Safety Guidelines

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

**DANGER**

indicates that death or severe personal injury will result if proper precautions are not taken.

**WARNING**

indicates that death or severe personal injury may result if proper precautions are not taken.

**CAUTION**

with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

**CAUTION**

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

**NOTICE**

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by qualified personnel. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

Prescribed Usage

Note the following:

**WARNING**

This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens. Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

Trademarks

All names identified by ® are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.
Preface

Purpose of the Operating Instructions

These operating instructions provide information based on the requirements defined by DIN EN 62079 for mechanical engineering documentation. The information relates to the HMI device, its place of use, transportation, storage, installation, use, and maintenance.

These operating instructions are intended for:

- Users
- Commissioning engineers
- Service technicians
- Maintenance technicians

Please read the section "Safety instructions and general notes" carefully.

The help integrated in WinCC flexible, the WinCC flexible Information System, contains detailed information. The information system contains instructions, examples and reference information in electronic form.

Basic Knowledge Requirements

General knowledge of automation technology and process communication is needed to understand the operating instructions.

It is also assumed that those using the manual have experience in using personal computers and knowledge of Microsoft operating systems.

Range of Validity for the Operating Instructions

These operating instructions apply to the HMI devices TP 177A, TP 177B and OP 177B in combination with the WinCC flexible software package.
Position in the Information Scheme

These operating instructions form part of the SIMATIC HMI documentation. The following provides an overview of the information landscape for SIMATIC HMI.

User manuals

- WinCC flexible Micro
  Describes the basics of configuration with the WinCC flexible Micro engineering system.

- WinCC flexible Compact/Standard/Advanced
  Describes basic principles of configuration using the WinCC flexible Compact/WinCC flexible Standard/WinCC flexible Advanced engineering systems.

- WinCC flexible Runtime
  Describes how to commission and operate your runtime project on a PC.

- WinCC flexible Migration
  - Describes how to convert an existing ProTool project to WinCC flexible.
  - Describes how to convert an existing WinCC project to WinCC flexible.
  - Describes how to convert an existing ProTool project including a change of the HMI device, for example from OP3 to OP 73 or from OP7 to OP 77B
  - Describes how to convert an existing ProTool project including a change from a graphics device to a Windows CE device.

- Communication
  - Communication Part 1 describes the connection of the HMI device to SIMATIC PLCs.
  - Communication Part 2 describes the connection of the HMI device to third-party controllers.
Operating instructions

- Operating instructions for SIMATIC HMI devices.
  - OP 73, OP 77A, OP 77B
  - TP 170micro, TP 170A, TP 170B, OP 170B
  - OP 73micro, TP 177micro
  - TP 177A, TP 177B, OP 177B
  - TP 270, OP 270
  - MP 270B
  - MP 277
  - MP 370
  - MP 377
- Operating instructions for mobile SIMATIC HMI devices
  - Mobile Panel 170
  - Mobile Panel 177
  - Mobile Panel 277
- Operating Instructions(Compact) for SIMATIC HMI devices
  - OP 77B
  - Mobile Panel 170
  - Mobile Panel 177

Getting Started

- WinCC flexible for first time users
  Based on an example project, this is a step-by-step introduction to the basics of configuring screens, alarms, recipes and screen navigation.
- WinCC flexible for power users
  Based on an example project, this is a step-by-step introduction to the basics of configuring logs, project reports, scripts, user management, multilingual projects and integration in STEP 7.
- WinCC flexible Options
  Based on an example project, this is a step-by-step introduction to the basics of configuring the WinCC flexible Sm@rtServices, Sm@rtAccess and OPC server options.

Online Availability

Technical documentation on SIMATIC products and SIMATIC systems is available in PDF format in various languages at the following addresses:

- SIMATIC Guide Technical Documentation:
  "http://www.automation.siemens.com/simatic/portal/html_00/techdoku.htm"
Conventions

Configuration and runtime software differ with regard to their names as follows:

- "WinCC flexible 2008," for example, refers to the configuration software.
  
The term "WinCC flexible" is used in a general context. The full name, for example "WinCC flexible 2008", is always used when it is necessary to differentiate between different versions of the configuration software.

- "WinCC flexible Runtime" refers to the runtime software that can run on HMI devices.

The name "TP 177B" is the umbrella term for the following HMI devices:

- TP 177B 4"

- TP 177B 6"

Text is highlighted as follows to simplify reading the operating instructions:

<table>
<thead>
<tr>
<th>Notation</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Add screen&quot;</td>
<td>• Terms that appear in the user interface, for example, dialog names, tabs, buttons, menu commands</td>
</tr>
<tr>
<td></td>
<td>• Required input, for example, limits, tag values.</td>
</tr>
<tr>
<td></td>
<td>• Path information</td>
</tr>
<tr>
<td>&quot;File &gt; Edit&quot;</td>
<td>Operator actions, for example, menu commands, shortcut menu commands.</td>
</tr>
<tr>
<td>&lt;F1&gt;, &lt;Alt+P&gt;</td>
<td>Keyboard operation</td>
</tr>
</tbody>
</table>

Please observe notes labeled as follows:

**Note**

Notes contain important information concerning the product, its use or a specific section of the documentation to which you should pay particular attention.

Representatives and offices

If you have any further questions relating to the products described in this manual, please contact your local representative at the SIEMENS branch nearest you.

You can locate your contact partner on this Internet URL:

"http://www.siemens.com/automation/partner"

Training Center

Siemens AG offers a variety of training courses to familiarize you with automation systems. Please contact your regional Training Center, or the central Training Center in D90327 Nuremberg.

Phone: +49 (911) 895-3200
Internet: "http://www.sitrain.com"

Technical Support

You can reach the Technical Support for all A&D products using the support request form on the web:

"http://www.siemens.de/automation/support-request"

Phone: + 49 180 5050 222
Fax: + 49 180 5050 223

For further information about Siemens Technical Support, refer to the Internet at "http://www.siemens.com/automation/support-request"

Service & Support on the Internet

Service & Support provides additional comprehensive information on SIMATIC products through online services at "http://support.automation.siemens.com;"

- The newsletter provides up-to-date information relating to your products.
- Our Service & Support search engine provides you access to all available documentation.
- A forum for global exchange of information by users and experts
- Current product information, FAQs and downloads
- Your local Automation & Drives representative
- Information about on-site services, repairs, spare parts and much more is available on our "Services" pages.

1.1 Product Overview

Advanced applications with the Touch Panels TP 177A, TP 177B and OP 177B

The TP 177B 4" features a 4.3" TFT display with wide-screen format. This display extends the visible area on the HMI device by approximately 25 % compared to similar displays with 4:3 format. The HMI device also features four function keys with tactile feedback. In combination with the intuitive touch operation, it offers maximum operating efficiency. In addition to MMC cards, the TP 177B 4" supports SD cards and USB memory sticks.

OP 177B offers an additional feature. It can now be operated using widely-available touch screens in addition to the membrane keyboard. The function keys can be configured to system keys for specific screens.

The TP 177A, TP 177B and OP 177B panels offer quick commissioning times, large user memory and high performance, and they are optimized for projects based on WinCC flexible.
1.2 Design of the TP 177A HMI Device

Front view and side view

1. Opening caused by design - not a slot for a memory card
2. Display / touch screen
3. Mounting seal
4. Mounting clamp recess

Bottom view
1.3 Design of the TP 177B 6" HMI device

Rear view

1. Opening caused by design - not a slot for a memory card
2. Rating label
3. DIP switch
4. Interface name

Front view and side view

1. Slot for a MultiMedia card
2. Display / touch screen
3. Mounting seal
4. Mounting clamp recess
Overview

1.6 Accessories

Accessory kit

The accessory kit contains the following:

- For the power supply: a plug-in terminal strip
- To install the TP 177A, TP 177B 6”, and the OP 177B: Plastic mounting clamps
- For the installation of the TP 177B 4”: Metal mounting clamps

Additional documents may be enclosed with the accessory kit.

1.7 Miscellaneous

RS 422 / RS 232 converter

The converter is required to connect a SIMATIC S5 controller and controllers from other manufacturers. Connect the RS 422-RS 232 converter to the RS 422 / RS 485 interface. The converter converts the input signals to RS-232 signals.

The converter is not part of the scope of delivery of the HMI device. The converter can be ordered separately using order number 6AV6 671-8XE00-0AX0.

PC / PPI cable

You need the PC / PPI cable for TP 177A, TP 177B 6” and OP 177B to update the operating system by resetting it to the factory settings. In addition, with TP 177B and OP 177B you can use the cable for transferring purposes. Connect the PC/PPI cable to the RS 422/RS 485 interface. The cable converts the input signals to RS-232 signals.

The cable is not included the scope of delivery for the HMI device. The cable can be ordered separately under the order number 6ES7 901-3CB30-0XA0.

Note

If the connection fails during the operating system update, set the system to a lower bit rate. If you use a higher bit rate, you must use the PC / PPI cable release 3 or higher. The version code is printed on the cable (e.g., "E stand 3" corresponds to version 3).

90° elbow adapter

If space is limited, e.g. to install the TP 177A in vertical format, you can use an elbow adapter at the RS 422 / RS 485 interface.

The adapter is not part of the scope of delivery of the HMI device. The adapter can be ordered separately with order number 6AV6 671-8XD00-0XA0.
PROFIBUS bus connector

We recommend using straight PROFIBUS bus connectors. The connectors are not included in the scope of supply for the HMI device. The connectors can be ordered separately with order number 6GK1 500-0FC10.

Memory card

Only use SD memory cards or MultiMediaCards tested and approved by Siemens AG for the respective HMI device.

Protective foil

Protective foil is available for the HMI devices. Suitable protective foil can be ordered separately under the following order numbers:

- TP 177A, TP 177B 6”, OP 177B: Order number 6AV6 671-2XC00-0AX0
- TP 177B 4”: Order number 6AV6 671-2EC00-0AX0

Protective cover set

A protective cover set can be ordered for the TP 177A and TP 177B 6” HMI devices with the order number 6AV6 574-1AE00-4AX0.

1.8 Functional scope with WinCC flexible

General

The following tables show the objects which can be integrated in a project for a TP 177A, TP 177B and OP 177B.

Note

The specified values are maximum values for the respective objects. It is not possible to use the maximum values for all objects because the available memory of the HMI device is limited. For additional information on calculation of the system limits see the WinCC flexible online help.

2) not with TP 177B 4"
1.9 Software options

The following software options are available for the TP 177B and the OP 177B:

- **WinCC Flexible/Sm@rtService**
  The Sm@rtService option enables you to access a remote HMI device from the HMI device or PC via Ethernet.

- **WinCC Flexible/Sm@rtAccess**
  The Sm@rtAccess option enables you to set up communication between different HMI systems.

The following software options are available for the TP 177B 4":

- **Uninterruptable Power Supply (UPS) with USB support**
  When interfacing an uninterruptible power supply, the HMI device is shut down in a controlled manner after a buffer time in the event of a power failure. The TP 177B 4" supports SITOP DC UPS modules connected via the USB port.

1.10 Communication Using the TP 177A

---

1) Applies to controllers SLC503, SLC504, SLC505, MicroLogix  
2) Applies to controllers SLC504, via DF1.  
3) Only with converter RS 422-RS 232 6AV6 671-8XE00-0AX0 (Option)  
4) PROFINET IO must be locked.  
5) Not approved for TP 177B 6" DP or OP 177B DP  
6) Deactivate the "Remote Control" check box under "Channel 1" in the "Transfer Settings".
Safety Instructions and General Notes

2.1 Safety Information

Working on the cabinet

⚠️ WARNING
Open equipment
The HMI device is an open equipment. This means that the HMI device may only be installed in cubicles or cabinets, whereby the device can be operated from the front panel. Access to the cubicle or cabinet in which the HMI device is installed should only be possible by means of a key or tool and for personnel who have received instruction or are authorized.

Danger, high voltage
Opening the cabinet will expose high voltage parts. Contact with these parts could be fatal. Switch off the power supply to the cabinet before opening it.

Hazardous areas

When operating the HMI device in hazardous areas the following warning applies.

⚠️ WARNING
Explosion Hazard
Do not disconnect while circuit is live unless area is known to be non-hazardous. Substitution of components may impair suitability for Class 1, Division 2 or Zone 2.

High frequency radiation

NOTICE
Unintentional operating situations
High frequency radiation, from mobile phones for example, can cause unintentional operating situations.
2.2 Standards and Approvals

Valid certifications

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Valid certifications</strong></td>
</tr>
<tr>
<td>The overview below provides information on available certifications.</td>
</tr>
<tr>
<td>The HMI device itself is certified as shown on the label on its rear panel.</td>
</tr>
</tbody>
</table>

CE Certification

The automation system meets the general and safety-related requirements of the following EC directives and conforms to the harmonized European standards (EN) for programmable logic controllers published in the official gazettes of the European Union:

- 2004/108/EC "Electromagnetic Compatibility" (EMC Directive)
- 94/9/EC "Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres" (Explosion Protection Directive)

EC Declaration of Conformity

The EC Declarations of Conformity are available to the relevant authorities at the following address:

Siemens Aktiengesellschaft
Industry Sector
IIA AS RD ST PLC
P.O. Box 1963
D-92209 Amberg
2.2 Standards and Approvals

UL approval

Underwriters Laboratories Inc. conforming to
- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142, (Process Control Equipment)

or

Underwriters Laboratories Inc. conforming to
- UL 508 (Industrial Control Equipment)
- CSA C22.2 No. 142, (Process Control Equipment)
- UL 1604 (Hazardous Location)
- CSA-213 (Hazardous Location)

Approved for use in
- Class I, Division 2, Group A, B, C, D or
- Class I, Zone 2, Group IIC or
- non-hazardous locations

FM Approval

Factory Mutual Research (FM) conforming to
- Approval Standard Class Number 3611, 3600, 3810

Approved for use in
- Class I, Division 2, Group A, B, C, D T4
- Class I, Zone 2, Group IIC T4
Ex Certification

The following certifications apply to the HMI device in accordance with

- EN 60079-0:2006
- EN 60079-15:2005
- EN 61241-1:2004
- IEC 61241-0:2004+Cor.2005

Label for Australia

\[N117\]

The HMI device fulfills the requirements of standard AS/NZS 2064 (Class A).

IEC 61131

The HMI device fulfills the requirements and criteria conforming to IEC 61131-2, Programmable Logic PLCs, Part 2: Operating resource requirements and tests.
2.3 Notes about Usage

Use in Industrial Environments

The HMI device is designed for industrial use. It conforms to the following standards:

- Requirements for unintentional emissions EN 61000-6-4: 2007
- Requirements for interference immunity DIN EN 61000-6-2:2005

Use in Residential Areas

Note

The HMI device is not suitable for use in residential areas. If you use the HMI device in residential areas, the radio/TV reception may be impeded.

If the HMI device is used in residential areas, you must take measures to achieve limit class B conforming to EN 55011 for RF interference.

A suitable measure for achieving the required RF interference level for limit class B includes for example:

- Use of filters in electrical supply lines

Individual acceptance is required.

Use in Potentially Explosive Atmosphere, Zones 2 and 22.

CAUTION

The following overview shows possible certifications.

The HMI device itself is certified as shown on the label on its rear panel.

DANGER

Explosion hazard

Operate the HMI device in a potentially explosive zone 2 atmosphere only if it has been approved and certified for such environments.

WARNING

Personal Injury and Property Damage Can Occur

Personal injury and property damage can occur in potentially explosive atmospheres if an electric plug is disconnected from the HMI device while the system is in operation.

In potentially explosive atmospheres, always turn off power to the HMI device before disconnecting any connectors.
Potentially Explosive Atmospheres Zones 2 and 22

Potentially explosive atmospheres are classified by zones. The zones are classified according to the probability of the presence of an explosive atmosphere.

<table>
<thead>
<tr>
<th>Zone</th>
<th>Explosion hazard</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Explosive gas atmospheres occur seldom and briefly</td>
<td>Areas around flanged pipe joints with flat gaskets in closed rooms</td>
</tr>
<tr>
<td>22</td>
<td>Explosive dust atmospheres occur seldom and briefly</td>
<td>-</td>
</tr>
</tbody>
</table>
| Safe zone | No | • Outside zone 2  
• Outside zone 22  
• Standard applications for distributed IO |

Approval

The following certifications apply to the HMI device in accordance with

- EN 60079-0:2006
- EN 60079-15:2005
- EN 61241-1:2004
- IEC 61241-0:2004+Cor.2005

2.3 Notes about Usage

Operating conditions for Zones 2 and 22

- The HMI device must be installed in some form of enclosure. In accordance with EN 60529, the enclosure must guarantee the following:
  - Protection type IP54 or higher for zone 2
  - Protection type IP5x or higher for zone 22

Installation must ensure that at least IP65 degree of protection is given (according to EN 60529).

Make allowances for the ambient conditions under which you install the HMI device. A manufacturer declaration must be provided for the enclosure in accordance with EC directive 94/9, stating that it is fit for purpose.

Follow the operating instructions to ensure that the protection type on the front panel is guaranteed.

- The ambient temperature range is 0 °C ≤ T ≤ 50 °C. Under these conditions, the HMI device will satisfy temperature class Tx for category 3G and support a maximum surface temperature of xx °C for category 3D. (x ... temperature values, see design examination certificate).

Refer to the operating instructions for details of limitations resulting from the ambient temperature range.

- In situations where the temperature on the cable at the cable inlet of this enclosure exceeds 70 °C, or where the temperature on the wire branching point exceeds 80 °C under operating conditions, the temperature specifications of the cables must match the actually measured temperatures.

- Put measures in place to ensure the rated voltage is not exceeded.
  Any transient interference voltages above the rated value must not exceed 40 %.

- The HMI device should be protected from mechanical loads > 4 J or > 2 J in the region of the display.

- Ensure that the atmosphere is not explosive during servicing.
  Measures that impair or remove the protection type of the HMI device are not permitted while the system is in operation.

- If the HMI device was dismantled, check the mounting seal for damage before reassembling the HMI device. A damaged, porous or used mounting seal no longer meets the requirements of the protection type. In this case, the mounting seal must be replaced.

- Turn the HMI device off if any cracks appear in the front coating, holes are damaged or the front coating starts to peel off.
  Exchange the HMI device. Restart the system again after the device has been exchanged.
2.4 Electromagnetic Compatibility

Repairs

The HMI device is maintenance-free. In case of repair, the HMI device must be shipped to the Return Center in Fürth. The HMI device may only be repaired there. The address is:

Siemens AG
Industry Sector
Returns Center
Siemensstrasse 2
90766 Fürth
Germany

Additional Information

Please also observe the product information "Use in potentially explosive atmospheres, zones 2 and 22."
The product information is located on the mini CD that is enclosed with the HMI device upon delivery.

Approval

Note

HMI devices with approval to II 3G Ex nA II T4 may only be used on SIMATIC systems of device category 3.

2.4 Electromagnetic Compatibility

Introduction

The HMI device fulfills requirements of the EMC directive of the domestic European market and other requirements.

EMC-compliant mounting of HMI devices

EMC-compliant mounting of the HMI device and the use of interference-proof cables will ensure trouble-free operation. The "Directives for Interference-free installation of PLCs" and the "PROFIBUS Networks" manual also apply for the installation of the HMI device.
### Pulse-shaped Interference

The following table shows the EMC properties of the modules with respect to pulse-shaped interference. The HMI device must fulfill the specifications and directives relating to electrical installation as a basic prerequisite.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Additional Measures

Before you connect an HMI device to the public electricity supply, ensure that it is compliant with Limit Class B conforming to 55022.

2.5 Transport and Storage Conditions

Mechanical and Climatic Transport and Storage Conditions

The transport and storage conditions of this HMI device exceed requirements conforming to IEC 61131-2. The following specifications apply to the transport and storage of an HMI device in its original packing.

The climatic conditions comply to the following standards:

- IEC 60721-3-3, Class 3K7 for storage
- IEC 60721-3-2, Class 2K4 for transport

The mechanical requirements are compliant with EC 60721-3-2, Class 2M2.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Shock conforming to IEC 60068-2-29</td>
<td>250 m/s², 6 ms, 1000 shocks</td>
</tr>
</tbody>
</table>

NOTICE

Ensure that no condensation (dewing) develops on or inside the HMI device after transporting it at low temperatures or after it has been exposed to extreme temperature fluctuations.

The HMI device must have acquired room temperature before it is put into operation. Do not expose the HMI device to direct radiation from a heater in order to warm it up. If dewing has developed, wait approximately four hours until the HMI device has dried completely before switching it on.

Prerequisite for the trouble-free and safe operation of the HMI device is proper transport and storage, installation and assembly and careful operation and maintenance.

Warranty for the HMI device is deemed void if these specifications are ignored.
3 Planning Use

3.1 Mounting Information

Mechanical and Climatic Conditions of Use
The HMI device is intended for installation in weatherproof permanent locations. The conditions of use are compliant with requirements to DIN IEC 60721-3-3:

- Class 3M3 (mechanical requirements)
- Class 3K3 (climatic requirements)

Use with Additional Measures
Examples of applications where the use of the HMI device requires additional measures:

- In locations with a high degree of ionizing radiation
- In locations with extreme operating conditions resulting from situations such as the following:
  - Corrosive vapors, gases, oils or chemicals
  - Electrical or magnetic fields of high intensity
- In plants requiring special monitoring features, for example:
  - Elevator systems
  - Systems in especially hazardous rooms

Mechanical ambient conditions
The mechanical ambient conditions for the HMI device are specified in the following table in terms of sinusoidal vibration.

<table>
<thead>
<tr>
<th>Frequency range in Hz</th>
<th>Constant</th>
<th>Intermittent</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 ≤ f ≤ 58</td>
<td>Amplitude 0.0375 mm</td>
<td>Amplitude 0.075 mm</td>
</tr>
<tr>
<td>58 ≤ f ≤ 150</td>
<td>Constant acceleration 0.5 g</td>
<td>Constant acceleration 1 g</td>
</tr>
</tbody>
</table>
Reduction of Vibration

If the HMI device is subjected to greater shocks or vibrations, you must take appropriate measures to reduce acceleration or amplitudes.

We recommend fitting the HMI device to vibration-absorbent material (on metal shock absorbers, for example).

Testing for Mechanical Ambient Conditions

The following table provides information on the type and scope of tests for mechanical ambient conditions.

<table>
<thead>
<tr>
<th>The check includes</th>

<td></td>
</tr>
</tbody>
</table>
3.2 Mounting Positions and Fixation

Mounting position

The HMI device is designed for mounting in racks, cabinets, control boards and consoles. In the following, all of these mounting options are referred to by the general term "cabinet".

The HMI device is self-ventilated and approved for vertical and inclined mounting in stationary cabinets.

<table>
<thead>
<tr>
<th>Mounting position</th>
<th>Deviation from the vertical</th>
</tr>
</thead>
<tbody>
<tr>
<td>① Inclined</td>
<td>≤ –35°</td>
</tr>
<tr>
<td>② Vertical</td>
<td>0°</td>
</tr>
<tr>
<td>③ Inclined</td>
<td>≤ 35°</td>
</tr>
</tbody>
</table>

CAUTION

Impermissible ambient temperatures

Do not operate the HMI device without auxiliary ventilation if the maximum permissible ambient temperature is exceeded. The HMI device may otherwise get damaged and its certifications and warranty will be void.
Horizontal mounting for TP 177A, TP 177B and OP 177B

When mounted horizontally, the cable inlets are located at the bottom.

Vertical mounting for TP 177A

When mounted vertically, the cable inlets are located on the right.

Securing the TP 177A, TP 177B 6" and OP 177B

Plastic mounting clamps are provided for mounting the device. The mounting clamps hook into recesses on the HMI device. The overall HMI device dimensions are not exceeded by this.

- Hook
- Cross-tip screw
3.3 Preparing for Mounting

Securing the TP 177B 4"

Metal mounting clamps are provided for mounting. The mounting clamps hook into recesses on the HMI device. The overall HMI device dimensions are not exceeded by this.

① Threaded stud
② Hook

3.3 Preparing for Mounting

Select the mounting location of the HMI device

Points to observe when selecting the mounting location:

- Position the HMI device so that it is not subjected to direct sunlight.
- Position the HMI device such that it is ergonomically accessible for the user. Choose a suitable mounting height.
- Ensure that the air vents of the HMI device are not covered as a result of the mounting.
- Observe the permissible mounting positions for the HMI device.

Degrees of protection

The degrees of protection are only guaranteed when the following is observed for the mounting cut-out:

- Material thickness at the mounting cut-out for IP65 degree of protection: 2 to 6 mm
- Material thickness at the mounting cut-out for NEMA 4X/NEMA 12 degree of protection (indoor use only): 3 mm to 6 mm
- Permitted deviation from plane at the mounting cut-out: ≤ 0.5 mm
  This condition must be fulfilled for the mounted HMI device.
- Permissible surface roughness in the area of the seal: ≤ 120 µm (Rz 120)
### Dimensions of the mounting cut-out

The following table shows the dimensions of the mounting cut-out required.

<table>
<thead>
<tr>
<th>Mounting cut-out</th>
<th>TP 177A horizontal mounting</th>
<th>TP 177A vertical mounting</th>
<th>TP 177B 6&quot; horizontal mounting</th>
<th>TP 177B 4&quot; horizontal mounting</th>

</tr>
<tr>
<td>Depth</td>
<td>50 mm</td>
<td>50 mm</td>
<td>50 mm</td>
<td>50 mm</td>
<td>55 mm</td>
</tr>
</tbody>
</table>

### Maintaining clearances

The HMI device must be installed with the following clearances:

- 50 mm above and below the mounting cut-out for ventilation
- 15 mm to the right and left of the mounting cut-out for inserting the mounting clamps for installation
- At least 10 mm clearance in addition to the depth of the HMI device is required at the rear

**NOTICE**

Ensure that the maximum ambient temperature is not exceeded when mounting the device in a cabinet and especially in a closed enclosure.
3.4 Specifications for Insulation Tests, Protection Class and Degree of Protection

Test Voltages

Insulation resistance is demonstrated in the type test with the following test voltages conforming to IEC 61131-2:

<table>
<thead>
<tr>
<th>Circuits with a nominal voltage of $U_e$ to other circuits or ground</th>
<th>Test voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 50 V</td>
<td>500 V DC</td>
</tr>
</tbody>
</table>

Protection Class

Protection Class I conforming to IEC 60536, i.e. equipotential bonding conductor to profile rail required!

Protection from foreign objects and water

<table>
<thead>
<tr>
<th>Degree of protection conforming to IEC 60529</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Front                                        | When mounted:  
- IP65  
- NEMA 4X/NEMA 12 (indoor use only) |
| Rear                                         | IP20  
Protection against touch with standard test fingers.  
There is no protection against ingress by water. |

The degree of protection provided by the front side can only be guaranteed when the mounting seal lies completely against the mounting cut-out.

3.5 Nominal Voltages

The following table details the allowed rated line voltages and associated tolerance ranges.

<table>
<thead>
<tr>
<th>HMI device</th>
<th>Rated voltage</th>
<th>Tolerance range</th>
</tr>
</thead>
<tbody>
<tr>
<td>TP 177A, TP 177B 6&quot;, OP 177B</td>
<td>+24 VDC</td>
<td>20.4 to 28.8 V (–15%, +20%)</td>
</tr>
<tr>
<td>TP 177B 4&quot;</td>

</tr>
</tbody>
</table>
Installation and connection

4.1 Checking the package contents

Check the package contents for visible signs of transport damage and for completeness.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Damaged parts</td>
</tr>
<tr>
<td>Do not install parts damaged during shipment. In the case of damaged parts, contact your Siemens representative.</td>
</tr>
</tbody>
</table>

The following is contained in the delivery:

- HMI device
- Accessory kit
  - 1 terminal block for the power supply
  - Mounting clamps for mounting the HMI device
  Additional documents may be enclosed with the accessory kit.

Keep the supplied documentation in a safe place. The documentation belongs to the HMI device and is required for subsequent commissioning.

4.2 Mounting the HMI Device

Requirement

All packaging components and protective foils should be removed from the HMI device.

You need the mounting clamps from the accessories kit for the installation. The mounting seal must be available on the HMI device. If the mounting seal is damaged, order a replacement seal. The mounting seal is part of the associated service pack.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plastic mounting clamps are enclosed in the TP 177A, TP 177B 6&quot; and the OP177B.</td>
</tr>
<tr>
<td>Metal mounting clamps are included with the TP 177B 4&quot;.</td>
</tr>
</tbody>
</table>
Mounting clamps on the TP 177A and TP 177B 6"

Use a plastic mounting clamp on each side of the HMI device to secure it in the mounting cut-out.

Mounting clamps TP 177B 4"

The recesses required to suspend the metal mounting clamps are marked with an arrow on the back of the HMI device.

① Marking for position of a mounting clamp

To ensure one of the degrees of protection IP65 or NEMA 4, suspend the metal mounting clamps in the marked recesses.

In each case use one metal mounting for the right, left and bottom, and two at the top.

Mounting clamps on the OP 177B

If IP65 or NEMA 4 degrees of protection are required for the OP 177B, the mounting clamps must be installed as follows.

① Additionally required plastic mounting clamps for IP65 and NEMA 4 degrees of protection
### Mounting

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always mount the HMI device according to the instructions in this manual.</td>
</tr>
</tbody>
</table>

**Risk of guaranteed level of protection not being met**

If the mounting seal is damaged or protrudes beyond the HMI device, the level of protection is not ensured.

Check the fit of the mounting seal.

---

**Note**

Tighten the set screw or the cross-tip screw of the mounting clamps until the HMI device is flush with the surface of the control cabinet. As an alternative, you can tighten the mounting clamps using the following torque:

- Plastic mounting clamps: max. 0.15 Nm
- Metal mounting clamps: max. 0.2 Nm

Proceed as follows:

1. Check that the mounting seal is fitted on the HMI device.
   - Do not install the mounting seal turned inside out. This may cause leaks in the mounting cut-out.
2. Insert the HMI device into the mounting cut-out from the front.
3. Insert a mounting clamp into the intended recesses on the HMI device.
4. Tighten the mounting clamp using a threaded stud or a cross-tip screwdriver.
5. Repeat steps 3 and 4 for all mounting clamps.
6. Check the fit of the mounting seal.
   - If necessary, repeat steps 1 to 6.
4.3 Connecting the HMI Device

Result

The HMI device is mounted and the relevant level of protection is ensured at the front.

See also

Accessories (Page 22)

4.3 Connecting the HMI Device

Requirement

- The HMI device must be mounted according to the specifications of these operating instructions.
- Always use standard shielded cables.

Note

Connector on the TP 177B 4"

Use only straight connectors on the TP 177B 4". Angled connectors could conceal neighboring ports.

You can find more information about this on the Internet at "http://mall.automation.siemens.com".

Connection sequence

Connect the HMI device in the following sequence:

1. Equipotential bonding
2. Power supply
   Perform a power-up test to ensure the power supply is connected with the correct polarity.
3. PLC / configuring PC if needed

**NOTICE**

Connection sequence

Always follow the correct sequence for connecting the HMI device. Failure to do so may result in damage to the HMI device.

Connecting the cables

When connecting the cables, ensure that the contact pins are not bent. Secure the connectors with screws.

The pin assignment of the ports is described in the technical specifications.

4.3.5 Connecting the Equipotential Bonding Circuit

Potential Differences

Differences in potential between spatially separated system parts can lead to high equalizing currents over the data cables and therefore to the destruction of their interfaces. This situation may arise if the cable shielding is terminated at both ends and grounded at different system parts. Potential differences may develop when a system is connected to different mains.

General Requirements for Equipotential Bonding

Potential differences must be reduced by means of equipotential bonding in order to ensure trouble-free operation of the relevant components of the electronic system. The following must therefore be observed when installing the equipotential bonding circuit:

- The effectiveness of equipotential bonding increases as the impedance of the equipotential bonding conductor decreases or as its cross-section increases.
- If two system parts are connected to each other via shielded data lines with shielding connected to the grounding/protective conductor on both sides, the impedance of the additionally installed equipotential bonding cables may not exceed 10% of the shielding impedance.
- The cross-section of a selected equipotential bonding conductor must be capable of handling the maximum equalizing current. The best results for equipotential bonding between two cabinets were achieved with a minimum conductor cross-section of 16 mm².
- Use equipotential bonding conductors made of copper or galvanized steel. Establish a large-surface contact between the equipotential bonding conductors and the grounding/protective conductor and protect these from corrosion.
- Terminate the shielding of the data cable on the HMI device flush and near the equipotential busbar using suitable cable clamps.
- Route the equipotential bonding conductor and data cables in parallel with minimum clearance between these. See following wiring diagram.

**NOTICE**

**Equipotential Bonding Conductor**

Cable shielding is not suitable for equipotential bonding. Always use the prescribed equipotential bonding conductors. The minimum cross-section of a conductor used for equipotential bonding is 16 mm². When you install MPI and PROFIBUS DP networks, always use cables with a sufficient cross-section since otherwise the interface modules may be damaged or destroyed.
**Wiring diagram**

1. Chassis terminal on the HMI device (example)
2. Equipotential bonding conductor cross-section: 4 mm²
3. Cabinet
4. Equipotential bonding conductor cross-section: min. 16 mm²
5. Ground connection
6. Cable clip
7. Voltage bus
8. Parallel routing of the equipotential bonding conductor and data cable

Electromagnetic Compatibility [Page 36]
4.3.6 Connecting the Power Supply

Wiring diagram

The figure below illustrates the connection between the power supply and the HMI device.

Note when connecting

The power terminal block is included in the assembly kit and is designed for conductors with a maximum cross-section of 1.5 mm².
Connecting the terminal block

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Damage</td>
</tr>
<tr>
<td>The pressure of the screwdriver may damage the socket if the terminal strip is plugged into the HMI device when you tighten the screws.</td>
</tr>
<tr>
<td>Only connect the wires when the plug-in terminal strip is withdrawn.</td>
</tr>
</tbody>
</table>

There are two types of plug-in terminal strips that can be used for the TP 177A, TP 177B and OP 177B.

Plug-in terminal strip, version 1

<table>
<thead>
<tr>
<th>GND</th>
</tr>

</tr>
</tbody>
</table>

Plug-in terminal strip, version 2

<table>
<thead>
<tr>
<th>GND</th>
</tr>
</thead>
<tbody>
<tr>
<td>+24 VDC</td>
</tr>
</tbody>
</table>

Connect the power supply cables to the terminal strip as shown in the figure above. Ensure that the lines are connected properly to the correct terminals. Refer to the label for the contact pins on the rear of the HMI device.

Reverse polarity protection

The HMI device is equipped with a reverse polarity protection.
Connecting the power supply

**CAUTION**

**Supply voltage**

With the supply voltage, pay attention to a secure electrical separation. Always use power supply modules that conform to IEC 364-4-41 or HD 384.04.41 (VDE 0100, Part 410).

Always use power supply modules that comply to SELV (Safety Extra-Low Voltage) and PELV (Protective Extra Low Voltage) standards.

