r1624	Field-generating current setpoint total / Id_set total		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6640, 6721, 6723, 6727
	P-Group: Displays, signals	Unit group: 6_2	Unit selection: p0505
	Not for motor type: REL	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the limited field-generating current setpoint (Id_set). This value comprises the steady-state field-generating current setpoint r1623 and a dynamic component that is only set when changes are made to the flux setpoint.		

p1625[0...n]	Excitation current setpoint calibration / I_exc_set cal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.0 [%]	200.0 [%]	100.0 [%]
Description:	Sets the gain factor to weight the excitation current setpoint.		

r1626[0...1]	CO: Excitation current setpoint / I_exc_set		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]
Description:	Displays the calculated excitation current setpoint. The following applies for index 0: For direct excitation, the value is referred to p0390. For brushless excitation, the value is referred to p0690. The following applies for index 1: The value is referred to p0390.		
Index:	[0] = Excitation current of the excitation equipment [1] = Excitation current for direct excitation		
Dependency:	Refer to: p0390, p0690		

r1627	CO: Current model load angle / I_mod load angle		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: p2005	Expert list: 1
	Min	Max	Factory setting
	- [°]	- [°]	- [°]
Description:	Displays the load angle of the current model.		

p1628[0...n]	Current model controller dynamic factor / I_mod_ctr dyn_fact		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6727
	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [%]	400 [%]	50 [%]
Description:	Sets the dynamic response factor for the current model controller.		

2 Parameters

2.2 List of parameters

p1629[0...n]	Current model controller P gain / I_mod_ctrl Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	100000.000	0.000
Description:	Sets the proportional gain for the current model controller. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.		

p1630[0...n]	Current model controller integral time / I_mod_ctrl Tn		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	10000.00 [ms]	0.00 [ms]
Description:	Sets the integral time for the current model controller. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.		

r1631	Current model controller P gain effective / I_mod ctrl Kp eff		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the effective P gain of the current model controller.		

r1632	Current model controller integral time effective / I_mod_ctrl Tn eff		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the effective integral time of the current model controller.		

r1633	Current model flux setpoint / I_mod flux set		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]
Description:	Displays the effective flux setpoint of the current model. The value is referred to the rated motor flux.		

r1634	Current model flux actual value / I_mod flux ActV		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: 6727 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the effective flux actual value of the current model. The value is referred to the rated motor flux.		
r1635	Current model controller I component / I_mod_ctrl I comp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 4 Func. diagram: 6727 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Displays the I component of the current model controller.		
r1636	Current model controller output / I_mod_ctrl outp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 4 Func. diagram: 6727 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Displays the output of the current model controller.		
r1637	Current model magnetizing current d axis / I_mod I_mag d-ax		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 4 Func. diagram: 6727 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Displays the magnetizing current of the current model in the d-axis.		
r1638	Current model magnetizing current q axis / I_mod I_mag q-ax		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 4 Func. diagram: 6727 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Displays the magnetizing current of the current model in the q-axis.		

2 Parameters

2.2 List of parameters

r1639	CO: Current model Isq after actual value tracking / I_mod Isq track		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 4 Func. diagram: 6727 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Displays the stator current in the q axis after the current actual value tracking.		
p1640[0...n]	CI: Excitation current actual value signal source / I_exc_ActV s_s		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 3 Func. diagram: 6727 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the excitation current actual value		
r1641[0...1]	Excitation current actual value / I_exc_ActV		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: 6727, 8020 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the excitation current actual value that is read in.		
Index:	[0] = Excitation current of the excitation equipment [1] = Excitation current for direct excitation		
Dependency:	Refer to: p0390		
Note:	The following applies for index 0: For direct excitation, the value is referred to p0390. For brushless excitation, the value is referred to p0690. The following applies for index 1: The value is referred to p0390.		
p1642[0...n]	Minimum excitation current / Min I_exc		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, PMSM, REL, RESM Min 0.1 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 50.0 [%]	Access level: 4 Func. diagram: 6727 Unit selection: - Expert list: 1 Factory setting 5.0 [%]
Description:	Sets the minimum excitation current. This means that negative excitation currents can be avoided.		

p1643[0...n]	Minimum excitation current closed-loop control gain factor / I_exc_min Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	5.00	0.40
Description:	Sets the gain factor for the minimum excitation current, closed-loop control. This is active if the excitation current is below 75 % of p1642.		
Dependency:	Refer to: p1642		

r1644	CO: Excitation current monitoring output / I_exc_mon outp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6727
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the output of the excitation current monitoring for separately excited synchronous motors.		

p1645[0...7]	BI: Excitation feedback signals signal source / Exc FS s_s		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 6495
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	[0...6] 1 [7] 0
Description:	Sets the signal source for the individual feedback signals from the excitation.		
Index:	[0] = Excitation ready for switching on [1] = Excitation ready [2] = Excitation operational [3] = Excitation group signal fault [4] = Excitation group signal alarm [5] = Not used [6] = Not used [7] = Excitation at the voltage limit		
Dependency:	Refer to: r1649		

p1646	Excitation monitoring time / Excit t_mon		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6495
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2.0 [s]	1300.0 [s]	20.0 [s]
Description:	Sets the monitoring time of the excitation. After an ON command, the feedback signal must be received within this monitoring time.		

2 Parameters

2.2 List of parameters

Note: After the on command for the excitation (r1648.0 = 1), its feedback signal must be available at r1649.1 within this monitoring time (BI: p1645[1]).
The same monitoring time is effective after the excitation is enabled for operation (r1648.3 = 1) up to the feedback signal "excitation operational" (r1649.2 = 1, BI: p1645[2]).

p1647		Excitation switch-off delay time / Exc t_{off}		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6495	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [s]	5.0 [s]	0.8 [s]	
Description:	Sets the switch-off delay time to shut down the excitation equipment.			
Note:	The delay time starts if, when switching off, r0863.0 = 0. r1648.0 and r1648.3 are reset at the end of the delay time.			

r1648.0...11		CO/BO: Excitation control word / Excitation STW			
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 6495		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the control word for the excitation equipment.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Power up excitation	Yes	No	-
	01	Excitation no OFF2	Yes	No	-
	02	Excitation no OFF3	Yes	No	-
	03	Excitation operation enable	Yes	No	-
	07	Excitation acknowledge fault	Yes	No	-
	10	Reserved	-	-	-
	11	Reverse field excitation invert excitation current setpoint	Yes	No	-
Note:	For bit 00: This bit is set dependent on r0863.0.				

r1649.0...11		CO/BO: Excitation status word / Excitation ZSW			
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 6495		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Display and BICO output for the status word of the excitation equipment.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Excitation ready for switching on feedback signal	Yes	No	-
	01	Excitation ready feedback signal	Yes	No	-
	02	Excitation operational feedback signal	Yes	No	-
	03	Excitation group signal fault	Yes	No	-
	07	Excitation group signal alarm	Yes	No	-
	08	Excitation at the voltage limit	Yes	No	-
	11	Excitation voltage present at the power unit	Yes	No	-

Dependency: Refer to: p1645
Refer to: A49204

r1650	Current setpoint torque-generating before filter / Iq_set before filt		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5710
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: REL	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the torque generating current setpoint Iqset after the torque limits and the clock cycle interpolation is ahead of the current setpoint filters.		

r1650	Current setpoint force-generating before filter / Iq_set before filt		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5710
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: REL	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the force generating current setpoint Iqset after the force limits and the clock cycle interpolation is ahead of the current setpoint filters.		

r1651	CO: Torque setpoint function generator / M_set FG		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2003	Expert list: 1
	Min	Max	Factory setting
	- [Nm]	- [Nm]	- [Nm]
Description:	Displays the torque setpoint of the function generator.		

r1651	CO: Force setpoint function generator / F_set FG		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2003	Expert list: 1
	Min	Max	Factory setting
	- [N]	- [N]	- [N]
Description:	Displays the force setpoint of the function generator.		

p1653[0...n]	Current setpoint torque-generating smoothing time minimum / Isq_s t_smth min		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6710
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1 [ms]	20.0 [ms]	0.1 [ms]
Description:	Sets the minimum smoothing time constant for the setpoint of the torque-generating current components.		

2 Parameters

2.2 List of parameters

p1654[0...n]	Curr. setpoint torque-gen. smoothing time field weakening range / Isq_s T_smth FW				
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 4		
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6710		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	0.1 [ms]	50.0 [ms]	4.8 [ms]		
Description:	Sets the smoothing time constant for the setpoint of the torque-generating current components.				
Note:	The smoothing time does not become effective until the field-weakening range is reached.				
p1655[0...4]	CI: Current setpoint/Speed actual value filter nat. frequency tuning / I/n_set_filt f_n				
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 6700, 6710		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: REL	Scaling: PERCENT	Expert list: 1		
	Min	Max	Factory setting		
	-	-	1		
Description:	Sets the signal source for tuning the natural frequency of the current setpoint filter 1, 2 and speed actual value filter 5.				
Index:	[0] = Filter 1 [1] = Filter 2 [2] = Reserved [3] = Reserved [4] = Filter 5				
p1656[0...n]	Manipulated variable filter velocity controller activation / Filt v_ctrl act				
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3		
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 4965		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 bin		
Description:	Setting for activating/deactivating the manipulated variable filter for the velocity controller.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Filter 1	Active	Inactive	-
	01	Filter 2	Active	Inactive	-
	02	Filter 3	Active	Inactive	-
	03	Filter 4	Active	Inactive	-
Dependency:	Refer to: p1657, p1658, p1659, p1660, p1661, p1662, p1663, p1664, p1665, p1666, p1699				
p1656[0...n]	Activates current setpoint filter / I_set_filt act				
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3		
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 5710		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0001 bin		
Description:	Setting for activating/deactivating the current setpoint filter.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Filter 1	Active	Inactive	-
	01	Filter 2	Active	Inactive	-
	02	Filter 3	Active	Inactive	-
	03	Filter 4	Active	Inactive	-
Dependency:	The individual current setpoint filters are parameterized as of p1657.				
Note:	If not all of the filters are required, then the filters should be used consecutively starting from filter 1.				

p1656[0...n]	Current setpoint/Speed actual value filter activation / I_set_filt act			
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 4715, 6710	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 0001 bin	
Description:	Setting for activating/deactivating the current setpoint filter 1, 2 and speed actual value filter 5.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Filter 1	Active	Inactive
	01	Filter 2	Active	Inactive
	04	Filter 5	Active	Inactive
				FP
				-
				-
				-
Dependency:	The individual current setpoint/speed actual value filters are parameterized starting at p1657.			
Note:	If not all of the filters are required, then the filters should be used consecutively starting from filter 1.			
p1656	Signal filter activation / I_set_filt act			
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 0000 bin	
Description:	Setting for activating/deactivating the 2nd order filter.			
Bit field:	Bit	Signal name	1 signal	0 signal
	04	Filter 5	Active	Inactive
				FP
				8940
Dependency:	The filter is parameterized from p1677.			
p1657[0...n]	Manipulated variable filter 1 velocity controller type / Filt 1 v_ctrl type			
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4965	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1	2	1	
Description:	Sets the type for manipulated variable filter 1 of the velocity controller			
Value:	1: PT2 low pass 2: General 2nd order filter			
Dependency:	For p1657 = 1, the following parameters should be set: - p1656.0, p1658, p1659 For p1657 = 2, the following parameters should be set: - p1656.0, p1658, p1659, p1660, p1661 Refer to: p1656, p1658, p1659, p1660, p1661, p1662, p1663, p1664, p1665, p1666			
Note:	For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB \text{ bandwidth}} = 2 * D_{denominator} * f_{bandstop \text{ frequency}}$			

2 Parameters

2.2 List of parameters

p1657[0...n]	Current setpoint filter 1 type / I_set_filt 1 type		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: U, T Data type: Integer16 P-Group: Closed-loop control Not for motor type: REL Min 1	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: 5710, 6710 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the current setpoint filter 1 as low pass (PT2) or general 2nd-order filter.		
Value:	1: PT2 low pass 2: General 2nd order filter		
Dependency:	The current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.		
Note:	For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$		
p1658[0...n]	Manip. var. filter 1 velocity controller denom. natural freq. / Filt1 v_ctr fn_den		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.5 [Hz]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 16000.0 [Hz]	Access level: 3 Func. diagram: 4965 Unit selection: - Expert list: 1 Factory setting 1999.0 [Hz]
Description:	Sets the denominator natural frequency for manipulated variable filter 1 of the velocity controller.		
Dependency:	Refer to: p1656, p1657, p1659, p1660, p1661, p1662, p1663, p1664, p1665, p1666		
p1658[0...n]	Current setpoint filter 1 denominator natural frequency / I_set_filt1 fn_den		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.5 [Hz]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 16000.0 [Hz]	Access level: 3 Func. diagram: 5710, 6710 Unit selection: - Expert list: 1 Factory setting 1999.0 [Hz]
Description:	Sets the denominator natural frequency for current setpoint filter 1 (PT2, general filter).		
Dependency:	The current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.		
p1659[0...n]	Manip. variable filter 1 velocity controller denominator damping / Filt 1 v_ctr D_den		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.001	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10.000	Access level: 3 Func. diagram: 4965 Unit selection: - Expert list: 1 Factory setting 0.700
Description:	Sets the denominator damping for manipulated variable filter 1 of the velocity controller.		
Dependency:	Refer to: p1656, p1657, p1658, p1660, p1661, p1662, p1663, p1664, p1665, p1666		

p1659[0...n]	Current setpoint filter 1 denominator damping / I_set_filt 1 D_den		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5710, 6710
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001	10.000	0.700
Description:	Sets the denominator damping for current setpoint filter 1.		
Dependency:	The current setpoint filter 1 is activated via p1656.0 and parameterized via p1657 ... p1661.		

p1660[0...n]	Manip. var. filter 1 velocity controller numerator natural freq. / Filt1 v_ctr fn_num		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4965

Description:	Sets the denominator damping for manipulated variable filter 4 of the velocity controller.		
Dependency:	Manipulated variable filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.		
p1674[0...n]	Current setpoint filter 4 denominator damping / I_set_filt 4 D_den		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.001	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10.000	Access level: 3 Func. diagram: 5710 Unit selection: - Expert list: 1 Factory setting 0.700
Description:	Sets the denominator damping for current setpoint filter 4.		
Dependency:	Current setpoint filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.		

2 Parameters

2.2 List of parameters

p1675[0...n]	Manip. var. filter 4 velocity controller numerator natural freq. / Filt4 v_ctr fn_num		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4965
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]

Description: Sets the numerator natural frequency for manipulated variable filter 4 of the velocity controller.

Dependency: Manipulated variable filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.

p1675[0...n]	Current setpoint filter 4 numerator natural frequency / I_set_filt4 fn_den		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5710
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]

Description: Sets the numerator natural frequency for current setpoint filter 4 (general filter).

Dependency: Current setpoint filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.

p1676[0...n]	Manip. variable filter 4 velocity controller numerator damping / Filt 4 v_ctr D_num		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4965
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700

Description: Sets the numerator damping for manipulated variable filter 4 of the velocity controller.

Dependency: Manipulated variable filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.

p1676[0...n]	Current setpoint filter 4 numerator damping / I_set_filt 4 D_num		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5710
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700

Description: Sets the numerator damping for current setpoint filter 4.

Dependency: Current setpoint filter 4 is activated via p1656.3 and parameterized via p1672 ... p1676.

p1677[0...n]	Speed actual value filter 5 type / n_act_filt 5 type		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4715
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2	2

Description: Sets the speed actual value filter 5 as low pass (PT2) or general 2nd-order filter.

Value:
 1: PT2 low pass
 2: General 2nd order filter

Dependency: The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

Note: For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$$

p1677	Vdc actual value filter 5 type / Vdc act_filt 5 typ		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2	2

Description: Sets the Vdc actual value filter 5 as low pass (PT2) or as extended general 2nd order filter.

Value:
 1: PT2 low pass
 2: General 2nd order filter

Dependency: The Vdc actual value filter is activated with p1656.4 and parameterized via p1677 ... p1681.

Note: For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$$

p1678[0...n]	Speed actual value filter 5 denominator natural frequency / n_act_filt5 fn_den		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4715
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]

Description: Sets the denominator natural frequency for speed actual value filter 5 (PT2, general filter).

Dependency: The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

p1678	Vdc actual value filter 5 denominator natural frequency / VdcAct_filt5 fn_den		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1000.0 [Hz]

Description: Sets the denominator natural frequency for the Vdc actual value filter 5 (PT2, general filter).

Dependency: The Vdc actual value filter is activated with p1656.4 and parameterized via p1677 ... p1681.

p1679[0...n]	Speed actual value filter 5 denominator damping / n_act_filt 5 D_den		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4715
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001	10.000	0.700

Description: Sets the denominator damping for speed actual value filter 5.

Dependency: The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

2 Parameters

2.2 List of parameters

p1679	Vdc actual value filter 5 denominator damping / Vdc act_fil5 D_den		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001	10.000	0.700

Description: Sets the denominator damping for Vdc actual value filter 5.

Dependency: The Vdc actual value filter is activated with p1656.4 and parameterized via p1677 ... p1681.

p1680[0...n]	Speed actual value filter 5 numerator natural frequency / n_act_filt5 fn_num		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4715
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]

Description: Sets the numerator natural frequency for speed actual value filter 5 (general filter).

Dependency: The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

p1680	Vdc actual value filter 5 numerator natural frequency / VdcAct_fil5 fn_num		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1000.0 [Hz]

Description: Sets the numerator natural frequency for the Vdc actual value filter 5 (general filter).

Dependency: The Vdc actual value filter is activated with p1656.4 and parameterized via p1677 ... p1681.

p1681[0...n]	Speed actual value filter 5 numerator damping / n_act_filt 5 D_num		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4715
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700

Description: Sets the numerator damping for speed actual value filter 5.

Dependency: The speed actual value filter is activated via p1656.4 and parameterized via p1677 ... p1681.

p1681	Vdc actual value filter 5 numerator damping / Vdc act_fil5 D_num		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.010

Description: Sets the numerator damping for Vdc actual value filter 5.

Dependency: The Vdc actual value filter is activated with p1656.4 and parameterized via p1677 ... p1681.

p1699	Filter data acceptance / Filt data accept		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Activates data acceptance for parameter changes for the filter. p1699 = 0: The new filter data are immediately accepted. p1699 = 1: The new filter data are only accepted when this parameter is reset.		
Dependency:	Velocity setpoint filter 1, 2 (p1414 and following) Velocity actual value filter (p1413, p1446 and following) Manipulated variable filter velocity controller 1, 2 (p1656 and following) Manipulated variable filter (p1800 and following) Precontrol filter (p1721 and following)		
p1699	Filter data acceptance / Filt data accept		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Activates data acceptance for parameter changes for the filter. p1699 = 0: The new filter data are immediately accepted. p1699 = 1: The new filter data are only accepted when this parameter is reset.		
Dependency:	Speed setpoint filter 1, 2 (p1414 and following) Speed actual value filter (p1413, p1446 and following) Current setpoint filter 1 ... 4 (p1656 and following) Current setpoint filter 5 ... 10 (function module, p5200 and following) APC filter (APC function module, p3704 and following) Refer to: p1414, p1656, p5200		
p1700[0...n]	Force controller loop gain / F_ctrl loop_gain		
HLA	Can be changed: U, T	Calculated: CALC_MOD_EQU	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [N/V]	1000000000.0 [N/V]	0.0 [N/V]
Description:	Sets the loop gain for the force controller.		
Dependency:	Refer to: p1400, p1715, p1717, p1718, p1719, p1720		

2 Parameters

2.2 List of parameters

p1701[0...n]	Current controller reference model dead time / I_ctrRefMod t_dead		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5714
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	1.000	1.000
Description:	Sets the fractional dead time for the current controller reference model. This parameter emulates the computing dead time of the proportionally controlled current control loop.		
Note:	Dead time = p1701 * p0115[0]		
p1702[0...n]	Isd current controller precontrol scaling / Isd_ctr_prectrScal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	70.0 [%]
Description:	Sets the scaling of the dynamic current controller precontrol for the flux-generating current component Isd.		
Note:	The parameter is effective for permanent and separately excited synchronous motors.		
p1703[0...n]	Isq current controller precontrol scaling / Isq_ctr_prectrScal		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	0.0 [%]
Description:	Sets the scaling of the dynamic current controller precontrol for the torque/force-generating current component Isq.		
p1703[0...n]	Isq current controller precontrol scaling / Isq_ctr_prectrScal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	70.0 [%]
Description:	Sets the scaling of the dynamic current controller precontrol for the torque/force-generating current component Isq.		
p1704[0...n]	Isq current controller precontrol EMF scaling / Isq_ctrl EMF scal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714, 6726
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	100.0 [%]
Description:	Sets the scaling of the EMF precontrol for the Isq current controller.		

p1705[0...n]	Flux setpoint/actual value tracking threshold / Flux track thr		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714, 6726
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	100.0 [%]	100.0 [%]
Description:	Threshold for the setpoint - actual value tracking of the EMF precontrol of the Isq current controller.		
p1710[0...n]	Current controller adaptation direct axis starting point Kp / Id_adapt pt Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [Arms]	6000.00 [Arms]	0.00 [Arms]
Description:	Sets the starting point of the current-dependent current controller adaptation where the current controller gain p1720 is effective.		
Dependency:	Refer to: p1720		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	For p1712 = 100 % or p1402.2 = 0, the current controller adaptation is disabled and p1720 is effective over the entire range.		
p1711[0...n]	Current ctrl adaptation direct axis starting point Kp adapted / Id_adapt pt Kp adpdt		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [Arms]	6000.00 [Arms]	0.00 [Arms]
Description:	Sets the starting point of the current-dependent current controller adaptation where the adapted current controller gain p1720 x p1712 is effective.		
Dependency:	Refer to: p1710, p1712, p1720		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	For p1712 = 100 % or p1402.2 = 0, the current controller adaptation is disabled and p1720 is effective over the entire range.		
p1712[0...n]	Current controller adaptation direct axis P gain adaptation / Id_adapt Kp adpdt		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	1000.00 [%]	100.00 [%]
Description:	Sets the factor for the current controller P gain in the adaptation range (d-current > p1711). The value is referred to p1720.		
Dependency:	Refer to: p1710, p1711, p1720		

2 Parameters

2.2 List of parameters

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: For p1712 = 100 % or p1402.2 = 0, the current controller adaptation is disabled and p1720 is effective over the entire range.

p1715[0...n]	Force controller P gain / F_ctrl Kp		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10000.000	0.000
Description:	Sets the proportional gain for the force controller.		
Dependency:	Refer to: p1400, p1700, p1717, p1718, p1719, p1720		

p1715[0...n]	Current controller P gain / I_ctrl Kp		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5714, 7017
	P-Group: Closed-loop control	Unit group: 18_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [V/A]	100000.000 [V/A]	0.000 [V/A]
Description:	Sets the proportional gain of the current controller for the lower adaptation current range. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.		
Dependency:	Refer to: p0391, p0392, p0393		
Note:	For p0393 = 100 %, the current controller adaptation is disabled and p1715 is effective over the entire range.		

p1715[0...n]	Current controller P gain / I_ctrl Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6700, 6714, 7017
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	100000.000	0.000
Description:	Sets the proportional gain of the current controller for the lower adaptation current range. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.		
Dependency:	Refer to: p0391, p0392, p0393		
Note:	For p0393 = 100 %, the current controller adaptation is disabled and p1715 is effective over the entire range.		

p1716[0...n]	Force controller P gain weakening / F_ctrl Kp red		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1 [%]	100.0 [%]	40.0 [%]
Description:	Sets the weakening of the proportional gain for large actuating signals for the force controller. The setting value specifies what percentage of a P component of 10 V is weakened.		
Dependency:	Refer to: p1715		

p1717[0...n]	Force controller integral time / F_ctrl Tn		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	2000.00 [ms]	40.00 [ms]
Description:	Sets the integral time of the force controller.		
Dependency:	Refer to: p1400, p1700, p1715, p1718, p1719, p1720		
p1717[0...n]	Current controller integral-action time / I_ctrl Tn		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5714, 6700, 6714, 7017
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	1000.00 [ms]	2.00 [ms]
Description:	Sets the integral-action time of the current controller.		
Dependency:	Refer to: p1715		
p1718[0...n]	Force controller D component smoothing time constant / F_ctrl D comp T		
HLA	Can be changed: T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.250 [ms]	100.000 [ms]	0.500 [ms]
Description:	Sets the smoothing time constant of the D component for the force controller.		
Dependency:	Refer to: p1400, p1700, p1715, p1717, p1719, p1720		
r1718	CO: Isq controller output / Isq_ctrl outp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the actual output of the Isq current controller (torque/force generating current, PI controller). The value contains the proportional and integral components of the PI controller.		
p1719[0...n]	Force controller derivative-action time / F_ctrl t_deriv		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10000.0 [ms]	10000.0 [ms]	0.0 [ms]
Description:	Sets the derivative-action time for the force controller.		
Dependency:	Refer to: p1400, p1700, p1715, p1717, p1718, p1720		

2 Parameters

2.2 List of parameters

r1719	Isq controller integral component / Isq_ctrl I_comp			
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714	
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505	
	Not for motor type: REL	Scaling: p2001	Expert list: 1	
	Min	Max	Factory setting	
	- [Vrms]	- [Vrms]	- [Vrms]	
Description:	Displays the integral component of the Isq current controller (torque/force-generating current, PI controller).			
p1720[0...n]	Force controller precontrol factor / F_ctrl prectr fact			
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [%]	120.0 [%]	100.0 [%]	
Description:	Sets the factor for the velocity precontrol of the force controller.			
p1720[0...n]	Current controller d axis P gain / Id_ctrl Kp			
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.000	100000.000	0.000	
Description:	Sets the proportional gain of the d-current controller for the lower adaptation current range. This value is automatically pre-set using p3900 or p0340 when commissioning has been completed.			
p1721[0...n]	Precontrol filter activation / Prectrl_filt act			
HLA	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 4970	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 bin	
Description:	Setting for activating/deactivating the precontrol filter.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Activate filter	Yes	No
Dependency:	Refer to: p1699, p1722, p1724, p1725, p1726, p1727			
p1722[0...n]	Precontrol filter type / Prectrl_filt type			
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4970	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1	2	1	
Description:	Sets the precontrol filter as low pass (PT2) or as general 2nd-order filter.			
Value:	1: PT2 low pass 2: General 2nd order filter			
Dependency:	The precontrol filter is activated via p1721.0 and parameterized via p1721 ... p1726.			

Note: For an extended general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$$

p1722[0...n]	Current controller d axis integral time / I_ctrl d-axis Tn		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	1000.00 [ms]	2.00 [ms]
Description:	Sets the integral time of the d-current controller.		

r1723	CO: Isd controller output / Isd_ctrl outp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the actual output of the Isd current controller (flux-generating current, PI controller). The value contains the proportional and integral components of the PI controller.		

p1724[0...n]	Precontrol filter denominator natural frequency / Prectr_filt fn_den		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]
Description:	Sets the denominator natural frequency for the precontrol filter (PT2, general filter).		
Recommendation:	The precontrol filter is activated via p1721.0 and parameterized via p1722 ... p1727.		
Dependency:	Refer to: p1721		

r1724	Isd controller integral component / Isd_ctrl I_comp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the integral component of the Isd current controller (flux-generating current, PI controller).		

p1725[0...n]	Precontrol filter denominator damping / Prectrl_filt D_den		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	0.001	10.000	0.700
Description:	Sets the denominator damping for the precontrol filter (PT2, general filter).		
Dependency:	The precontrol filter is activated via p1721.0 and parameterized via p1722 ... p1727. Refer to: p1721		
r1725	Isd controller integral component limit / Isd_ctrl I_limit		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the limit value for the integral component of the Isd current controller.		
p1726[0...n]	Precontrol filter numerator natural frequency / Prectrl_filt fn_num		
HLA	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]
Description:	Sets the numerator natural frequency for the precontrol filter (general filter).		
Dependency:	Refer to: p1721		
Note:	The precontrol filter is activated via p1721.0 and parameterized via p1722 ... p1727.		
p1726[0...n]	Quadrature arm decoupling scaling / Transv_decpl scal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	75.0 [%]
Description:	Sets the scaling of the quadrature arm decoupling		
Note:	This parameter is ineffective for sensorless vector control. In this case, p1727 is always used. If p1726 is set to 0, then the quadrature de-coupling is deactivated. The integral component of the Isd current controller remains effective in the complete speed control range. For the closed-loop control of synchronous motors, this parameter is used to scale the current controller de-coupling.		

p1727[0...n]	Precontrol filter numerator damping / Prectrl_filt D_num		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4970
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for precontrol filter.		
Dependency:	The precontrol filter is activated via p1721.0 and parameterized via p1722 ... p1727.		
p1727[0...n]	Quadrature arm decoupling at voltage limit scaling / TrnsvDecplVmaxScal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	50.0 [%]
Description:	Sets the scaling of quadrature arm decoupling when the voltage limit is reached.		
r1728	De-coupling voltage direct axis / U_dir-axis_decoupl		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the actual output of the quadrature channel de-coupling for the d axis.		
r1729	De-coupling voltage quadrature axis / U_quad_decoupl		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 6714
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the actual output of the quadrature channel de-coupling for the q axis.		
p1730[0...n]	Isd controller integral component shutdown threshold / Isd ctrl Tn shutd		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	30 [%]	150 [%]	30 [%]
Description:	Sets the speed threshold for deactivating the integral component of the Isd controller. The d current controller is only effective as P controller for speeds greater than the threshold value. Instead of the integral component, the quadrature arm decoupling is effective.		
Warning:	For settings above 80%, the d current controller is active up to the field weakening limit. When operated at the voltage limit, this can result in an unstable behavior. In order to avoid this, the dynamic voltage reserve p1574 should be increased.		
			
Note:	The parameter value is referred to the synchronous rated motor speed.		

2 Parameters

2.2 List of parameters

p1731[0...n]	Isd controller combination current time component / Isd ctr I_combi T1		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL, RESM	Scaling: -	Expert list: 1
	Min 0.00 [ms]	Max 10000.00 [ms]	Factory setting 0.00 [ms]
Description:	Sets the time constant to calculate the d current DC component difference (combination current) to add to the d current controller actual value.		
Note:	It is not added for p1731 = 0.		
r1732	CO: Direct-axis voltage setpoint / Direct U set		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5700, 5714, 6714, 5718

0.00 [%]

99.00 [%]

50.00 [%]

Description:

Separately excited synchronous motor:

Sets the upper speed for the transition "n_set -> n_act" in sensorless operation.

This value is entered as a percentage of p1755.

Induction motor without speed encoder:

Depending on the motor data, the drive has calculated a minimum value of the operating frequency for rugged operation.

If the minimum value is greater than the lower changeover limit parameterized with p1755 * (1 - 2 * p1756), then the difference is displayed using p1749 * p1755. The parameter value cannot be changed.

Dependency:

Refer to: p1748, p1752, p1755, p1756

Note:

RESM: reluctance synchronous motor (synchronous reluctance motor)

-

-

0000 0000 0000 0000 bin

Description:

Sets the configuration for the motor model.

Bit 0 = 1: Forces open-loop speed-controlled starting (ASM).

Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM).

Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM).

Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM).

Bit 4 = 1: Time-controlled change between current and observer models (ASM).

Bit 5 = 1: test signal technique (pulse technique) to estimate the progressing (RESM, PMSM).

Bit 6 = 1: If the motor is blocked, sensorless vector control remains speed-controlled (ASM).

For a stalled (blocked) synchronous motor (PMSM), the sensorless vector control remains open-loop speed controlled.

Bit 7 = 1: Use rugged switchover limits to switchover the model between open-loop and closed-loop controlled operation (ASM).

Bit 8 = 1: Open-loop speed controlled operation independent of the speed setpoint (except for OFF3) (ASM).

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Controlled start	Yes	No	-
01	Controlled through 0 Hz	Yes	No	-
02	Closed-loop ctrl oper. down to zero freq. for passive loads	Yes	No	-
03	Motor model Lh_pre = f(PsiEst)	Yes	No	-
04	Model changeover	Time controlled	Freq. controlled	-
05	Closed-loop controlled operation down to f = 0 Hz w/ test signal	Yes	No	-
06	Closed-/open-loop controlled when motor is blocked	Yes	No	-
07	Use rugged changeover limits	Yes	No	-
08	Closed-loop controlled until wait time p1758 has expired	Yes	No	-

Caution:

Do not use bit 6 = 1 if the motor can be slowly reversed by the load at the torque limit. Long delay times due to blocking (p2177 > p1758) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

Note:

Bit 0 ... 3 only have influence for sensorless vector control, bit 4 only for vector control with encoder. Bit 2 is pre-assigned depending on p0500.

For bit 02 = 1:

The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 = 1, then bit 3 is automatically set to 1. Manual deselection is possible and may be sensible if the saturation characteristic (p1960) was not measured for third-party motors. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

When the bit is set, the selection of bits 0 and 1 is ignored.

For bit 02 = 0:

If the model feedback is deactivated (p1784 = 0), with bit 2 = 0, then bit 3 is also automatically set to 0.

For bit 05:

This test signal technique (pulse technique) is only supported for synchronous-reluctance motors (RESM) and permanent-magnet synchronous motors (PMSM) with power units (Motor Modules) in the "Booksize" format.

It is only possible to change bit 5 when the pulses are inhibited.

For p1750.5 = 1, initially p1810.3 is set, and then a system power up is requested via F01040 to configure the power unit in the oversampling mode.

When deactivating p1750.5 = 0, p1810.3 remains unchanged. As a consequence, to undo the configuration of the power unit from the oversampling mode you must perform the following

(after manually deselecting p1750.5), then initially p1810.3 must be manually deleted - and then a manual warm restart initiated.

As an alternative to a warm restart: save the parameters and carry out a POWER ON (switch-off/switch-on).

When the function "safety without encoder" (p9306/p9506) is activated, this setting is not permissible and results in monitoring errors.

For bit 06 = 1:

The following applies for sensorless vector control of induction motors:

For a blocked motor (see p2175, p2177) the time condition in p1758 is bypassed and a change is not made into open-loop controlled operation.

The following applies for sensorless vector control of synchronous motors:

For a blocked motor (see p2175, p2177), the speed ramp-function generator is held in open-loop speed controlled operation, and a switchover is not made into closed-loop controlled operation.

For bit 07 = 1:

The following applies for sensorless vector control of induction motors:

If the changeover limits are parameterized too low (p1755, p1756), then they are automatically increased to rugged values by the absolute amount $p1749 * p1755$.

The effective time condition for changing over into open-controlled operation is obtained from the minimum of p1758 and $0.5 * r0384$.

Activation can make sense for applications that demand a high torque at low frequencies and therefore low speed gradients.

Adequate parameterization must be ensured (p1610, p1611).

For bit 08 = 1: no influence on the functionality of bits 0, 1, 2

The following applies for sensorless vector control of induction motors:

Changeover into open-loop speed controlled operation is no longer dependent on the speed setpoint (except for OFF3), but instead is essentially dependent on time condition p1758. As a consequence, a drive can be started or reversed in closed-loop speed controlled operation with setpoints from an external control system, if these briefly lie in the open-loop speed control range.

r1751 Motor model status / MotMod status					
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting

0.00 [m/min] 1000.00 [m/min] 1000.00 [m/min]

Description: Sets the velocity to change over the motor model for operation with encoder.

Dependency: Refer to: p1756

Note: A monitoring function (F07412) is activated for velocities greater than p1752.
The motor model is additionally influenced when kT adaptation is activated (p1780.3 = 1).

p1752[0...n] Motor model changeover speed operation with encoder / MotMod n_chgov enc

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting

0.00 [rpm] 210000.00 [rpm] 210000.00 [rpm]

Description: Sets the speed to change over the motor model for operation with encoder.

Dependency: In U/f characteristic mode the parameter is of no significance.

Using the friction characteristic for operation with encoder:
When changing the motor model changeover speed p1752, the points along the friction characteristic should be recalculated (p0340 = 5) and the friction characteristic recorded again (p3845). For slight changes, only the associated friction characteristic points must be recorded (see p3844).
Refer to: p1756

p1753[0...n] Motor model changeover speed hysteresis operation with encoder / MotMod n_chgovHysE

VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting

0.0 [%] 90.0 [%] 0.0 [%]

Description: Sets the hysteresis for the changeover speed of the motor model for operation with speed encoder.

Dependency: Refer to: p1752

Note: The value refers to p1752.
In the case of separately excited synchronous motors, the lower hysteresis value is calculated with $p1752 * p1753$; in the case of all other types of motor, $p1752 * (1 - p1753)$ is used.

p1754[0...n]	Flux angle difference smoothing time / Angle diff t_smth		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6733
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1 [ms]	10000.0 [ms]	5.0 [ms]
Description:	Sets the smoothing time constant to filter the main flux angle difference from the voltage and current models. The filtered value is included in the calculation of the total flux angle. PMSM: Sets the smoothing time constant to display the angular difference between the motor model and encoder.		
Note:	In the case of a separately excited synchronous motor (SESM) and sensorless vector control, the parameter must be set to the minimum value to improve motor model changeover. PMSM: permanent-magnet synchronous motor SESM: separately excited synchronous motor		

p1755[0...n]	Motor model changeover speed encoderless operation / MotMod n_chgSnsorl		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	95.0 [%]	50.0 [%]
Description:	Sets the hysteresis for the changeover speed of the motor model for encoderless operation. In the case of separately excited synchronous motors, the lower hysteresis value is calculated with $p1756 * p1755$; in the case of all other types of motor, $p1755 * (1 - p1756)$ is used.		
Dependency:	In U/f characteristic mode the parameter is of no significance. Refer to: p1755		
Note:	The parameter value refers to p1755. In the case of separately excited synchronous motors, the lower hysteresis value is calculated with $p1755 * p1756$; in the case of all other types of motor, $p1755 * (1 - p1756)$ is used.		

p1757[0...n]	Motor model w/o enc. op./cl.-loop controlled stab. controller Kp / MotMod w/o enc Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01	10.00	0.70
Description:	Sets the gain of the transient response controller when the motor model changes over from open-loop controlled operation to closed-loop controlled operation.		

Note: Only for ASM and PSM in encoderless operation:
 The settling range starts at $0.5 * p1755 * p1756$.
 For ASM, it ends at $p1755 * p1756$, or for $p1755$, if $p1759$ is at the maximum value.
 For PSM it always ends at $p1755 * p1756$.

p1758[0...n]	Motor model changeover delay time closed/open-loop control / MotMod t cl_op		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	100 [ms]	10000 [ms]	1000 [ms]
Description:	Sets the minimum time for falling below the changeover speed when changing from closed-loop controlled operation to open-loop controlled operation.		
Dependency:	The wait time has no significance if the setpoint speed before the ramp-function generator lies in the open-loop speed controlled operating range. In this case, the change is made without any delay. Refer to: p1755, p1756		
Note:	If p1758 is changed, commissioning must be selected in order to validate the value for the blocking monitoring.		

p1759[0...n]	Motor model changeover delay time open/closed-loop control / MotMod t op_cl		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	2000 [ms]	0 [ms]
Description:	Sets the minimum time for a transition from open-loop controlled to closed-loop controlled operation after the lower changeover speed $p1755 * (1 - p1756 / 100 \%)$ has been exceeded.		
Dependency:	Refer to: p1755, p1756		
Note:	With $p1759 = 2000$ ms, the delay time becomes ineffective and the model changeover is determined by the output frequency only (changeover for p1755).		

p1760[0...n]	Motor model with encoder speed adaptation Kp / MotMod wE n_ada Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	100000.000	1000.000
Description:	Sets the proportional gain Kp of the controller for speed adaptation with encoder		

p1761[0...n]	Motor model with encoder speed adaptation Tn / MotMod wE n_ada Tn		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1000 [ms]	4 [ms]
Description:	Sets the integral-action time Tn of the controller for speed adaptation with encoder

	Min	Max	Factory setting
	-5.000 [V]	5.000 [V]	0.000 [V]
Description:	Sets the offset voltage in the beta direction; this compensates the offset voltages of the drive converter/inverter at low speeds. The value is valid for the rated (nominal) pulse frequency of the power unit.		
Note:	The value is pre-set during the rotating measurement.		

r1776[0...6]	Motor model status signals / MotMod status sig		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the internal status signals of the motor model. For index [0]: Changeover ramp between current and voltage models. For index [1]: Changeover ramp for model feedback (only encoderless induction motors). For index [2]: Changeover ramp for frequency in the zero range (only encoderless induction motors). For index [3]: Transition ramp actual speed from speed setpoint to model value (SESM without encoder) For index [4]: Speed controller enable (SESM encoderless). For index [5]: Transition ramp between current and voltage model (SESM without encoder). For index [6]: Transition ramp for EMF deviation at PLL input (PMSM without encoder)		
Index:	[0] = Changeover ramp motor model [1] = Changeover ramp model tracking [2] = Changeover ramp zero frequency induction motor without encoder [3] = Changeover ramp actual speed SESM without encoder [4] = Enable speed controller SESM without encoder [5] = Changeover ramp motor model SESM without encoder [6] = Changeover ramp motor model PMSM without encoder		
Note:	For index [3...5]: Are only relevant in the case of encoderless control of separately excited synchronous motors.		

r1778[0...2]	Motor model flux angle difference / MotMod ang diff		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: p2005	Expert list: 1
	Min	Max	Factory setting
	- [°]	- [°]	- [°]
Description:	Displays the flux angle difference of the motor model. The values are calculated above the switchover speed of the motor model (p1752, p1755).		

2 Parameters

2.2 List of parameters

Index: [0] = Smoothed
[1] = Angle for F07412
[2] = Unsmoothed

Note: For index [0]:
Displays the smoothed angular error.
Induction motor (ASM):
Displays the difference between the motor model flux angle and transformation angle.
Permanent-magnet synchronous motor (PMSM):
Displays the angular difference between motor model and encoder.
For index [1]:
Displays the smoothed absolute angular error, which is used for fault F07412. F07412 is output above 80 °.
For index [2]:
Displays the unsmoothed angular error.

r1778	Motor model flux angle difference / MotMod ang diff		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: p2005	Expert list: 1
	Min	Max	Factory setting
	- [°]	- [°]	- [°]
Description:	Induction motor (ASM): Displays the difference between the motor model flux angle and the transformation angle. Permanent-magnet synchronous motor (PMSM): Displays the angular difference between motor model and encoder.		
Dependency:	A setting for smoothing the display can be made using p1754.		

r1779	Motor model absolute flux / MotMod abs flux		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL, RESM	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]
Description:	Displays the absolute value of the flux of the motor model.		

p1780[0...n]	Motor model adaptation configuration / MotMod adpt config		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0010 0000 bin

Description: Sets the configuration for the adaptation circuit of the motor model.
Induction motor (ASM): Rs, Rr (only for operation with encoder), Lh and offset compensation.
Permanent-magnet synchronous motor (PMSM): kT

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	03	Select motor model PMSM kT adaptation	Yes	No	-
	05	Reserved	Yes	No	-
	07	Reserved	Yes	No	-
	08	Compensation voltage emulation error in the drive converter	Yes	No	-
	09	kT(iq) characteristic active	Yes	No	-

Caution:

For the PMSM kT adaptation (p1780.3) as well as the compensation of the voltage emulation error (p1780.8) and for the kT(iq) characteristic (p1780.9), the function module "Extended torque control" (r0108.1) should be activated.

