at the beginning of this manual (see Safety notices).

Caution

The description of this safety notice can be found at the beginning of this manual (see Safety notices).

Caution

The description of this safety notice can be found at the beginning of this manual (see Safety notices).

Notice

The description of this safety notice can be found at the beginning of this manual (see Safety notices).

Note

Information that the user may find useful.
1.1.2 Number ranges of parameters

Note:
The following number ranges represent an overview for all of the parameters available for the SINAMICS drive family.
The parameters for the product described in this List Manual are described in detail in Section 1.2.

Parameters are grouped into the following number ranges:

Table 1-7 Number ranges for SINAMICS

## 1.2 List of parameters

### r0002 Infeed operating display / INF op_display

**B_INF**

- **Can be changed:** -
- **Data type:** Integer16
- **P-Group:** -
- **Min:** 0
- **Max:** 250

**Description:** Operating display for the infeed.

**Value:**
- 0: Operation - everything enabled
- 31: Rdy for sw on - pre-chrg running (p0857)
- 32: Ready for switching on - set "ON/OFF1" = "0/1" (p0840)
- 35: Switching on inhibited - carry out first commissioning (p0010)
- 41: Switching on inhibited - set "ON/OFF1" = "0" (p0840)
- 42: Switching on inhibited - set "OC/OFF2" = "1" (p0844, p0845)
- 44: Switching on inhibited - connect 24 V to terminal EP (hardware)
- 45: Switching on inhibited - remove fault cause, acknowledge fault
- 46: Switching on inhibited - exit comm mode (p0009, p0010)
- 60: Infeed de-activated/not operational
- 70: Initialization

**Dependency:** Refer to: r0046

**Notice:** For several missing enable signals, the corresponding value with the highest number is displayed.

**Note:**
- OC: Operating condition
- COMM: Commissioning

### r0002 Control Unit operating display / CU op_display

**CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**

- **Can be changed:** -
- **Data type:** Integer16
- **P-Group:** -
- **Min:** 0
- **Max:** 117

**Description:** Operating display for the Control Unit (CU).

**Value:**
- 0: Operation
- 10: Ready
- 20: Wait for run-up
- 25: Wait for automatic FW update of DRIVE-CLiQ components
- 31: Commissioning software download active
- 33: Remove/acknowledge topology error
- 35: Carry out first commissioning
- 70: Initialization
- 80: Reset active
- 99: Internal software error
- 101: Specify topology
- 111: Insert drive object
- 112: Delete drive object
- 113: Change drive object number
- 114: Change component number
- 115: Run parameter download
- 117: Delete component

**Notice:** For several missing enable signals, the corresponding value with the highest number is displayed.
### r0002 Encoder DO operating display / Enc DO op_display

<table>
<thead>
<tr>
<th>ENC</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level: 1</th>
</tr>
</thead>
<tbody>

<td>Units group: -</td>
<td>Unit selection: -</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:** Operating display for encoder drive object

**Value:**
- 0: Encoder in cyclic operation
- 35: Carry out first commissioning (p0010)
- 45: Remove fault cause, acknowledge fault
- 46: Exit commissioning mode (p0009, p0010)
- 60: Encoder de-activated
- 200: Wait for booting/partial booting
- 250: Device signals a topology error

**Notice:** For several missing enable signals, the corresponding value with the highest number is displayed.

### r0002 DRIVE-CLiQ Hub Module operating display / Hub op_display

<table>
<thead>
<tr>

### p0003  BOP access level / BOP_acc_level

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Sets the access level for reading and writing parameters via the Basic Operator Panel (BOP).</td>
</tr>
</tbody>
</table>
## List of parameters

### Parameters

- **Value:**
  - 1: Standard
  - 2: Extended
  - 3: Expert
  - 4: Service

### Note:
- Access level 1 (standard):
  - Parameters for simplest possible operations.
- Access level 2 (extended):
  - Parameters to operate the basic functions of the drive unit.
- Access level 3 (experts):
  - Expert know-how is required for these parameters (e.g. BICO parameterization).
- Access level 4 (service):
  - For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

### Description:
Sets the display filter for parameters with the Basic Operator Panel (BOP).

### p0004

#### BOP display filter / BOP disp_filter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN</td>
<td>C2(1), U, T</td>
<td>-</td>
<td>1</td>
</tr>
</tbody>
</table>

- **Data type:** Integer16
- **Dynamic index:** -
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1
- **Min:** 0
- **Max:** 99
- **Factory setting:** 0

### Dependency:
Refer to: p0003

### Notice:
The display filter via p0004 provides precise filtering and displays the corresponding parameters only when p0009 and p0010 = 0.

### Note:
The set access level via p0003 is also relevant for the display filter via p0004.

Examples (assumption: p0009 = p0010 = 0):
- **p0003 = 1, p0004 = 3**
  - Only the parameters for the motor with access level 1 are displayed.
- **p0003 = 2, p0004 = 3**
  - Only the parameters for the motor with access levels 1 and 2 are displayed.
### BOP operating display selection / BOP op_disp sel

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Function</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0005[0...1]</td>
<td>All objects</td>
<td>2</td>
</tr>
</tbody>
</table>

**Description:**
Sets the parameter number and parameter index for display for p0006 = 2, 4 for the Basic Operator Panel (BOP).

**Examples for the SERVO drive object:**
- p0005[0] = 21, p0005[1] = 0: Actual speed smoothed (r0021)
- p0005[0] = 25, p0005[1] = 0: Output voltage smoothed (r0025)

**Index:**
- [0] = Parameter number
- [1] = Parameter index

**Dependency:**
Refer to: p0006

**Note:**
Procedure:
1. The parameter number to be displayed should be set in index 0. Only the monitoring parameters (read-only parameters) can be set that actually exist for the actual drive object. If the set parameter number is not indexed, or if there is an index in index 1 that lies outside the valid range of the set parameter, then index 1 is automatically set to 0.
2. The index that belongs to the parameter set in index 0 should be set in index 1. The permissible changes in index 1 always depend on the parameter number set in index 0.

### BOP operating display mode / BOP op_disp mode

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Function</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0006</td>
<td>B_INF, VECTOR_G</td>
<td>3</td>
</tr>
</tbody>
</table>

**Description:**
Sets the mode of the operating display for the Basic Operator Panel (BOP) in the operating states "ready for operation" and "operation".

**Value:**
- 0: Operation → r0021, otherwise r0020 ↔ r0021
- 1: Operation → r0021, otherwise r0020
- 2: Operation → p0005, otherwise p0005 ↔ r0020
- 3: Operation → r0002, otherwise r0002 ↔ r0020
- 4: p0005

**Dependency:**
Refer to: p0005

**Note:**
Mode 0 ... 3 can only be selected if also r0020, r0021 are available on the drive object. Mode 4 is available for all drive objects.

**Parameters**

**List of parameters**

29: Device download
30: Parameter reset
50: OA application configuration
55: OA application installation
101: Topology input
111: Insert drive object
112: Delete drive object
113: Change drive object number
114: Change component number
115: Parameter download
117: Delete component
10000: Ready (asynchron)

**Notice:**
For p0009 = 10000 the following applies:
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**
The drives can only be powered up outside the device commissioning (the inverter enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010).

p0009 = 1: Device configuration
At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110).

p0009 = 2: Defines the drive type / function module
In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]).

p0009 = 3: Drive basic configuration
In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180).

p0009 = 4: Data set basic configuration
In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...).

p0009 = 29: Device download
If a download is made using the commissioning software, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.

p0009 = 30: Parameter reset
In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.

p0009 = 50: OA application configuration
In this state, after the device has been commissioned for the first time, changes can be made for the individual drive objects regarding the activity (p4956) of the OA applications.

p0009 = 55: OA application installation
OA applications can be installed and/or uninstalled in this state.

p0009 = 101: Topology input
In this state, the DRIVE-CLIQ target topology can be entered using p9902 and p9903.

p0009 = 111: Insert drive object
This state allows a new drive object to be inserted using p9911.

p0009 = 112: Delete drive object
This state allows existing drive objects to be deleted using p9912 after the device has been commissioned for the first time.

p0009 = 113: Change drive object number
This state allows the drive object number of existing drive objects to be changed using p9913 after the device has been commissioned for the first time.
p0009 = 114: Change component number
This state allows the component number of existing components to be changed using p9914 after the device has been commissioned for the first time.

p0009 = 115: Parameter download
This state allows the complete device and drive commissioning using the parameter services.

p0009 = 117: Delete component
This state allows components to be deleted using p9917 after the device has been commissioned for the first time.

<table>
<thead>
<tr>
<th>p0010</th>
<th>Infeed commissioning parameter filter / INF comm par_filt</th>
</tr>
</thead>

<tr>
<td>Min</td>
<td>Max</td>
</tr>
<tr>
<td>0</td>
<td>30</td>
</tr>
</tbody>
</table>

**Description:**
Sets the parameter filter to commission an infeed unit.
Setting this parameter filters out the parameters that can be written into in the various commissioning steps.

**Value:**
- 0: Ready
- 1: Quick commissioning
- 2: Power unit commissioning
- 5: Technological application/units
- 29: Only Siemens int
- 30: Parameter reset

**Note:**
The drive can only be powered up outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0.
For p3900 not equal to 0, at the end of the quick commissioning, this parameter is automatically reset to 0.
Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1.

<table>

|           | 29 | Only Siemens int |   |
|           | 30 | Parameter reset |   |
|           | **Dependency:** | Refer to: p0970 |   |
|           | **Note:** | Only the following values are possible: p0010 = 0, 30 |
|           | Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1. |   |
|           | p0010 | TM54F commissioning parameter filter / TM54F com par_filt | **Value:**
|           | Can be changed: C2(1), T | Calculated: - | Access level: 1 |
|           | Data type: Integer16 | Dynamic index: - | Func. diagram: 2847 |
|           | P-Group: - | Units group: - | Unit selection: - |
|           | Not for motor type: - | Scaling: - | Expert list: 1 |
|           | Min | Max | 0 |
|           | 95 | 0 |   |
|           | **Description:** | Sets the parameter filter for commissioning a Terminal Module 54F (TM54F). Setting this parameter filters out the parameters that can be written into in the various commissioning steps. For the BOP, this setting also causes the read access operations to be filtered. |
### p0010 Drive commissioning parameter filter / Drv comm. par_filt

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: C2(1), T</th>
<th>Calculated: -</th>
<th>Access level: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: Integer16</td>
<td>Dynamic index: -</td>
<td>Func. diagram: 2800, 2846</td>
<td></td>
</tr>
<tr>
<td>P-Group: -</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the parameter filter to commission a drive.

**Value:**
- 0: Ready
- 1: Quick commissioning
- 2: Power unit commissioning
- 3: Motor commissioning
- 4: Encoder commissioning
- 5: Technological application/units
- 15: Data sets
- 17: Basic positioner commissioning
- 25: Position control commissioning
- 29: Only Siemens int
- 30: Parameter reset
- 95: Safety Integrated commissioning
- 10000: Ready with immediate feedback signal

**Notice:**
*For p0010 = 10000 the following applies:*
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Procedure for "Reset parameter":** Set p0010 to 30 and p0970 to 1.

**Note:**
- The drive can only be powered up outside the drive commissioning (inverter enable). To realize this, this parameter must be set to 0.
- By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0.
- Procedure for "Reset parameter": Set p0010 to 30 and p0970 to 1.
- p0010 = 10000 corresponds to p0010 = 0. Unlike with p0010 = 0, the parameter modification is applied immediately and the calculations are made in the background. Further parameter modifications cannot be made while the calculations are being performed.

### p0011 BOP password entry (p0013) / BOP passw ent p13

<table>
<thead>
<tr>
<th></th>

<td>Unit selection: -</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the password for the Basic Operator Panel (BOP).

**Value:**
- 0: Ready
- 10000: Ready with immediate feedback signal

**Dependency:**
Refer to: p0012, p0013
### p0012 BOP password acknowledgement (p0013) / BOP passw ackn p13

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0012</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16  
**P-Group:** Functions  
**Not for motor type:** -  
**Min:** 0  
**Max:** 65535  
**Factory setting:** 0

**Description:** Acknowledges the password for the Basic Operator Panel (BOP).

**Dependency:** Refer to: p0011, p0013

### p0013[0...49] BOP user-defined list / BOP list

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0013</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16  
**P-Group:** Functions  
**Not for motor type:** -  
**Min:** 0  
**Max:** 65535  
**Factory setting:** 0

**Description:** Sets the required parameters to read and write via the Basic Operator Panel (BOP).

**Activation:**
1. p0003 = 3 (expert).
2. p0013[0...49] = requested parameter number
3. If required, enter p0011 = password in order to prevent non-authorized de-activation.
4. p0016 = 1 --> activates the selected user-defined list.

**De-activation/change:**
1. p0003 = 3 (expert).
2. If required, p0012 = p0011, in order to be authorized to change or de-activate the list.
3. If required p0013[0...49] = required parameter number.
4. p0016 = 1 --> activates the modified user-defined list.
5. p0003 = 0 --> de-activates the user-defined list.

**Dependency:** Refer to: p0009, p0011, p0012, p0976

**Note:**
- The following parameters can be read and written on the Control Unit drive object:  
  - p0003 (access stage)
  - p0009 (device commissioning, parameter filter)
  - p0012 (BOP password acknowledgement (p0013))
- The following applies for the user-defined list:
  - password protection is only available on the drive object Control Unit and is valid for all of the drive objects.
  - p0013 cannot be included in the user-defined list for all drive objects.
  - p0003, p0009, p0011, p0012, p0976 cannot, for the drive object Control Unit, be included in the user-defined list.
  - the user-defined list can be cleared and de-activated “restore factory setting”.
- A value of 0 means: Entry is empty.

### p0015 Macro drive object / Macro DO

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0015</td>
<td>C2(1)</td>

</tbody>
</table>

**Data type:** Unsigned32  
**P-Group:** Commands  
**Not for motor type:** -  
**Min:** 0  
**Max:** 999999  
**Factory setting:** 0

**Description:** Runs the corresponding macro files.

**The selected macro file must be available on the memory card/device memory.**

**Example:**
- p0015 = 6 --> the macro file PM000006.ACX is run.
Dependency: Refer to: p0700, p1000, p1500, r8570

Caution: When executing a specific macro, the corresponding programmed settings are made and become active.

Notice: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK_IBN group!

Note: The macros in the specified directory are displayed in r8570. r8570 is not in the expert list of the commissioning software.

Macros available as standard are described in the technical documentation of the particular product.

The parameter is not influenced by setting the factory setting.

### p0015 Macro drive unit / Macro drv unit

<table>
<thead>
<tr>

</tr>
<tr>
<td>14</td>
<td>Motorized potentiometer lower</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:**
Displays the control word for the Basic Operator Panel (BOP).

**Dependency:**
Refer to: r0060

**Note:**
Smoothing time constant = 100 ms
The signal is not suitable as a process quantity and may only be used as a display quantity.
The speed setpoint is available smoothed (r0020) and unsmoothed (r0060).

**r0020**
**Speed setpoint smoothed / n_set smth**

**Vector G**

**Can be changed:**

**Calculated:**

**Access level:** 2

**Data type:** FloatingPoint32

**Dynamic index:** -

**Func. diagram:** 5020, 6799

**P-Group:** Displays, signals

**Units group:** 3_1

**Unit selection:** p0505

**Not for motor type:**

**Scaling:** p2000

**Expert list:** 1

**Min**

**Max**

**Factory setting**

**Description:**
Displays the currently smoothed speed setpoint at the input of the speed controller or U/f characteristic (after the interpolator).

**Dependency:**
Refer to: r0060

**Note:**
Smoothing time constant = 100 ms
The signal is not suitable as a process quantity and may only be used as a display quantity.
The speed setpoint is available smoothed (r0020) and unsmoothed (r0060).

**r0021**
**CO: Actual speed smoothed / n_act smooth**

**Vector G**

**Can be changed:**

**Calculated:**

**Access level:** 2

**Data type:** FloatingPoint32

**Dynamic index:** -

**Func. diagram:** 4710, 6799

**P-Group:** Displays, signals

**Units group:** 3_1

**Unit selection:** p0505

**Not for motor type:**

**Scaling:** p2000

**Expert list:** 1

**Min**

**Max**

**Factory setting**

**Description:**
Displays the smoothed actual value of the motor speed.

**Dependency:**
Refer to: r0022, r0063

**Note:**
Smoothing time constant = 100 ms
The signal is not suitable as a process quantity and may only be used as a display quantity.
The speed setpoint is available smoothed (r0021, r0022) and unsmoothed (r0063).
For U/f control, the mechanical speed calculated from the output frequency and the slip is shown in r0063[2] even if slip compensation is deactivated.
### r0022
**Speed actual value rpm smoothed / n_act rpm smooth**

<table>
<thead>
<tr>
<th>Vector</th>
<th>Description</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>VECTOR_G</td>
<td>Displays the smoothed actual value of the motor speed.</td>
<td>-</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Dependency:** r0021, r0063

**Note:**
- Smoothing time constant = 100 ms
- The signal is not suitable as a process quantity and may only be used as a display quantity.

For U/f control and when slip compensation is deactivated (see p1335), the synchronous speed to the output frequency is shown in r0022.

For U/f control, the mechanical speed calculated from the output frequency and the slip is shown in r0063[2] even if slip compensation is deactivated.

### r0024
**Output frequency smoothed / f_outp smooth**

<table>
<thead>

Unit selection: p0505

Not for motor type: -  
Scaling: r2004  
Expert list: 1

Min - [kW]  
Max - [kW]  
Factory setting

**Description:**
Displays the smoothed actual value of the active power.

**Dependency:**
Refer to: r0082

**Notice:**
This smoothed signal is not suitable for diagnostics or evaluation of dynamic operations. In this case, the unsmoothed value should be used.

For Basic Line Modules of chassis format, the displayed value is invalid as these units do not have any current sensing.

**Note:**
Significance for the drive: Power output at the motor shaft

Significance for the infeed: Line power drawn

For A_INF, B_INF and S_INF the following applies:
The active power is available smoothed (r0032 with 300 ms) and unsmoothed (r0082).

The following applies for SERVO:
The active power is available smoothed (r0032 with 100 ms, r0082[1] with p0045) and unsmoothed (r0082[0]).
For VECTOR and VECTORMV, the following applies:
The active power is available smoothed (r0032 with 100 ms) and unsmoothed (r0082).

### Parameter Details:

#### r0032 - CO: Active power actual value smoothed / P_actv_act smth
- **Can be changed:** -
- **Data type:** FloatingPoint32
- **P-Group:** Displays, signals
- **Not for motor type:** -
- **Min:** - [kW]
- **Max:** - [kW]
- **Access level:** 2
- **Func. diagram:** 5730, 6799, 8750, 8850, 8950
- **Units group:** 14_10
- **Unit selection:** p0505
- **Expert list:** 1

#### r0033 - Torque utilization smoothed / M_util smooth
- **Can be changed:** -
- **Data type:** FloatingPoint32
- **P-Group:** Displays, signals
- **Not for motor type:** -
- **Min:** - [%]
- **Max:** - [%]
- **Access level:** 3
- **Func. diagram:** 8012
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1
- **Factory setting**

### Factory setting:

- r0032: [kW] - [kW] - [kW]
- r0033: [%] - [%] - [%]
### r0034: Motor utilization / Motor utilization

**Description:**
Displays the motor utilization from motor temperature model 1 (I2t) or 3.

**Dependency:**
The motor utilization is only determined for permanent-magnet synchronous motors when the motor temperature model 1 (I2t) or 3 is activated.

For motor temperature model 1 (I2t) (p0612.0 = 1), the following applies:
\[
\text{r0034} = \frac{(\text{motor model temperature} - 40 \, \text{K})}{(p0605 - 40 \, \text{K})} \times 100\% 
\]

For motor temperature model 3 (p0612.2 = 1), the following applies:
\[
\text{r0034} = \frac{(\text{motor model temperature} - p0613)}{(p5390 - p0613)} \times 100\% 
\]

**Notice:**
After the drive is switched on, the system starts to determine the motor temperature with an assumed model value. This means that the value for the motor utilization is only valid after a stabilization time.

**Note:**
Smoothing time constant = 100 ms

The signal is not suitable as a process quantity and may only be used as a display quantity.

For r0034 = -200.0 %, the following applies:
- The value is invalid (e.g. the motor temperature model is not activated or has been incorrectly parameterized).

### r0035: Temperature input / Temp_input

**Description:**
Displays the temperature currently measured at X21 (booksize) or X41 (chassis).

For a BLM with internal Braking Module, a bimetallic sensor must be connected up to monitor the temperature of the braking resistor. The temperature sensor type is indicated using p0601 and cannot be changed for the existing internal Braking Module.

Temperature within permissible limit values: r0035 = -50°C
Temperature outside the permissible limit values: r0035 = 250°C

**Notice:**
The function in r0192.11 must be available in order to obtain a correct display.

**Note:**
- For r0035 equal to -200.0 °C, the following applies:
  - "no sensor" selected in p0601!
- For r0035 equal to -300.0 °C, the following applies:
  - a KTY84 is selected in p0601 but is not connected!
  - the temperature display is not valid (temperature sensor error)!

### r0035: Motor temperature / Mot temp

**Description:**
Displays the actual temperature in the motor.
Note:
For r0035 not equal to -200.0 °C, the following applies:
- this temperature display is valid.
- a KTY sensor is connected.
- the thermal model for the induction motor is activated (p0612 bit 1 = 1 and temperature sensor de-activated: p0600 = 0 or p0601 = 0).

For r0035 equal to -200.0 °C, the following applies:
- this temperature display is not valid (temperature sensor error).
- A PTC sensor or bimetallic NC contact is connected.
- the temperature sensor of the synchronous motor is de-activated (p0600 = 0 or p0601 = 0).

r0036 CO: Power unit overload I2t / PU overload I2t
Can be changed: - Calculated: - Access level: 3
Data type: FloatingPoint32 Dynamic index: - Func. diagram: 8014
P-Group: Displays, signals Units group: - Unit selection: -
Not for motor type: - Scaling: PERCENT Expert list: 1
Min - [%] Max - [%] Factory setting
Description:
Displays the power unit overload determined using the I2t calculation.
A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.).
If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed.
In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.
Dependency:
Refer to: p0290, p0294
Refer to: F30005

r0037[0...19] CO: Power unit temperatures / PU temperatures
Can be changed: - Calculated: - Access level: 3
Data type: FloatingPoint32 Dynamic index: - Func. diagram: 8014
P-Group: Displays, signals Units group: 21_1 Unit selection: p0505
Not for motor type: - Scaling: p2006 Expert list: 1
Min - [°C] Max - [°C] Factory setting
Description:
Displays the temperatures in the power unit.
Index:
[0] = Inverter, maximum value
[1] = Depletion layer maximum value
[2] = Rectifier maximum value
[3] = Air intake
[4] = Interior of power unit
[5] = Inverter 1
[6] = Inverter 2
[7] = Inverter 3
[8] = Inverter 4
[9] = Inverter 5
[10] = Inverter 6
[11] = Rectifier 1
[12] = Rectifier 2
[13] = Depletion layer 1
[14] = Depletion layer 2
[15] = Depletion layer 3
[16] = Depletion layer 4
[17] = Depletion layer 5
[18] = Depletion layer 6
[19] = Cooling unit liquid intake
### Parameters

#### List of parameters

**Note:**

The value of -200 indicates that there is no measuring signal.

- `r0037[0]`: Maximum value of the inverter temperatures (r0037[5...10]).
- `r0037[1]`: Maximum value of the depletion layer temperatures (r0037[13...18]).
- `r0037[2]`: Maximum value of the rectifier temperatures (r0037[11...12]).

The maximum value is the temperature of the hottest inverter, depletion layer, or rectifier.

#### r0037[0...1] Control Unit temperature / CU temp

| Data type: FloatingPoint32 | Dynamic index: - | Func. diagram: - |
| P-Group: Displays, signals | Units group: - | Unit selection: - |
| Not for motor type: - | Scaling: p2006 | Expert list: 1 |

**Min** | **Max** | **Factory setting**
- [°C] | - [°C] | - [°C]

**Description:**
Displays the measured Control Unit temperature.

**Index:**
- [0] = Actual measured value
- [1] = Maximum measured value

**Dependency:**
Refer to: A01009

**Note:**
The value of -200 indicates that there is no measuring signal.

#### r0038 Power factor smoothed / Cos phi smooth

|VECTOR_G | Can be changed: - | Calculated: - | Access level: 3 |
| Data type: FloatingPoint32 | Dynamic index: - | Func. diagram: 6799, 8850, 8950 |
| P-Group: Displays, signals | Units group: - | Unit selection: - |
| Not for motor type: - | Scaling: - | Expert list: 1 |

**Min** | **Max** | **Factory setting**
- | - |

**Description:**
Displays the smoothed actual power factor.

**Notice:**
For infeed units, the following applies:
For active powers < 25 % of the rated power, this does not provide any useful information.

**Note:**
Smoothing time constant = 300 ms
The signal is not suitable as a process quantity and may only be used as a display quantity.

**Meaning for motor:**
- Power factor of the basic fundamental signals at the converter output.

**Meaning for infeed:**
- Power factor at the connection point (r3470, r3471)

#### r0039[0...2] Energy display / Energy displ

|VECTOR_G | Can be changed: - | Calculated: - | Access level: 2 |
| Data type: FloatingPoint32 | Dynamic index: - | Func. diagram: - |
| P-Group: Displays, signals | Units group: - | Unit selection: - |
| Not for motor type: - | Scaling: - | Expert list: 1 |

**Min** | **Max** | **Factory setting**
- [kWh] | - [kWh] |

**Description:**
Displays the energy values at the output terminals of the power unit.

**Index:**
- [0] = Energy balance (sum)
- [1] = Energy drawn
- [2] = Energy fed back

**Dependency:**
Refer to: p0040

**Note:**
Re index 0:
Sum of the energy drawn and energy that is fed back.
p0040  | Reset energy consumption display / Energy usage reset
--- | ---
**VECTOR_G** | Can be changed: U, T | Calculated: - | Access level: 2
Data type: Unsigned8 | Dynamic index: - | Func. diagram: -
P-Group: Displays, signals | Units group: - | Unit selection: -
Not for motor type: - | Scaling: - | Expert list: 1
Min | Max | Factory setting
0 | 1 | 0
Description: Setting to reset the display in r0039 and r0041.
Procedure: Set p0040 = 0 --> 1
The displays are reset and the parameter is automatically set to zero.
Dependency: Refer to: r0039

r0041  | Energy consumption saved / Energy cons saved
--- | ---
**VECTOR_G** | Can be changed: - | Calculated: - | Access level: 2
Data type: FloatingPoint32 | Dynamic index: - | Func. diagram: -
P-Group: Displays, signals | Units group: - | Unit selection: -
Not for motor type: - | Scaling: - | Expert list: 1
Min | Max | Factory setting
- [kWh] | - [kWh] | - [kWh]
Description: Displays the saved energy referred to 100 operating hours.
Dependency: Refer to: p0040
Note: This display is used for a fluid-flow machine.
The flow characteristic is entered into p3320 ... p3329.
For an operating time of below 100 hours, the display is interpolated up to 100 hours.

p0045  | Display values smoothing time constant / Disp_val T_smooth
--- | ---
**VECTOR_G** | Can be changed: U, T | Calculated: - | Access level: 2
Data type: FloatingPoint32 | Dynamic index: - | Func. diagram: 4715, 5610, 5730, 6714, 8012
P-Group: - | Units group: - | Unit selection: -
Not for motor type: - | Scaling: - | Expert list: 1
Min | Max | Factory setting
0.00 [ms] | 10000.00 [ms] | 1.00 [ms]
Description: Sets the smoothing time constant for the following display values:
SERVO: r0078[1], r0079[1], r0081 (calculated from the quantities smoothed with p0045), r0082[1].
VECTOR: r0063[1], r0068[1], r0080[1], r0082[1].

r0046.0...29  | CO/BO: Missing enable sig / Missing enable sig
--- | ---
**B_INF** | Can be changed: - | Calculated: - | Access level: 1
Data type: Unsigned32 | Dynamic index: - | Func. diagram: 8734
P-Group: Displays, signals | Units group: - | Unit selection: -
Not for motor type: - | Scaling: - | Expert list: 1
Min | Max | Factory setting
Description: Displays missing enable signals that are preventing the closed-loop infeed control from being commissioned.
Bit field: | Bit | Signal name | 1 signal | 0 signal | FP
--- | --- | --- | --- | --- | ---
00 | OFF1 enable missing | Yes | No | - | -
01 | OFF2 enable missing | Yes | No | - | -
08 | EP terminals enable missing | Yes | No | - | -
16 | OFF1 enable internal missing | Yes | No | - | -
17 | OFF2 enable internal missing | Yes | No | - | -

#### Dependency:
Refer to: r0002
Note: The value r0046 = 0 indicates that all enable signals for this drive are present.

Bit 00 = 1 (enable signal missing), if:
- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:
- the signal source in p0844 or p0845 is a 0 signal.

Bit 02 = 1 (enable signal missing), if:
- the signal source in p0848 or p0849 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:
- the signal source in p0852 is a 0 signal.

Bit 04 = 1 (armature short-circuit active), if:
- the signal source in p1230 has a 1 signal

Bit 05, Bit 06: Being prepared

Bit 08 = 1 (enable signal missing), if:
- safety functions have been enabled and STO is active.

STO selected via terminals:
- the pulse enable via terminal EP is missing (booksise: X21, chassis: X41), or the signal source in p9620 is for a 0 signal.

STO selected via PROFI safe or TM54F:
- A safety-relevant signal is present with a STOP A response.

Bit 09 = 1 (enable signal missing), if:
- the signal source in p0864 is a 0 signal.

Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
- When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.

Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0009 > 0 or p0010 > 0).
- there is an OFF2 fault response.
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

Bit 18 = 1 (internal pulse enable missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.

Bit 19 = 1 (internal pulse enable missing), if:
- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.

Bit 20 = 1 (internal armature short-circuit active), if:
- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Bit 21 = 1 (enable signal missing), if:
- The pulses have been enabled and the speed setpoint has still not been enabled, because:
  - the holding brake opening time (p1216) has still not expired.
  - the motor has still not been magnetized (induction motor).
  - the encoder has not been calibrated (U/f vector and synchronous motor)

Bit 22: Being prepared

Bit 26 = 1 (enable signal missing), if:
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).
- All power units of a parallel connection are deactivated (p0125, p0895).

Bit 27 = 1 (enable signal missing), if:
- de-magnetizing has still not been completed (only for vector).

Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.

Bit 29 = 1 (enable signal missing), if:

Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
- A 0 signal is available via BI: p0856.
- the function generator with current input is active.
- the measuring function "current controller reference frequency characteristic" is active.
- the pole position identification is active.
- motor data identification is active (only certain steps).

Bit 31 = 1 (enable signal missing), if:
- the speed setpoint from jog 1 or 2 is entered.

### Parameters

#### List of parameters

**r0064**  
**CO: Speed controller system deviation / n_ctrl system dev**  
**VECTOR_G**  
- **Can be changed:** -  
- **Calculated:** -  
- **Access level:** 3  
- **Data type:** FloatingPoint32  
- **Dynamic index:** -  
- **Func. diagram:** 5040, 6040  
- **P-Group:** Displays, signals  
- **Units group:** 3_1  
- **Unit selection:** p0505  
- **Not for motor type:** -  
- **Scaling:** p2000  
- **Expert list:** 1  
- **Min** - [rpm]  
- **Max** - [rpm]  
- **Factory setting** - [rpm]  

**Description:** Displays the actual system deviation of the speed controller.  
**Note:** In servo control mode with active reference model, the system deviation to the P component of the speed controller is displayed.

**r0065**  
**Slip frequency / f_Slip**  
**VECTOR_G**  
- **Can be changed:** -  
- **Calculated:** -  
- **Access level:** 3  
- **Data type:** FloatingPoint32  
- **Dynamic index:** -  
- **Func. diagram:** 1710, 6310, 6727, 6730, 6732  
- **P-Group:** Displays, signals  
- **Units group:** 2_1  
- **Unit selection:** p0505  
- **Not for motor type:** -  
- **Scaling:** p2000  
- **Expert list:** 1  
- **Min** - [Hz]  
- **Max** - [Hz]  
- **Factory setting** - [Hz]  

**Description:** Displays the slip frequency for induction motors (ASM).

**r0066**  
**CO: Output frequency / f_outp**  
**VECTOR_G**  
- **Can be changed:** -  
- **Calculated:** -  
- **Access level:** 3  
- **Data type:** FloatingPoint32  
- **Dynamic index:** -  
- **Func. diagram:** 1690, 5300, 5730, 6310, 6730, 6731, 6799  
- **P-Group:** Displays, signals  
- **Units group:** 2_1  
- **Unit selection:** p0505  
- **Not for motor type:** -  
- **Scaling:** p2000  
- **Expert list:** 1  
- **Min** - [Hz]  
- **Max** - [Hz]  
- **Factory setting** - [Hz]  

**Description:** Displays the Motor Module output frequency.  
**Dependency:** Refer to: r0024  
**Note:** The output frequency is available smoothed (r0024) and unsmoothed (r0066).

**r0067**  
**CO: Output current, maximum / I_outp max**  
**VECTOR_G**  
- **Can be changed:** -  
- **Calculated:** -  
- **Access level:** 3  
- **Data type:** FloatingPoint32  
- **Dynamic index:** -  
- **Func. diagram:** 5722, 6300, 6640, 6724  
- **P-Group:** Displays, signals  
- **Units group:** 6_2  
- **Unit selection:** p0505  
- **Not for motor type:** -  
- **Scaling:** p2002  
- **Expert list:** 1  
- **Min** - [Arms]  
- **Max** - [Arms]  
- **Factory setting** - [Arms]  

**Description:** Displays the maximum output current of the Motor Module.  
**Dependency:** The maximum output current is determined by the parameterized current limit and the motor and converter thermal protection.

- **Unit selection:** -
- **Not for motor type:** -
- **Scaling:** PERCENT
- **Expert list:** 1
- **Min**
- [- %]
- **Max**
- [- %]
- **Factory setting**

**Description:**
Displays the torque utilization as a percentage.
The torque utilization is obtained from the required smoothed torque referred to the torque limit.

**Dependency:**
Refer to: r0033

**Note:**
The torque utilization is available smoothed (r0033) and unsmoothed (r0081).
The torque utilization is obtained from the required torque referred to the torque limit as follows:
- Positive torque: $r0081 = \frac{(r0079 / r1538)} {r1538} \times 100\%$
- Negative torque: $r0081 = \frac{(-r0079) / (-r1539)} {-r1539} \times 100\%$

### r0082 CO: Active power actual value / P_act

**B_INF**

- **Can be changed:** -
- **Calculated:** -
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** -
- **Func. diagram:** 8750, 8850, 8950
- **P-Group:** Displays, signals

<td>1</td>
<td>Integer16</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Setting to pre-assign/check the sampling times for the internal controller clock cycles for clock-synchronous PROFIdrive operation.

Re p0092 = 1:
The controller clock cycles are set so that clock synchronous PROFIdrive operation is possible. If it is not possible to change the controller clock cycles of the clock-cycle synchronous PROFIdrive operation, then an appropriate message is output.
The pre-setting of the controller clock cycles can result in a derating of the Motor Module (e.g. p0115[0] = 400 µs > 375 µs).

When calculating the drive unit utilization (r9976), when using the fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD", "Send BEFORE IF1 PROFIdrive PZD", "Receive AFTER IF2 PROFIdrive PZD" (from V4.4) and "Send BEFORE IF2 PROFIdrive PZD" (from V4.4), then its maximum computing time load has already been calculated during ramp-up for isochronous operation and taken into account in r9976 (from V4.3).

Re p0092 = 0:
The controller clock cycles are set without any restrictions by the clock-cycle PROFIdrive operation (same as for up to V2.3).

When calculating the drive unit utilization (r9976), when using the fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD", "Send BEFORE IF1 PROFIdrive PZD", "Receive AFTER IF2 PROFIdrive PZD" (from V4.4) and "Send BEFORE IF2 PROFIdrive PZD" (from V4.4), then its maximum computing time load has already been calculated during ramp-up for isochronous operation and taken into account in r9976 (from V4.3).

**Value:**
0: No isochronous PROFIBUS
1: Isochronous PROFIBUS

**Dependency:**
Refer to: r0110, p0115
Refer to: A01223, A01224

**Caution:**
Only current controller clock cycles (p0115[0]) which are integers of 125 µs are permitted for isochronous mode.
In addition, current controller clock cycles 31.25 µs and 62.5 µs are possible.

**Notice:**
p0092 only affects the automatic default for the clock cycles (p0115) in the drive. If the clock cycles are modified subsequently in expert mode (p0112 = 0), p0092 = 0 should be set so that the new values are not overwritten again by the automatic default when the parameters are downloaded.
The conditions for current controller clock cycle for isosynchronous operation must still be carefully ensured (refer under Caution!).

### r0094 CO: Transformation angle / Transformat_angle

<table>
<thead>
<tr>
<th>Address</th>
<th>Description</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>P-Group</th>
<th>Units group</th>

<td>3</td>
<td>FloatingPoint32</td>
<td>-</td>
<td>Displays, signals</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Displays the transformation angle.

**Dependency:**
Refer to: p0431, r1778

**Note:**
The transformation angle corresponds to the electrical commutation angle.
If no pole position identification is carried out (p1982), and the encoder is adjusted, the following applies:
The encoder supplies the value and indicates the electrical angle of the flux position (d axis).
**Parameters**

**List of parameters**

**p0097**

Select drive object type / Select DO type

- **CU_G130_DP**, **CU_G130_PN**, **CU_G150_DP**, **CU_G150_PN**
  - Can be changed: C1(1)
  - Data type: Integer16
  - P-Group: Topology
  - Not for motor type: -
  - Description:
    - Executes an automatic device configuration.
    - In so doing, p0099, p0107 and p0108 are appropriately set.
  - Value:
    - 0: No selection
    - 1: Drive object type SERVO
    - 2: Drive object type VECTOR
    - 3: SINAMICS GM (DFEMV & VECTORMV)
    - 4: SINAMICS SM (AFEMV & VECTORMV)
    - 5: SINAMICS SL (VECTORMV & VECTORMV)
    - 6: SINAMICS SL (VECTORMV)
    - 12: Drive object type VECTOR parallel circuit
    - 13: Drive object type VECTORMV - GM parallel circuit
    - 14: Drive object type VECTORMV - SM parallel circuit
    - 15: Drive object type DC_CTRL
    - 16: Drive object type SERVO HMI
    - 17: Drive object type VECTOR HMI
    - 24: Drive object type VECTORMV - SM parallel circuit
  - Dependency:
    - Refer to: r0098, p0099
    - Refer to: A01330
  - Note:
    - For p0097 = 0, p0099 is automatically set to the factory setting.
The possible settings are dependent upon the device type.

**r0098[0...5]**

Actual device topology / Device_act topo

- **CU_G130_DP**, **CU_G130_PN**, **CU_G150_DP**, **CU_G150_PN**
  - Can be changed: -
  - Data type: Unsigned32
  - P-Group: Topology
  - Not for motor type: -
  - Description:
    - Displays the automatically detected actual device topology in coded form.
    - The possible settings are dependent upon the device type.
  - Index:
    - [0] = DRIVE-CLIQ socket X100
    - [1] = DRIVE-CLIQ socket X101
    - [2] = DRIVE-CLIQ socket X102
    - [3] = DRIVE-CLIQ socket X103
    - [4] = DRIVE-CLIQ socket X104
    - [5] = DRIVE-CLIQ socket X105
  - Dependency:
    - Refer to: p0097, p0099
  - Note:
    - Topology coding: abcd efgh hex
    - a = number of Active Line Modules
    - b = number of Motor Modules
    - c = number of motors
    - d = number of encoders (or the line supply voltage sensing for Active Line Modules)
    - e = number of additional encoders (or the line supply voltage sensing for Active Line Modules)
    - f = number of Terminal Modules
    - g = number of Terminal Boards
    - h = reserved
    - If the value 0 is displayed in all indices, then components are not detected via DRIVE-CLIQ.
    - If a value F hex occurs at a position of the coding (abcd efgh hex), then an overflow has occurred.
**Parameters**

**List of parameters**

---

### p0099[0...5] Device target topology / Device_target topo

<table>
<thead>
<tr>
<th>Data type:</th>
<th>Unsigned32</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-Group:</td>
<td>Topology</td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>-</td>
</tr>
</tbody>
</table>

- **Min:** 0000 hex
- **Max:** FFFF FFFF hex
- **Factory setting:** 0000 hex

**Description:**
Sets the device target topology in coded form (refer to r0098). The setting is made during commissioning. De-activated or non-available components are also counted.

**Index:**
- [0] = DRIVE-CLiQ socket X100
- [1] = DRIVE-CLiQ socket X101
- [2] = DRIVE-CLiQ socket X102
- [3] = DRIVE-CLiQ socket X103
- [4] = DRIVE-CLiQ socket X104
- [5] = DRIVE-CLiQ socket X105

**Dependency:**
The parameter can only be written into for p0097 = 0.

To perform an automatic device configuration run, an index of the device target topology must be set to the value of the device actual topology in r0098 for acknowledgement. An index of the device actual topology with a value other than 0 must be selected.

Refer to: p0097, r0098
Refer to: A01330

**Note:**
The parameter can only be set to the values 0, the value of the actual device topology, the value of the actual device target topology and FFFFFFFF hex.
If the value 0 is displayed in all of the indices, then the system has still not been commissioned.
The value FFFFFFFF hex indicates that the topology was not generated by the automatic device configuration but was commissioned using the commissioning software (e.g. using parameter download).

---

### p0100 IEC/NEMA mot stds / IEC/NEMA mot stds

<table>
<thead>
<tr>
<th>Data type:</th>
<th>Integer16</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-Group:</td>
<td>Converter</td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>FEM</td>
</tr>
</tbody>
</table>

- **Min:** 0
- **Max:** 1
- **Factory setting:** 0

**Description:**
Defines whether the motor and drive converter power settings (e.g. rated motor power, p0307) are expressed in [kW] or [hp].
Depending on the selection, the rated motor frequency (p0310) is either set to 50 Hz or 60 Hz.
For p0100 = 0, the following applies: The power factor (p0308) should be parameterized.
For p0100 = 1, the following applies: The efficiency (p0309) should be parameterized.

**Value:**
- 0: IEC-Motor (50 Hz, SI units)
- 1: NEMA motor (60 Hz, US units)

**Dependency:**
If p0100 is changed, all of the rated motor parameters are reset. Only then are possible unit changeovers made.
The units of all motor parameters are changed that are involved in the selection of IEC or NEMA (e.g. r0206, p0307, p0316, r0333, r0334, p0341, p0344, r1493, r1969).
Refer to: r0206, p0210, p0300, p0304, p0305, p0307, p0308, p0309, p0310, p0311, p0314, p0320, p0322, p0323, p0335, r0336, r0337, p1800

**Note:**
The parameter can only be changed for vector control (p0107).
The parameter value is not reset when the factory setting is restored (p0010 = 30, p0970).
### Parameters

</table>

#### Description:
Setting to activate/de-activate a drive object.

#### Value:
0: De-activate drive object
1: Activate drive object
2: Drive object, de-activate and not present

#### Recommend.:
After inserting all of the components of a drive object, before activating, first wait for Alarm A01316.

#### Dependency:
Refer to: r0106
Refer to: A01314, A01316

#### Caution:
When activating drive objects with the safety functions enabled, the following applies:
After reactivating, a warm restart (p0009 = 30, p0976 = 2, 3) or POWER ON should be carried out.

#### Notice:
The following applies when activating:
If components are inserted for the first time and the appropriate drive object is activated, then the drive system is automatically booted. To do this, the pulses of all of the drive objects must be suppressed.

#### Note:
Re value = 0, 2:
When a drive object is deactivated it no longer outputs any errors.
If value = 0:
All components of the drive object were completely commissioned and are deactivated using this value. They can be removed from the DRIVE-CLiQ without any error.
If value = 1:
All components of the drive object must be available for error-free operation.
If value = 2:
Components of a drive object in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the components are marked to be bypassed in the DRIVE-CLiQ line.
For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

**p0105 Activate/de-activate drive object / DO act/deact**

| Description: | Setting to activate/de-activate a drive object. |
| Value:       | 0: De-activate drive object |
|             | 1: Activate drive object |
| Dependency:  | Refer to: r0106 |

Parameters
List of parameters

[7] = Drive object type, object 7
[8] = Drive object type, object 8
[9] = Drive object type, object 9
[10] = Drive object type, object 10
[12] = Drive object type, object 12
[13] = Drive object type, object 13
[14] = Drive object type, object 14
[15] = Drive object type, object 15
[16] = Drive object type, object 16
[17] = Drive object type, object 17
[18] = Drive object type, object 18
[19] = Drive object type, object 19
[20] = Drive object type, object 20
[21] = Drive object type, object 21
[22] = Drive object type, object 22
[23] = Drive object type, object 23

Dependency:
Refer to: p0103, r0103

Caution:
If you change this parameter and exit the device commissioning mode, then the complete software will be set up again and all of the previous drive parameter settings are deleted.

Note:
The number (p0101) and the associated drive object type are in the same index.
For SINAMICS S a drive object type can only be changed between SERVO and VECTOR. If you change the parameter and exit drive start-up (p0009 from 2 to 0) the drive parameters are set up again.

0000 0000 0000 0000 0000 0000 0000 0000 bin

Description:
The function module of an existing drive object is entered into each index (see p0101, p0107).
The following bits are available for the Control Unit (Index 0):

Bit 18: Free function blocks
Bit 20: CAN
Bit 30: COMM BOARD
Bit 31: PROFINET
For all other drive objects (Index > 0), the significance of the bits should be taken from the display parameters r0108 of the drive object.

**Index:**

**Note:** A "function module" is a functional expansion of a drive object that can be activated when commissioning.

The following bits are only automatically set, if the power units are detected with the appropriate properties.

- Bit 16: Parallel connection of the same power units (only automatically set for G150/G130).
- Bit 20: Software gating unit (only automatically set when power units are connected in parallel).
- Bit 24: Type PM330 power units are presently not supported.
Bit 26: Type PM250 power units with F3E energy recovery are only supported for S120 CRANES.
Bit 28: Power units with liquid cooling.

</tr>
</tbody>
</table>

**Dependency:**
Refer to: r0110

### r0111 Basic sampling time selection / t_basis sel

<table>
<thead>
<tr>
<th>Description</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the selected basic sampling time for this drive object.</td>
<td>-</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Dependency:**
Refer to: r0110

**Note:**
For TB30 and the Terminal Module, this parameter has no significance.
For TB30 and certain Terminal Modules, the sampling times can be set using p4099 (see description of p4099 for the Module in question).

### p0112 Sampling times pre-setting p0115 / t_sample for p0115

Parameters
List of parameters

SINAMICS S, servo drive:
  p0112 = 1: 250 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs (for chassis units)
  p0112 = 2: 125 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs
  p0112 = 3: 125 / 125 / 125 / 4000 / 1000 / 4000 / 4000 µs
  p0112 = 4: 62.5 / 62.5 / 62.5 / 1000 / 1000 / 2000 / 1000 µs
  p0112 = 5: 31.25 / 31.25 / 31.25 / 1000 / 1000 / 2000 / 1000 µs
SINAMICS S, Active Infeed (p0112 = 1 not for p0092 = 1):
  p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)
  p0112 = 2: 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)
  p0112 = 3: 125 / - / - / 2000 µs
  p0112 = 4: 125 / - / - / 1000 µs
  p0112 = 5: 125 / - / - / 500 µs
SINAMICS S, Smart Infeed (p0112 = 1 not for p0092 = 1):
  p0112 = 1: 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)
  p0112 = 2: 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)
  p0112 = 3: 125 / - / - / 2000 µs
  p0112 = 4: 125 / - / - / 1000 µs
  p0112 = 5: Not possible
SINAMICS S, Basic Infeed, booksize:
SINAMICS S, Basic Infeed, chassis:
  p0112 = 2: 2000 / - / - / 2000 µs (pre-setting)
  p0112 = 4: Not possible
  p0112 = 5: Not possible
SINAMICS S/G, vector drive (p0112 = 1 not for p0092 = 1 and not for PM340):
  p0112 = 1: 400 / 1600 / 1600 / 3200 / 3200 / 3200 µs (for rated pulse frequency = 1.25, 2.5 kHz)
  p0112 = 2: 250 / 1000 / 2000 / 1000 / 2000 / 4000 / 4000 µs
  p0112 = 3: 250 / 1000 / 1000 / 2000 / 4000 / 4000 µs (for rated pulse frequency = 2.0, 4.0 kHz)
SINAMICS S, vector drive:
  p0112 = 5: 250 / 250 / 1000 / 500 / 1000 / 2000 / 1000 µs

Value:
  0: Expert
  1: xLow
  2: Low
  3: Standard
  4: High
  5: xHigh

Recommend.:
When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.

Dependency:
It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).
If, for a servo drive, p112 = 5 is set, then the pulse frequency p1800 is preassigned 8 kHz. For D410-2 and vector drive, the current controller sampling time can only be permanently changed for p0112 = 0.
Refer to: p0092

Note:
For p0112 = 0 (expert) the individual sampling times in p0115 can be adjusted.
The setting p0112 = 1 cannot be set for a vector drive with power unit type PM340 (refer to r0203).
### List of parameters

**Description:**
Pre-assignment of the sampling times in p0115.

The clock cycles for the current controller / speed controller / flux controller / setpoint channel / position controller / positioning / technology controller are pre-assigned as follows:

**SINAMICS S, servo drive:**
- **p0112 = 1:** 250 / 250 / 250 / 4000 / 2000 / 8000 / 4000 µs (for chassis units)
- **p0112 = 2:** 125 / 125 / 250 / 4000 / 2000 / 8000 / 4000 µs
- **p0112 = 3:** 125 / 125 / 125 / 1000 / 4000 / 4000 µs
- **p0112 = 4:** 62.5 / 62.5 / 1000 / 4000 / 1000 / 2000 / 1000 µs
- **p0112 = 5:** 31.25 / 31.25 / 31.25 / 1000 / 1000 / 2000 / 1000 µs

**SINAMICS S, Active Infeed (p0112 = 1 not for p0092 = 1):**
- **p0112 = 1:** 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)
- **p0112 = 2:** 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)
- **p0112 = 3:** 250 / - / - / 2000 µs
- **p0112 = 4:** 250 / - / - / 1000 µs
- **p0112 = 5:** Not possible

**SINAMICS S, Smart Infeed (p0112 = 1 not for p0092 = 1):**
- **p0112 = 1:** 400 / - / - / 1600 µs (pre-setting for the rated pulse frequency = 2.5 kHz)
- **p0112 = 2:** 250 / - / - / 2000 µs (pre-setting for the rated pulse frequency = 4.0 kHz)
- **p0112 = 3:** 250 / - / - / 2000 µs
- **p0112 = 4:** 250 / - / - / 1000 µs
- **p0112 = 5:** Not possible

**SINAMICS S, Basic Infeed, booksize:**
- **p0112 = 4:** 250 / - / - / 2000 µs

**SINAMICS S, Basic Infeed, chassis:**
- **p0112 = 1:** 2000 / - / - / 2000 µs
- **p0112 = 2:** 2000 / - / - / 2000 µs (pre-setting)
- **p0112 = 3:** 2000 / - / - / 2000 µs
- **p0112 = 4:** Not possible
- **p0112 = 5:** Not possible

**SINAMICS S/G, vector drive (p0112 = 1 not for p0092 = 1 and not for PM340):**
- **p0112 = 1:** 400 / 1600 / 1600 / 1600 / 3200 / 3200 / 3200 µs (for rated pulse frequency = 1.25, 2.5 kHz)
- **p0112 = 2:** 250 / 1000 / 2000 / 2000 / 4000 / 4000 / 4000 µs
- **p0112 = 3:** 250 / 1000 / 1000 / 1000 / 2000 / 4000 / 4000 µs (for rated pulse frequency = 2.0, 4.0 kHz)

**Value:**
- **Expert**
- **xLow**
- **Low**
- **Standard**

**Recommend.:**
When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.

**Dependency:**
It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).
If, for a servo drive, \( p112 = 5 \) is set, then the pulse frequency \( p1800 \) is preassigned 8 kHz. For D410-2 and vector drive, the current controller sampling time can only be permanently changed for \( p0112 = 0 \).

Refer to: \( p0092 \)

**Note:**
For \( p0112 = 0 \) (expert) the individual sampling times in \( p0115 \) can be adjusted. The setting \( p0112 = 1 \) cannot be set for a vector drive with power unit type PM340 (refer to \( r0203 \)).

---

### p0113 Minimum pulse frequency, selection / \( f_{puls \ min \ sel} \)

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: C1(3)</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: FloatingPoint32</td>
<td>Dynamic index: -</td>
<td>Func. diagram: -</td>
<td></td>
</tr>
<tr>
<td>P-Group: Closed-loop control</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
</tr>
<tr>
<td>1.000 [kHz]</td>
<td>2.000 [kHz]</td>
<td>2.000 [kHz]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
The current controller sampling time (\( p0115[0] \)) is pre-assigned by selecting the minimum pulse frequency.

**Dependency:**
The parameter can only be changed with \( p0112 = 0 \) (expert). For isochronous operation (\( p0092 = 1 \)) the parameter can only be set so that a current controller clock cycle of 125 µs is obtained as an integer number.

The required pulse frequency can be set in \( p1800 \) after commissioning (\( p0009 = p0010 = 0 \)).

Refer to: \( p0112, r0114, p0115, p1800 \)

**Note:**
The current controller sampling time (\( p0115[0] \)) is set to the inverse value of twice the minimum pulse frequency.

For \( p0113 = 1.0 \) kHz, \( p0115[0] = 500 \) µs is set, for \( p0113 = 2.0 \) kHz, \( p0115[0] = 250 \) µs is set. The current controller sampling time (\( p0115[0] \)), calculated from the pulse frequency, is set in a grid of 1.25 µs.

For a power unit type PM340 (refer to \( r0203 \)), only the values 1.0 and 2.0 kHz can be set. 1.0 kHz can be set in order to achieve a current controller clock cycle of 500µs. However, in this case, the minimum pulse frequency \( p1800 \) is limited to 2 kHz.

---

### r0114[0...9] Minimum pulse frequency, recommended / \( f_{puls \ min \ recom} \)

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: -</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: FloatingPoint32</td>
<td>Dynamic index: -</td>

<td></td>
</tr>
<tr>
<td>P-Group: Closed-loop control</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
</tr>
<tr>
<td>- [kHz]</td>
<td>- [kHz]</td>
<td>- [kHz]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Displays the recommended values (indices 0 and 1) for the minimum pulse frequency (\( p0113 \)).

If the system rejects a change to \( p0113 \) because the value to be used lies outside the permitted value range, then instead the recommended value from \( r0114 \) can be used.

**Index:**
0 = If only the actual drive is changed
1 = If all drives connected to the DRIVE-CLiQ line are changed
2 = 2. possible pulse frequency
3 = 3. possible pulse frequency
4 = 4. possible pulse frequency
5 = 5. possible pulse frequency
6 = 6. possible pulse frequency
7 = 7. possible pulse frequency
8 = 8. possible pulse frequency
9 = 9. possible pulse frequency

**Dependency:**
Refer to: \( p0113 \)

**Note:**
After exiting commissioning (\( p0009 = p0010 = 0 \)), the pulse frequencies calculated from the sampling time \( p115[0] \) are displayed in indices 1 to 9. If additional restrictions do not apply (e.g. due to having selected an output filter), these can be entered into \( p1800 \). The maximum pulse frequency of the power units was already taken into account in \( r0114 \).

A value of 0 kHz does not define a recommended pulse frequency.
Description:
Sets the sampling times for the control loops.
The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).

Recommend.:
When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.

Index:

- [0] = Current controller
- [1] = Speed controller
- [2] = Flux controller
- [3] = Setpoint channel
- [4] = Pos controller
- [5] = Positioning
- [6] = Technology controller

Dependency:
The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms.
Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. p0115[1] = N * p0115[0]; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]).
For servo drives, the maximum sampling time of the current controller is 250 µs and for vector drives, 500 µs.
The sampling times for setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) must have at least 2x the value of the current controller sampling time (p0115[0]).
Refer to: r0110, r0111, p0112

Note:
For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned.
For the Active Line Module (ALM) and Smart Line Module (SLM), the current and DC link voltage controllers operate with the same sampling time. For ALM/SLM the maximum current controller clock cycle is 400 µs.
For the Basic Line Module (BLM), the DC link voltage measurement operates in the current controller sampling time.
For BLM booksiz, only the current controller sampling time of 250 µs is permitted. For BLM chassis, only the current controller sampling time of 2000 µs is permitted.
For power unit type PM340 (r0203), only current controller sampling times of 62.5 µs, 125 µs, 250 µs and 500 µs can be set. The maximum current controller clock cycle for servo drives and the minimum current controller clock cycle for vector drives is 250 µs.
If sampling times in p0115 are individually changed for p0112 = 0 (expert) then it must always be observed that the selected sampling times of the setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) are always greater than or equal to twice the current controller sampling time (p0115[0]).
### Parameters

<td>C1(3)</td>
<td>FloatingPoint32</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>0.00 [µs]</td>
<td>16000.00 [µs]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the sampling times for the control loops.

The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).

**Recommend:**
When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are re-calculated using p0340 = 4.
When adjusting the current controller sampling time, it is recommended to use values that are an integer multiple of 6.25 µs. The sampling times of analog or digital inputs/outputs (see p0799, p4099) should be set to an integer multiple of the current controller sampling time.

If the current controller sampling time is to be reduced with respect to the default setting (e.g. < 250 µs), then it is recommended that the motor data identification (standstill measurement) is executed beforehand, in order to avoid a thermal overload of the power unit as a result of high pulse frequencies (p1800).

Index:

- [0] = Current controller
- [1] = Speed controller
- [2] = Flux controller
- [3] = Setpoint channel
- [4] = Pos controller
- [5] = Positioning
- [6] = Technology controller

Dependency:

Depending on the number and type of vector drives, the sampling times are preset differently.

The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms.

Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. p0115[1] = N * p0115[0]; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]).

The sampling times for setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) must have at least 2x the value of the current controller sampling time (p0115[0]).

The sampling time of the current controller p0115[0] and pulse frequency p1800 are checked at each parameter download, and when necessary changed, if, for p0092 = 1, the current controller clock cycle is not an integral multiple of 125 µs or if p0112 is set > 1. For p0092 = 0, the check with p0112 = 0 (= expert) can be deactivated.

Refer to: r0110, r0111, p0112

Note:

For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned.

For power unit type PM340 (r0203), only current controller sampling times of 250 µs or 500 µs can be set. The minimum current controller clock cycle is otherwise 125 µs (SINAMICS G: 250 µs), the maximum current controller clock cycle is 500 µs. The minimum speed controller clock cycle for SINAMICS G is 1 ms.

Current controller clock cycles less than 250 µs are restricted by the number of drives or by the number of power units connected in parallel (also see F01340).

For chassis power units connected in parallel, it is recommended to connect the DRIVE-CLiQ cables (partially) in parallel between the Control Unit and the individual Motor Modules.

For D410-2, the current controller sampling times can only be permanently changed with p0112 = 0 (e.g. to 250 µs).

**r0116[0...1]**

**Drive object clock cycle recommended / DO_clock recom**

| Can be changed: | Calculated: | Access level: 3 |
| Data type: | Dynamic index: | Func. diagram: |
| P-Group: | Units group: | Unit selection: |
| Not for motor type: | Scaling: | Expert list: 1 |

**Description:**

Displays the recommended sampling time for the drive objects.

r00116[0] = recommended sampling time:

Recommended value which would then make the complete system operational.

r00116[1] = recommended sampling time:

Recommended value, which after changing other clock cycles on the DRIVE-CLiQ line, would result in an operational system.

**Index:**

- [0] = Change only for the actual drive object
- [1] = Changing all objects on the DRIVE-CLiQ line

**Dependency:**

Refer to: p0115
Parameters
List of parameters

### p0117

**Current controller computing dead time mode / I_ctrl t_dead mode**

<table>
<thead>
<tr>
<th>CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: U, T</td>

</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>Factory setting</td>
</tr>
</tbody>
</table>

**Description:**
Sets the mode for the computing dead time of the current controller.

0: Offset (shifted) clocking, minimum computing dead time of each drive, automatic setting
1: Clocking at the same time, the dead time aligns itself to the dead time of the latest drive, automatic setting
2: Manual setting of the computing dead time, early transfer
3: Manual setting of the computing dead time, late transfer
4-6: As for 0-2, however, no early transfers are set for vectors

**Dependency:**
Refer to: p0118
Refer to: A02100

**Note:**
The mode change is not effective until the drive unit is powered up again.
Re p0117 = 0:
The times when the setpoints become effective for the individual controls is automatically and individually determined. Another computing dead time is set for each control (closed-loop) (p0118). Current is impressed for the individual controls without any offset with respect to time (improved EMC compatibility).
Re p0117 = 1:
The latest closed-loop control determines when the setpoints for each of the individual controls become active. The same computing dead time is set for each control (p0118). Current is impressed (flows) for the individual controls without any offset with respect to time.
Re p0117 = 2:
The computing dead time is manually set. The user must optimize the value in p0118.
Re p0117 = 3:
The computing dead time is manually set. The user must optimize the value in p0118.
Re p0117 = 4 ... 6:
Behavior as for p0117 = 0 ... 2, however for vectors, the earliest times are not determined.

### p0118

**Current controller computing dead time / I_ctrl t_dead**

<table>
<thead>
<tr>
<th>B_INF, VECTOR_G</th>

</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0.00 [µs]</td>
</tr>
</tbody>
</table>

**Description:**
This parameter is pre-set as a function of the current controller sampling time (p0115[0]) and normally does not have to be changed.