The power supply voltage must always be within the specified range to prevent malfunctions on the HMI device.

**Equipotential bonding**

Connect the 24 V DC voltage to the GND conductor at a central connection point for equipotential bonding. This ensures the GND supply for the HMI device.

**See also**

4.3.7 Connecting uninterruptible power supply on the TP 177B 4"

Wiring diagram

The following figure shows the connection between the uninterruptible power supply and HMI device. The uninterruptible power supply is connected to the 24-V input and one of USB ports of the HMI device.

When connected to the USB port of the HMI device, the following uninterruptible power supplies are supported:

SITOP DC UPS modules as of a rated power value of 6 A, e.g. 6EP1931-2DC42.

![Wiring diagram of uninterruptible power supply connection](image)

**Note**

Observe all the notes relating to connecting a power supply.

See also

Interfaces on the TP 177B 4" (Page 51)

4.3.8 Connecting the Controller

Wiring diagram

The figure below illustrates the connection between the HMI device and controller.
NOTICE

Cables
Always use the approved cables to connect a SIMATIC S7 PLC.

Standard cables are available for the connection. You can find more information about this on the Internet at "http://mall.automation.siemens.com".
Connecting PROFINET

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use a cross-cable for the PROFINET connection of the TP 177B 6&quot; and the OP 177B when using a point-to-point connection.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFINET IO is not capable of function</td>
</tr>
<tr>
<td>If you connect the HMI device directly to the controller, it could cause PROFINET IO direct keys not to function properly. Connect the switch with a PROFINET cable to the HMI device. For detailed instructions regarding the installation of PROFINET networks, please refer to the PROFINET system description manual.</td>
</tr>
</tbody>
</table>

Only connect the HMI device to public Ethernet networks using a switch or comparable device.

Configuring the RS-485 Interface

A DIP switch for the configuration of the RS-485 interface is located on the back side of the HMI device.

In the factory state, the DIP switch is set for communication with the SIMATIC S7 controller.

**Note**

Note the diagrams of the DIP switch settings on the back of the HMI device.

The following table shows the settings of the DIP switch. The transmitting and receiving directions will be switched over internally with the RTS signal.

<table>
<thead>
<tr>
<th>Communication</th>
<th>Switch setting</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

4.3.9 Connecting a configuration PC

Wiring diagram

The figure below illustrates the connection between the HMI device and the configuration PC. You can use this connection to transfer the image, the project and further project data.
Use a cross-cable for the Ethernet connection of the TP 177B 6" and the OP 177B when using a point-to-point connection.

You can use a standard cable for the Ethernet connection of the TP 177B 4", as this HMI device has an automatic cross-over function.

The interfaces are described in the technical specifications.

For RS-485-RS-232 conversion, you can order the PC / PPI cable from Siemens AG using order number 6ES7 901-3CB30-0XA0.
Configuring a PC / PPI cable

Use the DIP switches to configure the transfer rate of the PC / PPI cable.

**Note**
If the connection fails during the operating system update, set the system to a lower bit rate. If you use a higher bit rate, you must use the PC / PPI cable release 3 or higher. The version code is printed on the cable (e.g., "E stand 3" corresponds to version 3).

---

**① DIP switch**
**② LEDs**

Set the DIP switches 1 to 3 to the same bit rate as in WinCC flexible. DIP switches 4 to 8 must be set to "0".

---

<table>
<thead>
<tr>
<th>Bit rate in kbit/s</th>

</tr>
</tbody>
</table>

In the figure, the bit rate is set to 115.2 kbit/s.
Note when connecting

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
</table>

**USB connection sequence**

Observe the following sequence when connecting by USB:
1. HMI device
2. PC

**USB host-to-host cable**

Use only the driver for the USB host-to-host cable that is included in the WinCC flexible package. Never use the driver supplied with the USB host-to-host cable.

**Updating the operating system**

If there is no HMI device image on the HMI device or the HMI device image is corrupt, the operating system can only be updated via the HMI device's RS 485 interface or the PC / PPI cable.

4.4 Switching on and Testing the HMI Device

Procedure

Proceed as follows:

1. Connect the plug-in terminal strip on the HMI device.
2. Restart the power supply.

The display lights up after power on. A progress bar is displayed during startup. If the HMI device does not start, it is possible the wires on the terminal block have been crossed. Check the connected wires and change the connections if necessary. The Loader opens once the operating system has started.

The HMI device automatically switches to "Transfer" mode during initial startup under the following conditions:

- No project is loaded on the device.
- At least one data channel has been configured.

The following dialog appears:

3. Press "Cancel" to stop the transfer.
Result

The Loader appears again.

Note

When restarting the system, a project may already be loaded on the HMI device. In this case, the project will then start after an adjustable delay or when you press the "Start" button.

Use the relevant operator control object to close the project.

Refer to your plant documentation to find any additional information on this topic.

Function test

Perform a function test following commissioning. The HMI device is fully functional when one of the following states is indicated:

- The "Transfer" dialog is displayed.
- The Loader opens.
- A project is started.

Switching off the HMI Device

You have the following options for switching off the HMI device:

- Shut down the power supply.
- Disconnect the plug-in terminal strip on the HMI device.
5.1 Front-side Operator Controls

Operating elements on the TP 177A and TP 177B 6"

1. Display with touch screen

TP 177B 4" operating elements

1. Display with touch screen
2. Function keys without LED
Operating elements on the OP 177B

① Display with touch screen
② Function keys with LED
③ Function keys without LED

Touch screen

The standard input unit on the HMI device is the touch screen. All operator controls required for operation are displayed on the touch screen once the HMI device has started.

CAUTION

Damage to the touch screen
Pointed or sharp objects can damage the plastic surface of the touch screen.
Always operate the touch screen with your fingers or with a touch pen only.

Triggering unintended actions
Touching several operator controls at the same time can trigger unintended actions.
Always touch only one operator control on the screen.
5.2 Connecting a memory card to the TP 177B 6" and OP 177B

Approved memory cards

Only use MultiMediaCards tested and approved by Siemens AG for the respective HMI device.

**NOTICE**

The SIMATIC S7 MultiMedia card can no longer be used

If you format a MultiMedia card for the SIMATIC S7 in the HMI device, this MultiMedia card can no longer be used in the SIMATIC S7.

Only use MultiMedia cards that are approved for the HMI device.
Procedure - Inserting a memory card

Proceed as follows:

1. Insert the memory card into the relevant slot.
   
   When inserting the memory card, please note that it can only be inserted in the slot when the front side of the memory card is visible.
   
   The following figure shows you how to insert the memory card, for example, in the TP 177B 6”.

![Memory Card Insertion Diagram]

   1. Memory card interlock
   2. Memory card
   3. Memory card slot

2. Check that the memory card is properly seated.

   If the memory card is inserted correctly in the memory card slot, the memory card lock engages behind the memory card.

Using a memory card for the first time

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data loss</strong></td>
</tr>
</tbody>
</table>

When requested by the HMI device to format a memory card for first time use, you should save a backup copy of memory card data to a PC.

Proceed as follows to prevent data loss:

1. Cancel the formatting procedure by pressing "ESC".
2. Save a backup copy of vital data to a PC.
3. Format the memory card on the HMI device.
4. If you require on the HMI device data that has been saved on the PC, transfer the data back to the memory card.

   You can now transfer the backup data from the memory card to the HMI device.
**Procedure – Ejecting a Memory Card**

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loss of data possible</td>
</tr>
<tr>
<td>The data on the memory card is lost if you attempt to remove it while the HMI device is accessing its data.</td>
</tr>
<tr>
<td>Do not remove the memory card while data is being accessed. Observe the corresponding alarms on the screen.</td>
</tr>
</tbody>
</table>

The following figure shows you how to eject the memory card on the example of the TP 177B.

① Eject button

Proceed as follows:

1. Press the ejection button.
   This ejects the memory card out of the slot.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not force the ejector. This could damage its mechanism.</td>
</tr>
</tbody>
</table>

2. Unplug the memory card from the memory card slot.
3. Store the memory card in a safe place.
5.3 Insert a memory card in the TP 177B 4"

Approved memory cards

Only use SD memory cards or MultiMediaCards tested and approved by Siemens AG for the respective HMI device.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>The SIMATIC S7 MultiMedia card can no longer be used</td>
</tr>
<tr>
<td>If you format a MultiMedia card for the SIMATIC S7 in the HMI device, this MultiMedia card can no longer be used in the SIMATIC S7.</td>
</tr>
<tr>
<td>Only use MultiMedia cards that are approved for the HMI device.</td>
</tr>
</tbody>
</table>

Procedure - Inserting a memory card

The memory card can be inserted during operation.

Proceed as follows:

1. Insert the memory card in the slot until it stops.
   
   When inserting the memory card, please note that it can only be inserted in the slot when the front side of the memory card is visible.

2. Check that the memory card is properly seated.
Using a memory card for the first time

**NOTICE**

**Data loss**
When requested by the HMI device to format a memory card for first time use, you should save a backup copy of memory card data to a PC.

Proceed as follows to prevent data loss:
1. Cancel the formatting procedure by pressing "ESC".
2. Save a backup copy of vital data to a PC.
3. Format the memory card on the HMI device.
4. If you require on the HMI device data that has been saved on the PC, transfer the data back to the memory card.

You can now transfer the backup data from the memory card to the HMI device.

Procedure – removing a memory card

**NOTICE**

**Loss of data possible**
The data on the memory card is lost if you attempt to remove it while the HMI device is accessing its data.

Do not remove the memory card while data is being accessed. Observe the corresponding alarms on the screen.

Proceed as follows:
1. Unplug the memory card from the memory card slot.
2. Store the memory card in a safe place.
5.4 Labeling function keys on the TP 177B 4” and OP 177B

Introduction

You can label the function keys as required for your project. Use labeling strips to do so.

**NOTICE**

Do not write on the keyboard to label the function keys.

Printing Labeling Strips

WinCC flexible comes with a range of labeling strip templates. You will find further information regarding the location of the templates in the WinCC flexible online help.

Any printable and writable foil can be used as labeling strips. You can use transparency film, the keyboard membrane of the HMI device is printed on the reverse side. Use transparent foil so that the LEDs of the function keys can be seen. The permitted thickness of the labeling strip is 0.15 mm. Paper should not be used as labeling strips.

Dimensions for the labeling strips of the TP 177B 4”

Dimensions for the labeling strips of the OP 177B
Procedure

Note
With TP 177B 4" the slots are located at the sides of the HMI device.
With OP 177B, the slots for the labeling strips are located on the bottom of the HMI device.

Proceed as follows:
1. Edit and then print the template.
   You can also print out an empty template and later write on it by hand.
2. Spray the labeling strips with fixing spray.
   The fixing spray ensures that the text is water resistant and does not smear, and that the printer ink on the keyboard membrane does not run.
3. Cut out the labeling strip.
   Ensure that the corners are cut according to the diagram shown above as this makes it easier to slide them into the slot.
4. Remove any existing labeling strips.
   Note
   Wait for the printed labeling strips to dry before you insert them.

5. Slide the labeling strips ② into the slot ①.

6. Slide the labeling strips into the slot up to the stop.
   The labeling strips will protrude approximately 3 cm out of the slot. The template dimensions for the labeling strips are designed so that the labeling is correctly placed for the function keys. It is not necessary to secure the labeling strip.

When mounting the HMI device, ensure that the labeling strips do not become jammed between the mounting cut-out and the HMI device.
5.4 Labeling function keys on the TP 177B 4" and OP 177B
6 Configuring the Operating System

6.1 Configuring the Operating System on the TP 177A

6.1.1 Overview

Loader

The figure below shows the Loader. It appears briefly when the HMI device starts up.

![Loader Diagram]

The Loader buttons have the following functions:
- Use the "Transfer" button to set "Transfer" mode on the HMI device.
- Press the "Start" button to open the project stored on the HMI device.
- Press "Control Panel" to open the HMI device Control Panel.
  
The Control Panel is used to configure various settings such as the transfer settings.

The loader also appears every time you close the project.
Protecting the Control Panel with a password

You can protect the Control Panel and taskbar from unauthorized access. Without a password, you can still read the settings in the Control Panel, but you cannot change all the settings.

This prevents inadvertent operations and increases security for the plant or machine because the settings cannot be changed when a project is not open.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the password is no longer available, you cannot change settings in the Control Panel and taskbar unless you update the operating system.</td>
</tr>
<tr>
<td>All data on the HMI device will be overwritten when you update the operating system!</td>
</tr>
</tbody>
</table>

See also

Switching on and Testing the HMI Device (Page 68)
Changing the Password Settings (Page 89)
Configuring the Data Channel (Page 93)

6.1.2 Control Panel

6.1.2.1 Overview

Control Panel of the HMI Device

The HMI device Control Panel can be used to modify the following HMI device settings:

- Screen settings
- Transfer settings

Opening the Control Panel

Open the Control Panel using the HMI device Loader.

The following options are available to open the Loader:

- The Loader appears briefly after starting the HMI device.
- During runtime:
  - If configured, touch the relevant operator control object to stop the project. The Loader opens. Refer to your plant documentation to find any additional information on this topic.
Touch the "Control Panel" button in the Loader to open the HMI device Control Panel.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP</td>
<td>Changing screen settings, displaying information about HMI device, calibrating the touch screen</td>
</tr>
<tr>
<td>Password</td>
<td>Setting password protection for the Control Panel</td>

<td>Changing MPI/DP Settings</td>
</tr>
<tr>
<td>Screen saver</td>
<td>Configuring the screen saver</td>
</tr>
<tr>
<td>Transfer</td>
<td>Change transfer settings, configure the data channel</td>
</tr>
</tbody>
</table>

Procedure

Proceed as follows to change settings in the Control Panel:

1. You must exit the project before changing settings in the Control Panel. Use the relevant operator control object provided in the project.
2. Open the Control Panel as described above.
3. Open the desired dialog by double-clicking on the corresponding icon in the Control Panel.
4. To change settings, touch the respective input field or check box and use the displayed screen keyboard if necessary. Enter the required password if the Control Panel is protected against unauthorized access. Change the HMI device settings in the dialog.
5. Press X or OK to close the dialog.
6. Press X or OK to close the dialog.
7. Start the project using the Loader.
6.1.2.2 Changing Screen Settings

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:

1. From the "OP Properties" dialog, select the "Display" tab.

2. The buttons "UP" and "DOWN" are located in the "Contrast" group. Proceed as follows to change contrast of the screen:
   - Touch the "UP" button to increase the contrast of the screen
   - Touch the "DOWN" button to decrease the contrast of the screen

3. The radio buttons "Landscape" and "Portrait" are located in the "Orientation" group. Proceed as follows to change the orientation of the screen:
   - Enable the "Landscape" radio button to orientate the screen of the HMI device diagonally
   - Enable the "Portrait" radio button to orientate the screen of the HMI device vertically

4. In the input field "Delay time", which is located in the "Startup Delay" group, set the delay time for the startup of the HMI device. The delay time is the time in seconds that is waited from the appearance of the loader until the start of the project.

   With the value "0", the project starts immediately. It is then no longer possible to call the loader after switching on the HMI device. In this case, an HMI device with the function "End project" would have to be configured.

   Valid value range is 0 s to 60 s.

5. Close the dialog and save your entries with. Touch to discard the entries
Result

The regional settings for the HMI device screen have now been changed.

Screen orientation

The orientation of the screen has already been configured by the configuration engineer when setting up the project. When transferring the project to the HMI device, a suitable orientation of the screen is set automatically.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a project is available on the HMI device, do not change the screen orientation afterwards.</td>
</tr>
</tbody>
</table>

You can, for example, change the orientation of the screen in the Control Panel if you need to operate the loader on a vertically mounted HMI device without a project.
6.1.2.3 Displaying Information about the HMI Device

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:

1. Open the "OP Properties" dialog and select the "Device" tab.

![OP Properties dialog]

- **Device**: TP 177A
- **Flash Size**: 4 MB
- **Bootloader**: 1.2
- **Boot Rel Date**: 1970-01-01
- **Image**: 01.02.00.00_01.01

1. **HMI device name**
2. **Size of the internal flash memory in which the HMI device image and project are stored**
3. **Version of the boot loader**
4. **Boot loader release date**
5. **Version of the HMI device image**

2. The "Device" tab displays the HMI-device-specific information and is read-only. You will need this information if you contact A&D Technical Support.

3. Use **OK** or **X** to close the dialog when the information is no longer required.

Note

The size of the internal flash memory does not correspond to the available working memory for a project.
6.1.2.4 Calibrating the Touch Screen

Introduction

Depending on the mounting position and viewing angle, it is possible that parallax may occur when operating the HMI device. In order to prevent any operating errors as a result, calibrate the touch screen again in the startup phase or during runtime.

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:

1. Open the "OP Properties" dialog, then select the "Touch" tab.

![OP Properties dialog]

- If the HMI device does not react precisely to a touch, the touch screen may require calibration.
- Button for calibrating the touch screen

2. Touch the "Recalibrate" button.

The following dialog appears.

- Carefully press the center of the calibration crosshairs. Repeat the process as long as the calibration crosshairs move on the touch screen.
- Calibration crosshair
3. Briefly touch the calibration crosshairs.

The calibration crosshairs then goes to four more positions. Touch the center of the calibration crosshairs for each position. If you do not touch the center of the calibration crosshair, the procedure is repeated.

Once you have touched the calibration crosshairs for all positions, the following dialog appears:

![New calibration settings have been measured. Tap the screen to register saved data. Wait for 30 seconds to cancel saved data and keep the current setting.]

- The new calibration values are measured. Touch the touch screen to save the calibration values. If you do not touch the screen within 30 seconds, the new calibration values will be discarded.
- Time remaining until the calibration values are discarded

4. Touch the screen within 30 seconds

The new calibration is saved. If you wait longer than 30 seconds, the new calibration is discarded and the original calibration remains in effect.

5. Close the dialog with OK

The Control Panel is displayed.

Result

The HMI device touch screen is now recalibrated.
6.1.2.5 Display License Information

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:
1. From the "OP Properties" dialog, select the "License" tab.

The "License" tab displays the license information for the software of the HMI device.

2. Use or OK to close the dialog when the information is no longer required.

6.1.2.6 Changing the Password Settings

Requirement

The "Password Properties" dialog has been opened with the "Password" icon.

① Input field for the password
② Input field for repeating the password

Procedure – entering a password

Proceed as follows:
1. Enter a password in the "Password" input field.
   Touch the input field. The alphanumeric screen keyboard is displayed.
2. Repeat the password entry in the "Confirm Password" input field.
3. Close the dialog with OK.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your password must not contain blank spaces or special characters * ? . % / &quot;.</td>
</tr>
</tbody>
</table>

Result
The Control Panel is now protected against unauthorized access. Without entering a password, you can read some settings but you cannot change them.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the password is no longer available, you cannot change settings in the Control Panel and taskbar unless you update the operating system.</td>
</tr>
<tr>
<td>All data on the HMI device will be overwritten when you update the operating system!</td>
</tr>
</tbody>
</table>

Procedure – deleting a password

Proceed as follows:
1. Delete the entries in the "Password" and "Confirm password" input fields.
2. Close the dialog with OK.

Result
The password protection for the Control Panel has been removed.
6.1.2.7 Changing MPI/DP Settings

Requirement

The "MPI/DP - Transfer Settings" dialog has been opened with the "MPI/DP Settings" icon.

- Bus address of the HMI device
- Data transmission rate

Procedure

Proceed as follows:

1. Enter the bus address for the HMI device in the "Address" input field
   Touch the input field. The numerical screen keyboard is displayed.
2. Select the data transfer rate for communication in the "Baud rate" input field.
   Touch the input field. The symbolic screen keyboard is displayed.
3. Close the dialog with OK.

NOTICE

Address in the MPI / PROFIBUS DP network
The value specified in the "Address" input field should be used in an MPI / PROFIBUS DP network just once.

Note

During the transfer of a project to the HMI device, the MPI / DP settings will be overwritten with the values from the transferred project.

Result

The MPI / DP settings of the HMI device have been changed.
General information

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
</table>

**Transfer mode using MPI / PROFIBUS DP**

The bus parameters for MPI / PROFIBUS DP transfer, e.g. the MPI / PROFIBUS DP address of the HMI device, will be read from the project currently loaded on the HMI device.

You can change the settings for MPI / PROFIBUS DP transfer. To do this, you must first end the project and then change the settings on the HMI device. Then return to transfer mode.

The HMI device uses the new MPI / PROFIBUS DP settings until you transfer another project to it. During the transfer of a project to the HMI device, the MPI / PROFIBUS DP settings will be overwritten with the values from the transferred project.

You can thus edit the MPI / DP settings for the TP 177A irrespective of the project settings.

**Transfer settings**

A project can only be transferred from the configuration PC to the HMI device when at least one of the data channels is enabled on the HMI device.

Do not change the transfer settings if a project is running or the HMI device is in transfer mode.

---

6.1.2.8 Setting the Screen Saver

**Introduction**

You can set a period of time for automatic activation of the screen saver on the HMI device. The screen saver is automatically activated if the HMI device is not operated within the specified period of time.

The screen saver switches off in the following cases:
- When you touch the touch screen.
- A message is displayed.

**Requirement**

The "Screen Saver Settings" dialog has been opened with the "Screen Saver" icon.

![Screen Saver Settings Icon](image)
Procedure

Proceed as follows:

1. Enter the number of minutes before the screen saver is to be activated. Touch the input field. You can enter a value between 5 and 360 minutes. Entering "0" deactivates the screen saver.

2. Close the dialog and save your entries with OK. Touch X to discard the entries.

NOTICE

Activating the screen saver

You should always activate the screen saver. Otherwise, the screen contents may leave a burn-in effect in the background if they appear too long.

This effect is reversible, however.

Result

The screen saver for the HMI device has now been set.

6.1.2.9 Configuring the Data Channel

Introduction

If you block all data channels, the HMI device is protected against unintentional overwriting of the project data and HMI device image.

Requirement

The "Transfer Settings" dialog has been opened with the "Transfer" icon.

① Group for the data channel 1 (channel 1)
② Group for the data channel 2 (channel 2)
③ Button for the "MPI / DP Transfer Settings" dialog
Configuring the Operating System

6.1 Configuring the Operating System on the TP 177A

Procedure

Proceed as follows:

1. Configure the data channel that you want to use.
   
   You can clear the required data channel by activating the associated "Enable Channel" check box in the "Channel 1" or "Channel 2" group. In the "Channel 1" group, the RS 485 port is configured for the serial data transfer.
   
   – Activate the "Enable Channel" check box to enable the data channel.
   – Deactivate the "Enable Channel" check box to lock the data channel.

2. Automatically configure the transfer for the data channel 2.
   
   – Deactivate the "Remote Control" check box to disable automatic transfer.
   – Activate the "Remote Control" check box to enable automatic transfer.

   **WARNING**

   Unintentional transfer mode

   Ensure that the configuration PC does not inadvertently switch the HMI device to transfer mode during the open project. This could cause unintentional actions to be triggered in the plant.

3. Using the "Advanced" button, go to the "MPI / DP - Transfer Settings" dialog where you can change the MPI / DP settings.
   
   Close the "MPI / DP - Transfer Settings" dialog after changing the MPI / DP settings with ✓.

4. Close the "Transfer Settings" dialog and save your entries with ✓ to accept the entries.
   
   Touch ✗ to discard the entries

Result

The data channel is configured.
General information

NOTICE

Transfer mode using MPI / PROFIBUS DP

The bus parameters for MPI / PROFIBUS DP transfer, e.g. the MPI / PROFIBUS DP address of the HMI device, will be read from the project currently loaded on the HMI device.

You can change the settings for MPI / PROFIBUS DP transfer. To do this, you must first end the project and then change the settings on the HMI device. Then return to "Transfer" mode.

During the transfer of a project to the HMI device, the MPI / DP settings will be overwritten with the values from the transferred project.

Transfer settings

A project can only be transferred from the configuration PC to the HMI device when at least one of the data channels is enabled on the HMI device.

See also

Changing MPI/DP Settings (Page 91)
6.2 Configuring the operating system for TP 177B 6" and OP 177B

6.2.1 Overview

Loader

The figure below shows the Loader.

The Loader buttons have the following functions:

- Use the "Transfer" button to set "Transfer" mode on the HMI device. The transfer mode can only be activated when at least one data channel has been enabled for the transfer.
- Press the "Start" button to open the project stored on the HMI device.
- Press "Control Panel" to open the HMI device Control Panel. The Control Panel is used to configure various settings such as the transfer settings.
- Press the "Taskbar" button to activate the taskbar containing the open Windows CE Start menu.
Password protection

You can protect the Control Panel and taskbar from unauthorized access. When password protection is enabled, the message "password protect" is displayed in the Loader.

If the password is not entered, only the "Transfer" and "Start" buttons are operable. This prevents inadvertent operations and increases security for the plant or machine because the settings cannot be changed when a project is not open.

**NOTICE**

If the password is no longer available, you cannot change settings in the Control Panel and taskbar unless you update the operating system.

All data on the HMI device will be overwritten when you update the operating system!

6.2 Configuring the operating system for TP 177B 6" and OP 177B

6.2.2 Control Panel

6.2.2.1 Overview

Control Panel of the HMI Device

The settings you can make in the Control Panel of the HMI device include:

- Communication
- Date/time
- Screen saver
- Backup and restore
- Regional settings
- Transfer settings
- Delay time
- Password

Opening the Control Panel

Touch the "Control Panel" button in the Loader to open the HMI device Control Panel. The following options are available to open the Loader:

- The Loader appears briefly after starting the HMI device.
- Closing a Project

If configured, touch the relevant operator control object to stop the project. The Loader opens. Refer to your plant documentation to find any additional information on this topic.
“Backup / Restore”  Backing up and restoring the HMI device image and the project on memory cards

“Communication Properties”  Setting device names for network operation

“Date / Time”  Setting the date and time of day on the HMI device

“InputPanel”  Configuring the screen keyboard

“Keyboard”  Setting the character repeat for the screen keyboard

“Mouse”  Setting the double-click on the touch screen

“Network”  Setting network parameters

“OP”  Changing screen settings, displaying information about HMI device, calibrating the touch screen

“Password”  Setting password protection for the Control Panel

“Printer”  Configuring printers

“Regional Settings”  Making local region settings

“S7 Transfer Settings”  Setting the transfer parameters for MPI / DP

“Screen Saver”  Configuring the screen saver

“System”  Displaying information about the operating system, processor and memory

“Transfer”  Configuring a data channel for the transfer

“WinCC Internet Settings”  Parameters for using the Internet - for PN HMI devices only

Procedure

Proceed as follows to change settings in the Control Panel:

1. You must exit the project before changing settings in the Control Panel.
   Use the provided operating element.

2. Open the Control Panel as described above.

3. Open the desired dialog by double-clicking on the corresponding icon in the Control Panel.
   Enter the required password if the Control Panel is protected against unauthorized access.

4. Change settings for your HMI device in the Control Panel
   To change settings, touch the respective input field or check box and use the displayed screen keyboard if necessary.

5. Press OK or use the button to close the dialog.

6. Press the button or OK to close the Control Panel.

7. Start the project in the loader.
6.2.2.2 Input Using the Screen Keyboard

Introduction

A variety of screen keyboards are available to input information outside an open project, for example in the Control Panel. A screen keyboard appears as soon as you touch an input field. You can switch the screen keyboard and change its position on screen. Confirm your entries with $\text{Enter}$ or discard your entries with $\text{Esc}$. Either action closes the screen keyboard.

Screen Keyboard Outside an Open Project

- Numerical screen keyboard

```
7 8 9
4 5 6
1 2 3
0 .
```

- Alphanumerical screen keyboard

```
1 2 3 4 5 6 7 8 9 0 . , - = +
q w e r t y u i o p
a s d f g h j k l
z x c v b n m
```

The alphanumerical keyboard has multiple levels.

1. Normal level
2. Shift level
3. Level on which the control keys are activated

The figure shows the normal level of the alphanumeric screen keyboard.

You can also reduce both screen keyboards:
Switching between Screen Keyboards

- `Alt` switches between the alphanumerical and numerical screen keyboards
- `Esc` switches between the normal level and Shift level of the alphanumerical screen keyboard
- `Shift` activates and deactivates the numerical and alphanumerical keys of the alphanumerical screen keyboard
- `Insert` switches from full display to reduced display
- `Print Screen` switches from reduced display to full display
- `Delete` closes the reduced display of the screen keyboard

Moving the Screen Keyboard on the Touch Screen

You can move the screen keyboard if it blocks you from operating a dialog in any way.

1. Touch `Esc`.
   Keep touch contact to move the screen keyboard on the touch screen. Release touch contact on the icon when the required position is reached.

6.2.2.3 Configuring the Screen Keyboard

Introduction

In the Control Panel you can configure the screen keyboard that is used to make entries outside an open project.

Requirement

The "Siemens HMI Input Panel - Options" dialog has been opened with the "Input Panel" icon.

![Screen Keyboard Configuration](image)

1. Button for displaying the screen keyboard
2. Button for saving the screen keyboard
Procedure

1. Touch the "Open Input Panel" button.
   The screen keyboard is displayed.
   The "Siemens HMI Input Panel – Options" dialog changes its appearance.

2. Touch the <Num> button of the screen keyboard two toggle between the numerical and alphanumerical screen keyboard.
   Set the position of the screen keyboard.

3. Touch the "Save" button to save the settings.

4. Touch the "Close Input Panel" button to close the screen keyboard.

5. Close the dialog with OK or X.

Result

The screen keyboard settings have been modified.

See also

Input Using the Screen Keyboard (Page 100)
6.2.2.4 Setting the Character Repeat for the Screen Keyboard

Introduction

In the Control Panel you can set the character repeat for the screen keyboard that is used to make entries outside an open project.

Requirement

The "Keyboard Properties" dialog has been opened with the "Keyboard" icon.

Procedure

Proceed as follows:

1. Specify whether or not the character repeat of the keyboard should be activated
   - Activate the "Enable character repeat" check box to enable the character repeat
   - Deactivate the "Enable character repeat" check box to disable the character repeat

2. Use the buttons or slide bar to set the use and rate of the character repeat

3. Verify your settings
   - Touch the test field. The screen keyboard opens.
   - Move the screen keyboard as needed.
   - Touch any character and keep it pressed
   - Check the activation of the character repeat and its rate in the test field
   - Correct your setting if necessary

4. Close the dialog and save your entries with OK. Touch X to discard the entries.

Result

The character repeat for the keyboard is now set.
6.2.2.5 Setting the Double-click on the Touch Screen

Introduction
You can start application in the Control Panel and in Windows CE with a double-click, two brief touches is sequence.
Set the time between two touches in the Control Panel.

Requirement
The "Mouse Properties" dialog has been opened with the "Mouse" icon.

Procedure
Proceed as follows:
1. Touch the pattern twice
   - The pattern is displayed in inverse colors at the second touch

2. Touch the icon twice
   If the double-click is detected, the icon is displayed as follows at the second touch.

3. If the icon remains unchanged, double-click on the pattern again.
4. Close the dialog and save your entries with OK. Touch X to discard the entries.

Result
The double-click on the touch screen is now set.
6.2.2.6 Backup and Restore Using a Memory Card

Introduction

A backup involves copying the operating system, applications and data in flash memory of the HMI device to a memory card.

A restore operation deletes all old data from flash memory of the HMI device on confirmation. The data stored on the memory card is then copied to the internal flash memory.

Requirement

A memory card with ≥16 MB capacity is inserted in the HMI device.

The "Backup/Restore" dialog has been opened with the "Backup/Restore" icon.

1. Button for data backup
2. Button for data restore

Procedure for backup

Proceed as follows:

1. Touch the "BACKUP" button.
   The message "Starting backup" is displayed.
   The following message appears if no memory card is inserted in the card slot or if the memory card is damaged:

   ![WARNING]
   No storage card detected!

   Then perform steps 2 and 3.

2. Touch OK.
   This message is displayed: "Backup aborted".

3. Confirm with "OK."
   The Control Panel is displayed again.
Repeat the procedure with a suitable memory card.

1. Using the memory card

2. Touch the "BACKUP" button.
   
   The message "Storage card detected" is displayed.
   
   – A warning is displayed if the available space is insufficient. The backup is aborted. Delete any unneeded data on the memory card using the Windows CE Explorer.
   
   – If the memory card contains data, the following message is displayed: "You have an old backup on the storage card. Do you want to delete it?".

3. Press "Yes" if you want to delete the data.

   Press "No" if you want to retain the data.

   The messages "Checking the registry settings" and "Saving CE image" are displayed in sequence when the backup begins. A progress bar shows the status of the process.

   The backup ends with the following message: "Backup successfully completed. Touch OK and remove memory card."

4. Touch the "OK" button.

   The Control Panel is displayed.

**Result**

The HMI device data is now saved on the memory card.

**Procedure for restoring**

Proceed as follows:

1. Touch the "RESTORE" button.

   The message "Restore started" is displayed.

   The following message appears if no memory card is inserted in the card slot or if the memory card is damaged:

   ![RESTORE Message](image)

Then perform steps 2 and 4.

2. Touch **OK**.

   This message is displayed: "Restore aborted. Remove the memory card".

3. Remove the memory card.

4. Confirm with "OK."

   The Control Panel is displayed again.
Repeat the procedure with a suitable memory card.

1. Using the memory card

2. Touch the "RESTORE" button.
   
   This message is displayed: "Restore started". The following message appears:
   "Checking data". When the data has been checked, the following message appears:
   "You are starting a restore. All files except those on the memory card and the registry
   files will be deleted. Are you sure?"

3. Press "Yes" if you want to restore the data.
   
   Press "No" if you want to cancel the restore.

   The messages "Deleting files in the internal Flash memory" and "Restoring CE image"
   are displayed in sequence once the restore process begins. A progress bar shows the
   status of the process.

   The restore ends with the message "The restore of the CE images is completed.
   The HMI device will now be restarted. Do not remove the memory card."

4. Touch the "OK" button.
   
   The operating system boots, opening the Loader and Control Panel in sequence.
   Two messages appear.

   Then the final message appears: "Restore successfully completed. Touch OK and
   remove memory card."

5. Touch the "OK" button.

   The HMI device boots. The Control Panel is displayed.

6. Remove the memory card, if necessary.
   
   Store the memory card in a safe place.

**Result**

The data from the memory card is now on the HMI device. The existing licenses are retained
on the HMI device, all other files have been deleted.
6.2.2.7 Setting the Date and Time

Requirement

The "Date/Time Properties" dialog has been opened with the "Date/Time Properties" icon.

![Date/Time Properties](image)

- ① Time zone
- ② Time
- ③ Date
- ④ "Daylight savings" check box
- ⑤ Button for applying changes

Procedure

Proceed as follows:

1. Select the appropriate time zone for the HMI device from the "Time Zone" selection list.
2. Touch the "Apply" button to confirm your entry.
   The time of day shown in the "Current Time" box is adjusted correspondingly to the selected time zone.
3. Set the date in the selection field.
4. Set the current time of day in the "Current Time" text box.
5. Touch the "Apply" button to confirm your input.
   The values you have set are now in effect.