Note:

ASM: Induction motor
PMSM: permanent-magnet synchronous motor

p1780[0...n]	Motor/converter model adaptation configuration / MotMod adpt config		
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0001 0010 1000 bin

Description:

Sets the configuration for the adaptation circuit of the motor model.
Induction motor (ASM): Rs, Rr (only for operation with encoder), Lh and offset compensation.
Permanent-magnet synchronous motor (PMSM): kT

Bit field:

Bit	Signal name	1 signal	0 signal	FP
03	Select motor model PMSM kT adaptation	Yes	No	-
05	Reserved	Yes	No	-
07	Reserved	Yes	No	-
08	Compensation voltage emulation error in the drive converter	Yes	No	-
09	kT(iq) characteristic active	Yes	No	-

Caution:

For the PMSM kT adaptation (p1780.3) as well as the compensation of the voltage emulation error (p1780.8) and for the kT(iq) characteristic (p1780.9), the function module "Extended torque control" (r0108.1) should be activated.

Note:

ASM: Induction motor
PMSM: permanent-magnet synchronous motor
The kT adaptation is only active at a speed greater than the changeover speed with encoder (p1752).
The kT adaptation and the kT characteristic can be simultaneously selected.
For kT adaptation (p1780.3 = 1):
- the kT adaptation is only active at a speed greater than the changeover speed with encoder (p1752).
- beforehand, an identification of the voltage emulation error must be started (p1909.14 = 1).
- if the electrical configuration (e.g. Motor Module, cable routing) or the pulse frequency (p1800) changes, then a new identification run must be carried out.
- To identify the voltage emulation error the Motor Module should still be warm.
- the motor temperature (r0035) should not change significantly (i.e. it should not be identified immediately after a load duty cycle).
For kT(iq) characteristic (p1780.9 = 1):
- for the kT(iq) characteristic $kT(iq) = kT + kT3 * iq^2 + kT5 * iq^4 + kT7 * iq^6$, the parameters must first be identified (p1959.6 = 1, kT: p0316, kT3: p0646, kT5: p0647, kT7: p0647).

p1780[0...n]	Motor model adaptation configuration / MotMod adpt config		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0111 1100 bin

Description:

Sets the configuration for the adaptation circuit of the motor model.
Induction motor (ASM): Rs, Rr (only for operation with encoder), Lh and offset compensation.
Permanent-magnet synchronous motor (PMSM): kT

2 Parameters

2.2 List of parameters

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Select motor model ASM Rs adaptation	Yes	No	-
	02	Select motor model ASM Lh adaptation	Yes	No	-
	03	Select motor model PMSM kT adaptation	Yes	No	-
	04	Select motor model offset adaptation	Yes	No	-
	05	Select ASM Rr adaptation (only with encoder)	Yes	No	-
	06	Select pole position identification PMSM encoderless	Yes	No	-
	07	Select T(valve) with Rs adaptation	Yes	No	-
	08	Deselect prelim. meas. of inductance for pole position ident.	Yes	No	-
	10	Filter time combination current like current ctrl integral time	Yes	No	-
	11	Fast flying restart with voltage model for induction motor	Yes	No	-
	12	Start PMSM sensorless with last angle	Yes	No	-
	13	Fast pulsed pole position identification	Yes	No	-
	14	Delay of the precontrol speed to the motor model	Yes	No	-
	15	RESM Q flux model linear	Yes	No	-

Dependency:

In U/f characteristic operating mode, only bit 7 and bit 11 are relevant.

For active motor model feedback (see p1784), the Lh adaptation is internally deactivated automatically.

When the power units are connected in parallel with separate, offset motor winding systems (p7003 = 2), then the compensation of the valve interlocking times should be implemented as Rs adaptation (bit 7 = 1).

Caution:

For bit 11:

The selection is not enabled for dv/dt filters (see p0230).

Notice:

It is only permissible to change bit 11 if the drive is switched off.

When selecting bit 11, also for U/f characteristic operation, a standstill measurement must have been performed to set the necessary current controller for a fast flying restart.

Note:

ASM: Induction motor

PMSM: permanent-magnet synchronous motor

When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.

In order that the correction values of the Rs, Lh and kT adaptation (selected using bit 0 ... bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

For bit 11:

This bit has no influence on flying restart with speed encoder. Depending on the motor, the fast flying restart is suitable for speeds of maximum 1.5x to 4x the rated motor speed.

For bit 12 (only for synchronous motors and bit 6 = 1):

The pole position identification is only carried out after power on and after the motor has coasted down. The switch-off speed p1226 should be as low as possible. If the power unit is switched off when the motor is stationary, then the next time that the power unit is switched on, the old angle is used as starting value. The precondition applies that while the power unit is switched off the motor does not rotate.

For bit 13:

When the bit is set, the duration of the pole position identification is shortened. As a consequence, the pole wheel angle error can be slightly greater.

p1784[0...n]	Motor model feedback scaling / MotMod fdbk scal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	1000.0 [%]	0.0 [%]
Description:	Sets the scaling for model fault feedback.		
Note:	Feeding back the measured model fault to the model states increases the control stability and makes the motor model rugged against parameter errors. When feedback is selected (p1784 > 0), Lh adaptation is not effective.		
p1785[0...n]	Motor model Lh adaptation Kp / MotMod Lh Kp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3

	P-Group: Modulation	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1.000 [kHz]	32.000 [kHz]	4.000 [kHz]	
Description:	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.			
Dependency:	The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values: a) $p1800 = 1000 / (p0115[0] * n)$ with $n = 2, 3, 4, 5$ b) $p1800 = 1000 * n / p0115[0]$ with $n = 1, 2, 3, 4, \dots$ Example: $p0115[0] = 125 \mu s \rightarrow p1800 = 1.6, 2, 2.6, 4 \text{ kHz}$ (from equation a) $p0115[0] = 125 \mu s \rightarrow p1800 = 8, 16 \text{ kHz}$ (from equation b) Possible setting values can be taken from r0114 (if p0009 = p0010 = 0). Refer to: r0110, r0111, p0112, p0113, r0114, p0115, r0193, p0230, p1817			

Note: The maximum possible pulse frequency is also determined by the power unit being used. When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).
 If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).
 For encoderless operation (p1404 = 0 or p1300 = 20), the following conditions apply:
 $p1800 = 1 / (n * p0115[0])$ with $n = 2, 3, 4$
 or
 $p1800 \geq n / p0115[0]$, $n = 1, 2, \dots$
 For motors with a low power rating (< 300 W) we recommend that p1800 is set acc. to the second condition. Although, pulse frequencies $p1800 = 1 / (n * p0115[0])$ with $n = 3$ or 4 are possible, for $p0115[0] > 62.5 \mu s$, they result in unsteady closed-loop control and should be avoided.
 For motors with a low leakage inductance, it is not permissible to set the pulse frequency to an excessively low value.

p1800[0...n]	Pulse frequency setpoint / Pulse freq set		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8021
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.000 [kHz]	16.000 [kHz]	4.000 [kHz]
Description:	Sets the pulse frequency for the converter. This parameter is pre-set to the rated converter value when the drive is first commissioned.		
Dependency:	The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values: $p1800 = 1000 / (p0115[0] * 2)$ or $p1800 = n * 1000 / p0115[0]$ with $n = 1, 2, 3, \dots$ Example: $p0115[0] = 250 \mu s \rightarrow p1800 = 2, 4, 8, 12, 16 \text{ kHz}$ Possible setting values can be taken from r0114 (if p0009 = p0010 = 0). Minimum pulse frequency: $p1800 \geq 12 * p1082 * r0313 / 60$ If p0092 = 1 the sampling times p0115 and the pulse frequency p1800 are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be deactivated by setting p0092 = 0 (making this setting does not influence isochronous PROFIBUS operation). The pulse frequency cannot be changed when motor data identification is active (p1910). If the pulse frequency is set asynchronously to the current controller sampling time (p1810.12), the following limit applies: $p1800 \leq 1000 * 2 / p0115[0]$ If wobulation is selected (p1810.2), the pulse frequency can only be changed as part of pulse enabling to values with the following ratio: a) $p1800 \leq 1000 / p0115[0]$ for $p1811 > 0 \%$ b) $p1800 \leq 1000 * 2 / p0115[0]$ for $p1811 = 0 \%$ When the pulses are inhibited $p1800 > 1000 / p0115[0] \rightarrow p1811 = 0$ $p1800 > 1000 * 2 / p0115[0] \rightarrow p1810.2 = 0$ and $p1811 = 0$ (applicable for all indices) Refer to: r0110, r0111, p0112, p0113, r0114, p0115, r0193, p0230, p1817		

2 Parameters

2.2 List of parameters

Notice: The pulse frequency p1800 can also be asynchronously set to the current controller sampling time (0.05 kHz increment). To do this, p1810.12 must be set to 1 (secondary condition, see p1810).

Effects:

- switching over the gating unit (p1810.2).
- activating the current actual value correction (p1840.0).
- minimum pulse frequency $1000 * 0.5 / p0115[0]$.
- maximum pulse frequency $1000 * 2 / p0115[0]$.
- fluctuating deadtimes and dynamic performance in the current control loop.
- increased level of current ripple in the current display.

Note: The maximum possible pulse frequency is also determined by the power unit being used.

When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).

When using output reactors and dv/dt filters (see p0230), the following restrictions apply:

- maximum 4 kHz
- maximum double rated pulse frequency (2.5 or 4 kHz)
- maximum rated pulse frequency for chassis converters with set property bit r0193.14

When using a sine-wave filter as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter.

For an external sine-wave filter (p0230 = 4), then the minimum pulse frequency is calculated as follows:

$$f_{\text{puls_min}} = 1.6 / (2 * \text{Pi} * \text{root}(p0233 * p0234 * p0235))$$

- p0233 in H
- p0234 in F

In this case, the pulse frequency must be a multiple of the inverse value of the current controller sampling time (p0115[0]).

If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be changed below the minimum value required for the filter.

If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

It is not possible to change the pulse frequency as long as motor data identification is selected.

Not for motor type: -

Scaling: -

Expert list: 1

Min

Max

Factory setting

1.000 [kHz]

16.000 [kHz]

8.000 [kHz]

Description: Sets the pulse frequency for the converter.

This parameter is pre-set to the rated converter value when the drive is first commissioned.

Dependency:

The switching frequency can only be changed so that it remains an integer multiple of the current controller sampling rate (p0115[0]). For p1810.12 = 1, pulse frequency p1800 can also be asynchronously set to the current controller sampling time (increment width, 0.05 kHz).

The minimum pulse frequency is always half the value of the current controller sampling rate (current controller frequency). Further, whether a setting value is actually permissible also depends on the line filter being used (p0220).

Danger:

An incorrectly set line filter (p0220) - and a consequentially incorrect setting of the pulse frequency (p1800), which does not match the actually connected line filter (Active Interface Module, AIM) can result in significant damage to the line filter and the converter. Further, this represents a fire hazard.

Notice:

The following should be noted for an asynchronous pulse frequency (p1810.12 = 1):

- fluctuating deadtimes and dynamic performance in the current control loop.
- increased level of current ripple in the current display.

Note:

The Power Unit being used defines the maximum possible pulse frequency.

p1801[0...n]	Manipulated variable filter type / ManVarFilt type		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2	1
Description:	Sets the manipulated variable filter as low pass (PT2) or as extended general 2nd order filter.		
Value:	1: PT2 low pass 2: General 2nd order filter		
Dependency:	The manipulated variable filter is activated via p1800.0 and parameterized via p1801 ... p1805. Refer to: p1800		
Note:	For an extended general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB \text{ bandwidth}} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$		
r1801	Actual pulse frequency / Pulse freq act		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [kHz]	- [kHz]	- [kHz]
Description:	Display and connector output for the actual converter switching frequency.		
Note:	The selected pulse frequency (p1800) may be reduced if the drive converter has an overload condition (p0290). The value can be displayed up to 12 current controller sampling times later than when it is actually effective, because it is not transferred in every current controller sampling time.		
r1801[0...1]	CO: Pulse frequency / Pulse frequency		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [kHz]	- [kHz]	- [kHz]
Description:	Display and connector output for the actual converter switching frequency.		
Index:	[0] = Actual [1] = Modulator minimum value		
Note:	The selected pulse frequency (p1800) may be reduced if the drive converter has an overload condition (p0290). The following applies for vector drives (p0107): The pulse frequency can also be reduced when changing over the modulator to an optimized pulse pattern. This is used to avoid overcontrol. In the case of chassis power units, two-thirds of the setpoint pulse frequency is displayed in the FLB modulation range.		

r1801	Actual pulse frequency / Pulse freq act		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [kHz]	- [kHz]	- [kHz]
Description:	Displays the actual pulse frequency of the converter. When pulse frequency wobulation is active (p1810), then the center switching frequency is displayed.		
Notice:	The frequency value displayed in the "Smart Mode" (p3400.0 = 1) is not valid.		
Note:	The displayed frequency always corresponds to the inverted duration of the switching period, which is decisive for selecting a suitable line filter (p0220). The displayed frequency value is therefore not dependent on whether flattop modulation or space vector modulation is selected (p1810, p3410).		

p1802[0...n]	Manipulated variable filter denominator natural frequency / ManVarFilt fn_den		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]
Description:	Sets the denominator natural frequency for manipulated variable filter (PT2, general filter).		
Dependency:	The manipulated variable filter is activated via p1800.0 and parameterized via p1801 ... p1805. Refer to: p1800		

p1802[0...n]	Modulator mode / Modulator mode		
VECTOR, VECTOR_AC, VECTOR_L_AC	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	19	0
Description:	Sets the modulator mode.		
Value:	0: Automatic changeover SVM/FLB 1: Flat top modulation (FLB) 2: Space vector modulation (SVM) 3: SVM without overcontrol 4: SVM/FLB without overcontrol 5: SVM with pulse frequency reduction 6: SVM/FLB with pulse frequency reduction 7: No edge modulation up to 100 Hz 8: No edge modulation up to 60 Hz 9: Edge modulation 19: Optimized pulse pattern		
Dependency:	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), or if the power unit firmware is not able to calculate edge modulation (r0192.0 = 0), then only space vector modulation without overcontrol can be set as modulation type (p1802 = 3). For permanent-magnet synchronous motors and chassis power units, the following applies: Edge modulation or optimized pulse pattern can only be used, if p1810 bit 2 = 1 is set. Refer to: r0192, p0230, p7003		
Notice:	If the pulse patterns are enabled with overmodulation option (p1802 < 3) or edge modulation (p1802 > 6), then the current actual value correction is automatically activated (p1840.0 = 0).		

Note: When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.

p1802 = 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.

The setting p1802 = 19 is only released for chassis power units and SIMOTICS FD motors.

p1802[0...n]	Modulator mode / Modulator mode		
VECTOR (F3E), VECTOR_AC (F3E), VECTOR_I_AC (F3E)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	4	4
Description:	Sets the modulator mode.		
Value:	0: Automatic changeover SVM/FLB 2: Space vector modulation (SVM) 3: SVM without overcontrol 4: SVM/FLB without overcontrol		
Dependency:	If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only space vector modulation without overcontrol can be selected as modulation type (p1802 = 3). Refer to: r0192, p0230, p7003		
Note:	When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 2), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple. When changing p1802[x], the values for all of the other existing indices are also changed.		

p1803[0...n]	Manipulated variable filter denominator damping / ManVar_filt D_den		
HLA	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001	10.000	0.700
Description:	Sets the denominator damping for the manipulated variable filter (PT2, general filter).		
Dependency:	The manipulated variable filter is activated via p1800.0 and parameterized via p1801 ... p1805. Refer to: p1800		

p1803[0...n]	Maximum modulation depth / Mod_depth max		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 6723
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	20.0 [%]	150.0 [%]	100.0 [%]
Description:	Defines the maximum modulation depth.		
Note:	p1803 = 100% is the overcontrol limit for space vector modulation (for an ideal drive converter without any switching delay). If optimized pulse patterns are enabled (edge modulation), then the modulation depth is limited to below the output frequency of 28 Hz as there is no optimized pulse pattern in this range.		

2 Parameters

2.2 List of parameters

p1803[0...n]	Maximum modulation depth / Mod_depth max		
VECTOR (F3E), VECTOR_AC (F3E), VECTOR_I_AC (F3E)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3

0000 0000 0000 0000 bin

Description:

Sets the configuration for the modulator.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
01	DC link voltage compensation in the power unit.	Yes	No	-
11	Current controller dynamics higher	Yes	No	-

2 Parameters

2.2 List of parameters

Note: For bit 11:
Prerequisite:
- firmware version 4.4 or higher for the Control Unit and power unit.
- booksize or S120 Combi power unit (r0192.27 = 1).
- current controller sampling time p0115[0] >= 62.5 µs.
- for a Double Motor Module the two drive controls must be operated with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.
- when operating servo and vector U/f on a Double Motor Module, p1810.11 must be set = 0.
- it is not permissible that the "safety without encoder" is activated (p9306/p9506).
The following changes are necessary after changing bit 11:
- computing dead time (p0118 = 20.5 µs for bit 11 = 1, p0118 = 0 µs for bit 11 = 0).
- controller gains (p1715, p1460).
- with p0340 = 4 computing dead time and controller gains can be automatically pre-assigned. It may be necessary to still optimize the speed controller.
Before commissioning for the first time (p3925.0 = 0 for all data sets) this parameter is automatically pre-assigned to the optimum value.

p1810	Modulator configuration / Modulator config		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned16 P-Group: Modulation Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0010 bin

Description: Sets the configuration for the modulator.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Avg value filter for V_lim (only for Vdc_comp in modulator)	Yes	No	-
	01	DC link voltage compensation in the current control	Yes	No	-
	02	Wobulation activated	Yes	No	-
	03	Current measurement oversampling selected	Yes	No	-
	08	Pulse frequency reduction (speed dependent) stage 1	Yes	No	-
	09	Pulse frequency reduction (speed dependent) stage 2	Yes	No	-
	10	Activate pulse-locking/pulse-dropping function	Pulse-Dropping	Pulse-Locking	-
	12	Pulse freq. can be asynchronously set to curr. ctrl clock cycle	Yes	No	-
	13	Pulse freq. reduction before optimized pulse patterns for 500 µs	Yes	No	-
	14	Deactivate maximum angular difference adaptation	Yes	No	-
	15	Increase overmodulation range	Yes	No	-

Dependency: If bit 2 is set from 1 to 0, p1811 = 0 is set.

Notice: Bit 1 = 0 can only be set when the pulses are inhibited and for r0192.14 = 1.

Bit 2 can only be set to 1 subject to the following prerequisites:

- Pulse inhibit
- r0192.16 = 1
- p1800 < 2 x 1000/p0115[0]

Bit 12 can only be changed subject to the following prerequisites:

- preconditions, the same as bit 2 = 1
- p1810.3 = 0

For fast current changes, bit 15 = 1 together with p1802 = 0, 2 and p1803 > 106 % result in a significant increase in the torque ripple. As a consequence, increasing the modulation limit must be checked on an application for application basis.

Note:

For bit 00 = 0:

Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).

For bit 00 = 1:

Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).

The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).

For bit 01 = 0:

DC link voltage compensation in the modulator.

For bit 01 = 1:

DC link voltage compensation in the current control.

For bit 02 = 0:

A gating unit that does not permit wobulation is used.

Edge modulation is not possible for a parallel connection with a single-winding system (p7003 = 0).

Bit 02 cannot be set to 0 if bit 12 = 1.

For bit 02 = 1:

A gating unit that permits wobulation is used.

For a wobulation amplitude $p1811 = 0$, the maximum possible pulse frequency in $p1800 = 2 \times 1000 / p0115[0]$.

For a wobulation amplitude $p1811 > 0$, the maximum possible pulse frequency in $p1800 = 1000 / p0115[0]$.

If optimized pulse patterns has been activated ($p1802 > 6$), then a parameter save is required and switch off and switch on again. This is displayed using a message (F01040).

For bit 03 = 1:

The current actual value sensing and the determination of the valve ON times takes place with a double current controller clock cycle and phase offset.

The activation is only possible with $r0192.23 = 1$ and $p1810.12 = 0$ - and takes effect the next time the system is powered up.

For bit 08 = 1:

Above the frequency threshold $r1836[0]$, the pulse frequency is switched to the value in $p1800$. Below $r1836[0]$ (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see $r0114$).

For bit 09 = 1:

Above the frequency threshold $r1836[1]$, the pulse frequency is increased to the next possible value. Below $r1836[1]$ (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency.

If bit 8 is set to 0, bit 9 is automatically reset.

For bit 10 = 0:

Pulse-locking function activated.

For bit 10 = 1:

Pulse-dropping function activated.

For bit 12 = 0:

The pulse frequency $p1800$ can also be synchronously set to the current controller clock cycle (see $r0114$).

Bit 12 can only be set from 1 to 0 if the pulse frequency $p1800$ is set synchronously to the current controller clock cycle. In this case, the gating unit is not switched over.

For bit 12 = 1:

The pulse frequency $p1800$ can also be asynchronously set to the current controller clock cycle. In this case, the effects should be observed (see $p1800$).

If bit 12 is set to 1, then the gating unit is automatically switched over ($p1810.2 = 1$). If this is not possible (see above), then bit 12 cannot be set to 1.

Bit 12 cannot be set to 1, if $p1810.3 = 1$ is set.

For bit 15 = 1:

For $p1802 = 0, 2$ and $p1803 > 106\%$, dynamically, a modulation depth of more than 106 % is permitted. When $p1803$ is increased, the dynamic modulation depth reserve $p1574$ should be increased so that the maximum output voltage $r0071$ approximately remains the same. For U/f control, the overcontrol in $p1381$ can be separately reduced.

2 Parameters

2.2 List of parameters

p1810		Modulator configuration / Modulator config			
VECTOR (F3E), VECTOR_AC (F3E), VECTOR_I_AC (F3E)	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Modulation	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0000 0000 0000 bin		
Description:	Sets the configuration for the modulator.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Avg value filter for V_lim (only for Vdc_comp in modulator)	Yes	No	-
	01	DC link voltage compensation in the current control	Yes	No	-
	08	Pulse frequency reduction (speed dependent) stage 1	Yes	No	-
	09	Pulse frequency reduction (speed dependent) stage 2	Yes	No	-
Notice:	Bit 1 = 0 can only be set when the pulses are inhibited and for r0192.14 = 1.				
Note:	For bit 00 = 0: Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage). For bit 00 = 1: Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current). The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0). For bit 01 = 0: DC link voltage compensation in the modulator. For bit 01 = 1: DC link voltage compensation in the current control. For bit 08 = 1: Above the frequency threshold r1836[0], the pulse frequency is switched to the value in p1800. Below r1836[0] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency (see r0114). For bit 09 = 1: Above the frequency threshold r1836[1], the pulse frequency is increased to the next possible value. Below r1836[1] (minus the hysteresis), the pulse frequency is reduced to the next possible pulse frequency. If bit 8 is set to 0, bit 9 is automatically reset.				

p1810		Modulator configuration / Modulator config			
A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 4		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Modulation	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	1000 0100 0001 0000 bin		
Description:	Sets the configuration for the modulator.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	02	Activate wobulation in the power unit	Yes	No	-
	04	Disable wobulation amplitude	Yes	No	-
	05	Activate extended current limitation control	Yes	No	-
	06	Activate isochronous current limitation	Yes	No	-
	07	Activate voltage impression with dynamic current limits	Yes	No	-
	10	Activate pulse-locking/pulse-dropping function	Pulse-Dropping	Pulse-Locking	-

12	Pulse freq. can be asynchronously set to curr. ctrl clock cycle	Yes	No	-
13	Compute software gating unit on Control Unit	Yes	No	-
14	Activate flat-top shifting	Yes	No	-
15	Activate flat-top modulation	Yes	No	-

Dependency: The modulator configuration is overwritten when the power unit (p0201) or the line filter type (p0220) is changed. It is possible that special settings required for the modulator must be newly set.

Notice: For bit 02 = 1:

The wobble function influences the quality of the current control (grid droop operation with p5401 = 1 is not influenced). This is the reason that the risk of faults due to overcurrent increases for applications with the highest dynamic response in the overload range,

For booksize drive units, the following additionally applies:

This function involves additional computing time. It may be necessary to reduce the number of DO objects computed on the same Control Unit, or longer sampling times must be used (observe the messages). For example, a current controller sampling time setting of p0115[0] = 125 µs is not possible.

For bit 13 = 1:

This function involves additional computing time. It may be necessary to reduce the number of DO objects computed on the same Control Unit, or longer sampling times must be used (observe the messages).

Note:

The following applies to all bits:

If the line droop control (p5401) is active or the grid support (p5501) is active, the setting can only be changed when the pulses are inhibited (see also p5456, p5526).

For bit 02, 05, 14, 15:

The setting can only be changed when the pulses are inhibited.

For bit 02 = 0:

A gating unit that does not permit wobulation is used.

For bit 02 = 1 (only permissible for r0192.16 = 1):

A gating unit that permits wobulation is used.

The frequency range of the wobulation function is set using p1811.

The Smart Mode (p3400.0 = 1) is not permissible and results in F06050.

For bit 04 = 0 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is enabled.

For bit 04 = 1 (only valid for bit 2 = 1):

The pulse frequency wobulation amplitude (p1811) is disabled.

For bit 05 = 1 (only permissible for r0192.19 = 1):

Reserved.

For bit 06 (only valid for bit 05 = 1):

Reserved.

For bit 07 (only valid for bit 05 = 1):

Reserved.

For bit 10 = 0:

The pulse-locking function is activated.

For bit 10 = 1:

The pulse-dropping function is activated.

For bit 12:

Reserved.

For bit 13 = 0:

The gating unit is separately calculated in each power unit.

For bit 13 = 1 (only permissible for r0192.26 = 1):

The gating unit is calculated in the Control Unit.

The Smart Mode (p3400.0 = 1) is not permissible and results in F06050.

2 Parameters

2.2 List of parameters

For bit 14 = 0:

The phase angle for flattop modulation is independent of the cos phi value (see r0038).

For bit 14 = 1 (only permissible for bit 13 = 1 and ALM Chassis-2 devices):

The phase angle of the flattop modulation is dependent on the cos phi value (see r0038), to guarantee minimum power loss for a high reactive power ($r0038 \ll 1$).

Angle-dependent modulation is active, if $|r0076| > 0.15 * r0207$.

Depending on the cos phi value, the offset angle can reach a maximum absolute value of 30° if $|r0076| > 0.35 * r0207$.

Offset angle smoothing is set using p1882.

For bit 15 = 0:

To deactivate the flattop control mode, p3400.1 must also be set to 0.

For bit 15 = 1:

Flattop control mode is active regardless of the setting for p3400.1.

p1811[0...n]	Pulse frequency wobulation amplitude / Puls wobb ampl		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [%]	20 [%]	0 [%]
Description:	Sets the amplitude of the statistical wobulation signal. This signal is used to vary the pulse frequency to create a more pleasant sound.		
Note:	p1811 > 0 is possible, if the following applies: - configuration: p1810.2 = 1 (wobulation activated) - pulse frequency: p1800 <= 1000 / p0115[0] - output filter, filter type: p0230 < 3 (no sine-wave filter)		
p1811	Pulse frequency wobulation amplitude / Puls wobb ampl		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [%]	20 [%]	0 [%]
Description:	Sets the amplitude of the statistical wobulation signal. This signal is used to vary the pulse frequency to create a more pleasant sound.		
Dependency:	The modulator configuration is overwritten when the power unit (p0201) or the line filter type (p0220) is changed. It is possible that special settings required for the modulator must be newly set.		
Note:	The change between the selected wobble width and the wobble width zero is also possible in operation with the pulses enabled (p1810.4).		
p1812	BI: Offset calibration output current measurement / Offs_cal I_outp		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 4
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source to activate/deactivate offset calibration for output current measurement.		
Caution:	The absence of offset calibration can have a negative effect on control properties. Offset calibration must be performed before switching on the power unit for the first time after POWER ON.		
			
Note:	Offset calibration is only performed with pulses suppressed and can take up to one second.		

p1814[0...n]	Vdc filter dead band for modulation switchover / Vdc filt dead band			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 4	
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -	
	P-Group: Modulation	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [%]	12.0 [%]	0.0 [%]	
Description:	Sets the filter dead bandwidth for the DC link voltage signal to switch over the modulation type for optimized pulse patterns. The parameter value refers to the rated line voltage of the power unit.			
Recommendation:	For power units with controlled regenerative line feedback, a value of approximately 2 % is recommended. For all other power units, a value of approximately 8 % (as a result of the increased DC link voltage ripple under load).			
p1815	Phase for PWM generation subgroup / Ph for PWM subgr			
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Modulation	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0001 bin	
Description:	Sets bit 0 for recording the power unit in the subgroup for the "offset clocking".			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Recording in subgroup for offset clocking	Yes	No
Dependency:	Refer to: p1818, p1819			
Note:	A change only becomes effective after booting. If one of the following secondary conditions is not fulfilled, then none of the power units from the subgroup are clocked with an offset. Secondary conditions for clocking with an offset: - the PWM frequency (p1800[D]) of all power units in the subgroup must be the same. - the PWM frequency (p1800[D]) must be the same in all drive data sets in the subgroup. - the following must apply for the ratio between the PWM cycle (1/p1800[D]) and the current controller cycle (p0115[0]): The ratio (1/p1800[D]) / (p0115[0]) must be an even integer number (2, 4, 6, ...) for all power units in the subgroup. or The ratio (p0115[0]) / (1/p1800[D]) must be an integer number (1, 2, 3, ...) for all power units in the subgroup.			
p1816	Set phase for PWM generation manually / Set Ph for PWM			
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Modulation	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-1	16	-1	
Description:	Sets manual setting and overwriting of automatically determined phase shift for "offset clocking". For p1816 = -1, the following applies: Automatic mode. The phase shift value is automatically determined. For p1816 = 0 ... 16, the following applies: Manual mode. The user should define the phase shift value as follows: 1. PWM cycle (1/p1800) > current controller cycle (p0115[0]) The power unit executes a phase shift from Tshift = current controller cycle (p0115[0]) * p1816. 2. PWM cycle (1/p1800) <= current controller clock cycle (p0115[0]) For p1816 >= 1, the power unit executes a phase shift from Tshift = PWM cycle/2.			

2 Parameters

2.2 List of parameters

Dependency: Refer to: r0116, p1800, p1819

p1817	Pulse frequency to output frequency ratio minimum / f_pulse/f_outp min		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(2)	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Converter	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	8.3	15.0	12.0

Description: Sets the minimum ratio between the pulse frequency and the output frequency.

Notice: If the ratio between the pulse frequency and the output frequency is reduced, then oscillations can occur in the output current that can result in significant levels of current ripple with the appropriate negative effects.

Note: When the maximum speed is changed, the pulse frequency p1800 is automatically limited to this minimum ratio. It is not permissible to reduce the pulse frequency if this would result in this ratio being undershot.

p1818	Phase for PWM generation configuration / Ph for PWM config		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	1

Description: Sets the phase shift for offset clocking.

For the first active power unit, it is specified whether clocking is to start at 0° (value = 0) or 180° (value = 1). All other active power units are clocked alternately according to the setting made here.

Dependency: Refer to: p1819

Note: A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

p1819	Phase for PWM generation / Ph for PWM		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, S_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1	16	-1

Description: Display for "offset clocking".

Depending on the particular case, the value is interpreted differently:

Case 1:

The PWM clock cycle (1/p1800[D]) is greater than the current controller clock cycle (p115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 4 kHz, 2 kHz, 1 kHz).

The value displayed refers to:

- the phase shift in the current-controller cycles to be executed by the power unit.

Case 2:

The PWM clock cycle (1/p1800[D]) is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 8 kHz, 16 kHz).

The value 1 displayed means that:

- the power unit is to apply a phase shift of 180 ° (from the PWM cycle).

A value of 0 displayed on all power units of the drive line-up means the following:

- the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an offset.

Dependency: Refer to: r0108, p0115, p1800, p1815, p1816, p1818

Note: For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that factory setting -1 no longer has any significance and is only available for reasons of compatibility.

p1819 Phase for PWM generation / Ph for PWM

A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1	16	0

Description: Display for "offset clocking".
Depending on the particular case, the value is interpreted differently:
Case 1:
The PWM clock cycle is greater than the current controller clock cycle (p0115[0]) and the ratio between the PWM clock cycle and the current controller clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, pulse frequency = 4 kHz, 2 kHz).
The value displayed refers to:
- the phase shift in the current-controller cycles to be executed by the power unit.
Case 2:
The PWM clock cycle is less than or equal to the current controller clock cycle (p0115[0]) and the ratio between the current controller clock cycle and the PWM clock cycle is an integer and even multiple of it (e.g. p0115[0] = 125 µs, pulse frequency = 8 kHz, 16 kHz).
The value 1 displayed means that:
- the power unit is to apply a phase shift of 180 ° (from the PWM cycle).
A value of 0 displayed on all power units of the drive line-up means the following:
- the general conditions of the "offset clocking" (see p1815) are not fulfilled, i.e. no power unit is clocked with an offset.

Dependency: Refer to: r0108, p0115, p1800, p1815, p1816, p1818

Note: For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a display parameter. This means that the minimum value -1 no longer has any significance and is only available for reasons of compatibility.

p1820[0...n] Invert output voltage / U_output inv

HLA	Can be changed: C2(3)	Calculated: CALC_MOD_CON	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Setting to invert the output voltage.
This means that with the same setpoint, the piston direction is reversed without inverting the encoder actual value.
When a velocity encoder is being used, it may be necessary to also invert the encoder actual value (p0410).

Value:
0: OFF
1: ON

Note: This setting can only be changed when the controller is inhibited.

p1820[0...n]	Reverse the output phase sequence / Outp_ph_seq rev		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(3)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 6732
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Sets the phase sequence reversal for the motor. If the motor does not rotate in the required direction, then the output phase sequence can be reversed using this parameter. This means that with the same setpoint, the motor direction is reversed without reversing the encoder actual value. When a speed encoder is being used, it may be necessary to also invert the encoder actual value (p0410).		
Value:	0: OFF 1: ON		
Dependency:	Refer to: p1821		
Caution:	For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15. Changing the direction using p1820 or p1821 is not recognized by the "Safe Direction without encoder". As a consequence, the limit provided by SDI (Safe Direction) from r9733 no longer functions.		
			
Note:	This setting can only be changed when the pulses are inhibited. p1821 can be used to reverse the phase sequence and encoder actual value.		

p1821[0...n]	Direction / Direction		
HLA	Can be changed: C2(3)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Setting to change the direction. If the parameter is changed, it reverses the direction of rotation of the cylinder and the encoder actual value without changing the setpoint.		
Value:	0: Clockwise 1: Counter-clockwise		
Dependency:	Refer to: F07434		
Notice:	For a drive data set changeover with differently set direction and power enable, an appropriate fault is output. The piston must be recalibrated after a direction reversal. After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring: - p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder)		
Note:	The actual velocity (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]). p1820 can be used to reverse the direction of the cylinder without reversing the encoder actual value.		

p1821[0...n]	Direction of rotation / Dir of rot	Calculated: -	Access level: 3
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: C2(3) Data type: Integer16 P-Group: Motor Not for motor type: - Min 0	Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1	Func. diagram: 4704, 4710, 4711, 4715, 5730, 6730, 6731, 6732 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: Clockwise 1: Counter-clockwise		
Dependency:	Refer to: F07434		
Notice:	An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled. After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring: - p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder) - p9539/p9339 "SI Motion gearbox direction of rotation reversal" (also in encoderless operation)		
Note:	For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft. When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).		
p1821[0...n]	Direction / Direction	Calculated: -	Access level: 3
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: C2(3) Data type: Integer16 P-Group: Motor Not for motor type: - Min 0	Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1	Func. diagram: 4704, 4710, 4711, 4715, 5730, 6730, 6731, 6732 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to change the direction. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: Clockwise 1: Counter-clockwise		
Dependency:	Refer to: F07434		
Notice:	For a drive data set changeover with differently set direction and pulse enable, an appropriate fault is output. After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring: - p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder) - p9539/p9339 "SI Motion gearbox direction of rotation reversal" (also in encoderless operation)		
Note:	For operation with the phase sequence U/V/W, the direction is defined when viewing the face side of the motor output shaft. When changing the direction, the rotating field direction of the current controller is reversed. The actual velocity (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]). For VECTOR, the following applies: p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.		

p1821[0...n]	Direction of rotation / Dir of rot		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(3) Data type: Integer16	Calculated: - Dyn. index: DDS, p0180	Access level: 3 Func. diagram: 4704, 4710, 4711, 4715, 5730, 6730, 6731, 6732
	P-Group: Motor Not for motor type: -	Unit group: - Scaling: -	Unit selection: - Expert list: 1
	Min 0	Max 1	Factory setting 0
Description:	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: Clockwise 1: Counter-clockwise		
Dependency:	Refer to: F07434		
Danger: 	When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.		
Caution: 	For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.		
Notice:	An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled. After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring: - p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder) - p9539/p9339 "SI Motion gearbox direction of rotation reversal" (also in encoderless operation)		
Note:	For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft. When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]). p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.		

p1821[0...n]	Direction of rotation / Dir of rot		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: C2(3) Data type: Integer16	Calculated: - Dyn. index: DDS, p0180	Access level: 3 Func. diagram: 4704, 4710, 4711, 4715, 5730, 6730, 6731, 6732
	P-Group: Motor Not for motor type: -	Unit group: - Scaling: -	Unit selection: - Expert list: 1
	Min 0	Max 1	Factory setting 0
Description:	Setting to change the direction of rotation. If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.		
Value:	0: Clockwise 1: Counter-clockwise		
Dependency:	Refer to: p6278 Refer to: F07434		
Danger: 	When using external speed actual values for the speed controller (see p1440), for a direction of rotation change (p1821 = 1), then its polarity must also be changed (e.g. for drive object ENCODER via p0410). Otherwise, a positive coupling can occur in the speed control loop and the drive would then be accelerated up to the speed limit.		

Caution:

For 12-pulse converters with 30° offset angle for system 2, for a direction of rotation reversal, the phase offset changes by 60° as the sign of the angle offset changes. This can be adapted in p1810.15.

When using a separately excited synchronous machine with reverse field excitation, when setting p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.

Notice:

An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.

After changing parameter p1821, the direction of rotation is not automatically adapted in the safety area. The following parameters can be used to set the direction of rotation for safety monitoring:

- p9516.1/p9316.1 "Position actual value sign change" (only for operation with encoder)
- p9539/p9339 "SI Motion gearbox direction of rotation reversal" (also in encoderless operation)

Note:

For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.

When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).

p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.

p1822**Power unit line phases monitoring tolerance time / PU ph mon t_tol**

SERVO, VECTOR,
SERVO_AC,
VECTOR_AC,
SERVO_I_AC,
VECTOR_I_AC

Can be changed: T
Data type: Unsigned32
P-Group: -
Not for motor type: -
Min
500 [ms]

Calculated: -
Dyn. index: -
Unit group: -
Scaling: -
Max
540000 [ms]

Access level: 4
Func. diagram: -
Unit selection: -
Expert list: 1
Factory setting
1000 [ms]

Description:

Sets the tolerance time for line phase monitoring for blocksize power units.

If a line phase fault is present for longer than this tolerance time, then a corresponding fault is output.

Dependency:

Refer to: F30011

Notice:

When operating with a failed line phase, depending on the active power, values higher than the default value can either immediately damage the power unit or damage it over the long term.

Note:

For the setting p1822 = maximum value, line phase monitoring is deactivated.

p1825**Converter valve threshold voltage / Threshold voltage**

VECTOR,
VECTOR_AC,
VECTOR_I_AC

Can be changed: U, T
Data type: FloatingPoint32
P-Group: Modulation
Not for motor type: -
Min
0.0 [Vrms]

Calculated: CALC_MOD_ALL
Dyn. index: -
Unit group: -
Scaling: -
Max
100.0 [Vrms]

Access level: 3
Func. diagram: -
Unit selection: -
Expert list: 1
Factory setting
0.6 [Vrms]

Description:

Sets the threshold voltage drop of the valves (power semiconductor devices) to be compensated.

Note:

The value is automatically calculated in the motor data identification routine.

p1827**Infeed compensation valve lockout time operating mode / INFcomp t_lockMode**

A_INF, S_INF, R_INF

Can be changed: U, T
Data type: Integer16
P-Group: Modulation
Not for motor type: -
Min
0

Calculated: -
Dyn. index: -
Unit group: -
Scaling: -
Max
1

Access level: 4
Func. diagram: -
Unit selection: -
Expert list: 1
Factory setting
0

Description:

Sets the operating mode for the compensation of the valve lockout time.

