Process Control System PCS 7 CFC Elementary Blocks

Programming and Operating Manual

Block parameters EN, ENO, SAMPLE_T	1
Startup on S7-300 CPUs	2
CFC blocks	3
Logic blocks of the data type BOOL	4
Logic blocks of the data type WORD and DWORD	5
Blocks for comparing two input values of the same type	6
Blocks for converting data types	7
Arithmetic blocks of the data type REAL	8
Arithmetic blocks of the data type INT and DINT	9
Flip-flop blocks	10
Shift blocks	11
Multiplexer blocks	12
Counter blocks	13
Blocks for generating or processing pulses	14
Blocks for acquiring or processing time intervals and timebases	15
Control blocks	16
System function blocks (SFBs)	17
AS-wide blocks	18
Appendix	19

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

CAUTION

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

NOTICE

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by **qualified personnel**. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be adhered to. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Table of contents

1	Block parameters EN, ENO, SAMPLE_T	11
2	Startup on S7-300 CPUs	13
3	CFC blocks	15
4	Logic blocks of the data type BOOL.....	17
4.1	BIT_LGC	17
4.2	AND: AND operation	18
4.3	OR: OR operation	19
4.4	XOR: Exclusive-OR operation	20
4.5	NAND: NAND operation.....	21
4.6	NOR: NOR operation	22
4.7	NOT: NOT operation	23
5	Logic blocks of the data type WORD and DWORD	25
5.1	WRD_LGC	25
5.2	WAND_W: Word AND operation.....	26
5.3	WOR_W: Word OR operation	27
5.4	WXOR_W: Word exclusive-OR operation	28
5.5	WNAND_W: Double word AND operation	29
5.6	WNOR_W: Word NOR operation.....	30
5.7	WNOT_W	31
5.8	WAND_DW	32
5.9	WOR_DW.....	32
5.10	WXOR_DW	33
5.11	WNAND_DW.....	33
5.12	WNOR_DW	34
5.13	WNOT_DW: Double word NOT operation	34
6	Blocks for comparing two input values of the same type.....	35
6.1	COMPARE	35
6.2	CMP_I: Comparator for INT values.....	35
6.3	CMP_DI: Comparator for DINT values	36
6.4	CMP_R: Comparator for REAL values	37
6.5	CMP_T: Comparator for TIME values.....	38

7	Blocks for converting data types	39
7.1	CONVERT	39
7.2	BY_DW	41
7.3	BY_W	41
7.4	DI_DW	42
7.5	DI_I	42
7.6	DI_R	43
7.7	DW_DI	43
7.8	DW_R	44
7.9	DW_W	44
7.10	I_DI	45
7.11	I_DW	45
7.12	I_R	46
7.13	I_W	46
7.14	R_DI	47
7.15	R_DW	47
7.16	R_I	48
7.17	W_BY	48
7.18	W_DW	49
7.19	W_I	49
7.20	BO_BY	50
7.21	BO_W	50
7.22	BO_DW	51
7.23	BY_BO	51
7.24	W_BO	52
7.25	DW_BO	52

8	Arithmetic blocks of the data type REAL	53
8.1	MATH_FP	53
8.2	ADD_R: Addition of REAL values	54
8.3	SUB_R: Subtraction of REAL values	54
8.4	MUL_R: Multiplication of REAL values	55
8.5	DIV_R: Division of REAL values	55
8.6	MAXn_R: Maximum of REAL values	56
8.7	MINn_R: Minimum of REAL values	57
8.8	ABS_R: Absolute value of REAL values	58
8.9	SQRT: Square root	58
8.10	EXP: Exponential function	59
8.11	POW10: Power-of-10 function	59
8.12	LN: Natural logarithm	60
8.13	LOG10: Base-10 logarithm	60
8.14	SIN: Sin function	61
8.15	COS: Cos function	61
8.16	TAN: Tan function	62
8.17	ASIN: Arc sin function	62
8.18	ACOS: Arc cos function	63
8.19	ATAN: Arc tan function	63
8.20	NEG_R	64
8.21	LIM_R: Limiter of REAL values	64
8.22	EPS_R	65
8.23	CADD_R	66
8.24	POWXY: General power function	67
8.25	SAMP_AVE: Floating average value	68

9	Arithmetic blocks of the data type INT and DINT	69
9.1	MATH_INT	69
9.2	ADD_I: Addition of INT values	70
9.3	SUB_I: Subtraction of INT values	70
9.4	MUL_I: Multiplication of INT values	71
9.5	DIV_I: Division of INT values	71
9.6	MOD_I: Modulo function of INT values	72
9.7	MAXn_I: Maximum of INT values	72
9.8	MINn_I: Minimum of INT values	73
9.9	ABS_I Absolute value of INT values	73
9.10	NEG_I: Inverter for INT values	74
9.11	LIM_I: Limiter for INT values	74
9.12	EPS_I: Accuracy approximation of INT values	75
9.13	CADD_I: Controllable adder of INT values	76
9.14	ADD_DI: Addition of DINT values	77
9.15	SUB_DI: Subtraction of DINT values	77
9.16	MUL_DI: Multiplication of DINT	78
9.17	DIV_DI: Division of DINT values	78
9.18	MOD_DI: Modulo function of DINT values	79
9.19	MAXn_DI: Maximum of DINT values	79
9.20	MINn_DI: Minimum of DINT values	80
9.21	ABS_DI: Absolute value of DINT values	80
9.22	NEG_DI: Inverter for DINT values	81
9.23	LIM_DI: Limiter for DINT values	81
9.24	EPS_DI: Accuracy approximation of DINT values	82
9.25	CADD_DI: Controllable adder of DINT values	83
10	Flip-flop blocks	85
10.1	FLIPFLOP	85
10.2	JK_FF	85
10.3	RS_FF: RS flip-flop, reset dominant	86
10.4	SR_FF: SR flip-flop, set dominant	86

11	Shift blocks	87
11.1	SHIFT	87
11.2	SHL_W: WORD shift left	87
11.3	SHL_DW: DWORD shift left	88
11.4	SHR_W: WORD shift right	88
11.5	SHR_DW: DWORD shift right	89
11.6	ROL_W: WORD rotate left	89
11.7	ROL_DW: DWORD rotate left	90
11.8	ROR_W: WORD rotate right	90
11.9	ROR_DW: DWORD rotate right	91
12	Multiplexer blocks	93
12.1	MULTIPLX	93
12.2	MUXn_I: Multiplexer 1 of n for INT values	94
12.3	MUXn_DI: Multiplexer 1 of n for DINT values	95
12.4	MUXn_R: Multiplexer 1 of n for REAL values	96
12.5	MUXn_BO: Multiplexer 1 of n for BOOL values	97
12.6	SEL_BO: Multiplexer 1 of 2 for BOOL values	98
12.7	SEL_R: Multiplexer 1 of 2 for REAL values	98
13	Counter blocks	99
13.1	COUNTER	99
13.2	CTU: Up counter	100
13.3	CTD: Down counter	101
13.4	CTUD: Up/down counter	102
14	Blocks for generating or processing pulses	103
14.1	PULSE	103
14.2	TIMER_P: Pulse generator	104
14.3	R_TRIG: Detection of the rising edge	107
14.4	F_TRIG: Detection of the falling edge	108
14.5	AFP: Clock	109
15	Blocks for acquiring or processing time intervals and timebases	111
15.1	TIME	111
15.2	TIME: Measures the execution time	111
15.3	TIME_BEG: Outputs the current time of day	112
15.4	TIME_END: Compares the input time with the actual time	112

16	Control blocks.....	113
16.1	CONTROL.....	113
16.2	CONT_C.....	114
16.2.1	CONT_C: Continuous-action controller.....	114
16.2.2	CONT_C: Block diagram.....	119

19.10	Manipulated value processing	150
19.11	Disturbance variable input	151
19.12	Symmetrical characteristic for three-step controller.....	151
19.13	Asymmetrical characteristic for three-step controller.....	152
	Index.....	153

Block parameters EN, ENO, SAMPLE_T

EN

EN (enable): Enable input.

The input exists only in the graphical interface of CFC however it is switched to hidden. You can use the enable input to enable/disable block processing. It ensures that the block is only called in the task code at AS level if it has been enabled via EN = 1.

ENO

ENO: ENO is the same as BR (Binary Result - refer to the STEP 7 documentation).

ENO = 1 shows a valid result as appropriate to the function. When the operating system and/or the error-handling routine detects an error in the block program, ENO will be set to 0 to indicate an invalid result. You can use this information in order to switch to other values (e.g., safety values) and to output messages to the OS as required.

If EN = FALSE, then ENO = FALSE.

SAMPLE_T

All blocks with the input parameter SAMPLE_T must be processed in temporally equidistant tasks, e.g. OB 35: Watchdog interrupt 100 ms. If they are implemented in acyclic tasks, e.g., process alarms, these blocks will return incorrect results

Startup on S7-300 CPUs

Startup

As it is not possible for S7-300 CPU restarts to be detected automatically, memory word 0 (MW0) is used as a startup bit memory word in startup blocks (blocks included in ELEM_300). This memory word must not, therefore, be modified in the user program.

In order to ensure a proper restart, you must insert the RESTART (FC 70) function into a CFC chart once for each S7-300 CPU.

Procedure:

1. Open the process editor with the menu command **Edit > Process Sequence** or via the icon in the toolbar.
2. Position the RESTART block at the beginning of OB 100.
3. Delete the RESTART block in the cyclic task (default: OB 35)
the block will only still be called in OB 100.

CFC blocks

The following CFC block families are available:

Family	Purpose
BIT_LGC (Page 17)	Logic blocks of the data type BOOL.
WRD_LGC (Page 25)	Logic blocks of the data type WORD and DWORD
COMPARE (Page 35)	Blocks for comparing two input values of the same type
CONVERT (Page 39)	Blocks for converting data types
MATH_FP (Page 53)	Arithmetic blocks of the data type REAL
MATH_INT (Page 69)	Arithmetic blocks of the data type INT and DINT
FLIPFLOP (Page 85)	Flip-flop blocks
SHIFT (Page 87)	Shift blocks
MULTIPLX (Page 93)	Multiplexer blocks
COUNTER (Page 99)	Count blocks
PULSE (Page 103)	Blocks for generating or processing pulses
TIME (Page 111)	Blocks for acquiring or processing time intervals and timebases
CONTROL (Page 113)	Closed-loop-control blocks
SYSTEM (Page 135)	System function blocks (SFBs)
IC (Page 141)	AS-wide blocks

Logic blocks of the data type BOOL

4.1 BIT_LGC

CFC blocks of the "BIT_LGC" family

In this family we have implemented the following blocks with which logic combinations can be implemented:

AND (Page 18)	AND operation
OR (Page 19)	OR operation
XOR (Page 20)	Exclusive-OR operation
NAND (Page 21)	NAND operation
NOR (Page 22)	NOR operation
NOT (Page 23)	NOT operation

4.2 AND: AND operation

Function

This block generates logic AND operations at inputs. The output is 1 if all inputs are 1. Otherwise, the output is 0. The number of "IN" inputs at the block can be modified.

Truth table (example of n = 2)

IN1	IN2	OUT
0	0	0
0	1	0
1	0	0
1	1	1

I/Os

	Name	Data type	Default setting
Inputs	IN1	BOOL	1
	IN2	BOOL	1
	...	...	
	INn	BOOL	1
Output	OUT	BOOL	1

4.3 OR: OR operation

Function

This block generates logic OR operations at inputs. The output is 1 if at least one input is 1. If all inputs are 0, the output is 0. The number of "IN" inputs at the block can be modified.

Truth table (example of n = 2)

IN1	IN2	OUT
0	0	0
0	1	1
1	0	1
1	1	1

I/Os

	Name	Data type	Default setting
Inputs	IN1	BOOL	0
	IN2	BOOL	0
	...	...	
	INn	BOOL	0
Output	OUT	BOOL	0

4.4 XOR: Exclusive-OR operation

Function

This block generates logic exclusive-OR operations at inputs. The output is 0 if all inputs have the same value. Otherwise, the output is 1. The number of "IN" inputs at the block can be modified.

Truth table (example of n = 2)

IN1	IN2	OUT
0	0	0
0	1	1
1	0	1
1	1	0

I/Os

	Name	Data type	Default setting
Inputs	IN1	BOOL	0
	IN2	BOOL	0
	...	...	
	INn	BOOL	0
Output	OUT	BOOL	0

4.5 NAND: NAND operation

Function

This block generates and inverts logic AND operations at inputs. The output is 0 if all inputs are 1. The number of "IN" inputs at the block can be modified.

Truth table (example of n = 2)

IN1	IN2	OUT
0	0	1
0	1	1
1	0	1
1	1	0

I/Os

	Name	Data type	Default setting
Inputs	IN1	BOOL	1
	IN2	BOOL	1
	...	...	
	INn	BOOL	1
Output	OUT	BOOL	0

4.6 NOR: NOR operation

Function

This block generates and inverts OR logic operations at inputs. The output is 1 if all inputs are 0. The number of "IN" inputs at the block can be modified.

Truth table (example of n = 2)

IN1	IN2	OUT
0	0	1
0	1	0
1	0	0
1	1	0

I/Os

	Name	Data type	Default setting
Inputs	IN1	BOOL	0
	IN2	BOOL	0
	...	...	
	INn	BOOL	0
Output	OUT	BOOL	1

4.7 NOT: NOT operation

Function

This block inverts the input.