**Dependency:**
Refer to: p0117
Refer to: A02100

**Note:**
For p0118 <= 0.005 µs, the current controller output is delayed by a complete current controller clock cycle (p0115[0]).
After p0118 has been changed, we recommend that the current controller is adapted (p1715).
### p0120  Number of Power unit Data Sets (PDS) / PDS count

| Description: | Sets the number of Power unit Data Sets (PDS). The value corresponds to the number of power units connected together for a parallel circuit configuration. |
| Dependency: | Refer to: p0107, r0107 |
| Note: | This parameter is only significant for drive objects A_INFEED and VECTOR with a parallel circuit configuration. |

### p0125[0...n] Activate/de-activate power unit components / PU_comp act/deact

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value</th>
<th>Dependency</th>
<th>Caution</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>p0125[0...n]</td>
<td>Setting to activate/deactivate a power unit component.</td>
<td>0: De-activate component&lt;br&gt;1: Activate component&lt;br&gt;2: Component, de-activate and not present</td>
<td>After inserting a component, before activating, first wait for Alarm A01317.</td>
<td>For a parallel connection, the following applies: When deactivating individual power units using p0125, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.</td>
<td>It is not permissible to de-activate drive objects with safety functions enabled. The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. For units connected in parallel, when one of the power units is de-activated, then the enable in p7001 is withdrawn. Re value = 0, 2: When a component is deactivated it no longer outputs any errors. If value = 0: The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error. If value = 1: The component must be available for error-free operation. If value = 2: A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the component is marked to be bypassed in the DRIVE-CLiQ line. For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.</td>

</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>199</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:** The motor data set is assigned to a motor using this parameter.

This unique component number is assigned when parameterizing the topology.

Only component numbers can be entered into this parameter that correspond to a motor.
### p0139[0...2] Copy Motor Data Set MDS / Copy MDS

**VECTOR_G**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VECTOR_G</strong></td>
<td>Copying a Motor Data Set (MDS) into another.</td>
<td>C2(15)</td>
<td>-</td>
<td>2</td>
<td>Unsigned8</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**

Copying a Motor Data Set (MDS) into another.

**Index:**

- [0] = Source motor data set
- [1] = Target motor data set
- [2] = Start copying procedure

**Note:**

Procedure:

1. In Index 0, enter which motor data set should be copied.
2. In Index 1, enter the motor data set data that is to be copied into.
3. Start copying: Set index 2 from 0 to 1.

p0139[2] is automatically set to 0 when copying is completed.

When copying, p0131 is not taken into account.

### p0140 Number of Encoder Data Sets (EDS) / EDS count

**ENC**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ENC</strong></td>
<td>Sets the number of Encoder Data Sets (EDS).</td>
<td>C1(3)</td>
<td>-</td>
<td>2</td>
<td>Unsigned8</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Description:**

Sets the number of Encoder Data Sets (EDS).

**Note:**

When parameterizing the drive with "no encoder" there must be at least one encoder data set (p0140 >= 1).

### p0140 Number of Encoder Data Sets (EDS) / EDS count

**VECTOR_G**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VECTOR_G</strong></td>
<td>Sets the number of Encoder Data Sets (EDS).</td>
<td>C1(3)</td>
<td>-</td>
<td>2</td>
<td>Unsigned8</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>16</td>
<td>1</td>
</tr>
</tbody>
</table>

**Description:**

Sets the number of Encoder Data Sets (EDS).

**Note:**

When parameterizing the drive with "no encoder" there must be at least one encoder data set (p0140 >= 1).

### p0141[0...n] Encoder interface (Sensor Module) component number / Enc_interf comp_no

**ENC, VECTOR_G**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
</table>
| **ENC, VECTOR_G** | This parameter is used to assign the encoder data set to an encoder evaluation (e.g. SMC). This unique component number is assigned when parameterizing the topology. Only component numbers can be entered into this parameter that correspond to an encoder evaluation. **Note:**

If the encoder evaluation and encoder are integrated (motor with DRIVE-CLIQ), then their component numbers are identical. For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142). | C1(4)          | -          | 3            | Unsigned8        | EDS, p0140     | -             | -           | -              | -           | 0   | 199 | 0               |
### p0142[0...n] Encoder component number / Encoder comp_no

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: C1(4)</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: Unsigned8</td>
<td>Dynamic index: EDS, p0140</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>P-Group: Data sets</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0</td>
<td>199</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
This parameter is used to assign the encoder data set to an encoder. This assignment is made using the unique component number that was assigned when parameterizing the topology. Only component numbers can be entered into this parameter that correspond to an encoder.

**Note:**
If the encoder evaluation and encoder are integrated (motor with DRIVE-CLiQ), then their component numbers are identical. For an SMC, different component numbers are assigned for the SMC (p0141) and the (actual) encoder (p0142).

### p0144[0...n] Sensor Module detection via LED / SM detection LED

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: U, T</th>
<th>Calculated: -</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: Unsigned8</td>
<td>Dynamic index: EDS, p0140</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Detects the Sensor Module assigned to this drive and data set.

**Note:**
While p0144 = 1, the READY LED flashes green/orange or red/orange with 2 Hz at the appropriate Sensor Module.

### p0145[0...n] Activate/de-activate encoder interface / Enc_intf act/deact

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: C1(4), U, T</th>
<th>Calculated: -</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: Integer16</td>
<td>Dynamic index: EDS, p0140</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>P-Group: Data sets</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0</td>
<td>2</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Setting to activate/de-activate an encoder interface (Sensor Module).

**Value:**
- 0: De-activate component
- 1: Activate component
- 2: Component, de-activate and not present

**Recommend.:**
After inserting a component, before activating, first wait for Alarm A01317.

**Dependency:**
Refer to: r0146
Refer to: A01314, A01317

**Note:**
The de-activation of an encoder interface corresponds to the "parking encoder" function and has the same effect. The activation of a component can be rejected if the component was inserted for the first time.

In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. With the encoder interface for encoder 1 (motor encoder), the relevant drive object for writing the parameter must be in the "Ready for operation" state.

With the encoder interface for encoders 2 and 3, the parameter can also be written during operation.

Re value = 0, 2:
When a component is deactivated it no longer outputs any errors.
If value = 0:
The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error.
If value = 1:
The component must be available for error-free operation.
### Parameters

#### List of parameters

If value = 2:

A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start.

For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

---

#### r0146[0...n]

**Encoder interface active/inactive / Enc_intf act/inact**

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: -</th>
<th>Calculated: -</th>
<th>Access level: 2</th>

### Notice

This information represents the characteristics/features of the power unit firmware. It does not provide information/data about the characteristics/features of the hardware (e.g. bit 06 = 1 means that although the firmware supports "liquid cooling", a power unit with liquid cooling does not have to be used).

### Note

**Re bit 09:**

The Motor Module supports the internal armature short-circuit. The function is internally required for voltage protection (p1231 = 3).

**Re bit 10:**

The Motor Module supports the autonomous internal voltage protection.

If the "internal voltage protection" function is activated (p1231 = 3) the Motor Module decides autonomously - using the DC link voltage - as to whether the short-circuit is activated.

**Re bit 23:**

The component supports the detection of current actual values (and the detection of valve close durations) with double clocking and phase shift.
**Parameters**

</tbody>
</table>

**Data type:** Unsigned32

**Dynamic index:** -

**Units group:** -

**Unit selection:** -

**Expert list:** 1

**Min**

**Max**

**Factory setting**

**Description:** Displays the BIOS and EEPROM data version.

- r0198[0]: BIOS version
- r0198[1]: EEPROM data version

**Dependency:** Refer to: r0018, r0128, r0148, r0158, r0197

**Note:** Example: The value 1010100 should be interpreted as V01.01.01.00.

---

### p0199[0...24]

**Drive object name / DO name**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>All objects</td>
<td>C1</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16

**Dynamic index:** -

**Units group:** -

**Unit selection:** -

**Expert list:** 1

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>65535</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Freely assignable name for a drive object.

In the commissioning software, this name cannot be entered using the expert list, but is specified in the configuration assistant. The object name can be subsequently modified in the Project Navigator using standard Windows resources.

**Note:** The parameter is not influenced by setting the factory setting.

---

### r0200[0...n]

**Power unit code number actual / PU code no. act**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>B_INF, VECTOR_G</td>
<td>-</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16

**Dynamic index:** PDS, p0120

**Unit selection:** -

**Expert list:** 1

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:** Displays the unique code number of the power unit.

**Note:**
- r0200 = p0201: No power unit found
- For parallel circuit configurations, the parameter index is assigned to a power unit.

---

### p0201[0...n]

**Power unit code number / PU code no**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>B_INF</td>
<td>C2(2)</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16

**Dynamic index:** PDS, p0120

**Unit selection:** -

**Expert list:** 1

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>65535</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Sets the actual code number from r0200 to acknowledge the power unit being used.

When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.

**Dependency:** Refer to: F07815

**Note:**
- The parameter is used to identify when the drive is being commissioned for the first time.
- The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2).
- For parallel circuit configurations, the parameter index is assigned to a power unit.
### List of parameters

#### p0201[0...n]

**Power unit code number / PU code no**

**Description:**
Sets the actual code number from r0200 to acknowledge the power unit being used.

When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.

**Dependency:**
Refer to: F07815

**Value:**
- Can be changed: C2(2)
- Calculated: -
- Access level: 3

**Data type:** Unsigned16

**Dynamic index:** PDS, p0120

**P-Group:** Converter

**Units group:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min:** 0

**Max:** 65535

**Factory setting:** 0

**Description:**
Displays the type of power unit found.

#### r0203[0...n]

**Actual power unit type / PU actual type**

**Value:**
- Can be changed: -
- Calculated: -
- Access level: 3

**Data type:** Integer16

**Dynamic index:** PDS, p0120

**P-Group:** Converter

**Units group:** -

**Not for motor type:** -

**Scaling:** -

**Expert list:** 1

**Min:** 2

**Max:** 400

**Factory setting:** -

**Description:**
Displays the type of power unit found.

**Value:**
- 2: MICROMASTER 440
- 3: MICROMASTER 411
- 4: MICROMASTER 410
- 5: MICROMASTER 436
- 6: MICROMASTER 440PX
- 7: MICROMASTER 430
- 100: SINAMICS S
- 101: SINAMICS S (value)
- 102: SINAMICS S (combi)
- 103: SINAMICS S120M (distributed)

## Parameters

### List of parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P0205</td>
<td>Power unit application / PU application</td>
</tr>
<tr>
<td>R0206[0...4]</td>
<td>Rated power unit power / PU P_rated</td>
</tr>
</tbody>
</table>

### P0205

**Can be changed:** C2(1, 2)  
**Data type:** Integer16  
**P-Group:** Converter  
**Not for motor type:** -  
**Min:** 0  
**Max:** 7  
**Factory setting:** 6

**Description:**  
Overloading the load duty cycles applies under the prerequisite that before and after the overload, the drive converter is operated with its base load current - in this case, a load duty cycle of 300 s is used as basis.  
For booksize drive units, the following applies:  
Only the setting p0205 = 0 can be selected. In this particular case, the base load current has a load duty cycle of 150 % for 60 s and 176 % for 30 s.  
For chassis units, the following applies:  
The base load current for a low overload condition is based on a load duty cycle 110 % for 60 s and 150 % for 10 s.  
The base load current for a high overload condition is based on a load duty cycle 150 % for 60 s and 160 % for 10 s.

**Value:**  
0: Load duty cycle with high overload for vector drives  
1: Load duty cycle with low overload for vector drives  
6: S1 duty cycle for servo drives (feed drive)  
7: S6 duty cycle for servo drives (spindle drive)

**Note:**  
When the parameter is changed, all of the motor parameters and the control mode are pre-assigned according to the selected application.

The parameter has no influence when calculating the thermal overload.  
p0205 can only be changed to the settings that are saved in the power unit EEPROM.  
The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970).

### R0206[0...4]

**Can be changed:** -  
**Data type:** FloatingPoint32  
**P-Group:** Converter  
**Not for motor type:** -  
**Min:** - [kW]  
**Max:** - [kW]  
**Factory setting:** - [kW]

**Description:**  
Displays the rated power unit power for various load duty cycles.

**Index:**  
[0] = Rated value  
[1] = Load duty cycle with low overload  
[2] = Load duty cycle with high overload  
[3] = S1 cont duty cyc  
[4] = S6 load duty cycle

**Dependency:**  
IEC drives (p0100 = 0): Units kW  
NEMA drives (p0100 = 1): Units hp  
Refer to: p0100, p0205
**List of parameters**

### Parameter: r0207[0...4]
**Rated power unit current / PU PI\_rated**

<table>
<thead>
<tr>
<th>Description</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
<th>Func. diagram:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the rated power unit power for various load duty cycles.</td>
<td>-</td>
<td>-</td>
<td>2</td>

</tr>
</tbody>
</table>

**Index:**
- [0] = Rated value
- [1] = Load duty cycle with low overload
- [2] = Load duty cycle with high overload
- [3] = S1 cont duty cyc
- [4] = S6 load duty cycle

**Dependency:** Refer to: p0205

### Parameter: r0208
**Rated power unit line supply voltage / PU U\_rated**

<table>
<thead>
<tr>
<th>Description</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
<th>Func. diagram:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the rated line supply voltage of the power unit.</td>
<td>-</td>
<td>-</td>
<td>2</td>
<td>-</td>
</tr>
</tbody>
</table>

**Index:**
- [0] = r0208 = 400 : 380 - 480 V +/-10 %
- [1] = r0208 = 500 : 500 - 600 V +/-10 %
- [2] = r0208 = 690 : 660 - 690 V +/-10 %

For the Basic Line Module (BLM) the following applies:
- r0208 = 690 : 500 - 690 V +/-10 %

### Parameter: r0209[0...4]
**Power unit, maximum current / PU I\_max**

<table>

<td></td>
</tr>
<tr>
<td>1 [V]</td>
<td>63000 [V]</td>
<td>600 [V]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the drive unit supply voltage.

**AC/AC unit:** The rms value of the phase-to-phase line supply voltage should be entered.

**DC/AC unit:** The rated DC voltage of the connection busbar should be entered.

**Dependency:**
- Set p1254, p1294 (automatic detection of the Vdc switch-on levels) = 0.
- The switch-in thresholds of the Vdc_max controller are then directly determined using p0210.
- The parameter can be reduced to p0210 = 100 V if p0212.0 = 1 has been set.

Refer to: p0212

**Caution:**
If the line supply voltage is higher than the entered value, the Vdc controller may be automatically de-activated in some cases to prevent the motor from accelerating. In this case, an appropriate alarm is output.

**Note:**
- Setting ranges for p0210 as a function of the rated power unit voltage:
  - U_rated = 400 V:
    - p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC)
    - p0210 = 500 V:
      - p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC)
      - p0210 = 660 ... 690 V:
        - p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC)
        - p0210 = 500 ... 690 V:
          - p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC)
  - The pre-charging switch-in threshold for the DC link voltage (Vdc) is calculated from p0210:
    - Vdc_pre = p0210 * 0.82 * 1.35 (AC/AC)
    - Vdc_pre = p0210 * 0.82 (DC/AC)
  - The undervoltage thresholds for the DC link voltage (Vdc) are calculated from p0210 as a function of the rated power unit voltage:
    - U_rated = 400 V:
      - U_min = p0210 * 0.78 (AC/AC) > 330 V, p0210 * 0.60 (DC/AC) > 380 V
### p0212 Power unit configuration / PU config

**B_INF**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Drive unit line supply voltage reduced</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
<tr>
<td>02</td>
<td>Supply voltage tolerance range extended</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:**

- Re bit 00: Reduced supply voltages are only possible on booksize power units. Bit 0 = 1 can only be set if r0192.22 = 1.

**Caution:**

- Re bit 00: Working with reduced input voltages de-activates undervoltage detection.
- Re bit 03: If the automatic setting of the Vdc max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).

**Note:**

- Re bit 00 = 0: It is not possible to reduce the supply voltage in p0210.
- Re bit 00 = 1 (only for B_INF): With this setting the supply voltage in p0210 can be reduced to 70 V. Bit 0 = 1 can only be set for booksize power units with a rated power of up to 40 kW.

### p0212 Power unit configuration / PU config

**VECTOR_G**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Drive unit line supply voltage reduced</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
<tr>
<td>01</td>
<td>External pre-charging present</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
<tr>
<td>03</td>
<td>Automatically adapt Vdc_max limit</td>
<td>No</td>
<td>Yes</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:**

- Re bit 00: Reduced supply voltages are only possible for booksize and chassis power units (DC/AC). Bit 0 = 1 can only be set if r0192.22 = 1.
- Re bit 01 = 1: The external pre-charging setting only affects the DC/AC power units.
- Re bit 03 = 1: The automatic adaptation (reduction) of the Vdc max limit is deactivated (only for chassis power units). Bit 3 only has an effect, if bit 0 is simultaneously set.

**Refer to:** r0192, p0210
### Caution:

- **Re bit 00:**
  Working with reduced input voltages de-activates undervoltage detection.
- **Re bit 03:**
  If the automatic setting of the Vdc max limit is deactivated, then all of the components connected to the DC link must be suitable for the maximum DC link voltage of the power unit (e.g. 820 V for 400 V units).

### Note:

- **Re bit 00 = 0:**
  It is not possible to reduce the supply voltage in p0210.
- **Re bit 00 = 1:**
  With this setting the supply voltage in p0210 can be reduced to 100 V.
  - Booksize PU: only for operating mode p1300 = 19
  - Chassis PU: only for operating mode p1300 > 19 and closed-loop DC voltage control
- **Re bit 01 = 0:**
  There is no external pre-charging of the DC/AC Motor Modules. The pre-charging monitoring is bypassed.
- **Re bit 01 = 1:**
  There is external pre-charging of the DC/AC Motor Modules. The pre-charging monitoring is calculated.
- **Re bit 03 = 0:**
  The DC link voltage limit is calculated from p0210.
- **Re bit 03 = 1:**
  The DC link voltage limit is set to the maximum value of the power unit.

### Description:

Sets the type of the filter at the motor side.

**Value:**

- **0:** No filter
- **1:** Motor reactor
- **2:** dv/dt filter
- **3:** Sine-wave filter, Siemens
- **4:** Sine-wave filter, third-party

### Dependency:

The following parameters are influenced using p0230:

- **p0230 = 1:**
  - --> p0233 (power unit, motor reactor) = filter inductance
  - p0230 = 3:
  - --> p0233 (power unit, motor reactor) = filter inductance
  - --> p0234 (power unit sine-wave filter capacitance) = filter capacitance
  - --> p0290 (power unit overload response) = inhibit pulse frequency reduction
  - --> p1082 (maximum speed) = Fmax filter / pole pair number
  - --> p1800 (pulse frequency) >= nominal pulse frequency of the filter
  - --> p1802 (modulator modes) = space vector modulation without overcontrol
  - --> p1811 (modulator configuration) = wobbulation amplitude
  - --> p1909 (motor data identification, control word) = only Rs measurement

- **p0230 = 4:**
  - --> p0290 (power unit overload response) = inhibit pulse frequency reduction
  - --> p1802 (modulator modes) = space vector modulation without overcontrol
  - --> p1811 (modulator configuration) = wobbulation amplitude
  - --> p1909 (motor data identification, control word) = only Rs measurement

---

**Dynamic index:** -
**Units group:** -
**Unit selection:** -
**Expert list:** 1

**Min:** 0
**Max:** 4
**Factory setting:** 0
The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted.

--> p0233 (power unit, motor reactor) = filter inductance
--> p0234 (power unit sine-wave filter capacitance) = filter capacitance
--> p1082 (maximum speed) = Fmax filter / pole pair number
--> p1800 (pulse frequency) >= nominal pulse frequency of the filter

Refer to: p0233, p0234, p0290, p1082, p1800, p1802

**Note:**

if a filter type cannot be selected, then this filter type is not permitted for the Motor Module.

\[ p0230 = 1: \]

The output frequency of booksize power units with output reactors is restricted to 120 Hz, for blocksize and chassis power units, to 150Hz. The maximum pulse frequency for booksize and blocksize power units is 4 kHz, for chassis power units, twice the rated pulse frequency (2.5 kHz or 4 kHz).

\[ p0230 = 2: \]

Chassis power units with dv/dt filter, depending on the rated pulse frequency, may be operated with a maximum pulse frequency of \( p1800 = 2.5 \text{ kHz or } 4 \text{ kHz} \). The output frequency is limited to 150 Hz.

\[ p0230 = 3: \]

Sine-wave filters with a rated pulse frequency of 1.25 or 2.5 kHz should only be operated with a current controller sampling rate \( p0115[0] = 400 \mu s \), sine-wave filters with a rated pulse frequency of 2 or 4 kHz with \( p0115[0] = 250 \mu s \).

The sine-wave filter cannot be selected if the current controller sampling rate has not been appropriately set.

Chassis power units with sine-wave filter are limited to output frequencies of 115 Hz or 150 Hz.

### p0233 Power unit motor reactor / PU mot reactor

**VECTOR_G**

*Can be changed: C2(2), U, T*

*Data type: FloatingPoint32*

*P-Group: Converter*

*Not for motor type: -*

*Min: 0.000 [mH] Max: 1000.000 [mH] Factory setting: 0.000 [mH]*

**Description:**
Enter the inductance of a filter connected at the power unit output.

**Dependency:**
This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.

Refer to: p0230

**Note:**

When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out.

### p0234 Power unit sine-wave filter capacitance / PU sine filter C

**VECTOR_G**

*Can be changed: C2(2), U, T*

*Data type: FloatingPoint32*

*P-Group: Converter*

*Not for motor type: -*

*Min: 0.000 [µF] Max: 1000.000 [µF] Factory setting: 0.000 [µF]*

**Description:**
Enters the capacitance of a sine-wave filter connected at the power unit output.

**Dependency:**
This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.

Refer to: p0230

**Note:**

The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground). When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).

-80 [V]  0 [V]

**Description:**
Sets the absolute value by which the threshold to initiate the undervoltage fault (F30003) is reduced.

**Dependency:**
Refer to: p0210, r0296

Refer to: F30003

**Notice:**
When using a Control Supply Module (CSM) for 24 V supply from the DC link, the minimum continuous DC link voltage may not lie below 430 V. DC link voltages in the range 300 ... 430 V are permissible up to a duration of 1 min. For chassis power units, this parameter has no significance.

**Note:**
The resulting shutdown threshold can be read in r0296 and is dependent on the selected rated voltage (p0210) and the power unit being used.

</tr>
</tbody>
</table>
### Parameters

#### List of parameters

The following quantities can result in a response to thermal overload:
- heat sink temperature (r0037 index 0)
- chip temperature (r0037 index 1)
- power unit overload I2T (r0036)

Possible measures to avoid thermal overload:
- reduce the output current limit r0289 and r0067 (for closed-loop speed/velocity or torque/force control) or the output frequency (for U/f control) indirectly via the output current limit and the intervention of the current limiting controller.
- reduce the pulse frequency (only for vector control).

A reduction, if parameterized, is always realized after an appropriate alarm is output.

**Value:**
- 0: Reduce output current or output frequency
- 1: No reduction, shutdown when overload threshold is reached
- 2: Reduce i_output or f_output and f_pulse (not using I2t)
- 3: Reduce the pulse frequency (not using I2t)

**Dependency:**
If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1).
If a fault or alarm is present, then r2135.13 or r2135.15 is set.
Refer to: r0036, r0037, p0108, r0108, p0230, r2135
Refer to: A05000, A05001, A07805

**Caution:**
If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.

**Note:**
The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g., applications with variable torque such as for pumps and fans).
Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g., minimum speed p1090 and suppression [skip] speeds p1091 ... p1094) can be passed through.
For p0290 = 2, 3, the I2t overload detection of the power unit does not influence the responses.
When the motor data identification routine is selected, p0290 cannot be changed.

**Note:**
The parameter is only relevant for booksize units!
### p0294: Power unit alarm with I2t overload / PU I2t alrm thresh

**Description:**
Sets the alarm threshold for the I2t power unit overload.

**Drive:**
If this threshold is exceeded, an overload alarm is generated and the system responds as parameterized in p0290.

**Infeed:**
When the threshold value is exceeded, only an overload alarm is output.

**Dependency:**
Refer to: r0036, p0290
Refer to: A07805

**Note:**
The I2t fault threshold is 100 %. If this value is exceeded, fault F30005 is output.

### r0296: DC link voltage undervoltage threshold / Vdc U_lower_thresh

**Description:**
Sets the threshold for detecting a DC link undervoltage.

If the DC link voltage falls below this threshold, the Motor Module is shut down due to a DC link undervoltage condition (F30003).
Parameters
List of parameters

Dependency: Refer to: p0278
Refer to: F30003

Note: The value depends on the device type and the selected rated voltage p0210.
For booksize drive units, the following applies:
The undervoltage threshold can be reduced with p0278.

p0300[0...n] Motor type selection / Mot type sel
VECTOR_G
Can be changed: C2(1, 3) Calculated: - Access level: 1
Data type: Integer16 Dynamic index: MDS, p0130 Func. diagram: 6310
P-Group: Motor Units group: - Unit selection: -
Not for motor type: - Scaling: - Expert list: 1
Min 0 Max 10001 Factory setting 0

Description: Selects the motor type or starts to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000 or 10001, if there is a second data set).
For p0300 < 10000 the following applies:
The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list:
1 = Rotating induction motor
2 = Rotating synchronous motor
3 = Linear induction motor (reserved)
4 = Linear synchronous motor
5 = Synchronous motor separately-excited
7 = SIEMOSYN motor
8 = Reluctance motor
The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/AOP).

Value:
0: No motor
1: Induction motor (rotating)
2: Synchronous motor (rotating, permanent-magnet)
7: SIEMOSYN motor
8: Reluctance motor
10: 1LE1 standard induction motor
11: 1LA1 standard induction motor
12: 1LE2 standard induction motor (NEMA)
13: 1LG6 standard induction motor
15: 1LA5 standard induction motor
16: 1LA6 standard induction motor
17: 1LA7 standard induction motor
18: 1LA8 / 1PQ8 standard induction motor
19: 1LA9 standard induction motor
102: 1PH2 induction motor
104: 1PH4 induction motor
107: 1PH7 induction motor
108: 1PH8 induction motor
111: Induction motor (rotary) for OEMs
134: 1PM4 induction motor
136: 1PM6 induction motor
166: 1PL6 induction motor
222: Synchronous motor (rotary) for OEMs
264: 1FW4 synchronous motor
283: 1FW3 synchronous motor
10000: Motor with DRIVE-CLiQ
10001: Motor with DRIVE-CLiQ 2nd data set

Dependency:
Motors, selection 206, 236, 237 cannot be operated (also not as motor with DRIVE-CLiQ).
p0300 = 5 cannot be selected with SINAMICS G.
When the motor type is changed, the code number in p0301 may be reset to 0.
p0300 = 12 can only be selected for p0100 = 1 (NEMA).
When selecting a motor type from the 1LA5 and 1LA7 series, parameters p0335, p0626, p0627 and p0628 of the
thermal motor model are pre-assigned as a function of p0307 and p0311.
When selecting a 1FW4 motor, if the motor database permits this, when exiting commissioning then p1750 bit 5 is
automatically set. This is the reason that after exiting commissioning, all parameters must be saved and a warm
restart must be initiated (e.g. p0009=30, p0976=3).
Refer to: p0301

Caution:
A permanent-magnet synchronous motor cannot be operated with an SSI encoder without HTL/TTL track.
A separately-excited synchronous motor can only be operated with an SSI encoder if this is used as the second
encoder and an HTL/TTL encoder is used as the first encoder.

Caution:
If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters
that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor
type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection
is automatically canceled when the results of motor data identification are copied to the motor parameters.
The motor type of a catalog motor corresponds to the upper three digits of the code number or the following assign-
ment (if the particular motor type is listed):
Type/code number ranges
102 / 102xx, 112xx, 122xx
104 / 104xx, 114xx, 124xx
107 / 107xx, 117xx, 127xx
108 / 108xx, 118xx, 128xx, 138xx, 148xx, 158xx
134 / 134xx, 144xx, 154xx
136 / 136xx, 146xx, 156xx
166 / 166xx, 176xx, 186xx
264 / 264xx, 274xx, 284xx, 294xx
283 / 283xx, 293xx

Notice:
For 1PQ8 motors (p0300 = 18) the fan type p0335 should be set to 5.

Note:
With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with
p0300 = 10001, the motor parameters of a second data set (if available).
If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited.
A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists.
Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately
selected, this means that the motor parameters are pre-assigned the settings for a third-party motor.
This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000
or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number)
in order to be able to cancel the write protection.
### p0301[0...n] Motor code number selection / Mot code No. sel

<table>
<thead>
<tr>
<th>Feature</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VECTOR_G</strong></td>

<td><strong>FEM</strong></td>
</tr>
<tr>
<td><strong>Min</strong></td>
<td><strong>0</strong></td>
</tr>
<tr>
<td><strong>Max</strong></td>
<td><strong>65535</strong></td>
</tr>
</tbody>
</table>

**Description:**
The parameter is used to select a motor from a motor parameter list. When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.

**Dependency:**
Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. For 1PH2, 1PH4, 1PH7, 1PM4, 1PM6, 1FT6 motors, code numbers are also possible, whose fourth decimal position is greater by a value of 1 or 2 than the matching motor type in p0300. For 1FE1 motors, the third decimal position can be higher by a value of 1.

**Note:**
The motor code number can only be changed if the matching catalog motor was first selected in p0300. For a motor with DRIVE-CLiQ, p0301 cannot be changed. In this case, p0301 is automatically written to the code number of the motor parameter read in (r0302) if p0300 is set to 10000.

When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.

### r0302[0...n] Motor code number of motor with DRIVE-CLiQ / Motor code Mot DLQ

<table>
<thead>

- Units group: -
- Unit selection: -
- Not for motor type: -
- Expert list: 1
- Min: 0.00 [Arms]
- Max: 10000.00 [Arms]
- Factory setting: 0.00 [Arms]

**Description:**
Sets the rated motor current (rating plate).

**Dependency:**
Refer to: p0349

**Caution:**
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Notice:**
If p0305 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).

If the rated motor current exceeds twice the maximum drive converter current (r0209), then the maximum current is reduced due to the current harmonics that increase overproportionally (r0067).

**Note:**
When the parameter value is entered the connection type of the motor (star-delta) must be taken into account.

---

#### p0306[0...n] Number of motors connected in parallel / Motor qty

**VECTOR_G**

- Can be changed: C2(1, 3)
- Calculated: -
- Access level: 1
- Data type: Unsigned8
- Dynamic index: MDS, p0130
- Unit selection: -
- P-Group: Motor
- Units group: -
- Unit selection: -
- Not for motor type: FEM
- Expert list: 1
- Min: 1
- Max: 50
- Factory setting: 1

**Description:**
Number of motors that can be operated in parallel using one motor data set.

Depending on the motor number entered, internally an equivalent motor is calculated. The following should be carefully observed for motors connected in series:

The following rating plate data should only be entered for one motor:
- resistances and inductances: p0350 ... p0361
- currents: p0305, p0320, p0323, p0325, p0329, p0389, p0390, p0391, p0392
- power ratings: p0307
- masses/moments of inertia: p0341, p0344

All other parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).
**Parameters**

*List of parameters*

---

**Recommend:**
For motors connected in parallel, external thermal protection should be provided for each individual motor.

**Dependency:**
Refer to: r0331

**Caution:**
The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)).

The mounting regulations when connecting motors in parallel must be carefully maintained! Especially for synchronous motors, the pole position of motors that are rigidly coupled with one another (mechanically) must be identical.

The number of motors set must correspond to the number of motors that are actually connected in parallel.

After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1).

For synchronous motors connected in parallel with p1300 >= 20, the following applies:
- the individual motors must be mechanically coupled with one another and the EMF must be aligned to one another.

For induction motors that are connected in parallel, but which are not mechanically coupled with one another, then the following applies:
- an individual motor must not be loaded beyond its stall point.

**Notice:**
If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. This is not the case when commissioning the motor (p0010 = 3).

**Note:**
Only operation with U/f characteristic makes sense if more than 10 identical motors are connected in parallel.

Separately-excited synchronous motors must not be connected in parallel.

Synchronous and reluctance motors that are not coupled with one another align themselves when the pulses are switched in. If the motors have different load levels, then equalization currents flow between the motors.

---

### p0307[0...n] Rated motor power / Mot P_rated

<td>1.000</td>
</tr>
</tbody>
</table>

**Description:**
Sets the rated motor power factor (cos phi, rating plate).

For a parameter value of 0.000, the power factor is internally calculated and displayed in r0332.

**Dependency:**
This parameter is only available for IEC motors (p0100 = 0).

Refer to: p0100, p0309, r0332

**Caution:**
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**
The parameter is not used for synchronous motors (p0300 = 2xx).
**p0309[0...n]**

**Min**  
0.00 [Hz]  
**Max**  
3000.00 [Hz]  
**Factory setting**  
0.00 [Hz]  

**Description:**  
Sets the rated motor frequency (rating plate).  
The number of pole pairs (r0313) is automatically re-calculated when the parameter is changed (together with p0311), if p0314 = 0.  
The rated frequency is restricted to values between 1.00 Hz and 650.00 Hz.  
Refer to: p0311, r0313, p0314  

**Caution:**  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.  

**Notice:**  
If p0310 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).  

---  

**p0311[0...n]**  
**Rated motor speed / Mot n_{rated}**  
**VECTOR_G**  
**Can be changed:** C2(1, 3)  
**Calculated:** -  
**Access level:** 1  
**Data type:** FloatingPoint32  
**Dynamic index:** MDS, p0130  
**Func. diagram:** -  
**P-Group:** Motor  
**Units group:** -  
**Unit selection:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min**  
0.0 [rpm]  
**Max**  
210000.0 [rpm]  
**Factory setting**  
0.0 [rpm]  

**Description:**  
Sets the rated motor speed (rating plate).  
For VECTOR the following applies (p0107):  
For p0311 = 0, the rated motor slip of induction motors is internally calculated and displayed in r0330.  
It is especially important to correctly enter the rated motor speed for vector control and slip compensation for U/f control.  

**Dependency:**  
If p0311 is changed and for p0314 = 0, the pole pair (r0313) is re-calculated automatically.  
Refer to: p0310, r0313, p0314  

**Caution:**  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.  

**Notice:**  
If p0311 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).
### r0313[0...n] Motor pole pair number, actual (or calculated) / Mot PolePairNo act

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16  
**P-Group:** Motor  
**Not for motor type:** -  
**Min** | **Max**  
| - | - |

**Description:** Displays the number of motor pole pairs. The value is used for internal calculations.

- r0313 = 1: 2-pole motor
- r0313 = 2: 4-pole motor, etc.

**Dependency:**

- For p0314 > 0, the entered value is displayed in r0313.
- For p0314 = 0, the pole pair number (r0313) is automatically calculated from the rated power (p0307), rated frequency (p0310) and rated speed (p0311).  
  Refer to: p0307, p0310, p0311, p0314

**Note:**

- For the automatic calculation, the pole pair number is set to the value of 2 if the rated speed or the rated frequency is zero.

### p0314[0...n] Motor pole pair number / Mot pole pair No.

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>C2(1, 3)</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16  
**P-Group:** Motor  
**Not for motor type:** -  
**Min** | **Max**  
| 0 | 255 |

**Description:** Sets the motor pole pair number.

- p0314 = 1: 2-pole motor
- r0314 = 2: 4-pole motor, etc.

**Dependency:**

- For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313.

**Notice:**

- If p0314 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).

  For induction motors, the value need only be input if the rated data of a generator is entered therefore resulting in a negative rated slip. In this case, the number of pole pairs in r0313 is too low by 1 and must be manually corrected.

### p0316[0...n] Motor torque constant / Mot kT

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>

</tbody>
</table>

**Data type:** FloatingPoint32  
**P-Group:** Motor  
**Not for motor type:** ASM, REL, FEM  
**Min** | **Max**  
| 0.00 [Nm/A] | 400.00 [Nm/A] | 0.00 [Nm/A] |

**Description:** Sets the torque constant of the synchronous motor.

- p0316 = 0: The torque constant is calculated from the motor data.
- p0316 > 0: The selected value is used as torque constant.

**Dependency:**

- Refer to: r0334

**Caution:**

- When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**

- This parameter is not used for induction motors (p0300 = 1xx).
### List of parameters

**p0318[0...n]**  
**Motor stall current / Mot I_standstill**  
**VECTOR_G**  
Can be changed: C2(3)  
Data type: FloatingPoint32  
P-Group: Motor  
Not for motor type: ASM, REL, FEM  
Min: 0.00 [Arms]  
Max: 1000.00 [Arms]  
Factory setting: 0.00 [Arms]

**Description:**  
Sets the stall current for synchronous motors (p0300 = 2xx).

**Caution:**  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**  
The parameter is used for the I2t monitoring of the motor (refer to p0611). This parameter is not used for induction motors (p0300 = 1xx).

**p0320[0...n]**  
**Motor rated magnetizing current/short-circuit current / Mot I_mag_rated**  
**VECTOR_G**  
Can be changed: C2(3), U, T  
Data type: FloatingPoint32  
P-Group: Motor  
Not for motor type: REL, FEM  
Min: 0.000 [Arms]  
Max: 5000.000 [Arms]  
Factory setting: 0.000 [Arms]

**Description:**  
Sets the rated motor magnetizing current.  
For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331.  
Synchronous motors:  
Sets the rated motor short-circuit current.  
Caution:  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**  
The magnetization current p0320 for induction motors (not for catalog motors) is reset when quick commissioning is exited with p3900 > 0.  
VECTOR:  
If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.

**p0322[0...n]**  
**Maximum motor speed / Mot n_max**  
**VECTOR_G**  
Can be changed: C2(1, 3)  
Data type: FloatingPoint32  
P-Group: Motor  
Not for motor type: -  
Min: 0.0 [rpm]  
Max: 210000.0 [rpm]  
Factory setting: 0.0 [rpm]

**Description:**  
Sets the maximum motor speed.  
**Dependency:**  
Refer to: p1082  
**Caution:**  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Notice:**  
If p0322 is changed during quick commissioning (p0010 = 1), the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).

Data type: FloatingPoint32 Dynamic index: MDS, p0130 Func. diagram: -
P-Group: Motor Units group: 7_4 Unit selection: p0100
Not for motor type: - Scaling: - Expert list: 1
Min Max Factory setting
- [Nm] - [Nm]
Description: Displays the rated motor torque.
Dependency: IEC drives (p0100 = 0): unit Nm
NEMA drives (p0100 = 1): unit lbf ft
Note: For induction and reluctance motors, r0333 is calculated from p0307 and p0311.
For synchronous motors, r0333 is calculated from p0305, p0316, p0327 and p0328. The result can deviate from the input in p0312. If p0316 = 0, then r0333 = p0312 is displayed.
In the case of multi-motor operation r0333 is increased by the factor p0306 compared to the rated torque of an individual motor.
### List of parameters

#### r0334[0...n] Actual motor-torque constant / Mot kT act

<table>

<tbody>
<tr>
<td>p0335</td>
<td>Sets the motor cooling system used.</td>
<td></td>
<td>For 1LA5 and 1LA7 motors (refer to p0300), the parameter is pre-set as a function of p0307 and p0311.</td>
<td>When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection. The parameter influences the thermal 3-mass motor model. 1LA1 and 1LA8 motors are characterized by the fact that they have an internal rotor fan. This &quot;internal cooling&quot; lies within the motor frame and is not visible. Air is not directly exchanged with the motor ambient air. For 1PQ8 motors, p0335 should be set to 5 as these motors are force-ventilated motors. p0335 = 128 applies for 1LA7 motors, frame size 56. These are operated without a fan.</td>
</tr>
</tbody>

Parameters

List of parameters

p0340 = 3:
--> All of the parameters influenced for p0340 = 4, 5
--> p0325 (is only calculated for p0325 = 0)
--> p0348 (*) (is only calculated for p0348 = 0)
--> p0441, p0442, p0443, p0444, p0445 (only for 1FT6, 1FK6, 1FK7 motors)
--> p0492, p1082, p1980, p1319, p1326, p1327, p1612, p1752, p1755

p0340 = 4:
--> p1461 (for p0348 > p0322, p1461 is set to 100 %)
--> p1463 (for p0348 > p0322, p1463 is set to 400 %)

p0340 = 5:
--> p1037, p1038, p1520, p1521, p1530, p1531, p2140 ... p2142, p2148, p2150, p2155, p2161, p2162, p2163, p2164, p2175, p2177, p2194, p3820 ... p3829

VECTOR:
p0340 = 1:
--> All of the parameters influenced for p0340 = 2, 3, 4, 5
--> p0341 (*)

p0340 = 2:
--> p0350 (*), p0354 ... p0361 (*), p0652 ... p0660
--> p0625 (matching p0350)

p0340 = 3:
--> All of the parameters influenced for p0340 = 4, 5
--> p0346, p0347, p0492, p0622, p1262, p1320 ... p1327, p1582, p1584, p1612, p1616, p1744, p1748, p1749, p1755, p1756, p2178

p0340 = 4:

p0340 = 5:
--> p260 ... p264, p1037, p1038, p1520, p1521, p1530, p1531, p1574, p1750, p1802, p1803, p2140, p2142, p2148, p2150, p2161, p2162, p2163, p2164, p2175, p2177, p2194, p3208, p3815, p3820 ... p3829

Note:
p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5 without overwriting the motor parameters from the Siemens motor lists (p0301 > 0).

p0340 = 2 calculates the motor parameters (p0350 ... p0360), but only if it does involve a Siemens catalog motor (p0301 = 0).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

If the STARTER commissioning software writes a 3 into p0340 when "downloading to target device", then this corresponds to a "complete calculation of the motor/control parameters without equivalent circuit diagram data". The same calculations are carried out as for p0340 = 1, however, without the equivalent circuit diagram parameters of the motor (p0340 = 2), the motor moment of inertia and the motor weight (p0344).

For third-party linear synchronous motors (p0300 = 4) equivalent circuit diagram data are not calculated (p0340 = 2).
**p0341[0...n]**  
**Motor moment of inertia / Mot M_mom of inert**

**Dependency:**  
Refer to: r0313, r0333, r0336, p0341, p0342

### p0346[0...n] Motor excitation build-up time / Mot t_excitation

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>C2(3), U, T</td>
<td>CALC_MOD_REG</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** FloatingPoint32  
**Dynamic index:** MDS, p0130  
**Func. diagram:** -  
**Units group:**  
**Unit selection:** -  
**Expert list:** 1  
**Min**  
-20.000 [s]  
**Max**  
20.000 [s]  
**Factory setting**  
0.000 [s]

**Description:** Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.

**Caution:** If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note). This is especially true for sensorless vector control or Uff control.

**Notice:**  
If the parameter is set to 0 s for separately-excited synchronous motors (p0300 = 5), then an excitation current setpoint is generated even if the drive is powered down. In the base speed range, this is the no-load excitation current (p0389). In the field-weakening range, the value is reduced with the inverse value of the actual speed. An excitation current setpoint is not generated during de-magnetizing (p0347) and if an encoder fault is detected. When starting an encoderless separately-excited synchronous motor with vector control from standstill, the rotor position is detected using the field current ramp. The length of the ramp is pre-assigned from the motor data for p0346 = 0 s. If it crystallizes out that this time is too short, then it can be extended by entering a negative value in p0346, whereby otherwise, the excitation behavior corresponds with that for p0346 = 0 s. For all other cases, p0346 is internally limited downwards to 0 s.

**Note:** The parameter is calculated using p0340 = 1, 3.

For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384).
For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

<td>20.000 [s]</td>
</tr>
</tbody>
</table>

Description: Sets the demagnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.

Note: The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is shortened too much, then this can result in an inadequate de-magnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

Description: Sets the stator resistance of the motor at ambient temperature p0625 (phase value).

Dependency: Refer to: p0625, r1912

Caution: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance (p0352).
List of parameters

Description:
Resistance of the power cable between the Motor Module and motor.

Dependency:
Refer to: p7003

Caution:
The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.

Notice:
Parallel circuits with one winding system (p7003 = 0):
p0352 includes the feeder cable resistance of an individual Motor Module. The total feeder cable resistance is obtained from p0352 divided by the number of activated Motor Modules (refer to r0395).

Parallel circuits with multi-winding system (p7003 = 1):
p0352 includes the complete feeder cable resistance and is directly added to the stator resistance (refer to r0395).

Note:
The parameter influences the temperature adaptation of the stator resistance.
The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value.

Exception:
For parallel circuit configurations with one winding system (p07003 = 0), the cable resistance is directly measured. It is important to note that only the component of an individual Motor Module is entered into p0352.
The cable resistance is reset when quick commissioning is exited with p3900 > 0.

Description:
Sets the series inductance.

Note:
For the automatic calculation with p0340 = 1, 3 or 4, the calculation of p1715 is influenced by p0353.
The series inductance is reset when quick commissioning is exited with p3900 > 0.

Description:
Sets the rotor/secondary section resistance of the motor at the ambient temperature p0625.

For separately-excited synchronous motors: Sets the damping resistance in the rotor direction (d-axis).

This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor data identification routine (p1910) (not for separately-excited synchronous motors).

Dependency:
Refer to: p0625

Caution:
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note:
The parameter is not used for synchronous motors (p0300 = 2xx).

**Min**  
0.00000 [ohm]  
**Max**  
300.00000 [ohm]  
**Factory setting**  
0.00000 [ohm]  

**Description:**  
Sets the damping resistance of the separately-excited synchronous motor quadrature to the rotor direction (q axis). This parameter value is automatically calculated using the motor model (p0340 = 1, 2).

### p0356[0...n] Motor stator leakage inductance / Mot L_stator leak.

**TYPE:** VECTOR_G  
**Can be changed:** C2(3), U, T  
**Calculated:** CALC_MOD_EQU  
**Access level:** 3  
**Data type:** FloatingPoint32  
**Dynamic index:** MDS, p0130  
**Func. diagram:** -  
**P-Group:** Motor  
**Units group:** 15_1  
**Unit selection:** p0349  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min**  
0.00000 [mH]  
**Max**  
1000.00000 [mH]  
**Factory setting**  
0.00000 [mH]  

**Description:**  
Induction motor, separately-excited synchronous motor: Sets the rotor leakage inductance of the motor. Synchronous motor: Sets the stator quadrature axis inductance of the motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

**Caution:**  
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**  
If the stator leakage inductance (p0356) for induction motors is changed outside the commissioning phase (p0010 > 0), the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).

For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is, therefore, ideal for a low current.

### p0357[0...n] Motor stator inductance, d axis / Mot L_stator d

**TYPE:** VECTOR_G  
**Can be changed:** C2(3), U, T  
**Calculated:** CALC_MOD_EQU  
**Access level:** 3  
**Data type:** FloatingPoint32  
**Dynamic index:** MDS, p0130  
**Func. diagram:** -  
**P-Group:** Motor  
**Units group:** 15_1  
**Unit selection:** p0349  
**Not for motor type:** ASM, REL, FEM  
**Scaling:** -  
**Expert list:** 1  
**Min**  
0.00000 [mH]  
**Max**  
1000.00000 [mH]  
**Factory setting**  
0.00000 [mH]  

**Description:**  
Sets the stator direct-axis inductance of the synchronous motor. This parameter value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910).

**Note:**  
The parameter is not used for separately-excited synchronous motors (p0300 = 5).

For permanent-magnet synchronous motors (p0300 = 2), this is the non-saturated value and is ideal for a low current.

### p0358[0...n] Motor rotor leakage inductance / damping inductance, d axis / Mot L_r leak / LDd

**TYPE:** VECTOR_G  
**Can be changed:** C2(3), U, T  
**Calculated:** CALC_MOD_EQU  
**Access level:** 3  
**Data type:** FloatingPoint32  
**Dynamic index:** MDS, p0130  
**Func. diagram:** 6727  
**P-Group:** Motor  
**Units group:** 15_1  
**Unit selection:** p0349  
**Not for motor type:** PEM, REL  
**Scaling:** -  
**Expert list:** 1  
**Min**  
0.00000 [mH]  
**Max**  
1000.00000 [mH]  
**Factory setting**  
0.00000 [mH]  

**Description:**  
Sets the rotor/secondary section leakage inductance of the motor. For separately-excited synchronous motors: Sets the damping inductance in the rotor direction (d-axis).
This value is automatically calculated using the motor model (p0340 = 1, 2) or using the motor identification routine (p1910) (not for separately-excited synchronous motors).

Caution:
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note:
The parameter is not used for synchronous motors (p0300 = 2xx).

VECTOR:
If the rotor leakage inductance (p0358) for induction motors is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance (p0360) is automatically adapted to the new EMF (r0337). You are then advised to repeat the measurement for the saturation characteristic (p1960).

**p0359[0...n]**  
**Motor damping inductance, q axis / Mot L_damp q**

**Description:**
Sets the damping inductance of the separately-excited synchronous motor quadrature to the rotor direction (q axis).  
This parameter value is automatically calculated using the motor model (p0340 = 1, 2).

**Can be changed:** C2(3), U, T  
**Data type:** FloatingPoint32  
**P-Group:** Motor  
**Not for motor type:** ASM, PEM, REL

**Description:**
The saturation characteristic (flux as mapping of current) is defined using 4 points.
This parameter specifies the y coordinate (flux) for the 1st value pair of the characteristic.
Induction motors (ASM) and separately-excited synchronous motors (SESM):
- The saturation characteristic describes the mapping of the magnetizing current onto the motor flux.
- The parameter sets the first motor flux as a [%] referred to the rated motor flux.
Permanent-magnet synchronous motors (PESM):
- The saturation characteristic describes the mapping of the stator quadrature axis current onto the stator quadrature axis flux.
- The parameter sets the first stator quadrature axis flux as a [%] referred to the product of the unsaturated quadrature inductance (p0356) and the rated motor current.

**Dependency:**
The following applies for the flux values:
p0362 < p0363 < p0364 < p0365
The following applies for the stator quadrature axis flux values (PESM):
20% < p0362 < p0363 < p0364 < p0365
Refer to: p0366

**Caution:**
For permanent-magnet synchronous motors (PESM):
If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.

**Note:**
For induction motors, p0362 = 100 % corresponds to the rated motor flux.
For separately-excited synchronous motors p0362 = 100 % corresponds to an induced terminal voltage with the magnitude of the rated motor voltage (under no-load conditions at the synchronous speed).
With permanent-magnet synchronous motors, p0362 = 100 % corresponds to the product of the unsaturated quadrature inductance (p0356) and the rated motor current (p0305).
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

**p0363[0...n]** Motor saturation characteristic flux 2 / Mot saturat.flux 2

**Description:**
The saturation characteristic (flux as mapping of current) is defined using 4 points.
This parameter specifies the y coordinate (flux) for the 2nd value pair of the characteristic.
Induction motors (ASM) and separately-excited synchronous motors (SESM):
- The saturation characteristic describes the mapping of the magnetizing current onto the motor flux.
- The parameter sets the second motor flux as a [%] referred to the rated motor flux.
Permanent-magnet synchronous motors (PESM):
- The saturation characteristic describes the mapping of the stator quadrature axis current onto the stator quadrature axis flux.
- The parameter sets the second stator quadrature axis flux as a [%] referred to the product of the unsaturated quadrature inductance (p0356) and the rated motor current.
List of parameters

Dependency:
The following applies for the flux values:
p0362 < p0363 < p0364 < p0365
The following applies for the stator quadrature axis flux values (PESM):
20% < p0362 < p0363 < p0364 < p0365
Refer to: p0367

Caution:
For permanent-magnet synchronous motors (PESM):
If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated
quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.

Note:
For induction motors, p0363 = 100 % corresponds to the rated motor flux.
For separately-excited synchronous motors p0363 = 100% corresponds to an induced terminal voltage with the
magnitude of the rated motor voltage (under no-load conditions at the synchronous speed).
With permanent-magnet synchronous motors, p0362 = 100 % corresponds to the product of the unsaturated
quadrature inductance (p0356) and the rated motor current (p0305).
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been
selected (refer to p0300).

If the parameters are not set as specified, i.e. not in ascending order and to more than 20 %, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.

Note:
When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

<tr>
<td>Not for motor type: REL</td>
<td>Min Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0.00 [Arms]</td>
<td>6000.00 [Arms]</td>
<td>0.00 [Arms]</td>
</tr>
</tbody>
</table>

**Description:**
Sets the starting point of the current-dependent current controller adaptation where the adapted current controller gain \( p1715 \times p0393 \) is effective.

**Dependency:**
Refer to: p0391, p0392, p1402, p1715

**Caution:**
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**
When quick commissioning is exited with \( p3900 > 0 \), then the parameter is reset if a catalog motor has not been selected (refer to p0300).

### p0393[0...n]
**Current controller adaptation P gain scaling / I_adapt Kp scal**

<table>
<thead>
<tr>
<th>Vector</th>
<th>Calculated: CALC_MOD_REG</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: C2(3), U, T</td>
<td>Dynamic index: MDS, p0130</td>
<td>Func. diagram: 6714</td>
</tr>
<tr>
<td>Data type: FloatingPoint32</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>P-Group: Motor</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
</tr>
<tr>
<td>Not for motor type: REL</td>
<td>Min Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0.00 [%]</td>
<td>100.00 [%]</td>
<td>100.00 [%]</td>
</tr>
</tbody>
</table>

**Description:**
Sets the factor for the current controller P gain in the adaptation range (e.g. \( r0078 > p392 \), if \( p392 > p0391 \)). The value is referred to p1715.

**Dependency:**
Refer to: p0391, p0392, p1402, p1715

**Caution:**
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**
For \( p0393 = 100 \% \) or \( p1402.2 = 0 \), the current controller adaptation is disabled and p1715 is effective over the entire range.

When quick commissioning is exited with \( p3900 > 0 \), then the parameter is reset if a catalog motor has not been selected (refer to p0300).

### r0395[0...n]
**Actual stator resistance / R_stator act**

<table>
<thead>
<tr>
<th>Vector</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: -</td>
<td>Dynamic index: MDS, p0130</td>
<td>Func. diagram: 6300, 6730, 6731, 6732</td>
</tr>
<tr>
<td>Data type: FloatingPoint32</td>
<td>Units group: 16_1</td>
<td>Unit selection: p0349</td>
</tr>
<tr>
<td>P-Group: Motor</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td>Min Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>- [ohm]</td>
<td>- [ohm]</td>
<td>- [ohm]</td>
</tr>
</tbody>
</table>

**Description:**
Displays the actual stator resistance (phase value).

**Dependency:**
In the case of induction motors the parameter is also affected by the motor temperature model.

**Note:**
Refer to: p0350, p0352, p0620
### r0396[0...n] Actual rotor resistance / R_rotor_act

- **Vector_G**
  - **Can be changed:** -
  - **Data type:** FloatingPoint32
  - **P-Group:** Motor
  - **Not for motor type:** PEM, REL, FEM
  - **Min:** - [ohm]
  - **Max:** - [ohm]
  - **Access level:** 3
  - **Dependency:** Refer to: p0354, p0620
  - **Note:** In each case, only the rotor resistance of the active Motor Data Set is included with the rotor temperature of the thermal motor model.
  - **Description:** Displays the actual rotor/secondary section resistance (phase value). The parameter is affected by the motor temperature model.

### p0398[0...n] Angle magn decoupling (cross saturation) coeff 1 / Magn decoupl C1

- **Vector_G**
  - **Can be changed:** C2(3), U, T
  - **Data type:** FloatingPoint32
  - **P-Group:** Motor
  - **Not for motor type:** ASM, FEM
  - **Min:** -10.000000
  - **Max:** 10.000000
  - **Access level:** 4
  - **Dependency:** The magnetic cross coupling of the motor’s d and q axes caused by saturation (current-dependent) leads to an angle offset affecting the axis system d’q’; this decouples the magnetic quantities.
  - **Description:** The angle offset can be described as a 3rd order polynomial function of the load current consumed: $\phi_{Offset} = f(C1*iq + C3*iq^3)$
  - **Note:** This parameter is the coefficient C1; it describes the linear load impact effect.

### p0399[0...n] Angle magn decoupling (cross saturation) coeff 3 / Magn decoupl C3

- **Vector_G**
  - **Can be changed:** C2(3), U, T
  - **Data type:** FloatingPoint32
  - **P-Group:** Motor
  - **Not for motor type:** ASM, FEM
  - **Min:** -10.000000
  - **Max:** 10.000000
  - **Access level:** 4
  - **Dependency:** The magnetic cross coupling of the motor’s d and q axes caused by saturation (current-dependent) leads to an angle offset affecting the axis system d’q’; this decouples the magnetic quantities.
  - **Description:** The angle offset can be described as a 3rd order polynomial function of the load current consumed: $\phi_{Offset} = f(C1*iq + C3*iq^3)$
  - **Note:** This parameter is the coefficient C3; it describes the cubic load impact effect.

### p0400[0...n] Encoder type selection / Enc_typ sel

- **ENC**
  - **Can be changed:** C2(1, 4)
  - **Data type:** Integer16
  - **P-Group:** Encoder
  - **Not for motor type:** -
  - **Min:** 0
  - **Max:** 10100
  - **Access level:** 1
  - **Dependency:** Selects the encoder from the list of encoder types supported.
  - **Value:**
    - 0: No encoder
    - 202: DRIVE-CLiQ encoder AS20, singleturn
    - 204: DRIVE-CLiQ encoder AM20, multiturn 4096
    - 242: DRIVE-CLiQ encoder AS24, singleturn
    - 244: DRIVE-CLiQ encoder AM24, multiturn 4096

</tbody>
</table>

**Caution:**

An encoder type with p0400 < 9999 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9999) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).

**Note:**

The connected encoder can be identified by setting p0400 to 10000 or 10100. This assumes that the encoder supports this method, which is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface, DRIVE-CLiQ encoder.

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999
- set p0404.15 to 1

**Prerequisite:**

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.
Parameters
List of parameters

For p0400 = 10000 the following applies:
If an identification is not possible, then p0400 is set to 0.
For p0400 = 10100 the following applies:
If an identification is not possible, p0400 remains set to 10100 until it becomes possible.

<td></td>
</tr>
<tr>
<td>1</td>
<td>10100</td>
<td>9999</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Selects the gearbox type to pre-set the inversion and the gearbox factor.
Measuring gear factor = motor or load revolutions / encoder revolutions.

**Value:**
1: Gearbox 1:1 not inverted
2: Gearbox 2:7 inverted
3: Gearbox 4:17 inverted
4: Gearbox 2:10 inverted
9999: Gearbox, user-defined
10000: Identify gearbox
10100: Identify gearbox

**Dependency:**
Refer to: p0410, p0432, p0433

**Note:**
Re p0402 = 1:
Automatic setting of p0410 = 0000 bin, p0432 = 1, p0433 = 1.
Re p0402 = 2:
Automatic setting of p0410 = 0011 bin, p0432 = 7, p0433 = 2.
Re p0402 = 3:
Automatic setting of p0410 = 0011 bin, p0432 = 17, p0433 = 4.
Re p0402 = 4:
Automatic setting of p0410 = 0011 bin, p0432 = 10, p0433 = 2.
Re p0402 = 9999:
No automatic setting of p0410, p0432, p0433. The parameters should be manually set.
Re p0402 = 10000:
It is only possible to identify the gearbox type for a motor with DRIVE-CLiQ. Parameters p0410, p0432 and p0433 are set corresponding to the identified gearbox. If an identification is not possible, then p0402 is set to 9999.

Parameters

List of parameters

12 Equidistant zero mark Yes No -
13 Irregular zero mark Yes No -
14 Distance-coded zero mark Yes No -
15 Commutation with zero mark (not ASM) Yes No -
16 Acceleration Yes No -
17 Track A/B analog Yes No -
20 Voltage level 5 V Yes No -
21 Voltage level 24 V Yes No -
22 Remote sense (only SMC30) Yes No -
23 Resolver excit. Yes No -

Caution: This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

Notice: If an SSI encoder (bit 9 = 1) is used as motor encoder for permanent-magnet synchronous motors, then this is only permissible in conjunction with an additional A/B track (bit 3 = 1 or bit 4 = 1).

Note: ZM: Zero mark
SMC: Sensor Module Cabinet
If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:
The track A/B is adjusted to match the magnetic position of the motor.
Re bit 01, 02 (absolute encoder, multiturn encoder):
These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.
Re bit 10 (DRIVE-CLiQ encoder):
This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.
Re bit 12 (equidistant zero mark):
The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).
The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.
Re bit 13 (irregular zero mark):
The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.
Re bit 14 (distance-coded zero mark):
The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.
Re bit 15 (commutation with zero mark):
Only applicable for synchronous motors.
The function can be de-selected by priority via p0430.23.
For distance-coded zero marks, the following applies:
The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).
The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.
The fine synchronization is only started after two zero marks have been passed.

p0405[0...n] Square-wave encoder track A/B / Sq-wave enc A/B

ENC, VECTOR_G
Can be changed: C2(4) Calculated: - Access level: 3

<td>03</td>
<td>Meas. gearbox, activate pos. tracking for incremental encoders</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Notice:**
For p0411.3 = 1 the following applies:
If position tracking is activated for incremental encoders, only the position actual value is stored. Axis or encoder motion is not detected when de-activated! Any tolerance window entered in p0413 has no effect.

**Note:**
For the following events, the non-volatile, saved position values are automatically reset:
- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).
### List of parameters

#### p0412[0...n]

**Measuring gear, absolute encoder, rotary, revolutions, virtual / Abs rot rev**

**ENC, VECTOR_G**

Can be changed: C2(4)

Data type: Unsigned32

P-Group: Encoder

Not for motor type: -

Min: 0

Max: 4194303

Factory setting: 0

**Description:** Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.

**Dependency:**

This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).

**Note:**

The resolution that is set must be able to be represented using r0483.

For rotary axes/modulo axes, the following applies:

- **p0411.0 = 1:** This parameter is pre-set with p0421 and can be changed.
- **p0411.3 = 1:** The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

For linear axes, the following applies:

- **p0411.0 = 1:** This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.
- **p0411.3 = 1:** The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

#### p0413[0...n]

**Measuring gear, position tracking tolerance window / Pos track window**

**ENC, VECTOR_G**

Can be changed: C2(4)

Data type: FloatingPoint32

P-Group: Encoder

Not for motor type: -

Min: 0.00

Max: 4294967300.00

Factory setting: 0.00

**Description:** Sets a tolerance window for position tracking.

After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:

- Difference within the tolerance window → The position is reproduced as a result of the encoder actual value.
- Difference outside the tolerance window → An appropriate message is output.

**Dependency:**

Refer to: F31501, F32501, F33501

**Caution:** Rotation, e.g. through a complete encoder range is not detected.

**Note:**

The value is entered in integer (complete) encoder pulses.

For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range.

Example:

Quarter of the encoder range = (p0408 * p0421) / 4

It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).
### p0414[0...n] Redundant coarse position value relevant bits (identified) / Relevant bits

<td></td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Description
Sets the fine resolution in bits of the incremental position actual values.

#### Value
2 18 11

#### Factory setting
2 18 11
Note:
The parameter applies for the following process data:
- Gx_XIST1
- Gx_XIST2 for reference mark or flying measurement

The fine resolution specifies the fraction between two encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048).

For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information.

