Synchronous motors 1FK7

Operating instructions · 03/2011
### Legal information

**Warning notice system**

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

<table>
<thead>
<tr>
<th><strong>DANGER</strong></th>
<th>Indicates that death or severe personal injury will result if proper precautions are not taken.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WARNING</strong></td>
<td>Indicates that death or severe personal injury may result if proper precautions are not taken.</td>
</tr>
<tr>
<td><strong>CAUTION</strong></td>
<td>With a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.</td>
</tr>
<tr>
<td><strong>CAUTION</strong></td>
<td>Without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.</td>
</tr>
<tr>
<td><strong>NOTICE</strong></td>
<td>Indicates that an unintended result or situation can occur if the corresponding information is not taken into account.</td>
</tr>
</tbody>
</table>

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

**Qualified Personnel**

The product/system described in this documentation may be operated only by personnel qualified for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

**Proper use of Siemens products**

Note the following:

| **WARNING** | Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be adhered to. The information in the relevant documentation must be observed. |

**Trademarks**

All names identified by © are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

**Disclaimer of Liability**

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Introduction

1.1 About these operating instructions

These operating instructions describe the motor and explain how to handle the motor from the delivery up to disposal.

Before you start to handle the motor, you must read these operating instructions. to ensure safe, problem-free operation and to maximize the service life.

These operating instructions are valid in conjunction with the relevant SIEMENS Configuration Manual.

Siemens continually strives to improve the quality of information provided in these operating instructions. If you find any mistakes or would like to offer suggestions about how this document could be improved, please contact the Siemens Service Center.

Always follow the safety instructions and notices in these operating instructions. The warning notice system is explained on the rear of the inside front.

Text format features

In addition to the safety-related notices and instructions that you must carefully observe, you will find the text in these operating instructions is formatted in the following way:

1. Handling instructions are always shown as a numbered list. Always perform the handling steps in the sequence given.

- Lists are formatted as bulleted lists.
  - Lists at the second level are hyphenated.

Note

A Note is an important item of information about the product, handling of the product or the relevant section of the document. Notes provide you with help or further suggestions/ideas.
Introduction

1.1 About these operating instructions
Safety instructions

2.1 General safety notes

Safety and commissioning information for converter-fed low-voltage three-phase motors

⚠️ DANGER

All activities associated with transporting, connecting, commissioning, and maintaining the motors must be carried out by properly trained, responsible personnel (observe DIN EN 50110-1; IEC 60364).

Failure to follow proper procedures may result in injury or material damage.

Special versions and design versions may differ with respect to certain technical aspects. If in doubt, you are strongly advised to contact the manufacturer, specifying the type designation and serial number (see rating plate), or arrange for any maintenance work to be carried out by the SIEMENS Service Center.

Systems and machines with converter-fed low-voltage three-phase motors must fulfill the protective requirements of the EMC Directive.

The machine manufacturer is responsible for ensuring that installation is carried out properly.

The signal and power cables to the motor must be shielded.

The information provided by the converter manufacturer regarding EMC-compliant installation must be observed.

Intended use

These motors are designed for use in industrial or commercial systems. They comply with the EN 60034-1 standards and the relevant associated sections.

⚠️ WARNING

It is forbidden to install them in hazardous areas unless they are explicitly designed for this.

If more stringent requirements are necessary in special cases (e.g. shock-hazard protection in non-commercial applications where children are likely to be present), the customer must implement the relevant measures to ensure that these requirements are fulfilled.

Any alternative data specified on the rating plate must be taken into account. The conditions at the installation location must comply with the rating plate specifications.

The motors are designed for use in sheltered areas under normal climatic conditions, such as those found in production environments.
2.2 Safety and application instructions

The safe use of electrical machines

⚠️ WARNING

Rotating or live parts
Rotating or live parts are dangerous.
Fatal or severe injuries and substantial material damage can occur if the necessary covers are removed or if the machines are not handled, operated, or maintained properly.
Covers must only be removed and the motor operated in accordance with the relevant regulations. The motor must be maintained on a regular basis.

Qualified personnel

These operating instructions only contain the information necessary for ensuring that the motor is operated by properly trained personnel in accordance with its intended purpose.

Those responsible for plant safety must ensure the following:

- The basic planning work for the plant or system and all work relating to transportation, assembly, installation, commissioning, maintenance and repairs is carried out by qualified personnel and checked by responsible, suitably skilled personnel.
- The operating instructions and the motor documentation are available at all times.
- The technical data and specifications relating to installation, connection, ambient and operating conditions are taken into account at all times.
- The system-specific installation and safety regulations are observed.
- Personal protective equipment is used.
- Unqualified persons must not work on or in the vicinity of these motors at any time.
- If the motors are used outside industrial areas, the installation site must be protected against unauthorized access by means of suitable protective measures (e.g. safety fences and warning signs).

Note

Siemens Service Center

For any service work you may require, you are advised to contact your nearest Siemens Service Center to request their services and support for maintenance activities.
Observing the five safety rules

For your personal safety and to prevent material damage when working on the machine, always observe the safety instructions and the following five safety rules. Apply the five safety rules in the order stated before starting work at the machine.