Truth table

IN	OUT
0	1
1	0

I/Os

	Name	Data type	Default setting
Input	IN	BOOL	0
Output	OUT	BOOL	1

Logic blocks of the data type WORD and DWORD

5.1 WRD_LGC

CFC blocks of the "WRD_LGC" family

This family contains the following word logic blocks for the data types WORD and DWORD:

WAND_W (Page 26)	Word AND operation
WAND_DW (Page 32)	Double word AND operation
WOR_W (Page 27)	Word OR operation
WOR_DW (Page 32)	Double word OR operation
WXOR_W (Page 28)	Word exclusive-OR operation
WXOR_DW (Page 33)	Double word exclusive-OR operation
WNAND_W (Page 29)	Word NAND operation
WNAND_DW (Page 33)	Double word NAND operation
WNOR_W (Page 30)	Word NOR operation
WNOR_DW (Page 34)	Double word NOR operation
WNOT_W (Page 31)	Word NOT operation
WNOT_DW (Page 34)	Double word NOT operation

5.2 WAND_W: Word AND operation

Function

This block generates word logic AND operations at inputs. All input bits of the same significance are logically linked by AND; the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (two inputs)

IN1	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
IN2	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 1 1
OUT	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 0 1

I/Os

	Name	Data type	Default setting
Inputs	IN1	WORD	0
	IN2	WORD	0
	...		
Output	OUT	WORD	0

5.3 WOR_W: Word OR operation

Function

This block generates word logic OR operations at inputs. All input bits of the same significance are logically linked by OR and the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (two inputs)

IN1	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
IN2	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 1 1
OUT	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 1 1

I/Os

	Name	Data type	Default setting
Inputs	IN1	WORD	0
	IN2	WORD	0
	...		
Output	OUT	WORD	0

5.4 WXOR_W: Word exclusive-OR operation

Function

This block generates word logic exclusive-OR operations at inputs. All input bits of the same significance are logically linked by exclusive-OR and the result is written to the corresponding output bit. The bit is 0 if all input bits of the same significance have the same value. Otherwise the bit is 1. The number of "IN" inputs at the block can be modified.

Example (two inputs)

IN1	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
IN2	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 1 1
OUT	2# 0 0 0 0_0 0 0 0_1 1 0 0_0 0 0 0_1 1 1 0

I/Os

	Name	Data type	Default setting
Inputs	IN1	WORD	0
	IN2	WORD	0
	...		
Output	OUT	WORD	0

5.5 WNAND_W: Double word AND operation

Function

This block generates word logic NOT AND operations at inputs. All input bits of the same significance are logically linked by AND, inverted and the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (two inputs)

IN1	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
IN2	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 1 1
OUT	2# 0 0 0 0_1 1 1 1_1 1 0 0_1 1 1 1_1 1 1 0

I/Os

	Name	Data type	Default setting
Inputs	IN1	WORD	0
	IN2	WORD	0
	...		
Output	OUT	WORD	0

5.6 WNOR_W: Word NOR operation

Function

This block generates word logic NOT OR operations at inputs. All input bits of the same significance are logically linked by OR. The result is then inverted and written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (two inputs)

IN1	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
IN2	2# 1 1 1 1_0 0 0 0_0 0 1 1_0 0 0 0_0 0 1 1
OUT	2# 0 0 0 0_1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0

I/Os

	Name	Data type	Default setting
Inputs	IN1	WORD	0
	IN2	WORD	0
Output	OUT	WORD	0

5.7 WNOT_W

Function

This block inverts the input word. Each bit of the input is inverted and written to the output bit of the corresponding significance.

Example

IN	2# 1 1 1 1_0 0 0 0_1 1 1 1_0 0 0 0_1 1 0 1
OUT	2# 0 0 0 0_1 1 1 1_0 0 0 0_1 1 1 1_0 0 1 0

I/Os

	Name	Data type	Default setting
Input	IN	WORD	0
Output	OUT	WORD	1

5.8 WAND_DW

Function

This block generates DWORD logic AND operations at inputs. All input bits of the same significance are logically linked by AND; the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (same as WAND_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Inputs	IN1	DWORD	0
	IN2	DWORD	0
Output	OUT	DWORD	0

5.9 WOR_DW

Function

This block generates DWORD logic OR operations at inputs. All input bits of the same significance are logically linked by OR and the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (same as WOR_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Inputs	IN1	DWORD	0
	IN2	DWORD	0
Output	OUT	DWORD	0

5.10 WXOR_DW

Function

This block generates DWORD logic exclusive-OR operations at inputs. All input bits of the same significance are logically linked by exclusive-OR and the result is written to the corresponding output bit. The bit is 0 if all input bits of the same significance have the same value. Otherwise the bit is 1. The number of "IN" inputs at the block can be modified.

Example (same as WXOR_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Inputs	IN1	DWORD	16#0
	IN2	DWORD	16#0
Output	OUT	DWORD	16#00000000

5.11 WNAND_DW

Function

This block generates DWORD logic NOT AND operations at inputs. All input bits of the same significance are logically linked by AND, inverted and the result is written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (same as WNAND_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Inputs	IN1	DWORD	0
	IN2	DWORD	0
Output	OUT	DWORD	0

5.12 WNOR_DW

Function

This block generates DWORD logic NOT OR operations at inputs. All input bits of the same significance are logically linked by OR. The result is then inverted and written to the corresponding output bit. The number of "IN" inputs at the block can be modified.

Example (same as WNOR_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Inputs	IN1	DWORD	0
	IN2	DWORD	0
Output	OUT	DWORD	0

5.13 WNOT_DW: Double word NOT operation

Function

This block inverts the input word. Each bit of the input is inverted and written to the output bit of the corresponding significance.

Example (same as WNOT_W, extended to 32 bits)

I/Os

	Name	Data type	Default setting
Input	IN	DWORD	0
Output	OUT	DWORD	0

Blocks for comparing two input values of the same type

6.1 COMPARE

CFC blocks of the "COMPARE" family

This family contains blocks for comparing two input variables.

CMP_I (Page 35)	Comparator for INT values
CMP_DI (Page 36)	Comparator for DINT values
CMP_R (Page 37)	Comparator for REAL values
CMP_T (Page 38)	Comparator for TIME values

6.2 CMP_I: Comparator for INT values

Function

This block compares two input variables and sets the outputs as follows:

GT = 1 if $IN1 > IN2$

GE = 1 if $IN1 \geq IN2$,

EQ = 1 if $IN1 = IN2$

LT = 1 if $IN1 < IN2$

LE = 1 if $IN1 \leq IN2$

The other four outputs are set to 0 in each case.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Input variable 1	0
	IN2	INT	Input variable 2	0
Outputs	GT	BOOL	1, $IN1 > IN2$	0
	GE	BOOL	1, $IN1 \geq IN2$	0
	EQ	BOOL	1, $IN1 = IN2$	0
	LT	BOOL	1, $IN1 < IN2$	0
	LE	BOOL	1, $IN1 \leq IN2$	0

6.3 CMP_DI: Comparator for DINT values

Function

This block compares two input variables and sets the outputs as follows:

GT = 1 if $IN1 > IN2$

GE = 1 if $IN1 \geq IN2$,

EQ = 1 if $IN1 = IN2$

LT = 1 if $IN1 < IN2$

LE = 1 if $IN1 \leq IN2$

The other four outputs are set to 0 in each case.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Input variable 1	0
	IN2	DINT	Input variable 2	0
Outputs	GT	BOOL	1, $IN1 > IN2$	0
	GE	BOOL	1, $IN1 \geq IN2$	0
	EQ	BOOL	1, $IN1 = IN2$	0
	LT	BOOL	1, $IN1 < IN2$	0
	LE	BOOL	1, $IN1 \leq IN2$	0

6.4 CMP_R: Comparator for REAL values

Function

This block compares two input variables and sets the outputs as follows:

GT = 1 if $IN1 > IN2$

GE = 1 if $IN1 \geq IN2$,

EQ = 1 if $IN1 = IN2$

LT = 1 if $IN1 < IN2$

LE = 1 if $IN1 \leq IN2$

The other four outputs are set to 0 in each case.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Input variable 1	0
	IN2	REAL	Input variable 2	0
Outputs	GT	BOOL	1, $IN1 > IN2$	0
	GE	BOOL	1, $IN1 \geq IN2$	0
	EQ	BOOL	1, $IN1 = IN2$	0
	LT	BOOL	1, $IN1 < IN2$	0
	LE	BOOL	1, $IN1 \leq IN2$	0

6.5 CMP_T: Comparator for TIME values

Function

This block compares two input variables and sets the outputs as follows:

GT = 1 if $IN1 > IN2$

GE = 1 if $IN1 \geq IN2$,

EQ = 1 if $IN1 = IN2$

LT = 1 if $IN1 < IN2$

LE = 1 if $IN1 \leq IN2$

The other four outputs are set to 0 in each case.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	TIME	Input variable 1	0
	IN2	TIME	Input variable 2	0
Outputs	GT	BOOL	1, $IN1 > IN2$	0
	GE	BOOL	1, $IN1 \geq IN2$	0
	EQ	BOOL	1, $IN1 = IN2$	0
	LT	BOOL	1, $IN1 < IN2$	0
	LE	BOOL	1, $IN1 \leq IN2$	0

Blocks for converting data types

7.1 CONVERT

Introduction

CFC only allows the interconnection of block outputs (source type) to block inputs (target type) if both data types are identical (e.g., REAL output <-> REAL input). Conversion blocks must be used to allow the interconnection of different data types. The input and output data of the block are of a different type, and it thus converts the input data type according to the data type set at the output.

Conversion rules

The abbreviated name of the source and target data type, connected by means of an underscore "_", form the type name.

The table below shows a brief description of conversion rules for specific blocks. If the IN input value is not within the allowed range, the OUT output value becomes invalid and the test output ENO = 0 is displayed.

You can evaluate ENO, for example, to provide a substitute/safety value for further processing.

The CONVERT library contains blocks you can use to convert n values of a data type to m values of another data type (the values of m and n may be equal).

7.1 CONVERT

The following blocks convert **one** value of a data type into **one** value of another data type:

BY_DW (Page 41)	Converts BYTE to DWORD
BY_W (Page 41)	Converts BYTE to WORD
DI_DW (Page 42)	Converts DINT to DWORD
DI_I (Page 42)	Converts DINT to INT
DI_R (Page 43)	Converts DINT to REAL
DW_DI (Page 43)	Converts DWORD to DINT
DW_R (Page 44)	Converts DWORD to REAL
DW_W (Page 44)	Converts DWORD to WORD
I_DI (Page 45)	Converts INT to DINT
I_DW (Page 45)	Converts INT to DWORD
I_R (Page 46)	Converts INT to REAL
I_W (Page 46)	Converts INT to WORD
R_DI (Page 47)	Converts REAL to DINT
R_DW (Page 47)	Converts REAL to DWORD
R_I (Page 48)	Converts REAL to INT
W_BY (Page 48)	Converts WORD to BYTE
W_DW (Page 49)	Converts WORD to DWORD
W_I (Page 49)	Converts WORD to INT

The following blocks convert **several** BOOL type values into **one** BYTE, WORD or DWORD type value:

BO_BY (Page 50)	Converts BOOL to BYTE, 8 inputs
BO_W (Page 50)	Converts BOOL to WORD, 16 inputs
BO_DW (Page 51)	Converts BOOL to DWORD, 32 inputs

The following blocks convert **one** BYTE, WORD or DWORD type values into **several** BOOL type values:

BY_BO (Page 51)	Converts BYTE to BOOL, 8 outputs
W_BO (Page 52)	Converts WORD to BOOL, 16 outputs
DW_BO (Page 52)	Converts DWORD to BOOL, 32 outputs

7.2 BY_DW

Function

Copies the byte of IN to the low-byte of OUT and sets the high-bytes to 0.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	BYTE	0
Output	OUT	DWORD	0

7.3 BY_W

Function

Copies the byte of IN to the low-byte of OUT and sets the high-byte to 0.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	BYTE	0
Output	OUT	WORD	0

7.4 DI_DW

Function

Copies the bit string of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Description	Default setting
Input	IN	DINT	Input value	0
Output	OUT	DWORD	Output value	0

7.5 DI_I

Function

Converts the IN bit string to INT and copies the result to OUT.

Troubleshooting

If the values of IN lie outside the range of -32 768 to 32 767, ENO = 0 and OUT is an invalid value.

I/Os

	Name	Data type	Description	Default setting
Input	IN	DINT	Input value	0
Output	OUT	INT	Output value	0

7.6 DI_R

Function

Converts the value of IN to a REAL number and copies the result to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	DINT	0
Output	OUT	REAL	0

7.7 DW_DI

Function

Copies the bit string of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Description	Default setting
Input	IN	DWORD	Input value	0
Output	OUT	DINT	Output value	0

7.8 DW_R

Method of operation

The block only forwards the bit string and does not change any values. To cause a value change to REAL, the DW_DI block and then the DI_R block must be used.

Function

Copies the bit string of IN to OUT.

Troubleshooting

Not applicable

I/Os

	Name	Data type	Description	Default setting
Input	IN	DWORD	Input value	0
Output	OUT	REAL	Output value	0

7.9 DW_W

Function

Copies the low-word of IN to the word of OUT.

Troubleshooting

ENO = 0 if the IN high-word > 0

I/Os

	Name	Data type	Description	Default setting
Input	IN	DWORD	Input value	0
Output	OUT	WORD	Output value	0

7.10 I_DI

Function

Copies the value of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	INT	0
Output	OUT	DINT	0

7.11 I_DW

Function

Copies the bit string of IN to the low-word of OUT and sets the high-word to 0.

