Manual

#### NOTE

For your own safety, observe the warnings and safety instructions contained in this document, if available.

#### **Disclaimer of Liability**

Subject to changes and errors. The information given in this document only contains general descriptions and/or performance features which may not always specifically reflect those described, or which may undergo modification in the course of further development of the products. The requested performance features are binding only when they are expressly agreed upon in the concluded contract.

Document version: DC8-134-2.01

Edition: 07.2023

Version of the product described:

#### Copyright

Copyright © Siemens 2023. All rights reserved.

The disclosure, duplication, distribution and editing of this document, or utilization and communication of the content are not permitted, unless authorized in writing. All rights, including rights created by patent grant or registration of a utility model or a design, are reserved.

#### **Trademarks**

SIPROTEC, DIGSI, SIGRA, SIGUARD, SIMEAS, SAFIR, SICAM, and MindSphere are trademarks of Siemens. Any unauthorized use is prohibited.

# **Preface**

#### Purpose of the Manual

This manual describes the SICAM 8 Application Group **Communication**. This is divided into:

OPC UA Server

#### **Target Audience**

This manual is addressed to personnel and customers who are responsible for evaluation, conceptual design, configuration, and technical system maintenance. It provides hints on how to get information or files via the website https://support.industry.siemens.com. If you do not have access to this website, contact your project manager at Siemens.

#### Scope

This manual is valid for the SICAM 8 series.

#### **Indication of Conformity**

The product described conforms to the regulations of the following European Directives:

2014/30/EU

Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to electromagnetic compatibility; Official Journal of the EU L96, 29/03/2014, p. 79–106

• 2014/35/EU

Directive of the European Parliament and of the Council of 26 February 2014 on the harmonization of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits; Official Journal of the EU L96, 29/03/2014, p. 357–374

• 2011/65/EU

Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment; Official Journal of the EU L174, 01/07/2011, p. 88-110

The conformity of the product with the above mentioned regulations is proven through the observance of the following harmonized standards:

- IEC/EN 60870-2-1 for 2014/30/EU
- IEC/EN 61010-1 and IEC/EN 61010-2-201 for 2014/35/EU;
   IEC/EN 61010-2-030 (only Al-8510, Al-8511, CM-8820, Al-8330, Al-8340)
- IEC/EN 63000 for 2011/65/EU

This declaration certifies the conformity with the specified directives, but is not an assurance of characteristics in the sense of the product liability law.

The product is intended exclusively for use in an industrial environment.

#### **Standards**

This product is UL-certified based on the Technical data: UL 61010-1 and UL 61010-2-201; UL 61010-2-030

CAN/CSA-C22.2 No. 61010-1 and CAN/CSA-C22.2 No. 61010-2-201; CAN/CSA C22.2 No. 61010-2-030

IND. CONT. EQ. E486146 E496940

For more information, see Product iQ on the Internet: https://productiq.ulprospector.com/de.

Log in (or use the option **Search abridged site without login**) and search for UL file number **E496940**, **E486146** or **E469507**, to see a list of the currently certified modules.

#### **Additional Support**

For questions about the system, contact your Siemens sales partner.

#### **Customer Support Center**

Our Customer Support Center provides a 24-hour service.

Siemens AG

Smart Infrastructure – Protection Automation Tel.: +49 911 2155 4466

Customer Support Center E-Mail: energy.automation@siemens.com

#### **Training Courses**

Inquiries regarding individual training courses should be addressed to our Training Center:

Siemens AG Siemens Power Academy TD Humboldtstraße 59 90459 Nuremberg Germany

Phone: +49 911 9582 7100

E-mail: poweracademy@siemens.com
Internet: www.siemens.com/poweracademy

#### **Notes on Safety**

This document is not a complete index of all safety measures required for operation of the equipment (module or device). However, it comprises important information that must be followed for personal safety, as well as to avoid material damage. Information is highlighted and illustrated as follows according to the degree of danger:

#### **DANGER**

**DANGER** means that death or severe injury will result if the measures specified are not taken.

♦ Comply with all instructions, in order to avoid death or severe injuries.

#### WARNING

WARNING means that death or severe injury may result if the measures specified are not taken.

♦ Comply with all instructions, in order to avoid death or severe injuries.

#### CAUTION

**CAUTION** means that medium-severe or slight injuries **can** occur if the specified measures are not taken.

Comply with all instructions, in order to avoid moderate or minor injuries.

#### **NOTICE**

**NOTICE** means that property damage **can** result if the measures specified are not taken.

♦ Comply with all instructions, in order to avoid property damage.

#### NOTE

Important information about the product, product handling or a certain section of the documentation which must be given attention.

#### OpenSSL

This product includes software developed by the OpenSSL Project for use in OpenSSL Toolkit (http://www.openssl.org/).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

# 1 General Information

1.1	Platform Thought	10
1.2	Terms	12
1.3	Engineering	13

### 1.1 Platform Thought

With the SICAM 8 series, the new automation platform, you have a consistent, scalable platform for different purposes (everywhere where energy flows).

With the SICAM 8 series, you are able to functionally integrate different modules (e.g. SICAM HMI, complete controllers) and have end-to-end engineering with the SICAM Device Manager.

With SICAM 8, the new automation platform, you benefit from:

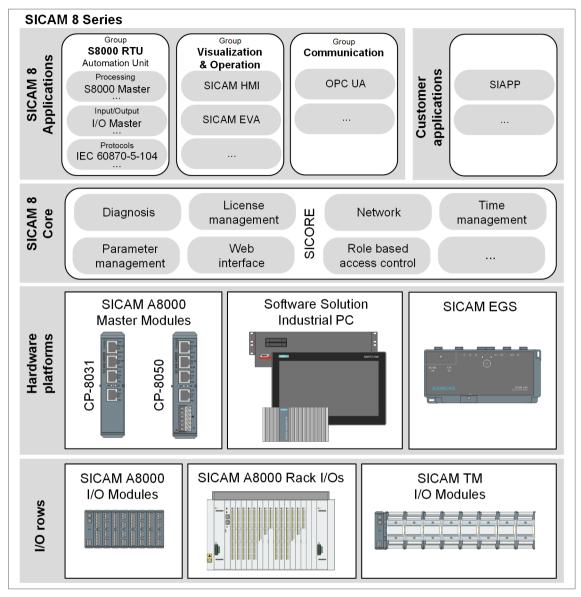

- Unified platform for hardware, software, controllers and engineering less training required for operating personnel.
- Significant reduction of different systems in the network Minimization of maintenance effort and costs.