Value:

- 0: Compensation valve lockout time deactivated
- 1: Compensation valve lockout time activated

Note:

The compensation is always active, independent of the value of this parameter if the closed-loop control is activated to suppress circulating currents (p7035) for power units connected in parallel.

p1828	Compensation valve lockout time phase U / Comp t_lock ph U		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [A]	- [A]	- [A]
Description:	Displays the phase setpoint currents for hardware current control.		
Index:	[0] = Phase U [1] = Phase V [2] = Phase W		
p1834[0...n]	Transition point compensation U1 positive zero range / Trans pt U1 pos		
HLA	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966, 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	95.00 [%]	0.00 [%]
Description:	Sets the voltage U for point 1 positive (zero range) of the transition point compensation. The characteristic for the transition point compensation comprises the following value pairs: Flow rate (Q) / voltage (U) Positive range: - p1833 / p1834 --> Point 1 pos (zero range), rounding p1835 - p1839 / p1840 --> Point 2 pos, rounding p1841 - p1845 / p1846 --> Point 3 pos (saturation) Negative range: - p1836 / p1837 --> Point 1 neg (zero range), rounding p1838 - p1842 / p1843 --> Point 2 neg, rounding p1844 - p1847 / p1848 --> Point 3 neg (saturation)		
Dependency:	Refer to: p1833, p1835		
p1835[0...n]	Transition point compensation rounding 1 positive zero range / Trans pt rnd 1 pos		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966, 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	30.00 [%]	0.00 [%]
Description:	Sets the rounding for point 1 positive (zero range) of the transition point compensation. The characteristic for the transition point compensation comprises the following value pairs: Flow rate (Q) / voltage (U) Positive range: - p1833 / p1834 --> Point 1 pos (zero range), rounding p1835 - p1839 / p1840 --> Point 2 pos, rounding p1841 - p1845 / p1846 --> Point 3 pos (saturation) Negative range: - p1836 / p1837 --> Point 1 neg (zero range), rounding p1838 - p1842 / p1843 --> Point 2 neg, rounding p1844 - p1847 / p1848 --> Point 3 neg (saturation)		
Dependency:	Refer to: p1833, p1834		

p1835[0...1]	Pulse frequency reduction switchover frequency shift / f_puls_red f_swov		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: SESM, REL Min 0.00 [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 800.00 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [Hz]
Description:	Frequency to shift the switchover frequency r1836 for pulse frequency reduction. The parameter value reduces the switchover frequency threshold with the same parameter index.		
Index:	[0] = Frequency limit 1 [1] = Frequency limit 2		
Dependency:	Refer to: r1836		
p1836[0...n]	Transition point compensation Q1 negative zero range / Trans pt Q1 neg		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: - Min 0.01 [%]	Calculated: CALC_MOD_REG Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 95.00 [%]	Access level: 3 Func. diagram: 4966, 4975 Unit selection: - Expert list: 1 Factory setting 0.01 [%]
Description:	Sets the flow rate Q for point 1 negative (zero range) of the transition point compensation.		
Dependency:	Refer to: p1837, p1838		
r1836[0...1]	Pulse frequency reduction, switchover frequency / f_puls_red f_swov		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Modulation Not for motor type: SESM, REL Min - [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [Hz]
Description:	Displays the frequency limits, under which the pulse frequency is automatically reduced. Starting from the parameterized pulse frequency p1800, the pulse frequency is reduced to the next possible one, if the frequency limits and an additional hysteresis are fallen below.		
Index:	[0] = Frequency limit 1 [1] = Frequency limit 2		
Dependency:	Refer to: p1810, p1835		
Note:	The pulse frequency reduction is not active for U/f control. A minimum clearance of 10 Hz is kept between the frequency thresholds, which cannot be fallen below when changing p1835. For index [0]: Frequency limit for the first pulse frequency reduction (active for p1810.8 = 1). For index [1]: Frequency limit for the second pulse frequency reduction (active for p1810.9 = 1).		
p1837[0...n]	Transition point compensation U1 negative zero range / Trans pt U1 neg		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: - Min 0.00 [%]	Calculated: CALC_MOD_REG Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 95.00 [%]	Access level: 3 Func. diagram: 4966, 4975 Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Sets the voltage U for point 1 negative (zero range) of the transition point compensation.		
Dependency:	Refer to: p1836, p1838		

r1837	Gating unit configuration / Gating unit config				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3

	22	Vdc correction deactivated in the gating unit	Yes	No	-
	23	Fast current and DC link monitoring activated in bypass	Yes	No	-

p1838[0...n]	Transition point compensation rounding 1 negative zero range / Trans pt rnd 1 neg			
HLA	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966, 4975	
	P-Group: Motor	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.00 [%]	30.00 [%]	0.00 [%]	
Description:	Sets the rounding for point 1 negative (zero range) of the transition point compensation.			
Dependency:	Refer to: p1836, p1837			

r1838.0...15 CO/BO: Gating unit status word 1 / Gating unit ZSW1

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and BICO output for status word 1 of the power unit.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Fault time-critical	ON	OFF	-
	01	Gating unit mode bit 0	ON	OFF	-
	02	Pulse enable	ON	OFF	-
	03	Upper switch-off signal path	Inactive	Active	-
	04	Lower switch-off signal path	Inactive	Active	-
	05	Gating unit mode bit 1	ON	OFF	-
	06	Gating unit mode bit 2	ON	OFF	-
	07	Brake state	ON	OFF	-
	08	Brake diagnostics	ON	OFF	-
	09	Armature short-circuit braking	Active	Not active	-
	10	Gating unit state bit 0	ON	OFF	-
	11	Gating unit state bit 1	ON	OFF	-
	12	Gating unit state bit 2	ON	OFF	-
	13	Alarm status bit 0	ON	OFF	-
	14	Alarm status bit 1	ON	OFF	-
	15	Diagnostics 24 V	ON	OFF	-

Note: If the Control Unit is operated with a PM240-2 with hardware STO (HW-STO), then the following assignments are obtained for the two HW-STO input terminals:

Input terminal STO_A -> r1838.4 switch-off signal path lower

Input terminal STO_B -> r1838.3 switch-off signal path upper

The bits that are not written to are used for internal diagnostics.

2 Parameters

2.2 List of parameters

p1845[0...n]	Transition point compensation Q3 positive saturation / TransPt Q3 pos sat		
HLA	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [%]	100.00 [%]	100.00 [%]
Description:	Sets the flow rate Q for point 3 positive (saturation) of the transition point compensation.		
Dependency:	Refer to: p1846		
p1845[0...n]	Actual value correction evaluation factor Lsig / ActV_corr ev Lsig		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	10.00	1.00
Description:	Sets the weighting factor for the leakage inductance of the L-R element of the actual value correction.		
Dependency:	Refer to: p0391, p0392, p0393		
Note:	The load-dependent adaptation of the leakage inductance of the current actual value correction is defined using p0391 ... p0393.		
p1846[0...n]	Transition point compensation U3 positive saturation / TransPt U3 pos sat		
HLA	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [%]	100.00 [%]	100.00 [%]
Description:	Sets the voltage U for point 3 positive (saturation) of the transition point compensation.		
Dependency:	Refer to: p1845		
p1846[0...n]	Actual value correction damping factor / ActV_corr D_factor		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	10.00	1.00
Description:	Sets the damping factor for the actual value correction. The factor multiplies the T0/Tsig ratio in the feedback branch of the LR element.		
p1847[0...n]	Transition point compensation Q3 negative saturation / TransPt Q3 neg sat		
HLA	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [%]	100.00 [%]	100.00 [%]
Description:	Sets the flow rate Q for point 3 negative (saturation) of the transition point compensation.		
Dependency:	Refer to: p1848		

p1848[0...n]	Transition point compensation U3 negative saturation / TransPt U3 neg sat		
HLA	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4975
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [%]	100.00 [%]	100.00 [%]
Description:	Sets the voltage U for point 3 negative (saturation) of the transition point compensation.		
Dependency:	Refer to: p1847		

r1848[0...5]	Actual value correction phase currents / ActV_corr I_ph		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays phase correction currents as well as the drive converter phase currents		
Index:	[0] = Harmonics phase U [1] = Harmonics phase V [2] = Harmonics phase W [3] = Measured value phase U [4] = Measured value phase V [5] = Measured value phase W		

r1849[0...5]	Actual value correction phase voltages / ActV_corr U_ph		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Modulation	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the phase correction voltages and and the drive converter phase voltages		
Index:	[0] = Harmonics phase U [1] = Harmonics phase V [2] = Harmonics phase W [3] = Measured value phase U [4] = Measured value phase V [5] = Measured value phase W		

p1850[0...n]	Control voltage limiting positive / U_ctrl limit pos		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [V]	10.0 [V]	10.0 [V]
Description:	Sets the limit for the positive control voltage.		
Dependency:	Refer to: p1851		

p1851[0...n]	Control voltage limiting negative / U_ctrl limit neg		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4966
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.0 [V]	0.0 [V]	-10.0 [V]
Description:	Sets the limit for the negative control voltage.		
Dependency:	Refer to: p1850		
p1882	Gating unit Flattop modulation angle offset / Flattop angle		
A_INF (SW_gating unit), R_INF (SW_gating unit)	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	80.0 [ms]
Description:	Sets the filter time constant for loss-optimized flattop modulation.		
p1900	Motor data identification and rotating measurement / MotID and rot meas		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(1), T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2	2
Description:	Sets the motor data identification and speed controller optimization. p1900 = 0: Function inhibited. p1900 = 2: Induction motors --> set p1910 = 1 and p1960 = 0 Permanent-magnet or separately excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0 When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution. For permanent-magnet or separately excited synchronous motors, the encoder is adjusted with the next switch-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.		
Value:	0: Inhibited 2: Identify motor data (stationary)		
Dependency:	In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed. Refer to: p1272, p1300, p1910 Refer to: F07990, A07991		
Notice:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). It is not permissible to activate write protection during the motor identification (p7761). During the rotating measurement it is not possible to save the parameters (p0971, p0977).		

Note: The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for $p1300 < 20$ (U/f controls).
An appropriate alarm is output when the parameter is set.
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.
p1900 is automatically set to 0 after the motor data identification routine has been completed.
For a reluctance motor, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.
For U/f control (p1300), identification with speed controller optimization does not make sense (e.g. p1900 = 1).

p1900	Motor data identification and rotating measurement / MotID and rot meas		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: C2(1), T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	2

Description: Sets the motor data identification and speed controller optimization.
The motor identification should first be performed with the motor stationary (p1900 = 1, 2; also refer to p1910). Based on this, additional motor and control parameters can be determined using the motor data identification with the motor rotating (p1900 = 1, 3; also refer to p1960); not for $p1300 < 20$.
p1900 = 0:
Function inhibited.
p1900 = 1:
Induction motors --> set p1910 = 1 and p1960 = 0, 1, 2 depending on p1300
Permanent-magnet or separately excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0, 1, 2 depending on p1300
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.
For permanent-magnet or separately excited synchronous motors, the encoder is adjusted with the next switch-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.
With the following switch-on command, a rotating motor data identification routine is carried out - and in addition, a speed controller optimization by making measurements at different motor speeds.
p1900 = 2:
Induction motors --> set p1910 = 1 and p1960 = 0
Permanent-magnet or separately excited synchronous motors --> set p1910 = 1, p1990 = 1 and p1960 = 0
When the drive enable signals are present, a motor data identification routine is carried out at standstill with the next switch-on command. Current flows through the motor which means that it can align itself by up to a quarter of a revolution.
For permanent-magnet or separately excited synchronous motors, the encoder is adjusted with the next switch-on command. The motor must be free to rotate and rotates through 1.5 revolutions of the motor encoder.
p1900 = 3:
Sets p1960 = 0, 1, 2 depending on p1300
This setting should only be selected if the motor data identification was already carried out at standstill.
When the drive enable signals are present, with the next switch-on command, a rotating motor data identification routine is carried out - and in addition, speed controller optimization by taking measurements at different motor speeds.

Value:

- 0: Inhibited
- 1: Motor data ident. (stationary) and sp. contr. opt.
- 2: Identify motor data (stationary)
- 3: Optimize speed controller (rotating)

2 Parameters

2.2 List of parameters

- Dependency:** In the simulation mode, the parameter cannot be written into.
When selecting the motor data identification routine, the drive data set changeover is suppressed.
Refer to: p1272, p1300, p1910, p1960, p1990
Refer to: A07980, A07981, F07982, F07983, F07984, F07985, F07986, A07987, F07988, F07990, A07991
- Notice:** If there is a motor holding brake, it must be open (p1215 = 2).
To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
It is not permissible to activate write protection during the motor identification (p7761).
During the rotating measurement it is not possible to save the parameters (p0971, p0977).
p1900 = 3:
This setting should only be selected if the motor data identification was already carried out at standstill.
- Note:** The motor and control parameters of the vector control are only optimally set when both measurements are carried out (initially at standstill, and then with the motor rotating). The measurement with rotating motor is not performed for p1300 < 20 (U/f controls).
An appropriate alarm is output when the parameter is set.
The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it.
The duration of the measurements can lie between 0.3 s and several minutes. This time is, for example, influenced by the motor size and the mechanical conditions.
p1900 is automatically set to 0 after the motor data identification routine has been completed.
For a reluctance motor, a pole position identification is carried out during the stationary measurement. As a consequence, faults that occur can also be assigned to the pole position identification.
For U/f control (p1300), identification with speed controller optimization does not make sense (e.g. p1900 = 1).

p1901

Test pulse evaluation configuration / Test puls config

VECTOR,
VECTOR_AC,
VECTOR_I_AC

Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 2
Data type: Unsigned32	Dyn. index: -	Func. diagram: -
P-Group: Motor identification	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	0000 bin

- Description:** Sets the configuration for the test pulse evaluation.
Bit 00: Check for conductor-to-conductor short circuit once/always when the pulses are enabled.
Bit 01: Check for ground fault once/always when the pulses are enabled.
Bit 02: Activation of the tests selected using bit 00 and/or bit 01 each time the pulses are enabled

- Recommendation:** If the ground fault test is incorrectly initiated because the motor is not at a complete standstill, then the pulse cancellation delay time (p1228) should be increased.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Phase short-circuit test pulse active	Yes	No	-
	01	Ground fault detection test pulse active	Yes	No	-
	02	Test pulse at each pulse enable	Yes	No	-

- Dependency:** The ground fault test is only possible when the motor is stationary, and is therefore only realized when flying restart is deactivated (p1200 = 0).
When a sine-wave filter is connected, the short-circuit and the ground fault test are deactivated, as the filter could be excited by the test pulse.
Refer to: p0287

- Note:** If a conductor-to-conductor short-circuit is detected during the test, this is displayed in r1902.1.
If a ground fault is detected during the test, this is displayed in r1902.2.
For bit 02 = 0:
If the test was successful once after POWER ON (see r1902.0), it is not repeated.
For bit 02 = 1:
The test is not only performed after POWER ON, but also each time the pulses are enabled.

r1902		Test pulse evaluation status / Test puls ev stat			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -		
	P-Group: -	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the status of the test pulse evaluation.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Short-circuit test successfully performed	Yes	No	-
	01	Phase short-circuit detected	Yes	No	-
	02	Ground fault test successfully performed	Yes	No	-
	03	Ground fault detected	Yes	No	-
	04	Identification pulse width greater than the minimum pulse width	Yes	No	-
Note:	If the ground fault test was selected, but not successfully performed, then sufficient current was not be able to be established during the test pulses.				
	For bit 04:				
	A test pulse longer than one sampling time has occurred				

p1903		BI: Data identification control / Data ID ctrl		
HLA	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	1	
Description:	Sets the signal source to control data identification (moving measurement).			
	For p1903 = 1 signal, the following applies:			
	- data identification is started using p1960 = -1 or 1.			
	For p1903 = 0 signal, the following applies:			
	- data identification is selected using p1960 = -1 or 1; however, is only actually executed with p1903 = 0/1 signal.			
	The following generally applies:			
	- when data identification is running, the function can be canceled with binector input p1903 = 0 signal.			

p1905		Parameter tuning selection / Par tuning select		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: C2(1), T	Calculated: -	Access level: 1	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: ASM, REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	90	0	
Description:	The fine encoder calibration should be started during the first commissioning or after the encoder is replaced.			
	The fine calibration starts when the pulses are enabled and performs a rotating measurement (approximately 1 minute). In this case, a setpoint speed of at least 40 % of the motor rated speed must be entered, and the torque must be less than half of the motor rated torque.			
	The phases of the fine calibration of displayed using alarm A07976.			
	The fine calibration ends with the calculation of p0431 for the following pulse inhibit.			
	p1905 is automatically set to 0 at the end of the fine calibration.			
Value:	0: Inactive			
	90: Fine encoder calibration			

2 Parameters

2.2 List of parameters

Dependency:	If the motor encoder adjustment has not been performed (p3925.4 = 0) or the encoder calibration is activated (p1990 != 0), then encoder fine calibration is prevented. Refer to: p1272, p1910, p1960, p1990 Refer to: A07976
Notice:	During encoder fine calibration, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.
Note:	For p1905 = 90 and with the pulses not enabled, the function is only executed the next time that the pulses are enabled. When selecting the encoder fine calibration, the changeover of the motor data sets is suppressed.

p1909	Data identification without enabling activation / Data ID w/o enab				
HLA	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Motor identification	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 bin		
Description:	Activates the stationary data identification without enable.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Pressure sensors execute offset calibration	Yes	No	-
	01	Execute piston calibration	Yes	No	-
Dependency:	Refer to: p1910				
Note:	The offset calibration is immediately started when writing to p1909. The associated bit is automatically reset if the function was executed. For bit 00: The precondition for the offset calibration is that the pressure at all of the pressure sensors is zero. The offset is entered in p0241, p0243 and p0245. For bit 01: The precondition is that the cylinder must have been completely retracted (piston at the A side). The position offset is entered in p0476.				

p1909[0...n]	Motor data identification control word / MotID STW				
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 3		
	Data type: Unsigned16	Dyn. index: MDS, p0130	Func. diagram: -		
	P-Group: Motor identification	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0010 0111 0000 0000 bin		
Description:	Sets the configuration for the motor data identification.				
Recommendation:	For the stationary motor data identification, if a motor holding brake is being used it should be opened and the motor finely synchronized before the measurement. This should only be done if it can be safely carried out and no external forces can act on the motor. This determines the angular commutation offset (p1909.13, p0431).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	08	Measure D inductance	Yes	No	-
	09	Measure Q inductance	Yes	No	-
	10	Magnetizing field inductance and measure rotor resistance	Yes	No	-
	13	Measure commutation angle and direction of rotation	Yes	No	-
	14	Determining the voltage emulation error	Yes	No	-
Dependency:	Refer to: p1910, r1912, r1913, r1915, r1925, r1927, r1932, r1933, r1934, r1935, r1936, r1950, r1951, p1952, p1953				

Note: For an induction motor (ASM) the following bits: 8, 9, 10, 13 are effective
 For a synchronous motor (SRM) the following bits: 8, 9, 13, 14 are effective
 For bit 14:
 - the display of the phase voltage actual values (r0089), the actual active power value (r0082) and the torque actual value (r0080) is significantly more accurate after successfully determining the voltage emulation error.
 - the voltage emulation errors should be identified with the Motor Module in the warm state.
 - the motor temperature (r0035) should not change significantly (i.e. it should not be identified immediately after a load duty cycle).

p1909[0...n]	Motor data identification control word / MotID STW		
SERVO (Ext M_ctrl, Lin), SERVO_AC (Ext M_ctrl, Lin), SERVO_I_AC (Ext M_ctrl, Lin)	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned16	Dyn. index: MDS, p0130	Func. diagram: -

Description: Sets the configuration for the motor data identification.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Stator inductance estimate no measurement	Yes	No	-
	01	Cl.-loop current control w/ dead-beat controller	Yes	No	-
	02	Rotor time constant estimate no measurement	Yes	No	-
	03	Leakage inductance estimate no measurement	Yes	No	-

04	Activates the identification dynamic leakage inductance	Yes	No	-
05	Determine Tr and Lsig evaluation in the time range	Yes	No	-
06	Activate vibration damping	Yes	No	-
07	Deactivate vibration detection	Yes	No	-
11	Deactivate pulse measurement Lq Ld	Yes	No	-
12	Deactivate rotor resistance Rr measurement	Yes	No	-
14	Deactivate valve interlocking time measurement	Yes	No	-
15	Determine only stator resistance, valve voltage fault, dead time	Yes	No	-
16	Short motor identification (lower quality)	Yes	No	-
17	Measurement without control parameter calculation	Yes	No	-
20	Estimate cable resistance	Yes	No	-
22	Only identify circle	Yes	No	-
23	Deactivate circle identification	Yes	No	-
24	Circle identification with 0 and 90 degrees	Yes	No	-
25	Deactivate gating unit switchover	Yes	No	-

Note:

For bit 20 = 1 (only for p0352 = 0 Ohm):

For motors with code number (with the exception of 1LE1, 1PE5, 1PC1), the cable resistance p0352 is calculated from the difference between the measurement results of the overall stator resistance and the stator resistance listed in the motor data sheet.

For all other motors, the stator resistance from the automatic calculation is used instead of that from the motor data sheet.

The following applies to permanent-magnet synchronous motors:

Bit 11 = 0 and "Closed-loop control" operating mode:

The direct inductance Ld and the quadrature inductance Lq are measured at a low current.

Bit 11 = 1 or "U/f" operating mode:

The stator inductance is measured with half the rated motor current.

If the stator inductance is not measured but is to be estimated, then bit 0 should be set and bit 11 should be deselected.

Can be changed: U, T**Calculated:** -**Access level:** 2**Data type:** Integer16**Dyn. index:** -**Func. diagram:** -**P-Group:** Motor identification**Unit group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

0

1

0

Description:

Setting to activate the standstill data valve offset calibration when enabled.

Value:0: Inactive/cancel
1: Start calibration**Dependency:**

Precondition is position-controlled operation.

Refer to: p1909

Refer to: A07991

Note:

The offset is entered in p1832.

The calibration is started when enabled, and after data identification has been completed, is automatically set back to a value of zero.

p1910	Motor data identification routine stationary (standstill) / MotID standstill		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-3	1	0
Description:	Setting to control the motor data identification with the motor stationary.		
Value:	-3: Accept identified parameters -2: Acknowledge encoder inversion actual value (F07993) -1: Start motor data identification without acceptance 0: Inactive/inhibit 1: Start motor data identification with acceptance		
Recommendation:	For motors with brakes, the brake should be opened before carrying out the stationary motor data identification routine (p1215 = 2) as long as this can be done without incurring any danger. The commutation angle and the direction of rotation are also determined. Motor data identification is not required for catalog motors and DRIVE-CLiQ motors. It is recommended to increase the torque accuracy or for third-party motors.		
Dependency:	Refer to: p1909, r1912, r1913, r1915, r1925, r1927, r1932, r1933, r1934, r1935, r1936, r1950, r1951, p1952, p1953 Refer to: F07990, A07991, F07993		
Caution:	For motors without brake or with the brake open (p1215 = 2), for the stationary (zero speed) measurement, the motor may rotate slightly.		
			
Note:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). Motor data identification can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be switched on until the motor data identification has been completed or deselected. After a started motor identification is ended, the parameter is automatically reset to 0. A motor data identification that is presently being carried out can be terminated with p1910 = 0.

	Min	Max	Factory setting
	0	28	1
Description:	Sets the motor data identification routine. The motor data identification routine is carried out after the next switch-on command. p1910 = 1: All motor data and the drive converter characteristics are identified and then transferred to the following parameters: p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830 After this, the control parameter p0340 = 3 is automatically calculated.		
Value:	0: Inhibited 1: Complete identification (ID) and acceptance of motor data 2: Complete identification (ID) of motor data without acceptance 3: ID of the saturation characteristic and acceptance 4: ID of the saturation characteristic without acceptance 5: ID of dynamic leakage inductance Lsig (r1920) without acceptance 6: ID of lockout time (r1926) without acceptance 7: ID of stator resistance Rs (r1912) without acceptance 8: ID of stator inductance Ls (r1915) Rr (r1927) without acceptance 9: ID of rotor time constant Tr (r1913) without acceptance 10: ID of static leakage inductance Lsig (r1914) without acceptance 20: Voltage vector input 21: Voltage vector input without filter		

- 22: Rectangular voltage vector input without filter
 23: Triangular voltage vector input without filter
 24: Rectangular voltage vector input with filter
 25: Triangular voltage vector input with filter
 26: Enter voltage vector with DTC correction
 27: Enter voltage vector with AVC
 28: Enter voltage vector with DTC + AVC correction

- Dependency:** "Quick commissioning" must be carried out (p0010 = 1, concluded with p3900 > 0) before executing the motor data identification routine!
 In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.
 When the sine-wave filter is connected, p1909.15 must be activated as only the stator resistance can be measured.
 Refer to: p1272, p1900
 Refer to: F07990, A07991
- Notice:** After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next switch-on command:
 - current flows through the motor and a voltage is present at the drive converter output terminals.
 - during the identification routine, the motor shaft can rotate through a maximum of half a revolution.
 - however, no torque torque is generated.
- Note:** If there is a motor holding brake, it must be open (p1215 = 2).
 To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).
 When setting p1910, the following should be observed:
 1. "With acceptance" means:
 The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.
 2. "Without acceptance" means:
 The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged.
 3. p1910 = 3, 4, 5 can only be selected for induction motors.
 4. For settings 27 and 28, the AVC configuration set using p1840 is active.
 The switch-on command must remain set during a measurement and after the measurement has been completed, the drive automatically resets it. The duration of the measurements can lie between 0.3 s and several minutes. This time is mainly influenced by the motor size. p1910 is automatically set = 0 after the motor data identification routine has been completed. If only the stationary measurement is selected, then p1900 is also reset to 0. Otherwise, the rotating measurement is activated.

p1911		Phases to be identified number / Ph to ident qty		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 4	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ohm]	- [ohm]	- [ohm]
Description:	Displays the identified cable resistance.		
Index:	[0] = Phase U [1] = Phase V [2] = Phase W		
r1932[0...19]	d inductance identified / Ld ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified (differential) d-inductance.		
Dependency:	Refer to: p1909, p1910, r1912, r1913, r1915, r1925, r1927, r1933, r1934, r1935, r1936, r1950, r1951, p1952, p1953		
Note:	The Ld characteristic consists of the value pairs from p1932 and p1933 with the same index. This value corresponds to the value of the total leakage inductance (r0377).		
r1933[0...19]	d inductance identification current / Ld I_ID		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the identification current of the d inductance.		
Dependency:	Refer to: p1909, p1910, r1912, r1913, r1915, r1925, r1927, r1932, r1934, r1935, r1936, r1950, r1951, p1952, p1953		
Note:	The Ld characteristic consists of the value pairs from p1932 and p1933 with the same index.		
r1934[0...9]	q inductance identified / Lq ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified (differential) q-inductance.		
Dependency:	Refer to: p1909, p1910, r1932, r1933		
Note:	The Lq characteristic consists of the value pairs from p1934 and p1935 with the same index. This value corresponds to the value of the total leakage inductance (r0377).		

r1934[0...9]	q inductance identified / Lq ident		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified (differential) q-inductance.		
Dependency:	Refer to: r1935, p1959, p1960		
Note:	The Lq characteristic consists of the value pairs from p1934 and p1935 with the same index. This value corresponds to the value of the total leakage inductance (r0377).		

r1935[0...20]	Identification current / I_ID		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the identification current for the identification of the q-inductance ([0...9]) as well as the torque constant ([10]) and the torque characteristic ([11...20]).		
Index:	[0] = q inductance identification current measuring point 1 [1] = q inductance identification current measuring point 2 [2] = q inductance identification current measuring point 3 [3] = q inductance identification current measuring point 4 [4] = q inductance identification current measuring point 5 [5] = q inductance identification current measuring point 6 [6] = q inductance identification current measuring point 7 [7] = q inductance identification current measuring point 8 [8] = q inductance identification current measuring point 9 [9] = q inductance identification current measuring point 10 [10] = Torque constant identification current [11] = Torque characteristic identification current measuring point 1 [12] = Torque characteristic identification current measuring point 2 [13] = Torque characteristic identification current measuring point 3 [14] = Torque characteristic identification current measuring point 4 [15] = Torque characteristic identification current measuring point 5 [16] = Torque characteristic identification current measuring point 6 [17] = Torque characteristic identification current measuring point 7 [18] = Torque characteristic identification current measuring point 8 [19] = Torque characteristic identification current measuring point 9 [20] = Torque characteristic identification current measuring point 10		
Dependency:	Refer to: p1909, p1910, r1934, p1959, p1960		
Note:	- the Lq characteristic consists of the value pairs from r1934 and r1935 with the same index. - the torque constant is identified with the current r1935[10] and displayed in r1937[0]. If the reluctance torque constant is identified (p1959.7 = 1), the torque constant is identified with 150% rated current (p0305), otherwise with 100% rated current. - the torque characteristic (r1937[1...10]) is identified in the range between the rated current (p0305) and the maximum current (p0640) (r1935[11...20]).		

r1935[0...20]	Identification current / I_ID		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the identification current for the identification of the q-inductance ([0...9]) as well as the force constant ([10]) and the force characteristic ([11...20]).		
Index:	[0] = q inductance identification current measuring point 1 [1] = q inductance identification current measuring point 2 [2] = q inductance identification current measuring point 3 [3] = q inductance identification current measuring point 4 [4] = q inductance identification current measuring point 5 [5] = q inductance identification current measuring point 6 [6] = q inductance identification current measuring point 7 [7] = q inductance identification current measuring point 8 [8] = q inductance identification current measuring point 9 [9] = q inductance identification current measuring point 10 [10] = Force constant identification current [11] = Force characteristic identification current measuring point 1 [12] = Force characteristic identification current measuring point 2 [13] = Force characteristic identification current measuring point 3 [14] = Force characteristic identification current measuring point 4 [15] = Force characteristic identification current measuring point 5 [16] = Force characteristic identification current measuring point 6 [17] = Force characteristic identification current measuring point 7 [18] = Force characteristic identification current measuring point 8 [19] = Force characteristic identification current measuring point 9 [20] = Force characteristic identification current measuring point 10		
Dependency:	Refer to: p1909, p1910, r1934, p1959, p1960		
Note:	- the Lq characteristic consists of the value pairs from r1934 and r1935 with the same index. - the force constant is identified with the current r1935[10] and displayed in r1937[0]. If the reluctance force constant is identified (p1959.7 = 1), the force constant is identified with 150% rated current (p0305), otherwise with 100% rated current. - the force characteristic (r1937[1...10]) is identified in the range between the rated current (p0305) and the maximum current (p0640) (r1935[11...20]).		

r1935[0...9]	q inductance identification current / Lq I_ID		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the identification current to identify the q inductance ([0...9]).		
Dependency:	Refer to: r1934, p1959, p1960		
Note:	The Lq characteristic consists of the value pairs from r1934 and r1935 with the same index.		

r1936	Magnetizing inductance identified / L_H ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified magnetizing inductance(gamma equivalent circuit diagram).		
Dependency:	Refer to: p1909, p1910, r1913, r1915, r1927, p1959, p1960, r1962, r1963		
Note:	This value corresponds to the value of the transformed magnetizing inductance (r0382).		

r1937[0...10]	Torque constant identified / kT ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: 28_1	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Nm/A]	- [Nm/A]	- [Nm/A]
Description:	Displays the identified torque constant/torque characteristic over the q current.		
Index:	[0] = Torque constant identified [1] = Torque characteristic identified measuring point 1 [2] = Torque characteristic identified measuring point 2 [3] = Torque characteristic identified measuring point 3 [4] = Torque characteristic identified measuring point 4 [5] = Torque characteristic identified measuring point 5 [6] = Torque characteristic identified measuring point 6 [7] = Torque characteristic identified measuring point 7 [8] = Torque characteristic identified measuring point 8 [9] = Torque characteristic identified measuring point 9 [10] = Torque characteristic identified measuring point 10		
Dependency:	Refer to: r1938, r1939, p1959, p1960, r1969		
Note:	- the value in r1937[0] corresponds to the torque constant (p0316) and was identified with the current in r1935[10]. If the reluctance torque is identified (p1959.7 = 1), the torque constant is identified with 150% rated current (p0305), otherwise with 100% rated current. - if indices r1937[1...10] are not equal to zero, they show the values of the torque characteristic identified for the current in r1935[11...20]. The torque characteristic is identified in the range between rated current (p0305) and maximum current (p0640).		

r1937[0...10]	Force constant identified / kT ident		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

p1952[0...n]	Voltage emulation error final value / U_error final val		
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.000 [V]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.000 [V]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [V]
Description:	Sets the final value to compensate the voltage emulation error.		
Dependency:	Refer to: p1953		
Note:	The voltage emulation error is calculated and compensated for every phase according to the following formula: $u_error = u0 * i / (abs(i) + i0)$ u0: This is set in p1952. i0: This is set in p1953. i: Phase current to which the emulation error u_error belongs. For p1954 not equal to zero, p1952 refers to a pulse frequency of 4 kHz and a DC link voltage of 600V. Changes to the DC link voltage and pulse frequency are then automatically adapted, and the formula is as follows: $u_error = p1954 + p1952 * i / (abs(i) + p1953 * 600 \text{ V}/r0070) * r1801/4 \text{ kHz} * r0070/600 \text{ V}$		
p1953[0...n]	Voltage emulation error current offset / U_error I_offset		
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.000 [A]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.000 [A]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [A]
Description:	Sets the current offset to compensate the voltage emulation error.		
Dependency:	Refer to: p1952		
Note:	The voltage emulation error is calculated and compensated for every phase according to the following formula: $u_error = u0 * i / (abs(i) + i0)$ u0: This is set in p1952. i0: This is set in p1953. i: Phase current to which the emulation error u_error belongs. For p1954 not equal to zero, p1952 refers to a DC link voltage of 600V, and the formula is. $u_error = p1954 + p1952 * i / (abs(i) + p1953 * 600 \text{ V}/r0070) * r1801/4 \text{ kHz} * r0070/600 \text{ V}$		
p1954[0...n]	Voltage emulation error semiconductor voltage / U_error U_semi		
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min -10.000 [V]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10.000 [V]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [V]
Description:	Sets the semiconductor voltage drop to compensate the voltage emulation error. The value is determined with the motor data identification routine (p1910).		
Note:	The voltage emulation error is calculated and compensated for every phase according to the following formula: For p1954 = 0: $u_error = p1952 * i / (abs(i) + p1953)$ For p1954 > 0: $u_error = p1954 + p1952 * i / (abs(i) + p1953 * 600 \text{ V}/r0070) * r1801/4 \text{ kHz} * r0070/600 \text{ V}$ i: Phase current to which the emulation error u_error belongs.		

p1955[0...3]	Valve identification voltage / Valve ID U		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00 [V]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10.00 [V]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 0.00 [V] [1] 10.00 [V] [2] 2.00 [V] [3] 2.00 [V]
Description:	Sets the voltage to identify the valve characteristic.		
Index:	[0] = Measuring range start [1] = Measuring range end [2] = Travel positive [3] = Travel negative		
Dependency:	Refer to: p1956, p1957, p1958, p1960, r1961, r1962		
Note:	The characteristic is measured with a positive and negative voltage in the range of p1955[0] to p1955[1]. To move to a suitable starting position, either p1955[2] or -p1955[3] is used.		
p1956[0...1]	Valve identification measuring distance / Valve ID dist		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 10.0 [%] [1] 90.0 [%]
Description:	Sets the range for the maximum measuring distance for valve identification.		
Index:	[0] = Minimum [1] = Maximum		
Dependency:	Refer to: p1955, p1957, p1958, p1960, r1961, r1962		
Note:	The parameter is referred to the maximum valve stroke (p0313). The values are only effective when the piston position is known (r1407.3 = 1).		
p1957[0...1]	Valve identification measured value / Valve ID val		
HLA	Can be changed: U, T Data type: Unsigned16 P-Group: Motor identification Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 100 [1] 4
Description:	Sets the measured value for valve identification.		
Index:	[0] = Number [1] = Standstill identification encoder pulses		
Dependency:	Refer to: p1955, p1956, p1958, p1960, r1961, r1962		
Note:	For index [0]: The entered value is used for the positive and negative ranges. For index [1]: Standstill is identified if these encoder pulses are not passed within the standstill monitoring time.		

p1958[0...4]		Valve identification time / Valve ID t		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100.00 [s]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 0.10 [s] [1] 0.10 [s] [2] 0.10 [s] [3] 4.00 [s] [4] 4.00 [s]	
Description:	Sets the times for valve identification.			
Index:	[0] = Ramp time [1] = Settling time [2] = Measuring time [3] = Standstill time [4] = Wait time			
Dependency:	Refer to: p1955, p1956, p1957, p1960, r1961, r1962			
Note:	For index [0]: In this time, the voltage is changed from 0 ... 10 V. The ramp time is effective for all voltage changes. For index [1]: After the target voltage has been reached, the system waits this time before the measurement is started. For index [2]: The velocity is averaged within this time. For index [3]: If there is no motion, time before the next measurement is made. For index [4]: Time between 2 measurements in order to fill the pressure accumulator. The value applies for the maximum velocity, and is internally reduced depending on the velocity.			
p1958[0...n]		Rotating measurement ramp-up/ramp-down time / Rot meas t_r up/dn		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min -1.00 [s]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 999999.00 [s]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1.00 [s]	
Description:	Sets the ramp-up/ramp-down time for the rotating measurement. The following applies for negative values: When the function module "extended setpoint channel" is activated (r0108.8 = 1), the maximum of the ramp-up/ramp-down time of the setpoint channel becomes effective. When this function module is inactive, then no ramp-up/ramp-down time is effective. The following applies for positive values: The selected ramp-up/ramp-down time becomes effective.			
Recommendation:	A ramp-up/ramp-down time should not be activated for the motor data identification (p1958 = 0) as long as this can be safely done without incurring any danger. This means that the identification is complete and more accurate. When the ramp-up/ramp-down time is activated, the following steps of the rotating motor data identification are not executed: <ul style="list-style-type: none"> - p1959.5 (identifying the q inductance) - p1959.7 (identifying the reluctance torque constant) 			
Dependency:	Refer to: p1959, p1960			

p1958[0...n]	Moving measurement ramp-up/ramp-down time / Mov meas t_r up/dn		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1.00 [s]	999999.00 [s]	-1.00 [s]
Description:	Sets the ramp-up/ramp-down time for the moving measurement. The following applies for negative values: When the function module "extended setpoint channel" is activated (r0108.8 = 1), the maximum of the ramp-up/ramp-down time of the setpoint channel becomes effective. When this function module is inactive, then no ramp-up/ramp-down time is effective. The following applies for positive values: The selected ramp-up/ramp-down time becomes effective.		
Recommendation:	A ramp-up/ramp-down time should not be activated for the motor data identification (p1958 = 0) as long as this can be safely done without incurring any danger. This means that the identification is complete and more accurate. When the ramp-up/ramp-down time is activated, the following steps of the moving motor data identification are not executed: - p1959.5 (identifying the q inductance) - p1959.7 (identifying the reluctance force constant)		
Dependency:	Refer to: p1959, p1960		

p1959[0...n]	Data identification moving configuration / Dat_ID mov config				
HLA	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 2		
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -		
	P-Group: Motor identification	Unit group: -	Unit selection: -		
	Not for motor type: REL	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0001 0011 1111 bin		
Description:	Sets the configuration for data identification with movement.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Control sense correction	Yes	No	-
	01	Valve offset correction	Yes	No	-
	02	Automatic piston calibration	Yes	No	-
	03	Automatic traversing range detection	Yes	No	-
	04	Automatic characteristic identification	Yes	No	-
	05	Stiction forces	Yes	No	-
	08	System pressure correction for characteristic identification	Yes	No	-
Dependency:	Refer to: F07988				
Notice:	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).				
Note:	For bit 00: In order to automatically correct the control sense for the velocity controller, the complete traversing distance must be free. When required, p1820 is automatically adapted. For bit 01: The drive moves to correct the valve offset. When required, p1832 is automatically adapted. For bit 02: Full automatic piston calibration, the drive must either be referenced, or must be equipped with an absolute encoder. Further, the complete traversing distance must be free. For piston calibration, the drive is traversed to the end stop (completely inserted) with a negative search voltage (p1955[3]) and the associated absolute position entered in p0476.				

For bit 03:

For automatic traversing range identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the complete traversing distance must be free.

To prepare for the identification of the characteristic, the possible traversing range is determined. To do this, the drive is traversed to the right-hand and left-hand end stops with the search voltage (p1955[3...4]) and the position with distance reserve is entered into p1956.

If there are pressure sensors, then the correct interconnection for pressure measurements A and B is checked.

For bit 04:

For automatic characteristic identification, the drive must either be referenced (homed), or must be equipped with an absolute encoder. Further, the piston must have been calibrated and the free traversing range must have been entered in p1956.

The drive traverses with different valve voltages and takes into account p1958.

For bit 05:

The drive is moved with a positive and negative velocity, and the measured stiction forces are entered into p1555 and p1556.

For bit 06:

The drive is traversed to both end stops. In so doing, the dead volume and the loop gain of the force control loop is measured, and entered into p0314 and p0315.

For bit 08:

For the automatic characteristic identification (p1959.4), the measured velocity with the measured system pressure is converted to the average system pressure; this means that system pressure fluctuations hardly influence the measurement. The system pressure as well as pressures A and B must be measured. The conversion is not performed if the pressure measurements are not available. If the pressure measurements do not measure the specified pressures, then the conversion must be deactivated in order to avoid any errors.

p1959[0...n]		Rotating measurement configuration / Rot meas config			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 3		
	Data type: Unsigned16	Dyn. index: MDS, p0130	Func. diagram: -		
	P-Group: Motor identification	Unit group: -	Unit selection: -		
	Not for motor type: REL	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 1110 1110 0111 bin		
Description:	Sets the configuration of the rotating measurement.				
Recommendation:	A direction inhibit should not be activated for the rotating measurement (p1959.14 = 1 and p1959.15 = 1) as long as this can be done without incurring any danger. This means that the identification is complete and more accurate. When the direction inhibit is activated, the reluctance torque constant (p1959.7) is not identified and the angular commutation offset (p1959.10, p0431) is inaccurately determined. The reluctance torque constant (p1959.7) is also not identified in encoderless operation.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Identify periodic position error	Yes	No	-
	01	Identify the saturation characteristic	Yes	No	-
	02	Identify the moment of inertia	Yes	No	-

	06	Identify the torque constant	Yes	No	-
	07	Identify the reluctance torque constant	Yes	No	-
	08	Identify the q inductance at the test stand	Yes	No	-
	09	Identify the magnetizing current / magnetizing inductance	Yes	No	-
	10	Identify the commutation angle and direction of rotation	Yes	No	-
	11	Identify rotor resistance	Yes	No	-
	14	Positive direction permitted	Yes	No	-
	15	Negative direction permitted	Yes	No	-
Dependency:	Refer to: p1958, p1960				

2 Parameters

2.2 List of parameters

Notice: The step p1959.8 (identify q inductance on the test stand) may only be selected if the drive can be kept at zero speed or at a fixed speed either using a test stand or other mechanical measures.

During steps p1959.2 (identifying the moment of inertia) and p1959.6 (identifying the torque constant) the Vdc_min controller is disabled (p1240).

During step p1959.7 (identifying the reluctance torque constant) the Vdc_min controller and Vdc_max controller are disabled (p1240).

Note: For an induction motor (ASM), the following bits 1, 2, 5, 8, 9, 10, 14, 15 are effective
For a synchronous motor (SRM), the following bits 2, 5, 6, 7, 8, 10, 14, 15 are effective
For bit 00:

This function is only active when the "Cogging torque compensation" function module is activated (r0108.22 = 1). The motor should not be operated with any mounted load.

For bit 05:

For "motor holding brake the same as sequence control" (p1215 = 1 or 3), the Lq characteristic is only measured up to approximately the rated motor current (p0305) instead of up to the current limit (p0640). Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.

For bit 10:

If the motor holding brake is set just the same as the sequence control (p1215 = 1 or 3), the commutation angle and the direction of rotation are not measured. Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.

For bit 14, 15:

The following applies for bit 14 and 15 = 0:

When the function module "extended setpoint channel" is activated (r0108.8 = 1), the direction inhibit of the setpoint channel becomes effective. No direction of inhibit is effective if the function module is inactive.