Troubleshooting

n.a.

I/Os

	Name	Data type	Description	Default setting
Input	IN	INT	Input value	0
Output	OUT	DWORD	Output value	0

7.12 I_R

Function

Copies the integer of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	INT	0
Output	OUT	REAL	0

7.13 I_W

Function

Copies the bit string of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Description	Default setting
Input	IN	INT	Input value	0
Output	OUT	WORD	Output value	0

7.14 R_DI

Function

Converts the REAL value of IN to OUT.

Troubleshooting

If the value of IN is outside the range -2.147483648×10^9 und 2.147483647×10^9 , then ENO = 0 and OUT is invalid.

I/Os

	Name	Data type	Default setting
Input	IN	REAL	0
Output	OUT	DINT	0

7.15 R_DW

Method of operation

The block only forwards the bit string and does not change any values. In order to convert REAL to DWORD, you must use the R_TO_DW block (PCS 7 Library).

Function

Copies the bit string of IN to OUT.

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Input	IN	REAL	0
Output	OUT	DWORD	0

7.16 R_I

Function

Converts the REAL value of IN to OUT.

Troubleshooting

If the value at IN is not in the range –32768 to 32767, then ENO = 0 and OUT is invalid.

I/Os

	Name	Data type	Default setting
Input	IN	REAL	0
Output:	OUT	INT	0

7.17 W_BY

Function

Copies the low-byte of IN to OUT.

Troubleshooting

If the high-byte > 0, then ENO = 0.

I/Os

	Name	Data type	Description	Default setting
Input	IN	WORD	Input value	0
Output	OUT	BYTE	Output value	0

7.18 W_DW

Function

Copies the word of IN to the low-word of OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	WORD	0
Output	OUT	DWORD	0

7.19 W_I

Function

Copies the bit string of IN to OUT.

Troubleshooting

n.a.

I/Os

	Name	Data type	Description	Default setting
Input	IN	WORD	Input value	0
Output	OUT	INT	Output value	0

7.20 BO_BY

Function

This block converts the eight Boolean type input values to a BYTE type value and outputs the result. 8 BOOL -> 1 BYTE conversions are performed as follows:
The i-th bit of the BYTE value is set to 0 (or 1) when the i-th input value is 0 (or 1).
(i = 0 to 7).

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Inputs	IN0	BOOL	0
	...	...	
	IN7	BOOL	0
Output	OUT	BYTE	0

7.21 BO_W

Function

This block converts the 16 Boolean type input values to a WORD type value and outputs the result. 16 BOOL -> 1 WORD conversions are performed as follows:
The i-th bit of the WORD value is set to 0 (or 1) when the i-th input value is 0 (or 1).
(i = 0 to 15).

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Inputs	IN0	BOOL	0
	...	...	
	IN15	BOOL	0
Output	OUT	WORD	0

7.22 BO_DW

Function

This block converts the 32 Boolean type input values to a DWORD type value and outputs the result. 32 BOOL -> 1 DWORD conversions are performed as follows:

The i-th bit of the DWORD value is set to 0 (or 1) when the i-th input value is 0 (or 1) (i = 0 to 31).

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Inputs	IN0	BOOL	0
	...	...	
	IN31	BOOL	0
Output	OUT	DWORD	0

7.23 BY_BO

Function

This block converts the input value of data type BYTE to 8 values of data type BOOL and outputs the result in 8 variables. IN bit0 is mapped to OUT0, IN bit1 to OUT1, etc.

Troubleshooting

n.a.

I/Os

	Name	Data type	Default setting
Input	IN	BYTE	0
Outputs	OUT0	BOOL	0
	...	...	
	OUT7	BOOL	0

7.24 W_BO

Function

This block converts the input value of the WORD data type in 16 values of the BOOL data type, which are created at the 16 outputs. IN-Bit0 is then converted to OUT0, IN-Bit1 to OUT1 etc.

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Input	IN	WORD	0
Outputs	OUT0	BOOL	0
	...	...	
	OUT15	BOOL	0

7.25 DW_BO

Function

This block converts the input value of the DWORD data type in 32 values of the BOOL data type, which are created at the 32 outputs. IN-Bit0 is then converted to OUT0, IN-Bit1 to OUT1 etc.

Troubleshooting

Not applicable

I/Os

	Name	Data type	Default setting
Input	IN	DWORD	0
Outputs	OUT0	BOOL	0
	...	...	
	OUT31	BOOL	0

Arithmetic blocks of the data type REAL

8.1 MATH_FP

CFC blocks of the "MATH_FP" family

This family contains the following floating-point arithmetic blocks for data of the type REAL.

ADD_R (Page 54)	Addition of REAL values
SUB_R (Page 54)	Subtraction of REAL values
MUL_R (Page 55)	Multiplication of REAL values
DIV_R (Page 55)	Division of REAL values
ABS_R (Page 58)	Absolute value of REAL values
EPS_R (Page 65)	Precision; approximation
NEG_R (Page 64)	Negation of REAL values
MAXn_R (Page 56)	Maximum of REAL values
MINn_R (Page 57)	Minimum of REAL values
LIM_R (Page 64)	Limiter of REAL values
CADD_R (Page 66)	Controllable adder of REAL values
SQRT (Page 58)	Square root
EXP (Page 59)	Exponential function
POW10 (Page 59)	Power of ten
LN (Page 60)	Natural logarithm
LOG10 (Page 60)	Logarithm to base 10
SIN (Page 61)	Sine function
COS (Page 61)	Cosine function
TAN (Page 62)	Tangent function
ASIN (Page 62)	Arc sine function
ACOS (Page 63)	Arc cosine function
ATAN (Page 63)	Arc tangent function
POWXY (Page 67)	General power function
SAMP_AVE (Page 68)	Variable average

Note

The value range of real numbers is:
 $-3.40282e^{+38} \dots -1.755e^{-38} \dots 0 \dots 1.755e^{-38} \dots 3.40282e^{+38}$

8.2 ADD_R: Addition of REAL values

Function

This block adds the values of inputs and outputs the sum.

$$\text{OUT} = \text{IN1} + \text{IN2}$$

Troubleshooting

ENO = 0 on overflow or underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Addend 1	0.0
	IN2	REAL	Addend 2	0.0
Output	OUT	REAL	Sum	0.0

8.3 SUB_R: Subtraction of REAL values

Function

This block subtracts the value at input IN2 from input IN1 and outputs the difference.

$$\text{OUT} = \text{IN1} - \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Minuend	0.0
	IN2	REAL	Subtrahend	0.0
Output	OUT	REAL	Difference	0.0

8.4 MUL_R: Multiplication of REAL values

Function

This block multiplies the inputs and outputs the product.

$$\text{OUT} = \text{IN1} * \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Multiplicand	0.0
	IN2	REAL	Multiplier	0.0
Output	OUT	REAL	Product	0.0

8.5 DIV_R: Division of REAL values

Function

This block divides the value at input IN1 by the value at input IN2 and outputs the quotient.

$$\text{OUT} = \text{IN1} / \text{IN2}$$

Troubleshooting

ENO is set to 0 on divisions by 0, overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Dividend	0.0
	IN2	REAL	Divisor	0.0
Output	OUT	REAL	Quotient	0.0

8.6 MAXn_R: Maximum of REAL values

Function

This block compares the inputs and outputs their maximum value.

OUT = MAX {IN1, ... , INn}

Blocks

Name	Description
MAX2_R	2 inputs of type REAL
MAX4_R	4 inputs of type REAL
MAX8_R	8 inputs of type REAL

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Input variable 1	0.0
	...			
	INn	REAL	Input variable n	0.0
Output	OUT	REAL	Maximum value	0.0

8.7 MINn_R: Minimum of REAL values

Function

This block compares the inputs and outputs their minimum value.
 $OUT = \min \{IN1, \dots, INn\}$

Blocks

Name	Description
MIN2_R	2 inputs of type REAL
MIN4_R	4 inputs of type REAL
MIN8_R	8 inputs of type REAL

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Input variable 1	0.0
	...			
	INn	REAL	Input variable n	0.0
Output	OUT	REAL	Maximum value	0.0

8.8 ABS_R: Absolute value of REAL values

Function

This block outputs the absolute value of the input.

$$\text{OUT} = |\text{IN}|$$

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	REAL	Input value	0.0
Output	OUT	REAL	Absolute value	0.0

8.9 SQRT: Square root

Function

This block calculates and outputs the square root of the input.

$$\text{OUT} = \text{SQRT}(\text{IN})$$

Troubleshooting

ENO = 0 and OUT = 0 if IN < 0.

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Radicand	0.0
Output	OUT	REAL	Square root	0.0

8.10 EXP: Exponential function

Function

This block calculates and outputs the exponential function of the input. In this equation, "e" is Euler's constant 2.71..., the base of the natural logarithm.

$$\text{OUT} = e^{\text{IN}}$$

Troubleshooting

ENO = 0 on overflow and underflow.

ENO = 0 and OUT = 0 if $\text{IN} < 0$.

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Exponent	0.0
Output	OUT	REAL	Exponential function	0.0

8.11 POW10: Power-of-10 function

Function

This block calculates the power of 10^{IN} of the input and send the result to the output.

$$\text{OUT} = 10^{\text{IN}}$$

Troubleshooting

ENO = 0 with $\text{IN} < -37.9$ and $\text{IN} > 38.5$

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Exponent	0.0
Output	OUT	REAL	Power of ten	0.0

8.12 LN: Natural logarithm

Function

This block calculates and outputs the natural logarithm of the input.

$OUT = LN(IN)$

The variable at input IN must be positive.

Troubleshooting

ENO = 0 on overflow and underflow.

ENO = 0 and OUT = 0 if $IN < 0$.

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	nat. Logarithm	0.0

8.13 LOG10: Base-10 logarithm

Function

This block calculates and outputs the base-10 logarithm value of the input.

$OUT = LOG10(IN)$

The variable at input IN must be positive.

Troubleshooting

ENO = 0 on overflow and underflow.

ENO = 0 and OUT = 0 if $IN < 0$.

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Logarithm	0.0

8.14 SIN: Sin function

Function

This block calculates and outputs the sine of the input. The variable at IN must be a radian value.

$$\text{OUT} = \text{SIN}(\text{IN})$$

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Sine	0.0

8.15 COS: Cos function

Function

This block calculates and outputs the cosine of the input. The variable at IN must be a radian value.

$$\text{OUT} = \text{COS}(\text{IN})$$

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Cosine	0.0

8.16 TAN: Tan function

Function

This block calculates and outputs the tangent of the input. The variable at IN must be a radian value.

$$\text{OUT} = \text{TAN}(\text{IN})$$

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Tangent	0.0

8.17 ASIN: Arc sin function

Function

This block calculates and outputs the arc sine of the input. The result is output as a radian value between $-\pi/2$ and $+\pi/2$. The range of the function argument must be between -1 and +1.

$$\text{OUT} = \text{ASIN}(\text{IN})$$

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Arc sine	0.0

8.18 ACOS: Arc cos function

Function

This block calculates and outputs the arc cosine of the input. The result is output as a radian value between 0 and π . The range of the function argument must be between -1 and +1.

OUT = ACOS(IN)

Troubleshooting

ENO = 0 at IN < -1 --> OUT = 3.14.

ENO = 0 at IN > 1 --> OUT = 0

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Arc cosine	0.0

8.19 ATAN: Arc tan function

Function

This block calculates and outputs the arc tangent of the input. The result is output as a radian value between $-\pi/2$ and $+\pi/2$. The range of the function argument is the entire REAL number range.

OUT = ATAN(IN)

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Argument	0.0
Output	OUT	REAL	Arc tangent	0.0

8.20 NEG_R

Function

This block outputs the input variable with inverted sign.

I/Os

	Name	Data type	Description	Default setting
Input	IN	REAL	Input variable	0.0
Output	OUT	REAL	Output variable	0.0

8.21 LIM_R: Limiter of REAL values

Function

This block compares the input variables IN, MAX and MIN. It checks if IN is within or outside the intervals limited by MIN and MAX. If the low limit MIN of the interval is greater than or equal to the high limit MAX, the output OUT = MAX and the outputs OUTU and OUTL are set to 1. IN > MAX represents a violation of the high limit, OUT = MAX, OUTU = 1 and OUTL = 0. IN < MIN represents a violation of the low limit, OUT = MIN, OUTU = 0, OUTL = 1. If IN is between MIN and MAX, OUT = IN, OUTU = 0, OUTL = 0 are set.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	REAL	Input variable	0.0
	MIN	REAL	Low limit	-100.0
	MAX	REAL	High limit	100.0
Outputs	OUT	REAL	Output variable	0
	OUTU	BOOL	Out of high limits	0
	OUTL	BOOL	Out of low limits	0

8.22 EPS_R

Function

This block compares the absolute values of the inputs. If the absolute value of input IN < than the INTERVAL limit, output QA will be set to 1 and output QN to 0. In this case the input variable IN is contained in the interval. Otherwise output QA is set to 0 and output QN is set to 1. The input variable IN is then outside the interval.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	REAL	Input variable	0.0
	INTERVAL	REAL	Interval limit	0.0
Outputs	QA	BOOL	Validation bit memory	0
	QN	BOOL	Inverted validation bit memory	0

8.23 CADD_R

Function

This block adds input variable IN to output variable OUT, if input CI = 1 and inputs RI and SI = 0. If RI = 1, OUT = 0. If SI = 1 and RI = 0, then OUT = IN.