For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

### p0419[0...n]
**Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2**

**ENC, VECTOR_G**

- **Can be changed:** C2(4)
- **Data type:** Unsigned8
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** 2
- **Max:** 18

**Description:**
Sets the fine resolution in bits of the absolute position actual values.

**Dependency:**
Refer to: p0418

**Note:**
This parameter applies to process data Gx_XIST2 when reading the absolute value.

### p0420[0...n]
**Encoder connection / Enc_connection**

**ENC, VECTOR_G**

- **Can be changed:** C2(4)
- **Data type:** Unsigned16
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** -
- **Max:** -

**Description:**
Selecting the encoder connection.

**Absolute encoder rotary multiturn resolution / Enc abs multiturn**

**ENC, VECTOR_G**

- **Can be changed:** C2(4)
- **Data type:** Unsigned16
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** 0

**Description:**
Sets the number of rotations that can be resolved for a rotary absolute encoder.

**Caution:**
This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

#### Notice:

A bit-wise configuration is only possible if the corresponding property is also present in r0458.

#### Note:

- **Re bit 17 (burst oversampling):**
  - if bit = 1, burst oversampling is switched on.
  - if bit = 1, continuous oversampling is switched on.

- **Re bit 19 (Safety position actual value sensing):**
  - if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

- **Re bit 20 (speed calculation mode):**
  - if bit = 1, the speed is calculated via incremental difference without extrapolation.
  - if bit = 0, the speed is calculated via edge time measurement with extrapolation, p0453 is effective in this mode.

- **Re bit 21 (zero mark tolerance):**
  - if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

- **Re bit 22 (rotor position adaptation):**
  - if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

- **Re bit 23 (de-select commutation with zero mark):**
  - The bit should only be set for encoders that have not been adjusted.

- **Re bit 24 (commutation with selected zero mark):**
  - if bit = 1, the commutation position is corrected via a selected zero mark.

- **Re bit 25 (disconnect the encoder power supply on parking):**
  - if bit = 1, the encoder power supply is switched off on parking (0 V).
  - if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

- **Re bit 27 (extrapolate position values):**
  - if bit = 1, the extrapolation of the position values is activated.

- **Re bit 28 (cubic correction):**
  - if bit = 1, the cubic correction for track A/B sine is activated.
### List of parameters

**Re bit 29 (phase correction):**
- if bit = 1, the phase correction for track A/B sine is activated.

**Re bit 30 (amplitude correction):**
- if bit = 1, the amplitude correction for track A/B sine is activated.

**Re bit 31 (offset correction):**
- if bit = 1, the offset correction for track A/B sine is activated.

**p0431[0...n]** Angular commutation offset / Ang_com offset

**VECTOR_G**

- **Can be changed:** C2(4)
- **Data type:** FloatingPoint32
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** -180.00 ['']
- **Max:** 180.00 ['']

**Description:**
Sets the angular commutation offset.

**Dependency:**
The value is taken into account in r0094.
Refer to: r0094, r1778

**Caution:**
When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled:
- The motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx).
- The encoder is a resolver (p0404.23 = 1).
- The actual speed value is inverted (p0410.0 = 1).

**Note:**
The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).

**For p0404.5 = 1 (track C/D) the following applies:**
The angular offset in p0431 acts on track A/B, the zero mark on track C/D.

**For p0404.6 = 1 (Hall sensor) the following applies:**
The angular offset in p0431 acts on track A/B and the zero mark.

---

**p0432[0...n]** Gearbox factor, encoder revolutions / Grbx_fact enc_rev

**ENC, VECTOR_G**

- **Can be changed:** C2(4)
- **Data type:** Integer16
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** 1
- **Max:** 10000

**Description:**
Sets the encoder revolutions for the gearbox factor of the encoder evaluation.
The gearbox factor specifies the ratio between the encoder shaft and motor shaft (for motor encoders) or between the encoder shaft and the load.

**Dependency:**
This parameter can only be set for p0402 = 9999.
Refer to: p0402, p0410, p0433

**Note:**
Negative gearbox factors should be implemented with p0410.
### p0433[0...n] Gearbox factor, motor/load revolutions / Grbx_fact mot_rev

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: C2(4)</td>
</tr>
<tr>
<td>Data type: Integer16</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

**Description:**
Sets the motor and load revolutions for the gearbox factor of the encoder evaluation. The gearbox factor specifies the ratio between the encoder shaft and motor shaft (for motor encoders) or between the encoder shaft and the load.

**Dependency:**
This parameter can only be set for p0402 = 9999.
Refer to: p0402, p0410, p0432

**Note:**
Negative gearbox factors should be implemented with p0410.

### p0434[0...n] Encoder SSI error bit / Enc SSI error bit

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: C2(4)</td>
</tr>
<tr>
<td>Data type: Unsigned16</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the position and level of the error bit in the SSI protocol.

**Notice:**
The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.

**Note:**
Value = dcba
ba: Position of the error bit in the protocol (0 ... 63).
c: Level (0: Low level, 1: High level).
d: Status of the evaluation (0: Off, 1: On error bit, 2: On with 2 error bits ... 9: On with 9 error bits).
For several error error bits, the following applies:
- the position specified under ba and the additional bits are assigned increasing consecutively.
- the level set under c applies to all error bits.
Example:
p0434 = 1013
--> The evaluation is switched in and the error bit is at position 13 with a low level.
p0434 = 1113
--> The evaluation is switched in and the error bit is at position 13 with a high level.

### p0435[0...n] Encoder SSI alarm bit / Enc SSI alarm bit

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can be changed: C2(4)</td>
</tr>
<tr>
<td>Data type: Unsigned16</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the position and level of the alarm bit in the SSI protocol.

**Notice:**
The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.

**Note:**
Value = dcba
ba: Position of the alarm bit in protocol (0 ... 63).
c: Level (0: Low level, 1: High level).
d: State of the evaluation (0: Off, 1: On).
### Parameters

**List of parameters**

Example:
- **p0435 = 1014**
  --> The evaluation is switched in and the alarm bit is at position 14 with a low level.
- **p0435 = 1114**
  --> The evaluation is switched in and the alarm bit is at position 14 with a high level.

<table>
<thead>
<tr>
<th>p0436[0...n] Encoder SSI parity bit / Enc SSI parity bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENC, VECTOR_G</td>

<tr>
<td>Data type: Unsigned16</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Sets the position and parity of the parity bit in the SSI protocol.

**Notice:** The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.

**Note:** Value = dcba
- ba: Position of the parity bit in the protocol (0 ... 63).
- c: Parity (0: even, 1: uneven).
- d: State of the evaluation (0: Off, 1: On).

Example:
- **p0436 = 1015**
  --> The evaluation is switched in and the parity bit is at position 15 with even parity.
- **p0436 = 1115**
  --> The evaluation is switched in and the parity bit is at position 15 with uneven parity.

<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
<tr>
<td>31</td>
<td>Analog unipolar track monitoring</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:** Refer to: p0430, r0459
Note:
A value of zero is displayed if an encoder is not present.
Re bit 00:
When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.
Re bit 01:
If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.
For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.
Re bit 02:
If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.
Re Bit 04 and Bit 05:
The actual hardware only supports 1x or 4x signal evaluation.
Bit 5/4 = 0/0: Signal evaluation per period, 4x.
Bit 5/4 = 1/0: Illegal setting.
Bit 5/4 = 0/1: Signal evaluation per period, 1x.
Bit 5/4 = 1/1: Illegal setting.
Re bit 06:
If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.
Re bit 07:
If the bit is set, the encoder pulses which have not been corrected are added to p4688 at the zero mark.
Re bit 11:
If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.
Re bit 12:
Additional fault messages can be activated for extended fault diagnostics.
Re bit 13:
When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn_XIST2 can be requested via Gn_STW.13.
Re bit 20:
If the bit is set, the bandwidth of the analog filter for SMx10 (resolver) and SMx20 (sin/cos encoder) can be set via p4660.
Re bit 26:
Track monitoring is de-activated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.
Re bit 28:
Monitoring of the difference between incremental and absolute position in the case of linear encoders.
Re bit 29:
When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.
Re bit 31:
When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

</tbody>
</table>

**Dependency:**

Refer to: p0430, r0459

**Note:**

A value of zero is displayed if an encoder is not present.

Re bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

Re bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction detected. For a positive direction, the positive edge of the zero mark is considered and for a negative direction, the negative edge of the zero mark.

Re bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

Re Bit 04 and Bit 05:

Bit 5/4 = 0/0: Signal evaluation per period, 4x.
Bit 5/4 = 1/0: Signal evaluation per period, 4x.
Bit 5/4 = 0/1: Signal evaluation per period, 1x.
Bit 5/4 = 1/1: Illegal setting.

Re bit 06:

If the function is active, when dndt monitoring responds, the velocity actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

Re bit 07:

If the bit is set, the encoder pulses detected as faulty between two zero marks are accumulated (p4688).

Re bit 29:

When the bit is set, the EnDat encoder is initialized under a certain velocity and, therefore, with high accuracy. If initialization at a higher velocity is requested, fault F31151, F32151, or F33151 is output.
Re bit 31:
When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

<table>

<tr>
<td></td>
<td>0.00 [µs]</td>
<td>100.00 [µs]</td>
<td>0.64 [µs]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Description: Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values:
- 0: No filtering
- 0.04 µs
- 0.64 µs
- 2.56 µs
- 10.24 µs
- 20.48 µs

Dependency: Refer to: r0452
Notice: If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.
Note: The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.

<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Description: Copies the actual serial number of the encoder belonging to this Encoder Data Set (EDS) to p0441 ... p0445. Example:
For p0440[0] = 1, the serial number of the encoder belonging EDS0 is copied to p0441[0] ... p0445[0].

Value: 0: No action
1: Transfer serial number

Dependency: Refer to: p0441, p0442, p0443, p0444, p0445, r0460, r0461, r0462, r0463, r0464, p1990
Note: For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440.
In the following cases, copying is automatically started in the following cases:
1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
2.) When writing into p0431.
3.) For p1990 = 1.
p0440 is automatically set to 0 when the copying has been completed.
In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

**List of parameters**

### p0445[0...n] Encoder commissioning serial number part 5 / Enc comm ser_no 5

**ENC, VECTOR_G**

- Can be changed: C2(4)
- Calculated: CALC_MOD_ALL
- Access level: 4
- Data type: Unsigned32
- Dynamic index: EDS, p0140
- Func. diagram: -
- P-Group: Encoder
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min: 0000 hex
- Max: FFFF hex
- Factory setting: 0000 hex

**Description:** Serial number part 5 of the encoder for the commissioning.

**Dependency:** Refer to: p0440, p0441, p0442, p0443, p0444, r0460, r0461, r0462, r0463, r0464

**Note:** A value of zero is displayed if an encoder is not present.

### p0446[0...n] Encoder SSI number of bits before the absolute value / Enc SSI bit before

**ENC, VECTOR_G**

- Can be changed: C2(4)
- Calculated: -
- Access level: 3
- Data type: Unsigned16
- Dynamic index: EDS, p0140
- Func. diagram: -
- P-Group: Encoder
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min: 0
- Max: 65535
- Factory setting: 0

**Description:** Sets the number of bits before the absolute value in the SSI protocol.

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** For example, error bit, alarm bit or parity bit can be positioned at these bits.

### p0447[0...n] Encoder SSI number of bits absolute value / Enc SSI bit val

**ENC, VECTOR_G**

- Can be changed: C2(4)
- Calculated: -
- Access level: 3
- Data type: Unsigned16
- Dynamic index: EDS, p0140
- Func. diagram: -
- P-Group: Encoder
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min: 0
- Max: 65535
- Factory setting: 25

**Description:** Sets the number of bits for the absolute value in the SSI protocol.

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

### p0448[0...n] Encoder SSI number of bits after the absolute value / Enc SSI bit after

**ENC, VECTOR_G**

- Can be changed: C2(4)
- Calculated: -
- Access level: 3
- Data type: Unsigned16
- Dynamic index: EDS, p0140
- Func. diagram: -
- P-Group: Encoder
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min: 0
- Max: 65535
- Factory setting: 0

**Description:** Sets the number of bits after the absolute value in the SSI protocol.

**Caution:** This parameter is automatically pre-set for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** For example, error bit, alarm bit or parity bit can be positioned at these bits.

r0458  Sensor Module properties / SM properties

ENC  Can be changed: -  Calculated: -  Access level: 3
Data type: Unsigned32  Dynamic index: -  Func. diagram: 4704
P-Group: Encoder  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
-  -
Description: Sets the Sensor Module configuration.

Dependency: Refer to: p0437, p0600, p0601
Note: A value of zero is displayed if an encoder is not present.
Re bit 11:
When the property is set, the following parameters can be changed without the actual value in the encoder interface becoming invalid (state r0481.14 = 1 "parking encoder active"); p0314, p0315, p0430, p0431, p0441, p0442, p0443, p0444, p0445
Re bit 12:
The extended functions can be configured using p0437.
Re bit 13:
Encoder faults can be acknowledged via Gn_STW.15.
Re bit 14:
Only for internal Siemens use.
Re bit 23:
When the property is set, commutation with zero mark can be de-selected using p0430.23.
Re bit 24:
If the property is set, commutation to the selected zero mark can be carried out.

</tr>
</tbody>
</table>

**Description:** Displays the position difference before the measuring gear between powering down and powering up.

**Dependency:** Refer to: F31501, F32501, F33501

**Note:** The increments are displayed in the format the same as r0483. The position difference should be read in encoder increments.
Description:
Displays the position difference before the measuring gear between powering down and powering up.

Index:
[0] = Encoder 1
[1] = Encoder 2
[2] = Encoder 3

Dependency:
Refer to: F31501, F32501, F33501

Note:
The increments are displayed in the format the same as r0483. The position difference should be read in encoder increments.

Description:
Displays the encoder actual position value Gn_XIST1 according to PROFIdrive for diagnostics.
In contrast to r0482, the value is updated in each DRIVE-CLiQ basic clock cycle and displayed with sign.

Caution:
Following ramping-up or after a data set changeover, the new value is present at connector inputs which are interconnected to connector output r0479 and under certain circumstances take 100 ms to become available.

Reason:
These interconnections are updated in the background, unlike interconnections involving other connector outputs (e.g. CO: r0482).
The value is immediately available when non-cyclically reading r0479 (e.g. via the expert list).
### p0480

</tbody>
</table>

#### Note:

Re bit 14:
Displays the acknowledgement for "activate parking encoder" (Gn_STW.14 = 1) or encoder position actual value (Gn_XIST1) invalid.

Re bit 14, 15:
r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:
- the encoder is parked.
- the encoder is de-activated.
- the encoder is being commissioned.
- no parameterized encoder available.
- encoder data set is being changed over.

r0481.14 = 1 and r0481.15 = 1 has the following significance:
An encoder error has occurred and the encoder position actual value (Gn_XIST1) is invalid.

**Recommend.:**
Possible causes of the error codes:
- Error code 4097 and 4098: Defective Control Unit hardware.
- Error codes 4099 and 4100: Too many measuring pulses have occurred.

**Notice:** The encoder position actual value must be requested using the encoder control word Gn_STW.13.

**Note:**
- in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
- if GxZSW.15 = 1 (r0481), then an error code with the following significance is located in Gx_XIST2 (r0483):
  1: Encoder fault.
  2: Possible position shift in Gx_XIST1.
  3: Encoder parking not possible.
  4: Abort, reference mark search.
  5: Abort, retrieve reference value.
  6: Abort, flying measurement.
  7: Abort, retrieve measured value.
  8: Abort, absolute value transfer.
  3841: Function not supported.
  4097: Abort, reference mark search due to an initialization error.
  4098: Abort, flying measurement due to an initialization error.
  4099: Abort, reference mark search due to a measuring error.

Description:
Displays the redundant coarse encoder position including CRC (Cyclic Redundancy Check).

Upper 16 bits:
CRC over the redundant coarse encoder position.

Lower 16 bits:
Redundant coarse encoder position.
On an SMx Sensor Module, the encoder coarse position count direction is opposite to r0482 (encoder actual value Gn_XIST1). The value contains 2 bit fine resolution.

With a DRIVE-CLiQ encoder, the encoder coarse position count direction is the same as r0482.

Dependency:
The values are valid when the safety position actual value sensing is activated (p0430.19 = 1).
Refer to: p0430

Note:
This absolute value does not change, contrary to r0482, when de-selecting the function "parking axis".

<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Description:
Sets the behavior for the ENCODER fault response (motor encoder).
This means, for example, if an encoder fault occurs, encoderless operation can be automatically selected with a shutdown behavior that can be selected.
**Value:**
- 0: Encoder fault results in OFF2
- 1: Enc fault results in encoderless oper. and oper. continues
- 2: Encoder fault results in encoderless operation and OFF1
- 3: Encoder fault results in encoderless operation and OFF3
- 4: Encoder fault results in an armature short-cct int/DC braking
- 5: Enc fault results in encoderless op, operation continues, alarm

**Dependency:**
The following parameters are relevant for encoderless operation. Refer to: p0341, p0342, p1470, p1472, p1517, p1612, p1755
Refer to: F07575

**Caution:**
For a value = 1, 2, 3, the following applies:
- encoderless operation must have been started.

For a value = 1, the following applies:
- in spite of the motor encoder fault that has occurred, the motor continues to operate.

**Note:**
For a value = 1, 2, 3, the following applies:
- Refer to the status signal "encoderless operation due to a fault" (BO: r1407.13).
- Not possible for separately excited synchronous motors (p0300 = 5).

**Description:**
Sets the maximum permissible speed difference within the current controller sampling time for squarewave encoders.

**Dependency:**
Refer to: F31118, A31418

**Note:**
For a value of 0.0, the speed change monitoring is disabled.
if the set maximum speed difference is only exceeded for one sampling time of the current controller, then an appropriate alarm is output. However, if the maximum speed difference is exceeded over several sampling times, then a corresponding fault is output.

**Description:**
Sets the maximum permissible velocity difference within the current controller sampling time for square-wave encoders.

**Dependency:**
Refer to: F31118, A31418

**Note:**
For a value of 0.0, velocity change monitoring is disabled.
if the set maximum velocity difference is only exceeded for one sampling time of the current controller, then an appropriate alarm is output. However, if the maximum speed difference is exceeded over several sampling times, then a corresponding fault is output.

  - Refer to: F07902, F31118, A31418, F32118, A32418, F33118, A33418
- **Note:** For a value of 0.0, the speed change monitoring is disabled.
  - The following applies for square-wave encoders:
    - If the speed difference exceeds the threshold value p0492, depending on p0491, either encoderless closed-loop speed/torque control is selected or the drive is powered down with fault F3x118.
    - The following applies for other speed encoders:
      - If the speed difference exceeds threshold value p0492, in order to avoid subsequent faults, the old speed actual value is kept and after time p2178 shut down with fault F07902 (motor stalled).

**p0493**

- **Description:** Sets the input terminal for selecting the reference mark via BERO/switching signal when performing referencing with several zero marks.
  - The encoder interface supplies the position of the reference mark, which was detected immediately after the positive edge of the BERO signal.
- **Value:**
  - 0: No selection via BERO
  - 1: DI/DO 9 (X122.10/X121.8)
  - 2: DI/DO 10 (X122.12/X121.10)
  - 3: DI/DO 11 (X122.13/X121.11)
  - 4: DI/DO 13 (X132.10/X131.2)
  - 5: DI/DO 14 (X132.12/X131.4)
  - 6: DI/DO 15 (X132.13/X131.5)
  - 7: DI/DO 8 (X122.9/X121.7)
  - 8: DI/DO 12 (X132.9/X131.1)
- **Notice:**
  - For Cx32, NX10 and NX15, only DI/DO 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).
  - To the terminal designation:
    - The first designation is valid for CU320, the second for CU310.
- **Note:**
  - Refer to the encoder interface for PROFIdrive.
  - The terminal must be set as input (p0728).
  - For p0493 = 0 (factory setting) the following applies:
    - there is no logic operation between the reference mark search and an input signal.
  - For p0493 > 0, the following applies:
    - the positive edge of the input signal is evaluated. If the negative edge is to be evaluated, signal inversion must be parameterized via p0490.
    - if a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0580, p0680, p2517, or p2518.

**p0495** Equivalent zero mark, input terminal / ZM_equiv input

**ENC**
- **Can be changed:** U, T
- **Data type:** Integer16
- **P-Group:** Encoder
- **Not for motor type:** -
- **Min:** 0
- **Max:** 8
- **Factory setting:** 0

**Description:** Selects the input terminal for connecting an equivalent zero mark (external encoder zero mark).

**Value:**
- 0: No equivalent zero mark (evaluation of the encoder zero mark)
- 1: DI/DO 9 (X122.10/X121.8)
- 2: DI/DO 10 (X122.12/X121.10)
- 3: DI/DO 11 (X122.13/X121.11)
- 4: DI/DO 13 (X132.10/X131.2)
- 5: DI/DO 14 (X132.12/X131.4)
- 6: DI/DO 15 (X132.13/X131.5)
- 7: DI/DO 8 (X122.9/X121.7)
- 8: DI/DO 12 (X132.9/X131.1)

**Notice:** For Cx32, NX10 and NX15, only DI/DO 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

For p0494 > 0, the setting in p0494 and p0495 is invalid.

To the terminal designation:
- The first designation is valid for CU320, the second for CU310.

**Note:** Refer to the encoder interface for PROFIdrive.

For p0495 = 0 (factory setting), the encoder zero mark is evaluated as zero mark.

For p0495 > 0, the following applies:
- Depending on the direction of motion, the positive or negative edge at the appropriate input is evaluated.
  - Increasing position actual values (r0482) --> the 0/1 edge is evaluated.
  - Decreasing position actual values (r0482) --> the 1/0 edge is evaluated.

Only one zero mark is supported. If function 2, 3 or 4 is selected, this results in a fault message in Gn_ZSW.

The inversion of the inputs via p0490 affects the function "referencing with equivalent zero mark". This is the reason that the edge evaluation is interchanged as a function of the direction of motion.

An input can only be assigned to one encoder as measuring probe 1, 2 or equivalent zero mark. Exception: The same encoder can be simultaneously used as measuring probe and equivalent zero mark as both functions cannot be simultaneously requested.

**List of parameters**

**Description:**
Displays the trace signal for encoder diagnostics (low component).
The signal to be output is selected in p0496.

**Dependency:**
Refer to: p0496, r0497, r0499

**Description:**
Displays the trace signal for encoder diagnostics (high component).
The signal to be output is selected in p0496.

**Dependency:**
Refer to: p0496, r0497, r0498

**Description:**
Displays the trace signal for encoder diagnostics (high component).
The signal to be output is selected in p0496.

**Dependency:**
Refer to: p0496, r0497, r0498

**Description:**
Sets the technology application.
The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0578.

**Value:**
0: Standard drive (VECTOR)
1: Pumps and fans
2: Sensorless closed-loop control down to f = 0 (passive loads)

**Dependency:**
Refer to: p2175, p2177
Note: The calculation of parameters dependent on the technology application can be called up as follows:
- when exiting quick commissioning using p3900 > 0
- when writing p0340 = 1, 3, 5
- when writing p0578 = 1

For p0500 = 0 and when the calculation is initiated, the following parameters are set:
p1574 = 10 V (for separately-excited synchronous motors: 20 V)
p1750.2 = 0
p1802 = 4 (SVM/FLB without overcontrol)
p1803 = 106 %

For p0500 = 1 and when the calculation is initiated, the following parameters are set:
p1574 = 2 V (for separately-excited synchronous motors: 4 V)
p1750.2 = 0
p1802 = 9 (edge modulation), if r0192.0 = 1
p1802 = 4, if r0192.0 = 0
p1803 = 106 %

For p0500 = 2 and when the calculation is initiated, the following parameters are set:
p1574 = 2 V (for separately-excited synchronous motors: 4 V)
p1750.2 = 1: Encoderless control of the induction motor is effective down to zero frequency.
This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.
p1802 = 4 (SVM/FLB without overcontrol)
p1803 = 106 %

The setting of p1750 is only relevant for induction motors.
p1802 and p1803 are only relevant, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

---

### p0505 Selecting the system of units / Unit sys select

<table>
<thead>
<tr>
<th>B_INF, ENC, VECTOR_G</th>
<th>Can be changed: C2(5)</th>
<th>Calculated: -</th>
<th>Access level: 1</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the actual system of units.

**Value:**
1: SI system of units
2: System of units, referred/SI
3: US system of units
4: System of units, referred/US

**Dependency:**
The parameter cannot be changed when master control is active.

**Caution:**
If a per unit representation is selected and if the reference parameters (e.g. p2000) are subsequently changed, then the physical significance of several control parameters is also adapted at the same time. As a consequence, the control behavior can change (see p1576, p1621, p1744, p1752, p1755 and p1609, p1612, p1619, p1620).

**Note:**
Reference parameter for the unit system % are, for example, p2000 ... p2004. Depending on what has been selected, these are displayed using either SI or US units.

### p0528 Controller gain, system of units / Ctrl_gain_unit_sys

<table>
<thead>
<tr>
<th>ENC</th>

</tr>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the system of units for the controller gains.
Value:
0: Representation, physical/% (p0505)
1: Representation, no dimensions (referred)

Note:
For p0528 = 0 (physical%), the following applies:
Using p0505, the dependent parameters can be changed over between physical and % representation.
For SERVO (r0107) the following applies:
The parameter is pre-assigned a value of 0 and cannot be changed.

### p0528
**Controller gain, system of units / Ctrl_gain unit_sys**

<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0</td>
<td>104</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the bearing version.
Corresponding to the bearing version entered, its code number (p0531) is automatically set.
0 = No selection
1 = Manual entry
101 = STANDARD
102 = PERFORMANCE
103 = HIGH PERFORMANCE
104 = ADVANCED LIFETIME

**Dependency:**
Refer to: p0301, p0531, p0532, p1082

**Caution:**
For p0530 = 101, 102, 103, 104, the maximum bearing speed (p0532) is write protected. Write protection is withdrawn with p0530 = 1.

**Notice:**
If p0530 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3). The maximum speed of the bearing is factored into the limit for the maximum speed p1082.

**Note:**
For a motor with DRIVE-CLiQ, p0530 can only be set to 1.

### p0531[0...n]
**Bearing code number selection / Bearing codeNo sel**

**VECTOR_G**

<table>

Description: Display parameters for MT_DIAG
### p0570 Inhibit list values effective number / Inhib list no

**VECTOR**

<table>
<thead>
<tr>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>U, T</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned8  
**Dynamic index:** -  
**P-Group:** Applications  
**Units group:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min** 0  
**Max** 50  
**Factory setting** 0

**Description:** Sets the number of parameters in the inhibit list p0571 that should be withdrawn from the automatic motor and closed-loop control parameter calculation (p0340, p0578), starting from index 0.

**Note:** Defines the number of entries in p0571 that should be taken into account. This means that a value of 0 de-activates the complete list.

### p0571[0...49] Inhibit list, motor/closed-loop control parameter calculation / Inhib list calc

**VECTOR**

<table>
<thead>
<tr>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>U, T</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Integer16  
**Dynamic index:** -  
**P-Group:** Applications  
**Units group:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min** 0  
**Max** 2142  
**Factory setting** 0

**Description:** The inhibit list contains parameters that should be withdrawn from the automatic motor and closed-loop control parameter calculation (p0340, p0578).

**Value:**
- 0: No parameter
- 600: Motor temperature sensor
- 640: Current limit
- 1082: Maximum speed
- 1460: Speed controller P gain
- 1462: Speed controller integral time
- 1470: Speed controller P gain, encoderless
- 1472: Speed controller integral time, encoderless
- 1520: Torque limit upper/motoring
- 1521: Torque limit lower/regenerative
- 1530: Power limit motoring
- 1531: Power limit regenerative
- 1590: Flux controller P gain
- 1592: Flux controller integral time
- 2141: Speed threshold 1
- 2142: Hysteresis speed 1

**Note:** p0570 defines the number of entries (starting at index 0) for which the inhibit should apply. p0572 can be used to define for which drive data sets the inhibit list should apply.

If a motor data set is entered into a parameter number, then this is not overwritten as soon as only one drive data set refers to the motor data set (p0186).

### p0572[0...n] Activate/de-activate inhibit list / Inh_list act/deact

**VECTOR**

<table>
<thead>
<tr>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>U, T</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Integer16  
**Dynamic index:** DDS, p0180  
**P-Group:** Applications  
**Units group:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min** 0  
**Max** 1  
**Factory setting** 0

**Description:** Setting for activating/de-activating the inhibit list.

Depending on the setting, the parameters of the inhibit list (p0571) should be overwritten when calculating the motor and closed-loop control parameters for the particular drive data set (DDS).

**Value:**
- 0: No
- 1: Yes
**p0573**  
Inhibit automatic reference value calculation / Inhibit calc  

**Description:** Setting to inhibit the calculation of reference parameters (e.g. p2000) when automatically calculating the motor and closed-loop control parameters (p0340, p3900).  

**Value:**  
0: No  
1: Yes  

**Notice:** The inhibit for the reference value calculation is canceled when new motor parameters (e.g. p0305) are entered and only one drive data set exists (p0180 = 1). This is the case during initial commissioning.  
Once the motor and control parameters have been calculated (p0340, p3900), the inhibit for the reference value calculation is automatically re-activated.  

**Note:**  
If value = 0:  
The automatic calculation (p0340, p3900) overwrites the reference parameters.  
If value = 1:  
The automatic calculation (p0340, p3900) does not overwrite the reference parameters.  

**p0578[0...n]**  
Calculate technology-dependent parameters / Calc tec par  

**Description:** This parameter is used to calculate all parameters that depend on the technology of the application (p0500). All of the parameters are calculated that can also be determined using p0340 = 5.  

**Value:**  
0: No calculation  
1: Complete calculation  

**Note:** At the end of the calculations, p0578 is automatically set to 0.  

**p0595**  
Technological unit selection / Tech unit select  

**Description:** Selects the units for the parameters of the technology controller.  

**Value:**  
1: %  
2: 1 referred, no dimensions

Description:
Sets the sensor to monitor the motor temperature.
Value:
0: No sensor
1: Temperature sensor via encoder 1
2: Temperature sensor via encoder 2
3: Temperature sensor via encoder 3
10: Temperature sensor via a BICO interconnection
11: Temperature sensor via Motor Module / CU terminals
20: Temperature sensor via a BICO interconnection p0608
21: Temperature sensor via a BICO interconnection p0609
Dependancy:
Refer to: r0458, p0601, p0603

© Siemens AG 2012 All Rights Reserved
SINAMICS G130/G150 List Manual (LH2), 01/2012, A5E03263479A
1-209
Caution: If, for a selected temperature sensor (p0600 > 0), the motor temperature sensor is not connected but another sensor, then the temperature adaptation of the motor resistances must be switched out. Otherwise, in controlled-loop operation, torque errors will occur that will mean that the drive will not be able to be stopped.

Notice: The parameter is calculated in the drive using p0340 and is inhibited for p0340 > 0.

Re p0600 = 0:
With induction motors, the motor temperature is calculated using the motor temperature model (see also p0612.1).

Re p0600 = 1, 2, 3:
Bimetallic switch (p0601 = 4) and PT100 temperature sensor (p0601 = 5) are not supported.

Re p0600 = 10:
The BICO interconnection should be executed via connector input p0603.

Re p0600 = 11:
For SINAMICS S120 AC Drive (AC/AC) and using the Control Unit Adapter CUA31, the temperature sensor is connected at the adapter (X210).

Re p0600 = 20, 21:
The BICO interconnection should be executed via connector input p0608 or p0609.

Associated parameters: p0601, p4600 ... p4603, p4610 ... p4613

**p0601** Temperature sensor, sensor type / Temp_sens type

Description: Sets the sensor type for the temperature measurement at input X21 (booksize) or X41 (chassis).
The measured value is displayed in r0035.

Value:

0: No sensor
1: PTC alarm & timer
2: KTY84
4: Bimetallic NC contact alarm & timer

Dependency:
Refer to: r0035

Note: The measured value display depends on the selected sensor type.

Re p0601 = 0 (no sensor):
-> r0035 = -200 °C

Re p0601 = 1 (PTC alarm & timer):
Tripping resistance = 1650 Ohm (lower resistance --> r0035 = -50 °C, higher resistance --> r0035 = 250 °C).

Re p0601 = 2 (KTY84):
Displays the temperature in °C.

Re p0601 = 4 (bimetallic NC contact alarm & timer):
r0035 = -50 °C
-> The tripping resistance is less than 100 Ohm (bimetallic NC contact is closed or has a short-circuit).
r0035 = 250 °C
-> The tripping resistance is greater than 100 Ohm (bimetallic NC contact is open, not connected or has a wire breakage).

When using the following components, a value of 4 is set as the factory setting and can no longer be changed:
- Basic Line Module (BLM) with internal Braking Module.
- Active Line Module (ALM) with line filter Active Interface Module (AIM, p0220[0] = 41 ... 45).

In these cases, in addition to the temperature display, the temperature is also monitored.
### Motor temperature sensor type / Mot_temp_sens type

<table>

<td>Factory setting</td>
</tr>
</tbody>
</table>

**Description:**
Sets the sensor type for the motor temperature monitoring.

**Value:**
- 0: No sensor
- 1: PTC alarm & timer
- 2: KTY84
- 3: KTY84 and PTC (only for motors with DRIVE-CLiQ)
- 4: Bimetallic NC contact alarm & timer (only for temp_eval via MM)
- 5: PT100
- 10: Evaluation via several temperature channels SME12x
- 11: Evaluation via several temperature channels BICO

**Dependency:**
The thermal motor model is only calculated for p0612.1 = 1. Refer to: r0458, p0600, p0612

**Note:**
The temperature sensor for the temperature evaluation is set in p0600.
For p0600 = 10 (temperature sensor via a BICO interconnection), the setting in p0601 has no significance.
Information on using temperature sensors is provided in the following literature:
- hardware description of the appropriate components
- SINAMICS S120 Commissioning Manual

Re p0601 = 1 (PTC alarm & timer):
Tripping resistance = 1650 Ohm.
After the tripping resistance has been exceeded, an appropriate alarm is output and after the delay time set in p0606 has expired, an appropriate fault is output.
Re p0601 = 3 (KTY84 and PTC (only for motors with DRIVE-CLiQ)):
For motors with DRIVE-CLiQ and 2 temperature sensors, the value is automatically set.
Re p0601 = 4 (bimetallic NC contact alarm & timer (only for temperature evaluation via the Motor Module)):
Tripping resistance = 100 Ohm.
After tripping, an appropriate alarm is output and after the delay time set in p0606 has expired, an appropriate fault is output.
Re p0601 = 5 (PT100):
It is only possible to evaluate a PT100 for p0600 = 11 and r0192 bit 15 = 1.
Re p0601 = 10 (evaluation through several temperature channels (SME12x)):
Not permitted for p0600 = 0, 10, 11.
Associated parameters: p4600 ... p4603 (can be switched via EDS)
For r0458.8 = 1, a temperature evaluation is supported through several temperature channels.

**Examples:**
- When evaluating using SME120 or SME125, 4 temperature channels are available (parameterized using p4600, p4601, p4602, p4603).
- When evaluating using CU310 and CUA32, 2 temperature channels are available (encoder interface, parameterization via p4600 / terminal block, parameterization via p4601).
Re p0601 = 11 (evaluation via several temperature channels (BICO)):
Not permitted for p0600 = 0, 10, 11.
Associated parameters: p4610 ... p4613 (can be switched via MDS)
### p0602 Par_circuit power unit number, temperature sensor / PU_No temp_sensor

<td>-</td>
<td>-</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the signal source to evaluate the motor temperature via a BICO interconnection.

**Dependency:**
Refer to: p0600

**Note:**
- Temperature sensor KTY: Valid temperature range -48 °C ... 248 °C.
- PTC temperature sensor:
  - For a value = -50 °C, the following applies: Motor temperature < nominal response temperature of the PTC.
  - For a value = 250 °C, the following applies: Motor temperature >= nominal response temperature of the PTC.
- When using a Terminal Module 31 (TM31), the following applies:
  - the sensor type used is set using p4100.
  - the temperature signal is interconnected using CO: r4105.

### p0604[0...n] Mot_temp_mod 1/KTY alarm threshold / Mod 1/KTY A thresh

<table>
<thead>
<tr>

<td>21_1</td>
<td>1</td>
<td>0.0 °C</td>
<td>200.0 °C</td>
<td>130.0 °C</td>
</tr>
</tbody>
</table>

**Description:**
Sets the alarm threshold for monitoring the motor temperature for motor temperature model 1 or KTY. After the alarm threshold is exceeded, alarm A07910 is output and timer (p0606) is started.

**Dependency:**
- Refer to: p0606, p0612
- Refer to: F07011, A07910
- Refer to: p0505

**Caution:**
When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**
- The hysteresis is 2 K.
- When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).
**List of parameters**

### p0605[0...n]

</thead>
<tbody>
<tr>
<td>p0606</td>
<td>Sets the timer for monitoring the motor temperature for motor temperature model 2 or KTY. This timer is started when the temperature alarm threshold (p0604) is exceeded. If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output. If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.</td>
<td>2</td>
<td>FloatingPoint32</td>
<td>MDS, p0130</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>0.000 [s] 600.000 [s] 0.000 [s]</td>
</tr>
</tbody>
</table>

**Dependency:**
- Refer to: p0604, p0605
- Refer to: F07011, A07910

**Note:**
- With p0606 = 0 s, the timer is de-activated and only the fault threshold is effective.
- KTY sensor: When setting the minimum value, the timer is disabled and a fault is not output until p0605 is exceeded.
- PTC sensor, bimetallic NC contact: The timer minimum value has no special significance.

### p0607[0...n]
**Temperature sensor fault timer / Sensor fault time**

**VECTOR_G**

<table>
<thead>
<tr>

### p0610[0...n] Motor overtemperature response / Mot temp response

<table>
<thead>
<tr>
<th>Description:</th>
<th>Sets the system response when the motor temperature reaches the alarm threshold.</th>
</tr>
</thead>
</table>
| Value:       | 0: No response only alarm no reduction of I_max  
|              | 1: Alarm with reduction of I_max and fault                                         
|              | 2: Alarm and fault no reduction of I_max                                          |
| Dependency:  | Refer to: p0601, p0604, p0605  
|              | Refer to: F07011, A07910                                                        |
| Note:        | The I_max reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4). The I_max reduction results in a lower output frequency. |

### p0611[0...n] I2t motor model thermal time constant / I2t mot_mod T

| Description: | Sets the winding time constant.  
|              | The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached. |
| Dependency:  | This parameter is only used for synchronous motors (p3030 = 2xx).  
|              | Refer to: r0034, p0612, p0615  
|              | Refer to: F07011, A07910                                                         |
| Caution:     | This parameter is automatically pre-set from the motor database for motors from the motor list (p3031).  
|              | When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p3030 should be carefully observed when removing write protection. |
| Note:        | When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (also refer to p0612).  
|              | If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625. |

### p0612[0...n] Mot_temp_mod activation / Mot_temp_mod act

| Description: | Setting to activate the motor temperature model. |
| Bit field:   | Bit | Signal name | 1 signal | 0 signal | FP |
|              | 00  | Activating motor temperature model 1 (I2t) | Yes | No | - |
|              | 01  | Activate motor temperature model 2 | Yes | No | - |
| Dependency:  | Refer to: r0034, p0604, p0605, p0606, p0611, p0615, p0625, p0626, p0627, p0628  
|              | Refer to: F07011, A07012, A07910                                                   |
| Note:        | Mot_temp_mod: motor temperature model  
|              | Re bit 00:                        
|              | This bit is only used for permanent-magnet synchronous motors (p3030 = 2xx). It is only possible to activate this motor temperature model (I2t) for a time constant greater than zero (p0611 > 0). |
Re bit 01:
This bit is used to activate/deactivate the motor temperature model for induction motors.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
</tbody>
</table>

**Description:**
Selects the identification of the stator resistance after booting the Control Unit (only for vector control).

The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.

- **p0621 = 1:** Identification of the stator resistance only when the drive is powered up for the first time (pulse enable) after booting the Control Unit.
- **p0621 = 2:** Identification of the stator resistance every time the drive is powered up (pulse enable).

**Value:**
- 0: No Rs identification
- 1: Rs identification after switching-on again
- 2: Rs identification after switching-on each time

**Dependency:**
- perform motor data identification (see p1910) with cold motor.
- enter ambient temperature at time of motor data identification in p0625.

Refer to: p0622, r0623

**Notice:**
The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.

Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.

**Note:**
The measurement is carried out:
- For induction motors
- When vector control is active (see p1300)
- If a temperature sensor (KTY) has not been connected
- When the motor is at a standstill when switched on

When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).

If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is de-energized internally and alarm A07416 is displayed. The speed is enabled after completion of the measurement.

### p0622[0...n]

**Motor excitation time for Rs_ident after powering up again / t_excit Rs_id**

**VECTOR_G (n/M)**

<table>

<td>Factory setting</td>
<td>0.000 [s]</td>
</tr>
</tbody>
</table>

**Description:**
Sets the excitation time of the motor for the stator resistance identification after powering up again (restart).

**Dependency:**
Refer to: p0621, r0623

**Note:**
For p0622 < p0346 the following applies:

If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current.
Parameters

List of parameters

For p0622 >= p0346 the following applies:
Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.

**r0623**

Stator resistance of Rs identification after powering up again / R_stator Rs-Id

<td>100.0 [K]</td>
<td>0.0 [K]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the temperature offset for the PT100 measured value.
If there is a difference between the motor temperature displayed in r0035 and the actual motor temperature, this offset can be entered in this parameter, thereby compensating for the difference.

**Dependency:**
Refer to: p0600, p0601, p0602

**Note:**
The parameter only takes effect with the following settings:
- Temperature sensor of the power unit detected (p0600 = 11).
- Sensor type PT100 selected (p0601 = 5).
If the resistance in series with the PT100 (e.g. the cable resistance of the feeder cable) is known, the following conversion formula must be used:
Offset in p0624 = Measured resistance in ohms x 2.5 K/Ohm
Example:
Measured cable resistance = 2 Ohm
--> 2 Ohm x 2.5 K / Ohm = 5.0 K

**p0625[0...n]**

Motor ambient temperature / Mot T_ambient

</tr>
</tbody>
</table>

**Description:**
Defines the ambient temperature of the motor for calculating the motor temperature model.

**Note:**
The parameters for stator and rotor resistance (p0350, p0354) refer to this temperature.
If the thermal I2t motor model is activated for permanent-magnet synchronous motors (refer to p0611), p0625 is included in the model calculation if a temperature sensor is not being used (see p0601).

List of parameters

**p0636[0...n]**  Q flux direct axis current constant unsaturated / PSIQ KID UNSAT

**VECTOR_G**

- **Can be changed:** C2(3), U, T
- **Calculated:** -
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** MDS, p0130
- **P-Group:** Motor
- **Units group:** -
- **Not for motor type:** ASM, FEM
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.00 [Arms]
- **Max:** 10000.00 [Arms]
- **Factory setting:** 0.00 [Arms]

**Description:**
The non-linear and cross-coupled quadrature axis flux functions are defined using 4 coefficients. This parameter describes the interdependency of the unsaturated component of the direct axis current.

**Dependency:**
Refer to: p0634

**p0637[0...n]**  Q flux flux gradient saturated / PSIQ Grad SAT

**VECTOR_G**

- **Can be changed:** C2(3), U, T
- **Calculated:** -
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** MDS, p0130
- **P-Group:** Motor
- **Units group:** -
- **Not for motor type:** ASM, FEM
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.00 [mH]
- **Max:** 10000.00 [mH]
- **Factory setting:** 0.00 [mH]

**Description:**
The non-linear and cross-coupled quadrature axis flux functions are defined using 4 coefficients. This parameter describes the gradients of the saturated component over the quadrature axis current.

**Dependency:**
Refer to: p0634, p0635, p0636

**p0640[0...n]**  Current limit / Current limit

**VECTOR_G**

- **Can be changed:** C2(1, 3), U, T
- **Calculated:** CALC_MOD_ALL
- **Access level:** 2
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **P-Group:** Motor
- **Units group:** -
- **Not for motor type:** -
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.00 [Arms]
- **Max:** 10000.00 [Arms]
- **Factory setting:** 0.00 [Arms]

**Description:**
Sets the current limit.

**Dependency:**
Refer to: r0209, p0323

**Note:**
The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305, p0323 and p0338.

The current limit p0640 is limited to r0209 and p0323. The limit to p0323 is not realized if a value of zero is entered there.

The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the Motor Module.

The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5.

For VECTOR the following applies (p0107):
p0640 is limited to 4.0 x p0305.
p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]).
p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0).
For SERVO the following applies (p0107):
p0640 is pre-assigned as follows using the automatic parameterization (p0340 = 1, p3900 > 0) taking into account the limits r0209 and r0323:
- for induction motors: p0640 = 1.5 x p0305
- for synchronous motors: p0640 = p0338

**List of parameters**

**r0686[0...7]**  
**CO: Central measuring probe, measuring time rising edge / CenMeas t_meas 0/1**

- **CU_G130_DP**, **CU_G130_PN**, **CU_G150_DP**, **CU_G150_PN**
- **Can be changed:** -
- **Data type:** Unsigned16
- **P-Group:** Displays, signals
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Expert list:** 1

**Description:**
Displays the measuring time for a rising edge at the digital input for the "central measuring probe evaluation" function.

The measuring time is specified as a 16-bit value with a resolution of 0.25 µs.

- r0686[0]: Measuring time, rising edge measuring probe 1
- r0686[1]: Measuring time, rising edge measuring probe 2
- r0686[2]: Measuring time, rising edge measuring probe 3
- r0686[3]: Measuring time, rising edge measuring probe 4
- r0686[4]: Measuring time, rising edge measuring probe 5
- r0686[5]: Measuring time, rising edge measuring probe 6
- r0686[6]: Measuring time, rising edge measuring probe 7
- r0686[7]: Measuring time, rising edge measuring probe 8

**Note:**
The parameter is only active for the evaluation procedure p0684 = 0, 1. For p0684 = 16, r0686[0...7] = 0 is displayed.

**r0687[0...7]**  
**CO: Central measuring probe, measuring time falling edge / CenMeas t_meas 1/0**

- **CU_G130_DP**, **CU_G130_PN**, **CU_G150_DP**, **CU_G150_PN**
- **Can be changed:** -
- **Data type:** Unsigned16
- **P-Group:** Displays, signals
- **Not for motor type:** -
- **Min:** -
- **Max:** -

**Description:**
Displays the measuring time for a falling edge at the digital input for the "central measuring probe evaluation" function.

The measuring time is specified as a 16-bit value with a resolution of 0.25 µs.

- r0687[0]: Measuring time, falling edge measuring probe 1
- r0687[1]: Measuring time, falling edge measuring probe 2
- r0687[2]: Measuring time, falling edge measuring probe 3
- r0687[3]: Measuring time, falling edge measuring probe 4

**Description:**
Runs the corresponding macro files.

The binector inputs of the corresponding command data set are appropriately interconnected.

The selected macro file must be available on the memory card/device memory.

Example:
p0700 = 6 --> macro file PM000006.ACX is run.

**Dependency:**
Refer to: p0015, p1000, p1500, r8571

**Caution:**
When executing a specific macro, the corresponding programmed settings are made and become active.

**Notice:**
No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK_IBN group!

**Note:**
The macros in the specified directory are displayed in r8571. r8571 is not in the expert list of the commissioning software.

Macros available as standard are described in the technical documentation of the particular product.

### List of parameters

#### p0776[0...2] Test socket mode / Test skt mode
- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
  - **Can be changed**: U, T
  - **Data type**: Integer16
  - **P-Group**: Terminals
  - **Not for motor type**: -
  - **Min**: 96
  - **Max**: 99

**Description:**
Sets the mode for the test sockets.

**Value:**
- 96: Physical address (32-bit integer signal unsigned)
- 97: Physical address (32-bit integer signal)
- 98: Physical address (32-bit floating-point signal)
- 99: BICO signal

**Index:**
- [0] = T0
- [1] = T1
- [2] = T2

**Dependency:**
Refer to: p0771, r0772, r0774, p0777, p0779, p0780, p0783, p0784, r0786, p0788, p0789, r0790

#### p0777[0...2] Test socket characteristic value x1 / Test skt char x1
- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
  - **Can be changed**: U, T
  - **Data type**: FloatingPoint32
  - **P-Group**: Terminals
  - **Not for motor type**: -
  - **Min**: -100000.00 [%]
  - **Max**: 100000.00 [%]

**Description:**
The scaling characteristic for the test sockets is defined using two points. This parameter specifies the x coordinate (percentage) of the first point on the characteristic.

**Index:**
- [0] = T0
- [1] = T1
- [2] = T2

**Dependency:**
Can only be set when p0776 = 99.

Refer to: p0778, p0779, p0780, r0786

**Note:**
The value 0.00 % corresponds to 2.49 V.

#### p0778[0...2] Test socket characteristic value y1 / Test skt char y1
- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
  - **Can be changed**: U, T
  - **Data type**: FloatingPoint32
  - **P-Group**: Terminals
  - **Not for motor type**: -
  - **Min**: 0.00 [V]
  - **Max**: 4.98 [V]

**Description:**
The scaling characteristic for the test sockets is defined using two points. This parameter specifies the y coordinate (output voltage) of the first point on the characteristic.

**Index:**
- [0] = T0
- [1] = T1
- [2] = T2

**Dependency:**
Can only be set when p0776 = 99.

Refer to: p0777, p0779, p0780, r0786
### p0779[0...2] Test socket characteristic value x2 / Test skt char x2

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:** U, T  
- **Data type:** FloatingPoint32  
- **P-Group:** Terminals  
- **Not for motor type:** -  
- **Min:** -100000.00 [%]  
- **Max:** 427.9E9 [%]

**Description:**
The scaling characteristic for the test sockets is defined using two points. This parameter specifies the x coordinate (percentage) of the second point on the characteristic.

**Index:**
[0] = T0  
[1] = T1  
[2] = T2

**Dependency:**
Can only be set when p0776 = 99.

**Note:**
The value 100.00 % corresponds to 4.98 V.

### p0780[0...2] Test socket characteristic value y2 / Test skt char y2

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:** U, T  
- **Data type:** FloatingPoint32  
- **P-Group:** Terminals  
- **Not for motor type:** -  
- **Min:** 0.00 [V]  
- **Max:** 4.98 [V]

**Description:**
The scaling characteristic for the test sockets is defined using two points. This parameter specifies the y coordinate (output voltage) of the second point on the characteristic.

**Index:**
[0] = T0  
[1] = T1  
[2] = T2

**Dependency:**
Can only be set when p0776 = 99.

**Note:**
Refer to: p0777, p0778, p0780, r0786

### p0783[0...2] Test sockets offset / Test skt offset

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:** U, T  
- **Data type:** FloatingPoint32  
- **P-Group:** Terminals  
- **Not for motor type:** -  
- **Min:** -4.98 [V]  
- **Max:** 4.98 [V]

**Description:**
Sets an additional offset for the test sockets.

**Index:**
[0] = T0  
[1] = T1  
[2] = T2

### p0784[0...2] Test socket limit on/off / TestSktLim on/off

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:** U, T  
- **Data type:** Integer16  
- **P-Group:** Terminals  
- **Not for motor type:** -  
- **Min:** 0  
- **Max:** 1

**Description:**
Sets the limit for a signal to be output via test sockets.

**Value:**
0: Limiting off  
1: Limiting on
**Parameters**

**List of parameters**

<table>
<thead>

<td>FloatingPoint32</td>
<td>-</td>
<td>2</td>
<td>Terminals</td>
<td>-</td>
<td>-</td>
<td>1</td>
<td>-</td>
</tr>
</tbody>
</table>

**Note:**
- Limiting on:
  - If signals are output outside the permissible measuring range, the signal is limited to 4.98 V or to 0 V.
- Limiting off:
  - If signals are output outside the permissible measuring range, this causes signal overflow. In the case of signal overflow, the signal jumps from 0 V to 4.98 V or from 4.98 V to 0 V.

- Refer to: p0789, r0790

**Dependency:**
- Changes only become effective if p0776 does not equal 99.
- Refer to: p0789, r0790
Dependency: Changes only become effective if p0776 does not equal 99.
Refer to: p0788

### r0790[0...2]

**Test sockets physical address signal value / TestSktsPhyAddrVal**

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:**
- **Data type:** Unsigned32
- **P-Group:** Terminals

**Dependency:**
Displays the actual value of a signal determined via a physical address.

**Description:**
Displays the actual value of a signal determined via a physical address.

**Index:**
- [0] = T0
- [1] = T1
- [2] = T2

**Dependency:**
Only effective when p0776 = 97 or p0776 = 96.
Refer to: p0788

### p0795

**CU digital inputs simulation mode / CU DI simulation**

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Can be changed:** U, T
- **Data type:** Unsigned32
- **P-Group:** Commands

**Dependency:**
Sets the simulation mode for digital inputs.

**Description:**
Sets the simulation mode for digital inputs.

**Bit field:**

</tbody>
</table>

**Dependency:**
The setpoint for the input signals is specified using p0796.
Refer to: p0796, p9620

**Notice:**
If a digital input is used as signal source for the function "STO" (BI: p9620) then it is not permissible to select the simulation mode and this is rejected.

To the terminal designation:
The first designation stands for CU320, the second for CU310.
**Parameters**

**List of parameters**

**Note:**
This parameter is not saved when data is backed-up (p0971, p0977).

</table>

**Description:**  Displays what has the master control.

The drive can be controlled via the BICO interconnection or from external (e.g. the commissioning software).

**Dependency:**  Refer to: p0806

**Notice:**  The master control only influences control word 1 and speed setpoint 1. Other control words/setpoints can be transferred from another automation device.

**Note:**  Bit 0 = 0: BICO interconnection active  
Bit 0 = 1: Master control for PC/AOP  
The commissioning software (drive control panel) uses the master control, for example.

#### p0809[0...2]  Copy Command Data Set CDS / Copy CDS

</tr>
</tbody>
</table>

#### Parameter Descriptions

**p0826[0...n]**
- **Description:** Sets the freely-assignable motor number for the motor changeover.
- **Dependency:** Refer to: p0827
- **Caution:** When changing over motor data sets with the same motor number (e.g. star-delta changeover) and for a motor with brake, the motor brake remains open during the changeover.
- **Note:** When the motor data sets are changed over, the following applies: The same motor number signifies the same thermal model. For the same motor number, the correction values of the Rs, Lh or kT adaptation are applied for the data set changeover (refer to r1782, r1787, r1797).

**p0827[0...n]**
- **Description:** Sets the bit number for every motor data set.
- **Example:**
  - p0827[0] = 0: For MDS0, r0830.0 is switched.
  - p0827[1] = 5: For MDS1, r0830.5 is switched.
- **Dependency:** Refer to: p0826, r0830
- **Note:** A motor is only changed over (a new motor selected) after the pulses have been suppressed. When the motor data sets are changed over, the following applies:
  - Bit numbers that are not identical, signify that the motor must be changed over.

**p0828[0...n]**
- **Description:** Sets the signal source for the feedback signal when changing over the motor.
- **Dependency:** Refer to: p0833
- **Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
### r0830.0...15

**Description:**
Displays the status word of the motor changeover.
These signals can be connected to digital outputs to change over the motor.

**Bit field:**

</tbody>
</table>

**Dependency:**
Refer to: p0827

### p0831[0...15]

**Description:**
Sets the signal source for the feedback signal of the contactors when changing over motors.
There is a fixed inter-relationship between energizing the contactor and the feedback signal.

**Example:**
A changeover is to be made between MDS0 (motor 0) and MDS1 (motor 1). The contactors should be switched using bit 4 (contactor 0) and 5 (contactor 1). The changeover should be made with an interconnection of the feedback signal.

**Implementation:**
MDS0: p0827[0] = 4, interconnect output to switch contactor 0 to r0830.4, p0831[4] = "input, feedback signal, contactor 0"
MDS1: p0827[1] = 5, interconnect output to switch contactor 1 to r0830.5, p0831[5] = "input, feedback signal, contactor 1"

The following sequence applies when changing over from MDS0 to MDS1:
1. The status bit r0830.4 is deleted. When the feedback signal (p0831[4]) is connected, the system waits until the feedback signal "contactor open" is displayed. If the feedback signal is not connected, then the system waits for the switch-off interlocking time of 320 ms.
2. The status bit r0830.5 is set. If the feedback signal (p0831[5]) is connected, the system waits until the feedback signal "contactor closed" is displayed. If the feedback signal is not connected, then the system waits for the switch-on interlocking time of 160 ms.

<td>-</td>
<td></td>
</tr>
<tr>
<td>02</td>
<td>02</td>
<td>Suppress drive parking for EDS changeover</td>
<td>Yes</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>
**Note:**

Re bit 00:
When the bit is set and the motor has to be changed over, then p0827 must be set differently in the appropriate motor data sets.

Re bit 02:
The bit defines whether, for an EDS changeover, the status signal Gn_ZSW.14 is suppressed (parking encoder active).

Re motor changeover to running motor:
The "flying restart" function should also be activated (p1200) when changing over to a motor that is already running.

### r0835.2

**CO/BO: Data set changeover status word / DDS_ZSW**

<td>-</td>
</tr>
</tbody>
</table>

**Note:**
This parameter is only supplied with up-to-date values if data set changeover has been selected or is running.

Re bit 00:
The signal is only influenced when a motor changeover is set via p0827 (unequal bit numbers).

Re bit 01:
The signal is only influenced when an encoder changeover is set via p0187, p0188, or p0189.

Re bit 02:
A data set changeover is delayed by the time required for the internal parameter calculation.

Re bit 04:
A data set changeover is only carried out when the armature short circuit is not activated.

Re bit 05:
The following applies for SERVO:
A data set changeover is only carried out when pole position identification, encoder adjustment, motor data identification, and rotating measurement are not running.
The following applies for VECTOR:

A data set changeover is only carried out when pole position identification is not running.

Re bit 06:
A data set changeover is only carried out when the friction characteristic record is not running.

Re bit 07 (VECTOR only):
A data set changeover is only carried out when rotating measurement is not running.

Re bit 08 (VECTOR only):
A data set changeover is only carried out when motor data identification is not running.

Re bit 10:
A motor changeover is set with p0833.1 = 1. It can only be carried out when the application performs pulse suppression.

Re bit 11:
A motor changeover is set with p0833.0 = 1. The pulses are only enabled when the "Motor changeover feedback" signal is detected.

### r0836.0...3

**Description:**
Displays the selected Motor Data Set (MDS) and the selected Encoder Data Sets (EDS).

**Index:**
- [0] = Motor Data Set MDS selected
- [1] = Encoder 1 Encoder Data Set EDS selected
- [2] = Encoder 2 Encoder Data Set EDS selected
- [3] = Encoder 3 Encoder Data Set EDS selected

**Dependency:**
Refer to: r0049, p0186, p0187, p0188, p0189

**Note:**
Value 99 means the following: No encoder assigned (not configured).

#### p0839
**Motor changeover contactor control delay time / Mot_chg ctrl t_del**

<table>

<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the delay time for the contactor control for the motor changeover.

**Note:**
The delay time is taken into account in the following cases:
- for feedback signal, previous contactor "Open". The new motor contactor is controlled (energized) after the delay time has expired.
- for the feedback signal, new motor contactor "Closed". The pulses are enabled after the delay time has expired.

#### p0840[0...n]
**BI: ON / OFF (OFF1) / ON / OFF (OFF1)**

<table>

</tbody>
</table>

**Description:**
Sets the signal source for the command "ON/OFF (OFF1)"

**Recommend:**
When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.

**Dependency:**
Refer to: p1055, p1056

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

⚠️ **Notice:**
For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056.
The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056.
For binector input p0840 = 0 signal, the switch-on inhibit is acknowledged.
Only the signal source that originally powered up can also power down again.
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**
For drives with closed-loop speed control (p1300 = 20, 21), the following applies:
- BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression)
For drives with closed-loop torque control (p1300 = 22, 23), the following applies:
- BI: p0840 = 0 signal: immediate pulse suppression

For drives with closed-loop torque control (activated using p1501), the following applies:
- BI: p0840 = 0 signal: No dedicated braking response, but pulse cancelation when standstill is detected (p1226, p1227)

For drives with closed-loop speed/torque control, the following applies:
- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

For active infeeds (Active Line Module and Smart Line Module) the following applies:
- BI: p0840 = 0 signal: OFF1 (reduce Vdc along the ramp, then pulse suppression and pre-charging contactor/line contactor open)
- BI: p0840 = 0/1 signal: ON (pre-charging contactor/line contactor close, pulses can be enabled)

For passive infeeds (Basic Line Module) the following applies:
- BI: p0840 = 0 signal: OFF1 (pre-charging contactor/line contactor open)
- BI: p0840 = 0/1 signal: ON (pre-charging contactor/line contactor close)

r0863.1 of a drive can also be selected as signal source.

<table>
<thead>

**Description:** Sets the signal source for the command "control by PLC/no control by PLC". For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).
**List of parameters**

### Caution:
When "master control from PC" is activated, this binector input is ineffective. 

### Notice:
The parameter may be protected as a result of p0922 or p2079 and cannot be changed. 
This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1. If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

### Note:
The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake). 
If "enable speed controller" is withdrawn, then an existing brake will be closed. If "speed controller enable" is withdrawn, the pulses are not suppressed.

---

### p0855[0...n]
**BI: Unconditionally release holding brake / Uncond open brake**

<table>

<td>1 signal Master ctrl by PLC.</td>
</tr>
</tbody>
</table>

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

**Dependency:**
Refer to: p0858

**Note:**
The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake).

### p0856[0...n]
**BI: Speed controller enable / n_ctrl enable**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BI: p0855</td>
<td>1</td>
<td>1 signal Enables speed controller.</td>
</tr>
</tbody>
</table>

**Caution:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Dependency:**
Refer to: r0898

**Note:**
The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake).

### p0857
**Power unit monitoring time / PU t_monit**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BI: p0857</td>
<td>100.0 [ms]</td>
<td>100.0 [ms] 60000.0 [ms] 6000.0 [ms]</td>
</tr>
</tbody>
</table>

**Caution:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Dependency:**
Refer to: r0898

**Note:**
The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake).

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Dependency:**
Refer to: p0858

**Note:**
The signal via BI: p0858 (unconditionally close holding brake) has a higher priority than via BI: p0855 (unconditionally open holding brake).
The following applies for infeeds and drives:

The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, then fault F06000 (infeeds) or F07802 (drives) is output.