1. Isolate the equipment from the power supply
   You must also make sure that the auxiliary circuits are also disconnected.
2. Protect against reconnection.
3. Make sure that the equipment is de-energized and in a no-voltage condition.
4. Ground and short-circuit
5. Cover or enclose adjacent components that are still live.

After the work has been completed, undo the previous measures in the reverse order.

Thermal hazard

⚠️ CAUTION

The surface temperature of the motors can exceed 100 °C.

Do not touch hot surfaces!

Temperature-sensitive components (electric cables, electronic components) must not be placed on hot surfaces. If the motors overheat, this can destroy the windings/bearings and permanent magnets may become demagnetized.

Only operate the motors in conjunction with effective temperature monitoring!
Notes about electromagnetic fields

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Electromagnetic fields</td>
</tr>
</tbody>
</table>
Electromagnetic fields are generated by the operation of electrical power equipment – such as transformers, converters or motors.

Electromagnetic fields can destroy electronic devices, which could cause them to malfunction. For example, the operation of heart pacemakers can be impaired, potentially leading to personal injury or even death. It is therefore forbidden for persons with heart pacemakers to enter these areas.

The company operating the plant is responsible for taking appropriate measures (labels and hazard warnings) to adequately protect operating personnel and others against any possible risk.

- Observe the relevant local and domestic health and safety regulations. In Germany, "electromagnetic fields" are subject to regulations BGV B11 and BGR B11 stipulated by the German statutory industrial accident insurance institution.
- Display adequate hazard warning notices.
- Place barriers around hazardous areas.
- Take measures, e.g. using shields, to reduce electromagnetic fields at their source.
Description

3.1 Product description

Overview

1FK7 motors are compact permanent-magnet synchronous motors. The available options, gear units and encoders, together with the expanded product range, mean that the 1FK7 motors can be optimally adapted to any application. They therefore also satisfy the permanently increasing demands of state-of-the-art machine generations. 1FK7 motors can be combined with the SINAMICS S120 drive system to create a high-performance system with a high degree of functionality. The integrated encoder systems for speed and position control can be selected depending on the application. The motors are designed for operation without external ventilation as the heat is dissipated through the motor surface. 1FK7 motors have a high overload capability.

Benefits

1FK7 Compact motors offer:

- Space-saving installation thanks to extremely high power density
- Can be universally used for many applications
- Wide range of motors

1FK7 High Inertia motors offer:

- Rugged closed-loop control properties for high or variable load moments of inertia
- Low optimization and commissioning overhead to compensate disturbances

Applications

- Machine tools
- Robots and handling systems
- Wood, glass, ceramics and stone working
- Packaging, plastics and textile machines
- Auxiliary axes

</table>
### 3.2 Technical features

#### Integrated encoder systems for motors with DRIVE-CLiQ interface
- AS24DQI absolute encoder single-turn 24 bit, for SH 36 to SH 100
- AM24DQI absolute encoder 24 bit + 12 bit multiturn, for SH 36 to SH 100
- AS20DQI absolute encoder single-turn 20 bit, for SH 36 to SH 100
- AM20DQI absolute encoder 20 bit + 12 bit multiturn, for SH 36 to SH 100
- IC22DQ incremental encoder 22 bit + commutation position, 11 bit, for SH 20 to SH 100
- AM22DQI absolute encoder 22 bit + 12 bit multiturn, for SH 36 to SH 100
- AM20DQ absolute encoder 20 bit + 12 bit multiturn, for SH 28
- AM15DQ absolute encoder 15 bit + 12 bit multiturn, for SH 28
- R15DQ resolver 15 bit, for SH 28
- R14DQ resolver 14 bit, for SH 28

#### Connecting
- Connectors for signals and power, can be rotated

#### Holding brake
- Optional mounted holding brake (free of backlash, 24 V)

#### Second rating plate
- Enclosed separately

---

1) 1FK701 only available in degree of protection IP54 with paint finish, planetary gearbox not possible
2) Radial eccentricity of the shaft extension, concentricity of centering edge and axial eccentricity of the mounting flange to the axis of the shaft extension.
3) P/R = Pulses/Revolution
3.3 Rating plate (type plate)

The rating plate (type plate) contains the technical data relevant for the motor.

---

</table>
3.4 Design

3.4.1 Standards and regulations

The motors comply with the following regulations according to IEC / EN 60034:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ratings and operating performance</td>
<td>IEC/EN 60034-1</td>
</tr>
<tr>
<td>Degree of protection (1)</td>
<td>IEC/EN 60034-5</td>
</tr>
<tr>
<td>Type of construction (1)</td>
<td>IEC/EN 60034-7</td>
</tr>
<tr>
<td>Terminal markings</td>
<td>IEC/EN 60034-8</td>
</tr>
<tr>
<td>Noise emission</td>
<td>IEC/EN 60034-9</td>
</tr>
<tr>
<td>Temperature monitoring</td>
<td>IEC/EN 60034-11</td>
</tr>
<tr>
<td>Vibration severity levels</td>
<td>IEC/EN 60034-14</td>
</tr>
</tbody>
</table>

(1) The degree of protection and type of construction of the motor are stamped on its rating plate.