Note

The system does not automatically switch between winter and summer time!
6. If you want to switch from winter to summer time, select the "Daylight savings time currently in effect" check box.
   When you press the "Apply" button, the time is brought forward by one hour.

7. If you want to switch from summer to winter time, deactivate the "Daylight savings time currently in effect" check box.
   When you press the "Apply" button, the time is moved backwards by one hour.

8. Close the dialog and save your entries with OK.
   Touch X to discard the entries.

**NOTICE**
Reboot the HMI device if you have made changes to the time zone.

**Result**
The settings for the date and time of day have now been changed.

**Synchronizing the date and time with the PLC**
The date and time of the HMI device can be synchronized with the controller, if this has been configured in the project and the controller program.

Additional information on this subject is available in the "WinCC flexible" system manual.

**NOTICE**
Synchronize the date and time if time-based reactions are to be triggered in the PLC.

**6.2.2.8 Saving Registry Information**

**Introduction**
If you are running your own programs on the HMI device under MS Windows CE, you should back up the registry information after installing the programs. There are several ways to save files:

- Save the registry information to the Flash memory.
- Save files in a temporary folder to the Flash memory.

Saving to the Flash memory allows you to automatically restore the file system on the HMI device.
### Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

#### Procedure

1. Touch the "Save Registry" button to save the current registry settings
2. Touch the "Save Files" button to save temporary files
3. Specify whether or not the file system on the memory card should be restored when the HMI device starts up or when a memory card is inserted.
   - Activate the check box "Automatically Repair ...", if you wish to have the files system restored automatically.
   - Deactivate the check box "Automatically Repair ...", if you wish to have the files system restored only upon prompting.
4. Close the dialog and save your entries with **OK**. Touch **X** to discard the entries.

### Result

The HMI device uses the saved registry information the next time it starts. The temporary files are copied back.
6.2.2.9 Changing Screen Contrast

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:

1. From the "OP Properties" dialog, select the "Display" tab.

2. Proceed as follows to change contrast of the screen:
   - Touch the "UP" button to increase the contrast of the screen
   - Touch the "DOWN" button to decrease the contrast of the screen

3. Close the dialog and save your entries with OK. Touch X to discard the entries

Result

The HMI device screen contrast has now been changed.

Note

You can also adjust the contrast within an open project. Refer to the corresponding system documentation for more information in this regard.
6.2 Configuring the operating system for TP 177B 6" and OP 177B

6.2.2.10 Displaying Information about the HMI Device

Requirement

The "OP Properties" dialog has been opened with the "OP" icon.

Procedure

Proceed as follows:

1. Open the "OP Properties" dialog, then select the "Device" tab.

<table>
<thead>
<tr>
<th>OP Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Persistent Storage</td>
</tr>
<tr>
<td>Device:</td>
</tr>
<tr>
<td>Image:</td>
</tr>
<tr>
<td>Bootloader:</td>
</tr>
<tr>
<td>Bootloader RD Date:</td>
</tr>
<tr>
<td>Flashsize:</td>
</tr>
<tr>
<td>MAC-Address:</td>
</tr>
<tr>
<td>Reboot</td>
</tr>
</tbody>
</table>

1. HMI device name
2. Version of the HMI device image
3. Version of the boot loader
4. Boot loader release date
5. Size of the internal flash memory in which the HMI device image and project are stored
6. MAC address of the HMI device
7. Button for restarting the HMI device

2. The device-specific information is displayed in the "Device" tab. You will need this information if you contact A&D Technical Support.

3. Activate the "Reboot" button if you want to reboot the HMI device

   After you have activated the "Reboot" button, a warning is displayed on the screen. If you acknowledge this with "OK", the HMI device is rebooted immediately.

4. Use OK or to close the dialog when the information is no longer required.

**CAUTION**

Data loss when the HMI device is restarted

All volatile data is lost when the HMI device is rebooted. No check is carried out as to whether or not the project on the HMI device is running, the communication is active whether or not data are currently being written into the flash memory.

Note

The size of the internal flash memory does not correspond to the available working memory for a project.
6.2.11  Calibrating the Touch Screen

Introduction
Depending on the mounting position and viewing angle, it is possible that parallax may occur when operating the HMI device. In order to prevent any operating errors as a result, calibrate the touch screen again in the startup phase or during runtime.

Requirement
The "OP Properties" dialog has been opened with the "OP" icon.

Procedure
Proceed as follows:
1. Open the "OP Properties" dialog, then select the "Touch" tab.
   - If the HMI device does not react precisely to a touch, the touch screen may require calibration.
   - Button for calibrating the touch screen

2. Touch the "Recalibrate" button.
   - Carefully press the middle of the calibration crosshairs. Repeat the process as long as the calibration crosshairs move on the touch screen.
   - Calibration crosshair
3. Briefly touch the calibration crosshairs.

The calibration crosshairs then go to four more positions. Touch the middle of the calibration crosshairs for each position. If you do not touch the middle of the calibration crosshairs, the procedure is repeated.

Once you have touched the calibration crosshairs for all positions, the following dialog appears:

![New calibration settings have been measured. Tap the screen to register saved data. Wait for 30 seconds to cancel saved data and keep the current setting.

- Time limit: 30 sec

① The new calibration values are measured. Touch the touch screen to save the calibration values. If you do not touch the screen within 30 seconds, the new calibration values will be discarded.

② Time remaining until the calibration values are discarded

4. Touch the screen within 30 seconds

The new calibration is saved. If you wait longer than 30 seconds, the new calibration is discarded and the original calibration remains in effect.

5. Close the dialog with OK.

The Control Panel is displayed.

Result

The HMI device touch screen is now recalibrated.
6.2.12 Changing the Password Settings

Introduction
You can protect the Control Panel and Windows CE taskbar with a password.

Requirement
The "Password Properties" dialog has been opened with the "Password" icon.

Procedure – entering a password
Proceed as follows:
1. Enter a password in the "Password" input field.
   Touch the input field. The alphanumerical screen keyboard is displayed.
2. Repeat the password entry in the "Confirm Password" input field.
3. Close the dialog with OK

NOTICE
Your password must not contain blank spaces or special characters * ? . % / ".

Result
You cannot open the Control Panel or Windows CE taskbar without entering a password.

NOTICE
If the password is no longer available, you cannot make changes in the Control Panel or use the Windows CE taskbar unless you update the operating system.
All data on the HMI device will be overwritten when you update the operating system!
Configuring the Operating System

6.2 Configuring the operating system for TP 177B 6" and OP 177B

Procedure – deleting a password

Proceed as follows:
1. Delete the entries in the "Password" and "Confirm password" input fields
2. Close the dialog with OK

Result

Password protection for the Control Panel and Windows CE taskbar has been removed.

6.2.2.13 Changing Printer Settings

Printing on Network Printers

HMI devices with a PROFINET interface can also print on network printers.

Hardcopies and logs can be printed on network printers. Individual new incoming or outgoing alarms cannot be printed.

Requirement

The "Printer Properties" dialog has been opened with the "Printer" icon.

![Printer Properties dialog]

- Printer selection list
- Interface
- Network address of the printer (applies to TP 177B 6" PN/DP and OP 177B PN/DP)
- Paper size selection list
- Orientation setting
- Print quality setting
Procedure

Proceed as follows:
1. Touch the "Printer Language" selection list and select a printer
2. Touch the "Port" selection list and set the port for the printer
3. Applies to TP 177B 6" PN/DP and OP 177B PN/DP with a "Network" interface:
   Touch the "Network" selection field to enter the network address of the printer.
   The alphanumerical screen keyboard is displayed.
4. Touch the "Paper Size" selection field and select the format of the paper.
5. Touch the desired check box in the "Orientation" field:
   - "Portrait"
   - "Landscape"
6. Select the print quality.
   - Activate the check box "Draft Mode", if you wish to print a draft.
   - Deactivate the check box "Draft Mode", if you wish to print with higher quality.
7. Set the color mode.
   - Activate the check box "Color", if you wish to print in color. Deactivate it to print in monochrome.
8. Close the dialog and save your entries with [OK]. Touch [X] to discard the entries.

Result

The settings for the printer have now been changed.

Note

The list of current printers and required settings for HMI devices can be found on the Internet under "http://support.automation.siemens.com/WW/view/en/11376409".
6.2.2.14 Changing Regional Settings

Introduction

The display format of the date, time and decimal point etc. differ from region to region. You can adjust the regional settings on the HMI device to meet local requirements.

Requirement

The "Regional Settings Properties" dialog has been opened with the "Regional Settings" icon.

Procedure - Changing Regional Settings

Proceed as follows:
1. Touch the "Regional" selection list for the language in the "Regional Settings" tab
2. Select the desired language.
   To do this, touch the input field. The symbolic screen keyboard is displayed.

Procedure - Changing the Number Format

Proceed as follows:
1. Open the "Number" tab.
2. Set the following in the selection lists:
   - The character for the decimal separator
   - The character for the thousand separator
   - The separator character for number sequences
3. Touch the respective selection list and set the desired value using the screen keyboard
Procedure - Changing the Time Format
1. Open the "Time" tab.
2. Set the following in the selection lists:
   - Time of day format
   - Define the separator between hours, minutes and seconds.
   - The format for the time before 12:00 noon.
   - The format for the time after 12:00 noon.
3. Touch the respective selection list and set the desired value using the screen keyboard.

Procedure - Changing the Date Format
1. Open the "Date" tab.
2. Set the following in the selection lists:
   - Define the separator between year, month and day.
   - The abbreviated format of the date
   - The full format of the date
3. Touch the respective selection list and set the desired value using the screen keyboard.

Procedure - Closing the Dialog
1. Close the dialog and save your entries with **OK**. Touch **X** to discard the entries.

Result
The regional settings for the HMI device screen have now been changed.

6.2.2.15 Changing MPI/PROFIBUS DP Settings

Requirement
The "S7 Transfer Settings" dialog has been opened with the "S7 Transfer" icon.

![S7-Transfer Settings dialog]

1. Network selection
2. Button for opening the properties dialog
Procedure

Proceed as follows:

1. Select a network and then touch the "Properties" button

   One of the two following dialogs is displayed.

   ![Diagram of MPI configuration parameters]

   - The HMI device is the only master on the bus.
   - Bus address of the HMI device
   - Time-out
   - Data transmission rate in total network
   - Highest station address in the network
   - Profile
   - Button for displaying the bus parameters

2. If more masters are connected to the bus, deactivate the check box "Panel is the only master on the bus"

3. Enter the bus address for the HMI device in the "Address" input field

   Touch the input field. A selection list is displayed.

4. Select the highest transmission rate from the "Transmission rate" input field

   Touch the input field. The symbolic screen keyboard is displayed.
5. Select the highest station address on the bus in the "Highest Station Address" input field. Touch the input field. The symbolic screen keyboard is displayed.

6. Select the desired profile from the "Profile" selection field. Touch the input field. The symbolic screen keyboard is displayed.

7. The profile data is displayed when you press the "Bus Parameters" button in the PROFIBUS dialog. This dialog is read-only.

<table>
<thead>
<tr>
<th>Profile</th>

<td>9</td>
<td>Bit</td>
</tr>
<tr>
<td>Gap factor</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>Retry limit</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>

8. Close the dialog and save your entries with OK. Touch X to discard the entries.

**NOTICE**

**Address in the MPI / PROFIBUS DP network**

The value specified in the "Address" input field should be used in an MPI / PROFIBUS DP network just once.

**Bus parameters in the MPI / PROFIBUS DP network**

The bus parameters must be the same for all stations in the MPI / PROFIBUS DP network.

**Note**

When a project is opened, the MPI / DP settings are overwritten with the values from the project.
General information

NOTICE

Transfer mode using MPI / PROFIBUS DP
The bus parameters for MPI / PROFIBUS DP transfer, e.g. the MPI / PROFIBUS DP address of the HMI device, will be read from the project currently loaded on the HMI device.
You can change the settings for MPI / PROFIBUS DP transfer. To do this, you must first end the project and then change the settings on the HMI device. Then return to transfer mode.
The HMI device uses the new MPI / PROFIBUS DP settings until you start a project or transfer a project to it. The MPI / PROFIBUS DP settings are then overwritten by the values from this project.

Transfer settings
A project can only be transferred from the configuration PC to the HMI device when at least one of the data channels is enabled on the HMI device.
Do not change the transfer settings if a project is running or the HMI device is in transfer mode.

Result
The MPI / DP settings of the HMI device have been changed.
6.2.2.16 Setting the Delay Time

Introduction
The project is opened following a delay time when the HMI device is switched on. The Loader is displayed during the delay time.

Requirements
The "Transfer Settings" dialog has been opened with the "Transfer" icon. You have opened the "Directories" tab.

1. Memory location for the project file
2. Memory location for the compressed source file of your project for backtransfer.
   The external memory card or the network connections can be defined as the memory location. During the next backup process, the project's source file is stored in the specified location.
3. Storage location and initialization file of the HMI device for process operation
4. Selection list for the delay time

NOTICE
Settings in "Project File" and "Path"
Do not change the setting in the "Project File" and "Path" fields if you are working on a project. The project may not open at the next start of the HMI if changes are made here.

Procedure for setting the delay time
1. Touch the “Wait [sec]” section list.
   A selection list is displayed. Select the desired delay time.
   With the value "0", the project starts immediately. It is then no longer possible to call the loader after switching on the HMI device. If you still wish to access the loader, an operating element must be configured to close the project.
2. Close the dialog and save your entries with OK. Touch X to discard the entries.

Result
The delay time for the HMI device is now set.
6.2.2.17 Setting the Screen Saver

Introduction

You can set a period of time for automatic activation of the screen saver on the HMI device. The screen saver is automatically activated if the HMI device is not operated within the specified period of time.

The screen saver is deactivated when any key is pressed or the touch screen is touched. The function assigned to that key is not triggered.

Requirement

The “Screen Saver” dialog has been opened with the “Screen Saver” icon.

![Screen Saver Dialog]

1. Period of time in minutes before the screen saver is activated
2. Screen saver setting
3. Enter ‘0’ to disable the screen saver. The minimum value is 5 and the maximum value is 71582 minutes.

Procedure

Proceed as follows:

1. Enter the number of minutes before the screen saver is to be activated.
   Touch the input field. A selection list is displayed. Entering "0" disables the screen saver.
2. Select either the standard screen saver or an empty screen.
   - Activate the "Standard" radio button to enable the screen saver
   - Activate the "Blank Screen" radio button to enable a blank screen as the screen saver
3. Close the dialog and save your entries with OK. Touch to discard the entries.

NOTICE

Activating the screen saver

Generally, you should always activate the screen saver. Otherwise, the screen contents may leave a burn-in effect in the background if they appear for too long.

This effect is reversible, however.

Result

The screen saver for the HMI device has now been set.
6.2.2.18  Displaying System Information

Requirement

The "System Properties" dialog has been opened with the "System" icon.

Procedure - Displaying System Information

Proceed as follows:

1. Open the "General" tab.
   The system information is displayed. This dialog is read-only.

2. Close the dialog with OK or X.

   ① Copyright to Microsoft Windows CE

   ② Information about the processor, amount of the internal Flash memory, and capacity of a memory card when inserted

   ③ Copyright to Microsoft Windows CE

   ④ Information about the processor, amount of the internal Flash memory, and capacity of a memory card when inserted

   ⑤ Copyright to Microsoft Windows CE

   ⑥ Information about the processor, amount of the internal Flash memory, and capacity of a memory card when inserted
6.2 Configuring the Operating System for TP 177B 6” and OP 177B

Procedure - Displaying Memory Information

Proceed as follows:

1. Open the "Memory" tab.
   The memory information is displayed.

   ![System Properties]
   
   - **General**
     - Move slider to the left for more memory to run programs.
   - **Memory**
     - Only unused RAM (blue portion of the slider bar) can be adjusted.
   - **Storage memory**
   - **Program memory**
   - **Total**
   - **In use**

2. Close the dialog with **OK** or **X**.

   **NOTICE**
   "Memory" Tab
   Do not change the amount of memory in the "Memory" tab.

6.2.2.19 Configuring the Data Channel

Introduction

If you block all data channels, the HMI device is protected against unintentional overwriting of the project data and HMI device image.

Requirement

The "Transfer Settings" dialog has been opened with the "Transfer" icon.

- **1** Group for the data channel 1 (channel 1)
- **2** Group for the data channel 2 (channel 2)
- **3** Button for the "MPI / DP Transfer Settings" or "Network Configuration" dialog
Procedure

Proceed as follows:

1. Configure the data channel that you want to use

   You can clear the required data channel by activating the associated "Enable Channel" check box in the "Channel 1" or "Channel 2" group. In the "Channel 1" group, the RS-485 port is configured for the serial data transfer.
   - Activate the "Enable Channel" check box to enable the data channel
   - Deactivate the "Enable Channel" check box to lock the data channel

2. Configure the automatic transfer
   - Deactivate the "Remote Control" check box to disable automatic transfer
   - Activate the "Remote Control" check box to enable automatic transfer

3. Enter the required protocol for "Channel 2".
   Touch the input field. A selection list is displayed.

4. Touch the "Advanced" button
   - Applies to the "MPI / PROFIBUS DP" protocol:
     Touch the "Advanced" button if you wish to switch to the "S7 Transfer Settings" dialog. You can change the settings for MPI / PROFIBUS DP there.
     Close the "S7 Transfer Settings" dialog with OK.
   - Applies to the "ETHERNET" protocol:
     Touch the "Advanced" button if you wish to switch to the "Network Configuration" dialog. You can change the settings for TCP / IP there.
     Close the "Network Configuration" dialog with OK after making the changes.

5. Close the "Transfer Settings" dialog and save your entries with OK to accept the entries.
   Touch × to discard the entries

Result

The data channel is configured.
General information

Note

Changes during the "Transfer" mode

If the HMI device is in "Transfer" mode while changes are made to the transfer settings, the settings only go into effect after the transfer function is restarted. This may occur if the Control Panel is opened to change the transfer properties in an active project.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer mode via channel 2</td>
</tr>
<tr>
<td>The bus parameters, such as the address of the HMI device, are read from the project currently loaded on the HMI device.</td>
</tr>
<tr>
<td>You can change the settings for the transfer via channel 2. To do this, you must first end the project and then change the settings on the HMI device. Then return to &quot;Transfer&quot; mode.</td>
</tr>
<tr>
<td>The next time the project is started on the HMI device, the settings will be overwritten by the values from the project.</td>
</tr>
</tbody>
</table>

Transfer settings

A project can only be transferred from the configuration PC to the HMI device when at least one of the data channels is enabled on the HMI device.

Changing Network Settings (Page 133)
Changing MPI/PROFIBUS DP Settings (Page 119)
6.2.2.20 Overview of Network Operation

Introduction
The HMI device with a PROFINET interface can be connected to a TCP/IP network. Connection to a TCP/IP network can offer the following advantages:

- Printing via a network printer
- Saving recipe records to a server
- Exporting recipe records
- Importing recipe records
- Transferring a project
- Backing up data

These advantages are not available with a direct PC connection. However, peripherals connected to the PC can be used. For example, you can use a local printer for printing.

**NOTICE**
The HMI device can only be used in TCP/IP and PROFINET networks.
The HMI device only has client functionality in the PC network. This means that users can access files of a subscriber with TCP/IP server functionality from the HMI device via the network. However, it is not possible to access files on the HMI device via the network from a PC.

**Note**
Information on communication using SIMATIC S7 via PROFINET is provided in the "WinCC flexible Communication" user manual.

Requirements
Within a TCP/IP or PROFINET network, computers are addressed using network names. These network names are translated from a DNS or WINS server to TCP/IP and PROFINET addresses. Direct addressing via TCP/IP and PROFINET addresses is also supported by the operating system. This is why a DNS or WINS server is needed for addressing via device name names when the HMI device is in a TCP/IP or PROFINET network. Appropriate servers are available in common TCP/IP and PROFINET networks. Consult your network administrator if you have questions in this regard.

Printing via a Network Printer
The HMI device’s operating system does not support the direct alarm logging via a network printer. All other printer functions, such as printing hardcopies or logs, are possible via the network without restriction.
General Procedure for Configuring the Network

The HMI device must be appropriately configured before setting into network operation. The configuration is basically divided into the following steps:

- Set device name of the HMI device.
- Configure the network address.
- Set the logon information.
- Save the settings.
- Switch off the HMI device once the network is configured.
  
  If your network address is assigned automatically:
  
  Before switching the HMI device on, insert the network cable in the corresponding interface so that a unique IP address for the HMI device can be assigned during startup.

- Switch on the HMI device.

Preparation

Before beginning the configuration, request the following network parameters from your network administrator.

- Does the network use DHCP for dynamic assignment of network addresses?
  
  If not, get a new TCP/IP network address for the HMI device.

- What is the TCP/IP address of the default gateway?

- If a DNS network is used, what is the address of the name server?

- If a WINS network is used, what is the address of the name server?
6.2.2.21 Setting the Device Name of the HMI Device

Requirement

The "Communications Properties" dialog has been opened with the "Communications" icon.

1. The HMI device uses this information to identify itself to other PCs.
2. Device name of the HMI device
3. Description for the HMI device (optional)

Procedure

Proceed as follows:

1. Enter the device name for the HMI device in the "Device name" input field.
   Touch the input field. The screen keyboard is displayed.
2. Enter a description for the HMI device in the "Device description" input field.
   Touch the input field. The screen keyboard is displayed.
3. Close the dialog and save your entries with OK. Touch X to discard the entries.

Result

The device name for the HMI device is now set.

Note

Change the device name for the HMI device in the "Device name" input field to activate the network functions.

See also

Overview of Network Operation (Page 129)
6.2.2.22 Activating a Direct Connection

Requirement

The “Communications Properties” dialog has been opened with the “Communications” icon.

![Communications Properties Dialog]

These settings control the connection between the HMI device and a desktop computer.

1. Enabling a direct connection
2. Button for changing the desktop computer

Procedure

Proceed as follows:

1. Open the "PC Connection" tab.
   The information about the direct connection is displayed.
2. Close the dialog with "X".

NOTICE

"PC Connection" Tab

If you want to operate a project on the HMI device, do not change the information in the "PC Connection" tab.
6.2.2.23 Changing Network Settings

**Requirement**

The "Network Configuration" dialog has been opened with the "Network" icon.

1. Selection for PROFINET adapters
2. MAC address of the HMI device
3. Button for the properties dialog

**Procedure**

Proceed as follows:

1. Touch the "SMSC100FD1: Onboard LAN Ethernet Driver"
2. Touch the "Properties" button

The "Onboard LAN Ethernet Driver" dialog is displayed.

1. Address assignment setting
2. Input field for the IP address
3. Input field for the address of the subnet mask
4. Input field for the address of the default gateway
3. Select either automatic address assignment via DHCP or manual address assignment.

4. If you set the address yourself, use the screen keyboard and enter the respective addresses in the input fields for "IP Address", "Subnet Mask" and, if used, "Default Gateway."

5. If a name server (DNS) is used in the network, open the "Name Server" tab.

   The "Name Servers" tab of the "Onboard LAN Ethernet Driver" dialog is displayed:

   ![Name Server Tab](image)

   - **Primary DNS**: [Address]
   - **Secondary DNS**: [Address]
   - **Primary WINS**: [Address]
   - **Secondary WINS**: [Address]

6. Enter the respective addresses in the input fields using the screen keyboard.

7. Close the dialog and save your entries with **OK**. Touch **X** to discard the entries.

   Once you have applied the settings, you are prompted to reboot the HMI device.

8. When prompted, open the "Device" tab of the "OP Properties" dialog and reboot the HMI device.

**Result**

The network parameters for the HMI device have now been set.

**See also**

- Displaying Information about the HMI Device (Page 112)
- Overview of Network Operation (Page 129)
6.2.2.24  Changing the Logon Information

Requirements

The "Network Configuration" dialog has been opened with the "Network" icon.

![Network Configuration Dialog]

1. Windows CE uses this information to gain access to the network resources. Enter the user name, password, and domain you have received from your administrator.
2. Input field for the user name
3. Input field for the password
4. Input field for the domain

Procedure

Proceed as follows:
1. Enter the user name in the "User name" input field
2. Touch the input field. The screen keyboard is displayed.
3. Enter your password in the "Password" input field
   Touch the input field. The screen keyboard is displayed.
4. Enter the domain name in the "Domain" input field
   Touch the input field. The screen keyboard is displayed.
5. Close the dialog and save your entries with OK. Touch to discard the entries.

Result

The logon data has now been set.

Overview of Network Operation (Page 129)
6.2.2.25 Changing Internet Settings

Requirement
The "WinCC flexible Internet Settings" dialog has been opened with the "WinCC Internet Settings" icon.

Procedure - Changing E-mail Settings
Proceed as follows:
1. Select the "Email" tab.

2. Specify the SMTP server
   - Activate the check box "Use the default of the project file" if you want to use the SMTP server permanently configured in the project
   - Deactivate the check box "Use the default of the project file" if you do not want to use the SMTP server permanently configured in the project
     Touch the input field to enter the SMTP server. The screen keyboard is displayed.

3. Enter the name for the sender in the "Sender" input field
   Touch the input field. The screen keyboard is displayed.

4. Enter the e-mail account for your e-mail in the "Authentication" input field
   Touch the input field. The screen keyboard is displayed.

Some e-mail providers only allow you to send mail if you specify the e-mail account. The "Authentication" input field can remain empty if your e-mail provider allows you to send mail without checking the account.
Procedure - changing proxy settings

Proceed as follows:

1. Select the "Proxy" tab

![WinCC flexible Internet Settings]

- □ Check box for using a proxy server
- □ Address of the proxy server
- □ Port

2. Activate the check box "Use proxy server" if you want to use a proxy server

3. If you use a proxy server:

   Specify the address of the proxy server and the desired port. Touch the corresponding input field. The screen keyboard is displayed.

4. Close the dialog and save your entries with OK. Touch X to discard the entries.

Result

The Internet settings have been changed.

Note

Options

Additional tabs may appear in the "WinCC Internet Settings" tab. This depends on the options that have been enabled for network operation in the project.

Refer to your plant documentation to find any additional information on this topic.

Overview of Network Operation (Page 129)
6.3 Configuring the operating system on the TP 177B 4"

6.3.1 Loader

Overview

The figure below shows the Loader. The header line contains details of the loader version. These details are not shown in the following figure.

The Loader buttons have the following functions:

- Press the "Transfer" button to set the HMI device to "Transfer" mode.
  The transfer mode can only be activated when at least one data channel has been enabled for the transfer.
- Press the "Start" button to start the project on the HMI device.
  If you do not perform an operation, the project on the HMI device will automatically start after a delay.
- Press the "Control Panel" button to open the HMI device Control Panel.
  You can change various settings in the Control Panel, for example, the transfer settings.
- Press the "Taskbar" button to activate the taskbar with the Windows CE start menu open.
Open Loader

The following options are available to open the Loader:

- The Loader appears briefly after starting the HMI device.
- The Loader appears when the project is closed.
  
  If configured, use the relevant operating element to close the project.
  
  For further information on this, refer to your plant documentation.

Protection against unauthorized access

You can use a password to protect the Control Panel and taskbar from unauthorized access.

In addition, you can protect the taskbar and the desktop with the aid of the SecureMode. If the HMI device is protected, the label "secure mode" will be displayed on the Windows CE desktop. For more information, refer to SecureMode in section "Setting up and disabling SecureMode (Page 140)."

The "Transfer" and "Start" buttons can always be operated without a password entry.

Password protection prevents maloperation. This in turn increases security on the plant or machine. The settings for the active project can only be changed by entering the password.

<table>
<thead>

<tr>
<td>- Change settings in the Control Panel</td>
</tr>
<tr>
<td>- Operating the Windows CE taskbar</td>
</tr>
<tr>
<td>All data on the HMI device will be deleted when you update the operating system!</td>
</tr>
<tr>
<td>Therefore use the password to protect against loss.</td>
</tr>
</tbody>
</table>
6.3 Configuring the operating system on the TP 177B 4"

6.3.2 Setting up and disabling SecureMode

Overview
You can use a password to protect the Control Panel against unauthorized access. You can also protect the taskbar and the desktop with the aid of the SecureMode.

Function of SecureMode
You set up the SecureMode by setting up a password in the Control Panel. The SecureMode is then automatically activated. The label "secure mode" will be displayed on the Windows CE desktop.

For more information, refer to the "Changing password protection (Page 151)" section.

If you now operate a function in the taskbar or the desktop, you must enter a password. After entering the password, the label "secure mode" is no longer displayed. All functions in the taskbar and the desktop can now be operated. To reactivate SecureMode, double-click the symbol on the desktop. The label "secure mode" will be shown again. The HMI device is protected again.

Disabling SecureMode
To completely disable SecureMode, delete the password.
6.3 Configuring the operating system on the TP 177B 4"

6.3.3 Control Panel

6.3.3.1 Overview

The HMI device's Control Panel is similar to the control panel on a PC.

The Control Panel looks like this:

![Control Panel Image]

The control panel can be used to modify the following settings:

- Date and time
- Screen saver
- Regional settings
- Transfer settings
- Network settings
- Delay time
- Password
6.3.3.2 Opening the Control Panel

Introduction

The HMI device Control Panel can be opened as follows:

- Independently of a running project
  - Press the "Control panel" button in the loader.
  - By calling up from the Windows CE start menu.
- With active project
  An operating element must be configured to open the Control Panel for this purpose.

Procedure – open the Control Panel via the Start menu

Proceed as follows:

1. Open the Windows CE start menu.
   Alternatively, press the key twice on the alphanumerical screen keyboard.
2. Select "Settings > Control panel".

Result

The control panel is opened.

6.3.3.3 Reference for functions

\(^1\) Additional tabs may appear in the "WinCC flexible Internet Settings" dialog. This depends on the options that have been enabled for network operation in the project.
6.3.3.4 Operator control options for the Control Panel

Entries using the touch screen
The operating elements shown in the dialogs are touch-sensitive. Touch objects are basically operated in the same way as mechanical keys. You activate operating elements by touching them with your finger. To double-click them, touch an operating element twice in succession.

Entries using an external USB keyboard
An external keyboard can be used to operate the Control Panel in exactly the same way as the HMI device keyboard. Use the keys of the external keyboard which correspond to the HMI device keys in the description.

Operating using an external USB mouse
An external mouse can be used to operate the Control Panel in exactly the same way as the HMI device touch screen. Click the described operating elements with the mouse.

6.3.3.5 Operating the Control Panel with the touch screen

Introduction
The control panel is operated with the HMI device touch screen or a connected mouse.

Requirement
An active project has been terminated. The Loader appears.

Procedure
Proceed as follows to change settings in the Control Panel:
1. Open the Control Panel with the "Control Panel" button.
2. To open the required dialog, double-click on its icon.
3. Change the tab as required.
4. Make the necessary changes.
   Touch the corresponding input object.
   – Use the screen keyboard of the HMI device to enter the new values in the text boxes.
   – Touch a button to operate it.
   – To open a selection list, touch the triangle at the end of the field. Touch the required entry from the selection list.
   – Touch the check box to activate or deactivate a check box.
   – Touch a radio button to select it.
5. Confirm the selection with the OK button or abort the entry with the button.
   The dialog closes.
6. Close the Control Panel with the button.
   The Loader appears.
Input with the screen keyboard

A screen keyboard is available for data input. The screen keyboard is displayed as soon as you touch a text box. You can also call up the screen keyboard directly from the Control Panel.

Display methods for the screen keyboard

You can change the display method for the screen keyboard and fix the position on the screen. Confirm the entry with the button or abort the entry with the key. Either action closes the screen keyboard.

- Numerical screen keyboard

- Alphanumerical screen keyboard

The alphanumerical keyboard is organized in the following two layers:
- Normal level
- Shift level

- Reduced screen keyboard

6.3.4 Changing settings for operation

6.3.4.1 Configuring the screen keyboard

Introduction

You can set at which screen position and in which view the screen keyboard will open.

Requirements

You have opened the "Siemens HMI Input Panel - Options" dialog with the "InputPanel" icon.

![Diagram]

1 Button for displaying the screen keyboard
2 Button for saving the screen keyboard settings
Procedure

Proceed as follows:
1. Use the "Open Input Panel" button to open the screen keyboard.
2. If you want to switch between the numerical and alphanumerical screen keyboard, press the `key.
3. If you want to change the position of the screen keyboard, use the mouse pointer to select a free space between the keys.
   Move the screen keyboard to the required position and release the mouse pointer once you have reached the required position.
4. If you want to save the settings, press the "Save" button.
5. Confirm your entries.
   The dialog closes.

Result

The screen keyboard settings have been modified.

6.3.4.2 Setting the character repeat

Introduction

You can use this function to set the character repeat and associated delay for the screen keyboard.

Requirement

You have opened the "Keyboard Properties" dialog with the "Keyboard" icon.

| 1 | Check box for activating the character repeat |
| 2 | Slider control and buttons for the delay time before character repeat |
| 3 | Slider control and buttons for the rate of the character repeat |
| 4 | Test field |
Procedure

Proceed as follows:

1. If you want to enable character repetition, activate the "Enable character repeat" check box.

2. If you want to change the delay, press a button or the slider in the "Repeat delay" group.
   Moving the slider to the right will shorten the delay. Moving to the left will extend the delay.

3. If you want to change the repeat rate, press a button or the slider in the "Repeat rate" group.
   Moving the slider to the right will shorten the repeat rate. Moving to the left will extend the repeat rate.

4. Touch the test field in order to check the settings.
   The screen keyboard opens.

5. Move the screen keyboard as needed.

6. Press an alphanumeric key and keep the key pressed down.
   Check the implementation of the character repetition and the rate of the character repetition in the test field.

7. If the settings are not perfect, correct them.

8. Confirm your entries.
   The dialog closes.

Result

The character repetition and delay are set.

6.3.4.3 Setting the double-click

Introduction

You can start applications in the Control Panel and in Windows CE with a double-click. A double-click corresponds to two brief touches in sequence.

In the "Mouse Properties" dialog, make the following adjustments for touch screen operation and operation with external mouse:

- Interval between touch contacts on the touch screen
- Interval between mouse clicks
6.3 Configuring the operating system on the TP 177B 4"

Requirement

You have opened the "Mouse Properties" dialog with the "Mouse" icon.

![Mouse Properties Dialog]

1. Pattern
2. Icon

Procedure

Proceed as follows:

1. Click the pattern twice.
   After one double-click, the grid is shown in inverse colors. The white fields change to grey. The time before the second click is saved.