Troubleshooting

ENO = 0 on overflow and underflow.

Truth table

RI	SI	CI	OUT	ENO
1	X	X	0	1
0	1	X	IN	1
0	0	1	OUT* + IN	1
0	0	0	OUT*	1

X is a random value

OUT* is the old value from the previous cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	REAL	Addend	0.0
	RI	BOOL	Reset	0
	SI	BOOL	Set	0
	CI	BOOL	Count	0
Output	OUT	REAL	Sum	0.0

8.24 POWXY: General power function

Function

This block sends the input variable IN1 to the output, raised to the power of the input variable IN2.

$$\text{OUT} = \text{IN1}^{\text{IN2}}$$

Troubleshooting

M7 goes to STOP with an overshoot or undershoot.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	REAL	Base	0.0
	IN2	REAL	Exponent	0.0
Output	OUT	REAL	Output variable	0.0

8.25 SAMP_AVE: Floating average value

Function

This block outputs the average value of the last N input values.

$$\text{OUT} = (\text{IN}_k + \text{IN}_{k-1} + \dots + \text{IN}_{k-n+1}) / N$$

where IN_k is the current input value. For the number of input values N the condition

$$0 < N < 33$$

must be satisfied.

Startup characteristics

During startup and initial run each element of the buffer for IN and OUT values is set to 0.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	REAL	Input variable	0.0
	N	INT	Number of input values considered	1
Output	OUT	REAL	Average value	0.0

Arithmetic blocks of the data type INT and DINT

9.1 MATH_INT

CFC blocks of the "MATH_INT" family

This family contains the following blocks used for arithmetic operations with data of the INT and DINT types.

ADD_I (Page 70)	Addition of INT values
ADD_DI (Page 77)	Addition of DINT values
SUB_I (Page 70)	Subtraction of INT values
SUB_DI (Page 77)	Subtraction of DINT values
MUL_I (Page 71)	Multiplication of INT values
MUL_DI (Page 78)	Multiplication of DINT values
DIV_I (Page 71)	Division of INT values
DIV_DI (Page 78)	Division of DINT values
ABS_I (Page 73)	Absolute value of INT values
ABS_DI (Page 80)	Absolute value of DINT values
EPS_I (Page 75)	Accuracy; approximation of INT values
EPS_DI (Page 82)	Accuracy; approximation of DINT values
NEG_I (Page 74)	Inverter for INT values
NEG_DI (Page 81)	Inverter for DINT values
MOD_I (Page 72)	Modulo function of INT values
MOD_DI (Page 79)	Modulo function of DINT values
MAXn_I (Page 72)	Maximum of INT values
MAXn_DI (Page 79)	Maximum of DINT values
MINn_I (Page 73)	Minimum of INT values
MINn_DI (Page 80)	Minimum of DINT values
LIM_I (Page 74)	Limiter for INT values
LIM_DI (Page 81)	Limiter for DINT values
CADD_I (Page 76)	Controllable adder of INT values
CADD_DI (Page 83)	Controllable adder of DINT values

Note

The value range of data types INT and DINT is

INT: -32 768 ... 32 767

DINT: -2 147 483 648 ... 2 147 483 647

9.2 ADD_I: Addition of INT values

Function

This block adds the values of inputs and outputs the sum.

$$\text{OUT} = \text{IN1} + \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Addend 1	0
	IN2	INT	Addend 2	0
Output	OUT	INT	Sum	0

9.3 SUB_I: Subtraction of INT values

Function

This block subtracts input IN2 from input IN1 and outputs the difference.

$$\text{OUT} = \text{IN1} - \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Minuend	0
	IN2	INT	Subtrahend	0
Output	OUT	INT	Difference	0

9.4 MUL_I: Multiplication of INT values

Function

This block multiplies the inputs and outputs the product.

$$\text{OUT} = \text{IN1} * \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Multiplicand	0
	IN2	INT	Multiplier	0
Output	OUT	INT	Product	0

9.5 DIV_I: Division of INT values

Function

This block divides the value at input IN1 by the value at input IN2 and outputs the quotient.

$$\text{OUT} = \text{IN1} / \text{IN2}$$

Troubleshooting

ENO = 0 in the case of division by 0 and -32768 in the case of division by -1.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Dividend	0
	IN2	INT	Divisor	0
Output	OUT	INT	Quotient	0

9.6 MOD_I: Modulo function of INT values

Function

This block outputs the modulo of an integer division DIV_I (Page 71) of input IN1 by input IN2.

Troubleshooting

ENO = 0 in the case of division by 0.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Dividend	0
	IN2	INT	Divisor	0
Output	OUT	INT	Remainder	0

9.7 MAXn_I: Maximum of INT values

Function

This block compares the inputs and outputs their maximum value.

$OUT = \text{MAX} \{IN1, \dots, INn\}$

Blocks

Name	Description
MAX2_I	2 inputs of the type INT
MAX4_I	4 inputs of the type INT
MAX8_I	8 inputs of the type INT

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Input variable 1	0
	...			
	INn	INT	Input variable n	0
Output	OUT	INT	Maximum value	0

9.8 MINn_I: Minimum of INT values

Function

This block compares the inputs and outputs their minimum value.

$OUT = \text{MIN} \{IN1, \dots, INn\}$

Blocks

Name	Description
MIN2_I	2 inputs of the type INT
MIN4_I	4 inputs of the type INT
MIN8_I	8 inputs of the type INT

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	INT	Input variable 1	0
	...			
	INn	INT	Input variable n	0
Output	OUT	INT	Maximum value	0

9.9 ABS_I Absolute value of INT values

Function

This block outputs the absolute value of the input.

$OUT = |IN|$

Troubleshooting

ENO = 0 if IN = -32 768

I/Os

	Name	Data type	Description	Default setting
Input	IN	INT	Input value	0
Output	OUT	INT	Absolute value	0

9.10 NEG_I: Inverter for INT values

Function

This block outputs the input variable with inverted sign.

Troubleshooting

ENO = 0 if IN = -32 768

I/Os

	Name	Data type	Description	Default setting
Input	IN	INT	Input variable	0
Output	OUT	INT	Output variable	0

9.11 LIM_I: Limiter for INT values

Function

This block compares the input variables IN, MAX and MIN. It checks if IN is within or outside the intervals limited by MIN and MAX.

If the low limit MIN of the interval is greater than the high limit MAX, the output OUT = MAX and the outputs OUTU and OUTL are set to 1.

IN > MAX represents a violation of the high limit, OUT = MAX, OUTU = 1 and OUTL = 0. IN < MIN represents a violation of the low limit, OUT = MIN, OUTU = 0, OUTL = 1. If IN is between MIN and MAX, OUT = IN, OUTU = 0, OUTL = 0 are set.

Troubleshooting

ENO = 0 with MIN > MAX --> OUT = MAX; OUTU = OUTL = 1

I/Os

	Name	Data type	Description	Default setting
Inputs	MAX	INT	High limit	0
	IN	INT	Input variable	0
	MIN	INT	Low limit	0
Outputs	OUTU	BOOL	Out of high limits	0
	OUTL	BOOL	Out of low limits	0
	OUT	INT	Output variable	0

9.12 EPS_I: Accuracy approximation of INT values

Function

This block compares the absolute value of the input IN with the value of the INTERVAL input. If the absolute amount of input IN < than the INTERVAL limit, output QA will be set to 1 and output QN to 0. In this case the input variable IN is contained in the interval. Otherwise output QA is set to 0 and output QN is set to 1. The input variable IN is then outside the interval.

INTERVAL must have a positive value.
If $\text{INTERVAL} \leq 0$, then $\text{QA} = 0$.

Troubleshooting

ENO = 0 with IN = -32 768

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	INT	Input variable	0
	INTERVAL	INT	Interval limit	0
Outputs	QA	BOOL	Validation bit memory	0
	QN	BOOL	Inverted validation bit memory	0

9.13 CADD_I: Controllable adder of INT values

Function

This block adds the input variable IN to the output variable OUT when the CI input is set to 1 and the RI and SI inputs are set to 0. If RI = 1, the OUT output is set to 0. If SI = 1 and RI = 0, then OUT = IN.

Troubleshooting

ENO = 0 on overflow and underflow.

Truth table

RI	SI	CI	OUT	ENO
1	X	X	0	1
0	1	X	IN	1
0	0	1	OUT* + IN	1
0	0	0	OUT*	1

X is any value

OUT* is the old value from the last cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	INT	Addend	0
	RI	BOOL	Reset	0
	SI	BOOL	Set	0
	CI	BOOL	Count	0
Output	OUT	INT	Sum	0

9.14 ADD_DI: Addition of DINT values

Function

This block adds the values of inputs and outputs the sum.

$$\text{OUT} = \text{IN1} + \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Addend 1	0
	IN2	DINT	Addend 2	0
Output	OUT	DINT	Sum	0

9.15 SUB_DI: Subtraction of DINT values

Function

This block subtracts the value at input IN2 from input IN1 and outputs the difference.

$$\text{OUT} = \text{IN1} - \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Minuend	0
	IN2	DINT	Subtrahend	0
Output	OUT	DINT	Difference	0

9.16 MUL_DI: Multiplication of DINT

Function

This block multiplies the inputs and outputs the product.

$$\text{OUT} = \text{IN1} * \text{IN2}$$

Troubleshooting

ENO = 0 on overflow and underflow.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Multiplicand	0
	IN2	DINT	Multiplier	0
Output	OUT	DINT	Product	0

9.17 DIV_DI: Division of DINT values

Function

This block divides the value at input IN1 by the value at input IN2 and outputs the quotient.

$$\text{OUT} = \text{IN1} / \text{IN2}$$

Troubleshooting

ENO = 0 in the case of division by 0 and -2147483648 in the case of division by -1.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Dividend	0
	IN2	DINT	Divisor	0
Output	OUT	DINT	Quotient	0

9.18 MOD_DI: Modulo function of DINT values

Function

This block outputs the modulo of an integer division DIV_DI (Page 78) of input IN1 by input IN2.

Troubleshooting

ENO = 0 in the case of division by 0.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Dividend	0
	IN2	DINT	Divisor	0
Output	OUT	DINT	Remainder	0

9.19 MAXn_DI: Maximum of DINT values

Function

This block compares the inputs and outputs their maximum value.

$OUT = \text{MAX} \{IN1, \dots, INn\}$

Blocks

Name	Description
MAX2_DI	2 inputs of the type DINT
MAX4_DI	4 inputs of the type DINT
MAX8_DI	8 inputs of the type DINT

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Input variable 1	0
	...			
	INn	DINT	Input variable n	0
Output	OUT	DINT	Maximum value	0

9.20 MINn_DI: Minimum of DINT values

Function

This block compares the inputs and outputs their minimum value.

$OUT = \min \{IN1, \dots, INn\}$

Blocks

Name	Description
MIN2_DI	2 inputs of the type DINT
MIN4_DI	4 inputs of the type DINT
MIN8_DI	8 inputs of the type DINT

I/Os

	Name	Data type	Description	Default setting
Inputs	IN1	DINT	Input variable 1	0
	...			
	INn	DINT	Input variable n	0
Output	OUT	DINT	Maximum value	0

9.21 ABS_DI: Absolute value of DINT values

Function

This block outputs the absolute value of the input.

$OUT = |IN|$

Troubleshooting

ENO = 0 if IN = -2 147 483 648 (smallest negative number)

I/Os

	Name	Data type	Description	Default setting
Input	IN	DINT	Input value	0
Output	OUT	DINT	Absolute value	0

9.22 NEG_DI: Inverter for DINT values

Function

This block outputs the input variable with inverted sign.

Troubleshooting

ENO = 0 if IN = -2 147 483 648

I/Os

	Name	Data type	Description	Default setting
Input	IN	DINT	Input variable	0
Output	OUT	DINT	Output variable	0

9.23 LIM_DI: Limiter for DINT values

Function

This block compares the input variables IN, MAX and MIN. It checks if IN is within or outside the intervals limited by MIN and MAX.

If the low limit MIN of the interval is greater than the high limit MAX, the output OUT = MAX and the outputs OUTU and OUTL are set to 1.

IN > MAX represents a violation of the high limit, OUT = MAX, OUTU = 1 and OUTL = 0. IN < MIN represents a violation of the low limit, OUT = MIN, OUTU = 0, OUTL = 1. If IN is between MIN and MAX, OUT = IN, OUTU = 0, OUTL = 0 are set.

Troubleshooting

ENO = 0 with MIN > MAX --> OUT = MAX; OUTU = OUTL = 1

I/Os

	Name	Data type	Description	Default setting
Inputs	MAX	DINT	High limit	0
	IN	DINT	Input variable	0
	MIN	DINT	Low limit	0
Outputs	OUTU	BOOL	Out of high limits	0
	OUTL	BOOL	Out of low limits	0
	OUT	DINT	Output variable	0

9.24 EPS_DI: Accuracy approximation of DINT values

Function

This block compares the absolute value of the input IN with the value of the INTERVAL input. If the absolute value of the IN input is less than the INTERVAL limit, the QA output is set to 1 and the QN output is set to 0. In this case the input variable IN is contained in the interval. Otherwise output QA is set to 0 and output QN is set to 1. In this case the input variable IN is outside of the range of the interval.

INTERVAL must have a positive value.

If $\text{INTERVAL} \leq 0$, $\text{QA} = 0$.

