Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-10.000 [mH]	10.000 [mH]	0.000 [mH]

Description: Sets an imaginary supplementary inductance for the infeed.
The supplementary inductance supplements the effect of the voltage droop, in particular for transient operations.

Dependency: Refer to: p5424

Warning: Unsuitable supplementary inductance and smoothing time settings will make line droop control unstable.

Note: The supplementary inductance is deactivated with p5423 = 0.
The converter's output voltage is calculated so that the converter behaves like a supplementary inductance and as such achieves an effect similar to a line reactor with higher/lower inductance.
The supplementary inductance can be used for damping in the event of resonance phenomena on the line.
This parameter can only be set to 0.

Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
0.00 [ms]	100.00 [ms]	0.00 [ms]

Description: Sets the smoothing time for the effect of the supplementary inductance (p5423).

Dependency: Refer to: p5423

Note: The supplementary inductance causes current change to be fed back to the converter's output voltage.
This parameter can only be set to 0.

Description:	Sets the parameters for rapid precontrol of the output voltage in the event of a voltage dip. The values relate to the voltage setpoint from the voltage droop (r5420). The voltage output by the converter is formed from the product of the voltage setpoint and the adaptation factor, which is calculated in rapid precontrol.		
Index:	[0] = Adaptation factor lower limit [1] = Adaptation factor increment current limit [2] = Adaptation factor increment voltage difference [3] = Adaptation factor increment increase		
Dependency:	Refer to: r5452		

2 Parameters

2.2 List of parameters

Note: Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller.

For index [0]:
Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The factory setting is appropriate if the inductance of the commutating reactor (p0223) has the value p3421 - p3424.
Higher values for p5428[0] result in higher rms values of the currents in the case of a short circuit. However, current limiting also intervenes more – and more harmonics are generated.
For excessively low values in p5428[0], the short-circuit displayed in r5479[1] is no longer reached.
The function is deactivated with p5428[0] = 100 %.

For index [1]:
When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. The function is deactivated for a value of 100%.

For index [2]:
If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller sampling times, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle.

For index [3]:
If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller sampling time (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of precontrol by means of multiplication by the droop setpoint r5420 is cancelled out.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	15.0 [%]	50.0 [%]	20.0 [%]

Description: Sets the permissible current hysteresis in the event of an overload and short circuit for the modulator to intervene and apply limiting.

The effective current limits are calculated from the parameterized overcurrent (p5453) and the hysteresis width (p5454).

Index:
[0] = No-load operation (p5451 = 1 signal)
[1] = Normal operation (p5451 = 1 signal)

[3] = No-load operation (p5451 = 0 signal)
[4] = Normal operation (p5451 = 0 signal)
[5] = Short-circuit operation (p5451 = 0 signal)

Dependency: The hysteresis width (p5454) cannot be set greater than or equal to the overcurrent limit (p5453).

Refer to: p5453, p5478

Notice: The setting values are automatically set. This manual setting is only possible for the case that p5478[0, 1] = 50 %, and it is critical that expert knowledge is available.

Note: The value is referred to the internal reference current.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.0 [%]	100.0 [%]	20.0 [%]

Description: Sets the permissible tolerance range in the event of an overload and short circuit for the modulator to intervene and apply limiting.

The effective current limit is calculated from the overcurrent limit (p5453) plus the overcurrent tolerance range (p5455).

Index:

Description:	Sets the gain for the DT1 element of the frequency droop. In addition or alternatively to fast droop (p5413, p5414), with this D component power oscillations in the island line can be dampened. The reference quantity is the gain of the regular frequency droop (p5407).		
Recommendation:	Typical setting values lie between 50 % and 100 %.		
Dependency:	Refer to: p5477		
Note:	With p5476 = 100 %, a frequency change from the power-frequency droop, unscaled for the integration of the line angle becomes effective. With p5476 = 0, damping of the line control via the DT1 element is deactivated.

A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 5.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2000.0 [%]	Access level: 4 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 200.0 [%]
Description:	Sets the smoothing time for the DT1 element of the frequency droop. The reference quantity is the smoothing time for the regular frequency droop (p5409).		
Recommendation:	Typical setting values lie between 100 % and 200 %.		
Dependency:	Refer to: p5476		
Note:	With a lower smoothing time, the corner frequency of the high pass filter formed by the DT1 element increases. To dampen resonance in the line, the corner frequency must lie below the resonant frequency, and the setting value for the smoothing time must be selected to be correspondingly high.

Description: Sets the mode for the transformer magnetization.

Using this function, a transformer is magnetized using a voltage that is in synchronism with the external line supply; this means that no inrush currents flow when this transformer is connected to the line supply.

If value = 11:
Automatic determination of the magnetizing inductance.
The magnetizing inductance determined in r5491 must be transferred to p5492 in order to take effect.
Observe notes regarding r5491.

If value = 12:
Automatic determination of the transformer phase shift and the gain correction.
The transformer phase shift determined in r6440 must be transferred to p6420 in order to take effect.
The gain correction determined in r6441 must be transferred to p6421 in order to take effect.

If value = 13:
Determination of the total leakage inductance of the transformer during line data identification. p3410 = 1 is set automatically and the inductance is measured on the next switch-on. Once the measurement has been completed the converter shuts down automatically and p3410 is set = 0 and p5480 is set = 1.
The total leakage inductance of the transformer determined in r5489 must be transferred to p5490 in order to take effect.

If value = 101:
The infeed goes into line droop control, however the main switch/circuit breaker is not closed, and the transformer magnetization remains in the state r5482 = 4.
Test operation requires the "Line droop control" function module to be activated (r0108.12 = 1).

If value = 102:
As for test operation 1.
However, synchronization with the line is not realized (VSM2 measured data r5460 and following is not used); instead, the output voltage is generated corresponding to the rated data p0210, p0211, p5486.

Value:

- 0: Deactivated
- 1: Normal operation
- 11: Identification transformer magnetizing inductance
- 12: Identification transformer phase shift/gain correction

Notice: The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

For an active black start (p5580 > 0), a separate transformer magnetization is not performed.

Note: The transformer magnetizing function is used in order to magnetize a line transformer to which the Active Line Module (ALM) is connected.

The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate precharging transformer or for photovoltaic applications).

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1

The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.

The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.

If value = 13:

For weak line supplies, it is recommended to reduce the excitation current p3415 for identifying the inductance (e.g. p3415[0] = p3415[1] = 5 %).

Sets the ramp duration for the transformer voltage.

For index [1]:

Sets the bounce time for the circuit breaker at the line side of the line transformer.

An interruption-free connection between the line supply and the transformer is only guaranteed after the bounce time has expired.

The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

The wait state until the debounce time has expired is canceled if the following conditions are fulfilled:

- feedback signal p0860 = 1.
- current rise or DC link voltage change identified.

For index [2]:

Sets the permissible maximum time.

If the maximum time elapses without the line being synchronized, alarm A06502 is output.

The minimum duration of line synchronization is 25 % of this maximum time, however, as a minimum 40 ms.

If there is a circuit breaker at the transformer primary side, then the transformer can be magnetized before closing this circuit breaker in order to avoid high inrush currents. The setting of this primary voltage and setting the device supply voltage (p0210) defines the transformer ratio. To magnetize the transformer, the voltage has to be measured at the line side of the circuit breaker. To do this, an additional VSM must be connected and parameterized using p0150[0] and following. The voltage actual values of this VSM are displayed in r5461[0] and r5462[0]. The voltages converted over to the transformer secondary side are displayed in r5488[0, 1, 2].

Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio.

To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the ALM connection point can be displayed in r5488[3, 4, 5]. To do this, the following BICO interconnections are acquired: p5487[2] = r5461[1], p5487[3] = r5462[1].

The result of the identification must be entered into p5492.

Dependency: Refer to: p5480, p5492

Notice: Overmodulation (r0074 > 97 %) during the measurement as a result of an excessively low DC link voltage, can have a significant influence on the measurement result. A countermeasure, for example, can be to reduce the output voltage using p5494.

The measurement result depends very strongly on precisely specifying the filter capacitance (p0221).

When filter monitoring is active (p3678 > 0), the current measured values of the VSM (r3671, r3672) are used to identify the magnetizing inductance. Incorrect VSM measured values result in excessively high deviations when determining the magnetizing inductance.

Note: During identification, the value previously entered in p5492 is not effective.

The display value is reset to 0 at POWER ON.

If the precharging circuit of an application only creates a low DC link voltage, which is not sufficient to fully magnetize the transformer (modulation depth r0074 limited), then the target value for the magnetization can be reduced (p5494[0]).

When closing the line contactor, the residual magnetization required only causes a relatively low recharging current surge that is generally within permissible limits.

For index [1]:

If, during transformer magnetization, the current limit is exceeded ($r0068 > p5494[1] * r0207$), then fault F06505 is output.

	10	Permit active power during non-symmetrical FRT	Yes	No	-

Dependency: Refer to: p5507, r5510, p5520

Note: For bit 00:

If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint.
 $r0075 = p3610 + p3611 + r3471 + r5510[0]$

For p5500.0 = 1, the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (r5502.1 = 1).

In this case, the following applies:

$r0075 = p3610 + r3471 + r5510[0]$

For bit 01:

Only active for $p5500.3 = 0$.

If $p5500.1 = 0$ the alpha and beta amplitudes of the line voltage, which were smoothed with $p5507[2]$, are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint ($r5510$) is prevented.

If $p5500.1 = 1$, the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with $p5507[3]$.

For bit 02:

Only effective if $p5500.1 = 0$ and $p5500.3 = 0$.

If $p5500.2 = 0$, the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint ($r5510$) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced.

If $p5500.2 = 1$, the average value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic.

For bit 03:

For $p5500.3 = 0$, no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical.

For $p5500.3 = 1$, for an asymmetrical line supply voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage asymmetry and therefore supports the grid.

The negative phase-sequence system current is impressed using the negative phase-sequence system controller ($p3636$ and following).

The negative phase-sequence system controller is automatically activated and deactivated (the following applies, $p3640.0 = p5500.3$).

For bit 04:

Only active for $p5500.3 = 1$.

For $p5500.4 = 0$, a negative phase-sequence system current setpoint according to characteristic $p5505/p5506$ is generated if the difference between two line phase voltage amplitudes is greater than $p5509[9]$ - and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic.

For $p5500.4 = 1$, an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than $p5509[9]$.

For bit 05:

For $p5500.5 = 1$, the limiting of the support reactive current is not active according to the characteristic $p5505/p5506$. Instead, the current limits $p5506[1]$ and $p5506[3]$ are effective after adding the supplementary reactive current setpoints $p3610$ and $p3611$.

For bit 06:

For $p5500.6 = 1$, the apparent current is limited to the smoothed apparent current ($r0027$) effective at the start of an FRT. During this line fault, this value of the apparent current limit is continually effective.

For bit 07:

Only effective for $p5526.7 = 1$ and $p192.19 = 1$

For $p5500.7 = 1$, for each phase, a tolerance band is generated around the current setpoint, which the current actual value does not leave.

For $p5500.7 = 0$, a tolerance band is generated based on the current setpoint amplitude. The current actual value for each phase can be within this tolerance band.

For bit 08:

Only active for $p5500.3 = 1$.

For $p5500.8 = 1$, during a line short-circuit ($r5502.4 = 1$) the active line infeed current is reduced to zero.

For $p5500.8 = 0$, during a line short circuit ($r5502.4 = 1$) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For bit 09:

Only active for $p5500.3 = 1$.

For $p5500.9 = 1$, during a line short-circuit ($r5502.4 = 1$) the active line infeed current and the supporting reactive current are reduced to zero.

For $p5500.9 = 0$, the standard response of dynamic line support applies corresponding to $p5500.8 = 0$.

For bit 10:

Only active for p5500.3 = 1.

For p5500.10 = 1, during an asymmetrical line short circuit (r5502.2 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For p5500.10 = 0, during an asymmetrical line short-circuit (r5502.2 = 1) the active line infeed current is reduced to zero.

Recommendation:

The smoothing time for the line PLL (p3458[1]) should be set to values higher than 20 ms so as to ensure stable operation even with significant dips in supply voltage.

Dependency:

For p5501[0], the following applies:

The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.

Notice:

Dynamic grid support can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

Note:

If grid support has been activated:

Line disturbance will trigger grid support in accordance with the set characteristic (p5505, p5506).

If grid support is deactivated:

Line disturbance will generate the standard response to phase failures on the part of the infeed for drive applications (see A06205).

Dependency: Refer to: p5500, p5509, p5529

Note: For index [0]:
Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).
For index [1]:
Minimum time for line disturbance for the start of grid support in accordance with the characteristic.
If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.
For index [2]:
Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0.
An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.
A smoothing time of less than a line period makes no sense.
If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.
For index [3]:
Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.
The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.

Description: Sets the scaling values for dynamic grid support.**Recommendation:**

For index [0]:

If the reactive current setpoint increases to rapidly, at the start of a grid fault, this can result in DC link overvoltages. If possible, we then recommend p5509[0] = 5 ... 10 %.

For index [1]:

In order to guarantee that the support reactive current is kept, even when the Vdc thresholds p5508 are reached, we recommend p5509[1] = 0.1 %.

For index [7]:

If a support reactive current is also required for a non-symmetrical grid faults, then correspondingly p5509[7] must be set > 0.1 % (typically = 100 %).

For index [8]:

If a support reactive current is also required for non-symmetrical grid faults, then we recommend p5509[8] > 20 % in order to reduce Vdc oscillation.

For index [11]:

A value p5509[11] > 30 % can help avoid DC link overvoltages during grid faults.

Notice:

For index [5]:

For devices with r0192.19 = 0 (e.g., Active Line Module Booksize), the maximum apparent current limit can be set to p5509[5] = 80 %.

Note:

For index [0]:

Change in the reactive current setpoint (% per ms) at the beginning and end of dynamic grid support.

This avoids sudden changes in the reactive current if the starting points for the line voltage (p5505[0], p5505[2]) are overshoot.

For index [1]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is overshoot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

The reactive current ramp is deactivated with p5509[1] = 0.1 %. The reactive current required for dynamic support is also kept, even when the Vdc threshold is reached.

For index [2]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is undershoot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

For index [3]:

Sets the hysteresis for the line voltage to exit grid support (as a percentage of the supply voltage p0210).

To exit grid support, the line voltage must be in the interval reduced by the hysteresis width (the interval is defined with the starting points p5505[0] and p5505[2] and the hysteresis width p5509[3]).

For index [4]:

Sets the scaling factor for the reference voltage for dynamic grid support (as a percentage of the supply voltage p0210).

As a result, the product of p0210 x p5509[4] is applied as the voltage zero.

For index [5]:

Sets the scaling factor for the maximum permissible absolute apparent current value when grid support is active (p5501 = 1 signal).

The value is referred to the maximum current r0209.

Values higher than 100% will not be applied.

Values greater than 80% can only be set if the duration that can be set is less than or equal to 3 seconds for the short-circuit state p5528.

For Active Line Module Booksize, the setting value is limited to 80 %.

For index [6]:

Only active for p5500.3 = 1.

Sets the percentage voltage change (as a percentage of p0210) from which value the calculated positive phase-sequence system and negative phase-sequence system amplitudes are quickly adapted. As a consequence, the grid is quickly supported when step-type faults occur.

For index [7]:

Only active for p5500.3 = 1.

Sets the maximum positive phase-sequence system reactive current absolute value to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

If a symmetrical support reactive current (positive phase-sequence system current), is also specified for non-symmetrical grid faults, then generally, p5509[7] should be set to = 100 %.

For index [8]:

Only active for p5500.3 = 1.

Sets the maximum negative phase-sequence system absolute current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

For the case p5509[7] = 100 %, we recommend setting p5509[8] > 20 %.

For index [9]:

Only active for p5500.3 = 1.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support.

For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value.

For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.

For index [10]:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

For index [11]:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for grid voltage out of tolerance (r5502.1 = 1).

The value is referred to the permissible apparent current p5509[5] * r0209.

For index [12]:

Only active for p5500.3 = 1.

Sets the scaling factor for dynamic grid support for 2-phase grid dips. The gradient of the support characteristic p5505/p5506 is scaled using this factor if asymmetry (r5502.2=1) is present. The setting of p5509[0] is applicable for the transition ramp

For index [13]:

Only active for p5500.3 = 1.

If the grid voltage dips by this voltage with respect to the value of p0210, then the voltage precontrol is quickly adapted based on the calculated positive phase-sequence system and negative phase-sequence system amplitudes.

For index [14]:

Sets the scaling factor for the maximum permissible reactive current absolute value when grid support is active (p5501 = 1 signal).

The value is referred to the rated current r0207.

Values greater than 150% cannot be set.

Values greater than 105% can only be set if the following applies - r0193.16 = 1 and p5509[8] <= 100%.

For Active Line Module Booksize devices, the setting value is limited to 105 %.

Dependency:

Refer to: p5541
Refer to: F06851

Notice:

For bit 00:

Fault F06851 is additionally displayed if, as a result of a line voltage fault, the current control was inhibited (alarm A06205, r03405.2 = 1) - and the inhibit is continuously active while the wait time is elapsing (p5545[0]). To make reference to the temporarily output alarm A06205, fault F06200 is subsequently output.

Note:

AISL: Anti Islanding

FRT: Fault Ride Through (riding through a grid fault)

HFRT: High Frequency Ride Through (riding through frequency increases)

HVRT: High Voltage Ride Through (riding through voltage increases)

LFRT: Low Frequency Ride Through (riding through frequency dips)

LVRT: Low Voltage Ride Through (riding through voltage dips)

For bit 00:

The monitoring thresholds of the voltage and frequency criterion are defined using p5543 and p5544. If these thresholds are violated, then this is flagged in status word r5542 bits 6 to 9. If the violation remains during wait time p5545[0], then fault F06851 is output.

For bit 01:

The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.

For bit 04:

It is only possible to activate the FRT voltage-time characteristic (HVRT, LVRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5543 are deactivated. The voltage-time monitoring to be set using p5550 to p5554 applies (display in r5542 bits 10 and 11).

For bit 05:

Sets the response after a voltage dip (LVRT).

0 = immediate shutdown.

1 = shutdown only after the time in p5545[2] has expired.

For bit 07:

It is only possible to activate the FRT frequency-time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5544 are deactivated. The frequency-time monitoring to be set using p5555 to p5559 applies (display in r5542 bits 12 and 13).

For bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3], and the system waits until these limits are maintained (r3402 = 7 or r3402 = 12 when transformer magnetization is active (p5480 > 0)).

If the voltage and frequency limits are violated, then this is indicated in status word r5542 bits 6 to 9.

For bit 10 (only effective for p5540.4 = 1 or p5540.7 = 1):

0 = when the overvoltage or undervoltage limit is violated (p5550[0, 1]), both curves (overvoltage and undervoltage curve) always start at the same time. Correspondingly applies for the frequency-time characteristics.

1 = activation of separate initiation of FRT voltage-time characteristics for an overvoltage or undervoltage event.

Correspondingly applies for the frequency-time characteristics.