Your advantages with the new platform:

- Optimum adaptability: for every application through modular AND variable hardware, identical software.
- High operational reliability: "State of the Art" Cybersecurity according to BDEW Whitepaper and NERC CIP.
   Certification according to process industry safety standard IEC62443.
- Faster network expansion: thanks to hardware-independent reuse of applications.
- Reduced effort for engineering training: by standardizing new hardware variants based on the SICAM 8
  platform.
- Shorter repair times (MTTR Mean Time to Repair): enables the flexible use or replacement of hardware.
- Tailor-made hardware and software: made for all areas of energy supply.

#### Modular system

SICAM 8 is a modular system that can be optimally adapted to the required plant requirements. The SICAM 8 platform consists of application groups and their applications, which provide functionalities for diverse business logic. The range of SICAM 8 applications is constantly being expanded.

[dw\_SICAM\_8\_Overview, 2, en\_US

The SICAM 8 core functions are available for running the applications. These contain all the necessary functions and infrastructure services for operating, managing, configuring and updating these applications.

Several hardware versions are available to run the SICAM 8 Core with the applications.

#### 1.2 Terms

#### **Application (formerly Firmware)**

As previously mentioned, the SICAM 8 Core platform manages a wide variety of applications. Software applications are meant here, such as the SICAM S8000 RTU applications or HMI applications. On the SICAM A8000 devices, these applications used to be referred to as firmwares. Since the term firmware rather reflects a hardware dependency, with the release of the product SICAM 8 Software Solution the term firmware was replaced by the term application and used for all device types.

#### **Automation Unit**

The term automation unit is used for all applications of the "S8000 RTU" application group. In previous products, this always meant the entire device, since only the RTU function actually ran on these devices. The SICAM 8 product line is developing more and more into a platform (SICORE) on which different applications run simultaneously. e.g. the S8000 RTU functionality as well as "visualization and operating functions" such as the SICAM HMI application.

#### **Basic System Element / Supplementary System Elements**

These terms come from products (e.g. SICAM ACP), where each application (formerly also called firmware) was assigned to a dedicated hardware element. For reasons of consistency, these terms will continue to be used. In the SICAM 8 system, each system element corresponds to its own process, which is managed by the SICORE platform.

#### System-technical Addressing

The addressing of automation units via regional component numbers and applications within the automation unit via basic and supplementary system element numbers is also often referred to as "system-technical addressing". This term is mainly used in the engineering tool SICAM Toolbox II.

#### **Process-technical Parameterization**

The term "Process-technical Parameterization" is used in the engineering tool SICAM Toolbox / OPM and means the data point-specific parameterization of signals. i.e. the properties of the signal can be adjusted via parameters for each data point/signal. In the engineering tool SICAM Device Manager, these parameters are parameterized in the S8000 RTU tile Signals, the term signal assignment is used for this. The term signal assignment is used in the document for reasons of consistency.

### 1.3 Engineering

The following engineering tools are available for the SICAM 8 Series:

- SICAM Device Manager
- SICAM WEB<sup>1</sup>

#### 1.3.1 SICAM Device Manager

Engineering is an important cost factor in the creation of new plants for energy generation, distribution and transmission. The maintenance of existing systems and the maintenance of the relevant databases also require high expenses. Configuration, parameterization, test and commissioning with the SICAM Device Manager solve these tasks and requirements in an intuitive manner and save time and money.

The SICAM Device Manager supports project and device management for:

- SICAM A8000 CP-8031
- SICAM A8000 CP-8050
- SICAM 8 Software Solution
- SICAM EGS

The SICAM Device Manager is available in German and English language.

There are 3 licenses to choose from:

- 6MF7800-1FB00: SICAM Device Manager Basic
- 6MF7800-1FS00: SICAM Device Manager standard (inclusive CFC)
- 6MF7800-1GS00: SICAM Device Manager Upgrade Basic to Standard

Supported operating systems:

- Microsoft Windows 7
- Microsoft Windows 10
- Microsoft Windows 2012 Server R2
- Microsoft Windows 2016 Server R2

#### **Cyber Security**

In line with the SICAM 8 series, the SICAM Device Manager also meets the cyber security requirements of tomorrow. In addition to the already known features, such as BDEW White Paper conformity, the SICAM Device Manager only supports digitally signed Application.

#### 1.3.2 SICAM WEB

Particular value was placed on simplest operation. SICAM WEB has an integrated web server that is operated with a standard web browser. By means of that, no special tools or additional licenses are needed.

Supported web browser:

- Google Chrome
- Microsoft Edge
- Mozilla Firefox

<sup>1</sup> SICAM WEB only offers very limited functions for engineering

3.9	Signals	42
3.10	Interoperability	59

#### 3.1 OPC UA Server

The OPC UA protocol (OPC Unified Architecture) is an Ethernet-based industry standard communication protocol that is widely used in automation technology and industrial applications. It enables secure and reliable communication between different devices and systems from different manufacturers.

The OPC UA server provides information for further processing to higher-level systems.

#### Applications for OPC UA:

Application	System	Standard and function
OPCUA00	SICAM 8 A8000 (CP-8031, CP-8050)	OPC UA Server
OPCUA00	SICAM 8 Software Solution (IPC)	OPC UA Server

#### Overview

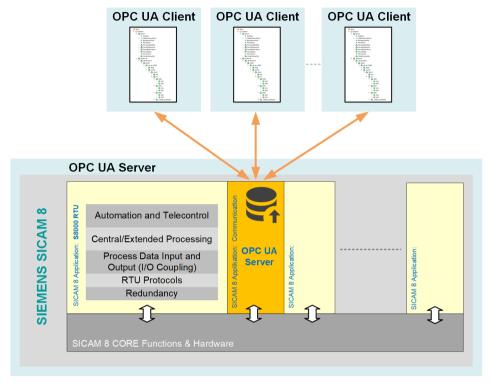

Open Platform Communications Unified Architecture (OPC UA) was developed by the OPC Foundation, founded in 1996, of which Siemens is a founding member. The OPC Foundation is a global non-profit organization with more than 850 members from all industries. It works closely with users and manufacturers to continuously develop the open, manufacturer-independent standard.

OPC UA is specified in the IEC 62541 series of standards.