The three-phase motors comply with the relevant sections of EN 60034 and EN 60204-1. Three-phase motors comply with the Low-Voltage Directive 2006/95/EC. Motors which have "UR" stamped on their rating plates comply with UL regulations.

Low-voltage motors are components designed for installation in machines in accordance with the Machinery Directive. They must not be commissioned until it has been verified that the end product complies with this directive (also take into account EN 60204-1).

Note

Make sure that your end product is in compliance with all of the applicable laws! The applicable domestic, local, and system-specific regulations and requirements must be taken into account.

3.4.2 Types of construction

The motor has type construction IM B5 (IM V1, IM V3).

3.4.3 Degree of protection

1FK7 motors are available with IP64 or IP65 degree of protection. The degree of protection of the motor is specified on the rating plate.
3.4 Design

3.4.4 Ambient conditions

The following temperature ranges apply to naturally-cooled motors.

- Permissible temperature range in operation: \( T = -15 \, ^\circ C \) to \( +40 \, ^\circ C \)
- Permissible temperature range during storage: \( T = -20 \, ^\circ C \) to \( +70 \, ^\circ C \)

For deviating conditions (ambient temperature > 40°C or installation altitude > 1000 m above sea level) the permissible torque/power must be determined from the following table. Ambient temperatures and installation altitudes are rounded off to 5°C and 500 m respectively.

<table>
<thead>
<tr>
<th>Installation altitude above sea level [m]</th>

</tr>
<tr>
<td>4000</td>
<td>0.82</td>
</tr>
</tbody>
</table>

NOTICE

What has to be observed when installing the motors

1FK7 motors are not suitable for operation
- in salt-laden or corrosive atmospheres
- outdoors

3.4.5 Cooling

Natural cooling

The rated data only applies when the ambient temperature does not exceed 40 °C (104 °F) as a result of the installation conditions.

To ensure sufficient cooling, a minimum clearance of 100 mm from adjacent components must be observed at three lateral surfaces.
3.4.6 Noise emission

When operated in the speed range 0 to rated speed, 1FK7 motors can reach the following measuring-surface sound pressure level Lp(A):

Table 3-5 Sound pressure level

<table>
<thead>
<tr>
<th>Shaft height</th>
<th>Measuring-surface sound pressure level Lp(A)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1FK701 to 1FK704</td>
<td>55 dB(A) + 3 dB tolerance</td>
</tr>
<tr>
<td>1FK706</td>
<td>65 dB(A) + 3 dB tolerance</td>
</tr>
<tr>
<td>1FK708 to 1FK710</td>
<td>70 dB(A) + 3 dB tolerance</td>
</tr>
</tbody>
</table>

The motors are certified for a wide range of installation and operating conditions. These conditions such as rigid or vibration-isolated foundation design influence noise emission, sometimes significantly.
4 Preparing for use

4.1 Shipping and packaging

Checking the delivery for completeness

The drive systems are assembled on an individual basis. Upon receipt of the delivery, check immediately whether the items delivered are in accordance with the accompanying documents. Siemens will not accept any guarantee for claims relating to defects which are submitted at a later date.

- Report any apparent transport damage to the company delivering the equipment immediately.
- Report any apparent defects/missing components to the appropriate Siemens office immediately.

A second rating plate is included in the scope of delivery and can be attached close to the motor as an additional means of making the motor data available.

4.2 Transport and storage

4.2.1 Transport

Use suitable load suspension devices when transporting and installing the motor. Country-specific regulations must be observed.

If the motor is not to be commissioned immediately following delivery, it must be stored in a dry, dust-free room that is not susceptible to vibration (see the Chapter “Storage”).

⚠️ WARNING

Danger during lifting and transport operations!

Improper handling, devices and equipment that are unsuitable or damaged can result in personal injury and/or material damage.

Lifting devices, industrial trucks, and load suspension devices must comply with requirements. Pay attention to the lifting capacity of the hoisting gear. Do not attach any additional loads. To hoist the motor, use suitable cable-guidance or spreading equipment (particularly if the motor is equipped with mounted assemblies). The weight of the motor is specified on the rating plate (type plate). The motor must not be lifted or transported by means of the power connector, signal connector, or at the Sensor Module. The motor can fall down. This can result in serious physical injury or material damage to the motor up to it's complete destruction.
### WARNING

**Transporting and lifting the motor using its eyebolts**

In the case of larger motors, eyebolts are attached to the bearing end shields or threads to attach eyebolts.

- Eyebolts must be screwed in completely and secured by hand (approx. 8 Nm); do not overtighten.
- Do not use deformed or damaged eyebolts.
- Do not remove the laminated fiber washers.
- Loads applied transversely to the plane of the eyebolt are not permitted.
- The motor must only be lifted at the eyebolts at the bearing end shields. It is not permissible to attach eyebolts to the shaft extension.

