1 Parameters

1.1 Introduction to MICROMASTER 440 System Parameters

The layout of the parameter description is as follows.

1 Par number [index]	2 Parameter name	5 Datatype	7 Unit:	9 Min:	12 Level:
	3 CStat:	6 active:	8 Quick Comm:	10 Def:	2
	4 P-Group:			11 Max:	
13	Description:				

1. Parameter number

Indicates the relevant parameter number. The numbers used are 4-digit numbers in the range 0000 to 9999. Numbers prefixed with an “r” indicate that the parameter is a “read-only” parameter, which displays a particular value but cannot be changed directly by specifying a different value via this parameter number (in such cases, dashes “-“ are entered at the points “Unit”, “Min”, “Def” and “Max” in the header of the parameter description.

All other parameters are prefixed with a “P”. The values of these parameters can be changed directly in the range indicated by the “Min” and “Max” settings in the header.

[index] indicates that the parameter is an indexed parameter and specifies the number of indices available.

2. Parameter name

Indicates the name of the relevant parameter. Certain parameter names include the following abbreviated prefixes: BI, BO, CI, and CO followed by a colon.

These abbreviations have the following meanings:

BI	= Binector input, i.e. parameter selects the source of a binary signal
BO	= Binector output, i.e. parameter connects as a binary signal
CI	= Connector input, i.e. parameter selects the source of an analog signal
CO	= Connector output, i.e. parameter connects as an analog signal
CO/BO	= Connector/Binector output, i.e. parameter connects as an analog signal and/or as a binary signal

To make use of BiCo you will need access to the full parameter list. At this level many new parameter settings are possible, including BiCo functionality. BiCo functionality is a different, more flexible way of setting and combining input and output functions. It can be used in most cases in conjunction with the simple, level 2 settings.

The BiCo system allows complex functions to be programmed. Boolean and mathematical relationships can be set up between inputs (digital, analog, serial etc.) and outputs (inverter current, frequency, analog output, relays, etc.).

3. CStat

Commissioning status of the parameter. Three states are possible:

Commissioning	C
Ready to run	U
Run	T

This indicates when the parameter can be changed. One, two or all three states may be specified. If all three states are specified, this means that it is possible to change this parameter setting in all three inverter states

4. **P-Group**

Indicates the functional group of the particular.

Note

Parameter P0004 (parameter filter) acts as a filter and focuses access to parameters according to the functional group selected.

5. **Datatype**

The data types available are shown in the table below.

Notation	Meaning
U16	16-bit unsigned
U32	32-bit unsigned
I16	16-bit integer
I32	32-bit integer
Float	Floating point

6. **Active**

Indicates whether

- ◆ Immediately changes to the parameter values take effective immediately after they have been entered, or
- ◆ Confirm the "P" button on the operator panel (BOP or AOP) must be pressed before the changes take effect.

7. **Unit**

Indicates the unit of measure applicable to the parameter values

8. **QuickComm**

Indicates whether or not (Yes or No) a parameter can only be changed during quick commissioning, i.e. when P0010 (parameter groups for commissioning) is set to 1 (quick commissioning).

9. **Min**

Indicates the minimum value to which the parameter can be set.

10. **Def**

Indicates the default value, i.e. the value which applies if the user does not specify a particular value for the parameter.

11. **Max**

Indicates the maximum value to which the parameter can be set.

12. **Level**

Indicates the level of user access. There are four access levels: Standard, Extended, Expert and Service. The number of parameters that appear in each functional group depends on the access level set in P0003 (user access level).

13. **Description**

The parameter description consists of the sections and contents listed below. Some of these sections and contents are optional and will be omitted on a case-to-case basis if not applicable.

Instructions for use:

- Step 1: Set P0003 = 3 (expert user)
- Step 2: Go to P0013 indices 0 to 16 (user list)
- Step 3: Enter into P0013 index 0 to 16 the parameters required to be visible in the user-defined list. The following values are fixed and cannot be changed:
 - P0013 index 19 = 12 (key for user defined parameter)

 - P0013 index 17 = 3 (user access level)
- Step 4: Set P0003 = 0 to activate the user defined parameter.

Dependency:

First, set P0011 ("lock") to a different value than P0012 ("key") to prevent changes to user-defined parameter. Then, set P0003 to 0 to activate the user-defined list.

When locked and the user-defined parameter is activated, the only way to exit the user-defined parameter (and view other parameters) is to set P0012 ("key") to the value in P0011 ("lock").

P0100	Europe / North America			Min: 0	Level: 1
	CStat: C	Datatype: U16	Unit: -	Def: 0	
	P-Group: QUICK	Active: first confirm	QuickComm. Yes	Max: 2	

Determines whether power settings (e.g. nominal rating plate power - P0307) are expressed in [kW] or [hp].

The default settings for the nominal rating plate frequency (P0310) and maximum motor frequency (P1082) are also set automatically here, in addition to reference frequency (P2000).