#### OPC UA features:

- Manufacturer-independent and platform-neutral
- Internationally standardized interfaces for easy machine integration (companion specifications)
- Secure communication without additional hardware directly in the protocol
- Communication between machines (M2M) and higher-level systems
- Cyclic and event-driven transmission of information
- Information model and semantic services
- Simple and unambiguous interpretation of the data
- Simple Ethernet-based networking, using the existing Industrial Ethernet infrastructure
- Integrated security concept (encryption, signing and authentication)
- Unrestricted parallel operation with other protocols on the TCP/IP level
- High performance through fast communication

#### Schematic configuration

[OPC UA Configuration intern [GER], 1, en US]

#### NOTE

• If required, several applications for OPC UA servers can be configured in one device. Several OPC UA servers in a device with the same IP address must use different port numbers for communication.

## 3.2 Functions

OPC UA Server	Function	OPCUA00

#### Restrictions

#### NOTE

- The application for OPC UA Server in SICAM 8 supports only a subset of the possible functions of OPC UA.
  - When used in the project, the supported functionality must be observed!
- The application for OPC UA Server in SICAM 8 uses the open source protocol stack**open62541**(see <a href="https://www.open62541.org/#">https://www.open62541.org/#</a>) this is included in the C program of the application.

3rd Party System			

#### 3.4 Overview

#### 3.4.1 What is OPC UA?

The OPC UA protocol (OPC Unified Architecture) is an industry standard communication protocol that is widely used in the automation and Industry 4.0 industries. It enables secure and reliable communication between different devices and systems in industrial environments.

OPC UA It is based on a standardized, hierarchical data model that allows data to be organized and exchanged in a structured way.

One of the main strengths of OPC UA is its ability to work in different industrial environments, regardless of the hardware or software platforms used. It is vendor independent and enables interoperability between different devices and systems that support OPC UA. This makes it easier to integrate devices from different manufacturers into a common infrastructure.

OPC UA also offers advanced security features that ensure the protection of data and systems in industrial environments. It supports various encryption and authentication mechanisms to ensure data confidentiality, integrity and availability.

#### **OPC UA Server**

An OPC UA Server is a software component or device that provides data and information according to the OPC UA protocol and can be accessed by OPC UA clients. It is essentially a communication interface that allows data and information from different sources to be accessed and made available to other OPC UA clients.

#### How is data transferred with OPC UA?

Data transfer takes place via the OPC UA protocol, which is based on a client-server model. OPC UA defines a standardized communication interface for the exchange of data and information between OPC UA clients and OPC UA servers.

Basic steps for data transfer with OPC UA:

- Connection setup: The OPC UA client establishes a connection to the OPC UA server. Various security and authentication mechanisms are used to protect the connection and control access to the data.
- Request-Response-Mechanism: The OPC UA client sends requests to the OPC UA server to retrieve data
  or information or to perform actions. The OPC UA server then answers (Response) with the requested
  data or information. This request-response mechanism enables the bidirectional exchange of data and
  information between client and server.
- OPC UA messages: OPC UA uses a structured format for transferring data and information in the form of OPC UA messages. These messages can contain different types of data, such as variable values, states, events or method calls <sup>7</sup>. OPC UA messages can be transmitted in different formats. The OPC UA Server in SICAM 8 only supports binary encoding.
- OPC UA-Security: OPC UA also provides advanced data transfer security mechanisms to ensure the confidentiality, integrity and authenticity of the data transferred. This includes encryption, digital signature, authentication of clients and servers, as well as the management of access rights.
- Session Management: OPC UA enables sessions to be managed between the client and server. A session is created when the connection is established and can have various properties such as timeout, recovery mechanisms and security settings. The session allows to manage the state of communication between client and server and efficiently exchange data and information.

#### Addressing of the data with OPC UA

OPC UA data addressing is a technique used to access data and information within an OPC UA system. OPC UA uses a hierarchical modeling of data in the form of address spaces, which allows data and information to be

<sup>7</sup> Are currently not supported by the OPC UA Server in SICAM 8.

presented in a structured and organized manner. There are two main types of addressing in OPC UA: node ID addressing and browse addressing.

- Node ID addressing: In the OPC UA node ID addressing, a specific node, i.e. a unit of data or information, is accessed using a unique node ID. A node ID is a unique identifier for a node within the OPC UA address space and can appear in different forms, such as a numeric value, a GUID (Globally Unique Identifier) or a string. Node ID addressing enables direct and precise access to a specific node within the OPC UA address space.
- Browse addressing: OPC UA browse addressing uses a browsing mechanism to access nodes in the OPC
   UA address space. A so-called browse request is sent to the OPC UA server to obtain information about
   the nodes and their hierarchy. The server responds with a list of nodes that exist in the address space
   and meet certain criteria. The client can then point to the desired node in the response list and access its
   data and information. Browse addressing enables flexible and dynamic navigation in the OPC UA address
   space to access different nodes and their information.

#### Communication models for OPC UA

#### Client/Server

Service-oriented approach for acyclic operations like reading/writing data or function calls 8.

#### Publish/Subscribe<sup>8</sup>

Message-oriented approach to cyclic communication

#### **OPC UA Services**

#### OPC UA Basis Service – Browse

The client can guery information such as the data management of a server.

#### OPC UA Basic Service - Read/Write

The Read/Write service specifies how data can be read and written from an OPC UA server.

#### OPC UA Basic Service – Subscribe

This service is available for change notification. A client can subscribe to specific data points. The server notifies the client of changes to the corresponding data.

#### OPC UA Basic Service – MethodCall<sup>8</sup>

In principle, OPC UA servers can also provide functions for clients. The MethodCallService offers the possibility to call such functions from the client.

#### OPC UA Basis Service – Discovery

The discovery services serve as the basis for the automatic connection between server and client. Various discovery services are specified for finding an OPC UA server.

Local Discovery Server (LDS)

To find an OPC UA server, the client must establish a connection to the corresponding device. This is usually done with a FindServersRequest. The device then responds to this request with an application description of the OPC UA servers available on the device.

- Local Discovery Multicast Extension (LDS-ME) <sup>9</sup>
- Global Discovery Server (GDS) 9

#### Security with OPC UA

OPC UA allows data exchange between different systems, both within the process and production level, as well as to systems at the management and company level.

OPC UA offers the following security mechanisms:

<sup>8</sup> Currently not supported by the OPC UA Server in SICAM 8.