For drives, the following also applies:

After the pulse enable (operation enabled, p0852), the monitoring time is re-started. If the infeed does not signal ready to the drive within the monitoring time (using BI: p0864 of the drive), fault F07840 is initiated.

**Dependency:** Refer to: F06000, F07802, F07840, F30027

**Notice:**

- The maximum time to pre-charge the DC link is monitored in the power unit and cannot be changed. The maximum duration of the pre-charging depends on the power class and the power unit design.
- The monitoring time for the pre-charging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum pre-charging duration is exceeded.

**Note:**

- The factory setting for p0857 depends on the power class and the design of the power unit.
- The monitoring time for the ready signal of the power unit includes the time to pre-charge the DC link and, if relevant, the de-bounce time of the contactors.
- If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

**p0858[0...n]**

**BI: Unconditionally close holding brake / Uncond close brake**

<table>
<thead>
<tr>
<th>Vector_G</th>
<th>Can be changed:</th>
<th>T</th>
</tr>

<td>1</td>
<td></td>
</tr>
<tr>
<td>Factory setting:</td>
<td>863.1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:** Sets the signal source for the feedback signal from the line contactor.

**Recommend.:**

When the monitoring is activated (BI: p0860 not equal to r0863.1), then to control the line contactor, signal BO: r0863.1 of its own drive object should be used.

**Dependency:** Refer to: p0861, r0863

**Notice:**

- The line contactor monitoring is de-activated if the control signal of the particular drive object is set as the signal source for the feedback signal of the line contactor (BI: p0860 = r0863.1).
- The state of the line contactor is monitored depending on signal BO: r0863.1.

**Note:**

- When the monitoring is activated (BI: p0860 not equal to r0863.1), fault F07300 is then also output if the contactor is closed before it is controlled using r0863.1.
**p0861**  
**Line contactor monitoring time / LineContact t_mon**

**Dependency:**  
Refer to: p0864
Note:  
Re bit 00:  
Bit 0 signals that the infeed is ready.
When the operating signal is transferred via BO: r0863.0 this allows several drives to start (run-up) staggered over time when they are simultaneously powered up. 
To realize this, the following connections/interconnections are required:  
Drive 1: Interconnect BI: p0864 with BO: r0863.0 of the infeed  
Drive 2: Interconnect BI: p0864 with BO: r0863.0 of drive 1  
Drive 3: Interconnect BI: p0864 with BO: r0863.0 of drive 2, etc.  
The first drive only transfers the operating signal to the next drive after it has reached its ready condition. 
Re bit 01:  
Bit 1 is used to control an external line contactor. 
Re bit 02:  
This bit only signals line supply failure for Active Infeed (A_INF) and Smart Infeed (S_INF).

### p0864  
**BI: Infeed operation / INF operation**  
**VECTOR_G**  
Can be changed: T  
Data type: Unsigned32 / Binary  
P-Group: Commands  
Not for motor type: -  
Min: -  
Max: -  
Access level: 2  
Access level: 2  
Description: Sets the signal source for the operating signal of the infeed (e.g. BO: r0863.0).  
Dependency: Refer to: r0863  
Note: The sequence control of a servo/vector drive requires this signal. 
The following applies for an infeed without DRIVE-CLiQ:  
For these infeeds, the "ready" message is available via an output terminal. This signal must be connected to a digital input. The drives supplied from this infeed must use this signal as ready signal (BI: p0864 = digital input).

### p0868  
**Power unit DC switch debounce time / PU DC sw t_deboun**  
**VECTOR_G**  
Can be changed: T  
Data type: FloatingPoint32  
P-Group: Commands  
Not for motor type: -  
Min: 0 [ms]  
Max: 65000 [ms]  
Factor setting: 65000 [ms]  
Access level: 3  
Access level: 3  
Description: Sets the debounce time for the DC circuit breaker for Motor Modules in "chassis" format.  
Note: The following applies if p0868 = 65000 ms:  
The debounce time defined internally in the power unit's EEPROM is implemented.

### r0873  
**CO/BO: Infeed, total operation / INF total oper**  
**B_INF**  
Can be changed: -  
Data type: Unsigned16  
P-Group: Commands  
Not for motor type: -  
Min: -  
Max: -  
Access level: 2  
Access level: 2  
Description: Displays the operational readiness of the infeeds when using Smart Line Module (SLM) and Basic Line Module (BLM) together (mixed operation). 
In order that signal BO: r0873 is available at one of the infeeds, then BI: p0874 of the one infeed must be interconnected to BO: r0863.0 of the other infeed.  
Dependency: Refer to: r0863, p0874  
Note: Mixed operation is not possible with the Active Line Module (ALM)!
p0874  BI: Smart/ Basic Line Module operation / SLM/BLM operation

Can be changed: T  Calculated: -  Access level: 2
Data type: Unsigned32 / Binary  Dynamic index: -  Func. diagram: 8732, 8832
P-Group: Commands  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min -  Max -  Factory setting 0

Description: Setting to interconnect the ready signal for mixed operation of Smart Line Module (SLM) and Basic Line Module (BLM).
In order that signal BO: r0873 is available at one of the infeeds, then BI: p0874 of the one infeed must be intercon-
nected to BO: r0863.0 of the other infeed.
Dependency: Refer to: r0863, r0873
Note: Mixed operation is not possible with the Active Line Module (ALM)!

p0894  Parking pre-setting / Parking pre-set

Can be changed: U, T  Calculated: -  Access level: 4
Data type: Unsigned32  Dynamic index: -  Func. diagram: -
P-Group: Displays, signals  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min -  Max -  Factory setting 0000 bin

Description: Pre-setting for the "Parking axis" and "Parking encoder" function.
Dependency: Refer to: p0480, p0897
Note: Re bit 00:
If there is at least one BICO interconnection for "Parking axis" or "Parking encoder", this default setting is taken into
consideration during power-up.

p0895[0...n]  BI: Activate/de-activate power unit components / PU_comp act/deact

Can be changed: T  Calculated: -  Access level: 1
Data type: Unsigned32 / Binary  Dynamic index: PDS, p0120  Func. diagram: -
P-Group: Displays, signals  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min -  Max -  Factory setting 1

Description: Sets the signal source to activate/de-activate a power unit component.
Dependency: BI: p0895 = 0 signal
De-activating power unit components
BI: p0895 = 1 signal
Activating power unit components
Refer to: p0125, r0126
Refer to: A05054

Caution: It is not permissible to de-activate drive objects with safety functions enabled.
Notice: For Active Line Modules in the "Chassis" format, the Voltage Sensing Module (VSM, p0145) belonging to the power
unit is automatically activated/deactivated.
Note: The power unit is only de-activated when the pulses are suppressed.
For units connected in parallel, when one of the power units is de-activated, then the enable in p7001 is withdrawn.
**Parameters**

P-Group: Displays, signals  
Not for motor type: -  
Min -  
Max -  
Dependency:  
BI: p0897 = 0 signal  
The function "parking axis" is not selected.  
BI: p0897 = 1 signal  
The function "parking axis" is selected.  
Refer to: r0896  
Description: Sets the signal source to select the "parking axis" function.  
Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.  
Note: After it has been selected the "parking axis" function only becomes active when the pulses are suppressed.

220: SIEMENS telegram 220, PZD-10/10
352: SIEMENS telegram 352, PZD-6/6
999: Free telegram configuration with BICO

**Dependency:** Refer to: F01505, F01506

**Caution:** Telegrams 2, 3 and 4 are not suitable for sensorless vector control (p1300 = 20).
For sensorless vector control, it is necessary that the setpoint speed is entered at the ramp-function generator input (e.g. p1070) and not after the ramp-function generator (p1155).

**Note:** If a value is not equal to 999, a telegram is set and the automatically set interconnections in the telegram are inhibited.
The inhibited interconnections can only be changed again after setting value 999.

### r0924[0...1] ZSW bit pulses enabled / ZSW pulse enab

**VECTOR_G**

**Can be changed:** -

**Data type:** Unsigned16

**P-Group:** Communications

**Not for motor type:** -

**Description:** Displays the position of the "Pulses enabled" status signal in the PROFIdrive telegram.

**Index:**

[0] = Signal number
[1] = Bit position

### p0925 PROFIdrive clock synchronous sign-of-life tolerance / PD SoL_tol

**ENC, VECTOR_G (n/M)**

**Can be changed:** U, T

**Data type:** Unsigned16

**P-Group:** Communications

**Not for motor type:** -

**Description:** Sets the number of tolerated consecutive sign-of-life errors of the clock-cycle synchronous master.
The sign-of-life signal is normally received in PZD4 (control word 2) from the master.

**Dependency:** Refer to: p2045, r2065
Refer to: F01912

Parameters

List of parameters

r0946[0...65534] Fault code list / Fault code list

All objects
Can be changed: -
Calculated: -
Access level: 3
Data type: Unsigned16
Dynamic index: -
Func. diagram: 8060
P-Group: Messages
Unit selection: -
Not for motor type: -
Expert list: 0
Min -
Max -

Description:
Lists the fault codes stored in the drive unit.
The indices can only be accessed with a valid fault code.

Dependency:
The parameter assigned to the fault code is entered in r0951 under the same index.

r0947[0...63] Fault number / Fault number

All objects
Can be changed: -
Calculated: -
Access level: 3
Data type: Unsigned16
Dynamic index: -
Func. diagram: 1750, 8060
P-Group: Messages
Unit selection: -
Not for motor type: -
Expert list: 1
Min -
Max -

Description:
This parameter is identical to r0945.

r0948[0...63] Fault time received in milliseconds / t_fault recv ms

All objects
Can be changed: -
Calculated: -
Access level: 3
Data type: Unsigned32
Dynamic index: -
Func. diagram: 1750, 8060
P-Group: Messages
Unit selection: -
Not for motor type: -
Expert list: 1
Min - [ms]
Max - [ms]

Description:
Displays the system runtime in milliseconds when the fault occurred.

Dependency:
Refer to: r0945, r0947, r0949, r2109, r2114, r2130, r2133, r2136, r3115, r3120, r3122

Notice:
The time comprises r2130 (days) and r0948 (milliseconds).

Note:
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the fault buffer and the assignment of the indices is shown in r0945.
When the parameter is read via PROFl drive, the TimeDifference data type applies.

r0949[0...63] Fault value / Fault value

All objects
Can be changed: -
Calculated: -
Access level: 3
Data type: Integer32
Dynamic index: -
Func. diagram: 1750, 8060
P-Group: Messages
Unit selection: -
Not for motor type: -
Expert list: 1
Min -
Max -

Description:
Displays additional information about the fault that occurred (as integer number).

Dependency:
Refer to: r0945, r0947, r0948, r2109, r2130, r2133, r2136, r3115, r3120, r3122

Note:
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the fault buffer and the assignment of the indices is shown in r0945.
### p0952 Fault cases, counter / Fault cases qty

<table>

**Data type:** Unsigned16  
**Dynamic index:** -  
**P-Group:** Communications  
**Units group:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min:** 0  
**Max:** 255  
**Factory setting:** -

**Description:** Displays the corresponding value for the PROFIBUS baud rate.  
**Value:**  
0: 9.6 kbit/s  
1: 19.2 kbit/s  
2: 93.75 kbit/s  
3: 187.5 kbit/s  
4: 500 kbit/s  
6: 1.5 Mbit/s  
7: 3 Mbit/s  
8: 6 Mbit/s  
9: 12 Mbit/s  
10: 31.25 kbit/s  
11: 45.45 kbit/s  
255: unknown

### r0964[0...6] Device identification / Device ident.

<table>
<thead>
<tr>
<th>CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>

</table>

**Data type:** Unsigned16  
**Dynamic index:** -  
**P-Group:** Communications  
**Units group:** -  
**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1  
**Min:** -  
**Max:** -  
**Factory setting:** -

**Description:** Displays the device identification.  
**Index:**  
0 = Company (Siemens = 42)  
1 = Device type  
2 = Firmware version  
3 = Firmware date (year)  
4 = Firmware date (day/month)  
5 = Number of drive objects  
6 = Firmware patch/hot fix  

**Note:** Example:  
r0964[0] = 42 --> SIEMENS  
r0964[1] = device type, see below  
r0964[2] = 403 --> first part of the firmware version V04.03 (for second part, refer to index 6)  
r0964[3] = 2010 --> year 2010  
r0964[4] = 1705 --> 17th of May  
r0964[5] = 2 --> 2 drive objects  
r0964[6] = 200 --> second part, firmware version (complete version: V04.03.02.00)
### List of parameters

#### r0965
**PROFIdrive profile number / PD profile number**

<table>
<thead>
<tr>
<th>Device type</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>CU_G130_DP,</td>
<td></td>
<td></td>
<td>3</td>

</tr>
<tr>
<td>CU_G150_DP,</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CU_G150_PN</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16

**P-Group:** Communications

**Not for motor type:** -

**Min**
- 

**Max**
- 

**Factory setting**
- 

**Description:** Displays the PROFIdrive profile number and profile version.

Constant value = 0329 hex.

Byte 1: Profile number = 03 hex = PROFIdrive profile

Byte 2: Profile version = 29 hex = Version 4.1

**Note:** When the parameter is read via PROFIdrive, the Octet String 2 data type applies.

#### p0969
**System runtime relative / t_System relative**

<table>
<thead>
<tr>
<th>Device type</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>CU_G130_DP,</td>
<td>T</td>
<td></td>
<td>3</td>
</tr>
<tr>
<td>CU_G130_PN,</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CU_G150_DP,</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CU_G150_PN</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Data type:** Unsigned32

**P-Group:** Displays, signals

**Not for motor type:** -

**Min**
- 0 [ms]

**Max**
- 4294967295 [ms]

**Factory setting**
- 0 [ms]

**Description:** Displays the system runtime in ms since the last POWER ON.

**Note:** The value in p0969 can only be reset to 0.

The value overflows after approx. 49 days.

When the parameter is read via PROFIdrive, the TimeDifference data type applies.

#### p0970
**Reset infeed parameter / INF par reset**

<table>
<thead>
<tr>
<th>Device type</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>B_INF</td>
<td>C2(30)</td>
<td></td>
<td>2</td>
</tr>
</tbody>
</table>

**Data type:** Unsigned16

**P-Group:** Factory settings

**Not for motor type:** -

**Min**
- 0

**Max**
- 100

**Factory setting**
- 0

**Description:** The parameter is used to initiate a reset of the parameters of an individual infeed unit.

The parameters of the basic commissioning (refer to p0009) are in this case not reset (p0107, p0108, p0121, p0170). These can only be reset using the factory setting of the complete drive unit (p0976).

The sampling times (p0111, p0112, p0115) are only not reset if this results in a conflict with the basic clock cycle (p0110).

**Value:**
- 0: Inactive
- 1: Start a parameter reset
- 100: Start a BICO interconnection reset

**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).

At the end of the calculations, p0970 is automatically set to 0.

Parameter reset has been completed if p0970 and p0010 have been set to 0.
p0970  ENCODER reset parameters / ENC par reset

**Description:**
The parameter is used to initiate the reset of the parameters on the ENCODER drive object.

Parameter p0141 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).

**Value:**
- 0: Inactive
- 1: Start a parameter reset
- 100: Start a BICO interconnection reset

**Notice:**
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**
A factory setting run can only be started if p0010 was first set to 30 (parameter reset).

At the end of the calculations, p0970 is automatically set to 0.

Parameter reset has been completed if p0970 and p0010 have been set to 0.

---

p0970  TB30 reset parameters / TB30 par reset

**Description:**
The parameter is used to initiate a reset of the parameters on Terminal Board 30 (TB30).

Parameter p0161 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976).

**Value:**
- 0: Inactive
- 1: Start a parameter reset
- 100: Start a BICO interconnection reset

**Notice:**
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**
A factory setting run can only be started if p0010 was first set to 30 (parameter reset).

At the end of the calculations, p0970 is automatically set to 0.

Parameter reset has been completed if p0970 and p0010 have been set to 0.

---

p0970  TM150 reset parameters / TM150 par reset

**Description:**
The parameter is used to initiate a reset of the parameters on Terminal Module 150 (TM150).

**Value:**
- 0: Inactive
- 1: Start a parameter reset
- 100: Start a BICO interconnection reset

**Dependency:**
Refer to: p0010

**Notice:**
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**
A factory setting run can only be started if p0010 was first set to 30 (parameter reset).

At the end of the calculations, p0970 is automatically set to 0.
### p0970  TM31 reset parameters / TM31 par reset

| Description: | The parameter is used to initiate a reset of the parameters on Terminal Module 31 (TM31). The sampling time p4099 is not reset if in so doing a conflict occurs with the basic clock cycle. Parameter p0151 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976). |
| Value: | 0: Inactive<br>1: Start a parameter reset<br>100: Start a BICO interconnection reset |
| Dependency: | Refer to: p0010 |
| Notice: | After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. |
| Note: | A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. |

### p0970  TM54F reset parameters / TM54F par reset

| Description: | The parameter is used to initiate a reset of the parameters on Terminal Module 54F (TM54F). Parameter p0151 is not reset. It is only reset if the entire drive unit is reset to the factory settings (p0976). |
| Value: | 0: Inactive<br>1: Start a parameter reset<br>5: Starts a safety parameter reset<br>100: Start a BICO interconnection reset |
| Notice: | After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0. |
| Note: | A factory setting run can only be started if p0010 was first set to 30 (parameter reset). At the end of the calculations, p0970 is automatically set to 0. Parameter reset has been completed if p0970 and p0010 have been set to 0. For p0970 = 5 the following applies:<br>The password for Safety Integrated must be set.<br>When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed.<br>Then save the parameters and carry out a POWER ON. |

### p0970  Reset drive parameters / Drive par reset

| Description: | The parameter is used to initiate the reset of the parameters of an individual drive unit. |
Parameters
List of parameters

Parameters p0100, p0205 (only for VECTOR) and the parameters of the basic drive commissioning (p0009) are not reset (p0107, p0108, p0111, p0112, p0115, p0121, p0130, p0131, p0140, p0141, p0142, p0170, p0186 ... p0189).
These can only be reset using the factory setting of the complete drive unit (p0970).

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td>Inactive</td>
</tr>
<tr>
<td>1:</td>
<td>Start a parameter reset</td>
</tr>
<tr>
<td>5:</td>
<td>Starts a safety parameter reset</td>
</tr>
<tr>
<td>100:</td>
<td>Start a BICO interconnection reset</td>
</tr>
</tbody>
</table>

Dependency:
Refer to: F01659

Notice:
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note:
A factory setting run can only be started if p0010 was first set to 30 (parameter reset).
At the end of the calculations, p0970 is automatically set to 0.
Parameter reset has been completed if p0970 and p0010 have been set to 0.

For p0970 = 5 the following applies:
The password for Safety Integrated must be set.
When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed.
Then save the parameters and carry out a POWER ON.
For p0970 = 1 the following applies:
If a Safety Integrated function is parameterized (p9601), then the safety parameters are not reset. In this case, a fault F01659 is output with fault value 2.

<table>
<thead>
<tr>
<th>p0971</th>

</tbody>
</table>

Description:
Setting to save the parameter of the particular drive object in the non-volatile memory.

Value:
0: Inactive
1: Save drive object

Dependency:
Refer to: p0977, p1960, p3845, r3996

Caution:
The Control Unit power supply may only be powered down after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

Notice:
Writing to parameters is inhibited while saving.
The progress while saving is displayed in r3996.

Note:
Starting from the particular drive object, the following parameters are saved:
CU3xx: Device-specific parameters and PROFIBUS device parameters.
Other objects: Parameters of the actual object and PROFIBUS device parameters.
Prerequisite:
In order that the parameter of a drive object, saved with p0971 = 1, is read the next time that the Control Unit is booted, then all parameters must, as a minimum, have first been saved once with p0977 = 1.

<table>
<thead>
<tr>

Description:
Sets the required procedure to execute a hardware reset for the drive unit.

Value:
0: Inactive
1: Hardware-Reset immediate

© Siemens AG 2012 All Rights Reserved
2: Hardware reset preparation
3: Hardware reset after cyclic communication has failed

**Danger:**
It must be absolutely ensured that the system is in a safe condition.
The memory card/device memory of the Control Unit must not be accessed.

**Note:**
If value = 1:
Reset is immediately executed and communications interrupted.
After communications have been established, check the reset operation (refer below).
If value = 2:
Help to check the reset operation.
Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.
After communications have been established, check the reset operation (refer below).
If value = 3:
The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.
If cyclic communication is not active, then the reset is immediately executed.
If the cyclic communication is active for both PROFinet interfaces, then the reset is executed after completing both cycle communications.
After communications have been established, check the reset operation (refer below).
To check the reset operation:
After the drive unit has been restarted and communications have been established, read p0972 and check the following:
p0972 = 0? --> The reset was successfully executed.
p0972 > 0? --> The reset was not executed.

### Parameters

#### List of parameters

- **p0976**: Reset and load all parameters / Reset load all parameters
  - **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
  - **Can be changed**: C1(30)
  - **Data type**: Unsigned16
  - **P-Group**: Factory settings
  - **Not for motor type**: -
  - **Description**: Resets or downloads all parameters of the drive system.
  - **Value**:  
    - **0**: Inactive
    - **1**: Start reset of all parameters to factory setting
    - **2**: Start download of param. saved in non-volatile mem w/ p0977=1
    - **3**: Start download of volatile parameters from RAM
    - **10**: Start download of param. saved in non-volatile mem w/ p0977=10
    - **11**: Start download of param. saved in non-volatile mem w/ p0977=11
    - **12**: Start download of param. saved in non-volatile mem w/ p0977=12
    - **20**: Start download Siemens internal setting 20
    - **21**: Start download Siemens internal setting 21
    - **22**: Start download Siemens internal setting 22
    - **23**: Start download Siemens internal setting 23
    - **24**: Start download Siemens internal setting 24
    - **25**: Start download Siemens internal setting 25
    - **26**: Start download Siemens internal setting 26
    - **100**: Start resetting of all BICO interconnections
    - **1011**: Start download of param. saved in volatile mem w/ p0977=1011
    - **1012**: Start download of param. saved in volatile mem w/ p0977=1012
    - **1013**: Start download of param. saved in volatile mem w/ p0977=1013
  - **Notice**: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
  - **Note**: After all of the parameters have been reset to their factory setting, the system must be commissioned for the first time again.
  - **Procedure**:  
    1. Set p0009 = 30 (parameter reset).
    2. Set p0976 to "required value". The system is rebooted.
    p0976 is automatically set to 0 and p0009 is automatically set to 1 after this has been carried out.

- **p0977**: Save all parameters / Save all parameters
  - **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
  - **Can be changed**: U, T
  - **Data type**: Unsigned16
  - **P-Group**: Factory settings
  - **Not for motor type**: -
  - **Description**: Saves all parameters of the drive system to the non-volatile memory.
  - **Value**:  
    - **0**: Inactive
    - **1**: Save in non-volatile memory - downloaded at POWER ON
    - **10**: Save as opt. in non-vol. memory - downloaded w/ p0976=10
    - **11**: Save as opt. in non-vol. memory - downloaded w/ p0976=11
    - **12**: Save as opt. in non-vol. memory - downloaded w/ p0976=12
    - **20**: Save in non-volatile memory as setting 20 (reserved)
    - **21**: Save in non-volatile memory as setting 21 (reserved)
    - **22**: Save in non-volatile memory as setting 22 (reserved)
    - **23**: Save in non-volatile memory as setting 23 (reserved)
    - **24**: Save in non-volatile memory as setting 24 (reserved)
    - **25**: Save in non-volatile memory as setting 25 (reserved)
26: Save in non-volatile memory as setting 26 (reserved)
80: Save in non-volatile memory time-optimized (reserved)
1011: Save in volatile memory, downloaded with p0976=1011
1012: Save in volatile memory, downloaded with p0976=1012
1013: Save in volatile memory, downloaded with p0976=1013

Dependency:
Refer to: p0976, p1960, p3845, r3996

Caution:
The Control Unit power supply may only be powered down after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).

Notice:
Writing to parameters is inhibited while saving.
The progress while saving is displayed in r3996.

Note:
Parameters saved with p0977 = 10, 11 or 12 can be downloaded again with p0976 = 10, 11 or 12.

### p0978[0...24]

**List of drive objects / List of the DO**

<table>
<thead>
<tr>
<th>CU_G130_DP,</th>
<th>Can be changed: C1(1)</th>
<th>Calculated: -</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CU_G130_PN,</td>
<td>Data type: Unsigned8</td>
<td>Dynamic index: -</td>
<td>Func. diagram: -</td>
</tr>
<tr>
<td>CU_G150_DP,</td>
<td>P-Group: Topology</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>CU_G150_PN</td>
<td>Not for motor type: -</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
</tr>
</tbody>
</table>

**Min**

| 0                        | 255                               |

**Max**

<table>
<thead>
<tr>
<th>[0] 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1...24] 0</td>
</tr>
</tbody>
</table>

**Description:**
This parameter is an image of p0101 in conformance with PROFIdrive.
Parameters p0101 and p0978 contain the following information:
1) The same number of drive objects
2) The same drive objects
In this sense, they are consistent.

**Difference between p0101 and p0978:**
p0978 can be re-sorted and a zero inserted in order to identify those drive objects that participate in the process data exchange and to define their sequence in the process data exchange. Drive objects that are listed after the first zero, are excluded from the process data exchange.

For p0978, in addition, the value 255 can be inserted a multiple number of times.
p0978[n] = 255 means: The drive object is visible for the PROFIBUS master and is empty (without any actual process data exchange). This allows cyclic communications of a PROFIBUS master with unchanged configuring to the drive units with a lower number of drive objects.

**Dependency:**
Refer to: p0101, p0971, p0977

**Note:**
p0978 cannot be changed when the drive system is first commissioned. The reason for this is that at this time the actual topology has still not been acknowledged (p0099 is still not equal to r0098 and p0009 is set to 0).

### r0979[0...10]

**PROFIdrive encoder format / PD encoder format**

All objects Can be changed: - Calculated: - Access level: 3
Data type: Unsigned16 Dynamic index: - Func. diagram: -
P-Group: - Units group: - Unit selection: -
Not for motor type: - Scaling: - Expert list: 0
Min - Max Factory setting
-
Description: Displays those parameters with a value other than the factory setting for this drive.
Dependency: Refer to: r0990, r0991
Note: Modified parameters are displayed in indices 0 to 98. If an index contains the value 0, then the list ends here.
This list consists solely of the following parameters:
r0990[0...99], r0991[0...99] ... r0999[0...99]
The parameters in this list are not displayed in the expert list of the commissioning software. However, they can be
read from a higher-level control system (e.g. PROFIBUS master).

p1000[0...n] Macro Connector Inputs (CI) for speed setpoints / Macro CI n_set

VECTOR_G Can be changed: C2(1), T Calculated: - Access level: 1
Data type: Unsigned32 Dynamic index: CDS, p0170 Func. diagram: -
P-Group: Commands Units group: - Unit selection: -
Not for motor type: - Scaling: - Expert list: 1
Min 0 Max 999999 Factory setting 0

Description: Runs the corresponding macro files.
The Connector Inputs (CI) for the speed setpoints of the appropriate Command Data Set (CDS) are appropriately
interconnected.
The selected macro file must be available on the memory card/device memory.
Example: p1000 = 6 --> the macro file PM000006.ACX is run.
Dependency: Refer to: p0015, p0700, p1500, r8572
Caution: When executing a specific macro, the corresponding programmed settings are made and become active.
Notice: No errors were issued during quick commissioning (p3900 = 1) when writing to parameters of the QUICK_IBN
group!
Note: The macros in the specified directory are displayed in r8572. r8572 is not in the expert list of the commissioning
software.
Macros available as standard are described in the technical documentation of the particular product.
CI: Connector Input

<td>No</td>
<td>-</td>
</tr>
<tr>
<td>04</td>
<td>Ramp-function generator always active</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

Notice: The following prerequisites must be fulfilled in order to be able to save the setpoint (Bit 03 = 1) in a non-volatile fashion:
- Firmware with V2.3 or higher.
- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).

Note: Re bit 00:
0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.
1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.
Re bit 01:
0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).
1: With ramp-function generator in the automatic mode.

For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

Re bit 02:
0: Without initial rounding-off
1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).
The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:
\[ r = 0.01 \% \times \frac{p1082 \ [1/s]}{0.13^2 \ [s^2]} \]
The jerk acts up until the maximum acceleration is reached (a_max = p1082 [1/s] / p1047 [s]), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.
Re bit 03:
0: Non-volatile data save de-activated.
1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).
Re bit 04:
When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050.
### Description:
Sets the signal source to continually increase the setpoint for the motorized potentiometer.
The setpoint change (CO: r1050) depends on the set ramp-up time (p1047) and the duration of the signal that is present (BI: p1035).

### Dependency:
Refer to: p1036

### Notice:
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

### Description:
Sets the signal source to continuously lower the setpoint for the motorized potentiometer.
The setpoint change (CO: r1050) depends on the set ramp-down time (p1048) and the duration of the signal that is present (BI: p1036).

### Dependency:
Refer to: p1035

### Notice:
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

### Description:
Sets the maximum speed/velocity for the motorized potentiometer.
Note:
This parameter is automatically pre-assigned in the commissioning phase.
The setpoint output from the motorized potentiometer is limited to this value.

### Description:
Sets the minimum speed/velocity for the motorized potentiometer.
Note:
This parameter is automatically pre-assigned in the commissioning phase.
The setpoint output from the motorized potentiometer is limited to this value.
### List of parameters

### p1063[0...n] Speed limit setpoint channel / n_limit_setp

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** -
- **Access level:** 1
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **P-Group:** Setpoints
- **Units group:** 3_1
- **Not for motor type:** -
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.000 [rpm]
- **Max:** 210000.000 [rpm]
- **Factory setting:** 40000.000 [rpm]

**Description:** Sets the speed limit/velocity limit effective in the setpoint channel.

**Dependency:** Sets the speed limit/velocity limit effective in the setpoint channel.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

### p1070[0...n] CI: Main setpoint / Main setp

**VECTOR_G**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 3
- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** CDS, p0170
- **P-Group:** Setpoints
- **Units group:** -
- **Not for motor type:** -
- **Scaling:** -
- **Expert list:** 1
- **Min:** -
- **Max:** -
- **Factory setting:** 1024[0]

**Description:** Sets the signal source for the main setpoint.

**Examples:**
- r1024: Fixed speed setpoint effective
- r1050: Motor, potentiometer setpoint after the ramp-function generator

**Dependency:** Refer to: p1082, p1083, p1085, p1086, p1088

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

### p1071[0...n] CI: Main setpoint scaling / Main setp scal

**VECTOR_G**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 3
- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** CDS, p0170
- **P-Group:** Setpoints
- **Units group:** -
- **Not for motor type:** -
- **Scaling:** PERCENT
- **Expert list:** 1
- **Min:** -
- **Max:** -
- **Factory setting:** 1

**Description:** Sets the signal source for scaling the main setpoint.

### p1075[0...n] CI: Supplementary setpoint / Suppl setp

**VECTOR_G**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 3
- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** CDS, p0170
- **P-Group:** Setpoints
- **Units group:** -
- **Not for motor type:** -
- **Scaling:** -
- **Expert list:** 1
- **Min:** - [rpm]
- **Max:** - [rpm]
- **Factory setting:** 0

**Description:** Sets the signal source for the supplementary setpoint.
### Dependency:
Refer to: p1076, r1077, r1078

</tbody>
</table>

#### Description:
Sets the lowest possible motor speed.
This value is not undershot in operation.

#### Dependency:
Refer to: p1106

#### Notice:
The effective minimum speed is formed from p1080 and p1106.

#### Note:
The parameter value applies for both motor directions.
In exceptional cases, the motor can operate below this value (e.g. when reversing).
### List of parameters

#### p1082[0...n]

**Maximum speed / \( n_{\text{max}} \)**

<td><strong>Factory setting</strong></td>
<td>1500.000 [rpm]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the highest possible speed.

**Dependency:**
- For vector control (p1300 = 20 ... 23) the maximum speed is limited to \((60.0 / (8.333 \times p0115[0] \times r0313))\). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.
- If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.
- For reactors and dU/dt filters, it is limited to \(150 \, \text{Hz} \times 60 / r0313\) (for chassis power units) or \(120 \, \text{Hz} \times 60 / r0313\) (for booksize power units).
- Refer to: p0115, p0230, r0313, p0322, p0324, r0336, p0532

**Notice:**
- After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.
- The parameter applies for both motor directions.

#### p1083[0...n]

**Description:** Sets the signal source for the speed/velocity limit of the negative direction.
Parameters

List of parameters

**Description:** Sets skip speed 1.

**Dependency:** Refer to: p1092, p1093, p1094, p1101

**Notice:** Skip bandwidths can also become ineffective as a result of the downstream limits in the setpoint channel.

**Note:** The skip (suppression) speeds can be used to prevent the effects of mechanical resonance.

**Description:** Sets skip speed 2.

**Dependency:** Refer to: p1091, p1093, p1094, p1101

**Notice:** Skip bandwidths can also become ineffective as a result of the downstream limits in the setpoint channel.

**Description:** Sets skip speed 3.

**Dependency:** Refer to: p1091, p1092, p1094, p1101

**Notice:** Skip bandwidths can also become ineffective as a result of the downstream limits in the setpoint channel.

**Description:** Sets skip speed 4.

**Dependency:** Refer to: p1091, p1092, p1093, p1101

**Notice:** Skip bandwidths can also become ineffective as a result of the downstream limits in the setpoint channel.
**p1101[0...n]** | Skip speed bandwidth / n_skip bandwidth
---|---
Vector G | Can be changed: U, T | Calculated: - | Access level: 3

**Data type:** FloatingPoint32  
**P-Group:** Setpoints  
**Not for motor type:** -  
**Min** | 0.000 [rpm]  
**Max** | 210000.000 [rpm]  
**Units group:** 3_1  
**Scaling:** p2000  
**Unit selection:** p0505  
**Expert list:** 1  
**Func. diagram:** 3050  
**Dynamic index:** DDS, p0180  
**Data type:** DDS  
**Not for motor type:** -  
**Min** | 0.000 [rpm]  
**Max** | 210000.000 [rpm]  

**Description:** Sets the bandwidth for the skip speeds/velocities 1 to 4.

**Dependency:** Refer to: p1091, p1092, p1093, p1094

**Note:** The setpoint (reference) speeds are skipped (suppressed) in the range of the skip speed +/-p1101. Steady-state operation is not possible in the skipped (suppressed) speed range. The skip (suppression) range is skipped.

**Example:**

p1091 = 600 and p1101 = 20  
--> setpoint speeds between 580 and 620 [rpm] are skipped.

For the skip bandwidths, the following hysteresis behavior applies:

For a setpoint speed coming from below, the following applies:

r1170 < 580 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 580 [rpm]

For a setpoint speed coming from above, the following applies:

r1170 > 620 [rpm] and 580 [rpm] <= r1114 <= 620 [rpm] --> r1119 = 620 [rpm]

**Description:** The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.

**Dependency:** Refer to: p1082, p1138

**Note:** The ramp-up time can be scaled via connector input p1138. The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized.

For U/f control and sensorless vector control (see p1300), ramp-up times of 0 s are not expedient. The setting should be based on the startup times (r0345) of the motor.

**Description:** The ramp-function generator ramps-down the speed setpoint from the maximum speed (p1082) down to standstill (setpoint = 0) in this time. Further, the ramp-down time is always effective for OFF1.

**Dependency:** Refer to: p1082, p1139

**Note:** For U/f control and sensorless vector control (see p1300), ramp-down times of 0 s are not recommended. The setting should be based on the startup times (r0345) of the motor.

<td>0</td>
</tr>
</tbody>
</table>

**Description:**  
Sets the smoothed response to the OFF1 command or the reduced setpoint for the extended ramp-function generator.

**Value:**  
0: Cont. smoothing  
1: Discont smoothing

**Dependency:**  
No effect up to initial rounding-off time (p1130) > 0 s.

**Note:**  
If the setpoint is reduced while ramping-up, initially a final rounding-off is carried out and then the ramp-up completed. During the final rounding-off, the output of the ramp-function generator continues to go in the direction of the previous setpoint (overshoot). After the final rounding-off has been completed, the output goes toward the new setpoint.

p1134 = 0 (continuous smoothing)  
If the setpoint is reduced while ramping-up, the output goes immediately in the direction of the new setpoint. For the setpoint change there is no rounding-off.

**p1135[0...n]**  
**OFF3 ramp-down time / OFF3 t_RD**

#### Description:
Sets the signal source for the command "enable ramp-function generator/inhibit ramp-function generator".

For the PROFIdrive profile, this command corresponds to control word 1 bit 4 (STW1.4).

BI: p1140 = 0 signal:
Inhibits the ramp-function generator (the ramp-function generator output is set to zero).
### BI: p1140 = 1 signal:
Ramp-function generator enable.

**Dependency:**
Refer to: p1141, p1142

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

![Caution Icon]

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

<table>

</table>

**Description:**
Sets the signal source for the command "continue ramp-function generator/freeze ramp-function generator".

For the PROFIdrive profile, this command corresponds to control word 1 bit 5 (STW1.5).

BI: p1141 = 0 signal:
Freezes the ramp-function generator.

BI: p1141 = 1 signal:
Continue ramp-function generator.

**Dependency:**
Refer to: p1140, p1142

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

![Caution Icon]

**Notice:**
The ramp-function generator is, independent of the state of the signal source, active in the following cases:
- OFF1/OFF3.
- ramp-function generator output within the suppression bandwidth.
- ramp-function generator output below the minimum speed.

**Description:**
Sets the signal source for the command "enable setpoint/inhibit setpoint".

For the PROFIdrive profile, this command corresponds to control word 1 bit 6 (STW1.6).

BI: p1142 = 0 signal
Inhibits the setpoint (the ramp-function generator input is set to zero).

BI: p1142 = 1 signal
Setpoint enable.

**Dependency:**
Refer to: p1140, p1141

**Caution:**
When "master control from PC" is activated, this binector input is ineffective.

![Caution Icon]

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**
When the function module "position control" (r0108.3 = 1) is activated, this binector input is interconnected as follows as standard:
BI: p1142 = 0 signal
**p1143[0...n]**  
**BI: Ramp-function generator, accept setting value / RFG accept set v**

- **Dynamic index:** CDS, p0170
- **Units group:** -
- **Expert list:** 1
- **Min:** -
- **Max:** -
- **Scaling:** p2000
- **Factory setting:** 0

**Description:**
Sets the signal source for the ramp-function generator setting value.

**Dependency:**
The signal source for accepting the setting value is set using parameters.

**Refer to:** p1143

**p1145[0...n]**  
**Ramp-function generator tracking intensity. / RFG track intens**

- **VECTOR_G**
- **Can be changed:** U, T
- **Calculated:** CALC_MOD_ALL
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Units group:** -
- **Expert list:** 1
- **Min:** 0.0
- **Max:** 50.0
- **Scaling:** -
- **Factory setting:** 1.3

**Description:**
Sets the ramp-function generator tracking.

The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.

**Recommend.:**
- **p1145 = 0.0:**
  - This value de-activates the ramp-function generator tracking.
  - **p1145 = 0.0 ... 1.0:**
    - Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating.
  - **p1145 > 1.0:**
    - The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.
**Notice:**
If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.

Remedy:
- switch off ramp-function generator tracking (p1145 = 0).
- increase the ramp-up/ramp-down time (p1120, p1121).

**Note:**
In the U/f mode, ramp-function generator tracking is not active.

For SERVO with U/f operation, the following applies:
The complete ramp-function generator is not active, i.e. ramp-up and ramp-down time = 0.

---

**p1148[0...n]**  
**Ramp-function gen., tolerance for ramp-up and ramp-down active / RFG tol HL/RL act**

**Data type:** FloatingPoint32  
**P-Group:** Setpoints  
**Not for motor type:** -  
**Min:** 0.000 [rpm]  
**Max:** 1000.000 [rpm]  
**Factory setting:** 19.800 [rpm]

**Description:**
Sets the tolerance value for the status of the ramp-function generator (ramp-up active, ramp-down active).
If the input of the ramp-function generator does not change in comparison to the output by more than the entered tolerance time, then the status bits "ramp-up active" and "ramp-down active" are not influenced.

**Dependency:**
Refer to: r1199

---

**r1149**  
**CO:** Ramp-function generator, acceleration / RFG acceleration

**Data type:** FloatingPoint32  
**P-Group:** Setpoints  
**Not for motor type:** -  
**Min:** - [rev/s²]  
**Max:** - [rev/s²]

**Description:**
Displays the acceleration of the ramp-function generator.

**Dependency:**
Refer to: p1145

---

**r1150**  
**CO:** Ramp-function generator speed setpoint at the output / RFG n_set at outp

**Data type:** FloatingPoint32  
**P-Group:** Setpoints  
**Not for motor type:** -  
**Min:** - [rpm]  
**Max:** - [rpm]

**Description:**
Displays the setpoint at the output of the ramp-function generator.

---

**p1151[0...n]**  
**Ramp-function generator configuration / RFG config**

**Data type:** Unsigned16  
**P-Group:** Setpoints  
**Not for motor type:** -  
**Min:** -  

**Description:**
Sets the configuration for the extended ramp-function generator.

**Bit field:**
- **Bit:** 00  
- **Signal name:** Disable rounding-off at the zero cross-over  
- **1 signal:** Yes  
- **0 signal:** No  
- **FP:** 3070

**Caution:**
Re bit 00 = 1:
If the ramp-up time is longer than the ramp-down time (p1120 > p1121), then there is an acceleration step at the zero crossover. This can have a negative impact on the mechanical system.
### Note:
Re bit 00 = 1:
When the direction change is changed there is no rounding-off before and after the zero crossover.

The ramp-function generator is set (SERVO: to the actual value, VECTOR: To the setpoint (r1170)) and stops the drive corresponding to the ramp-downtime (p1121 or p1135). While stopping via the ramp-function generator, STW1.4 is effective (enable ramp-function generator).

When the function module "position control" (r0108.3 = 1) is activated, this connector input is interconnected as follows as standard:

Cl: p1160 = r2562

### Notice:
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

### Dependency:
The effectiveness of this setpoint depends on, e.g. STW1.4 and STW1.6.

Refer to: r0002, p0840, p0844, p0848, p0852, p0854, r0898, p1140, p1142, p1160, r1170, p1189

### Note:
For OFF1/OFF3, the ramp-function generator ramp is effective.

The ramp-function generator is set (SERVO: to the actual value, VECTOR: To the setpoint (r1170)) and stops the drive corresponding to the ramp-downtime (p1121 or p1135). While stopping via the ramp-function generator, STW1.4 is effective (enable ramp-function generator).

When the function module "position control" (r0108.3 = 1) is activated, this connector input is interconnected as follows as standard:

Cl: p1160 = r2562

### Notice:
The value is only correctly displayed at r0899.2 = 1 (operation enabled).

- Bit 02:
  - The bit is an OR logic operation - bit 00 and bit 01.

#### p1200[0...n]

**Flying restart operating mode / FlyRest op_mode**

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>6</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the operating mode for flying restart.

**Value:**
- 0: Flying restart inactive
- 1: Flying restart always active (start in setpoint direction)
- 2: Flying restart active after on, fault, OFF2 (start in setpt. dir.)
- 3: Flying restart active after fault, OFF2 (start in setp. direction)
- 4: Flying restart always active (start only in setpoint direction)
- 5: Flying restart active after on, fault, OFF2 (start only in setp_dir)
- 6: Flying restart active after fault, OFF2 (start only in setpt. dir.)

**Dependency:**
For induction motors, the following applies:

A differentiation is made between flying restart for U/f control and for vector control (p1300).

Flying restart, U/f control: p1202, p1203, r1204
Flying restart, vector control: p1202, p1203, r1205

For synchronous motors, the following applies:

Flying restart is not possible with U/f control or if, in the case of sensorless vector control, a Voltage Sensing Module (VSM) has not been connected and parameterized.
If two VSMs are connected to the Motor Module, then the motor voltage for the flying restart is measured using the second VSM (see p0151[1]).

If only one VSM is connected, then this can be used for the flying restart.

Refer to: p1201
Refer to: F07330, F07331

Notice:
The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.

It does not make sense to use "flying restart" together with the "motor holding brake function" (p1215 > 0) because then the flying restart will always be realized with the motor stationary.

Note:
For p1200 = 1, 4, the following applies:
Flying restart is active after faults, OFF1, OFF2, OFF3.
For p1200 = 2, 5, the following applies:
The "power-on" is the first power-on operation after the drive system has been booted. This is practical for motors with a high-inertia load.
For p1200 = 1, 2, 3, the following applies: The search is made in both directions.
For p1200 = 4, 5, 6, the following applies: The search is only made in the setpoint direction. For a setpoint of zero, a search is not made in the negative direction of rotation.
For operation with encoder, the following applies:
p1200 = 1, 4 as well as p1200 = 2, 5 and p1200 = 3, 6 have the same meaning.
For U/f control (p1300 < 20), the following applies:
The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.

If p1200 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

### p1201[0...n]
**BI: Flying restart enable signal source / Fly_res enab S_src**

<td>Expert list:</td>
<td>1</td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td>100 [%]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the search current for the "flying restart" function.
The value is referred to the motor magnetizing current.

**Dependency:**
Refer to: r0331

**Caution:**
An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

**Note:**
In U/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs.
Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).

### p1203[0...n] Flying restart search rate factor / FlyRst_v_Srch Fact

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>U, T</th>
<th>Calculated:</th>
<th>Access level: 3</th>
</tr>
</thead>
</table>

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Func. diagram:** -  
**P-Group:** Functions  
**Units group:** -  
**Scaling:** -  
**Expert list:** 1  
**Min:** 10 [%]  
**Max:** 4000 [%]  
**Factory setting:** 100 [%]

**Description:**
Sets the factor for the search speed for flying restart. The value influences the rate at which the output frequency is changed during a flying restart. A higher value results in a longer search time.

**Recommend.:**
For encoderless vector control and motor cables longer than 200 m, set the factor p1203 >= 300 %.

**Caution:**
An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion. For vector control, a value that is too low or too high can cause flying restart to become unstable.

**Note:**
The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart). With this pre-setting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads or with U/f control and low speeds), we recommend that the search rate is reduced (by increasing p1203).

### r1204.0...13 CO/BO: Flying restart, U/f control status / FlyRest Uf st

Scaling: -
Expert list: 1

Description:
Sets faults for which automatic restart should not be effective.
Dependency:
The setting is only effective for p1210 = 6, 16.
Refer to: p1210

p1207 BI: AR connection following drive object / AR connection DO
B_INF
Can be changed: U, T
Data type: Unsigned32 / Binary
P-Group: Functions
Not for motor type: -
Min
Max
Factory setting
Access level: 3
Dynamic index: -
Units group: -
Scaling: -
Expert list: 1

Description:
Modifies the pre-charging monitoring of the infeed.
The active automatic restart (AR) of the following drive object can be interconnected using this binector input (BI: p1207 = r1214.2).
This means that when the automatic restart is operational, the pre-charging monitoring of the infeed is de-activated and is only re-activated under the following conditions:
- the absolute current in the DC link is greater than 2 % of the maximum current (r0209) of the infeed to provide protection against short-circuit in the DC link.
- if a Voltage Sensing Module (VSM) is being used, the line supply voltage amplitude is greater than 3 % of the parameterized unit supply voltage (p0210) to protect the pre-charging resistors against continuous filter current when the line supply partially returns.
Dependency:
Refer to: r0209, p0210, r1214
### List of parameters

#### p1208[0...1]

**BI: AR modification infeed / AR modification**

<table>

<td></td>
</tr>
<tr>
<td>0</td>
<td>6</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the automatic restart mode (AR).

**Value:**

- 0: Inhibit automatic restart
- 1: Acknowledge all faults without restarting
- 4: Restart after line supply failure w/o additional start attempts
- 6: Restart after fault with additional start attempts

**Dependency:**
The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.

When using an Advanced Operator Panel (AOP) in the LOCAL Mode, then there is no automatic restart.

Refer to: p0840, p0857, p1267

Refer to: F30003

**Danger:**
If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.

**Caution:**
A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). For p1210 > 1, the infeed is automatically started.

**Note:**
When automatic restart mode is activated, the supply voltage must remain connected (e.g. backed up by UPS).

Re p1210 = 1:
Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgement, then these are also automatically acknowledged again. A minimum time of p1212 + 1 s must expire between a successful fault acknowledgement and a fault re-occurring if the signal ON/OFF1 (STW1.0) is at a HIGH signal level. If the signal ON/OFF1 is at a LOW signal level, then the time between a successful fault acknowledgement and a new fault must be at least 1 s. p1211 has no influence on the number of acknowledgement attempts.

Re p1210 = 4:
An automatic restart is only executed if fault F06200 has occurred. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.
Re p1210 = 6:
An automatic restart is carried out if any fault has occurred.

<table>
<thead>
<tr>
<th>p1210</th>
<th>Automatic restart, mode / AR mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>VECTOR_G</td>
<td>Can be changed: U, T</td>
</tr>
<tr>
<td>Data type: Integer16</td>
<td>Calculated: -</td>
</tr>

</tr>
<tr>
<td>0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Factory setting</td>
</tr>
<tr>
<td>6</td>
<td>0</td>
</tr>
</tbody>
</table>

Description: Sets the automatic restart mode (AR).

Value:
0: Inhibit automatic restart
1: Acknowledge all faults without restarting
4: Restart after line supply failure w/o additional start attempts
6: Restart after fault with additional start attempts
14: Restart after line supply failure following man. acknowledgment
16: Restart after fault following manual acknowledgment

Recommend.: For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.

Dependency: The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.

When using an Operator Panel in the LOCAL mode, then there is no automatic start.

For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart.

Refer to: p0840, p0857, p1267

Refer to: F30003

Danger: If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.

Caution: A change is only accepted and made in the state “initialization” (r1214.0) and “wait for alarm” (r1214.1). When faults are present, therefore, the parameter cannot be changed.

For p1210 > 1, the motor is automatically started.

Note: When automatic restart mode is activated, the supply voltage must remain connected (e.g. backed up by UPS).

Re p1210 = 1:
Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts.

Re p1210 = 4:
An automatic restart is only carried out if fault F30003 occurred at the Motor Module or a 1 signal is present at binector input p1208[1]. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.

Re p1210 = 6:
An automatic restart is carried out if any fault has occurred or there is a 1 signal at binector input p1208[0].

Re p1210 = 14:
As for p1210 = 4. However, faults that are present must be manually acknowledged.

Re p1210 = 16:
As for p1210 = 6. However, faults that are present must be manually acknowledged.
# p1211 Automatic restart, start attempts / AR start attempts

| Description: | Sets the start attempts of the automatic restart function for p1210 = 4, 6. |
| Dependency: | The setting of this parameter is always effective for p1210 = 6. For p1210 = 4, the parameter only has an influence if an additional line phase failure (F6200) occurs at the start attempt. Refer to: p1210, r1214 |
| Caution: | A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). Notice: After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated. After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2. |
| Note: | A start attempt starts immediately when a fault occurs. The restart attempt is considered to have been completed if the infeed is powered up and an additional delay time of 1 s has expired. As long as a fault is present, an acknowledgement command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning. Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt (i.e. a fault/error has no longer occurred up to the end of the power-up operation) the start counter is again reset to the parameter value after 1 s. If faults re-occur, the parameterized number of start attempts is again available. At least one start attempt is always carried out. After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also affects the start counter to be decremented. |

---
Note: A start attempt starts immediately when a fault occurs. The start attempt is considered to have been completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired.

As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning.

Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.

At least one start attempt is always carried out.

After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.

### p1212 Automatic restart, delay time start attempts / AR t_wait start

| Description: | Sets the delay time up to restart. |
| Dependency: | This parameter setting is active for p1210 = 4, 6. |
| Caution: | A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). |
| Note: | The faults are automatically acknowledged and the system is powered up again after half of the delay time has expired and after the full delay time has expired. |

</tr>
</tbody>
</table>

**Description:**  
Sets the monitoring time of the automatic restart (AR).

**Index:**  
- [0] = Restart  
- [1] = Reset start counter

**Dependency:**  
Refer to: p1210, r1214

**Caution:**  
A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

**Notice:**  
After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.

**Note:**  
1. **Index 0:**  
The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If the drive has not restarted at the end of the monitoring time, fault F07320 is signaled. The monitoring is de-activated with p1213 = 0. If p1213 is set to a value which is lower than in p1212, fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present).

2. **Index 1:**  
The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.
Index 1:
The start counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213[1] has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged.
The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

Note:
Re bit 00:
State to display the single initialization after POWER ON.
Re bit 01:
State in which the automatic restart function waits for faults (initial state).
Re bit 02:
General display that a fault has been identified and that the restart or acknowledgement has been initiated.
Re bit 03:
Displays the acknowledge command within the "acknowledge alarms" state (bit 4 = 1). For bit 5 = 1 or bit 6 = 1, the acknowledge command is continually displayed.
Re bit 04:
State in which the faults that are present are acknowledged. The state is exited again after successful acknowledgement. A change is only made into the next state if it is signaled that a fault is no longer present after an acknowledgement command (bit 3 = 1).
Re bit 05:
State in which the drive is automatically powered up (only for p1210 = 4, 6).
Re bit 06:
State in which the system waits after having been powered up, to the end of the start attempt. For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.
Re bit 07:
State which is assumed after a fault occurs within the automatic restart function.
Re bits 12 ... 15:
Actual state of the start counter (binary coded).

- Re bit 05: State in which the drive is automatically powered up (only for p1210 = 4, 6).
- Re bit 06: State in which the system waits after having been powered up, to the end of the start attempt (to the end of the magnetizing process).
- For p1210 = 1, this signal is directly set after the faults have been successfully acknowledged.
- Re bit 07: State which is assumed after a fault occurs within the automatic restart function. This is only reset after acknowledging the fault and withdrawing the power-on command.
- Re bit 10: When the automatic restart function is active, r1214 bit 7 is displayed, otherwise the effective fault r2139 bit 3.
- Re bits 12 ... 15: Actual state of the start counter (binary coded).
### p1215 Motor holding brake configuration / Brake config

**VECTOR_G**

- **Can be changed:** T
- **Data type:** Integer16
- **P-Group:** Functions
- **Not for motor type:** -
- **Access level:** 2
- **Func. diagram:** 2701, 2707, 2711

**Description:**
Sets the holding brake configuration.

**Value:**
- 0: No motor holding brake available
- 1: Motor holding brake acc. to sequence control
- 2: Motor holding brake always open
- 3: Motor holding brake like sequence control, connection via BICO

**Dependency:**
Refer to: p1216, p1217, p1226, p1227, p1228, p1278

**Caution:**
For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.

**Notice:**
If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.

**Note:**
If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control".

If a motor holding brake is used via the brake connection of the Motor Module integrated in the drive, then it is not permissible that p1215 is set to 3.

If an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.

When the function module "extended brake control" is activated (r0108.14 = 1), r1229.1 should be interconnected as control signal.

The parameter can only be set to zero when the pulses are inhibited.

The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

### p1216 Motor holding brake, opening time / Brake t_open

**VECTOR_G**

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Functions
- **Not for motor type:** -
- **Access level:** 2
- **Func. diagram:** 2701, 2711

**Description:**
Sets the time to open the motor holding brake.

**Recommend:**
This time should be set longer than the actual opening time of the brake. This ensures that the drive cannot accelerate when the brake is applied.

**Dependency:**
Refer to: p1215, p1217

**Note:**
For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.
### p1217 Motor holding brake closing time / Brake t_close

<table>
<thead>
<tr>
<th>Vector</th>
<th>Description</th>
<th>Calculation</th>
<th>Access level</th>
<th>Data type</th>
<th>Dynamic index</th>
<th>Access level</th>
<th>P-Group</th>
<th>Scaling</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VECTOR_G</td>
<td>Sets the time to apply the motor holding brake. After OFF1 or OFF3 and the holding brake is controlled (the brake closes), then the drive remains closed-loop controlled for this time stationary with a speed setpoint/velocity setpoint of zero. The pulses are suppressed when the time expires.</td>
<td>Calculated: -</td>
<td>2</td>
<td>FloatingPoint32</td>
<td>-</td>
<td>-</td>
<td>Functions</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Min</td>
<td>0 [ms]</td>
<td>10000 [ms]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Max</td>
<td>100 [ms]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Recommend:**
This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.

**Dependency:**
Refer to: p1215, p1216

**Notice:**
If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.

**Note:**
For a motor with DRIVE-CLiQ and integrated brake, for p0300 = 10000, this time is pre-assigned the value saved in the motor.

### p1218[0...1] BI: Open motor holding brake / Open brake

</tr>
<tr>
<td><strong>p1221</strong></td>
<td><strong>Open motor holding brake, threshold / Open brake thresh</strong></td>
<td>Sets the threshold value for the command &quot;open brake&quot;. Refer to: p1220, r1229, p1277</td>
</tr>
<tr>
<td><strong>p1222</strong></td>
<td><strong>BI: Motor holding brake feedback signal brake closed / Brake feedb closed</strong></td>
<td>Sets the signal source for the feedback signal &quot;brake closed&quot;. For motor holding brakes with feedback signal, the signal &quot;brake closed&quot; can be activated using p1275.5 = 1. Refer to: p1223, p1275</td>
</tr>
<tr>
<td><strong>p1223</strong></td>
<td><strong>BI: Motor holding brake feedback signal brake open / Brake feedb open</strong></td>
<td>Sets the signal source for the feedback signal &quot;brake open&quot;. For motor holding brakes with feedback signal, the signal &quot;brake open&quot; can be activated using p1275.5 = 1. Refer to: p1222, p1275</td>
</tr>
</tbody>
</table>

### p1220 Parameters

- **VECTOR_G** (Extended brk)
- **Can be changed:** T
- **Data type:** Unsigned32 / FloatingPoint32
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Description:** Sets the signal source for the command "open brake".
- **Dependency:** Refer to: p1215, p1221, r1229, p1277

### p1221 Parameters

- **VECTOR_G** (Extended brk)
- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** 0.00 [%]
- **Max:** 200.00 [%]
- **Description:** Sets the threshold value for the command "open brake".
- **Dependency:** Refer to: p1220, r1229, p1277

### p1222 Parameters

- **VECTOR_G** (Extended brk)
- **Can be changed:** T
- **Data type:** Unsigned32 / Binary
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Description:** Sets the signal source for the feedback signal "brake closed". For motor holding brakes with feedback signal, the signal "brake closed" can be activated using p1275.5 = 1.
- **Dependency:** Refer to: p1223, p1275
- **Note:** 1 signal: Brake closed. When braking with 1 feedback signal, the inverted feedback signal is connected to the BICO input for the second feedback signal (p1223). For r1229.5 = 1, OFF1/OFF3 are suppressed to prevent the drive accelerating by a load that drives the motor whereby OFF2 remains effective.

### p1223 Parameters

- **VECTOR_G** (Extended brk)
- **Can be changed:** T
- **Data type:** Unsigned32 / Binary
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Description:** Sets the signal source for the feedback signal "brake open". For motor holding brakes with feedback signal, the signal "brake open" can be activated using p1275.5 = 1.
- **Dependency:** Refer to: p1222, p1275
- **Note:** 1 signal: Brake open. When braking with 1 feedback signal, the inverted feedback signal is connected to the BICO input for the second feedback signal (p1222).

**Dependency:**
-  Sets the speed threshold for the standstill identification.
-  Acts on the actual value and setpoint monitoring.
-  When braking with OFF1 or OFF3, when the threshold is undershot, standstill is identified.
-  The following applies when the brake control is activated:
  - When the threshold is undershot, the brake control is started and the system waits for the brake closing time in p1217. The pulses are then suppressed.
  - if the brake control is not activated, the following applies:
    - When the threshold is undershot, the pulses are suppressed and the drive coasts down.

-  Refer to: p1215, p1216, p1217, p1227

**Notice:**
For reasons relating to the compatibility to earlier firmware versions, a parameter value of zero in indices 1 to 31 is overwritten with the parameter value in index 0 when the Control Unit boots.

**Note:**
-  Standstill is identified in the following cases:
  - the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
  - the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.
-  The actual value sensing is subject to measuring noise. For this reason, standstill cannot be detected if the speed threshold is too low.
### Description:
Sets the monitoring time for the standstill identification.

When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).

After this, the brake control is started, the system waits for the closing time in p1217 and then the pulses are suppressed.

### Dependency:
Refer to: p1215, p1216, p1217, p1226

### Notice:
For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.

### Note:
Standstill is identified in the following cases:
- the speed actual value falls below the speed threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the speed threshold in p1226 and the time started after this in p1227 has expired.

For p1227 = 300.000 s, the following applies:
Monitoring is de-activated.

For p1227 = 0.000 s, the following applies:
With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.

### Description:
Sets the delay time for pulse suppression.

After OFF1 or OFF3, the pulses are canceled, if at least one of the following conditions is fulfilled:
- the speed actual value falls below the threshold in p1226 and the time started after this in p1228 has expired.
- the speed setpoint falls below the threshold in p1226 and the time started after this in p1227 has expired.

### Notice:
When the motor holding brake is activated, pulse cancellation is additionally delayed by the brake closing time (p1217).
List of parameters

05 Brake does not close
06 Brake threshold exceeded
07 Brake threshold undershot
08 Brake monitoring time expired
09 Pulse enable request missing/n_ctrl inhibited
10 Brake OR logic operation result
11 Brake AND logic operation result

**Factory setting**

**Description:**
Setting to activate the various types for armature short-circuit / DC braking.

**Value:**
0: No function
1: External armature short-circuit with contactor feedback signal
2: Ext. armature short circuit without contactor feedback signal
3: Internal voltage protection
4: Internal armature short-circuit / DC braking
5: DC braking for OFF1/OFF3
14: DC braking below starting speed

**Dependency:**
Refer to: p0300, p1230, p1232, p1233, p1234, p1235, p1236, p1237, r1238, r1239, p1345, p1346

**Danger:**
- only short-circuit-proof motors may be used, or suitable resistors must be used to short-circuit the motor
- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential!)
- it is only permissible to use motors that are short-circuit-proof (p0320 < p0323).
- The Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).
- the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.
- if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.
- if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.
- if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).
**Parameters**

**List of parameters**

Re p1231 = 4 and synchronous motor:
- when armature short-circuit is active, all of the motor terminals are at half of the DC link potential.
- it is only permissible to use motors that are short-circuit proof (p0320 < p0323).
- The Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).

**Note:**

Re p1231 = 1, 2:
The external armature short circuit can only be selected for synchronous motors (p0300). In this case, control bit BO: r1239.0 must be interconnected (e.g. to a digital input) to control the external contactor.
The external armature short circuit cannot be set as a fault response. It can be triggered via binector input p1230. It is also always activated in the case of pulse suppression.