---

*Figure 4-1  Lifting and transporting the motor using slings*
4.2.2 Storage

The motors can be stored for up to two years in a dry, dust-free room that is not susceptible to vibration (\(v_{\text{eff}} < 0.2 \text{ mm/s}\)) without the specified storage time being reduced.

**CAUTION**

Seizure damage to bearings
If the motors are stored incorrectly, bearing seizure damage can occur (e.g. brinelling) as a result of vibrations.

Storing indoors

- Apply a preservation agent (e.g. Tectyl) to bare, external components (e.g. shaft ends) if this has not already been carried out in the factory.
- Store the motor in an area that fulfills the following requirements:
  - Dry, dust-free, frost-free and vibration-free The relative air humidity should be less than 60% and the temperature should not drop below -15 °C (to EN 60034-1).
  - Well ventilated
  - Offers protection against extreme weather conditions
  - The air in the storage area must not contain any harmful gases.
- Protect the motor against shocks and humidity.
- Make sure that motor is covered properly.
- Avoid contact corrosion. You are advised to rotate the end of the shaft manually every three months.

Protection against humidity

If a dry storage area is not available, the following measures must be taken:

- Wrap the motor in humidity-absorbent material and then wrap it in film so that it is air tight.
- Include several bags of desiccant in the seal-tight packaging. Check the desiccant and replace as required.
- Place a humidity meter in the seal-tight packaging to indicate the level of air humidity inside it.
- Inspect the motor on a regular basis.

<tr>
<td>When installing and mounting the motor, ensure that the shaft extension is protected against impact and pressure.</td>
</tr>
</tbody>
</table>

**Note**
Observe the technical data on the labeling plates on the motor enclosure.

The following must be taken into account when installing motors

- Observe the data on the rating plate, as well as the warning and information plates on the motor.
- Observe permissible radial and axial forces (refer to the configuration manual). Axial forces are not permitted for motors equipped with an integrated brake.
- Check that the motors comply with the conditions (e.g. temperature, installation altitude) at the installation location.
- Their use is prohibited in hazardous zones and areas.
- Ensure that the shaft extension is completely free of any anti-corrosion protection (use a commercially available solvent).
- For natural-cooled motors, it must be ensured that thermal losses can be properly dissipated (see the chapter titled "Cooling").
- If the motor is installed vertically with the shaft extension facing up, ensure that no liquid can enter the upper bearing.
5.1 Installation

- Eyebolts that have been screwed in must either be tightened or removed after installation.
- Ensure that the flange joint sits evenly; avoid applying an excessive force to fixing screws when tightening. Use hexagon socket head cap screws with a property class of 8.8. Observe the tightening torques for the fixing screws of the motor flange.

5.2 Attaching transmission elements

**NOTICE**

Do not subject the motor's shaft and bearings to impact. Do not exceed the permissible axial and radial forces at the shaft extension, as defined in the configuration specifications. Axial forces are not permitted for motors with an integrated holding brake.

Suitable equipment (see figure) must be used when fitting and removing transmission elements (e.g. coupling, gear wheel, belt pulley).

- Use a threaded hole in the shaft extension.
- If necessary, heat up the transmission elements.
- When removing transmission elements, use an intermediate disk or washer to protect the centering in the shaft extension.
- If necessary, fully balance the motor with transmission elements in accordance with ISO 1940.

![Figure 5-1 Fitting/removing transmission elements; A = intermediate disk/washer (to protect the centering in the shaft extension)](image-url)
5.3 Vibration response

Motors with a keyway are balanced with a half fitted key by the manufacturer. The vibration response of the system at the installation location is influenced by transmission elements, any mounted parts, the alignment, the installation, and external vibrations. As a result, the motor's vibration values may change.

The motors conform to vibration severity grade A in accordance with EN 60034-14 (IEC 60034-14).

The specified values refer only to the motor. These values can be increased at the motor due to the overall vibration response of the complete system after the drive has been mounted.

The vibration severity level is maintained up to the rated speed ($n_N$).

Figure 5-2 Vibration severity levels
6 Connecting

6.1 Electrical connection

6.1.1 Safety instructions

⚠️ DANGER

Risk of electric shock
When the rotor is turning, a voltage of approx. 300 V is available at the motor terminals.
All work performed on electrical components must be carried out when the motor is at a standstill. This also applies to auxiliary circuits.
Converters and connectors must only be installed by appropriately trained personnel.
The connectors may only be installed or removed when the equipment is in a no-voltage condition.
Regulations regarding work carried out in electrical installations must be observed.

⚠️ CAUTION

Electrostatic sensitive devices
The motor contains electrostatic sensitive devices. Touching signal connections with electrostatically charged hands or tools can result in malfunctions.
Note the ESD protection measures.

Safety regulations for work performed in electrical installations to EN 50110-1
(DIN VDE 0105-100):

- Disconnect the system.
- Protect against reconnection.
- Make sure that the equipment is de-energized and in a no-voltage condition.
- Ground and short-circuit.
- Cover or enclose adjacent components that are still live.
6.1 Electrical connection

6.1.2 Circuit diagram

The circuit diagram contains information about wiring and connecting the motor winding.