 $<sup>^{\</sup>rm 9}$   $\,$  Currently not supported by the OPC UA Server in SICAM 8.

#### 3.4 Overview

- Checking the identity of OPC UA server and clients. 9
- Verification of the identity of the users. <sup>9</sup>
- Signed/encrypted data exchange between OPC UA server and clients.

## 3.5 Configure OPC UA Server Application

So that the OPC UA Server application can be used for SICAM 8, it must first be downloaded and then imported into the SICAM Device Manager and configured for the device.

#### Import application for OPC UA Server in the SICAM Device Manager

• Click in menu **Applications** ...

[Applikation importieren\_01 [GER], 1, en\_US]

• Click Import application

[Applikation importieren 02 [GER], 1, en US]

Select application and import with OK <sup>10</sup>

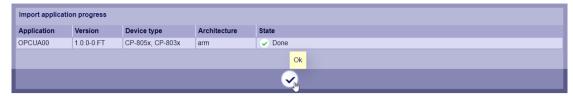

[Applikation importieren 03 [GER], 1, en US]

<sup>10</sup> The current revision of the application can differ from the representation in the picture.

#### 3.5 Configure OPC UA Server Application

• Complete the import of the application with **OK** 

[Applikation importieren\_04 [GER], 1, en\_US]

• The imported application is displayed in the overview. Close the display with **OK**.

[Applikation importieren 05 [GER], 1, en US]

#### Configure application for OPC UA Server in the SICAM Device Manager

• Click Home | Application configuration and licensing

[Applikationen - Konfiguration der Applikationen und Lizenzierung [GER], 1, en US

In the Applications section click Add new row

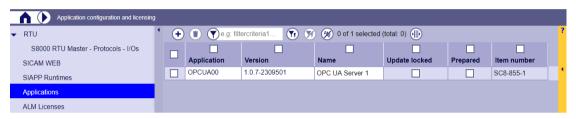

[Applikationen - neue Zeile einfügen [GER], 1, en\_US

• In the **Add new application** dialog, select the application for the OPC UA server (OPCUA00) and then confirm the selection.

[Applikationen - Applikation auswählen 1 [GER], 1, en US

• When the application is successfully added, the new application will appear in the **Applications** section

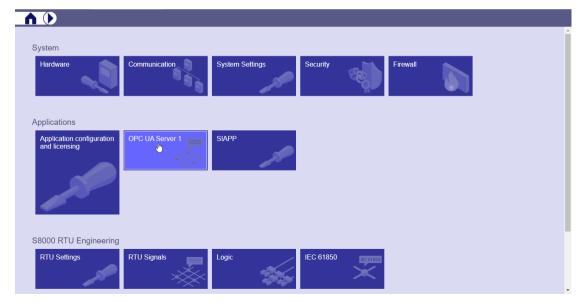

[Applikationen - Applikation auswählen\_2 [GER], 1, en\_US

• In the **Applications** section, click on the **Name** of the selected application and, if necessary, change the name of the application for OPC UA Server in the device.

[Applikationen - Applikation auswählen\_2b [GER], 1, en\_US]

The selected application for OPC UA Server is displayed under Home

[Applikationen - OPC UA Server [GER], 1, en\_US]

3.5 Configure OPC UA Server Application

#### NOTE

• If required, several applications for OPC UA servers can be configured in one device. Several OPC UA servers in a device with the same IP address must use different port numbers for communication.

### 3.6 Licenses

A license is required in SICAM 8 for each **OPC UA Server** application.

#### Requirements

• For permanent operation a license is required

#### Order information - Function Point Manager License

SICAM function point manager Licenses are generated with the *SICAM function point manager* <sup>11</sup>. The ordering process is described in the **Function Points Manager** user manual, section **SICAM License Files**.

#### **Ordering Information**

Medium	Designation (License type)
OSD Download	OPC UA Server

#### Import the license into the device

The license is loaded into the device via SICAM WEB.

- Connect the SICAM 8 device to the PC and start SICAM WEB.
- On the SICAM WEB interface of the device, click Home | Applications

[SICAM WEB - Applikationen [GER], 1, en\_US]

Click Licenses

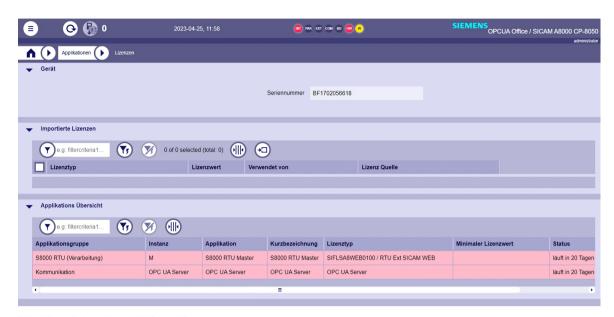

[SICAM WEB - Applikationen - Lizenzen [GER], 1, en US]

Import the license for the device generated with the Function Points Manager

<sup>11</sup> The serial number of the device, required for generating the license file with the SICAM function point manager, is displayed with SICAM WEB under Home | Applications | Licenses

#### 3.6 Licenses

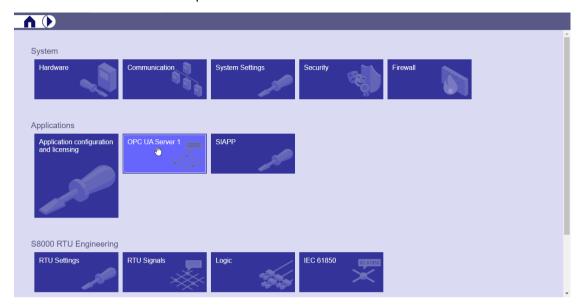

[SICAM WEB - Applikationen - Lizenzen\_2[GER], 1, en\_US

## 3.7 Parameters and Properties

The parameters for the application OPC UA Server (signals and properties of the application) are to be parameterized with the SICAM Device Manager in the tile for OPC UA Server.

Select OPC UA Server: Click Home | OPC UA Server 12

[Applikationen - OPC UA Server [GER], 1, en\_US]

Click Application properties

[OPC UA Server - Eigenschaften der Applikation [GER] red, 1, en\_US]

• The properties of the application (parameters) are displayed

[OPC UA Server Eigenschaften der Applikation 2a [GER], 1, en US]

#### Application parameters and properties

#### **Common settings**

[OPC UA Server\_Eigenschaften der Applikation\_2a [GER], 1, en\_US

<sup>12</sup> The name of the application can be changed when configuring the application.