The following applies for minimum bit 14 = 1 or bit 15 = 1:

The direction inhibit set in p1959 becomes effective.

Description: Sets the configuration of the moving measurement.

Recommendation: A direction inhibit should not be activated for the moving measurement (p1959.14 = 1 and p1959.15 = 1) as long as this can be done without incurring any danger. This means that the identification is complete and more accurate.

When the direction inhibit is activated, the reluctance force constant (p1959.7) is not identified and the angular commutation offset (p1959.10, p0431) is inaccurately determined. The reluctance force constant (p1959.7) is also not identified in encoderless operation.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Identify periodic position error	Yes	No	-
01	Identify the saturation characteristic	Yes	No	-
02	Identify the moment of inertia	Yes	No	-
05	Identify the q inductance	Yes	No	-
06	Identify the force constant	Yes	No	-
07	Identify the reluctance force constant	Yes	No	-
08	Identify the q inductance at the test stand	Yes	No	-
09	Identify the magnetizing current / magnetizing inductance	Yes	No	-
10	Identify commutation angle and direction	Yes	No	-
11	Identify rotor resistance	Yes	No	-
14	Positive direction permitted	Yes	No	-
15	Negative direction permitted	Yes	No	-

Dependency: Refer to: p1958, p1960

- Notice:** The step p1959.8 (identify q inductance on the test stand) may only be selected if the drive can be kept at zero speed or at a fixed velocity either using a test stand or other mechanical measures.
During steps p1959.2 (identifying the moment of inertia) and p1959.6 (identifying the force constant) the Vdc_min controller is disabled (p1240).
During step p1959.7 (identifying the reluctance force constant) the Vdc_min controller and Vdc_max controller are disabled (p1240).
- Note:** For an induction motor (ASM), the following bits 1, 2, 5, 8, 9, 10, 14, 15 are effective
For a synchronous motor (SRM), the following bits 2, 5, 6, 7, 8, 10, 14, 15 are effective
For bit 00:
This function is only active when the "Cogging torque compensation" function module is activated (r0108.22 = 1). The motor should not be operated with any mounted load.
For bit 05:
For "motor holding brake the same as sequence control" (p1215 = 1 or 3), the Lq characteristic is only measured up to approximately the rated motor current (p0305) instead of up to the current limit (p0640). Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.
For bit 10:
If the motor holding brake is set just the same as the sequence control (p1215 = 1 or 3), the commutation angle and the direction of rotation are not measured. Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger.
For bit 14, 15:
The following applies for bit 14 and 15 = 0:
When the function module "extended setpoint channel" is activated (r0108.8 = 1), the direction inhibit of the setpoint channel becomes effective. No direction of inhibit is effective if the function module is inactive.
The following applies for minimum bit 14 = 1 or bit 15 = 1:
The direction inhibit set in p1959 becomes effective.

p1959[0...n]	Rotating measurement configuration / Rot meas config		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 2
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0001 1111 bin

Description: Sets the configuration of the rotating measurement.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Encoder test active	Yes	No	-
	01	Saturation characteristic identification	Yes	No	-
	02	Moment of inertia identification	Yes	No	-
	03	Re-calculates the speed controller parameters	Yes	No	-
	04	Speed controller optimization (vibration test)	Yes	No	-
	05	q leakage inductance ident. (for current controller adaptation)	Yes	No	-
	11	Do not change the controller parameters during the measurement	Yes	No	-
	12	Measurement shortened	Yes	No	-
	13	After measurement direct transition into operation	Yes	No	-
	14	Calculate speed actual value smoothing time	Yes	No	-

Dependency: Refer to: F07988

Note: The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).
 The following parameters are influenced for the individual optimization steps:
 Bit 00: None
 Bit 01: p0320, p0360, p0362 ... p0369
 Bit 02: p0341, p0342
 Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496
 Bit 04: Dependent on p1960
 Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors
 p1960 = 1, 3: p1458, p1459, p1470, p1472, p1496, p1400.0
 p1960 = 2, 4: p1458, p1459, p1460, p1462, p1496, p1461, p1463
 The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).
 For bit 11 = 1:
 Bits 02, 03, 04 no longer have any effect. It makes sense to set bit 11 if the speed controller and its adaptation were already set before the measurement.
 For bit 12 = 1:
 The selection only has an effect on the measurement p1960 = 1, 2. For the shortened measurement, the magnetizing current and moment of inertia are determined with a somewhat lower accuracy.
 For bit 13 = 1:
 After the measurement has been completed, the system immediately goes into closed-loop speed controlled operation.

	Min	Max	Factory setting
	-3	1	0
Description:	Activates the moving measurement.		
Value:	-3: Accept identified Ch parameters -1: Start data identification without Ch transfer 0: Inactive/cancel 1: Start data identification with transfer		
Dependency:	Refer to: p1955, p1956, p1957, p1958, r1961, r1962 Refer to: F07990, A07991, F07993		
Notice:	The drive moves after data identification with movement has been activated and enabled. In this case the force limiting is not active. If it is not permissible that the complete traversing range is traversed, then the following must be executed before the start: - deselect automatic traversing range detection (p1959.3 = 0). - deselect automatic piston calibration (p1959.2 = 0). - calibrate the piston manually. - manually enter the traversing range limits (p1956). For the identification of the characteristic (p1959.4), the velocities are traversed up to the maximum velocity, depending on the setting in p1955[0...1].		

p1960		Rotating measurement selection / Rot meas sel	
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-3	1	0
Description:	Activates the rotating measurement.		
Value:	-3: Accept identified parameters -2: Acknowledge encoder inversion actual value (F07993) -1: Start motor data identification without acceptance 0: Inactive/inhibit 1: Start motor data identification with acceptance		
Recommendation:	Before carrying out the rotation measurement for motors with brake, the brake should be opened (p1215 = 2) - as long as this can be done without incurring any danger. The commutation angle and the direction are also determined. Motor data identification is not required for catalog motors and DRIVE-CLiQ motors. It is recommended to increase the torque accuracy or for third-party motors.		
Dependency:	Refer to: r1934, r1935, r1936, r1937, r1938, r1939, r1947, r1948, p1958, p1959, r1962, r1963, r1969 Refer to: F07990, A07991, F07993		
Danger:	For the rotating measurement, the motor is accelerated up to the maximum speed. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).		
			
Notice:	If there is a motor holding brake, it must be open (p1215 = 2). To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).		
Note:	The rotating measurement can only be selected when the pulses of all of the drive objects of the Control Unit have been suppressed. After selection, all of the other drive objects of the Control Unit are interlocked so that they cannot be switched on until the rotating measurement has been completed or deselected. When the rotating measurement is activated (p1960 = 1), it is not possible to save the parameters (p0971, p0977).

	1 [%]	400 [%]	100 [%]
Description:	Sets the dynamic response factor for speed controller optimization. After optimization, the dynamic response achieved is displayed in r1968.		

2 Parameters

2.2 List of parameters

Dependency: Refer to: p1959, r1968

Refer to: F07985

Note: For a rotating measurement, this parameter can be used to optimize the speed controller.

p1967 = 100 % --> speed controller optimization according to a symmetric optimum.

p1967 > 100 % --> optimization with a higher dynamic response (Kp higher, Tn lower).

If the actual dynamic response (see r1968) is significantly reduced with respect to the required dynamic response (p1967), then this can be as a result of mechanical load oscillations. If, in spite of this load behavior, a higher dynamic response is required, then the oscillation test (p1959.4 = 0) should be deactivated and the measurement repeated.

0

99

99

Description:

Sets the pole position identification technique.

Value:

0: Saturation-based 1st + 2nd harmonics
 1: Saturation-based 1st harmonics
 4: Saturation based 2-stage
 10: Motion-based
 20: Elasticity-based
 99: No technique selected

Dependency:

Refer to: p0325, p0329, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996, p1997, p3090, p3091, p3092, p3093, p3094, p3095, p3096, r3097
 Refer to: F07995

Notice:

If the incorrect technique is applied, this can cause the motor to accelerate in an uncontrolled fashion.
 Under the following conditions, the integral time must be disabled (p1996 = 0):
 - p1980 = 10 (motion-based).
 - motor encoder with track A/B sq-wave (p0404.3 = 1)
 - p0430.20 = 0 (flank time measurement).

Once the integral time has been disabled, the motion is increased during the identification (a minimum of 90 ° electrical). As a result of this, the maximum distance (p1981) must also be increased.

Note:**PollD:** Pole position identification

When commissioning a catalog motor, the technique is automatically selected depending on the motor type being used.

The following applies for 1FN3 motors:

A technique with 2nd harmonic may not be used (do not use p1980 = 0, 4).

For 1FK7 motors, the following applies:

A two-stage technique may not be used (do not use p1980 = 4).

The automatically set value in p0329 may not be changed.

	0	2	0
Description:	Activates the pole position identification routine to determine the commutation angle and to carry out a plausibility check.		
Value:	0: Pole position identification off 1: Pole position identification for commutation 2: Pole position identification for plausibility check		
Recommendation:	For p1982 = 1: This is used for synchronous motors with motor encoder without absolute data. The information/data regarding the absolute commutation angle is supplied via a track C/D, Hall sensors, an absolute encoder or from the pole position identification routine. For separately excited synchronous motors, the position identification is realized using the voltage measurement of a Voltage Sensing Module VSM (p1980 = 12). If there is no VSM then the setting is not possible. For p1982 = 2: This is used for synchronous motor with motor encoder with absolute data to check this data. With p1982 = 2, each time the pulses are enabled it is checked whether the absolute position supplied from the encoder does not exceed a deviation of 45 degrees to the identified pole wheel position. Not possible for separately excited synchronous motors.		
Dependency:	Refer to: p0325, p0329, p1980, p1981, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996, p1997, p3090, p3091, p3092, p3093, p3094, p3095, p3096, r3097		
Note:	For encoderless operation, the pole position identification routine is selected with p1780.6

p1990	Encoder adjustment determine angular commutation offset / Enc_adj det ang		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder. The function acts on the active motor data set. When adjusting the encoder, the angular commutation offset is determined and transferred into p0431. Alarm A07971 is output while the angular commutation offset is being determined. p1990 is automatically set to 0 after the angular commutation offset has been determined. p1990 = 0: Deactivated p1990 = 1: Activated with transfer		
Dependency:	Refer to: p0325, p0329, p0431, p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1999 Refer to: A07971		
Danger:	For recommendation 3:  When performing this measurement there is a danger of coming into contact with system parts that are at a high (hazardous) electrical voltage. This measurement may only be performed by authorized service personnel.		
Warning:	 The motor can move in an uncontrolled fashion. To determine the angular commutation offset, pulses must be immediately enabled after p1990 = 1. For commutation with a zero mark - or with distance-coded zero marks - the drive must also be traversed over the zero mark or over two zero marks. If a POWER ON is carried out before activating the pulse enable and where relevant before passing the zero mark, then after powering up p1990 = 0, and the commutation angle is not determined.		

Notice: When the pulses are enabled, the function is immediately executed with p1990 = 1; otherwise, the next time that the pulses are enabled.

In order to prevent an incorrect orientation of the electrical pole position (uncontrolled motor movement), the automatically determined angular commutation offset (p0431) should, for reasons of safety, be checked using one of the following recommendations:

Recommendation 1:

Set encoderless operation (p1300 = 20 or p1404 = 0), deselect pole position identification (p1982 = 0), operate under no-load conditions with a speed > p1755, correct the actual value inversion (p0410.0) (e.g. r0061 = r0063), read the angular error in r1778; the result in r1778 should be approximately 0, for $|r1778| > 2$ degrees, add the value to p0431 - taking into account the sign - and enter in p0431.

Recommendation 2:

Set current limit to 0 (p0640 = 0), activate travel to fixed stop (p1545 = 1); record r0089[0] (phase voltage) and r0093 (pole position, electrically scaled), (e.g. trace) while the motor is being externally moved.

When doing this, the rising zero crossing of the phase voltage must coincide with the step 360 ° --> 0 ° from r0093.

Recommendation 3:

Measure phase voltage U (measure phase U with respect to a virtual neutral point created using 3 resistors) and r0093 (pole position, electrically scaled).

When doing this, the rising zero crossing of the phase voltage must coincide with the step 360 ° --> 0 ° from r0093.

Recommendation 4:

Determine the average value from several results of a pole position identification routine executed as test (p1983) at various electrical angles and add the value to p0431 - taking into account the sign and enter into p0431.

Note: If fault F07414 is present, the following applies:

First set p1990 to 1, then acknowledge the fault and then issue the enable signals.

p1990 Encoder adjustment determine angular commutation offset / Enc_adj det ang

VECTOR,
VECTOR_AC,
VECTOR_I_AC

Can be changed: T	Calculated: -	Access level: 2
Data type: Integer16	Dyn. index: -	Func. diagram: -
P-Group: Motor identification	Unit group: -	Unit selection: -
Not for motor type: ASM	Scaling: -	Expert list: 1
Min	Max	Factory setting
0	3	0

Description: This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder.

The function acts on the active motor data set.

Alarm A07971 is output while the angular commutation offset is being determined.

p1990 is automatically set to 0 after the angular commutation offset has been determined.

For p1990 = 1 (encoder adjustment with transfer), the following applies:

The angular commutation offset is determined and transferred into p0431.

For p1990 = 2 (encoder adjustment for checking), the following applies:

The angular commutation offset is determined and is not transferred into p0431. For a deviation of more than 6 ° electrical, fault F07413 is output.

For p1990 = 3 (encoder adjustment in operation), the following applies:

PolID procedure runs before the zero mark detection. The angular commutation offset is determined and transferred into p0431. A fine adjustment (p1905) is then optionally possible.

Value:
0: Deactivated
1: Activated with transfer
2: Activated for checking
3: Activates encoder adjustment in operation

Dependency: In the simulation mode, the parameter cannot be written into.
When selecting the encoder adjustment, the changeover of the drive data sets is suppressed.
Encoder adjustment is only carried out if the function module for "speed/torque control" is activated (r0108.2 = 1).
Refer to: p0325, p0329, p0431, p1272, p1900

Caution: When the encoder is being adjusted, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

2.2 List of parameters

p1998[0...n]	PolID circle center point / PolID circ center		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, PMSM, SESM, REL Min 0.0000 [A]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10000.0000 [A]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0000 [A]
Description:	Determined current offset to determine the speed (RESM).		
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p1993, p1994, p1995, p1996		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		
p1999[0...n]	Ang. commutation offset calibr. and PolID scaling / Com_ang_offs scal		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: ASM, REL Min 10 [%]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 5000 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100 [%]
Description:	Sets the scaling for the runtime of the automatic encoder calibration and of the pole position identification technique in which the current is injected.		
Dependency:	Refer to: p0341, p0342		
Caution:	For p1999 > 100 % (setting large moments of inertia) the following applies: There is no locked rotor monitoring (F07970 fault value 2). The plausibility check of the encoder signal (F07970 fault value 4) only checks the sign.		
			
Note:	For high moments of inertia, it is practical to scale the runtime of the calibration higher.		
p2000	Reference velocity / v_ref		
HLA	Can be changed: T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0.600 [m/min]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 600.000 [m/min]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 120.000 [m/min]
Description:	Sets the reference quantity for velocity. All velocities specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Dependency:	Refer to: p0500, p2001, p2002, p2003, r2004		
Note:	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a velocity setpoint (e.g. p1155[0]). The actual percentage input value is cyclically converted into the absolute velocity setpoint using the reference velocity (p2000). Example 2: The setpoint from PROFIBUS (r2060[1]) is connected to a velocity setpoint (e.g. p1155[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 0000 hex. This percentage value is converted to the absolute velocity setpoint via reference velocity (p2000).		

p2000	Reference speed reference frequency / n_ref f_ref		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	6.00 [rpm]	210000.00 [rpm]	3000.00 [rpm]
Description:	Sets the reference quantity for speed and frequency. All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Dependency:	Refer to: p0500, p2001, p2002, p2003, r2004		
Note:	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).		

p2000	Reference velocity reference frequency / v_ref f_ref		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.60 [m/min]	700.00 [m/min]	120.00 [m/min]
Description:	Sets the reference quantity for velocity and frequency. All velocities or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference velocity (in (m/min) / 60)		
Dependency:	Refer to: p0500, p2001, p2002, p2003, r2004		
Note:	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is at the factory setting. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a velocity setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute velocity setpoint using the reference velocity (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a velocity setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute velocity setpoint via reference velocity (p2000).		

p2000		Reference speed reference frequency / n_ref f_ref

	Min	Max	Factory setting
	10 [V]	100000 [V]	1000 [V]
Description:	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Note:	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		

2 Parameters

2.2 List of parameters

p2001	Reference voltage / Reference voltage		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 10 [Vrms]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 100000 [Vrms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1000 [Vrms]
Description:	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC link voltage. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). Note: This reference quantity also applies to direct voltage values. It is not interpreted as rms value, but as DC voltage value.		
Note:	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.		
p2002	Reference pressure / p_ref		
HLA	Can be changed: T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0.10 [bar]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 5000.00 [bar]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [bar]
Description:	Sets the reference quantity for pressures. All pressures specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Notice:	If various DDS are used with different valve/cylinder data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for BICO interconnections).		
Note:	If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.		
p2002	Reference current / I_ref		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0.10 [Arms]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 100000.00 [Arms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [Arms]
Description:	Sets the reference quantity for currents. All currents specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		

Notice: If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records).
 Example:
 p2002 = 100 A
 Reference quantity 100 A corresponds to 100 %
 p0305[0] = 100 A
 Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current
 p0305[1] = 50 A
 Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.
 SERVO:
 Pre-assigned value for p0338 > 0.001 is p0338, otherwise 2 * p0305.
 VECTOR:
 Pre-assigned value is p0640.
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
 For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity.
 Example:
 The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The current actual value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

p2003	Reference force / F_ref		
HLA	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: 8_2	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01 [N]	20000000.00 [N]	100.00 [N]

Description: Sets the reference quantity for forces.

All forces specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is at the factory setting.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example:

The actual value of the total force (r0079[0]) is connected to a test socket (e.g. p0771[0]). The actual force is cyclically converted into a percentage of the reference force (p2003) and output according to the parameterized scaling.

p2003	Reference torque / M_ref		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, TM41	Can be changed: T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: 7_2	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01 [Nm]	20000000.00 [Nm]	1.00 [Nm]

Description: Sets the reference quantity for torque.

All torques specified as relative value are referred to this reference quantity.

The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).

2 Parameters

2.2 List of parameters

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

SERVO:

Pre-assigned value for p0338 and p0334 > 0.001 is p0338 * p0334, otherwise 2 * p0333.

VECTOR:

Pre-assigned value is 2 * p0333.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example:

The actual value of the total torque (r0079) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

p2003	Reference force / Reference force

Note:	The parameter is not influenced by setting the factory setting.		

p2023	Field bus interface USS PKW count / Field bus USS PKW		
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	127	127
Description:	Sets the number of 16-bit words in the PKW part of the USS telegram for the field bus interface.		
Value:	0: PKW 0 words 3: PKW 3 words 4: PKW 4 words 127: PKW variable		
Dependency:	Refer to: p2030		
Note:	The parameter is not influenced by setting the factory setting.		

p2024[0...2]	Fieldbus interface times / Fieldbus times		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	[0] 1000 [ms] [1] 0 [ms] [2] 0 [ms]
Description:	Sets the time values for the fieldbus interface. For Modbus the following applies: p2024[0, 1]: Not relevant. p2024[2]: Telegram pause time (pause time between two telegrams).		
Index:	[0] = Max. processing time [1] = Character delay time [2] = Telegram pause time		
Dependency:	Refer to: p2020, p2030		
Note:	For p2024[2] (Modbus): If the field bus baud rate is changed (p2020), the default time setting is restored. The default setting corresponds to a time of 3.5 characters (dependent on the baud rate that has been set).		

r2029[0...7]	Field bus interface error statistics / Field bus error		
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the receive errors on the field bus interface (USS).		
Index:	[0] = Number of error-free telegrams [1] = Number of rejected telegrams [2] = Number of framing errors [3] = Number of overrun errors [4] = Number of parity errors [5] = Number of starting character errors [6] = Number of checksum errors [7] = Number of length errors		
p2030	Field bus interface protocol selection / Field bus protocol		
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	3	6	3
Description:	Sets the communication protocol for the field bus interface.		
Value:	3: PROFIBUS 6: USS (X140)		
Note:	Changes only become effective after POWER ON. The parameter is not influenced by setting the factory setting.		
p2030	Field bus interface protocol selection / Field bus protocol		
CU_S_AC_PN, CU_S120_PN, CU_S150_PN	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	7	13	7
Description:	Sets the communication protocol for the field bus interface.		
Value:	7: PROFINET 10: EtherNet/IP 13: Modbus TCP		
Note:	Changes only become effective after POWER ON. The parameter is not influenced by setting the factory setting.		

2 Parameters

2.2 List of parameters

r2032		Master control control word effective / PcCtrl STW eff			
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the effective control word 1 (STW1) of the drive for the master control.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	ON/OFF1	Yes	No	-
	01	OC / OFF2	Yes	No	-
	02	OC / OFF3	Yes	No	-
	03	Enable operation	Yes	No	-
	04	Enable ramp-function generator	Yes	No	-
	05	Start ramp-function generator	Yes	No	-
	06	Enable speed setpoint	Yes	No	-
	07	Acknowledge fault	Yes	No	-
	08	Jog bit 0	Yes	No	3030
	09	Jog bit 1	Yes	No	3030
	10	Master control by PLC	Yes	No	-
Notice:	The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.				
Note:	OC: Operating condition				

r2032		Master control control word effective / PcCtrl STW eff			
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the effective control word 1 (STW1) of the drive for the master control.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	ON/OFF1	Yes	No	-
	01	OC / OFF2	Yes	No	-
	02	OC / OFF3	Yes	No	-
	03	Enable operation	Yes	No	-
	04	Enable ramp-function generator	Yes	No	-
	05	Start ramp-function generator	Yes	No	-
	06	Enable velocity setpoint	Yes	No	-
	07	Acknowledge fault	Yes	No	-
	08	Jog bit 0	Yes	No	3030
	09	Jog bit 1	Yes	No	3030
	10	Master control by PLC	Yes	No	-
Notice:	The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.				
Note:	OC: Operating condition				

r2032		Master control control word effective / PcCtrl STW eff		
A_INF, S_INF, R_INF, B_INF	Can be changed: -	Calculated: -	Access level: 2	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Displays, signals	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays the effective control word 1 (STW1) of the drive for the master control.			

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	ON/OFF1	Yes	No	-
	01	OC / OFF2	Yes	No	-
	03	Enable operation	Yes	No	-
	07	Acknowledge fault	Yes	No	-
	10	Master control by PLC	Yes	No	-

Notice: The master control only influences control word 1 and speed setpoint 1. Other control word/setpoints can be transferred from another automation device.

Note: OC: Operating condition

p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no			
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: U, T	Calculated: -	Access level: 2	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1	62	2	

Description: Sets the drive object number for communication via the field bus interface (USS).

Dependency: Refer to: p0978

Note: p2035 defines the destination for USS parameter requests (PIV).
p0978[0] defines the destination for USS process data (PZD).
The parameter is available globally on all drive objects.
The parameter is not influenced by setting the factory setting.

p2037	IF1 PROFIdrive STW1.10 = 0 mode / IF1 PD STW1.10=0			
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	2	0	

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".
Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value: 0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	2	0	

Description: Displays the interface mode of the PROFIdrive control words and status words.

Value: 0: SINAMICS
1: SIMODRIVE 611 universal
2: VIK-NAMUR

Dependency: Refer to: p0922, p2079

Notice: The parameter is protected and cannot be changed.

2 Parameters

2.2 List of parameters

Note: For telegram selection p0922 (p2079) = 102, 103, 105, 106, 116, 118, 125, 126, 136, 138, 139, then p2038 is automatically set = 1.
When another telegram is selected, then p2038 is automatically set = 0.

p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode		
SERVO (EPOS, Pos ctrl), SERVO_AC (EPOS, Pos ctrl)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	0	0
Description:	Displays the interface mode of the PROFIdrive control words and status words.		
Value:	0: SINAMICS		
Dependency:	Refer to: p0922, p2079		
Notice:	The parameter is protected and cannot be changed.		

p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2	0
Description:	Displays the interface mode of the PROFIdrive control words and status words.		
Value:	0: SINAMICS 1: SIMODRIVE 611 universal 2: VIK-NAMUR		
Dependency:	Refer to: p0922, p2079		
Notice:	The parameter is protected and cannot be changed.		
Note:	For telegram selection p0922 (p2079) = 20, then p2038 is automatically set = 2. When another telegram is selected, then p2038 is automatically set = 0.		

p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode		
VECTOR (EPOS, Pos ctrl), VECTOR_AC (EPOS, Pos ctrl)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	0	0
Description:	Displays the interface mode of the PROFIdrive control words and status words.		
Value:	0: SINAMICS		
Dependency:	Refer to: p0922, p2079		
Notice:	The parameter is protected and cannot be changed.		
Note:	For p0922 (p2079) = 7, 9, 110, 111, p2038 is automatically set to 0 and cannot be changed.		

p2039	Select debug monitor interface / Debug mon select		
CU_I, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	1
Description:	Sets the serial interface for the debug monitor. The serial interface for the debug monitor is COM1 (X140) or COM2 (internal). Value = 0: COM2 (internal) Value = 1: COM1 (X140), commissioning protocol is deactivated Value = 2: COM2 (internal) Value = 3: Reserved		
p2039	Select debug monitor interface / Debug mon select		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0
Description:	Sets the serial interface for the debug monitor. The serial interface for the debug monitor is COM1 (X140) or COM2 (internal). Value = 0: COM2 (internal) Value = 1: COM1 (X140), commissioning protocol is deactivated Value = 2: COM2 (internal) Value = 3: Reserved		
p2040	COMM INT monitoring time / COMM INT t_mon		
CU_I, CU_NX_CX, CU_I_D410, CU_LINK	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1999999 [ms]	20 [ms]
Description:	Sets the monitoring time to monitor the process data received via the internal communications interface. If no process data is received within this time, then an appropriate message is output.		
Note:	Value = 0: Monitoring is deactivated.		
p2040	Fieldbus interface monitoring time / Fieldbus t_mon		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1999999 [ms]	100 [ms]
Description:	Sets the monitoring time to monitor the process data received via the fieldbus interface. If no process data is received within this time, then an appropriate message is output.		
Dependency:	Refer to: p2030		

2 Parameters

2.2 List of parameters

Note: The parameter is only relevant for the setting of the following fieldbus protocols.
 - USS (X140) (p2030 = 6)
 - Modbus TCP (p2030 = 13)
 Value = 0: Monitoring is deactivated.

p2042		PROFIBUS Ident Number / PB ident no		
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	1	0	
Description:	Sets the PROFIBUS ident number (PNO-ID). SINAMICS can be operated with various identities on PROFIBUS. This allows the use of a PROFIBUS GSD that is independent of the device (e.g. PROFIdrive VIK-NAMUR with ident number 3AA0 hex).			
Value:	0: SINAMICS 1: VIK-NAMUR			
Note:	Every change only becomes effective after a POWER ON.			

r2043.0...2		BO: IF1 PROFIdrive PZD state / IF1 PD PZD state			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: -	Calculated: -	Access level: 3		
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 2410		
	P-Group: Communications	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the PROFIdrive PZD state.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Setpoint failure	Yes	No	-
	01	Clock cycle synchronous operation active	Yes	No	-
	02	Fieldbus running	Yes	No	-
Dependency:	Refer to: p2044				
Note:	When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.				

p2044		IF1 PROFIdrive fault delay / IF1 PD fault delay		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 2410	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0 [s]	100 [s]	0 [s]	
Description:	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that it is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).			
Dependency:	Refer to: r2043			

p2045	CI: PB/PN clock synchronous controller sign-of-life signal source / PB/PN ctr SoL s_s		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, SERVO, VECTOR (n/M), HLA, SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M), TM41, ENC	Can be changed: T Data type: Unsigned32 / Integer16 P-Group: Communications Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting 0
Description:	Connector input for the sign-of-life of the clock synchronous PROFIBUS/PROFINET controller. The sign-of-life is expected at bits 12 to 15. Bits 0 to 11 are not evaluated. The sign-of-life signal is normally received in PZD4 (control word 2) from the controller.		
Dependency:	Refer to: p0925, r2065		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
p2047	PROFIBUS additional monitoring time / PB suppl t_mon		
CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: U, T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 20000 [ms]	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting 0 [ms]
Description:	Sets the additional monitoring time to monitor the process data received via PROFIBUS. Enables short bus faults to be compensated. If no process data is received within this time, then an appropriate message is output.		
Recommendation:	In the isochronous mode, the additional monitoring time should not be set.		
Note:	For controller STOP, the additional monitoring time is not effective.		
p2048	IF1 PROFIdrive PZD sampling time / IF1 PZD t_samp		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 1.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 16.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4.00 [ms]
Description:	Sets the sampling time for the cyclic interface 1 (IF1).		
Note:	The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set. For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).		

p2049	PROFIdrive isochronous operation asynchronous participation / Isochron async		
SERVO, VECTOR, SERVO_I_AC, VECTOR_I_AC	Can be changed: C1(3) Data type: Integer16 P-Group: Closed-loop control Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting for asynchronous participation in isochronous operation. For p2049 = 1: The axis only asynchronously participates in isochronous PROFIdrive operation. The control sampling times of this axis are not included in the bus cycle time check (Tdp), in the time of the actual value sensing (Ti) and in the time of the setpoint sensing (To). For p2049 = 0: No effect on the setting in p0092.		
Value:	0: No 1: Yes		
Dependency:	Refer to: p0092		
Caution:	Restrictions for asynchronous participation in isochronous PROFIBUS operation:		
	- the setpoints are effective at undefined instant in time (deviating from To). As a consequence, interpolating operation with other axes is not possible, for example. - the actual values are read at undefined instant in time (deviating from Ti). As a consequence, the actual values cannot be used to control other axes, for example.		

r2050[0...19]	CO: IF1 PROFIdrive PZD receive word / IF1 PZD rcv word		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: Communications Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: 4000H Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output to interconnect PZD (setpoints) with word format received from the fieldbus controller.		
Index:	[0] = PZD 1 [1] = PZD 2 [2] = PZD 3 [3] = PZD 4 [4] = PZD 5 [5] = PZD 6 [6] = PZD 7 [7] = PZD 8 [8] = PZD 9 [9] = PZD 10 [10] = PZD 11 [11] = PZD 12 [12] = PZD 13 [13] = PZD 14 [14] = PZD 15 [15] = PZD 16 [16] = PZD 17 [17] = PZD 18 [18] = PZD 19 [19] = PZD 20		
Note:	IF1: Interface 1		

Parameter	CO: IF1 PROFIdrive PZD receive word / IF1 PZD rcv word
r2050[0...21]	
SERVO, HLA, SERVO_AC, SERVO_I_AC, TM41	Can be changed: - Data type: Integer16 P-Group: Communications Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: 4000H Max -
	Access level: 3 Func. diagram: 2440, 2468 Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output to interconnect PZD (setpoints) with word format received from the fieldbus controller.
Index:	[0] = PZD 1 [1] = PZD 2 [2] = PZD 3 [3] = PZD 4 [4] = PZD 5 [5] = PZD 6 [6] = PZD 7 [7] = PZD 8 [8] = PZD 9 [9] = PZD 10 [10] = PZD 11 [11] = PZD 12 [12] = PZD 13 [13] = PZD 14 [14] = PZD 15 [15] = PZD 16 [16] = PZD 17 [17] = PZD 18 [18] = PZD 19 [19] = PZD 20 [20] = PZD 21 [21] = PZD 22
Dependency:	Refer to: r2060
Notice:	Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types. A BICO interconnection for a single PZD can only take place either on r2050 or r2060.
Note:	IF1: Interface 1

Note: IF1: Interface 1

r2054 COMM INT state / C INT state

CU_I, CU_NX_CX, CU_I_D410, CU_LINK	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	255	-

Description: Status display for the internal communications interface.

Value:

0:	No initialization
1:	Fatal fault
2:	Initialization
3:	Send configuration
4:	Receive configuration
5:	Non-cyclic communication
6:	Cyclic communications but no setpoints (stop/no clock cycle)
255:	Cyclic communication

r2054 PROFIBUS status / PB status

CU_S_AC_DP, CU_S120_DP, CU_S150_DP	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 2410
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	4	-

Description: Status display for the PROFIBUS interface.

Value:

0:	OFF
1:	No connection (search for baud rate)
2:	Connection OK (baud rate found)
3:	Cyclic connection with master (data exchange)
4:	Cyclic data OK

Note: For r2054 = 2:

If the state is not exited, then set or check the PROFIBUS address in p0918.

For r2054 = 3:

In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation:

- no setpoints are being received as the PROFIBUS master is in the STOP condition.

Only for isochronous operation, the following applies:

- the drive is not in synchronism as the global control (GC) has an error.

For r2054 = 4:

In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free.

This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

2 Parameters

2.2 List of parameters

r2064[0...7]	PB/PN diagnostics clock cycle synchronism / PB/PN diag clock		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer32 P-Group: Communications Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2410 Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the last parameter received from the PROFIBUS/PROFINET controller for clock synchronism. The parameters for clock synchronism are created when configuring the bus and are transferred at the start of cyclic operation from the controller to the device.		
Index:	[0] = Clock synchronous mode activated [1] = Bus cycle time (Tdp) [μs] [2] = Master cycle time (Tmapc) [μs] [3] = Instant of actual value acquisition (Ti) [μs] [4] = Instant of setpoint acquisition (To) [μs] [5] = Data exchange interval (Tdx) [μs] [6] = PLL window (Tpll-w) [1/12 μs] [7] = PLL delay time (Tpll-d) [1/12 μs]		
r2065	PB/PN controller sign of life diagnostics / PB/PN ctr SoL diag

	0	65535	0
Description:	Selects the faults for which the fault response should be changed		
Dependency:	The fault is selected and the required response is set under the same index. Refer to: p2101		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		

p2101[0...19]	Change fault response response / Chg resp resp		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 8050, 8075
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	0	0
Description:	Sets the fault response for the selected fault.		
Value:	0: NONE		
Dependency:	The fault is selected and the required response is set under the same index.		
Notice:	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		

p2101[0...19]		Change fault response response / Chg resp resp	
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, TM41	Can be changed: U, T Data type: Integer16 P-Group: Messages Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 7	Access level: 3 Func. diagram: 8050, 8075 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the fault response for the selected fault.		
Value:	0: NONE 1: OFF1 2: OFF2 3: OFF3 5: STOP2 6: Internal armature short-circuit / DC braking 7: ENCODER (p0491)		
Dependency:	The fault is selected and the required response is set under the same index. Refer to: p2100		
Notice:	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved. The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms"). Example: F12345 and fault response = OFF3 (OFF1, OFF2, NONE) --> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE. For value = 1 (OFF1): Braking along the ramp-function generator down ramp followed by a pulse inhibit. For value = 2 (OFF2): Internal/external pulse inhibit. For value = 3 (OFF3): Braking along the OFF3 down ramp followed by a pulse inhibit. For value = 5 (STOP2): n_set = 0 For value = 6 (armature short-circuit, internal/DC braking): The value can only be set for all motor data sets when p1231 = 3, 4. a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed. b) For induction motors (p0300 = 1xx), a DC braking is initiated. For value = 7 (ENCODER (p0491)): The fault response set in p0491 is executed if applicable. Note: IASC: Internal Armature Short Circuit DCBRK: DC braking		

p2101[0...19]	Change fault response response / Chg resp resp		
A_INF, S_INF, R_INF, B_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 8050, 8075
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2	0
Description:	Sets the fault response for the selected fault.		
Value:	0: NONE 1: OFF1 2: OFF2		
Dependency:	The fault is selected and the required response is set under the same index.		
Notice:	For the following cases, it is not possible to re-parameterize the fault response to a fault: - fault number does not exist (exception value = 0). - Message type is not "fault" (F). - fault response is not permissible for the set fault number.		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		

p2102	BI: Acknowledge all faults / Ackn all faults		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 2546, 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to acknowledge all faults at all drive objects of the drive system.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		

p2103	BI: 1st acknowledge faults / 1st acknowledge		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the first signal source to acknowledge faults.		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		

p2103[0...n]	BI: 1st acknowledge faults / 1st acknowledge		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2441, 2442, 2443, 2447, 2475, 2546, 9220, 9677, 9678 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the first signal source to acknowledge faults.		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		

p2104	BI: 2nd acknowledge faults / 2nd acknowledge		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the second signal source to acknowledge faults.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		

p2104[0...n]	BI: 2nd acknowledge faults / 2nd acknowledge		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546, 8060 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the second signal source to acknowledge faults.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		

2 Parameters

2.2 List of parameters

p2105	BI: 3rd acknowledge faults / 3rd acknowledge		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the third signal source to acknowledge faults.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		
p2105[0...n]	BI: 3rd acknowledge faults / 3rd acknowledge		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546, 8060 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the third signal source to acknowledge faults.		
Note:	A fault acknowledgment is triggered with a 0/1 signal.		
p2106	BI: External fault 1 / External fault 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 1.		
Dependency:	Refer to: F07860		
Note:	An external fault is triggered with a 0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		
p2106[0...n]	BI: External fault 1 / External fault 1		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 1.		
Dependency:	Refer to: F07860		

Note: An external fault is triggered with a 0 signal.
If this fault is output at the Control Unit, then it is transferred to all existing drive objects.

p2107	BI: External fault 2 / External fault 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 2.		
Dependency:	Refer to: F07861		
Note:	An external fault is triggered with a 0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		

p2107[0...n]	BI: External fault 2 / External fault 2		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 2.		
Dependency:	Refer to: F07861		
Note:	An external fault is triggered with a 0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		

p2108	BI: External fault 3 / External fault 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p3110, p3111, p3112 Refer to: F07862		
Note:	An external fault is triggered with a 0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		

p2108[0...n]			
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	BI: External fault 3 / External fault 3		
	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: CDS, p0170	Func. diagram: 2546
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source for external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p3110, p3111, p3112 Refer to: F07862		
Note:	An external fault is triggered with a 0 signal. If this fault is output at the Control Unit, then it is transferred to all existing drive objects.		
<hr/>			
r2109[0...63]			
All objects	Fault time removed in milliseconds / t_flt rem ms		
	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 8050, 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the system runtime in milliseconds when the fault was removed.		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2114, r2130, r2133, r2136, r3115, r3120, r3122		
Notice:	The time comprises r2136 (days) and r2109 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the fault buffer and the assignment of the indices is shown in r0945.		
<hr/>			
r2110[0...63]			
All objects	Alarm number / Alarm number		
	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	This parameter is identical to r2122.		
<hr/>			
p2111			
All objects	Alarm counter / Alarm counter		
	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Number of alarms that have occurred after the last reset.		
Dependency:	When p2111 is set to 0, the following is initiated: - all of the alarms of the alarm buffer that have gone [0...7] are transferred into the alarm history [8...63]. - the alarm buffer [0...7] is deleted. Refer to: r2110, r2122, r2123, r2124, r2125		
Note:	The parameter is reset to 0 at POWER ON.		

p2112	BI: External alarm 1 / External alarm 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 1.		
Dependency:	Refer to: A07850		
Note:	An external alarm is triggered with a 0 signal.		
p2112[0...n]	BI: External alarm 1 / External alarm 1		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 1.		
Dependency:	Refer to: A07850		
Note:	An external alarm is triggered with a 0 signal.		
r2114[0...1]	System runtime total / Sys runtime tot		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the total system runtime for the drive unit. The time comprises r2114[0] (milliseconds) and r2114[1] (days). After r2114[0] has reached a value of 86.400.000 ms (24 hours) this value is reset and r2114[1] is incremented.		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r0948, r2109, r2123, r2125, r2130, r2136, r2145, r2146		
Note:	The time in r2114 is used to display the times for faults and alarms. When the electronic power supply is switched out, the counter values are saved. After the drive unit is switched on, the counter continues to run with the last value that was saved.		