Settings:

- 0 Europe [kW], frequency default 50 Hz
- 1 North America [hp], frequency default 60 Hz
- 2 North America [kW], frequency default 60 Hz

Dependency:

The setting of DIP switch 2 under the I/O board determines the validity of settings 0 and 1 for P0100 according to the table below:

DIP 2 setting	Meaning		P0100 setting	Meaning
OFF	[kW], frequency default 50 [Hz]	overwrites	1	[hp], frequency default 60 [Hz]
ON	[hp], frequency default 60 [Hz]	overwrites	0	[kW], frequency default 50 [Hz]

Stop drive first (i.e. disable all pulses) before you change this parameter.

P0010 = 1 (commissioning mode) enables changes to be made.

Changing P0100 resets all rated motor parameters as well as other parameters that depend on the rated motor parameters (see P0340 - calculation of motor parameters).

Notice:

P0100 setting 2 (==> [kW], frequency default 60 [Hz]) is not overwritten by the setting of DIP switch 2 (see table above).

P0205	Inverter application	Min: 0	Level: 3	
	CStat: C	Datatype: U16		Unit: -
	P-Group: INVERTER	Active: first confirm		QuickComm. Yes

Selects inverter application.

Constant torque (CT):

CT is used if the application needs a constant torque on the whole frequency range.

Variable torque (VT):

VT is used if the application has a parabolic frequency-torque characteristic like many fans and pumps.

Variable torque allows with the same inverter:

- * Higher rated inverter current r0207
- * Higher rated inverter power r0206
- * Higher threshold for I2t protection

If P0205 is modified in quick commissioning it immediately calculates various motor parameters

- 1. Rated motor current P0305 (Level 2)
- 2. Rated motor power P0307 (Level 2)
- 3. Motor overload factor P0640 (Level 2)
- 4. Control mode P1300 (Level 2)

It is recommended to modify P0205 first. Afterwards motor parameter may be adapted. Motor parameter will be overridden by changing this sequence.

Settings:

- 0 Constant torque
- 1 Variable torque

Note:

The parameter value is not reset by the factory setting (see P970).

To set P0205 = 1 (variable torque) is not possible for all inverters.

Notice:

Use setting 1 (variable torque) only for variable-torque applications (e.g. pumps and fans). If used for constant-load applications, I2t warning will be produced too late, causing overheating in the motor.

	CStat: CT	Datatype: U16	Unit: V	Def: 230	
	P-Group: INVERTER	Active: Immediately	QuickComm. No	Max: 1000	

Optimizes Vdc controller, which extends the ramp-down time if regenerative energy from motor would otherwise cause DC link overvoltage trips.

Reducing the value enables controller to cut in earlier and reduce the risk of overvoltage.

Dependency:

Set P1254 ("Auto detect Vdc switch-on levels") = 0. Cut-in levels for Vdc-controller and compound braking are then derived directly from P0210 (supply voltage).

Vdc_min switch-on level = $P1245 * V_{mains}$
Vdc_max switch-on level = $1.15 * \sqrt{2} * V_{mains}$
Compound braking switch-on level = $1.13 * \sqrt{2} * V_{mains}$
Dynamic braking switch-on level = $1.13 * \sqrt{2} * V_{mains}$

Note:

If mains voltage is higher than value entered, automatic deactivation of the Vdc controller may occur to avoid acceleration of the motor. An alarm will be issued in this case (A0910).

r0231[2]	Max. cable length	Datatype: U16	Unit: m	Min: -	Level: 3

Notice:

For full EMC compliance, the screened cable must not exceed 25 m in length when an EMC filter is fitted.

Settings:

0 Reduce output frequency (usually only effective on variable torque appl.)
1 Trip (F0004)
2 Reduce pulse frequency and output frequency
3 Reduce pulse frequency then trip (F0004)

Notice:

A trip will always result eventually, if the action taken does not sufficiently reduce internal temperature.

The pulse frequency is normally reduced only if higher than 2 kHz (see P0291 - configuration of inverter protection).

	CStat: CT	Datatype: U16	Unit: -	Def: 0	
	P-Group: TERMINAL	Active: first confirm	QuickComm. No	Max: 4	

Defines type of analog input and also enables analog input monitoring.

To switch over from voltage to current analog input it is not sufficient to merely modify parameter P0756. Rather, the DIPs on the terminal board must also be set to the correct position. The DIP settings are as follows:

- OFF = voltage input (10 V)
- ON = current input (20 mA)

Allocation of DIPs to analog inputs is as follows:

- DIP on left (DIP 1) = Analog input 1
- DIP on right (DIP 2) = Analog input 2

Settings:

- 0 Unipolar voltage input (0 to +10 V)
- 1 Unipolar voltage input with monitoring (0 to 10 V)
- 2 Unipolar current input (0 to 20 mA)
- 3 Unipolar current input with monitoring (0 to 20 mA)
- 4 Bipolar voltage input (-10 V to +10 V)

Index:

- P0756[0] : Analog input 1 (ADC 1)
- P0756[1] : Analog input 2 (ADC 2)

Dependency:

Notice:

When monitoring is enabled and a deadband defined (P0761), a fault condition will be generated (F0080) if the analog input voltage falls below 50 % of the deadband voltage.

Details:

See P0757 to P0760 (ADC scaling).