   ![Pattern in Inverse Colors]

2. Check the double-click.
   Click on the icon twice in succession to do this. If the double-click is recognized, the icon is displayed as follows:

   ![Recognized Double-Click Icon]

3. If the settings are not perfect, correct them.
   To do this, repeat steps 1 to 2.

4. Confirm your entries.
   The dialog closes.

Result

The double-click adjustment is completed.
6.3.4.4 Calibrating the touch screen

Introduction
Depending on the mounting position and viewing angle, it is possible that parallax may occur when operating the touch screen. In order to prevent any operating errors as a result, calibrate the touch screen again in the startup phase or during runtime.

Requirement
You have opened the "OP Properties" dialog box, "Touch" tab, by touching the "OP" icon.

Procedure
Proceed as follows:
1. Click on the "Recalibrate" button.
   The following dialog opens:

   Carefully press and briefly hold stylus on the center of the target. Repeat as the target moves around the screen.

   Carefully press the center of the calibration crosshairs. Repeat this process as long as the calibration crosshair moves on the touch screen.

① If the HMI device does not react precisely to a touch, the touch screen may require calibration.
② Button for calibrating the touch screen
2. Briefly touch the center of the calibration crosshairs ②.
   The calibration crosshairs is then displayed at four more positions.
3. Briefly touch the middle of the calibration crosshairs for each position.
   Once you have touched all the positions of the calibration crosshairs, the following dialog appears:

   New calibration settings have been measured.
   Tap the screen to register saved data.
   Wait for 30 seconds to cancel saved data and keep the current setting.

   Time limit: 30 sec

   ① The new calibration values are measured. Touch the touch screen to save the calibration values. If you do not touch the screen within 30 seconds, the new calibration values will be discarded.
   ② Time remaining until the calibration values are discarded

4. Touch the touch screen.
   The calibration is saved. The "OP Properties" dialog box, "Touch" tab is displayed again. If you do not touch the touch screen within the time shown, your original setting will be retained.
5. Close the dialog.

Result
The HMI device touch screen is calibrated.

6.3.5 Changing password protection

Introduction
You can protect access to the Control Panel and the Windows CE taskbar with a password. When you set up the password protection, the SecureMode is activated automatically. For more information, refer to SecureMode in section "Setting up and disabling SecureMode (Page 140)".
Configuring the Operating System

6.3 Configuring the operating system on the TP 177B 4"

Requirements

You have opened the "Password Properties" dialog with the "Password" icon.

![Password Properties dialog](image)

**NOTICE**

**Password not available**

If the password is no longer available, you can execute the following once you have first reset the computer to factory settings:

- Change settings in the Control Panel
- Use the Windows CE taskbar

All data on the HMI device will be deleted when you update the operating system! Therefore use the password to protect against loss.

Procedure – setting up password protection

**Note**

The following characters cannot be used in passwords:

- Blank
- Special characters *, ?, %, /, ', "

Proceed as follows:

1. Enter a password in the "Password" text box.
2. Repeat the password entry in the "Confirm password" text box.
3. Confirm your entries.

   The dialog closes.

**Result**

You cannot open the Control Panel or Windows CE taskbar without entering a password.
6.3 Configuring the operating system on the TP 177B 4"

Procedure – disabling password protection

Proceed as follows:
1. Delete the entries in the "Password" and "Confirm password" input fields.
2. Confirm your entries.
   The dialog closes.

Result

Password protection for the Control Panel and the Windows CE taskbar is disabled. There is free access to these applications.

6.3.6 Changing the HMI device settings

6.3.6.1 Setting the date and time

Introduction

You can set the date and time on the HMI device. The HMI must be restarted in the following cases:

- You have changed the time zone setting.
- You have changed the "Daylight savings time currently in effect" check box setting.

Requirements

You have opened the "Date/Time Properties" using the "Date/Time Properties" icon.

![Image of Date/Time Properties window]

- Date selection field
- Input field for the time
- Button for applying changes
- Time zone selection list
- "Daylight savings" check box
6.3 Configuring the operating system on the TP 177B 4"

**Procedure**

Proceed as follows:

1. Select the appropriate time zone for the HMI device from the "Time Zone" selection list.
2. Touch the "Apply" button to confirm your entry.
   
   The time of day shown in the "Current Time" field is adjusted correspondingly to the selected time zone.
3. Set the date in the selection field.
4. Set the current time of day in the "Current Time" text box.
5. Touch the "Apply" button to confirm your input.
   
   The values you have set are now in effect.

**Note**

The system does not automatically switch between winter and summer time.

6. If you want to switch from winter to summer time, activate the "Daylight savings time currently in effect" check box.
   
   When you press the "Apply" button, the time is brought forward by one hour.
7. If you want to switch from summer to winter time, deactivate the "Daylight savings time currently in effect" check box.
   
   When you press the "Apply" button, the time is moved backwards by one hour.
8. Confirm your entries.
   
   The dialog closes.

**Result**

The settings for the data and time of day have now been changed.

**Internal clock**

The HMI device has an internal buffered clock. The buffering is time-restricted.

**Synchronizing the date and time with the PLC**

The date and time of the HMI device can be synchronized with the PLC if this has been configured in the project and the PLC program.

Further information on this subject is available in the "WinCC flexible" system manual.

**NOTICE**

**Time-dependent reactions**

You have to synchronize the date and time when time-controlled responses are triggered in the PLC by the HMI device.
6.3.6.2 Changing regional settings

Introduction

In different countries, for example, the date, time and decimal points are displayed differently. You can adjust this display to meet the requirements of different regions.

The country-specific settings apply to the current project. If the project language is changed, the country-specific settings are also changed.

Requirements

You have opened the "Regional and Language Settings" dialog with the "Regional Settings" icon.

![Image of Regional and Language Settings dialog]

① Region selection list

Procedure

Proceed as follows:

1. Select the region from the selection list.
2. Change to the "Number", "Currency", "Time" and "Date" tabs and set the selection lists to the desired settings.
3. Confirm your entries.
   The dialog closes.

Result

The HMI device's regional settings have been changed.
6.3.6.3 Backup registry information

Registry information and temporary data

You can install and uninstall your own programs on the HMI devices under Windows CE. You must save the registry settings after installation or uninstallation.

You can save the following data to the flash memory:

- Registry Information
- Temporary files

Restoring the file system of a memory card

If memory cards are used, the file system on the memory card may become damaged, perhaps due to a power failure. The HMI device detects the defective file system on start-up or when the memory card is inserted. The HMI device can restore the file system automatically or on request.

Requirements

You have opened the "OP Properties" dialog, "Persistant Storage" tab with the "OP" icon.

1. Saves the current registry information to the flash memory. The HMI device loads the saved registry information the next time it boots.
2. Button for saving registry information
3. Button for saving temporary files
4. Saves all the files in temporary storage to the flash memory (for example, from the "Program Files" directory). These files are written back when the HMI device is started. The "Temp" directory is not saved.
5. Automatically restores the file system on the memory card when the HMI device starts up and when a memory card is inserted.
**Procedure**

Proceed as follows:

1. If you want the system to be restored automatically, activate the "Automatically repair file system errors ..." check box.
   
   If the check box is unchecked, the system is restored only once prompted to do so.

2. Click on the necessary buttons.

3. Confirm your entries.

   The dialog closes.

**Result**

The HMI device uses the saved registry information the next time it starts. The temporary files are copied back.

### 6.3.6.4 Changing monitor settings

**Requirements**

You have opened the "OP Properties", dialog "Display" tab with the "OP" icon.

![OP Properties dialog](image)

**Procedure**

Proceed as follows:

1. If you want to increase the brightness, press the "UP" button.

2. If you want to decrease the brightness, press the "DOWN" button.

3. Confirm your entries.

   The dialog closes.

**Result**

The screen settings have been changed.
6.3.6.5 Setting the screen saver

Introduction

You can activate a screen saver for the HMI device. You can also set the HMI device so that the backlighting of the screen is reduced if it is not used for a while. This has the following advantages:

- The service life of the screen LEDs is extended.
- The HMI device uses less power.

You can set the following time intervals on the HMI device:

- For the automatic activation of the screen saver
- For the automatic reduction in the screen's backlighting

When you do not undertake an operation within the configured interval, the configured function will be activated automatically.

The screen saver and the reduced screen backlighting functions are switched back off by means of the following actions:

- By pressing any key
- By touching the touch screen

The function associated to the key or button will not be executed by this.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Reduce backlighting</strong></td>
</tr>
<tr>
<td>The brightness of the backlighting decreases incrementally during its operational life.</td>
</tr>
<tr>
<td>In order to not shorten the operational lifetime of the backlighting unnecessarily, activate the backlighting reduction.</td>
</tr>
</tbody>
</table>

**Activating the screen saver**

Screen contents which remain unchanged for long periods can remain dimly visible in the background. This effect is reversible.

Therefore activate the screen saver. When the screen saver is active, the backlighting is also reduced. If you set the screen saver "Blank Screen", the backlighting is switched off completely.
6.3 Configuring the operating system on the TP 177B 4"

Requirements

You have opened the "Screen saver" dialog with the "ScreenSaver" icon.

![ScreenSaver Dialog](image)

1. Time interval in minutes until backlighting is reduced
2. Period of time in minutes before the screen saver is activated
3. Radio buttons for the screensaver

Procedure

Proceed as follows:

1. Enter the interval in minutes after which the backlighting is to be reduced.
   Entering "0" will deactivate the backlighting reduction.
2. Enter the number of minutes before the screen saver is to be activated.
   The minimum time is 5 minutes and the maximum time is 71582 minutes.
   Entering "0" disables the screen saver.
3. Select either the screen saver or an empty screen.
   - If you want the screen saver to function, activate the "Standard" radio button.
   - If you do not want the screen saver to function, activate the "Blank Screen" radio button.
     With this setting, the backlighting of the HMI device is switched off completely if the set interval for activating the screen saver expires.
4. Confirm your entries.
   The dialog closes.

Result

The screen saver and the reduced backlighting for the HMI device is set.
6.3.6.6 Changing the printer properties

Introduction

The HMI device can print on local printers or network printers. You can print hardcopies and reports on a network printer. Line printing of alarms is not possible on a network printer.

The list of current printers and required settings for HMI devices can be found on the Internet under "http://support.automation.siemens.com/WW/view/en/11376409".

Requirements

You have opened the “Printer Properties” dialog with the “Printer” icon.

[Diagram of printer properties dialog]

- Selection list for the printer
- Selection list for the interface
- Network address of the printer
- Paper format selection list
- “Orientation” group with radio buttons for print orientation
- Check box to improve the color quality (only for Brother HL 2700 printers)
- Color printing check box
- Print quality check box
Procedure

Proceed as follows:
1. Select a printer from the "Printer Language" selection list.
2. Select the port for the printer from the "Port" selection list.
3. If you wish to print via the network, enter the printer's network address in the "Network" text box.
4. Select a paper format in the "Paper Size" selection list.
5. Activate a radio button in the "Orientation" group.
   - "Portrait" for portrait
   - "Landscape" for landscape
6. Select the print quality.
   - Select the "Draft Mode" check box if you wish to print in draft mode.
   - Deactivate the "Draft Mode" check box if you wish to print with higher quality.
7. If the printer selected can print in color and you wish it to do so, select the "Color" check box.
8. If you use the Brother HL 2700 printer model, enable the "CMY" check box. In this way you can increase the color quality when printing.
9. Confirm your entries.
   The dialog closes.

Result

The settings for the printer have now been changed.
6.3.6.7 Restarting the HMI device

Introduction

You can restart the HMI device or reset it to factory settings prior to the restart. For more information, refer to the section "Resetting factory settings (Page 213)".

Essential restart

The HMI device must be restarted in the following cases:

- You have activated or deactivated the PROFINET IO direct keys.
- You have changed the time zone setting.
- You have changed the automatic daylight savings and standard setting.

**NOTICE**

**Data loss when the HMI device is restarted**

All volatile data is lost when the HMI device is rebooted.

Check the following:

- The project on the HMI device is complete.
- No data is being written to the flash memory.

The HMI device must be restarted in the following cases:

Requirement

- You have opened the "OP Properties", dialog "Device" tab with the "OP" icon.

![OP Properties dialog]

1. Button for restarting the HMI device

- If you wish to start the HMI device by resetting to factory settings: The HMI device is connected via PROFINET to a configuration PC.
6.3 Configuring the operating system on the TP 177B 4"

Procedure

1. If you want to restart the HMI device, press the "Reboot" button.
   The following message is displayed:
   ![Attention]
   
   ① If you run this function, all data which has not been backed up will be lost. Please close all applications before restarting.
   ② Button for resetting factory settings and subsequent restart
   ③ Button for the restart

2. Click on one of the buttons.
   • If you want to restart the HMI device, press the "Reboot" button.
     The HMI device restarts without delay.
   • If you want to reset the HMI device to factory settings and then perform a restart, press the "Prepare for Reset" button.
     You are given the option to reset the HMI device via ProSave to factory settings. Then restart the HMI device.
   • If you want do not want to restart the HMI device, press the "No" button.
     The message ends. There will be no restart.

Result

The HMI device starts.
6.3.6.8 Displaying information about the HMI device

Introduction

You will need the device-specific information if you contact A&D Technical Support.

Requirements

You have opened the "OP Properties", dialog "Device" tab with the "OP" icon. The HMI device-specific information is displayed in the "Device" tab. The data displayed are device-specific and may therefore deviate from that of your HMI device.

<table>
<thead>
<tr>
<th>OP Properties</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Persistent Storage</td>
<td>Display</td>
</tr>
</tbody>
</table>

- **Device:** TP 177B 4" color PN/DP
- **Image Version:** V01.00.00.00_01.47
- **Bootloader Version:** 0.30
- **Bootloader Rel.Date:** 29.2.2008
- **Flashsize:** 32 MB
- **MAC-Address:** 08:00:06-29:de-00

① HMI device name
② Version of the HMI device image
③ Version of the boot loader
④ Boot loader release date
⑤ Size of the internal flash memory in which the HMI device image and project are stored
⑥ MAC address of the HMI device
⑦ See section Restarting the HMI device (Page 162)

Note

The size of the internal flash memory does not correspond to the available working memory for a project.
6.3.6.9 Displaying system properties

Introduction

The general system-specific information provides you with information about the processor, operating system and memory.

Requirements

You have opened the "System Properties" dialog box, "General" tab, by touching the "System" icon.

The data displayed are device-specific and may therefore deviate from that of your HMI device.

Result

The system properties are displayed. This dialog is read-only. Close the dialog.
6.3.6.10 Displaying memory distribution

Introduction

The "Memory" system-specific information provides you with information about the distribution and size of the memory in the HMI device.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Memory&quot; tab</td>
</tr>
<tr>
<td>Do not change the memory distribution in the &quot;Memory&quot; tab.</td>
</tr>
<tr>
<td>Applies for the usage of options:</td>
</tr>
<tr>
<td>An alteration to the memory distribution may be necessary. Please refer to the accompanying documentation for further information.</td>
</tr>
</tbody>
</table>

Requirements

You have opened the "System Properties" dialog box, "Memory" tab, by touching the "System" icon.

**System Properties**

- **General Memory Device Name**
- **Storage Memory**
  - **Allocated**: 512KB
  - **In Use**: 80KB
- **Program Memory**
  - **Allocated**: 47304KB
  - **In Use**: 11116KB

Procedure

1. Determine the HMI device's current memory structure.
2. Close the dialog.
6.3.6.11 Activate memory management

Memory management

Provided the memory management is activated, the HMI device will automatically close the project if the memory needs reorganizing during an active project. The project is shut down and the HMI device will display a message. You have to restart the project.

**NOTICE**

Memory management

If you do not activate memory management, undefined states can occur during the runtime of the project.

Activate the memory management.

Requirements

You have opened the "OP Properties" dialog, "Memory Monitoring" tab with the "OP" icon.

![OP Properties dialog](image)

1. Maximum memory used since the HMI device was last switched on
2. Percentage of memory currently used
3. Activate memory management

Procedure

Proceed as follows:

1. If you want to enable memory management, activate the check box.
   
   If memory management is active and there is not enough working memory, the SIMATIC HMI runtime and therefore the current project will be closed.

2. Confirm your entries.
   
   The dialog closes.

Result

Memory management is activated.
6.3.7 Setting storage location

Introduction

There are various storage locations available for storing the compressed source file of your project. The following describes how you can set the storage location.

Requirements

You have opened the "Transfer Settings", dialog "Directories" tab with the "Transfer" icon.

![Transfer Settings dialog](image)

① Memory location for the project file
② Memory location for the compressed source file of your project for backtransfer
③ Storage location and initialization file of the HMI device for process operation

NOTICE

Settings under "Project File" and "Path"

The project may not open the next time the HMI device is started if changes are made in the "Project File" and "Path" text boxes.

Do not change the entries in the "Project File" and "Path" text boxes.

Procedure

1. Select a memory location from the "Project Backup" input field.
   The external memory card or the location in the data network can be defined as the storage location. During the next backup process, the project's source file is stored in the specified location.
2. Confirm your entries.
   The dialog closes.

Result

The storage location for the source file is now set.
6.3.8 Setting the delay time

Introduction

Once the HMI device has been switched on, a project can be started after a delay. The Loader is displayed during the delay time.

Requirements

You have opened the "Transfer Settings", dialog "Directories" tab with the "Transfer" icon.

- **NOTICE**
  Settings under "Project File" and "Path"
  The project may not open the next time the HMI device is started if changes are made in the "Project File" and "Path" text boxes.
  Do not change the entries in the "Project File" and "Path" text boxes.

Procedure

1. Select the desired delay time in seconds from the "Wait [sec]" selection list.
   With the value "0", the project starts immediately. It is then no longer possible to call the Loader after switching on the HMI device. If you still wish to access the loader, an operating element must be configured to close the project.

2. Confirm your entries.
   The dialog closes.

Result

The delay time for the HMI device is now set.
6.3 Configuring the operating system on the TP 177B 4"

6.3.9 Enabling PROFINET IO

PROFINET IO

If the HMI device is connected to the PLC via PROFINET, function keys or buttons, for example, can be configured as PROFINET IO direct keys. If PROFINET IO direct keys are used in the project, they must be enabled.

Note

If you enable PROFINET IO direct keys, you cannot use the RS 422 / RS 485 port for serial communication.

PROFINET IO direct keys and PROFIBUS DP direct keys are mutually exclusive.

Requirements

You have opened the "PROFINET" dialog with the "PROFINET" icon.

![PROFINET dialog]

① Activating or deactivating the PROFINET IO direct keys
② Text box for the device name
③ MAC address of the HMI device

NOTICE

Inconsistent device name

If the device name does not match the device name entered in the HW Config of STEP 7, the direct keys do not work.

Use the device name from the HW Config of STEP 7. This device name does not correspond to the device name used under Windows CE.
Within the ETHERNET data network, the device name must be unique and satisfy the DNS conventions. These include:

- The device name can consist of maximum 240 characters.
- If the device name is longer than 63 characters, it must be classified in the name component. Each name component can consist of maximum 63 characters.
- Name components are separated from each other by means of points.

  Example: <Subdomain-Name>.<Domain-Name>.<Top-Level-Domain-Name>

- The device name may include characters, figures, hyphens or points.
- The device name must not start or end with a "," character.
- The device name must not take the form n.n.n.n (n = 0 to 999).
- The device name must not start with the character sequence "port-xyz-" (x, y, z = 0 to 9).

**Procedure**

Proceed as follows:

1. If you want to enable the PROFINET IO direct keys, activate the "PROFINET IO enabled" check box.
2. Enter the device name of the HMI device.
3. Confirm your entries.
   
   The dialog closes.

**Result**

The PROFINET IO direct keys are enabled.
6.3.10 Changing transfer settings

6.3.10.1 Configuring the data channel

Introduction

If you block all data channels, the HMI device is protected against unintentional overwriting of the project data and HMI device image.

Note

A project can only be transferred from the configuring PC to the HMI device when at least one of the data channels is enabled on the HMI device.

Requirements

The “Transfer Settings” dialog, "Channel" tab has been opened with the "Transfer Settings" icon.

1 Group for the data channel 1 (Channel 1)
2 Group for the data channel 2 (Channel 2)
3 Button for the “S7-Transfer Settings” and / or "Network and Dial-Up Connections" dialog
WARNING

Unintentional transfer mode
Unintentional transfer mode could cause unintentional actions to be triggered in the plant.
Ensure that the configuring PC does not inadvertently switch the HMI device to transfer mode during the open project.

NOTICE

"Remote control" for "Channel 1"
If the "Remote Control" check box is activated during "Online" operating mode, the X10 / IF 1B port cannot be used for communication.
The "Remote Control" check box must be deactivated for "Online" operating mode. Once the serial transfer is complete, in the "Channel 1" group you must therefore deactivate the "Remote Control" check box.

Transfer mode using "Channel 2"
When the project on the HMI device starts, transfer parameters, e.g. HMI device address, for MPI / PROFIBUS DP are overwritten with the values from the project.
You can change the settings for the transfer via "Channel 2".
The following steps are required:
- Close the project.
- Change the settings on the HMI device.
- Then return to "Transfer" mode.
The next time the project is started on the HMI device, the settings will be overwritten by the values from the project.

Note
If the HMI device is in "Transfer" mode while changes are made to the transfer settings, the settings only go into effect after the transfer function is restarted.
This may occur if the Control Panel is opened to change the transfer properties in an active project.
# Procedure

Proceed as follows:

1. If you want to enable a data channel, activate the "Enable Channel" check box in the "Channel 1" or "Channel 2" group.
   - In the "Channel 1" group, the RS-422/RS-485 port is enabled for the serial data transfer.
   - The network port is enabled in the "Channel 2" group.

2. If you want to enable the automatic transfer, activate the associated "Remote Control" check box.

3. If you have enabled the data channel for "Channel 2", select the log from the selection list.

4. Enter further parameters if required.
   - Applies to "MPI / PROFIBUS / S7 Ethernet":
     - Press the "Advanced" button to switch to the "S7-Transfer Settings" dialog box.
     - You can change the settings for MPI / PROFIBUS / S7 Ethernet there.
     - Confirm your entries.
     - The "S7-Transfer Settings" dialog box closes.
   - Applies to "ETHERNET":
     - Use the "Advanced" button to change to "Network&Dial-Up Connections".
     - Open the "LAN9115" entry. You can change the TCP/IP settings there.
     - Confirm your entries.
     - Close "Network&Dial-Up Connections".
   - Applies to "USB":
     - No settings are needed for "USB".

5. Confirm your entries.
   - The dialog closes.

# Result

The data channel is configured.
6.3.10.2 Changing MPI/PROFIBUS DP settings

Introduction

The communication settings for MPI, PROFIBUS DP and S7 Ethernet are defined in the HMI device project.

In the following cases, the transfer settings might have to be changed:

- With the first project transfer.
- If changes are made to the project but are only applied later.

**NOTICE**

Transfer mode using MPI / PROFIBUS DP

The bus parameters are read from the project currently loaded on the HMI device.

You can change the settings for MPI / PROFIBUS DP transfer. The following steps are required:

- Close the project.
- Change the settings on the HMI device.
- Then return to "Transfer" mode.

The changed MP/PROFIBUS DP settings will be overwritten in the following cases:

- The project is started again.
- A project is transferred and started.

**Transfer settings**

If the HMI device is in "Transfer" mode while changes are made to the transfer settings, the settings only go into effect after the transfer function is restarted.

**Requirements**

You have opened the "S7-Transfer Settings" dialog with the "S7-Transfer Settings" icon.

![S7-Transfer Settings dialog]

① Network selection

② Button for opening the properties dialog
**Procedure**

Proceed as follows:

1. Select a network.
   
   If you have chosen S7 Ethernet, continue as described under
   Changing the network configuration (Page 181).

2. Use the "Properties" button to open the "MPI" or "PROFIBUS" dialog.

   ![Diagram of MPI and PROFIBUS configurations]

   1. The HMI device is the only master on the bus.
   2. Bus address of the HMI device
   3. Time-out
   4. Data transmission rate in total network
   5. Highest station address in the network
   6. Profile
   7. Button for displaying the bus parameters

3. If there are several masters connected on the bus, deactivate the
   "Panel is the only master on the bus" check box.

**NOTICE**

The bus address in the "Address" text box must be unique throughout the
MPI/PROFIBUS DP network.
4. Enter the bus address for the HMI device in the "Address" text box.
5. Select the transmission rate from the "Transmission Rate" selection list.
6. Enter the highest station address on the bus in the "Highest Station Address" or "Highest Station" text box.
7. With PROFIBUS settings: Select the required profile in the "Profile" selection list.
8. With PROFIBUS settings: If you want to view the profile data, press the "Busparameter" button of the PROFIBUS dialog.
   The profile data are displayed. The "Profile" dialog is read-only.

**NOTICE**

The bus parameters must be the same for all stations in the MPI/PROFIBUS DP network.

9. Close the "Profile" dialog.
10. Confirm your entries.
    The dialog closes.

**Result**

The MPI/PROFIBUS DP settings of the HMI device have been changed.
6.3.11 Network operation

6.3.11.1 Overview

Introduction

You can connect the HMI device to a PROFINET network via the Ethernet port.

Note

The HMI device can only be used in PROFINET networks.
If Sm@rtService or Sm@rtAccess are not used on the HMI device, the following applies:

The HMI device only has client functionality in the PC network. This means that users can access files of a node with TCP/IP server functionality from the HMI device via the network. However, you cannot, for example, access data on the HMI device from a PC via the network.

The Sm@rtService or Sm@rtAccess options enable access to an HMI device located somewhere else.

Note

Information on communication using SIMATIC S7 via PROFINET is provided in the "WinCC flexible communication" user manual.

The connection to a network offers, for example, the following options:

- Printing via a network printer
- Saving, exporting and importing of recipe data records on or from a server
- Transferring a project
- Saving data

Addressing

Within a PROFINET network, computers are usually addressed using computer names. These computer names are translated from a DNS or WINS server to TCP/IP addresses. This is why a DNS or WINS server is needed for addressing via computer names when the HMI device is in a PROFINET network.

The corresponding servers are generally available in PROFINET networks.

Note

The use of TCP/IP addresses to address PCs is not supported by the HMI device's operating system.

Consult your network administrator if you have questions in this regard.
Printing via a network printer

The HMI device's operating system does not support line by line alarm logging via a network printer. All other printing functions, for example hardcopy or logs are available without restriction via the network.

Preparation

Before beginning the configuration, request the following network parameters from your network administrator.

- Does the network use DHCP for dynamic assignment of network addresses? If not, get a new TCP/IP network address for the HMI device.
- Which TCP/IP address does the default gateway have?
- If a DNS network is used, what are the addresses of the name server?
- If a WINS network is used, what are the addresses of the name server?

General procedure for configuring the network

The HMI device must be configured prior to network operation. The configuration is basically divided into the following steps:

1. Enter the computer name of the HMI device.
2. Configure the network address.
3. Set the logon information.
4. Save the settings.
6.3 Configuring the operating system on the TP 177B 4"

6.3.11.2 Setting the device name of the HMI device

Introduction

The HMI device uses the device name to identify itself in the communication network.

Requirements

You have opened the “System Properties” dialog box, “Device Name” tab, by touching the “System” icon.

![System Properties dialog box]

1. Device name of the HMI device
2. Description for the HMI device (optional)

Note

To activate the network functions, enter a unique computer name in the Device name input field.

Procedure

Proceed as follows:

1. Enter the device name for the HMI device in the "Device name" text box.
2. If necessary, enter a description for the HMI device in the "Device description" text box.
3. Confirm your entries.
   The dialog closes.

Result

The device name for the HMI device is now set.
6.3.11.3  Changing the network configuration

Introduction
You can change the network settings for the LAN connection under "Network&Dial-Up Connections".

Requirements
You have opened the following display by touching the "Network&Dial-Up Connections" icon.

Procedure
Proceed as follows:
1. Open the "LAN9115" entry.
   The "LAN9115' Settings" dialog opens.

   - An IP address can be automatically assigned to this computer. If your network does not automatically assign IP addresses, ask your network administrator for an address, and then type it in the space provided.
   - "Obtain an IP address via DHCP"
   - "Specify an IP address"

   - IP Address: 192.168.56.198
   - Subnet Mask: 255.255.255.0
   - Default Gateway: . . .

2. If you need automatic issuing of addresses, select the "Obtain an IP address via DHCP" radio button.
3. If you need manual issuing of addresses, select the "Specify an IP address" radio button.
4. If you have selected manual issuing of addresses, enter the corresponding addresses in the following input fields:
   - "IP Address"
   - "Subnet Mask"
   - If necessary: "Default Gateway"
5. If a name server is used in the network, change to the "Name Servers" tab.

6. If you wish to change the Ethernet settings, switch to the "Ethernet Parameters" tab.

For the data rate and the transmission speed of the Ethernet connection, the following is set as default "Mode and Speed" "Automatic". With this setting, the HMI device detects the data rate and the speed of communication via the Ethernet and automatically employs it.

7. If you do not want to use these settings, select the required combination of data rate and transmission speed in the selection list.

8. Confirm your entries.

   The dialog closes.

   The Control Panel is displayed again.

Result

The LAN connection parameters for the HMI device have been changed.
6.3.11.4 Changing the logon data

Introduction

Windows CE uses this logon data to gain access to the network resources. Enter the user name, password and domain you have received from your administrator.

Requirements

You have opened the "Owner Properties" dialog with the "Network ID" icon.

![Owner Properties dialog](image)

Procedure

Proceed as follows:

1. Enter the user name in the "User name" text box.
2. Enter your password in the "Password" text box.
3. Enter the domain name in the "Domain" text box.
4. Confirm your entries.

The dialog closes.

Result

The logon information has now been set.
6.3.11.5 Changing e-mail settings

Requirements
You have opened the "WinCC flexible Internet Settings" dialog with the "WinCC Internet Settings" icon.

1. Setting the SMTP server
2. Name for the sender
3. E-mail account

Note
Additional tabs may appear in the "WinCC flexible Internet Settings" dialog. This depends on the options that have been enabled for network operation in the project.

Procedure
Proceed as follows:

1. Specify the SMTP server.
   - Activate the "Use the default of the project file" radio button if you want to use the SMTP server configured in the project.
   - Deactivate the "Use the default of the project file" radio button if you do not want to use the SMTP server configured in the project. Specify the required SMTP server.
2. Enter the name for the sender in the "Sender" text box.
3. Enter the e-mail account for your e-mail in the "Authentication" text box.
   Some e-mail providers only allow you to send mail if you specify the e-mail account.
   The "Authentication" text box can remain empty if your e-mail provider allows you to send mail without checking the account.
4. Confirm your entries.
   The dialog closes.

Result
The e-mail settings have been changed.
6.3.11.6 Importing and deleting certificates

Overview

You can import, view and delete certificates that have been imported for the HMI device. The certificates differ in the following ways:

- Certificates that you trust
- Own certificates
- Other certificates

You can import additional certificates and delete certificates that are not required.

The required settings can be obtained from your network administrator.

Requirements

You have opened the "Certificates" dialog with the "Certificates" icon.

Procedure

Proceed as follows:

1. Select the type of certificate from the selection list:
   - "Trusted Authorities"
   - "My Certificates"
   - "Other Certificates"

2. If required, start the importing process with the "Import" button.
   A dialog with source details will open.

3. If required, delete certificates with the "Remove" button.
   Mark the desired certificate.

4. If you want to list the properties of the certificate marked, press the "View" button.

5. Confirm your entries.
   The dialog closes.

Result

The certificates have been changed.
6.3.12 Backup and restore

6.3.12.1 Saving to external storage device (backup)

Introduction
A backup involves copying the operating system, applications and data from the internal in flash memory of the HMI device to an external storage device.

Requirements
- The HMI device features an external storage device with sufficient free space.
- You have opened the "Backup/Restore" dialog with the "Backup/Restore" icon.

Procedure - using a memory card for the first time

**NOTICE**
Loss of data possible
The first time you use a memory card the HMI device will request that you format the card. Save a backup copy of memory card data to a PC before formatting.

Proceed as follows:
1. Cancel the formatting procedure by pressing "ESC".
2. Remove the memory card from the HMI device.
3. Save a backup copy of vital data to a PC.
4. Insert the memory card into the HMI device.
5. Format the memory card on the HMI device.
Procedure

Proceed as follows:

1. Press the "BACKUP" button to open the "Select Storage Card" dialog.

   The --- no storage card available --- message appears if there is no external memory in the HMI device or if this memory is defective. Insert an external memory or a different one.

2. Select the external memory for backup from the "Please select a Storage Card" selection field.

3. Click on the "Start Backup" button.

   The HMI device checks the external memory.

   If an external memory with a greater memory capacity is needed, a message is displayed. Acknowledge this message. Backup is aborted. Insert an external memory with a greater memory capacity and restart the backup process.

   If the "You may have an old backup on the storage card. Do you want to delete it?" message appears, there is already a backup on the external memory. If you do not want to overwrite the backup, press the "No" button. Otherwise, click on the "Yes" button.

   Several messages are displayed in sequence during the backup process:
   - "Saving registry data"
   - "Copy files"

   A progress bar shows the status of the backup process. When the backup process is completed, the following message is displayed:

   "The operation completed successfully."

4. Acknowledge this message.

   The dialog closes.

Result

The HMI device data is now saved on the external memory.
6.3 Configuring the operating system on the TP 177B 4"

6.3.12.2 Restoring from external storage device

Introduction

A restore operation deletes the old data from flash memory of the HMI device on confirmation. The data stored on the external memory is then copied to the internal flash memory.

Requirements

- The external memory holding the backed up data is inserted in the HMI device.
- You have opened the "Backup/Restore" dialog with the "Backup/Restore" icon.

NOTICE

Loss of data possible

All data on the HMI device will be deleted during a restore operation. License keys are deleted after counter-inquiry.

Back up the HMI device's data before restoring if required.

External memory with data backup

If several external memories with data backups are plugged in, the data cannot be restored.

Remove the external memory with the data backups not needed.
Procedure

Proceed as follows:

1. Select "RESTORE" to start restore.
   The HMI device checks the external memory.
   The HMI device issues messages in the following situations:
   - The external memory is not available or is defective:
     Acknowledge the displayed messages.
     The Control Panel is displayed again.
     Replace the external memory.
   - More than one external memory with valid backup is available:
     Remove all external memories with backups that are not needed.
     If necessary, you can check the available external memories using the "REFRESH" button.

2. If necessary, start the restore process with the "RESTORE" button.
   The data to be restored is checked.
   When the check is complete, one of the following prompts is displayed:
   - "You are starting RESTORE now. All files (except files on storage cards) and the registry will be erased. Are you sure?"
     At this point you can cancel the restore using the "No" button to prevent the data on the HMI device from being deleted.
   - You are now starting RESTORE. All files on the panel and the licenses listed below as well as the registry will be erased. Are you sure?
     This query is displayed when license keys are available both on the HMI device and in the backup data. If necessary, cancel the restore process with the "No" button and first back up the HMI device's license keys. For more information, refer to the section "Transferring and transferring back license keys (Page 225)".
     - Then restart the restore process.

3. Start to restore the data by selecting "Yes".
   A progress bar shows the status of the restoration of the Windows CE image.