2 Parameters

2.2 List of parameters

p2116	BI: External alarm 2 / External alarm 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 2.		
Dependency:	Refer to: A07851		
Note:	An external alarm is triggered with a 0 signal.		
<hr/>			
p2116[0...n]	BI: External alarm 2 / External alarm 2		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 2.		
Dependency:	Refer to: A07851		
Note:	An external alarm is triggered with a 0 signal.		
<hr/>			
p2117	BI: External alarm 3 / External alarm 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 3.		
Dependency:	Refer to: A07852		
Note:	An external alarm is triggered with a 0 signal.		

p2117[0...n]	BI: External alarm 3 / External alarm 3		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for external alarm 3.		
Dependency:	Refer to: A07852		
Note:	An external alarm is triggered with a 0 signal.		
p2118[0...19]	Change message type message number / Chg type msg_no		
All objects	Can be changed: U, T Data type: Unsigned16 P-Group: Messages Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535	Access level: 3 Func. diagram: 8050, 8075 Unit selection: - Expert list: 1 Factory setting 0
Description:	Selects faults or alarms for which the message type should be changed.		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2119		
Note:	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone.		
p2119[0...19]	Change message type type / Change type type		
All objects	Can be changed: U, T Data type: Integer16 P-Group: Messages Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: 8050, 8075 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the message type for the selected fault or alarm.		
Value:	1: Fault (F) 2: Alarm (A) 3: No message (N)		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2118		
Note:	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone. The message type can only be changed for messages with the appropriate identification (exception, value = 0). Example: F12345(A) --> Fault F12345 can be changed to alarm A12345. In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.		

r2120	CO: Sum of fault and alarm buffer changes / Sum buffer changed		
All objects	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the sum of all of the fault and alarm buffer changes in the drive unit.		
Dependency:	Refer to: r0944, r2121		

r2121	CO: Counter alarm buffer changes / A buff changed		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	This counter is incremented every time the alarm buffer changes.		
Dependency:	Refer to: r2110, r2122, r2123, r2124, r2125		

r2122[0...63]	Alarm code / Alarm code		
All objects	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the number of alarms that have occurred.		
Dependency:	Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Notice:	The properties of the alarm buffer should be taken from the corresponding product documentation.		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). Alarm buffer structure (general principle): r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest) ... r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest) When the alarm buffer is full, the alarms that have gone are entered into the alarm history: r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest) ... r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)		

r2123[0...63]	Alarm time received in milliseconds / t_alarm rcv ms		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the system runtime in milliseconds when the alarm occurred.		
Dependency:	Refer to: r2110, r2114, r2122, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Notice:	The time comprises r2145 (days) and r2123 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		

r2124[0...63]	Alarm value / Alarm value		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays additional information about the active alarm (as integer number).		
Dependency:	Refer to: r2110, r2122, r2123, r2125, r2134, r2145, r2146, r3121, r3123		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		
r2125[0...63]	Alarm time removed in milliseconds / t_alarm rem ms		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 8050, 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the system runtime in milliseconds when the alarm was cleared.		
Dependency:	Refer to: r2110, r2114, r2122, r2123, r2124, r2134, r2145, r2146, r3121, r3123		
Notice:	The time comprises r2146 (days) and r2125 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). The structure of the alarm buffer and the assignment of the indices is shown in r2122.		
p2126[0...19]	Change acknowledge mode fault number / Chg ackn flt_no		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8075
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Selects the faults for which the acknowledge mode is to be changed		
Dependency:	Selects the faults and sets the required acknowledge mode realized under the same index Refer to: p2127		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		
p2127[0...19]	Change acknowledge mode mode / Chg ackn mode		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 8050, 8075
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	3	1
Description:	Sets the acknowledge mode for selected fault.		
Value:	1: Acknowledgment only using POWER ON 2: Ack IMMEDIATELY after the fault cause has been removed 3: Acknowledgment only for PULSE INHIBIT		
Dependency:	Selects the faults and sets the required acknowledge mode realized under the same index Refer to: p2126		

2 Parameters

2.2 List of parameters

- Notice:** It is not possible to re-parameterize the acknowledge mode for a fault in the following cases:
- fault number does not exist (exception value = 0).
 - Message type is not "fault" (F).
 - Acknowledge mode is not permissible for the set fault number.
- Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
- The acknowledge mode can only be changed for faults with the appropriate identification.
- Example:
 F12345 and acknowledge mode = IMMEDIATELY (POWER ON)
 --> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

p2128[0...15]	Faults/alarms trigger selection / F/A trigger sel		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8050, 8070
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Sets the faults/alarms for which a trigger signal should be generated in r2129.0...15.		
Dependency:	If the fault/alarm set in p2128[0...15] occurs, then the particular binector output r2129.0...15 is set. Refer to: r2129		

r2129.0...15	CO/BO: Faults/alarms trigger word / F/A trigger word				
All objects	Can be changed: -	Calculated: -	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8070		
	P-Group: Messages	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Display and BICO output for the trigger signals of the faults/alarms set in p2128[0...15].				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Trigger signal p2128[0]	ON	OFF	-
	01	Trigger signal p2128[1]	ON	OFF	-
	02	Trigger signal p2128[2]	ON	OFF	-
	03	Trigger signal p2128[3]	ON	OFF	-
	04	Trigger signal p2128[4]	ON	OFF	-
	05	Trigger signal p2128[5]	ON	OFF	-
	06	Trigger signal p2128[6]	ON	OFF	-
	07	Trigger signal p2128[7]	ON	OFF	-
	08	Trigger signal p2128[8]	ON	OFF	-
	09	Trigger signal p2128[9]	ON	OFF	-
	10	Trigger signal p2128[10]	ON	OFF	-
	11	Trigger signal p2128[11]	ON	OFF	-
	12	Trigger signal p2128[12]	ON	OFF	-
	13	Trigger signal p2128[13]	ON	OFF	-
	14	Trigger signal p2128[14]	ON	OFF	-
	15	Trigger signal p2128[15]	ON	OFF	-
Dependency:	If the fault/alarm set in p2128[0...15] occurs, then the particular binector output r2129.0...15 is set. Refer to: p2128				
Note:	CO: r2129 = 0 --> None of the selected messages has occurred. CO: r2129 > 0 --> At least one of the selected messages has occurred.				

r2130[0...63]	Fault time received in days / t_fault recv days		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the system runtime in days when the fault occurred.		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2109, r2114, r2133, r2136, p3100, r3115, r3120, r3122		
Notice:	The time comprises r2130 (days) and r0948 (milliseconds). The time display depends on the selected mode (p3100).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		
r2131	CO: Actual fault code / Act fault code		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the code of the oldest active fault.		
Dependency:	Refer to: r3131, r3132		
Note:	0: No fault present.		
r2132	CO: Actual alarm code / Alarm code act		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the code of the last alarm that occurred.		
Note:	0: No alarm present.		
r2133[0...63]	Fault value for float values / Fault val float		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays additional information about the fault that occurred for float values.		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2136, r3115		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		

r2134[0...63]	Alarm value for float values / Alarm value float		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays additional information about the active alarm for float values.		
Dependency:	Refer to: r2110, r2122, r2123, r2124, r2125, r2145, r2146, r3121, r3123		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		

r2135.0...15	CO/BO: Status word faults/alarms 2 / ZSW fault/alarm 2				
All objects	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 2548		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Display and BICO output for the second status word of faults and alarms.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Fault encoder 1	Yes	No	-
	01	Fault encoder 2	Yes	No	-
	02	Fault encoder 3	Yes	No	-
	12	Fault motor overtemperature	Yes	No	8016
	13	Fault power unit thermal overload	Yes	No	8021
	14	Alarm motor overtemperature	Yes	No	8016
	15	Alarm power unit thermal overload	Yes	No	8021

r2136[0...63]	Fault time removed in days / t_fit rem days		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the system runtime in days when the fault was removed.		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2109, r2114, r2130, r2133, r3115, r3120, r3122		
Notice:	The time comprises r2136 (days) and r2109 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		

r2138.7...15	CO/BO: Control word faults/alarms / STW fault/alarm			
All objects	Can be changed: -	Calculated: -	Access level: 2	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 2546	
	P-Group: Displays, signals	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Display and BICO output for the control word of faults and alarms.			

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	07	Acknowledge fault	Yes	No	8060
	10	External alarm 1 (A07850) effective	Yes	No	8065
	11	External alarm 2 (A07851) effective	Yes	No	8065
	12	External alarm 3 (A07852) effective	Yes	No	8065
	13	External fault 1 (F07860) effective	Yes	No	8060
	14	External fault 2 (F07861) effective	Yes	No	8060
	15	External fault 3 (F07862) effective	Yes	No	8060

Dependency: Refer to: p2103, p2104, p2105, p2106, p2107, p2108, p2112, p2116, p2117, p3110, p3111, p3112

r2139.0...15 CO/BO: Status word faults/alarms 1 / ZSW fault/alarm 1

All objects	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 2548
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and BICO output for status word 1 of faults and alarms.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Being acknowledged	Yes	No	-
	01	Acknowledgment required	Yes	No	-
	03	Fault present	Yes	No	8060
	05	Safety message present	Yes	No	-
	06	Internal message 1 present	Yes	No	-
	07	Alarm present	Yes	No	8065
	08	Internal message 2 present	Yes	No	-
	11	Alarm class bit 0	High	Low	-
	12	Alarm class bit 1	High	Low	-
	13	Maintenance required	Yes	No	-
	14	Maintenance urgently required	Yes	No	-
	15	Fault gone/can be acknowledged	Yes	No	-

Note: For bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. For this reason, the fault/alarm buffer should only be read if, after "Fault active" or "Alarm active" occurs, a change is also identified in the buffer (r0944, r9744, r2121).

For bit 06, 08:

These status bits are used for internal diagnostic purposes only.

For bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

p2140[0...n] Hysteresis speed 2 / n_hysteresis 2

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	300.00 [rpm]	90.00 [rpm]

Description: Sets the hysteresis speed (bandwidth) for the following signals:

"|n_act| <= speed threshold value 2" (BO: r2197.1)

"|n_act| > speed threshold value 2" (BO: r2197.2)

Dependency: Refer to: p2155, r2197

2 Parameters

2.2 List of parameters

p2140[0...n]	Hysteresis velocity 2 / v_hysteresis 2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 10.00 [m/min]	Factory setting 0.90 [m/min]
Description:	Sets the hysteresis velocity (bandwidth) for the following signals: " n_act <= velocity threshold value 2" (BO: r2197.1) " n_act > velocity threshold value 2" (BO: r2197.2)		
Dependency:	Refer to: p2155, r2197		
p2141[0...n]	Speed threshold 1 / n_thr val 1		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 5.00 [rpm]
Description:	Sets the speed threshold value for the signal "f or n comparison value reached or exceeded" (BO: r2199.1).		
Dependency:	Refer to: p2142, r2199		
p2141[0...n]	Velocity threshold value 1 / v_thr val 1		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 1000.00 [m/min]	Factory setting 0.05 [m/min]
Description:	Sets the velocity threshold value for the signal "f or n comparison value reached or exceeded" (BO: r2199.1).		
Dependency:	Refer to: p2142, r2199		
p2142[0...n]	Hysteresis speed 1 / n_hysteresis 1		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 300.00 [rpm]	Factory setting 2.00 [rpm]
Description:	Sets the hysteresis speed (bandwidth) for the signal "f or n / v comparison value reached or exceeded" (BO: r2199.1).		
Dependency:	Refer to: p2141, r2199		

p2142[0...n]	Hysteresis speed 1 / n_hysteresis 1		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 10.00 [m/min]	Factory setting 0.02 [m/min]
Description:	Sets the hysteresis speed (bandwidth) for the signal "f or n / v comparison value reached or exceeded" (BO: r2199.1).		
Dependency:	Refer to: p2141, r2199		
p2144[0...n]	BI: Motor stall monitoring enable (negated) / Mot stall enab neg		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: CDS, p0170	Func. diagram: 8012
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting 0
Description:	Sets the signal source for the negated enable (0 = enable) of the motor stall monitoring.		
Dependency:	Refer to: p2163, p2164, p2166, r2197, r2198 Refer to: F07900		
Note:	When interconnecting the enable signal with r2197.7 then the stall signal is suppressed if there is no speed setpoint - actual value deviation.		
r2145[0...63]	Alarm time received in days / t_alarm rcv days		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting -
Description:	Displays the system runtime in days when the alarm occurred.		
Dependency:	Refer to: r2110, r2114, r2122, r2123, r2124, r2125, r2134, r2146, r3121, r3123		
Notice:	The time comprises r2145 (days) and r2123 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		
r2146[0...63]	Alarm time removed in days / t_alarm rem days		
All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8065
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting -
Description:	Displays the system runtime in days when the alarm was cleared.		
Dependency:	Refer to: r2110, r2114, r2122, r2123, r2124, r2125, r2134, r2145, r3121, r3123		
Notice:	The time comprises r2146 (days) and r2125 (milliseconds).		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139).		

2 Parameters

2.2 List of parameters

p2147	Delete fault buffer of all drive objects / Del fault buffer		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Displays, signals Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 4 Func. diagram: 8060 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to delete the fault buffer of all existing drive objects.		
Value:	0: Inactive 1: Start to delete the fault buffer of all drive objects		
Dependency:	Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136		
Note:	p2147 is automatically set to 0 after execution. In order that faults with "POWER ON" acknowledgment can also be cleared from the fault buffer, POWER ON must first be carried out.		

p2148[0...n]	BI: RFG active / RFG active		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: CALC_MOD_LIM_REF Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 8011 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the signal "ramp-function generator active" for the following signals/messages: "Speed setpoint - actual value deviation within tolerance t_on" (BO: r2199.4) "Ramp-up/ramp-down completed" (BO: r2199.5)		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The binector input is automatically pre-assigned to r1199.2. The following applies for SERVO: The pre-assignment using the automatic calculation of the motor/control parameters in the drive (p0340 = 1, 3, 5) is only realized if, at the instant of the calculation, the "setpoint channel" function module is active (r0108.8 = 1). If the calculation in p0340 is not selected when downloading parameters, then the parameter is not pre-assigned.		

p2149[0...n]	Monitoring configuration / Mon config				
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0000 bin		
Description:	Sets the configuration for messages and monitoring functions.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Enable alarm A07903	Yes	No	8011
	01	Load monitoring only in the 1st quadrant	Yes	No	8013
	03	Reserved			-
	15	Automatic parameterization carried out (p0340 = 1, p3900 > 0)	Yes	No	-
Dependency:	Refer to: r2197 Refer to: A07903				

Note: For bit 00:
Alarm A07903 is output when the bit is set with $r2197.7 = 0$ ($n_set \neq n_act$).
For bit 01:
When the bit is set, the load monitoring is only executed in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).
For bit 03:
When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions.
For bit 15:
The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out.
If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

p2149[0...n]**Monitoring configuration / Mon config**VECTOR,

-

-

0000 0000 0000 0001 bin

Description: Sets the configuration for messages and monitoring functions.**Bit field:**

Bit	Signal name	1 signal	0 signal	FP
00	Enable alarm A07903	Yes	No	8011
01	Load monitoring only in the 1st quadrant	Yes	No	8013
03	Reserved	-	-	-
06	Enable underspeed monitoring	Yes	No	8010
15	Automatic parameterization carried out (p0340 = 1, p3900 > 0)	Yes	No	-

Dependency:

Refer to: r2197

Refer to: A07903

Note:

For bit 00:

Alarm A07903 is output when the bit is set with $r2197.7 = 0$ ($n_set \neq n_act$).
For bit 01:When the bit is set, the load monitoring is only executed in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).
For bit 03:When the bit is set, r2197.1 and r2197.2 are determined using separate hysteresis functions.
For bit 06:When the bit is set, with $r2197.1 = 1$ ($n_act < p2155$ speed threshold value 2), then alarm A08721 is output, and with $r2199.0 = 1$ ($n_act < p2161$ speed threshold value 3), then fault F07822 is output.

For separately excited synchronous motors (without encoder) in torque control (p1501 set), the underspeed speed monitoring is automatically activated if conditions (p0300 = 5, p1300 = 20) for the automatic pre-assignment of the threshold values during commissioning (p0340 = 1) are fulfilled.

The alarm threshold p2155 is preassigned with $1.5 * p1755$ - and the fault threshold p2161, with p1755.

For bit 15:

The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out.

If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

2 Parameters

2.2 List of parameters

p2150[0...n]	Hysteresis speed 3 / n_hysteresis 3		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3

	Min	Max	Factory setting
	0 [ms]	1000000 [ms]	0 [ms]
Description:	Sets the time constant of the PT1 element to smooth the speed / velocity actual value. The smoothed actual speed/velocity is compared with the threshold values and is only used for messages and signals.		
Dependency:	Refer to: r2169		

2 Parameters

2.2 List of parameters

p2153[0...n]	Velocity actual value filter time constant / v_ActV filt Tc		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000000 [ms]	Access level: 3 Func. diagram: 8010 Unit selection: - Expert list: 1 Factory setting 0 [ms]
Description:	Sets the time constant of the PT1 element to smooth the speed / velocity actual value. The smoothed actual speed/velocity is compared with the threshold values and is only used for messages and signals.		
Dependency:	Refer to: r2169		
p2154[0...n]	CI: Speed setpoint 2 / n_set 2		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: p2000 Max -	Access level: 3 Func. diagram: 8010 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for speed setpoint 2. The sum of p2151 and p2154 is used for the following messages/signals: "Speed setpoint - actual value deviation within tolerance t_off" (r2197.7) "Speed setpoint - actual value deviation within tolerance t_on" (r2199.4) "Ramp-up/ramp-down completed" (r2199.5)		
Dependency:	Refer to: p2151, r2197, r2199		
p2154[0...n]	CI: Velocity setpoint 2 / v_set 2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: p2000 Max -	Access level: 3 Func. diagram: 8010 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the velocity setpoint 2. The sum of p2151 and p2154 is used for the following messages/signals: "Velocity setpoint - actual value deviation within tolerance t_off" (r2197.7) "Velocity setpoint - actual value deviation within tolerance t_on" (r2199.4) "Ramp-up/ramp-down completed" (r2199.5)		
Dependency:	Refer to: p2151, r2197, r2199		
p2155[0...n]	Speed threshold 2 / n_thr val 2		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8010 Unit selection: p0505 Expert list: 1 Factory setting 900.00 [rpm]
Description:	Sets the speed threshold value for the following messages: " n_act <= speed threshold value 2" (BO: r2197.1) " n_act > speed threshold value 2" (BO: r2197.2)		
Dependency:	Refer to: p2140, r2197		

p2155[0...n]	Velocity threshold value 2 / v_thr val 2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 1000.00 [m/min]	Factory setting 9.00 [m/min]
Description:	Sets the velocity threshold value for the following messages: " v_act <= velocity threshold value 2" (BO: r2197.1) " v_act > velocity threshold value 2" (BO: r2197.2)		
Dependency:	Refer to: p2140, r2197		
p2155[0...n]	Speed threshold 2 / n_thr val 2		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 900.00 [rpm]
Description:	Sets the speed threshold value for the following messages: " n_act <= speed threshold value 2" (BO: r2197.1) " n_act > speed threshold value 2" (BO: r2197.2)		
Dependency:	Refer to: p2140, r2197		
Caution:	The filter monitoring function is deactivated with p2155 = 0.0.		
			
Note:	The parameter is used as alarm threshold for underspeed monitoring. Monitoring for an underspeed condition is automatically activated internally for encoderless separately-excited synchronous motors in closed-loop torque controlled operation (p0300 = 5, p1300 = 20, p1501 = 1 signal) - and can be manually activated with p2149.6 = 1. For separately excited synchronous motors, when exiting commissioning (p0340 = 5), this parameter is automatically assigned 1.5 * p1755.		
p2156[0...n]	On-delay comparison value reached / t_on cmprr val rchd		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0 [ms]	Max 10000.0 [ms]	Factory setting 0.0 [ms]
Description:	Sets the switch-on delay time for the signal "comparison value reached" (BO: r2199.1).		
Dependency:	Refer to: p2141, p2142, r2199		

2 Parameters

2.2 List of parameters

p2161[0...n]	Speed threshold 3 / n_thr val 3		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010, 8011
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 5.00 [rpm]
Description:	Sets the speed threshold value for the signal " n_act < speed threshold value 3" (BO: r2199.0).		
Dependency:	Refer to: p2142, r2199		
p2161[0...n]	Velocity threshold value 3 / v_thr val 3		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010, 8011
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 1000.00 [m/min]	Factory setting 0.05 [m/min]
Description:	Sets the velocity threshold value for the signal " v_act < velocity threshold value 3" (BO: r2199.0).		
Dependency:	Refer to: p2142, r2199		
p2161[0...n]	Speed threshold 3 / n_thr val 3		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010, 8011
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 210000.00 [rpm]	Factory setting 5.00 [rpm]
Description:	Sets the speed threshold value for the signal " n_act < speed threshold value 3" (BO: r2199.0).		
Dependency:	Refer to: p2142, r2199		
Caution:	The threshold monitoring function is deactivated with p2161 = 0.0.		
			
Note:	The parameter is used as fault threshold for underspeed monitoring Monitoring for an underspeed condition is automatically activated internally for encoderless separately-excited synchronous motors in closed-loop torque controlled operation (p0300 = 5, p1300 = 20, p1501 = 1 signal) - and can be manually activated with p2149.6 = 1. For separately excited synchronous motors, when exiting commissioning (p0340 = 5), this parameter is automatically assigned p1755.		
p2162[0...n]	Hysteresis speed n_act > n_max / Hyst n_act>n_max		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 60000.00 [rpm]	Factory setting 0.00 [rpm]
Description:	Sets the hysteresis speed (bandwidth) for the signal "n_act > n_max" (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		

Notice: For p0322 = 0, the following applies: $p2162 \leq 0.1 * p0311$
 For p0322 > 0, the following applies: $p2162 \leq 1.02 * p0322 - p1082$
 If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.

Note: For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value.
 If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

p2162[0...n]	Hysteresis velocity v_act > v_max / Hyst v_act > v_max		
SERVO (Lin), HLA, SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	1000.00 [m/min]	6.00 [m/min]
Description:	Sets the hysteresis velocity (bandwidth) for the signal "v_act > v_max" (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		
Notice:	For p0322 = 0, the following applies: $p2162 \leq 0.1 * p0311$ For p0322 > 0, the following applies: $p2162 \leq 1.02 * p0322 - p1082$ If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
Note:	For a negative velocity limit (r1087) the hysteresis is effective below the limit value and for a positive velocity limit (r1084) above the limit value.		

p2163[0...n]	Velocity threshold value 4 / v_thr val 4		
HLA	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	1000.00 [m/min]	0.90 [m/min]
Description:	Sets the velocity threshold value for the "velocity setpoint - actual value deviation in tolerance t_off" message (BO: r2197.7).		
Dependency:	Refer to: p2164, p2166, r2197		

p2163[0...n]	Speed threshold 4 / n_thr val 4		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2

	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	90.00 [rpm]
Description:	Sets the speed threshold value for the "speed setpoint - actual value deviation in tolerance t_off" signal/message (BO: r2197.7).		
Dependency:	Refer to: p2164, p2166, r2197		

2 Parameters

2.2 List of parameters

p2163[0...n]	Velocity threshold value 4 / v_thr val 4		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 1000.00 [m/min]	Factory setting 0.90 [m/min]
Description:	Sets the velocity threshold value for the "speed setpoint - actual value deviation in tolerance t_off" message (BO: r2197.7).		
Dependency:	Refer to: p2164, p2166, r2197		
p2164[0...n]	Hysteresis velocity 4 / v_hysteresis 4		
HLA	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 10.00 [m/min]	Factory setting 0.02 [m/min]
Description:	Sets the hysteresis velocity (bandwidth) for the "velocity setpoint - actual value deviation in tolerance t_off" message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2166, r2197		
p2164[0...n]	Hysteresis speed 4 / n_hysteresis 4		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [rpm]	Max 200.00 [rpm]	Factory setting 2.00 [rpm]
Description:	Sets the hysteresis speed (bandwidth) for the "speed setpoint - actual value deviation in tolerance t_off" signal/message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2166, r2197		
p2164[0...n]	Hysteresis velocity 4 / v_hysteresis 4		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [m/min]	Max 10.00 [m/min]	Factory setting 0.02 [m/min]
Description:	Sets the hysteresis velocity (bandwidth) for the "speed setpoint - actual value deviation in tolerance t_off" message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2166, r2197		

p2166[0...n]	Off-delay $v_{act} = v_{set} / t_{del_off} n_i=n_{so}$		
HLA	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	200.0 [ms]
Description:	Sets the switch-off delay time for the "velocity setpoint - actual value deviation in tolerance t_{off} " signal/message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2164, r2197		
p2166[0...n]	Off-delay $n_{act} = n_{set} / t_{del_off} n_i=n_{so}$		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	200.0 [ms]
Description:	Sets the switch-off delay time for the "speed setpoint - actual value deviation in tolerance t_{off} " signal/message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2164, r2197		
p2166[0...n]	Off-delay $v_{act} = v_{set} / t_{del_off} n_i=n_{so}$		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	200.0 [ms]
Description:	Sets the switch-off delay time for the "velocity setpoint - actual value deviation in tolerance t_{off} " signal/message (BO: r2197.7).		
Dependency:	Refer to: p2163, p2164, r2197		
p2167[0...n]	Switch-on delay $n_{act} = n_{set} / t_{on} n_{act}=n_{set}$		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	200.0 [ms]
Description:	Sets the switch-on delay for the "speed setpoint - actual value deviation in tolerance t_{on} " signal/message (BO: r2199.4).		
p2167[0...n]	On-delay $v_{act} = v_{set} / t_{on} n_{act}=n_{set}$		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8011
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	10000.0 [ms]	200.0 [ms]
Description:	Sets the switch-on delay for the "speed setpoint - actual value deviation in tolerance t_{on} " signal/message (BO: r2199.4).		

r2169	CO: Actual velocity smoothed signals / v_act smth message		
HLA	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Display and connector output of the smoothed velocity actual value for messages.		
Dependency:	Refer to: p2153		

r2169	CO: Actual speed smoothed signals / n_act smth message		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8010
	P-Group: Messages	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Display and connector output of the smoothed speed actual value for messages.		
Dependency:	Refer to: p2153		

r2169	CO: Actual velocity smoothed signals / v_act smth message		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8010
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Display and connector output of the smoothed velocity actual value for messages.		
Dependency:	Refer to: p2153		

p2174[0...n]	Torque threshold value 1 / M_thr val 1		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: 7_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [Nm]	20000000.00 [Nm]	5.13 [Nm]
Description:	Sets the torque threshold value for the signal "Torque setpoint < torque threshold value 1" (BO: r2198.10).		
Dependency:	Refer to: p2195, r2198		

p2174[0...n]	Force threshold value 1 / F_thr val 1		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: 8_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [N]	20000000.00 [N]	1000.00 [N]
Description:	Sets the force threshold value for the signal "force setpoint < force threshold value 1" (BO: r2198.10).		
Dependency:	Refer to: p2195, r2198		

p2174[0...n]	Torque threshold value 1 / M_thr val 1		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 2 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 5.13 [Nm]
Description:	Sets the torque threshold value for the messages: "Torque setpoint < torque threshold value 1 and n_set reached" (BO: r2198.9) "Torque setpoint < torque threshold value 1" (BO: r2198.10) "Torque setpoint > torque threshold value 1" (BO: r2198.13)		
Dependency:	Refer to: p2195, r2198		
p2175[0...n]	Motor blocked velocity threshold / Mot blk v_thr		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [m/min]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 4_1 Scaling: - Max 1000.00 [m/min]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 1.20 [m/min]
Description:	Sets the velocity threshold for the message "Motor locked".		
Dependency:	Refer to: p2177 Refer to: F07900		
p2175[0...n]	Motor blocked speed threshold / Mot blk n_thr		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 120.00 [rpm]
Description:	Sets the speed threshold for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2177, r2198 Refer to: F07900		
p2175[0...n]	Motor blocked velocity threshold / Mot blk v_thr		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [m/min]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 4_1 Scaling: - Max 1000.00 [m/min]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 1.20 [m/min]
Description:	Sets the velocity threshold for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2177, r2198 Refer to: F07900		

2 Parameters

2.2 List of parameters

p2175[0...n]	Motor blocked speed threshold / Mot blk n_thr		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 120.00 [rpm]
Description:	Sets the speed threshold for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2177, r2198 Refer to: F07900		
Note:	The following applies for sensorless vector control for induction motors: At low speeds in open-loop speed controlled operation (see p1755, p1756), a blocked motor cannot be detected. The following applies for sensorless vector control for permanent magnet synchronous motors: At low speeds in open-loop speed controlled operation (see p1755, p1756), a blocked motor can only be detected if p2175 = p1755, and p1750.6 is set to 1.		
<hr/>			
p2177[0...n]	Motor blocked delay time / Mot blk t_del		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.000 [s]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 65.000 [s]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1.000 [s]
Description:	Sets the delay time for the message "Motor locked".		
Dependency:	Refer to: p0500, p2175, r2198 Refer to: F07900		
<hr/>			
p2177[0...n]	Motor blocked delay time / Mot blk t_del		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.000 [s]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 65.000 [s]	Access level: 2 Func. diagram: 8012 Unit selection: - Expert list: 1 Factory setting 1.000 [s]
Description:	Sets the delay time for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2175, r2198 Refer to: F07900		
<hr/>			
p2177[0...n]	Motor blocked delay time / Mot blk t_del		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.000 [s]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 65.000 [s]	Access level: 2 Func. diagram: 8012 Unit selection: - Expert list: 1 Factory setting 1.000 [s]
Description:	Sets the delay time for the message "Motor blocked" (BO: r2198.6).		
Dependency:	Refer to: p0500, p2175, r2198 Refer to: F07900		

Note: The following applies for sensorless vector control:
 At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably.
 As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

p2178[0...n]	Motor stalled delay time / Mot stall t_{del}		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [s]	10.000 [s]	0.010 [s]
Description:	Sets the delay time for the message "Motor stalled" (BO: r2198.7).		
Dependency:	Refer to: r2198		

p2181[0...n]	Load monitoring response / Load mon resp		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 8013
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	6	0
Description:	Sets the response when evaluating the load monitoring.		
Value:	0: Load monitoring disabled 1: A07920 for torque/speed too low 2: A07921 for torque/speed too high 3: A07922 for torque/speed out of tolerance 4: F07923 for torque/speed too low 5: F07924 for torque/speed too high 6: F07925 for torque/speed out of tolerance		
Dependency:	Refer to: p2182, p2183, p2184, p2185, p2186, p2187, p2188, p2189, p2190, p2192, r2198 Refer to: A07920, A07921, A07922, F07923, F07924, F07925		
Note:	The response to the faults F07923 ... F07925 can be set. This parameter setting has no effect on the generation of fault F07936.		

p2182[0...n]	Load monitoring velocity threshold 1 / v_{thr 1}		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8013
	P-Group: Messages	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	1000.00 [m/min]	0.05 [m/min]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n _{threshold 1}) --> p2185 (M _{threshold 1} , upper), p2186 (M _{threshold 1} , lower) p2183 (n _{threshold 2}) --> p2187 (M _{threshold 2} , upper), p2188 (M _{threshold 2} , lower) p2184 (n _{threshold 3}) --> p2189 (M _{threshold 3} , upper), p2190 (M _{threshold 3} , lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2183, p2184, p2185, p2186 Refer to: A07926		
Note:	In order that the load monitoring can reliably respond, the speed threshold p2182 should always be set lower than the minimum motor speed to be monitored.		

2 Parameters

2.2 List of parameters

p2182[0...n]	Load monitoring speed threshold value 1 / n_thr 1		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 150.00 [rpm]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2183, p2184, p2185, p2186 Refer to: A07926		
Note:	In order that the load monitoring can reliably respond, the speed threshold p2182 should always be set lower than the minimum motor speed to be monitored.		

p2183[0...n]	Load monitoring velocity threshold 2 / v_thr 2		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [m/min]	Calculated: - Dyn. index: DDS, p0180 Unit group: 4_1 Scaling: - Max 1000.00 [m/min]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.05 [m/min]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2182, p2184, p2187, p2188 Refer to: A07926		

p2183[0...n]	Load monitoring speed threshold value 2 / n_thr 2		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 900.00 [rpm]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2182, p2184, p2187, p2188 Refer to: A07926		

p2184[0...n]	Load monitoring velocity threshold 3 / v_thr 3		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [m/min]	Calculated: - Dyn. index: DDS, p0180 Unit group: 4_1 Scaling: - Max 1000.00 [m/min]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.05 [m/min]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2182, p2183, p2189, p2190 Refer to: A07926		
Note:	In order that the load monitoring can reliably respond, the speed threshold p2184 should always be set higher than the maximum motor speed to be monitored.		
p2184[0...n]	Load monitoring speed threshold value 3 / n_thr 3		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 1500.00 [rpm]
Description:	Sets the speed/torque envelope curve for load monitoring. The envelope curve (upper and lower envelope curve) is defined as follows based on 3 speed thresholds: p2182 (n_threshold 1) --> p2185 (M_threshold 1, upper), p2186 (M_threshold 1, lower) p2183 (n_threshold 2) --> p2187 (M_threshold 2, upper), p2188 (M_threshold 2, lower) p2184 (n_threshold 3) --> p2189 (M_threshold 3, upper), p2190 (M_threshold 3, lower)		
Dependency:	The following applies: p2182 < p2183 < p2184 Refer to: p2182, p2183, p2189, p2190 Refer to: A07926		
Note:	In order that the load monitoring can reliably respond, the speed threshold p2184 should always be set higher than the maximum motor speed to be monitored.		
p2185[0...n]	Load monitoring force threshold 1 upper / F_thr 1 upper		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 100000.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2185 > p2186 Refer to: p2182, p2186 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		

2 Parameters

2.2 List of parameters

p2185[0...n]	Load monitoring torque threshold 1 upper / M_thr 1 upper		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 10000000.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2185 > p2186 Refer to: p2182, p2186 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		
<hr/>			
p2186[0...n]	Load monitoring force threshold 1 lower / F_thr 1 lower		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2186 < p2185 Refer to: p2182, p2185 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
<hr/>			
p2186[0...n]	Load monitoring torque threshold 1 lower / M_thr 1 lower		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2186 < p2185 Refer to: p2182, p2185 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
<hr/>			
p2187[0...n]	Load monitoring force threshold 2 upper / F_thr 2 upper		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 100000.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2187 > p2188 Refer to: p2183, p2188 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		

p2187[0...n]	Load monitoring torque threshold 2 upper / M_thr 2 upper		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 10000000.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2187 > p2188 Refer to: p2183, p2188 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		
p2188[0...n]	Load monitoring force threshold 2 lower / F_thr 2 lower		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2188 < p2187 Refer to: p2183, p2187 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
p2188[0...n]	Load monitoring torque threshold 2 lower / M_thr 2 lower		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2188 < p2187 Refer to: p2183, p2187 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
p2189[0...n]	Load monitoring force threshold 3 upper / F_thr 3 upper		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 100000.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2189 > p2190 Refer to: p2184, p2190 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		

2 Parameters

2.2 List of parameters

p2189[0...n]	Load monitoring torque threshold 3 upper / M_thr 3 upper		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 10000000.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2189 > p2190 Refer to: p2184, p2190 Refer to: A07926		
Note:	The upper envelope curve is defined by p2185, p2187 and p2189.		
<hr/>			
p2190[0...n]	Load monitoring force threshold 3 lower / F_thr 3 lower		
SERVO (Ext msg, Lin), SERVO_AC (Ext msg, Lin), SERVO_I_AC (Ext msg, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: - Max 100000.00 [N]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [N]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2190 < p2189 Refer to: p2184, p2189 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
<hr/>			
p2190[0...n]	Load monitoring torque threshold 3 lower / M_thr 3 lower		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: - Max 20000000.00 [Nm]	Access level: 3 Func. diagram: 8013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm]
Description:	Sets the speed/torque / velocity/force envelope curve for the load monitoring.		
Dependency:	The following applies: p2190 < p2189 Refer to: p2184, p2189 Refer to: A07926		
Note:	The lower envelope curve is defined by p2186, p2188 and p2190.		
<hr/>			
p2192[0...n]	Load monitoring delay time / Load mon t_del		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 65.00 [s]	Access level: 3 Func. diagram: 8013 Unit selection: - Expert list: 1 Factory setting 10.00 [s]
Description:	Sets the delay time to evaluate the load monitoring.		

p2194[0...n]	Torque threshold value 2 / M_thr val 2		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100.00 [%]	90.00 [%]
Description:	Sets the torque threshold value for the message "Torque utilization < torque threshold value 2" (BO: r2199.11). The message "torque setpoint < p2174" (BO: r2198.10) and "torque utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.		
Dependency:	Refer to: r0033, p2195, r2199		
p2194[0...n]	Force threshold value 2 / F_thr val 2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100.00 [%]	90.00 [%]
Description:	Sets the force threshold value for the signal "force utilization < force threshold value 2" (BO: r2199.11). The message "force setpoint < p2174" (BO: r2198.10) and "force utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.		
Dependency:	Refer to: r0033, p2195, r2199		
p2195[0...n]	Torque utilization switch-off delay / M_util t_off		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	1000.0 [ms]	800.0 [ms]
Description:	Sets the switch-off delay time for the negated signal "run-up completed". The message "torque setpoint < p2174" (BO: r2198.10) and "torque utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.		
Dependency:	Refer to: p2174, p2194		
p2195[0...n]	Force utilization switch-off delay / F_util t_off		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8012
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	1000.0 [ms]	800.0 [ms]
Description:	Sets the switch-off delay time for the negated signal "run-up completed". The message "force setpoint < p2174" (BO: r2198.10) and "force utilization < p2194" (BO: r2199.11) are only evaluated after the run-up and the delay time has expired.		
Dependency:	Refer to: p2174, p2194		

2 Parameters

2.2 List of parameters

p2196[0...n]	Torque utilization scaling / M_util scal		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.00 [%]	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the scaling factor for torque utilization (r0033).		

r2197.1...13	CO/BO: Status word monitoring 1 / ZSW mon 1		
HLA	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Display and BICO output for the first status word of the monitoring functions.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	v_act <= velocity threshold value 2 p2155	Yes	No	8010
	02	v_act > velocity threshold value 2 p2155	Yes	No	8010
	03	v_act >= 0	Yes	No	8011
	06	v_act > v_max	Yes	No	8010
	07	Velocity setpoint - actual value deviation in tolerance t_off	Yes	No	8011
	13	v_act > v_max (F07901)	Yes	No	-

Note: For bit 01, 02:
The threshold value is set in p2155 and the hysteresis in p2140.
For bit 03:
The hysteresis is set in p2150.
For bit 06:
The hysteresis is set in p2162.
For bit 07:
The threshold value is set in p2163 and the hysteresis is set in p2164.
For bit 13:
Only for internal Siemens use.

r2197.1...13	CO/BO: Status word monitoring 1 / ZSW mon 1		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: 2534 Unit selection: - Expert list: 1 Factory setting -

Description: Display and BICO output for the first status word of the monitoring functions.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	n_act <= speed threshold value 2 p2155	Yes	No	8010
	02	n_act > speed threshold value 2 p2155	Yes	No	8010
	03	n_act >= 0	Yes	No	8011
	06	n_act > n_max	Yes	No	8010
	07	Speed setpoint - actual value deviation in tolerance t_off	Yes	No	8011
	13	n_act > n_max (F07901)	Yes	No	-

Note: For bit 01, 02:
The threshold value is set in p2155 and the hysteresis in p2140.
For bit 03:
The hysteresis is set in p2150.
For bit 06:
The hysteresis is set in p2162.
For bit 07:
The threshold value is set in p2163 and the hysteresis is set in p2164.
For bit 13:
Only for internal Siemens use.

04	n_set < p2161	Yes	No	8011
05	n_set > 0	Yes	No	8011
06	Motor blocked	Yes	No	8012
07	Motor stalled	Yes	No	8012
10	M_set < torque threshold value 1	Yes	No	8012
11	Load in the alarm range	Yes	No	8013
12	Load in the fault range	Yes	No	8013

Note: For bit 10:
The torque threshold value 1 is set in p2174.
For bit 12:
This bit is reset after the fault cause disappears, even if the fault itself is still present.

r2199.0...11		CO/BO: Status word monitoring 3 / ZSW monitor 3			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 2537		
	P-Group: Messages	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Display and BICO output for the third status word of the monitoring functions.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	n_act < speed threshold value 3	Yes	No	8010
	01	f or n comparison value reached or exceeded	Yes	No	8010
	04	Speed setpoint - actual value deviation in tolerance t_on	Yes	No	8011
	05	Ramp-up/ramp-down completed	Yes	No	8011
	06	Current below the zero current threshold	Yes	No	8020
	11	Torque utilization < torque threshold value 2	Yes	No	8012
Dependency:	Refer to: F07913				
Note:	For bit 00: The speed threshold value 3 is set in p2161.				
	For bit 01: The comparison value is set in p2141. We recommend setting the hysteresis (p2142) for canceling the bit to a value lower than that in p2141. Otherwise, the bit is not reset.				
	For bit 11: The torque threshold value 2 is set in p2194.				

r2199.0...11		CO/BO: Status word monitoring 3 / ZSW monitor 3

	00	Data save active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Non-volatile data save active for p2230.0 = 1	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-
Dependency:	Refer to: r2231, p2240				
Notice:	The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:				
	- Firmware with V2.3 or higher.				
	- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).				
Note:	For bit 00:				
	0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.				
	1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.				
	For bit 02:				
	0: Without initial rounding-off				
	1: With initial rounding-off.				
	The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).				
	It is calculated as follows:				
	$r = 0.0001 \times \max(p2237, p2238) [\%] / 0.13^2 [s^2]$				
	The jerk is active until maximum acceleration is reached ($a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$); after this, the drive continues to operate with constant, linear acceleration.				
	The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.				
	For bit 03:				
	0: Non-volatile data save deactivated.				
	1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).				
	For bit 04:				
	When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.				

2 Parameters

2.2 List of parameters

r2231	Technology controller motorized potentiometer setpoint memory / Tec_ctrl moP mem		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: - Max - [%]	Access level: 2 Func. diagram: 7954 Unit selection: p0595 Expert list: 1 Factory setting - [%]
Description:	Displays the setpoint memory for the motorized potentiometer of the technology controller. For p2230.0 = 1, the last setpoint that was saved is entered after ON.		
Dependency:	Refer to: p2230

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.0 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [s]	Access level: 2 Func. diagram: 7954 Unit selection: - Expert list: 1 Factory setting 10.0 [s]
Description:	Sets the ramp-up time for the internal ramp-function generator for the motorized potentiometer of the technology controller.		
Dependency:	Refer to: p2248		
Note:	The time is referred to 100 %. When the initial rounding-off is activated (p2230.2 = 1) the ramp-up is correspondingly extended.		
p2248[0...n]	Technology controller motorized potentiometer ramp-down time / Tec_ctrMoP t_rdown		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.0 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [s]	Access level: 2 Func. diagram: 7954 Unit selection: - Expert list: 1 Factory setting 10.0 [s]
Description:	Sets the ramp-down time for the internal ramp-function generator for the motorized potentiometer of the technology controller.		
Dependency:	Refer to: p2247		
Note:	The time is referred to 100 %. When the initial rounding-off is activated (p2230.2 = 1) the ramp-down is correspondingly extended.		
r2250	CO: Technology controller motorized potentiometer setpoint after RFG / Tec_ctr moP aftRFG		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max - [%]	Access level: 2 Func. diagram: 7954 Unit selection: p0595 Expert list: 1 Factory setting - [%]
Description:	Displays the effective setpoint after the internal ramp-function generator for the motorized potentiometer of the technology controller.		
Dependency:	Refer to: r2245		

p2252		Technology controller configuration / Tec_ctrl config			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned16 P-Group: Modulation Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0111 bin		
Description:	Sets the configuration of the technology controller.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Ramp-up/down time independent of setpoint sign	Yes	No	-
	01	Integrator independent of Kp	Yes	No	-
	02	Output signal without ramp active	Yes	No	-
	03	Actual value limit	Yes	No	-
	07	Activate Kp adaptation	Yes	No	7958
	08	Activate Tn adaptation	Yes	No	7958
Dependency:	Refer to: p2257, p2258, p2267, p2268, p2280, p2285				
Note:	For bit 00 = 0: The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle. For bit 00 = 1: When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time. For bit 01 = 0: The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time). For bit 01 = 1: The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0. For bit 02 = 0: When the PID controller is deactivated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293. For bit 02 = 1: When the PID controller is deactivated via p2200, the output signal r2294 is set directly to zero. For bit 03 = 0: The actual values are not limited by p2267 and p2268. For bit 03 = 1: The actual values are limited by p2267 and p2268.				
p2253[0...n]		CI: Technology controller setpoint 1 / Tec_ctrl set 1			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0		
Description:	Sets the signal source for the setpoint 1 of the technology controller.				
Dependency:	Refer to: p2254, p2255

2 Parameters

2.2 List of parameters

p2263	Technology controller type / Tec_ctrl type			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T Data type: Integer16 P-Group: Technology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0	
Description:	Sets the type of technology controller.			
Value:	0: D component in the actual value signal 1: D component in system deviation			
p2264[0...n]	CI: Technology controller actual value / Tec_ctrl ActV			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0	
Description:	Sets the signal source for the actual value of the technology controller.			
p2265	Technology controller actual value filter time constant / Tec_ctrl act Tc			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60.000 [s]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0.000 [s]	
Description:	Sets the time constant for the actual value filter (PT1) of the technology controller.			
r2266	CO: Technology controller actual value after filter / Tec_ctr act aftFil			
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max - [%]	Access level: 2 Func. diagram: 7958 Unit selection: p0595 Expert list: 1 Factory setting - [%]	
Description:	Display and connector output for the smoothed actual value after the filter (PT1) of the technology controller.			

p2267	Technology controller upper limit actual value / Tec_ctrl u_lim act		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -10000.00 [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max 10000.00 [%]	Access level: 3 Func. diagram: 7958 Unit selection: p0595 Expert list: 1 Factory setting 200.00 [%]

Description: Sets the upper limit for the actual value signal of the technology controller.