Dependency: Refer to: p0281, p0282, p0284, p0285, r6311, r6313, r6314, r6316

Note: For bit 00:
It is recommended that the PLL2 should be deactivated if invalid voltage values are present (e.g. when the power supply is shutdown).
After activation initially a PLL synchronization is carried out. An excessively low voltage prevents synchronization from starting and this is displayed using r5572.3...0 = 1011.

For bit 01:
After PLL synchronization starts (r5572.0 = 0) and the settling time has expired, the actual values are valid for phase angle, frequency and amplitude (r5572.1 = 0).
In operation, r5572.1 is set = 1 if the absolute value of the PLL angular error - smoothed over 50 ms - exceeds a value of 7.5°. The PLL actual values are then no longer valid.

For bit 02:
The tolerance limits are set using p0284 and p0285.

For bit 03:
The tolerance limits are set using p0281 and p0282.

Index:

Note: PLL2 is deactivated with input signal 0.

The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):

- the voltage of the island grid is measured using a VSM (r5461[0] and r5462[0]), which is connected in front of the circuit breaker between the island grid and the ALM.
- the voltage of the external grid is measured using another VSM (r5461[1] and r5462[1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

	0	3	0

Description: Sets the mode for the black start.

An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.

Prerequisite:

Activating function module "Line droop control" (r0108.12 = 1) and line droop operation (p5401).

If value = 0:

The black start is deactivated.

If value = 2:

At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.

If value = 3:

At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switching-on operation is carried out with synchronization to the existing grid voltage.

If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

2 Parameters

2.2 List of parameters

Value:	0: Deactivated 2: Grid black start 3: Grid black start automatic
Notice:	A black start is only possible when the grid droop control (p5401) is activated. A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1). The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).
Note:	Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly. In order to avoid the high inrush currents, when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function. The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero.

[1] = Setpoint ramp voltage

Notice:

In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.

In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!

The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

Note:

In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.

The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

Description:

Sets the signal sources for island grid synchronization.

Using the island grid synchronization function, an island grid can be synchronized with an external grid regarding frequency, phase angle and voltage amplitude.

After synchronization has been performed, a circuit breaker between the two grids can be closed (r5493.1).

2.2 List of parameters

Notice: For index [1]:
The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1].
The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p0860 and following).

Note: In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation!
This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.
For index [0]:
Signal source for the start command to synchronize the island grid with an external grid.
The target values for the synchronization, are the output values of the PLL2 (r6311[1], r6313, r6314).
The PLL2 must be activated at the latest when synchronization starts (p5571, p5574).
For index [1]:
Signal source for the feedback signal of the circuit breaker between the island grid and the external grid.
For index [2]:
Signal source to reset the supplementary setpoints for voltage and frequency(r5582[0, 1]) after island grid synchronization has been completed.
At the same time as the reset command, the external cyclic supplementary setpoints (p5406[0], p5416[0]) must be appropriately adapted.

Dependency:	Refer to: p5589, p5590, p5591			
Notice:	The set time values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]).			
Note:	For index [0]: Sets the duration of the asymmetrical voltage output. After reaching the set duration, the asymmetry is exited and the regular symmetrical grid voltage droop becomes active again. To start an additional voltage asymmetry, a 0/1 edge of the activation signal p5591 is first required. With p5588[0] = 0, the asymmetry set with p5590 is active without any time limit (up until it is deactivated with p5591 = 0). For index [1]: Sets the duration of an initial ramp at the start of the asymmetrical voltage output. When required, with a ramp, overvoltages in systems that are capable of oscillation can be prevented. The ramp starts as soon as the trigger condition according to p5589 is fulfilled. During the ramp, the voltage output is changed step-by-step from the regular symmetrical rotating voltage vector into the asymmetry set using p5590. The ramp is part of the duration of the asymmetrical voltage output set using p5588[0]. With p5588[1] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590). For index [2]: Sets the duration of an end ramp at the completion of the asymmetrical voltage output. When required, with a ramp, overvoltages in systems that are capable of oscillation can be prevented. The ramp starts as soon as the time for the asymmetrical voltage output has expired. As a consequence, the end ramp is not part of the duration set using p5588[0]. During the ramp, the voltage output is changed step-by-step from the asymmetry set using p5590 to the regular symmetrical rotating voltage vector. With p5588[2] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590).

Description:	Sets the trigger angle for the asymmetrical voltage output.			
Dependency:	Refer to: p5590, p5591			
Notice:	The set angular values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]). Example: With p0115[0] = 0.25 ms and a 50 Hz line frequency, an angular resolution of $0.25 \text{ ms} * 50 \text{ Hz} * 360^\circ = 4.5^\circ$ is obtained.			

Note: The function is activated using binector input p5591 = 0/1 signal.
 After this function is activated, the start of asymmetry is delayed until the phase angle (r5412) reaches the value of p5589. This means that asymmetrical voltage changes can be implemented, which can be synchronized with the basic fundamental of the grid voltage - and that are reproducible.
 With $p5589 < 0^\circ$, asymmetry starts immediately with the 0/1 edge, and is therefore not synchronized with the grid voltage.

Description: Sets the signal sources for scaling the individual phase and line voltages.
 This therefore allows asymmetrical voltage sources to be implemented (negative phase-sequence system voltage not equal to 0).
 The scaling of phase and line voltages can be freely combined.
 As a result of the 3-conductor connection, using the power unit, a zero system cannot be implemented as a result of the inherent operating principle. As a consequence, the sum of the output voltages is always 0.
 We recommend that p5594 is used for simple handling based on fixed values.

 [2] = Differential voltage factor TR
 [3] = Phase voltage factor R
 [4] = Phase voltage factor S
 [5] = Phase voltage factor T
 [6] = Zero system voltage factor R0
 [7] = Zero system voltage factor S0
 [8] = Zero system voltage factor T0

Dependency: Refer to: p5415, p5416, p5594

Danger: By scaling the phase voltages, phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized.

This means that special care must be taken when using this function.

The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

Notice: The voltage control of the grid droop (p5429) uses the symmetrical basic fundamental amplitude (positive phase-sequence system voltage) as control variable. Changing an individual phase voltage therefore results in an undesirable subsequent control of the positive phase sequences system voltage.
 In the case of an asymmetrical setpoint voltage due to p5590, we therefore recommend that p5426 = p5427 are set = 0.

For the same reason, generally the modulation depth controller (r5433) must be deactivated.

The setting value of indices 6, 7 and 8 together must add up to 300% in order to ensure that the zero system is completely subdivided. Otherwise, a remaining zero system is automatically distributed internally and symmetrically across all 3 phases.

Note: Using the grid droop function (p5415, p5416), depending on the reactive current actual value, a voltage amplitude is calculated for all 3 grid phases (positive phase-sequence system voltage, r5429). The amplitude of the individual grid phases is obtained by multiplying this positive phase-sequence system voltage by the associated scaling factors p5590[...]. The DC component control (p5436), the harmonic control (p5440) and the interventions when reaching the current limits (p5478) remain active, also for asymmetrical setpoint voltages.

The setting p5590[...] = 1 deactivates the corresponding scaling (as a consequence, internally a value of 100% is active).

For index [0, 1, 2]:

Virtual three-phase voltage source in a delta connection.

Internally, the values are limited to the range 0 ... 100%.

Setpoint voltage amplitude phase RS: $U_{RS} = r5429 * \text{root}(2) * p5590[0]$

Setpoint voltage amplitude phase ST: $U_{ST} = r5429 * \text{root}(2) * p5590[1]$

Setpoint voltage amplitude phase TR: $U_{TR} = r5429 * \text{root}(2) * p5590[2]$

The instantaneous voltages are internally adapted using a transformation matrix so that a zero system-free three-phase voltage system is obtained. For example, a short circuit between phases R and S can be directly emulated using p5590[0].

For index [3, 4, 5]:

Virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range 0 ... 150%.

Setpoint voltage amplitude phase R: $U_R = r5429 * \text{root}(2/3) * p5590[3]$

Setpoint voltage amplitude phase S: $U_S = r5429 * \text{root}(2/3) * p5590[4]$

Setpoint voltage amplitude phase T: $U_T = r5429 * \text{root}(2/3) * p5590[5]$

As the sum of the 3 sinusoidal voltages must be 0 at any particular instant in time, the average value of the instantaneous voltages are subtracted in each phase (i.e. the zero system components are evenly distributed across the 3 branches). For example, this is the reason that p5590[3] = 0% does not result in a DC voltage of 0 in phase R.

For index [6, 7, 8]:

Zero system distribution of the virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range -300 ... 300 %.

Using these factors, it is defined with which component an existing zero system (instantaneous value $u_0 = (u_R + u_S + u_T)/3$) should be subtracted in the individual phases.

Zero system correction phase R: $u1_R = u_R - u_0 * p5590[6]$

Zero system correction phase S: $u1_S = u_S - u_0 * p5590[7]$

Zero system correction phase T: $u1_T = u_T - u_0 * p5590[8]$

In order to obtain a zero system-free U1 system, p5590[6] + p5590[7] + p5590[8] must = 300%. If this condition is violated, then the remaining zero system component is evenly distributed across all 3 branches.

Example:

The combination of p5590[3] = 0% and p5590[6] = 0% results in a voltage 0 in phase R. The phase voltage U_{ST} keeps its rated value, the sinusoidal curves of the two other differential voltages lie one above the other.

Description:	Sets the hysteresis of the speed setpoint for rotating field inversion of the stator current in the reverse field exciter.			
Dependency:	Refer to: p1821, p6277			
Notice:	When changing the direction of rotation of the main machine using p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.			

2 Parameters

2.2 List of parameters

Note: The amount of the value entered in the parameter is dynamically limited to the rated speed of the motor.
The value 0 is not permissible.
The sign of the hysteresis defines the rotating field of the stator current for the reverse field exciter depending on the mechanical direction of rotation.
The hysteresis is symmetrical around the value in parameter p6277.

Description:	Display and connector output for the line frequency determined with PLL2 for the voltage signals specified in p5574.		
Index:	[0] = Unsmoothed [1] = Smoothed		
Note:	A positive sign of the frequency is obtained when the line supply phases U, V and W are connected with the correct phase sequence. A negative sign of the frequency is obtained when the 3 line phases are interchanged therefore designating a negative direction of the rotating field of the 3-phase line supply voltage. For index [0]: Displays the instantaneous value. The following applies for the dynamic time constant of the PLL2: p3458[1] * p6423 For index [1]: Displays the values additionally smoothed with a time constant of 50 ms (suitable for monitoring the frequency).

Description:	Display and connector output of the actual value of the PLL output voltage (only for assigned VSM).		
Dependency:	Refer to: p3472		
Note:	A plausible value is only displayed if the motor is assigned a VSM, and PLL is activated. For induction motors, this is the case when pulses are inhibited and for a flying restart; for separately excited synchronous machines, only when the pulses are inhibited. For permanent-magnet synchronous motors and controlled reluctance motors, PLL is operational, even when the pulses are inhibited. VSM: Voltage Sensing Module

Index:	[0] = Supply transformer [1] = Island grid transformer		

2 Parameters

2.2 List of parameters

Warning:

Switching-in with a significantly incorrectly parameterized offset angle ($> 5^\circ$) can cause a peak current intervention and / or triggering the crowbar thyristor.

Caution:

If this parameter is changed in the "ready for operation" state and if a synchronizing voltage is already available at the VSM, under certain circumstances, a line supply fault can be signaled. When this occurs for the first time after changing the parameter, the fault can be ignored and acknowledged.

Note:

This phase shift must be determined when commissioning the system.

Example:

If the converter input voltage (= secondary side voltage of the power transformer) lags the synchronizing voltage measured by the VSM by 30° , then p6420 should be set to -30° .

Description:	Setting to parameterize the recorder. The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms. The variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card. The development and system test departments have the software necessary to decode the content.			
Index:	[0] = Enable [1] = Recording time [2] = Pre-trigger time [3] = Output message [4] = Recording factor			
Dependency:	Refer to: A49998			

2 Parameters

2.2 List of parameters

Note: For index [0]:
 Enables or disables the function.
 p6999[0] = 0
 Inhibits the function.
 p6999[0] = 1
 Enables the function.

For index [1]:
 Sets the recording time, [ms].
 A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time.
 Example:
 The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs.
 --> every drive object can record a maximum of $8000/4 = 2000$ measuring points.
 --> the recording time that can be realized is $2000 * 0.250 \text{ ms} = 500 \text{ ms}$.

Note:
 - the recording time that can be realized is displayed in r6991[1].
 - if the recording time is set too long, then it is automatically reduced to what can be realized.

For index [2]:
 Sets the pretrigger time, [ms].
 This time is included in the recording time and cannot be longer than the recording time p6999[1].

Note:
 - when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.
 - the pretrigger time that can be realized is displayed in r6991[2].

For index [3]:
 Enables or disables the output of message A4998 when the trigger event is triggered.

For index [4]:
 p6999[4] = n, n = 0 ... 4
 Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2^n times, and reduces the number of signals 2^n times.
 Example:
 Number of drive objects = 1, p0115[0] = 250 µs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4
 --> recording time: $2000 \text{ ms} * 2^4 = 32 \text{ s}$, pre-trigger time: $1000 \text{ ms} * 2^4 = 16 \text{ s}$, number of signals $64/16 = 4$.
 When setting p6999[4] to 0, the results are as follows:
 --> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

Description:	Setting to enable the power units for a parallel connection.		
Value:	0: Deactivated 1: Activated		
Dependency:	Refer to: r7000		
Caution:	For a parallel connection, the following applies:  When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.		
Note:	For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit. p7001 is automatically reset if a power unit is deactivated via p0125 or p0895.

Description:	Specifies the motor winding system when power units are connected in parallel.		
Value:	0: One-winding system 1: Several separate winding systems or motors 2: Two separate offset winding systems		
Dependency:	For p7003 = 2: In order to permit separate, offset winding systems, wobulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397. When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1). Refer to: p1802, p6397		
Notice:	If, for motors with multi-winding system, the individual winding is connected with several partial inverters, then a development system (p7003 = 0) must be parameterized. The cable resistance should be entered in p0352 - and then the motor data identification performed with configuration p1909.20 = 1 (estimate cable resistance).		

2 Parameters

2.2 List of parameters

Note: For p7003 = 0:

- the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352.
- the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1).
- individual Motor Modules can be activated and deactivated (p7001).

For p7003 = 1, 2:

- the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352).
- all Motor Modules are activated. It is not possible to deactivate a Motor Module.

VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 2.0	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4.0
Description:	Sets the integral time of the circulating current controller. The parameter is referred to the current controller sampling time (p0115[0]).		
Dependency:	Refer to: p0115		
Note:	Using p7037 = 1000, the integral component is deactivated (held in operation). This is the preferred setting for operation with separate motor winding system.		
p7037	Infeed par_cct circulating current control integral time / I_cct Tn		
A_INF (Parallel), S_INF (Parallel), R_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100000.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [%]
Description:	Sets the scaled integral time of the circulating current controller.		
Note:	A value of 100 % corresponds to the basic setting derived from the current controller sampling time p0115[0]. The integral component of the controller is deactivated with p7037 = 0.		
p7038[0...n]	Par_circuit circulating current control limit / I_cct limit		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 1 [%]	Calculated: CALC_MOD_ALL Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 50 [%]
Description:	Sets the limit of the circulating current controller output values. The parameter is, depending on the phase, referred to the valve lockout times (p1828, p1829, p1830).		

p7038	Infeed par_circuit circulating current control limit / I_{cct} limit		
A_INF (Parallel), S_INF (Parallel), R_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 1 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100 [%]
Description:	Sets the limit of the circulating current controller output values. The parameter is, depending on the phase, referred to the valve lockout times (p1828, p1829, p1830).		
p7040[0...n]	Par_circuit correction valve lockout time phase U / Comp t_{lockout} U		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel), A_INF (Parallel), S_INF (Parallel), R_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [μs]	Calculated: - Dyn. index: PDS, p0120 Unit group: - Scaling: - Max 1000000.00 [μs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [μs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase U (p1828). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1828		
p7042[0...n]	Par_circuit correction valve lockout time phase V / Comp t_{lockout} V		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel), A_INF (Parallel), S_INF (Parallel), R_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [μs]	Calculated: - Dyn. index: PDS, p0120 Unit group: - Scaling: - Max 1000000.00 [μs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [μs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase V (p1829). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1829		
p7044[0...n]	Par_circuit correction valve lockout time phase W / Comp t_{lockout} W		
VECTOR (Parallel), VECTOR_AC (Parallel), VECTOR_I_AC (Parallel), A_INF (Parallel), S_INF (Parallel), R_INF (Parallel)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min -1000000.00 [μs]	Calculated: - Dyn. index: PDS, p0120 Unit group: - Scaling: - Max 1000000.00 [μs]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [μs]
Description:	For the particular Motor Module, the correction time must be added to the valve lockout time to be compensated for phase W (p1830). The corrective value is used to compensate variations/spread in the valve lockout times of Motor Modules for a parallel circuit configuration.		
Dependency:	Refer to: p1830

Description:	Sets the alarm threshold to detect asymmetry of the VSM voltages in the parallel connection. The deviation between the measured values and average value is evaluated. The reference value for the alarm threshold depends on the device supply voltage and the number of active VSM. The following applies for the reference value: $\sqrt{2} * p0210 * (2 - 1/r7000)$.		
Dependency:	Refer to: p0210 Refer to: A05066		
Notice:	For the monitoring function, precisely those Voltage Sensing Modules that are assigned to active power units must be activated.		
Note:	For p7324 = 100 %, the monitoring is deactivated.

Dependency:	Refer to: p7761, p7765, p7766, p7767, p7768			
Note:	KHP: Know-How Protection For bit 00: Write protection can be activated/deactivated via p7761 on the Control Unit. For bit 01: The know-how protection can be activated by entering a password (p7766 ... p7768). For bit 02: If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset. For bit 03: Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list. For bit 04: When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.			

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

Note:

KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

2 Parameters

2.2 List of parameters

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

2 Parameters

2.2 List of parameters

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Extended copy protection - linked to the memory card and CU	Yes	No	-
	01	Basic copy protection - linked to the memory card	Yes	No	-
	02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: Refer to: p7766, p7767, p7768

Note: KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

Description: Sets the password for know-how protection.

Example of a password:

123aBc = 49 50 51 97 66 99 dec (ASCII characters)

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

Dependency: Refer to: p7767, p7768

Notice:

An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning tool, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- password entry must start with p7766[0].

- no gaps are permissible in the password.

- entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

Note:

KHP: Know-How Protection

When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed.

Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.

Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.

A product-specific list of these parameters is also available in the corresponding List Manual.

p7767[0...29]	KHP password new / KHP pw new		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 0
	Min	Max	Factory setting
	-	-	-

Description: Sets the new password for know-how protection.