Troubleshooting

ENO = 0 with IN = -2 147 483 648

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DINT	Input variable	0
	INTERVAL	DINT	Interval limit	0
Outputs	QA	BOOL	Validation bit memory	0
	QN	BOOL	Inverted validation bit memory	0

9.25 CADD_DI: Controllable adder of DINT values

Function

This block adds the input variable IN to the output variable OUT when the CI input is set to 1 and the RI and SI inputs are set to 0. If RI = 1, the OUT output is set to 0. If SI = 1 and RI = 0, then $OUT = IN$.

Troubleshooting

ENO = 0 on overflow and underflow.

Truth table

RI	SI	CI	OUT	ENO
1	X	X	0	1
0	1	X	IN	1
0	0	1	$OUT^* + IN$	1
0	0	0	OUT^*	1

X is any value

OUT^* is the old value from the last cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DINT	Addend	0
	RI	BOOL	Reset	0
	SI	BOOL	Set	0
	CI	BOOL	Count	0
Output	OUT	DINT	Sum	0

Flip-flop blocks

10.1 FLIPFLOP

CFC blocks of the "FLIPFLOP" family

This family contains the following flip-flop blocks:

JK_FF (Page 85)	JK flip-flop
RS_FF (Page 86)	RS flip-flop, reset dominant
SR_FF (Page 86)	SR flip-flop, set dominant

10.2 JK_FF

Function

Q

J	K	Q_n	$\overline{Q}_n$
0	0	Q_{n-1}	$\overline{Q}_{n-1}$
0	1	0	1
1	0	1	0
1	1	$\overline{Q}_{n-1}$	Q_{n-1}^*

*The pulse signal of the implemented tasks toggles the output values

I/Os

	Name	Data type	Description	Default setting
Inputs	J	BOOL	Set	0
	K	BOOL	Reset	0
Outputs	Q	BOOL	Output	0
	$\overline{Q}$	BOOL	Inverted output	1

10.3 RS_FF: RS flip-flop, reset dominant

Function

R	W	Q_n	$\bar{Q}_n$
0	0	Q_{n-1}	$\bar{Q}_{n-1}$
0	1	1	0
1	0	0	1
1	1	0	1

I/Os

	Name	Data type	Description	Default setting
Inputs	R	BOOL	Reset	0
	W	BOOL	Set	0
Outputs	Q	BOOL	Output	0
	$\bar{Q}$	BOOL	Inverted output	1

10.4 SR_FF: SR flip-flop, set dominant

Function

R	W	Q_n	$\bar{Q}_n$
0	0	Q_{n-1}	$\bar{Q}_{n-1}$
0	1	1	0
1	0	0	1
1	1	1	0

I/Os

	Name	Data type	Description	Default setting
Inputs	R	BOOL	Reset	0
	W	BOOL	Set	0
Outputs	Q	BOOL	Output	0
	$\bar{Q}$	BOOL	Inverted output	1

Shift blocks

11.1 SHIFT

CFC blocks of the "SHIFT" family

This family contains the following blocks to shift or rotate input-value bits and output the result:

SHL_W (Page 87)	WORD shift left
SHL_DW (Page 88)	DWORD shift left
SHR_W (Page 88)	WORD shift right
SHR_DW (Page 89)	DWORD shift right
ROL_W (Page 89)	WORD rotate left
ROL_DW (Page 90)	DWORD rotate left
ROR_W (Page 90)	WORD rotate right
ROR_DW (Page 91)	DWORD rotate right

11.2 SHL_W: WORD shift left

Function

The bits of input value IN are shifted left by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	WORD	Input value	0
	N	WORD	Number of steps	0
Output	OUT	WORD	Output	0

11.3 SHL_DW: DWORD shift left

Function

The bits of input value IN are shifted left by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DWORD	Input value	0
	N	WORD	Number of steps	0
Output	OUT	DWORD	Output	0

11.4 SHR_W: WORD shift right

Function

The bits of input value IN are shifted right by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	WORD	Input value	0
	N	WORD	Number of steps	0
Output	OUT	WORD	Output	0

11.5 SHR_DW: DWORD shift right

Function

The bits of input value IN are shifted right by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DWORD	Input value	0
	N	WORD	Number of steps	0
Output	OUT	DWORD	Output	0

11.6 ROL_W: WORD rotate left

Function

The bits of input value IN are rotated left by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	WORD	Input value	0
	N	WORD	Number of rotations	0
Output	OUT	WORD	Output	0

11.7 ROL_DW: DWORD rotate left

Function

The bits of input value IN are rotated left by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DWORD	Input value	0
	N	WORD	Number of rotations	0
Output	OUT	DWORD	Output	0

11.8 ROR_W: WORD rotate right

Function

The bits of input value IN are rotated right by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	WORD	Input value	0
	N	WORD	Number of rotations	0
Output	OUT	WORD	Output	0

11.9 ROR_DW: DWORD rotate right

Function

The bits of input value IN are rotated right by the number of steps specified in input IN. The result is displayed at the output.

I/Os

	Name	Data type	Description	Default setting
Inputs	IN	DWORD	Input value	0
	N	WORD	Number of rotations	0
Output	OUT	DWORD	Output	0

Multiplexer blocks

12.1 MULTIPLX

CFC blocks of the "MULTIPLX" family

This family contains the following blocks used to set one of n inputs to the output, depending on the value at a specific input.

MUXn_I (Page 94)	Multiplexer 1 of n for INT values (n = 2, 4, 8)
MUXn_DI (Page 95)	Multiplexer 1 of n for DINT values (n = 2, 4, 8)
MUXn_R (Page 96)	Multiplexer 1 of n for REAL values (n = 2, 4, 8)
MUXn_BO (Page 97)	Multiplexer 1 of n for BOOL values (n = 2, 4, 8)
SEL_BO (Page 98)	Multiplexer 1 of 2 for BOOL values
SEL_R (Page 98)	Multiplexer 1 of 2 for REAL values

12.2 MUXn_I: Multiplexer 1 of n for INT values

Function

The block is a multiplexer 1 of n for INT values ($n = 2, 4, 8$). One of the inputs IN0...IN7 is set to the output, depending on the value at selection input K.

Troubleshooting

ENO = 0 and OUT = 0, if $k > (n-1)$ or $k < 0$.

Function table

Number of inputs									
2	K:	0	1						
	OUT:	IN0	IN1						
4	K:	0	1	2	3				
	OUT:	IN0	IN1	IN2	IN3				
8	K:	0	1	2	3	4	5	6	7
	OUT:	IN0	IN1	IN2	IN3	IN4	IN5	IN6	IN7

I/Os

	Name	Data type	Description	Default setting
Inputs	K	INT	Selection input	0
	IN0	INT	Value 1	0
	...		...	
	INm (n-1)	INT	Value n	0
Output	OUT	INT	Output	0

12.3 MUXn_DI: Multiplexer 1 of n for DINT values

Function

The block is a multiplexer 1 of n for DINT values ($n = 2, 4, 8$). One of the inputs IN0...IN7 is set to the output, depending on the value at selection input K.

Troubleshooting

ENO = 0 and OUT = 0, if $k > (n-1)$ or $k < 0$.

Function table

Number of inputs									
2	K:	0	1						
	OUT:	IN0	IN1						
4	K:	0	1	2	3				
	OUT:	IN0	IN1	IN2	IN3				
8	K:	0	1	2	3	4	5	6	7
	OUT:	IN0	IN1	IN2	IN3	IN4	IN5	IN6	IN7

I/Os

	Name	Data type	Description	Default setting
Inputs	K	INT	Selection input	0
	IN0	DINT	Value 1	0
	...		...	
	INm (n-1)	DINT	Value n	0
Output	OUT	DINT	Output	0

12.4 MUXn_R: Multiplexer 1 of n for REAL values

Function

The block is a multiplexer 1 of n for REAL values ($n = 2, 4, 8$). One of the inputs IN0...IN7 is set to the output, depending on the value at selection input K.

Troubleshooting

ENO = 0 and OUT = 0, if $k > (n-1)$ or $k < 0$.

Function table

Number of inputs									
2	K:	0	1						
	OUT:	IN0	IN1						
4	K:	0	1	2	3				
	OUT:	IN0	IN1	IN2	IN3				
8	K:	0	1	2	3	4	5	6	7
	OUT:	IN0	IN1	IN2	IN3	IN4	IN5	IN6	IN7

I/Os

	Name	Data type	Description	Default setting
Inputs	K	INT	Selection input	0
	IN1	REAL	Value 1	0
	...		...	
	INm	REAL	Value m ($m=n-1$)	0
Output	OUT	REAL	Output	0

12.5 MUXn_BO: Multiplexer 1 of n for BOOL values

Function

The block is a multiplexer 1 of n for BOOL values ($n = 2, 4, 8$). One of the inputs IN0...IN7 is set to the output, depending on the value at selection input K.

Troubleshooting

ENO = 0 and OUT = 0, if $k > (n-1)$ or $k < 0$.

Function table

Number of inputs									
2	K:	0	1						
	OUT:	IN0	IN1						
4	K:	0	1	2	3				
	OUT:	IN0	IN1	IN2	IN3				
8	K:	0	1	2	3	4	5	6	7
	OUT:	IN0	IN1	IN2	IN3	IN4	IN5	IN6	IN7

I/Os

	Name	Data type	Description	Default setting
Inputs	K	INT	Selection input	0
	IN0	BOOL	Value 1	0
	...		...	
	INm (n-1)	BOOL	Value n	0
Output	OUT	BOOL	Output	0

12.6 SEL_BO: Multiplexer 1 of 2 for BOOL values

Function

This block sets the value of input IN0 (K = 1) or IN1 (K = 0) at the output, depending on the value at input K.

I/Os

	Name	Data type	Default setting
Inputs	K	BOOL	0
	IN0	BOOL	0
	IN1	BOOL	0
Output	OUT	BOOL	0

12.7 SEL_R: Multiplexer 1 of 2 for REAL values

Function

This block sets the value of input IN0 (K = 1) or IN1 (K = 0) at the output, depending on the value at input K.

I/Os

	Name	Data type	Default setting
Inputs	K	BOOL	0
	IN0	REAL	0.0
	IN1	REAL	0.0
Output	OUT	REAL	0.0

Counter blocks

13.1 COUNTER

CFC blocks of the "COUNTER" family

This family contains the following counter blocks:

CTU (Page 100)	Up counter
CTD (Page 101)	Down counter
CTUD (Page 102)	Up/down counter

13.2 CTU: Up counter

Function

This block is an edge-triggered up counter. On a rising edge at input S, the value PV is written to the counter. A rising edge at input CU increments the counter. The counter value is output at CV. The counter is stopped when the maximum INT value is reached. A reset signal sets the counter to 0 and restarts the up count.

Q = 0 if CV = max. INT (32767)

Q = 1 if CV > 0

Startup characteristics

The block's startup behavior is identical to its reset behavior (CV = 0).

Truth table

R	CU	CV	ENO
1	X	0	1
0	1	CV*+1	1
0	0	CV*	1

X is a random value

CV* is the old value from the previous cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	CU	BOOL	Up-count pulse	0
	R	BOOL	Reset	0
	W	BOOL	Set (load)	0
	PV	INT	Load value	1000
Outputs	Q	BOOL	Overflow	0
	CV	INT	Counter value	0

13.3 CTD: Down counter

Function

This block is an edge-triggered down counter. On a rising edge at input S, the value PV is written to the counter. A rising edge at input CD decrements the counter. The counter value is output at CV. The counter is stopped when the minimum INT value is reached. A reset signal sets the counter to 0.

Q = 0 if CV = – max. INT (-32768)

Q = 1 if CV > 0

Startup characteristics

The block's startup behavior is identical to its reset behavior (CV = 0).

Truth table

R	CD	CV	ENO
1	X	0	1
0	1	CV*-1	1
0	0	CV*	1

X is a random value

CV* is the old value from the previous cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	CD	BOOL	Down-count pulse	0
	R	BOOL	Reset	0
	W	BOOL	Set (load)	0
	PV	INT	Load value	1000
Outputs	Q	BOOL	Underflow	0
	CV	INT	Counter value	0

13.4 CTUD: Up/down counter

Function

This block is an edge-triggered up/down counter. On a rising edge at input S, the value PV is written to the counter. A rising edge at input CU increments the counter. A rising edge at input CD decrements the counter. The counter value is output at CV. Outputs QU or QD can be used to monitor the counter value. The counter is reset with R=1.

QU = 1 if CV $\geq$ 0

QU = 0 if CV = max. INT (32767)

QD = 0 if CV = – max. INT (-32768)

QD = 1 if CV > 0

Startup characteristics

The block's startup behavior is identical to its reset behavior (CV = 0).