![Circuit diagram]

Figure 6-1  Circuit diagram

6.1.3 Motor connection

⚠️ DANGER

Warning regarding motor damage!
The motor will be destroyed if it is directly connected to the three-phase line supply. Only operate the motors with the appropriately engineered converters! Ensure the correct phase sequence is used!

Encoder systems and temperature sensors are electrostatic sensitive devices (ESD). Do not touch the connections with either hands or tools that could be electrostatically charged!

- We recommend that SIEMENS prefabricated cables are used (not included in the scope of delivery). These cables reduce installation costs and increase operational reliability (see the Configuration Manual).
- The manufacturer of the plant/machine is responsible for the ensuring that the installation is performed correctly.
- Observe the data on the rating plate and the circuit diagrams.
- Adapt the connecting cables in accordance with the type of use and the voltages and currents that arise.
- When fed from a converter, high-frequency current and voltage oscillations in the motor feeder cables can cause electromagnetic interference. Use shielded power cables and signal lines. Carefully observe the EMC information of the converter manufacturer.
- Make sure that the inside of the connector is clean and free of cable cuttings and moisture.
- Avoid protruding cable ends.
- Check seals and sealing surfaces of the connectors to ensure that the degree of protection is maintained.
- Take measures to ensure that connecting cables cannot rotate, are not subject to strain and pushing force and also provide anti-kink protection. It is not permissible to subject the connector to continuous force.

- The coding groove of the plug-in connection must be inserted so that it is aligned in the socket connector and the screw cap must be tightened by hand as far as it will go.

---

**CAUTION**

**High thermal stress**

For high thermal stresses, e.g. overload when the motor is stationary, the protective function with integrated temperature sensor may not be adequate. In these cases, apply additional protective measures, e.g. \( I^2t \) monitoring.
### Current-carrying capacity for power and signal cables

The current carrying capacity of PVC/PUR-insulated copper cables is specified for routing types B1, B2, C and E under continuous operating conditions in the table with reference to an ambient air temperature of 40 °C. For other ambient temperatures, the values must be corrected by the factors from the "Derating factors" table.

NOTICE
Rotating the connectors
- It is not permissible that the specified rotation range is exceeded.
- In order to guarantee the degree of protection, max. 10 revolutions are permissible.
- Connectors should be rotated using the matching mating connector located on the connector thread. Only rotate Sensor Modules by hand. The use of pipe wrenches, hammers, or similar is not permitted.

Figure 6-4 Ability to rotate the connector using 1FK7xxx-5 motors as an example
6.1.5 Rotating the connector for 1FK7xxx-2, 1FK7xxx-3, 1FK7xxx-4

Power connectors and signal connectors can be rotated to a limited extent. A suitable socket connector can be used to rotate the angle plug. Make sure that the socket connector is completely secure to avoid damaging the pin contacts. For encoders with integrated Sensor Modules (DQI) the cable outlet towards the top is fixed and cannot be changed.

6.1.6 Motors with DRIVE-CLiQ interface

Motors designed for SINAMICS drive systems have an integrated encoder and temperature evaluation system as well as an electronic rating plate. The connection to the converter system uses a 10-pole RJ45plus socket. This is known as a DRIVE-CLiQ interface. The pin assignment is independent of the motor-internal encoder.

**NOTICE**

The Sensor Module is in direct contact with electrostatically-sensitive components. It is not permissible to touch the connections with either hands or tools that could be electrostatically charged.

The signal connection between the motor and Motor Module is established using a DRIVE-CLiQ cable (MOTION-CONNECT). The DRIVE-CLiQ cable connector must be inserted far enough so that the catch springs engage.

![Diagram of Encoder interface with DRIVE-CLiQ](image)

Figure 6-5 Encoder interface with DRIVE-CLiQ
6.1.7 Motors without DRIVE-CLiQ interface

If a motor is not equipped with a DRIVE-CLiQ interface, the speed encoder and temperature sensor are connected via a signal connector.

Motors without DRIVE-CLiQ require a Sensor Module Cabinet (SMC) for operation with a SINAMICS S120 drive system. The motor is connected to the SMC via a signal line. The SMC is connected to the motor via a DRIVE-CLiQ cable (MOTION-CONNECT).

![Diagram of encoder connection without DRIVE-CLiQ](image)

Figure 6-6 Encoder connection without DRIVE-CLiQ

6.1.8 Connecting to a converter

Selecting and connecting the cable

To connect the motor to a converter, use MOTION-CONNECT cables or shielded connecting cables. The protective braided shield of the cable must be made up of as many strands as possible and have good electrical conductivity. Braided shields made of copper or aluminum are very suitable.

The shield must be connected at both ends to the motor and the converter; unshielded cable ends must be kept as short as possible.