Dependency: Refer to: p7766, p7768

Note: KHP: Know-How Protection
When reading, p7767[0...29] = 42 dec (ASCII character = "**") is displayed.

p7768[0...29]	KHP password confirmation / KHP pw confirm		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Confirms the new password for know-how protection.		
Dependency:	Refer to: p7766, p7767		
Note:	KHP: Know-How Protection When reading, p7768[0...29] = 42 dec (ASCII character = "**") is displayed.		

p7769[0...20]	KHP memory card reference serial number / KHP mem ref ser_no		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Unsigned8 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Sets the reference serial number for the memory card. Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.		
Dependency:	Refer to: p7765, p7766, p7767, p7768		
Note:	KHP: Know-How Protection - the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data". - SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.		

p7770	NVRAM action / NVRAM action		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM31, TM41, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB	Can be changed: T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the action to be executed for NVRAM data. At the end of the action the value is automatically set to 0.		
Value:	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset		
Notice:	After action p7770 = 1 no more pulses may be enabled. After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.		

2 Parameters

2.2 List of parameters

Note: If value = 1:
This action loads the NVRAM data to the parameters.
If value = 2:
This action loads the parameters to the NVRAM.
If value = 3:
This action sets parameters p7771 ... p7774 to the factory setting.
It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

p7775	NVRAM data backup/import/delete / NVRAM backup		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: C1, U, T Data type: Integer16 P-Group: All groups Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 17	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0

Description: Setting to backup/import/delete NVRAM data.
NVRAM data are non-volatile data in the device (e.g. fault buffer).
For NVRAM data actions, the following data are excluded:
- crash diagnostics
- CU operating hours counter
- CU temperature
- safety logbook

Value: 0: Inactive
1: NVRAM data backup to memory card
2: Import NVRAM data from the memory card
3: Delete NVRAM data in the device
10: Error when clearing
11: Error when backing up, memory card not available
12: Error when backing up, insufficient memory space
13: Error when backing up
14: Error when importing, memory card not available
15: Error when importing, checksum error
16: Error when importing, no NVRAM data available
17: Error when importing

Notice: For value = 2, 3:
These actions are only possible when pulses are inhibited.

Note: After the action has been successfully completed, the parameter is automatically set to zero.
The actions importing and deleting NVRAM data immediately initiate a warm restart.
If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

p7786[0...n]	Service report / Service report		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, B_INF	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: PDS, p0120 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0000 bin

Description: Service parameter to internally document repairs.
After a component has been replaced, this must be confirmed using p7786[PDS].x = 0/1. The "Generate report" function is then automatically executed.
After the procedure has been completed, p7786[PDS] is automatically set = 0.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Control Interface Module (CIM) replaced	Yes	No	-
	01	Valve 1 replaced	Yes	No	-
	02	Valve 2 replaced	Yes	No	-
	03	Valve 3 replaced	Yes	No	-
	04	Valve 4 replaced	Yes	No	-
	05	Valve 5 replaced	Yes	No	-
	06	Valve 6 replaced	Yes	No	-
	15	Generate report	Yes	No	-

Notice: The write process can take several minutes (p7786[PDS].x = 1). It is not permissible that the device is switched off during the procedure (only when p7786 = 0).

Note: The power unit involved can be assigned the correct P index using p0124 (power unit detection via LED).

p7788	Power unit sign-of-life monitoring tolerance window / PU SoL mon tol			
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF	Can be changed: U, T	Calculated: -	Access level: 4	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Converter	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1	1000	10	

Description: Sets the tolerance window for the sign of life monitoring for communication to the power unit.

Dependency: Refer to: A30853

Note: An active window is generated by means of DRIVE-CLiQ telegrams.
If more than one sign-of-life error appears in the window, then A30853 is output.
The lower the value in p7788, the greater the monitoring tolerance.

p7789	Power unit sign-of-life monitoring fault threshold / PU SoL mon F_thr			
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF	Can be changed: U, T	Calculated: -	Access level: 4	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Converter	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	1000	1	

Description: Sets the number of consecutive sign-of-life errors that are tolerated for communication to the power unit.

Dependency: Refer to: F30008

Note: F30008 is output in the case of a fault.
The higher the value in the parameter, the higher the monitoring tolerance.

p7790[0...15]	Component trace signal / Comp trace sig		
SERVO, VECTOR, SERVO_I_AC, VECTOR_I_AC, A_INF, R_INF (Parallel)	Can be changed: U, T Data type: Integer16 P-Group: Converter Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 11	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 2 [1] 3 [2] 4 [3] 7 [4] 8 [5] 9 [6] 5 [7] 0 [8] 6 [9] 1 [10...15] 0

Description: Sets the individual signals for the component trace.
 For p7790[0...15] = 0, the component trace is deactivated.
 For index [0...7]:
 The signals are set in p7790[0...7], whose characteristic is to be recorded over time.
 If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased.
 For index [8...15]:
 The signals are set in p7790[8...15], whose instantaneous value is to be recorded.

Value:

- 0: No signal
- 1: Pulse frequency
- 2: Phase current U
- 3: Phase current V
- 4: Phase current W
- 5: IGBT chip temperature
- 6: Heat sink temperature
- 7: DC link voltage
- 8: Modulation depth
- 9: Angle

- [12] = Trace channel 12
- [13] = Trace channel 13
- [14] = Trace channel 14
- [15] = Trace channel 15

Dependency: Refer to: p7791, p7792
 Refer to: A01302

Note: In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data is overwritten after more than 5 trigger events.
The trigger event can be set in p7791.
By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

Description: Sets the parameter index and the number of indices.
 For index [0]:
 Sets the parameter index to access a parameter of a DRIVE-CLiQ component.
 For index [1]:
 Number of indices that should be written to.
 Write:
 If several indices are to be written using a DRIVE-CLiQ task, then the values must be transferred to the CU via p7837.
 The DRIVE-CLiQ task is executed if the number n, set using p7822[1], is written to p7837 [n].

Description:	Sets the behavior for the automatic firmware update of the DRIVE-CLiQ components.		
Value:	0: Deactivated 1: Upgrade and downgrade 2: Upgrade		
Notice:	If this parameter is changed, it only becomes effective the next time that the drive system boots.		

2 Parameters

2.2 List of parameters

Note: The firmware is automatically updated when the system boots. The boot can take several minutes. After the update has been completed, it is necessary to carry out a new POWER ON (switch-off/switch-on) for the components involved.

The firmware update procedure is displayed as follows:
Control Unit (LED RDY):
Flashes yellow with 0.5 Hz --> firmware is being updated.
Flashing yellow with 2 Hz --> POWER ON is required for the components involved.
Components involved:
Flashing red/green with 0.5 Hz --> firmware is being updated.
Flashing red/green with 2 Hz --> POWER ON of the components is required.
Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

Description: Sets the component number for the required DRIVE-CLiQ component.
For index [0]:
Component number of the DRIVE-CLiQ component for which a firmware download is to be made.
For index [1]:
Component number of the DRIVE-CLiQ component for which the reference firmware version, saved in r7825 on the memory card/device memory, is to be displayed.

[1] = Reference firmware version

Dependency: Refer to: p0121, p0141, p0151, p7829

Note: For p7828[0] = 399, the firmware for all of the existing components is downloaded.
The firmware download is started with p7829 = 1.

Description:	Activating the firmware download for the DRIVE-CLiQ components specified in p7828. 1: Activate download. -1: activate the download and carry out a reset. 0: Download successfully completed. > 1: Fault code 011: DRIVE-CLiQ component has detected a checksum error. 015: The selected DRIVE-CLiQ components did not accept the contents of the firmware file. 018: Firmware version is too old and is not accepted by the component. 019: Firmware version is not suitable for the hardware release of the component. 101: After several communication attempts, no response from the DRIVE-CLiQ component. 140: Firmware file for the DRIVE-CLiQ component not available on the memory card/device memory. 143: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware. 144: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card/device memory is defective. 145: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time. 156: Component with the specified component number is not available. Additional values: Only for internal Siemens troubleshooting.			
Dependency:	Refer to: p7828			
Note:	p7829 is automatically set to 0 after the firmware has been successfully downloaded. The new firmware only becomes active at the next system run-up.

Description: Displays the actual serial number of the memory card.
 The individual characters of the serial number are displayed in the ASCII code in the indices.

Dependency: Refer to: p9920, p9921

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

Note: Example: displaying the serial number for a memory card:

Description: Displays the version of the firmware stored on the memory medium of the converter.
 Depending on the converter being used, the memory medium is a memory card (e.g. SINAMICS S120) - or the internal, non-volatile device memory (e.g. SINAMICS G120).

Index: [0] = Internal
 [1] = External
 [2] = Parameter backup
 [3] = Motor data addon

Note: For index [0]:
 Displays the internal firmware version (e.g. 04402315).
 This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.
 For index [1]:
 Displays the external firmware version (e.g. 04040000 -> 4.4).
 For automation systems with SINAMICS Integrated this is the runtime version of the automation system.
 For index [2]:
 Displays the internal firmware version of the parameter backup.
 With this CU firmware version, the parameter backup was saved, which was used when powering up.

2 Parameters

2.2 List of parameters

For index [3]:

Displays the version of the subsequently loaded motor database.

If there is no motor data available, then this index has a value of 0.

Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.

Description:

Displays the sampling times currently present on the drive unit.

r7901[0...63]: sampling times of hardware time slices.

r7901[64...82]: sampling times of software time slices.

r7901[x] = 0, means the following:

No methods have been registered in the time slice involved.

Note:

The basis for the software time slices is T_NRK = p7901[15].

Description:

Displays the number of hardware sampling times that can still be assigned.

These free sampling times can be used by technology functions such as TEC, DCC or FBLOCKS.

Note:

TEC: Technology Extension

DCC: Drive Control Chart

FBLOCKS: free blocks

The displayed value depends on the following:

The specific CU version (Sinamics S provides more sampling times than Sinamics G/DCM);

The sampling times that existed in the system up until now;

The internally reserved sampling times.

Additional application and system-dependent criteria must be taken into consideration for the possibility of registering an OA runtime group or a clock cycle change.

Description:	Sets the life guarding parameter for the following CANopen objects: - 100C hex: Guard Time - 100D hex: Life Time Factor The life time is derived by multiplying guard time by the life time factor.		
Index:	[0] = Time interval [ms] for the life time [1] = Factor for the life time		
Dependency:	Refer to: p8606 Refer to: F08700		
Note:	For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated. The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is activated (p8606 > 0). The life guarding event service is deactivated in the first commissioning.

2.2 List of parameters

Note: Corresponds to the CANopen object 1018 hex.
For index [3]:
The SINAMICS serial number comprises 60 bits.
Of these bits, the following are displayed in this index:
Bits 0 ... 19: Consecutive number
Bits 20 ... 23: Production ID
- 0 hex: Development
- 1 hex: P1 unique number
- 2 hex: P2 unique number
- 3 hex: WA unique number
- 9 hex: Pattern
- F hex: All others
Bits 24 ... 27: Month of manufacture (0 means January, B means December)
Bits 28 ... 31: Year of manufacture (0 means 2002)

Description: As a result of a Bus Off error, the CAN controller is set into the initialization state.
For index [0]:
The CAN controller is manually started after resolving the cause of the error with p8608[0] = 1
For index [1]:
The automatic CAN bus start function is activated using p8608[1] = 1.
At 2 second intervals, the CAN controller is automatically restarted until the cause of the error has been resolved and a CAN connection has been established.

Value: 0: Inactive
1: Start CAN controller

Index: [0] = Manual controller start function
[1] = Activating the automatic controller start function

Note: For index [0]:
This parameter is automatically reset to 0 after start.

Description:	Displays the Pre-defined Error Field of the CAN node. It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history. The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code. Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code. CANopen error code: 0000 hex: No error present. 8110 hex: Alarm A08751 present. 8120 hex: Alarm A08752 present. 8130 hex: Alarm A08700(F) with alarm value = 2 present. 1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799) 1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700) All drive objects are acknowledged by writing the value 0 to index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

Description:	Display or setting of the CANopen Node ID. The Node ID can be set as follows: 1) Using the address switch on the Control Unit. --> p8620 can then only be read and displays the selected Node ID. --> A change only becomes effective after a POWER ON. --> CANopen Node ID and PROFIBUS address are identical. 2) Using p8620 --> Only if address 0 is set using the address switch. --> the Node ID is set as standard to 126. --> A change only becomes effective after save and POWER ON.			
Dependency:	Refer to: r8621			
Note:	Every node ID change only becomes effective after a POWER ON. The active node ID is displayed in r8621. The parameter is not influenced by setting the factory setting. It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

Description: Sets the bit timing for the C_CAN controller to the associated and selected bit rate (p8622).

Bits are distributed to the following parameters of the C_CAN controller in p8623[0...7]:

Bit 0 ... 5: BRP (Baud Rate Prescaler)

Bit 6 ... 7: SJW (Synchronization Jump Width)

Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)

Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)

Bit 15: Reserved

Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)

Bit 20 ... 31: Reserved

Example:

Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

Recommendation: Use the factory setting when setting the bit timing.

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Description:

Display and connector output of the standardized CANopen I16 setpoint objects of the profile torque mode for SDO transfer.

An index does not contain a sensible value if the corresponding object is mapped in one of the 8 possible RPDO (p8710 ... p8717). In this case, the interconnection and the SDO transfer must be realized via PZD interface 2 (r8850[x]).

Index:

[0] = Target torque

Dependency:

Refer to: p8710, p8711, p8712, p8713, p8714, p8715, p8716, p8717, r8750, r8850

Note:

RPDO: Receive Process Data Object

SDO: Service Data Object

For index [0]:

Corresponds to the CANopen object 6071 hex + 800 hex * x (x: Drive number 0 ... 7).

The displayed parameter value is scaled using the reference torque p2003:

4000 hex corresponds to p2003.

Value:	1: Interface 1 (IF1) 2: Interface 2 (IF2)		
Index:	[0] = Isochronous mode [1] = PROFIsafe		
Dependency:	Refer to: p8839		
Note:	A change only becomes effective after POWER ON, reset or project download. Example: p8815[0] = 1: IF1 supports the isochronous mode. p8815[1] = 2: IF2 supports PROFIsafe.		
r8828[0...1]	CBE41 temperature / CBE41 temp

Description:	Displays the measured temperature on the Communication Board Ethernet 41 (CBE41). An appropriate message is output when the permitted operating temperature is exceeded.		
Index:	[0] = Actual measured value [1] = Maximum measured value		
Dependency:	Refer to: A01977, F01978		
Note:	The value of -200 indicates that there is no measuring signal. For index [1]: The maximum measured temperature is retentively saved on the component.		
p8835	CBE20 firmware selection / CBE20 FW sel		
CU_S120_PN (PN CBE20), CU_S150_PN (PN CBE20), CU_S120_DP (PN CBE20), CU_S150_DP (PN CBE20)	Can be changed: C1(1) Data type: Integer16 P-Group: Communications Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 99	Access level: 3 Func. diagram: 2197, 2198 Unit selection: - Expert list: 1 Factory setting 1
Description:	Selects the firmware version for the CBE20.		
Value:	1: PROFINET Device 2: PROFINET gate 3: SINAMICS Link 4: EtherNet/IP 5: Modbus TCP 99: Customer-specific from the OEM directory		
Note:	A change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting. CBE20: Communication Board Ethernet 20		

p8836	SINAMICS link node address / Node address		
CU_S120_PN (PN CBE20), CU_S150_PN (PN CBE20), CU_S120_DP (PN CBE20), CU_S150_DP (PN CBE20)	Can be changed: C1(1) Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 64	Access level: 3 Func. diagram: 2198 Unit selection: - Expert list: 1 Factory setting 0
Description:	Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20). p8836 = 0: SINAMICS Link deactivated p8836 = 1 ... 64: SINAMICS Link node address		
Dependency:	Refer to: p8811, p8835		
Note:	The maximum number of permitted participant addresses is limited by the project selection p8811. SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3). A change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting.		
p8837	IF2 STW1.10 = 0 mode / IF2 STW1.10=0		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC	Can be changed: T Data type: Integer16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2
Description:	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
Value:	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
Recommendation:	Do not change the setting p2037 = 0.		
Note:	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.		
p8839[0...1]	PZD interface hardware assignment / PZD intf HW assign		
CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: C1(1) Data type: Integer16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 99	Access level: 3 Func. diagram: 2197, 2198 Unit selection: - Expert list: 1 Factory setting 99
Description:	Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).		
Value:	0: Inactive 1: Control Unit onboard 2: COMM BOARD 99: Automatic		
Index:	[0] = Interface 1 [1] = Interface 2		
Dependency:	Refer to: p2030, p8815		

2 Parameters

2.2 List of parameters

Note: For value = 99 (automatic) the following applies:
- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.
- if a CBE20 is inserted, then the following applies:
-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.
-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.
- CAN CBC10 always communicates via IF2.
For a value not equal to 99 (automatic) the following applies:
- both indices must be set to a number not equal to 99 (automatic).
A change only becomes effective after POWER ON, reset or download.

p8840	COMM BOARD monitoring time / CB t_mon		
CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 20 [ms]
Description:	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.		
Dependency:	Refer to: p8835		
Note:	This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus. For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5). For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored. Value = 0: Monitoring is deactivated.		

p8841[0...239]	COMM BOARD send configuration data / CB s config_dat		
CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the send configuration data for the COMM BOARD. The setting is activated with p8842.		
Dependency:	Refer to: p8842		
Note:	The configuration data are specific to the inserted COMM BOARD. For CBE20, the configuration data are not relevant.		

p8842	Activate COMM BOARD send configuration / CB s config act		
CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: 2199, 2200 Unit selection: - Expert list: 1 Factory setting 0
Description:	Activate a modified send configuration for COMM BOARD. With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.		
Dependency:	Refer to: p8841		

Note: For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).

r8843.0...2	BO: IF2 PZD state / IF2 PZD state				
CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: -	Calculated: -	Access level: 3		
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 2410		
	P-Group: Communications	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the PROFIdrive PZD state.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Setpoint failure	Yes	No	-
	01	Clock cycle synchronous operation active	Yes	No	-
	02	Fieldbus running	Yes	No	-
Dependency:	Refer to: p2044				
Note:	When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.				

p8844	IF2 fault delay / IF2 fit delay			
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 2410	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0 [s]	100 [s]	0 [s]	
Description:	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that it is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).			
Dependency:	Refer to: r2043			

p8848	IF2 PZD sampling time / IF2 PZD t_sample			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: C1(3)	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1.00 [ms]	16.00 [ms]	4.00 [ms]	
Description:	Sets the sampling time for the cyclic interface 2 (IF2).			
Note:	The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set. For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).			

r8849[0...139]	COMM BOARD receive configuration data / CB r config_dat			
CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)	Can be changed: -	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays the receive configuration data for the COMM BOARD.			
Note:	For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4).

Description:	Displays the COMM BOARD diagnostics data.		
Note:	The display depends on the COMM BOARD being used. For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4). Example for CBE20: r8858[0] = 4201 --> Siemens CBE20 r8858[1] = 3 --> firmware version = SINAMICS Link (see p8835) r8858[2 ... 39] --> only for internal Siemens diagnostics.