4. After successful restoration of the Windows CE image, the following message is displayed: "Restore of CE Image is finished. The device will be rebooted now. Don’t remove the storage card."
   Acknowledge this message.

5. The HMI device starts. The operating system boots, opening the Loader and Restore dialog in sequence.

6. The restore process is resumed. All data stored on the flash file system is restored.
   Afterwards the following message is displayed: "Restore succesfully finished. Press ok, remove your storage card and reboot your device."

7. Remove the external memory.

8. Acknowledge this message.
   The HMI device starts.
6.3 Configuring the operating system on the TP 177B 4"

Result
The data from the external memory is now on the HMI device.

Note
Calibrating the touch screen
After the reset, you may have to recalibrate the touch screen.

6.3.13 Setting the uninterruptible power supply

Introduction
UPS monitoring is an option you load as an add-on with ProSave.

A UPS ensures that the HMI device is shut down in a controlled manner after a buffer time in the event of a power failure. This avoids the loss of data.

The following uninterruptible power supplies are supported:

- SITOP DC UPS modules as of a rated power value of 6 A, e.g. 6EP1931-2DC42

Connect the UPS to the 24-V input and a USB port. Configure the USB port for UPS monitoring.

Requirements
You have opened the "UPS Properties", dialog "Configuration" tab with the "UPS" icon.

- Text box for the time after which the "Battery mode activated" message is displayed
- Check box for enabling battery mode
- Text box for the time after which the "Faulty port" message is displayed
- Check box for the "Faulty port" message
Procedure for setting the UPS

Proceed as follows:

1. Activate the "Battery mode" check box to enable battery mode.
2. Delete the entries in the "min" and "s" input fields.
   You will receive a message when UPS takes effect.
   If battery mode is enabled, the applications on the HMI device are closed after the specified interval.
3. If the port to which the UPS is connected is faulty and you therefore want to receive a message, activate the "Port disturbed" check box.
4. Select the desired message from the selection list.
5. Enter the time after which the "Faulty port" message is displayed in the "min" and "s" input fields.

Result

Port monitoring for the UPS is set.

Procedure for displaying the USP status

To display the monitoring status of the USP, switch to the "Current Status" tab. If you want to refresh the display, press the "Update" button.
6.3 Configuring the operating system on the TP 177B 4”
Commissioning a project

7.1 Overview

Configuration and Process Control Phases

HMI devices can be used to operate and monitor tasks in process and production automation. The plant screens on the HMI devices are used to provide a clearer overview of active processes. The HMI device project, which includes the plant screens, is created during the configuration phase.

Once the project is transferred to the HMI device and the HMI device is connected to a PLC in the automation system, processes can be operated and monitored in the process control phase.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Transfer the project</td>
<td>Connection to the PLC</td>
</tr>
<tr>
<td></td>
<td>PLC</td>
</tr>
</tbody>
</table>
Transferring the project to the HMI device
To transfer a project to an HMI device, the following procedures can be selected:

- Transfer from the configuration PC
- Restore from a PC using ProSave
  In this case, an archived project is transferred from a PC to the HMI device. The configuration software need not be installed on this PC.
- On the TP 177B and OP 177B: Restoring from an external storage device
These procedures can be selected both during the initial startup as well as in the recommissioning of a project.

Initial startup and recommissioning
- When the HMI device is initially started up there is no project at first.
  The HMI device is also in this state after the operating system has been updated.
- When recommissioning, any project already on the HMI device is replaced.

See also
- Transfer (Page 198)
- Backup and Restore using WinCC flexible (Page 204)
- Backup and Restore using ProSave (Page 206)
- Backup and Restore Using a Memory Card (Page 105)
- Restoring from external storage device (Page 188)
7.1.1 Setting the Operating Mode

Operating Modes

Operating modes of the HMI device:

- Offline
- Online
- Transfer

"Offline mode" and "Online mode" can be set on the configuration computer and on the HMI device. To set these modes on the HMI device, use a corresponding operator control object of the project.

Switching the Operating Mode

The configuration engineer must have configured an appropriate operator control object to allow a change of the operating mode on the HMI device during ongoing operation.

Refer to your plant documentation to find any additional information on this topic.

"Offline" Operating Mode

In this mode, there is no communication between the HMI device and PLC. Although the HMI device can be operated, it cannot exchange data with the PLC.

"Online" Operating Mode

In this mode, the HMI device and PLC communicate. You can operate the plant on the HMI device according to your system configuration.

"Transfer" Operating Mode

In this mode, you can transfer a project from the configuration computer to the HMI device or backup and restore HMI device data, for example.

The following options are available for setting "Transfer" mode on the HMI device:

- When the HMI device starts up
  Start "Transfer" mode manually in the HMI device Loader.

- During ongoing operation
  Start the "Transfer" mode manually within the project using an operator control object. The HMI device toggles to "Transfer" mode when automatic mode is set and a transfer is initiated on the configuring PC.
7.1.2 Reusing Existing Projects

You can reuse existing projects from the following HMI devices:

- Projects from TP 170A on the TP 177A or TP 177B
- Projects from TP 170B on the TP 177B
- Projects from OP 17 on the OP 177B
- Projects from OP 170B on the OP 177B
- Projects for the OP 77B for the TP 177B 4"
- Projects for the TP 177B 6" for the TP 177B 4"

The following cases are possible:

1. A project created with ProTool is available.
   Migrate the project to WinCC flexible and then switch the HMI device.

2. A project created with WinCC flexible is available.
   Switch the HMI device in WinCC flexible.
   If you switch to TP 177B 4", the available images will automatically adapt to the broader screen on the HMI device.

For more information, please see the online help for WinCC flexible or the "WinCC flexible Migration" user manual.
### 7.1.3 Data Transmission Options

7.2 Transfer

7.2.1 Overview

Transfer

During transfer, the project is downloaded from the configuration computer to the HMI device.

The "Transfer" mode can be started manually or automatically on the HMI device. Transferred data is written directly to the flash memory on the HMI device. The transfer function uses a data channel you need to configure before you initiate any transfers.

Serial data transmission with the TP 177A

You can use one of the following adapters for serial transmission between TP 177A and a configuration PC:

- RS 232/PPI cable MM Multimaster
- USB/PPI cable MM Multimaster (as of manufacturer version 05 of the cable)

Serial data transmission with TP 177B and OP 177B

Use a PC/PPI cable, order number 6ES7 901-3CB30-0XA0, for serial transmission between TP 177B or OP 177B and a configuration PC.

Resetting to factory settings via USB with TP 177B 6" and OP 177B

You can only use the USB/PPI cable MM Multimaster adapter (as of manufacturer version 05) if you have updated the operating system with reset to factory setting in stand-alone mode via ProSave.
7.2.2 Starting Manual Transfer

Introduction

You can manually switch the HMI device to "Transfer" mode as follows:

- With a configured operating element during ongoing operation.
- In the Loader of the HMI device.

Requirements

- The project "*.hmi" is opened in WinCC flexible.
- The HMI device is connected to a configuring PC.
- The data channel is configured on the HMI device.
- The HMI device is in "Transfer" mode.

Procedure

Proceed as follows:
1. On the configuring PC, select the "Transfer settings" command in the menu "Project > Transfer" in WinCC flexible.
   The "Select devices for transfer" dialog opens.
2. Select the HMI device in the left area of the dialog.
3. Select the type of connection between the HMI device and the configuring PC.
   Set the connection parameters.
4. Set the transfer parameters in the right area of the dialog.
5. Start transfer in WinCC flexible with "Transfer".
   The configuring PC checks the connection to the HMI device. The project is transferred to the HMI device. If the connection is not available or is defective, an error message is displayed on the configuring PC.

Result

When the transfer is completed successfully, the project can be found on the HMI device.
The transferred project is then started automatically.

Data Transmission Options (Page 197)
Overview (Page 198)
7.2 Transfer

7.2.3 Starting Automatic Transfer

Introduction

The HMI device can be automatically switched to "Transfer" mode during runtime as soon as transfer is started on the configuring PC connected.

Automatic transfer is particularly suited for the test phase of a new project since transfer is completed without interfering with the HMI device.

Automatic transfer is available for the following data channels:

<table>
<thead>
<tr>
<th>HMI device</th>
<th>Serial</th>
<th>MPI/PROFIBUS DP</th>
<th>USB</th>
<th>PROFINET</th>
</tr>
</thead>
<tbody>
<tr>
<td>TP 177A</td>
<td>No</td>
<td>Yes</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>TP 177B, OP 177B</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

NOTICE

If the automatic transfer has been activated on the HMI device and a transfer is initiated on the configuring PC, the project currently running is automatically stopped. The HMI device then automatically switches to "Transfer" mode.

After the commissioning phase, deactivate the automatic transfer so that the HMI device cannot be inadvertently switched to transfer mode. The transfer mode can trigger unintentional actions in the device.

You can set a password for the Loader of the HMI device to restrict access to the transfer settings and thus avoid unauthorized modifications.

Requirements

- The project *.hmi is opened in WinCC flexible.
- The HMI device is connected to a configuring PC.
- The data channel is configured on the HMI device.
- The automatic transfer is activated in the data channel for the transfer.
- The project is started on the HMI device.
Commissioning a project
7.2 Transfer

Procedure

Proceed as follows:

1. On the configuring PC, select the "Transfer settings" command in the menu "Project > Transfer" in WinCC flexible.
   The "Select devices for transfer" dialog opens.
2. Select the HMI device in the left area of the dialog.
3. Select the type of connection between the HMI device and the configuring PC.
   Set the connection parameters.
4. Set the transfer parameters in the right area of the dialog.
5. Start transfer in WinCC flexible with "Transfer".
   The configuring PC checks the connection to the HMI device. The HMI device shuts down the current project and automatically switches to "Transfer" mode. The project is transferred to the HMI device. If the connection is not available or is defective, an error message is displayed on the configuring PC.

Result

When the transfer is completed successfully, the project can be found on the HMI device. The transferred project is then started automatically.

7.2.4 Testing a Project

Introduction

There are two options to test a project:

- Test the project on the configuring PC
  
  You can test a project at a configuring PC, using a simulator. For detailed information, refer to the "WinCC flexible" user manual and to the WinCC flexible Online Help.

- Offline testing of the project on the HMI device
  
  Offline testing means that communication between the HMI device and PLC is down while the test is being carried out.

- Online testing of the project on the HMI device
  
  Online testing means that the HMI device and PLC communicate with each other during testing.

Perform the tests, starting with the "Offline test", followed by the "Online test".

Note

You should always test the project on the HMI device on which the project will be used.

Check the following:

1. Check the correct layout of the screens.
2. Check the screen navigation.
3. Check the input objects.
4. Enter the tag values.

The test increases the certainty that the project will run error-free on the HMI device.

Requirements for offline testing

- The project has been transferred to the HMI device.
- The HMI device is in "Offline" mode.

Procedure

In "Offline" mode, you can test individual project functions on the HMI device without them being affected by the PLC. PLC tags, therefore, are not updated.

Test the operating elements and visualization of the project as far as possible without connecting to the PLC.

Requirements for online testing

- The project has been transferred to the HMI device.
- The HMI device is in "Online" mode.
### Procedure

In "Online" mode, you can test individual project functions on the HMI device without them being affected by the PLC. PLC tags are updated in this case.

You have the option to test all communication-dependent functions, for example alarms, etc.

Test the operating elements and views of the project.

Setting the Operating Mode (Page 195)

### 7.3 Backup and Restore

#### 7.3.1 Overview

**Backup and restoring**

You can back up and restore the following data found in the internal flash memory of the HMI device with a PC:

- Project and HMI device image
- User administration
- Recipe data
- License keys

Use one of the following tools for backup and restoring:

- WinCC flexible
- ProSave

**General information**

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Power failure</strong></td>
</tr>
<tr>
<td>If a complete restore operation is interrupted due to power failure on the HMI device, the operating system of the HMI device may be deleted! In this case, you have to reset the HMI device to its factory settings.</td>
</tr>
<tr>
<td><strong>Compatibility conflict</strong></td>
</tr>
<tr>
<td>If a message is output on the HMI device warning of a compatibility conflict during the restore operation, the operating system must be updated.</td>
</tr>
</tbody>
</table>
7.3.2 Backup and Restore using WinCC flexible

Requirements

- The HMI device is connected to a configuring PC.
- No project is open in WinCC flexible.
- The data channel is configured on the HMI device.

Procedure for backup

Proceed as follows:

1. On the configuring PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible.
   The "Communication Settings" dialog opens.
2. Select the type of HMI device.
3. Select the type of connection between the HMI device and the configuring PC.
   Set the connection parameters.
4. Close the dialog with "OK".
5. Select the "Backup" command in the menu "Project > Transfer" in WinCC flexible.
   The "SIMATIC ProSave [Backup]" dialog opens.
6. Select the data to be backed up.
7. Select a destination folder and a file name for the "*.psb" backup file.
8. Set "Transfer" mode on the HMI device.
   If automatic transfer mode is enabled on the HMI device, the HMI device automatically sets "Transfer" mode when a backup is initiated.
9. Start the backup operation in WinCC flexible with "Start Backup" on the configuration PC.
   Follow the instructions in WinCC flexible.
   A status view opens to indicate the progress of the operation.

Result

The system outputs a message when the backup is completed.
The relevant data is now backed up on the configuration PC.
Procedure for restoring

- On the configuring PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible. The "Communication Settings" dialog opens.
- Select the type of HMI device.
- Select the type of connection between the HMI device and the configuring PC.
- Set the connection parameters.
- Close the dialog with "OK".
- Select the "Restore" command in the menu "Project > Transfer" in WinCC flexible. The "SIMATIC ProSave [Restore]" dialog opens.
- Select the "*.psb" backup file to be restored from the "Open" field. You can see the HMI device for which the backup file was created and the type of backup data the file contains.
- Set "Transfer" mode on the HMI device. If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when a restore operation is initiated.
- Start the restore operation in WinCC flexible with "Start Restore" on the configuration PC. If there are license keys both on the HMI device and in the backup, a dialog box will appear. Use this dialog to establish whether you want to overwrite the license keys or abort the restore process.
  - If necessary, abort the backup and first back up the License Keys of the HMI device. For more information, refer to the section "Transferring and transferring back license keys (Page 225)".
  - Then restart the restore process.
- Follow the instructions in WinCC flexible.
  A status view opens to indicate the progress of the operation.

Result

When the restore is successfully completed, the data backed up on the configuring PC is now on the HMI device.
7.3.3 Backup and Restore using ProSave

Requirement

- The HMI device is connected to a PC on which ProSave is installed.
- The data channel is configured on the HMI device.

Procedure for backup

Proceed as follows:

1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
   Set the connection parameters.
4. Select the data to be backed up in the "Backup" tab.
5. Select the folder and file name for the backup file ".psb."
   If you are working with the TP 177A with WinCC flexible 2008 or higher and backup recipes in CSV format, then select a folder. A CSV file is created for each recipe in this folder.
6. Set "Transfer" mode on the HMI device.
   If automatic transfer mode is enabled on the HMI device, the HMI device automatically sets "Transfer" mode when a backup is initiated.
7. Start the backup operation in ProSave with "Start Backup".
   Follow the instructions in ProSave.
   A status view opens to indicate the progress of the operation.

Result

The system outputs a message when the backup is completed.
The relevant data is now backed up on the PC.
Procedure for restoring

Proceed as follows:
1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
4. Set the connection parameters.
5. Select the "*.psb" backup file to be restored from the "Restore" tab.
   - You will receive information for which HMI device the backup file was created and which type of backup data are available in the file.
   - If you are working on a TP 177A with WinCC flexible 2008 or higher and want to restore recipes in CSV format, then select one or more CSV files from the source directory.
6. Set "Transfer" mode on the HMI device.
   - If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when a restore operation is initiated.
7. Start the restore operation in ProSave on the PC with "Start Restore".
   - If there are license keys both on the HMI device and in the backup, a dialog box will appear. Use this dialog to establish whether you want to overwrite the license keys or abort the restore process.
     - If necessary, abort the backup and first back up the License Keys of the HMI device. For more information, refer to the section "Transferring and transferring back license keys (Page 225)".
     - Then restart the restore process.
8. Follow the instructions in ProSave.
   - A status view opens to indicate the progress of the operation.

Result

When the restore is successfully completed, the data backed up on the PC is now on the HMI device.

Procedure for restoring by resetting to factory settings on the TP 177A

On the TP 177A, when restoring data you can also reset the HMI device to factory settings. Proceed as follows:
1. Switch off power to the HMI device.
2. Execute steps 1 through 5 as described in "Procedure for restoring".
3. Select the "Bootstrap" check box.
4. Execute steps 7 through 8 as described under "Procedure for restoring".
5. Switch on the power supply of the HMI device.

Result

When the restore is successfully completed, the data backed up on the PC is now on the HMI device.

The HMI device is reset to factory settings.
7.4 Updating operating systems on the TP 177A, TP 177B 6" and OP 177B

7.4.1 Overview

Updating the operating system

A compatibility conflict may occur when transferring a project to the HMI device. This is caused by different versions of the configuration software used and the HMI device image available on the HMI device. If there are different versions, the transfer is aborted. A message indicating a compatibility conflict is displayed on the configuring PC.

There are two ways to match the versions:

- Update the HMI device image if the project was created with the most recent version of the configuration software.
- Transfer a matching older version of the HMI device image if you do not want to adapt the project to the most recent version of the configuration software for the project.

<table>

<td>An operating system update resets all parameters for the data channels. The transfer can only be started in the Loader following reconfiguration of the data channels.</td>
</tr>
</tbody>
</table>

Note

Calibrating the touch screen

After updating, you may have to re-calibrate the touch screen.
7.4.2  Resetting to factory settings

Resetting to factory settings

In ProSave or WinCC flexible, you can update the operating system with or without resetting to factory settings, depending on the HMI device used.

- Updating the operating system without reset to factory setting
  First, set "Transfer" mode on the HMI device or use the automatic transfer function if the project is active. Then start the operating system update in ProSave or WinCC flexible.

- Updating the operating system with reset to factory setting
  First, start the operating system update in ProSave or WinCC flexible. Then switch the power on the HMI device off and on again.

**Note**

Updating the operating system by resetting to factory settings must be carried out in the following cases:

- No operating system is loaded on the HMI device.
- The operating system of the HMI device is damaged.

Point-to-point coupling with a PC / PPI cable is necessary in order to update the operating system with reset to factory settings.

In ProSave or WinCC flexible, set the "Reset to factory state" check box status according to your selected operating system update mode.

7.4.3  Updating the operating system with WinCC flexible

Requirements

- The HMI device is connected to a configuring PC.
- No project is open in WinCC flexible.
- When updating the operating system without reset to factory setting only:
  The data channel is configured on the HMI device.
Commissioning a project

7.4 Updating operating systems on the TP 177A, TP 177B 6" and OP 177B

Procedure

Proceed as follows:

1. When updating the operating system with reset to factory setting only:
   Switch off power to the HMI device.
2. On the configuration PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible. The dialog "Communication settings" opens.
3. Select the type of HMI device.
4. Select the type of connection between the HMI device and the configuration PC, then set the connection parameters.
5. Close the dialog with "OK".
6. In WinCC flexible, select the command "OS Update" in the "Project > Transfer" menu.
7. Select whether to update the operating system with / without resetting to factory settings by setting the "Reset to factory settings" check box accordingly.
8. In "Image path", select the HMI device image file "*.img".
   The HMI device image files are available under "WinCC flexible Images" in the WinCC flexible installation folder or on the WinCC flexible installation CD.
   In the output area, you are provided information on the version of the HMI device image file after it is opened.
9. When updating without reset to factory setting only:
   Set "Transfer" mode on the HMI device.
   If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when an update is initiated.
10. In WinCC flexible, select "Update OS" on the configuration PC to run the operating system update.
11. When updating with reset to factory setting only:
   Switch on the power supply to the HMI device.
12. Follow the instructions in WinCC flexible.
   During the operating system update a status view opens to indicate progress.

Result

A message is displayed when the operating system update is successfully completed.
This operation has deleted the project data from the HMI device.
7.4 Updating operating systems on the TP 177A, TP 177B 6" and OP 177B

7.4.4 Updating the operating system with ProSave

Requirement

- The HMI device is connected to a PC on which ProSave is installed.
- When updating the operating system without reset to factory setting:
  The data channel is configured on the HMI device.

Procedure

Proceed as follows:

1. When updating the operating system with reset to factory setting:
   Switch off power to the HMI device.
2. From the Windows Start menu, start ProSave on the PC.
3. Select the HMI device type in the "General" tab.
4. Select the type of connection between the HMI device and the PC, then set the connection parameters.
5. Select the "OS Update" tab.
6. Select whether to update the operating system with / without resetting to factory settings by setting the "Reset to factory settings" check box accordingly.
7. In "Image path", select the HMI device image file ".img".
   The HMI device image files are available under "WinCC flexible Images" in the WinCC flexible installation folder or on the WinCC flexible installation CD.
   In the output area, you are provided information on the version of the HMI device image file after it is opened.
8. When updating without reset to factory setting:
   Set "Transfer" mode on the HMI device.
   If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when an update is initiated.
9. Select "Update OS" on the PC to run the operating system update.
10. When updating with reset to factory setting only:
    Switch on the power supply to the HMI device.
11. Follow the instructions in ProSave.
    During the operating system update a status view opens to indicate progress.

Result

A message is displayed when the operating system update is successfully completed.
This operation has deleted the project data from the HMI device.
7.5 Updating the operating system on the TP 177B 4"

7.5.1 Overview

Updating the operating system

A compatibility conflict may occur when transferring a project to the HMI device. This is caused by different versions of the configuration software used and the HMI device image available on the HMI device. If there are different versions, the transfer is aborted. A message indicating a compatibility conflict is displayed on the configuring PC.

There are two ways to match the versions:

- Update the HMI device image if the project was created with the most recent version of the configuration software.

- Transfer a matching version of the HMI device image if you do not want to adapt the project for the HMI device to the most recent version of the configuration software for the project.

7.5.2 Resetting factory settings

In ProSave or WinCC flexible, you can update the operating system with or without resetting to the factory setting.

- Updating the operating system without resetting to factory settings
  
  First, switch into “Transfer” mode on the HMI device or use the automatic transfer function if the project is active. Then start the operating system update in ProSave or WinCC flexible.

- Updating the operating system with resetting to factory settings

  **Note**
  
  Updating the operating system by resetting to factory settings must be carried out in the following cases:
  
  - No operating system is loaded on the HMI device.
  
  - The operating system of the HMI device is damaged.

<table>

7.5.3 Updating the operating system using WinCC flexible

Requirements

- No project is open on the configuring PC in WinCC flexible.
- The HMI device is connected to this configuring PC.
- The data channel is configured on the HMI device.

Procedure

Proceed as follows:

1. On the configuring PC, select the "Communication settings" command from the "Projekt > Transfer" menu in WinCC flexible.
   The "Communication Settings" dialog opens.
2. Select the type of HMI device.
3. Select the type of connection between the HMI device and the configuring PC.
4. Set the connection parameters.
5. Close the dialog with "OK".
6. In WinCC flexible, select the command "OS Update" from the "Projekt > Transfer" menu.
7. In "Image path", select the HMI device image file ".img".
   The HMI device image files are available under "WinCC flexible Images" in the WinCC flexible installation folder or on the WinCC flexible installation CD.
   In the output area, you are provided information on the version of the HMI device image file after it is opened.
8. Switch into "Transfer" mode on the HMI device.
   If you have activated automatic transfer mode for the HMI device, the device automatically switches to "Transfer" mode when an update is initiated.
9. In WinCC flexible, select "Update OS" on the configuring PC to run the operating system update.
10. Follow the instructions in WinCC flexible.
    During the operating system update a status view opens to indicate progress.

Result

A message is displayed when the operating system update is successfully completed.
This operation has deleted the project data from the HMI device.
7.5.4 Updating the operating system using ProSave

Requirements

- The HMI device is connected to a PC on which ProSave is installed.
- The data channel is configured on the HMI device.

Procedure

Proceed as follows:

1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
4. Set the connection parameters.
5. Select the "OS Update" tab.
6. In "Image path", select the HMI device image file "*.img".
   - The HMI device image files are available under "WinCC flexible Images" in the WinCC flexible installation folder or on the WinCC flexible installation CD.
   - In the output area, you are provided information on the version of the HMI device image file after it is opened.
7. Switch into "Transfer" mode on the HMI device.
   - If you have activated automatic transfer mode for the HMI device, the device automatically switches to "Transfer" mode when an update is initiated.
8. Select "Update OS" on the PC to run the operating system update.
9. Follow the instructions in ProSave.
   - During the operating system update a status view opens to indicate progress.

Result

A message is displayed when the operating system update is successfully completed.
This operation has deleted the project data from the HMI device.
7.5 Updating the operating system on the TP 177B 4"

7.5.5 Resetting to factory settings with WinCC flexible

Requirements

- No project is open on the configuring PC in WinCC flexible.
- The HMI device is connected to this configuration PC over the standard Ethernet cable.
- Have the MAC address of the Ethernet interface on your HMI device to hand.
  - The MAC address is displayed briefly when the HMI device is turned on.
  - The MAC address is displayed in the "PROFINET" dialog in the Control Panel.

Procedure - Setting the PC interface

1. Select "Start > Control Panel > Set PG / PC interface" on the configuration PC.
2. Select "S7ONLINE (STEP7) -> TCP / IP" from the "Application access point" area.
3. Select the interface which is connected to the HMI device from the "Interface parameterization used" area.
4. Confirm your entries.

Procedure - Restoring factory settings

Proceed as follows:

1. On the configuring PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible.
   The "Communication Settings" dialog opens.
2. Select the HMI device type from the "General" tab, and select "Ethernet" from the "Connection" area.
3. Enter an IP address.

Note
Possible address conflicts with incorrect IP address

Do not use a dynamic IP configuration for "Reset to factory settings".
Specify a unique IP address in which the configuration PC is located. For the duration of the update process, the HMI device is automatically assigned to the specified address.
If the HMI device has already been used with WinCC flexible or ProSave you can use the existing IP address for "Reset to factory settings."
4. Confirm your entries.
5. In WinCC flexible, select the command "Update OS" in the "Project > Transfer" menu.
6. Activate the "Reset to factory settings" check box.
   A text box opens where you can enter the MAC address.
7. Enter the HMI device's MAC address in the text box.
8. In "Image path", select the HMI device image file "*.img".
   The HMI device image files are available under "WinCC flexible Images" in the
   WinCC flexible installation folder or on the WinCC flexible installation CD.
   In the output area, you are provided information on the version of the HMI device image
   file after it is opened.
9. In WinCC flexible, select "Update OS" on the configuring PC to run the operating
    system update.
10. In the Control Panel of the HMI device, open the "OP Properties" dialog and select the
    "Device" tab.
11. Click on the "Reboot" button.
    A query is opened.
12. Click on the "Prepare for Reset" button.
13. On the configuration PC, follow the instructions in WinCC flexible.
    During the operating system update a status view opens to indicate progress.
7.5 Updating the operating system on the TP 177B 4"

Result

A message is displayed when the operating system update is successfully completed. This operation has deleted the project data from the HMI device. The factory settings are reset.

Note
If you can no longer call the Control Panel on the HMI device, as the operating system is missing, switch off the HMI device. Then reset to factory settings and restart the HMI device.
If the HMI device doesn’t start up, switch it off and then on again.

Note
Calibrating the touch screen
After the reset, you may have to recalibrate the touch screen.

7.5.6 Resetting to factory settings with ProSave

Requirement

- The HMI device is connected over the Ethernet to a PC on which ProSave is installed.
- Have the MAC address of the Ethernet interface on your HMI device to hand.
  - The MAC address is displayed briefly when the HMI device is turned on.
  - The MAC address is displayed in the "PROFINET" dialog in the Control Panel.

Procedure - Setting the PC interface

1. Select "Start > Control Panel > Set PG / PC interface" on the configuration PC.
2. Select "S7ONLINE (STEP7) -> TCP / IP" from the "Application access point" area.
3. Select the interface which is connected to the HMI device from the "Interface parameterization used" area.
4. Confirm your entries.
Procedure - Restoring factory settings

Proceed as follows:

1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type from the "General" tab, and select "Ethernet" from the Connection area.
3. Enter an IP address.

Note

Possible address conflicts with incorrect IP address

Do not use a dynamic IP configuration for "Reset to factory settings".
Specify a unique IP address of the subnet in which the configuration PC is located.
For the duration of the update process, the HMI device is automatically assigned to the specified address of ProSave.
If the HMI device has already been used with WinCC flexible or ProSave you can use the existing IP address for "Reset to factory settings."
4. Change to the "OS Update" tab.
5. Activate the "Reset to factory settings" check box.
   A text box opens where you can enter the MAC address.
6. Enter the HMI device's MAC address in the text box.
7. In "Image path", select the HMI device image file "*.img".
   The HMI device image files are available under "WinCC flexible Images" in the
   WinCC flexible installation folder or on the WinCC flexible installation CD.
   In the output area, you are provided information on the version of the HMI device image
   file after it is opened.
8. Select "Update OS" on the PC to start the "Reset to factory settings" process.
9. In the Control Panel of the HMI device, open the "OP Properties" dialog and select the
    "Device" tab.
10. Click on the "Reboot" button.
    A query is opened.
11. Click on the "Prepare for Reset" button.
12. Follow the instructions in ProSave.
   During the operating system update a status view opens to indicate progress.

**Result**

A message is displayed when the operating system update is successfully completed.
This operation has deleted the project data from the HMI device. The factory settings
are reset.

**Note**

If you can no longer call the Control Panel on the HMI device, as the operating system is
missing, switch off the HMI device. Then reset to factory settings and restart the HMI device.
If the HMI device doesn’t start up, switch it off and then on again.

**Note**

**Calibrating the touch screen**

After the reset, you may have to recalibrate the touch screen.
7.6 Installing and Removing Options

7.6.1 Overview

Options

You can install options on for the HMI device, for example, additional programs developed especially for the HMI device.

You can also remove options from the HMI device.

Note

A license key may be need to run an option. The license key unlocks the option for use.

7.6.2 Installing and Removing Options using WinCC flexible

Requirements

- The HMI device is connected to a configuring PC.
- No project is open in WinCC flexible.
- The data channel is configured on the HMI device.

Procedure for installing an option

Proceed as follows:

1. On the configuring PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible.

   The "Communication Settings" dialog opens.

2. Select the type of HMI device.

3. Select the type of connection between the HMI device and the configuring PC, then set the connection parameters.

4. Close the dialog with "OK".

5. Select the "Options" command in the menu "Project > Transfer" in WinCC flexible.

6. Select the desired option under "Available options".

7. Set "Transfer" mode on the HMI device.

   If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when the installation of an option is initiated.

8. Start the installation of the option in WinCC flexible on the configuring PC with the ">>" button.

   Follow the instructions in WinCC flexible.

   A status display appears indicating the progress of the installation.
7.6 Installing and Removing Options

Result

The option has now been installed on the HMI device.

Procedure for removing an option

Proceed as follows:

1. On the configuring PC, select the "Communication settings" command in the menu "Project > Transfer" in WinCC flexible.
   The "Communication Settings" dialog opens.
2. Select the type of HMI device.
3. Select the type of connection between the HMI device and the configuring PC, then set the connection parameters.
4. Close the dialog with "OK".
5. Select the "Options" command in the menu "Project > Transfer" in WinCC flexible.
6. Select the desired option under "Installed options".
7. Set "Transfer" mode on the HMI device.
   If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when the removal of an option is initiated.
8. Start the removal of the option in WinCC flexible on the configuring PC with the "<<" button.
   Follow the instructions in WinCC flexible.
   A status display appears indicating the progress of the removal.

Result

The option has now been removed on the HMI device.

7.6.3 Installing and removing options using ProSave

Requirements

- The HMI device is connected to a PC on which ProSave is installed.
- The data channel is configured on the HMI device.

Procedure for installing an option

Proceed as follows:

1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
4. Set the connection parameters.
5. Select the "Options" tab.
6. Select the desired option under "Available options".
7. Set "Transfer" mode on the HMI device.
   - If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when the installation of an option is initiated.
8. Start the installation of the option in ProSave with the ">>" button.
9. Follow the instructions in ProSave.
   - A status display appears indicating the progress of the installation.

Result

The option has now been installed on the HMI device.

Procedure for removing an option

Proceed as follows:

1. From the Windows Start menu, start ProSave on the PC.
2. Select the HMI device type in the "General" tab.
3. Select the type of connection between the HMI device and the PC.
4. Set the connection parameters.
5. Select the "Options" tab.
6. Press the "Device status" button to update the display.
7. Select the desired option under "Installed options".
8. Set "Transfer" mode on the HMI device.
   - If automatic transfer mode is enabled on the HMI device, the device automatically sets "Transfer" mode when the removal of an option is initiated.
9. Start the removal of the option in ProSave with the "<<" button.
   - Follow the instructions in ProSave.
   - A status display appears indicating the progress of the removal.
Result

The option has now been removed on the HMI device.

7.7 Transferring License Keys and Transferring Them Back

7.7.1 Overview

Transferring and transferring back license keys

With the purchase of an optional package, you obtain a specific user license with an associated license key. Once you have installed an option, transfer a license key to the HMI device. The license key unlocks an option for use.

You can also transfer back the license key from the HMI device to the storage location.

Note

You only transfer License Keys with the Automation License Manager or WinCC flexible.
7.7.2 Transferring and transferring back license keys

Requirements

- When transferring or transferring back using WinCC flexible:
  No project is open on the configuring PC in WinCC flexible.
- The HMI device is connected to this configuring PC.
- The data channel is configured on the HMI device.
- The storage location and the license key awaiting transfer are ready.

Procedure for transferring a license key

Proceed as follows:

1. Switch to "Transfer" mode on the HMI device.
2. When transferring using WinCC flexible:
   Select the "License Keys" command in the menu "Project > Transfer".
   The Automation License Manager opens.
   When transferring using the Automation License Manager:
   Start the Automation License Manager via the Windows Start menu.
3. In the Automation License Manager, select the command "Connect HMI device" in the menu "Edit > Connect target system".
   The "Connect Target System" dialog opens.
4. Under "Device Type", select the appropriate HMI device type.
5. Select the type of connection from the "Connection" box.
6. Set the connection parameters.
7. Select "OK".
   The connection to the HMI device is established. The connected HMI device is displayed in the left window of the Automation License Manager.
8. In the left window, select the source drive.
   The right window displays the available license keys.
9. Drag one or more license keys from the right window and drop them on the HMI device in the left window.
   The license keys are then transferred to the HMI device.