Truth table

R	CU	CD	CV	ENO
1	X	X	0	1
0	1	0	CV*+1	1
0	0	1	CV*-1	1
0	0	0	CV*	1
0	1	1	CV*	1

X is a random value

CV* is the old value from the previous cycle

I/Os

	Name	Data type	Description	Default setting
Inputs	CU	BOOL	Up-count pulse	0
	CD	BOOL	Down-count pulse	0
	R	BOOL	Reset	0
	W	BOOL	Set (load)	0
	PV	INT	Load value	1000
Outputs	QU	BOOL	Counter at high limit	0
	QD	BOOL	Counter at low limit	0
	CV	INT	Counter value	0

Blocks for generating or processing pulses

14.1 PULSE

CFC blocks of the "PULSE" family

This family contains the following pulse-processing blocks:

TIMER_P (Page 104)	Pulse generator
R_TRIG (Page 107)	Detection of the rising edge
F_TRIG (Page 108)	Detection of the falling edge
AFP (Page 109)	Clock

14.2 TIMER_P: Pulse generator

Function

The block starts the timer in the operating mode set by the value at the MODE input:

- Pulse generator
- Extended pulse
- ON delay
- ON delay with memory
- OFF delay

Operating modes

MODE	Operating mode
0	Start pulse forming timer
1	Start extended pulse timer
2	Start ON delay timer
3	Start ON delay timer with memory
4	Start OFF delay timer

The block only applies the operating mode (MODE) on a rising edge at input I0. The timer counter PTIME is loaded with the value TIME0 and decremented periodically by the sample time SAMPLE_T. The status at the output Q0 changes according to the set MODE once the time has expired. The values at outputs Q0 = 0 and PTIME = 0 are output via RESET = 1.

Pulse diagrams

MODE=0 pulse

MODE=1 extended pulse

MODE=2 ON delay

MODE=3 ON delay with memory

MODE=4 OFF delay

Note the following when entering values:

- The sample time (SAMPLE_T) must be less than the switching time (TIME0).
- The difference between TIME0 and SAMPLE_T may not be more than 10^7 .

I/Os

	Name	Data type	Description	Default setting
Inputs	SAMPLE_T	REAL	Task sampling time in s	1.0
	TIME0	REAL	Time in s	0.0
	MODE	INT	Operating mode (see above)	0
	RESET	BOOL	Reset	0
	I0	BOOL	Input pulse	0
Outputs	QERR	BOOL	Error	1
	Q0	BOOL	Output pulse	0
	PTIME	REAL	Time-to-go	0.0

14.3 R_TRIG: Detection of the rising edge

Note

In order to ensure proper operation of the R_TRIG block, it must be installed in a watchdog interrupt (cyclic task).

Function

This block checks for a rising edge at the input variable and outputs the result. Output Q = 1 if a rising edge is detected at pulse input CLK.

Startup characteristics

The edge bit memory is set to 0 on startup.

Pulse diagram

I/Os

	Name	Data type	Description	Default setting
Input	CLK	BOOL	Input pulse	0
Output	Q	BOOL	Output pulse	0

14.4 F_TRIG: Detection of the falling edge

Note

To operate correctly, the F_TRIG block must be installed in a cyclic interrupt (cyclic task).

Function

This block checks for a falling edge at the input variable and outputs the result. Output Q = 1 if a falling edge is detected at pulse input CLK.

Startup characteristics

The edge bit memory is set to 1 on startup.

Pulse diagram

I/Os

	Name	Data type	Description	Default setting
Input	CLK	BOOL	Input pulse	0
Output	Q	BOOL	Output pulse	0

14.5 AFP: Clock

Note

To operate correctly, the AFP block must be installed in a cyclic interrupt (cyclic task).

Function

Clock. This block generates pulses according to a set pulse/break ratio. This ratio can be configured and is specified in ms units.

Startup characteristics

During startup, the counters and enable bits are set for the periods $Q = 0$ and $Q = 1$. Whereby the enable bit for $Q = 0$ will be set to 1, the other values to 0.

Pulse diagram

I/Os

	Name	Data type	Description	Default setting
Inputs	SAMPLE_T	REAL	Task sampling time in s	1.0
	T0	TIME	Interpulse period	T#0ms
	T1	TIME	Pulse duration	T#0ms
Output	Q	BOOL	Output pulse	0

Blocks for acquiring or processing time intervals and timebases

15

15.1 TIME

CFC blocks of the family

This family contains the following timer blocks:

TIME (Page 111)	Measures the execution time
TIME_BEG (Page 112)	Outputs the current time of day
TIME_END (Page 112)	Compares the input time with the actual time

15.2 TIME: Measures the execution time

Function

This block measures the time between two calls (maximum: 2 147 483 647 ms).

Note

There must be no date change between the calls otherwise there would be a negative time difference (00:00:00 – measured time).

I/Os

	Name	Data type	Description	Default setting
Inputs	DIFF	BOOL	Difference measurement ON	1
Output	OUT	TIME	Time	

15.3 TIME_BEG: Outputs the current time of day

Function

This block outputs the system time at which the block is called at output TM.

I/Os

	Name	Data type	Description	Default setting
Output	TM	TIME	Current time	T#0ms

15.4 TIME_END: Compares the input time with the actual time

Function

This block indicates the time difference between input TM and the actual system time at output TM_DIFF. Input TM of this block can be interconnected to output TM of a TIME_BEG block in order to determine the time between calls to those two blocks.

I/Os

	Name	Data type	Description	Default setting
Input	TM	TIME	Input time in ms	T#0ms
Output	TM_DIFF	TIME	Time difference	T#0ms

Control blocks

16.1 CONTROL

CFC blocks of the "CONTROL" family

This family contains the following blocks:

CONT_C (Page 114)	Continuous control (closed-loop)
CONT_S (Page 120)	Step control
PULSEGEN (Page 125)	Pulse generator

16.2 CONT_C

16.2.1 CONT_C: Continuous-action controller

Object name (type + number)

FB 1

Introduction

The CONT_C function block is used on SIMATIC S7 programmable logic controllers to control technical processes with continuous input and output variables. By means of parameter assignment you can activate or deactivate subfunctions of the PID controller to adapt the controller to the controlled system.

Application

You can use the controller as a PID fixed-setpoint controller either alone or in multi-loop feedback controls as a cascade, blending or ratio controller. The functions of the controller are based on the PID control algorithm of the sampling controller with an analog output signal, if necessary extended by including a pulse generator stage to generate pulse-duration modulated output signals for two-step or three-step controllers with proportional final controlling elements.

Description

Apart from the functions in the setpoint and process variable branches, the function block implements a complete PID controller with continuous manipulated value output and the option of influencing the manipulated value manually. The following subfunctions exist:

- Setpoint branch (Page 150)
- Process variable branch (Page 148)
- Error signal (Page 150)
- PID algorithm (Page 150)
- Manual-value processing (Page 147)
- Manipulated-value processing (Page 150)
- Disturbance variable input (Page 151)

Complete restart/Restart operating states

The CONT_C function block has a complete-restart routine.

During startup, the integrator is set internally to the initialization value I_ITVAL. When it is called in a watchdog interrupt priority class, it continues to work starting at this value.

All other outputs are set to their default values.

Error information

The error-message word RET_VAL is not used.

Input parameters

Parameters	Data type	Value range	Default setting	Description
MAN_ON	BOOL		TRUE	MANUAL VALUE ON If the "manual value on" input is set, the control loop is interrupted. A manual value is set as the manipulated value.
PVPER_ON	BOOL		FALSE	PROCESS VARIABLE PERIPHERY ON If the process variable is to be read in from the I/Os, the PV_PER input must be interconnected to the I/Os and the "process variable peripheral on" input must be set.
P_SEL	BOOL		TRUE	PROPORTIONAL ACTION ON The PID components can be activated or deactivated individually in the PID algorithm. The P component is on when the "proportional action on" input is set.
I_SEL	BOOL		TRUE	INTEGRAL ACTION ON The PID components can be activated or deactivated individually in the PID algorithm. The I component is on when the "integral action on" input is set.
INT_HOLD	BOOL		FALSE	INTEGRAL ACTION HOLD The output of the integrator can be frozen by setting the "integral action hold" input.
I_ITL_ON	BOOL		FALSE	INITIALIZATION OF THE INTEGRAL ACTION The output of the integrator can be set to the I_ITL_VAL input. The "initialization of the integral action" input must be set for this purpose.
D_SEL	BOOL		FALSE	DERIVATIVE ACTION ON The PID components can be activated or deactivated individually in the PID algorithm. The D component is on when the "derivative action on" input is set.
SAMPLE_T	REAL	$\geq 0.001 \text{ s}$	T#1s	SAMPLE TIME The time between block calls must be constant. The "sample time" input specifies the time between block calls.
SP_INT	REAL	-100.0 ... +100.0% or phys. value	0.0	INTERNAL SETPOINT The "internal setpoint" input is used to specify a setpoint.

Parameters	Data type	Value range	Default setting	Description
PV_IN	REAL	-100.0 ... +100.0% or phys. value	0.0	PROCESS VARIABLE IN An initialization value can be set at the "process variable in" input or an external process variable in floating point format can be connected.
PV_PER	WORD		W#16#0000	PROCESS VARIABLE PERIPHERAL The process variable peripheral is interconnected to the controller at the "process variable peripheral" input.
MAN	REAL	-100.0 ... +100.0% or phys. value	0.0	MANUAL VALUE The "manual value" input is used to set a manual value using the operator control and monitoring function.
GAIN	REAL		2.0	PROPORTIONAL GAIN The "proportional gain" input sets the controller gain.
TN	TIME	$\geq$ SAMPLE_T	T#20s	RESET TIME The "reset time" input determines the time response of the integrator.
TV	TIME	$\geq$ SAMPLE_T	T#10s	DERIVATIVE TIME The "derivative time" input determines the time response of the derivative unit.
TM_LAG	TIME	$\geq$ SAMPLE_T/2	T#2s	TIME LAG OF THE DERIVATIVE ACTION The algorithm of the D component includes a time lag that can be assigned at the "time lag of the derivative action" input.
DEADB_W	REAL	$\geq$ 0.0% or phys. value	0.0	DEAD BAND WIDTH A dead band is applied to the error signal. The "dead band width" input determines the size of the dead band.
LMN_HLM	REAL	LMN_LLM ... +100.0% or phys. value	100.0	MANIPULATED VALUE HIGH LIMIT The manipulated value is always limited to an upper and lower limit. The "manipulated value high limit" input specifies the upper limit.
LMN_LLM	REAL	-100.0 ... LMN_HLM % or phys. value	0.0	MANIPULATED VALUE LOW LIMIT The manipulated value is always limited to an upper and lower limit. The "manipulated value low limit" input specifies the lower limit.
PV_FAC	REAL		1.0	PROCESS VARIABLE FACTOR The "process variable factor" input is multiplied by the process variable. The input is used to adapt the process variable range.

Parameters	Data type	Value range	Default setting	Description
PV_OFF	REAL		0.0	PROCESS VARIABLE OFFSET The "process variable offset" input is added to the process variable. The input is used to adapt the process variable range.
LMN_FAC	REAL		1.0	MANIPULATED VALUE FACTOR The "manipulated value factor" input is multiplied by the manipulated value. The input is used to adapt the manipulated value range.
LMN_OFF	REAL		0.0	MANIPULATED VALUE OFFSET The "manipulated value offset" is added to the manipulated value. The input is used to adapt the manipulated value range.
I_ITLVAL	REAL	-100.0 ... +100.0% or phys. value	0.0	INITIALIZATION VALUE OF THE INTEGRAL ACTION The output of the integrator can be set at the I_ITL_ON input. The initialization value is applied to the "initialization value of the integral action" input.
DISV	REAL	-100.0 ... +100.0% or phys. value	0.0	DISTURBANCE VARIABLE For feedforward control, the disturbance variable is connected to the "disturbance variable" input.

Output parameters

Parameters	Data type	Value range	Default setting	Description
LMN	REAL		0.0	MANIPULATED VALUE The effective manipulated value is output in floating point format at the "manipulated value" output.
LMN_PER	WORD		W#16#0000	MANIPULATED VALUE PERIPHERY The manipulated value periphery is connected to the controller at the "manipulated value periphery" output.
QLMN_HLM	BOOL		FALSE	HIGH LIMIT OF MANIPULATED VALUE REACHED The manipulated value is always limited to an upper and lower limit. The "high limit of manipulated value reached" output indicates that the upper limit has been exceeded.
QLMN_LLM	BOOL		FALSE	LOW LIMIT OF MANIPULATED VALUE REACHED The manipulated value is always limited to an upper and lower limit. The "low limit of manipulated value reached" output indicates that the lower limit has been undershot.
LMN_P	REAL		0.0	PROPORTIONALITY COMPONENT The "proportional component" output contains the proportional component of the manipulated value.
LMN_I	REAL		0.0	INTEGRAL COMPONENT The "integral component" output contains the integral component of the manipulated value.
LMN_D	REAL		0.0	DERIVATIVE COMPONENT The "derivative component" output contains the derivative component of the manipulated value.
PV	REAL		0.0	PROCESS VARIABLE The effective process variable is output at the "process variable" output.
ER	REAL		0.0	ERROR SIGNAL The effective error signal is output at the "error signal" output.

Additional information

For more information, refer to the section:

CONT_C: Block diagram (Page 119)

16.2.2 CONT_C: Block diagram

16.3 CONT_S

16.3.1 CONT_S: Step controller

Object name (type + number)

FB 2

Introduction

The CONT_S function block is used on SIMATIC S7 programmable logic controllers to control technical processes with binary manipulated-value output signals for integrating final controlling elements. By means of parameter assignment you can activate or deactivate subfunctions of the PI step controller to adapt the controller to the process.

Application

You can use the controller as a PI fixed-setpoint controller or in secondary control loops in cascade, blending or ratio controllers, but not as the master controller. The functions of the controller are based on the PI control algorithm of the sampling controller supplemented by the functions for generating the binary output signal from the analog actuating signal.

The I component of the controller can be closed with $TN = T\#0ms$. In this way the block can be used as a P controller.

So that the controller can work without repeated manipulated value, the manipulated value calculated internally does not match the final controlling element position. A comparison is made if the manipulated value ($ER * GAIN$) is negative. The controller then sets the output manipulated-value signal down (QLMNDN) until the low limit signal of the repeated manipulated value (LMNR_LS) is set.