Parameters P0757 - P0760 configure the input scaling as shown in the diagram:

Where:

- Analog setpoints represent a [%] of the normalized frequency in P2000.
- Analog setpoints may be larger than 100 %
- ASPmax represents highest analog setpoint (this may be at 10 V).
- ASPmin represents lowest analog setpoint (this may be at 0 V).
- Default values provide a scaling of 0 V = 0 %, and 10 V = 100 %.

	CStat: CUT	Datatype: Float	Unit: -	Def: 0	
	P-Group: TERMINAL	Active: first confirm	QuickComm. No	Max: 20	

Defines width of deadband on analog input. The diagrams below explain its use

Example:

ADC value 2 to 10 V (0 to 50 Hz)
 The above example produces a 2 to 10 V analog input (0 to 50 Hz)
 P0757 = 2 V P0761 = 2 V P2000 = 50 Hz

ADC value 2 to 10 V (-50 to +50 Hz)
 The above example produces a 2 to 10 V analog input (-50 to +50 Hz) with center zero and a "holding point" 0.2 V wide.
 P0758 = -100 % P0761 = 0.1 (0.1 V to each side of center)

Index:

- P0761[0] : Analog input 1 (ADC 1)
- P0761[1] : Analog input 2 (ADC 2)

Note:

P0761[x] = 0 : No deadband active.

Notice:

Deadband starts from 0 V to value of P0761, if both values of P0758 and P0760 (y coordinates of ADC scaling) are positive or negative respectively. However, deadband is active in both directions from point of intersection (x axis with ADC scaling curve), if sign of P0758 and P0760 are opposite.

Fmin (P1080) should be zero when using center zero setup. There is no hysteresis at the end of the deadband.

Parameters of DAC scaling block (P0777 ... P0781) work as follows:

Where:
Points P1 (x1, y1) and P2 (x2, y2) can be chosen freely.

Example:

The default values of the scaling block provides a scaling of P1: 0.0 % = 0 mA or 0 V and P2: 100.0 % = 20 mA or 20 V.

r0947[8]	Last fault code	Datatype: U16	Unit: -	Min: -	Level: 2
	P-Group: ALARMS			Def: - Max: -	

Displays fault history according to the diagram below

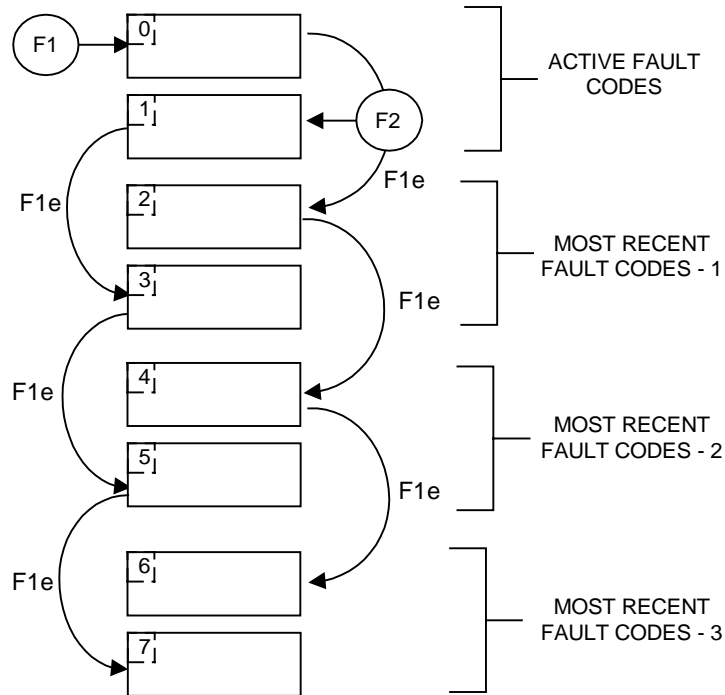

where:

"F1" is the first active fault (not yet acknowledged).

"F2" is the second active fault (not yet acknowledged).

"F1e" is the occurrence of the fault acknowledgement for F1 & F2.

This moves the value in the 2 indices down to the next pair of indices, where they are stored. Indices 0 & 1 contain the active faults. When faults are acknowledged, indices 0 & 1 are reset to 0.

Example:

If the inverter trips on undervoltage and then receives an external trip before the undervoltage is acknowledged, you will obtain:

Index 0 = 3 Undervoltage

Index 1 = 85 External trip

Whenever a fault in index 0 is acknowledged (F1e), the fault history shifts as indicated in the diagram above.

P1001[3]	Fixed frequency 1			Min: -650.00	Level: 2
	CStat: CUT	Datatype: Float	Unit: Hz	Def: 0.00	
	P-Group: SETPOINT	Active: Immediately	QuickComm. No	Max: 650.00	

Defines fixed frequency setpoint 1.

There are 3 types of fixed frequencies:

1. Direct selection
2. Direct selection + ON command
3. Binary coded selection + ON command

1. Direct selection (P0701 - P0706 = 15)

In this mode of operation 1 digital input selects 1 fixed frequency.

If several inputs are active together, the selected frequencies are summed.

E.g.: FF1 + FF2 + FF3 + FF4 + FF5 + FF6.

2. Direct selection + ON command (P0701 - P0706 = 16)

The fixed frequency selection combines the fixed frequencies with an ON command.

In this mode of operation 1 digital input selects 1 fixed frequency.