Dependency: Refer to: p2252, p2264, p2265, p2271
Refer to: F07426

Notice: If the actual value exceeds this upper limit, this results in fault F07426.

Note: Limiting only active for p2252.3 = 1.

p2268	Technology controller lower limit actual value / Tec_ctrl l_lim act		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -10000.00 [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max 10000.00 [%]	Access level: 3 Func. diagram: 7958 Unit selection: p0595 Expert list: 1 Factory setting -200.00 [%]

Description: Sets the lower limit for the actual value signal of the technology controller.

Dependency: Refer to: p2252, p2264, p2265, p2271
Refer to: F07426

Notice: If the actual value falls below this lower limit, this results in fault F07426.

Note: Limiting only active for p2252.3 = 1.

p2269	Technology controller gain actual value / Tec_ctrl gain ActV		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 500.00 [%]	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 100.00 [%]

Description: Sets the scaling factor for the actual value of the technology controller.

Dependency: Refer to: p2264, p2265, p2267, p2268, p2271

Note: For 100%, the actual value is not changed.

p2270	Technology controller actual value function / Tec_ctr ActV fct		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Integer16 P-Group: Technology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to use an arithmetic function for the actual value signal of the technology controller.		
Value:	0: Output (y) = input (x) 1: Root function (root from x) 2: Square function (x * x) 3: Cube function (x * x * x)		
Dependency:	Refer to: p2264, p2265, p2267, p2268, p2269, p2271		
p2271	Technology controller actual value inversion (sensor type) / Tec_ctrl ActV inv		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T Data type: Integer16 P-Group: Technology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to invert the actual value signal of the technology controller. The inversion depends on the sensor type for the actual value signal.		
Value:	0: No inversion 1: Inversion actual value signal		
Caution:	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			
Note:	The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal of the technology controller. --> If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion). --> If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted).		
r2272	CO: Technology controller actual value scaled / Tec_ctrl ActV scal		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max - [%]	Access level: 2 Func. diagram: 7958 Unit selection: p0595 Expert list: 1 Factory setting - [%]
Description:	Display and connector output for the scaled actual value signal of the technology controller.		
Dependency:	Refer to: p2264, p2265, r2266, p2267, p2268, p2269, p2270, p2271		

r2273	CO: Technology controller system deviation / Tec_ctrl SysDev		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: 9_1 Scaling: PERCENT Max - [%]	Access level: 2 Func. diagram: 7958 Unit selection: p0595 Expert list: 1 Factory setting - [%]
Description:	Displays the system deviation between the setpoint and actual value of the technology controller.		
Dependency:	Refer to: p2263		

p2274	Technology controller differentiation time constant / Tec_ctrl D comp Tc		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60.000 [s]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0.000 [s]
Description:	Sets the time constant for the differentiation (D component) of the technology controller.		
Note:	p2274 = 0: Differentiation is disabled.		

p2280	Technology controller proportional gain / Tec_ctrl Kp		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.000	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 1.000
Description:	Sets the proportional gain (P component) of the technology controller.		
Dependency:	Refer to: p2252		
Note:	p2280 = 0: The proportional gain is disabled.		

p2285	Technology controller integral time / Tec_ctrl Tn		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60.000 [s]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0.000 [s]
Description:	Sets the integral time (I component, integrating time constant) of the technology controller.		
Dependency:	Refer to: p2252		
Note:	p2285 = 0: The integral time is disabled.		

p2286[0...n]	BI: Hold technology controller integrator / Tec_ctr integ hold		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to hold the integrator for the technology controller.		

p2289[0...n]	CI: Technology controller precontrol signal / Tec_ctr prectr_sig		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the precontrol signal of the technology controller.		

p2291	CO: Technology controller maximum limiting / Tec_ctrl max_lim		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -200.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max 200.00 [%]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the maximum limit of the technology controller.		
Dependency:	Refer to: p2292		
Caution:	The maximum limit must always be greater than the minimum limit (p2291 > p2292).		
			

p2292	CO: Technology controller minimum limiting / Tec_ctrl min_lim		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -200.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max 200.00 [%]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Sets the minimum limit of the technology controller.		
Dependency:	Refer to: p2291		
Caution:	The maximum limit must always be greater than the minimum limit (p2291 > p2292).		
			

p2293	Technology controller ramp-up/ramp-down time / Tec_ctrl t_RU/RD		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.00 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100.00 [s]	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 1.00 [s]
Description:	Sets the ramping time for the output signal of the technology controller.		
Dependency:	Refer to: p2291, p2292		
Note:	The time refers to the set maximum and minimum limits (p2291, p2292).		

r2294	CO: Technology controller output signal / Tec_ctrl outp_sig		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - [%]	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Display and connector output for the output signal of the technology controller.		
Dependency:	Refer to: p2295		

p2295	CO: Technology controller output scaling / Tec_ctrl outp_scal		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -100.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max 100.00 [%]	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Sets the scaling for the output signal of the technology controller.		

p2296[0...n]	CI: Technology controller output scaling / Tec_ctrl outp_scal		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 2295[0]
Description:	Sets the signal source for the scaling value of the technology controller.		
Dependency:	Refer to: p2295		

2 Parameters

2.2 List of parameters

p2297[0...n]	CI: Technology controller maximum limit signal source / Tec_ctrl max_l s_s		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 2291[0]
Description:	Sets the signal source for the maximum limiting of the technology controller.		
Dependency:	Refer to: p2291		
p2298[0...n]	CI: Technology controller minimum limit signal source / Tec_ctrl min_l s_s		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 2292[0]
Description:	Sets the signal source for the minimum limiting of the technology controller.		
Dependency:	Refer to: p2292		
p2299[0...n]	CI: Technology controller limit offset / Tec_ctrl lim offs		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the offset of the output limiting of the technology controller.		
p2306	Technology controller system deviation inversion / Tec_ctr SysDev inv		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T Data type: Integer16 P-Group: Technology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: 7958 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to invert the system deviation of the technology controller. The setting depends on the type of control loop.		
Value:	0: No inversion 1: Inversion		
Caution:	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			

Note: The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:
The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).

If value = 1:
The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

p2310 CI: Technology controller Kp adaptation input value signal source / Kp adpt inp s_s

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the input value of the adaptation of proportional gain Kp for the technology controller.

Dependency: Refer to: p2252, p2311, p2312, p2313, p2314, p2315, r2316

p2311 Technology controller Kp adaptation lower value / Kp adpt lower val

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	1000.000	1.000

Description: Sets the lower value for the adaptation of proportional gain Kp for the technology controller.

Dependency: Refer to: p2310, p2312, p2313, p2314, p2315, r2316

Caution: The upper value must be set higher than the lower value (p2312 > p2311).

Note: Kp adaptation is activated with p2252.7 = 1.

p2312 Technology controller Kp adaptation upper value / Kp adpt upper val

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	1000.000	10.000

Description: Sets the upper value for the adaptation of proportional gain Kp for the technology controller.

Dependency: Refer to: p2310, p2311, p2313, p2314, p2315, r2316

Caution: The upper value must be set higher than the lower value (p2312 > p2311).

Note: Kp adaptation is activated with p2252.7 = 1.

p2313 Technology controller Kp adaptation lower starting point / Kp adpt lower pt

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min 0.00 [%]	Max 400.00 [%]	Factory setting 0.00 [%]

Description: Sets the lower starting point for the adaptation of proportional gain Kp for the technology controller.

Dependency: Refer to: p2310, p2311, p2312, p2314, p2315, r2316

Caution: The upper starting point must be set higher than the lower starting point (p2314 > p2313).

Note: Kp adaptation is activated with p2252.7 = 1.

p2314 Technology controller Kp adaptation upper starting point / Kp adpt upper pt

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min 0.00 [%]	Max 400.00 [%]	Factory setting 100.00 [%]

Description: Sets the upper activation point for the adaptation of proportional gain Kp for the technology controller.

Dependency: Refer to: p2310, p2311, p2312, p2313, p2315, r2316

Caution: The upper starting point must be set higher than the lower starting point (p2314 > p2313).

Note: Kp adaptation is activated with p2252.7 = 1.

p2315 CI: Technology controller Kp adaptation scaling signal source / Kp adpt scal s_s

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 7959
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min -	Max -	Factory setting 1

Description: Sets the signal source to scale the results of the adaptation of the proportional gain Kp for the technology controller.

Dependency: Refer to: p2310, p2311, p2312, p2313, p2314, r2316

Note: Kp adaptation is activated with p2252.7 = 1.

r2316	CO: Technology controller, Kp adaptation output / Kp adpt outp		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: 7959 Unit selection: - Expert list: 1 Factory setting -
Description:	Display and connector output for the output signal of the adaptation of proportional gain Kp for the technology controller.		
Dependency:	Refer to: p2252, p2310, p2311, p2312, p2313, p2314, p2315		
p2317	CI: Technology controller Tn adaptation input value signal source / Tn adpt inp s_s		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Technology Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max -	Access level: 2 Func. diagram: 7959 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the input value of the adaptation of integral time Tn for the technology controller.		
Dependency:	Refer to: p2252, p2318, p2319, p2320, p2321, r2322		
Note:	Tn adaptation is activated with p2252.8 = 1.		
p2318	Technology controller Tn adaptation upper value / Tn adpt upper val		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60.000 [s]	Access level: 2 Func. diagram: 7959 Unit selection: - Expert list: 1 Factory setting 3.000 [s]
Description:	Sets the upper value for the adaptation of integral time Tn for the technology controller.		
Dependency:	Refer to: p2317, p2319, p2320, p2321, r2322		
Note:	Tn adaptation is activated with p2252.8 = 1.		
p2319	Technology controller Tn adaptation lower value / Tn adpt lower val		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.000 [s]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60.000 [s]	Access level: 2 Func. diagram: 7959 Unit selection: - Expert list: 1 Factory setting 10.000 [s]
Description:	Sets the lower value for the adaptation of integral time Tn for the technology controller.		
Dependency:	Refer to: p2317, p2318, p2320, p2321, r2322		
Note:	Tn adaptation is activated with p2252.8 = 1.		

p2320	Technology controller Tn adaptation lower starting point / Tn adpt lower pt		
SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Technology Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max 400.00 [%]	Access level: 2 Func. diagram: 7959 Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Sets the lower activation point for the adaptation of integral time Tn for the technology controller.		
Dependency:	Refer to: p2317, p2318, p2319, p2321, r2322		
Caution:	The upper starting point must be set higher than the lower starting point (p2321 > p2320).

Note:	Tn adaptation is activated with p2252.8 = 1.		

r2349.0...13 CO/BO: Technology controller status word / Tec_ctrl ZSW

SERVO (Tech_ctrl), VECTOR (Tech_ctrl), SERVO_AC (Tech_ctrl), VECTOR_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 7958
	P-Group: Technology	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and BICO output for the status word of the technology controller.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Technology controller deactivated	Yes	No	-
	01	Technology controller limited	Yes	No	-
	02	Technology controller motorized potentiometer limited max	Yes	No	-
	03	Technology controller motorized potentiometer limited min	Yes	No	-
	04	Technology controller speed setpoint total in setpoint channel	Yes	No	-
	05	Technology controller RFG bypassed in the setpoint channel	Yes	No	-
	06	Technology controller starting value at the current limit	No	Yes	-
	07	Technology controller output negative	Yes	No	-
	08	Technology controller actual value at the minimum	Yes	No	-
	09	Technology controller actual value at the maximum	Yes	No	-
	10	Technology controller output at the minimum	Yes	No	-
	11	Technology controller output at the maximum	Yes	No	-
	12	Fault response active	Yes	No	-
	13	Technology controller limiting enable	Yes	No	-

p2369 BI: Closed-loop cascade control, control word / Csc_ctrl STW

VECTOR (Tech_ctrl), VECTOR_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the selection of the "Switch in motor" function.

When the function is selected, monitoring of the switches is deactivated with the "bypass" function. This means that the power unit can be connected to other motors via an external control without switch monitoring responding.

p2502[0...n] LR encoder assignment / Encoder assignment

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: C2(25)	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 4010
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	1

Description: Setting to assign the encoder.

The actual value preprocessing and the closed-loop position control are carried out using the assigned encoder.

2 Parameters

2.2 List of parameters

Value:
 0: No encoder
 1: Encoder 1
 2: Encoder 2
 3: Encoder 3

Dependency: Refer to: p0187, p0188, p0189

Notice: For the setting p2502 = 0 (no encoder), closed-loop position control is not possible. This setting is only practical as supportive measure to implement encoderless closed-loop speed control (e.g. if the motor encoder is defective).

Note: The assigned encoder (p2502 = 1, 2, 3) must be allocated an encoder data set (p0187, p0188, p0189).

Note:	The gearbox factor between the encoder shaft and the motor shaft is set using p0432 and p0433.		
p2506[0...n]	LR length unit LU per load path / LU per load path		
SERVO (APC, AVS/APC-ECO, Lin, Pos ctrl), SERVO_AC (APC, AVS/APC-ECO, Lin, Pos ctrl), SERVO_I_AC (APC, AVS/APC-ECO, Lin)	Can be changed: C2(25) Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 1 [LU]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2147483647 [LU]	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 10000 [LU]
Description:	Sets the neutral length units LU per load path. Therefore, for a rotary encoder, a reference is established between the physical arrangement and the neutral length units LU used in the drive. Example: Rotary encoder, ballscrew with 10 mm/revolution, 10 mm should be broken down to units of μm (i.e. 1 LU = 1 μm). --> One load path corresponds to 10000 LU --> p2506 = 10000		
Note:	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the precontrol is active. Increasing p2506 counteracts this behavior.		
p2506[0...n]	LR length unit LU per load revolution / LU per load rev		
SERVO (APC, AVS/APC-ECO, Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (APC, AVS/APC-ECO, Pos ctrl), VECTOR_AC (Pos ctrl), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: C2(25) Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 1 [LU]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2147483647 [LU]	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 10000 [LU]
Description:	Sets the neutral length units LU per load revolution. Therefore, for a rotary encoder, a reference is established between the physical arrangement and the neutral length units LU used in the drive. Example: Rotary encoder, ballscrew with 10 mm/revolution, 10 mm should be broken down to units of μm (i.e. 1 LU = 1 μm). --> One load revolution corresponds to 10000 LU --> p2506 = 10000		
Note:	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the precontrol is active. Increasing p2506 counteracts this behavior.		

2 Parameters

2.2 List of parameters

p2507[0...n]	LR absolute encoder adjustment status / Abs_enc_adj stat		
SERVO (EPOS, Pos ctrl), VECTOR (EPOS, Pos ctrl), SERVO_AC (EPOS, Pos ctrl), VECTOR_AC (EPOS, Pos ctrl)	Can be changed: U, T Data type: Integer16 P-Group: Closed-loop position control Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 4	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 1
Description:	Activates the adjustment and display of the status of the adjustment for absolute encoders. For p2507 = 2: This initiates encoder adjustment. The status is displayed using the other values. For p2507 = 4: This means that the encoder adjustment offset (p2525) can be directly accepted after new commissioning, without having to approach the adjustment point.		
Value:	0: Error occurred while adjusting 1: Absolute encoder not adjusted 2: Absolute encoder not adjusted and encoder adjustment initiated 3: Absolute encoder adjusted 4: Absolute encoder adjustment by accepting the offset		
Dependency:	Refer to: p2525, p2598, p2599, p2733		
Caution:	For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after switch-off/switch-on. In this range, it is only permissible that the encoder overflows. After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system. If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443. There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after switch-off/switch-on. When adjusting, the position actual value is set to the reference point. For p2507 = 4: For an adjustment where the offset is accepted, the position actual value manifests a step.		
Note:	In order to permanently save the determined position offset (p2525) and the DDS number (p2733), they must be saved in a non-volatile fashion (p0971, p0977). This adjustment can only be initiated for an absolute encoder.		
p2508[0...3]	BI: LR activate reference mark search / Ref_mark act		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the function "activate reference mark search".		
Index:	[0] = Position control [1] = Encoder 1 [2] = Encoder 2 [3] = Encoder 3		
Dependency:	Refer to: p0490, p0495, p2502, p2509, r2684 Refer to: A07495		
Notice:	When activating the function "set position actual value" while the function "reference mark search" is activated, then the function "reference mark search" is automatically deactivated.		

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established:
 BI: p2508[0] = r2684.0
 The function can only be activated using a 0/1 signal if no reference function is active (r2526.2).
 If "reference mark search" and "measuring probe evaluation" are simultaneously activated, then no function is activated and the actual function is interrupted.

p2509[0...3] BI: LR activate measuring probe evaluation / MT_eval act

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 0
--	--	--	--

Description: Sets the signal source for the function "activate measuring probe evaluation".
 0/1 signal:
 The function "activate measuring probe evaluation" is started.

Index: [0] = Position control
 [1] = Encoder 1
 [2] = Encoder 2
 [3] = Encoder 3

Dependency: Refer to: p0488, p0489, p0490, p2502, p2508, p2510, p2511, p2517, p2518
 Refer to: A07495

Notice: When the "set position actual value" is activated while the function "measuring probe evaluation" is activated, then the function "measuring probe evaluation" is automatically deactivated.

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established:
 BI: p2509[0] = r2684.1
 The function can only be activated using a 0/1 signal if no reference function is active (r2526.2).
 If "reference mark search" and "measuring probe evaluation" are simultaneously activated, then no function is activated and the actual function is interrupted.

p2510[0...3] BI: LR selecting measuring probe evaluation / MT_eval select

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3615, 4010 Unit selection: - Expert list: 1 Factory setting 0
--	--	--	--

Description: Sets the signal source to select the measuring probe.
 1 signal = measuring probe 2 is activated for binector input p2509 = 0/1 edge.
 0 signal = measuring probe 1 is activated for binector input p2509 = 0/1 edge.

Index: [0] = Position control
 [1] = Encoder 1
 [2] = Encoder 2
 [3] = Encoder 3

Dependency: Refer to: p2502, p2509, p2511

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established:
 BI: p2509[0] = r2684.1
 The measuring probe is selected at the 0/1 signal transition at r2684.1 (flying referencing active).

2 Parameters

2.2 List of parameters

p2511[0...3]	BI: LR measuring probe evaluation edge / MT_eval edge		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3615, 4010 Unit selection: - Expert list: 1 Factory setting 0

Description:	Sets the input terminal for direct measuring probe 1. The direct measuring probe can either be parameterized as a non-cyclic (value 1 ... 8) or a cyclic (value 11 ... 18) measuring probe. After it has been activated via binector input: p2509 = 0/1 signal, the non-cyclic measuring probe measures once and can be used with EPOS. After it has been activated via the p2509 = 1 signal, the cyclic measuring probe measures cyclically and cannot be used with EPOS. In order to process signals faster, the direct measuring probe bypasses the handshake technique via the encoder control word and encoder status word.		
Value:	0: No measuring probe 1: DI/DO 9 (X122.10/X121.8) 2: DI/DO 10 (X122.12/X121.10) 3: DI/DO 11 (X122.13/X121.11) 4: DI/DO 13 (X132.10/X131.2) 5: DI/DO 14 (X132.12/X131.4) 6: DI/DO 15 (X132.13/X131.5) 7: DI/DO 8 (X122.9/X121.7) 8: DI/DO 12 (X132.9/X131.1) 11: DI/DO 9 cyclic 12: DI/DO 10 cyclic 13: DI/DO 11 cyclic 14: DI/DO 13 cyclic 15: DI/DO 14 cyclic 16: DI/DO 15 cyclic 17: DI/DO 8 cyclic 18: DI/DO 12 cyclic 50: DI/DO 0 distributed (X3.2) 51: DI/DO 1 distributed (X3.4)		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		
Dependency:	Refer to: p0490, p0728, p2509, p2510, p2511		

Caution:

In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

Notice:

To select the values:

For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).

Regarding the terminal designation:

The first designation is valid for CU320-2, the second for CU310-2.

Note:

DI/DO: Bidirectional Digital Input/Output

The terminal must be set as input (p0728).

If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580 or p0680.

Direct measurement via p2517 has a higher priority than measurements via p0488.

For the direct measuring probe evaluation, the DP clock cycle must be integer multiple of the position controller clock cycle.

Index: [0] = Encoder 1
[1] = Encoder 2
[2] = Encoder 3

Dependency: Refer to: p0490, p0728, p2509, p2510, p2511

Caution: In order to prevent incorrect measurement values, these parameters may not be written during an active measurement.

Notice:

To select the values:
For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).
Regarding the terminal designation:
The first designation is valid for CU320-2, the second for CU310-2.

Note: DI/DO: Bidirectional Digital Input/Output
 The terminal must be set as input (p0728).
 If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580 or p0680.
 Direct measurement via p2518 has a higher priority than measurements via p0489.
 For the direct measuring probe evaluation, the DP clock cycle must be integer multiple of the position controller clock cycle.

p2518[0...2] LR direct measuring probe 2 / Direct MT 2

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Integer16 P-Group: Closed-loop position control Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 18	Access level: 3 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 0
--	---	---	--

Description: Sets the input terminal for direct measuring probe 2.
 The direct measuring probe can either be parameterized as a non-cyclic (value 1 ... 8) or a cyclic (value 11 ... 18) measuring probe.
 After it has been activated via binector input: p2509 = 0/1 signal, the non-cyclic measuring probe measures once and can be used with EPOS.
 After it has been activated via the p2509 = 1 signal, the cyclic measuring probe measures cyclically and cannot be used with EPOS.
 In order to process signals faster, the direct measuring probe bypasses the handshake technique via the encoder control word and encoder status word.

Value:

0:	No measuring probe
1:	DI/DO 9 (X122.10/X121.8)

p2519[0...n] LR position actual value preprocessing config. DDS changeover / s_act config DDS

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	5	1

Description: Sets the behavior of the position actual value preprocessing for the position controller for a DDS changeover.
For p2519 = 1:
In the following cases, for a DDS changeover, the actual position actual value becomes invalid and the reference point is reset:

- the EDS effective for the closed-loop position control changes.
- the encoder assignment changes (p2502).
- the mechanical relationships change (p2503 ... p2506).
- the direction of rotation changes (p1821).

For absolute encoders, the status of the adjustment (p2507) is also reset if the same absolute encoder remains selected for the closed-loop position control, but the mechanical relationships or the direction of rotation have changed.

In the operation state, in addition, a fault (F07494) is generated.

Notice: The remaining setting values are intended for expanded functionality.

Note: The behavior for a DDS changeover is determined using the value of p2519 in the target data set.

r2520[0...2] CO: LR Position actual value preprocessing encoder control word / ActV_prep STW

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1

	Min	Max	Factory setting
	0.00 [ms]	100.00 [ms]	0.00 [ms]

Description: Sets a PT1 filter to emulate the timing behavior of the closed-speed control loop.

Dependency: Refer to: p2535

Notice: When speed precontrol is inactive (p2534 = 0 %), the following applies:
If a PT1 filter has been set, it is not effective.

Note: Together with p2535, the timing behavior of the closed-loop control loop can be emulated.

p2537 CI: LR position controller adaptation / Adaptation

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-	-	1

Description: Sets the signal source for the adaptation of the proportional gain of the position controller.

Dependency: Refer to: p2538

p2538[0...n] LR proportional gain / Kp

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [1000 rpm]	300.000 [1000 rpm]	1.000 [1000 rpm]

Description: Sets the proportional gain (P gain, position loop gain, Kv factor) of the position controller.

Dependency: Refer to: p2537, p2539, p2555, r2557, r2558

Note: The proportional gain is used define at which traversing velocity which following error is obtained (without precontrol)
 Low proportional gain:
 Slow response to a setpoint - actual value difference, the following error becomes large.
 High proportional gain:
 Fast response to the setpoint - actual value difference, the following error becomes small.

p2539[0...n]	LR integral time / Tn		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100000.00 [ms]	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Setting to activate the integral time of the position controller. Value = 0 ms --> The I component of the position controller is deactivated.		
Dependency:	Refer to: p2538, r2559		

p2540	CO: LR position controller output velocity limit / LR_outp v_lim		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min 0.000 [m/min]	Calculated: - Dyn. index: - Unit group: 4_1 Scaling: p2000 Max 1000.000 [m/min]	Access level: 3 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting 1000.000 [m/min]
Description:	Setting and connector output for the velocity limit of the position controller output.		
Dependency:	Refer to: p2541		

p2540	CO: LR position controller output speed limit / LR_outp n_lim		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min 0.000 [rpm]	Calculated: - Dyn. index: - Unit group: 3_1 Scaling: p2000 Max 210000.000 [rpm]	Access level: 3 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting 210000.000 [rpm]
Description:	Setting and connector output for the speed limit of the position controller output.		
Dependency:	Refer to: p2541		

p2541	CI: LR position controller output velocity limit signal source / LR_outp v_lim s_s		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: p2000 Max -	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 2540[0]
Description:	Sets the signal source for the position controller output limit.		
Dependency:	Refer to: p2540		

2 Parameters

2.2 List of parameters

p2541	CI: LR position controller output speed limit signal source / LR_outp n_lim s_s
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - Max -
	Calculated: - Dyn. index: - Unit group: - Scaling: p2000
	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 2540[0]
Description:	Sets the signal source for the position controller output limit.
Dependency:	Refer to: p2540
<hr/>	
p2542	LR standstill window / Standstill window
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 0 [LU]
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647 [LU]
	Access level: 1 Func. diagram: 4020 Unit selection: - Expert list: 1 Factory setting 200 [LU]
Description:	Sets the standstill window for the standstill monitoring function. After the standstill monitoring time expires, it is cyclically checked whether the difference between the setpoint and actual position is located within the standstill window and, if required, an appropriate fault is output. Value = 0 --> The standstill monitoring is deactivated.
Dependency:	Refer to: p2543, p2544 Refer to: F07450
Note:	The following applies for the setting of the standstill window and positioning window: Standstill window (p2542) >= positioning window (p2544)
<hr/>	
p2543	LR standstill monitoring time / t_standstill mon
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min 0.00 [ms]
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100000.00 [ms]
	Access level: 1 Func. diagram: 4020 Unit selection: - Expert list: 1 Factory setting 200.00 [ms]
Description:	Sets the standstill monitoring time for the standstill monitoring function. After the standstill monitoring time expires, it is cyclically checked whether the difference between the setpoint and actual position is located within the standstill window and, if required, an appropriate fault is output.
Dependency:	Refer to: p2542, p2545 Refer to: F07450
Note:	The following applies for the setting of the standstill and positioning monitoring time: Standstill monitoring time (p2543) <= positioning monitoring time (p2545)
<hr/>	
p2544	LR positioning window / Pos_window
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 0 [LU]
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647 [LU]
	Access level: 1 Func. diagram: 4020 Unit selection: - Expert list: 1 Factory setting 40 [LU]
Description:	Sets the positioning window for the positioning monitoring function. After the positioning monitoring time expires, it is checked once as to whether the difference between the setpoint and actual position lies within the positioning window and if required an appropriate fault is output. Value = 0 --> The positioning monitoring function is deactivated.

Dependency: Refer to: p2542, p2545, r2684
Refer to: F07451

Note: The following applies for the setting of the standstill and positioning window:
Standstill window (p2542) >= positioning window (p2544)

p2545 **LR positioning monitoring time / t_pos_mon**

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4020
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	100000.00 [ms]	1000.00 [ms]

Description: Sets the positioning monitoring time for the positioning monitoring.
After the positioning monitoring time expires, it is checked once as to whether the difference between the setpoint and actual position lies within the positioning window and if required an appropriate fault is output.

Dependency: Refer to: p2543, p2544, r2684
Refer to: F07451

Note: The following applies for the setting of the standstill and positioning monitoring time:
Standstill monitoring time (p2543) <= positioning monitoring time (p2545)

p2546[0...n] **LR dynamic following error monitoring tolerance / s_delta_mon tol**

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: 4025
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [LU]	2147483647 [LU]	1000 [LU]

Description: Sets the tolerance for the dynamic following error monitoring.
If the dynamic following error (r2563) exceeds the selected tolerance, then an appropriate fault is output.
Value = 0 --> The dynamic following error monitoring is deactivated.

Dependency: Refer to: r2563, r2684
Refer to: F07452

Note: The tolerance bandwidth is intended to prevent the dynamic following error monitoring incorrectly responding due to operational control sequences (e.g. during load surges).

p2547 **LR cam switching position 1 / Cam position 1**

SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 4025
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-2147483648 [LU]	2147483647 [LU]	0 [LU]

Description: Sets the cam switching position 1.

Dependency: Refer to: p2548, r2683

Caution: Only after the axis has been referenced can it be guaranteed that the cam switching signals when output have a "true" position reference.

Note: Position actual value <= cam switching position 1 --> r2683.8 = 1 signal
Position actual value > cam switching position 1 --> r2683.8 = 0 signal

2 Parameters

p2548	LR cam switching position 2 / Cam position 2		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min -2147483648 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647 [LU]	Access level: 1 Func. diagram: 4025 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the cam switching position 2.		
Dependency:	Refer to: p2547, r2683		
Caution:	Only after the axis has been referenced can it be guaranteed that the cam switching signals when output have a "true" position reference.		
			
Note:	Position actual value <= cam switching position 2 --> r2683.9 = 1 signal Position actual value > cam switching position 2 --> r2683.9 = 0 signal		
<hr/>			
p2549	BI: LR enable 1 / Enable 1		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 899.2
Description:	Sets the signal source for the position controller enable 1.		
Dependency:	Refer to: r0899, p2550		
Note:	The position controller is enabled by the following AND logic operation: - BI: p2549 - BI: p2550		
<hr/>			
p2550[0...n]	BI: LR enable 2 / Enable 2		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the position controller enable 2.		
Dependency:	Refer to: p2549		
Note:	The position controller is enabled by the following AND logic operation: - BI: p2549 - BI: p2550 When the "Position control" or "Basic positioner" function module is activated, the following BICO interconnection is established: - BI: p2550 = 1		

p2551	BI: LR setpoint signal fixed / Mess set fixed		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4020 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the "setpoint fixed" signal. BI: p2551 = 1 signal: The end of the positioning operation on the setpoint side is signaled and the positioning and standstill monitoring activated. BI: p2551 = 0 signal: The start of a positioning operation or tracking mode on the setpoint side is signaled and the positioning and standstill monitoring deactivated.		
Dependency:	Refer to: p2554, r2683		
Note:	When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established: BI: p2551 = r2683.2		
p2552	BI: LR signal travel to fixed stop active / Signal TfS act		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4025 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the signal "travel to fixed stop active". BI: p2552 = 1 signal: The activity associated with travel to fixed stop is signaled and the detection of the fixed stop is started via the maximum following error (p2634).		
Dependency:	Refer to: r2683		
Note:	When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established: BI: p2552 = r2683.14		
p2553	BI: LR signal fixed stop reached / Signal fixed stop		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4025 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the signal "fixed stop reached". BI: p2553 = 1 signal: When the fixed stop is reached, this is signaled and the fixed stop monitoring window is activated.		
Dependency:	Refer to: r2683		
Note:	When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established: BI: p2553 = r2683.12		

2 Parameters

2.2 List of parameters

p2554	BI: LR signal traversing command active / Sig trav_cmnd act
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min - Max -
	Calculated: - Dyn. index: - Unit group: - Scaling: -
	Access level: 1 Func. diagram: 4020 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the signal "traversing command active". BI: p2554 = 1 signal: It is signaled that positioning is active and therefore the positioning monitoring is not activated with the signal "setpoint fixed" (p2551).
Dependency:	Refer to: p2551, r2684
Note:	When the function module "basic positioner" (r0108.4 = 1) is activated, the following BICO interconnection is established: BI: p2554 = r2684.15

p2555	CI: LR LU/revolution LU/mm / LU/rev LU/mm
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - Max -
	Calculated: - Dyn. index: - Unit group: - Scaling: -
	Access level: 3 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting 2524[0]
Description:	Sets the signal source for the reference of the internal length unit LU (Length Unit). For rotary encoders, reference is made to a motor revolution - and for linear encoders, reference is made to mm.
Dependency:	Refer to: p0404, r2524
Note:	The signal value is used to convert the length unit to the speed or velocity setpoint.

r2556	CO: LR position setpoint after setpoint smoothing / s_set after interp
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min - [LU] Max - [LU]
	Calculated: - Dyn. index: - Unit group: - Scaling: -
	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Display and connector output for the position setpoint after setpoint smoothing.

r2557	CO: LR position controller input system deviation / LR_inp SysDev
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min - [LU] Max - [LU]
	Calculated: - Dyn. index: - Unit group: - Scaling: -
	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Display and connector output for the difference between the position setpoint and the position actual value at the position controller input.

r2558	CO: LR position controller output P component / LR_outp P comp		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4015

	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Display and connector output for the I component at the output of the position controller (velocity setpoint).		

r2559	CO: LR position controller output I component / LR_outp I comp		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Display and connector output for the I component at the output of the position controller (speed setpoint).		

r2560	CO: LR velocity setpoint / v_set		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Display and connector output for the velocity setpoint after limiting (CI: p2541).		

2 Parameters

2.2 List of parameters

r2560	CO: LR speed setpoint / n_set		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [rpm]	Calculated: - Dyn. index: - Unit group: 3_1 Scaling: p2000 Max - [rpm]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [rpm]
Description:	Display and connector output for the speed setpoint after limiting (CI: p2541).		
<hr/>			
r2561	CO: LR velocity precontrol value / v_prectrl val		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [m/min]	Calculated: - Dyn. index: - Unit group: 4_1 Scaling: p2000 Max - [m/min]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [m/min]
Description:	Display and connector output for the velocity setpoint as a result of precontrol.		
<hr/>			
r2561	CO: LR speed precontrol value / n_prectrl val		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [rpm]	Calculated: - Dyn. index: - Unit group: 3_1 Scaling: p2000 Max - [rpm]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [rpm]
Description:	Display and connector output for the speed setpoint as a result of precontrol.		
<hr/>			
r2562	CO: LR velocity setpoint total / v_set total		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [m/min]	Calculated: - Dyn. index: - Unit group: 4_1 Scaling: p2000 Max - [m/min]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [m/min]
Description:	Display and connector output for the total velocity setpoint. This value is obtained from the sum of the velocity precontrol and position controller output.		
Dependency:	Refer to: r2560, r2561		
<hr/>			
r2562	CO: LR total speed setpoint / n_set total		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [rpm]	Calculated: - Dyn. index: - Unit group: 3_1 Scaling: p2000 Max - [rpm]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [rpm]
Description:	Display and connector output for the total speed setpoint. This value is obtained from the sum of the speed precontrol and position controller output.		
Dependency:	Refer to: r2560, r2561		

r2563	CO: LR following error dynamic model / Follow error dyn		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 4025 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Display and connector output for the dynamic following error. This value is the deviation, corrected by the velocity-dependent component, between the position setpoint and the position actual value.		
Note:	For $p2534 \geq 100\%$ (precontrol activated) the following applies: The dynamic following error (r2563) corresponds to the system deviation (r2557) at the position controller input. For $0\% < p2534 < 100\%$ (precontrol activated) or $p2534 = 0\%$ (precontrol deactivated) the following applies: The dynamic following error (r2563) is the deviation between the measured position actual value and a value that is calculated from the position setpoint via a PT1 model. This compensates the system-related velocity-dependent system deviation for a P controller.		
r2564	CO: LR force precontrol value / F_prectrl val		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [N]	Calculated: - Dyn. index: - Unit group: 8_1 Scaling: p2003 Max - [N]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [N]
Description:	Display and connector output for the force setpoint.		
Dependency:	Refer to: p1511, p1512		
Note:	The force precontrol value is the derivation over time of the velocity precontrol value and is referred to a high inertia mass of 1000.0 kg. When using the precontrol, then this should be evaluated corresponding to the actual mass.		
r2564	CO: LR torque precontrol value / M_prectrl val		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [Nm]	Calculated: - Dyn. index: - Unit group: 7_1 Scaling: p2003 Max - [Nm]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [Nm]
Description:	Display and connector output for the torque precontrol value.		
Dependency:	Refer to: p1511, p1512		
Note:	The torque precontrol value is the derivation over time of the speed precontrol value and is referred to a moment of inertia of 1 kgm ² /2 PI. When using the precontrol, then this should be evaluated corresponding to the actual moment of inertia.		
r2565	CO: LR following error actual / Following err act		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 4015 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Display and connector output for the actual following error. This value is the deviation between the position setpoint - after fine interpolation - and the position actual value.		

2 Parameters

2.2 List of parameters

Notice: When speed precontrol is active (p2534 > 0 %), the following applies:
To calculate this value, the position setpoint is delayed by two position controller sampling times.
When speed precontrol is inactive (p2534 = 0 %), the following applies:
To calculate this value, the position setpoint is delayed by two position controller clock cycles.

r2566	LR velocity input precontrol / v inp prectrl		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Displays the velocity at the input of the precontrol channel.		
Note:	This display parameter is used for diagnostics even when the precontrol is inactive (p2534 = 0%).		

r2566	LR speed input precontrol / n inp prectrl		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Displays the speed at the input of the precontrol channel.		
Note:	This display parameter is used for diagnostics even when the precontrol is inactive (p2534 = 0%).		

p2567[0...n]	LR force precontrol mass / F_prectrl mass		
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 27_1	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000000 [kg]	100000.000000 [kg]	1.000000 [kg]
Description:	Sets the mass for the force precontrol.		
Dependency:	Refer to: p2534, r2564		
Note:	When calculating the force precontrol value (r2654), the derivation over time of the speed precontrol value is multiplied by p2567. For reasons associated with the compatibility to earlier firmware releases, the factory setting for p2567 = 1 kg. This means that CO: r2564 remains, as standard, the derivation over time of the velocity precontrol value and refers, as before, to a weight of 1 kg. For force precontrol, the mass can now be directly entered into p2567 (instead of subsequently evaluating the precontrol value).		

p2567[0...n]	LR torque precontrol moment of inertia / M_prectrl M_inert		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 4015
	P-Group: Closed-loop position control	Unit group: 25_1	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000000 [kgm ²]	100000.000000 [kgm ²]	0.159155 [kgm ²]
Description:	Sets the moment of inertia for the torque precontrol.		
Dependency:	Refer to: p2534, r2564		

Note: When calculating the torque precontrol value (r2654), the time derivation of the speed precontrol value is multiplied by $2 \text{ PI} * \text{p2567}$.

For reasons associated with the compatibility to earlier firmware versions, the factory setting for p2567 = $1 \text{ kgm}^2/2 \text{ PI}$. This means that CO: r2564 remains as standard the derivation over time of the speed precontrol value and is referred, as before, to a moment of inertia of $1 \text{ kgm}^2/2 \text{ PI}$. For torque precontrol, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the precontrol value).

p2568	BI: EPOS STOP cam activation / STOP cam act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to activate the function "STOP cam". BI: p2568 = 1 signal --> The evaluation of the STOP cam minus (BI: p2569) and STOP cam plus (BI: p2570) is active.		
Dependency:	Refer to: p2569, p2570		
Note:	The traversing range can also be limited using software limit switches.		

p2569	BI: EPOS STOP cam minus / STOP cam minus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source for the STOP cam in the negative direction of travel.		
Recommendation:	Set the OFF3 ramp-down time (p1135) so that after the axis reaches the STOP cam at maximum velocity, the braking distance traveled by the axis is not greater than the distance that is available. Sets message 07491 as alarm (A07491): Set the maximum deceleration (p2573), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available.		
Dependency:	Refer to: p1135, p2568, p2570, p2573, r2684 Refer to: F07491		
Caution:	The STOP cams are low active. Sets message 07491 as fault (F07491): For a 0 signal, the drive stops with the OFF3 ramp-down time (p1135), status signal r2684.13 = 1 is set, saved and the corresponding fault is output. After the fault has been acknowledged, only motion moving away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.13 is set to 0. Sets message 07491 as alarm (A07491): For a 0 signal, the axis is stopped with the maximum deceleration (p2573), status signal r2684.13 is set to 1, saved and the appropriate alarm is output. Only motion away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.13 is set to 0 and the alarm is deleted.		

2 Parameters

2.2 List of parameters

p2570	BI: EPOS STOP cam plus / STOP cam plus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1
Description:	Sets the signal source for the STOP cam in the positive direction of travel.		
Recommendation:	Set the OFF3 ramp-down time (p1135) so that after the axis reaches the STOP cam at maximum velocity, the braking distance traveled by the axis is not greater than the distance that is available. Sets message 07492 as alarm (A07492): Set the maximum deceleration (p2573), so that the axis, after reaching the STOP cam at the maximum velocity, does not move through a higher braking travel than is actually available.		
Dependency:	Refer to: p1135, p2568, p2569, p2573, r2684 Refer to: F07492		
Caution:	The STOP cams are low active.		
	Sets message 07492 as fault (F07492): For a 0 signal, the drive stops with the OFF3 ramp-down time (p1135), status signal r2684.14 = 1 is set, saved and the corresponding fault is output. After the fault has been acknowledged, only motion moving away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.14 is set to 0. Sets message 07492 as alarm (A07492): For a 0 signal, the axis is stopped with the maximum deceleration (p2573), status signal r2684.14 is set to 1, saved and the appropriate alarm is output. Only motion away from the STOP cam is permitted. For a 0/1 signal and valid travel direction, when the STOP cam is exited, this is detected and the status signal r2684.14 is set to 0 and the alarm is deleted.		
p2571	EPOS maximum velocity / v_max		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/min]	40000000 [1000 LU/min]	30000 [1000 LU/min]
Description:	Sets the maximum velocity for the "basic positioner" function (EPOS).		
Dependency:	Refer to: r1084, r1087, p2503, p2504, p2505, p2506		
Note:	The maximum velocity is active in all of the operating modes of the basic positioner. The maximum velocity for the basic positioner should be aligned with the maximum speed/velocity of the speed/velocity controller: Rotary encoders: $p2571[1000 \text{ LU/min}] = \min(r1084 , r1087)[\text{rpm}] \times p2505/p2504 \times p2506/1000$ Linear encoders: $p2571[1000 \text{ LU/min}] = \min(r1084 , r1087)[\text{m/min}] \times p2503/10[\text{m}]$		
p2572	EPOS maximum acceleration / a_max		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/s ²]	2000000 [1000 LU/s ²]	100 [1000 LU/s ²]
Description:	Sets the maximum acceleration for the "basic positioner" function (EPOS).		
Dependency:	Refer to: p2619, p2644		

Note: The maximum acceleration appears to exhibit jumps (without jerk).
 "Traversing blocks" operating mode:
 The programmed acceleration override (p2619) acts on the maximum acceleration.
 "Direct setpoint input/MDI" mode:
 The acceleration override is effective (p2644, 4000 hex = 100 %).
 "Jog" and "search for reference" modes
 No acceleration override is active. The axis starts with the maximum acceleration.

p2573	EPOS maximum deceleration / -a_max		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/s ²]	2000000 [1000 LU/s ²]	100 [1000 LU/s ²]

Description: Sets the maximum deceleration for the "basic positioner" function (EPOS).
Dependency: Refer to: p2620, p2645
Note: The maximum deceleration appears to exhibit jumps (without jerk).
 "Traversing blocks" operating mode:
 The programmed deceleration override (p2620) acts on the maximum deceleration.
 "Direct setpoint input/MDI" mode:
 The deceleration override is effective (p2645, 4000 hex = 100 %).
 "Jog" and "search for reference" modes
 No deceleration override is effective. The axis breaks with the maximum deceleration.

p2574	EPOS jerk limiting / Jerk lim		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/s ³]	100000000 [1000 LU/s ³]	10000 [1000 LU/s ³]

Description: Sets the jerk limiting
Dependency: Refer to: p2572, p2573, p2575
Note: The jerk limiting is internally converted into a jerk time as follows:

$$\text{Jerk time } T_r = \max(p2572, p2573) / p2574$$
 The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]).
 The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573).
 For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values.
 If, in the traversing profile, the acceleration time without jerk limiting is shorter than jerk time T_r , then motion with jerk limiting is not time-optimized.
 For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk.
 CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle.
 For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time.