Value:	0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station		
Dependency:	Refer to: p8905, r8914		
Note:	The interface configuration (p8900 and following) is activated with p8905. The parameter is not influenced by setting the factory setting.		
p8905	Activate IE interface configuration / IE IF config act		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to activate the interface configuration for the Industrial Ethernet interface (X127) on the Control Unit. p8905 is automatically set to 0 at the end of an operation.		
Value:	0: No function 1: Activate configuration 2: Activate and save configuration 3: Delete configuration		
Dependency:	Refer to: p8900, p8901, p8902, p8903, p8904 Refer to: A08561		
Note:	When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8905 is set = 1 or 2. For p8905 = 1: The interface configuration (p8900 and following) is activated. For p8905 = 2: The interface configuration (p8900 and following) is activated and saved to non-volatile memory. For p8905 = 3: The interface configuration is reset to the factory setting at all points. The factory settings for the interface configuration are loaded on activation (p8905 = 1) or at the next POWER ON.		

p8906	Commissioning tool maximum telegram length / Com tel max

	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2	2

Description: Sets the maximum telegram length for the Ethernet connection to a commissioning tool (e.g. STARTER, Startdrive, HMI).

Value:
 0: 240 bytes
 1: 480 bytes
 2: 960 bytes

Note: The parameter is effective for Ethernet interfaces (Ethernet X127, PROFINET X150, PROFINET CBE20 X1400).
 The telegram length actually used is negotiated between the participants.
 We recommend that the telegram length is reduced to 240 bytes in the following cases:
 - problems when operating with routed connections.
 - operation with a SINUMERIK 840D.
 A change only becomes effective after a POWER ON or reset.
 The parameter is not influenced by setting the factory setting.

	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Activation of the FTP server.
 Permits the FTP access to the /INSTALL/SINAMICS directory of the memory card.

Value:
 0: No
 1: Yes

Note: Activation of the FTP server becomes effective immediately.
 Deactivation only becomes effective after a POWER ON of the Control Unit.
 Before the first commissioning, the FTP server is activated irrespective of the parameter setting.

Dependency:	Refer to: r8961, r8962		
Note:	The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10). For PROFINET, the following applies: For two connections (Shared Device or system redundancy) the display in the index depends on the sequence in which the connections are established. The IP addresses of controllers 1 and 2 are displayed in r8961 and r8962. The following states are displayed for system redundancy: Primary controller: r8936[x] = 13 Backup controller: r8936[x] = 11 If value = 10: If the connection remains in this state, then when using PROFINET IRT the following can apply: - topology error (incorrect port assignment). - synchronization missing. For EtherNet/IP, the following applies: Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

Note: The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).
 For PROFINET, the following applies:
 For index [5]:
 Bit 0 = 1: there is at least one RT connection.
 Bit 1 = 1: there is an IRT connection.
 For EtherNet/IP, the following applies:
 For index [1, 3, 5]:

2.2 List of parameters

Note: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
The interface configuration (p8940 and following) is activated with p8945.
The parameter is not influenced by setting the factory setting.

p8941[0...3]	CBExx IP address / CBExx IP addr		
CU_S_AC_DP (CBE41 TSN), CU_S_AC_PN (CBE41 TSN), CU_S120_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S120_DP (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_DP (CBE41 TSN, PN CBE20, PN CBE25)	Can be changed: U, T Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the IP address for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41).		
Dependency:	Refer to: p8945, r8951		
Note:	The interface configuration (p8940 and following) is activated with p8945. The parameter is not influenced by setting the factory setting.		

p8942[0...3]	CBExx default gateway / CBExx def gateway		
CU_S_AC_DP (CBE41 TSN), CU_S_AC_PN (CBE41 TSN), CU_S120_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S120_DP (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_DP (CBE41 TSN, PN CBE20, PN CBE25)	Can be changed: U, T Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the default gateway for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41).		
Dependency:	Refer to: p8945, r8952		
Note:	The setting p8942[0...3] = 0 or p8942 = p8941 (own IP address) means that a default gateway has not been set. The interface configuration (p8940 and following) is activated with p8945. The parameter is not influenced by setting the factory setting.		

p8943[0...3]		CBExx subnet mask / CBExx subnet mask	
CU_S_AC_DP (CBE41 TSN), CU_S_AC_PN (CBE41 TSN), CU_S120_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S120_DP (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_DP (CBE41 TSN, PN CBE20, PN CBE25)	Can be changed: U, T Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the subnet mask for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41).		
Dependency:	Refer to: p8945, r8953		
Note:	The interface configuration (p8940 and following) is activated with p8945. The parameter is not influenced by setting the factory setting.		
p8944		CBExx DHCP mode / CBExx DHCP mode	
CU_S_AC_DP (CBE41 TSN), CU_S_AC_PN (CBE41 TSN), CU_S120_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S120_DP (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_DP (CBE41 TSN, PN CBE20, PN CBE25)	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the DHCP mode for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41). The actual DHCP mode is displayed in parameter r8954.		
Value:	0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station		
Dependency:	Refer to: p8945, r8954		
Notice:	When the DHCP mode is active (p8944 not equal to 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	The interface configuration (p8940 and following) is activated with p8945. The parameter is not influenced by setting the factory setting.

2.2 List of parameters

p8945	CBExx activate configuration of interfaces / CBExx intf config		
CU_S_AC_DP (CBE41 TSN), CU_S_AC_PN (CBE41 TSN), CU_S120_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_PN (CBE41 TSN, PN CBE20, PN CBE25), CU_S120_DP (CBE41 TSN, PN CBE20, PN CBE25), CU_S150_DP (CBE41 TSN, PN CBE20, PN CBE25)	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to activate the interface configuration for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41). p8945 is automatically set to 0 at the end of an operation.		
Value:	0: No function 1: Activate configuration 2: Activate and save configuration 3: Delete configuration		
Dependency:	Refer to: p8940, p8941, p8942, p8943, p8944 Refer to: A08565		
Notice:	When the DHCP mode is active (p8944 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	For CBE20, the parameter is only valid for firmware version "PROFINET Device" (p8835 = 1), "EtherNet/IP" (p8835 = 4) or "MODBUS TCP" (p8835 = 5). Otherwise, it is locked. This restriction is not applicable for the CBE25. When a project is downloaded, the interface configuration is only activated if parameter p8945 is set = 1 or 2 in the offline project. For p8945 = 1: The interface configuration (p8940 and following) is activated. For p8945 = 2: The interface configuration (p8940 and following) is activated - and is saved in a non-volatile fashion (retentively). For p8945 = 3: All storage locations for the interface configuration are restored to the factory setting. The factory setting of the interface configuration is loaded when activated (p8945 = 1) or with the next POWER ON.

Description: The setting to activate/deactivate SNMP for the Industrial Ethernet interface (X127) and the onboard PROFINET interface (X150).
Facilitates SNMP access for network diagnostic tools (e.g. PRONETA).

Value:
0: No
1: Yes

Notice: When SNMP is activated, carefully note the impact relating to Industrial Security.

Note: SNMP: Simple Network Management Protocol
A change only becomes effective after a POWER ON or reset.
The setting is only active on onboard interfaces (X127/X150).
For PROFINET CBExx, SNMP is always activated.

p9210	Flashing component number / Flash comp_no		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned16 P-Group: Topology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 499	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the component number for a component to get its status LED to flash.		
Dependency:	Refer to: p9211		
<hr/>			
p9211	Flash function / Flash fct		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Topology Not for motor type: - Min -1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the function for the components selected in p9210. After initiating a function, the parameter is automatically reset again. Example: - set the component number (p9210). - select the "flashing on" function (set p9211 = 1).		
Value:	-1: Select function 0: Flashing off 1: Flashing on		
Dependency:	Refer to: p9210		

Notice: If a task cannot be executed (e.g. the component number in p9210 does not exist), the following applies:

- there is no negative feedback signal.
- the value is reset anyway.

r9220	Statistics number of entries / Stat entries qty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the number of statistic entries in r9222.		
Dependency:	In p9221, the component Id is set whose statistical entries are to be displayed. Refer to: p9221, r9222		

p9221	Statistic components Id / Stat comp Id		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Unsigned8 P-Group: - Not for motor type: - Min 0000 hex	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 00FF hex	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0002 hex
Description:	Selects the component Id whose statistics are to be displayed in r9222.		
Dependency:	Refer to: r9220, r9222		

r9222[0...n]	Statistic DRIVE-CLiQ acyclic communication / Stat DQ acycl comm		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: r9220 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the statistics for the acyclic DRIVE-CLiQ communication of a component. The component is preset in p9221. The entry comprises the following elements: Index 0: Parameter Id. Index 1: Number of messages sent. Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0). Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0). Index 4: Average of all acyclic requests referred to the parameter Id (index 0). The time unit is 10 µs.		
Dependency:	The number of statistic entries is displayed in p9220. In p9221, the component Id can be set whose statistic is to be displayed. Refer to: r9220, p9221		
Note:	As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified. Example: The 2nd entry should be called: rdp 1 9222 5 5 or rdpa 1 9222 5 5		

p9300	SI Motion monitoring clock cycle (Motor Module) / SI Mtn clock MM

Description:	Sets the modulo value in degrees for rotary axes of the "Safe position" function. This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled. The value should be set so that it is precisely at 2 ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump. The modulo function is deactivated for a value = 0.		
Dependency:	Refer to: F01681		
Notice:	When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output. If the absolute position is not enabled, then the parameterized modulo value is not taken into account. This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for an induction motor.

For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

Description:

Sets the function configuration for the safe motion monitoring functions.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Extended message acknowledgment	Yes	No	-
01	Setpoint velocity limit for STOP F	No	Yes	-
02	Actual value sensing encoderless motor type	Synchronous motor	ASM/RESM	-
03	SS1 with OFF3 (brake response)	SS1E external stop	SS1 with OFF3	-
05	Actual value sensing sensorless edge modulation	Yes	No	-
06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-

Dependency:

Refer to: C01711

Notice:

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note:

For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual speed is calculated for an induction/reluctance motor.

For bit = 1, the actual speed is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

For bit 06:

When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10146.

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder.

- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: Refer to: p0115, p9300, p9511

Refer to: F01652

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).
 The monitoring clock cycle from p9300 must be an integer multiple of this parameter.
 In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
 The clock cycle time of the actual value sensing should not be set to more than 8 ms.
 A change only becomes effective after a POWER ON.

p9343	SI Motion gearbox switching position tolerance (MM) / SI Mtn grbx tol MM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the factor to increase the tolerance for the data cross-check of the actual position between the two monitoring channels while the gearbox stage is being switched over. This factor is effective when actual value synchronization is activated and when deactivated. Depending on the following tolerance, the following is obtained: - actual value synchronization activated: p9549 * p9543 - actual value synchronization deactivated: p9542 * p9543		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
p9344	SI Motion actual value comparison tolerance (referencing) (MM) / SI mtn ref tol MM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.0000 [mm]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 36.0000 [mm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0100 [mm]
Description:	Sets the tolerance for checking the actual values. For an incremental encoder, the actual values are checked after referencing; for an absolute encoder, when switching on.		
Dependency:	Refer to: C01711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For linear axes, the maximum value is limited to 1 mm.		
p9344	SI Motion actual value comparison tolerance (referencing) (MM) / SI mtn ref tol MM		
SERVO (Safety rot), VECTOR (Safety rot), SERVO_AC (Safety rot), VECTOR_AC (Safety rot), SERVO_I_AC (Safety rot), VECTOR_I_AC (Safety rot)	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.0000 [°]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 36.0000 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0100 [°]
Description:	Sets the tolerance for checking the actual values. For an incremental encoder, the actual values are checked after referencing; for an absolute encoder, when switching on.		
Dependency:	Refer to: C01711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For linear axes, the maximum value is limited to 1 mm.		
p9345	SI Motion SSM filter time (Motor Module) / SI Mtn SSM filt MM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 500000.00 [µs]	Access level: 3 Func. diagram: 2823 Unit selection: - Expert list: 1 Factory setting 0.00 [µs]
Description:	Sets the filter time for the SSM feedback signal to detect standstill ($n < nx$).		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		

Note: The filter time is effective only if the function is enabled (p9301.16 = p9501.16 = 1).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.
The parameter is included in the data cross-check of the two monitoring channels.
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

p9346	SI Motion SSM velocity limit (Motor Module) / SI Mtn SSM v_limMM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95)	Calculated: -	Access level: 3

	Min	Max	Factory setting
	0.00 [mm/min]	1000000.00 [mm/min]	20.00 [mm/min]

Description: Sets the velocity limit for the SSM feedback signal to detect standstill ($n < nx$).
When this limit value is undershot, the signal "SSM feedback signal active" is set.
For p9368 = p9568 = 0, the value in p9346/p9546 is also applicable for SAM/SBR.

Dependency: Refer to: p9546

Caution: The "SAM/SBR" function is deactivated if the selected threshold value is undershot.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)
SBR: Safe Brake Ramp (safe brake ramp monitoring)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

Description:	Sets the velocity tolerance for the "SAM" function.		
Dependency:	Refer to: p9548 Refer to: C01706		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	SAM: Safe Acceleration Monitor (safe acceleration monitoring)		

p9349	SI Motion slip velocity tolerance (Motor Module) / SI Mtn slip MM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [mm/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6000.00 [mm/min]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 6.00 [mm/min]
Description:	Sets the velocity tolerance that is used for a 2-encoder system in cross-check between the two monitoring channels.		
Dependency:	Refer to: p9301, p9342, p9549		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	If the "actual value synchronization" is not enabled (p9301.3 = 0), then the value parameterized in p9342 is used as tolerance in the data cross-check.		
p9349	SI Motion slip velocity tolerance (Motor Module) / SI Mtn slip MM		
SERVO (Safety rot), VECTOR (Safety rot), SERVO_AC (Safety rot), VECTOR_AC (Safety rot), SERVO_I_AC (Safety rot), VECTOR_I_AC (Safety rot)	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [rpm]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6000.00 [rpm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 6.00 [rpm]
Description:	Sets the velocity tolerance that is used for a 2-encoder system in cross-check between the two monitoring channels.		
Dependency:	Refer to: p9301, p9342, p9549		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	If the "actual value synchronization" is not enabled (p9301.3 = 0), then the value parameterized in p9342 is used as tolerance in the data cross-check.		
p9351	SI Motion SLS(SG) changeover/SOS (SBH) delay time (MM) / SI SLS/SOS t MM		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 0.00 [μs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 600000000.00 [μs]	Access level: 3 Func. diagram: 2819, 2820 Unit selection: - Expert list: 1 Factory setting 100000.00 [μs]
Description:	Sets the delay time for the SLS changeover and for the activation of SOS for the functions "Safely-Limited Speed" (SLS) and "Safe Operating Stop" (SOS). When transitioning from a higher to a lower Safely-Limited Speed level, and when activating Safe Operating Stop (SOS), within this delay time, the "old" speed level remains active. This delay is also applicable when activating SLS from the state "SOS and SLS inactive" and activating SOS from the state "SOS inactive".		
Dependency:	Refer to: p9551		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle. SLS: Safely-Limited Speed SOS: Safe Operating Stop

Dependency:	Refer to: r9713		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C30711 is output with value 7001 - along with the STOP F safety stop response.

	-1	4	-1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: p9507 Refer to: F30681, C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For synchronous motors, the value 4 must be set.
If value = -1:
- for synchronous motors, the calculation is automatically made with the value 4.
- for induction/re reluctance motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	5.00 [ms]	1000.00 [ms]	100.00 [ms]

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.
The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: Refer to: C30711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The smoothing is realized with a 1st order lowpass filter
For p9387 = minimum value, the filter is deactivated.
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).
- the value must be increased if C30711 has occurred with message value 1042.
- the value must be decreased if C30711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:
 $|p0305 \times p9783| \geq p9388 \times 1.2$

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency:	Refer to: r9785 Refer to: C30711
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

p9389 SI Motion actual value sensing sensorless accel. limit (MM) / ActV sl a_lim MM

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 10.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
---	--	--	--

Description: Sets the acceleration limit to filter velocity fluctuations.
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C30711 with message value 1043 has occurred.

- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784

Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9389 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set so that it is precisely at 2ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency: Refer to: p9501
Refer to: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

SP: Safe Position

Description:	Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-
Dependency:	Refer to: C01711				
Notice:	For bit 00: If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.				
Note:	SDI: Safe Direction (safe motion direction) SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring) For bit 00: For bit = 1 and with the SSM safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level. For bit = 0 and with the SSM safety function activated, the following applies: - Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state. For bit 08: For bit = 1 and with the SDI safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the status signal indicates inactive. For bit = 0 and with the SDI safety function activated, the following applies: - Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	Setting for isochronous communication between PROFIdrive controller and Control Unit. The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1). If a PROFIdrive controller exchanges process data isochronously with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data isochronously. Examples for isochronous communication: - isochronous control for the motion control (e.g. SIMOTION). - isochronous PROFIsafe master (e.g. SIMATIC S7-400F).				
Value:	0: Communication not isochronous 1: Communication isochronous				
Dependency:	Refer to: C01711, A01796

	0	16	16

Description: Sets the number of relevant bits for the redundant coarse position value.
The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Dependency: Refer to: p0414, r0472, p9325

Note: For safety functions that are not enabled (p9501 = 0), the following applies:
 - p9525 is automatically set the same as r0472 when the system boots.
 For safety functions that are enabled (p9501 > 0), the following applies:
 - p9525 is checked to see that it matches r0472.

Description:	Sets the number of the encoder, which is used by the second channel for safe motion monitoring functions.		
Dependency:	For the safe motion monitoring functions, the redundant safety position actual value sensing must be activated in the appropriate encoder data set (p0430.19 = 1). Refer to: p0187, p0188, p0189, p0430		
Note:	- for p9526 = 1, the encoder for the closed-loop speed control is used for the second channel of the motion monitoring functions (1-encoder system). This setting is only permissible when using a DQI encoder. - a change only becomes effective after a POWER ON.

Description:	Sets the bit number for the safe most significant bit (MSB) of the Gx_XIST1 coarse position. The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.		
Dependency:	Refer to: p0415, r0475, p9329		
Note:	For safety functions that are not enabled (p9501 = 0), the following applies: - p9529 is automatically set the same as r0475 when the system boots. For safety functions that are enabled (p9501 > 0), the following applies: - p9529 is checked to see that it matches r0475. MSB: Most Significant Bit

	0.000 [%]	100.000 [%]	80.000 [%]

Description: This is an evaluation factor to define the setpoint limit from the selected actual speed limit.
The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.