Re p1231 = 3:
Internal voltage protection (using an internal armature short circuit) can only be selected for synchronous motors (p0300) and Motor Modules in booksize or chassis format. Further, it is not permissible for Safety Integrated to be active on blocksize Motor Modules (i.e. p0501 = 0 and p0601 = 0). The internal voltage protection prevents the DC link capacitance from being charged if there is no possibility of regenerating the EMF of a motor operated in the field-weakening mode. The Motor Module must support this function (r0192.9 = 1).

a) If the Motor Module does not support the autonomous, internal armature short-circuit (r0192.10 = 0), the armature short-circuit is activated as soon as the activation criterion is fulfilled (refer below):
b) If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module itself decides - using the DC link voltage - as to whether the short-circuit should be activated. In this case, protection is also provided even if the DRIVE-CLIQ connection between the Control Unit and Motor Module was interrupted. The short circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn. This therefore ensures that the required input voltage for the Control Supply Module is maintained.

For chassis units, the following applies:
The value for the voltage limits is calculated, depending on the voltage class, from EEPROM data of the particular power unit and a factor.
Re p1231 = 4:
The function is activated as soon as the activation criterion is fulfilled.
- the function can be superseded by OFF2
  a) For synchronous motors (p0300 = 2xx, 4xx), the internal armature short-circuit is initiated.
  b) For induction motors (p0300 = 1xx), the DC braking is initiated.
Activation criterion (one of the following criteria is fulfilled):
- binector input p1230 = 1 signal (DC braking activation).
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).
Re p1231 = 5:
DC braking can only be set for induction motors.
DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1/OFF3, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely.
DC braking by means of fault response continues to be possible.
Re p1231 = 14:
DC braking can only be set for induction motors.
DC braking is initiated if binector input p1230 = 1 during operation and the actual speed is below the starting speed p1234 (before this, the drive must have operated above p1234 plus the hysteresis). Then, following upstream demagnetization (see p0347), the braking current p1232 is injected for the time set in p1233. The drive then changes into normal operation. During braking the command for DC braking can be withdrawn. If the time p1233 is exceeded, then DC braking is inhibited and the drive changes into normal operation.
For OFF1 and OFF3, DC braking is only executed, if binector input p1230 = 1 signal.
DC braking by means of fault response continues to be possible.
Re p1231 = 3, 4, 5, 14:
The value can only be changed to values not equal to 3, 4, 5 or 14 if p0491 is not equal to 4 and p2101 is not equal to 6 (armature short-circuit/DC braking not set).
### List of parameters

#### p1232[0...n] DC braking, braking current / DCBRK I_brake

**Description:** Sets the braking current for DC braking.

**Dependency:** Refer to: p1230, p1231, p1233, p1234, r1239, p1345, p1346

**Note:** A change to the braking current becomes effective the next time that DC braking is switched on. The value for p1232 is specified as an rms value in the 3-phase system. The magnitude of the braking current is the same as that of an identical output current at frequency zero (see r0067, r0068, p0640). The braking current is internally limited to r0067.

For the current controller, the settings of parameters p1345 and p1346 (I_max limiting controller) are used.

#### p1233[0...n] DC braking time / DCBRK time

<table>
<thead>

</tr>
<tr>
<td>0.00 [rpm]</td>
<td>210000.00 [rpm]</td>
<td>40000.00 [rpm]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:** Sets the starting speed for DC braking.

**Dependency:** Refer to: p1230, p1231, p1232, p1233, r1239

**Caution:** If the actual speed falls below this threshold, then DC braking is activated. If an encoder fault occurs during closed-loop operation with an encoder, controlled deceleration of the drive down to the start speed p1234 is no longer possible. In this case, DC braking is activated immediately and injects the braking current p1232 for the braking time p1233 after de-magnetizing. The braking current and braking duration must, therefore, be dimensioned accordingly for this situation so that the drive can be decelerated to standstill. In the case of operation with an encoder, this speed may not be set too low so as to ensure that the oscillation movement induced by the residual flux/ remanence of the motor does not cause DC braking to be de-activated again.

</tbody>
</table>
List of parameters

3: Active - feedback signal "Closed" OK
4: Active - feedback signal "Closed" missing
5: Prompt to remove the armature short-circuit
6: Active - feedback signal "Open" missing

Dependency:
Refer to: p1230, p1231, p1235, p1236, p1237, r1239
Refer to: A07904, F07905

Note:
Activation criterion (one of the following criteria is fulfilled):
- the signal at BI: p1230 (armature short-circuit activation) is 0.
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Re state "switched out" (r1238 = 0):
- the external armature short-circuit can be selected with p1231 = 1.

Re state "ready" (r1238 = 1):
- as soon as the activation criterion is fulfilled, then a transition is made into the state "active" (r1238 = 2).

Regarding the state "active" (r1238 = 2), "active - feedback signal "Closed" OK" (r1238 = 3), "active - feedback signal "Closed" missing" (r1238 = 4):
- the control signal to close contactor r1239.0 is set to "1" (closed) and the pulses are suppressed.
- if a contactor feedback signal is not connected (BI: p1235 = 0 signal), then a transition is immediately made into state 3.
- if a contactor feedback signal is connected, then a transition is made into state 3 if the feedback signal at BI: p1235 goes to "1" (closed) within the monitoring time (p1236).
- otherwise, a transition is made into state 4.

Re state "prompt to remove the armature short-circuit" (r1238 = 5):
- the activation criterion is no longer fulfilled. An attempt is made to again remove the armature short circuit.
- the control signal to close the contactor r1239.0 is set to "0" (open) and the pulses remain suppressed.
- if a contactor feedback signal is not connected (BI: p1235 = 0 signal), the system waits for the delay time (p1237) to expire until a transition is made into state 1.
- if a contactor feedback signal is connected, the system waits until the feedback signal at BI:p1235 goes to "0" (open) until a transition is made into state 1. If this does not occur within the monitoring time (p1236), then a transition is made into state 6.

Re state "active - feedback signal "Open" missing" (r1238 = 6):
- this error state can be exited by de-selecting the external armature short-circuit (p1231 = 0).

Dependency: Refer to: p1230, p1231, p1232, p1233, p1234, p1235, p1236, p1237

Note: External armature short-circuit (bits 0 ... 3):
- Re bit 00:
  Using this signal, the motor is short-circuited through an external contactor circuit. This means that this BO: p1239.0 must be interconnected e.g. to a digital output.
- Re bit 01:
  This signal indicates the state of the contactor to establish the armature short-circuit. To do this, BI: p1235 must be interconnected to a digital input.
- Re bit 02:
  The external armature short-circuit configuration is ready and is activated as soon as the activation criterion is fulfilled.
- Re bit 03:
  1: A feedback signal from an external contactor was parameterized in BI: p1235.

Internal voltage protection / internal armature short-circuit (bits 4 ... 6):
- Re bit 04:
  a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).
  The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.
  a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).
  The Motor Module decides autonomously whether the armature short-circuit is activated. In this case, the following applies: r1239.4 = r1239.5.
  c) Internal armature short-circuit (p1231 = 4) was selected.
  The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.
- Re bit 05:
  The Motor Module signals that the motor is short-circuited in the Motor Module through the power semiconductors.
- Re bit 06:
  a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).
  The internal voltage protection is ready and is activated as soon as the activation criterion is fulfilled.
  a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).
  The internal voltage protection is ready and the Motor Module decides autonomously - using the DC link voltage - whether the short-circuit is activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short-circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn.
  c) Internal armature short-circuit (p1231 = 4) was selected.
  The internal armature short-circuit is ready and is activated as soon as the activation criterion is fulfilled.

Activation criterion (one of the following criteria is fulfilled):
- the signal at BI: p1230 (armature short-circuit activation) is 1.
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Re bit 12, 13:
- Only effective for p1231 = 14.

Description: Sets the controller configuration of the DC link voltage (Vdc controller) in the closed-loop control mode.
### List of parameters

#### Parameters

**Value:**
- 0: Inhib Vdc ctrl
- 1: Vdc_max controller enable
- 2: Vdc_min controller (kinetic buffering) enable
- 3: Vdc_min controller and Vdc_max controller enable
- 4: Activates Vdc_max monitoring
- 5: Activates Vdc_min monitoring
- 6: Activates Vdc_min monitoring and Vdc_max monitoring

**Dependency:**
Refer to: p1245
Refer to: A07400, A07401, A07402, F07403, F07404, F07405, F07406

**Warning:**
When the Udc max controller is active, the motor can accelerate, e.g. for driving loads or for high DC link voltages caused by other drives that are connected to the common DC link busbar.

**Caution:**
If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with high moments of inertia. If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated.

Drives with Udc control must be able to brake and accelerate independently of one another.

**Notice:**
An excessively high value in p1245 can possibly negatively influence the normal operation of the drive.

**Note:**
P1240 = 1, 3:
When the DC link voltage limit specified for the Motor Module is reached the following applies:
- the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking.
- the ramp-down times are automatically increased.
P1240 = 2, 3:
When the switch-in threshold of the Vdc_min controller is reached (p1245), the following applies:
- the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating.
- the motor is braked in order to use its kinetic energy to buffer the DC link.
P1240 = 4, 5, 6:
When the threshold in r1242 or r1246 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage.

If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled. See also p1531.

### r1242 Vdc_max controller switch-in level / Vdc_max on_level

**VECTOR_G (n/M)**

**Can be changed:** -
**Calculated:** -
**Access level:** 3

**Data type:** FloatingPoint32
**Dynamic index:** -
**Func. diagram:** 6220

**P-Group:** Functions
**Units group:** -
**Unit selection:** -

**Not for motor type:** REL
**Scaling:** p2001
**Expert list:** 1

**Min**
- [V]

**Max**
- [V]

**Factory setting**
- [V]

**Description:**
Displays the switch-in level for the Vdc_max controller.

If p1254 = 0 (automatic sensing of the switch-in level = off), then the following applies:
AC/AC device: r1242 = 1.15 * sqrt(2) * p0210
DC/AC device: r1242 = 1.15 * p0210

If p1254 = 1 (automatic sensing of the switch-in level = on), then the following applies:
r1242 = Vdc_max - 50.0 V (Vdc_max: Overvoltage threshold of the power unit)
r1242 = Vdc_max - 25.0 V (for 230 V power units)

**Note:**
The Vdc_max controller is not switched back off until the DC-link voltage falls below the threshold 0.95 * p1242 and the controller output is zero.
### List of parameters

**p1243[0...n]**  
**Vdc_max controller dynamic factor / Vdc_max dyn_factor**

<table>

<td>10000 [%]</td>
<td>100 [%]</td>
</tr>
</tbody>
</table>

**Description:**  
Sets the dynamic factor for the DC link voltage controller (Vdc_max controller).  
100% means that p1250, p1251, and p1252 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization.  
If subsequent optimization is required, this can be carried out using the dynamic factor. In this case p1250, p1251, p1252 are weighted with the dynamic factor p1243.  
If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.

**Note:**  
The pre-setting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.

**p1245[0...n]**  
**Vdc_min controller switch-in level (kinetic buffering) / Vdc_min on_level**

**Note:**
An integral time is normally not required for single axis drives. For multi-axis drives on the other hand, it may be possible to compensate for interference from other axes using the integral time (integral component).
p1251 = 0: The integral component is de-activated.

**Description:**
Sets the rate time constant for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).

**Dependency:**
The effective rate time is obtained taking into account p1243 (Vdc_max controller dynamic factor).

**Value:**
0: Automatic detection inhibited
1: Automatic detection enabled

**Notice:**
If a time threshold has been parameterized, the Vdc_max controller should also be activated (p1240 = 3) so that the drive does not shut down with overvoltage when Vdc_min control is exited (due to the time violation) and in the event of fault response OFF3. It is also possible to increase the OFF3 ramp-down time p1135.
### p1257[0...n] Vdc_min controller speed threshold / Vdc_min n_thresh

**Description:**
Sets the speed threshold for the Vdc-min controller (kinetic buffering).
If this value is exceeded a fault is output; the required response can be parameterized.

**Value:**
- Can be changed: U, T
- Calculated: CALC_MOD_ALL
- Access level: 3
- Data type: FloatingPoint32
- Dynamic index: DDS, p0180
- Func. diagram: -
- P-Group: Functions
- Units group: 3_1
- Unit selection: p0505
- Not for motor type: REL
- Scaling: -

- Min: 0.00 [rpm]
- Max: 210000.00 [rpm]
- Factory setting: 50.00 [rpm]

### r1258 CO: Vdc controller output / Vdc_ctrl output

**Description:**
Displays the actual output of the Vdc controller (DC link voltage controller)

**Value:**
- Can be changed: -
- Calculated: -
- Access level: 3
- Data type: FloatingPoint32
- Dynamic index: -
- Func. diagram: 6220
- P-Group: Functions
- Units group: 6_2
- Unit selection: p0505
- Not for motor type: REL
- Scaling: p2002
- Expert list: 1
- Min: - [Arms]
- Max: - [Arms]
- Factory setting: - [Arms]

### p1260 Bypass configuration / Bypass config

**Description:**
Sets the configuration for the bypass function.

**Value:**
- Can be changed: U, T
- Calculated: -
- Access level: 2
- Data type: Integer16
- Dynamic index: -
- Func. diagram: -
- P-Group: -
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min: 0
- Max: 3
- Factory setting: 0

**Note:**
If the bypass function is selected ((p1260 > 0), then when the power unit restarts after POWER OFF, the state of the bypass switch is evaluated. This means that after the ramp-up, it is possible to directly change into the standby mode. This is only possible for p1267 = 1 (bypass using the control signal) and if the control command after the system has been booted is still available (p1266). This function has a higher priority than the automatic restart function (p1210).
The "bypass" function can only be switched off again (p1260 = 0) if the bypass is not active or the bypass function has a fault.
The corresponding function should be activated in p3800 for bypass with synchronization.

### r1261.0...9 CO/BO: Bypass control/status word / Bypass STW / ZSW

**Description:**
Control and feedback signals of the bypass switch.

**Bit field:**
- Bit | Signal name | 1 signal | 0 signal | FP
- 00 | Command switch motor - power unit | Close | Open | -
- 01 | Command switch motor - line supply | Close | Open | -
### Parameters

#### p1276 Motor holding brake, standstill detection, bypass / Brk standst bypass

**VECTOR_G**

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** 0.000 [s]
- **Max:** 300.000 [s]
- **Factory setting:** 300.000 [s]

**Description:** Sets the delay time for closing the brake at standstill.

After this time has expired, if the "close brake at standstill" or OFF1/OFF3 is present, the brake is closed and the pulses are suppressed.

For p1276 = 300.000 s, the timer is de-activated - this means that the timer output is always zero.

#### p1277 Motor holding brake, braking threshold delay exceeded / Del thresh exceed.

**VECTOR_G**

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** 0.000 [s]
- **Max:** 300.000 [s]
- **Factory setting:** 0.000 [s]

**Dependency:** Refer to: p1220, p1221, r1229

**Description:** Sets the delay time for the signal "braking threshold exceeded" (BO: r1229.6).

#### p1278 Brake control, diagnostics evaluation / Brake diagnostics

**VECTOR_G**

- **Can be changed:** U, T
- **Data type:** Integer16
- **P-Group:** Functions
- **Not for motor type:** -
- **Min:** 0
- **Max:** 1
- **Factory setting:** 0

**Description:** Sets the brake control type (with or without diagnostics evaluation).

Example for brake control with diagnostics evaluation.
- brake control in the Motor Modules in booksize format
- Safe Brake Relay for AC Drive

Example for brake control without diagnostics evaluation.
- Brake Relay for AC Drive

**Value:**
- 0: Brake control with diagnostics evaluation
- 1: Brake control without diagnostics evaluation

**Note:**
- If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".
- It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).
**p1279[0...3]**  
**BI: Motor holding brake, OR/AND logic operation / Brake OR AND**  
**VECTOR_G**  
(Extended brk)  
**Can be changed:** T  
**Data type:** Unsigned32 / Binary  
**P-Group:** Functions  
**Not for motor type:** -  
**Min**  
**Access level:** 2  
**Dynamic index:** -  
**Units group:** -  
**Scaling:** -  
**Expert list:** 1  
**Factory setting:** 0  
| Description: | Sets the signal source for the OR/AND logic operation.  
| Dependency: | Refer to: r1229  
| Note: | [0]: OR logic operation, input 1 --> the result is displayed in r1229.10.  
| | [1]: OR logic operation, input 2 --> the result is displayed in r1229.10.  
| | [2]: AND logic operation, input 1 --> the result is displayed in r1229.11.  
| | [3]: AND logic operation, input 2 --> the result is displayed in r1229.11.  

**p1280[0...n]**  
**Vdc controller or Vdc monitoring configuration (U/f) / Vdc_ctr config U/f**  
**VECTOR_G**  
**Can be changed:** U, T  
**Data type:** Integer16  
**P-Group:** Functions  
**Not for motor type:** -  
**Min**  
**Access level:** 3  
**Dynamic index:** DDS, p0180  
**Units group:** -  
**Scaling:** -  
**Expert list:** 1  
**Factory setting:** 0  
| Description: | Sets the configuration of the controller for the DC link voltage (Vdc controller) in the U/f operating mode.  
| Value: | 0: Inhib Vdc ctrl  
| | 1: Vdc_max controller enable  
| | 2: Vdc_min controller (kinetic buffering) enable  
| | 3: Vdc_min controller and Vdc_max controller enable  
| | 4: Activates Vdc_max monitoring  
| | 5: Activates Vdc_min monitoring  
| | 6: Activates Vdc_min monitoring and Vdc_max monitoring  
| Warning: | When the Udc max controller is active, the motor can accelerate, e.g. for driving loads or for high DC link voltages caused by other drives that are connected to the common DC link busbar.  
| Caution: | If several drives are operated from the same DC link busbar, then it is recommended that the Udc control is only activated for the drives with relatively high moments of inertia. If the Udc controls for various drives are simultaneously active, then they can mutually influence one another. In this case, the controller dynamic performance should be reduced or the Udc control of individual drives should be deactivated.  
| Drives with Udc control must be able to brake and accelerate independently of one another.  
| Note: | p1240 = 4, 5, 6:  
| | When the threshold in r1282 or r1286 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage.  
| If a braking resistor is connected to the DC link, then the Vdc_max control should be disabled.  

**r1282**  
**Vdc_max controller switch-in level (U/f) / Vdc_max on level**  
**VECTOR_G**  
**Can be changed:** -  
**Data type:** FloatingPoint32  
**P-Group:** Functions  
**Not for motor type:** -  
**Min**  
**Access level:** 3  
**Dynamic index:** -  
**Units group:** -  
**Scaling:** p2001  
**Expert list:** 1  
| | Factory setting  
| | - [V]  
| | - [V]  
| Description: | Displays the switch-in level for the Vdc_max controller.  
| If p1294 = 0 (automatic sensing of the switch-in level = off), then the following applies:  
| AC/AC device: r1282 = 1.15 * sqrt(2) * p0210  
| DC/AC device: r1282 = 1.15 * p0210  

© Siemens AG 2012 All Rights Reserved  
SINAMICS G130/G150 List Manual (LH2), 01/2012, A5E03263479A
If \( p1294 = 1 \) (automatic sensing of the switch-in level = on), then the following applies:

\[ r1282 = V_{dc\_max} - 50.0 \text{ V} \]  
\[ r1282 = V_{dc\_max} - 25.0 \text{ V} \]  
(for 230 V power units)

**Note:**
The Vdc\(_{\text{max}}\) controller is not switched back off until the DC-link voltage falls below the threshold \( 0.95 \times p1282 \) and the controller output is zero.

### p1283[0...n] Vdc\(_{\text{max}}\) controller dynamic factor (U/f) / Vdc\(_{\text{max}}\) dyn_factor

**Description:**
Sets the dynamic factor for the DC link voltage controller (Vdc\(_{\text{max}}\) controller).

100\% means that \( p1290, p1291, \) and \( p1292 \) (gain, integral time, and rate time) are used in accordance with their basic settings and on the basis of a theoretical controller optimization.

If subsequent optimization is required, this can be carried out using the dynamic factor. In this case, \( p1290, p1291, \) and \( p1292 \) are weighted with the dynamic factor \( p1283 \).

If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.

**Note:**
The pre-setting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.

### p1285[0...n] Vdc\(_{\text{min}}\) controller switch-in level (kinetic buffering) (U/f) / Vdc\(_{\text{min}}\) on_level

**Description:**
Sets the switch-in level for the Vdc\(_{\text{min}}\) controller (kinetic buffering).

The value is obtained as follows:

\[ V_{dc\_min} = p1285\% \times \sqrt{2} \times p0210 \]  
\[ V_{dc\_min} = p1285\% \times p0210 \]  

**Warning:**
An excessively high value may adversely affect normal drive operation. The values up to 150 \% are intended for operating modes \( p1240 = 5, 6 \).

### r1286 Vdc\(_{\text{min}}\) controller switch-in level (kinetic buffering) (U/f) / Vdc\(_{\text{min}}\) on_level

**Description:**
Displays the switch-in level for the Vdc\(_{\text{min}}\) controller (kinetic buffering).

**Note:**
The Vdc\(_{\text{min}}\) controller is not switched back off until the DC-link voltage rises above the threshold \( 1.05 \times p1286 \) and the controller output is zero.

</tbody>
</table>

**Description:**
- Sets the proportional gain for the Vdc controller (DC link voltage controller).

**Note:**
- The gain factor is proportional to the capacitance of the DC link. The parameter is pre-set to a value that is optimally adapted to the capacitance of the individual Motor Module. The capacitances of the other power units which are connected to the DC link can be taken into account using the dynamic factor (p1287 or p1283).
### p1291[0...n] Vdc controller integral time (U/f) / Vdc_ctrl Tn

**Description:** Activates/de-activates the automatic sensing of the switch-in level for the Vdc_max controller. When the sensing function is de-activated, the activation threshold r1282 for the Vdc_max controller is determined from the parameterized connection voltage p0210.

**Value:**

0: Automatic detection inhibited
1: Automatic detection enabled

### p1295[0...n] Vdc_min controller time threshold (U/f) / Vdc_min t_thresh

<table>
<thead>

<td>0.000 [s]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:** Sets the time threshold for the Vdc_min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized.

**Prerequisite:** p1296 = 1.
### Parameters

**List of parameters**

#### Notice:

If a time threshold has been parameterized, the Vdc_max controller should also be activated (p1280 = 3) so that the drive does not shut down with overvoltage when Vdc_min control is exited (due to the time violation) and in the event of fault response OFF3. It is also possible to increase the OFF3 ramp-down time p1135.

---

### p1296[0...n]

**Vdc_min controller response (kinetic buffering) (U/f / Vdc_min response)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Max:</strong></td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**

Sets the response for the Vdc_min controller (kinetic buffering).

**Value:**

0: Buffer Vdc until undervoltage, n<p1297 -> F07405
1: Buff. Vdc until undervolt., n<p1297 -> F07405, t>p1295 -> F07406

**Note:**

Re p1296 = 1:
The quick stop ramp entered in p1135 must not be equal to zero, to prevent overcurrent shutdown if F07406 is triggered.

---

### p1297[0...n]

**Description:**

Sets the U/f control mode of the drive.

**Value:**

0: U/f control with linear characteristic
1: U/f control with linear characteristic and FCC
2: U/f control with parabolic characteristic
3: U/f control with parameterizable characteristic
4: U/f control with linear characteristic and ECO
5: U/f control for drives requiring a precise freq. (e.g. textiles)
6: U/f control for drives requiring a precise frequency and FCC
7: U/f control for a parabolic characteristic and ECO
Parameters

List of parameters

15: Operation with braking resistor
19: U/f control with independent voltage setpoint

Recommend.: The use of the vector control operating modes is recommended for synchronous motors.

Dependency: If you are working with reduced supply voltages (p0212.0 = 1), only U/f control with independent voltage setpoint (p1300 = 19) can be set as the operating mode.

The use of the vector control operating modes is recommended for synchronous motors.

Notice: This operating mode is only possible for chassis power units (DC/AC Motor Module).

Notice: The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

Note: For the open-loop control modes p1300 = 5 and 6, the slip compensation p1335 and the resonance damping p1338 are internally switched out (disabled) in order to be able to precisely set the output frequency.

Note: During operation (pulses enabled) the open-loop control mode cannot be changed by changing over drive data sets.

Min Max Factory setting
0 23 20

Description: Sets the open and closed-loop control mode of a drive.

Value:
0: U/f control with linear characteristic
1: U/f control with linear characteristic and FCC
2: U/f control with parabolic characteristic
3: U/f control with parameterizable characteristic
4: U/f control with linear characteristic and ECO
5: U/f control for drives requiring a precise freq. (e.g. textiles)
6: U/f control for drives requiring a precise frequency and FCC
7: U/f control for a parabolic characteristic and ECO
15: Operation with braking resistor
18: U/f control with fixed current
19: U/f control with independent voltage setpoint
20: Speed control (encoderless)
21: Speed control (with encoder)
22: Torque control (encoderless)
23: Torque control (with encoder)

Recommend.: The use of the vector control operating modes is recommended for synchronous motors.

Dependency: Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400). Closed-loop speed or torque control can be selected if the closed-loop speed/torque control was selected as operating mode (p0108.2).

A reluctance motor can only be operated in a U/f control mode (p1300 < 20). Sensorless control on separately excited synchronous motors is only possible with a VSM module (see p0150, p0151).

For chassis power units with reduced line voltage (see r0212 bit 0), the drive can only be operated in a control mode (p1300 = 20...23) and with the DC link voltage control activated.

Refer to: p0108, r0108, p0212, p0300, p0311, p0400, p1501

Notice: Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).
The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.

Note:
The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.

For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the Imax frequency controller are switched off internally so that the output frequency can be set precisely. The Imax voltage controller remains active.

For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant).

Separately-excited synchronous motors can only be operated in modes p1300 = 20, 21 and 23 - or for diagnostic purposes in modes p1300 = 0, 3 and 18. For I/f control (p1300 = 18), the current amplitude can be set using p1609. Both for U/f as well as for I/f control only a small load may be applied to the separately-excited synchronous motor because the excitation current is not calculated as a function of the load.

During operation (pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.

p1300 is pre-assigned depending on r0108.2 and p0187.

### p1302[0...n]

**U/f control configuration / U/f configuration**

<table>
<thead>
<tr>
<th>Can be changed: T</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: Unsigned16</td>

<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
<tr>
<td>01</td>
<td>Take into account the setpoint voltage sign</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Note:**
Re bit 00:
If the bit is set the device will always start up with setpoint angle zero on pulse enable. This also affects the setpoint angle for DC braking (p1231).

Re bit 01:
If the bit is set, in the case of U/f control with independent voltage setpoint (p1300 = 19) and negative setpoint voltages at the input of p1330, the setpoint angle is rotated through 180 degrees, thereby achieving a negative output voltage. The voltage boost is in this case not active (p1310, p1311).

### p1310[0...n]

**Voltage boost permanent / U_boost perm**

<table>
<thead>
<tr>
<th>Can be changed: U, T</th>
<th>Calculated: -</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: FloatingPoint32</td>
<td>Dynamic index: DDS, p0180</td>
<td>Func. diagram: 1690, 6300</td>

</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>0.0 [%]</td>
<td>250.0 [%]</td>
<td>50.0 [%]</td>
</tr>
</tbody>
</table>

**Description:**
Defines the voltage boost as a [%] referred to the rated motor current (p0305).

The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present.

The magnitude of the boost in Volt at a frequency of zero is defined as follows:
Voltage boost [V] = 1.732 x p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1310 (permanent voltage boost [%]) / 100 %

At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following:
- magnetize the induction motor.
- hold the load.
- compensate for losses in the system.
This is the reason that the output voltage can be increased using p1310.
The voltage boost can be used for both linear as well as square-law U/f characteristics.

**Dependency:**
The current limit p0640 limits the boost.
For vector control, the permanent voltage boost (p1310) has no effect as the drive converter automatically sets the optimum operating conditions.
Refer to: p1300, p1311, p1312, r1315

**Notice:**
The voltage boost increases the motor temperature (particularly at zero speed).

**Note:**
The voltage boost is only effective for U/f control (p1300).
The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).
However, these parameters are assigned the following priorities: p1310 > p1311, p1312

---

**p1311[0...n]**  
**Voltage boost at acceleration / U_boost accelerate**

<table>
<thead>
<tr>
<th>ACCESS LEVEL</th>
<th>DATA TYPE</th>
<th>DYNAMIC INDEX</th>
<th>P-GROUP</th>
<th>NOT FOR MOTOR TYPE</th>
<th>MIN</th>
<th>MAX</th>
<th>FACTORY SETTING</th>
</tr>
</thead>

<td>U/f open-loop control</td>
<td>-</td>
<td>0.0 [%]</td>
<td>250.0 [%]</td>
<td>0.0 [%]</td>
</tr>
</tbody>
</table>

**Description:**
p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load.
The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed.
The magnitude of the boost in Volt at a frequency of zero is defined as follows:
Voltage boost [V] = 1.732 * p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %

**Dependency:**
The current limit p0640 limits the boost.
Refer to: p1300, p1310, p1312, r1315

**Notice:**
The voltage boost results in a higher motor temperature increase.

**Note:**
The voltage boost when accelerating can improve the response to small, positive setpoint changes.
Assigning priorities for the voltage boosts: refer to p1310

---

**p1312[0...n]**  
**Voltage boost when starting / U_boost starting**

<table>

**Description:** Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip).

\[p_{1335} = 0.0 \%: \text{Slip compensation de-activated.}\]

\[p_{1335} = 100.0 \%: \text{The slip is completely compensated.}\]

**Dependency:** Prerequisite for a precise slip compensation for \(p_{1335} = 100 \%\) are the precise motor parameters (p0350 ... p0360).

If the parameters are not precisely known, a precise compensation can be achieved by varying \(p_{1335}\).

For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.

**Note:**

- The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors.
- For synchronous motors, this effect does not occur and the parameter has no effect in this case.
- For the open-loop control modes \(p_{1300} = 5\) and \(6\) (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency.

If \(p_{1335}\) is changed during commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of \(p_{1335}\) have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

**Description:** Displays the actual compensated slip [%] referred to r0330 (rated motor slip).

**Dependency:** \(p_{1335} > 0 \%: \text{Slip compensation active.}\)

Refer to: \(p_{1335}\)
### p1338[0...n]
**U/f mode resonance damping gain / Uf Res_damp gain**

| Description | Sets the gain for resonance damping for U/f control.  
| Dependency | Refer to: p1300, p1339, p1349  
| Note | The resonance damping function dampens active current oscillations that frequency occur under no-load conditions.  
| | The resonance damping is active in a range from approximately 6 % of the rated motor frequency (p0310). The shutoff frequency is determined by p1349.  
| | For the open-loop control modes p1300 = 5 and 6 (textile sectors), the resonance damping is internally disabled in order that the output frequency can be precisely set. |

| p1339[0...n] | U/f mode resonance damping filter time constant / Uf Res_damp T  
| Description | Sets the filter time constant for resonance damping for U/f control.  
| Dependency | Refer to: p1300, p1338, p1349  

| p1340[0...n] | I_max frequency controller proportional gain / I_max_ctrl Kp  
| Description | Sets the proportional gain of the I_max frequency controller.  
| | The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded.  
| | In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time). |
| Dependency | In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.  
| Notice | When de-activating the I_max controller, the following must be carefully observed:  
| | When the maximum current (r0067) is exceeded, the output current is no longer reduced, however, overcurrent alarm messages are generated. The drive is shut down if the overcurrent limit (r0209) is exceeded. |
| Note | The I_max limiting controller becomes ineffective if the ramp-function generator is de-activated with p1122 = 1.  
| | p1341 = 0: I_max frequency controller de-activated and I_max voltage controller activated over the complete speed range. |

| Description: | Displays the economic factor determined for optimizing motor consumption.
Dependency: | Refer to: p1335
Note: | The value is only determined for operating modes with Economic (p1300 = 4, 7). For p1346 = 0, the following applies: The integral time of the I_max voltage controller is de-activated.

| Description: | Sets the maximum output frequency for resonance damping for U/f control. Resonance damping is inactive above this output frequency.
Dependency: | Refer to: p1338, p1339
Note: | For p1349 = 0, the changeover limit is automatically set to 95 % of the rated motor frequency - however, to a max. of 45 Hz.

| Description: | Sets whether the voltage is continuously increased during the magnetizing phase (p1350 = 1, On) or whether it jumps directly to the voltage boost (p1350 = 0, Off).
Value: | 0: OFF
1: ON |
Note: | The settings for this parameter have the following advantages and disadvantages:
0 = off (jump directly to voltage boost)
Advantage: Flux is established quickly -> torque is quickly available
Disadvantage: The motor can move while it is being magnetized
1 = on (voltage is continually established)
Advantage: The motor is unlikely to rotate
Disadvantage: The flux is established slower -> torque is available later
## List of parameters

### Description:
Sets the frequency setting value at the slip compensation output for starting up with motor holding brake.

### Dependency:
When setting p1351 > 0, then slip compensation is automatically activated (p1335 = 100 %).

### Notice:
A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

### Note:
A value of 100% corresponds to the motor rated slip (r0330).

**Parameters**

**List of parameters**

**Dependency:**
Select operation with braking resistor: p1300 = 15
Refer to: p1362, r1363, p1364
Refer to: A06921, F06922

### p1362[0...1]
**Braking chopper activation threshold / Br_chop thresh**

**VECTOR_G**

**Can be changed:** U, T  
**Calculated:** CALC_MOD_ALL  
**Access level:** 3

**Data type:** Unsigned16  
**Dynamic index:** -  
**Func. diagram:** -

**P-Group:** U/f open-loop control  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1

**Min**  
0 [V]  

**Max**  
1158 [V]  

**Factory setting**  
[0] 0 [V]  
[1] 60 [V]

**Description:**
Sets the activation threshold for the brake chopper.
The hysteresis defines the range of the output voltage from zero up to the maximum voltage.

**Index:**
[0] = Braking chopper threshold value  
[1] = Braking chopper hysteresis

**Dependency:**
Select operation with braking resistor: p1300 = 15
Refer to: p1360, r1363, p1364
Refer to: A06921, F06922

### r1363
**CO: Braking chopper output voltage / Br_chop U_output**

**VECTOR_G**

**Can be changed:** -  
**Calculated:** -  
**Access level:** 3

**Data type:** FloatingPoint32  
**Dynamic index:** -  
**Func. diagram:** -

**P-Group:** Displays, signals  
**Units group:** 5_1  
**Unit selection:** p0505

<td>No</td>
<td>6030</td>
</tr>
<tr>
<td>20</td>
<td>Acceleration model</td>
<td>ON</td>
<td>OFF</td>
<td>6030</td>
</tr>
</tbody>
</table>

**Description:**

Sets the configuration for the closed-loop speed control.

**Note:**

- Re bit 01: When the bit is set, the I component of the speed controller is kept when changing into the open-loop controlled mode.
- Re bit 16: When the bit is set, the integral component of the speed controller is only held if it reaches the torque limit.
- Re bit 19: When this bit is set, speed overshoots when accelerating along the torque limit and for load surges are reduced. If the setpoint torque reaches the torque limit, then the integral component is set to the difference between the torque limit and P component.
- Re bit 20: The acceleration model for the speed setpoint is only active for encoderless vector control if p1496 is not zero.

#### p1401[0...n] Flux control configuration / Flux ctrl config

<td></td>
</tr>
</tbody>
</table>

Note:

Re bit 00:

When the bit is set, the speed following error is compensated that is obtained as a result of the smoothing time constant in p1441.

Re bit 02:

The current controller adaptation (p0391 ... p0393) is only calculated when the bit is set.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**

Sets the dead time to symmetrize the speed setpoint for active torque pre-control.

The selected multiplier refers to the speed controller clock cycle (dead time= p1428 * p0115[1]).

**Dependency:**

In conjunction with p1429, this parameter can emulate the characteristics of how the torque is established (dynamic response of closed current control loop).

The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, a fixed dead time is used.

Refer to: p1429, p1511

**p1429[0...n]**

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**

Sets the time constant (PT1) for symmetrizing the speed setpoint for active torque pre-control.

**Dependency:**

In conjunction with p1428, this parameter can emulate the characteristics of how torque is established (dynamic response of the closed current control loop).
For VECTOR (r0107) the following applies:
The parameter is only effective if the acceleration model is supplied using external acceleration signals (p1400.2 = 1). For p1400.2 = 0, time constant p1442 (or p1452 for sensorless vector control) is used.
Refer to: p1428, p1511

### r1431

**CO: Speed pre-control to motor model / n_prectrl mot_mod**

<table>
<thead>
<tr>
<th>VECTOR_G (n/M)</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-</td>
<td>-</td>
<td>4</td>
</tr>
</tbody>
</table>

**Data type:** FloatingPoint32  
**Units group:** 3_1  
**Expert list:** 1

**P-Group:** Closed-loop control  
**Not for motor type:** REL

**Min**  
- [rpm]

**Max**  
- [rpm]

**Factory setting**  
- [rpm]

**Description:** Displays the speed setpoint for pre-controlling the motor model with sensorless vector control.

**Note:** With p1400 bit 15 = 0 or encoderless torque control, the pre-control signal is kept continuously in the range of the voltage model.

### p1433[0...n]

**Speed controller reference model natural frequency / n_ctrl RefMod fn**

<table>
<thead>
<tr>
<th>VECTOR_G (n/M)</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** FloatingPoint32  
**Units group:** 3_1  
**Expert list:** 1

**P-Group:** Closed-loop control  
**Not for motor type:** REL

**Min**  
- [Hz]

**Max**  
8000.0 [Hz]

**Factory setting**  
0.0 [Hz]

**Description:** Sets the natural frequency of a PT2 element for the reference model of the speed controller.

**Recommend.:** The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.

**Dependency:** Together with p1434 and p1435, the characteristics (in the time domain) of the closed-loop speed control (P) can be emulated.

For VECTOR (r0107) the following applies:
The reference model is activated with p1400.3 = 1. For sensorless vector control (p1300 = 20) the reference model is disabled in open-loop speed controlled operation (refer to p1755).

Refer to: p1434, p1435

### p1434[0...n]

**Speed controller reference model damping / n_ctrl RefMod D**

<table>
<thead>
<tr>

<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

**Data type:** FloatingPoint32  
**Units group:** 3_1  
**Expert list:** 1

**P-Group:** Closed-loop control  
**Not for motor type:** REL

**Min**  
0.000

**Max**  
5.000

**Factory setting**  
1.000

**Description:** Sets the damping of a PT2 element for the reference model of the speed controller.

**Recommend.:** The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.

**Dependency:** In conjunction with p1433 and p1435, the characteristics (in time) of the P-controlled speed control loop can be emulated.

For VECTOR (r0107) the following applies:
The reference model is activated with p1400.3 = 1.

Refer to: p1433, p1435
### p1435[0...n] Speed controller reference model dead time / n_ctrRefMod t_dead

- **VECTOR_G (n/M)**
- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Closed-loop control
- **Not for motor type:** REL
- **Min:** 0.00
- **Max:** 3.00

**Description:**
Sets the "fractional" dead time for the reference model of the speed controller. This parameter emulates the computing dead time of the proportionally controlled speed control loop. The selected multiplier refers to the speed controller clock cycle (dead time = p1435 * p0115[1]).

**Recommend:**
The reference model is correctly set when the characteristics of p1439 (reference model output) and p1445 (actual speed value) are virtually identical when the I component of the speed controller is disabled.

**Dependency:**
In conjunction with p1433 and p1434, the characteristics (in time) of the P-controlled speed control loop can be emulated.

For VECTOR (r0107) the following applies:
The reference model is activated with p1400.3 = 1.
Refer to: p0115, p1433, p1434

### r1436 CO: Speed controller reference model speed setpoint output / RefMod n_set outp

- **VECTOR_G (n/M)**
- **Can be changed:** -
- **Data type:** FloatingPoint32
- **P-Group:** Closed-loop control
- **Not for motor type:** REL
- **Min:** - [rpm]
- **Max:** - [rpm]

**Description:**
Displays the speed setpoint at the output of the reference model.

**Dependency:**
For VECTOR (r0107) the following applies:
The reference model is activated with p1400.3 = 1.

### p1437[0...n] CI: Speed controller, reference model I component input / n_ctrRefMod I_comp

- **VECTOR_G (n/M)**
- **Can be changed:** T
- **Data type:** Unsigned32 / FloatingPoint32
- **P-Group:** Closed-loop control
- **Not for motor type:** REL
- **Min:** -
- **Max:** -

**Description:**
Sets the signal source for speed setpoint for the integral component of the speed controller.

**Dependency:**
The reference model is activated with p1400.3 = 1.
Refer to: p1400

**Caution:**
In should be ensured that a speed setpoint is selected as signal source that corresponds to the setpoint for the P component of the speed controller.

### r1438 CO: Speed controller, speed setpoint / n_ctrl n_set

- **VECTOR_G (n/M)**
- **Can be changed:** -
- **Data type:** FloatingPoint32
- **P-Group:** Closed-loop control
- **Not for motor type:** REL
- **Min:** - [rpm]
- **Max:** - [rpm]

**Description:**
Displays the speed setpoint after setpoint limiting for the P component of the speed controller.
## List of parameters

**For U/f operation, the value that is displayed is of no relevance.**

### Dependency:
Refer to: r1439

### Note:
In the standard state (the reference model is de-activated), \( r_{1438} = r_{1439} \).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>

<td>CI: Speed controller speed actual value / ( n_{\text{ctrl}} ) ( n_{\text{act}} )</td>
<td>3</td>
</tr>
<tr>
<td>p1441[0...n]</td>
<td>Actual speed smoothing time / ( n_{\text{act}} ) ( T_{\text{smooth}} )</td>
<td>3</td>
</tr>
</tbody>
</table>

### Description:
Displays the speed setpoint for the I component of the speed controller (output of the reference model after the setpoint limiting).

### Dependency:
Refer to: r1438

### Note:
In the standard state (the reference model is de-activated), \( r_{1438} = r_{1439} \).

### Danger:
When using external speed actual values for the speed controller, for a direction of rotation change via \( p_{1821} = 1 \), then its polarity must also be changed, e.g. for an encoder DO via \( p_{0410} \). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.

### Caution:
Speed control with encoder (\( p_{1300} = 21 \)):

- For the speed or position signal of the motor model there must always be a motor encoder available (evaluation via SMC/SMI, see \( p_{0400} \)). The actual speed of the motor \( (r_{0061}) \) and the position data for synchronous motors continue to come from this motor encoder and are not affected by the setting of \( p_{1440} \).
- Interconnection of \( p_{1440} \):
  - If connector input \( p_{1440} \) is interconnected with an external speed actual value, the identical scaling of the speed should be observed \( (p_{2000}) \).

### Notice:
Speed control without encoder (\( p_{1300} = 20 \)):

- Dependent upon the transmission path of the external speed signal there will be dead times which have to be taken into account when setting the speed controller parameters \( (p_{1470}, p_{1472}) \) and can lead to dynamic losses accordingly. It is for this reason that signal transmission times have to be kept as low as possible.
- So that the speed controller can also work at standstill, set \( p_{1750.2} = 1 \) (closed-loop operation from zero speed for passive loads). If you do not make this setting, operation will switch to open-loop speed control in the low speed range, switching the closed-loop speed controller off and rendering the measured actual speed ineffective.

### Note:
Speed control with encoder (\( p_{1300} = 21 \)):

- An external speed signal should, on the average, correspond to the speed of the motor encoder \( (r_{0061}) \).

### Data type and Function diagrams:
- **r1439**: FloatingPoint32, Dynamic index: -

- **r1439**: Units group: 3_1, Unit selection: p0505, Expert list: 1
- **p1440**: Units group: -
- **p1441**: Units group: -

### Access levels:
- **r1439**: Access level: 3
- **p1440**: Access level: 3
- **p1441**: Access level: 3

### Default values:
- **r1439**: Min: 0rpm, Max: 0rpm, Factory setting: 0rpm
- **p1440**: Min: 0rpm, Max: 63rpm
- **p1441**: Min: 0.00 [ms], Max: 1000.00 [ms]
Parameters
List of parameters

Dependency: Refer to: r0063

Notice: Smoothing times above 20 ms are only possible if the drive is accelerated or braked with the appropriately long ramp-up/ramp-down times. Otherwise, significant torque errors can occur and there is the danger that the drive is powered down (tripped) with F07902 (motor stalled).

Note: The speed actual value should be smoothed for encoders with a low pulse number or for resolvers. After this parameter has been changed, we recommend that the speed controller is adapted and/or the speed controller settings checked Kp (p1460) and Tn (p1462).

- **Data type:** FloatingPoint32  
- **Dynamic index:** DDS, p0180  
- **func. diagram:** 6050  
- **Not for motor type:** REL  
- **Units group:** -  
- **Unit selection:** -  
- **Scaling:** -  
- **Expert list:** 1  
- **Min:** 0.0 [%]  
- **Max:** 200000.0 [%]  
- **Factory setting:** 100.0 [%]

**Description:**  
Sets the integral time of the speed controller after the adaptation speed range (> p1465).

The entry is made referred to the integral time for the lower adaptation speed range of the speed controller (% referred to p1462).
### Speed controller adaptation speed, lower / \text{n\_ctrl n lower}

**p1464[0...n]**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_CON
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Unit selection:** p0505
- **Units group:** 3_1
- **Expert list:** 1
- **Scaling:** 
  - **Min:** 0.00 [rpm]
  - **Max:** 210000.00 [rpm]
  - **Factory setting:** 0.00 [rpm]

**Description:**
Sets the lower adaptation speed of the speed controller.
No adaptation is effective below this speed.

**Dependency:**
Refer to: p1460, p1461, p1462, p1463, p1464

**Note:**
If the upper transition point p1465 of the speed controller adaptation is set to lower values than the lower transition point p1464, then the controller below p1465 is adapted with p1461 or p1463. This means that an adaptation can be implemented for low speeds without having to change the controller parameters.

### Speed controller adaptation speed, upper / \text{n\_ctrl n upper}

**p1465[0...n]**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_CON
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Unit selection:** p0505
- **Units group:** 3_1
- **Expert list:** 1
- **Scaling:** 
  - **Min:** 0.00 [rpm]
  - **Max:** 210000.00 [rpm]
  - **Factory setting:** 210000.00 [rpm]

**Description:**
Sets the upper adaptation speed of the speed controller.
No adaptation is effective above this speed.
For P gain, p1460 x p1461 is effective. For the integral time, p1462 x p1463 is effective.

**Dependency:**
Refer to: p1460, p1461, p1462, p1463, p1464

**Note:**
If the upper transition point p1465 of the speed controller adaptation is set to lower values than the lower transition point p1464, then the controller below p1465 is adapted with p1461 or p1463. This means that an adaptation can be implemented for low speeds without having to change the controller parameters.

### CI: Speed controller P-gain scaling / \text{n\_ctrl Kp scal}

**p1466[0...n]**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 3
- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** CDS, p0170
- **Unit selection:** -
- **Units group:** -
- **Expert list:** 1
- **Scaling:** PERCENT
  - **Min:** -
  - **Max:** 1
  - **Factory setting:** 1

**Description:**
Sets the signal source for the scaling of the P gain of the speed controller.
This also makes the effective P gain (including adaptations) scalable.

### CO: Speed controller P-gain effective / \text{n\_ctrl Kp eff}

**r1468**

- **Can be changed:** -
- **Calculated:** -
- **Access level:** 3
- **Data type:** FloatingPoint32
- **Dynamic index:** -
- **Unit selection:** -
- **Units group:** -
- **Expert list:** 1
- **Scaling:** -
  - **Min:** -
  - **Max:** -
  - **Factory setting:** -

**Description:**
Displays the effective P gain of the speed controller.
For p0528 = 1, the speed controller gain is represented without any dimensions. In this case, connector output signal r1468 is increased by a factor of 100 in order to improve the resolution.

**Dependency:**
Refer to: p1462, p1464, p1465

**Note:**
If the upper transition point p1465 of the speed controller adaptation is set to lower values than the lower transition point p1464, then the controller integral time below p1465 is adapted with p1463. This means that an adaptation can be implemented for low speeds without having to change the controller parameters.

<td>-</td>
<td>Max</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:**
- The switching in of the torque setting value for the motor holding brake has a higher priority than the setting of the integrator value using p1477 and p1478.

**Note:**
- The setting of the integral output of the speed controller begins after magnetizing (see p0346, r0056 bit 4) and ends at the end of the brake control opening time p1216. A setting value of zero means that no setting procedure will take place.

Description: Sets the signal source for scaling the integrator setting value (p1478) of the speed controller.

Dependency: Refer to: p1477, p1478

Description: Displays the torque setpoint at the output of the PI speed controller.

Description: Displays the torque setpoint at the output of the P speed controller.

Description: Displays the torque setpoint at the output of the I speed controller.

Description: Sets the signal source for the compensation torque to be output within the droop calculation. p1486 should be connected with the torque setpoint (corresponding to the selection p1488) of the drive, with which load equalization should take place.

</table>

| p1488[0...n] | Droop input source / Droop input source | | | |
| VECTOR_G (n/M) | Can be changed: U, T | Calculated: - | Access level: 3 | |
| Data type: | Integer16 | Dynamic index: DDS, p0180 | Func. diagram: 6030 | |
| P-Group: | Closed-loop control | Units group: - | Unit selection: - | |
| Not for motor type: | REL | Scaling: - | Expert list: 1 | |
| Min | Max | Factory setting | | |
| 0 | 3 | 0 | | |
| Description: | Sets the source for droop feedback. | | | |
| With increasing torque, the speed setpoint is reduced (enabled using p1492), so that for mechanically coupled drives a load equalization (load compensation) is obtained. A load difference compensation is also possible, if p1486 is connected with the torque setpoint of the other drive. | | | |
| Value: | 0: Droop feedback not connected | | | |
| | 1: Droop from torque setpoint | | | |
| | 2: Droop from speed controller output | | | |
| | 3: Droop from integral output, speed controller | | | |
| Dependency: | Refer to: p1486, p1487, p1489, r1490, p1492 | | | |
| Caution: | For active acceleration precontrol of the speed controller (refer to p1496), it is not recommended that p1488 is set to 1, as this could result in positive coupling effects. Instead of this, as source of the droop feedback, the output signal of the speed controller should be used, which generally sets the load torque. | | | |

<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Enables the droop to be applied to the speed/velocity setpoint.

**Dependency:** Refer to: p1486, p1487, p1488, p1489, r1490

**Note:** Even when not enabled, the droop speed is calculated but not subtracted from the setpoint speed. This makes it possible to subtract the result of this calculation from the speed of another drive.

#### r1493 CO: Moment of inertia, total / M_inertia total

<table>
<thead>

<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Sets the signal source for the acceleration pre-control.

**Dependency:** The signal source for the acceleration is activated with p1400.2 = 1.

For p1400.2 = 0, the acceleration pre-control is calculated from the speed setpoint change from r0062.

For p1400.2 = 0 and activate reference model (p1400.3 = 1) the acceleration pre-control is switched out.

Refer to: p1400, p1496

**Note:** If the acceleration is entered as external signal, then the accelerating torque is calculated as follows (r1518):

\[ r1518 = \text{acceleration (\% of p2007)} / 100 \% \times (p2007 \times 60 \text{ s}) / (p3011 \times r0345 / 1 \text{ s} \times r0333) \]

#### p1496[0...n] Acceleration pre-control scaling / a_prectrl scal

<table>
<thead>
<tr>
<th>VECTOR_G (n/M)</th>
<th>Can be changed: U, T</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>
<td>FloatingPoint32</td>
<td>Dynamic index: DDS, p0180</td>
<td>Func. diagram: 1700, 6031</td>
</tr>
<tr>
<td>P-Group:</td>
<td>Closed-loop control</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>Not for motor type: REL</td>
<td>Scaling: -</td>
<td>Expert list: 1</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td>0.0 [%] 10000.0 [%]</td>
</tr>
</tbody>
</table>

**Description:** Sets the scaling for the acceleration pre-control of the speed/velocity controller.

**Dependency:** When the reference model is activated (p1400.3 = 1) and for an internal acceleration pre-control (p1400.2 = 0), the acceleration pre-control is switched out (disabled). The reference model (p1400.3 = 1) and external acceleration pre-control (p1400.2 = 1) can be operated together.

Refer to: p0341, p0342
Warning:
The acceleration precontrol r1518 is kept at the old value if the ramp-function generator tracking (r1199.5) is active or the ramp-function generator output is set (r1199.3). This is used to avoid torque peaks. Depending on the application, it may therefore be necessary to disable the ramp-function generator tracking (p1145 = 0) or the acceleration precontrol (p1496 = 0).
The acceleration precontrol is set to zero, if the Vdc control is active (r0056.14/15).

Note:
The parameter is set to 100% by the rotating measurement (refer to p1960).

The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled.

We also recommend that the pre-control mode is not used if there is gearbox backlash.

**Description:**

Sets the signal source for scaling the supplementary torque 1.

Sets the signal source for supplementary torque 2.

Sets the scaling for supplementary torque 2.

Displays the total supplementary torque. The displayed value is the total of supplementary torque values 1 and 2 (p1511, p1512, p1513, p1514).

Displays the total supplementary torque and the accelerating torque. The displayed value is the total of the smoothed supplementary torque and the accelerating torque (p1516 = p1516[1] + r1515).
### p1517[0...n]
**Accelerating torque smoothing time constant / M_accel T_smooth**

**VECTOR_G (n/M)**

- **Can be changed:** U, T
- **Calculated:** -
- **Access level:** 3

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Func. diagram:** 5042, 5210, 6060

- **P-Group:** Closed-loop control  
- **Units group:** -
- **Scaling:** -
- **Expert list:** 1

- **Min**  
  0.00 [ms]  
  Factory setting 4.00 [ms]

**Description:** Sets the smoothing time constant of the accelerating torque.

**Note:**
- For servo drives, the following applies:
  - For p1402.4 = 1, the highest dynamic performance is achieved with p1517 = 0 ms.
  - In encoderless operation, p1517 should be set >= 0.5 ms; for an induction motor with current displacement rotor p1517 >= 20 ms is recommended.
- For vector drives, the following applies:
  - The acceleration pre-control is inhibited if the smoothing is set to the maximum value.

### r1518[0...1]
**CO: Accelerating torque / M_accel**

**VECTOR_G (n/M)**

- **Can be changed:** -
- **Calculated:** -
- **Access level:** 3

**Data type:** FloatingPoint32  
**Dynamic index:** -  
**Func. diagram:** 6060

- **P-Group:** Closed-loop control  
- **Units group:** 7_1  
- **Scaling:** p2003  
- **Expert list:** 1

- **Min**  
  - [Nm]  
  - Factory setting [Nm]
- **Max**  
  - [Nm]  
  - [Nm]

**Description:** Displays the accelerating torque for pre-control of the speed controller.

**Index:**
- [0] = Unsmoothed  
- [1] = Smoothed

**Dependency:** Refer to: p0341, p0342, p1496

### p1520[0...n]
**CO: Torque limit upper / M_max upper**

**VECTOR_G (n/M)**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_LIM_REF  
- **Access level:** 2

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Func. diagram:** 1700, 6630

- **P-Group:** Closed-loop control  
- **Units group:** 7_1  
- **Scaling:** p2003  
- **Expert list:** 1

- **Min**  
  -1000000.00 [Nm]  
  -20000000.00 [Nm]  
  Factory setting 0.00 [Nm]

**Description:** Sets the fixed, upper torque limit.

**Dependency:** Refer to: p1521, p1522, p1523, r1538, r1539

**Danger:** Negative values when setting the upper torque limit (p1520 < 0) can result in the motor accelerating in an uncontrollable fashion.

**Notice:** A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

**Note:**
- The torque limit is limited to 400% of the rated motor torque. When automatically calculating the motor/closed-loop control parameters (p0340), the torque limit is set to match the current limit (p0640).

### Parameters

#### p1525[0...n]

**CO:** Torque limit lower scaling / M_max lower scal  
**VECTOR_G (n/M)**  
*Can be changed: U, T*  
*Calculated: -*  
*Access level: 3*  
*Data type: FloatingPoint32*  
*Dynamic index: DDS, p0180*  
*Func. diagram: 6630*  
*P-Group: Closed-loop control*  
*Units group: -*  
*Unit selection: -*  
*Not for motor type: REL*  
*Scaling: PERCENT*  
*Expert list: 1*  
*Min*  
*Max*  
*2000.0 [%]*  
*100.0 [%]*  
**Description:**  
Sets the scaling for the lower torque limit.  
**Notice:** A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.  
**Note:** This parameter can be freely interconnected. The value has the meaning stated above if it is interconnected from connector input p1528.

### r1526

**CO:** Torque limit upper without offset / M_max up w/o offs  
**VECTOR_G (n/M)**  
*Can be changed: -*  
*Calculated: -*  
*Access level: 3*  
*Data type: FloatingPoint32*  
*Dynamic index: -*  
*Func. diagram: 6060, 6630, 6640*  
*P-Group: Closed-loop control*  
*Units group: 7_1*  
*Unit selection: p0505*  
*Not for motor type: REL*  
*Scaling: p2003*  
*Expert list: 1*  
*Min*  
*Max*  
*[-Nm]*  
*[-Nm]*  
**Description:** Displays the upper torque limit of all torque limits without offset.  
**Dependency:** Refer to: p1520, p1521, p1522, p1523, p1528, p1529

### r1527

**CO:** Torque limit lower without offset / M_max low w/o offs  
**VECTOR_G (n/M)**  
*Can be changed: -*  
*Calculated: -*  
*Access level: 3*  
*Data type: FloatingPoint32*  
*Dynamic index: -*  
*Func. diagram: 6060, 6630, 6640*  
*P-Group: Closed-loop control*  
*Units group: 7_1*  
*Unit selection: p0505*  
*Not for motor type: REL*  
*Scaling: p2003*  
*Expert list: 1*  
*Min*  
*Max*  
*[-Nm]*  
*[-Nm]*  
**Description:** Displays the lower torque limit of all torque limits without offset.  
**Dependency:** Refer to: p1520, p1521, p1522, p1523, p1528, p1529

### p1528[0...n]

**CI:** Torque limit upper scaling / M_max upper scal  
**VECTOR_G (n/M)**  
*Can be changed: T*  
*Calculated: -*  
*Access level: 3*  
*Data type: Unsigned32 / FloatingPoint32*  
*Dynamic index: CDS, p0170*  
*Func. diagram: 6630*  
*P-Group: Closed-loop control*  
*Units group: -*  
*Unit selection: -*  
*Not for motor type: REL*  
*Scaling: PERCENT*  
*Expert list: 1*  
*Min*  
*Max*  
*1524[0]*  
**Description:** Sets the signal source for the scaling of the upper torque limit in p1522.  
**Danger:** For p1400.4 = 0 (torque limiting, upper/lower) the following applies:  
Negative values resulting from the signal source and scaling can cause the motor to accelerate in an uncontrolled manner.  
**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
### p1529[0...n]

- [Arms]

#### Unit selection:
- [Arms]

#### Expert list:
1

#### Access level:
3

#### Description:
Sets the signal source for the scaling of the upper torque limiting to limit the speed controller output without taking into account the current and power limits.
### p1555[0...n] CI: Power limit / P_max

**VECTOR_G (n/M)**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 3

- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** CDS, p0170
- **Func. diagram:** 6640

- **P-Group:** Closed-loop control
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1

- **Not for motor type:** REL
- **Scaling:** r2004
- **Min**
- **Max**

**Description:** Sets the signal source for the motoring and negative regenerative power limit.

**Dependency:** Refer to: p1530, p1531

**Note:**
- The resulting motoring power limit is the minimum from p1530 and the signal which is read in.
- The resulting regenerative power limit is the maximum from p1531 and the negative signal which is read in.

### p1556[0...n] Power limit scaling / P_max scal

**VECTOR_G (n/M)**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 2

- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Func. diagram:** 6640

- **P-Group:** Closed-loop control
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1

- **Not for motor type:** REL
- **Scaling:** -
- **Min**
- **Max**

**Description:** Sets the scaling of the signal source for the motoring and negative regenerative power limit.

0 signifies no power limiting.

### p1569[0...n] CI: Supplementary torque 3 / M_suppl 3

**VECTOR_G (n/M)**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 2

- **Data type:** Unsigned32 / FloatingPoint32
- **Dynamic index:** DDS, p0170
- **Func. diagram:** 7010

- **P-Group:** Functions
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1

- **Not for motor type:** REL
- **Scaling:** p2003
- **Min**
- **Max**

**Description:** Sets the signal source for supplementary torque 3.

**Dependency:** Refer to: p3842

**Notice:**
- The signal input is after the torque limit (r1538, r1539). For vector drives, the signals that are entered are only limited by the current and power limits.

**Note:**
- The signal input is preferably used to enter the friction characteristic. The friction compensation is also effective if the speed controller output reaches its torque limits, but the current limits have still not been reached (this only applies to vector drives).

### p1570[0...n] CO: Flux setpoint / Flux setpoint

**VECTOR_G (n/M)**

- **Can be changed:** U, T
- **Calculated:** -
- **Access level:** 2

- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Func. diagram:** 6722

- **P-Group:** Closed-loop control
- **Units group:** -
- **Unit selection:** -
- **Expert list:** 1

- **Not for motor type:** PEM, REL
- **Scaling:** PERCENT
- **Min**
- **Max**

**Description:** Sets the flux setpoint referred to rated motor flux.

**Notice:**
A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

**Note:**
- For p1570 > 100%, the flux setpoint increases as a function of the load from 100% (no-load operation) to the setting in p1570 (above rated motor torque), if p1580 > 0% has been set.

</tbody>
</table>

**Description:**
- Sets the signal source for the supplementary flux setpoint.
- Low flux setpoints can cause the drive to stall at higher loads. This is the reason that the flux setpoint should only be adapted for slow load changes.
- The supplementary flux setpoint is limited to +/- 50 %.

**Notice:**
- Sets the supplementary flux setpoint for the flux controller.
- The value is referred to the rated motor flux.
- The parameter should be set back to 0% again for normal closed-loop control operation.
- The parameter is used to optimize the flux controller. The current model is not influenced by the setting.

**Note:**
- The parameter only has an influence if the flux actual value reaches the threshold value p1573 more quickly during magnetizing than the time set in p0346.
- The parameter has no influence for flying restart (see p1200) and after DC braking (see p1231).