If several inputs are active together, the selected frequencies are summed.

E.g.: FF1 + FF2 + FF3 + FF4 + FF5 + FF6.

3. Binary coded selection + ON command (P0701 - P0706 = 17)

Up to 16 fixed frequencies can be selected using this method. The fixed frequencies are selected according to the following table:

		DIN4	DIN3	DIN2	DIN1
	OFF	Inactive	Inactive	Inactive	Inactive
P1001	FF1	Inactive	Inactive	Inactive	Active
P1002	FF2	Inactive	Inactive	Active	Inactive

	CStat: CUT	Datatype: U16	Unit: -	Def: 0	
	P-Group: FUNC	Active: first confirm	QuickComm. No	Max: 6	

Starts inverter onto a spinning motor by rapidly changing the output frequency of the inverter until the actual motor speed has been found. Then, the motor runs up to setpoint using the normal ramp time.

Settings:

- 0 Flying start disabled
- 1 Flying start is always active, start in direction of setpoint
- 2 Flying start is active if power on, fault, OFF2, start in direction of setpoint
- 3 Flying start is active if fault, OFF2, start in direction of setpoint
- 4 Flying start is always active, only in direction of setpoint
- 5 Flying start is active if power on, fault, OFF2, only in direction of setpoint
- 6 Flying start is active if fault, OFF2, only in direction of setpoint

Note:

Useful for motors with high inertia loads.

Settings 1 to 3 search in both directions.

Settings 4 to 6 search only in direction of setpoint.

Notice:

Flying start must be used in cases where the motor may still be turning (e.g. after a short mains break) or can be driven by the load. Otherwise, overcurrent trips will occur.

	CStat: CUT	Datatype: U16		Unit: %

- P1202[1] : 2nd. Drive data set (DDS)

P1203[3]	Search rate: Flying start	Min: 10	Level: 3	
	CStat: CUT	Datatype: U16		Unit: %
	P-Group: FUNC	Active: first confirm		QuickComm. No Def: 100 Max: 200

Sets factor by which the output frequency changes during flying start to synchronize with turning motor. This value is entered in [%] relative to the default time factor defines the initial gradient in the curve below (and thus influences the time taken to search for the motor frequency):

The search time is the time taken to search through all frequencies between $f_{max} + 2 \times f_{slip}$ to 0 Hz.

P1203 = 100 % is defined as giving a rate of 2 % of $f_{slip,nom}$ / [ms]
 P1203 = 200 % would result in a rate of frequency change of 1 % of $f_{slip,nom}$ / [ms]

Example:

For a motor with 50 Hz, 1350 rpm, 100 % would produce a maximum search time of 600 ms. If the motor is turning, the motor frequency is found in a shorter time.

- P1203[1] : 2nd. Drive data set (DDS)
- P1203[2] : 3rd. Drive data set (DDS)

Note:

A higher value produces a flatter gradient and thus a longer search time.
 A lower value has the opposite effect.

P1215	Holding brake enable	Min: 0	Level: 2	
	CStat: T	Datatype: U16		Def: 0
	P-Group: FUNC	Active: first confirm		QuickComm. No Max: 1

Enables/disables holding brake function. This function applies the following profile to the inverter:

Relay switching is also possible at point 1 and point 2 (if programmed in P0731 = 52.C) to control a brake.

- Settings:**
- 0 Motor holding brake disabled
 - 1 Motor holding brake enabled

Note: The brake relay opens at point 1, if enabled using P0731 (function of digital output), and closes at point 2.

P1216	Holding brake release delay	Min: 0	Level: 2	
	CStat: T	Datatype: Float		Unit: s
	P-Group: FUNC	Active: first confirm		QuickComm. No Def: 1.0 Max: 20.0

Defines period during which inverter runs at f_min before ramping up at point 1 (as shown in P1215 - holding brake enable). Inverter starts at f_min on this profile, i.e. it does not use a ramp.

Note: A typical value of f_min for this type of application is the slip frequency of the motor.

You can calculate the rated slip frequency by using the following formula:

$$\frac{n_{syn} - n_n}{n_{syn}} * f_n$$

Notice: If used to hold the motor at a certain frequency against a mechanical brake (i.e. you are using a relay to control mechanical brake), it is important that f_min < 5 Hz; otherwise, the current drawn may be too high and the relay may not open.

	CStat: CUT Datatype: U32 Unit: - Def: 0:0	P-Group: COMMANDS Active: first confirm QuickComm. No Max: 4000:0	
Enables DC braking via a signal applied from an external source. Function remains active while external input signal is active.			
DC braking causes the motor to stop rapidly by applying a DC braking current (current applied also holds shaft stationary).			
When the DC braking signal is applied, the inverter output pulses are blocked and the DC current is not applied until the motor has been sufficiently demagnetized.