In order to ensure good discharge of high-frequency currents, provide a 360° contact through a large surface area at the converter.
Commissioning

7.1 Measures prior to commissioning

Before commissioning the system, check that it is properly installed and connected. The drive system must be commissioned as described in the operating instructions for the converter/inverter.

![DANGER]

Risk of electric shock

When commissioning/operating electric motors, parts of the motor are always at a dangerous voltage. If this motor is not correctly handled/operated, this can result in death or severe personal injury as well as significant material damage. All of the warning information on the product must be carefully observed!

![WARNING]

Danger from rotating rotor.

Provide the appropriate guards and covers for transmission elements.

Note

This list below does not claim to be complete. It may be necessary to perform additional checks and tests in accordance with the specific situation at the plant or system.

Mechanical connection

Make sure that:

- Touch protection measures are in place for moving and live parts.
- The fitted keys in the shaft extension (if available) must be firmly secured to prevent them from being flung out.
- The motor has been correctly installed and aligned.
- The rotor can turn without coming into contact with other parts and components.
- The operating conditions correspond to the data specified on the rating plate.
Commissioning

7.1 Measures prior to commissioning

- All fixing screws, connecting elements, and electrical connections are tight and have been attached properly.
- The transmission elements have the proper setting conditions according to type, for example:
  - Couplings are aligned and balanced.
  - The belt tension is properly adjusted if a belt drive is used.
  - Gear tooth flank play and gear tooth tip play as well as radial play are properly adjusted if a gear drive is used.

Electrical connection

Make sure that:
- The grounding and equipotential bonding connections have been established correctly.
- The brake is operating perfectly.
- The specified speed limit $n_{\text{max}}$ is not exceeded when operated from a converter.

Monitoring equipment

Make sure that:
- Appropriately configured control and speed monitoring functions are being used to ensure that the motor cannot exceed the permissible speeds specified on the rating plate.
- Any supplementary motor monitoring devices and equipment have been correctly connected and are fully functional.

Brake (optional)

Make sure that:
- Applying the operating voltage causes the brake to open.
- The brake functions (opens, closes) correctly.
7.2 Switching on

Before you switch on the motor, ensure that the parameters of the frequency converter have been assigned correctly.

Use the appropriate commissioning tools (e.g. "Drive ES" or "STARTER").

**CAUTION**

Uneven running or abnormal noises

The motor can be damaged by improper handling during transport, storage or installation. If a damaged motor is operated, this can damage the winding or bearings and could even destroy the system.

If the motor is not running smoothly or is making abnormal noises, shut the motor down and try to determine the cause of the fault as it runs down.

**CAUTION**

Observe the maximum speed

The maximum speed $n_{\text{max}}$ is the highest permissible operating speed. The maximum speed is specified on the rating plate.

Exceeding speed $n_{\text{max}}$ can result in material damage or could even completely destroy the motor. An appropriately configured control or an active speed monitoring function in the drive should be used to ensure that the motor cannot exceed the permissible speeds.
8.1 Safety guidelines in operation

![WARNING]

**Do not remove covers when the motor is running**

Rotating or live parts are dangerous. Death, serious injury, or material damage can result if the required covers are removed.

All covers that prevent personnel from coming into contact with active or rotating parts, ensure compliance with the required degree of protection, or ensure proper air guidance and, in turn, effective cooling must not be opened/removed during operation.

![WARNING]

**Faults in operation**

Deviations from normal operation (e.g. increased power consumption, temperature, or vibration levels, unusual noises or smells, tripping of monitoring equipment, etc.) indicate that the machine is not functioning properly. This can cause faults that can result in eventual or immediate death, severe personal injury, or material damage.

Immediately inform the maintenance personnel. If in doubt, shut down the motor immediately, taking into account the plant-specific safety regulations.

![CAUTION]

**Danger of burns**

The temperature of certain parts of the motor can exceed 100 °C. Physical contact can cause serious burns.

Check the temperature of the parts before touching them and take appropriate protective measures if necessary.
8.2 Faults

**Note**

**Damage to the machine caused by faults**

Correct the cause of the fault as specified in the remedial measures section. Repair any damage to the machine/motor.

---

**Note**

When operating the motor with a converter, refer also to the operating instructions of the frequency converter if electrical faults occur.

---

If there are deviations from normal operation or if faults occur, initially proceed according to the following list. In this regard, observe the relevant chapters in the documentation associated with the components of the complete drive system.

Even in test operation, never disable protective functions or devices.

</tbody>
</table>

If the fault still cannot be resolved after applying the measures specified above, please contact the manufacturer or the Siemens Service Center.
8.3 Non-operational periods

Measures for motors that are ready for operation but which are presently not being used

- If the motor is out of service for extended periods of time, operate it at regular intervals (roughly once a month) or at least spin the rotor.
- Refer to the section "Switching on" before recommissioning the motor.

**NOTICE**

**Damage due to improper storage**

The motor can be damaged if it is not stored properly.

If the motor is out of service for extended periods of time, apply suitable anti-corrosion, preservation and ensure that it is kept dry.

