Use of application examples

Application examples illustrate the solution of automation tasks through an interaction of several components in the form of text, graphics and/or software modules. The application examples are a free service by Siemens AG and/or a subsidiary of Siemens AG ("Siemens"). They are nonbinding and make no claim to completeness or functionality regarding configuration and equipment. The application examples merely offer help with typical tasks; they do not constitute customer-specific solutions. You yourself are responsible for the proper and safe operation of the products in accordance with applicable regulations and must also check the function of the respective application example and customize it for your system.

Siemens grants you the non-exclusive, non-sublicensable and non-transferable right to have the application examples used by technically trained personnel. Any change to the application examples is your responsibility. Sharing the application examples with third parties or copying the application examples or excerpts thereof is permitted only in combination with your own products. The application examples are not required to undergo the customary tests and quality inspections of a chargeable product; they may have functional and performance defects as well as errors. It is your responsibility to use them in such a manner that any malfunctions that may occur do not result in property damage or injury to persons.

Disclaimer of liability

Siemens shall not assume any liability, for any legal reason whatsoever, including, without limitation, liability for the usability, availability, completeness and freedom from defects of the application examples as well as for related information, configuration and performance data and any damage caused thereby. This shall not apply in cases of mandatory liability, for example under the German Product Liability Act, or in cases of intent, gross negligence, or culpable loss of life, bodily injury or damage to health, non-compliance with a guarantee, fraudulent non-disclosure of a defect, or culpable breach of material contractual obligations. Claims for damages arising from a breach of material contractual obligations shall however be limited to the foreseeable damage typical of the type of agreement, unless liability arises from intent or gross negligence or is based on loss of life, bodily injury or damage to health. The foregoing provisions do not imply any change in the burden of proof to your detriment. You shall indemnify Siemens against existing or future claims of third parties in this connection except where Siemens is mandatorily liable.

By using the application examples you acknowledge that Siemens cannot be held liable for any damage beyond the liability provisions described.

Other information

Siemens reserves the right to make changes to the application examples at any time without notice. In case of discrepancies between the suggestions in the application examples and other Siemens publications such as catalogs, the content of the other documentation shall have precedence.

The Siemens terms of use (https://support.industry.siemens.com) shall also apply.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the Internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place. For additional information on industrial security measures that may be implemented, please visit https://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at: <u>https://www.siemens.com/industrialsecurity</u>.

1 Task

Introduction

LOGO! sets are functioning and tested automation configurations for simple, fast and inexpensive implementation of automation tasks for small-scale automation.

Overview of the automation task

A logistics center features several rolling shutter gates for persons and industrial trucks such as fork-lift trucks and other motorized means of transport. For easier and faster passing, the aim is to automate the opening and closing of these rolling shutter gates while considering the protection of persons and goods. Except for authorized staff, the rolling shutter gate must not be opened outside working hours. Automatic control of the rolling shutter gate is to be implemented centrally via a module.

Figure 1-1

2 Solution

2.1 Overview of the overall solution

Two retro-reflective sensors connected to the LOGO! logic module allow detection of incoming and outgoing objects and objects in the hazardous area.

An anti-crushing device on the bottom of the rolling shutter gate provides additional protection for objects in the hazardous area.

The LOGO! logic module direct the rolling shutter gate motor to OPEN or CLOSED by means of a reversing contactor combination that consists of two SIRIUS contactors. A SIRIUS circuit breaker protects the motor. The movement in the respective direction is stopped after 5 seconds.

To control the rolling shutter gate motor, the automation solution uses a LOGO! logic module with a weekly timer. It allows locking the rolling shutter gate outside working hours. This function can be enabled or disabled using a key switch.

The LOGO! display shows the position of the rolling shutter gate as a text and as a bar graph. In the event of a malfunction of the rolling shutter gate, a "gate malfunction" diagnostic message will appear on the display.

The activation type that makes the rolling shutter gate ready for operation is displayed on the LOGO! display.