P1237	Dynamic braking	Min: 0	Level:
	CStat: CUT	Datatype: U16	Def: 0
	P-Group: FUNC	Active: Immediately	QuickComm. No Max: 5

Dynamic braking absorbs the braking energy. This parameter defines the rated duty cycle of the braking resistor (chopper resistor).

$$\text{Dynamic braking switch-on level} = 1.13 * \sqrt{2} * V_{\text{mains}} = 1.13 * \sqrt{2} * P0210$$

Settings:

- 1 5 % duty cycle
- 2 10 % duty cycle
- 3 20 % duty cycle
- 4 50 % duty cycle
- 5 100 % duty cycle

Notice:

Initially the brake will operate at a high duty cycle dependant on the DC link level until the thermal limit is approached. The duty cycle specified by this parameter will then be imposed. The resistor should be able to operate at this level indefinitely without overheating.

P1240[3]	Configuration of Vdc controller	Min: 0	Level:
	CStat: CT	Datatype: U16	Def: 1
	P-Group: FUNC	Active: Immediately	QuickComm. No Max: 3

Enables / disables Vdc controller.

The Vdc controller dynamically controls the DC link voltage to prevent overvoltage trips on high inertia systems.

Settings:

- 0 Vdc controller disabled
- 1 Vdc-max controller enabled
- 2 Vdc-min controller (Kinetic buffering) enabled

Note:

Vdc max automatically increases ramp-down times to keep the DC-link voltage (r0026) within limits (P2172)

Vdc min is activated if DC-link voltage falls below minimum level. The kinetic energy of the motor is then used to buffer the DC-link voltage, thus causing deceleration of the drive.

Dependency:

Limited internally to 200 Hz or 5 * rated motor frequency (P0305) when P1300 >= 20 (control mode = vector control). The value is displayed in r0209 (maximum frequency)

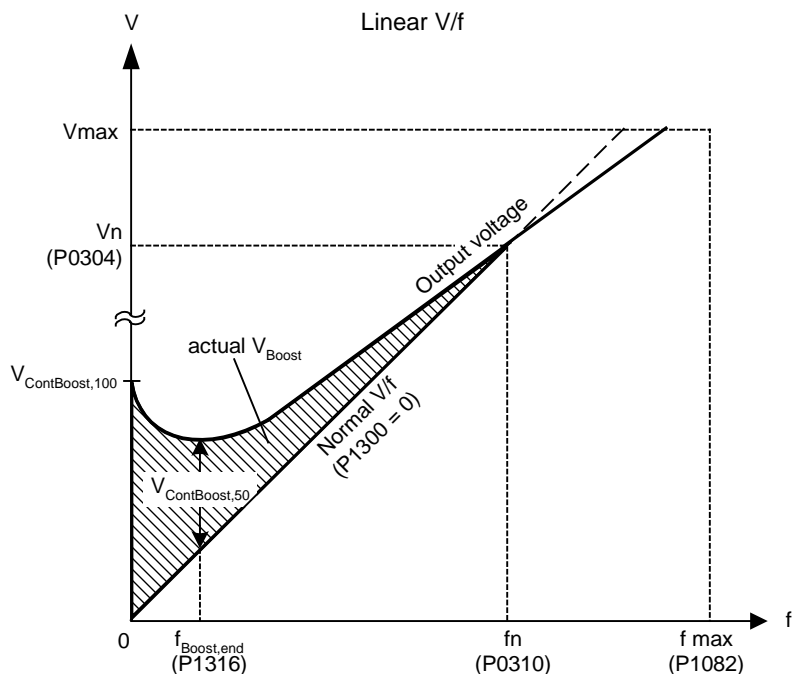

Note:

- P1300 = 1 : V/f with FCC

- * If FCC is chosen, linear V/f is active at low frequencies.

- P1300 = 2 : V/f with a quadratic curve
- * Suitable for centrifugal fans / pumps

P1310[3]	Continuous boost	Datatype: Float	Unit: %	Min: 0.0	Level: 2
	CStat: CUT	Active: Immediately	QuickComm. No	Def: 50.0	
	P-Group: CONTROL			Max: 250.0	

Defines boost level in [%] relative to P0305 (rated motor current) applicable to both linear and quadratic V/f curves according to the diagram below:

where
 $V_{Boost,100}$ = voltage given by rated motor current (P0305) * Stator resistance (P0350)

Index:

- P1310[0] : 1st. Drive data set (DDS)
- P1310[1] : 2nd. Drive data set (DDS)
- P1310[2] : 3rd. Drive data set (DDS)

Dependency:

Setting in P0640 (motor overload factor [%]) limits the boost.

Note:

The boost values are combined when continuous boost (P1310) used in conjunction with other boost parameters (acceleration boost P1311 and starting boost P1312). However priorities are allocated to these parameters as follows:

P1310 > P1311 > P1312

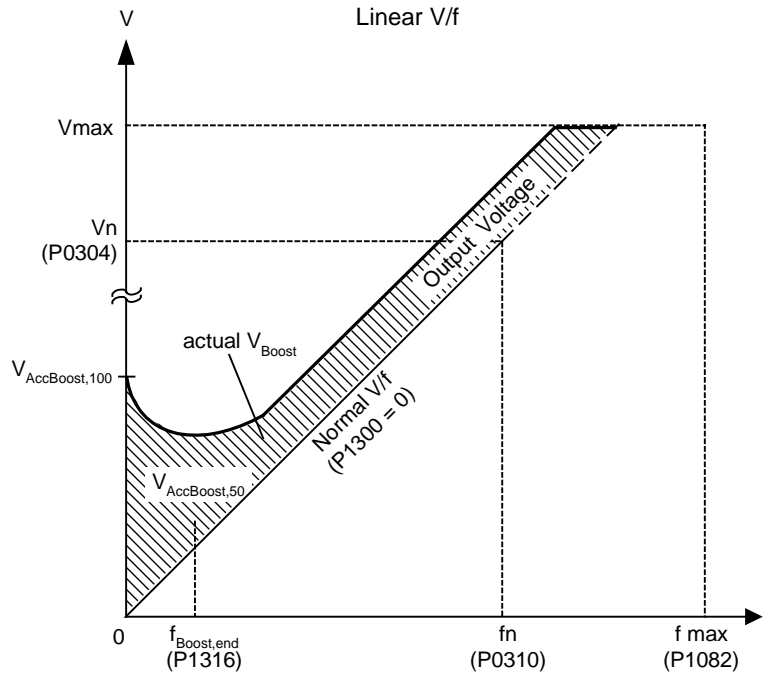

Notice:

Increasing the boost levels increases motor heating (especially at standstill).

$$\sum \text{Boosts} \leq \frac{300}{I_{mot}} * R_s$$

P1311[3]	Acceleration boost	Datatype: Float	Unit: %	Min: 0.0	Level: 2
	CStat: CUT	Active: Immediately	QuickComm. No	Def: 0.0	
	P-Group: CONTROL			Max: 250.0	

Applies boost in [%] relative to P0305 (rated motor current) following a positive setpoint change and drops back out once the setpoint is reached.

Index:

- P1311[0] : 1st. Drive data set (DDS)
- P1311[1] : 2nd. Drive data set (DDS)
- P1311[2] : 3rd. Drive data set (DDS)

Dependency:

Setting in P0640 (motor overload factor [%]) limits boost.

Note:

Acceleration boost can help to improve response to small positive setpoint changes.

$$\sum \text{Boosts} \leq \frac{300}{I_{mot}} * R_s$$

Notice:

Increasing the boost level increases motor heating.

Details:

See note in P1310 for boost priorities.

P1312[3]	Starting boost			Min: 0.0	Level: 2
	CStat: CUT	Datatype: Float	Unit: %	Def: 0.0	
	P-Group: CONTROL	Active: Immediately	QuickComm. No	Max: 250.0	

Applies a constant linear offset (in [%] relative to P0305 (rated motor current)) to active V/f curve (either linear or quadratic) after an ON command and is active until setpoint is reached for the first time. This is useful for starting loads with high inertia.

Setting the starting boost (P1312) too high will cause the inverter to limit the current, which will in turn restrict the output frequency to below the setpoint frequency.

- P1312[1] : 2nd. Drive data set (DDS)
- P1312[2] : 3rd. Drive data set (DDS)

Dependency:

Notice:

Increasing the boost levels increases motor heating.

$$\sum \text{Boosts} \leq \frac{300}{I_{mot}} * R_s$$

Sets V/f coordinates (P1320/1321 to P1324/1325) to define V/f characteristic.

$$P1310[V] = \frac{P1310[\%]}{100[\%]} \cdot \frac{r0395[\%]}{100[\%]} \cdot P0304[V]$$

Example:

This parameter can be used to provide correct torque at correct frequency and is useful when used with synchronous motors.

Dependency:

Note:

Linear interpolation will be applied between points set from P1320/1321 to P1324/1325.

V/f with programmable characteristic (P1300 = 3) has 3 programmable points. The two non-programmable points are:

- Nominal voltage at nominal frequency

The acceleration boost and starting boost defined in P1311 and P1312 are applied to V/f with programmable characteristic.

 P1338[2] : 3rd. Drive data set (DDS)

Note:

The resonance circuit damps oscillations of the active current which frequently occur during no-load operation.

In V/f modes (see P1300), the resonant damping circuit is active in a range from approx. 5 % to 70 % of rated motor frequency (P0310).

P1340[3]	Imax controller prop. gain	Min: 0.000	Level: 3	
	CStat: CUT	Datatype: Float		Def: 0.000
	P-Group: CONTROL	Active: Immediately		QuickComm. No Max: 0.499

Proportional gain of the I_max frequency controller.

The Imax controller reduces inverter current if the output current exceeds the maximum motor current (P0067).

In linear V/f, parabolic V/f, FCC, and programmable V/f modes the I_max controller uses both a frequency controller (see parameters P1340 and P1341) and a voltage controller (see parameters P1344 and P1345). The frequency controller seeks to reduce current by limiting the inverter output frequency (to a minimum of the two times nominal slip frequency). If this action does not successfully remove the overcurrent condition, the inverter output voltage is reduced using the I_max voltage controller. When the overcurrent condition has been removed successfully, frequency limiting is removed using the ramp-up time set in P1120.

In linear V/f for textiles, FCC for textiles, or external V/f modes only the I_max voltage controller is used to reduce current (See parameters P1345 and P1346).

Note:

The I_max controller can be disabled by setting the frequency controller integral time P1341 to zero. This disables both the frequency and voltage controllers. Note that when disabled, the I_max controller will take no action to reduce current but overcurrent warnings will still be generated, and the Drive will trip in excessive overcurrent or overload conditions.