When recommissioning the motor after it has been out of service for a longer period of time, carry out the measures recommended in the Chapter "Commissioning".
9.1 Inspection and maintenance

9.1.1 Safety instructions

If you are unclear about anything, consult the manufacturer, specifying the motor type and serial number, or arrange for the maintenance work to be carried out by one of the Siemens Service Centers.

**DANGER**

Risk of electric shock from touching live parts
Live electrical parts are dangerous. Touching these parts will result in an electric shock, which in turn causes death or serious injury.
Before starting work on the machines, make sure that the plant or system has been disconnected in a manner that is compliant with the appropriate specifications and regulations. In addition to the main currents, make sure that supplementary and auxiliary circuits, particularly heating devices, are also disconnected.

**WARNING**

Danger of burns
Some parts of the frame of electrical motors can reach temperatures in excess of 100°C. Touching components when the machine is in operation can cause severe burns.
Do not touch frame parts while the machine is in operation or immediately after machine operation. Allow frame parts to cool off before starting any work.

Safety regulations

Before starting maintenance work, always observe the five safety rules.
1. Disconnect the system.
2. Protect against reconnection.
3. Make sure that the equipment is de-energized and in a no-voltage condition.
4. Ground and short-circuit.
5. Cover or enclose adjacent components that are still live.
9.1 Inspection and maintenance

9.1.2 Maintenance intervals

General

Careful and regular maintenance, inspections, and overhauls are essential for detecting and eliminating faults in good time before they can cause any damage.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Inspection if there are faults or unusual conditions</strong></td>
</tr>
<tr>
<td>Unusual conditions or faults that represent electrical or mechanical overstressing of the three-phase motor, such as overload, short circuit, etc. can cause consequential damage to the machine.</td>
</tr>
<tr>
<td>If there are faults or unusual conditions such as overload or short circuit etc. immediately perform the inspections.</td>
</tr>
</tbody>
</table>

Measures, inspection/maintenance intervals

Operating conditions and characteristics can vary widely. For this reason, only general maintenance intervals can be specified here.

● Maintenance intervals should, therefore, be scheduled to suit the local conditions (pollution/dirt, switching frequency, load, etc.).

● Perform the following measures after the operating time or the interval specified in the following table elapses.

Table 9- 1 Measures after operating times or intervals

<table>
<thead>
<tr>
<th>Measures</th>
<th>Operating times and intervals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace the bearings</td>
<td>Note the recommended bearing replacement intervals (see &quot;Bearing replacement intervals&quot;)</td>
</tr>
<tr>
<td>Replace the radial shaft sealing rings</td>
<td>Approximately every 10,000 operating hours with oil lubrication</td>
</tr>
</tbody>
</table>
9.1.3 Bearing change interval

The bearings are subject to wear and must be replaced after a defined number of operating hours. For average load levels, the bearings must be replaced after approx. 25 000 h.

The lifetime can be extended if the motor is operated under favorable conditions (e.g. low or medium speeds, low radial forces (cantilever forces), vibration load).

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Harsh operating conditions</td>
</tr>
<tr>
<td>If the motor is subject to harsh operating conditions (e.g. continuous operation at $n_{\text{max}}$, high vibration/shock loads, frequent reversing duty etc.), the bearing replacement intervals $t_{\text{LW}}$ can decrease by up to 50%.</td>
</tr>
</tbody>
</table>
9.2 Repair

9.2.1 Safety instructions

Qualified personnel

This machine must be commissioned and operated by qualified personnel only. For the purpose of the safety information in this documentation, a "qualified person" is someone who is authorized to energize, ground, and tag equipment, systems, and circuits in accordance with established safety procedures.

Safety notes

⚠️ WARNING
Rotating or live parts
Rotating or live parts are dangerous. Death, serious injury, or material damage can result if the required covers are removed or if the device is not operated properly.
Before starting work on the motor and, in particular, before opening the covers of live parts, make sure that the motor or system is properly disconnected and is in a no voltage condition.

⚠️ WARNING
Transportation in accordance with proper procedures
Only transport the motor in accordance with the transport guidelines. Death, serious injury, or material damage can result if the motor is not transported properly.
Whenever you have to transport the motor, follow the instructions provided in the section "Transport and storage".
9.2.2 Removing/Installing the encoder

For 1FK7□□-2, 1FK7□□-3 and 1FK7□□-4 motors, the encoder module (with the exception of resolver) can be simply replaced without re-adjustment.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Electrostatic sensitive devices</strong></td>
</tr>
<tr>
<td>Electronic modules contain components that can be destroyed by electrostatic discharge. These modules can be easily destroyed by improper handling.</td>
</tr>
<tr>
<td>To protect your equipment against damage, follow the instructions provided in the chapter &quot;ESD Guidelines&quot;.</td>
</tr>
</tbody>
</table>

**Removal**

1. Disconnect the motor
2. Remove the four fastening screws of the encoder.
3. Remove the encoder

**Installation**

1. Insert the coupling element onto the encoder shaft.
2. Align the coupling element with the coupling half on the motor.
3. Attach the encoder at this position on the motor shaft.
4. Secure the encoder with four screws (tightening torque: 2 to 3 Nm).