Dependency: This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1)
 r9733[0] = p9531[x] x p9533 (converted from the load side to the actuator side)
 r9733[1] = - p9531[x] x p9533 (converted from the load side to the actuator side)
 [x] = Selected SLS stage
 Conversion factor from the actuator side to the load side:
 - actuator type = rotary and axis type = linear: p9522 / (p9521 x p9520)
 - otherwise: p9522 / p9521

Refer to: p9501, p9531, p9601

Note: The active actual speed limit is selected via safety-relevant inputs (SGE).
When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

Description:

Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

p9567	SI Motion switchover velocity to SOS/SLS level (CU) / SI Mtn v_SOS/SG CU		
HLA	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]
Description:	Sets the switchover velocity to SOS/SLS level. Below this velocity limit, for a transition to SOS/SLS level, standstill (zero velocity) is assumed. The transition times from STOP C, D, E and the delay time when selecting SOS are canceled if this velocity threshold is fallen below. The wait time from p9569 is started, and after it has expired, SOS is active. The transition time from a higher to a lower safety-limited velocity level is canceled when this velocity level is fallen below. The wait time from p9569 is started, and after it has expired, the new SLS level becomes active. For a STOP C, this switchover velocity is the only criterion for prematurely activating an SOS. In the other cases mentioned here, it must first have been signaled that the axis had correctly braked.		
Dependency:	Refer to: p9501, p9551, p9552, p9553, p9554		
Note:	With p9567 = 0, reducing the wait time for the transition to SOS/SLS level is deactivated. SOS: Safe Operating Stop SLS: Safely-Limited Speed

	Min	Max	Factory setting
	0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]
Description:	Sets the velocity limit for the "SAM" and "SBR" functions. If the drive is being ramped down, but accelerates by the tolerance in p9548/p9348, then the SAM function identifies this and a STOP A is initiated. The monitoring operates as follows: - monitoring by SAM is activated for SS1 (or STOP B) and SS2 (or STOP C). - the SAM limit value is frozen after the velocity limit in p9568/p9368 is undershot. - SAM monitoring is still executed until the transition time to SOS/STO has expired.		
Note:	SAM: Safe Acceleration Monitor (safe acceleration monitoring) SBR: Safe Brake Ramp (safe brake ramp monitoring) SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring) For p9568 = p9368 = 0, the following applies: The value in p9546/p9346 (SSM) is applied as the velocity limit for SAM/SBR.

Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C0711 is output with value 7001 - along with the STOP F safety stop response.

Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787 Refer to: F01681, C01711		
Notice:	Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

	Min	Max	Factory setting
	5.00 [ms]	1000.00 [ms]	100.00 [ms]

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.
 The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: Refer to: C01711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
 The set time is rounded internally to an integer multiple of the monitoring clock cycle.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	100.00 [ms]	25.00 [ms]

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The smoothing is realized with a 1st order lowpass filter

For p9587 = minimum value, the filter is deactivated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	1000.00 [%]	10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).

- the value must be increased if C01711 has occurred with message value 1042.

- the value must be decreased if C01711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:

$|p0305 \times p9783| \geq p9588 \times 1.2$

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785

Refer to: C01711

2 Parameters

2.2 List of parameters

Notice: If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

p9589 SI Motion act. value sensing sensorless acceleration limit (CU) / ActV sl a_lim CU

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min 10.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
---	--	--	--

Description: Sets the acceleration limit to filter velocity fluctuations.
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.
If this value is decreased, and this dampens the velocity peaks when accelerating.
- the value must be increased if C01711 with message value 1043 has occurred.
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784

Refer to: C01711

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9589 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

Description:	Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.			
Value:	0: Inhibit SBC 1: Enable SBC			
Dependency:	Refer to: p9802			
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible. Description: Sets the signal source for the following functions on the Control Unit:
 STO: Safe Torque Off / SH: Safe standstill
 SBC: Safe Brake Control
 SS1: Safe Stop 1 (time monitored)

Dependency: Refer to: p9601

Note: The following signal sources are permitted:
 - fixed zero (standard setting).
 - digital inputs DI 0 ... 7, 16, 17, 20, 21 on the Control Unit 320-2 (CU320-2).

Description:	Sets the discrepancy time to change over the safety-related inputs (SGE) on the Control Unit. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.		
Dependency:	Refer to: p9850		
Note:	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)

Description:	Sets the debounce time for the failsafe digital inputs used to control STO/SS1.		
Note:	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed. The set debounce time impacts the response time of the safety function.

Description:	Sets the debounce time for the failsafe digital inputs used to control STO/SBC/SS1.		
Notice:	To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]: - if p0799[0] is less than 1 ms, then p9651 = 1 ms or a multiple integer of 1 ms. - if p0799[0] is greater or equal to 1 ms, then p9651 must = p0799[0] - or must be a multiple integer of p0799[0].		
Note:	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed. The set debounce time impacts the response time of the safety function.

Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).			
Recommendation:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228			
Dependency:	Refer to: p1135, p9852

For index [1]: The display of the load-side position actual value on the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.		

For index [2]:

The difference between the load-side position actual value on the Control Unit and load-side position actual value in the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

For index [3]:

The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

For index [4]:

Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".

The value is an average value from the values in index 0 and 1.

When the function is not enabled, the content corresponds to the value in index 0.

For index [5]:

The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter.

Input in p9542: p9708[3] + p9708[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in p9708[3].

Description:

For index [0]:

Displays the message value that resulted in the STOP F on the drive.

Value = 0:

The Control Unit signaled a STOP F.

Value = 1 ... 999:

Number of the incorrect date in the data cross-check between the monitoring channels.

Value >= 1000:

Additional diagnostic values of the drive.

For index [1]:

Displays the value of the Control Unit that resulted in the STOP F.

For index [2]:

Displays the value from the second channel that resulted in the STOP F.

Index:

[0] = Message value for KDV

[1] = Control Unit KDV actual value

[2] = Components KDV actual value

Dependency:

Note:

The significance of the individual message values is described in message C01711.

KDV: Data cross-check

For index [1, 2]:

When Safety message C01711 with message value >= 1000 occurs, these indices are not supplied with values.

Description: Displays the velocity resolution for safety-relevant motion monitoring functions.
For index [0]:
Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.
For index [1]:
Displays the safe velocity accuracy based on the safe encoder accuracy

Index: [0] = Actual velocity resolution
[1] = Minimum velocity resolution

Note: For index [0]:
This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.
Conversion of:
(internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle).
Example:
For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained.
For index [1]:
- for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only
Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary).
- for safety without encoder, index 1 is not relevant, and is always the value of zero.

- Dependency:** For SLS: $r9733[0] = p9531[x] \times p9533$ (converted from the load side to the actuator side)
For SDI negative: $r9733[0] = 0$
For SLS: $r9733[1] = -p9531[x] \times p9533$ (converted from the load side to the actuator side)
For SDI positive: $r9733[1] = 0$
[x] = Selected SLS stage
Conversion factor from the actuator side to the load side:
- actuator = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$
- otherwise: $p9522 / p9521$
Refer to: p9531, p9533

Note:

For bit 00:

When STO or "Safe power inhibit" is selected, the cause is displayed in bits 16 ... 21.

For bit 01:

- For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active.

- For p9772.1 = 1 and p9772.19 = 1, safe power inhibit is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.

Note:

If p9601.0 = 1 and p9601.2 = 1 and p9801.5 = 1 then for bit 0 and 1, the STO function applies.

For bit 05:

When SS1 is selected, the cause is displayed in bits 22 and 23.

For bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

For bit 19:

With SMM with encoder no actual value sensing is possible on account of parking.

For Safety functions without selection, safe power inhibit to selected (p9772.19 = 1).

SMM: Safe Motion Monitoring

For bit 22 and 23:

These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description: Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition:
|p0305 x p9783| >= p9588 x 1.2

Dependency: Refer to: p9588
Refer to: C01711

Notice: Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9783 = maximum value, current injection is deactivated.
Current injection is not effective in the U/f control mode.

Description:	Displays the acceleration resolution (load side) for the "SLA" function. Setpoints for acceleration limits or parameter changes for acceleration levels below this threshold have no effect.		
Index:	[0] = Coarse resolution [1] = Fine resolution		
Note:	This parameter does not provide any information about the actual accuracy of the acceleration sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi ²) to m/s ² (linear) or 1/s ² (rotary) with Tsi = p9500 (SI motion monitoring clock cycle) Example: For Tsi = 12 ms, r9790[0] = 0.006944 m/s ² (linear) or 0.019290 1/s ² (rotary) is obtained. For Tsi = 12 ms, r9790[1] = 0.000006944 m/s ² (linear) or 0.000019290 1/s ² (rotary) is obtained. Result for a coarse resolution is 0.006944 m/s ² (linear) - or 0.019290 1/s ² (rotary). Description: Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module.

0: Inhibit SBC

1: Enable SBC

Dependency: Refer to: p9602

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

Description:	Sets the signal source for Safe Brake Adapter (SBA). This defines via which digital input the Safe Brake Adapter feedback signal is read-in (SBA_DIAG). p9621/p9821 = 0: There is no Safe Brake Control (SBC) with Safe Brake Adapter (SBA) available. p9621/p9821 = r0722.x (x = 0, 1 ... 7) Safe Brake Adapter and Booksize unit (no Communication Interface Module (CIM)). p9621/p9821 = r9872.3 Safe Brake Adapter and Chassis unit (CIM).			
Dependency:	Refer to: p9601, p9602, p9621			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	No difference is tolerated for a data cross-check between p9621 and p9821. To use the "Safe Brake Adapter" function the following must apply: p9601 = p9801 <> 0 and p9602 = p9802 = 1

Description:	Sets the discrepancy time to change over the safety-related inputs (SGE) on the Motor Module/Hydraulic Module. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.		
Dependency:	Refer to: p9650		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)

Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Description:	Sets the delay time for STO for the function "Safe Stop 1" (SS1) on the Hydraulic Module to brake along the OFF3 down ramp (p1135).		
Recommendation:	The delay time should be set as follows so that the drive can completely decelerate along the OFF3 ramp: Delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9652		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9812 = 1). For a data cross-check between p9652 and p9852, a difference of one safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).		
Recommendation:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9652

Description:	Sets the transition period from STOP F to STOP A on the Motor Module/Hydraulic Module.		
Dependency:	Refer to: p9658, r9895 Refer to: F30611		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		

Note: For a data cross-check between p9658 and p9858, a difference of one safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time. STOP F: Defect in a monitoring channel (error in the data cross-check) STOP A: STO as a result of a fault detected by Safety Integrated

2.2 List of parameters

Note: The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Article No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Article Number

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

Description:

For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency:

Refer to: p9904, p9905

Note:

The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Index 8 = license key character 9 (e.g. 65 dec) Index 9 = license key character 10 (e.g. 0 dec) ...		
Dependency:	Refer to: r7843, p9921 Refer to: F13000, A13001, F13010		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. With the STARTER commissioning tool, the ASCII characters are not entered coded, i.e. the license key characters can be entered as printed in the Certificate of License. In this case, the commissioning tool codes the characters.		
Note:	For an invalid license key, all the indices have the value 0 dec. Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-"). When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec. After entering the license key, the license key must be activated (p9921). The following fault and LED indicate that the licensing is not adequate: - F13000 --> licensing not adequate - LED READY --> flashes red at approximately 2 Hz

Description:	Select a failsafe digital input (F-DI) for the signal "acknowledge internal event" (internal fault). The signal is transferred to the corresponding control signal of all drives. The falling edge at this input resets the status "internal event" in the drives. The rising edge at this input acknowledges any existing discrepancy errors.

Description:	Sets the test stop mode for the particular safety digital output (F-DO). Index 0: F-DO 0 Index 1: F-DO 1 Index 2: F-DO 2 Index 3: F-DO 3				
Value:	1: Test mode 1 evaluation of int. diagnostic signal (passive load) 2: Test mode 2 read back F-DO in DI (relay circuit) 3: Test mode 3 read back F-DO in DI (actuator with feedback signal)				
Note:	If value = 1: When this test mode is being used, and excessive resistance of the load between DO+ and DO- can lead to problems during the test stop. It is therefore important to make sure that the load resistance at an individual F-DO does not exceed 10 kOhm.

Note: If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is deselected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10040) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselected the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselected the safety function.

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

The debounce time acts on the following digital inputs:

- Failsafe digital inputs (F-DI).
- Single-channel digital input 22 (DI 22, read back input for the forced checking procedure).

The debounce time is accepted rounded off to whole milliseconds.

Dependency:

Refer to: p10017

Note:

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

Dependency:	Refer to: p9501, p9601, p10117, p10140, p10150			
Note:	F-DI: Failsafe Digital Input			
	If a safety function is assigned to an input (e.g. via p10122), then the following applies:			
	- logical "0": Safety function is selected			
	- logical "1": Safety function is deselected			
	The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10140) of the input as NC contact or NO contact, and is aligned to the use of a safety function:			
	With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.			
	This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselected the safety function.			
	With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.			
	This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselected the safety function.			
	The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.			
	The parameter is only updated in the following cases:			
	- if the Safety Extended Functions are enabled by means of activation via F-DI.			
	- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).			
	In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

The following list contains the parameters that are dependent on the encoder data sets.

Product: SINAMICS S120/S150, Version: 5206900, Language: eng, Type: EDS

p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_intf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0145[0...n]	Activate/deactivate encoder interface / Enc_intf act/deact
r0146[0...n]	Encoder interface active/inactive / Enc_intf act/deact
r0147[0...n]	Sensor Module EEPROM data version / SM EEPROM version
r0148[0...n]	Sensor Module firmware version / SM FW version
p0400[0...n]	Encoder type selection / Enc_type sel
p0402[0...n]	Gearbox type selection / Gearbox type sel
p0404[0...n]	Encoder configuration effective / Enc_config eff
p0405[0...n]	Square-wave encoder track A/B / Sq-wave enc A/B
p0407[0...n]	Linear encoder grid division / Enc grid div
p0408[0...n]	Rotary encoder pulse number / Rot enc pulse no
p0410[0...n]	Encoder inversion actual value / Enc inv ActV
p0411[0...n]	Measuring gear configuration / Meas gear config
p0412[0...n]	Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev
p0413[0...n]	Measuring gear position tracking tolerance window / Pos track window
p0414[0...n]	Redundant coarse position value relevant bits (identified) / Relevant bits
p0415[0...n]	Gx_XIST1 Coarse position safe most significant bit (identified) / Gx_XIST1 safe MSB
p0416[0...n]	Non safety-relevant meas. steps position value POS1 (detected) / nsrPos1
p0417[0...n]	Encoder safety comparison algorithm (detected) / Safety comp_algo

Chapter "Data sets"

The following list contains the parameters that are dependent on the motor data sets.

Product: SINAMICS S120/S150, Version: 5206900, Language: eng, Type: MDS

p0131[0...n]	Motor component number / Mot comp_no
p0133[0...n]	Motor configuration / Motor config
p0300[0...n]	Motor type selection / Mot type sel
p0301[0...n]	Motor code number selection / Mot code no sel
r0302[0...n]	Motor code number of motor with DRIVE-CLiQ / Mot code mot w DQ
r0303[0...n]	Motor with DRIVE-CLiQ status word / Motor w DQ ZSW
p0304[0...n]	Rated motor voltage / Mot U_rated
p0305[0...n]	Rated motor current / Mot I_rated
p0306[0...n]	Number of motors connected in parallel / Mot parallel qty
p0307[0...n]	Rated motor power / Mot P_rated
p0308[0...n]	Rated motor power factor / Mot cos phi rated
p0309[0...n]	Rated motor efficiency / Mot eta_rated
p0310[0...n]	Cylinder piston diameter / Cyl piston diam
p0310[0...n]	Rated motor frequency / Mot f_rated
p0311[0...n]	Cylinder piston rod diameter A side / Cyl PistRodDiam A
p0311[0...n]	Rated motor speed / Mot n_rated
p0311[0...n]	Rated motor velocity / Mot v_rated
p0312[0...n]	Cylinder piston rod diameter B side / Cyl rod diam B
p0312[0...n]	Rated motor torque / Mot M_rated
p0312[0...n]	Rated motor force / Mot F_rated
p0313[0...n]	Cylinder piston stroke / Cyl pist stroke
r0313[0...n]	CO: Motor pole pair number, actual (or calculated) / MotPolePair no act
p0314[0...n]	Cylinder dead volume A side / Cyl_dead vol A
p0314[0...n]	Motor pole pair number / Mot PolePair no
p0315[0...n]	Cylinder dead volume B side / Cyl_dead vol B
p0315[0...n]	Motor pole pair width / Mot PolePair width
p0316[0...n]	Motor torque constant / Mot kT
p0316[0...n]	Motor force constant / Mot kT
p0317[0...n]	Motor voltage constant / Mot kE
p0318[0...n]	Motor stall current / Mot I_standstill
p0319[0...n]	Motor stall torque / Mot M_standstill
p0319[0...n]	Motor stall force / Mot F_standstill
p0320[0...n]	Motor rated magnetizing current/short-circuit current / Mot I_mag_rated
p0322[0...n]	Maximum motor speed / Mot n_max
p0322[0...n]	Motor maximum velocity / Mot v_max
p0323[0...n]	Maximum motor current / Mot I_max
p0324[0...n]	Winding maximum speed / Winding n_max
p0324[0...n]	Winding maximum velocity / Winding v_max
p0325[0...n]	Motor pole position identification current 1st phase / Mot PolID I 1st Ph
p0326[0...n]	Motor stall torque correction factor / Mot M_stall_corr
p0326[0...n]	Motor stall force correction factor / Mot F_stall_corr
p0327[0...n]	Optimum motor load angle / Mot phi_load opt
p0328[0...n]	Motor reluctance torque constant / Mot kT_reluctance
p0328[0...n]	Motor reluctance force constant / Mot kT_reluctance
p0329[0...n]	Motor pole position identification current / Mot PolID current
r0330[0...n]	Rated motor slip / Mot slip_rated

r0331[0...n]	Actual motor magnetizing current/short-circuit current / Mot I_mag_rtd act
r0332[0...n]	Rated motor power factor / Mot cos phi rated
r0333[0...n]	Rated motor torque / Mot M_rated
r0334[0...n]	Actual motor-torque constant / Mot kT act
r0334[0...n]	Actual motor force constant / Mot kT act
p0335[0...n]	Motor cooling type / Mot cool type
r0336[0...n]	Actual rated motor frequency / Mot f_rated act
r0337[0...n]	Rated motor EMF / Mot EMF_rated
p0338[0...n]	Motor limit current / Mot I_limit
r0339[0...n]	Rated motor voltage / Mot U_rated
p0341[0...n]	Cylinder weight / Cyl weight
p0341[0...n]	Motor moment of inertia / Mot m_inert
p0341[0...n]	Motor weight / Mot weight
p0342[0...n]	Ratio between the total and motor moment of inertia / Mot m_inert ratio
p0343[0...n]	Valve/cylinder configuration / Valve/cyl config
p0343[0...n]	Rated motor current identified / Mot I_rated ident
p0344[0...n]	Cylinder mounting position A side / Cyl mount pos A
p0344[0...n]	Motor weight (for the thermal motor model) / Mot weightThermMod
r0345[0...n]	Nominal motor starting time / Mot t_start_rated
p0346[0...n]	Line length A side / Line length A
p0346[0...n]	Motor excitation build-up time / Mot t_excitation
p0347[0...n]	Line length B side / Line length B
p0347[0...n]	Motor de-excitation time / Mot t_de-excitat
p0348[0...n]	Internal line diameter / Line_inner diam
p0348[0...n]	Speed at the start of field weakening Vdc = 600 V / n_strt field weak
p0348[0...n]	Velocity at the start of field weakening Vdc = 600 V / v_strt field weak
p0350[0...n]	Motor stator resistance cold / Mot R_stator cold
p0352[0...n]	Cable resistance / R_cable
p0353[0...n]	Motor series inductance / Mot L_series
p0354[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R_r cold/R_D d
p0355[0...n]	Motor damping resistance q axis / Mot R_damp q
p0356[0...n]	Motor stator leakage inductance / Mot L_stator leak
p0357[0...n]	Motor stator inductance d axis / Mot L_stator d
p0358[0...n]	Motor rotor leakage inductance / damping inductance d axis / Mot L_r leak / LDd
p0359[0...n]	Motor damping inductance q axis / Mot L_damp q
p0360[0...n]	Motor magnetizing inductance/magn. inductance d axis saturated / Mot Lh/Lh d sat
p0361[0...n]	Motor magnetizing inductance q axis saturated / Mot L_magn q sat
p0362[0...n]	Motor saturation characteristic flux 1 / Mot sat flux 1
p0363[0...n]	Motor saturation characteristic flux 2 / Mot sat flux 2
p0364[0...n]	Motor saturation characteristic flux 3 / Mot sat flux 3
p0365[0...n]	Motor saturation characteristic flux 4 / Mot sat flux 4
p0366[0...n]	Motor saturation characteristic I_mag 1 / Mot sat I_mag 1
p0367[0...n]	Motor saturation characteristic I_mag 2 / Mot sat I_mag 2
p0368[0...n]	Motor saturation characteristic I_mag 3 / Mot sat I_mag 3
p0369[0...n]	Motor saturation characteristic I_mag 4 / Mot sat I_mag 4
r0370[0...n]	Motor stator resistance cold / Mot R_stator cold
r0372[0...n]	Total power unit cable resistance / PU cable R tot
r0373[0...n]	Motor rated stator resistance / Mot R_stator rated
r0374[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R_r cold/R_D d
r0375[0...n]	Motor damping resistance q axis / Mot R_damp q
r0376[0...n]	Rated motor rotor resistance / Mot rated R_rotor
r0377[0...n]	Motor leakage inductance total / Mot L_leak total
r0378[0...n]	Motor stator inductance d axis / Mot L_stator d
r0380[0...n]	Motor damping inductance d axis / Mot L_damp d
r0381[0...n]	Motor damping inductance q axis / Mot L_damp q