In manual mode, the rolling shutter gate can be set to "open" and "closed" using the LOGO! cursor keys.

Fields of application

Applications

- Hoisting devices
- Transport equipment
- Rolling shutter gate controls
- Conveyor systems
- Access monitoring
- Automotive industry

Advantages/benefits

- Cost-effective combination of sensor technology and control functions through the LOGO! logic module
- Precise detection of objects by means of fast and accurate optical proximity switches
- Direct display of messages and device states (e.g., motor operating hours, rolling shutter gate malfunction) via the integrated display of the LOGO! logic module. The display has 4 lines with 16 characters each. "Ticker mode" allows the display of up to 32 characters per line.
- Manual control with the LOGO! cursor keys (e.g., rolling shutter gate OPEN / CLOSED)
- Unassigned digital outputs of LOGO! can be programmed, for example, for switching signal lamps.

2.2 Hardware and software components used

Products

* Attachment to DIN rail

All hardware components such as circuit breakers, retro-reflective sensors, anticrushing device, contactors, motors, etc. must be adapted to the conditions in your plant.

The solution presented in this application is not suitable for controlling gates with requirements for the protection of persons in hazardous areas.

If there is such a requirement, the hardware components of the required safety category have to be selected. (E.g., safety sensors from Leuze electronic GmbH + Co. KG).

3 Function Mechanisms of this Application

3.1 Retro-reflective sensor

Measuring principle

The optical proximity switches used here are retro-reflective sensors. Transmitter and receiver are located in one housing.

A special reflector is necessary that rotates the polarized light by 90°. This ensures that even objects with a smooth reflective surface such as stainless steel are reliably detected although the light beam is reflected.

Figure 3-1

 Transmitter with polarization filter
 Reflector, 90° polarizing
 Receiver with polarization filter rotated by 90°
 Object with a smooth reflective surface

Sensitivity setting

In order to reliably detect even small objects in the light beam, you have to set the sensitivity of the retro-reflective sensor. For more information, please refer to the appropriate manual.

Figure 3-2

Switching outputs

The retro-reflective sensor used here has 2 switching outputs. Output WH (2) provides a 1 signal when the light beam is interrupted. Output BK (4) provides a 1 signal when the light beam is not interrupted. The application uses the BK output.

3.2 Anti-crushing device

Types

For all types, the anti-crushing device consists of a hollow rubber profile. They differ in the method of measurement of how contact is detected.

- Optically: The rubber profile's change in shape reduces the light beam in the hollow space.
- Mechanically: The rubber profile's change in shape causes two conductors in the hollow space to contact.

For both methods of measurement, a module connected downstream detects the signal difference and signals the contact via a switching contact.

3.3 LOGO! logic module / LOGO! TD

Inputs and outputs

Table 3-1

Inputs	Function		
11	Contactor checkback signal, rolling shutter gate OPEN = 1 (NO)		
12	Contactor checkback signal, rolling shutter gate CLOSED = 1 (NO)		
13	Retro-reflective sensor outside, light beam interrupted = 0 (NC)		
14	Retro-reflective sensor inside, light beam interrupted = 0 (NC)		
15	Anti-crushing device, contact activated = 0 (NC)		
16	Key switch, no calendar control = 1 (NO)		
17	Limit switch OPEN (NO)		
18	Limit switch CLOSED (NO)		
Outputs	Function		
Q1	Set rolling shutter gate to OPEN = 1		
Q2	Set rolling shutter gate to CLOSED = 1		

Controlling the rolling shutter gate

The rolling shutter gate opens when at least one of the two retro-reflective sensors is interrupted. When no retro-reflective sensor is interrupted, the rolling shutter gate closes after a delay time of 10 seconds.

The downward movement of the rolling shutter gate stops and reverses for 0.5 seconds if the anti-crushing device on the bottom of the rolling shutter gate is activated.

Opening the rolling shutter gate is restricted to working hours. The key switch can be used to work around this restriction.