Parameter name	Description	Settings
Application name	Name of the OPC UA Server application.  The name is read out by the UPC UA client when connecting with Discovery and displayed as the name for the configured connection and returned as Application-Name in the "FindServersResponse" response.	Permitted range =  • Max. 100 characters  • all characters are permitted  Default setting =
Application URI	Globally unique identifier for the application instance. For security, this URI must match the subject alternative name URI in the server certificate.	Permitted range =  • Max. 100 characters  • all characters are permitted  Default setting =

#### Parameter for security (Details see section Application parameters and properties)

- Enable security profiles
- Certificate verification accept all
- Certificate
- Certificate authority

#### Certificate

The certificate must include the following extensions:

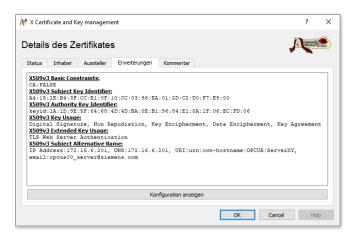

- X509v3 Basic Constraints
- X509v3 Subject Key Identifier
- X509v3 Authority Key Identifier
- X509v3 Key Usage
- X509v3 Extended Key Usage
- X509v3 Subject Alternative Name <sup>16</sup>

Example:

<sup>14</sup> signed or signed and encrypted

<sup>15</sup> outdated

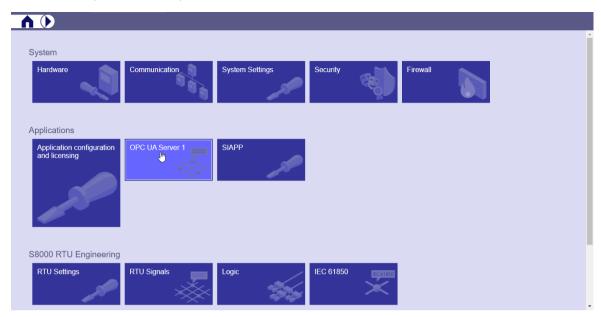

<sup>16</sup> IP, DNS and URI are required

[Beispiel - OPC UA Zertifikat, 1, --\_--

# 3.9 Signals

Signals are those data points that are transferred from the SICAM 8 device between the OPC UA Server and the remote station (= OPC UA Client).

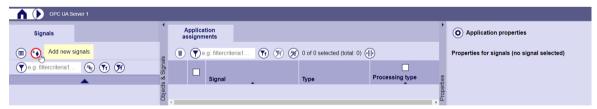

[Applikationen - OPC UA Server [GER], 1, en US

## 3.9.1 Overview

## Add signals

The signals can be added with the SICAM Device Manager either in the OPC UA Server application or in the tile RTU signals.

The signals are assigned to the application and the properties of the signals are parameterized with the SICAM Device Manager in the OPC UA Server application (see **Assignment of the signals to the application**). Details on the engineering of signals can be found in the SICAM Device Manager manual.

[OPCUA00 Signal hinzufügen [GER] red, 1, en US]

#### **Supported Signal Types**

SICAM 8 signal type	Direction	Processing type <sup>17</sup>	OPCUA0 0
Command	Receive	Receive signals	<b>✓</b>

Integrated Total	_	-	_

#### The SICAM 8 signal type (Type) for signals is selected at Add signal.

[OPCUA00\_Signal\_hinzufügen\_01 [GER], 1, en\_US]

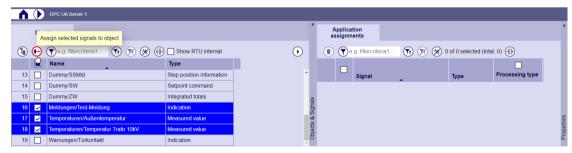

#### Data exchange between application and SICAM 8 Core

The signals assigned to the application **Communication** are registered by the application after startup with the SICAM 8 core function for transmission ("subscribed") and transmitted internally to the application in the event of a change or general query.

A logging of the transmitted signals between SICAM 8 Core function and the application for OPC UA Server is currently not supported.

#### Allocation of the signals to the application

• Select the required signals from the signal list and assign them to the application for OPC UA server with **Assign selected signals to object**.

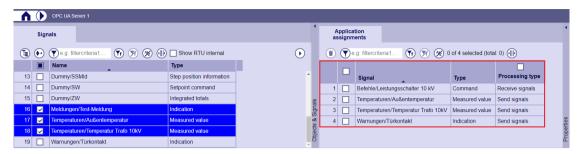

[OPCUA00\_Signale zuordnen\_01 [GER] red, 1, en\_US]

<sup>17</sup> The processing type is assigned automatically when the signals are assigned to the OPC UA server application.

#### 3.9 Signals

• The processing type is assigned automatically when the signals are assigned to the OPC UA server application.

No further properties need to be configured for the signals for the OPC UA server.

[OPCUA00\_Signale zuordnen\_02 [GER] red, 1, en\_US]

#### NOTE

Unsupported signal types are not assigned.

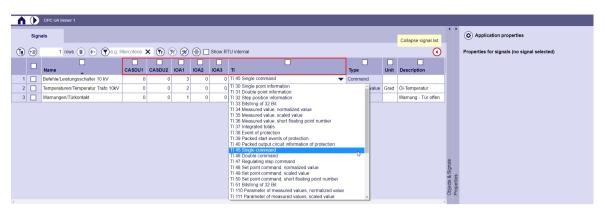

#### IEC 60870-5-101/104 Parameter

The IEC 60870-5-101/104 parameters are not evaluated by the application for OPC UA Server. The IEC 60870-5-101/104 parameters (CASDU, IOA, TI) are only required if the signals are processed in the application **S8000 RTU - Automation and Telecontrol** or in another application that requires these parameters. The IEC 60870-5-101/104 parameters are only displayed with the **Open signal list** setting.

[OPCUA00\_Signale\_RTU intern\_00b [GER] red, 1, en\_US

Parameters for IEC 60870-5-101/104 address (CASDU, IOA, TI) and the assignment of SICAM 8 signal type (Type) to IEC 60870-5-101/104 type identifier (TI):

IOPCUA00 Signale RTU intern 01 [GER] red. 1. en US]

#### **OPC UA Type**

The assignment of the SICAM 8 signal type (**Type**) to OPC UA **DataType Identifier** is done by the application for OPC UA Server.