2.3 Parameters for data sets

r0382[0...n]	Motor magnetizing inductance transformed / Lh d axis saturated / Mot L_m tr/Lhd sat
r0383[0...n]	Motor magnetizing inductance q axis saturated / Mot L_magn q sat
r0384[0...n]	Motor rotor time constant / damping time constant d axis / Mot Tc_rotor/T_Dd
r0385[0...n]	Motor damping time constant q axis / Mot L_damping q
r0386[0...n]	Motor stator leakage time constant / Mot Tc_stator leak
r0387[0...n]	Motor stator leakage time constant q axis / Mot Tc_Sleak /T_Sq
p0388[0...n]	Motor stall torque correction factor for p1402.6 = 1 / Mot M_stallCorrNew
p0389[0...n]	Excitation rated no-load current / Exc I_noload_rated
p0390[0...n]	Rated excitation current / Exc I_rated
p0391[0...n]	Current controller adaptation starting point Kp / I_adpt pt Kp
p0392[0...n]	Current controller adaptation starting point Kp adapted / I_adpt pt Kp adpt
p0393[0...n]	Current controller adaptation P gain adaptation / I_adpt Kp adpt
p0393[0...n]	Current controller adaptation P gain scaling / I_adpt Kp scal
r0395[0...n]	Actual stator resistance / R_stator act
r0396[0...n]	Actual rotor resistance / R_rotor act
p0397[0...n]	Angle magnetic decoupling maximum angle / Magn decpl max_ang
p0398[0...n]	Angle magn decoupling (cross saturation) coeff 1 / Magn decoupl C1
p0399[0...n]	Angle magn decoupling (cross saturation) coeff 3 / Magn decoupl C3
p0530[0...n]	Bearing version selection / Bearing vers sel
p0531[0...n]	Bearing code number selection / Bearing codeNo sel
p0532[0...n]	Bearing maximum speed / Bearing n_max
p0532[0...n]	Bearing maximum velocity / Bearing v_max
p0541[0...n]	Load gearbox code number / Load grbx code no
p0542[0...n]	Load gearbox maximum speed / Load grbx n_max
p0543[0...n]	Load gearbox maximum torque / Load grbx M_max
p0544[0...n]	Load gearbox overall ratio numerator / Load grbx ratio N
p0545[0...n]	Load gearbox overall ratio denominator / Load grbx ratio D
p0546[0...n]	Load gearbox direction of rotation inversion / Load grbx dir inv
p0547[0...n]	Load gearbox moment of inertia / Load grbx m_inert
p0550[0...n]	Brake version / Brake version
p0551[0...n]	Brake code number / Brake code no
p0552[0...n]	Maximum brake speed / Brake n_max
p0553[0...n]	Brake holding torque / Brake M_hold
p0554[0...n]	Brake moment of inertia / Brake m_inert
p0600[0...n]	Motor temperature sensor for monitoring / Mot temp_sensor
p0601[0...n]	Motor temperature sensor type / Mot_temp_sens type
p0604[0...n]	Mot_temp_mod 2: sensor alarm threshold / Mod 2: sens A_thr
p0605[0...n]	Mot_temp_mod 1/2 sensor threshold and temperature value / Mod 1/2 sens thr_T
p0606[0...n]	Mot_temp_mod 2: sensor timer / Mod 2:sens timer
p0607[0...n]	Temperature sensor fault timer / Sensor fault time
p0610[0...n]	Motor overtemperature response / Mot temp response
p0611[0...n]	I2t motor model thermal time constant / I2t MotMod Tc
p0612[0...n]	Mot_temp_mod activation / Mot_temp_mod act
p0613[0...n]	Mot_temp_mod 1/3 ambient temperature / Mod 1/3 amb_temp
p0614[0...n]	Thermal resistance adaptation reduction factor / Therm R_adapt red
p0615[0...n]	Mot_temp_mod 1 (I2t) fault threshold / I2t F thr
p0616[0...n]	Motor overtemperature alarm threshold 1 / Mot temp alarm 1
p0617[0...n]	Stator thermally relevant iron component / Stat therm iron
p0618[0...n]	Stator thermally relevant copper component / Stat therm copper
p0619[0...n]	Rotor thermally relevant weight / Rotor therm weight
p0620[0...n]	Thermal adaptation, stator and rotor resistance / Mot therm_adpt R
p0621[0...n]	Identification stator resistance after restart / ID rst restart
p0622[0...n]	Motor excitation time for Rs_ident after switching on again / t_excit Rs_id
p0624[0...n]	Motor temperature offset PT100 / Mot T_offset PT100
p0625[0...n]	Motor ambient temperature during commissioning / Mot amb_temp com

p0626[0...n]	Motor overtemperature, stator core / Mot T_over core
p0627[0...n]	Motor overtemperature, stator winding / Mot T_over stator
p0628[0...n]	Motor overtemperature rotor / Mot T_over rotor
p0629[0...n]	Stator resistance reference / R_stator ref
r0630[0...n]	Mot_temp_mod ambient temperature / Mod T_ambient
r0631[0...n]	Mot_temp_mod stator iron temperature / Mod T_stator
r0632[0...n]	Mot_temp_mod stator winding temperature / Mod T_winding
r0633[0...n]	Mot_temp_mod rotor temperature / Mod rotor temp
p0634[0...n]	Q flux flux constant unsaturated / PSIQ KPSI UNSAT
p0635[0...n]	Q flux quadrature axis current constant unsaturated / PSIQ KIQ UNSAT
p0636[0...n]	Q flux direct axis current constant unsaturated / PSIQ KID UNSAT
p0637[0...n]	Q flux flux gradient saturated / PSIQ Grad SAT
p0643[0...n]	Overvoltage protection for synchronous motors / U_over_protect
p0645[0...n]	Motor kT characteristic kT1 / Mot kT char kT1
p0646[0...n]	Motor kT characteristic kT3 / Mot kT char kT3
p0647[0...n]	Motor kT characteristic kT5 / Mot kT char kT5
p0648[0...n]	Motor kT characteristic kT7 / Mot kT char kT7
p0650[0...n]	Actual motor operating hours / Mot t_op act
p0651[0...n]	Motor operating hours maintenance interval / Mot t_op maint
p0652[0...n]	Motor stator resistance scaling / Mot R_stator scal
p0653[0...n]	Motor stator leakage inductance scaling / Mot L_S_leak scal
p0655[0...n]	Motor magnetizing inductance d axis saturated scaling / Mot L_m d sat scal
p0656[0...n]	Motor magnetizing inductance q axis saturated scaling / Mot L_m q sat scal
p0657[0...n]	Motor damping inductance d axis scaling / Mot L_damp d scal
p0658[0...n]	Motor damping inductance q axis scaling / Mot L_damp q scal
p0659[0...n]	Motor damping resistance d axis scaling / Mot R_damp d scal
p0660[0...n]	Motor damping resistance q axis scaling / Mot R_damp q scal
p0690[0...n]	Brushless excitation rated current / BLE I_rated
p0691[0...n]	Reverse field excitation correction factor / RFE correction
p0692[0...n]	Reverse field excitation iron resistance / RFE iron R
p0693[0...n]	Brushless excitation inductance d-axis saturated / BLE L_d sat
p0694[0...n]	Reverse field excitation leakage inductance / RFE L_leak
p0696[0...n]	Brushless excitation ratio / BLE ratio
p0697[0...n]	Brushless excitation number of pole pairs / BLE PolePair no
p0698[0...n]	Brushless excitation, excitation resistance / BLE exc_R
p0699[0...n]	Excitation configuration / Exc config
p0826[0...n]	Motor changeover motor number / Mot_chgov mot no
p0827[0...n]	Motor changeover status word bit number / Mot_chg ZSW bit no
p1231[0...n]	Armature short-circuit / DC braking configuration / ASC/DCBRK config
p1232[0...n]	DC braking braking current / DCBRK I_brake
p1233[0...n]	DC braking time / DCBRK time
p1234[0...n]	Speed at the start of DC braking / DCBRK n_start
p1234[0...n]	DC braking starting velocity / DCBRK v_start
p1236[0...n]	Ext. armature short-cct. contactor feedback signal monit. time / ASC ext t_mon
p1237[0...n]	External armature short-circuit delay time when opening / ASC ext t_wait
p1710[0...n]	Current controller adaptation direct axis starting point Kp / Id_adapt pt Kp
p1711[0...n]	Current ctrl adaptation direct axis starting point Kp adapted / Id_adpt pt Kp adpt
p1712[0...n]	Current controller adaptation direct axis P gain adaptation / Id_adapt Kp adapt
p1909[0...n]	Motor data identification control word / MotID STW
p1958[0...n]	Rotating measurement ramp-up/ramp-down time / Rot meas t_r up/dn
p1958[0...n]	Moving measurement ramp-up/ramp-down time / Mov meas t_r up/dn
p1959[0...n]	Rotating measurement configuration / Rot meas config
p1959[0...n]	Moving measurement configuration / Mov meas config
p1980[0...n]	PollID technique / PollID technique
p1981[0...n]	PollID distance max / PollID distance max

2 Parameters

2.3 Parameters for data sets

p1982[0...n]	PolID selection / PolID selection
p1991[0...n]	Motor changeover angular commutation correction / Ang_com corr
p1993[0...n]	PolID motion-based current / PolID I mtn_bas
p1994[0...n]	PolID motion-based rise time / PolID T mtn_bas
p1995[0...n]	PolID motion-based gain / PolID kp mtn_bas
p1996[0...n]	PolID motion-based integral time / PolID Tn mtn_bas
p1997[0...n]	PolID motion-based smoothing time / PolID t_sm mtn_bas
p1999[0...n]	Ang. commutation offset calibr. and PolID scaling / Com_ang_offs scal
p2952[0...n]	Flux characteristic coefficient K01 / Psid_mod K01
p2953[0...n]	Flux characteristic coefficient K02 / Psid_mod K02
p2954[0...n]	Flux characteristic coefficient K03 / Psid_mod K03
p2955[0...n]	Flux characteristic coefficient K04 / Psid_mod K04
p2980[0...n]	Quadrature axis flux model coefficient K01 / Psiq_mod K01
p2981[0...n]	Quadrature axis flux model coefficient K02 / Psiq_mod K02
p2982[0...n]	Quadrature axis flux model coefficient K03 / Psiq_mod K03
p2983[0...n]	Quadrature axis flux model coefficient K04 / Psiq_mod K04
p3011[0...n]	MotID current control adaptation lower starting point identified / I_adapt low ident
p3012[0...n]	MotID current control adaptation upper starting point identified / I_adapt up ident
p3013[0...n]	MotId current controller adaptation P gain identified / I_adapt Kp ident
p3049[0...n]	MotId Speed at start of field weakening identified / ident
p3049[0...n]	MotId Speed at start of field weakening identified / v_Fieldweak ident
p3050[0...n]	Motord stator resistance identified / R_stator ident
p3054[0...n]	MotId rotor resistance identified / R_rotor ident
p3056[0...n]	MotId stator leakage inductance identified / L_stator leak
p3058[0...n]	MotId rotor leakage inductance identified / L_rotor leak
p3060[0...n]	MotId magnetizing inductance identified / MotId Lh ident
p3090[0...n]	PolID elasticity-based configuration / PolID el config
p3091[0...n]	PolID elasticity-based ramp time / PolID el t_ramp
p3092[0...n]	PolID elasticity-based wait time / PolID el t_wait
p3093[0...n]	PolID elasticity-based measurement number / PolID el meas
p3094[0...n]	PolID elasticity-based deflection expected / PolID el defl exp

2.4.1 Parameters with "WRITE_NO_LOCK"

The following list contains the parameters with the "WRITE_NO_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS S120/S150, Version: 5206900, Language: eng, Type: WRITE_NO_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev com par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0124[0...n]	Power unit detection via LED / PU detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0144[0...n]	Voltage Sensing Module detection via LED / VSM detection LED
p0154[0...n]	Voltage Sensing Module 2 detection via LED / VSM2 detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p1903	BI: Data identification control / Data ID ctrl
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p4700[0...1]	Trace control / Trace control
p4701	Measuring function control / Meas fct ctrl
p4703[0...1]	Trace options / Trace options
p4707	Measurement function configuration / Meas fct config
p4710[0...1]	Trace trigger condition / Trace Trig_cond
p4711[0...5]	Trace trigger signal / Trace trig_signal

p4810	Function generator mode / FG operating mode
p4812	Function generator physical address / FG phys address
p4813	Function generator physical address reference value / FG phys addr ref
p4815[0...2]	Function generator drive number / FG drive number
p4816	Function generator output signal integer number scaling / FG outp integ scal
p4819	BI: Function generator control / FG control
p4820	Function generator signal shape / FG signal shape
p4821	Function generator period / FG period duration
p4822	Function generator pulse width / FG pulse width
p4823	Function generator bandwidth / FG bandwidth
p4824	Function generator amplitude / FG amplitude
p4825	Function generator 2nd amplitude / FG 2nd amplitude
p4826	Function generator offset / FG offset
p4827	Function generator ramp-up time to offset / FG ramp-up offset
p4828	Function generator lower limit / FG lower limit
p4829	Function generator upper limit / FG upper limit
p4830	Function generator time slice cycle / FG time slice
p4831	Function generator amplitude scaling / FG amplitude scal
p4832[0...2]	Function generator amplitude scaling / FG amplitude scal
p4833[0...2]	Function generator offset scaling / FG offset scal
p4835[0...4]	Function generator free measurement function scaling / FG fr MeasFct scal
p4840[0...1]	MTrace cycle number setting / Cycle number
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3

Fig. 3-4 1030 – Handling BICO technology

Handling BICO technology

Binector:  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

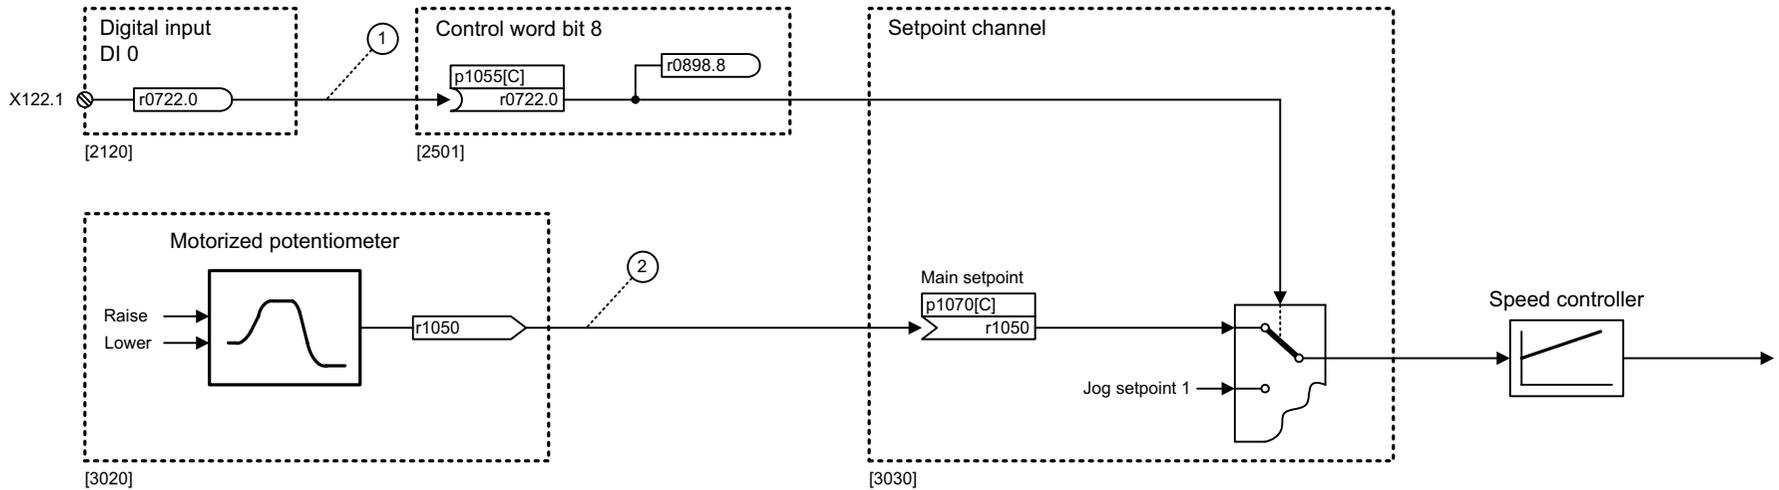

Connector:  Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
"Bl:" parameter for binectors (Bl = Binector Input)
or
"Cl:" parameter for connectors (Cl = Connector Input)

Example:

The main setpoint for the speed controller (Cl: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (Bl: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

Parameterizing steps:

- ① p1055[0] = r0722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = r1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> The drive object CU_LINK only exists for automation systems with SINAMICS Integrated (e.g. SIMOTION D, SINUMERIK NCU) and the corresponding controller extension (e.g. CX32-2, NX10).
On the SINAMICS Integrated, each controller extension is represented by a drive object CU_LINK.