In manual mode, the rolling shutter gate can be set to "open" and "closed" using the LOGO! cursor keys as described in section 5.2. When doing so, the LOGO! cursor keys must be kept pressed for safety reasons. If the rolling shutter gate has been set to "open" using the cursor key, it cannot be closed by another activation type. Manual mode stops when the rolling shutter gate has been set to "closed" using the cursor key.

The retro-reflective sensors are not active in manual mode (using the cursor keys of LOGO! or LOGO! TD).

The runtime for opening and closing the rolling shutter gate is limited to 5 seconds. After this time has elapsed, the relevant contactor will be deactivated. The counterclockwise and clockwise rotation of the motor is controlled using a reversing contactor combination by reversing two of the three phases.

The program includes mutual interlocking of the two contactors.

LOGO! display / LOGO! TD

Diagnostics can be derived from comparing actual and setpoint state of the contactors. For this purpose, an auxiliary contact of the contactor is read in via a LOGO! input.

If this comparison yields a difference, a malfunction can be assumed – an appropriate "gate malfunction" diagnostic message will be displayed on the LOGO! display for 10 seconds.

When the rolling shutter gate opens or closes and the new position has not been reached after 5 seconds, the "gate malfunction" diagnostic message will also be displayed on the LOGO! display for 10 seconds.

In any case of "gate malfunction" the reason has to be solved. For clearance of the malfunction the rolling shutter gate must be relieved by driving in manual mode via LOGO! cursor keys in the opposite direction.

The position of the rolling shutter gate is displayed as a text and as a bar graph. The position of the rolling shutter gate is emulated from the runtime of the rolling shutter gate and the signals of the limit switches.

If there is a malfunction of the rolling shutter gate, the position of the rolling shutter gate is unknown. In this case, the bar graph is alternately displayed with 0 % or 100 %.

The activation type of the rolling shutter gate, i.e. weekly timer, key switch or cursor keys, is also displayed on the LOGO! display.

4 Installation

4.1 Connection to a 400V three-phase mains

Figure 4-1

LOGO! Set 18 consists of the components described in chapter 0:

LOGO!Power (1) provides the power supply for the 24V loads and is protected by a miniature circuit breaker (2).

The LOGO! logic module (3) has relay outputs and an integrated calendar and time function.

Two digital outputs control the direction of rotation of the asynchronous motor (4) by means of a reversing contactor combination that consists of SIRIUS contactors (5). The contactor checkback signals are connected to two digital inputs (11, 12) of the LOGO! logic module.

A SIRIUS miniature circuit breaker (6) connected directly to the three-phase mains protects the asynchronous motor.

Two retro-reflective sensors (7) are connected to two digital inputs (I3, I4) of the LOGO! logic module.

The evaluation unit of the anti-crushing device (8) is connected to a digital input (I5) of the LOGO! logic module.

A key switch (9) is connected to a digital input (16) of the LOGO! logic module.

Two limit switches (12) are connected to two digital inputs (I7, I8) of the LOGO! logic module.

Note Always follow the installation guidelines for LOGO! and all components shown here (see section **Fehler! Verweisquelle konnte nicht gefunden werden.** \5\).

4.2 Connection to a 230V mains

Note If no three-phase mains is available, a SINAMICS G110 can be connected to a single-phase mains for test setup purposes. At its output, the SINAMICS G110 provides a three-phase alternating voltage.

This setup is only suitable for test purposes.

Figure 4-2

The connection diagram of LOGO! Set 18 for the 230V mains is based on the connection diagram for the 400V mains.

Deviating from this connection diagram, a SINAMICS G110 frequency inverter (11) is connected in front of the SIRIUS circuit breaker. The SINAMICS G110 frequency inverter is connected to the 230V mains via an I.v. h.b.c. fuse (10).

A digital output of the LOGO! logic module (Q3) is connected to digital inputs 2 and 3 of the frequency inverter to enable the frequency inverter.