P1800	Pulse frequency	Datatype: U16	Unit: kHz	Min: 2 Def: 4 Max: 16	Level: 2
	CStat: CUT P-Group: INVERTER	Active: Immediately	QuickComm. No		

Sets pulse frequency of power switches in inverter. The frequency can be changed in steps of 2 kHz.

Pulse frequencies > 4 kHz selected on 380-480 V units reduce the maximum continuous motor current.

Dependency:

Minimum pulse frequency depends on P1082 (maximum frequency) and P0310 (rated motor frequency).

Note:

At 4 kHz, full output current is obtained up to 50 degrees C (CT mode);
over 50 degrees C, full output may be obtained at 8 kHz

If silent operation is not absolutely necessary, lower pulse frequencies may be selected to reduce inverter losses and radio-frequency emissions.

Under certain circumstances, the inverter may reduce the switching frequency to provide protection against over-temperature (see P0290, Level 3).

r1801	CO: Act. switching frequency	Datatype: U16	Unit: kHz	Min: - Def: - Max: -	Level: 3
	P-Group: INVERTER				

Actual pulse frequency of power switches in inverter.

Notice:

Under certain conditions (inverter overtemperature, see P0290), this can differ from the values selected in P1800 (pulse frequency).

P1802	Modulator mode	Datatype: U16	Unit: -	Min: 0 Def: 0 Max: 2	Level: 3
	CStat: CUT P-Group: INVERTER	Active: first confirm	QuickComm. No		

Selects inverter modulator mode.

Settings:

0 SVM/ASVM automatic mode
1 Asymmetric SVM
2 Space vector modulation

Notice:

Asymmetric space vector modulation (ASVM) produces lower switching losses than space vector modulation (SVM), but may cause irregular rotation at very low speeds.

Space vector modulation (SVM) with over-modulation may produce current waveform distortion at high output voltages.

Space vector modulation (SVM) without over-modulation will reduce maximum output voltage available to motor.

P1803[3]	Max. modulation			Min: 20.0	Level: 4
	CStat: CUT	Datatype: Float	Unit: %	Def: 106.0

- P1803[1] : 2nd. Drive data set (DDS)
- P1803[2] : 3rd. Drive data set (DDS)

Note:

P1803 = 100 % = limit for over-control (for ideal inverter without switching delay). For vector control the modulation limit will be reduced automatically with 4 %.

P1820[3]	Reverse output phase sequence			Min: 0	Level: 2
	CStat: CT	Datatype: U16	Unit: -	Def: 0

Dependency:

If positive and negative revolution is enabled, frequency setpoint is directly used.
If both positive and negative revolution are disabled, reference value is set to zero.

Details:

See P1000 (select frequency setpoint)

Note:

Before selecting motor data identification, "Quick commissioning" has to be performed in advance.

Once enabled (P1910 = 1), A0541 generates a warning that the next ON command will initiate measurement of motor parameters.

Notice:

When choosing the setting for measurement, observe the following:
 1. "with parameter change" means that the values are actually adopted as Pxxxx parameter settings (see common settings above) and applied to the controller as well as being shown in the read-only parameters below.
 2. "without parameter change" means that the values are only displayed, i.e. shown for checking purposes in the read-only parameters r1912 (identified stator resistance), r1913 (identified rotor time constant), r1914 (ident. total leakage reactance), r1915/r1916/1917/1918/1919 (identified nominal stator reactance/identified stator reactance 1 to 4) and 1926 (identified gating unit dead time). The values are not applied to the controller.

P2181[3]	Belt failure detection mode	Min: 0	Level: 2	
	CStat: CT	Datatype: U16		Unit: -
	P-Group: ALARMS	Active: first confirm		QuickComm. No
		Def: 0		
		Max: 6		

Sets belt failure detection mode. This function allows detection of mechanical failure of the drive train, e.g. a broken drive belt. It can also detect conditions which cause an overload, such as a jam.

Two methods are provided of detecting the failure.

The first is achieved by comparing the actual frequency/torque curve with a programmed envelope (see P2182 - P2190). If the curve falls outside the envelope, a warning or trip is generated.

The second uses a pulse train from a simple sensor on the driven machine connected to the encoder circuit within the drive ASIC via a digital input. The pulse train, normally detecting one pulse per revolution of the drive machine, is converted to a frequency reference and compared with the actual inverter output frequency.

Settings:

- 0 Belt failure detection disabled
- 1 Warn low torque/speed
- 2 Warn high torque/speed
- 3 Warn high/low torque/speed
- 4 Trip low torque/speed
- 5 Trip high torque/speed
- 6 Trip high/low torque/speed

Sets a frequency threshold 1 for comparing actual torque to torque the envelope for belt failure detection.

The frequency torque envelope is defined by 9 parameters - 3 are frequency parameters (P2182 - P2184), and the other 6 define the low and high torque limits (P2185 - P2190) for each frequency (see diagram below).

The allowed frequency/torque region is defined by the shaded area. When the torque falls outside the area shown, a trip or warning occurs (see parameter P2181).