The controller can also be used in a controller cascade as a subordinate position controller. The final controlling element position is set with the setpoint input SP_INT. In this case the process-variable input and the integration time parameter (TN) have to be set to zero. A possible application would be a temperature controller with heating-capacity control via interpulse period control and cooling-capacity control via a butterfly valve.

In order to close the valve completely, the manipulated value ($ER * GAIN$) should be negative.

Description

In addition to the functions in the process-variable branch, the function block implements a complete PI controller with a binary manipulated-value output and the option of influencing the manipulated value manually. The step controller operates without repeated manipulated value. The following subfunctions exist:

- Setpoint branch (Page 150)
- Process variable branch (Page 148)
- Error signal (Page 150)
- PI step algorithm (Page 149)
- Disturbance variable input (Page 151)

Complete restart/Restart operating states

The CONT_S function block has a complete-restart routine.

All outputs are set to their default values.

Error information

The error-message word RET_VAL is not used.

Input parameters

Parameters	Data type	Value range	Default setting	Description
LMNR_HS	BOOL		FALSE	HIGH LIMIT SIGNAL OF REPEATED MANIPULATED VALUE The "control valve at upper limit stop" signal is connected to the "high limit signal of repeated manipulated value" input. LMNR_HS = TRUE means That the control valve is at the upper limit stop.
LMNR_LS	BOOL		FALSE	LOW LIMIT SIGNAL OF REPEATED MANIPULATED VALUE The "control valve at lower limit stop" signal is connected to the "low limit signal of repeated manipulated value" input. LMNR_LS = TRUE means that the control valve is at the lower limit stop.
LMNS_ON	BOOL		TRUE	MANIPULATED SIGNALS ON Manipulated-value signal processing is switched to manual at the "manipulated signals on" input.
LMNUP	BOOL		FALSE	MANIPULATED SIGNALS UP When manipulated-value signal processing is switched to manual, the output signal QLMNUP is set at the "manipulated signals up" input.

Parameters	Data type	Value range	Default setting	Description
LMNDN	BOOL		FALSE	MANIPULATED SIGNALS DOWN When manipulated-value signal processing is switched to manual, the output signal QLMNDN is set at the "manipulated signals down" input.
PVPER_ON	BOOL		FALSE	PROCESS VARIABLE PERIPHERY ON If the process variable is to be read in from the I/Os, the PV_VER input must be interconnected to the I/Os and the "process variable periphery on" input must be set.
SAMPLE_T	REAL	$\geq 0.001\text{s}$	T#1s	SAMPLE TIME The time between block calls must be constant. The "sample time" input specifies the time between block calls.
SP_INT	REAL	-100.0 ... +100.0% or phys. value	0.0	INTERNAL SETPOINT The "internal setpoint" input is used to specify a setpoint.
PV_IN	REAL	-100.0 ... +100.0% or phys. value	0.0	PROCESS VARIABLE IN An initialization value can be set at the "process variable in" input or an external process variable in floating point format can be connected.
PV_PER	WORD		W#16#0000	PROCESS VARIABLE PERIPHERAL The process variable peripheral is interconnected to the controller at the "process variable peripheral" input.
GAIN	REAL		2.0	PROPORTIONAL GAIN The "proportional gain" input sets the controller gain.
TN	TIME	$\geq \text{SAMPLE_T}$	T#20s	RESET TIME The "reset time" input determines the time response of the integrator.
DEADB_W	REAL	$\geq 0.0\%$ or phys. value	0.0	DEAD BAND WIDTH A dead band is applied to the error signal. The "dead band width" input determines the size of the dead band.
PV_FAC	REAL		1.0	PROCESS VARIABLE FACTOR The "process variable factor" input is multiplied by the process variable. The input is used to adapt the process variable range.
PV_OFF	REAL		0.0	PROCESS VARIABLE OFFSET The "process variable offset" input is added to the process variable. The input is used to adapt the process variable range.
PULSE_TM	TIME	$\geq \text{SAMPLE_T}$	T#3s	MINIMUM PULSE TIME A minimum pulse width can be set at the "minimum pulse time" parameter.

Parameters	Data type	Value range	Default setting	Description
BREAK_TM	TIME	$\geq$ SAMPLE_T	T#3s	MINIMUM BREAK TIME A minimum break duration can be set at the "minimum break time" parameter.
MTR_TM	TIME	$\geq$ SAMPLE_T	T#30s	MOTOR MANIPULATED VALUE The time required by the control valve to move from limit stop to limit stop is entered at the "motor manipulated value" parameter.
DISV	REAL	-100.0 ... +100.0% or phys. value	0.0	DISTURBANCE VARIABLE For feedforward control, the disturbance variable is connected to the "disturbance variable" input.

Output parameters

Parameters	Data type	Value range	Default setting	Description
QLMNUP	BOOL		FALSE	MANIPULATED SIGNAL UP If the "manipulated signal up" output is set, the control valve should be opened.
QLMNDN	BOOL		FALSE	MANIPULATED SIGNAL DOWN If the "manipulated signal down" output is set, the control valve should be closed.
PV	REAL		0.0	PROCESS VARIABLE The effective process variable is output at the "process variable" output.
ER	REAL		0.0	ERROR SIGNAL The effective error signal is output at the "error signal" output.

Block diagram (Page 124)

16.3.2 CONT_S: Block diagram

16.4 PULSEGEN

16.4.1 PULSEGEN: Pulse duration modulation for PID controller

Object name (type + number)

FB 3

Introduction

The PULSEGEN function block is used to structure a PID controller with pulse output for proportional final controlling elements.

Application

PID two-step or three-step controllers with pulse-duration modulation can be configured with the PULSEGEN function block. The function is normally used in conjunction with the continuous controller CONT_C (Page 114).

Description

The PULSEGEN function transforms the input variable INV (=LMN of the PID controller) by modulating the pulse duration in a pulse train with constant period time. It corresponds to the cycle time used to update the input variable and must be parameterized in PER_TM.

The duration of a pulse per period time is proportional to the input variable. The cycle assigned to PER_TM is not identical to the processing cycle of the PULSEGEN function block. Rather, a PER_TM cycle consists of several PULSEGEN function block processing cycles. In this context, the number of PULSEGEN calls per PER_TM cycle provides a measure of the accuracy of the pulse-duration modulation.

You will find more information on pulse duration modulation under: Pulse-duration modulation (Page 147)

An input variable of 30% and 10 PULSEGEN calls per PER_TM means:

- "One" at the QPOS output for the first three calls of PULSEGEN (30% of 10 calls)
- "Zero" at the QPOS output for seven further PULSEGEN calls (70% of 10 calls)

The pulse width is recalculated at the beginning of each period.

Accuracy of manipulated value

At a "sample ratio" of 1:10 (CONT_C calls to PULSEGEN calls) the accuracy of the manipulated value is restricted to 10% in this example. Default input values INV can only be mapped to a pulse width at the QPOS output with a tolerance of 10%.

Accuracy will, therefore, increase accordingly as the number of PULSEGEN calls per CONT_C call increases.

If PULSEGEN is called, for example, 100 times more often than CONT_C, a resolution of 1% of the manipulated value range is achieved.

Note

The call frequency must be programmed by the user.

Automatic synchronization

It is possible to synchronize the pulse output automatically with the block that updates the input variable INV (for example, CONT_C). This ensures that a changing input variable is output as quickly as possible as a pulse.

The pulse generator always evaluates the input variable INV at intervals corresponding to the period time PER_TM and converts the value into a pulse signal of corresponding length. Since, however, INV is usually calculated in a slower cyclic interrupt, the pulse generator should start the conversion of the discrete value into a pulse signal as soon as possible after the updating of INV.

To allow this, the block can synchronize the start of the period itself using the following procedure:

If INV changes and if the block call is not in the first or last two call cycles of a period, synchronization is performed. The pulse width is recalculated and is output in the next cycle with a new period.

Automatic synchronization can be disabled by setting the "SYN_ON" input to FALSE.

Note

When a new period starts, the old value of INV (in other words of LMN) will be simulated in the pulse signal more or less inaccurately following synchronization.

Operating modes

Depending on the parameters assigned to the pulse generator, PID controllers with a three-step output or with a bipolar or unipolar two-step output can be configured. The following table illustrates the setting of the switch combinations for the possible modes.

Operating mode	Switch		
	MAN_ON	STEP3_ON	ST2BI_ON
Three-step control	FALSE	TRUE	Any
Two-step control with bipolar control range (-100% ... +100%)	FALSE	FALSE	TRUE
Two-step control with monopolar control range (0% ... +100%)	FALSE	FALSE	FALSE
Manual operation	TRUE	Any	Any

Input parameters

Parameters	Data type	Value range	Default setting	Description
INV	REAL	-100.0 ... +100.0%	0.0	INPUT VARIABLE An analog manipulated value is connected to the "input variable" input parameter.
PER_TM	TIME	$\geq 20 * \text{SAMPLE_T}$	T#1s	PERIOD TIME The constant period time of the pulse width modulation is specified at the "Period time" input parameter. This corresponds to the sample time of the controller. The ratio between the sample time of the pulse generator and the sample time of the controller determines the accuracy of the pulse-duration modulation.
P_B_TM	TIME	$\geq \text{SAMPLE_T}$	T#0ms	MINIMUM PULSE/BREAK TIME A minimum pulse or minimum break time can be assigned at the "minimum pulse/break time" input parameter.
RATIOFAC	REAL	0.1 ... 10.0	1.0	RATIO FACTOR The "ratio factor" input parameter can be used to change the ratio of the duration of negative to positive pulses. In a thermal process, this would, for example, allow different time constants for heating and cooling to be compensated (for example, in a process with electrical heating and water cooling).

Parameters	Data type	Value range	Default setting	Description
STEP3_ON	BOOL		TRUE	THREE STEP CONTROL ON The "three step control on" input parameter activates this mode. In three-step control, both output signals are active.
ST2BI_ON	BOOL		FALSE	TWO STEP CONTROL FOR BIPOLAR MANIPULATED VALUE RANGE ON The "two step control for bipolar manipulated value range on" input parameter can be used to select between the "two-step control for bipolar manipulated value" and "two-step control for unipolar manipulated value range" modes. The STEP3_ON parameter must be set to FALSE.
MAN_ON	BOOL		FALSE	MANUAL MODE ON By setting the input parameter "manual mode on", the output signals can be set manually.
POS_P_ON	BOOL		FALSE	POSITIVE PULSE ON In manual operation with three-step control, the QPOS_P output signal can be set at the "positive pulse on" input parameter. In manual operation with two-step control, QNEG_P is always set inversely to QPOS_P.
NEG_P_ON	BOOL		FALSE	NEGATIVE PULSE ON In manual operation with three-step control, the QNEG_P output signal can be set at the "negative pulse on" input parameter. In manual operation with two-step control, QNEG_P is always set inversely to QPOS_P.
SYN_ON	BOOL		TRUE	SYNCHRONISATION ON The "synchronization on" input parameter can be set in order to synchronize the pulse output automatically with the block that updates the INV input variable. This ensures that a changing input variable is output as quickly as possible as a pulse.
SAMPLE_T	REAL	$\geq 0.001s$	1	SAMPLE TIME [s] The time between block calls must be constant. The "sample time" input specifies the time between block calls.

Note

The values of the input parameters are not limited in the block. There is no parameter check.

Output parameters

Parameters	Data type	Value range	Default setting	Description
QPOS_P	BOOL		FALSE	OUTPUT POSITIVE PULSE The "output positive pulse" output parameter is set when a pulse is to be output. In three-step control, this is always the positive pulse. In two-step control, QNEG_P is always set inversely to QPOS_P.
QNEG_P	BOOL		FALSE	OUTPUT NEGATIVE PULSE The "output negative pulse" output parameter is set when a pulse is to be output. In three-step control, this is the negative pulse. In two-step control, QNEG_P is always set inversely to QPOS_P.

Complete restart/Restart operating states

During a complete restart, all the signal outputs are set to 0.

Error information

The error-message word RET_VAL is not used.

Additional information

You can find additional information in the following sections:

Block diagram (Page 130)

Three-step control (Page 130)

Three-step control, asymmetrical (Page 132)

Two-step control (Page 133)

Manual operation in two-step or three-step control (Page 134)

16.4.2 PULSEGEN: Block diagram

16.4.3 PULSEGEN: Three-step control

Description

In "three-step control" mode, the actuating signal can adopt three states. The values of the binary output signals QPOS_P and QNEG_P are assigned to the relevant statuses of the final controlling element. The table shows the example of a temperature control:

Output signal	Final controlling element		
	Heat	Off	Cool
QPOS_P	TRUE	FALSE	FALSE
QNEG_P	FALSE	FALSE	TRUE

Based on the input variable, a characteristic curve is used to calculate a pulse width. The form of the characteristic curve is defined by the minimum pulse or minimum break time and the ratio factor. The normal value for the ratio factor is 1.

The "doglegs" in the curves are caused by the minimum pulse or minimum break times. You will find more information on characteristic curves under:

Symmetrical characteristic for three-step controller (Page 151)

Minimum pulse or minimum break time

A correctly assigned minimum pulse or minimum break time P_B_TM can prevent short on/off times that reduce the working life of switching elements and actuators.

Note

Small absolute values at the input variable LMN that would generate a pulse width shorter than P_B_TM are suppressed. Large input values that would generate a pulse width longer than (PER_TM - P_B_TM) are set to 100% or -100%.