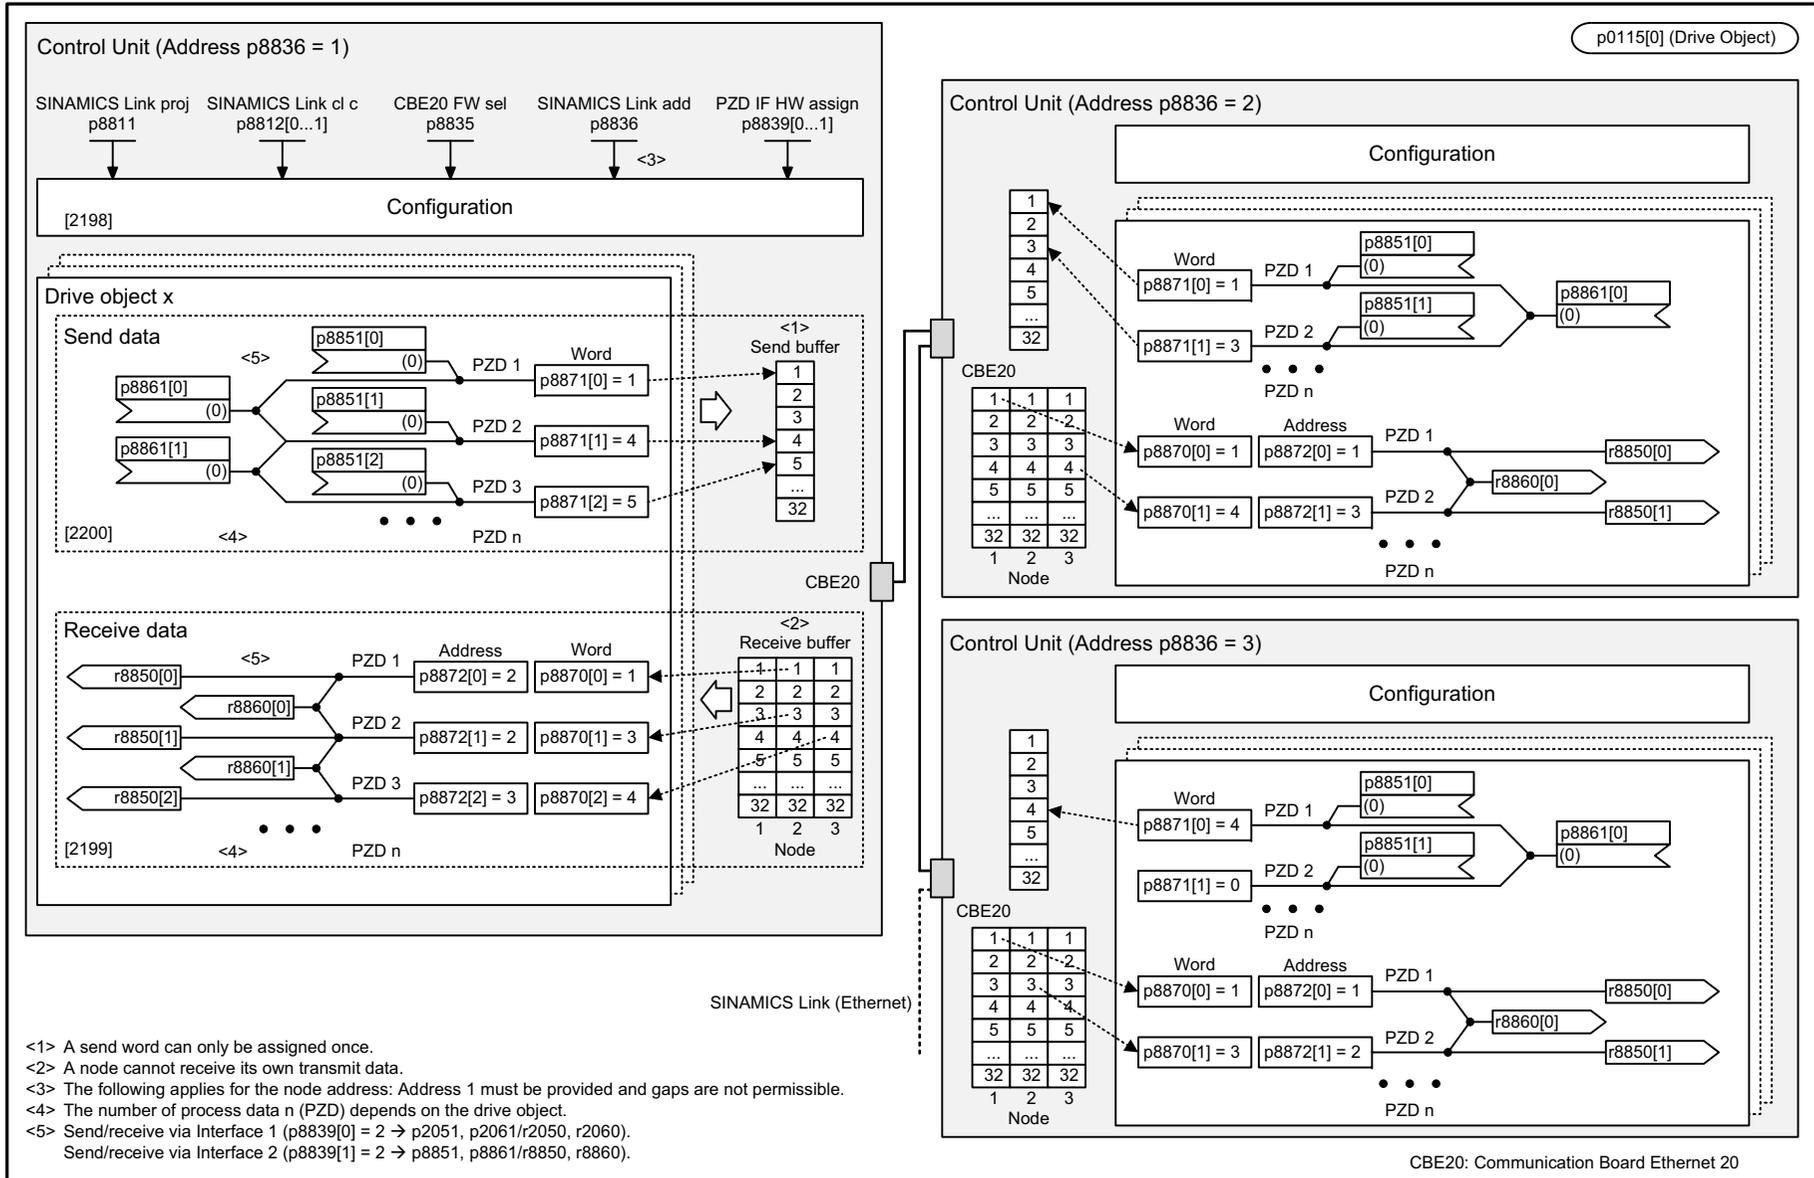

<2> p8800: CU_LINK address.
Address of the controller extension, represented by the drive object CU_LINK. The address correlates with the DRIVE-CLIQ socket of the Control Unit connected/configured to the controller extension configured.
Value range: See p0918 (PROFIBUS address)
The parameter p8800 is only readable through non-cyclic parameter access via DPV1 services.

<1> Depending on the drive object, only specific telegrams can be used.
 <2> If p0922 = 999 is changed to another value, the telegram is automatically assigned as specified in [2415] - [2423].
 If p0922 ≠ 999 is changed to p0922 = 999, the "old" telegram assignment is maintained as specified in [2415] - [2423].
 <3> Can be freely connected.
 <4> The maximum number of PZD words depends on the drive object type.
 <5> Only for SERVO (SINAMICS S120).
 <6> Only if the "Basic positioner" function module is active (r0108.4 = 1).

- <1> The number of PZD send words depends on the drive object type.
- <2> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD). The two corresponding connector inputs cannot be interconnected.
- <3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x). The following applies for temperature values: 100° C → 100 % = 4000 hex or 4000 0000 hex; 0° C → 0 %.
- <4> To comply with the PROFIdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.

- <1> Only for encoder:
p1400.10 = 1 is recommended if a torque pre-control signal is also connected at [5060] in addition to the speed pre-control signal.
- <2> The interpolator is only effective for clock-cycle synchronous PROFIdrive operation and sign-of-life received from the master (STW2.12 ... STW2.15). If the Dynamic Servo Control (DSC) is active, an additional deadtime of one speed controller sampling time is effective.
- <3> For a 1/0 edge from control command STW2.8 "travel to fixed stop" [2444] the output of all filters is set to the input value for an instantaneous response to a change of the speed setpoint sign.
- <4> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

- <1> For p1400.4 = 1, the first torque limit applies for motoring operation and the other for regenerative operation, independently of the sign of the torque and the speed (compatible with SIMODRIVE).
"Normal case": If neither dynamic limits nor offsets are required, the torque limit when motoring is entered via p1520. The torque limit when regenerating is entered via p1521 (as a negative value).

<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting. Changes that may be required are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

- <1> Only for measuring equipment with $R_i \geq 1 \text{ M}\Omega$.
- <2> With the factory setting, input values from -100...100 % result in output voltages from 0...4.98 V.
- <3> The input signals are determined by the reference quantities p200x (100 % corresponds to p200x). The calculated normalization is indicated via r0786.
- <4> Example: If a speed signal is entered via p0071 and r0786 indicates 100.0, a speed change of 100 rpm results in an output voltage change of 1.0 V.

<1> Differential input!
In case of a ground-based input signal, the terminal X521.2 must be connected to the reference potential.
Caution:
The voltage between an input (X521.1 or X521.2) and the ground point must not exceed 35 V.
When the load resistor is switched in (S5.0 closed), the voltage between the input terminals must not exceed 15 V.

4.1 Overview of faults and alarms

4.1.1 General information

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is initiated • Status signal ZSW1.3 is set. • The fault is entered into the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. <p>If the cause of the alarm is no longer present, they automatically reset themselves.</p>

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs.</p> <p>Note</p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p>Closed-loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> • n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired.</p> <p>Torque control (p1300 = 23)</p> <ul style="list-style-type: none"> • The following applies for torque control: Reaction as for OFF2. • When the system switches to torque control with p1501, the following applies: No separate braking reaction. <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault response only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse inhibit	<p>Closed-loop speed and torque control</p> <ul style="list-style-type: none"> • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 4-3 Acknowledging faults

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 2555) has the following layout:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name		
Message value:	Component number: %1, fault cause: %2		
Message class:	Text of the message class (number according to PROFIdrive)		
Drive object:	List of objects.		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledgement:	NONE		
Cause:	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).		
Remedy:	Description of possible remedies.		
Response to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)		
Acknowl. upon F:	IMMEDIATELY (POWER ON)		
Response upon N:	NONE		
Acknowl. upon N:	NONE		

----- **End of example** -----

Axxxxx	Alarm xxxxx
Axxxxx (F, N)	Alarm xxxxx (message type can be changed to F or N)
Fxxxxx	Fault xxxxx
Fxxxxx (A, N)	Fault xxxxx (report type can be changed to A or N)
Nxxxxx	No message
Nxxxxx (A)	No message (message type can be changed to A)
Cxxxxx	Safety message (separate message buffer)

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms" (Page 2555) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 2548)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
 - Specifies the "Channel error type" of the PROFINET channel diagnostics.
 - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
 - Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.
 - When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
 - Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
 - When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

4 Faults and alarms

4.1 Overview of faults and alarms

- ET 200 (dec)

Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.

- NAMUR (r3113.x)

Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Table 4-4 Message classes and coding of various diagnostic interfaces

2. Overvoltage condition of the electronics power supply

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Component:

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

Propagation:

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO

The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.

- DRIVE

The fault is passed on to all active drive objects with closed-loop control functions.

- GLOBAL

The fault is passed on to all active drive objects.

- LOCAL

The response of this type of propagation is dependent on parameter p3116.

With binector input p3116 = 0 (factory setting) the following applies:

The fault is passed on to the first active drive object with closed-loop control functions.

With binector input p3116 = 1-signal, the following applies:

The fault is not passed on.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 2543)

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 2545)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0..63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0..7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

 WARNING
On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms

Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 2555).

Faults and alarms are organized into the following number ranges:

Message class:	Hardware/software error (1)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		

Cause: It was not possible to download the firmware to a DRIVE-CLiQ component.
 Fault value (r0949, interpret hexadecimal):
 yyxxxx hex: yy = component number, xxxx = fault cause
 xxxx = 000B hex = 11 dec:
 DRIVE-CLiQ component has detected a checksum error.
 xxxx = 000F hex = 15 dec:
 The selected DRIVE-CLiQ component did not accept the contents of the firmware file.
 xxxx = 0012 hex = 18 dec:
 Firmware version is too old and is not accepted by the component.
 xxxx = 0013 hex = 19 dec:
 Firmware version is not suitable for the hardware release of the component.
 xxxx = 0065 hex = 101 dec:
 After several communication attempts, no response from the DRIVE-CLiQ component.
 xxxx = 008B hex = 139 dec:
 Initially, a new boot loader is loaded (must be repeated after POWER ON).
 xxxx = 008C hex = 140 dec:
 Firmware file for the DRIVE-CLiQ component not available on the memory card.
 xxxx = 008D hex = 141 dec:
 An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.
 xxxx = 008F hex = 143 dec:
 Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.
 xxxx = 0090 hex = 144 dec:
 When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.
 xxxx = 0091 hex = 145 dec:
 Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.
 xxxx = 009C hex = 156 dec:
 Component with the specified component number is not available (p7828).
 xxxx = Additional values:
 Only for internal Siemens troubleshooting.

Remedy:

- check the selected component number (p7828).
- check the DRIVE-CLiQ wiring.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

A01006	Firmware update for DRIVE-CLiQ component required		
Message value:	Component number: %1		
Message class:	General drive fault (19)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.		
Remedy:	Update the firmware using the commissioning tool: The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out. Firmware update via parameter: - take the component number from the alarm value and enter into p7828. - start the firmware download with p7829 = 1.

A01007	POWER ON for DRIVE-CLiQ component required		
Message value:	Component number: %1		
Message class:	General drive fault (19)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update). Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component. Note: For a component number = 1, a POWER ON of the Control Unit is required.		
Remedy:	- Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again. - For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.		

A01009 (N)	CU: Control module overtemperature		
Message value:	-		
Message class:	Overtemperature of the electronic components (6)		
Drive object:	All objects		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.		
Remedy:	- check the air intake for the Control Unit. - check the Control Unit fan. Note: The alarm is automatically withdrawn once the limit value has been fallen below.

Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	An unknown drive type was found. Fault value (r0949, interpret decimal): Drive object number (refer to p0101, p0107).		
Remedy:	- replace Power Module. - carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support.		

F01011 (N)	Download interrupted		
Message value:	%1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		

Cause: The project download was interrupted.
 Fault value (r0949, interpret decimal):
 1: The user prematurely interrupted the project download.
 2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).
 3: The project download was prematurely exited by the commissioning tool.
 100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".
Note:
 The response to an interrupted download is the state "first commissioning".

Remedy:

- check the communication cable.
- download the project again.
- boot from previously saved files (switch-off/switch-on or p0976).
- when loading into the file system (download from memory card), use the matching version.

F01012 (N) Project conversion error

Message value: %1
Message class: Hardware/software error (1)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: When converting the project of an older firmware version, an error occurred.
 Fault value (r0949, interpret decimal):
 Parameter number of the parameter causing the error.
 For fault value = 600, the following applies:
 The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.
Notice:
 Monitoring of the motor temperature is no longer ensured.

Remedy: Check the parameter indicated in the fault value and correctly adjust it accordingly.
 For fault value = 600:
 Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.
 Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.
 Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.
 Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.
 - if necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.
 - if necessary, upgrade the firmware to a later version.

Cause: The maximum operating time of the fan in the Control Unit has either been reached or exceeded.
Alarm value (r2124, interpret decimal):
0: The maximum fan operating time is 500 hours.
1: The maximum fan operating time has been exceeded (50000 hours).

Remedy: Replace the fan in the Control Unit and reset the operating hours counter to 0 (p3961 = 0).

F01014 Topology: DRIVE-CLiQ component property changed

Message value: Component number: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The properties of the DRIVE-CLiQ component have fundamentally changed.
Fault value (r0949, interpret hexadecimal):
Component number.

Remedy:
- check the DRIVE-CLiQ component, and if required replace.
- carry out a warm restart (p0009 = 30, p0976 = 2, 3).

Cause: At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.
Alarm value (r2124, interpret decimal):
0: Checksum of one file is incorrect.
1: File missing.
2: File too many.
3: Incorrect firmware version.
4: Incorrect checksum of the back-up file.

Remedy: For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.
Note:
The file involved can be read out using parameter r9925.
The status of the firmware check is displayed using r9926.

Cause:	For active PC master control, no sign-of-life was received within the monitoring time. The master control was returned to the active BICO interconnection.
Remedy:	Set the monitoring time higher at the PC or, if required, completely disable the monitoring function. The monitoring time is set as follows using the commissioning tool: <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds. Notice: The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

Reaction:	Infeed: NONE (OFF1, OFF2) Servo: NONE (OFF1, OFF2, OFF3) Vector: NONE (OFF1, OFF2, OFF3) Hla: NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	A fatal error was detected when downloading a project using the commissioning tool. Fault value (r0949, interpret decimal): 1: Device status cannot be changed to Device Download (drive object ON?). 2: Incorrect drive object number. 3: A drive object that has already been deleted is deleted again. 4: Deleting a drive object that has already been registered for generation. 5: Deleting a drive object that does not exist. 6: Generating an undeleted drive object that already existed. 7: Regenerating a drive object already registered for generation. 8: Maximum number of drive objects that can be generated exceeded. 9: Error while generating a device drive object. 10: Error while generating target topology parameters (p9902 and p9903). 11: Error when generating a drive object (global component). 12: Error when generating a drive object (drive component). 13: Unknown drive object type. 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949). 15: Drive status cannot be changed to drive download. 16: Device status cannot be changed to "ready for operation". 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals. 18: A new download is only possible if the factory settings are restored for the drive unit. 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD) 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR). 21: Error when accepting the download parameters. 22: Software-internal download error. 23: download not possible when know-how protection is activated. 24: download not possible during a partial power up after inserting a component. 25: The configuration is inconsistent. Know-how protection is either not activated or only partially. Additional values: Only for internal Siemens troubleshooting.
Remedy:	- use the current version of the commissioning tool. - modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive). - change the drive state (is a drive rotating or is there a message/signal?). - Observe additional active messages/signals and remove their cause (e.g. correct any incorrectly set parameters). - automatically calculate the control parameters (p0340). Then set p0010 = 0. - boot from previously saved files (switch-off/switch-on or p0976). - before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

Message value:	%1		
Message class:	Hardware/software error (1)		
Drive object:	All objects		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyyy.ACX, CAxxxxyyy.ACX, or CCxxxxyyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408. Alarm value (r2124, interpret hexadecimal): Only for internal Siemens troubleshooting.		
Remedy:	- check the parameters displayed in r9406 up to r9408, and correct these if required. - Restore the factory setting (p0976 = 1) and reload the project into the converter. Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and this alarm is withdrawn. Component: Control Unit (CU)

Propagation: GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause:	An upgrade (project/firmware download) was initiated on the memory card. While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated. Caution: During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit. If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.
Remedy:	Not necessary. The fault is automatically withdrawn after the upgrade has been completed.