SICAM 8 Signal type [Type]	IEC 60870-5-101/104 type Identification <sup>18</sup> [TI]	OPC UA DataType Identifier
Message	TI 30 Single-point information with time tag CP56Time2a	Boolean
Message	TI 31 Double-point information with time tag CP56Time2a	Boolean <sup>19</sup>
Bitstring of 32 bits Value	TI 33 Bitstring of 32 bits with time tag CP56Time2a	UInt32
Measured value	TI 34 Measured value, normalized value with time tag CP56Time2a	Float
Measured value	TI 35 Measured value, scaled value with time tag CP56Time2a	Float
Measured value	TI 36 Measured value, short floating-point number with time tag CP56Time2a	Float
Command	TI 45 Single command	Boolean
Command	TI 46 Double command	Boolean
Setpoint value	TI 48 Setpoint command, normalized value	Float
Setpoint value	TI 49 Setpoint command, scaled value	Float
Setpoint value	TI 50 Setpoint command, short floating-point number	Float

<sup>18</sup> The IEC 60870-5-101/104 type Identification is not evaluated from the application for OPC UA server. The 101/104 type identifier is only required if the signal is processed in the SICAM 8 application S8000 RTU automation and telecontrol function or in another application that requires the 101/104 type identifier.

In case of messages (TI 31 .. Double-point information with time tag CP56Time2a): Indeterminate state (DIFF) is represented in OPC UA status code with Uncertain\_LastUsableValue. Indeterminate state (DIFF) or faulty position (FAULT) is represented in OPC UA status code with Uncertain\_EngineeringUnitsExceeded.

## **OPC UA Attributes**

AccessRestristions		not supported

#### **Nodeld Identifier**

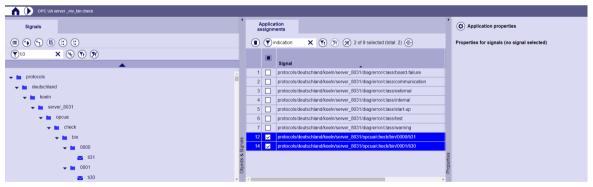

With OPC UA, the signal is addressed with the Nodeld identifier. The freely definable name of the signal from the SICAM Device Manager is used as the Nodeld identifier (complete tree structure).

#### Example:

Signal name = protocols/deutschland/koeln/server\_8031/opcua/check/bin/0000/ti31

OPC UA NodelD idenifier = protocols.deutschland.koeln.server 8031.opcua.check.bin.0000.ti31

#### Signals as a tree:

[OPCUA00 Signale Baum [GER] red, 1, en US

#### Signals as a list:

[OPCUA00\_Signale\_Liste [GER] red, 1, en\_US]

## Signal in OPC UA: 20

Att	tribute	Value
✓ Nodeld		ns=2;s=protocols.deutschland.koeln.server_8031.opcua.check.bin.0000.ti3

	UserAccessLevel	CurrentRead
	AccessLevelEx	BadAttributeIdInvalid (0x80350000)
	MinimumSamplingInterval	0
	Historizing	false

#### **OPC UA status code**

The quality identifier of the signals is transmitted by the application in the OPC UA status code.

Supported OPC UA status codes in the transmit direction (send signals):

IEC 60870-5-101/104 Quality Bit	SICAM 8 quality	OPC UA status code
NT Not Topical	NT Not Topical	Uncertain_LastUsableValue
IV Invalid	IV Invalid	Bad_DeviceFailure
OV Overflow	OV Overflow	Uncertain_EngineeringUnitsEx- ceeded <sup>21</sup>
SB Substitute	SB Substitute	Uncertain_SubstituteValue
BL Blocked	BL Blocked	Uncertain_LastUsableValue 21
		Good
_	_	Furthermore, the following status codes are supported by the opene62541 OPC UA server protocol stack: See
		https:// www.open62541.org/doc/1.0/ statuscodes.html

Supported OPC UA status codes in the receive direction (receive signals):

IEC 60870-5-101/104 Quality Bit	SICAM 8 quality	OPC UA status code
NT Not Topical	NT Not Topical	Uncertain_LastUsableValue
IV Invalid	IV Invalid	Bad_DeviceFailure

<sup>&</sup>lt;sup>20</sup> [NamespaceIndex=2] For your own signals the namespace is 2. Namespace 0 is reserved for the standard objects (see <a href="http://opcfoundation.org/UA/">http://opcfoundation.org/UA/</a>

<sup>21</sup> In case of messages (TI 31 .. Double-point information with time tag CP56Time2a): Indeterminate state (DIFF) is represented in OPC UA status code with Uncertain\_LastUsableValue. Indeterminate state (DIFF) or faulty position (FAULT) is represented in OPC UA status code with Uncertain\_EngineeringUnitsExceeded.

IEC 60870-5-101/104 Quality Bit	SICAM 8 quality	OPC UA status code	
OV Overflow	OV Overflow	Uncertain_EngineeringUnitsEx- ceeded <sup>21</sup>	
SB Substitute	SB Substitute	Uncertain_SubstituteValue	
		Good	
IV Invalid	IV Invalid	22	

## 3.9.2 Signals in Transmit Direction

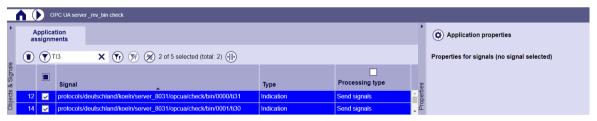

Signals in transmit direction: SICAM 8 OPC UA Server → OPC UA Client

IEC 60870-5-101/104 Type identification	SICAM 8 signal type (Type)	OPC UA Data Type Identi- fier
TI 30 Single-point information with time tag CP56Time2a	Message	Boolean
TI 31 Double-point information with time tag CP56Time2a	Message	Boolean
TI 33 Bitstring of 32 bits with time tag CP56Time2a	Bitstring of 32 bits	Uint32
	Bit value	
TI 34 Measured value, normalized value with time tag CP56Time2a	Measured value	Float
TI 35 Measured value, scaled value with time tag CP56Time2a	Measured value	Float
TI 36 Measured value, floating-point number with time tag CP56Time2a	Measured value	Float

#### 3.9.2.1 Indications

The parameterization of indications in transmit direction for OPC UA Server is done with the SICAM Device Manager in the application for OPC UA Server under **Objects & Signals - Application Assignments**.