---

Figure 9-1 Removing/Installing the encoder
**Note**

**Coupling element**

When replacing the encoder, the coupling element must also be replaced.

<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Motor data (electronic rating plate)</strong></td>
</tr>
<tr>
<td>You must ensure that the new encoder contains the correct motor data. If it does not, the motor may move in an uncontrolled fashion, leading to considerable material damage.</td>
</tr>
</tbody>
</table>

You can purchase a preprogrammed encoder module from the Siemens Service Center by quoting the relevant order number and serial number. If your encoder module is not preprogrammed, it must be programmed with the correct motor data prior to use.
10.1 Decommissioning

10.1.1 Preparing for removal

Disassembly of the machine must be carried out and/or supervised by qualified personnel with appropriate expert knowledge.

1. Contact a certified waste disposal organization in your vicinity. Clarify what is expected in terms of the quality when dismantling the machine and provision of the components.

2. Follow the five safety rules.

3. Disconnect all electrical connections.

4. Remove all liquids such as oil, water, …

5. Remove all cables.

6. Remove the machine fixing elements

7. Transport the machine to a suitable location for disassembly.

Also observe the notes provided in Chapter "Maintenance".

10.1.2 Dismantling the motor

Dismantle the machine using the general procedures commonly used in mechanical engineering.

WARNING

Machine parts can fall

The machine is made up of heavy parts. These parts can fall during dismantling. This can result in death, serious injury, or material damage.

Secure the machine parts being dismantled to prevent them falling.

The motors must be disposed of in accordance with domestic and local regulations as part of the standard recycling process or they can be returned to the manufacturer.
10.2 Disposal

Protecting the environment and preserving its resources are corporate goals of the highest priority for us. Our worldwide environmental management system to ISO 14001 ensures compliance with legislation and sets high standards in this regard. Environmentally friendly design, technical safety and health protection are always firm goals even at the product development stage.

Recommendations for the environmentally friendly disposal of the machine and its components are given in the following section. Be sure to comply with local disposal regulations.

Components

Sort the components for recycling according to whether they are:

- Electronics waste, e.g., sensor electronics
- Iron to be recycled
- Aluminum
- Non-ferrous metal, e.g., motor windings
- Insulating materials

Process materials and chemicals

Sort the process materials and chemicals for recycling according to whether they are:

- Oil
  Dispose of the spent oil as special waste in accordance with the spent oil ordinance.
- Grease
- Solvents
- Cleaner solvent
- Paint residues

Do not mix solvents, cleaner solvents and paint residues.

A.2 Declaration of conformity

SIEMENS

EG-Konformitätserklärung
EC Declaration of Conformity
No. 664.20022.21

Hersteller: Siemens Aktiengesellschaft
Manufacturer: Industrie Sector
Anschrift: DT MC EWN
Address: Industriestraße 1
97615 Bad Neustadt a. d. Saale
Germany
Produktbezeichnung: Drehstrom – Synchronmotor, Servoantrieb Typ 1FK7...
Description of the product: Three-phase synchronous servo-motor, type 1FK7...

Die bezeichneten Produkte stimmen in der von uns in Verkehr gebrachten Ausführung mit den Vorschriften folgender Europäischer Richtlinie überein:
The products described above in the form as delivered are in conformity with the provisions of the following European Directive:

Die Konformität mit der Richtlinie wird nachgewiesen durch die Einhaltung folgender Normen:
The safety and manual documentation have to be considered in detail.

Conformity to the Directive is assured through the application of the following Standards:
EN 60034-1*: 2004
EN 60204-1: 2006
*) mit allen relevanten Teilen / with all relevant parts

Die Sicherheitshinweise und Betriebsanleitungen sind zu beachten.
The safety and manual documentation have to be considered in detail.

Die bezeichneten Produkte sind zum Einbau in andere Maschinen bestimmt. Die Inbetriebnahme ist solange untersagt, bis die Konformität des Endproduktes mit der Richtlinie 2006/95/EG festgestellt ist.
Alle Sicherheitshinweise der zugehörenden Produktvorschriften sind zu beachten sowie dem Endanwender zur Kenntnis zu geben.

Diese Erklärung stellt keine Beschaffungs- und Haltbarkeitsgarantie gemäß § 443 BGB dar.
The products supplied are intended exclusively for installation in a machine. Commissioning is prohibited until it has been established that the end product conforms with the Directive 2006/95/EU. All safety instructions in the associated product documentation must be observed and given to the end user for further information.
This declaration contains no condition and durability guarantee to § 443 BGB (German Civilian Code).

Siemens Aktiengesellschaft

Frank Michael,
Head of the Electric Motor Factory, Bad Neustadt

Dr. Jan Damat,
Head of Engineering Department (KT)

Diese Erklärung bescheinigt die Übereinstimmung mit der genannten Richtlinie, ist jedoch keine Zuschreibung von Eigenschaften.
This declaration certifies the conformity to the specified Directive, but contains no assurance of properties.