Result

The license key is transferred from the storage location to the HMI device.
Procedure for transferring a license key back

Proceed as follows:

1. Switch to "Transfer" mode on the HMI device.
2. When transferring back using WinCC flexible:
   Select the "License Keys" command in the menu "Project > Transfer".
   The Automation License Manager opens.
   When transferring back using the Automation License Manager:
   Start the Automation License Manager via the Windows Start menu.
3. In the Automation License Manager, select the command "Connect HMI device" in the menu "Edit > Connect target system".
   The "Connect Target System" dialog opens.
4. Under "Device Type", select the appropriate HMI device type.
5. Select the type of connection from the "Connection" box.
6. Set the connection parameters.
7. Select "OK".
   The connection to the HMI device is established. The connected HMI device is displayed in the left window of the Automation License Manager.
8. In the left window, select the HMI device.
   The right window displays the available license keys.
9. Drag one or more license keys from the right window and drop them on the destination drive in the left window.
   The license keys are transferred back to the storage location.

Result

The license key is transferred back from the HMI device to the storage location.

Setting the Operating Mode (Page 195)
Data Transmission Options (Page 197)
Operating a Project

8.1 Operating a Project on the TP 177A

8.1.1 Overview

Using Operator Controls on the Touch Screen

Operator controls are touch-sensitive objects on the HMI screen such as buttons, I/O fields and alarm windows. Touch objects are basically operated in the same way as mechanical keys. You activate operator controls by touching them with your finger.

Some operations with the project may require in-depth knowledge about the specific plant on the part of the operator. It is therefore important to take special care, for example, in displaying typing. Further information on this may be available in your plant documentation.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always touch only one operator control on the screen. Never touch more than one operator control at a time, otherwise you may trigger unintentional actions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not use any pointed or sharp objects when operating the touch screen as this may damage the plastic membrane of the touch screen.</td>
</tr>
</tbody>
</table>

Operation Feedback

The HMI provides optical feedback when it detects that an operator control has been touched. This feedback is independent of any communication with the PLC. Therefore, this feedback does not indicate whether the relevant action is actually executed or not.

The configuration engineer may also have configured the feedback function in a different manner. Further information on this may be available in your plant documentation.
Optical Operation Feedback

The type of optical feedback depends on the operator control object:

- **Buttons**
  The HMI outputs different views of the "Touched" and "Untouched" states, provided the configuration engineer has configured a 3D effect:
  - "Touched" state:
    
    ![Touched state](image)
  
  - "Untouched" state:
    
    ![Untouched state](image)
  
  The configuration engineer defines the appearance of a selected field, for example, its line width and color for the focus.

- **Invisible buttons**
  The focus for invisible buttons is not identified after selection by default. No optical operation feedback is provided in this case.
  
  The configuration engineer may, however, configure invisible buttons so that their outline appears as lines when touched. This outline remains visible until the you select another operator control object.

- **I/O fields**
  After you touch an I/O field, a screen keyboard appears as optical operation feedback.
8.1.2 Setting the Project Language

Introduction

The HMI device supports multilingual projects. You need to configure a corresponding operator control object which lets you change the language setting on the HMI device during runtime.

The project always starts with the language set in the previous session.

Requirements

- The relevant project language must be available on the HMI device.
- The language switching function must be logically linked to a configured operator control object such as a button.

Selecting a Language

You can change project languages at any time. Language-specific objects are immediately output to the screen in the relevant language when you switch languages.

The following options are available for switching the language:

1. A configured operator control object switches from one project language to the next in a list.
2. A configured operator control directly sets the desired project language.

Further information on this may be available in your plant documentation.
8.1 Operating a Project on the TP 177A

8.1.3 Entries and Help within a Project

8.1.3.1 Overview

Procedure

Values are entered in the project input fields. The values are transferred from the input fields to the PLC.

Proceed as follows:

1. Touch the input field required on the screen.
   - The screen keyboard opens.
   - Based on your configuration, you can enter the following type of values in the input field:
     - Numerical
     - Alphanumeric
     - Symbolic
     - Date/time

2. Set the value.

3. Confirm the entry.

Screen keyboard

When you touch an input object such as an IO field on the HMI touch screen, a screen keyboard appears. This screen keyboard is also displayed when it is necessary to enter a password to access protected functions. The keyboard is automatically hidden again when input is complete.

Based on the configuration of the input object, the system opens a screen keyboard for entering numerical, alphanumerical or symbolic values.

Note

The screen keyboard display is independent of the configured project language.

Numerical values

You can enter numerical values character-by-character using the numerical screen keyboard.

Formats for Numerical Values

You can enter values in numerical input fields based on the following formats:

- Decimal
- Hexadecimal
- Binary
Limit Value Test of Numerical Values

Variables can be assigned limit values. The current limit values are indicated in the numerical screen keyboard. If an Alarm window has been configured, a system message is automatically output to indicate any violation of the configured input value limits. For example, 80 exceeds the configured limit value of 78. The entered value entered is rejected. The original value is displayed again.

Decimal places for numerical values

If a numerical input field is configured for a specific number of decimal points, decimal places in excess of the limit are ignored. Empty decimal places are filled with "0" after the number is confirmed.

Alphanumeric values

Alphanumeric values (numbers and letters) can be entered character-by-character using the alphanumerical screen keyboard.

Symbolic values

Symbolic values are entered from a list of predefined entries using the symbolic screen keyboard.

Date and time

You can enter date/time values character-by-character using the alphanumerical screen keyboard.

8.1.3.2 Entering and Editing Numerical Values

Numerical screen keyboard

When you touch an IO field on the HMI touch screen, the numerical screen keyboard appears. The screen keyboard is automatically hidden again when input is complete.

The display of the screen keyboard with a vertical mounting of the HMI device slightly differentiates from the figure above.
8.1 Operating a Project on the TP 177A

Procedure

Numerical and hexadecimal values can be entered character-by-character via the buttons on the numerical screen keyboard.

Proceed as follows:

1. Touch the required input field on the screen.
   The numerical screen keyboard opens and the existing value is displayed in the screen keyboard.

2. Enter the value.
   You can only operate the keys that are displayed in the 3D view. The operation of the keys depends on the nature of the values that are entered.
   You have the following options to enter a value:
   - The existing value is deleted when you enter the first character. Completely reenter the value.
   - Use the \( \text{←} \) and \( \text{→} \) keys to move the cursor within the current value. You can now edit or add to the characters of the current value.
     Use the \( \text{BSP} \) key to delete the character to the left of the cursor.
   - Change the sign of the value using the \( \pm \) key.
   - Select the \( \text{Help} \) key to view the infotext of the IO field.
     This button is only enabled if infotext has been configured for the IO field or for the screen which contains the IO field.

3. Use the \( \text{↓} \) key to confirm your entry or cancel it with \( \text{ESC} \). Either action closes the screen keyboard.

Note

Numerical I/O fields can be assigned limit values. The entered values are only accepted if they lie within these limits. Values outside of the configured limits are not accepted. A system alarm is then triggered on the HMI device.

When the screen keyboard appears, the high and low limit values are indicated if configured.

Result

You have changed the numerical value or entered a new one.
8.1.3.3 Entering and Editing Alphanumeric Values

Alphanumeric Screen Keyboard

When you touch an IO field on the HMI touch screen, the alphanumeric screen keyboard appears. The keyboard is automatically hidden again when input is complete.

![Figure 8-1 Alphanumeric screen keyboard, normal level]

The layout of the screen keyboard for a vertically mounted HMI device differs slightly from that shown in the figure above.

Keyboard Levels

The alphanumeric keyboard is organized on several levels:

- Normal level
- Shift level
Operating a Project
8.1 Operating a Project on the TP 177A

Procedure

You can enter alphanumerical values character-by-character using the alphanumerical screen keyboard.

Proceed as follows:

1. Touch the relevant IO field on the screen.
   The alphanumerical screen keyboard opens and displays the current value.

2. Set the value.
   The following options for entering values are available:
   - The current value is deleted when you enter the first character. Enter the value again.
   - Use the and keys to move the cursor within the current value. You can now edit the characters of the current value or add characters.
     Use the key to delete the character to the left of the cursor.
   - You can quickly switch between screen keyboard level using the key. When you toggle the level, the key labels on the screen keyboard change.
   - Select to view the infotext of the IO field.
     This button is only enabled if infotext has been configured for the IO field or for the screen which contains the IO field.

3. Select to confirm your entries or cancel them with . Both actions close the screen keyboard.

Result

You have changed the alphanumerical value or entered a new one.
8.1.3.4 Entering and Editing Symbolic Values

Symbolic Screen Keyboard

When you touch a symbolic IO field on the HMI touch screen, the symbolic screen keyboard appears. The screen keyboard is automatically hidden again when input is complete.

The display of the screen keyboard with a vertical mounting of the HMI device slightly differentiates from the figure above.

Procedure

Enter the symbolic values using the symbolic screen keyboard. Proceed as follows:

1. Touch the required symbolic IO field on the screen.
   The symbolic screen keyboard opens and the existing value is displayed in the screen keyboard.
2. Select an item from the selection list.
   You have the following options to enter a value:
   – Set the cursor directly on the entry in the selection list, by touching the entry.
   – Move the cursor to an entry in the selection list using the keys.
   – Select the key to view the infotext of the symbolic IO field.
      This button is only enabled if infotext has been configured for the symbolic IO field or for the screen which contains the IO field.
3. Use the key to confirm your entry or cancel it with . Either action closes the screen keyboard.

Result

You have changed the symbolic value or entered a new one.
8.1.3.5  Entering and Modifying the Date and Time

Entering the Date and Time

Enter the date and time in the same way you enter alphanumerical values.

---

Note

When entering the date and time, please note that the format is determined by the configured project language.

See also

Entering and Editing Alphanumeric Values (Page 233)
Setting the Project Language (Page 229)

8.1.3.6  Viewing infotext

Purpose

The configuration engineer uses infotext to provide additional information and operating instructions with respect to screens and operable screen objects.

Infotext can provide information on the value to be entered in an IO field, for example.

Infotext for Input Objects

Touch the key on the screen keyboard. This key is only enabled if infotext or the current screen has been configured for the input object.

---

Note

Switching between displayed infotext

If infotext has been configured for an IO field and a screen, touching the infotext window toggles between the two.
Infotext for the Current Screen

Infotext can also be configured for screens. The infotext for the current screen is called up or by the screen keyboard or by an operator control object assigned to this function.

Refer to your plant documentation to find any additional information on this topic.

Closing the Infotext

Close the infotext with \( \times \).

8.1.4 Project security

8.1.4.1 Overview

Overview

The configuration engineer can protect the operation of a project by implementing a security system.

The security system of the HMI device is based on permissions, user groups and users.

If operator control objects protected by a password are operated, the HMI device requests the entry of a password. A logon screen is displayed in which you enter your user name and password. After logging in, you can operate the operator control objects for which you have the necessary permissions.

The logon dialog can be set up by the configuration engineer via an individual operator control object.

In the same way, the configuration engineer can set up an operator control object to log off. After logging off, objects assigned password protection can no longer be operated; to do so, log in again.

Additional information on this may be available in your plant documentation.

User groups and permissions

Project-specific user groups are created by the configuration engineer. The "Administrators" group is included in all projects by default. User groups are assigned permissions.

The permission required for an operation is specifically defined for each individual object and function in the project.

The operating permissions can be saved with the "Backup" function.

Users

Each user is assigned to exactly one user group.

Users can be created as follows:
- By the configuration engineer during configuration
- By the administrator on the HMI device
- By a user with user management permission on the HMI device
Logoff times

A logoff time is configured in the system for each user. If the time between any two user actions, e.g., entering a value or changing screens, exceeds this logoff time, the user is automatically logged off. The user must then log in again to continue to operate objects assigned password protection.

Passwords

If an administrator or a user with administrator permission is logged on, all users on the HMI device are displayed in the User view.

If a user without user management permission is logged on, only the personal user entry is displayed.

The permissions of a user after logging in depends on the user group to which the user is assigned. Additional information on this may be available in your plant documentation.

The user data is encrypted and saved on the HMI device to protect it from loss due to power failure.

Note

Depending on the transfer settings, changes to the user data are overwritten when the project is transferred again.

User view

Use the User view to display the users on the HMI device.

If an administrator or a user with administrator permission is logged on, all users on the HMI device are displayed in the User view. If a user without user management permission is logged on, only the personal user entry is displayed.

The group to which each user is assigned is displayed next to the user names.

As administrator or user with user management permission, you can also add new users. Use the "<New User>" entry.
Backup and Restore

The users, passwords, group assignments and logoff times set up on the HMI device can be backed up and restored. This prevents you having to enter all of the data again on another HMI device.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>During a restore, the currently valid user data is overwritten. The restored user data and passwords are valid immediately.</td>
</tr>
</tbody>
</table>

Limits for User, Password and User View

<table>
<thead>
<tr>
<th>Length of user name, maximum</th>
<th>40</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length of password, minimum</td>
<td>3</td>
</tr>
<tr>
<td>Length of password, maximum</td>
<td>24</td>
</tr>
<tr>
<td>Entries in user view, maximum</td>
<td>50</td>
</tr>
</tbody>
</table>

8.1.4.2 User logon

Requirements

Use the logon dialog to log into the security system of the HMI device. Enter user name and password in the logon dialog.

You have the following options for displaying the logon dialog:

- Touch the operator control object with password protection.
- Touch an operator control object that was configured for displaying the logon dialog.
- Double-click on the "<ENTER>" entry in the User view.
- At the beginning of the project, the logon dialog will be automatically displayed in certain circumstances.

Further information on this may be available in your plant documentation.
8.1 Operating a Project on the TP 177A

Procedure

Proceed as follows:
1. Enter the user name and password.
   Touch the corresponding input field. The alphanumerical screen keyboard is displayed.
2. Touch the "OK" button.

Note
The user name is not case-sensitive.
The password is case-sensitive.

Result

After successful logon to the security system, you can execute password-protected functions on the HMI device for which you have permissions.

An error message is displayed if you enter the wrong password. In this case, no user is logged in to the project.

8.1.4.3 User logoff

Requirements

You have logged into the security system of the HMI device.

Procedure

You have the following options for logging off:

- When no operator actions occur and the logoff time has expired, the user is automatically logged off.
- Touching an operator control configured for logging off.
  Further information on this may be available in your plant documentation.

The current user is also logged off if an incorrect password is entered.

Result

The user is no longer logged into the project. In order to operate an operator control object with password protection, you must first log in again.
8.1.4.4 Create user

Requirements

New users are created in the user view.
To display the user view, switch to the screen that contains the user view.
To add a new user, you must have user management permission.

Procedure

Proceed as follows:

1. Touch the "<New User>" entry in the user view.
   The following dialog appears:

   ![](image)

   2. Enter the desired user information.
      Touch the corresponding input field. The appropriate screen keyboard is displayed.
      - The password may not contain space characters or the special characters "* ? . % / \ ".
      - For the logoff time, you can use values of 0 to 60 minutes. The value 0 stands for "no automatic logoff."

2. Touch the "OK" button.

Result

The new user is created.
8.1.4.5 Changing user data

Requirements

Change user data in the user view.

To display the user view, switch to the screen that contains the user view.

The following options are available for the range of changes that can be made:

- The administrator or a user with user management permission can change the data for all users on the HMI device system in the user view.
  - User name
  - Group assignment
  - Password
  - Logoff time

- Users without user management permission can only change their own user data.
  - Password
  - Logoff time

Note

You can only change the logoff time and password for the "Admin" user.

You can only change the logoff time for the "PLC_User". This user entry is used for logging in via the PLC.

Procedure

This procedure describes changing user data by the administrator or a user with user management permission.

Proceed as follows:

1. In the user view, touch the user whose user data you want to change.

   The following dialog appears:

   ![User dialog]

2. Change the desired user data.

   Touch the corresponding input field. The appropriate screen keyboard is displayed.

3. Touch the "OK" button.

Result

The user data for the user is changed.
8.1.4.6 Deleting a user

Requirements
You delete users in the user view:
To display the user view, switch to the screen that contains the user view.
To delete a user, you must have user management permission.

Note
The "Admin" and "PLC_User" users exist by default and cannot be deleted.

Procedure - Deleting a user
Proceed as follows:
1. Touch the user entry that you want to delete in the user view.
   The following dialog appears:

   ![User Entry Dialog]

   2. Touch the "User" input field.
   The alphanumerical screen keyboard is displayed.

   3. Touch the delete button on the screen keyboard.
   The existing user name is deleted from the screen keyboard.

   4. Touch the delete button on the screen keyboard.
   The user name in the "User" input field is deleted.

   5. Touch the "OK" button.

Result
The user is deleted.
8.1.5 Closing the project

Procedure

Proceed as follows:
1. Use the corresponding operator control object to close the project. Wait for the Loader to open after you closed the project.
2. Switch off power to the HMI device.

8.1.6 Operating the Trend View

8.1.6.1 Overview

Trends

Trends continuously display the current process data.

Trend View

Trends are displayed in the Trend view. A Trend view can display up to four trends simultaneously. The figure below shows an example of a Trend view:

The appearance, axes, value range and labels of the Trend view can be set by the configuration engineer.

The configuration engineer can set limits for the trend values. A color transition can be configured when the limits are exceeded.

Additional information on this may be available in your plant documentation.
8.1 Operating a Project on the TP 177A

Value Table

The trend values can be read from the value table, if this is configured.

Ruler

The exact trend values can be read from the ruler, if this is configured.

8.1.6.2 Operating the Trend View

Value Table

The trend values are displayed in the value table. When the ruler is displayed, the trend values are shown at a position of the ruler. When the ruler is hidden, the latest trend values are displayed.

Ruler

When configured, a ruler is available to provide an exact reading of the individual values. The position of the ruler can be changed by touching and dragging it on the touch screen. The configuration engineer can configure the following actions for operator controls outside the Trend display:

- Display or hide ruler
- Move ruler forward
- Move ruler backward

Further information on this may be available in your plant documentation.

Other Operator Actions

The configuration engineer can configure the following actions for operator controls outside the Trend display:

- Enlarge display of time intervals
- Reduce display of time intervals
- Scroll back by one display width
- Scroll forward by one display width
- Stop or resume trend recording

Further information on this may be available in your plant documentation.
8.2 Operating a project on TP 177B and OP 177B

8.2.1 Overview

Using Operator Controls on the Touch Screen

Operator controls are touch-sensitive objects on the HMI screen such as buttons, I/O fields and alarm windows. Touch objects are basically operated in the same way as mechanical keys. You activate operator controls by touching them with your finger.

Some operations with the project may require in-depth knowledge about the specific plant on the part of the operator. It is therefore important to take special care, for example, in displaying typing. Further information on this may be available in your plant documentation.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always touch only one operator control on the screen. Never touch more than one operator control at a time, otherwise you may trigger unintentional actions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not use any pointed or sharp objects when operating the touch screen as this may damage the plastic membrane of the touch screen.</td>
</tr>
</tbody>
</table>

Locking operator controls

The HMI provides optical feedback when it detects that an operator control has been touched. This feedback is independent of any communication with the PLC. Therefore, this feedback does not indicate whether the relevant action is actually executed or not.

The configuration engineer may also have configured the feedback function in a different manner. Further information on this may be available in your plant documentation.
Optical Feedback from Operator Controls

The type of optical feedback depends on the operator control object:

- **Buttons**
  
  The HMI outputs different views of the "Touched" and "Untouched" states, provided the configuration engineer has configured a 3D effect:
  
  - "Touched" state:

  ![Touched state](image)

  - "Untouched" state:

  ![Untouched state](image)

  The configuration engineer defines the appearance of a selected field, for example, its line width and color for the focus.

- **Invisible buttons**

  The focus for invisible buttons is not identified after selection by default. No optical operation feedback is provided in this case.

  The configuration engineer may, however, configure invisible buttons so that their outline appears as lines when touched. This outline remains visible until you select another operator control object.

- **I/O fields**

  After you touch an I/O field, a screen keyboard appears as optical operation feedback.
8.2 Operating a project on TP 177B and OP 177B

8.2.2 Operating keys on the TP 177B 4" and OP 177B

Function keys with global function assignment
A function key with global function assignment always triggers the same action on the HMI device or in the PLC, regardless of the current screen. An example of such an action is the activation of a screen or the closing an alarm window.

Function keys with local function assignment
A function key with local function assignment is screen-specific and is therefore only effective within the active screen.

The function assigned to a function key can vary from screen to screen.

The function key of a screen can be assigned one function only, either a global or local one. The local assignment function takes priority over the global setting.

Function keys as system keys
Function keys can also be configured as system keys. For example, they can function as the numerical keypad, the cursor keypad or as a section of the alphanumerical keypad.

Multi-key operation
Unwanted actions may be triggered if the operator unintentionally actuates a key combination.

⚠️ CAUTION

Unintentional actions
In "Online" mode, simultaneous operation of more than two keys may cause unintentional actions in the plant.
Do not press more than two keys simultaneously.
8.2.3 Direct keys

Introduction
Direct keys on the HMI device are used to set bits in the I/O area of a SIMATIC S7. Direct keys enable operations with short reaction times that are, for example, a jog mode requirement.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct keys are still active when the HMI device is in &quot;offline&quot; mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you operate a function key with direct key functionality in a running project, the direct key function is always executed, independent of the current screen contents.</td>
</tr>
</tbody>
</table>

Note
You can only use direct keys when there is a connection via PROFIBUS DP or PROFINET IO.
Direct keys result in additional basic load on the HMI device.

Direct keys
The following objects can be configured as a direct key:
- Buttons
- On TP 177B 4" and OP 177B: Function keys
You can also define image numbers in the case of HMI devices with touch operation. In this way, you can configure the direct keys on an image-specific basis.

Further information on configuring direct keys can be found in the "WinCC flexible Communication" system manual.
8.2.4 Setting the project language

Introduction
The HMI device supports multilingual projects. You need to configure a corresponding operator control object which lets you change the language setting on the HMI device during runtime.

The project always starts with the language set in the previous session.

Requirements
- The relevant project language must be available on the HMI device.
- The language changeover function must be logically linked to a configured operator control object such as a button.

Selecting a language
You can change project languages at any time. Language-specific objects are immediately output to the screen in the relevant language when you switch languages.

The following options are available for switching the language:
1. A configured operator control object switches from one project language to the next in a list.
2. A configured operator control directly sets the desired project language.

Further information on this may be available in your plant documentation.

8.2.5 Entries and help within a project

8.2.5.1 Overview

Screen keyboard
When you touch an operating element requiring entry on the HMI device touch screen, a screen keyboard appears. The screen keyboard is displayed in the following cases:
- An I/O field is selected for input.
- A password must be entered for accessing a password-protected function.

The screen keyboard is automatically hidden again when input is complete.

Based on the configuration of the operating element, the system displays different screen keyboards for entering numerical or alphanumerical values.

Note
The screen keyboard display is independent of the configured project language.
General procedure

The operating elements of a screen are operated by touching the touch screen. Proceed as follows:

1. Touch the desired operating element within the screen.
2. Depending on the operating element, perform further actions. Detailed descriptions can be found under the respective operating element.
   Examples:
   - I/O field: Enter numerical, alphanumerical or symbolic values in the I/O field.
   - Symbolic I/O field: Select an entry from the selection list.
   - Slider control: Move the slider control.

Procedure for text boxes

Values are entered in the project text boxes. Based on your configuration, the values are saved to tags and transferred, for example, to the PLC.

Proceed as follows:

1. Touch the desired text box within the screen.
   The screen keyboard opens.
   Depending on your configuration, you can enter values in the text box in the following manner:
   - Numerical values, for example decimal numbers, hexadecimal numbers, binary values
   - Alphanumerical values, for example digits and letters
   - Date/time
2. Enter the value.
3. Confirm your entry with or discard your entry with the button.
8.2.5.2 Entering numerical values on the TP 177A, TP 177B and OP 177B

Numerical screen keyboard

When you touch an operating element for numerical input on the HMI-device touch screen, the numerical screen keyboard appears. This is the case, for example, for a text box. The screen keyboard is automatically hidden again when input is complete.

Note

Opened screen keyboard

When the screen keyboard is open, PLC job 51, "Select screen" has no function.

Formats for numerical values

You can enter values in numerical text boxes based on the following formats:

- Decimal
- Hexadecimal
- Binary

Limit value test of numerical values

Tags can be assigned limit values. The current limit values are indicated in the numerical screen keyboard. If you enter a value that lies outside of this limit, it will not be accepted, for example, 80 with a limit value of 78. In this case the HMI device will deliver a system alarm, if an alarm window is configured. The original value is displayed again.
Decimal places for numerical values

The configuration engineer can define the number of decimal places for a numerical text box. The number of decimal places is checked when you enter a value in this type of I/O field.

- Decimal places in excess of the limit are ignored.
- Empty decimal places are filled with "0."

Procedure

Numerical and hexadecimal values can be entered character-by-character via the buttons on the numerical screen keyboard.

Proceed as follows:

1. Touch the desired operating element within the screen.

   The numerical screen keyboard opens. The existing value is displayed in the screen keyboard and is selected.

2. Enter the value.

   You can only operate keys that are required for entering values. The keys with letters cannot be used, for example, for entering a decimal value. Which keys can be operated can be seen from the appearance of the keys.

   You have the following options to enter a value:

   - The selected value is deleted when you enter the first character. Completely reenter the value.
   - Use the \( \text{BSP} \) and \( \text{→} \) keys to move the cursor within the current value. You can now edit or add to the characters of the current value.
     Use the \( \text{BSP} \) key to delete the character to the left of the cursor. If the value is selected, use this key to delete the selected part of the value.
   - Change the sign of the value using the \( \text{+\,−} \) key.
   - Use the \( \text{Help} \) key to display the infotext of the I/O field.
     This button is only enabled if infotext has been configured for the input object or the current screen.
   - Use the \( \text{Esc} \) key to confirm your entry or cancel it with \( \text{Esc} \). Either action closes the screen keyboard.

Result

You have changed the numerical value or entered a new one.
8.2.5.3 Entering alphanumerical values on the TP 177A, TP 177B 6" and OP 177B

Alphanumerical screen keyboard

When you touch an operating element for numerical input on the HMI-device touch screen, the alphanumerical screen keyboard appears. This is the case, for example, for an input field or a date / time field. The screen keyboard is automatically hidden again when input is complete. The figure below shows the normal level of the alphanumerical screen keyboard.

![Alphanumerical Screen Keyboard](image)

Note

Opened screen keyboard

When the screen keyboard is open, PLC job 51, "Select screen" has no function.

Language change

Language change in the project has no influence on the alphanumerical screen keyboard. The entry of Cyrillic or Asian characters is therefore not possible.

Keyboard levels

The alphanumerical screen keyboard has various levels:

- Normal level
- Shift level

If you change the levels with key `Shift`, the key assignments change.
Procedure

Alphanumeric values can be entered character-by-character via the buttons on the alphanumeric screen keyboard.

Proceed as follows:

1. Touch the desired operating element within the screen.
   The alphanumeric screen keyboard opens. The existing value is displayed in the screen keyboard and is selected.

2. Enter the value.
   You have the following options to enter a value:
   - The selected value is deleted when you enter the first character. Completely reenter the value.
   - Use the left and right keys to move the cursor within the current value. You can now edit or add to the characters of the current value.
     Use the BSP key to delete the character to the left of the cursor. If the value is selected, use this key to delete the selected part of the value.
   - Using key Shift it is possible to switch between the keyboard levels of the screen keyboard. On switchover, the key assignments of the screen keyboard change.
   - Use the Help key to display the infotext of the I/O field.
     This button is only enabled if infotext has been configured for the input object or the current screen.
   - Use the left key to confirm your entry or cancel it with ESC. Either action closes the screen keyboard.

Result

You have changed the alphanumeric value or entered a new one.
8.2.5.4 Entering alphanumerical values on the TP 177B 4"

Screen keyboard

When you touch an operating element on the HMI-device touch screen, the screen keyboard appears. This is the case, for example, for an input field or a date / time field. The screen keyboard is automatically hidden again when input is complete.

![Screen keyboard image]

**Note**

**Opened screen keyboard**

When the screen keyboard is open, PLC job 51, "Select screen" has no function.

**Language change**

Language change in the project has no influence on the alphanumerical screen keyboard. The entry of Cyrillic or Asian characters is therefore not possible.

**Keyboard levels**

All the keys on the screen keyboard are divided over several levels. Using the keys in the fourth row of the keyboard you can toggle between levels whilst inputting. The following table shows the levels of the screen keyboard and the associated calls:

<table>
<thead>
<tr>
<th>Name</th>
<th>Available keys</th>
<th>Call</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal level a to m</td>
<td>Lowercase letters from a to m</td>
<td>A-M</td>
</tr>
<tr>
<td>Shift level A to M</td>
<td>Uppercase letters from A to M</td>
<td>A-M +</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Shift</td>
</tr>
<tr>
<td>Normal level n to z</td>
<td>Lowercase letters from n to z</td>
<td>N-Z</td>
</tr>
<tr>
<td>Shift level N to Z</td>
<td>Uppercase letters from N to Z</td>
<td>N-Z +</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Shift</td>
</tr>
<tr>
<td>Normal level 0 to 9</td>
<td>Digits from 0 to 9</td>
<td>0-9</td>
</tr>
<tr>
<td>Normal level +/-*</td>
<td>Special characters</td>
<td>+/-*</td>
</tr>
<tr>
<td>Shift level +/-*</td>
<td>Special characters</td>
<td>+/-* +</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Shift</td>
</tr>
</tbody>
</table>
Procedure

The required values can be entered character by character using the screen keyboard buttons.

Proceed as follows:

1. Touch the desired operating element within the screen.
   The screen keyboard opens. The existing value is displayed in the screen keyboard and is selected.

2. Enter the value.
   You have the following options to enter a value:
   - The selected value is deleted when you enter the first character. Completely reenter the value.
   - Use the \[ \text{←} \] and \[ \text{→} \] keys to move the cursor within the current value. You can now edit or add to the characters of the current value.
     Use the \[ \text{BSP} \] key to delete the character to the left of the cursor. If the value is selected, use this key to delete the selected part of the value.
   - Using keys \[ A-M \], \[ N-Z \], \[ 0-9 \], \[ +^\] and \[ \text{Shift} \] it is possible to switch between the levels of the screen keyboard. On switchover, the key assignments change.

3. Use the \[ \text{←} \] key to confirm your entry or cancel it with \[ \text{ESC} \]. Either action closes the screen keyboard.

Result

You have changed the value or entered a new one.
8.2.5.5 Entering and editing symbolic values

Selection list

When you touch a symbolic IO field on the HMI touch screen, a selection list appears.

![Selection List Example]

Procedure

Proceed as follows:
1. Touch the required symbolic IO field.
   The selection list of the symbolic IO field is displayed. You can scroll through the selection list with the and buttons.
2. Select an entry in the selection list.
   Touch an entry to select it. This is then taken by the controller.

Result

You have changed the symbolic value or entered a new one.

8.2.5.6 Entering the Date and Time

Entering the date and time

Enter the date and time in the same way you enter alphanumerical values.

Note

When entering the date and time, please note that the format is determined by the configured project language.

See also

Setting the project language (Page 250)
8.2.5.7 Viewing Infotext

Purpose

The configuration engineer uses infotext to provide additional information and operating instructions with respect to screens and operable screen objects.

Infotext can provide information on the value to be entered in an IO field, for example.

Infotext for Input Objects

Touch the Help key on the screen keyboard. This key is only enabled if infotext or the current screen has been configured for the input object.

Note

Switching between displayed infotexts

If infotext has been configured for an IO field and a screen, touching the infotext window toggles between the two.

Infotext for Other Operator Controls

Infotext can also be configured for operator controls, such as buttons. The infotext of the selected operator control can be displayed by pressing a configured function key.

Refer to your plant documentation to find any additional information on this topic.

Infotext for the Current Screen

Infotext can also be configured for screens. The infotext for the current screen is called up or by the screen keyboard or by an operator control object assigned to this function.

Refer to your plant documentation to find any additional information on this topic.

Closing the Infotext

Close the infotext with \( \times \).
8.2.6 Operating a Gauge

Introduction
The gauge displays analog numerical values using a pointer. The operator at the HMI device can thus see at a glance, for example, that the boiler pressure is in the normal range.

![Gauge illustration]

Appearance
The appearance of the gauge depends on the configuration.

- A trailing pointer can display the maximum value reached so far on the scale. The trailing pointer is reset when the screen is reloaded.
- The label on the scale can show the measured variable, e.g. boiler pressure, and the physical unit, e.g. bar.

Operation
The gauge is for display only and cannot be controlled by the operator.
8.2.7 Using Switches

Introduction

The switches described in the following have two circuit states. Each circuit state is assigned a fixed value. When you operate the switch, it changes to the opposite circuit state and thereby activates the configured value.

Switches can contain sliders, texts or graphics for a specific project.

Procedure - Switch with Slider

Proceed as follows:

Move the slider on the touch screen of the HMI device to the other position or double-click the slider area.

Result

The slider is now in the other position. The assigned value is activated.

Procedure for a slider with text or graphic

Proceed as follows:

Touch the switch on the touch screen of the HMI device.

Result

The switch changes its appearance. The associated value is switched.
8.2.8 Using a Slider

Introduction

With the slider control you can change and monitor process values within a defined range. The slider control can also be configured without a slider. No value is entered in this case. The slider control serves only to display values.

![Slider control with labels](image)

① Slider control for entering values
② Value display with current value

Appearance

You can configure the appearance and the elements of the slider control. The slider control can contain a label and a setting range, for example. The current value can be configured to appear below the area of the slider control.

Procedure

Proceed as follows:
1. Touch the slider.
2. Move the slider to the required value.
   If a value display has been configured, you can check the exact value that has been set.
3. Release the slider.
   The set value is applied.

Result

The assigned value has been changed.
8.2.9 Using the Status Force Display

Use

You read or write access values of the connected controller directly in the status force view. The status force view allows you to carry out operations such as monitoring or modifying the addresses of the controller program, without the need of an online connection via PC or PG.

Note

The status force view can only be used in combination with SIMATIC S5 or SIMATIC S7 controllers.

Appearance

The figure shows the general layout of the status force view. A value can be monitored and controlled on every line.

The configuration engineer specifies which columns appear in the status force view. The table shows the significance of the potential columns.

<table>
<thead>
<tr>
<th>Column</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Connection&quot;</td>
<td>The PLC of which the address ranges are to be displayed</td>
</tr>
<tr>
<td>&quot;Type&quot;, &quot;DB Number&quot;, &quot;Offset&quot;, &quot;Bit&quot;</td>
<td>The address range of the value</td>
</tr>
<tr>
<td>&quot;Data type&quot;, &quot;Format&quot;</td>
<td>The data type of the value</td>
</tr>
<tr>
<td>&quot;Status value&quot;</td>
<td>The value read from the specified address</td>
</tr>
<tr>
<td>&quot;Control value&quot;</td>
<td>The value to be written to the specified address</td>
</tr>
</tbody>
</table>

Change column sequence

You change the column sequence if this has been configured. To reverse the "Format" and "Control Value" columns, for example, touch the "Format" header on the touch screen of the HMI device. Keep the touch screen pressed and drag the column heading to the "Control Value" heading.
Operating elements

The buttons have the following functions when configured:

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
</table>
| ![Read Button](image) | "Read" button  
Updates the display in the "Status value" column.  
The button engages when it is pressed. You cannot operate any input fields until the button is actuated again and the refresh is stopped. |
| ![Write Button](image) | "Write" button  
Applies the new value in the "Control value" column. The control value is then written to the PLC. |

Procedure for reading the status value

Proceed as follows:

1. Enter the address and the desired format of a value for each line. Touch the respective columns to display the screen keyboard.
2. Once you have entered all of the desired values, touch the "Read" button.