CU: Sampling time inconsistent

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified.
Alarm value (r2124, interpret decimal):
1: Value lower than minimum value.
2: Value higher than maximum value.
3: Value not a multiple of 1.25 µs.
4: Value does not match isochronous PROFIBUS operation.
5: Value not a multiple of 125 µs.
6: Value not a multiple of 250 µs.
7: Value not a multiple of 375 µs.
8: Value not a multiple of 400 µs.
10: Special restriction of the drive object violated.
20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).
21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).
30: Value less than 31.25 µs.
31: Value less than 62.5 µs (31.25 µs is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).
32: Value less than 125 µs.
33: Value less than 250 µs.
40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs. Further, none of the nodes has a sampling time of less than 125 µs.
41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 µs.
42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 µs.
43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.
44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).
45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 µs or 187.5 µs (for a 2x or 3x parallel connection).
46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.
52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 µs.
54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 µs.

4 Faults and alarms

4.2 List of faults and alarms

56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs.

58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 µs.

99: Inconsistency of cross drive objects detected.

116: Recommended clock cycle in r0116[0...1].

General note:

The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).

The parameters of the sampling times can also be changed with automatic calculations.

Example for highest common denominator: 125 s, 125 µs, 62.5 µs --> 62.5 µs

Remedy:

- check the DRIVE-CLiQ cables.

- set a valid sampling time.

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None

Propagation: LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified.

Alarm value (r2124, interpret decimal):

1: Value lower than minimum value.

2: Value higher than maximum value.

3: Resulting sampling time is not a multiple of 1.25 µs.

4: Value does not match isochronous PROFIBUS operation.

10: Special restriction of the drive object violated.

99: Inconsistency of cross drive objects detected.

116: Recommended clock cycle in r0116[0...1].

Remedy:

Set a valid pulse frequency.

F01303 Component does not support the required function

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** BICO
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.
Fault value (r0949, interpret decimal):
1: The component does not support the deactivation.
101: The Motor Module does not support an internal armature short-circuit.
102: The Motor Module does not support the deactivation.
201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.
202: The Sensor Module does not support parking/unparking.
203: The Sensor Module does not support the deactivation.
204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.
205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).
206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.
207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.
208: The Sensor Module does not support deselection of commutation with zero mark (via p0430.23).
211: The Sensor Module does not support single-track encoders (r0459.10).
212: The Sensor Module does not support LVDT sensors (p4677.0).
213: The Sensor Module does not support the characteristic type (p4662).
214: The power unit does not support the temperature evaluation via PT1000 (r0193).
215: The Terminal Module does not support the temperature evaluation via PT1000
216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.

Remedy: Upgrade the firmware of the DRIVE-CLiQ component involved.
For fault value = 205, 214, 215:
- check parameter p0600 and p0601 and if required, adapt.
For fault value = 207:
- replace the power unit or if required set the device supply voltage higher (p0210).
For fault value = 208:
- check parameter p0430.23 and reset if necessary.
For fault value = 216:
- check the setting of the sensor type (p3665).
- use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

A01317 (N) Deactivated component again present

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: If a component of the target topology for an active drive object is inserted and the associated parameter of the component is set to "deactivate" (p0125, p0145, p0155, p0165).
Note:
This is the only message that is displayed for a deactivated component.

Remedy: The alarm is automatically withdrawn for the following actions:
- activate the components involved (p0125 = 1, p0145 = 1, p0155 = 1, p0165 = 1).
- again withdraw the component involved.

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: This alarm is used in the following cases:
- if an inactive/non-operational drive object is active again/ready for operation
- if there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29])
- if the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed

Remedy: Reset alarm:
- set p9496 to 1 or 2
or
- deactivate the drive object again.

F01355	Topology: Actual topology changed
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	None
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	<p>The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning tool. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)</p>
Remedy:	<p>One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning is still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). In general: Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0. Generating vector drives with parallel connection: set p0097 to 12, set p0009 to 0. In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107). If commissioning has already been completed: - re-establish the original connections and re-connect power to the Control Unit. - restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again. - change the device parameterization to match the connections (this is only possible using the commissioning tool). Notice: Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting. See also: r0098 (Actual device topology)</p>

Cause:	The detected actual topology contains SINUMERIK and SIMOTION components. The drive system is no longer booted. In this state, the drive control (closed-loop) cannot be enabled. Alarm value (r2124, interpret hexadecimal): ddccbbaa hex: cc = fault cause, bb = component class of the actual topology, aa = component number of the component cc = 01 hex = 1 dec: An NX10 or NX15 was connected to a SIMOTION control. cc = 02 hex = 2 dec: A CX32 was connected to a SINUMERIK control.
Remedy:	For alarm value = 1: Replace all NX10 or NX15 by a CX32. For alarm value = 2: Replace all CX32 by an NX10 or NX15.

A01362	Topology: Topology rule(s) broken
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	None
Propagation:	LOCAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	At least one topology rule for the SINAMICS S120 Combi has been broken. In the event of a fault, the ramping up of the drive system is aborted and closed-loop drive control is not enabled. Alarm value (r2124, interpret decimal): The alarm value indicates which rule has been violated. 1: The S120 Combi may only be wired via DRIVE-CLiQ socket X200 to X100 on the NCU. 2: In DRIVE-CLiQ socket X101 on the NCU, only one Single Motor Module (SMM) may be connected via X200, one Double Motor Module (DMM) via X200, one Terminal Module 54F (TM54F) via X500 or one DRIVE-CLiQ Hub Module (DMC20, DME20) via X500. 3: In DRIVE-CLiQ socket X102 on the NCU, only one Terminal Module 54F (TM54F) may be connected via X500, one DRIVE-CLiQ Hub Module (Hub) via X500 or one NX15 via X100. 4: Only Sensor Modules may be connected to DRIVE-CLiQ sockets X201 up to X203 (3-axis) or X204 (4-axis) on the S120 Combi. 5: In DRIVE-CLiQ socket X205 (X204 is not available for 3 axes), only SMC / SME Sensor Modules and DRIVE-CLiQ encoders may be connected. 6: In the case of a Single Motor Module as first expansion axis, only one additional Single Motor Module may be connected in the DRIVE-CLiQ socket X201 via X200, one Terminal Module 54F (TM54F) via X500 or one DRIVE-CLiQ Hub Module (DMC20, DME20) via X500. 7: Only Sensor Modules or DRIVE-CLiQ encoders may be connected in the DRIVE-CLiQ socket X202 on possibly available Single Motor Modules. 8: For a second Single Motor Module or for a Double Motor Module, at X201 a 54F Terminal Module (TM54F) or a DRIVE-CLiQ Hub Module (DMC 20, DME 20) may be connected via X500. 9: If a Double Motor Module is used as an expansion axis, only Sensor Modules may be connected to X202 and X203. 10: If a Terminal Module 54F (TM54F) is configured, only one DRIVE-CLiQ Hub Module (DMC20, DME20) may be connected to X501 of the TM54F module via DRIVE-CLiQ socket X500. In this case, it is not permissible that an existing Hub Module is connected elsewhere. 11: For DRIVE-CLiQ Hub Modules, only Sensor Modules (SMC, SME) and DRIVE-CLiQ encoders may be connected to X501 to X505. 12: Only certain Motor Modules may be used for expansion axes.

4 Faults and alarms

4.2 List of faults and alarms

- 13: For an S120 Combi with 3 axes, nothing must be connected at the DRIVE-CLiQ Hub Module at X503.
- 14: A maximum of one Terminal Module 54F (TM54F) is permitted.
- 15: A maximum of one DRIVE-CLiQ Hub Module (DMC20, DME20) is permitted.
- 16: DRIVE-CLiQ socket X100 of NX15 must be connected with the NCU via X102.
- 17: The S120 Combi may only be connected to X101 of the NX15 via the DRIVE-CLiQ socket X200.
- 18: In DRIVE-CLiQ socket X102 on the NX15, only one Single Motor Module (SMM) may be connected via X200, one Double Motor Module (DMM) via X200, one Terminal Module 54F (TM54F) via X500 or one DRIVE-CLiQ Hub Module (DMC20, DME20) via X500.
- 19: It is not permissible that anything is connected at DRIVE-CLiQ socket X103 on the NX15.

Remedy: Evaluate the alarm value and ensure compliance with the corresponding topology rule(s).

A01508 BICO: Interconnections to inactive objects exceeded

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** BICO

Reaction: NONE

Acknowledge: NONE

Cause: The maximum number of BICO interconnections (signal sinks) when deactivating a drive object was exceeded. When deactivating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters:
- r9498[0...29]: List of the BI/CI parameters involved.
- r9499[0...29]: List of the associated BO/CO parameters.

Remedy: Not necessary.
This alarm is automatically withdrawn as soon as no BICO interconnection is entered in r9498[29] and r9499[29] (value = 0).
Notice:
When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

F01510 BICO: Signal source is not float type

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** BICO

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The requested connector output does not have the correct data type. This interconnection is not established. Fault value (r0949, interpret decimal):
Parameter number to which an interconnection should be made (connector output).

Remedy: Interconnect this connector input with a connector output having a float data type.

F01511 (A) BICO: Interconnection with different scalings

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** BICO

Reaction: NONE

Acknowledge: IMMEDIATELY

4 Faults and alarms

4.2 List of faults and alarms

Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. - the BICO output has different normalized units than the BICO input. - message only for interconnections within a drive object. Example: The BICO output has, as normalized unit, voltage and the BICO input has current. This means that the factor $p2002/p2001$ is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).
Remedy:	Not necessary.

Message value:	%1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	BICO
Reaction:	Infeed: OFF2 (OFF1) Servo: OFF2 Vector: OFF2 Hla: OFF2		
Acknowledge:	POWER ON		
Cause:	An attempt was made to determine a conversion factor for a scaling that does not exist. Fault value (r0949, interpret decimal): Unit (e.g. corresponding to SPEED) for which an attempt was made to determine a factor.		
Remedy:	Apply scaling or check the transfer value.		

F01513 (N, A) BICO: Interconnection cross DO with different scalings

Message value:	Parameter: %1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	BICO
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor $p2002/p2001$ is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor $p2001(DO1)/p2001(DO2)$ is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2 Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).		
Remedy:	Not necessary.

A01514 (F) BICO: Error when writing during a reconnect

Message value: Parameter: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** BICO
Reaction: NONE
Acknowledge: NONE
Cause: During a reconnect operation (e.g. while booting or downloading - but can also occur in normal operation) a parameter was not able to be written to.
 Example:
 When writing to BICO input with double word format (DWORD), in the second index, the memory areas overlap (e.g. p8861). The parameter is then reset to the factory setting.
 Alarm value (r2124, interpret decimal):
 Parameter number of the BICO input (signal sink).
Remedy: Not necessary.

Error in the PROFIsafe control.

For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.

6000: A fatal PROFIsafe communication error has occurred.

6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

6064: Destination address and PROFIsafe address are different (F_Dest_Add).

6069: Incorrect F-CRC length (F_CRC_Length).

6070: Incorrect F parameter version (F_Par_Version).

6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.

6072: F parameterization is inconsistent.

6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.

6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

Remedy:

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1900, 1901, 1902:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- check whether all F parameters of the drive match the F parameters of the F host.

4 Faults and alarms

4.2 List of faults and alarms

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

F01632	SI P1 (CU): shutoff valve control/feedback signal error
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	HLA
Component:	None Propagation: GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The drive-integrated "Safety Integrated" function on the Control Unit (monitoring channel 1) has detected a fault for the control/feedback signal of the shutoff valve and initiated a STOP A. Possible causes: - shutoff valve either not connected or not correctly connected (X272). - feedback signal of the shutoff valve either not connected or not correctly connected (X281/X282). - feedback signal of the shutoff valve incorrectly set (p9626/p9826). - shutoff valve defective. - Hydraulic Module defective. Fault value (r0949, interpret decimal): 10, 11: Fault in the "Open shutoff valve" operation. 20: Fault in the "Shutoff valve open" state. 30, 31: Fault in the "Close shutoff valve" operation. 40: Fault in the "Shutoff valve closed" state. 50, 80: Fault in the control/feedback signal of the cutoff valve or communication error between the Control Unit and the Hydraulic Module.

Remedy:

- check the shutoff valve connection (X272).
- check the feedback signals of the shutoff valve (X281, X282).
- check the configuration of the feedback signals of the shutoff valve (p9626/p9826).
- check for EMC-compliant control cabinet design and cable routing (e.g. use shielded cables and connect the shield).
- if necessary, replace the shutoff valve.

112:

- An actual value sensing clock cycle $p9511 = 0$ on a drive object of a Double Motor Module is not permissible in the existing configuration.

200, 201:

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- the current controller sampling time is set to zero ($p0115[0]$).

Remedy:

For enabled SI monitoring integrated in the drive ($p9601/p9801 > 0$):

- upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function ($p9501 > 0$):

- correct the monitoring clock cycle ($p9500$) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to $p9511 = 0$.

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).

- for motion monitoring functions integrated in the drive ($p9601/p9801\text{bit } 2 = 1$) the actual value sensing clock cycle can be directly parameterized in $p9511/p9311$.

- SINAMICS S120M: set the monitoring clock cycle ($p9500$) to an integer multiple of 2 ms.

For fault value = 104, 105:

- set a separate actual value sensing clock cycle in $p9511$.

- restrict operation to a maximum of two vector drives. For the standard setting in $p0112$, $p0115$, the current controller sampling time is automatically reduced to 250 μs . If the standard values were changed, then the current controller sampling time ($p0112$, $p0115$) should be appropriately set.

- increase the DP clock cycle for operation with an isochronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.

- With firmware version 2.5, please ensure that parameter $p9510$ is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same ($p10000$ and $p9500/p9300$).

For fault value = 107:

- set an actual value sensing clock cycle that matches the current controller clock cycle ($p9511 \geq 4 * p0115[0]$, $8 * p0115[0]$) is recommended.

Note:

An actual value sensing clock cycle ($p9511$) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in $p9511$.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS ($p9511 = 0$), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then $p9511$ must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in $p9511$ to the same value as the current controller clock cycle ($p0115[0]$).

- SINAMICS S110: set the actual value sensing clock cycle to $p9511 = 250 \mu\text{s}$.

For fault value = 110:

- set the actual value sensing clock cycle in $p9511$ to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in $p9500$ as an integer multiple of the sampling time of the current controller ($p0115[0]$).

For fault value = 112:

- set the actual value sensing clock cycle $p9511$ to the required value (not equal to zero).

For fault value = 200, 201:

- increase the current controller sampling time ($p0115[0]$).

- if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

Remedy:

For fault value = 1:

- set the Safety Integrated password (p9761).

For fault value = 2:

- inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.

For fault value = 3:

- end the simulation mode for the digital input (p0795).

For fault value = 10, 11, 12, 13, 14, 15, 17, 18, 19, 21, 22, 23, 27:

- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 16:

- inhibit the internal voltage protection (p1231).

For fault value = 20:

- correct the enable setting (p9601).

For fault value = 22:

- use a Power Module that supports the Safety Integrated Functions.

For fault value = 24:

- set the power unit data set for the holding brake (p7015).

For fault value = 25:

- use a Power Module that supports the PROFIsafe telegram selection.
- correct the telegram number setting (p9611).

For fault value = 26:

- deactivate the simulation mode for the set signal source for STO/SS1 (p9620) (p0795).

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

For fault value = 29:

- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- if required, parameterize the stop response for PROFIsafe failure to STOP A (p9612 = p9812 = 0).

For fault value = 33:

- deselect drive integrated motion monitoring without selection (p9601.5, p9801.5) and select safety functions that are supported (see p9771/p9871).
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Cause:	The write request for one or several Safety Integrated parameters on the Control Unit (CU) was rejected. Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): 1: The Safety Integrated password is not set. 2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled. 27: An attempt was made to activate the Basic Functions by controlling via TM54F although this is not supported. F01661 SI P1 (CU): Simulation of the safety inputs active

Message value: Fault cause: %1 bin

Message class: General drive fault (19)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Control Unit (CU) **Propagation:** DRIVE

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The simulation of the digital inputs of the Control Unit (p0795) is active.

It is not permissible that safety inputs are simulated.

Fault value (r0949, interpret binary):

The displayed bits indicate which digital inputs must not be simulated.

Remedy:

- deactivate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795).

- acknowledge fault.

F01663 SI P1 (CU): Copying the SI parameters rejected

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** DRIVE

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: In p9700, the value 87 or 208 is saved or was entered offline.

This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected in monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons.

As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages.

Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.

Note:

This fault does not result in a safety stop response.

SI: Safety Integrated

See also: p9700 (SI Motion copy function)

Remedy:

- set p9700 to 0.

- check p9501 and p9601 and if required, correct.

- restart the copying function by entering the corresponding value into p9700.

Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:

- call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").

- click on "Change settings".

- click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).

- save all parameters (p0977 = 1 or "copy RAM to ROM").

- carry out a POWER ON (switch-off/switch-on) for all components.

F01664 SI P1 (CU): No automatic firmware update

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** DRIVE

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause:	During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled. Note: This fault does not result in a safety stop response. See also: p7826 (Firmware update automatic)
Remedy:	When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0): 1. Activate the "Firmware update automatic" function (p7826 = 1). 2. Backup the parameters (p0977 = 1) and carry out a POWER ON. When deactivating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

A01666 (F)	SI Motion P1 (CU): Steady-state (static) 1 signal at the F-DI for safe acknowledgment
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL

Cause:	A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds. If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

4 Faults and alarms

4.2 List of faults and alarms

Cause: There is not sufficient memory space in the NVRAM on the drive to save parameters r9781 and r9782 (safety logbook).

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

0: There is no physical NVRAM available in the drive.

1: There is no longer any free memory space in the NVRAM.

Remedy:

For fault value = 0:

- use a Control Unit NVRAM.

For fault value = 1:

SI Motion: Ti and To unsuitable for DP cycle

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions.

Isosynchronous PROFIBUS:

The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To.

No isosynchronous PROFIBUS:

The DP clock cycle must be at least 4x the current controller clock cycle.

Notice:

If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.

Remedy:

Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time.

Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0):

Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual values sensing clock cycle must be at least 4x the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.