2 Parameters

2.2 List of parameters

p2575	BI: EPOS jerk limiting activation / Jerk limit act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to activate the jerk limiting. Activating/deactivating: - using BI: p2575 = 1 signal or 0 signal. - using the command JERK in the traversing block (only for BI: p2575 = 0 signal).		
Dependency:	Refer to: p2574		
Note:	A change of the signal state at the binector input is only accepted at zero speed.		
<hr/>			
p2576	EPOS modulo correction modulo range / Modulo corr range		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 1 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting 360000 [LU]
Description:	Sets the modulo range for axes with modulo correction.		
Dependency:	Refer to: p2577		
<hr/>			
p2577	BI: EPOS modulo correction activation / Modulo corr act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3630, 3635 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to activate modulo correction.		
Dependency:	Refer to: p2576		
Note:	When the signal state changes at the binector input, this only becomes effective in the "ready for switching on" state. Selecting modulo correction: The actual position setpoint in the modulo range is corrected. The position actual value differs from the position setpoint by the following error and can also leave the modulo range. Deselecting modulo correction: It is based on the actual position actual value.		
<hr/>			
p2578	CI: EPOS software limit switch minus signal source / SW lim sw min s_s		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Integer32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3630 Unit selection: - Expert list: 1 Factory setting 2580[0]
Description:	Sets the signal source for the software limit switch minus.		
Dependency:	Refer to: p2579, p2580, p2581, p2582 Refer to: A07469, A07477, A07479, F07481		
Notice:	A change to the software limit switch becomes immediately effective. If the software limit switch is changed, then this results in the positions in the traversing blocks being checked.		

Note: The following applies for the setting of the software limit switch:
Software limit switch minus < software limit switch plus

p2579	CI: EPOS software limit switch plus signal source / SW lim sw plus s_s		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2581[0]

Description: Sets the signal source for the software limit switch plus.

Dependency: Refer to: p2578, p2580, p2581, p2582
Refer to: A07470, A07478, A07480, F07482

Notice: A change to the software limit switch becomes immediately effective.

If the software limit switch is changed, then this results in the positions in the traversing blocks being checked.

Note: The following applies for the setting of the software limit switch:
Software limit switch minus < software limit switch plus

p2580	CO: EPOS software limit switch minus / SW lim sw minus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-2147482648 [LU]	2147482647 [LU]	-2147482648 [LU]

Description: Sets the software limit switch, in the negative direction of travel.

Dependency: Refer to: p2578, p2579, p2581, p2582

p2581	CO: EPOS software limit switch plus / SW lim sw plus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-2147482648 [LU]	2147482647 [LU]	2147482647 [LU]

Description: Sets the software limit switch, in the positive direction of travel.

Dependency: Refer to: p2578, p2579, p2580, p2582

p2582	BI: EPOS software limit switch activation / SW lim sw act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to activate the "software limit switch".

Dependency: Refer to: p2578, p2579, p2580, p2581

Caution: Software limit switch effective:

 - axis is referenced (r2684.11 = 1) and BI: p2582 = 1 signal.

Software limit switch ineffective:

- modulo correction active (BI: p2577 = 1 signal).

- search for reference is executed.

2 Parameters

2.2 List of parameters

Notice: Target position for relative positioning outside software limit switch:
 The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated.
 Target position for absolute positioning outside software limit switch:
 In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output.
 Axis outside the valid traversing range:
 If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

Note: The traversing range can also be limited using STOP cams.

p2583	EPOS backlash compensation / Backlash comp		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -200000 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 200000 [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the amount of play (backlash) for positive or negative play. 0: backlash compensation is deactivated. > 0: Positive backlash (normal case) When the direction is reversed, the encoder actual value leads the actual value. < 0: Negative backlash When the direction is reversed, the actual value leads the encoder actual value.		
Dependency:	If a stationary axis is referenced by setting the reference point, or an adjusted with absolute encoder is switched on, then the setting of p2604 is relevant for entering the compensation value. p2604 = 1: Traveling in the positive direction -> A compensation value is immediately entered. Traveling in the negative direction -> A compensation value is not entered p2604 = 0: Traveling in the positive direction -> A compensation value is not entered Traveling in the negative direction -> A compensation value is immediately entered. When again setting the reference point (a referenced axis) or for "flying referencing", p2604 is not relevant but instead the history of the axis. Refer to: p2604, r2667		

p2584	EPOS functions configuration / EPOS fct config				
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 bin		
Description:	Sets the configuration for additional functions for the basic positioner (EPOS).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activate position feedback signal	Yes	No	-
	01	Hardware limit switch evaluation	Level evaluation	Edge evaluation	-
	02	Travel to fixed stop - torque calculation based on the offset	Yes	No	-
Note:	For bit 00: When the bit is set, for traversing blocks with absolute target positions (p2617[x]) when the tolerance window (p2688) is reached, the traversing block number (p2616[x]) is output bit-coded (r2689). For bit 01: When the bit is set, the hardware limit switch is evaluated, level-triggered. This setting is recommended for a poor position actual value resolution, as in this case the direction does not have to be evaluated.				

For bit 02:

When the bit is set, for "Travel to fixed stop", the torque setpoints are calculated based on the offset for the torque limit (p1532).

p2585	EPOS jog 1 setpoint velocity / Jog 1 v_set		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3610
	P-Group: Basic positioner	Unit group: -	Unit selection: -

	Min	Max	Factory setting
	-40000000 [1000 LU/min]	40000000 [1000 LU/min]	300 [1000 LU/min]
Description:	Sets the setpoint velocity for jog 2.		
Dependency:	Refer to: p2588, p2590, p2591		

p2587	EPOS jog 1 traversing distance / Jog 1 distance		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3610
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [LU]	2147482647 [LU]	1000 [LU]
Description:	Sets the traversing distance for incremental jog 1.		
Dependency:	Refer to: p2585, p2589, p2591		
Note:	Incremental jog 1 is started with BI: p2591 = 1 signal and BI: p2589 = 0/1 signal. With BI: p2589 = 0 signal, incremental jog is interrupted.		

p2588	EPOS jog 2 traversing distance / Jog 2 distance		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3610
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [LU]	2147482647 [LU]	1000 [LU]
Description:	Sets the traversing distance for incremental jog 2.		
Dependency:	Refer to: p2586, p2590, p2591		
Note:	Incremental jog 2 is started with BI: p2591 = 1 signal and BI: p2590 = 0/1 signal. With BI: p2590 = 0 signal, incremental jogging is interrupted.		

2 Parameters

2.2 List of parameters

p2589	BI: EPOS jog 1 signal source / Jog 1 s_s		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3610, 3625 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for jog 1.		
Dependency:	When jogging, the axis is accelerated or braked with the maximum acceleration/deceleration (p2572/p2573). BI: p2591 = 0 signal The axis endlessly moves with the setpoint velocity, jog 1 (p2585). BI: p2591 = 1 signal The axis traverses through a parameterized distance (p2585) with the setpoint velocity, jog 1 (p2587). Refer to: p2572, p2573, p2585, p2587, p2591		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<hr/>			
p2590	BI: EPOS jog 2 signal source / Jog 2 s_s		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3610, 3625 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for jog 2.		
Dependency:	When jogging, the axis is accelerated or braked with the maximum acceleration/deceleration (p2572/p2573). BI: p2591 = 0 signal The axis endlessly moves with the setpoint velocity, jog 2 (p2586). BI: p2591 = 1 signal The axis traverses through a parameterized distance (p2586) with the setpoint velocity, jog 2 (p2588). Refer to: p2572, p2573, p2586, p2588, p2591		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<hr/>			
p2591	BI: EPOS jogging incremental / Jog incr		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3610 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for jogging incremental.		
Dependency:	Refer to: p2585, p2586, p2587, p2588, p2589, p2590		
<hr/>			
p2593	CI: EPOS LU/revolution LU/mm / LU/rev LU/mm		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 3630 Unit selection: - Expert list: 1 Factory setting 2524[0]
Description:	Sets the signal source for the reference of the internal length units LU to motor revolution for rotary encoders and to mm for linear encoders.		

Dependency: Refer to: p0404, r2524, p2594
Note: The signal value is used to convert the length unit to the speed or velocity setpoint.

p2594[0...2]	CI: EPOS Maximum velocity externally limited / v_max ext lim		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the externally limited maximum velocity.

Index:
 [0] = Setpoint limit absolute
 [1] = Setpoint limiting positive
 [2] = Setpoint limiting negative

Dependency: Refer to: r2524, p2571, p2593

Warning: In order that the externally limited velocity can be effective for the EPOS operating modes, connector input p2593 must be correctly interconnected.

p2595	BI: EPOS referencing start / Ref start		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612, 3625, 3614
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to start the "search for reference" or "flying referencing".

BI: p2595 = 0/1 signal
 Referencing is started.
 BI: p2595 = 1/0 signal
 Referencing is interrupted.

Dependency: Refer to: p2597, p2598, p2599, r2684

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: Search for reference (BI: p2597 = 0 signal):

The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed.

With the start, where relevant, the state signal "reference point set" (r2684.11) is reset.

Flying referencing (BI: p2597 = 1 signal):

With the start, the state signal "reference point set" (r2684.11) is not reset.

p2596	BI: EPOS set reference point / Set ref_pt		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the "set reference point".

Dependency: Refer to: p2598, p2599, r2684

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

2 Parameters

2.2 List of parameters

Note: Reference point setting is effective in the following operating states:

- in the basic state.
- for FIXED STOP with progress condition END (corresponds to the initial state).
- for traversing block interrupted via BI: p2640 = 0 signal (intermediate stop).
- for EPOS not enabled (BI: p2656 = 0 signal) and position actual value valid (BI: p2658 = 1 signal).

p2597	BI: EPOS referencing type selection / Ref_typ sel		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612, 3614, 3625
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to select referencing type.
1 signal: Flying referencing
0 signal: Search for reference

Dependency: Refer to: p2595

Note: Referencing is activated as follows:
- Select the referencing type (BI: p2597)
- Start referencing (BI: p2595 = 0/1 signal)

p2598[0...3]	CI: EPOS reference point coordinate signal source / Ref_pt coord s_s		
SERVO (EPOS, Pos ctrl), VECTOR (EPOS, Pos ctrl), SERVO_AC (EPOS, Pos ctrl), VECTOR_AC (EPOS, Pos ctrl)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3612, 3614
	P-Group: Closed-loop position control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	[0] 2599[0] [1] 0 [2] 0 [3] 0

Description: Sets the signal source for the reference point coordinate.
This value is used as reference for the following referencing operations:

- search for reference
- set reference point
- flying referencing
- absolute value adjustment

Index: [0] = Position control
[1] = Encoder 1
[2] = Encoder 2
[3] = Encoder 3

Dependency: Refer to: p2502, p2507, p2595, p2596, p2597, p2599

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following applies:
Incremental measuring system:
After the reference point is reached, the drive accepts the actual axis position from the position received via the connector input p2598[0].
Absolute encoder:
When adjusting the encoder, the position received via the connector input is set as the actual axis position. The position offset to the actual encoder value is displayed in p2525.

p2599	CO: EPOS reference point coordinate value / Ref_pt coord val		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Integer32 P-Group: Closed-loop position control Not for motor type: - Min -2147482648 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the position value for the reference point coordinate. This value is set as the actual axis position after referencing or adjustment.		
Dependency:	Refer to: p2507, p2525, p2595, p2596, p2597, p2598		
p2600	EPOS search for reference reference point offset / Ref_pt offset		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -2147482648 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the reference point offset for search for reference.		
Dependency:	Refer to: p2598		
p2601	EPOS flying referencing inner window / Inner window		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3614 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the inner window for flying referencing. Value = 0: The evaluation of the inner window is deactivated.		
Dependency:	Refer to: p2597, p2602, r2684		
Notice:	The inner window must be set so that it is smaller than the outer window.		
Note:	If the difference between the reference point coordinate and detected actual position is less than the inner window, then no correction is executed for a referenced axis. If the difference between the reference point coordinate and detected actual position is greater than the inner window and less than the outer window (p2602), then a correction is executed for a referenced axis.		
p2602	EPOS flying referencing outer window / Outer window		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3614 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the outer window for flying referencing. Value = 0: The evaluation of the outer window is deactivated.		
Dependency:	Refer to: p2597, r2684 Refer to: A07489		
Notice:	The inner window must be set so that it is smaller than the outer window.		

2 Parameters

2.2 List of parameters

Note: If the difference between the reference point coordinate and detected actual position is greater than the outer window, then no correction is executed for the referenced axis. Further, an appropriate message is output and r2684.3 is set to 1.

p2603	EPOS flying referencing, positioning mode relative / Pos_mode relative		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	1

Description: Sets the relative positioning mode for flying referencing.
Value = 1:
The corrected setpoint is not calculated into the traversing distance.
Value = 0:
The corrected setpoint is calculated into the traversing distance.

Dependency: Refer to: p2597, p2623, p2648

Notice: For p2603 = 0 the direction can change.

p2604	BI: EPOS search for reference start direction / Srch for ref dir		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal sources for the start direction of the search for reference.
1 signal: Start in the negative direction.
0 signal: Start in the positive direction.

Dependency: Refer to: p2583, p2595, p2597

p2605	EPOS search for reference approach velocity reference cam / v_appr ref_cam		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1 [1000 LU/min]	40000000 [1000 LU/min]	5000 [1000 LU/min]

Description: Sets the approach velocity to the reference cam for the search for reference.

Dependency: The search for reference only starts with the approach velocity to the reference cam when there is a reference cam (p2607 = 1).
Refer to: p2595, p2597, p2604, p2606, p2607

Note: When traversing to the reference cam, the velocity override is effective.
If, at the start of the search for reference, the axis is already at the reference cam, then the axis immediately starts to traverse to the zero mark.

p2606	EPOS search for reference reference cam maximum distance / Ref_cam max s		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 2147482647 [LU]
Description:	Sets the maximum distance after the start of the search for reference when traversing to the reference cam.		
Dependency:	Refer to: p2595, p2597, p2604, p2605, p2607 Refer to: F07458		
Note:	When using a reversing cam, the maximum distance must be set appropriately long.		
p2607	EPOS search for reference reference cam present / Ref_cam pres		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned8 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets whether or not a reference cam is present for the search for reference. Value = 1: Reference cam present. Value = 0: No reference cam present.		
Dependency:	Refer to: p2595, p2597, p2604, p2605, p2606		
p2608	EPOS search for reference approach velocity zero mark / v_appr ref_ZM		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 1 [1000 LU/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 40000000 [1000 LU/min]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 300 [1000 LU/min]
Description:	Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference.		
Dependency:	If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark. Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
Caution:	If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained. After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks.		
			
Note:	The velocity override is not effective when traversing to the zero mark.		
p2609	EPOS search for reference max distance ref cam and zero mark / Max s ref_cam ZM		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 20000 [LU]
Description:	Sets the maximum distance after leaving the reference cam when traversing to the zero mark.		
Dependency:	Refer to: p2595, p2597, p2604, p2607, p2608, p2610 Refer to: F07459		

2 Parameters

2.2 List of parameters

p2610	EPOS search for ref. tol. bandwidth for distance to zero mark / Tol_band to ZM		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 2147482647 [LU]
Description:	Sets the tolerance bandwidth for the distance to the zero mark The zero mark is evaluated within the maximum distance between the reference cam and zero mark (p2609) minus the tolerance bandwidth for the distance to the zero mark (p2610).		
Dependency:	Refer to: p2609		
p2611	EPOS search for reference approach velocity reference point / v_appr ref_pt		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned32 P-Group: Basic positioner Not for motor type: - Min 1 [1000 LU/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 40000000 [1000 LU/min]	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 300 [1000 LU/min]
Description:	Sets the approach velocity after detecting the zero mark to approach the reference point.		
Dependency:	Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
Note:	When traversing to the reference point, the velocity override is not effective.		
p2612	BI: EPOS search for reference reference cam / Ref_cam		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the reference cam.		
Dependency:	Refer to: p2607		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
p2613	BI: EPOS search for reference reversing cam minus / Rev minus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the reversing cam in the negative direction of travel. 1 signal: Reversing cam not reached. 0 signal: Reversing cam reached.		
Dependency:	Refer to: p2614		
Note:	If, during the search for reference from the reversing cam minus and plus, a 0 signal is detected, then the axis remains stationary (at standstill).		

p2614	BI: EPOS search for reference reversing cam plus / Rev cam plus		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3612 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the reversing cam in the negative direction of travel. 1 signal: Reversing cam not reached. 0 signal: Reversing cam reached.		
Dependency:	Refer to: p2613		
Note:	If, during the search for reference from the reversing cam minus and plus, a 0 signal is detected, then the axis remains stationary (at standstill).		
p2615	EPOS maximum number of traversing blocks / Trav_block qty max		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: C2(17) Data type: Unsigned8 P-Group: Basic positioner Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 64	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 64
Description:	Sets the maximum number of traversing blocks that are available.		
Dependency:	Refer to: p2616, p2617, p2618, p2619, p2620, p2621, p2622, p2623, p2624		
p2616[0...n]	EPOS traversing block block number / Trav_blk, blk no		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer16 P-Group: Basic positioner Not for motor type: - Min -1	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 63	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets a block number. -1: Invalid block number. These blocks are not taken into account. 0 ... 63: valid block number.		
Dependency:	The number of indices depends on p2615. Refer to: p2615, p2617, p2618, p2619, p2620, p2621, p2622, p2623, p2624		
p2617[0...n]	EPOS traversing block position / Trav_block pos		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -2147482648 [LU]	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 0 [LU]
Description:	Sets the target position for the traversing block.		
Dependency:	The number of indices depends on p2615. Refer to: p2615, p2616, p2618, p2619, p2620, p2621, p2622, p2623, p2624		
Note:	The target position is approached in either relative or absolute terms depending on p2623.		

2 Parameters

2.2 List of parameters

p2618[0...n]	EPOS traversing block velocity / Trav_block v		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min 1 [1000 LU/min]	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 40000000 [1000 LU/min]	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 600 [1000 LU/min]
Description:	Sets the velocity for the traversing block.		
Dependency:	The number of indices depends on p2615. Refer to: p2615, p2616, p2617, p2619, p2620, p2621, p2622, p2623, p2624, p2646		
Note:	The velocity can be influenced using the velocity override (p2646).		
<hr/>			
p2619[0...n]	EPOS traversing block acceleration override / Trav_block a_over		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min 1.0 [%]	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 100.0 [%]	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 100.0 [%]
Description:	Sets the acceleration override for the traversing block. The override refers to the maximum acceleration (p2572).		
Dependency:	The number of indices depends on p2615. Refer to: p2572, p2615, p2616, p2617, p2618, p2620, p2621, p2622, p2623, p2624		
<hr/>			
p2620[0...n]	EPOS traversing deceleration override / Trav_block -a_over		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min 1.0 [%]	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 100.0 [%]	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 100.0 [%]
Description:	Sets the deceleration override for the traversing block. The override refers to the maximum deceleration (p2573).		
Dependency:	The number of indices depends on p2615. Refer to: p2573, p2615, p2616, p2617, p2618, p2619, p2621, p2622, p2623, p2624		
Notice:	If, when calculating the traversing profile, it is identified that the target position of the next block with the programmed deceleration override will not be reached without direction reversal (flying block change), then the old (actual) deceleration override remains effective.		
<hr/>			
p2621[0...n]	EPOS traversing block task / Trav_block task		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer16 P-Group: Basic positioner Not for motor type: - Min 1	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 9	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the required task for the traversing block.		
Value:	1: POSITIONING 2: FIXED STOP 3: ENDLESS_POS 4: ENDLESS_NEG 5: WAITING 6: GOTO		

7: SET_O
8: RESET_O
9: JERK

Dependency: The number of indices depends on p2615.
Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2622, p2623, p2624

p2622[0...n]	EPOS traversing block task parameter / Trav_blk task_par		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -2147483648	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 2147483647	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets additional information/data of the appropriate task for the traversing block.		
Dependency:	The number of indices depends on p2615. Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2623, p2624		
Note:	The following should be set depending on the task: FIXED STOP: Clamping torque and clamping force (rotary 0...65536 [0.01 Nm], linear 0...65536 [N]) WAIT: Delay time [ms] GOTO: Block number SET_O: 1, 2 or 3 - set direct output 1, 2 or 3 (both) RESET_O: 1, 2 or 3 - reset direct output 1, 2 or 3 (both) JERK: 0 - deactivate, 1 - activate		

p2623[0...n]	EPOS traversing block task mode / Trav_block mode		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned16 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: p2615 Unit group: - Scaling: - Max 65535	Access level: 1 Func. diagram: 3515, 3616 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the influence of the task for the traversing block. Value = 0000 cccc bbbb aaaa cccc: Positioning mode cccc = 0000 --> ABSOLUTE cccc = 0001 --> RELATIVE cccc = 0010 --> ABS_POS (only for a rotary axis with modulo correction) cccc = 0011 --> ABS_NEG (only for a rotary axis with modulo correction) bbbb: Progression condition bbbb = 0000 --> END bbbb = 0001 --> CONTINUE WITH STOP bbbb = 0010 --> CONTINUE FLYING bbbb = 0011 --> CONTINUE EXTERNAL bbbb = 0100 --> CONTINUE EXTERNAL WAIT bbbb = 0101 --> CONTINUE EXTERNAL ALARM aaaa: IDs aaaa = 000x --> show/hide block (x = 0: show, x = 1: hide)		
Dependency:	The number of indices depends on p2615. Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2622, p2624		

2 Parameters

2.2 List of parameters

p2624	EPOS traversing block sorting / Trav_block sort		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: U, T Data type: Unsigned16 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the traversing blocks for sorting corresponding to their block number. Procedure: Set p2624 = 0 --> 1. Sorting is started and the parameters are automatically reset to zero once the operation has been completed.		
Dependency:	Refer to: p2615, p2616, p2617, p2618, p2619, p2620, p2621, p2622, p2623		
Note:	After sorting, the traversing blocks are written at the beginning of the memory in increasing sequence without any gaps.		
<hr/>			
p2625	BI: EPOS traversing block selection bit 0 / Trav_blk sel bit 0		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3616, 3640 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to select the traversing block, bit 0.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2626, p2627, p2628, p2629, p2630		
<hr/>			
p2626	BI: EPOS traversing block selection bit 1 / Trav_blk sel bit 1		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3616, 3640 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to select the traversing block, bit 1.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2625, p2627, p2628, p2629, p2630		
<hr/>			
p2627	BI: EPOS traversing block selection bit 2 / Trav_blk sel bit 2		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3616, 3640 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source to select the traversing block, bit 2.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2625, p2626, p2628, p2629, p2630		

p2628	BI: EPOS traversing block selection bit 3 / Trav_blk sel bit 3		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3640
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to select the traversing block, bit 3.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2625, p2626, p2627, p2629, p2630		

p2629	BI: EPOS traversing block selection bit 4 / Trav_blk sel bit 4		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3640
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to select the traversing block, bit 4.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2625, p2626, p2627, p2628, p2630		

p2630	BI: EPOS traversing block selection bit 5 / Trav_blk sel bit 5		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3640
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to select the traversing block, bit 5.		
Dependency:	Binector inputs p2625, p2626, p2627, p2628, p2629 and p2630 are used to select one of the maximum of 64 traversing blocks. Refer to: p2625, p2626, p2627, p2628, p2629		

p2631	BI: EPOS activate traversing task (0 -> 1) / Trav_task act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3625
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for "activating traversing task". BI: p2631 = 0/1 signal The traversing task, selected using BI: p2625 ... p2630, is started.		
Dependency:	Refer to: p2625, p2626, p2627, p2628, p2629, p2630, p2640, p2641		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		

2 Parameters

2.2 List of parameters

Note: To start a traversing block, the axis must be referenced (r2684.11 = 1).
The status signal r2684.12 = 0/1 signal is used for acknowledgment.
A traversing task can be influenced using the following signals:
- intermediate stop via BI: p2640.
- reject traversing task via BI: p2641.

p2632	EPOS external block change evaluation / Ext blk chg eval		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Integer16 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 1 Func. diagram: 3615, 3616 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the mode to evaluate "external block change".		
Value:	0: External block change via the measuring probe 1: External block change via BI: p2633		
Dependency:	Refer to: p2623, p2633, r2677, r2678		
Note:	In the mode "external block change via measuring probe" (p2632 = 0), the following applies: When starting a traversing block with the block change enable CONTINUE_EXTERNAL, CONTINUE_EXTERNAL_WAIT and CONTINUE_EXTERNAL_ALARM an activated "flying referencing" is interrupted. After ending the block, "flying referencing" must be re-activated via binector input p2595 = 0/1 signal.		

p2633	BI: EPOS external block change (0 -> 1) / Ext blk chg (0->1)		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3615 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for "external block change". BI: p2633 = 0/1 signal		
Dependency:	The evaluation of the signal is only active p2632 = 1. Refer to: p2623, p2632, p2640, p2641, r2677, r2678		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	A 0/1 edge initiates a flying block change in the subsequent traversing block. When the external block change is identified, the actual position is saved in r2678. A traversing task can be influenced using the following signals: - intermediate stop via BI: p2640. - reject traversing task via BI: p2641.		

p2634[0...n]	EPOS fixed stop maximum following error / Following err max		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3617, 4025 Unit selection: - Expert list: 1 Factory setting 1000 [LU]
Description:	Sets the following error to detect the "fixed stop reached" state (r2526.4).		
Dependency:	Refer to: r2526, p2621, r2675		
Note:	The state "fixed stop reached" is detected if the following error exceeds the theoretically calculated following error value by p2634.		

p2635	EPOS fixed stop monitoring window / Fixed stop mon		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop position control Not for motor type: - Min 0 [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147482647 [LU]	Access level: 1 Func. diagram: 3617, 4025 Unit selection: - Expert list: 1 Factory setting 100 [LU]
Description:	Sets the monitoring window of the actual position after the fixed stop is reached.		
Dependency:	Refer to: r2526, r2683 Refer to: F07484		
Note:	If, after the fixed stop is reached, the end stop shifts in either the positive or negative direction by more than the value set here, then BO: r2526.5 is set to 1 and an appropriate message is output.		
p2637	BI: EPOS fixed stop reached / Fixed stop reached		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3616, 3617 Unit selection: - Expert list: 1 Factory setting 2526.4
Description:	Sets the signal source for the feedback signal "fixed stop reached". BI: p2637 = 1 signal Fixed stop is reached. BI: p2637 = 0 signal Fixed stop is not reached.		
Dependency:	Refer to: r2526, p2634		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The identification of "fixed stop reached" is, for the factory setting, dependent on the signal BO: r2526.4 (fixed stop reached). This signal is influenced via p2634 (EPOS fixed stop, maximum following error).		
p2638	BI: EPOS fixed stop outside the monitoring window / Fixed stop outside		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 3616, 3617 Unit selection: - Expert list: 1 Factory setting 2526.5
Description:	Sets the signal source for the feedback signal "fixed stop outside the monitoring window". BI: p2638 = 1 signal Fixed stop is located outside the monitoring window. BI: p2638 = 0 signal Fixed stop is inside the monitoring window.		
Dependency:	Refer to: r2526, p2635		
Note:	The identification of "fixed stop outside the monitoring window" is, for the factory setting, dependent on signal BO: r2526.5 (fixed stop outside window). This signal is influenced via p2635 (EPOS fixed stop monitoring window).		

2 Parameters

2.2 List of parameters

p2639	BI: EPOS force limit reached / F_limit reached		
SERVO (EPOS, Lin), SERVO_AC (EPOS, Lin)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1407.7
Description:	Sets the signal source for the feedback signal "force limit reached" when traversing to fixed stop. BI: p2639 = 1 signal Force limit has been reached. BI: p2639 = 0 signal Force limit has not been reached.		
Dependency:	Refer to: r1407		
Note:	The feedback signal from "force limit reached" is, for the factory setting, dependent on the signal BO: r1407.7 (torque limit reached).		

p2639	BI: EPOS torque limit reached / M_limit reached		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	1407.7
Description:	Sets the signal source for the feedback signal "torque limit reached" when traversing to fixed stop. BI: p2639 = 1 signal Torque limit is reached. BI: p2639 = 0 signal Torque limit is not reached.		
Dependency:	Refer to: r1407		
Note:	The feedback signal from "torque limit reached" is, for the factory setting, dependent on the signal BO: r1407.7 (torque limit reached).		

p2640	BI: EPOS intermediate stop (0 signal) / Intermediate stop		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3620, 3625
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the "no intermediate stop/intermediate stop". BI: p2640 = 1 signal No intermediate stop. BI: p2640 = 0 signal Intermediate stop.		
Dependency:	Refer to: p2631, p2641, p2647, p2649		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI". When activating the intermediate stop, the axis brakes with the parameterized deceleration (p2620 or p2645).		

p2641		BI: EPOS reject traversing task (0 signal) / Trav_task reject	
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616, 3620, 3625
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for "do not reject traversing task/reject traversing task". BI: p2641 = 1 signal Do not reject traversing task. BI: p2641 = 0 signal Reject traversing task.		
Dependency:	Refer to: p2631, p2640, p2647, p2649		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI". When activating reject traversing tasks, then the axis brakes with the maximum deceleration (p2573).		

p2642		CI: EPOS direct setpoint input/MDI position setpoint / MDI s_set	
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3618
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2690[0]
Description:	Sets the signal source for the position setpoint in the mode "direct setpoint input/MDI".		
Dependency:	Refer to: p2648, p2649, p2650, p2690		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	Depending on p2649, the position setpoint is either transferred continuously or edge-triggered. The position setpoint input is interpreted as length unit [LU].		

p2643		CI: EPOS direct setpoint input/MDI velocity setpoint / MDI v_set	
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3618
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2691[0]
Description:	Sets the signal source for the velocity setpoint in the "direct setpoint input/MDI mode".		
Dependency:	Refer to: p2649, p2650, p2691		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	Depending on p2649, the velocity setpoint is either transferred continuously or edge-triggered. The velocity setpoint input is interpreted as [1000 LU/min].		

2 Parameters

2.2 List of parameters

p2644	CI: EPOS direct setpoint input/MDI acceleration override / MDI a_over
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - Access level: 1 Func. diagram: 3618 Unit selection: - Expert list: 1 Factory setting 2692[0]
Description:	Sets the signal source for the acceleration override in the operating mode "direct setpoint input/MDI".
Dependency:	Refer to: p2649, p2650, p2692
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note:	Depending on p2649, the acceleration override is either transferred continuously or edge-triggered. The signal value 4000 hex (16384 dec) corresponds to 100 %.
<hr/>	
p2645	CI: EPOS direct setpoint input/MDI deceleration override / MDI -a_over
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - Access level: 1 Func. diagram: 3618 Unit selection: - Expert list: 1 Factory setting 2693[0]
Description:	Sets the signal source for the deceleration override in the operating mode "direct setpoint input/MDI".
Dependency:	Refer to: p2649, p2650, p2693
Notice:	If, when calculating the traversing profile, it is identified that the target position with the programmed deceleration override cannot be reached without reversing the direction, then when accepting the dynamic values, the larger deceleration override is accepted and becomes effective. The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note:	Depending on p2649, the deceleration override is either transferred continuously or edge-triggered. The signal value 4000 hex (16384 dec) corresponds to 100 %.
<hr/>	
p2646	CI: EPOS velocity override / v_over
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - Access level: 1 Func. diagram: 3630 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the velocity override. This velocity override is effective in the following operating modes "direct setpoint input/MDI", "traversing blocks", "jogging" and "search for reference" (when approaching the reference cam).
Dependency:	Refer to: p2571, p2585, p2586, p2605, p2618, p2643, r2681
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note:	The effective override (r2681) can differ from the specified override due to limits (e.g. maximum velocity).
<hr/>	
p2647	BI: EPOS direct setpoint input/MDI selection / MDI selection
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Basic positioner Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 1 Func. diagram: 3620, 3625, 3640 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for selecting the operating mode "direct setpoint input/MDI".
Dependency:	Refer to: p2640, p2641, p2642, p2643, p2644, p2645, p2646, p2648, p2649, p2650, p2651, p2652, p2653

Note: In this mode, using binector input p2653 it is possible to make a flying changeover between setting-up and positioning.
In this mode, even if the axis is not referenced (r2684.11 = 0) relative positioning is possible.

p2648	BI: EPOS direct setpoint input/MDI positioning type / MDI pos_type		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the positioning type in the mode "direct setpoint input/MDI". BI: p2648 = 1 signal Absolute positioning is selected. BI: p2648 = 0 signal Relative positioning is selected.		
Dependency:	Refer to: p2649, p2650, p2654 Refer to: A07461, F07488		
Notice:	Absolute positioning: To traverse, the reference point must be set (r2684.11 = 1). Relative positioning: To traverse, it is not necessary that the reference point is set.		
Note:	Depending on p2649, the positioning type is either transferred continuously or edge-triggered. Binector input p2648 is only evaluated when connector input p2654 = 0. If p2654 is a value other than 0, the positioning type is evaluated by means of the set signal source.		

p2649	BI: EPOS direct setpoint input/MDI transfer type selection / MDI trans_type sel		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to define how values are transferred in the operating mode "direct setpoint input/MDI". BI: p2649 = 1 signal Values are continually transferred (refer to parameter under dependency). BI: p2649 = 0 signal The values are transferred for BI: p2650 = 0/1 signal.		
Dependency:	Refer to: p2642, p2643, p2644, p2645, p2648, p2650, p2651, p2652		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
			
Note:	Parameter p2649 can only be changed when p0922 (p2079) = 999.		

p2650	BI: EPOS direct setpoint input/MDI setpoint acceptance edge / MDI set_accept		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to accept the values for edge-triggered selection (BI: p2649 = 0 signal) in the operating mode "direct setpoint input/MDI". BI: p2650 = 0/1 signal and BI: p2649 = 0 signal Values are accepted, edge-triggered (refer to parameter under dependency).		

2 Parameters

2.2 List of parameters

Dependency: Refer to: p2640, p2641, p2642, p2643, p2644, p2645, p2648, p2649, p2651, p2652, r2684
Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.
Note: The status signal r2684.12 = 0/1 signal is used for acknowledgment.
The operating mode "direct setpoint input/MDI" can be influenced via the following signals:
- intermediate stop via BI: p2640.
- reject traversing task via BI: p2641.

p2651 **BI: EPOS direct setpoint input/MDI direction selection, positive / MDI dir_sel pos**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the positive direction selection in the operating mode "direct setpoint input/MDI".
Dependency: Refer to: p2576, p2648, p2649, p2650, p2652, p2653, p2654
Note: The following applies for "setting-up":
- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are deselected, then the axis remains stationary (zero speed).
The following applies for "positioning":
Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:
BI: p2651 / BI: p2652
0 signal / 0 signal: Absolute positioning through the shortest distance.
1 signal / 0 signal: Absolute positioning in the positive direction.
0 signal / 1 signal: Absolute positioning in the negative direction.
1 signal / 1 signal: Absolute positioning through the shortest distance.

p2652 **BI: EPOS direct setpoint input/MDI direction selection negative / MDI dir_sel neg**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the negative direction selection in the operating mode "direct setpoint input/MDI".
Dependency: Refer to: p2576, p2648, p2649, p2650, p2651, p2653, p2654
Note: The following applies for "setting-up":
- the traversing direction can be entered using this binector input.
- if both directions (p2651, p2652) are selected, then the axis remains stationary (zero speed).
- if both directions (p2651, p2652) are deselected, then the axis remains stationary (zero speed).
The following applies for "positioning":
Using binector inputs p2651 and p2652, when the modulo correction (BI: p2577 = 1 signal) is activated and for absolute positioning (BI: p2648 = 1 signal), the traversing direction is specified as follows:
BI: p2651 / BI: p2652
0 signal / 0 signal: Absolute positioning through the shortest distance.
1 signal / 0 signal: Absolute positioning in the positive direction.
0 signal / 1 signal: Absolute positioning in the negative direction.
1 signal / 1 signal: Absolute positioning through the shortest distance.

p2653	BI: EPOS direct setpoint input/MDI setting-up selection / MDI setting-up sel		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for setting-up in the operating mode "direct setpoint input/MDI". BI: p2653 = 1 signal Setting-up selected. BI: p2653 = 0 signal Positioning selected.		
Dependency:	Refer to: p2651, p2652		
Note:	In the operating mode "direct setpoint input/MDI", it is possible to make a flying changeover between setting-up and positioning. For "setup" (BI: p2653 = 1 signal), the following applies: A traversing direction must be selected via binector inputs p2651 and p2652.		

p2654	CI: EPOS direct setpoint input/MDI mode adaptation / MDI mode adapt		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Integer16	Dyn. index: -	Func. diagram: 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to interconnect the MDI mode to the operating mode "direct setpoint input MDI" via PROFIBUS telegram 110. CI: p2654 = 0 The binector inputs listed below are evaluated. CI: p2654 > 0 The following binector inputs are not evaluated: - BI: p2648 (positioning type) - BI: p2651 (direction selection, positive) - BI: p2652 (direction selection, negative) In this case, the following definitions apply: Signal via CI: p2654 = xx0x hex -> absolute Signal via CI: p2654 = xx1x hex -> relative Signal via CI: p2654 = xx2x hex -> abs_pos (only for modulo correction) Signal via CI: p2654 = xx3x hex -> abs_neg (only for modulo correction)		
Dependency:	Refer to: p2648, p2651, p2652		

p2655[0...1]	BI: EPOS select tracking mode / Sel tracking mode		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	[0] 1 [1] 2526.7
Description:	Sets the signal source to select tracking mode. BI: p2655[0] or BI: p2655[1] = 1 signal Tracking mode after withdrawing the enable signal from EPOS (BI: p2656 = 0 signal). BI: p2655[0] or BI: p2655[1] = 0 signal No tracking mode after withdrawing the enable signal from EPOS (BI: p2656 = 0 signal).		
Dependency:	Refer to: p2656		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	For the following events, independent of the signal that is present, tracking mode is selected: - after booting. - after a 0/1 signal at binector input p2658 (feedback signal, EPOS position actual value valid). - while a fault is present.		
p2656	BI: EPOS enable basic positioner / EPOS enable		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.3
Description:	Sets the signal source to enable the basic positioner. BI: p2656 = 1 signal The basic positioner is enabled. BI: p2656 = 0 signal The basic positioner is not enabled.		
Dependency:	Refer to: r2526, p2655		
p2657	CI: EPOS position actual value/position setting value / Pos act/set value		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3610, 3616, 3620, 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2521[0]
Description:	Sets the signal source for the position actual value/position setting value.		
Dependency:	Refer to: r2521, p2658		
Note:	In the tracking mode, the position setpoint is taken from this connector input.		

p2658	BI: EPOS position actual value valid feedback signal / Pos valid feedback		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3635
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.0
Description:	Sets the signal source for the feedback signal "position actual value is valid". BI: p2658 = 1 signal The position actual value received via CI: p2657 is valid. BI: p2658 = 0 signal The position actual value received via CI: p2657 is invalid.		
Dependency:	Refer to: r2526, p2657		
Note:	While a 0 signal is present, the position setpoint (p2665) is held at the value of 0.		
p2659	BI: EPOS referencing active feedback signal / Ref act fdbk		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.1
Description:	Sets the signal source for the feedback signal "referencing active". BI: p2659 = 1 signal Referencing is active. BI: p2659 = 0 signal Referencing is not active.		
Dependency:	Refer to: r2526		
p2660	CI: EPOS measured value referencing / Meas val ref		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 3612, 3614
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2523[0]
Description:	Sets the signal source for the measured value for the function "referencing".		
Dependency:	Refer to: r2523		

2 Parameters

2.2 List of parameters

p2661	BI: EPOS measured value valid feedback signal / MeasVal valid fdbk		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3612, 3614, 3615
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.2
Description:	Sets the signal source for the feedback signal "measured value valid". BI: p2661 = 1 signal The measured value received via CI: p2660 is valid. BI: p2661 = 0 signal The measured value received via CI: p2660 is invalid.		
Dependency:	Refer to: r2526, p2660		

p2662	BI: EPOS adjustment value valid feedback signal / Adj val valid FS		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.9
Description:	Sets the signal source for the feedback signal "adjustment value valid". BI: p2662 = 1 signal The adjustment value received via CI: p2660 is valid. BI: p2662 = 0 signal The adjustment value received via CI: p2660 is not valid.		
Dependency:	Refer to: r2526, p2660		

p2663	BI: EPOS clamping active feedback signal / Clamping act FS		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 3616
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	2526.8
Description:	Sets the signal source for the feedback signal "clamping active for travel to fixed stop". BI: p2663 = 1 signal Clamping is active BI: p2663 = 0 signal Clamping is not active.		
Dependency:	Refer to: r2526		
Note:	The feedback signal from "terminals active" is, for the factory setting, dependent on the signal BO: r2526.8 (terminals active when moving to a fixed stop).		