Result

All values are read cyclically by the controller and entered in the "Status Value" column until the "Read" button is touched again.

Requirements for controlling

The following requirements must be met to control values:

- The "Control value" column must be available.
- The "Write" button must be available.

Procedure - Controlling a value

Proceed as follows:

1. Enter the address of a value for each line. Enter the desired value in the "Control value" column. Touch the respective columns to display the screen keyboard.
2. Once you have entered all of the desired values, touch the "Write" button.

Result

The values from the "Control value" column are transferred once to the PLC.
8.2.10 Operating the Sm@rtClient View

Overview

The Sm@rtClient view for PN/DP HMI devices enables you to remotely monitor and operate an ongoing project on another HMI device. When properly configured, you can also access several democratic HMI devices on a remote HMI device.

Procedure - Starting Remote Operation

Proceed as follows:

1. Switch to the screen with the Sm@rtClient view on the HMI device.
   The following options are available to establish a connection to the remote HMI device:
   – The connection is automatically established.
   – The connection must be established by touching the appropriate button.
     You may be required to enter the address of the remote HMI device and a password.

2. The current screen of the ongoing project on the remote HMI device now appears on your HMI device.

3. You can now monitor and control this screen according to your configuration.
   Scroll bars are displayed if the screen of the remote HMI device is larger than that of the current HMI device.

Monitoring mode

If the Sm@rtClient view is configured for monitoring mode, you can only monitor the remote HMI device. You cannot control its operation.

Operating the function keys on the OP 177B and TP 177B 4"

The following options are available for operating the function keys:

- When a local function is configured for the function key:
  The function key effects your local HMI device.

- When no local function is configured for the function key:
  The function key effects a remote HMI device.
Procedure - Forcing Permissions

If several HMI devices have access to a HMI device, only one HMI device has operating permission at any one time.

Two cases must be distinguished for this calculation:

- If another HMI device is already controlling the remote HMI device, you can configure for emergency situations in which your HMI device is given forced permission to control the remote HMI device.
  - You attempt to operate the remote HMI device.
  - A dialog appears in which you are prompted to enter the appropriate password for remote control.
  - You can now operate the remote HMI device.

- If another HMI device is accessing your HMI device via the Sm@rtClient view, you can force local operating permission for your HMI device.
  - Touch the screen of your HMI device five times in sequence.
  - You now receive operating permission on the local HMI device.

Procedure - Ending Remote Operation

You can end remote monitoring and remote control with one of the following methods depending on the configuration:

- By touching a button configured for this action.
- By exiting the screen containing the Sm@rtClient view.
- If configured, a menu appears when you touch an empty location for a given period. Touch the menu item "Close".

Refer to your plant documentation to find any additional information on this topic.

Note

If another HMI device is accessing your HMI device via the Sm@rtClient view, this results in additional load on your HMI device.
8.2.11 Operating Trends

8.2.11.1 Overview

Trends

Trends continuously display the current process data.

Trend view

Trends are displayed in the Trend view. A Trend view can display several trends simultaneously.

The appearance, axes, value range and labels of the Trend view can be set by the configuration engineer.

The configuration engineer can set limits for the trend values. A color transition can be configured when the limits are exceeded.

Refer to your plant documentation to find any additional information on this topic.

Value table

The trend values can be read from the value table, if this is configured.

Ruler

The exact trend values can be read from the ruler, if this is configured.
8.2.11.2 Operating the Trend View

Value Table
The trend values are displayed in the value table. When the ruler is displayed, the trend values are shown at a position of the ruler. When the ruler is hidden, the latest trend values are displayed.

Ruler
When configured, a ruler is available to provide an exact reading of the individual values. The position of the ruler can be changed by touching and dragging it on the touch screen. The configuration engineer can configure the following actions for operator controls outside the Trend display:

- Display or hide ruler
- Move ruler forward
- Move ruler backward

Further information on this may be available in your plant documentation.

Other Operator Actions
The configuration engineer can configure the following actions for operator controls outside the Trend display:

- Enlarge display of time intervals
- Reduce display of time intervals
- Scroll back by one display width
- Scroll forward by one display width
- Stop or resume trend recording

Further information on this may be available in your plant documentation.
8.2 Operating a project on TP 177B and OP 177B

8.2.12 Project Security

8.2.12.1 Overview

Overview

The configuration engineer can protect the operation of a project by implementing a security system.

The security system of the HMI device is based on permissions, user groups and users. If operator control objects protected by a password are operated, the HMI device requests the entry of a password. A logon screen is displayed in which you enter your user name and password. After logging in, you can operate the operator control objects for which you have the necessary permissions.

The logon dialog can be set up by the configuration engineer via an individual operator control object.

In the same way, the configuration engineer can set up an operator control object to log off. After logging off, objects assigned password protection can no longer be operated; to do so, log in again.

Further information on this may be available in your plant documentation.

User Groups and Permissions

Project-specific user groups are created by the configuration engineer. The "Administrators" group is included in all projects by default. User groups are assigned permissions. The permission required for an operation is specifically defined for each individual object and function in the project.

Users

Each user is assigned to exactly one user group.

Users can be created as follows:

- By the configuration engineer during configuration
- By the administrator on the HMI device
- By a user with user management permission on the HMI device

Logoff Times

A logoff time is configured in the system for each user. If the time between any two user actions, e.g. entering a value or changing screens, exceeds this logoff time, the user is automatically logged off. The user must then log in again to continue to operate objects assigned password protection.
8.2 Operating a project on TP 177B and OP 177B

Passwords

If an administrator or a user with administrator permission is logged on, all users on the HMI device are displayed in the User view.

If a user without user management permission is logged on, only the personal user entry is displayed.

The permissions of a user after logging in depends on the user group to the user is assigned. Further information on this may be available in your plant documentation.

The user data is encrypted and saved on the HMI device to protect it from loss due to power failure.

Note
Depending on the transfer settings, changes to the user data are overwritten when the project is transferred again.

User View

Use the User view to display the users on the HMI device.

All users on the HMI device system are displayed in the User view to the administrator or to a user with administrator permissions. When user management permission is lacking, only the personal user entry is displayed.

The configuration engineer can implement simple or advanced User view in the project. The two user views offer the same functions and differ only in the display of information.

Simple User View

The simple user view only displays the user name and user group.

<table>
<thead>
<tr>
<th>User</th>
<th>Group</th>
<th>Login Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin</td>
<td>(9)</td>
<td>5</td>
</tr>
<tr>
<td>PLC User</td>
<td>(1)</td>
<td>5</td>
</tr>
<tr>
<td>User 1</td>
<td>(1)</td>
<td>5</td>
</tr>
<tr>
<td>&lt;New user&gt;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Enhanced User View

The enhanced user view displays information about the users.

<table>
<thead>
<tr>
<th>User</th>
<th>Password</th>
<th>Group</th>
<th>Login Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin</td>
<td>*********</td>
<td>(9)</td>
<td>5</td>
</tr>
<tr>
<td>PLC User</td>
<td>*********</td>
<td>(1)</td>
<td>5</td>
</tr>
<tr>
<td>User 1</td>
<td>*********</td>
<td>(1)</td>
<td>5</td>
</tr>
</tbody>
</table>
8.2 Operating a project on TP 177B and OP 177B

Backup and Restore

The users, passwords, group assignments and logoff times set up on the HMI device can be backed up and restored. This prevents you having to enter all of the data again on another HMI device.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>During a restore, the currently valid user data is overwritten. The restored user data and passwords are valid immediately.</td>
</tr>
</tbody>
</table>

Limits for User, Password and User View

<table>
<thead>
<tr>
<th>Number of characters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length of user name, maximum</td>
</tr>
<tr>
<td>Length of password, minimum</td>
</tr>
<tr>
<td>Length of password, maximum</td>
</tr>
<tr>
<td>Entries in user view, maximum</td>
</tr>
</tbody>
</table>

8.2.12.2 User Logon

Requirements

Use the logon dialog to log into the security system of the HMI device. Enter user name and password in the logon dialog.

You have the following options for displaying the logon dialog:

- Touching an operating element with password protection.
- Touching an operating element that was configured for displaying the logon dialog.
- Double-click the "<ENTER>" entry in the simple User view.
- At the beginning of the project, the logon dialog will be automatically displayed in certain circumstances.

Refer to your plant documentation to find any additional information on this topic.
Procedure

Proceed as follows:

1. Enter the user name and password.
   Touch the corresponding input field. The alphanumerical screen keyboard is displayed.
2. Touch the "OK" button.

   **Note**
   - The user name is not case-sensitive.
   - The password is case-sensitive.

Result

After a successful logon to the security system, you can execute password-protected functions on the HMI device for which you have authorizations.

If you enter an incorrect password, an error message is displayed when an Alarm window has been configured.

8.2.12.3 User Logoff

Requirements

You have logged into the security system of the HMI device.

Procedure

You have the following options for logging off:

- The user is logged off automatically if no operations are carried out and if the logoff time has been exceeded
- By touching the operating object that was configured for logging off

   Further information on this may be available in your plant documentation.

If an incorrect password is entered, the logged-on user is also logged off.

Result

The user is no longer logged into the project. In order to operate an operator control object with password protection, you must first log in again.
8.2.12.4 Creating a User

Requirements

New users are created in the user view.
To display the user view, switch to the screen that contains the user view.
To create a new user, you must have user management permission.

Procedure - Creating a User in the Simple User View

Proceed as follows:

1. Touch the "<New User>" entry in the user view.
   The following dialog appears:
   
   ![User View Dialog]

2. Enter the desired user information.
   Touch the corresponding input field. The alphanumerical screen keyboard is displayed.
   The password may not contain space characters or the special characters * ? . % / " .

3. Touch the "OK" button.
   The following dialog appears:
   
   ![Group Selection Dialog]

4. Enter the desired user information.
   Touch the corresponding input field. The appropriate screen keyboard is displayed.
   For the logoff time, you can use values of 0 to 60 minutes. The value 0 stands for
   "no automatic logoff."

5. Touch the "OK" button.

Result

The new user is created.
Procedure - Creating a User in the Advanced User View

Proceed as follows:

Enter the required user information on the empty lines of the User view.

Touch the corresponding input field. The appropriate screen keyboard is displayed.

- The password may not contain space characters or the special characters * ? . % / \ ".
- For the logoff time, you can use values of 0 to 60 minutes. The value 0 stands for "no automatic logoff."

Result

The new user is created.

8.2.12.5 Changing User Data

Requirements

Change user data in the user view.

To display the user view, switch to the screen that contains the user view.

The following options are available for the range of changes that can be made:

- The administrator or a user with user management permission can change the data for all users on the HMI device system in the user view.
  - User name
  - Group assignment
  - Password
  - Logoff time
- Users without user management permission can only change their own user data.
  - Password
  - Logoff time, if configured

Note

You can only change the logoff time and password for the "Admin" user.

You can only change the logoff time for the "PLC_User". This user entry is used for logging in via the PLC.
Operating a Project

8.2 Operating a project on TP 177B and OP 177B

Procedure - Changing User Data in the Simple User View

This procedure describes changing user data by the administrator or a user with user management permission.

Proceed as follows:

1. In the user view, touch the user whose user data you want to change.

   The following dialog appears:

   ![User Data Dialog](image)

   2. Change the desired user data.
      Touch the corresponding input field. The appropriate screen keyboard is displayed.

   3. Touch the "OK" button.
      The following dialog appears:

      ![User Data Dialog](image)

   4. Change the desired user data.
      Touch the corresponding input field. The appropriate screen keyboard is displayed.

   5. Touch the "OK" button.

Result

The user data for the user is changed.
Procedure - Changing User Data in the Advanced User View

This procedure describes changing user data by the administrator or a user with user management permission.

Proceed as follows:

1. In the user view, touch the user whose user data you want to change.

   The appropriate screen keyboard is displayed.

2. Change the desired user data.

   The user data for the user is changed.

8.2.12.6 Deleting a User

Requirements

You delete users in the user view:

To display the user view, switch to the screen that contains the user view.

To delete a user, you must have user management permission.

Note

The "Admin" and "PLC_User" users exist by default and cannot be deleted.
Procedure - Deleting a User in the Simple User View

1. Touch the user that you want to delete in the User view.
   The following dialog appears:

   ![User View Dialog]

2. Touch the "User" input field.
   The alphanumerical screen keyboard is displayed.

3. Touch the button on the screen keyboard.
   The existing user name is deleted from the screen keyboard.

4. Touch the button on the screen keyboard.
   The user name in the "User" input field is deleted.
   The following dialog appears:

   ![User View Dialog]

5. Touch the "OK" button.

Result

The user is deleted. The User view appears again.
Procedure - Deleting a User in the Advanced User View

Proceed as follows:

1. Touch the user you want to delete in the "User" input field of the User view.
   The alphanumerical screen keyboard is displayed.

2. Touch the button on the screen keyboard.
   The existing user name is deleted from the screen keyboard.

3. Touch the button on the screen keyboard.
   The user name in the "User" input field is deleted.

Result

The user is deleted.

8.2.13 Closing the Project

Procedure

Proceed as follows:

1. Use the corresponding operator control object to close the project.
   Wait for the Loader to open after you closed the project.

2. Switch off power to the HMI device.
9 Operating Alarms

9.1 Operating Alarms TP 177A

9.1.1 Overview

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received. An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Error location
- State
- Alarm class
- Alarm number
- Acknowledgement group
Alarm Classes

Alarms are assigned to various alarm classes:

- **Error**
  Alarms in this class must always be acknowledged. Alarms normally indicate critical errors within the plant such as "Motor temperature too high".

- **Warning**
  Warning alarms usually indicate states of a plant such as "Motor switched on".

- **System**
  System alarms indicate states or events which occur on the HMI device.

- **User-specific alarm classes**
  The properties of this alarm class must be defined in the configuration.

Further information on this may be available in your plant documentation.

Alarm Buffer

Alarm events are saved to an internal, volatile buffer. The size of this alarm buffer depends on the HMI device type.

9.1.2 Displaying Alarms

Alarm view and alarm window

Alarms are indicated in the Alarm view or in the Alarm window on the HMI device.

The layout and operation of the Alarm window correspond to that of the Alarm view.

The Alarm window is independent of the process screen. Depending on the configuration, the Alarm window appears automatically as soon as a new, unacknowledged alarm has been received. The Alarm window can be configured so that it only closes after all the alarms have been acknowledged.

Refer to your plant documentation to find any additional information on this topic.
Operating Alarms

9.1 Operating Alarms TP 177A

Operating elements

Functions of the Alarm view buttons:

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>Displays infotext for an alarm</td>
</tr>
<tr>
<td>↓</td>
<td>Edit alarm</td>
</tr>
<tr>
<td>!</td>
<td>Acknowledging an alarm</td>
</tr>
<tr>
<td>▶</td>
<td>Shows the full text of the selected alarm in a separate window, the alarm text window. In the alarm text window, you can view alarm texts that require more space than is available in the alarm view. Close the alarm text window with X</td>
</tr>
<tr>
<td>▼ ▲</td>
<td>Select the next or previous alarm in the list</td>
</tr>
<tr>
<td>▼ ▲</td>
<td>Scroll one page up or down</td>
</tr>
</tbody>
</table>

Alarm class layout

The various alarm classes are identified to distinguish them in the Alarm view:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Alarm class</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Error</td>
</tr>
<tr>
<td>(empty)</td>
<td>Operation</td>
</tr>
<tr>
<td>(depends on the configuration)</td>
<td>User-defined alarm classes</td>
</tr>
<tr>
<td>$</td>
<td>System</td>
</tr>
</tbody>
</table>

The configuration engineer can edit the alarm class symbols. Refer to your plant documentation to find any additional information on this topic.

Displaying infotext

The configuration engineer can also provide infotext for alarms.

Proceed as follows to view the infotext for an alarm:

1. Select the required alarm in the Alarm view
2. Touch ?
   If configured, the infotext assigned to this alarm is displayed.
3. Close the infotext window with X
Alarm indicator

The alarm indicator is a graphic symbol that shows current errors or errors that need to be acknowledged, depending on the configuration.

![Alarm Indicator Symbol]

The alarm indicator flashes as long as alarms are queued for acknowledgment. The number indicates the number of queued alarms. The configuration engineer can assign functions to be executed when the alarm indicator is operated.

Usually, the alarm indicator is only used for error alarms. Refer to your plant documentation to find any additional information on this topic.

9.1.3 Acknowledging Alarms

Requirements

- The alarm which is to be acknowledged is displayed in the Alarm window or in the Alarm view.
- Either the Alarm window or the Alarm view is enabled.
- The alarm must be acknowledged.

Procedure

Proceed as follows:

1. Select the alarm by touching it in the Alarm view or Alarm window.
2. Touch \[\text{I}^{\text{1}}\].

Result

The alarm or all alarms of the corresponding acknowledgement group are acknowledged.

Further information about acknowledgment groups may be available in your plant documentation.

See also

Displaying Alarms (Page 280)
9.1.4 Editing Alarms

Introduction

The configuration engineer can assign additional functions to each alarm. These functions are executed when the alarm is processed.

Requirements

- The alarm to be edited is indicated in the Alarm window or in the Alarm view.
- Either the Alarm window or the Alarm view is enabled.

Procedure

Proceed as follows:
1. Select the alarm by touching it in the Alarm view or Alarm window.
2. Touch $\boxed{\text{Edit}}$.

Result

The system executes the additional functions of the alarm. Further information on this may be available in your plant documentation.

Note

When you edit an unacknowledged alarm, it is acknowledged automatically.

See also

Displaying Alarms (Page 280)
9.2 Operating Alarms on TP 177B and OP 177B

9.2.1 Overview

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Error location
- State
- Alarm class
- Alarm number
- Acknowledgement group
- Diagnostics capability
Alarm Classes

Alarms are assigned to various alarm classes:

- **Error**
  Alarms in this class must always be acknowledged. Alarms normally indicate critical errors within the plant such as "Motor temperature too high".

- **Warning**
  Warning alarms usually indicate states of a plant such as "Motor switched on".

- **System**
  System alarms indicate states or events which occur on the HMI device.

- **SIMATIC diagnostic alarms**
  SIMATIC diagnostic alarms show states and events of the SIMATIC S7 or SIMOTION controllers.

- **User-specific alarm classes**
  The properties of this alarm class must be defined in the configuration.

Further information on this may be available in your plant documentation.

Alarm Buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

9.2.2 Displaying Alarms

**Alarm view**

Alarms are indicated in the Alarm view or in the Alarm window on the HMI device.

The Alarm view can be implemented with the following components:

- Alarm numbers and alarm texts are displayed as single lines.
- As simple Alarm view
- As advanced Alarm view

In the simple or advanced Alarm views the configuration engineer specifies the alarm information to be displayed.

**Alarm window**

The layout and operation of the Alarm window correspond to that of the Alarm view.

The Alarm window is independent of the process screen. Depending on the configuration, the Alarm window appears automatically as soon as a new, unacknowledged alarm has been received. The Alarm window can be configured so that it only closes after all the alarms have been acknowledged.

Refer to your plant documentation to find any additional information on this topic.
Simple Alarm view

19.04.2005 11:41:37 156 Engine 23 too hot

The buttons have the following functions:

<table>
<thead>
<tr>
<th>Button</th>

<td>Acknowledging an alarm</td>
</tr>
</tbody>
</table>
Changing the column sequence and sorting in the advanced Alarm view

You can change the column sequence and sorting to suit the project.

- Change column sequence
  To reverse the "Time" and "Date" columns, for example, touch the "Date" header on the HMI device touch screen. Continue to press the touch screen and drag the column heading to the "Time" heading.

- Changing sorting
  To change the sorting of the alarms, touch the respective column heading on the touch screen of the HMI device.

Alarm class layout

The various alarm classes are identified to distinguish them in the Alarm view:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Alarm class</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Error</td>
</tr>
<tr>
<td>(empty)</td>
<td>Operation</td>
</tr>
<tr>

<td>User-defined alarm classes</td>
</tr>
<tr>
<td>S7</td>
<td>SIMATIC or SIMOTION diagnostic alarms</td>
</tr>
<tr>
<td>$</td>
<td>System</td>
</tr>
</tbody>
</table>

The configuration engineer can edit the alarm class symbols. Refer to your plant documentation to find any additional information on this topic.

Displaying infotext

The configuration engineer can also provide infotext for alarms.

Proceed as follows to view the infotext for an alarm:

1. Select the required alarm in the Alarm view.

2. Touch the button in the simple Alarm view or in the advanced Alarm view.
   If configured, the infotext assigned to this alarm is displayed.

3. Close the infotext window with .
9.2 Operating Alarms on TP 177B and OP 177B

Alarm indicator

The alarm indicator is a graphic symbol that shows current errors or errors that need to be acknowledged, depending on the configuration.

The alarm indicator flashes as long as alarms are queued for acknowledgment. The number indicates the number of queued alarms. The configuration engineer can assign functions to be executed when the alarm indicator is operated.

Usually, the alarm indicator is only used for error alarms. Please refer to your system documentation to check whether additional information on this subject is available there.

9.2.3 Acknowledging Alarms

Requirements

- The alarm which is to be acknowledged is displayed in the Alarm window or in the Alarm view.
- Either the Alarm window or the Alarm view is enabled.
- The alarm must be acknowledged.

Procedure

Proceed as follows:
1. Select the alarm by touching it in the Alarm view or Alarm window.
2. Touch the ![Acknowledgement button] button in the simple Alarm view or ![Acknowledgement button] in the advanced Alarm view.
   - A soft key can also be configured to acknowledge alarms.

Result

The alarm or all alarms of the corresponding acknowledgement group are acknowledged.

Further information about acknowledgment may be available in your plant documentation.

Displaying Alarms (Page 285)
Operating Recipes

10.1 Overview

Introduction
Recipes are used when different variants of a product are manufactured with the same process. In this case, the product variants differ in terms of their type and quantity of the components, but not in terms of the manufacturing process sequence. The configuration engineer can store the combination of each individual product variant in a recipe.

Field of application
Recipes can be used everywhere the same product components are used in variable combinations to create different product variants.

Examples:
• Beverage industry
• Food processing industry
• Pharmaceutical industry
• Paint industry
• Building materials industry
• Steel industry
10.2 Structure of a recipe

Recipes

The recipe collection for the production of a product family can be compared to a file cabinet. A recipe which is used to manufacture a product corresponds to a drawer in a file cabinet.

Example:

In a plant for producing fruit juice, recipes are required for different flavors. There is a recipe, for example, for the flavors orange, grape, apple and cherry.
Recipe data records

The drawers of the file cabinet are filled with suspension folders. The suspension folders in the drawers represent records required for manufacturing various product variants.

Example:
Product variants of the flavor apple might be a soft drink, a juice or nectar, for example.

① Drawer Recipe Product variants of apple flavored drinks
② Suspension folder Recipe data record Apple drink
③ Suspension folder Recipe data record Apple nectar
④ Suspension folder Recipe data record Apple juice

Elements

In the figure showing the file cabinet, each suspension folder contains the same number of sheets. Each sheet in the suspension folder corresponds to an element of the recipe data record. All the records of a recipe contain the same elements. The records differ, however, in the value of the individual elements.

Example:
All drinks contain the same components: water, concentrate, sugar and flavoring. The records for soft drink, fruit juice or nectar differ, however, in the quantity of sugar used in production.
10.3 Recipes in the Project

Overview

If recipes are used in a project, the following components interact:

- **HMI device recipe memory**
  Recipes are saved in the form of data records in the HMI device recipe memory. The recipe data can also be saved in recipe tags.

- **Recipe view / recipe screen**
  On the HMI device, recipes are displayed and edited in the recipe view or in a recipe screen.
  - The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
  - The values of the recipe tags are displayed and edited in the recipe screen.

  **Note**
  The same recipe tags can be configured in a variety of recipes. If you modify the value of a recipe tag, the synchronization changes the value of the recipe tag in all recipes.

- **Recipe tags on the TP 177A**
  The recipe tags contain recipe data. Recipe tags configured in IO fields are always automatically synchronized with the recipe view. You can exchange the values of the recipe tags with the PLC.

- **Recipe tags on the TP 177B and OP 177B**
  The recipe tags contain recipe data. When you edit recipes in a recipe screen, the recipe values are stored in recipe tags.
  
  The recipe tags are not automatically synchronous with the recipe view. You can synchronize the recipe tags with the recipe data records so that the same values are saved in both. Depending on the configuration, the values of the recipe tags are exchanged with the PLC.

- **External storage medium on the TP 177B and OP 177B**
  You can store recipe data records on the memory card of the TP 177B and OP 177B. On the TP 177B 4" you can also save the recipe data records on a USB stick.
  
  Recipe data records are exported from the HMI device recipe memory and are saved to a CSV file on the external storage medium. The records can be reimported from the storage medium to the recipe memory.
The following figure shows the data flow in a project with recipes:

1. Editing, saving or deleting a recipe data record
2. Display recipe data record
3. Synchronize or do not synchronize recipe tags
   - The recipe tags are always synchronized on the TP 177A.
4. Display and edit recipe tags in the recipe screen
5. Write records from the recipe view to the PLC or read records from the PLC and display them in the recipe view.
6. TP 177B and OP 177B: Recipe tags are to the PLC online or offline
7. TP 177B and OP 177B: Export or import recipe data records to an external storage medium.
10.4 Displaying a Recipe

Displaying Recipes

You can display and edit recipes on the HMI device with a recipe view or recipe screen.

Recipe view

A recipe view is a screen object used to manage recipe data records. The recipe view shows recipe data records in tabular form.

Depending on the configuration, the recipe view is displayed as follows:

- As enhanced recipe view
- As simple recipe view

The configuration engineer also defines which operator controls are displayed in the recipe view. Only the simple recipe view can be configured on the TP 177A.

Enhanced recipe view on the TP 177B and OP 177B

The figure below shows an example of the enhanced recipe view:

1. Selection list for the recipe
2. Selection list for the recipe data record
3. Element name
   The element name designates a specific element in the recipe data record.
4. Display field
   This show the number of the selected recipe or the selected recipe data record.
5. Value of the element
6. Buttons for editing a recipe data record
7. Status bar for display of the status messages
Simple recipe view

The simple recipe view consists of three areas:

- Recipe list
- Record list
- Element list

In the simple recipe view, each area is shown separately on the HMI device. Depending on the configuration, the simple recipe view starts with the recipe list or data record list.

The figure below shows an example of the record list:

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Juice</td>
<td>Beverage</td>
<td>Nectar</td>
</tr>
</tbody>
</table>

① Number of the recipe data record
② Recipe data records
③ Buttons for changing the displayed list and calling the menu

Display of Values

| NOTICE |
| Changing the recipe data record in the background |
| Applies to the processing of a recipe data record: |
| If values of the corresponding recipe data record are changed by a PLC job, the recipe view is not updated automatically. |
| To update the recipe view, reactivate the respective recipe data record. |
Recipe screen

A recipe screen allows the correlation between the plant and the recipe data to be displayed in graphic form. The configuration engineer combines IO fields and screen objects to form a custom input screen. The configuration engineer can distribute the IO fields of a recipe over several recipe screens, thus allowing recipe elements to be arranged by subject. The recipe screen can be operated using buttons configured accordingly.

The figure below shows an example of the recipe screen:

1. Element names and corresponding values
   The element name designates a specific element in the recipe data record.
2. Buttons for editing a recipe data record
3. Modified recipe view
4. Buttons for transferring recipe data

The values displayed or entered in the recipe screen are saved in recipe tags. The recipe values are exchanged with the PLC immediately or later via these tags.

A configured recipe view can itself be a component of a recipe screen. You must synchronize the tags in order to synchronize data between the tags of the recipe screen and the recipe data records displayed in the recipe view. The recipe tags are always automatically synchronized on the TP 177A.

Refer to your plant documentation to find any additional information on this topic.
10.5 Recipe Values in the HMI Device and the PLC

Introduction

You can change the values of a recipe on the HMI device and therefore influence the manufacturing process or a machine.

Depending on the configuration, the recipe values are displayed, edited and saved in different ways.

- If you are editing recipes with a recipe view in your project, the values are saved in recipe data records.
- If you are editing recipes in a recipe screen in your project, the values are saved in recipe tags.

Differences may occur between the display values in the recipe view and the values saved in the associated tags in an ongoing project when you edit recipes with a recipe view and in a recipe screen. To prevent this, you need to synchronize the values of the recipe data records on the TP 177B and OP 177B with the values of the recipe tags.

The recipe tags are always automatically synchronized on the TP 177A.

Synchronizing Recipe Tags on the TP 177B and OP 177B

Note

Recipe tags can only be synchronized with the enhanced recipe view on the TP 177B and OP 177B.

Synchronization of the recipe tags depends on the configuration of the enhanced recipe view:

- Automatic synchronization:
  The values of the recipe view are synchronized with the associated recipe tags. In this case, changes to values in the recipe view have an immediate effect on the values of the associated recipe tags. The values are only synchronized, when an operator control that is outside the recipe view is operated.

- Synchronization by the user:
  The values of the recipe view and the associated recipe tags are not synchronized automatically. The configuration engineer has assigned the same function to the button or a different operator control in the recipe view. The recipe tags and the recipe view are only synchronized when you operate the buttons or the appropriate operator control.
Recipe Tags Online / Offline

The configuration engineer can configure a recipe so that changes to the values of the recipe tags do not have an immediate effect on the current process.

Synchronization of the recipe values between the HMI device and the PLC depends on whether the configuration engineer has selected the settings "Tags online" or the setting "Tags offline" for a recipe.

The recipe tags are always offline on the TP 177A.

- "Tags online":
  This setting has the following effect:
  - When you change recipe values in the recipe screen, these changes are applied immediately by the PLC and immediately influence the process.
  - If recipe values are changed in the PLC, the changed values are displayed immediately in the recipe screen.

- "Tags offline":
  With this setting, changed recipe values are not synchronized immediately between the HMI device and the PLC.

In this case, the configuration engineer must configure operator controls for transferring the values to the PLC or reading them from the PLC in a recipe screen. The recipe values are only synchronized between HMI device and PLC when you operate the appropriate operator control.

10.6 Operating the Enhanced Recipe View

10.6.1 Overview

Operation

The recipe view can be operated as follows:

- Enter values for the recipe elements
- Create recipe data records
- Save recipe data records or save them under a new name
- Delete recipe data records
- TP 177B and OP 177B: Synchronize values of the recipe view with the associated recipe tags
- Transfer recipe data records from the PLC and to the PLC
Operator Controls of the Recipe View

The table below shows the operator controls of the recipe view:

<table>
<thead>
<tr>
<th>Buttons</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>📊</td>
<td>Creates a new recipe data record. If a start value is configured, it is shown in the input field.</td>
</tr>
<tr>
<td>📊</td>
<td>Saves the displayed values of the recipe data record. The storage location is predefined by the project.</td>
</tr>
<tr>
<td>🗑️</td>
<td>The recipe data record is saved under a different name irrespective of the recipe view. A dialog box opens in which the name is entered.</td>
</tr>
<tr>
<td>🗑️</td>
<td>The displayed recipe data record is deleted.</td>
</tr>
<tr>
<td>🗑️</td>
<td>TP 177B and OP 177B: The values of the recipe view are synchronized with the associated recipe tags. The values changed during editing are written to the associated recipe tags. Subsequently all the values of the tags are read out and updated in the table.</td>
</tr>
<tr>
<td>📊</td>
<td>The recipe values from the PLC are displayed in the recipe view.</td>
</tr>
<tr>
<td>📊</td>
<td>The values of the set recipe data record displayed in the recipe view are transferred to the PLC.</td>
</tr>
</tbody>
</table>

Operating the Recipe Screen

You operate the recipes in a recipe screen with the operator controls provided by the configuration engineer.

Further information on this may be available in your plant documentation.

Entering the value.

If you want to change the value of a tag, call up the screen keyboard.

The functions listed in the table and the entry of values may also be assigned to a softkey on the OP 177B. Refer to the plant documentation for more information in this regard.
10.6.2 Creating a recipe data record

Introduction
You create a new recipe data record by modifying an existing record. You then save the modified data record under a new name.

Requirements
A screen with a recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Touch .
   A new recipe data record with the next available number is created.
   If you change the new data record number to an existing data record number, the existing data record is overwritten.
3. Enter values for the elements of the data record.
   The elements of the recipe data record can be assigned default values depending on the configuration.
4. Touch .
5. Enter a name for the data record.
   The data record is saved under the new name.
   If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

Result
The new recipe data record is saved to the selected recipe.

See also
Overview (Page 300)
10.6.3 Editing a recipe data record

Introduction
Edit the values of the recipe data records and save them in a recipe view.

Synchronization with the PLC
If you want to display the current recipe values from the PLC in the recipe view, you first have to read the current values from the PLC with the button.

The values changed in the recipe view only become effective when the amended data record is transferred to the PLC by means of the button.

Requirements
A screen with a recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record you want to change.
3. Change the data record as required.
4. Save your changes by means of the button.
   If you want to save the recipe data record under a different name, touch the key.
5. The recipe data record is saved.

Result
The edited recipe data record has now been saved in the selected recipe.

See also
Overview (Page 300)
Recipes in the Project (Page 294)
10.6.4 Deleting a recipe data record

Introduction
You can delete all the data records of a recipe which are not required.

Requirements
A screen with a recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record you want to delete.
3. Touch X.

Result
The recipe data record is deleted.

See also
Overview (Page 300)
Recipes in the Project (Page 294)
10.6.5 Synchronizing Tags on the TP 177B and OP 177B

Introduction

The values of the recipe elements can be saved to recipe tags, depending on the configuration.

Differences may occur between the display values in the recipe view and the actual values of tags in an ongoing project. Synchronize the tags to equalize such differences.

Synchronization always includes all the variables which belong to a recipe data record.

<table>

</thead>
<tbody>
<tr>
<td>Changed tag name</td>
</tr>
<tr>
<td>Tags and the value of the recipe data record cannot be assigned to each other if the tag name of the tag to be synchronized has been changed. The tags in question are not synchronized.</td>
</tr>
</tbody>
</table>

Note

Recipe tags can only be synchronized in the enhanced recipe view.

Requirement

A screen with a recipe view is displayed.

Procedure

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record you want to synchronize.
3. Touch .

Result

The elements of the recipe data record are synchronized with the recipe tags.
If the values of the recipe view and the tag do not match, the more current value is accepted.