**Description:**
- Sets the voltage reserve dynamic.
- In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. This can be improved by increasing the voltage reserve. Increasing the reserve reduces the steady-state maximum output voltage (r0071).
**Parameters**

**List of parameters**

**p1576[0...n]**  
**Flux boost, adaptation speed, lower / Flux boost n lower**  
VECTOR_G (n/M)  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: ASM, PEM, REL  
Min  
0.00 [rpm]  
Max  
210000.00 [rpm]  
Access level: 3  
Expert list: 1  
Factory setting  
0.00 [rpm]  

Description:  
Sets the lower adaptation speed of the flux boost.  
Below this speed, p1570 is set as reference (setpoint) flux.

**p1577[0...n]**  
**Flux boost adaptation speed, upper / Flux boost n upper**  
VECTOR_G (n/M)  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: ASM, PEM, REL  
Min  
1.0 [%]  
Max  
10000.0 [%]  
Access level: 3  
Expert list: 1  
Factory setting  
200.0 [%]  

Description:  
Sets the upper adaptation speed of the flux boost.  
Above this speed, the rated motor flux (100 %) is set as reference (setpoint) flux.

Dependency:  
The parameter value refers to the lower adaptation speed of the flux boost.  
Refer to: p1576

**p1580[0...n]**  
**Efficiency optimization / Efficiency opt.**  
VECTOR_G (n/M)  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: PEM, REL, FEM  
Min  
0 [%]  
Max  
100 [%]  
Access level: 2  
Expert list: 1  
Factory setting  
0 [%]  

Description:  
Sets the efficiency optimization.  
When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load.  
For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.  
It only makes sense to activate this function if the dynamic response requirements of the speed controller are low.  
In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp).

Note:  
Further, the smoothing time of the flux setpoint filter (p1582) should be increased.

**p1582[0...n]**  
**Flux setpoint smoothing time / Flux setp T_smth**  
VECTOR_G (n/M)  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: REL  
Min  
4 [ms]  
Max  
5000 [ms]  
Access level: 3  
Expert list: 1  
Factory setting  
15 [ms]  

Description:  
Sets the smoothing time for the flux setpoint.
r1583  |  Flux setpoint smoothed / Flux setp smooth  
VECTOR_G (n/M)  
Can be changed:  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: REL  
Min  
Max  
Description:  
The value is referred to the rated motor flux.

p1584[0...n]  |  Field weakening operation, flux setpoint smoothing time / Field weak T_smth  
VECTOR_G (n/M)  
Can be changed:  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: PEM, REL  
Min  
Max  
Factory setting  
Description:  
The smoothing should be especially used if there is no regenerative feedback into the line supply. This means that the DC link voltage can quickly increase in regenerative operation.

p1585[0...n]  |  Flux actual value, smoothing time / Flux actVal T_smth  
VECTOR_G (n/M)  
Can be changed:  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: ASM, PEM, REL  
Min  
Max  
Factory setting  
Description:  
Only the flux setpoint rise is smoothed.

p1586[0...n]  |  Field weakening characteristic, scaling / Field weak scal  
VECTOR_G (n/M)  
Can be changed:  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: REL, FEM  
Min  
Max  
Factory setting  
Description:  
Sets the scaling of the pre-control characteristic for the start of field weakening.

Note:  
If the start of field weakening is shifted to lower speeds, then the voltage reserve is increased for partial load situations.

If the start of field weakening is shifted to higher speeds, the voltage reserve is appropriately reduced so that for fast load changes, it can be expected that this will have a negative impact on the dynamic performance.

**Description:**
- Displays the pre-control value for the field weakening current.
- Sets the proportional gain for the flux controller.
- The value is automatically pre-assigned dependent on the motor when the drive system is first commissioned. When calculating controller parameters (p0340 = 4), this value is re-calculated.
- Sets the integral time for the flux controller.
- The value is automatically pre-assigned dependent on the motor when the drive system is first commissioned. When calculating controller parameters (p0340 = 4), this value is re-calculated.
- Displays the output of the field weakening controller (synchronous motor) or the output of the flux controller (separately-excited synchronous motor, induction motor).
- Sets the P gain of the field-weakening controller.

### Description:
- Sets the integral-action time of the field-weakening controller.
- Displays the output of the field weakening controller. The value is referred to the rated motor flux.
- Displays the effective flux setpoint. The value is referred to the rated motor flux.
- Sets the permissible difference between the actual excitation current and the excitation current setpoint. The excitation current flux controller is active within this difference.

### Notes:
- If the difference lies outside the specified limit value, then the I component of the excitation current flux controller is kept. Instead of this, for the flux controller of the field-generating current, an additional I controller is switched in (integral time according to p1592).
- If the difference again lies within the bandwidth, the I component of the excitation current flux controller is re-activated and the I component of the flux controller of the field-generating current is reduced as an exponential function with respect to time. The reduction of the I component over time depends on the rotor time constant (r0384).

- **Factory setting:** 50.0 [%]

**Description:**
Sets the static torque setpoint for sensorless vector control (SLVC).

This parameter is entered as a percentage referred to the rated motor torque (r0333). For sensorless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.

**Notice:**
p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.

**Note:**
- For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current).
- For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque.
- Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors.

### p1611[0...n] Supplementary accelerating torque (SLVC) / M_suppl_accel

**VECTOR_G (n/M)**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_ALL
- **Access level:** 2
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Func. diagram:** 1710, 6721, 6722, 6726
- **P-Group:** Closed-loop control
- **Units group:** -
- **Unit selection:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.0 [%]
- **Max:** 200.0 [%]
- **Factory setting:** 30.0 [%]

**Description:**
Enters the dynamic torque setpoint for the low-speed range for sensorless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque (r0333).

**Note:**
- When accelerating and braking p1611 is added to p1610 and the resulting total torque is converted into an appropriate current setpoint and controlled.
- For pure accelerating torques, it is always favorable to use the torque pre-control of the speed controller (p1496).

### p1612[0...n] Current setpoint magnetizing open-loop controlled / ld_set ctrl

**VECTOR_G (n/M)**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_ALL
- **Access level:** 2
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **Func. diagram:** -
- **P-Group:** Closed-loop control
- **Units group:** 6_2
- **Unit selection:** p0505
- **Not for motor type:** ASM, PEM, REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.00 [Arms]
- **Max:** 10000.00 [Arms]
- **Factory setting:** 0.00 [Arms]

**Description:**
Sets the magnetizing current setpoint in the open-loop controlled encoderless operation.

The value is only valid during the current model orientation.

**Dependency:**
Refer to: p1610, p1611

**Note:**
The value is effective at speeds less than p1755 and represents a reserve for a possibly existing load torque or torque error in the moment of inertia.
### r1614 EMF maximum / EMF max

- **[Vrms]**
- **[Vrms]**
- **[Vrms]**

**Description:** Displays the actual maximum possible electromotive force (EMF) of the separately-excited synchronous motor.

**Dependency:**
- Actual DC link voltage (r0070).
- Maximum modulation depth (p1803).
- Field-generating and torque-generating current setpoint.

### p1616[0...n] Current setpoint smoothing time / I_set T_smooth

<table>
<thead>
<tr>

<td>40 [ms]</td>
</tr>
</tbody>
</table>

**Description:** Sets the smoothing time for the current/torque setpoint in the open-loop-controlled operating range in the case of sensorless vector control.

**Note:**
- This parameter is only effective in the range where current is injected for sensorless vector control.
- For induction motors, the current setpoint is calculated from p1610 and p1611 and for separately excited synchronous motors the torque setpoint is calculated from p1610 and p1611.

### r1617 CO: Torque setpoint (controlled) / M_setp sv SLVC

<tr>
<td></td>
<td>Threshold for setpoint/actual value tracking of the stator current in the q axis of the current model.</td>
</tr>
</tbody>
</table>

| p1620[0...n] | Stator current, minimum / I_stator min |
| VECTOR_G (n/M) | Can be changed: U, T |
| Data type: FloatingPoint32 | Calculated: CALC_MOD_ALL |
| P-Group: Closed-loop control | Access level: 3 |
| Not for motor type: ASM, PEM, REL | Func. diagram: 6727 |
| Min | -10000.00 [Arms] |
| Max | 10000.00 [Arms] |
| Factory setting | 0.00 [Arms] |
| | Sets the minimum stator current for separately-excited synchronous motors (FEM). A negative value means that the field-generating stator current (d-axis) has a negative sign. The valid value is internally limited to 50% of the rated motor current (p0305). |

| p1621[0...n] | Changeover speed, inner cos phi = 1 / n_chngov cos phi=1 |
| VECTOR_G (n/M) | Can be changed: U, T |
| Data type: FloatingPoint32 | Calculated: CALC_MOD_ALL |
| P-Group: Closed-loop control | Access level: 3 |
| Not for motor type: ASM, PEM, REL | Func. diagram: 6727 |
| Min | 0.00 [rpm] |
| Max | 210000.00 [rpm] |
| Factory setting | 0.00 [rpm] |
| | Sets the speed where a change is made from the inner to the outer cos phi = 1. |
| | If the value that is entered exceeds the rated speed, then a change is made to the inner cos phi = 1 over the complete speed range. |

| p1622[0...n] | Field-generating current setpoint smoothing time constant / Id_setp T_smth |
| VECTOR_G (n/M) | Can be changed: U, T |
| Data type: FloatingPoint32 | Calculated: - |
| P-Group: Closed-loop control | Access level: 3 |
| Not for motor type: ASM, PEM, REL | Func. diagram: 6727 |
| Min | 0.1 [ms] |
| Max | 200.0 [ms] |
| Factory setting | 20.0 [ms] |
| | Sets the smoothing time constant for the setpoint of the field-generating current components. |
| | The current filtered in this way is included in the calculation of the cos phi. |

| r1623[0...1] | Field-generating current setpoint (steady-state) / Id_set stationary |
| VECTOR_G (n/M) | Can be changed: - |
| Data type: FloatingPoint32 | Calculated: - |
| P-Group: Displays, signals | Access level: 4 |
| Not for motor type: PEM, REL | Func. diagram: 6723, 6726, 6727 |
| Min | - [Arms] |
| Max | - [Arms] |
| Factory setting | - [Arms] |
| | Displays the steady-state field generating current setpoint (Id_set). |

### Dependency

The individual current setpoint/speed actual value filters are parameterized starting at p1657.

### Note

If not all of the filters are required, then the filters should be used consecutively starting from filter 1.
### List of parameters

**p1657[0...n]**  
**Current setpoint filter 1 type / I_set_filt 1 Typ**

**Data type:** Integer16  
**Dynamic index:** DDS, p0180  
**Units group:** -  
**Scaling:** -  
**Expert list:** 1

**Description:** Sets the current setpoint filter 1 as low pass (PT2) or as extended general 2nd-order filter.

**Value:**
1: Low pass: PT2  
2: General 2nd-order filter

**Dependency:** Current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.

**Note:**
For an extended general 2nd-order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

\[ f_{3\text{ dB bandwidth}} = \frac{2}{D_{\text{denominator}}} f_{\text{bandstop frequency}} \]

**Min:** 1  
**Max:** 2  
**Factory setting:** 1

**p1658[0...n]**  
**Current setpoint filter 1 denominator natural frequency / I_set_filt 1 fn_n**

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Units group:** -  
**Scaling:** -  
**Expert list:** 1

**Description:** Sets the denominator natural frequency for current setpoint filter 1 (PT2, general filter).

**Dependency:** Current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.

**Min:** 0.5 [Hz]  
**Max:** 16000.0 [Hz]  
**Factory setting:** 1999.0 [Hz]

**p1659[0...n]**  
**Current setpoint filter 1 denominator damping / I_set_filt 1 D_n**

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Units group:** -  
**Expert list:** 1

**Description:** Sets the denominator damping for current setpoint filter 1.

**Dependency:** Current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.

**Min:** 0.001  
**Max:** 10.000  
**Factory setting:** 0.700

**p1660[0...n]**  
**Current setpoint filter 1 numerator natural frequency / I_set_filt 1 fn_z**

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Units group:** -  
**Expert list:** 1

**Description:** Sets the numerator natural frequency for current setpoint filter 1 (general filter).

**Dependency:** Current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.
**List of parameters**

### p1661[0...n]
**Current setpoint filter 1 numerator damping / \( I_{\text{setfilt}} 1 \ D_z \)**

<table>
<thead>
<tr>

**Description:**
Sets the denominator damping for current setpoint filter 2.

**Dependency:**
Current setpoint filter 2 is activated via p1656.1 and parameterized via p1662 ... p1666.
Parameters

List of parameters

### p1665[0...n]
**Current setpoint filter 2 numerator natural frequency / I_set_filt 2 fn_z**

- **VECTOR_G (n/M)**
- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **P-Group:** Closed-loop control
- **Units group:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.5 [Hz]
- **Max:** 16000.0 [Hz]
- **Factory setting:** 1999.0 [Hz]

**Description:**
Sets the numerator natural frequency for current setpoint filter 2 (general filter).

**Dependency:**
Current setpoint filter 2 is activated via p1666.1 and parameterized via p1662 ... p1666.

### p1666[0...n]
**Current setpoint filter 2 numerator damping / I_set_filt 2 D_z**

- **VECTOR_G (n/M)**
- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **P-Group:** Closed-loop control
- **Units group:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.000
- **Max:** 10.000
- **Factory setting:** 0.700

**Description:**
Sets the numerator damping for current setpoint filter 2.

**Dependency:**
Current setpoint filter 2 is activated via p1666.1 and parameterized via p1662 ... p1666.

### p1677[0...n]
**Speed actual value filter 5 type / n_act_filt 5 type**

- **VECTOR_G (n/M)**
- **Can be changed:** U, T
- **Data type:** Integer16
- **Dynamic index:** DDS, p0180
- **P-Group:** Closed-loop control
- **Units group:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 1
- **Max:** 2

**Description:**
Sets speed actual value filter 5 as low pass (PT2) or as extended general 2nd order filter.

**Value:**
1: Low pass: PT2
2: General 2nd-order filter

**Dependency:**
The speed actual value filter is activated with p1656.4 and parameterized with p1677 ... p1681.

**Note:**
For an extended general 2nd-order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

\[ f_{3\text{dB bandwidth}} = 2 \cdot D_{\text{denominator}} \cdot f_{\text{bandstop frequency}} \]

### p1678[0...n]
**Speed actual value filter 5 denominator natural frequency / n_act_filt 5 fn_d**

- **VECTOR_G (n/M)**
- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **Dynamic index:** DDS, p0180
- **P-Group:** Closed-loop control
- **Units group:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0.5 [Hz]
- **Max:** 16000.0 [Hz]
- **Factory setting:** 1999.0 [Hz]

**Description:**
Sets the denominator natural frequency for speed actual value filter 5 (PT2, general filter).

**Dependency:**
The speed actual value filter is activated with p1656.4 and parameterized with p1677 ... p1681.

</tbody>
</table>

**Description:**
Sets the proportional gain of the current controller for the lower adaptation current range. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.

**Dependency:**
Refer to: p0391, p0392, p0393

**Note:**
For p0393 = 100 %, the current controller adaptation is disabled and p1715 is effective over the entire range.

**p1730[0...n]**  
**Isd controller integral component shutdown threshold / Isd_ctr I_compDeac**  
VECTOR_G (n/M)  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Closed-loop control  
Not for motor type: PEM, REL, FEM  
Min: 30 [%]  
Max: 150 [%]  
Factory setting: 30 [%]  

**Description:**  
Sets the speed threshold for deactivating the integral component of the Isd controller. The d current controller is only effective as P controller for speeds greater than the threshold value. Instead of the integral component, the quadrature arm decoupling is effective.

**Warning:**  
For settings above 80%, the d current controller is active up to the field weakening limit. When operated at the voltage limit, this can result in an unstable behavior. In order to avoid this, the dynamic voltage reserve p1574 should be increased.

**Note:**  
The parameter value is referred to the synchronous rated motor speed.

**p1731[0...n]**

  - **Factory setting:** - [%]

#### Note:

- **Gain resonance damping for encoderless closed-loop control / Gain res_damp**
  - Defines the gain of the controller for resonance damping for operation with sensorless vector control in the range that current is injected.

- **Motor model speed threshold stall detection / MotMod n_thr stall**
  - Sets the speed threshold value to detect a stalled motor.
  - If the adaptation controller output exceeds the parameterized speed difference, then bit 11 in status word p1408 is set.
  - **Dependency:** If a stalled drive is detected (p1408.11 set), fault 7902 is output after the delay time in p2178.
  - **Refer to:** p2178
  - **Note:** Speed monitoring is only effective in operation with a speed encoder (refer to p1300).
  - Stalling is also identified if steps/jumps occur in the speed signal, which exceed the value in p0492.

- **Motor model error threshold stall detection / MotMod ThreshStall**
  - Sets the fault threshold in order to detect a motor that has stalled.
  - If the error signal (r1746) exceeds the parameterized error threshold, then status signal r1408.12 is set to 1.
  - **Dependency:** If a stalled drive is detected (r1408.12 = 1), fault F07902 is output after the delay time set in p2178.
  - **Refer to:** p2178
  - **Note:** Monitoring is only effective in the low-speed range (below p1755 * (100% - p1756)).

- **Motor model error signal stall detection / MotMod sig stall**
  - Signal to initiate stall detection
  - **Note:** The signal is not calculated while magnetizing and only in the low speed range (below p1755 * (100 % - p1756)).

<td>No</td>
<td>-</td>
</tr>
<tr>
<td>03</td>
<td>Motor model $Lh_{pre} = f(PsiEst)$</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>
**Caution:**
Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

**Note:**
Bit 0 ... 3 only have influence for sensorless vector control, bit 4 only for vector control with encoder. Bit 2 is pre-assigned depending on p0500.

Re bit 2 = 1:
The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 = 1, then bit 3 is automatically set to 1. Manual de-selection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

When the bit is set, the selection of bits 0 and 1 is ignored.

Re bit 2 = 0:
If the model feedback is deactivated (p1784 = 0), with bit 2 = 0, then bit 3 is also automatically set to 0.

Re bit 5 = 1:
The selection of HF signal injection is only relevant for permanent-magnet synchronous motors (PESM). Therefore, activation of bit 5 is only possible outside of motor commissioning (p0010 = 0).

In order to achieve user-friendly configuration of the power unit components in the oversampling mode, when activated for the first time, initially p1810 bit 3 is set, and then an automatic system boot is initiated. This is only possible if all of the axes connected to the CU are switched off (refer to the setting conditions for p0009); otherwise, it is not possible to set the bit.

When deactivating p1750 bit 5, p1810 bit 3 remains unchanged and the system does not boot again.

Therefore, to reverse configure the power unit components from the oversampling mode (after manually deselecting p1750 bit 5) then initially p1810 bit 3 must be manually deleted and then a manual warm restart initiated.

As an alternative to a warm restart: save the parameters and carry out a POWER ON (switch-off/switch-on). When the function "safety without encoder" (p9306/p9506) is activated, this setting is not permissible and results in monitoring errors.

Re bit 6 = 1:
The following applies for encoderless vector control of induction motors:
For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.

Re bit 7 = 1:
The following applies for encoderless vector control of induction motors:
If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount p1749 * p1755.

The effective time condition for changing over into open-controlled operation is obtained from the minimum of p1758 and 0.5 * r0384.

Activation can make sense for applications that demand a high torque at low frequencies and therefore low speed gradients.

It must be ensured that p1610, p1611 have been adequately parameterized.

Note:
Re bit 17:
Displays the status when enabling the rugged model feedback (p1784) for operation with and without encoder.
The feedback is used to increase the parameter ruggedness of the motor model and is effective in the operating range of the two-component closed loop current control.
Re bit 18:
Displays the status when enabling the differential current feedback in the current model for operation with encoder.
The function is automatically enabled with p1784 > 0 or p1731 > 0. The feedback is used for a rugged change between the current model and complete machine model with active rugged model feedback and combination current.
Re bit 19:
Displays the currently active stator circuit feedback in current model operation.
Re bit 20:
Displays the currently effective increase of the changeover limits by the value p1749 * p1755.

p1752[0...n] Motor model changeover speed operation with encoder / MotMod n_chgov enc
VECTOR_G
Can be changed: U, T Calculated: CALC_MOD_REG Access level: 3
Data type: FloatingPoint32 Dynamic index: DDS, p0180 Func. diagram: -
P-Group: Closed-loop control Units group: 3_1 Unit selection: p0505
Not for motor type: REL Scaling: - Expert list: 1
Min Max Factory setting
0.00 [rpm] 210000.00 [rpm] 210000.00 [rpm]

Description:
Sets the speed to change over the motor model for operation with encoder.
Dependency:
In U/f characteristic mode the parameter is of no significance.
Using the friction characteristic for operation with encoder:
When changing the motor model changeover speed p1752, the points along the friction characteristic should be recalculated (p0340 = 5) and the friction characteristic recorded again (p3845). For slight changes, only the associated friction characteristic points must be recorded (see p3844).
Refer to: p1756
### List of parameters

**p1753[0...n]**  
**Motor model changeover speed hysteresis operation with encoder / MotMod n_chgGovHysE**

<table>
<thead>
<tr>
<th>Data type</th>

<td>FloatingPoint32</td>
<td>DDS, p0180</td>
<td>Closed-loop control</td>
<td>-</td>
<td>REL</td>
<td>-</td>
<td>0.0 [%]</td>
<td>90.0 [%]</td>
<td>0.0 [%]</td>
</tr>
</tbody>
</table>

**Description:** Sets the hysteresis for the changeover speed of the motor model for operation with speed encoder.

**Dependency:** Refer to: p1752

**Note:**
- The value refers to p1752. In the case of separately excited synchronous motors, the lower hysteresis value is calculated with p1752 * p1753; in the case of all other types of motor, p1752 * (1 - p1753) is used.

**p1754[0...n]**  
**Flux angle difference smoothing time / Angle diff T_smth**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Dynamic index</th>
<th>P-Group</th>
<th>Units group</th>
<th>Not for motor type</th>
<th>Scaling</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>

<tbody>
<tr>
<td>FloatingPoint32</td>
<td>DDS, p0180</td>
<td>Closed-loop control</td>
<td>-</td>
<td>ASM, REL</td>
<td>-</td>
<td>0.1 [ms]</td>
<td>10000.0 [ms]</td>
<td>5.0 [ms]</td>
</tr>
</tbody>
</table>

**Description:** Sets the smoothing time constant to filter the main flux angle difference from the voltage and current models.

The filtered value is included in the calculation of the total flux angle.

PESM: Sets the smoothing time constant for the angular difference display between motor model and encoder.

**Note:**
- In the case of a separately excited synchronous motor and sensorless vector control, the parameter must be set to
- the minimum value to improve motor model changeover.

**p1755[0...n]**  
**Motor model changeover speed encoderless operation / MotMod n_chgSnsorl**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Dynamic index</th>

<td>REL</td>
<td>-</td>
<td>0.00 [rpm]</td>
<td>210000.00 [rpm]</td>
<td>210000.00 [rpm]</td>
</tr>
</tbody>
</table>

**Description:** Sets the speed to change over the motor model to encoderless operation.

**Dependency:**
- In U/f characteristic mode the parameter is of no significance.

Refer to: p1749, p1756

**Notice:**
- The changeover speed represents the steady-state minimum speed up to which the motor model can be used in sensorless steady-state operation.

If the stability is not adequate close to the changeover speed, it may make sense to increase the parameter value.

**Note:**
- The changeover speed applies for the changeover between open-loop and closed-loop control mode.

**p1756**  
**Motor model changeover speed hysteresis encoderless operation / MotMod n_chgGovHyS**

<table>
<thead>
<tr>
<th>Data type</th>

<td>Closed-loop control</td>
<td>-</td>
<td>REL</td>
<td>-</td>
<td>0.0 [%]</td>
<td>95.0 [%]</td>
<td>50.0 [%]</td>
</tr>
</tbody>
</table>

**Description:** Sets the hysteresis for the changeover speed of the motor model for encoderless operation.
Dependency: In U/f characteristic mode the parameter is of no significance.
Refer to: p1755

Note: The parameter value refers to p1755.
In the case of separately excited synchronous motors, the lower hysteresis value is calculated with p1755 * p1756; in the case of all other types of motor, p1755 * (1 - p1756) is used.

p1757[0...n] Motor model w/o enc. op./cl.-loop controlled stab. controller Kp / MotMod w/o enc Kp

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>(n/M)</th>
</tr>
</thead>
<tbody>
<tr>

<td>10.00</td>
</tr>
<tr>
<td>Factory setting</td>
<td></td>
</tr>
</tbody>
</table>

Description: Sets the gain of the transient response controller when the motor model changes over from open-loop controlled operation to closed-loop controlled operation.

Note: Only for ASM and PSM in encoderless operation:
The settling range starts at 0.5 * p1755 * p1756.
For ASM it ends at p1755 * p1756 or at p1755, if p1759 is at the maximum value.
For PSM it always ends at p1755 * p1756.

p1758[0...n] Motor model changeover delay time closed/open-loop control / MotMod t cl_op

<table>
<thead>
<tr>
<th>VECTOR_G</th>

<td>Min</td>
<td>Max</td>
</tr>
<tr>
<td>0 [ms]</td>
<td>2000 [ms]</td>
</tr>
<tr>
<td>0 [ms]</td>
<td></td>
</tr>
</tbody>
</table>

Description: Sets the minimum time for exceeding the changeover speed when changing from open-loop controlled operation to closed-loop controlled operation.

Dependency: Refer to: p1755, p1756

Note: When p1759 = 2000 ms, the delay time becomes ineffective and the model changeover is determined by the output frequency only.

p1760[0...n] Motor model with encoder speed adaptation Kp / MotMod wE n_ada Kp

Description: Sets the proportional gain of the controller for speed adaptation with encoder.
### p1761[0...n] Motor model with encoder speed adaptation Tn / MotMod wE n_ada Tn

**VECTOR_G (n/M)**

Can be changed: U, T  
Calculated: CALC_MOD_CON  
Access level: 3

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Func. diagram:** -

**P-Group:** Closed-loop control  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** REL, FEM  
**Scaling:** -  
**Expert list:** 1

**Min**  
0 [ms]  
**Max**  
1000 [ms]  
**Factory setting**  
4 [ms]

**Description:**  
Sets the integral-action time of the controller for speed adaptation with encoder.

### r1762[0...1] Motor model deviation component 1 / MotMod dev comp 1

**VECTOR_G (n/M)**

Can be changed: -  
Calculated: -  
Access level: 4

**Data type:** FloatingPoint32  
**Dynamic index:** -  
**Func. diagram:** 6721, 6730, 6731

**P-Group:** Closed-loop control  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** REL, FEM  
**Scaling:** -  
**Expert list:** 1

**Min**  
-  
**Max**  
-  
**Factory setting**  
-

**Description:**  
Induction motor (ASM): Displays the referred imaginary system deviation for the adaptation circuit of the motor model.  
Permanent-magnet synchronous motor (PESM): Displays the system deviation for speed adaptation.  
$r1762.0$: Angular deviation [rad-el] of the estimated EMF.  
$r1762.1$: Angular deviation [rad-el] of the low-level signal response for pulse technique.

**Index:**  
[0] = Deviation Model1  
[1] = Deviation Model2

### r1763 Motor model deviation component 2 / MotMod dev comp 2

**VECTOR_G (n/M)**

Can be changed: -  
Calculated: -  
Access level: 4

**Data type:** FloatingPoint32  
**Dynamic index:** -  
**Func. diagram:** -

**P-Group:** Closed-loop control  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** REL, FEM  
**Scaling:** -  
**Expert list:** 1

**Min**  
-  
**Max**  
-  
**Factory setting**  
-

**Description:**  
Induction motor (ASM): Displays the referred real system deviation for the adaptation circuit of the motor model.  
Permanent-magnet synchronous motor (PESM): Not used.

### p1764[0...n] Motor model without encoder speed adaptation Kp / MotMod woE n_adaKp

**VECTOR_G (n/M)**

Can be changed: U, T  
Calculated: CALC_MOD_CON  
Access level: 3

**Data type:** FloatingPoint32  
**Dynamic index:** DDS, p0180  
**Func. diagram:** 6730

**P-Group:** Closed-loop control  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** REL, FEM  
**Scaling:** -  
**Expert list:** 1

**Min**  
0.000  
**Max**  
100000.000  
**Factory setting**  
1000.000

**Description:**  
Sets the proportional gain of the controller for speed adaptation without encoder.

<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Dependency:**

In U/f characteristic operating mode only bit 7 is relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

When the power units are connected in parallel with separate, offset motor winding systems (p7003 = 2), then the compensation of the valve interlocking times should be implemented as Rs adaptation (bit 7 = 1).

**Note:**

ASM: Induction motor

PEM: Permanent magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

</tbody>
</table>

**Description:**

Sets the scaling for model fault feedback.

**Note:**

Feeding back the measured model fault to the model states increases the control stability and makes the motor model rugged against parameter errors.

When feedback is selected (p1784 > 0), Lh adaptation is not effective.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kp</td>
<td></td>
<td>Sets the proportional gain Kp for speed adaptation with active pulse technique for the estimation of the continuous rotor position.</td>
</tr>
</tbody>
</table>

#### Data type: FloatingPoint32
#### Dynamic index: DDS, p0180
#### Access level: 3

**Dependency:**
- The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values:
  - \( p_{1800} = \frac{1000}{p_{0115}[0] \times 2} \)
  - \( p_{1800} = \frac{n \times 1000}{p_{0115}[0]} \) with \( n = 1, 2, 3, \ldots \)

**Example:**
\( p_{0115}[0] = 250 \mu s \rightarrow p_{1800} = 2, 4, 8, 12, 16 \text{ kHz} \)

Possible setting values can be taken from r0114 (if \( p_{0009} = p_{0010} = 0 \)).

If \( p_{0092} = 1 \) the sampling times \( p_{0115} \) and the pulse frequency \( p_{1800} \) are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be de-activated by setting \( p_{0092} = 0 \) (making this setting does not affect isochronous PROFIBUS operation).

If wobblulation is selected (p1810.2), the pulse frequency can only be changed as part of pulse enabling to values with the following ratio:
- a) \( p_{1800} \leq 1000 / p_{0115}[0] \) for \( p_{1811} > 0 \% \)
- b) \( p_{1800} \leq 1000 \times 2 / p_{0115}[0] \) for \( p_{1811} = 0 \% \)

**Effects:**
- switchover of the gating unit (p1810 bit 2)
- current actual value correction is activated (p1840 bit 0)
- minimum pulse frequency \( 1000 \times 0.5 / p_{0115}[0] \)
- maximum pulse frequency \( 1000 \times 2 / p_{0115}[0] \)
- fluctuating deadtimes and dynamic performance in the current control loop
- increased level of current ripple in the current display

### p1800[0...n] Pulse frequency setpoint / Pulse freq setp

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kp</td>
<td></td>
<td>Sets the pulse frequency for the converter.</td>
</tr>
</tbody>
</table>

This parameter is pre-set to the rated converter value when the drive is first commissioned.

#### Data type: FloatingPoint32
#### Dynamic index: DDS, p0180
#### Access level: 2

**Dependency:**
- The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values:
  - \( p_{1800} = 1000 / (p_{0115}[0] \times 2) \)

or

\( p_{1800} = n \times 1000 / p_{0115}[0] \) with \( n = 1, 2, 3, \ldots \)

**Example:**
\( p_{0115}[0] = 250 \mu s \rightarrow p_{1800} = 2, 4, 8, 12, 16 \text{ kHz} \)

Possible setting values can be taken from r0114 (if \( p_{0009} = p_{0010} = 0 \)).

If \( p_{0092} = 1 \) the sampling times \( p_{0115} \) and the pulse frequency \( p_{1800} \) are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be de-activated by setting \( p_{0092} = 0 \) (making this setting does not affect isochronous PROFIBUS operation).

If wobblulation is selected (p1810.2), the pulse frequency can only be changed as part of pulse enabling to values with the following ratio:
- a) \( p_{1800} \leq 1000 / p_{0115}[0] \) for \( p_{1811} > 0 \% \)
- b) \( p_{1800} \leq 1000 \times 2 / p_{0115}[0] \) for \( p_{1811} = 0 \% \)

**Effects:**
- switchover of the gating unit (p1810 bit 2)
- current actual value correction is activated (p1840 bit 0)
- minimum pulse frequency \( 1000 \times 0.5 / p_{0115}[0] \)
- maximum pulse frequency \( 1000 \times 2 / p_{0115}[0] \)
- fluctuating deadtimes and dynamic performance in the current control loop
- increased level of current ripple in the current display
Note: The maximum possible pulse frequency is also determined by the power unit being used. When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).

The maximum pulse frequency for operation with output reactors (see p0230) is 4 kHz for booksize and blocksize power units, for chassis power units it is twice the rated pulse frequency (2.5 kHz or 4 kHz).

If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter. If an external sine-wave filter is parameterized, (p0230 = 4), then the minimum pulse frequency is calculated as follows:

\[ f_{\text{puls_min}} = \frac{1.6}{(2 \times \pi \times \sqrt{p0233 \times p0234 \times p0235})} \], with p0233 in H and p0234 in F.

In this case, the pulse frequency must be a multiple of the inverse value of the current controller sampling time (p0115[0]).

If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be changed below the minimum value required for the filter.

If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

</tr>
<tr>
<td></td>
<td>Refer to: r0192, p0230, p07003</td>
</tr>
</tbody>
</table>
**Notice:**
If the pulse patterns are enabled with overmodulation option (p1802 < 3) or edge modulation (p1802 > 6), then the current actual value correction is automatically activated (p1840.0 = 0).

**Note:**
When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.
p1802 ≠ 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.

### p1803[0...n]  
**Maximum modulation depth / Modulat depth max**

**Description:**
Defines the maximum modulation depth.

**Note:**
p1803 = 100% is the overcontrol limit for space vector modulation (for an ideal drive converter without any switching delay).

If an optimized pulse pattern is enabled (edge modulation), then the modulation depth is limited to below the output frequency of 28 Hz as there is no optimized pulse pattern in this range.

  8: Edge modulation from 100 Hz; 9:1
  9: Optimized pulse pattern
- **Expert list:** 1

#### p1810 Modulator configuration / Modulator config

**VECTOR_G**

- **Can be changed:** U, T
- **Data type:** Unsigned16
- **P-Group:** Modulation
- **Value:**
  00: Avg value filter for \( U_{\text{lim}} \) (only for \( V_{\text{dc comp. in modulator}} \))
  01: DC link voltage compensation in the current control
  02: Wobbulation activated
  03: Current measurement oversampling selected
  08: Pulse frequency reduction (speed dependent) stage 1
  09: Pulse frequency reduction (speed dependent) stage 2
  10: Activate pulse-locking/pulse-dropping function
  12: Pulse freq. can be asynchronously set to curr. ctrl clock cycle
  13: Pulse freq. reduction before optimized pulse patterns for 500 µs
  14: Deactivate maximum angular difference adaptation
- **Expert list:**

**Dependency:** If bit 2 is set from 1 to 0, \( p1811 = 0 \) is set.
**Parameters**

**List of parameters**

**Notice:**
- Bit 1 = 0 can only be set under a pulse inhibit and for r0192.14 = 1.
- Bit 2 can only be set to 1 subject to the following prerequisites:
  - Pulse inhibit
  - r0192.16 = 1
  - p1800 < 2 x 1000/p0115[0]
- Bit 12 can only be changed subject to the following prerequisites:
  - preconditions, the same as bit 2 = 1
  - p1810.3 = 0

**Note:**
- Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).
- Re bit 00 = 1:
  - Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).
- The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).
- Re bit 01 = 0:
  - DC link voltage compensation in the modulator.
- Re bit 01 = 1:
  - DC link voltage compensation in the current control.
- Re bit 02 = 0:
  - A gating unit that does not permit wobulation is used.
  - Edge modulation is not possible for a parallel connection with a single-winding system (p7003 = 0).
  - Bit 02 cannot be set to 0 if bit 12 = 1.
- Re bit 02 = 1:
  - A gating unit that permits wobulation is used.
  - For a wobulation amplitude p1811 = 0, the maximum possible pulse frequency in P1800 = 2 x 1000 / p0115[0].
  - For a wobulation amplitude p1811 > 0, the maximum possible pulse frequency in P1800 = 1000 / p0115[0].
  - If optimized pulse patterns has been activated (p1802 > 6), then a parameter save is required and switch-off and switch-on again. This is displayed using a fault message (F01040).
- Re bit 03 = 1:
  - The actual current value sensing and the determination of the valve ON times takes place with a double current controller clock cycle and phase offset.
  - The activation is only possible with r0192.23 = 1 and p1810.12 = 0 - and takes effect the next time the system is powered up.
- Re bit 08 = 1:
  - Above the frequency threshold r1836[0], the pulse frequency is switched to the value in p1800. Below r1836[0] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see r0114).
- Re bit 09 = 1:
  - Above the frequency threshold r1836[1], the pulse frequency is increased to the next possible value. Below r1836[1] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency.
  - If bit 8 is set to 0, bit 9 is automatically reset.
- Re bit 10 = 0:
  - Pulse-locking function activated.
- Re bit 10 = 1:
  - Pulse-dropping function activated.
- Re bit 12 = 0:
  - The pulse frequency p1800 can also be synchronously set to the current controller clock cycle (see r0114).
  - Bit 12 can only be set from 1 to 0 if the pulse frequency p1800 is set synchronously to the current controller clock cycle. In this case, the gating unit is not switched over.
- Re bit 12 = 1:
  - The pulse frequency p1800 can also be asynchronously set to the current controller clock cycle. In this case, the effects should be observed (see p1800).
  - If bit 12 is set to 1, then the gating unit is automatically switched over (p1810.2 = 1). If this is not possible (see above), then bit 12 cannot be set to 1.
  - Bit 12 cannot be set to 1, if p1810.3 = 1 is set.
p1811[0...n]  Pulse frequency wobbulation amplitude / Puls wobb ampl

**Description:**
Sets the amplitude of the statistical wobbulation signal. This signal is used to vary the pulse frequency to create a more pleasant sound.

**Note:**
p1811 > 0 is possible, if the following applies:
- configuration: p1810.2 = 1 (wobbulation activated)
- pulse frequency: p1800 <= 1000 / p115[0]
- output filter, filter type: p0230 < 3 (no sine-wave filter)

**Description:**
Sets the signal source to activate/de-activate offset calibration for output current measurement.

**Caution:**
The absence of offset calibration can have a negative effect on control properties. Offset calibration must be performed before switching on the power unit for the first time after POWER ON.

**Note:**
Offset calibration is only performed with pulses suppressed and can take up to one second.

p1815  Phase for PWM generation subgroup / Ph for PWM subgr

**Description:**
Sets bit 0 for recording the power unit in the subgroup for the "offset clocking".

**Dependency:**
Refer to: p1818, p1819

**Note:**
A change only becomes effective after booting.
If one of the following secondary conditions is not fulfilled, then none of the power units from the subgroup are clocked with an offset.

Secondary conditions for clocking with an offset:
- the PWM frequency (p1800[D]) of all power units in the subgroup must be the same.
- the PWM frequency (p1800[D]) must be the same in all drive data sets in the subgroup.
- the following must apply for the ratio between the PWM cycle (1/p1800[D]) and the current controller cycle (p0115[0]):
The ratio (1/p1800[D]) / (p0115[0]) must be an even integer number (2, 4, 6, ...) for all power units in the subgroup.

or
The ratio (p0115[0]) / (1/p1800[D]) must be an integer number (1, 2, 3, ...) for all power units in the subgroup.
### p1816
**Set phase for PWM generation manually / Set Ph for PWM**

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: U, T</th>

<td>16</td>
<td>-1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets manual setting and overwriting of automatically determined phase shift for "offset clocking".

For p1816 = -1, the following applies:
Automatic mode. The phase shift value is automatically determined.

For p1816 = 0 ... 16, the following applies:
Manual mode. The user should define the phase shift value as follows:
1. PWM cycle (1/p1800) > current controller clock cycle (p0115[0])
The power unit executes a phase shift from Tshift = current controller cycle (p0115[0]) * p1816.
2. PWM cycle (1/p1800) <= current controller clock cycle (p0115[0])
For p1816 >= 1, the power unit executes a phase shift from Tshift = PWM cycle/2.

**Dependency:**
Refer to: r0116, p1800, p1819

### p1817
**Minimum ratio, pulse frequency to the output frequency / Min f_puls / f_max**

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: C2(2)</th>
<th>Calculated: -</th>
<th>Access level: 4</th>

<tr>
<td>8.3</td>
<td>15.0</td>
<td>12.0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the minimum ratio between the pulse frequency and the output frequency.

**Notice:**
If the ratio between the pulse frequency and the output frequency is reduced, then oscillations can occur in the output current that can result in significant levels of current ripple with the appropriate negative effects.

**Note:**
When the maximum speed is changed, the pulse frequency p1800 is automatically limited to this minimum ratio. It is not permissible to reduce the pulse frequency if this would result in this ratio being undershot.

**Description:**
Sets the phase shift for offset clocking.
For the first active power unit, it is specified whether clocking is to start at 0° (value = 0) or 180° (value = 1). All other active power units are clocked alternately according to the setting made here.

**Dependency:**
Refer to: p1819

**Note:**
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.
**p1819 Phase for PWM generation / Ph for PWM**

**Dependency:**
Refer to: p1821

**Caution:**
Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.

**Note:**
This setting can only be changed when the pulses are inhibited. p1821 can be used to reverse the phase sequence and encoder actual value.
## Description:
Setting to change the direction of rotation.
If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.

### Value:
- 0: CW
- 1: CCW

### Dependency:
Refer to: F07434

### Danger:
When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.

### Caution:
- For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.
- Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.
- An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.
- For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.
- When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).
- p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.

### Notice:
- The value is automatically calculated in the motor data identification routine.

### Note:
- The value is calculated in the motor data identification routine.

## p1825
### Converter valve threshold voltage / Threshold voltage

### Description:
Sets the threshold voltage drop of the valves (power semiconductor devices) to be compensated.

### Note:
The value is automatically calculated in the motor data identification routine.

## p1828
### Compensation valve lockout time phase U / Comp t_lock ph U

### Description:
Sets the valve lockout time to compensate for phase U.

### Notice:
The deadtime compensation is deactivated with p7003 = 2.
Note: The value is automatically calculated in the motor data identification routine.
For type PM340 power units, the value is limited to 3.98 µs.

**Description:** Frequency to shift the switchover frequency r1836 for pulse frequency reduction.

The parameter value reduces the switchover frequency threshold with the same parameter index.

**Index:**
- [0] = Frequency limit 1
- [1] = Frequency limit 2

**Dependency:** Refer to: r1836
### r1836[0...1]

**Pulse frequency reduction, switchover frequency / f_puls_red f_sw**

**Description:**
Displays the frequency limits, under which the pulse frequency is automatically reduced.

Starting from the parameterized pulse frequency p1800, the pulse frequency is reduced to the next possible one, if the frequency limits and an additional hysteresis are fallen below.

- **Index 0:** Frequency limit for the first pulse frequency reduction (active for p1810.8 = 1)
- **Index 1:** Frequency limit for the second pulse frequency reduction (active for p1810.9 = 1)

**Dependency:**
Refer to: p1810, p1835

**Note:**
The pulse frequency reduction is not active for U/f control.

A minimum clearance of 10 Hz is kept between the frequency thresholds, which cannot be fallen below when changing p1835.

### r1837

**Gating unit configuration / Gating unit config**

**Description:**
Display for the configuration of the gating unit driver.

**p1900**  
Motor data identification and rotating measurement / MotID and rot meas

- **VECTOR_G**
- **Can be changed:** C2(1), T
- **Data type:** Integer16
- **Dynamic index:** -
- **Func. diagram:** -
- **P-Group:** Motor identification
- **Units group:** -
- **Not for motor type:** -
- **Scaling:** -
- **Min:** 0
- **Max:** 2
- **Expert list:** 1
- **Access level:** 1

**Description:**
Sets the motor data identification and speed controller optimization.

- **p1900 = 0:**
  - Function inhibited.
- **p1900 = 2:**
  - Induction motors --> set p1910 = 1 and p1960 = 0
  - Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.

**Value:**

0: Inhibited
2: Identify motor data at standstill

**Dependency:**

In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1272, p1300, p1910
Refer to: F07990, A07991

**Notice:**

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

It is not permissible to activate write protection during the motor identification (p7761).

**Note:**

The motor and control parameters are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating).

An appropriate alarm is output when the parameter is set.

The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.

The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.

p1900 is automatically set to 0 after the motor data identification routine has been completed.

**Description:**

Sets the motor data identification and speed controller optimization.

The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960).

p1900 = 0:
Function inhibited.

p1900 = 1:
Induction motors --> set p1910 = 1 and p1960 = 0, 1, 2 depending on p1300
Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0, 1, 2 depending on p1300

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.

With the following power-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.

p1900 = 2:
Induction motors --> set p1910 = 1 and p1960 = 0
Permanent-magnet or separately-excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0

When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next power-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.

For permanent-magnet or separately-excited synchronous motors, the encoder is adjusted with the next power-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.
p1900 = 3:
Sets p1960 = 0, 1, 2 depending on p1300
This setting should only be selected if the motor data identification was already carried out at standstill.
When the drive enable signals are present, with the next power-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

Value:
0:  Inhibited
1:  Identify motor data at standstill and with motor rotating
2:  Identify motor data at standstill
3:  Identify motor data with motor rotating

Dependency:
In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.
Refer to: p1272, p1300, p1910, p1960, p1990
Refer to: A07980, A07981, F07982, F07983, F07984, F07985, F07986, F07987, F07988, F07990, A07991

Notice:
If there is a motor holding brake, it must be open (p1215 = 2).
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
It is not permissible to activate write protection during the motor identification (p7761).

p1900 = 3:
This setting should only be selected if the motor data identification was already carried out at standstill.

Note:
The motor and control parameters are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating).
An appropriate alarm is output when the parameter is set.
The power-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.
p1900 is automatically set to 0 after the motor data identification routine has been completed.

p1901  Test pulse evaluation configuration / Test puls config

Can be changed:  T
Calculated:  CALC_MOD_ALL
Access level:  2

Data type:  Unsigned32
Dynamic index:  -
Func. diagram:  -
P-Group:  Motor identification
Units group:  -
Unit selection:  -
Not for motor type:  -
Scaling:  -
Expert list:  1
Min  Max  Factory setting

Dependency:
Refer to: p0287

Note:
Re bit 02=0:
If the test was successful once after POWER ON (see r1902.0), it is not repeated.
Re bit 02=1:
The test is not only performed after POWER ON, but also each time the pulses are enabled.
If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.
If a ground fault is detected during the test, this is displayed in r1902.2.
r1902  Test pulse evaluation status / Test puls ev stat

Description:
Displays the status of the test pulse evaluation.

Short-circuit test:
Bit 0: The short-circuit test was executed without any fault.
Bit 1: A phase short circuit has been detected.
Bit 2: A ground fault test was successfully performed.
Bit 3: A ground fault was detected.
Bit 4: A test pulse longer than one sampling time has occurred

Note:
If the ground fault test was selected, but not successfully performed, then sufficient current will not be able to be established during the test pulse.

p1905  Parameter tuning selection / Par tune select

Description:
The fine encoder calibration (TUNE_ENC_FINE) should be started during the first commissioning or after the encoder is replaced.
The fine calibration starts when the pulses are enabled and performs a rotating measurement (approximately 1 minute). In this case, a setpoint speed of at least 40% of the motor rated speed must be entered, and the torque must be less than half of the motor rated torque.
The phases of the fine calibration of displayed using alarm A07976. The fine calibration ends with the calculation of p0431 for the following pulse inhibit. p1905 is automatically set to 0 at the end of the fine calibration.

Value:
0: Inactive
90: Encoder fine tuning

Dependency:
If the motor encoder adjustment has not been performed (p3925, bit 4 = 0) or the encoder calibration is activated (p1990 != 0), then encoder fine calibration is prevented.
Refer to: p1272, p1910, p1960, p1990
Refer to: A07976

Caution:
During encoder fine calibration, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

Notice:
For p1905 = 90 and with the pulses not enabled, the function is only executed the next time that the pulses are enabled. When selecting the encoder fine calibration, the changeover of the motor data sets is suppressed.

**Description:**
Sets the configuration for the motor data identification.

**Note:**
The following applies to permanent-magnet synchronous motors:
Without de-selection in bit 11, in the closed-loop control mode, the direct inductance LD and the quadrature inductance Lq are measured at a low current.
When de-selecting with bit 11 or in the U/f mode, the stator inductance is measured at half the rated motor current.
If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be de-selected.

### p1910
Motor data identification selection / MotID selection

<table>
<thead>
<tr>

<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>26</td>
<td>1</td>
</tr>
</tbody>
</table>

**Description:**
Sets the motor data identification routine.
The motor data identification routine is carried out after the next power-on command.
p1910 = 1;
All motor data and the drive converter characteristics are identified and then transferred to the following parameters:
p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830
After this, the control parameter p0340 = 3 is automatically calculated.

**Value:**
0: Inhibited
1: Complete identification (ID) and acceptance of motor data
2: Complete identification (ID) of motor data without acceptance
List of parameters

20: Voltage vector input
21: Voltage vector input without filter
22: Rectangular voltage vector input without filter
23: Triangular voltage vector input without filter
24: Rectangular voltage vector input with filter
25: Triangular voltage vector input with filter
26: Enter voltage vector with DTC correction

Dependency:
"Quick commissioning" must be carried out (p0010 = 1) before executing the motor data identification routine!

In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1272, p1900

Caution:
After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next power-on command:
- current flows through the motor and a voltage is present at the drive converter output terminals.
- during the identification routine, the motor shaft can rotate through a maximum of half a revolution.
- however, no torque is generated.

Notice:
If there is a motor holding brake, it must be open (p1215 = 2).
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

Note:
When setting p1910, the following should be observed:
1. "With acceptance" means:
The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.
2. "Without acceptance" means:
The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged.
3. p1910 = 3, 4, 5 can only be selected for induction motors.

03 Re-calculates the speed controller parame-

ters Yes No -  
04 Speed controller optimization (vibration test) Yes No -  
05 q leakage inductance ident. (for current con-

troller adaptation) Yes No -  
12 Measurement shortened Yes No -  
Description: Sets the configuration of the rotating measurement.  
Dependency: Refer to: F07988  
Note: The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).  
The following parameters are influenced for the individual optimization steps:  
Bit 00: None  
Bit 01: p0320, p0360, p0362 ... p0369  
Bit 02: p0341, p0342  
Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496  
Bit 04: Dependent on p1960  
Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors  
p1960 = 1, 3: p1400.0, p1458, p1459, p1470, p1472, p1496
The identification of the \(q\) leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the \(q\)-leakage inductance under no-load conditions is at least 30% higher than the total leakage inductance (p0356, p0358).

Re bit 12 = 1:

The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy.

### p1960 Rotating measurement selection / Rot meas sel

**VECTOR_G**

- **Can be changed:** T
- **Calculated:** -
- **Access level:** 2
- **Data type:** Integer16
- **Dynamic index:** -
- **Func. diagram:** -
- **P-Group:** Motor identification
- **Units group:** -
- **Unit selection:** -
- **Not for motor type:** REL
- **Scaling:** -
- **Expert list:** 1
- **Min:** 0
- **Max:** 4
- **Factory setting:** 0

**Description:**

Sets the rotating measurement.

The rotating measurement is carried out after the next power-on command.

The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300).

- **p1300 < 20 (U/f open-loop control):** It is not possible to select rotating measurement or speed controller optimization.
- **p1300 = 20, 22 (encoderless operation):** Only rotating measurement or speed controller optimization can be selected in the encoderless mode.
- **p1300 = 21, 23 (operation with encoder):** Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.

**Value:**

- 0: Inhibited
- 1: Rotating measurement in encoderless operation
- 2: Rotating measurement with encoder
- 3: Speed controller optimization in encoderless operation
- 4: Speed controller optimization with encoder

**Dependency:**

Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done.

In the simulation mode, a value of 1 cannot be written into the parameter.

When selecting the rotating measurement, the drive data set changeover is suppressed.

Refer to: p1272, p1300, p1900, p1959

Refer to: A07987

**Danger:**

For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.

**Notice:**

If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

**Note:**

When the rotating measurement is activated, it is not possible to save the parameters (p0971, p0977).

Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made.

The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s.

For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472).

Depending on whether the speed controller optimization is carried out with or without encoder, different \(K_{p}/T_{n}\) adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.
### p1961 Saturation characteristic speed to determine / Sat_char n determ

</table>

**Description:**
Displays the magnetizing inductances of the identified saturation characteristic. The values are referred to r0382.

**Index:**
- [0] = Value 1
- [1] = Value 2
- [2] = Value 3
- [3] = Value 4
- [4] = Value 5

**Dependency:**
- Refer to: r0382
### r1964[0...4] Saturation characteristic rotor flux / Sat_char rot flux

**VECTOR_G (n/M)**
- Can be changed: -
- Calculated: -
- Access level: 4

- Data type: FloatingPoint32
- Dynamic index: -
- Func. diagram: -

- P-Group: Motor identification
- Units group: -
- Unit selection: -

- Not for motor type: PEM, REL
- Scaling: -
- Expert list: 1

- Min - [%]
- Max - [%]
- Factory setting

**Description:**
Displays the rotor flux values of the identified saturation characteristic.
After they have been determined, the values are transferred to p0362 ... p0365.

**Index:**
- [0] = Value 1
- [1] = Value 2
- [2] = Value 3
- [3] = Value 4
- [4] = Value 5

### p1965 Speed_ctrl_opt speed / n_opt speed

**VECTOR_G (n/M)**
- Can be changed: U, T
- Calculated: -
- Access level: 3

- Data type: FloatingPoint32
- Dynamic index: -
- Func. diagram: -

- P-Group: Motor identification
- Units group: -
- Unit selection: -

- Not for motor type: REL
- Scaling: -
- Expert list: 1

- Min 10 [%]
- Max 75 [%] 40 [%]

**Description:**
Sets the speed for the identification of the moment of inertia and the vibration test.

- Induction motor:
The percentage value is referred to p0310 (rated motor frequency).
- Synchronous motor:
The percentage value is referred to the minimum from p0310 (rated motor frequency) and p1082 (maximum speed).

**Dependency:**
- Refer to: p0310, p1959
- Refer to: F07984, F07985

**Note:**
In order to calculate the inertia, sudden speed changes are carried out - the specified value corresponds to the lower speed setpoint. This value is increased by 20 % for the upper speed value. The q leakage inductance (refer to p1959 bit 5) is determined at zero speed and at 50% of p1965 - however, with a maximum output frequency of 15 Hz and at a minimum of 10% of the rated motor speed.

### p1967 Speed_ctrl_opt dynamic factor / n_opt dyn_factor

**VECTOR_G (n/M)**
- Can be changed: U, T
- Calculated: CALC_MOD_ALL
- Access level: 3

- Data type: FloatingPoint32
- Dynamic index: -
- Func. diagram: -

- P-Group: Motor identification
- Units group: -
- Unit selection: -

- Not for motor type: REL
- Scaling: -
- Expert list: 1

- Min 1 [%]
- Max 400 [%] 100 [%]

**Description:**
Sets the dynamic response factor for speed controller optimization.

**Dependency:**
- Refer to: p1959
- Refer to: F07985

**Note:**
For a rotating measurement, this parameter can be used to optimize the speed controller.
p1967 = 100 % --> speed controller optimization according to a symmetric optimum.
p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower).

</tbody>
</table>

**Description:**
Sets the pole position identification technique.
**Parameters**

**List of parameters**

**Value:**

1: Voltage pulsing 1st harmonics  
4: Voltage pulsing 2-stage  
6: Voltage pulsing 2-stage inverse  
10: DC current injection

**Dependency:**

In the simulation mode, the parameter cannot be written into.

Refer to: p1272, p1780

**Note:**

Voltage pulse technique (p1980 = 1, 4, 6) cannot be applied to separately-excited synchronous motors (p0300 = 5) and for operation with sine-wave output filters (p0230).

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Description:**

Activates the pole position identification routine to determine the commutation angle and to carry out a plausibility check.

**Value:**

0: Pole position identification off  
1: Pole position identification for commutation  
2: Pole position identification for plausibility check

**Recommend.:**

Re p1982 = 1:  
This is used for synchronous motors with motor encoder without absolute data.  
The information/data regarding the absolute commutation angle is supplied via a track C/D, Hall sensors, an absolute encoder or from the pole position identification routine.  
Re p1982 = 2:  
This is used for synchronous motor with motor encoder with absolute data to check this data.  
For VECTOR, the following applies:  
With p1982 = 2, each time the pulses are enabled it is checked whether the absolute position supplied from the encoder does not exceed a deviation of 45 degrees to the identified pole wheel position.  
With separately-excited synchronous motors (p0300 = 5), pole position identification cannot be selected if an encoder with position data is used (e.g. SSI encoder).

**Dependency:**

Refer to: p0325, p0329, p1980, r1984, r1985, r1987, r1990

**Note:**

For encoderless operation, the pole position identification routine is selected with p1780.6

<table>
<thead>
<tr>
<th>r1984</th>
<th>PolID angular difference / PolID ang diff</th>
</tr>

</tr>
</tbody>
</table>

**Description:**

Displays the angular difference between the actual electrical commutation angle and the angle determined by the pole position identification.

**Dependency:**

**Note:**

PolID: Pole position identification  
When the pole position identification routine is executed several times using p1983, the spread of the measured values can be determined using this value. At the same position, the spread should be less than 2 degrees electrical.
### r1985 PolID saturation curve / PolID sat_char

<table>
<thead>
<tr>
<th>VECTOR_G (n/M)</th>
<th>Can be changed: -</th>
<th>Calculated: -</th>

<td>- [Arms]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Displays the saturation characteristic of the pole position identification routine (saturation technique).
Displays the current characteristic of the pole position identification routine (elasticity technique).

**Dependency:**

**Note:**
PolID: Pole position identification

Regarding the saturation technique:
The values for the characteristic of the last saturation-based pole position identification routine are output every 1 ms in order to record signals (e.g. trace).

### r1987 PolID trigger characteristic / PolID trig_char

<table>
<thead>
<tr>
<th>VECTOR_G (n/M)</th>
<th>Can be changed: -</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>

</tr>
<tr>
<td>Min</td>
<td>- [%]</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>Max</td>
<td>- [%]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Displays the trigger characteristic of the pole position identification routine.
The values for the characteristic of the last pole position identification routine are output every 1 ms in order to record signals (e.g. trace).
The values for trigger characteristic and saturation characteristic are always output in synchronism from a time perspective.

**Dependency:**

**Note:**
PolID: Pole position identification

The following information and data can be taken from the trigger characteristic.
- the value -100% marks the angle at the start of the measurement.
- the value +100 % marks the commutation angle determined from the pole position identification routine.

### p1990 Encoder adjustment, determine angular commutation offset / Enc_adj det ang

<table>
<thead>
<tr>
<th>VECTOR_G</th>
<th>Can be changed: T</th>
<th>Calculated: -</th>
<th>Access level: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>
<td>Integer16</td>
<td>Dynamic index: -</td>
<td>Func. diagram: -</td>
</tr>
<tr>
<td>P-Group:</td>
<td>Motor identification</td>
<td>Units group: -</td>
<td>Unit selection: -</td>
</tr>
<tr>
<td>Not for motor type:</td>

<td>Expert list: 1</td>
</tr>
<tr>
<td>Min</td>
<td>0</td>
<td>Max</td>
<td>Factory setting</td>
</tr>
<tr>
<td>Max</td>
<td>3</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder. The function acts on the active motor data set.
Alarm A07971 is output while the angular commutation offset is being determined, p1990 is automatically set to 0 after the angular commutation offset has been determined.

For p1990 = 1 (encoder adjustment with transfer), the following applies:
The angular commutation offset is determined and transferred into p0431.

For p1990 = 2 (encoder adjustment for checking), the following applies:
The angular commutation offset is determined and is not transferred into p0431. For a deviation of more than 6° electrical, fault F07413 is output.

For p1990 = 3 (encoder adjustment in operation), the following applies:
PolID procedure runs before the zero mark detection. The angular commutation offset is determined and transferred into p0431. A fine adjustment (p1905) is then optionally possible.
### Parameters

#### List of parameters

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:</td>
<td>De-activated</td>
</tr>
<tr>
<td>1:</td>
<td>Activated with transfer</td>
</tr>
<tr>
<td>2:</td>
<td>Activated for checking</td>
</tr>
<tr>
<td>3:</td>
<td>Activates encoder adjustment in operation</td>
</tr>
</tbody>
</table>

**Dependency:**
- In the simulation mode, the parameter cannot be written into.
- When selecting the encoder adjustment, the changeover of the drive data sets is suppressed.
- Encoder adjustment is only carried out if the function module for "speed/torque control" is activated (r0108.2 = 1).
- Refer to: p0325, p0329, p0431, p1272, p1900

**Caution:**
- When the encoder is being adjusted, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

<table>
<thead>
<tr>
<th>p1991[0...n] Motor changeover, angular commutation correction / Ang_com corr</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VECTOR_G</strong></td>
</tr>
<tr>

</tr>
<tr>
<td>10 [%]</td>
</tr>
</tbody>
</table>

**Description:**
- Sets the scaling for the runtime of the automatic encoder calibration and of the pole position identification technique in which the current is injected.
- Refer to: p0341, p0342

**Caution:**
- For p1999 > 100 % (setting large moments of inertia) the following applies:
  - There is no locked rotor monitoring (F07970 fault value 2).
  - The plausibility check of the encoder signal (F07970 fault value 4) only checks the sign.

**Note:**
- For high moments of inertia, it is practical to scale the runtime of the calibration higher.

**p2000 Reference speed reference frequency / n Ref f Ref**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Access level</th>
<th>Description</th>
<th>Note</th>
</tr>
</thead>
</table>
| VECTOR_G | VECTOR_G | T | Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference speed (in ((rpm) / 60) x pole pair number) | Refer to: p2001, p2002, p2003, r2004  
For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000). |

© Siemens AG 2012 All Rights Reserved  
SINAMICS G130/G150 List Manual (LH2), 01/2012, A5E03263479A
**Description:**
Sets the reference quantity for voltages.
All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Note:**
This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.

**Note:**
For the automatic calculation \((p0340 = 1, p3900 > 0)\) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using \(p0573 = 1\).
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
For infeed units, the parameterized device supply voltage \((p0210)\) is pre-assigned as the reference quantity.

**Example:**
The actual value of the DC link voltage \((r0070)\) is connected to a test socket (e.g. \(p0771[0]\)). The actual voltage value is cyclically converted into a percentage of the reference voltage \((p2001)\) and output according to the parameterized scaling.