4.3 Installing, wiring and parameterizing the hardware

Table 4-1

No.	Action	Remark
1.	Install the components listed in chapter 0	Mount the components marked with * on a DIN rail
2.	Wire all components. Do not switch on the power supply yet.	See • Chapter 4.1: Connection to a 400V mains • Chapter 4.2: Connection to a 230V mains
3.	The motor must not yet be connected.	-

4.4 Parameterizing LOGO!

The program listed in Table 2-4 contains a parameterization for LOGO! 0BA6. If you are using LOGO! 0BA7, you have to set the following parameters:

Table 4-2

No.	Action	Remark	
1.	In LOGO!Soft Comfort, go to the Tools > Select Hardware menu option		
2.	Select the 0BA7 device		
3.	In LOGO!Soft Comfort, go to the Tools > Ethernet Connections menu option		
4.	Enter the IP address and subnet mask of your LOGO!	E.g., IP address: 192.168.0.3 Subnet mask: 255.255.255.0 see \5\	

4.5 Configuring the SIRIUS circuit breaker

Table 4-3

No.	Action	Remark
1.	If you are using the motor listed in chapter 0, set the setting screw of the SIRIUS circuit breaker to 0.9A.	

4.6 Configuring the SINAMICS G110 frequency inverter

Follow the steps in the table below only if you are using the SINAMICS G110 frequency inverter listed in chapter 0. The values in the "Value" column refer only to the asynchronous motor listed in chapter 0.

Table 4	-4
---------	----

No.	Action	Value	Parameter
1.	Press the P parameter key on the BOP of the SINAMICS G110 to go to parameterization mode. Use the arrow keys to access the parameters listed below.	-	P 0000
2.	Start quick commissioning.	1	P 0010
3.	Set the regional settings to Europe.	0	P 0100
4.	Set the rated motor voltage to 230V.	230	P 0304
5.	Set the rated motor current to 0.73A.	0.73	P 0305
6.	Set the rated motor output to 0.12kW.	0.12	P 0307
7.	Set the rated motor frequency to 50Hz.	50.00	P 0310
8.	Set the rated motor speed to 1350 min-1.	1350	P 0311
9.	As the command source of the SINAMICS G110, select the terminal strip.	2	P 0700
10.	As the frequency setpoint for the SINAMICS G110, allow fixed frequencies.	0	P 1000
11.	Set the minimum frequency to 0Hz.	0.00	P 1080
12.	Set the maximum frequency to 50Hz.	50.00	P 1082
13.	Set the startup time from minimum to maximum speed of the asynchronous motor to 1s.	1.00	P 1120
14.	Set the ramp-down time from maximum to minimum speed of the asynchronous motor to 1s.	1.00	P 1121
15.	Finish quick commissioning.	1	P 3900
16.	Enable more parameters.	3	P 0003
17.	Set the function for digital input 0 to "Fixed frequency + ON".	16	P 0701
18.	Set the function for digital input 1 to "ON / OFF1".	1	P 0702
19.	Set the fixed frequency selected via digital input 0 to 50Hz.	50.00	P 1001
20.	Save all values in the EEPROM.	1	P 0971

1.	Remove the motor cover. Change the wiring to "star" as shown in the picture to the right.	rear side
2.	Connect the motor to the contactor combination.	contactor 1 contactor 2 contactor 2 conta

Installing the software

Note It is assumed that the necessary **LOGO!Soft Comfort** software has been installed on your PC and that you are familiar with handling this software.

5 Operation of the Application

5.1 Functions

The following functions are included in this application:

- Manually setting the rolling shutter gate to OPEN and CLOSED using the LOGO! cursor keys; alternatively, LOGO! TD can also be used for operation.
- Automatically setting the rolling shutter gate to OPEN and CLOSED by means of retro-reflective sensors
- Anti-crushing device
- Access during working hours with the LOGO! weekly timer
- Access outside working hours with the key switch
- "Gate malfunction" diagnostics

5.2 Activation types and operation using LOGO! cursor keys

Activating the rolling shutter gate via weekly timer or key switch

The activation type is displayed in line 4.