#### Processing type: Send signals

OPCUA00\_Send\_signals\_Meldung [GER], 1, en\_US

#### Supported IEC 60870-5-101/104 type identification

IEC 60870-5-101/104 Type identification	SICAM 8 type	OPC UA data type
TI 30 Single-point information with time tag CP56Time2a	Indicaton	Boolean
TI 31 Double-point information with time tag CP56Time2a	Indicaton	Boolean

<sup>22</sup> OPC UA status codes that are not supported are converted to IV (invalid) by the application for OPC UA Server. Status codes see <a href="https://www.open62541.org/doc/1.0/statuscodes.html">https://www.open62541.org/doc/1.0/statuscodes.html</a>

Objects & Signals   Attribute

OPC UA Attribute <sup>30</sup>	Value	Note
Nodeld		'
Identifier		SICAM 8 signal name (complete tree structure)
		See NodeID identifier for signals
Value		
SourceTimeStamp		Signal acquisition time
		in format DD.MM.JJJJ hh:mm.ss.ms
<ul> <li>StatusCode</li> </ul>		see quality identifier of the signals (OPC UA status)
Value		Measured value in format <float32></float32>
		(IEEE Single Precision - 32 Bit - Floating Point Value)
DataType	Float	

## Conversion of the setpoint values to SICAM 8 format

SICAM 8	Description	
Туре	= Setpoint value	
Value	= OPC UA attribute "Value" <sup>31</sup>	
Time Stamp	= OPC UA attribute "SourceTimeStamp"	
Cause Of Transmission	= activation (ACT) <sup>32</sup>	
Quality	See supported OPC UA status codes (quality identifier of the signals) in receive direction.	
Add Info	not supported	
Originator	not supported	
Session-ID		

<sup>30</sup> Only the most important attributes are listed here. All attributes are documented under UPC UA attributes.

<sup>&</sup>lt;sup>31</sup> Value adjustment with the parameters X\_0%, X\_100%, Y\_0%, Y\_100% is currently not supported.

<sup>32</sup> Other causes of transmission are not supported.

## Supported properties for signals

Property name	Description		
Unit	will not be rated		
Selection before execution	"Only execution" is supported		
Timeout confirmation for selection	will not be rated (not supported)		
Timeout confirmation for execu-	will not be rated (not supported)		
tion			
Timeout termination	will not be rated (not supported)		
X0%, X100%, Y0%, Y100%	is supported		
Accuracy	will not be rated (not supported)		
Description	will not be rated		

# 3.10 Interoperability

## 3.10.1 SICAM 8 – OPC UA Server Features (General)

Name	Value	Description
Max. number of connected clients	100	The server supports up to 100 clients per application. The Server does not verify the IP address of client based on white list.
Used OPC UA Protocol Stack	open62541 v1.3.5	https://www.open62541.org/
Supported OPC UA Standard	v1.04	
Supported OPC UA Profiles	Micro Embedded Device 2017 Server Profile	

## 3.10.2 SICAM 8 - OPC UA Features

Fu	nction	OPCUA0 0
Fu	nction Server Information	
•	Product Name	SICAM 8

## 3.10.3 Supported OPC UA Profiles

[Micro Embedded Device 2017 Server Profile, 1, --\_--]

Name	Included Conformance Units		Description		
	Is Optional	Is Supported			
Application Profile: "Micro Em	Application Profile: "Micro Embedded Device 2017 Server Profile"   Session Services				
Session Minimum 2 Parallel	Session Minimum 2 Parallel		Support minimum 2 parallel Sessions (total for all Clients).		

Name	Included Confo	rmance Units	Description
	Is Optional	Is Supported	
Included Profile: "Nano Embed		7 Server Profile"	
Base Info Custom Type System	☑		The Server supports custom types (i.e. types that are derived from well-known ObjectTypes, VariableTypes, ReferenceTypes or DataTypes). Supporting this ConformanceUnit requires that the custom types with their full inheritance tree are exposed in the AddressSpace.
Base Info Diagnostics	☑		The Server supports the collection of diagnostic information. The Server supports the collection of diagnostic information. The EnabledFlag in the ServerDiagnostics Object can be set TRUE and in that case all static and dynamic Objects and Variables for diagnostic data as defined in UA Part 5 are supported.
Included Profile: "Core 2017 Se	erver Facet" I Ad	dress Space Mo	del
Address Space Atomicity		<u>a</u>	Support setting the NonatomicRead and NonatomicWrite flags in the AccessLevelEx Attribute for Variable Nodes to indicate whether Read or Write operations can be performed in atomic manner. If the flags are set to '1', atomicity cannot be assured.
Address Space Base		Ø	Support the NodeClasses with their Attributes and References as defined in Part 3. This includes for instance: Object, Object-Type, Variable, VariableType, References and DataType.
Address Space Full Array Only		Ø	Support setting the WriteFullArrayOnly flag in the AccessLevelEx Attribute for Variable Nodes of non-scalar data types to indicate whether write operations for an array can be performed with an IndexRange.
Address Space Addln DefaultIn- stanceBrowsename	Ø		Support the DefaultInstanceBrowseName Property for ObjectType.
Address Space AddIn Reference	Ø		Support the HasAddIn Reference to bind an AddIn to an Object or ObjectType.
Address Space Dictionary Entries	Ø		Support external dictionaries by relating OPC UA Nodes to dictionary entries using the HasDictionaryEntry ReferenceType.
Address Space Interfaces	Ø		Support Interfaces and associated rules.
Included Profile: "Core 2017 Se	rver Facet"   Bas		
Base Info Core Structure		☑	The Server supports the Server Object, ServerCapabilities and supports the OPC UA AddressSpace structure.
Base Info Currency	Ø		Support the Currency Property on Data- Variables that represent currency.