The duration of the positive or negative pulses is calculated from the input variable (in %) multiplied by the period time. $\text{Pulse width} = \text{INV}/100 * \text{PER_TM}$

Additional information

You can find additional information in the following sections:

Three-step control, asymmetrical (Page 132)

Two-step control (Page 133)

Manual operation (Page 134)

16.4.4 PULSEGEN: Three-step control, asymmetrical

Description

The ratio factor **RATIOFAC** can be used to change the ratio of the duration of positive to negative pulses. In a thermal process, for example, this would allow different system time constants for heating and cooling.

The ratio factor also affects the minimum pulse time or period time. A ratio factor < 1 means that the threshold value for negative pulses is multiplied by the ratio factor.

Ratio factor < 1

The pulse width at the negative pulse output calculated from the input variable multiplied by the period time is reduced by the ratio factor:

Positive pulse width = $INV/100 * PER_TM$

Negative pulse width = $INV/100 * PER_TM + RATIOFAC$

Ratio factor > 1

The pulse width at the positive pulse output calculated from the input variable multiplied by the period time is reduced by the ratio factor:

Positive pulse width = $INV/100 + PER_TM$

Negative pulse width = $INV/100 * PER_TM/RATIOFAC$

Additional information

You can find additional information in the following sections:

Asymmetrical characteristic for three-step controller (Page 152) Three-step control (Page 130)

Two-step control (Page 133)

Manual operation in two-step or three-step control (Page 134)

16.4.5 PULSEGEN: Two-step control

Description

In two-step control, only the positive pulse output QPOS_P of PULSEGEN is connected to the on/off final controlling element. Depending on the manipulated-value range being used, the two-step controller will have a bipolar or a unipolar manipulated-value range.

The negated output signal is available at QNEG_P if the interconnection of the two-step controller in the control loop requires a logically-inverted binary signal for the actuating pulses.

Pulse	Final cont. el. on	Final cont. el. off
QPOS_P	TRUE	FALSE
QNEG_P	FALSE	TRUE

Additional information

You can find additional information in the following sections:

Characteristic with bipolar range of manipulated values (Page 148)

Characteristic with unipolar range of manipulated values (Page 149)

Three-step control (Page 130)

Three-step control, asymmetrical (Page 132)

Manual operation in two-step or three-step control (Page 134)

16.4.6 PULSEGEN: Manual operation in two-step or three-step control

Description

In manual operation (MAN_ON = TRUE), the binary outputs of the three-step or two-step controller can be set using the POS_P_ON and NEG_P_ON signals regardless of INV.

	POS_P_ON	NEG_P_ON	QPOS_P	QNEG_P
Three-step control	FALSE	FALSE	FALSE	FALSE
	TRUE	FALSE	TRUE	FALSE
	FALSE	TRUE	FALSE	TRUE
	TRUE	TRUE	FALSE	FALSE
Two-step control	FALSE	Any	FALSE	TRUE
	TRUE	Any	TRUE	FALSE

Additional information

System function blocks (SFBs)

17.1 EVENT: Start of the priority class

CFC blocks of the "SYSTEM" family

This family contains the following system calls provided by the M7-300/400 run-time system:

EVENT (Page 136)	Generation of a software interrupt whose name is forwarded as a parameter
DELAY (Page 136)	Delay for all start events until processing is enabled
EDELAY (Page 137)	Enable signal for delayed start events
DISCARD (Page 137)	Discards all (not yet started) start events, in order to run the called task without interruption
EDISCARD (Page 138)	Enable signal for all new start events
LASTERR (Page 138)	Determines the error code of the I/O error and errors in the SFBs DELAY, EDELAY, DISCARD, EDISCARD, P_REASON
SYSTIME (Page 139)	Determines the system time
P_REASON (Page 139)	Determines the cause of process interrupts

17.2 DELAY

Note

The block can only be used for M7-300/400 run-time systems!

Function

The block generates a software interrupt. It starts the task whose name is set at the TN input.

If a name is specified to which no task has been assigned, an error will be reported during compilation and consistency checking.

I/Os

	Name	Data type	Description	Default setting
Input	TN	TASK	Task name	0

17.3 DELAY: Delaying the start event

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block enables the operation of a calling task without interruptions by other tasks. All queued start events are delayed either until processing is enabled (via the EDELAY (Page 137) block) or until the task currently being executed has been completed.

All queued start events are then executed.

Any errors that occur during task processing can be queried via the LASTERR (Page 138) block.

17.4 EDELAY: Enable signal for delayed start events

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block enables delayed start events. These events must have been delayed initially via the DELAY (Page 136) block.

Any errors that occur during task processing can be queried via the LASTERR (Page 138) block.

17.5 DISCARD: All arising start events are discarded

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block enables the operation of a calling task without interruptions by other tasks. All queued start events are discarded, i.e., the tasks are not started. Events already registered (delayed) are processed. Process interrupts are acknowledged immediately.

All queued start events are discarded either until processing is enabled (via the EDISCARD (Page 138) block) or until the task currently being executed has been completed.

Any errors that occur during task processing can be queried via the LASTERR (Page 138) block.

17.6 EDISCARD: Enable signal for all new start events

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block enables queued start events. These events must have been discarded initially via the DISCARD (Page 137) block.

Any errors that occur during task processing can be queried via the LASTERR (Page 138) block.

17.7 LASTERR: Determining the error code in DELAY, EDELAY, DISCARD, EDISCARD, P_REASON

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block returns the error code of the last error that occurred for the following error classes:

- I/O errors
- Errors in the system blocks DELAY (Page 136), EDELAY (Page 137), DISCARD (Page 137), EDISCARD (Page 138), P_REASON (Page 139)

The possible values represent a subset of M7 system software error codes. For additional information, refer to file M7API.H or to the M7 system software documentation.

I/Os

	Name	Data type	Description	Default setting
Output	ERR	DINT	Error code	0

17.8 SYSTIME: Determines the system time

Note

The block can only be used for M7-300/400 run-time systems!

Function

This block can be used to determine the system time and display it in TIME format at its output.

I/Os

	Name	Data type	Description	Default setting
Output	TIME	TIME	System time	0

17.9 P_REASON: Determining the cause of the process interrupt

Function

This block can be used to locate the cause of a process interrupt.

The name of the task required is specified at input TN. The block will not have any effect if this task is not a process interrupt.

Additional information the process alarm had output during its last call is written to the STATE output. This additional information refers to specific modules and its byte sequence is, therefore, returned in INTEL format.

The MASK output also returns the interrupt mask configured in CFC for this process-interrupt task.

Any errors that occur during task processing can be queried via the LASTERR (Page 138) block.

I/Os

	Name	Data type	Description	Default setting
Input	TN	TASK	Task name	0
Outputs	STATE	STATE	Alarm state	0
	MASK	DWORD	Alarm mask	0

17.10 FRC_CFC: Internal Block

Object name (type + number)

FB 136

This block is a system block and is only used internally. There is therefore no help available for it.

AS-wide blocks

18.1 IK_STATE

IK_STATE: Display status of an AS-wide connection

Object name (type + number)

FC 157

Application

The block is used in a CFC chart when AS-wide connections are used and when the error status of these connections is to be evaluated in the user program.

Insert one instance of the block in the CFC chart on the sending and receiving end for each AS-wide connection.

Remove the instances when you have deleted the AS-wide connection.

Function

The block will output the error status of the AS-wide connection whose ID was configured at the NETPRO_ID input.

The block outputs a separate bit for each error. A group error is also available. An error will also be issued if the specified NETPRO_ID does not exist.

Troubleshooting

The return value RET_VAL is not used.

Input parameters

Parameter	Data type	Default setting	Description
NETPRO_ID	INT	0	NETPRO_ID of the connection
MasterDB	INT	0	DB number of the Master DB. Automatically entered by the CFC

Output parameters

Parameter	Data type	Default setting	Description
SendErr	BOOL	FALSE	Send error Display in BSEND
RcvErr	BOOL	FALSE	Receive error Display in BRCV
SendOvl	BOOL	FALSE	Sender overload This error can be created when processing of the intermediate send buffers is too slow.
RcvOv	BOOL	FALSE	Receiver overload This error can be created when processing of the intermediate receive buffers is too slow.
RcvChg	BOOL	FALSE	Inconsistent change at receiver 1. The AS-wide connection has been reconfigured at the receiver end, which also has an effect on the sender. This could not be reached at that time. 2. The AS-wide connection has been reconfigured at the sender end, which also has an effect on the receiver. This could not be reached at that time. 3. Sender and receiver have different AS-wide data structures due to different charging states.
RcvTmout	BOOL	FALSE	Receiver timeout Possible reasons: 1. STOP the sending AS 2. Sender has not loaded BSEND (yet)
SysErr	BOOL	FALSE	System error AS-wide data block does not exist, for example
GroupErr	BOOL	FALSE	Group error of the 8 errors above
ConnNA	BOOL	FALSE	Configured NETPRO_ID does not exist

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.2 IK_MANAG

IK_MANAG

Object name (type+number)

FC152

Application

The "IK_MANAG block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.3 IK_SEND

IK_SEND

Object name (type+number)

FC155

Application

The "IK_SEND block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.4 IK_RCV

IK_RCV

Object name (type+number)

FC156

Application

The "IK_RCV block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.5 IK_CP_OU

IK_CP_OU

Object name (type+number)

FC154

Application

The "IK_CP_OU block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.6 IK_CP_IN

IK_CP_IN

Object name (type+number)

FC153

Application

The "IK_CP_IN block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

18.7 IK_ALARM

IK_ALARM

Object name (type+number)

FB244

Application

The "IK_ALARM block is part of the runtime system to support the AS-wide interconnections; it is copied during initial creation of an AS-wide interconnection to the block folder of the S7 program.

Therefore this block will not be described in detail.

Additional information on AS-wide connection is available in the help "CFC for SIMATIC S7 > Creating runtime structures > Creating and working with interconnections > Creating AS-wide interconnections".

Appendix

19.1 Manual value processing

It is possible to switch between manual and automatic operation. In the case of manual operation the manipulated variable is corrected to a manual value.

The integrator (INT) is set internally to $LMN - LMN_P - DISV$ and the differentiator (DIF) to 0, and then adjusted internally. This means that switching over to automatic operation will be smooth.

19.2 Pulse duration modulation

Key	
1	PULSEGEN cycle
2	Cycle CONT_C

19.3 Process variable branch

The process variable can be read in as a peripheral or floating-point value. The function CRP_IN converts the peripheral value PV_PER into a floating-point format from -100 to +100% in accordance with the following rule:

$$\text{Output of CRP_IN} = \text{PV_PER} * 100/27648$$

The function PV_NORM normalizes the output of CRP_IN in accordance with the following rule:

$$\text{Output of PV_NORM} = (\text{output of CRP_IN}) * \text{PV_FAC} + \text{PV_OFF}$$

The default value of PV_FAC is 1 and that of PV_OFF is 0.

19.4 Characteristic with bipolar range of manipulated values

Range of manipulated values -100% to 100%

Key	
1	Continuous "Off"
2	Duration of the positive pulse
3	Continuous "On"

19.5 Characteristic with unipolar range of manipulated values

Range of manipulated values 0% to 100%

Key	
1	Duration of the positive pulse

19.6 PI step algorithm

This function block runs without a repeated manipulated value. The I component of the PI algorithm and the assumed repeated manipulated value are calculated in one integrator (INT) and compared as a feedback value with the remaining P component. The difference then goes to a three-step element (THREE_ST) and to a pulse generator (PULSEOUT), which generates the pulses for the control valve. The switching frequency of the controller is reduced by adapting the response threshold of the three-step element.

19.7 PID algorithm

The PID algorithm functions as a manipulated variable algorithm. The proportional, integral (INT) and differential (DIF) components are connected in parallel and can be switched in or out individually. In this way P, PI, PD and PID controllers and even pure I and D controllers can be configured,

19.8 Error signal

The difference between setpoint value and process variable constitutes the error signal. In order to suppress a minor sustained oscillation due to quantization of manipulated values (for example, in the case of pulse duration modulation with PULSEGEN or limited resolution of the manipulated value by the control valve) the error signal is routed via a dead zone (DEADBAND). When DEADB_W = 0 the dead band is switched out.

19.9 Setpoint branch

The setpoint branch is input at input SP_INT in floating-point format.

19.10 Manipulated value processing

The manipulated value is limited to pre-definable values using the LMNLIMIT function. Signaling bits are set whenever the limits are exceeded.

The function LMN_NORM normalizes the output of LMNLIMIT in accordance with the following rule:

$$\text{LMN} = (\text{output of LMNLIMIT}) * \text{LMN_FAC} + \text{LMN_OFF}$$

The default value of LMN_FAC is 1 and that of LMN_OFF is 0.

The manipulated value is also available in periphery format. The function CRP_OUT converts the floating-point value LMN into a peripheral value in accordance with the following rule:

$$\text{LMN_PER} = \text{LMN} * 27648/100$$

19.11 Disturbance variable input

A disturbance variable can be feedforward-controlled additively at the DISV input.

19.12 Symmetrical characteristic for three-step controller

Ratio factor = 1

Key	
1	Duration of the positive pulse
2	Continuous "On"
3	Continuous "Off"
4	Duration of the negative pulse

19.13 Asymmetrical characteristic for three-step controller

Ratio factor = 0.5

Key	
1	Duration of the positive pulse
2	Duration of the negative pulse