- P2200[1] : 2nd. Command data set (CDS)
- P2200[2] : 3rd. Command data set (CDS)

Dependency:

Setting 1 automatically disables normal ramp times set in P1120 and P1121 and the normal frequency setpoints.

Following an OFF1 or OFF3 command, however, the inverter frequency will ramp down to zero using the ramp time set in P1121 (P1135 for OFF3).

Note:

The PID setpoint source is selected using P2253. The PID setpoint and the PID feedback signal are interpreted as [%] values (not [Hz]). The output of the PID controller is displayed as [%] and then normalized into [Hz] through P2000 (reference frequency) when PID is enabled.

In level 3, the PID controller source enable can also come from the digital inputs in settings 722.0 to 722.2 for DIN1 to DIN3 or from any other BiCo source

Notice:

The minimum and maximum motor frequencies (P1080 and P1082) as well as the skip frequencies (P1091 to P1094) remain active on the inverter output. However, enabling skip frequencies with PID control can produce instabilities.

Defines Fixed PID Setpoint 1

In addition, you can set any of the digital input parameters to Fixed PID Setpoint via the digital inputs (P0701 - P0706).

There are three selection modes for the PID fixed setpoint:

1 Direct selection (P0701 = 15 or P0702 = 15, etc)

In this mode of operation, 1 digital input selects one PID fixed setpoint.

2 Direct selection with ON command (P0701 = 16 or P0702 = 16, etc.)

Description as for 1), except that this type of selection issues an ON command concurrent with any setpoint selection.

3 Binary Coded Decimal selection (P0701 - P0706 = 17)

Using this method to select the PID Fixed Setpoint allows you to choose up to 16 different PID setpoints.

The setpoints are selected according to the following table:

		DIN4	DIN3	DIN2	DIN1

- 2 Increase the motor frequency while measuring the feedback signal.
- 3 If the feedback signal increases with an increase in motor frequency, the PID transducer type should be 0.
- 4 If the feedback signal decreases with an increase in motor frequency the PID transducer type should be set to 1.

P2280	PID proportional gain	Min: 0.000	Level: 2	
	CStat: CUT	Datatype: Float		Unit: -
	P-Group: TECH	Active: Immediately		QuickComm. No

Allows user to set proportional gain for PID controller.

The PID controller is implemented using the standard model.

For best results, enable both P and I terms.

Dependency:

If P term = 0, I term acts on the square of the error signal.

Note:

If the system is prone to sudden step changes in the feedback signal, P term should normally be set to a small value (0.5) with a faster I term for optimum performance.

The D term (P2274) multiplies the difference between the present and previous feedback signal thus accelerating the controller reaction to an error that appears suddenly.

Notice:

The D term should be used carefully, since it can cause the controller output to fluctuate as every change in the feedback signal is amplified by the controller derivative action.

P2285	PID integral time			Min: 0.000	Level: 2
	CStat: CUT	Datatype: Float	Unit: s	Def: 0.000	
	P-Group: TECH	Active: Immediately	QuickComm. No	Max: 60.000

	P-Group: TECH	Active: Immediately	QuickComm. No	Max: 200.00	

Sets upper limit for PID controller output in [%].

Dependency:

If F max (P1082) is greater than P2000 (reference frequency), either P2000 or P2291 (PID output upper limit) must be changed to achieve F max.

Note:

P2293	Ramp-up /-down time of PID limit			Min: 0.00	Level: 3
	CStat: CUT	Datatype: Float	Unit: s	Def: 1.00	
	P-Group: TECH	Active: Immediately	QuickComm. No	Max: 100.00	

Sets maximum ramp rate on output of PID.

When PI is enabled, the output limits are ramped up from 0 to the limits set in P2291 (PID output upper limit) and P2292 (PID output lower limit). Limits prevent large step changes appearing on the output of the PID when the inverter is started. Once the limits have been reached, the PID controller output is instantaneous.

These ramp times are used whenever a RUN command is issued.

Note:

If an OFF1 or OFF 3 are issued, the inverter output frequency ramps down as set in P1121 (ramp-down time) or P1135 (OFF3 ramp-down time).

Sets applied offset and deviation for PID autotuning.

Note:

P3900	End of quick commissioning			Min: 0	Level: 1
	CStat: C	Datatype: U16	Unit: -	Def: 0	
	P-Group: QUICK	Active: first confirm	QuickComm. Yes	Max: 3

After completion of calculation, P3900 and P0010 (parameter groups for commissioning) are automatically reset to their original value 0.

Settings:

- 0 No quick commissioning
- 1 Start quick commissioning with factory reset
- 2 Start quick commissioning
- 3 Start quick commissioning only for motor data

Dependency:

Changeable only when P0010 = 1 (quick commissioning)

Note:

When setting 1 is selected, only the parameter settings carried out via the commissioning menu "Quick commissioning", are retained; all other parameter changes, including the I/O settings, are lost. Motor calculations are also performed.

When setting 2 is selected, only those parameters, which depend on the parameters in the commissioning menu "Quick commissioning" (P0010 = 1) are calculated. The I/O settings are also reset to default and the motor calculations performed.

When setting 3 is selected, only the motor and controller calculations are performed. Exiting quick commissioning with this setting saves time (for example, if only motor rating plate data have been changed).