Name	Included Conformance Units		Description
	Is Optional	Is Supported	
Base Info Estimated Return Time	ব		Server supports the EstimatedReturnTime Property. It indicates the time at which the Server is expected to have a Server-Status.State of RUNNING_0. Clients can use this information to govern the reconnect logic.
Base Info OptionSet	Ø		The Server supports the VariableType OptionSetType.
Base Info Placeholder Modelling Rules	Ø		The Server supports defining custom Object or Variables that include the use of OptionalPlaceholder or MandatoryPlaceholder modelling rules.
Base Info Selection List	Ø		The Server supports Variables of the SelectionListType VariableType.
Base Info Server Capabilities	Ø		The Server supports publishing of the Server limitation in the ServerCapabilities, including MaxArrayLength, MaxStringLength, MaxNodePerRead, MaxNodesPerWrite, MaxNodesPerSubscription and MaxNodesPerBrowse.
Base Info ValueAsText	Ø		The Server supports the Property ValueAs- Text for enumerated DataTypes.
Included Profile: "Core 2017 Se	rver Facet" I Ra	se Services	
Session General Service Behaviour		✓ ✓	Implement basic Service behaviour. This includes in particular:
			<ul> <li>checking the authentication token</li> <li>returning the requestHandle in responses</li> <li>respecting a timeoutHint</li> </ul>
Base Services Diagnostics	Ø		The Server returns available diagnostic information as requested with the 'return-Diagnostics' parameter.
Included Profile: "Core 2017 Se	rver Facet" I Di	scovery Services	
Discovery Find Servers Self		<u> </u>	Support the FindServers Service only for itself.
Discovery Get Endpoints		Ø	Support the GetEndpoints Service to obtain all Endpoints of the Server. This includes filtering based on Profiles.

Name	Included Conformance Units		Description
	Is Optional	Is Supported	
Included Profile: "Core 2017 Se	erver Facet"   Ses	ssion Services	
Session Base		☑	Support the Session Service Set (CreateSession, ActivateSession, CloseSession) except the use of ActivateSession to change the Session user. This includes correct handling of all parameters that are provided.
			Note that for the CreateSession and ActivateSession services, if the SecurityMode = None then:  1) The Application Certificate and Nonce
			are optional. 2) The signatures are null/empty.
			The details of this are described in Part 4.
Session Minimum 1		Ø	Support minimum 1 Session (total).
Session Change User	Ø		Support the use of ActivateSession to change the Session user.
Included Profile: "Core 2017 Se		T .	
View Basic		<u> </u>	Support the View Service Set (Browse, BrowseNext).
View Minimum Continuation Point 01		₫	Support minimum 1 continuation point per Session.
View RegisterNodes		র	Support the RegisterNodes and UnregisterNodes Services as a way to optimize access to repeatedly used Nodes in the Server's OPC UA AddressSpace.
View TranslateBrowsePath		Ø	Support TranslateBrowsePathsToNodelds Service.
Included Profile: "Core 2017 Se			T
Attribute Read		☑	Supports the Read Service to read one or more Attributes of one or more Nodes.  This includes support of the IndexRange parameter to read a single element or a range of elements when the Attribute value is an array.
Attribute Write Index	Ø		Supports the IndexRange to write a single element or a range of elements when the Attribute value is an array and partial updates is allowed for this array.
Attribute Write Values	Ø		Supports writing to values to one or more Attributes of one or more Nodes.
Included Profile: "Core 2017 Se		· -	
SecurityPolicy Support		Ø	Support at least one Security Policy. Support of SecurityPolicy None is recommended for testing and compatibility reasons even if the UA Server supports a more secure policy.

Name	Included Confo	rmance Units	Description
	Is Optional	Is Supported	
Security Administration	Ø	<b>☑</b> 35	Allow configuration of the following Security related items (when they apply).
			<ul> <li>select the allowed/used User identifi- cation policy or policies (e.g. User Name/Password or X509).</li> </ul>
			<ul> <li>enable/disable or select the security policy "None" or other security poli- cies.</li> </ul>
			<ul> <li>enable/disable or select endpoints with MessageSecurityMode SIGN or SIGNANDENCRYPT.</li> </ul>
			• set the permitted certification authorities.
			define how to react to unknown     Certificates.
			allow accepting any valid Certificate
Security Role Server Authorization	☑		Restrict access based on the configured Roles and permissions.
Included Profile: "User Token –	I		
Security Invalid user token		☑	Servers shall take proper measures to protect against attacks on user identity tokens. Such an attack is assumed if repeated connection attempts with invalid user identity tokens happen. See Activate-Session Service in UA Part 4.
Security User Name Password		Ø	The Server supports User Name/Password combination(s). The token will be encrypted if required by the security policy of the User Token Policy or by the security policy of the endpoint. An unencrypted token either requires message encryption or means outside the scope of OPC UA to secure the identity token so that it cannot be retrieved by sniffing the communication. One option would be a secure transport like a VPN.
Included Profile: " <u>UA-TCP UA-S</u>			
Protocol UA TCP		☑	Support the UA TCP transport protocol defined in UA Part 6.
UA Binary Encoding		Ø	Support UA Binary Encoding. Values of these data types are encoded in compact binary formats, contiguously and without tagging. I.e. the receiver is assumed to understand the structure it is decoding.
UA Secure Conversation		Ø	Support UA Secure Conversation specified in UA Part 6.

<sup>35</sup> User Name/Password wird nicht unterstützt.

Name	Included Confo	rmance Units	Description
	Is Optional	Is Supported	
		•	
Included Profile: "Embedded D	ataChange Subs	scription Server	
Subscription Basic		Ø	Support the following Subscription Services: CreateSubscription, ModifySubscription, DeleteSubscriptions, Publish, Republish and SetPublishingMode.
Subscription Minimum 1		Ø	Support at least 1 Subscription per Session. This number has to be supported for all of the minimum required sessions.
Subscription Publish Min 02		<b>অ</b>	Support at least 2 Publish Service requests per Session. This number has to be supported for all of the minimum required sessions. Support of a NotificationMessage retransmission queue is not required; if not available the Republish Service returns Bad_MessageNotAvailable.
Subscription PublishRequest Queue Overflow		Ø	If the maximum supported number of PublishRequests has been queued and a new PublishRequest arrives, the "oldest" PublishRequest has to be discarded by returning the proper error.
Included Profile: "Embedded D	ataChange Subs	scription Server	Facet"   Monitored Item Services
Monitor Basic			Support the following MonitoredItem Services: CreateMonitoredItems, ModifyMonitoredItems, DeleteMonitoredItems and SetMonitoringMode.
Monitor Items 2		Ø	Support at least 2 MonitoredItems per Subscription where the size of each Moni- toredItem is at least equal to size of Double.
Monitor QueueSize_1		ব	This ConformanceUnit does not require queuing when multiple value changes occur during a "publish period". I.e. the latest change will be sent in the Notification.
Monitor Value Change		Ø	Support creation of MonitoredItems for Attribute value changes. This includes support of the IndexRange to select a single element or a range of elements when the Attribute value is an array.