---

**Description:**
Sets the reference quantity for currents.
All currents specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Notice:**
If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records).

**Example:**
\(p2002 = 100 \text{ A}\) 
Reference quantity 100 A corresponds to 100 %
\(p0305[0] = 100 \text{ A}\) 
Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current
\(p0305[1] = 50 \text{ A}\) 
Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current

**Note:**
For the automatic calculation \((p0340 = 1, p3900 > 0)\) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using \(p0573 = 1\).
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage \((p2002 = r0206 / p0210 / 1.73)\) is pre-assigned as the reference quantity.

**Example:**
The actual value of a phase current \((r0069[0])\) is connected to a test socket (e.g. \(p0771[0]\)). The actual current value is cyclically converted into a percentage of the reference current \((p2002)\) and output according to the parameterized scaling.
**p2003 Reference torque / M_ref**

**VECTOR_G**

<table>
<thead>

</tr>
<tr>
<td>Factory setting</td>
<td>1.00 [Nm]</td>
</tr>
</tbody>
</table>

**Description:**
Sets the reference quantity for torque.

All torques specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Note:**
- For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.
- If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

**Example:**
The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

**p2004 Reference power / P_ref**

**B_INF, VECTOR_G**

| Can be changed: | - |
| Calculated: | - |
| Access level: | 3 |
| Data type: | FloatingPoint32 |
| Dynamic index: | - |
| P-Group: | Communications |
| Units group: | 14_10 |
| Not for motor type: | - |
| Scaling: | - |
| Min | - [kW] |
| Max | - [kW] |
| Factory setting | - [kW] |

**Description:**
Displays the reference quantity for power.

All power ratings specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Dependency:**
This value is calculated as follows:
- Infeed: Calculated from voltage times current.
- Closed-loop control: Calculated from torque times speed.

**Note:**
- If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
- The reference power is calculated as follows:
  - 2 * Pi * reference speed / 60 * reference torque (motor)
  - reference voltage * reference current * root(3) (infeed)

**p2005 Reference angle / Reference angle**

**VECTOR_G**

| Can be changed: | T |
| Calculated: | CALC_MOD_ALL |
| Access level: | 3 |
| Data type: | FloatingPoint32 |
| Dynamic index: | - |
| P-Group: | Communications |
| Units group: | - |
| Not for motor type: | - |
| Scaling: | - |
| Min | 90.00 [*] |
| Max | 180.00 [*] |
| Factory setting | 90.00 [*] |

**Description:**
Sets the reference quantity for angle.

All angles specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Note:**
- For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.
- If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
Parameters
List of parameters

p2006  Reference temp / Ref temp

- **Can be changed:** T
- **Data type:** FloatingPoint32
- **P-Group:** Communications
- **Not for motor type:** -
- **Min:** 50.00 [°C]
- **Max:** 300.00 [°C]

**Description:**
Sets the reference quantity for temperature.
All temperatures specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

p2007  Reference acceleration / a_ref

- **Can be changed:** T
- **Data type:** FloatingPoint32
- **P-Group:** Communications
- **Not for motor type:** -
- **Min:** 0.01 [rev/s²]
- **Max:** 500000.00 [rev/s²]

**Description:**
Sets the reference quantity for acceleration rates.
All acceleration rates specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

**Note:**
For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
The reference acceleration is calculated as follows:
Reference speed (p2000) converted from 1/min to 1/s divided by 1 s
--> p2007 = p2000 [rpm] / (60 [s/min] * 1 [s])

r2019[0...7]  Comm int error statistics / Comm err

- **Can be changed:** -
- **Data type:** Unsigned32
- **P-Group:** Communications
- **Not for motor type:** -
- **Min:** -
- **Max:** -

**Description:**
Displays the receive errors at the commissioning interface (RS232).

**Index:**
[0] = Number of error-free telegrams
[1] = Number of rejected telegrams
[2] = Number of framing errors
[3] = Number of overrun errors
[4] = Number of parity errors
[5] = Number of starting character errors
[6] = Number of checksum errors
[7] = Number of length errors

p2020  Field bus interface baud rate / Field bus baud

- **Can be changed:** T
- **Data type:** Integer16
- **P-Group:** Communications
- **Not for motor type:** -
- **Min:** 4
- **Max:** 13

**Description:**
Sets the baud rate for the fieldbus interface USS.
Value:

4: 2400 baud
5: 4800 baud
6: 9600 baud
7: 19200 baud
8: 38400 baud
9: 57600 baud
10: 76800 baud
11: 93750 baud
12: 115200 baud
13: 187500 baud

Note:

Fieldbus IF: Fieldbus interface
Changes only become effective after POWER ON.
The parameter is not influenced by setting the factory setting.
The parameter is set to the factory setting when the protocol is reselected.

Description:
Displays or sets the address for the fieldbus interface USS.
The address can be set as follows:
1) Using the address switch on the Control Unit.
   --> p2021 displays the address setting.
   --> A change only becomes effective after a POWER ON.
2) Using p2021
   --> Only if an address of 0 or an address which is invalid for the fieldbus selected in p2030 has been set using the
      address switch.
   --> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".
   --> A change only becomes effective after a POWER ON.

Dependency:
Refer to: p2030

Note:
Changes only become effective after POWER ON.
The parameter is not influenced by setting the factory setting.
The parameter is set to the factory setting when the protocol is reselected.

Description:
Sets the number of 16-bit words in the PZD part of the USS telegram for the field bus interface.

Dependency:
Refer to: p2030

Note:
The parameter is not influenced by setting the factory setting.

### Parameters

#### List of parameters

**p2040**  
Fieldbus interface monitoring time / Fieldbus t_monit  
CU_G130_DP, CU_G150_DP  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Communications  
Not for motor type: -  
Min: 0 [ms]  
Max: 1999999 [ms]  
Factory setting: 100 [ms]  
Access level: 3  
Dependency: Refer to: F01910  
Note: 0: The monitoring is de-activated.

**Description:**
Sets the monitoring time to monitor the process data received via the fieldbus interface. If no process data is received within this time, an appropriate message is output.

**Note:**
Every change only becomes effective after a POWER ON.

**Value:**
- SINAMICS
- VIK-NAMUR

### p2042  
PROFIBUS Ident Number / PB Ident No.  
CU_G130_DP, CU_G150_DP  
Can be changed: T  
Data type: Integer16  
P-Group: Communications  
Not for motor type: -  
Min: 0  
Max: 1  
Factory setting: 0  
Access level: 3  
Dependency: Refer to: F01910  
Note: Sets the PROFIBUS Ident Number (PNO-ID). SINAMICS can be operated with various identities on PROFIBUS. This allows the use of a PROFIBUS GSD that is independent of the device (e.g. PROFIdrive VIK-NAMUR with Ident Number 3AA0 hex).

**Value:**
- 0: SINAMICS
- 1: VIK-NAMUR

### r2043.0...2  
BO: IF1 PROFIdrive PZD state / IF1 PD PZD state  
CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN  
Can be changed: -  
Data type: Unsigned8  
P-Group: Communications  
Not for motor type: -  
Min: -  
Access level: 3  
Dependency: Refer to: p2044  
Note: Displays the PROFIdrive PZD state. When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.

### p2044  
IF1 PROFIdrive fault delay / IF1 PD fault delay  
B_INF, ENC, VECTOR_G  
Can be changed: U, T  
Data type: FloatingPoint32  
P-Group: Communications  
Not for motor type: -  
Min: 0 [s]  
Max: 100 [s]  
Factory setting: 0 [s]  
Access level: 3  
Dependency: Refer to: F01910  
Note: Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that is is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).
Parameters

List of parameters

Dependency:
Refer to: r2043
Refer to: F01910

p2045  CI: PB/PN clock synchronous controller sign-of-life signal source / PB/PN ctrSol_S_src

ENC, VECTOR_G (n/M)

Can be changed: T  Calculated: -  Access level: 3
Data type: Unsigned32 / Integer16  Dynamic index: -  Func. diagram: 2410
P-Group: Communications  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
-  -  0

Description:
Connector input for the sign-of-life of the clock synchronous PROFIBUS/PROFINET controller.
The sign-of-life is expected at bits 12 to 15. Bits 0 to 11 are not evaluated.
The sign-of-life signal is normally received in PZD4 (control word 2) from the controller.

Dependency:
Refer to: p0925, r2065

Notice:
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

p2047  PROFIBUS additional monitoring time / PB suppl t_monit

CU_G130_DP, CU_G150_DP

Can be changed: U, T  Calculated: -  Access level: 3
Data type: FloatingPoint32  Dynamic index: -  Func. diagram: 2410
P-Group: Communications  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
0 [ms] 20000 [ms] 0 [ms]

Description:
Sets the additional monitoring time to monitor the process data received via PROFIBUS.
The additional monitoring time enables short bus faults to be compensated.
If no process data is received within this time, an appropriate message is output.

Recommend:
Do not set the additional monitoring time for clock-synchronous operation.

Dependency:
Refer to: F01910

Note:
For controller STOP, the additional monitoring time is not effective.

p2048  IF1 PROFIdrive PZD sampling time / IF1 PZD t_sample

CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN

Can be changed: C1(3)  Calculated: -  Access level: 3
Data type: FloatingPoint32  Dynamic index: -  Func. diagram: -
P-Group: Communications  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
1.00 [ms] 16.00 [ms] 4.00 [ms]

Description:
Sets the sampling time for the cyclic interface 1 (IF1).

Note:
The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set.
For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).

### Dependency:
Refer to: p2051, p2061

**Note:** IF1: Interface 1

#### r2054  PROFIBUS status / PB status

**CU_G130_DP, CU_G150_DP**

Can be changed: -  
Calculated: -  
Access level: 3

Data type: Integer16  
Dynamic index: -  
Func. diagram: 2410

P-Group: Communications  
Units group: -  
Unit selection: -

Not for motor type: -  
Scaling: -  
Expert list: 1

Min Max Factory setting
0 4 -

**Description:** Status display for the PROFIBUS interface.

**Value:**
0: OFF  
1: No connection (search for baud rate)  
2: Connection OK (baud rate found)  
3: Cyclic connection with master (data exchange)  
4: Cyclic data OK

**Note:** Re r2054 = 3:

In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation:

- No setpoints are being received as the PROFIBUS master is in the STOP condition.
- The drive is not in synchronism as the global control (GC) has an error.

Re r2054 = 4:

In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free.

This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

#### r2055[0...2]  PROFIBUS diagnostics standard / PB diag standard

**CU_G130_DP, CU_G150_DP**

Can be changed: -  
Calculated: -  
Access level: 3

Data type: Unsigned16  
Dynamic index: -  
Func. diagram: 2410

P-Group: Communications  
Units group: -  
Unit selection: -

Not for motor type: -  
Scaling: -  
Expert list: 1

Min Max Factory setting
- - -

**Description:** Diagnostics display for the PROFIBUS interface.

**Index:**
[0] = Master bus address  
[1] = Master input total length bytes  
[2] = Master output total length bytes
### Parameters

#### List of parameters

<table>
<thead>
<tr>

- **Units group:** -
- **Unit selection:** -
- **Not for motor type:** -
- **Scaling:** -
- **Expert list:** 1

### Min

- **Max**

**Factory setting**

### Description:

Displays the last parameter received from the PROFIBUS/PROFINET controller for clock synchronism.

The parameters for clock synchronism are created when configuring the bus and are transferred at the start of cyclic operation from the controller to the device.

### Index:

- **[0]** = Clock synchronous mode activated
- **[1]** = Bus cycle time (Tdp) [µs]
- **[2]** = Master cycle time (Tmapc) [µs]
- **[3]** = Instant of actual value acquisition (Ti) [µs]
- **[4]** = Instant of setpoint acquisition (To) [µs]
- **[5]** = Data exchange interval (Tdx) [µs]
- **[6]** = PLL window (Tpll-w) [1/12 µs]
- **[7]** = PLL delay time (Tpll-d) [1/12 µs]

Value: 370: SIEMENS telegram 370, PZD-1/1
371: SIEMENS telegram 371, PZD-5/8
999: Free telegram configuration with BICO
Dependency: Refer to: p0922

p2079 IF1 PROFIdrive PZD telegram selection extended / IF1 PD PZD tel ext
CU_G130_DP,
CU_G130_PN,
CU_G150_DP,
CU_G150_PN
Can be changed: T
Data type: Integer16
P-Group: Communications
Not for motor type: -
Min 390
Max 999
Value: 370: SIEMENS telegram 370, PZD-1/1
371: SIEMENS telegram 371, PZD-5/8
999: Free telegram configuration with BICO
Dependency: Refer to: p0922
For \( p0922 = 999 \) and \( p2079 < 999 \) the following applies:
The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

### Value:
- \( 390: \) SIEMENS telegram 390, PZD-2/2
- \( 391: \) SIEMENS telegram 391, PZD-3/7
- \( 392: \) SIEMENS telegram 392, PZD-3/15

- \( 395: \) SIEMENS telegram 395, PZD-4/25
- \( 999: \) Free telegram configuration with BICO

### p2079
**IF1 PROFldrive PZD telegram selection extended / IF1 PD PZD tel ext**

| ENC | Can be changed: T | Calculated: - | Access level: 3 |
|-----|-------------------|----------------|----------------
| Data type: Integer16 | Dynamic index: - | Func. diagram: - |
| P-Group: Communications | Units group: - | Unit selection: - |
| Not for motor type: - | Scaling: - | Expert list: 1 |

#### Description:
Sets the send and receive telegram.
Contrary to \( p0922 \), a telegram can be selected using \( p2079 \) and subsequently expanded.
For \( p0922 < 999 \) the following applies:
\( p2079 \) has the same value and is inhibited. All of the interconnections and extensions contained in the telegram are inhibited.
For \( p0922 = 999 \) the following applies:
\( p2079 \) can be freely set. If \( p2079 \) is also set to 999, then all of the interconnections can be set.
For \( p0922 = 999 \) and \( p2079 < 999 \) the following applies:
The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

#### Value:
- \( 81: \) SIEMENS telegram 81, PZD-2/6
- \( 82: \) SIEMENS telegram 82, PZD-2/7
- \( 83: \) SIEMENS telegram 83, PZD-2/8
- \( 999: \) Free telegram configuration with BICO

#### Dependency:
Refer to: \( p0922 \)

- [13] = Bit 13
- [14] = Bit 14
- [15] = Bit 15

**Dependency:**
Refer to: p2088, r2089

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
**Parameters**

**List of parameters**

---

**p2081[0...15] BI: Binector-connector converter status word 2 / Bin/con ZSW2**

- **B_INF, CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN, ENC, TB30, TM150, TM31, VECTOR_G**
- **Can be changed:** U, T  
  **Calculated:** -  
  **Access level:** 3
- **Data type:** Unsigned32 / Binary  
  **Dynamic index:** -  
  **Func. diagram:** 2472
- **P-Group:** Communications  
  **Units group:** -  
  **Unit selection:** -
- **Not for motor type:** -  
  **Scaling:** -  
  **Expert list:** 1

**Min** | **Max** | **Factory setting**
--- | --- | ---
- | - | 0

**Description:**

Selects bits to be sent to the PROFIdrive controller.

The individual bits are combined to form status word 2.

**Index:**

- [0] = Bit 0
- [1] = Bit 1
- [2] = Bit 2
- [3] = Bit 3
- [4] = Bit 4
- [5] = Bit 5
- [6] = Bit 6
- [7] = Bit 7
- [8] = Bit 8
- [9] = Bit 9
- [10] = Bit 10
- [12] = Bit 12
- [13] = Bit 13
- [14] = Bit 14
- [15] = Bit 15

**Dependency:**

Refer to: p2088, r2089

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**

For clock synchronous operation, bit 12 to 15 to transfer the sign-of-life are reserved in status word 2 - and may not be freely interconnected.

---

**p2082[0...15] BI: Binector-connector converter status word 3 / Bin/con ZSW3**

- **B_INF, CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN, ENC, TB30, TM150, TM31, VECTOR_G**
- **Can be changed:** U, T  
  **Calculated:** -  
  **Access level:** 3
- **Data type:** Unsigned32 / Binary  
  **Dynamic index:** -  
  **Func. diagram:** 2472
- **P-Group:** Communications  
  **Units group:** -  
  **Unit selection:** -
- **Not for motor type:** -  
  **Scaling:** -  
  **Expert list:** 1

**Min** | **Max** | **Factory setting**
--- | --- | ---
- | - | 0

**Description:**

Selects bits to be sent to the PROFIdrive controller.

The individual bits are combined to form free status word 3.

**Index:**

- [0] = Bit 0
- [1] = Bit 1
- [2] = Bit 2
- [3] = Bit 3
- [4] = Bit 4
- [5] = Bit 5
- [6] = Bit 6
- [7] = Bit 7
- [8] = Bit 8
- [9] = Bit 9
- [10] = Bit 10
- [12] = Bit 12
- [13] = Bit 13

</tbody>
</table>

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Sets the signal source for the connector-binector converter. A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).

**Dependency:** Refer to: r2094, r2095

**Note:** From the signal source set via the connector input, the corresponding lower 16 bits are converted. p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters:
- Connector input p2099[0] to binector output in r2094.0...15
- Connector input p2099[1] to binector output in r2095.0...15

**p2100[0...19] Setting the fault number for fault response / F_no F response**

<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>-----</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Selects the faults for which the fault response should be changed

**Dependency:** The fault is selected and the required response is set under the same index.

**Notice:** For the following cases, it is not possible to re-parameterize the fault response to a fault:
- if there is no existing fault number.
- the message type is not "fault" (F).

**Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

**p2101[0...19] Setting the fault response / Fault response**

**Description:** Sets the fault response for the selected fault.

**Value:**
- 0: NONE
- 1: OFF1
- 2: OFF2

**Dependency:** The fault is selected and the required response is set under the same index.

**Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
**Parameters**

List of parameters

- **VECTOR_G**

Can be changed: U, T  
Data type: Integer16  
P-Group: Messages  
Not for motor type: -  

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>7</td>
<td>0</td>
</tr>
</tbody>
</table>

Description:
Sets the fault response for the selected fault.

Value:
0: NONE
1: OFF1
2: OFF2
3: OFF3
4: STOP1 (being developed)
5: STOP2
6: Internal armature short-circuit / DC braking
7: ENCODER (p0491)

Dependency:
The fault is selected and the required response is set under the same index.

Refer to: p2100

Note:
Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").

Example:
F12345 and fault response = OFF3 (OFF1, OFF2, NONE)  
--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.

Re value = 1 (OFF1):
Braking along the ramp-function generator down ramp followed by a pulse inhibit.

Re value = 2 (OFF2):
Internal/external pulse inhibit.

Re value = 3 (OFF3):
Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):
n_set = 0

Re value = 6 (armature short-circuit, internal/DC braking):
The value can only be set for all motor data sets when p1231 = 3, 4.

a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed.
b) For induction motors (p0300 = 1xx), a DC braking is initiated.

Re value = 7 (ENCODER (p0491)):
The fault response set in p0491 is executed if applicable.
### List of parameters

**Note:**

IASC: Internal Armature Short Circuit  
DCBRK: DC braking

1-497
Parameters
List of parameters

r2121  CO: Counter, alarm buffer changes / Alrm buff changed
All objects  Can be changed: -  Calculated: -  Access level: 3
Data type: Unsigned16  Dynamic index: -  Func. diagram: 8065
P-Group: Messages  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
-  -
Description:  This counter is incremented every time the alarm buffer changes.
Dependency:  Refer to: r2110, r2122, r2123, r2124, r2125

r2122[0...63]  Alarm code / Alarm code
All objects  Can be changed: -  Calculated: -  Access level: 2
Data type: Unsigned16  Dynamic index: -  Func. diagram: 1750, 8065
P-Group: Messages  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
-  -
Description:  Displays the number of alarms that have occurred.
Dependency:  Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123
Notice:  The properties of the alarm buffer should be taken from the corresponding product documentation.
Note:  The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
Alarm buffer structure (general principle):
r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...  
r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)
When the alarm buffer is full, the alarms that have gone are entered into the alarm history:
r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...  
r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

r2123[0...63]  Alarm time received in milliseconds / t_alarm recv ms
All objects  Can be changed: -  Calculated: -  Access level: 3
Data type: Unsigned32  Dynamic index: -  Func. diagram: 1750, 8065
P-Group: Messages  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
- [ms]  - [ms]  - [ms]
Description:  Displays the system runtime in milliseconds when the alarm occurred.
Dependency:  Refer to: r2110, r2114, r2122, r2124, r2125, r2134, r2145, r2146, r3121, r3123
Notice:  The time comprises r2145 (days) and r2123 (milliseconds).
Note:  The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

r2124[0...63]  Alarm value / Alarm value
All objects  Can be changed: -  Calculated: -  Access level: 3
Data type: Integer32  Dynamic index: -  Func. diagram: 1750, 8065
P-Group: Messages  Units group: -  Unit selection: -
Not for motor type: -  Scaling: -  Expert list: 1
Min  Max  Factory setting
-  -
Description:  Displays additional information about the active alarm (as integer number).
### Dependency:
Refer to: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123

### Note:
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

### r2125[0...63]
**Alarm time removed in milliseconds / t_alarm res ms**

<table>
<thead>
<tr>
<th>All objects</th>

</tr>
</tbody>
</table>

### Description:
Selects the faults for which the acknowledge mode is to be changed

### Dependency:
Selects the faults and sets the required acknowledge mode realized under the same index

### Notice:
It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:
- Fault number does not exist.
- Message type is not "fault" (F).

### Note:
Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

### p2127[0...19]
**Sets acknowledgement mode / Acknowledge mode**

<table>
<thead>
<tr>
<th>All objects</th>
<th>Can be changed: U, T</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>
<td>Integer16</td>
<td>Dynamic index: -</td>
<td>Func. diagram: 1750, 8075</td>
</tr>
<tr>
<td>P-Group:</td>

<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

### Description:
Sets the acknowledge mode for selected fault.

### Value:
1: Acknowledgment only using POWER ON
2: Ack IMMEDIATELY after the fault cause has been removed
3: Acknowledgement only for PULSE INHIBIT

### Dependency:
Selects the faults and sets the required acknowledge mode realized under the same index

### Notice:
It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:
- if there is no existing fault number.
- the message type is not "fault" (F).

### Note:
Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
The acknowledge mode can only be changed for faults with the appropriate identification.
Example:
F12345 and acknowledge mode = IMMEDIATELY (POWER ON)
--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

### p2128[0...15] Selecting fault/alarm code for trigger / Message trigger

<table>

<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>65535</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Selects faults or alarms which can be used as trigger.

**Dependency:**
Refer to: r2129

### r2129.0...15 CO/BO: Trigger word for faults and alarms / Trigger word

<table>
<thead>
<tr>
<th>All objects</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>
<td>Unsigned16</td>

</table>

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:**
Trigger signal for the selected faults and alarms

**Dependency:**
If one of the faults or alarms selected in p2128[n] occurs, then the particular bit of this binector output is set.
Refer to: r2128

**Note:**
CO: r2129 = 0 --> None of the selected messages has occurred.
CO: r2129 > 0 --> At least one of the selected messages has occurred.

### r2130[0...63] Fault time received in days / t_fault recv days

<table>
<thead>
<tr>
<th>All objects</th>
<th>Can be changed:</th>
<th>Calculated:</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>

</table>

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:**
Displays the system runtime in days when the fault occurred.

**Dependency:**
Refer to: r0945, r0947, r0948, r0949, r2109, r2114, r2133, r2136, r3115, r3120, r3122

**Notice:**
The time comprises r2130 (days) and r0948 (milliseconds).

**Note:**
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

### Details

- **r2131**
  - **Data type:** Unsigned16
  - **P-Group:** Messages
  - **Not for motor type:** -
  - **Min:** -
  - **Max:** -
  - **Dependency:** Refer to: r3131, r3132
- **Description:** Displays the code of the oldest active fault.
- **Note:** 0: No fault present.

- **r2132**
  - **Data type:** Unsigned16
  - **P-Group:** Messages
  - **Not for motor type:** -
  - **Min:** -
  - **Max:** -
  - **Dependency:** Refer to: r3131, r3132
- **Description:** Displays the code of the last alarm that occurred.
- **Note:** 0: No alarm present.

- **r2133[0...63]**
  - **Data type:** FloatingPoint32
  - **P-Group:** Messages
  - **Not for motor type:** -
  - **Min:** -
  - **Max:** -
  - **Dependency:** Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2136, r3115
- **Description:** Displays additional information about the fault that occurred for float values.
- **Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

- **r2134[0...63]**
  - **Data type:** FloatingPoint32
  - **P-Group:** Messages
  - **Not for motor type:** -
  - **Min:** -
  - **Max:** -
  - **Dependency:** Refer to: r2110, r2122, r2123, r2124, r2125, r2145, r2146, r3121, r3123
- **Description:** Displays additional information about the active alarm for float values.
- **Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

- **r2135.0...15**
  - **Data type:** Unsigned16
  - **P-Group:** Displays, signals
  - **Not for motor type:** -
  - **Min:** -
  - **Max:** -
  - **Dependency:** Refer to: r3131, r3132
- **Description:** Displays the second status word of faults and alarms.

</thead>
<tbody>
<tr>
<td>11</td>
<td>Alarm class bit 0</td>
<td>High</td>
<td>Low</td>
</tr>
<tr>
<td>12</td>
<td>Alarm class bit 1</td>
<td>High</td>
<td>Low</td>
</tr>
</tbody>
</table>

**Note:**

Re bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present"/"alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 11, 12:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

### p2148[0...n]

**BI: RFG active / RFG active**

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:**
  - CALC_MOD_LIM_REF
- **Data type:** Unsigned32 / Binary
- **Dynamic index:** CDS, p0170
- **P-Group:** Messages
- **Units group:** -
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Expert list:** 1
- **Access level:** 3
- **Factory setting:** 0

**Description:**
Sets the signal source for the signal "ramp-function generator active" for the following signals/messages:

- "Speed setpoint - actual value deviation within tolerance t_on" (BO: r2199.4)
- "Ramp-up/ramp-down completed" (BO: r2199.5)

**Notice:**
The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:**
The binector input is automatically pre-assigned to r1199.2.

The following applies for SERVO:

The pre-assignment using the automatic calculation of the motor/control parameters in the drive (p0340 = 1, 3, 5) is only realized if, at the instant of the calculation, the "setpoint channel" function module is active (r0108.8 = 1). If the calculation in p0340 is not selected when downloading parameters, then the parameter is not preassigned.

### p2149[0...n]

**Monitoring configuration / Monit config**

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** -
- **Data type:** Unsigned16
- **Dynamic index:** DDS, p0180
- **P-Group:** Messages
- **Units group:** -
- **Not for motor type:** -
- **Min:** -
- **Max:** -
- **Expert list:** 1
- **Factory setting:** 0000 0000 0000 0001 bin
- **Access level:** 3

**Description:**
Sets the configuration for messages and monitoring functions.

**Bit field:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Enable alarm A07903</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>

<tr>
<td>15</td>
<td>Automatic parameterization carried out (p0340 = 1, p3900 &gt; 0)</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:**
Refer to: r2197
Refer to: A07903

**Note:**
Re bit 00:
Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act).
Re bit 01:
When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).
Re bit 03:
When the bit is set, r2197 bit 1 and bit 2 are determined via separate hystereses.
Re bit 15:
The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

**Description:**
Sets the hysteresis speed (bandwidth) for the signal "\(|n_{\text{act}}| > \text{n_max}\)" (BO: r2197.6).

**Dependency:**
Refer to: r1084, r1087, r2197

**Notice:**
For p0322 = 0, the following applies: p2162 \(\leq 0.1 \times p0311\)
For p0322 > 0, the following applies: p2162 \(\leq 1.02 \times p0322 - p1082\)
If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.

**Note:**
For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value.

© Siemens AG 2012 All Rights Reserved
SINAMICS G130/G150 List Manual (LH2), 01/2012, A5E03263479A
If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

**p2163[0...n]**

**List of parameters**

### r2169  CO: Actual speed smoothed signals / n_act smth message

- **Can be changed:** -
- **Data type:** FloatingPoint32
- **P-Group:** Messages
- **Not for motor type:** -
- **Min:** [rpm]
- **Max:** [rpm]

**Description:** Displays the smoothed actual speed for messages/signals.

**Dependency:** Refer to: p2153

### p2174[0...n]  Torque threshold value 1 / M_thresh val 1

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Messages
- **Min:** 0.00 [Nm]
- **Max:** 20000000.00 [Nm]

**Description:** Sets the torque threshold value for the messages:
- "Torque setpoint < torque threshold value 1 and n_set reached" (BO: r2198.9)
- "Torque setpoint < torque threshold value 1" (BO: r2198.10)
- "Torque setpoint > torque threshold value 1" (BO: r2198.13)

**Dependency:** Refer to: p2195, r2198

### p2175[0...n]  Motor blocked speed threshold / Mot lock n_thresh

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Messages
- **Min:** 0.00 [rpm]
- **Max:** 210000.00 [rpm]

**Description:** Sets the speed threshold for the message "Motor blocked" (BO: r2198.6).

**Dependency:** Refer to: p0500, p2177, r2198

**Note:** The following applies for sensorless vector control:
At low speeds in open-loop speed controlled operation (see p1755, p1756), a blocked motor cannot be detected.

### p2177[0...n]  Motor blocked delay time / Mot lock t_del

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Messages
- **Min:** 0.000 [s]
- **Max:** 65.000 [s]

**Description:** Sets the delay time for the message "Motor blocked" (BO: r2198.6).

**Dependency:** Refer to: p0500, p2175, r2198

**Note:** The following applies for sensorless vector control:
At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably.
As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

### p2178[0...n] Motor stalled delay time / Mot stall t_del

**VECTOR_G**

<table>
<thead>

<tr>
<td>0</td>
<td>6</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** Sets the response when evaluating the load monitoring.

**Value:**

0: Load monitoring disabled
1: A07920 for torque/speed too low
2: A07921 for torque/speed too high
3: A07922 for torque/speed out of tolerance
4: F07923 for torque/speed too low
5: F07924 for torque/speed too high
6: F07925 for torque/speed out of tolerance

**Dependency:** Refer to: p2182, p2183, p2184, p2185, p2186, p2187, p2188, p2189, p2190, p2192, r2198

**Note:** The response to the faults F07923 ... F07925 can be set. F07926 is evaluated only if p2181 is not zero.

### p2182[0...n] Load monitoring speed threshold value 1 / n_thresh 1

**VECTOR_G (Ext msg)**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>U, T</th>
<th>Calculated:</th>

<td>210000.00 [rpm]</td>
<td>150.00 [rpm]</td>
</tr>
</tbody>
</table>

**Description:** Sets the speed/torque envelope curve for load monitoring.

The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds:

- p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower)
- p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower)
- p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)

**Dependency:** The following applies: p2182 < p2183 < p2184

Refer to: p2183, p2184, p2185, p2186
**List of parameters**

### p2183[0...n] Load monitoring speed threshold value 2 / n_thresh 2

**Description:**
Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds:
- \( p2182 \) (n_threshold 1) \( \rightarrow \) \( p2185 \) (M_threshold 1, upper), \( p2186 \) (M_threshold 1, lower)
- \( p2183 \) (n_threshold 2) \( \rightarrow \) \( p2187 \) (M_threshold 2, upper), \( p2188 \) (M_threshold 2, lower)
- \( p2184 \) (n_threshold 3) \( \rightarrow \) \( p2189 \) (M_threshold 3, upper), \( p2190 \) (M_threshold 3, lower)

**Dependency:**
The following applies: \( p2182 < p2183 < p2184 \)

Refer to: \( p2182, p2183, p2184, p2185, p2186, p2187, p2188 \)

**Data type:** FloatingPoint32  
**Access level:** 3  
**Func. diagram:** 8013

### p2184[0...n] Load monitoring speed threshold value 3 / n_thresh 3

**Description:**
Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds:
- \( p2182 \) (n_threshold 1) \( \rightarrow \) \( p2185 \) (M_threshold 1, upper), \( p2186 \) (M_threshold 1, lower)
- \( p2183 \) (n_threshold 2) \( \rightarrow \) \( p2187 \) (M_threshold 2, upper), \( p2188 \) (M_threshold 2, lower)
- \( p2184 \) (n_threshold 3) \( \rightarrow \) \( p2189 \) (M_threshold 3, upper), \( p2190 \) (M_threshold 3, lower)

**Dependency:**
The following applies: \( p2182 < p2183 < p2184 \)

Refer to: \( p2182, p2183, p2184, p2185, p2186, p2187, p2188 \)

**Data type:** FloatingPoint32  
**Access level:** 3  
**Func. diagram:** 8013

### p2185[0...n] Load monitoring torque threshold 1, upper / M_thres 1 upper

**Description:**
Sets the speed/torque / velocity/force envelope curve for the load monitoring.

**Dependency:**
The following applies: \( p2185 > p2186 \)

Refer to: \( p2182, p2183, p2184, p2185, p2186 \)

**Data type:** FloatingPoint32  
**Access level:** 3  
**Func. diagram:** 8013

### p2186[0...n] Load monitoring torque threshold 1, lower / M_thres 1 lower

**Description:**
Sets the speed/torque / velocity/force envelope curve for the load monitoring.

**Dependency:**
The following applies: \( p2185 > p2186 \)

Refer to: \( p2182, p2183, p2184, p2185, p2186 \)

**Data type:** FloatingPoint32  
**Access level:** 3  
**Func. diagram:** 8013
Parameters

List of parameters

**p2186[0...n]** Load monitoring torque threshold 2, upper / M_thresh 2 upper

<table>
<thead>

**Description:**
The lower envelope curve is defined by p2186, p2188 and p2190.

**Note:**
The lower envelope curve is defined by p2186, p2188 and p2190.

**Dependency:**
The following applies: p2190 < p2189
Refer to: p2184, p2189

**Note:**
The upper envelope curve is defined by p2185, p2187 and p2189.
### List of parameters

**p2192[0...n]**  
**Load monitoring delay time / Load monitor t_del**  
**VECTOR_G (Ext msg)**  
- Can be changed: U, T  
- Calculated: -  
- Access level: 3  
- Data type: FloatingPoint32  
- Dynamic index: DDS, p0180  
- P-Group: Messages  
- Units group: -  
- Not for motor type: -  
- Scaling: -  
- Min: 0.00 [s]  
- Max: 65.00 [s]  
- Factory setting: 10.00 [s]  
**Description:** Sets the delay time to evaluate the load monitoring.

**p2194[0...n]**  
**Torque threshold value 2 / M_thresh val 2**  
**VECTOR_G**  
- Can be changed: U, T  
- Calculated: CALC_MOD_LIM_REF  
- Access level: 2  
- Data type: FloatingPoint32  
- Dynamic index: DDS, p0180  
- P-Group: Messages  
- Units group: -  
- Not for motor type: -  
- Scaling: -  
- Min: 0.00 [%]  
- Max: 100.00 [%]  
- Factory setting: 90.00 [%]  
**Description:** Sets the torque threshold value for the message "Torque utilization < torque threshold value 2" (BO: r2199.11). The message "torque setpoint < p2174" (BO: r2198.10) and "torque utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.

**p2195[0...n]**  
**Torque utilization switch-off delay / M_util t_off**  
**VECTOR_G**  
- Can be changed: U, T  
- Calculated: -  
- Access level: 2  
- Data type: FloatingPoint32  
- Dynamic index: DDS, p0180  
- P-Group: Messages  
- Units group: -  
- Not for motor type: -  
- Scaling: -  
- Min: 0.0 [ms]  
- Max: 1000.0 [ms]  
- Factory setting: 800.0 [ms]  
**Description:** Sets the switch-off delay time for the negated signal "run-up completed". The message "torque setpoint < p2174" (BO: r2198.10) and "torque utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.

**p2196[0...n]**  
**Torque utilization scaling / M_util scal**  
**VECTOR_G**  
- Can be changed: C2(1, 3), U, T  
- Calculated: -  
- Access level: 1  
- Data type: FloatingPoint32  
- Dynamic index: DDS, p0180  
- P-Group: Motor  
- Units group: -  
- Not for motor type: -  
- Scaling: -  
- Min: 0.00 [%]  
- Max: 100.00 [%]  
- Factory setting: 100.00 [%]  
**Description:** Sets the scaling factor for torque utilization (r0033).

**r2197.1...13**  
**CO/BO: Status word monitoring 1 / ZSW monitor 1**  
**VECTOR_G**  
- Can be changed: -  
- Calculated: -  
- Access level: 2  
- Data type: Unsigned16  
- Dynamic index: -  
- P-Group: Messages  
- Units group: -  
- Not for motor type: -  
- Scaling: -  
- Min: -  
- Max: -  
- Factory setting: -  
**Description:** Displays the first status word for monitoring functions.
### List of parameters

**Parameters**

#### Bit field:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>[n_act] &lt;= speed threshold value 2 (p2155)</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>02</td>
<td>[n_act] &gt; speed threshold value 2 (p2155)</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>03</td>
<td>(n_act &gt;= 0)</td>
<td>Yes</td>
<td>No</td>
<td>8011</td>
</tr>
<tr>
<td>06</td>
<td>[n_act] &gt; (n_max)</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>07</td>
<td>Speed setp - act val deviation in tolerance (t_off)</td>
<td>Yes</td>
<td>No</td>
<td>8011</td>
</tr>
<tr>
<td>13</td>
<td>[n_act] &gt; (n_max) (F07901)</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Note:**

- Re bit 01, 02:
  - The threshold value is set in \(p2155\) and the hysteresis in \(p2140\).
- Re bit 03:
  - The hysteresis is set in \(p2150\).
- Re bit 06:
  - The hysteresis is set in \(p2162\).
- Re bit 07:
  - The threshold value is set in \(p2163\) and the hysteresis is set in \(p2164\).
- Re bit 13:
  - Only for internal Siemens use.

#### r2198.4...12 CO/BO: Status word monitoring 2 / ZSW monitor 2

**VECTOR_G**

- Can be changed: -
- Calculated: -
- Access level: 2
- Data type: Unsigned16
- Dynamic index: -
- Func. diagram: 1530, 2536
- P-Group: Messages
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min
- Max
- Factory setting

**Description:**

Displays the second status word for monitoring functions.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>[n_set] &lt; (p2161)</td>
<td>Yes</td>
<td>No</td>
<td>8011</td>
</tr>
<tr>
<td>05</td>
<td>(n_set &gt; 0)</td>
<td>Yes</td>
<td>No</td>
<td>8011</td>
</tr>
<tr>
<td>06</td>
<td>Motor blocked</td>
<td>Yes</td>
<td>No</td>
<td>8012</td>
</tr>
<tr>
<td>07</td>
<td>Motor stalled</td>
<td>Yes</td>
<td>No</td>
<td>8012</td>
</tr>
<tr>
<td>10</td>
<td>[M_set] &lt; torque threshold value 1</td>
<td>Yes</td>
<td>No</td>
<td>8012</td>
</tr>
<tr>
<td>11</td>
<td>Load monitoring signals an alarm</td>
<td>Yes</td>
<td>No</td>
<td>8013</td>
</tr>
<tr>
<td>12</td>
<td>Load monitoring signals a fault condition</td>
<td>Yes</td>
<td>No</td>
<td>8013</td>
</tr>
</tbody>
</table>

**Note:**

- Re bit 10:
  - The torque threshold value 1 is set in \(p2174\).
- Re bit 12:
  - This bit is reset after the fault cause disappears, even if the fault itself is still present.

#### r2199.0...12 CO/BO: Status word monitoring 3 / ZSW monitor 3

**VECTOR_G**

- Can be changed: -
- Calculated: -
- Access level: 2
- Data type: Unsigned16
- Dynamic index: -
- Func. diagram: 1530, 2537, 8018
- P-Group: Messages
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 1
- Min
- Max
- Factory setting

**Description:**

Displays the third status word for monitoring functions.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>[n_act] &lt; speed threshold value 3</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>01</td>
<td>for n comparison value reached or exceeded</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>04</td>
<td>Speed setp - act val deviation in tolerance (t_on)</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
<tr>
<td>05</td>
<td>Ramp-up/ramp-down completed</td>
<td>Yes</td>
<td>No</td>
<td>8010</td>
</tr>
</tbody>
</table>
### Parameters

#### List of parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Type</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>p2200[n]</td>
<td>Technology controller enable / Tec_ctrl enable</td>
<td>Unsigned32 / Binary</td>
<td>0</td>
</tr>
<tr>
<td>p2201[n]</td>
<td>Technology controller, fixed value 1 / Tec_ctrl fix val1</td>
<td>FloatingPoint32</td>
<td>10.00 [%]</td>
</tr>
<tr>
<td>p2202[n]</td>
<td>Technology controller, fixed value 2 / Tec_ctrl fix val2</td>
<td>FloatingPoint32</td>
<td>20.00 [%]</td>
</tr>
<tr>
<td>p2203[n]</td>
<td>Technology controller, fixed value 3 / Tec_ctrl fix val3</td>
<td>FloatingPoint32</td>
<td>30.00 [%]</td>
</tr>
</tbody>
</table>

### Notes
- **p2200**: The speed threshold value is set in p2161.
- **p2201**: The comparison threshold is set in p2141. We recommend setting the hysteresis (p2142) for canceling the bit to a value lower than that in p2141. Otherwise, the bit is not reset.
- **p2202**: The torque threshold value 2 is set in p2194.

### Dependencies
- Refer to: p2220, p2221, p2222, p2223, r2224, r2229

### Notice
- A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.

### Parameters

**List of parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Dependency</th>
</tr>
</thead>
<tbody>
<tr>
<td>r2224</td>
<td>Displays the selected and effective fixed value of the technology controller.</td>
<td>Refer to: r2229</td>
</tr>
<tr>
<td>r2225.0</td>
<td>Displays the status word for the fixed value selection of the technology controller.</td>
<td></td>
</tr>
<tr>
<td>r2229</td>
<td>Displays the number of the selected fixed setpoint of the technology controller.</td>
<td>Refer to: r2224</td>
</tr>
<tr>
<td>p2230[0...n]</td>
<td>Sets the configuration for the motorized potentiometer of the technology controller.</td>
<td>Refer to: r2231, p2240</td>
</tr>
</tbody>
</table>

**Notice:**
- The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:
  - Firmware with V2.3 or higher.
  - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).
Note:

Re bit 00:
0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.
1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.
Re bit 02:
0: Without initial rounding-off
1: With initial rounding-off.
The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).
It is calculated as follows:
\[ r = 0.0001 \times \max(p2237, |p2238|) \times 0.13^2 \times \text{[s]}^2 \]
The jerk is effective until the maximum acceleration is reached (a_max = p2237 [\%] / p2247 [s] or a_max = p2238 [\%] / p2248 [s]), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.
Re bit 03:
0: Non-volatile data save de-activated.
1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).
Re bit 04:
When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

### p2252 Technology controller configuration / Tec_ctrl config

**VECTOR_G**

*(Tech_ctrl)*

**Can be changed:** U, T  
**Calculated:** -  
**Access level:** 3

**Data type:** Unsigned16  
**Dynamic index:** -  
**Func. diagram:** -

**P-Group:** Modulation  
**Units group:** -  
**Unit selection:** -

**Not for motor type:** -  
**Scaling:** -  
**Expert list:** 1

**Min**  
**Max**  
**Factory setting**

**-**  
**-**  
**0111 bin**

**Description:**  
Sets the configuration of the technology controller.

**Dependency:**  
Refer to: p2257, p2258, p2267, p2268, p2280, p2285

**Note:**

- **Re bit 00 = 0:**
  - The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle.
  - Re bit 00 = 1:
    - When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time.

- **Re bit 01 = 0:**
  - The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time).
  - Re bit 01 = 1:
    - The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0.
    - Re bit 02 = 0:
      - When the PID controller is de-activated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293.
      - Re bit 02 = 1:
        - When the PID controller is de-activated via p2200, the output signal r2294 is set directly to zero.

- **Re bit 03 = 0:**
  - The actual values are not limited by p2267 and p2268.
  - Re bit 03 = 1:
    - The actual values are limited by p2267 and p2268.

<td>Setting to use an arithmetic function for the actual value signal of the technology controller.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
<td>3</td>
<td>0</td>
</tr>
</tbody>
</table>

#### Description:
Setting to use an arithmetic function for the actual value signal of the technology controller.

#### Value:
0: No function
1: Root function (root from x)
2: Square function (x * x)
3: Cube function (x * x * x)

#### Dependency:
Refer to: p2264, p2265, p2267, p2268, p2269, p2271

### p2271 Technology controller actual value inversion (sensor type) / Tech_ctrl act inv

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>p2271</td>
<td>Setting to invert the actual value signal of the technology controller. The inversion depends on the sensor type for the actual value signal.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

#### Description:
Setting to invert the actual value signal of the technology controller.

#### Value:
0: No inversion
1: Inversion actual value signal

#### Caution:
If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

#### Note:
The correct setting can be determined as follows:
- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal of the technology controller.
- If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion).
- If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted).

<tr>
<td>P-Group: Technology</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
</tbody>
</table>

**Description:** Setting to invert the fault signal of the technology controller.

**The setting depends on the type of control loop.**

**Value:**

- 0: No inversion
- 1: Inversion

**Caution:** If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

**Note:**

The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:

The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). If value = 1:

The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

Min Max Factory setting

Description: Connector output of the reference quantity p2003 for torque (r0108.12 = 0) or force (r0108.12 = 1).
All torques specified as relative values (r0108.12 = 0) or forces (r0108.12 = 1) are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
The unit of this parameter is the same as the unit selected for p2003.
Dependency: p0505, r0108.12
Refer to: p2003
Note: This BICO parameter provides the numerical value of the reference quantity p2003 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

r2704 CO: Reference power / Reference power
B_INF, VECTOR_G
Can be changed: - Calculated: - Access level: 3
Data type: FloatingPoint32 Dynamic index: - Func. diagram: -
P-Group: - Units group: - Unit selection: -
Not for motor type: - Scaling: - Expert list: 1
Min Max Factory setting

Description: Connector output of the reference quantity for powers p2004.
All power ratings specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
The unit of this parameter is the same as the unit selected for p2004.
Dependency: This value is calculated as voltage x current for the infeed and as torque x speed for closed-loop controls.
Refer to: p2004
Note: This BICO parameter provides the numerical value of the reference quantity p2004 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.
The reference power is calculated as follows:
- 2 * Pi * reference speed / 60 * reference torque (motor)
- reference voltage * reference current * root(3) (infeed)

r2705 CO: Reference angle / Reference angle
B_INF, VECTOR_G
Can be changed: - Calculated: - Access level: 3
Data type: FloatingPoint32 Dynamic index: - Func. diagram: -
P-Group: - Units group: - Unit selection: -
Not for motor type: - Scaling: - Expert list: 1
Min Max Factory setting

Description: Connector output of the reference quantity for angles p2005.
All angles specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
This parameter has the unit degree.
Dependency: Refer to: p2005
Parameters
List of parameters

Note:
This BICO parameter provides the numerical value of the reference quantity p2005 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

r2706
CO: Reference temp / Reference temp

<table>
<thead>

</table>

Description:
Connector output of the reference quantity for temperatures.
All temperatures specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
This parameter has the unit degree Celsius.

Note:
This BICO parameter provides the numerical value of the reference quantity for the temperature as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

</tr>
</tbody>
</table>

Description:
All acceleration rates specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
The unit of this parameter is the same as the unit selected for p2007.

Dependency:
r0108.12, p0505
Refer to: p2007

Note:
This BICO parameter provides the numerical value of the reference quantity p2007 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value in the currently selected unit can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.

p2720[0...n] Load gear configuration / Load gear config

<table>
<thead>
<tr>
<th>VECTOR_G</th>

<td>Rotary axis</td>
<td>-</td>
</tr>
<tr>
<td>02</td>
<td>Load gear, reset position</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

Note:
For the following events, the non-volatile, saved position values are automatically reset:
- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).
- when adjusting the absolute encoder again
**Parameters**

**List of parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Dependency</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>p2721[0...n]</td>
<td>Load gear, rotary absolute encoder, revolutions, virtual / Abs rot rev</td>
<td>Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.</td>
<td>The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is pre-set with p0421 and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of over-flows) and cannot be changed.</td>
</tr>
<tr>
<td>p2722[0...n]</td>
<td>Load gear, position tracking tolerance window / Pos track tol</td>
<td>Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --&gt; The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --&gt; An appropriate message is output.</td>
<td>The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).</td>
</tr>
<tr>
<td>r2723[0...n]</td>
<td>CO: Load gear absolute value / Load gear abs_val</td>
<td>Displays the absolute value after the load gear.</td>
<td>The encoder position actual value must be requested using the encoder control word Gn_STW.13. The increments are displayed in the format the same as r0483.</td>
</tr>
</tbody>
</table>

<td>8060</td>
</tr>
<tr>
<td>11</td>
<td>11</td>
<td>Safety group message present</td>
<td>Yes</td>
<td>No</td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:**
Displays the global status word for messages. The appropriate bit is set if at least one message is present at the drive objects.

#### r3115[0...63]  
**Fault drive object initiating / F DO initiating**

**Description:**
Displays the drive object number of the initiating drive object for this fault as integer number.

**Value:** 63
The fault was initiated by the drive object itself.

**Dependency:**
Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3120, r3122

**Note:**
The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the fault buffer and the assignment of the indices is shown in r0945.
### p3116

**Description:**
Sets the signal source for the automatic acknowledgement on the device drive object.

- **BI: p3116 = 0** signal
  - Faults present are automatically acknowledged on the device drive object. Local device faults are forwarded to the first active drive object.
- **BI: p3116 = 1** signal
  - Faults present are not automatically acknowledged on the device drive object. Local device faults are not forwarded.

**Dependency:**
Refer to: p2102, p2103, p2104, p2105, p3981

**Note:**
When selecting a standard telegram, the BICO interconnection for control signal STW1.10 (master control by PLC) is automatically established.

### p3117

**Description:**
Sets the re-parameterization of all safety messages for faults and alarms.

- **0:** Safety messages are not re-parameterized
- **1:** Safety messages are re-parameterized

**Note:**
A change only becomes effective after a POWER ON.

### r3120[0...63]

**Description:**
Displays the component number of the fault which has occurred.

**Dependency:**
Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3122

**Note:**
Value = 0: Assignment to a component not possible.

The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

### r3121[0...63]

**Description:**
Displays the component number of the alarm which has occurred.
**Dependency:**
Refer to: r2110, r2122, r2123, r2124, r2125, r2134, r2145, r2146, r3123

**Note:**
Value = 0: Assignment to a component not possible.
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

---

### r3122[0...63] Diagnostic attribute fault / Diag_attr fault

**All objects**
Can be changed: -
Data type: Unsigned32
P-Group: Messages
Not for motor type: -
Min

**Description:**
Displays the diagnostic attribute of the fault which has occurred.

**Bit field:**
Bit | Signal name | 1 signal | 0 signal | FP
---|-------------|----------|----------|---
00 | Hardware replacement recommended | Yes | No | -

**Dependency:**
Refer to: r0945, r0947, r0948, r2109, r2130, r2133, r2136, r3120

**Note:**
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the fault buffer and the assignment of the indices is shown in r0945.

---

### r3123[0...63] Diagnostic attribute alarm / Diag_attr alarm

**All objects**
Can be changed: -
Data type: Unsigned32
P-Group: Messages
Not for motor type: -
Min

**Description:**
Displays the diagnostic attribute of the alarm which has occurred.

**Bit field:**
Bit | Signal name | 1 signal | 0 signal | FP
---|-------------|----------|----------|---
00 | Hardware replacement recommended | Yes | No | -

**Dependency:**
Refer to: r2110, r2122, r2123, r2124, r2125, r2134, r2145, r2146, r3121

**Note:**
The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
The structure of the alarm buffer and the assignment of the indices is shown in r2122.

---

### r3131 CO: Actual flt value / Actual flt value

**All objects**
Can be changed: -
Data type: Integer32
P-Group: Messages
Not for motor type: -
Min

**Description:**
Displays the fault value of the oldest active fault.

**Dependency:**
Refer to: r2131, r3132

---

### r3132 CO: Actual component number / Act comp_no.

**All objects**
Can be changed: -
Data type: Integer32
P-Group: Messages
Not for motor type: -
Min

**Description:**
Displays the component number of the oldest fault that is still active.

**Dependency:**
Refer to: r2131, r3131
### List of parameters

#### Description:
Sets the suppression of r2139.3 "Fault present" for certain fault responses.

#### Dependency:
Refer to: p0491, r2139

#### Note:
Depending on the suppression of a fault reaction in this parameter, r2139.1 "Acknowledgement required" is set when at least one fault occurs.

**Re bit 08:**
The suppression is only effective if p0491 = 1.

<td>Dynamic index: DDS, p0180</td>
<td></td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>ASM, PEM, REL</td>
<td>Units group: 6_2</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the threshold value for the zero current signal for the zero current monitoring.
If the absolute current falls below the threshold value then r2199.6 is set to 1 after the delay time has expired. The bit is reset if the threshold value and the hysteresis are exceeded again.

**Dependency:**
Refer to: r2199, p3208, p3209

**Note:**
The monitoring function is only carried out for separately-excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold value in p2161 (r2199.0 = 1).

**Min**
0.01 [Arms]

**Max**
10000.00 [Arms]

**Factory setting**
1.00 [Arms]

### p3208[0...n] Zero current signal hysteresis / I_0_sig hyst

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>U, T</th>

<td></td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>ASM, PEM, REL</td>
<td>Units group: 6_2</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the hysteresis for the zero current signal for the zero current monitoring.

**Dependency:**
Refer to: p3207, p3209

**Note:**
The monitoring function is only carried out for separately-excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold value in p2161 (r2199.0 = 1).

**Min**
0.01 [Arms]

**Max**
10000.00 [Arms]

**Factory setting**
1.00 [Arms]

### p3209[0...n] Zero current signal delay time / I_0_sig t_del

**VECTOR_G**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>U, T</th>
<th>Calculated:</th>
<th>Access level:</th>

<td>Dynamic index: DDS, p0180</td>
<td></td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>ASM, PEM, REL</td>
<td>Units group: -</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the delay time for the zero current signal for the zero current monitoring.

**Dependency:**
Refer to: p3207, p3208

**Note:**
The monitoring function is only carried out for separately-excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold in p2161 (r2199.0 = 1).

**Min**
0.00 [s]

**Max**
10.00 [s]

**Factory setting**
0.02 [s]

### p3233[0...n] Torque actual value filter, time constant / M_act_filt T

**VECTOR_G (Ext msg)**

<table>
<thead>
<tr>
<th>Can be changed:</th>
<th>U, T</th>
<th>Calculated:</th>
<th>Access level:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type:</td>
<td>FloatingPoint32</td>
<td>CALC_MOD_LIM_REF</td>
<td>3</td>
</tr>
<tr>
<td>P-Group:</td>
<td>Messages</td>
<td>Dynamic index: DDS, p0180</td>
<td></td>
</tr>
<tr>
<td>Not for motor type:</td>
<td>-</td>
<td>Units group: -</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the time constant for the PT1 element to smooth the torque actual value.
The smoothed torque actual value is compared with the threshold values and is only used for messages and signals.
### p3235 Phase failure signal motor monitoring time / Ph_fail t_monit

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** -
- **Access level:** 4

**Data type:** FloatingPoint32

**Dynamic index:** -

**P-Group:** Messages

**Units group:** -

**Exp. list:** 1

**Min**   **Max**
0 [ms]   2000 [ms] 320 [ms]

**Description:**
Sets the monitoring time for phase failure detection of the motor.

**Notice:**
After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

**Note:**
Monitoring is only effective for blocksize and booksize power units.
For p3235 = 0 the function is deactivated.
For VECTOR, the following applies:
The monitoring is automatically de-activated during the flying restart operation for a motor that is still rotating.

### p3236[0...n] Speed threshold 7 / n_thresh val 7

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_LIM_REF
- **Access level:** 3

**Data type:** FloatingPoint32

**Dynamic index:** DSS, p0180

**P-Group:** Messages

**Units group:** 3_1

**Exp. list:** 1

**Min**   **Max**
0.00 [rpm] 3000.00 [rpm] 100.00 [rpm]

**Description:**
Sets the speed threshold value for the signal "speed deviation model/external" (BO: r2199.7).

**Dependency:**
Refer to: r1443, r2169, r2199, p3237

### p3237[0...n] Hysteresis speed 7 / n_hysteresis 7

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** CALC_MOD_LIM_REF
- **Access level:** 3

**Data type:** FloatingPoint32

**Dynamic index:** DSS, p0180

**P-Group:** Messages

**Units group:** 3_1

**Exp. list:** 1

**Min**   **Max**
0.00 [rpm] 200.00 [rpm] 2.00 [rpm]

**Description:**
Sets the hysteresis speed for the signal "speed deviation model/external" (BO: r2199.7).

**Dependency:**
Refer to: r2199, p3236

### p3238[0...n] OFF delay n_act_motor model = n_act external / t_del n_a = n_ext

**VECTOR_G**

- **Can be changed:** U, T
- **Calculated:** -
- **Access level:** 3

**Data type:** FloatingPoint32

**Dynamic index:** DSS, p0180

**P-Group:** Messages

**Units group:** -

**Exp. list:** 1

**Min**   **Max**
0.0 [s]   100.0 [s] 3.0 [s]

**Description:**
Sets the OFF delay for the signal "speed deviation model/external in tolerance" (BO: r2199.7).
The smoothed actual speed of the motor model r2169 is compared with the speed measured externally r1443 (threshold value p3236).

**Dependency:**
Refer to: p3236, p3237

**Description:**
For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required.
This parameter specifies the power ($P$) of point 1 as a [%].
The characteristic comprises the following value pairs:
- Power ($P$) / speed ($n$)
  - $p3320 / p3321$ --> point 1 ($P1 / n1$)
  - $p3322 / p3323$ --> point 2 ($P2 / n2$)
  - $p3324 / p3325$ --> point 3 ($P3 / n3$)
  - $p3326 / p3327$ --> point 4 ($P4 / n4$)
  - $p3328 / p3329$ --> point 5 ($P5 / n5$)

**Dependency:**
Refer to: r0041, p3321, p3322, p3323, p3324, p3325, p3326, p3327, p3328, p3329

**Note:**
- The reference value for power and speed is the rated power/rated speed.
The energy saved is displayed in r0041.

| - | Not for motor type: | - | Scaling: | - | Expert list: | 1 |
| Min | Max | Factory setting |
| 0.00 | 100.00 | 92.00 |

**Description:**
For the energy-saving display of a fluid-flow machine, a typical flow characteristic \( P = f(n) \) with 5 points along the characteristic is required.

This parameter specifies the power \( P \) of point 4 as a [%].

**Dependency:**
Refer to: r0041, p3320, p3321, p3322, p3323, p3324, p3325, p3327, p3328, p3329

**Note:**
The reference value for power and speed is the rated power/rated speed.
The energy saved is displayed in r0041.

### p3327[0...n]
**Fluid flow machine speed point 4 / Fluid_mach n4**

| VECTOR_G | Can be changed: | U, T | Calculated: | - | Access level: | 2 |
| - | Data type: | FloatingPoint32 | Dynamic index: | DDS, p0180 | Func. diagram: | - |
| - | P-Group: | Displays, signals | Units group: | - | Unit selection: | - |
| - | Not for motor type: | - | Scaling: | - | Expert list: | 1 |
| Min | Max | Factory setting |
| 0.00 | 100.00 | 75.00 |

**Description:**
For the energy-saving display of a fluid-flow machine, a typical flow characteristic \( P = f(n) \) with 5 points along the characteristic is required.

This parameter specifies the speed \( n \) of point 4 as a [%].

**Dependency:**
Refer to: r0041, p3320, p3321, p3322, p3323, p3324, p3325, p3326, p3328, p3329

**Note:**
The reference value for power and speed is the rated power/rated speed.
The energy saved is displayed in r0041.

### p3328[0...n]
**Fluid flow machine power point 5 / Fluid_mach P5**

| VECTOR_G | Can be changed: | U, T | Calculated: | - | Access level: | 2 |
| - | Data type: | FloatingPoint32 | Dynamic index: | DDS, p0180 | Func. diagram: | - |
| - | P-Group: | Displays, signals | Units group: | - | Unit selection: | - |
| - | Not for motor type: | - | Scaling: | - | Expert list: | 1 |
| Min | Max | Factory setting |
| 0.00 | 100.00 | 100.00 |

**Description:**
For the energy-saving display of a fluid-flow machine, a typical flow characteristic \( P = f(n) \) with 5 points along the characteristic is required.

This parameter specifies the power \( P \) of point 5 as a [%].

**Dependency:**
Refer to: r0041, p3320, p3321, p3322, p3323, p3324, p3325, p3326, p3327, p3329

**Note:**
The reference value for power and speed is the rated power/rated speed.
The energy saved is displayed in r0041.

### p3329[0...n]
**Fluid flow machine speed point 5 / Fluid_mach n5**

| VECTOR_G | Can be changed: | U, T | Calculated: | - | Access level: | 2 |
| - | Data type: | FloatingPoint32 | Dynamic index: | DDS, p0180 | Func. diagram: | - |
| - | P-Group: | Displays, signals | Units group: | - | Unit selection: | - |
| - | Not for motor type: | - | Scaling: | - | Expert list: | 1 |
| Min | Max | Factory setting |
| 0.00 | 100.00 | 100.00 |

**Description:**
For the energy-saving display of a fluid-flow machine, a typical flow characteristic \( P = f(n) \) with 5 points along the characteristic is required.

This parameter specifies the speed \( n \) of point 5 as a [%].

Closed-loop control of the DC link voltage is improved by pre-controlling the power required for the other modules. A non-scaled quantity is expected so that the various power reference values (r2004) of the drive objects do not have to be taken into account. The scaling factors are used to adapt the scaling (p3521).

### Notes

- **p3554**
  - Displays the integral action component of the DC link voltage controller (Vdc controller).
  - A value of 100% corresponds to the basic setting derived from the loop control parameter (p3422).

- **p3560**
  - Sets the scaled proportional gain for the DC link voltage controller (Vdc controller).
  - A value of 100% corresponds to the basic setting derived from the loop control parameter (p3422).

- **p3562**
  - Sets the scaled integral time for the DC link voltage controller (Vdc).
  - A value of 100% corresponds to the basic setting derived from the loop control parameter (p3422).

- **p3660[0...n]**
  - Sets the voltage scaler for the Voltage Sensing Module (VSM).

**Example**

- When the 690 V input is used (X522) without voltage scaler, 0 % should be entered.
- When the 100 V input (X521) is used with voltage scaler to measure medium voltages, the dividing (scaling) factor multiplied by 100% should be entered.