10.6.6 Reading a recipe data record from the PLC

Introduction

In the current project, the values which are also stored in the recipes in the HMI device can be changed directly in the plant. This is the case, for example, if a valve was opened further directly at the plant than is stored in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

To synchronize the recipe values, read the values from the PLC and display them in the recipe view.

Requirements

A screen with a recipe view is displayed.

Procedure

Proceed as follows:

1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.

2. Select the recipe data record to which you want to apply the values from the PLC.

3. Touch \[button\].

   The values are read from the PLC.

4. If you want to store the displayed values in the HMI device, touch the \[button\].

Result

The values were read from the PLC, displayed on the HMI device and saved to the selected recipe data record.

10.6.7 Transferring a recipe data record to the PLC

Introduction
In order for an edited recipe data record to take effect in the process, you must transfer the values to the PLC.
The display values in the recipe view are always transferred to the PLC.

Requirements
A screen with a recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record whose values you want to transfer to the PLC.
3. Touch

Result
The display values in the recipe view were transferred to the PLC and take effect in the process.

10.7 Operating the Simple Recipe View

10.7.1 Overview

Introduction

The simple recipe view consists of three areas:

- Recipe list
- Record list
- Element list

You can use the shortcut menu to operate each of these display areas.

Operation

The simple recipe view can be operated as follows:

- Create recipe data records
- Save recipe data records or save them under a new name
- Rename recipe data records
- Delete recipe data records
- Transfer recipe data records from the PLC and to the PLC

Operator controls of the simple recipe view

Toggle between the display areas and the shortcut menus to operate the simple recipe views.

The table below shows the operation of the display area:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Touching an entry</td>
<td>The next lower display area opens, i.e. the data record list or the element list.</td>
</tr>
<tr>
<td>←</td>
<td>The next higher display area opens, i.e. the recipe list or the data record list.</td>
</tr>
<tr>
<td>←→</td>
<td>The shortcut menu of the display area opens.</td>
</tr>
<tr>
<td>▲</td>
<td>The previous entry is selected in the display area.</td>
</tr>
<tr>
<td>▼</td>
<td>The next entry is selected in the display area.</td>
</tr>
<tr>
<td>▲</td>
<td>A display page is scrolled up in the display area.</td>
</tr>
<tr>
<td>▼</td>
<td>A display page is scrolled down in the display area.</td>
</tr>
</tbody>
</table>

The table below shows the operation of the shortcut menu.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>←→</td>
<td>The menu is closed.</td>
</tr>
<tr>
<td></td>
<td>The display area opens.</td>
</tr>
<tr>
<td>Touch the menu command</td>
<td>The menu command is executed.</td>
</tr>
</tbody>
</table>
Shortcut menus of the simple recipe view

A shortcut menu can be called for each display area. The commands available in the shortcut menu depend on the currently selected display area. A number is assigned to each command. The command is executed when you enter the number of the command.

- **Recipe list**

<table>
<thead>
<tr>
<th>Menu command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>A new recipe data record is created for the selected recipe. If a start value is configured, it is shown in the input field.</td>
</tr>
<tr>
<td>Display infotext</td>
<td>The infotext configured for the simple recipe view is displayed.</td>
</tr>
<tr>
<td>Open</td>
<td>The record list of the selected recipe opens.</td>
</tr>
</tbody>
</table>

- **Record list**

<table>
<thead>
<tr>
<th>Menu command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>Creates a new recipe data record. If a start value is configured, it is shown in the input field.</td>
</tr>
<tr>
<td>Delete</td>
<td>The selected recipe data record is deleted.</td>
</tr>
<tr>
<td>Save as</td>
<td>The selected recipe data record is saved under another name. A dialog box opens in which the name is entered.</td>
</tr>
<tr>
<td>Rename</td>
<td>The selected recipe data record is renamed. A dialog box opens in which the name is entered.</td>
</tr>
<tr>
<td>Opening</td>
<td>The element list of the selected recipe data record opens.</td>
</tr>
<tr>
<td>Back</td>
<td>The recipe list opens.</td>
</tr>
</tbody>
</table>

  With the TP 177A HMI device, the following menu commands can also be configured for the record list:

<table>
<thead>
<tr>
<th>Menu command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>To PLC</td>
<td>The displayed values of the selected record are transferred from the HMI device to the PLC.</td>
</tr>
<tr>
<td>From PLC</td>
<td>The recipe values from the PLC are displayed on the HMI device in the recipe view.</td>
</tr>
<tr>
<td>Display infotext</td>
<td>The infotext configured for the simple recipe view is displayed.</td>
</tr>
</tbody>
</table>

- **Element list**

<table>
<thead>
<tr>
<th>Menu command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save</td>
<td>The selected record is saved.</td>
</tr>
<tr>
<td>To PLC</td>
<td>The displayed values of the selected record are transferred from the HMI device to the PLC.</td>
</tr>
<tr>
<td>From PLC</td>
<td>The recipe values from the PLC are displayed on the HMI device in the recipe view.</td>
</tr>
<tr>
<td>Save as</td>
<td>The data record is saved under the new name. A dialog box opens in which the name is entered.</td>
</tr>
</tbody>
</table>

  With the TP 177A HMI device, the following menu commands can also be configured for the element list:

<table>
<thead>
<tr>
<th>Menu command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display infotext</td>
<td>The infotext configured for the simple recipe view is displayed.</td>
</tr>
<tr>
<td>Rename</td>
<td>The selected record is renamed. A dialog box opens in which the name is entered.</td>
</tr>
<tr>
<td>Back</td>
<td>The data record list opens.</td>
</tr>
</tbody>
</table>
10.7 Operating the Simple Recipe View

Operating Menus

Touch the desired menu command. The command is executed.

Operating the Recipe Screen

You operate the recipes in a recipe screen with the operator controls provided by the configuration engineer.

Additional information on this may be available in your plant documentation.

10.7.2 Creating a Recipe Data Record

Introduction

Create a new recipe data record in the recipe list or in the record list. Then enter the values for the new record in the element list and save the record.

Requirement

A screen with a simple recipe view is displayed.

Procedure

Proceed as follows:

1. If the recipe list contains several recipes: Select the recipe for which you want to create a new recipe data record.
2. Open the recipe list menu.
3. Select the menu command "New".
   A new record is created.
   The element list of the new record opens.
4. Enter values for the elements of the data record.
   The tags of the record can be assigned default values depending on the configuration.
5. Open the menu of the element list and select the command "Save".
6. Enter a name for the new record.
7. Confirm your entries.
   If you change the new data record number to an existing data record number, the existing data record is overwritten.

Result

The new recipe data record is saved to the selected recipe.

See also

Overview (Page 308)
10.7.3  Editing a Recipe Data Record

Introduction
Edit the values of the recipe data records in a simple recipe view.

Synchronization with the PLC
If you want to display the current recipe values from the PLC in the simple recipe view, you first have to read the current values from the PLC with the menu command "From PLC" in the element list.

The values changed in the recipe view only take effect in the PLC when you transfer the edited data record to the PLC with the menu command "To PLC".

Requirement
A screen with a simple recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe list contains several recipes: Select the recipe which contains the desired recipe data record.
2. Open the data record list.
3. Select the recipe data record you want to change.
4. Open the element list.
5. Change the values of the records as required.
6. Save your changes with the menu command "Save".

The recipe data record is saved.

Result
The edited recipe data record has now been saved in the selected recipe.

See also
Overview (Page 308)
10.7.4 Deleting a Recipe Data Record

Introduction
You can delete all the data records which are not required.

Requirement
A screen with a simple recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe list contains several recipes: Select the recipe which contains the desired recipe data record.
2. Open the data record list.
3. Select the data record you want to delete.
4. Open the menu.
5. Select the menu command "Delete".

Result
The data record is deleted.

See also
Overview (Page 308)
10.7.5  Reading a Recipe Data Record from the PLC

Introduction
The values of recipe elements are exchanged with the PLC via tags.
In the current project, the values which are also stored in the recipes in the HMI device can be changed directly in the plant. This is the case, for example, if a valve was opened further directly at the plant than is stored in the recipe. The values of the tags on the HMI device possibly no longer match the values in the PLC.
To synchronize the recipe values, read the values from the PLC and display them in the recipe view.

TP 177A
With the TP 177A HMI device, the "From PLC" menu command can also be configured for the data record list: In this case, you can also select the "From PLC" menu command in the data record list.

Requirement
A screen with a simple recipe view is displayed.

Procedure
Proceed as follows:
1. If the recipe list contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the element list of the recipe data record to which you want to apply the values from the PLC.
3. Open the menu.
4. Select the menu command "From PLC". The values are read from the PLC.
5. If you want to save the displayed values in the HMI device, select the menu command "Save".

Result
The values were read from the PLC, displayed on the HMI device and saved to the selected recipe data record.

See also
Overview (Page 308)
10.7.6 Transferring a Recipe Data Record to the PLC

Introduction

In order for an edited recipe data record to take effect in the process, you must transfer the values to the PLC.

The displayed values in the recipe view are always transferred to the PLC.

TP 177A

With the TP 177A HMI device, the "To PLC" menu command can also be configured for the data record list: In this case, you can also select the "To PLC" menu command in the data record list.

Requirement

A screen with a simple recipe view is displayed.

Procedure

Proceed as follows:

1. If the recipe list contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the element list of the recipe data record whose values you want to transfer to the PLC.
3. Open the menu.
4. Select the menu command "To PLC".

Result

The values of the recipe data record were transferred to the PLC and take effect in the process.

Overview (Page 308)
10.8 Exporting Recipe Data Records on the TP 177B and OP 177B

Introduction
You can export one or more recipe data records to a CSV file, depending on the configuration. After export, the values in the recipe data record can be further processed in a spreadsheet program such as MS Excel. The degree to which you can influence the export depends on the configuration:

Requirements
- A screen with a recipe view is displayed
- An operating element with the function "Export record" has been configured.
- The following tags are configured equally in the recipe view and for the "Export record" operating element.
  - Recipe number
  - Data record number

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe which contains the desired recipe data record.
2. Select the recipe data record you want to export.
3. Operate the operating element which was configured for export, for example the "Export data record" button.
   The data record is exported as a CSV file to an external data medium.
Further information on this may be available in your plant documentation

Result
The recipe data record is exported.

See also
Recipes in the Project (Page 294)
10.9 Importing Recipe Data Records on the TP 177B and OP 177B

Introduction
You can import values from a CSV file to a recipe data record, depending on the configuration.

Requirements
- An operating element with the function "Import data record" has been configured, for example a button
- A screen with a recipe view is displayed

Procedure
Proceed as follows:
1. If the recipe view contains several recipes: Select the recipe which contains the recipe data record to be imported.
2. Operate the operating element with the function "Import data record".
   The record is imported from an external data medium as a CSV file and then displayed in the recipe view after import.

Result
The imported recipe data record is saved on the HMI device.

Deviating structure
If the structure of the CSV file differs from the structure of the recipe, deviations are handled as follows:
- Any additional values in the CSV file will be rejected
- The system applies the configured default value to the recipe data record if the CSV file contains an insufficient number of values
- If the CSV file contains values of the wrong data type, the configured default value is set in the recipe data record

Example:
The imported CSV file contains values that were entered as floating point numbers
However, the corresponding tag expects an integer value. In this case, the system discards the imported value and uses the configured default

11.1 Maintenance and Service

11.1.1 Maintenance and care

Introduction

The HMI device is designed for maintenance-free operation. The touch screen and keyboard membrane should nevertheless be cleaned regularly.

Requirements

Use a cleaning cloth dampened with a cleaning agent to clean the equipment. Only use water with a little liquid soap or a screen cleaning foam.

NOTICE

Unintentional response

When cleaning the touch screen, an unintentional response in the controller can be triggered by touching keys.

Switch the HMI device off before cleaning to prevent unintentional responses.

Damage caused by unauthorized cleaning products

The HMI device may be damaged if compressed air, steam jet-air ejectors, aggressive solvents or scouring powders are used for cleaning purposes.

Do not clean the HMI device with compressed air or steam jet blowers. Do not use aggressive solvents or scouring powder.

Procedure

Proceed as follows:

1. Switch off the HMI device.
2. Spray the cleaning solution onto a cleaning cloth.
   Do not spray directly onto the HMI device.
3. Clean the HMI device.
   When cleaning the display wipe from the screen edge inwards.
11.1.2 Clean screen on the TP 177A and TP 177B 6"

Introduction

The HMI screen can be cleaned when it is switched on and a project is running. An operating element must be available in the project to open the clean screen. After activating the clean screen, the touch screen and function keys are locked for the configured interval. The time the touch screen is locked can be set between 5 and 30 seconds. The time remaining for the lockout is indicated by a progress bar.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unintentional actions</strong></td>
</tr>
<tr>
<td>Clean the HMI device screen during operation with activated clean screen or switch off the HMI device.</td>
</tr>
<tr>
<td>Once the period for the clean screen has passed, operations are again possible.</td>
</tr>
<tr>
<td><strong>The HMI device cannot be operated with an active clean screen</strong></td>
</tr>
<tr>
<td>When the clean screen is active, operations on the HMI device are not possible.</td>
</tr>
<tr>
<td>Wait for the period for the clean screen to lapse. Then you can operate the plant again with the HMI device.</td>
</tr>
</tbody>
</table>

11.1.3 Protective Membrane

Protective foil

A protective foil is available for the HMI touch screens. The protective foil is not part of the scope of delivery of the HMI device. Required order information is available on the Internet at "http://mall.automation.siemens.com".

The self-adhesive protective foil prevents the screen from being scratched and soiled. The mat surface of the protective foil reduces reflections under unfavorable lighting.

The protective film can be removed without leaving any adhesive residue on the screen.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Installing and removing the protective foil</strong></td>
</tr>
<tr>
<td>Always shut down the HMI device before installing the protective foil. You might otherwise trigger unintended functions. This also applies when removing the protective foil.</td>
</tr>
<tr>
<td>Never use sharp or pointed tools, such as a knife, to remove the protective foil. This may damage the touch screen.</td>
</tr>
</tbody>
</table>
11.1.4 Protective covers on the TP 177A and TP 177B 6"

Protective cover

The cover protects the front of the TP 177A and TP 177B 6". The cover protects the display and the frame of the HMI device from dirt, scratches and chemicals. This allows the HMI devices to also be used in environments with a higher level of harmful substances.

When the cover is used, the protective class NEMA4 is achieved.

The following figure shows the components of protective cover:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Frame</td>
</tr>
<tr>
<td>2</td>
<td>Protective cover</td>
</tr>
<tr>
<td>3</td>
<td>Base frame</td>
</tr>
</tbody>
</table>
The figure below shows the HMI device with installed protective cover:

① Eyelet for securing a touch screen pen
② Touch screen of the HMI device
③ Protective cover

**Note**

**Custom designs of the front using the protective cover**

The front of the HMI device can be adapted for custom designs. You can find template "Labeling protective_cover_TP070_TP170.doc" for the labeling strips on the WinCC flexible Installation CD 2 under "\Documents\<Language>\Slides." The templates are formatted for various languages. <Language> stands for the respective language you are using.

**Requirement**

The HMI device has been removed.
Procedure for installation

Proceed as follows:

1. Position the HMI device with the front facing down.
   Set the HMI device down in such a way that the touch screen cannot be damaged during the work to follow.

2. Remove the mounting seal on the HMI device
   Do not damage the mounting seal.

3. Position the base frame on the HMI device
   Position the base frame in such a way that the legend field is visible.
4. Insert the mounting seal.

   Make sure the mounting seal is not twisted when inserting.

5. Turn the HMI device and position it on its back.

6. Position the protective cover

   Check to ensure that the protective cover and seal adhere to each other without any gaps. Make sure you use a protective cover that is in perfect condition.

7. Place the protective cover on the base frame and press down firmly.

   You will find eight attachment points on the base frame. Press the base frame and frame together at these points, until you hear them engage.

8. Insert the HMI device in the mounting cut-out.

9. Secure the HMI device as previously described in the operating instructions.
Procedure for dismantling

To remove the frame from the base frame, insert a screwdriver of a suitable size into a slot on the base frame. Then you can lever the frame from the base frame.

11.2 Service and spare parts

Repairs

In case of repair, the HMI device must be shipped to the Return Center in Fürth. The HMI device may only be repaired there.

The address is:
Siemens AG
Industry Sector
Returns Center
Siemensstr. 2
90766 Fürth
Germany

Service pack

A service pack can be ordered for servicing purposes. It contains the following spare parts:

- Mounting seal
- Mounting clamps
- Terminal block, 2-pin

The service pack can be ordered from your Siemens representative.
11.2 Service and spare parts

Appendix

A.1 ESD Guidelines

What does ESD mean?
All electronic modules are equipped with highly integrated modules or components. Based on their design, these electronic components are highly sensitive to overvoltage and thus to discharge of static electricity. These electronic components are therefore specially identified as ESD.

Abbreviations
The following abbreviations are commonly used for electrostatic sensitive devices:
- ESD – Electrostatic Sensitive Devices
- ESD – Electrostatic Sensitive Device as common international designation

Labeling
ESD modules are labeled with the following symbol:
Electrostatic charge

CAUTION

Electrostatic charge

ESDs may be destroyed by voltages well below the perception threshold of persons. Voltages of this kind develop when a component or an assembly is touched by a person who is not grounded against static electricity. Usually, it is unlikely that damage to an ESD as a result of overvoltage is detected immediately but may become apparent only after a longer period of operation.

Prevent electrostatic charge of your body before you touch the ESD!

Anyone who is not connected to the electrical potential of their surroundings is subjected to electrostatic charge.

The figure indicates the maximum electrostatic charge anyone is subjected to when contacting the materials shown. These values correspond with specifications to IEC 801-2.

![Graph showing electrostatic charge vs. relative humidity]

1. Synthetic materials
2. Wool
3. Antistatic materials such as wood or concrete
CAUTION

Grounding Measures
When working with electrostatic sensitive devices, make sure that the person, the workplace and the packaging are properly grounded. This helps to avoid electrostatic charge.

As a rule, only touch the ESD if this is unavoidable. Example: for maintenance. When you touch modules, make sure that you do not touch the pins on the modules or the PCB tracks. This prevents any discharge of static electricity to sensitive component and thus avoids damage.
Discharge electrostatic electricity from your body if you are performing measurements on an ESD. To do so, touch a grounded metallic object.
Always use grounded measuring instruments.

A.2 System Alarms

Introduction
System alarms on the HMI device provide information about internal states of the HMI device and PLC.
The overview below shows the causes of system alarms and how to eliminate the cause of error.
Depending on scope of functions, only parts of the system alarms described in this section apply to the various HMI devices.

Note
System alarms are only indicated if an alarm window was configured. System alarms are output in the language currently set on your HMI device.

System Alarm Parameters
System alarms may contain encrypted parameters which are relevant to troubleshooting because they provide a reference to the source code of the Runtime software. These parameters are output after the text "Error code:"
## Appendix

### A.2 System Alarms

#### Meaning of the System Alarms

<table>
<thead>
<tr>

<th>Effect/cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>The print job could not be started or was canceled due to an unknown error. Faulty printer setup. Or: No permission is available for accessing the network printer. Power supply failure during data transfer.</td>
<td>Check the printer settings, cable connections and the power supply. Set up the printer once again. Obtain a network printer authorization. If the error persists, contact the Hotline!</td>
</tr>
<tr>
<td>10001</td>
<td>No printer is installed or a default printer has not been set up.</td>
<td>Install a printer and/or select it as the default printer.</td>
</tr>
<tr>
<td>10002</td>
<td>Overflow of the graphics buffer for printing. Up to two images are buffered.</td>
<td>Allow sufficient intervals between successive print jobs.</td>
</tr>
<tr>
<td>10003</td>
<td>Images can now be buffered again.</td>
<td>—</td>
</tr>
<tr>
<td>10004</td>
<td>Overflow of the buffer for printing lines in text mode (e.g. alarms). Up to 1000 lines are buffered.</td>
<td>Allow sufficient intervals between successive print jobs.</td>
</tr>
<tr>
<td>10005</td>
<td>Text lines can now be buffered again.</td>
<td>—</td>
</tr>
<tr>
<td>10006</td>
<td>The Windows printing system reports an error. Refer to the output text and the error ID to determine the possible causes. Nothing is printed or the print is faulty.</td>
<td>Repeat the action if necessary.</td>
</tr>
<tr>
<td>20010</td>
<td>An error has occurred in the specified script line. Execution of the script was therefore aborted. Note the system alarm that may have occurred prior to this.</td>
<td>Select the specified script line in the configuration. Ensure that the tags used are of the allowed types. Check system functions for the correct number and types of parameters.</td>
</tr>
<tr>
<td>20011</td>
<td>An error has occurred in a script that was called by the specified script. Execution of the script was therefore aborted in the called script. Take the system alarm that may have occurred prior to this into account.</td>
<td>In the configuration, select the script that has been called directly or indirectly by the specified script. Ensure that the tags used are of the allowed types. Check the system functions for the correct number and type of parameters.</td>
</tr>
<tr>
<td>20012</td>
<td>The configuration data is inconsistent. The script could therefore not be generated.</td>
<td>Recompile the configuration.</td>
</tr>
<tr>
<td>20013</td>
<td>The scripting component of WinCC flexible Runtime is not correctly installed. Therefore, no scripts can be executed.</td>
<td>Reinstall WinCC flexible Runtime.</td>
</tr>
<tr>
<td>20014</td>
<td>The system function returns a value that is not written in any return tag.</td>
<td>Select the specified script in the configuration. Check if the script name has been assigned a value.</td>
</tr>
<tr>
<td>20015</td>
<td>Too many successive scripts have been triggered in short intervals. When more than 20 scripts are queued for processing, any subsequent scripts are rejected. In this case, the script indicated in the alarm is not executed.</td>
<td>Find what is triggering the scripts. Extend the times, e.g. the polling time of the tags which trigger the scripts.</td>
</tr>
<tr>
<td>30010</td>
<td>The tag could not accept the function result, e.g. when it has exceeded the value range.</td>
<td>Check the tag type of the system function parameter.</td>
</tr>
<tr>
<td>30011</td>
<td>A system function could not be executed because the function was assigned an invalid value or type in the parameter.</td>
<td>Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.</td>
</tr>
<tr>
<td>40010</td>
<td>The system function could not be executed since the parameters could not be converted to a common tag type.</td>
<td>Check the parameter types in the configuration.</td>

<tr>
<td>40011</td>
<td>The system function could not be executed since the parameters could not be converted to a common tag type.</td>
<td>Check the parameter types in the configuration.</td>
</tr>
<tr>
<td>50000</td>
<td>The HMI device is receiving data faster than it is capable of processing. Therefore, no further data is accepted until all current data have been processed. Data exchange then resumes.</td>
<td>—</td>
</tr>
<tr>
<td>50001</td>
<td>Data exchange has been resumed.</td>
<td>—</td>
</tr>
<tr>
<td>60000</td>
<td>This alarm is generated by the “DisplaySystemAlarms” function. The text to be displayed is transferred to the function as a parameter.</td>
<td>—</td>
</tr>
<tr>
<td>60010</td>
<td>The file could not be copied in the direction defined because one of the two files is currently open or the source/target path is not available. It is possible that the Windows user has no access rights to one of the two files.</td>
<td>Restart the system function or check the paths of the source/target files. Using Windows NT/2000/XP: The user executing WinCC flexible Runtime must be granted access rights for the files.</td>
</tr>
<tr>
<td>60011</td>
<td>An attempt was made to copy a file to itself. It is possible that the Windows user has no access rights to one of the two files.</td>
<td>Check the path of the source/target file. Using Windows NT/2000/XP with NTFS: The user executing WinCC flexible Runtime must be granted access rights for the files.</td>
</tr>
<tr>
<td>70010</td>
<td>The application could not be started because it could not be found in the path specified or there is insufficient memory space.</td>
<td>Check if the application exists in the specified path or close other applications.</td>
</tr>
<tr>
<td>70011</td>
<td>The system time could not be modified. The error alarm only appears in connection with area pointer “Date/time PC”. Possible causes: • An invalid time was transferred in the job mailbox. • The Windows user has no right to modify the system time. If the first parameter in the system alarm is displayed with the value 13, the second parameter indicates the byte containing the incorrect value.</td>
<td>Check the time which is to be set. Using Windows NT/2000/XP: The user executing WinCC flexible Runtime must be granted the right to change the system time of the operating system.</td>
</tr>
<tr>
<td>70012</td>
<td>An error occurred when executing the function “StopRuntime” with the option “Runtime and operating system”. Windows and WinCC flexible Runtime are not closed. One possible cause is that other programs cannot be closed.</td>
<td>Close all programs currently running. Then close Windows.</td>
</tr>
<tr>
<td>70013</td>
<td>The system time could not be modified because an invalid value was entered. Incorrect separators may have been used.</td>
<td>Check the time which is to be set.</td>
</tr>
<tr>
<td>70014</td>
<td>The system time could not be modified. Possible causes: • An invalid time was transferred. • The Windows user has no right to modify the system time. • Windows rejects the setting request.</td>
<td>Check the time which is to be set. Using Windows NT/2000/XP: The user executing WinCC flexible Runtime must be granted the right to change the system time of the operating system.</td>

<th>Remedy</th>
</tr>
</thead>
</table>
| 140020 | The version in the controller and that of the project (FWX file) do not match. Connection to the controller is canceled. | The following remedies are available:  
  - Download the current version to the PLC using SIMOTION Scout.  
  - Regenerate the project using WinCC flexible ES, close WinCC flexible Runtime and restart with a new configuration. |
| 150000 | No more data is read or written. Possible causes:  
  - The cable is defective.  
  - The PLC does not respond, is defective, etc.  
  - The wrong port is used for the connection.  
  - System overload. | Ensure that the cable is plugged in, the controller is operational, the correct interface is being used. Restart the system if the system alarm persists. |
| 150001 | Connection is up because the cause of the interruption has been eliminated. | — |
| 160000 | No more data is read or written. Possible causes:  
  - The cable is defective.  
  - The PLC does not respond, is defective, etc.  
  - The wrong port is used for the connection.  
  - System overload. | Ensure that the cable is plugged in, the controller is operational, the correct interface is being used. Restart the system if the system alarm persists. |
| 160001 | Connection is up because the cause of the interruption has been eliminated. | — |
| 160010 | No connection to the server because the server identification (CLS-ID) cannot be determined. Values cannot be read or written. | Check access rights. |
| 160011 | No connection to the server because the server identification (CLS-ID) cannot be determined. Values cannot be read or written. | Check, for example, if  
  - the server name is correct  
  - the computer name is correct  
  - the server is registered |
| 160012 | No connection to the server because the server identification (CLS-ID) cannot be determined. Values cannot be read or written. | Check, for example, if  
  - the server name is correct  
  - the computer name is correct  
  - the server is registered  
Note for advanced users: Interpret the value from HRESULT. |
<p>| 160013 | The specified server was started as InProc server. This has not been released and may possibly lead to incorrect behavior because the server is running in the same process area as the WinCC flexible Runtime software. | Configure the server as OutProc Server or Local Server. |
| 160014 | Only one OPC server project can be started on a PC/MP. An alarm is output when an attempt is made to start a second project. The second project has no OPC server functionality and cannot be located as an OPC server by external sources. | Do not start a second project with OPC server functionality on the computer. |
| 170000 | S7 diagnostics events are not indicated because it is not possible to log in to the S7 diagnostics functions at this device. The service is not supported. | — |</p>

<tr>
<td>230201</td>
<td>The connection to HTTP channel was established. Data is exchanged.</td>
<td>—</td>
</tr>
</tbody>
</table>
| 230202   | WININET.DLL has detected an error. This error usually occurs when an attempt to connect to the server fails or the server refuses to connect because the client lacks the proper authorization. An unknown server certificate may also be the cause if the connection is encrypted by means of SSL. The alarm text provides details. This text is always in the language of the Windows installation because it is returned by the Windows OS. Process values are no longer exchanged. | Depending on the cause: When an attempt to connect fails or a timeout error occurs:  
  • Check the network connection and the network.  
  • Check the server address.  
  • Check if the web server is actually running on the destination computer. Faulty authorization:  
  • The configured user name and/or password do not match those on the server. Establish consistency. When the server certificate is rejected:  
  Certificate signed by an unknown CA ( ):  
  • Either ignore this item in your project, or  
  • Install a certificate that has been signed with a root certificate known to the client computer.  
  The date of the certificate is invalid:  
  • Either ignore this item in your project, or  
  • Install a certificate with a valid date on the server. Invalid CN (Common Name or Computer Name):  
  • Either ignore this item in your project, or  
  • Install a certificate with a name that corresponds to that of the server address. |
| 230203   | Although a connection can be made to the server, the HTTP server refuses to connect because • WinCC flexible Runtime is not running on the server, or • the HTTP channel is not supported (503 Service unavailable). Other errors can only occur if the web server does not support the HTTP channel. The language of the alarm text depends on the web server. Data is not exchanged. | Error 503 Service unavailable: Check if WinCC flexible Runtime is running on the server the HTTP channel is supported. |
| 230301   | An internal error has occurred. An English text explains the error in more detail. This may be caused by insufficient memory. OCX does not work. | —                                                                      |
| 230302   | The name of the remote server cannot be resolved. The attempt to connect failed.                                                      | Check the configured server address. Check if the DNS service is available on the network. |
| 230303   | The remote server is not running on the addressed computer. Wrong server address. The attempt to connect failed                          | Check the configured server address. Check if the remote server is running on the target computer. |

Glossary

"Transfer" mode
an operating mode of the HMI device in which an executable project is transferred from the configuration computer to an HMI device.

Acknowledge
Acknowledging an alarm confirms that you have noted it.

AG
Controller of the SIMATIC S5 series such as the AG S5-115U, for example

Alarm logging
Output of user-specific alarms to a printer, in parallel to their output to the HMI device screen.

Alarm, acknowledging
Acknowledging an alarm confirms that you have noted it.

Alarm, activated
Moment at which an alarm is triggered by the controller or HMI device.

Alarm, deactivated
Moment at which the initiation of an alarm is reset by the controller.

Alarm, user-specific
A user-specific alarm can be assigned to one of the following alarm classes:
  • Error
  • Operation
  • User-specific alarm classes
A user-specific alarm designates a certain operating status of the plant connected to the HMI device via the controller.
Array
Area reserved in configured screens for the input and output of values.

AS
Controller of the SIMATIC S7 series such as a SIMATIC S7-300

AS 511
Protocol of the programming device interface of a SIMATIC S5 controller

Boot loader
Used to start the operating system. Automatically started when the HMI device is switched on. A start screen appears during startup. After the operating system has been loaded, the Loader opens.

Configuration PC
General term for programming devices (PGs) and PCs on which plant projects are created using an engineering software.

Control request
Triggers a function via the controller.

Controller
General term for devices and systems with which the HMI device communicates, e.g. SIMATIC S7.

Display duration
Defines whether and how long a system alarm is displayed on the HMI device.

EMC
Electromagnetic compatibility is the ability of electrical equipment to function properly in its electromagnetic environment without influencing this environment.

Engineering software
Software for the creation of projects for process visualization – see also project, process visualization and runtime software
Event

Functions are triggered by defined incoming events. Events can be configured. Events which can be assigned to a button include "Press" and "Release", for example.

Fault time

Refers to the time interval between an activated and deactivated alarm.

Figure

Form of the visualization of all logically related process data for a plant. The visualization of the process data can be supported by graphic objects.

Flash memory

Non-volatile memory with EEPROM chips, used as mobile storage medium or as memory module installed permanently on the motherboard.

Function key

Key on the HMI device which supports user-specific functions. A function is assigned to the key in the configuration. The assignment of the keys may be specific to an active screen or not.

Half brightness lifetime

Time period until the brightness degrades to 50% of its original value. The specified value is dependent on the operating temperature.

Hardcopy

Output of the screen content to a printer.

HMI device image

a file which can be transferred from the configuration computer to the HMI device. The HMI device image contains the operating system and elements of the runtime software required to run a project.

Infotext

Configured information on objects within a project. An alarm infotext, for example, may contain information on the cause of the fault and troubleshooting routines.

IO field

Enables the input or output of values on the HMI device which are transferred to the controller.
Glossary

Notation
System consisting of characters, symbols and rules. In particular used to define the write format of a programming language in data processing.

Object
Component of a project. Example: screen or alarm. Objects are used to view or enter texts and values on the HMI device.

Operator control object
Component of a project which is used to enter values and trigger functions. A button, for example, is an operator control object.

Plant
General term referring to machines, processing centers, systems, plants and processes which are operated and monitored on an HMI device.

Process visualization
Visualization of processes from the areas of production, logistics and services in text-based and graphics format. Configured plant screens allow operator intervention in active plant processes by means of the input and output data.

Project
Result of a configuration using an engineering software. The project normally contains several screens with embedded system-specific objects, basic settings and alarms. The project file of a project configured in WinCC flexible is saved under the file name extension *.hmi.

You need to distinguish between the project on the configuration computer and that on an HMI device. A project may be available in more languages on the configuration PC than can be managed on the HMI device. The project on the configuration PC can also be set up for different HMI devices. Only the project set up for a particular HMI device can be transferred to that HMI device.

Project file
File which is generated based on a source file for a specific HMI device when the configuration is completed. The project file is transferred to the corresponding HMI device and is used to operate and monitor plants. Refer to Source file.

Recipe
Combination of tags forming a fixed data structure. The data structure configured can be assigned data on the HMI device and is then referred to as a data record. The use of recipes ensures that when a data record is downloaded, all the assigned data is transferred synchronously to the controller.
Runtime software

is a process visualization software which can be used to test a project on a configuration computer. Also refer to "Project" and "Engineering software."

Screen object

Configured object for operating and monitoring the system, e.g. a rectangle, an IO field or a recipe view.

Source file

File from which various project files can be created, depending on the configuration. The source file is not transferred and remains on the configuration computer.

The file name extension of a source file is *.hmi. Refer to Source file, compressed and Project file.

Source file, compressed

Compressed form of the source file. Can be transferred in addition to the project file to the corresponding HMI device. "Enable Backtransfer" must be set in the project on the configuration computer. The file extension of a compressed source file is *.pdz. The standard memory location for a compressed source file is the external MMC. Refer to Source file.

To restore a source file, it is necessary to use the same WinCC flexible version which was used to configure the project.

STEP 7

Programming software SIMATIC S7, SIMATIC C7 and SIMATIC WinAC controllers.

STEP 7 Micro/WIN

Programming software for controllers of the SIMATIC S7-200 series.

Symbolic IO field

Box for the input/output of a parameter. Contains a list of default entries from which one can be selected.

System alarms

Assigned to the "System" alarm class. A system alarm refers to internal states on the HMI device and the controller.

Tab order

In the configuration, this sets the sequence in which objects are focused on pressing the <TAB> key.
Tag

Defined memory location to which values can be written to and read from. This can be done from the controller or the HMI device. Based on whether the tag is interconnected with the controller or not, we distinguish between "external" tags (process tags) and "internal" tags.

Transfer

The transfer of an executable project to the HMI device.