Example:

- 1000 V line supply voltage, voltage scaling, 10:1
  - voltage at the VSM input is 100 V
  - p3660 = 10 * 100 % = 1000 %
### r3661[0...n]

**Description:**
Displays the input voltage between phases L1 and L2 for the Voltage Sensing Module (VSM).

**Dependency:**
Refer to: p3660

**Note:**
- X521.1 or X522.1: Connection of L1
- X521.2 or X522.2: Connection of L2
- X521.3 or X522.3: Connection of L3

### r3662[0...n]

**Description:**
Displays the input voltage between phases L2 and L3 for the Voltage Sensing Module (VSM).

**Dependency:**
Refer to: p3660

**Note:**
- X521.1 or X522.1: Connection of L1
- X521.2 or X522.2: Connection of L2
- X521.3 or X522.3: Connection of L3

### r3664[0...n]

**Description:**
Displays the status of the temperature evaluation of the Voltage Sensing Module (VSM). This displays whether the temperature actual value has exceeded the fault/alarm threshold.

**Bit field:**
<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>

</tr>
</tbody>
</table>

**Dependency:**
Refer to: p3665, r3666, p3667, p3668

### p3665[0...n]

**Description:**
Setting of the temperature sensor for the Voltage Sensing Module (VSM). The temperature sensor is connected to terminals X520.5 and X520.6 of the VSM.

**Value:**
- 0: No sensor
- 1: PTC
- 2: KTY84

### r3674[0...n]

**CO: VSM 10 V input 2 actual value / VSM inp 2 U_act**

| VECTOR_G |
|------------------|------------------|------------------|
| **Can be changed:** | - | Calculated: - |
| **Data type:** | FloatingPoint32 | Dynamic index: p0150 |
| **P-Group:** | Closed-loop control | Units group: - |
| **Not for motor type:** | - | Scaling: p2001 |
| **Min** | - [V] | Max | - [V] |

**Description:** Displays the actual value of the voltage measured at the 10 V input 2 of the Voltage Sensing Modules (VSM).

**Dependency:** Displayed in the manual.

**Note:** 10 V input 2: Terminals X520.3 and X520.4

### p3680

**BI: Braking Module internal inhibit / BM int inhib**

| B_INF |
|------------------|------------------|------------------|
| **Can be changed:** | T | Calculated: - |
| **Data type:** | Unsigned32 / Binary | Dynamic index: - |
| **P-Group:** | - | Units group: - |
| **Not for motor type:** | - | Scaling: - |
| **Min** | - | Max | - |

**Description:** Sets the signal source to inhibit the internal Braking Module.

- **BI:** p3680 = 1 signal:
  - The Braking Module is inhibited.
- **BI:** p3680 = 0 signal:
  - The Braking Module is enabled.

**Dependency:** Refer to: A06904

**Caution:** When the Braking Module is inhibited, no energy can be dissipated in the braking resistor.

### p3681

**BI: Activating Braking Module internal DC link fast discharge / BM intDCdischg act**

| B_INF |
|------------------|------------------|------------------|
| **Can be changed:** | T | Calculated: - |
| **Data type:** | Unsigned32 / Binary | Dynamic index: - |
| **P-Group:** | - | Units group: - |
| **Not for motor type:** | - | Scaling: - |
| **Min** | - | Max | - |

**Description:** Sets the signal source to activate the DC link fast discharge for an internal braking module.

- When the following conditions apply, the DC link fast discharge is started later with delay time (p3682):
  - **BI:** p3681 = 1 signal.
  - an external line contactor is opened via r0863.1 "energize contactor".
- The DC link fast discharge is interrupted when the following conditions apply:
  - **BI:** p3681 = 0 signal.
  - ON command for the infeed.

**Recommend.:** The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults could occur when pre-charging (e.g. F300027).

**Dependency:** Refer to: p3682

**Notice:** The parameter is only effective for Basic Line Modules with the internal Braking Module (this is valid for Basic Line Modules with a power rating of less than 100 kW).

<tr>
<td>Note:</td>
<td>When the ground fault monitoring initiates a fault for overlapping synchronizing the threshold value p0287[1] for the Motor Module and the associated infeed must be appropriately increased (e.g. p0287[1] = 100 %). For p3800 = 1, the following applies: The INTERNAL voltage actual values are used for synchronization. The effects that a (sine-wave) filter - that is connected between the Motor Module and motor - has on the voltage actual values are taken into account (theoretically) by appropriately selecting p0230. VSM: Voltage Sensing Module</td>

#### p3801[0...n]  
**Sync-line-drive, drive object number / Sync DO_No**

| Description: | Sets the drive object number of the Voltage Sensing Module (VSM) used for the line-drive synchronization. |
| Dependency: | Refer to: p3800, p3802                               |
| Notice:     | The current controller sampling time p0115[0] of the drive object with the VSM used for synchronization must be identical to the current controller sampling time of the drive of the drive used to perform line synchronization. |
| Note:       | VSM: Voltage Sensing Module                          |
|             | The setting p3801 = 1 is always possible (no VSM selected). |
|             | If the VSM is assigned subsequently to a Motor Module, its drive object number must be entered in p3801. |
|             | The line voltage is always measured using the first VSM (see p0151 index 0). |

</tr>
</tbody>
</table>

**Note:**  
Re bit 9:  
For closed-control of an induction motors with encoder, the switchover between the current and observer model is displayed (see also r1751 bit 19), if p3844 is > 0.
For bit 9 = 0 (observer model active) the frictional torque is calculated from the characteristic values from the characteristic point entered into p3844.
For bit 9 = 1 (current model active) the frictional torque is calculated from the characteristic values below the characteristic point entered into p3844.

**r3841**

**Description:** Displays the torque of the friction characteristic dependent on the speed.

**Dependency:** Refer to: p1569, p3842

**p3842**

**Description:** Setting to activate and de-activate the friction characteristic.

**Value:**
- 0: Friction characteristic de-activated
- 1: Friction characteristic activated

**Dependency:** Refer to: p1569, r3841, p3845

**p3843[0...n]**

**Description:** Sets the smoothing time constant (PT1) for the frictional torque difference, which is entered when changing over the status bit r3840 bit 9.

**Dependency:** Refer to: p3844

**p3844[0...n]**

**Description:** Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.

The speed of this changeover point is preassigned when automatically calculating with the changeover speed p1752. The changeover point located below is preassigned with the changeover speed p1752 * (1 - p1753).
Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).
Depending on the display of r3840 bit 9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.
Dependency: As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.

Refer to: p3843

Notice: If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).

Note: For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.

### p3845 Friction characteristic record activation / Frict rec act

</tr>
</tbody>
</table>

Description: Setting for the friction characteristic record.

After the next power-on command, the friction characteristic is automatically recorded.

Value:

- **0**: Friction characteristic record de-activated
- **1**: Friction char record activated for all directions
- **2**: Friction char record activated for positive direction
- **3**: Friction char record activated for negative direction

Dependency:

- When selecting the friction characteristic measurement, the drive data set changeover is suppressed.
- For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.

Danger:

- For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.

Notice:

- To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

Note:

- When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).
- When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.
- When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

### p3846[0...n] Friction characteristic record ramp-up/ramp-down time / Frict rec t_RFG

<table>
<thead>

**Warning:** | Check that binector outputs BO: r3861.n are connected correctly and that the appropriate digital outputs are wired correctly. If the interconnection/wiring is incorrect, the software could execute a different (incorrect) function via binector outputs BO: r3861.n if the Braking Module develops a fault.
### Description:
Sets the delay time for switching in the DC link fast discharge.

### Dependency:
Refer to: p3862, r3864

### Note:
The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

### Description:
Sets the signal source to activate the DC link fast discharge.

#### The DC link fast discharge is started later with delay time (p3862) when the following conditions apply:
- BI: p3863 = 1 signal.
- an external line contactor is opened via r0863.1 "energize contactor".

#### The DC link fast discharge is interrupted when the following conditions apply:
- BI: p3863 = 0 signal.
- ON command for the infeed.

#### Recommend.:  
The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults could occur when pre-charging (e.g. F30027).

### Dependency:
Refer to: r3864  
Refer to: F30027

### Note:
The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

### Description:
Signal to control (energize) terminal X21.2 "DC link fast discharge" on the Braking Module.

#### This binector output is used as signal source to interconnect to a digital output. The digital output must be connected to terminal X21.2 of the particular Braking Module.

### Bit field:

<table>
<thead>
<tr>
<th>Bit</th>

<td>Fast discharge Braking Module 8</td>
<td>High</td>
<td>Low</td>
<td>-</td>
</tr>
</tbody>
</table>
**Dependency:**
Refer to: p3863
Refer to: F30027

**Warning:**
It must be carefully ensured that the binector outputs BO: p3864.n are correctly interconnected and also that the appropriate digital outputs are correctly connected up.

If the interconnection/connection is incorrect, in the case of an active DC link fast discharge, the software could execute another function (incorrect function) via binector outputs BO: p3864.n or could also permanently control the DC link fast discharge even if the line contactor is closed.

**Note:**
The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

Refer to: A06900

**Note:**
For the Braking Module, this message is output via the following terminal:
- X21.4 for the "Booksize" format
- X21.5 for the "Chassis" format

### p3900
**Completion of quick commissioning / Compl quick_comm**

<table>
<thead>
<tr>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exits the quick commissioning (p0010 = 1) with automatic calculation of all of the parameters that depend on the entries made during the quick commissioning.</td>
<td>C2(1)</td>
<td>-</td>
<td>1</td>
</tr>
<tr>
<td>p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning, the interconnections of PROFINET P2D telegram selection (p0922) and the interconnections via p0700 are re-established and all of the dependent filter and closed-loop control parameters are calculated (corresponding to p0340 = 1).</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the
interconnections via p0700 and the calculations corresponding to p0340 = 1.
p3900 = 3 only includes the end of quick commissioning.

Value:
- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick param. (only) for controller par. and reset for BICO par
- 3: Completion of quick commissioning

Notice:
After the value has been modified, no further parameter modifications can be made and the status is shown in
r3996. Modifications can be made again when r3996 = 0.

Note:
When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0.

**p3900**  
Completion of quick commissioning / Compl quick_comm  
VECTOR_G  
Can be changed: C2(1)  
Calculated: -  
Access level: 1

**Value:**
- 0: No quick parameterization
- 1: Quick parameterization after parameter reset
- 2: Quick parameterization (only) for BICO and motor parameters
- 3: Quick parameterization for motor parameters (only)

**Notice:**
After the value has been modified, no further parameter modifications can be made and the status is shown in
r3996. Modifications can be made again when r3996 = 0.

**Note:**
When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0.

When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associ-
ated with a selected Siemens catalog motor are not overwritten. If a catalog motor has not been selected (see p0300),
then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning
the drive for the first time:
induction motors p0320, p0352, p0353, p0362 ... p0369, p0391 ... p0393, p0604, p0605, p0626 ... p0628
synchronous motor p0326, p0327, p0352, p0353, p0391 ... p0393, p0604, p0605.

- 0: -40.0 [V]  
- 1: 40.0 [V]  
- 2: 0.0 [V]

**Dependency:**
Refer to: r0192, p0212

**Caution:**
Incorrect use of the calibration can have a negative impact on the closed-loop control. The parameter influences the
upper and lower voltage detection.

Differential voltage for calibrating the offset for DC-link voltage measurement.

Refer to: r0192, p0212

Incorrect use of the calibration can have a negative impact on the closed-loop control. The parameter influences the
upper and lower voltage detection.
### Note:
Parameter entries are directly saved in the DRIVE-CLiQ component involved.
The parameter is only effective in the case of booksize power units if r0192 bit 22 and p0212 bit 0 are set.

### r3925[0...n] Identification final display / Ident final_disp

</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Description: Sets the limit for the total output voltage of terminals X541.1, X541.2, X541.3 and X541.4 (DI/DO 8 ... 11) of Terminal Module 31 (TM31).

Value:
0: 0.1 A total current limit DI/DO 8 ... 11
1: 1.0 A total current limit DI/DO 8 ... 11

Dependency: Refer to: p4028

Warning: Since the sum of the output currents at terminals X541.1, X541.2, X541.3 and X541.4 is limited, an overcurrent or short circuit at one output terminal can cause a dip in the signal at the other terminals.

</tbody>
</table>

Description: Sets the type of analog inputs of Terminal Module 31 (TM31).
p4056[x] = 0, 4 correspond to a voltage input (r4052, p4057, p4059 are displayed in V).
p4056[x] = 2, 3, 5 correspond to a current input (r4052, p4057, p4059 are displayed in mA).
In addition, the associated switch S5 must be appropriately set.

AI 0: S5.0 = V --> voltage input, S5.0 = I --> current input (burden resistor = 250 Ohm)
AI 1: S5.1 = V --> voltage input, S5.1 = I --> current input (burden resistor = 250 Ohm)

**Value:**
- 0: Unipolar voltage input (0 V ... +10 V)
- 2: Unipolar current input (0 mA ... +20 mA)
- 3: Unipolar current input monitored (+4 mA to +20 mA)
- 4: Bipolar voltage input (-10 V ... +10 V)
- 5: Bipolar current input (-20 mA to +20 mA)

**Index:**
- [0] = AI 0 (X521.1/X521.2, S5.0)
- [1] = AI 1 (X521.3/X521.4, S5.1)

**Warning:**
The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V.

For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.

**Notice:**
For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set.

**Note:**
When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values:
- For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %.
- For p4056 = 2, 5, p4057 is set to 0.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.
- For p4056 = 3, p4057 is set to 4.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

**Description:**
Sets the scaling characteristic for the analog inputs of Terminal Board 30 (TB30).

The scaling characteristic for the analog inputs is defined using 2 points.

This parameter specifies the x coordinate (input voltage in V) of the 1st value pair of the characteristic.

**Index:**
- [0] = AI 0 (X482.1/X482.2)
- [1] = AI 1 (X482.3/X482.4)

**Note:**
The parameters for the characteristic do not have a limiting effect.

**Description:**
Sets the scaling characteristic for the analog inputs of Terminal Module 31 (TM31).

The scaling characteristic for the analog inputs is defined using 2 points.

This parameter specifies the x coordinate (input voltage in V or input current in mA) of the 1st value pair of the characteristic.

**Index:**
- [0] = AI 0 (X521.1/X521.2, S5.0)
- [1] = AI 1 (X521.3/X521.4, S5.1)

**Dependency:**
The unit of this parameter (V or mA) depends on the analog input type.
Refer to: p4056, p4056

**Notice:**
This parameter is automatically overwritten when the analog input type (p4056) is modified.

**Note:**
The parameters for the characteristic do not have a limiting effect.

**Description:**
Activates the absolute value generation for the analog outputs of the Terminal Board 30 (TB30).

**Value:**
- 0: No absolute value generation
- 1: Absolute value generation switched in

**Index:**
- [0] = AO 0 (X482.5/X482.6)
- [1] = AO 1 (X482.7/X482.8)
**Description:**
Activates the absolute value generation for the analog outputs of Terminal Module 31 (TM31).

**Value:**
0: No absolute value generation
1: Absolute value generation switched in

**Index:**
[0] = AO 0 (X522.1, X522.2, X522.3)
[1] = AO 1 (X522.4, X522.5, X522.6)

---

**Description:**
Displays the type of analog outputs of the Terminal Board 30 (TB30).

**Value:**
4: Voltage output (-10 V ... +10 V)

**Index:**
[0] = AO 0 (X482.5/X482.6)
[1] = AO 1 (X482.7/X482.8)

---

**Description:**
Sets the type of analog outputs of Terminal Module 31 (TM31).

**Value:**
0: Current output (0 mA ... +20 mA)
1: Voltage output (0 V ... +10 V)
2: Current output (+4 mA ... +20 mA)
3: Current output (-20 mA ... +20 mA)
4: Voltage output (-10 V ... +10 V)

**Index:**
[0] = AO 0 (X522.1, X522.2, X522.3)
[1] = AO 1 (X522.4, X522.5, X522.6)

**Dependencies:**
Refer to: p4077, p4078, p4080

**Note:**
When changing p4076, the parameters of the scaling characteristic (p4077, p4078, p4079, p4080) are overwritten with the following default values:
For p4076 = 0, 3, p4077 is set to 0.0 %, p4078 to 0.0 mA, p4079 to 100.0 % and p4080 to 20.0 mA.
For p4076 = 1, 4, p4077 is set to 0.0 %, p4078 to 0.0 V, p4079 to 100.0 % and p4080 to 10.0 V.
For p4076 = 2, p4077 is set to 0.0 %, p4078 to 4.0 mA, p4079 to 100.0 % and p4080 to 20.0 mA.
### List of parameters

#### p4077[0...1] TB30 analog outputs, characteristic value x1 / TB30 AO char x1

**Description:**
Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30).

**Index:**
- [0] = AO 0 (X482.5/X482.6)
- [1] = AO 1 (X482.7/X482.8)

**Dependency:**
Refer to: r4076, p4076

**Notice:**
This parameter is automatically overwritten when changing p4076 (type of analog outputs).

**Note:**
The parameters for the characteristic do not have a limiting effect.

<table>

<tbody>
<tr>
<td>p4078[0]</td>
<td>TM31 AO char y1</td>
<td>2</td>
<td>FloatingPoint32</td>
<td>-</td>
<td>9572</td>
</tr>
</tbody>
</table>
The scaling characteristic for the analog outputs is defined using 2 points.
This parameter specifies the y coordinate (output voltage in V or output current in mA) of the 1st value pair of the characteristic.

**Index:**
[0] = AO 0 (X522.1, X522.2, X522.3)  
[1] = AO 1 (X522.4, X522.5, X522.6)

**Dependency:**
The unit of this parameter (V or mA) depends on the analog output type.
Refer to: r4076, p4076

**Notice:**
This parameter is automatically overwritten when changing p4076 (type of analog outputs).

**Note:**
The parameters for the characteristic do not have a limiting effect.

---

### p4079[0...1] TB30 analog outputs, characteristic value x2 / TB30 AO char x2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TB30</strong></td>
<td>Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30).</td>
</tr>
</tbody>
</table>

The scaling characteristic for the analog outputs is defined using 2 points.
This parameter specifies the x coordinate (percentage) of the 2nd value pair of the characteristic.

**Index:**
[0] = AO 0 (X482.5/X482.6)  
[1] = AO 1 (X482.7/X482.8)

**Note:**
The parameters for the characteristic do not have a limiting effect.

---

### p4080[0...1] TB30 analog outputs, characteristic value y2 / TB30 AO char y2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TB30</strong></td>
<td>Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30).</td>
</tr>
</tbody>
</table>

The scaling characteristic for the analog outputs is defined using 2 points.
This parameter specifies the y coordinate (output voltage in V) of the 2nd value pair of the characteristic.

**Index:**
[0] = AO 0 (X482.5/X482.6)  
[1] = AO 1 (X482.7/X482.8)

**Note:**
The parameters for the characteristic do not have a limiting effect.
Description:
Sets the scaling characteristic for the analog outputs of Terminal Module 31 (TM31).
The scaling characteristic for the analog outputs is defined using 2 points.
This parameter specifies the y coordinate (output voltage in V or output current in mA) of the 2nd value pair of the characteristic.

Index:
[0] = AO 0 (X522.1, X522.2, X522.3)
[1] = AO 1 (X522.4, X522.5, X522.6)

Dependency:
The unit of this parameter (V or mA) depends on the analog output type.
Refer to: r4076, p4076

Notice:
This parameter is automatically overwritten when changing p4076 (type of analog outputs).

Note:
The parameters for the characteristic do not have a limiting effect.

Description:
Sets the signal source for inverting the analog output signals of Terminal Board 30 (TB30).

Index:
[0] = AO 0 (X482.5/X482.6)
[1] = AO 1 (X482.7/X482.8)

Description:
Sets the signal source for inverting the analog output signals of Terminal Module 31 (TM31).

Index:
[0] = AO 0 (X522.1, X522.2, X522.3)
[1] = AO 1 (X522.4, X522.5, X522.6)

Description:
Sets the offset for the analog outputs of Terminal Board 30 (TB30).
The offset is added to the output signal after the scaling characteristic.

Index:
[0] = AO 0 (X482.5/X482.6)
[1] = AO 1 (X482.7/X482.8)
### p4083[0...1] TM31 analog outputs, offset / TM31 AO offset

**TM31**

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Terminals
- **Not for motor type:** -
- **Min:** -20.000
- **Max:** 20.000

**Description:**
Sets the offset for the analog outputs of Terminal Module 31 (TM31). The offset is added to the output signal after the scaling characteristic.

**Index:**
- [0] = AO 0 (X522.1, X522.2, X522.3)
- [1] = AO 1 (X522.4, X522.5, X522.6)

**Dependency:**
The unit of this parameter (V or mA) depends on the analog input type.
Refer to: r4076, p4076

**Note:**
This means, for example, the offset of a downstream isolating amplifier can be compensated.

### p4095 TB30 digital inputs, simulation mode / TB30 DI sim_mode

**TB30**

- **Can be changed:** U, T
- **Data type:** Unsigned32
- **P-Group:** Commands
- **Not for motor type:** -
- **Min:** -
- **Max:** -

**Description:**
Sets the simulation mode for the digital inputs of the Terminal Board 30 (TB30).

**Bit field:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Signal name</th>
<th>1 signal</th>
<th>0 signal</th>
<th>FP</th>
</tr>
</thead>
<tbody>
<tr>

<td>DI 3 (X481.4)</td>
<td>Simulation</td>
<td>Terminal eval</td>
<td>-</td>
</tr>
</tbody>
</table>

**Dependency:**
The setpoint for the input signals is specified using p4096.
Refer to: p4096

**Warning:**
A drive that is moved by simulating the inputs of a Terminal Board is brought to a standstill while the Terminal Module is being activated or de-activated.

**Note:**
This parameter is not saved when data is backed-up (p0971, p0977).
DI: Digital Input

### p4095 TM31 digital inputs, simulation mode / TM31 DI sim_mode

**TM31**

- **Can be changed:** U, T
- **Data type:** Unsigned32
- **P-Group:** Terminals
- **Not for motor type:** -
- **Min:** -
- **Max:** -

**Description:**
Sets the simulation mode for the digital inputs of Terminal Module 31 (TM31).

**AI: Analog Input**

**Description:**
Sets the setpoint for the input value in simulation mode of the analog inputs of Terminal Module 31 (TM31).

**Index:**

- \[0\] = AI 0 (X521.1/X521.2, S5.0)
- \[1\] = AI 1 (X521.3/X521.4, S5.1)

**Dependency:**
The simulation of an analog input is selected using p4097.

If AI x is parameterized as voltage input (p4056), then the setpoint is a voltage in V.
If AI x is parameterized as current input (p4056), then the setpoint is a current in mA.

Refer to: r4056, p4056, p4097

**Note:**
This parameter is not saved when data is backed-up (p0971, p0977).

**AI: Analog Input**

**Description:**
Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).

**Index:**

- \[0\] = Digital inputs/outputs (DI/DO)
- \[1\] = Analog inputs (AI)
- \[2\] = Analog outputs (AO)

**Dependency:**
The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111).

Refer to: p0009, r0110, r0111

**Note:**
The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).
For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. A/D converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is powered down. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

**AI: Analog Input**

**Description:**
Sets the sampling time for the inputs and outputs of Terminal Module 31 (TM31).

**Index:**

- \[0\] = Digital inputs/outputs (DI/DO)
- \[1\] = Analog inputs (AI)
- \[2\] = Analog outputs (AO)
Dependency: The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the DRIVE-CLiQ clock cycle.
The minimum permissible sampling time is 125µs.
Refer to: p0009, r0110, r0111

Notice: The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).

Note: The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). Parameter p4099[0] must never be equal to zero.

### p4100[0...11] TM150 sensor type / TM150 sensor type

Description: Sets the sensor type for Terminal Module 150 (TM150)

This means that the temperature sensor type is selected and the evaluation is switched in.

Value: 0: Evaluation disabled
1: PTC thermistor
2: KTY84
4: Bimetallic NC contact
5: PT100
6: PT1000

Index: [0] = Temperature channel 0
[1] = Temperature channel 1
[2] = Temperature channel 2
[3] = Temperature channel 3
[4] = Temperature channel 4
[5] = Temperature channel 5
[6] = Temperature channel 6
[7] = Temperature channel 7
[8] = Temperature channel 8
[9] = Temperature channel 9
[10] = Temperature channel 10

Notice: For p4102[0...23] = 251 °C, evaluation of the corresponding threshold is deactivated.
For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:
To activate the corresponding alarm or fault, p4102[0...23] must be set <= 250 °C.

Note: The temperature sensors are connected to the following terminals:
X531 = channel 0 (for 2x2 conductor evaluation, additionally channel 6)
X532 = channel 1 (for 2x2 conductor evaluation, additionally channel 7)
X533 = channel 2 (for 2x2 conductor evaluation, additionally channel 8)
X534 = channel 3 (for 2x2 conductor evaluation, additionally channel 9)
X535 = channel 4 (for 2x2 conductor evaluation, additionally channel 10)
X536 = channel 5 (for 2x2 conductor evaluation, additionally channel 11)
Details on the wiring are included in the parameter description for p4108.

Description: Sets the sensor type for Terminal Module 31 (TM31)
### Parameters

#### List of parameters

This means that the temperature sensor type is selected and the evaluation is switched in.

**Value:**
- 0: Evaluation disabled
- 1: PTC thermistor
- 2: KTY84

**Notice:**
For p4102[0...1] = 251 °C, evaluation of the corresponding threshold is deactivated.

For sensor type "PTC thermistor" (p4100 = 1), the following applies:
To activate the corresponding alarm or fault, p4102[0...1] must be set <= 250 °C.

**Note:**
The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

---

### r4101[0...11]

**TM150 sensor resistance / TM150 R_sensor**

<table>
<thead>
<tr>
<th>TM150</th>
</tr>
</thead>
</table>

- **Can be changed:** -
- **Calculated:** -
- **Access level:** 3

- **Data type:** FloatingPoint32
- **Dynamic index:** -
- **Func. diagram:** 9626, 9627

- **P-Group:** Terminals
- **Units group:** -
- **Unit selection:** -

- **Not for motor type:** -
- **Scaling:** PERCENT
- **Expert list:** 1

- **Min** - [ohm]
- **Max** - [ohm]
- **Factory setting** - [ohm]

**Description:**
Displays the actual resistance value of the temperature sensor connected at the Terminal Module.

**Index:**
- [0] = Temperature channel 0
- [1] = Temperature channel 1
- [2] = Temperature channel 2
- [3] = Temperature channel 3
- [4] = Temperature channel 4
- [5] = Temperature channel 5
- [6] = Temperature channel 6
- [7] = Temperature channel 7
- [8] = Temperature channel 8
- [9] = Temperature channel 9
- [10] = Temperature channel 10

**Note:**
The maximum measurable resistance value is approx. 2500 Ohm.

For 1x2 and 2x2 conductor evaluation:

The actual sensor resistance is displayed in this parameter (i.e. the cable resistance (p4110) is taken into account).

The temperature sensors are connected to the following terminals:
- X531 = channel 0 (for 2x2 conductor evaluation, additionally channel 6)
- X532 = channel 1 (for 2x2 conductor evaluation, additionally channel 7)
- X533 = channel 2 (for 2x2 conductor evaluation, additionally channel 8)
- X534 = channel 3 (for 2x2 conductor evaluation, additionally channel 9)
- X535 = channel 4 (for 2x2 conductor evaluation, additionally channel 10)
- X536 = channel 5 (for 2x2 conductor evaluation, additionally channel 11)

Details on the wiring are included in the parameter description for p4108.

---

### r4101

**TM31 sensor resistance / TM31 R_sensor**

<table>
<thead>
<tr>
<th>TM31</th>
</tr>
</thead>
</table>

- **Can be changed:** -
- **Calculated:** -
- **Access level:** 3

- **Min** - [ohm]
- **Max** - [ohm]
- **Factory setting** - [ohm]

**Description:**
Displays the actual resistance value of the temperature sensor connected at the Terminal Module.

**Note:**
The maximum measurable resistance value is approx. 2170 Ohm.

The temperature sensor is connected at terminals X522.7(+) and X522.8(-).
**Description:**
Sets the fault threshold/alarm threshold for Terminal Module 150 (TM150).

For alarms (even indices [0, 2, 4 ... 22]), the following applies:
- The corresponding alarm is initiated, if the temperature actual value associated with a temperature channel exceeds the associated alarm threshold (r4105[x] > p4102[2x]). In addition, the timer is started (p4103[x]).
- The alarm remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x] - hysteresis (p4118[x]).

For faults (uneven indices [1, 3, 5 ... 23]), the following applies:
- The corresponding fault is initiated, if the temperature actual value associated with a temperature channel exceeds the associated fault threshold (r4105[x] > p4102[2x+1] or the associated timer (p4103[x]) has expired.
- The fault remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x+1] - hysteresis (p4118[x])) and the fault has been acknowledged.

**Index:**
- **[0]** = Channel 0 alarm threshold (A35211)
- **[1]** = Channel 0 fault threshold (F35207)
- **[2]** = Channel 1 alarm threshold (A35212)
- **[3]** = Channel 1 fault threshold (F35208)
- **[4]** = Channel 2 alarm threshold (A35213)
- **[5]** = Channel 2 fault threshold (F35209)
- **[6]** = Channel 3 alarm threshold (A35214)
- **[7]** = Channel 3 fault threshold (F35210)
- **[8]** = Channel 4 alarm threshold (A35410)
- **[9]** = Channel 4 fault threshold (F35400)
- **[10]** = Channel 5 alarm threshold (A35411)

- **[14]** = Channel 7 alarm threshold (A35413)
- **[15]** = Channel 7 fault threshold (F35403)
- **[16]** = Channel 8 alarm threshold (A35414)
- **[17]** = Channel 8 fault threshold (F35404)
- **[18]** = Channel 9 alarm threshold (A35415)
- **[19]** = Channel 9 fault threshold (F35405)
- **[20]** = Channel 10 alarm threshold (A35416)
- **[21]** = Channel 10 fault threshold (F35406)
- **[22]** = Channel 11 alarm threshold (A35417)
- **[23]** = Channel 11 fault threshold (F35407)

**Dependency:**
Refer to: p4103, r4104, r4105, p4118

**Caution:**
Faults F35207 ... F35210 and F35400 ... F35407 only result in the drive being shut down if at least one BICO interconnection exists between the drive and the TM150.

For p4102[0...23] = 251 °C, evaluation of the corresponding threshold is deactivated.

For sensor type "PTC thermistor" (p4100[0...11] = 1), the following applies:
To activate the corresponding alarm or fault, p4102[0...23] must be set <= 250 °C.

**Note:**
The hysteresis can be set in p4118[0...11].

**Index:**
- [0] = Alarm threshold
- [1] = Fault threshold

**Dependency:**
Refer to: r4104

**Caution:**
- Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.
- For p4102[0...1] = 251 °C, evaluation of the corresponding threshold is deactivated.
- For sensor type "PTC thermistor" (p4100 = 1), the following applies:
  - To activate the alarm or fault, p4102[0...1] must be set <= 250 °C.

**Description:**
Sets the fault threshold/alarm threshold for Terminal Module 31 (TM31).

A35211 is initiated, if the temperature actual value r4105[0] > p4102[0]
F35207 is initiated if the temperature actual value r4105[0] > p4102[1] or timer p4103[0] has expired

For alarm A35211 the following applies:
- Remains until the temperature actual value (r4105) reaches or falls below the value (p4102[0] - hysteresis).

For fault F35207 the following applies:
- Remains until the temperature actual value (r4105) reaches or falls below the value (p4102[1] - hysteresis) and the fault has been acknowledged.
- The hysteresis value is 5 K and cannot be changed by the user.

**p4103[0...11]  TM150 delay time / TM150 t_delay**

- [5] = Temperature channel 5
- [6] = Temperature channel 6
- [7] = Temperature channel 7
- [8] = Temperature channel 8
- [9] = Temperature channel 9

**Description:**
Sets the delay time for the output of the fault for the Terminal Module 150 (TM150).

The timer is started when the alarm threshold (e.g. p4102[0]) is exceeded.

If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then the corresponding fault is output.

The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.

For sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:
- If the fault threshold (e.g. p4102[1]) is exceeded before the delay time has expired, then the corresponding fault is immediately output.

For sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:
- Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.
[10] = Temperature channel 10

Dependency:
Refer to: p4102, r4104, r4105, p4118

Warning:
The fault F35207 ... F35210 and F35400 ... 35407 only results in the drive being shut down if at least one BICO interconnection exists between the drive and the TM150.

Note:
For p4103 = 0 s and sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:
- The corresponding fault can only be initiated via the fault threshold (output of the timer is always a logical 0).
For p4103 = 0 s and sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:
- The corresponding alarm and fault are simultaneously output (delay time = 0 s).

**p4103**

**TM31 temperature evaluation delay time / TM31 temp t_delay**

| Data type: | FloatingPoint32 |
| P-Group: | Motor |
| Not for motor type: | - |
| Min | 0.000 [ms] |
| Max | 600000.000 [ms] |

**Description:**
Sets the delay time for the output of the fault for the Terminal Module 31 (TM31).
The timer is started when the alarm threshold (p4102[0]) is exceeded.
If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F35207 is output.
The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.
For sensor type "KTY84" (p4100 = 2), the following applies:
If the fault threshold (p4102[1]) is exceeded before the delay time has expired, then fault F35207 is immediately output.
For sensor type "PTC thermistor" (p4100 = 1), the following applies:
- Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

**Dependency:**
Refer to: r4104

**Warning:**
Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

**Note:**
With p4103 = 0 ms, the timer is de-activated and only the fault threshold is effective.

**Description:** Sets the measuring method for the terminal block X531 ... X536 for the Terminal Module 150 (TM150).

Re \( p4108[0...5] = 0 \) (1x2 wire evaluation):
- the temperature sensor is connected at terminals 1(+) and 2(-).

Re \( p4108[0...5] = 1 \) (2x2 wire evaluation):
- The first temperature sensor is connected at terminals 1(+) and 2(-).
- The second temperature sensor is connected at terminals 3(+) and 4(-).

Re \( p4108[0...5] = 2 \) (3 wire evaluation):
- the temperature sensor is connected at terminals 3(+) and 4(-).
- the measuring conductor is connected at terminal 1(+) and 4(-).
- terminals 2(-) and 4(-) must be jumpered.

Re \( p4108[0...5] = 3 \) (4 wire evaluation):
- the temperature sensor is connected at terminals 3(+) and 4(-).
- the measuring conductor is connected at terminals 1(+) and 2(-).

**Value:**
- 0: 1x2 conductor evaluation
- 1: 2x2 conductor evaluation
- 2: 3 conductor evaluation
- 3: 4 conductor evaluation

**Index:**
- [0] = X531
- [1] = X532
- [2] = X533
- [3] = X534
The temperature sensors are connected to the following terminals:

X531 = channel 0 (for 2×2 conductor evaluation, additionally channel 6)
X532 = channel 1 (for 2×2 conductor evaluation, additionally channel 7)
X533 = channel 2 (for 2×2 conductor evaluation, additionally channel 8)
X534 = channel 3 (for 2×2 conductor evaluation, additionally channel 9)
X535 = channel 4 (for 2×2 conductor evaluation, additionally channel 10)
X536 = channel 5 (for 2×2 conductor evaluation, additionally channel 11)

Re p4108[0...5] = 0, 2, 3 (1×2, 3, 4 wire evaluation):
The temperature channel belonging to the terminal block with the higher number is automatically deactivated (e.g. for X531 with 3-wire evaluation, channel 6 is deactivated).

**Description:**
Setting to start the measurement of the conductor resistance for a channel for the Terminal Module 150 (TM150).

For a 2 conductor evaluation, the total conductor resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured cable resistance.

**Procedure:**
1. Select the measuring method (1×2/2×2) for the corresponding terminal block (p4108[0...5] = 0, 1).
2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).
3. Jumper the sensor to be connected (short-circuit the sensor conductor close to the sensor).
4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).
5. For the corresponding channel, start the measurement of the conductor resistance (p4109[x] = 1).
6. After p4109[x] = 0, check the measured resistance value in p4110[x].
7. Remove the jumper across the temperature sensor.

**Value:**
0: Inactive
1: Start

**Index:**

0 = Temperature channel 0
1 = Temperature channel 1
2 = Temperature channel 2
3 = Temperature channel 3
4 = Temperature channel 4
5 = Temperature channel 5
6 = Temperature channel 6
7 = Temperature channel 7
8 = Temperature channel 8
9 = Temperature channel 9
10 = Temperature channel 10
11 = Temperature channel 11

**Dependency:**
Refer to: p4100, p4108, p4110

**Notice:**
Conductor resistance measurement is only possible for 1x2 or 2x2 conductor evaluation (p4108[0...5] = 0, 1).

**Note:**
The conductor resistance value can be also directly entered into p4110[0...11].

The automatic conductor calibration for 1x2 and 2x2 conductor evaluation is always performed with the value in p4110[0...11].
**Description:**
Sets and displays the cable resistance for Terminal Module 150 (TM150).
The value is used for the automatic cable calibration.
The value is automatically set by starting the conductor resistance measurement (p4109[0...11]) of the corresponding channel.

**Index:**
- [0] = Temperature channel 0
- [1] = Temperature channel 1
- [2] = Temperature channel 2
- [3] = Temperature channel 3
- [4] = Temperature channel 4
- [5] = Temperature channel 5
- [6] = Temperature channel 6
- [7] = Temperature channel 7
- [8] = Temperature channel 8
- [9] = Temperature channel 9
- [10] = Temperature channel 10

**Dependency:**
Refer to: p4109

**Notice:**
Conductor resistance measurement is only possible for 1x2 or 2x2 conductor evaluation (p4108[0...5] = 0, 1).

**Note:**
Automatic conductor calibration is deactivated using p4110[0...11] = 0.

---

[9] = Temperature channel 9
[10] = Temperature channel 10

Dependency: Refer to: p4102, p4103, r4104, r4105

Note: The following applies for a corresponding alarm:
- Remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x] - hysteresis (p4118[x])).
The following applies for a corresponding fault:
- Remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x+1]) - hysteresis (p4118[x]) and the fault has been acknowledged.

**p4119[0...11]**

**TM150 activate/deactivate smoothing / TM150 smooth act**

**TM150**

Can be changed: T

Data type: Integer16

P-Group: -

Not for motor type: -

Min

Value: 0: Filter deactivated
1: Filter activated

Description: Setting to activate/deactivate the filter to smooth the temperature signal for the Terminal Module 150 (TM150).

The smoothing is realized with a 1st order lowpass filter.

The effective smoothing time constant depends on the number of channels that are simultaneously active and is displayed in r4120.

Index:

[0] = Temperature channel 0
[1] = Temperature channel 1
[2] = Temperature channel 2
[3] = Temperature channel 3
[4] = Temperature channel 4
[5] = Temperature channel 5
[6] = Temperature channel 6
[7] = Temperature channel 7
[8] = Temperature channel 8
[9] = Temperature channel 9
[10] = Temperature channel 10

Dependency: Refer to: r4120

**r4120**

**TM150 temperature filter time constant / TM150 temp_filt T**

**TM150**

Can be changed: -

Data type: Unsigned16

P-Group: -

Not for motor type: -

Min

Value: 0...11

Description: Displays the smoothing time constant for the temperature filter for Terminal Module 150 (TM150).

Dependency: Refer to: r4105, p4111, r4112, r4113

Note: The time constant lies in the range from 80 to 1000 ms and depends on the number of channels that are simultaneously active.

| Min | Max | Factory setting |
| 0 | 32 | 10 |

**Description:** Sets the sensor type of the third temperature sensor for the motor temperature monitoring.
Value:  
0: No sensor  
10: PTC fault  
11: PTC alarm  
12: PTC alarm & timer  
20: KTY84, PT100, PT1000  
30: Bimetallic NC contact fault  
31: Bimetallic NC contact alarm  
32: Bimetallic NC contact alarm & timer  

Dependency:  Refer to: r0458, p0600, p0601  
Note:  This parameter is effective only when p0601 = 11.  
PTC thermistor: Tripping resistance = 1650 Ohm  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual

**p4613[0...n]**  
**Motor temperature sensor 4 sensor type MDS / Temp sens4 typ MDS**

| Description | Sets the sensor type of the fourth temperature sensor for the motor temperature monitoring.  
| Value | 0: No sensor  
10: PTC fault  
11: PTC alarm  
12: PTC alarm & timer  
20: KTY84, PT100, PT1000  
30: Bimetallic NC contact fault  
31: Bimetallic NC contact alarm  
32: Bimetallic NC contact alarm & timer  
| Dependency | Refer to: r0458, p0600, p0601  
Note:  This parameter is effective only when p0601 = 11.  
PTC thermistor: Tripping resistance = 1650 Ohm  
Information on using temperature sensors is provided in the following literature:  
- hardware description of the appropriate components  
- SINAMICS S120 Commissioning Manual

**r4620[0...3]**  
**Motor temperature measured / Mot_temp meas**

| Description | Displays the actual temperature in the motor measured through temperature channels 1 ... 4.  
| Index | [0] = Temperature channel 1  
[1] = Temperature channel 2  
[2] = Temperature channel 3  
[3] = Temperature channel 4  
| Note:  For a value not equal to -200.0 °C, the following applies:  
- this temperature display is valid.  
- a KTY sensor is connected.  
For a value equal to -200.0 °C, the following applies:  
- this temperature display is not valid (temperature sensor error).  
- A PTC sensor or bimetallic NC contact is connected.  

- the temperature sensor evaluation is de-activated (p0600 = 0 or p0601 = 0).
- the sensor channel is de-activated (p460x = 0 or p461x = 0).

### r4640[0...95] Encoder diagnostics state machine / Enc diag stat_ma

**ENC, VECTOR_G**

- **Can be changed:** Not for motor type: 
  - Calculated: -
  - Access level: 4

- **Data type:** Unsigned32
- **P-Group:** Encoder
- **Not for motor type:**
  - Scaling: -
  - Expert list: 1

**Min**
- **Max**

**Description:** Displays the encoder diagnostics for the PROFIdrive interface.

### p4650 Encoder functional reserve component number / Enc fct_res num

**CU_G130_DP,**
**CU_G130_PN,**
**CU_G150_DP,**
**CU_G150_PN**

- **Can be changed:** U, T
- **Data type:** Unsigned16
- **P-Group:** Displays, signals
- **Not for motor type:**
  - Min 0
  - Max 399

**Description:** Sets the component number (p0141) of the encoder whose functional reserve is to be displayed (r4651).

**Dependency:** Refer to: r4651

### r4651[0...3] Encoder functional reserve / Enc fct_reserve

**CU_G130_DP,**
**CU_G130_PN,**
**CU_G150_DP,**
**CU_G150_PN**

- **Can be changed:** U, T
- **Data type:** FloatingPoint32
- **P-Group:** Displays, signals
- **Not for motor type:**
  - Min - [%]
  - Max - [%]

**Description:** Displays the functional reserve of the encoder selected via p4650.  
0 ... 25 %: The function limit has been reached. A service is recommended.  
26 ... 100 %: The encoder is working in the specified range.

**Index:**
- [0] = Incremental
- [1] = Reserved
- [2] = Abs track
- [3] = Code conn

**Dependency:** Refer to: p4650

**Note:** Value = 999 means:  
- the component specified in p4650 is not connected  
- the encoder does not support the display of the functional reserve

### p4652 XIST1_ERW reset mode / XIST1_ERW res mode

**ENC**

- **Can be changed:** C1(3)
- **Data type:** Integer16
- **P-Group:**
  - Scaling: -
  - Expert list: 1

**Min**
- **Max**

0.00 [kHz] 20000.00 [kHz] 0.00 [kHz]

Description: Sets the filter bandwidth for Sensor Module SMx10 (resolver) and SMx20 (sin/cos).
The value set on the Sensor Module is displayed in r4661.
The Sensor Module hardware only supports the following values:
- 0: The Sensor Module's default is used.
- 50 kHz
- 170 kHz
- 500 kHz
- Unlimited: Only the bandwidth of the operational amplifier is effective.

Dependency: Refer to: r4661
Note: A value of zero is displayed if an encoder is not present.

<tr>
<td>Data type: Integer16</td>
</tr>
<tr>
<td>P-Group: Encoder</td>
</tr>
<tr>
<td>Not for motor type: -</td>
</tr>
<tr>
<td>Min</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the characteristic type.

For non-linear sensors, the interrelationship between the signal voltage and the position can be defined using a third degree polynomial.

**Value:**
- 0: Characteristic inactive
- 1: Characteristic polynomial third degree

**Dependency:**
Refer to: p4663, p4664, p4665, p4666

**Note:**
If value = 1:
A third degree polynomial is defined as follows:
\[ F(x) = K3 \cdot x^3 + K2 \cdot x^2 + K1 \cdot x + K0 \]
Coefficients K0 ... K3 should be defined and entered into p4663 ... p4666.
The sensor range is emulated to \( x = -0.5 \) ... +0.5.

---

#### p4663[0...n]
**Encoder characteristic K0 / Enc char K0**

<td>Analog sensor configuration / Ana_sens config</td>
<td>Sets the configuration for evaluation on the analog sensor.</td>
</tr>
</tbody>
</table>

#### Notice:
- Re bit 06: Setting the bit sets the velocity actual value (r0061) permanently to 0.
- Re bit 13: Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).
### Note:

Re bit 09:
A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.
A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.
Re bit 10, 11:
If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated.
Re bit 14:
The bit is only evaluated for encoder 1. No effect for encoder 2 and encoder 3.

### p4671 [0...n]
**Analog sensor input / Ana_sens inp**

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed:</th>

</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>0</td>
<td>Factory setting</td>
<td>3</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:**
Sets the input circuit for the analog sensor.

**Value:**
- 0: Differential
- 1: Single-ended A, B
- 2: Single-ended A*, B*
- 3: Single-ended A, B sensitive

**Note:**
p4671 = 0: The two signals on a track are evaluated differentially.
p4671 = 1: Only the non-inverted signal on a track is evaluated.
p4671 = 2: Only the inverted signal on a track is evaluated.
p4671 = 3: Only the non-inverted signal on a track (high resolution) is evaluated.

### p4672 [0...n]
**Analog sensor channel A voltage at actual value zero / Ana_sens A U at 0**

<table>
<thead>
<tr>

<td>-10.0000 [V]</td>
<td>10.0000 [V]</td>
<td>6.0000 [V]</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the output voltage range to be mapped for the connected analog sensor.
The voltage range is determined by the following parameters:
- p4672 (voltage at actual value 0)
- p4673 (voltage per encoder period)

**Note:**
The minimum actual value which can be mapped is equal to p4672 - p4673/2.
The maximum actual value which can be mapped is equal to p4672 + p4673/2.
**Parameters**

**List of parameters**

<table>
<thead>

<tr>
<td>p4681[0...n]</td>
<td>Zero mark monitoring, tolerance window limit 1 positive / ZM tol lim 1 pos</td>
<td>Can be changed: C2(4)</td>
<td>0 1000 2</td>
</tr>
</tbody>
</table>

**Description:**
- Sets the ratio for the LVDT sensor.
- Sets the phase for the LVDT sensor.
- Sets the permissible tolerance in encoder pulses for the zero mark distance in the context of zero mark monitoring.
- Causes fault F3x100 to appear less frequently.
- The parameter is activated using p0430.21 = 1 (zero mark tolerance).
- Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring.

**Dependency:**
- Refer to: p0430
- Refer to: F31100
- Refer to: p4688
- Refer to: F31131

**Note:**
- The parameter is activated using p0430.21 = 1 (zero mark tolerance).
- The positive limit describes additional pulses due to EMC.
**p4682[0...n]**  
Zero mark monitoring, tolerance window limit 1 negative / ZM tol lim 1 neg

**Description:**
Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.

**Dependency:**
Refer to: p0437, p4681, p4688  
Refer to: F31131

**Note:**
This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

**p4683[0...n]**  
Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos

**Description:**
Sets the positive tolerance window in encoder pulses for limit 2 for the zero mark monitoring. If the zero mark deviation is higher than the tolerance set in p4681 and p4682 and fault F3x131 is re-parameterized to alarm (A) or no message (N), the accumulator p4688 is compared with this parameter and, if applicable, alarm A3x422 is output for 5 seconds.

**Dependency:**
Refer to: p0437, p4681, p4682, p4688  
Refer to: F31131, A31422

**Note:**
Zero mark monitoring is activated by setting p0437.2 = 1 (position actual value correction).

**p4684[0...n]**  
Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg

**Description:**
Sets the negative tolerance window in encoder pulses for limit 2 for the zero mark monitoring. If the zero mark deviation is higher than the tolerance set in p4681 and p4682 and fault F3x131 is re-parameterized to alarm (A) or no message (N), the accumulator p4688 is compared with this parameter and, if applicable, alarm A3x422 is output for 5 seconds.

**Dependency:**
Refer to: p0437, p4683, p4688  
Refer to: F31131, A31422

**Note:**
Zero mark monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -100001, the negated value of p4683 is effective.
### p4685[0...n]
#### Speed actual value mean value generation / n_act mean val

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: C2(4)</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Min</td>
<td>Max</td>
<td>Factory setting:</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>20</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Description:** Sets the number of current controller clock cycles for mean value generation of the speed actual value.

**Note:**
- Value = 0, 1: No mean value generation.
- Higher values also mean higher dead times for the speed actual value.

### p4686[0...n]
#### Zero mark minimum length / ZM min length

<table>
<thead>
<tr>
<th>ENC, VECTOR_G</th>
<th>Can be changed: C2(4)</th>
<th>Calculated: -</th>
<th>Access level: 3</th>
</tr>
</thead>

**Description:**
Setting for the saving/downloading/deletion of motor and/or encoder data for the component specified in p4690 (SMI/DQI).

A backup of this data can be saved to non-volatile memory. The backup procedure is performed automatically as part of the function for saving to non-volatile memory (p0977 = 1 or "Copy RAM to ROM"). If a part is replaced, the saved data can be reloaded.
Parameters

List of parameters

Procedure:
p4690 = set component number
p4691 = 1, 2, 30: Set the required procedure (save/download/delete).
p4691 = 9, 10, 36: Feedback signal on successful completion of the procedure.
p4691 = 11… 22, 37, 38: Error values if the procedure could not be executed successfully.

Value:
0: Inactive
1: Save SMI data
2: Download SMI data
9: SMI data downloaded and POWER ON required for component
10: SMI data backup complete
11: SMI data backup for selected component not found
12: Selected component not available or not connected
13: Insufficient memory space for backup
14: Format of saved data is incompatible
15: Transfer fault during data download
16: Transfer fault during data backup
17: Data backup does not match parameterized encoder/motor
18: Data backup directory not permissible
19: Component already contains data
20: Component does not contain any data
21: Component is not an SMI or a DQI
22: SMI data cannot be downloaded for component
30: Delete SMI data
35: Confirmation of SMI data delete required
36: SMI data deleted and POWER ON required for component
37: Access level not sufficient for delete
38: Delete SMI data not permitted for component
39: SMI data for component cannot be deleted

Dependency:
Refer to: p4690, p4692, p4693

Notice:
Once SMI/DQI data has been deleted or downloaded successfully, the component has to be powered up.

Note:
SMI: SINAMICS Sensor Module Integrated
DQI: DRIVE-CLiQ Sensor Integrated

Help for error value = 11:
- Save the data for the original SMI on the memory card.
- Use an SMI with a suitable hardware version.

Help for error value = 12:
- Set the correct component number or connect the component.

Help for error value = 13:
- Use a memory card with more memory space.

Help for error value = 14:
- Create a data backup on the memory card corresponding to the SMI type.

Help for error value = 15:
- Check the DRIVE-CLiQ wiring for the component.

Help for error value = 16:
- Check the DRIVE-CLiQ wiring for the component.

Help for error value = 17:
- Save the data for the original SMI on the memory card.

Help for error value = 18:
- Set parameter p4693 to an appropriate value.

Help for error value = 19:
- Perform an SMI delete or use a blank SMI.

Help for error value = 20:
- Use an SMI that is not blank.

Help for error value = 21:
- Set the correct component number (p4690).

Note for error value = 22:
- Data cannot be downloaded for component.

<tr>
<td><strong>Description:</strong> Sets the directory for downloading and saving data.&lt;br&gt;Example:&lt;br&gt;The SMI has the component number 5 and the SMI data (motor/encoder data) is to be stored in subdirectory C205.&lt;br&gt;--&gt; p4690 = 5, p4693[0] = 205, p4691 = 1</td>
<td></td>
</tr>
<tr>
<td><strong>Index:</strong>&lt;br&gt;[0] = Subdirectory selection&lt;br&gt;[1] = Reserved</td>
<td></td>
</tr>
<tr>
<td><strong>Dependency:</strong> Refer to: p4691, r4694</td>
<td></td>
</tr>
</tbody>
</table>
**Notice:**
If p4693[0] is not equal to 0 and p4693[0] is not equal to p4690, the following applies:
- Only a number >= 200 may be selected for the subdirectory when saving.
- In the case of downloads, a selection for the subdirectory may only be made for an SMI/DQI with a component number >= 200 (preliminary component number) (p4690 >= 200).

**Note:**
DQI: DRIVE-CLiQ Sensor Integrated
SMI: SINAMICS Sensor Module Integrated
Re index 0:
This index is used to select the subdirectory for saving and downloading data. The motor order number (MLFB) of the corresponding data backup is displayed in r4694.
For p4693[0] = 0, the following applies:
The directory is determined by the setting of p4690.

<table>
<thead>
<tr>
<th>r4694[0...19]</th>
<th>SMI spare part data backup motor order number / SMI dat_bkup MLFB</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Can be changed: - Calculated: - Access level: 3</td>
</tr>
<tr>
<td>CU_G130_DP,</td>

</tr>
<tr>
<td>CU_G150_PN,</td>
<td>Factory setting</td>
</tr>
<tr>
<td>P-Group:</td>
<td>Displays, signals</td>
</tr>
<tr>
<td>Not for motor type: -</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Max</td>
</tr>
<tr>
<td></td>
<td>-</td>
</tr>
</tbody>
</table>

**Description:**
Displays the motor order number (MLFB) of the data backup selected with p4693.

**Dependency:**
Refer to: p4691, p4692

**Caution:**
If the selected subdirectory contains a number of data sets, "More Datasets" is displayed in r4694[0...19].
If there is no SMI data (motor/encoder data) in the selected subdirectory or if the selected subdirectory does not exist, the following applies:
- The number of the next subdirectory located is displayed.
- This subdirectory is not checked for valid SMI data.
- If another subdirectory cannot be located, nothing is displayed in r4694[0...19].

**Note:**
SMI: SINAMICS Sensor Module Integrated

For value = 0:

The system injection point selected to inject the function generator signal is used.

For value = 1:

No system injection point is used.

When using the measuring function in the STARTER commissioning software, the following applies:

A change to a value only becomes effective after first closing and opening the measuring function screen form.

For value = 0:

The master control must be fetched.

There are two fixed and two freely selectable signals for recording.

For value = 1:

Master control does not have to be fetched.

There are four freely selectable signals for recording.

### Parameters

**List of parameters**

1. **Dependency:**
   - Only effective when p4710 does not equal 1.

2. **Note:**
   - It only makes sense to trace the PINs using the commissioning software.
   - For index 2(4) and 3(5) equal to zero, index 0(1) can only be written and vice versa.
   - Re index 0 ... 1:
     - The triggering PIN for trace 0 or 1 is entered as parameter in the BICO format.
   - Re index 2 ... 3:
     - Here, the trigger signal for trace 0 or 1 is entered as parameter in the BICO format.
     - For trace with a physical address (p4789), the data type of the trigger signal is set here.
   - Re index 4 ... 5:
     - The triggering PIN for trace 1 is entered here.

</tr>
<tr>
<td>[0] = Trace 0</td>
<td>0.000 [ms]</td>
</tr>
<tr>
<td>[1] = Trace 1</td>
<td></td>
</tr>
</tbody>
</table>

**Description:**
Sets the trigger delay for the trace.

- Trigger delay < 0:
  - Pretrigger: Tracing (recording) starts the selected time before the trigger event actually occurs.

- Trigger delay > 0:
  - Post trigger: Tracing does not start until the set time after the trigger event.

<table>

| CU_G150_DP, | | | | | | | | | | |
| CU_G150_PN | | | | | | | | | | |
| **Description:** | Displays the trace buffer (record buffer) for trace 0 and signal 0. | | | | | | | | | |
| | The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. | | | | | | | | | |
| | Example A: | | | | | | | | | |
| | The first 16384 values of signal 0, trace 0 are to be read out. | | | | | | | | | |
| | In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. | | | | | | | | | |
| | Example B: | | | | | | | | | |
| | The values 16385 to 32768 from signal 0, trace 0 are to be read out. | | | | | | | | | |
| | In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383]. | | | | | | | | | |
| **Dependency:** | Refer to: p4795 | | | | | | | | | |

**Dependency:** Refer to: r4740, p4795
### Description:
Displays the trace buffer (record buffer) for trace 0 and signal 0 as integer number.

### Note:
For signals, data type I32 or U32, the trace buffer is assigned as follows:

- \( r_{4760}[0] = \text{value 0} \)
- \( r_{4760}[1] = \text{value 1} \)
- ... 
- \( r_{4760}[8191] = \text{value 8191} \)

For signals, data type I16 or U16, the trace buffer is assigned as follows:

- \( r_{4760}[0] = \text{value 0 (bit 31 ... 16) and value 1 (bit 15 ... 0)} \)
- \( r_{4760}[1] = \text{value 2 (bit 31 ... 16) and value 3 (bit 15 ... 0)} \)
- ... 
- \( r_{4760}[8191] = \text{value 16382 (bit 31 ... 16) and value 16383 (bit 15 ... 0)} \)

For signals, data type I8 or U8, the trace buffer is assigned as follows:

- \( r_{4760}[0] = \text{value 0 (bit 31 ... 24) value 1 (bit 23 ... 16) value 2 (bit 15 ... 8) value 3 (bit 7 ... 0)} \)
- \( r_{4760}[1] = \text{value 4 (bit 31 ... 24) value 5 (bit 23 ... 16) value 6 (bit 15 ... 8) value 7 (bit 7 ... 0)} \)
- ... 
- \( r_{4760}[8191] = \text{value 32764 (bit 31 ... 24) value 32765 (bit 23 ... 16) value 32766 (bit 15 ... 8) value 32767 (bit 7 ... 0)} \)

</tr>
</tbody>
</table>

**Description:** Displays the free memory for the trace in bytes.

**Dependency:**
Refer to: r4708
p4800 Function generator control / FG control

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Data type:** Integer16
- **P-Group:** Trace and function generator
- **Not for motor type:** -
- **Min**
- **Max**
- **Description:** The function generator is started with p4800 = 1. The signal is only generated for a 1 signal of binector input p4819.
- **Value:**
  - 0: Stop function generator
  - 1: Start function generator
  - 2: Check function generator parameterization
  - 3: Start function generator without enable signals
- **Dependency:** Refer to: p4819

---

r4805 Function generator status / FG status

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Data type:** Integer16
- **P-Group:** Trace and function generator
- **Not for motor type:** -
- **Min**
- **Max**
- **Description:** Displays the actual status of the function generator.
- **Value:**
  - 0: Inactive
  - 1: Generate accelerating ramp to offset
  - 2: Generate parameterized signal shape
  - 3: Generate braking ramp
  - 4: Function generator stopped due to missing enable signals
  - 5: Function generator waits for BI: p4819
  - 6: Function generator parameterization has been checked
- **Dependency:** Refer to: p4800, p4819

---

r4806.0 BO: Function generator status signal / FG status signal

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Data type:** Unsigned32
- **P-Group:** Trace and function generator
- **Not for motor type:** -
- **Min**
- **Max**
- **Description:** Displays the status of the function generator.
- **Bit field:**
  - Bit 0: Signal name
  - 00: OFF
  - 01: ON
- **Dependency:**
  - 0 signal: Function generator inactive
  - 1 signal: Function generator running

---

p4810 Function generator mode / FG operating mode

- **CU_G130_DP, CU_G130_PN, CU_G150_DP, CU_G150_PN**
- **Data type:** Integer16
- **P-Group:** Trace and function generator
- **Not for motor type:** -
- **Min**
- **Max**
- **Description:** Sets the operating mode of the function generator.

<th>Dynamic index</th>
<th>Func. diagram</th>
<th>Units group</th>
<th>Unit selection</th>
<th>Expert list</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>p4828</td>
<td>Sets the lower limit for the function generator.</td>
<td>For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).</td>
<td>3</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>-100.00 [%]</td>
</tr>
</tbody>
</table>
### Parameters

#### List of parameters

---

**p4829 Function generator upper limit / FG upper limit**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p4829</td>
<td>Function generator upper limit / FG upper limit</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

Data type: FloatingPoint32
- P-Group: Trace and function generator
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 0

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00 [%]</td>
<td>10000.00 [%]</td>
<td>100.00 [%]</td>
</tr>
</tbody>
</table>

Description: Sets the upper limit for the function generator.
Dependency: For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).

---

**p4830 Function generator time slice cycle / FG time slice**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p4830</td>
<td>Function generator time slice cycle / FG time slice</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

Data type: FloatingPoint32
- P-Group: Trace and function generator
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 0

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.03125 [ms]</td>
<td>2.00000 [ms]</td>
<td>0.12500 [ms]</td>
</tr>
</tbody>
</table>

Description: Sets the time slice cycle in which the function generator is called.

---

**p4831 Function generator amplitude scaling / FG amplitude scal**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p4831</td>
<td>Function generator amplitude scaling / FG amplitude scal</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>

Data type: FloatingPoint32
- P-Group: Trace and function generator
- Units group: -
- Unit selection: -
- Not for motor type: -
- Scaling: -
- Expert list: 0

<table>
<thead>
<tr>
<th>Min</th>
<th>Max</th>
<th>Factory setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00000 [%]</td>
<td>200.00000 [%]</td>
<td>100.00000 [%]</td>
</tr>
</tbody>
</table>

Description: Sets the amplitude for the amplitude of the signal waveforms for all output channels.
The value can be changed while the function generator is running.

---

**p4832[0...2] Function generator amplitude scaling / FG amplitude scal**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can be changed</th>
<th>Calculated</th>
<th>Access level</th>
</tr>
</thead>
<tbody>
<tr>
<td>p4832</td>
<td>Function generator amplitude scaling / FG amplitude scal</td>
<td>U, T</td>
<td>-</td>
<td>3</td>
</tr>
</tbody>
</table>