r2665	CO: EPOS position setpoint / s_set			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting - [LU]	
Description:	Displays the actual absolute position setpoint.			
Dependency:	Refer to: p2530			
Note:	As standard, the following BICO interconnection is established: CI: p2530 = r2665			
r2666	CO: EPOS velocity setpoint / v_set			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min - [1000 LU/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [1000 LU/min]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting - [1000 LU/min]	
Description:	Displays the actual velocity setpoint.			
Dependency:	Refer to: p2531			
Note:	As standard, the following BICO interconnection is established: CI: p2531 = r2666			
r2667	CO: EPOS backlash compensation value / Backlash value			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting - [LU]	
Description:	Displays the actual effective value for backlash compensation.			
Dependency:	Refer to: p2516			
Note:	As standard, the following BICO interconnection is established: CI: p2516 = r2667			
r2669	CO/BO: EPOS actual operating mode / Op mode act			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3625, 3630 Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the actual active operating mode. Value = 00 hex -> no operating mode active Value = 01 hex -> jogging active Value = 02 hex -> search for reference active Value = 04 hex -> traversing blocks active Value = 08 hex -> Positioning for direct setpoint input/MDI active Value = 10 hex -> Setting-up for direct setpoint input/MDI active Value = 20 hex -> flying referencing active			
Dependency:	Refer to: p2589, p2590, p2595, p2631, p2647, p2653			

2 Parameters

2.2 List of parameters

r2670.0...15		CO/BO: EPOS status word active traversing block / ZSW act trav_blk			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 3615, 3625, 3650		
	P-Group: Basic positioner	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
-	-	-			
Description:	Displays the status word for the active traversing block. r2670.0: Active traversing block, bit 0 ... r2670.5: Active traversing block, bit 5 r2670.15: MDI active				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Active traversing block bit 0	Active	Not active	-
	01	Active traversing block bit 1	Active	Not active	-
	02	Active traversing block bit 2	Active	Not active	-
	03	Active traversing block bit 3	Active	Not active	-
	04	Active traversing block bit 4	Active	Not active	-
	05	Active traversing block bit 5	Active	Not active	-
	15	MDI active	Active	Not active	-
Dependency:	Refer to: p2631, p2647				
Note:	For bit 00 ... 05: Displays the active traversing block in the traversing blocks operating mode. For bit 15: For a 1 signal, the operating mode - direct setpoint input/MDI - is active				

r2671		CO: EPOS actual position setpoint / s_set act			
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1

	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
- [1000 LU/min]	- [1000 LU/min]	- [1000 LU/min]			
Description:	Displays the velocity setpoint presently being processed.				

r2673	CO: EPOS actual acceleration override / a_over act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [%]	Access level: 1 Func. diagram: 3610, 3612, 3616, 3620 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the acceleration override presently being processed.		
Note:	An override of 100% is effective in the "jogging" and "search for reference" operating modes.		
r2674	CO: EPOS actual deceleration override / -a_over act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: FloatingPoint32 P-Group: Basic positioner Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [%]	Access level: 1 Func. diagram: 3610, 3612, 3616, 3620 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the deceleration override presently being processed.		
Note:	An override of 100% is effective in the "jogging" and "search for reference" operating modes.		
r2675	CO: EPOS actual task / Task act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer16 P-Group: Basic positioner Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 9	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting -
Description:	Display and connector output for the order presently being processed.		
Value:	0: Inactive 1: POSITIONING 2: FIXED STOP 3: ENDLESS_POS 4: ENDLESS_NEG 5: WAITING 6: GOTO 7: SET_O 8: RESET_O 9: JERK		
Dependency:	Refer to: p2621		
r2676	CO: EPOS actual task parameter / Task par act		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3616 Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the task parameter presently being processed in the "traversing blocks" operating mode.		
Dependency:	Refer to: p2622		

2 Parameters

2.2 List of parameters

Note: The following is displayed depending on the task:
FIXED STOP: Clamping torque (0 ... 65536 [0.01 Nm]) or clamping force (0 ... 65536 [N])
WAIT: Delay time [ms]
GOTO: Block number
SET_O: 1, 2, 3 --> direct output 1, 2 or 3 (both) is set
RESET_O: 1, 2, 3 --> direct output 1, 2 or 3 (both) is reset
JERK: 0 --> deactivate, 1 --> activate

r2677 **CO: EPOS actual task mode / Task mode act**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 3616
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the task mode presently being processed.
Dependency: Refer to: p2623

r2678 **CO: EPOS external block change actual position / Ext blk chg s_act**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3615, 3616, 3620
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [LU]	- [LU]	- [LU]

Description: Displays the actual position for the following events:
- external block change via measuring probe (p2632 = 0, BI: p2661 = 0/1 signal).
- external block change via BI: p2633 (p2632 = 1, BI: p2633 = 0/1 signal).
- activate traversing task (BI: p2631 = 0/1 signal).
Dependency: Refer to: p2631, p2632, p2633, p2661

r2680 **CO: EPOS clearance reference cam and zero mark / Clear ref_cams/NM**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Integer32	Dyn. index: -	Func. diagram: 3612
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [LU]	- [LU]	- [LU]

Description: Display and connector output for the distance (clearance) between the reference cam and zero mark.
The value is determined with the reference point approach.

r2681 **CO: EPOS velocity override effective / v_over effective**

SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 3630
	P-Group: Basic positioner	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]

Description: Displays the actual effective velocity override.
Dependency: Refer to: p2571, p2646
Note: The effective override can differ from the specified override due to limits (e.g. p2571, maximum velocity).

r2682	CO: EPOS residual distance to go / Residual distance		
SERVO (EPOS), VECTOR (EPOS), SERVO_AC (EPOS), VECTOR_AC (EPOS)	Can be changed: - Data type: Integer32 P-Group: Basic positioner Not for motor type: - Min - [LU]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [LU]	Access level: 1 Func. diagram: 3635 Unit selection: - Expert list: 1 Factory setting - [LU]
Description:	Displays the current residual distance. The remaining distance is the distance to still to be moved through up to the end of the actual positioning task.		
Dependency:	Refer to: r2665, r2671, r2678		

r2683.0...14	CO/BO: EPOS status word 1 / POS_ZSW1				
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: - Data type: Unsigned16 P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3645 Unit selection: - Expert list: 1 Factory setting -		
Description:	Display and BICO output for status word 1 of the basic positioner (EPOS).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Tracking mode active	Yes	No	3635, 4020
	01	Velocity limiting active	Yes	No	3630
	02	Setpoint fixed	Yes	No	3635
	03	Set position reached	Yes	No	3635
	04	Axis moves forward	Yes	No	3635
	05	Axis moves backward	Yes	No	3635
	06	Software limit switch minus reached	Yes	No	3635
	07	Software limit switch plus reached	Yes	No	3635
	08	Position actual value <= cam switching position 1	Yes	No	4025
	09	Position actual value <= cam switching position 2	Yes	No	4025
	10	Direct output 1 via traversing block	Yes	No	3616
	11	Direct output 2 via traversing block	Yes	No	3616
	12	Fixed stop reached	Yes	No	3616, 3617
	13	Fixed stop clamping force reached	Yes	No	3616, 3617
	14	Travel to fixed stop active	Yes	No	3616, 3617
Dependency:	Refer to: r2684				
Note:	For bit 02, 04, 05, 06, 07: This signals designate the state after jerk limiting. For bits 08, 09: These signals are generated in the "closed-loop position control" function module.				

2 Parameters

2.2 List of parameters

r2683.0...14		CO/BO: EPOS status word 1 / POS_ZSW1			
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Unsigned16 P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3645 Unit selection: - Expert list: 1 Factory setting -		
Description:	Display and BICO output for status word 1 of the basic positioner (EPOS).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Tracking mode active	Yes	No	3635, 4020
	01	Velocity limiting active	Yes	No	3630
	02	Setpoint fixed	Yes	No	3635
	03	Set position reached	Yes	No	3635
	04	Axis moves forward	Yes	No	3635
	05	Axis moves backward	Yes	No	3635
	06	Software limit switch minus reached	Yes	No	3635
	07	Software limit switch plus reached	Yes	No	3635
	08	Position actual value <= cam switching position 1	Yes	No	4025
	09	Position actual value <= cam switching position 2	Yes	No	4025
	10	Direct output 1 via traversing block	Yes	No	3616
	11	Direct output 2 via traversing block	Yes	No	3616
	12	Fixed stop reached	Yes	No	3616, 3617
	13	Fixed stop clamping torque reached	Yes	No	3616, 3617
	14	Travel to fixed stop active	Yes	No	3616, 3617
Dependency:	Refer to: r2684				
Note:	For bit 02, 04, 05, 06, 07: This signals designate the state after jerk limiting. For bits 08, 09: These signals are generated in the "closed-loop position control" function module.				

r2684.0...15		CO/BO: EPOS status word 2 / POS_ZSW2			
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: Unsigned16 P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 3646 Unit selection: - Expert list: 1 Factory setting -		
Description:	Display and BICO output for status word 2 of the basic positioner (EPOS).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Search for reference active	Active	Not active	3612
	01	Flying referencing active	Active	Not active	3614
	02	Referencing active	Active	Not active	-
	03	Printing mark outside outer window	Yes	No	3614
	04	Axis accelerating	Yes	No	3635
	05	Axis decelerating	Yes	No	3635
	06	Jerk limiting active	Yes	No	3635
	07	Activate correction	Yes	No	3635
	08	Following error in tolerance	Yes	No	4025
	09	Modulo correction active	Yes	No	-
	10	Target position reached	Yes	No	4020

11	Reference point set	Yes	No	3612, 3614, 3630
12	Acknowledgment traversing block activated	Yes	No	3616, 3620
13	STOP cam minus active	Yes	No	3630
14	STOP cam plus active	Yes	No	3630
15	Traversing command active	Yes	No	3635

Note:

For bit 02:

The "referencing active" signal is an OR logic operation of "search for reference active" and "flying referencing active".

For bit 00 ... 07 and 11 ... 14:

These signals are generated in the function module "basic positioner".

For bit 08:

The signal is generated in the "closed-loop position control" function module.

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, TM41, ENC	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Display and connector output for the reference quantity for speed and frequency (p2000). All speeds or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). This parameter has the unit rpm. The following applies: Reference frequency (in Hz) = reference speed (in rpm) / 60			
Dependency:	Refer to: p2000			
Note:	This BICO parameter provides the numerical value of the reference quantity p2000 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.			
r2700	CO: Reference velocity/reference frequency actual / v_ref/f_ref act			
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Display and connector output for the actual reference quantity for velocity and frequency. All velocities or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference velocity (in m/min) / 60			
Dependency:	Refer to: p2000			

2 Parameters

2.2 List of parameters

Note: This parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC).
If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
Example 1:
The signal of an analog input (e.g. r4055[0]) is connected to a velocity setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute velocity setpoint using the reference velocity (p2000).
Example 2:
The setpoint from PROFIBUS (r2050[1]) is connected to a velocity setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute velocity setpoint via reference velocity (p2000).

r2700	CO: Reference frequency / f_ref		
A_INF, R_INF, B_INF	Can be changed: -	Calculated: -	Access level: 2

2 Parameters

2.2 List of parameters

r2702	CO: Reference current / Reference current		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output of the reference quantity for currents p2002. All currents specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). This parameter has the unit Arms.		
Dependency:	Refer to: p2002		
Note:	This BICO parameter provides the numerical value of the reference quantity p2002 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.		
<hr/>			
r2703	CO: Reference torque / Reference torque		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, TM41	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output of the reference quantity p2003 for torque (r0108.12 = 0) or force (r0108.12 = 1). All torques specified as relative values (r0108.12 = 0) or forces (r0108.12 = 1) are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The unit of this parameter is the same as the unit selected for p2003.		
Dependency:	p0505, r0108.12 Refer to: p2003		
Note:	This BICO parameter provides the numerical value of the reference quantity p2003 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.		
<hr/>			
r2703	CO: Reference force actual / Ref force cur		
SERVO (Lin), HLA, SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the actual reference quantity for forces. All forces specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
Dependency:	p0505, r0108.12 Refer to: p2003		

Note: This BICO parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC).
 This BICO parameter is not suitable for interconnecting for cyclic communication.
 If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.
 Example:
 The actual value of the total force (r0079[0]) is connected to a test socket (e.g. p0771[0]). The actual force is cyclically converted into a percentage of the reference force (p2003) and output according to the parameterized scaling.

r2704	CO: Reference power / Reference power		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output of the reference quantity for powers p2004. All power ratings specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The unit of this parameter is the same as the unit selected for p2004.		
Dependency:	This value is calculated as voltage x current for the infeed and as torque x speed for closed-loop controls. Refer to: r2004		
Note:	This BICO parameter provides the numerical value of the reference quantity p2004 in the currently selected unit as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication. The reference power is calculated as follows: - $2 * \text{Pi} * \text{reference speed} / 60 * \text{reference torque} \text{ (motor)}$ - $\text{reference voltage} * \text{reference current} * \text{root}(3) \text{ (infeed)}$		

r2705	CO: Reference angle / Reference angle		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Connector output of the reference quantity for angles p2005. All angles specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). This parameter has the unit degree.		
Dependency:	Refer to: p2005		
Note:	This BICO parameter provides the numerical value of the reference quantity p2005 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC. This BICO parameter is not suitable for interconnecting for cyclic communication.		

r2706	CO: Reference temperature / Reference temp		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM31, TM41, TM120, TM150	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Connector output of the reference quantity for temperatures.
All temperatures specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
This parameter has the unit degree Celsius.

Note: This BICO parameter provides the numerical value of the reference quantity for the temperature as a connector output for interconnection with Drive Control Chart (DCC). The numerical value can be adopted unchanged from this connector output in DCC.
This BICO parameter is not suitable for interconnecting for cyclic communication.

r2707	CO: Reference acceleration / Ref a		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, TM41	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Connector output of the reference quantity for accelerations p2007.
All acceleration rates specified as relative value are referred to this reference quantity.
The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).
The unit of this parameter is the same as the unit selected for p2007.

Dependency: r0108.12, p0505
Refer to: p2007

Note: This BICO parameter provides the numerical value of the reference quantity p2007 as a connector output for interconnection with Drive Control Chart (DCC). The numerical value in the currently selected unit can be adopted unchanged from this connector output in DCC.
This BICO parameter is not suitable for interconnecting for cyclic communication.

p2720[0...n]	Load gear configuration / Load gear config		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(1, 4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 bin

Description: Sets the configuration for position tracking of a load gear.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Load gear activate position tracking	Yes	No	-
	01	Axis type	Linear axis	Rotary axis	-
	02	Load gear reset position	Yes	No	-

Note: For the following events, the non-volatile, saved position values are automatically reset:
- when an encoder replacement has been identified.
- when changing the configuration of the Encoder Data Set (EDS).
- when adjusting the absolute encoder again

p2721[0...n]	Load gear rotary absolute encoder revolutions virtual / Abs rot rev		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(1, 4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 4194303	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.		
Dependency:	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).		
Note:	The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is pre-set with p0421 when activating position tracking and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421 when activating position tracking, expanded by 6 bits for multturn information (maximum number of overflows) and cannot be changed.		
p2722[0...n]	Load gear position tracking tolerance window / Pos track tol		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: C2(1, 4) Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 4294967300.00	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00
Description:	Sets a tolerance window for position tracking. After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
Dependency:	Refer to: F07449		
Caution:	Rotation, for example through a complete encoder range is not detected.		
			
Note:	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).		
r2723[0...n]	CO: Load gear absolute value / Load gear AbsV		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4010, 4704 Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the absolute value after the load gear.		
Notice:	The encoder position actual value must be requested using the encoder control word Gn_STW.13.		
Note:	The increments are displayed in the format the same as r0483.		

2 Parameters

2.2 List of parameters

r2724[0...n]	CO: Load gear position difference / Load gear pos diff		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: Integer32 P-Group: Encoder Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the position difference before the load gear between switching off and switching on.		
Note:	The increments are displayed in the same format as for r0483/r2723. If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments. If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor.		
p2730[0...3]	BI: LR pos. actual value preprocessing activate neg. corr. (edge) / ActV_prep neg corr		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned32 / Binary P-Group: Closed-loop position control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: 4010, 4015 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the function "activate position actual value preprocessing, negative corrective value (edge)". 0/1 signal: The correction value available via CI: p2513 is negated and activated.		
Index:	[0] = Position control [1] = Encoder 1 [2] = Encoder 2 [3] = Encoder 3		
Dependency:	Refer to: p2502, p2513, r2684		
p2733[0...n]	CO: LR encoder adjustment DDS / Enc_adj DDS		
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Unsigned8 P-Group: Closed-loop position control Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 255	Access level: 4 Func. diagram: 4010 Unit selection: - Expert list: 1 Factory setting 0
Description:	Number of the drive data set when adjusting the absolute encoder.		
Dependency:	Refer to: p0404, p2507, p2525		
Note:	This DDS number is only relevant for absolute encoders. The drive determines the value when adjusting the absolute encoder and the user should not change it. DDS: Drive Data Set		

p2740		Position controller preassignment torque precontrol / Preassgn M_prectrl	
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting the closed-loop control structure for the position controller loop.		
Value:	0: Speed precontrol value control 1: Torque precontrol value control		
Note:	After activation, the following BICO interconnections are established: Value = 0: CI r2562 -> p1160 CI: p1430 = 0 CI: p1513 = 0 Value = 1: CI: p1160 = 0 CI: r2561 -> p1430 CI: r2564 -> p1513		

r2741		CO: LR acceleration precontrol value / a_prectrl value	
SERVO (Lin, Pos ctrl), SERVO_AC (Lin, Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [m/s ²]	Calculated: - Dyn. index: - Unit group: 22_2 Scaling: p2007 Max - [m/s ²]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [m/s ²]
Description:	Display and connector output for the acceleration precontrol value.		
Dependency:	Refer to: p1511, p1512		
Note:	The acceleration precontrol value is a derivation of the speed precontrol value with respect to time.		

r2741		CO: LR acceleration precontrol value / a_prectrl value	
SERVO (Pos ctrl), VECTOR (Pos ctrl), SERVO_AC (Pos ctrl), VECTOR_AC (Pos ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop position control Not for motor type: - Min - [rev/s ²]	Calculated: - Dyn. index: - Unit group: 39_1 Scaling: p2007 Max - [rev/s ²]	Access level: 1 Func. diagram: 4015 Unit selection: p0505 Expert list: 1 Factory setting - [rev/s ²]
Description:	Display and connector output for the acceleration precontrol value.		
Dependency:	Refer to: p1511, p1512		
Note:	The acceleration precontrol value is a derivation of the speed precontrol value with respect to time.		

p2780[0...5]	Activate adaptation block / Act adpt block		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 0000 0000 0000 0000 bin

Description: Setting to activate the adaptation block for the corresponding drive data sets.

Index:
 [0] = Adaptation block 0
 [1] = Adaptation block 1
 [2] = Adaptation block 2
 [3] = Adaptation block 3
 [4] = Adaptation block 4
 [5] = Adaptation block 5

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activate block DDS0	Yes	No	-
	01	Activate block DDS1	Yes	No	-
	02	Activate block DDS2	Yes	No	-
	03	Activate block DDS3	Yes	No	-
	04	Activate block DDS4	Yes	No	-
	05	Activate block DDS5	Yes	No	-
	06	Activate block DDS6	Yes	No	-
	07	Activate block DDS7	Yes	No	-
	08	Activate block DDS8	Yes	No	-
	09	Activate block DDS9	Yes	No	-

	19	Activate block DDS19	Yes	No	-
	20	Activate block DDS20	Yes	No	-
	21	Activate block DDS21	Yes	No	-
	22	Activate block DDS22	Yes	No	-
	23	Activate block DDS23	Yes	No	-
	24	Activate block DDS24	Yes	No	-
	25	Activate block DDS25	Yes	No	-
	26	Activate block DDS26	Yes	No	-
	27	Activate block DDS27	Yes	No	-
	28	Activate block DDS28	Yes	No	-
	29	Activate block DDS29	Yes	No	-
	30	Activate block DDS30	Yes	No	-
	31	Activate block DDS31	Yes	No	-

Dependency: The following sequence applies when activating an adaptation block:
 1. Set the signal source of the corresponding block (p2788[0...5]).
 2. Set the adaptation mode for the corresponding block (p2782[0...5]).
 3. Activate the block for the required drive data sets (p2780[0...5].0...31).

Refer to: p2782, p2783, p2784, p2788, r2789

Note: DDS: Drive Data Set

p2782[0...5]	Adaptation mode / Adpt mode		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	8	0
Description:	Sets the mode for the corresponding adaptation block.		
Value:	0: No adaptation 1: Speed controller P gain (Kp) 2: Speed controller integral time inverse value (1/Tn) 3: Current setpoint filter 1 denominator/numerator frequency 4: Current setpoint filter 2 denominator/numerator frequency 5: Speed setpoint filter 1 denominator/numerator frequency 6: Speed controller reference model natural frequency 7: APC/AVS/APC-ECO rate time (Tv) 8: APC filter 2.1 denominator/numerator frequency		
Index:	[0] = Adaptation block 0 [1] = Adaptation block 1 [2] = Adaptation block 2 [3] = Adaptation block 3 [4] = Adaptation block 4 [5] = Adaptation block 5		
Dependency:	The following sequence applies when activating an adaptation block: 1. Set the signal source of the corresponding block (p2788[0...5]). 2. Set the adaptation mode for the corresponding block (p2782[0...5]). 3. Activate the block for the required drive data sets (p2780[0...5].0...31). Depending on the mode, the following parameters are adapted: - mode = 1: p1460 - Mode = 2: 1/p1462 - mode = 3: p1658, p1660 - mode = 4: p1663, p1665 - mode = 5: p1417, p1419 - mode = 6: p1433, p1434 - mode = 7: p3761 - mode = 8: p3721, p3723 Refer to: p2780, p2783, p2784, p2788, r2789		
Note:	This function is only active when the "Controller parameter adaptation" function module is active (r0171.29 = 1). For modes = 1, 2, 7, the following applies: - sampling time = 1 ms For modes = 3, 4, 5, 6, 8, the following applies: - sampling time = 40 ms For mode = 7, the following applies: - in addition, function module "Advanced Positioning Control (APC)" (r0108.7) or "Active Vibration Suppression (AVS/APC-ECO)" (r0108.19) must be activated. For mode = 8, the following applies: - in addition, function module "Advanced Positioning Control (APC)" (r0108.7) must be activated. APC: Advanced Positioning Control AVS: Active Vibration Suppression		

2 Parameters

2.2 List of parameters

p2783[0...5]	Adaptation lower limit value / Adpt lower lim val		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	500
Description:	Sets the lower limit value for the adaptation block. The lower limit value acts on the adaptation factor received at connector input p2788[0...3]. p2783 = 1000 corresponds to 100 %		
Index:	[0] = Adaptation block 0 [1] = Adaptation block 1 [2] = Adaptation block 2 [3] = Adaptation block 3 [4] = Adaptation block 4 [5] = Adaptation block 5		
Dependency:	The lower limit value must always be less than or equal to the upper limit value (p2783[0...5] <= p2784[0...5]). Refer to: p2780, p2782, p2784, p2788, r2789		

p2784[0...5]	Adaptation upper limit value / Adpt upper lim val		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	2000
Description:	Sets the upper limit value for the adaptation block. The upper limit value acts on the adaptation factor received at connector input p2788[0...3]. p2784 = 1000 corresponds to 100 %		
Index:	[0] = Adaptation block 0 [1] = Adaptation block 1 [2] = Adaptation block 2 [3] = Adaptation block 3 [4] = Adaptation block 4 [5] = Adaptation block 5		
Dependency:	The lower limit value must always be less than or equal to the upper limit value (p2783[0...5] <= p2784[0...5]). Refer to: p2780, p2782, p2783, p2788, r2789		

p2788[0...5]	CI: Adaptation factor signal source / Adpt fact s_s		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the adaptation factor of the corresponding adaptation block. When selecting manufacturer-specific PROFIdrive telegram 146, 148 or 149, p2788[0...3] is automatically interconnected with PZD ADAPT1 ... ADAPT4.		
Index:	[0] = Adaptation block 0 [1] = Adaptation block 1 [2] = Adaptation block 2 [3] = Adaptation block 3 [4] = Adaptation block 4 [5] = Adaptation block 5		
Dependency:	Refer to: p2780, p2782, p2783, p2784, r2789		

Note: For p2788[0...3]:
These indices are used to interconnect signal ADAPT1 ... ADAPT4.
For p2788[4, 5]:
These indices can be freely interconnected.

r2789[0...5]	Active adaptation factor / Act adpt fact		
SERVO (Ctrl_par adapt), SERVO_AC (Ctrl_par adapt), SERVO_I_AC (Ctrl_par adapt)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [%]	Access level: 3 Func. diagram: 5055 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the active adaptation factor of the corresponding adaptation block. The value takes into account the lower and upper limit values that have been set (p2783[0...5], p2784[0...5]).		
Index:	[0] = Adaptation block 0 [1] = Adaptation block 1 [2] = Adaptation block 2 [3] = Adaptation block 3 [4] = Adaptation block 4 [5] = Adaptation block 5		
Dependency:	Refer to: p2780, p2782, p2783, p2784, p2788

Dependency:

Refer to: p2900, p2901, p2930

Note:

The signal sources can, for example, be used to interconnect scalings.

p2909**Characteristic measurement control word / Char meas STW**VECTOR,
VECTOR_AC,
VECTOR_I_AC**Can be changed:** T**Calculated:** CALC_MOD_ALL**Access level:** 3**Data type:** Unsigned32**Dyn. index:** -**Func. diagram:** -**P-Group:** Motor identification**Unit group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

-

-

0000 bin

Description:

Sets the configuration for the characteristic measurement.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Continue last measurement	Yes	No	-
01	Insert cooling down time during the Iq stages	Yes	No	-
02	Deactivate speed check	Yes	No	-
03	Deactivate automatic parameter preassignment	Yes	No	-

Notice:

For bit 00:

- the function can only be activated if the measurement has still not been activated (p2911 = 0).

- the limit values for the measurement are loaded from the file. This means that the settings in p2920, p2921 and p2922 are not active.

Note:

For bit 00:

- the last measurement of the magnetic characteristics in the d and q axes (p2910 = 1) is continued at that position up until where the data were saved (in the file).

- to record the measurement again, the measurement with the highest index is used (data.txt or data_xx.txt, xx = [1...99]).

For bit 01:

- after each measured value of the quadrature axis, the current setpoint is ramped to 0, and the system waits for the time defined in p2925[1].

For bit 03:

- the automated pre-assignment of the current controller and time parameters is deactivated (p1715, p1720, p1722, p1710, p1711, p1712, p2924, p0045).

0

4

0

Description:

Activating characteristic measurement.

Value:

0: Deactivated
 1: Activated with transfer
 3: Activated with acceptance and conversion
 4: Activated without acceptance

2 Parameters

2.2 List of parameters

Dependency: For p2910 = 1:
- the measurement can only be activated if the pulses are not enabled.
- with this setting, only a value of 4 is possible.
- for each measurement, a new file is generated with consecutive number.
- for p2909.0 = 1, as a start point, the last value saved in the file with the highest index is used, and the following values are attached to the existing file.
- the parameter cannot be changed if p0096 is not 0.
Refer to: r2928

Note: The characteristic measurement progress is indicated in r2928.

p2920[0...1] Characteristic measurement lower limit / Lower char limit

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-500.00 [%]	500.00 [%]	-100.00 [%]

Description: Lower limit for measuring the characteristics.
Index: [0] = First coordinate
[1] = Second coordinate

Dependency: For p2910 = 1:
- for p2909.0 = 1, the parameter value is not taken into account .
- the value is used as setpoint for the lower current limit in the direct and quadrature axes.

Notice: The value must be less than \leq p2921.

p2921[0...1] Characteristic measurement upper limit / Upper char limit

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-500.00 [%]	500.00 [%]	100.00 [%]

Description: Upper limit for measuring the characteristics.
Index: [0] = First coordinate
[1] = Second coordinate

Dependency: p2910 = 1:
- if p2909.0 is set, then the parameter value is not taken into account .
- the value is used as setpoint for the lower current limit in the direct and quadrature axes.

Notice: Der value must be \geq p2920.

p2922[0...1] Characteristic measurement number of measurement points / Char meas pts qty

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	100	21

Description: Defines the number of measuring points in one coordinate direction. This defines the resolution of the measurement.
Uneven number of measuring points:
Resolution = $|p2921[x]-p2920[x]|/(p2922-1)$

Index: [0] = First coordinate
[1] = Second coordinate

Dependency: For p2910 = 1:
- for p2909.0 = 1, the parameter value is not taken into account .

Notice:

- the value of 0 is not included for an even number of measuring points.
- values less than 2 are not permitted.

p2923[0...1]	Characteristic measurement ramp time / Char t_ramp		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1000000 [ms]	100 [ms]
Description:	Ramp time to switch to a new setpoint.		
	The ramp time defines the time that is required to change from the lower to the upper limit value (p2920, p2921).		
Index:	[0] = First coordinate [1] = Second coordinate		
p2924[0...1]	Characteristic measurement wait time / Char t_wait		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1000000 [ms]	10 [ms]
Description:	Wait time until a measured value has been taken and a setpoint is set.		
Index:	[0] = First coordinate [1] = Second coordinate		
Note:	For p2910 = 1 and p2911 = 4, the following applies: The parameters are automatically preassigned when the measurement is activated. Changes, that were made before the activation, are overwritten.		
p2925[0...1]	Characteristic measurement cool-down time / Char t_cool		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	1000000 [ms]	10 [ms]
Description:	Wait time at the end of a measuring period, option of cooling down.		
Index:	[0] = First coordinate [1] = Second coordinate		
p2926[0...1]	CO: Characteristic measurement setpoint / Char meas set		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-10000.00 [%]	10000.00 [%]	0.00 [%]
Description:	Sets the connector output for the characteristic measurement.		
Index:	[0] = First coordinate [1] = Second coordinate		
Dependency:	For p2910 = 1: - the connection is automatically established when making the measurement.		
Note:	The value can be used to interconnect a scaling function (e.g. scaling the main setpoint).		

2 Parameters

2.2 List of parameters

p2927[0...1]	Characteristic measurement speed / Char n		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 150 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 60 [%] [1] 5 [%]
Description:	Speed value as a percentage at which point the characteristic is measured. Index 1 specifies the tolerance threshold.		
Index:	[0] = Measuring speed [1] = Speed tolerance		
r2928	Characteristic measurement progress display / Char progress		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the progress as a percentage when measuring the characteristics. Characteristic measurement is activated using p2911.		
Dependency:	Refer to: p2911		
p2930[0...n]	CO: Fixed value F [N] / Fixed value F [N]		
HLA	Can be changed: U, T Data type: FloatingPoint32 P-Group: Setpoints Not for motor type: REL Min -100000.00 [N]	Calculated: - Dyn. index: DDS, p0180 Unit group: 8_1 Scaling: p2003 Max 100000.00 [N]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting 0.00 [N]
Description:	Setting and connector output for a fixed force value.		
Dependency:	Refer to: p2900, p2901, r2902		
Notice:	A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.		
Note:	The value can, for example, be used to interconnect a supplementary force.		
p2930[0...n]	CO: Fixed value M [Nm] / Fixed value M [Nm]		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Setpoints Not for motor type: REL Min -100000.00 [Nm]	Calculated: - Dyn. index: DDS, p0180 Unit group: 7_1 Scaling: p2003 Max 100000.00 [Nm]	Access level: 3 Func. diagram: 1021 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm]
Description:	Setting and connector output for a fixed torque value.		
Dependency:	Refer to: p2900, p2901, r2902		
Notice:	A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.		
Note:	The value can, for example, be used to interconnect a supplementary torque.		

p2930[0...n]	CO: Fixed value F [N] / Fixed value F [N]		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 1021
	P-Group: Setpoints	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: p2003	Expert list: 1
	Min	Max	Factory setting
	-100000.00 [N]	100000.00 [N]	0.00 [N]
Description:	Setting and connector output for a fixed force value.		
Dependency:	Refer to: p2900, p2901, r2902		
Notice:	A BICO interconnection to a parameter that belongs to a drive data set always acts on the effective data set.		
Note:	The value can, for example, be used to interconnect a supplementary force.		
p2952[0...n]	Flux characteristic coefficient K01 / Psid_mod K01		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Sets coefficient K01 of the saturation characteristic for the flux model. The coefficients (K01, K02, K03) are determined by performing a rotating measurement (p1960). For some Siemens motors, these are also automatically preassigned.		
Dependency:	Refer to: p2953, p2954		
Note:	For p2952 = 0, the saturation characteristic is deactivated.		
p2953[0...n]	Flux characteristic coefficient K02 / Psid_mod K02		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Sets coefficient K02 of the saturation characteristic for the flux model. The coefficients (K01, K02, K03) are determined by performing a rotating measurement (p1960). For some Siemens motors, these are also automatically preassigned.		
Dependency:	Refer to: p2952, p2954		
Note:	For p2952 = 0, the saturation characteristic is deactivated.		
p2954[0...n]	Flux characteristic coefficient K03 / Psid_mod K03		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Sets coefficient K03 of the saturation characteristic for the flux model. The coefficients (K01, K02, K03) are determined by performing a rotating measurement (p1960). For some Siemens motors, these are also automatically preassigned.		
Dependency:	Refer to: p2952, p2953		
Note:	For p2952 = 0, the saturation characteristic is deactivated.		

p2955[0...n]	Flux characteristic coefficient K04 / Psid_mod K04		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Sets the reduction factor of the permanent magnet flux for maximum current (p0323). For some Siemens motors, the coefficient is automatically preassigned.		
Note:	For p2954 = 0, the saturation characteristic is deactivated.		

r2969[0...6]	Flux model value display / Psi_mod val disp		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the values of the direct access flux model for the synchronous reluctance motor (RESM) for diagnostic purposes. Valid values are only displayed when the pulses are inhibited. For index [0]: Displays the entered direct axis current id in Arms: For index [1, 2, 3]: Displays the saturation curves of the direct axis flux psid(id, iq): - r2969[1]: flux in Vsrms with respect to the direct axis current for iq = 0 - r2969[2]: flux in Vsrms with respect to the direct axis current for iq = 0.5 * p2950 - r2969[3]: flux in Vsrms with respect to the direct axis current for iq = p2950 For index [4, 5, 6]: Displays the relative error of the current inversion (id(psid, iq) - id) / p2950: - r2969[4]: error with respect to direct axis current for iq = 0 - r2969[5]: error with respect to direct axis current for iq = 0.5 * p2950 - r2969[6]: error with respect to direct axis current for iq = p2950		
Index:	[0] = d-current [1] = d-flux iq0 [2] = d-flux iq1 [3] = d-flux iq2 [4] = d-current error iq0 [5] = d-current error iq1 [6] = d-current error iq2		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		

p2980[0...n]	Quadrature axis flux model coefficient K01 / Psiq_mod K01		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Definition of the saturation characteristic for the quadrature axis flux model of the synchronous reluctance motor (RESM). This parameter is coefficient K01.		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		

p2981[0...n]	Quadrature axis flux model coefficient K02 / Psiq_mod K02		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: ASM, SESM, REL Min -	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Definition of the saturation characteristic for the quadrature axis flux model of the synchronous reluctance motor (RESM). This parameter is coefficient K02.		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		
p2982[0...n]	Quadrature axis flux model coefficient K03 / Psiq_mod K03		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: ASM, SESM, REL Min -	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Definition of the saturation characteristic for the quadrature axis flux model of the synchronous reluctance motor (RESM). This parameter is coefficient K03.		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		
p2983[0...n]	Quadrature axis flux model coefficient K04 / Psiq_mod K04		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: ASM, SESM, REL Min -	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Definition of the saturation characteristic for the quadrature axis flux model of the synchronous reluctance motor (RESM). This parameter is coefficient K04.		
Note:	RESM: reluctance synchronous motor (synchronous reluctance motor)		
p3011[0...n]	MotID current control adaptation lower starting point identified / I_adapt low ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00 [Arms]	Calculated: CALC_MOD_ALL Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 6000.00 [Arms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [Arms]
Description:	Starting point of the current-dependent current controller adaptation determined by the motor data identification routine. This value can be changed after the identification and accepted in p0391 with p1910/p1960 = -3.		
Dependency:	Refer to: p0356, p0391, p0392, p0393, r1934, r1935, p1960		

2 Parameters

2.2 List of parameters

p3012[0...n]	MotID current control adaptation upper starting point identified / I_adapt up ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00 [Arms]	Calculated: CALC_MOD_ALL Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 6000.00 [Arms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [Arms]
Description:	Starting point of the current-dependent current controller adaptation for the upper point determined by the motor data identification routine. This value can be changed after the identification and accepted in p0392 with p1910/p1960 = -3.		
Dependency:	Refer to: p0356, p0391, p0392, p0393, r1934, r1935, p1960		
p3013[0...n]	MotId current controller adaptation P gain identified / I_adapt Kp ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00 [%]	Calculated: CALC_MOD_ALL Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 1000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Factor for the P gain of the current controller in the adaptation range determined by the motor data identification routine. The value is referred to p1715. This value can be changed after the identification and accepted in p0393 with p1910/p1960 = -3.		
Dependency:	Refer to: p0356, p0391, p0392, p0393, r1934, r1935, p1960		
p3016	MotId torque constant identified / kT ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, SESM, REL Min 0.00 [Nm/A]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: 28_1 Scaling: - Max 100.00 [Nm/A]	Access level: 3 Func. diagram: - Unit selection: p0100 Expert list: 1 Factory setting 0.00 [Nm/A]
Description:	Torque constant for the synchronous motor determined by the motor data identification. This torque constant can be changed after the identification and accepted in p0316 with p1910/p1960 = -3.		
Dependency:	Refer to: p0316, r0334, r1937, p1960		
p3016	MotId force constant identified / kT ident		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, SESM, REL Min 0.00 [N/Arms]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: 29_1 Scaling: - Max 1000.00 [N/Arms]	Access level: 3 Func. diagram: - Unit selection: p0100 Expert list: 1 Factory setting 0.00 [N/Arms]
Description:	Force constant for a synchronous linear motor determined by the motor data identification. This force constant can be changed after the identification and is accepted in p0316 with p1910/p1960 = -3.		
Dependency:	Refer to: p0316, r0334, r1937, p1960		

p3017	Motld voltage constant identified / kE ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, SESM, REL Min 0.0 [Vrms]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 10000.0 [Vrms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0 [Vrms]
Description:	Voltage constant for a synchronous motor determined by the motor data identification. This voltage constant can be changed after the identification and accepted in p3017 with p1910/p1960 = -3. Units for rotating synchronous motors: Vrms/(1000 rpm), phase-to-phase		
Dependency:	Refer to: p0317, r1938, p1960		
p3017	Motld voltage constant identified / kE ident		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, SESM, REL Min 0.0 [Vrms s/m]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 1000.0 [Vrms s/m]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0 [Vrms s/m]
Description:	Voltage constant for a synchronous linear motor determined by the motor data identification. This voltage constant can be changed after the identification and accepted in p3017 with p1910/p1960 = -3. Units for linear synchronous motors: Vrms s/m, phase		
Dependency:	Refer to: p0317, r1938, p1960		
p3020	Motld magnetizing current identified / I_mag ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: SESM, REL Min 0.000 [Arms]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 5000.000 [Arms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [Arms]
Description:	Magnetizing current for an induction motor determined by the motor data identification. This magnetizing current can be changed after the identification and accepted in p3020 with p1910/p1960 = -3.		
Dependency:	Refer to: p0320, r0331, p1910, r1948, p1960		
p3027	Motld optimum load angle identified / phi_load opt ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: ASM, SESM, REL Min 0.0 [°]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 135.0 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0 [°]
Description:	Optimum load angle for a synchronous motor determined by the motor data identification. This optimum load angle can be changed after the identification and accepted in p3027 with p1910/p1960 = -3.		
Dependency:	Refer to: p0327, r1947, p1960		

2 Parameters

2.2 List of parameters

p3028	MotId reluctance torque constant identified / kT_reluct ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000.00 [mH]	1000.00 [mH]	0.00 [mH]
Description:	Reluctance torque constant for a synchronous motor determined by the motor data identification. This reluctance torque constant can be changed after the identification and accepted in p3028 with p1910/p1960 = -3.		
Dependency:	Refer to: p0328, r1939, p1960		
p3028	MotId reluctance force constant identified / kT_reluct ident		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000.00 [mH]	1000.00 [mH]	0.00 [mH]
Description:	Reluctance force constant for a synchronous motor determined by the motor data identification. This reluctance force constant can be changed after the identification and accepted in p3028 with p1910/p1960 = -3.		
Dependency:	Refer to: p0328, r1939, p1960		
p3030	ChId factor plane adaptation positive / ChId pl_adpt pos		
HLA	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.00 [%]	200.00 [%]	100.00 [%]
Description:	Sets the factor for the plane compensation in the positive direction from the characteristic identification. This value corresponds to p1830 of the drive data set selected for the identification.		
Dependency:	Refer to: p1830		
p3030	MotId angular commutation offset identified / Ang_com offset		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-180.00 [°]	180.00 [°]	0.00 [°]
Description:	Angular commutation offset for a synchronous motor determined by the motor data identification. This angular commutation offset can be changed after the identification and accepted in p0431 with p1910/p1960 = -3.		
Dependency:	Refer to: p0431, p1910, p1960, r1984		

p3031	Chld factor plane adaptation negative / Chld pl_adpt neg		
HLA	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10 [%]	200 [%]	100 [%]
Description:	Sets the factor for the plane compensation in the negative direction from the characteristic identification. This value corresponds to p1831 of the drive data set selected for the identification.		
Dependency:	Refer to: p1831		

p3031	Motld encoder inversion actual value identified / EnclnvActV ident			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 bin	
Description:	Inversion of the encoder actual value determined by the motor data identification. This inversion can be changed after the identification and accepted in p0410 with p1910/p1960 = -3.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Invert speed actual value	Yes	No
	01	Invert position actual value	Yes	No
				FP
				4710,
				4711,
				4715
				4704
Dependency:	Refer to: p0410, p1910, p1960			

p3031	Motld encoder inversion actual value identified / EnclnvActV ident			
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 bin	
Description:	Inversion of the encoder actual value determined by the motor data identification. This inversion can be changed after the identification and accepted in p0410 with p1910/p1960 = -3.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Invert velocity actual value	Yes	No
	01	Invert position actual value	Yes	No
				FP
				4710,
				4711,
				4715
				4704
Dependency:	Refer to: p0410, p1910, p1960			

p3032	Motld: flux characteristic coefficient K01 identified / Psid_mod K01 ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Coefficient K01 of the saturation characteristic determined from the motor data identification. This coefficient can be changed after the identification, and accepted in p2952 with p1910/p1960 = -3.		
Dependency:	Refer to: p1960, p2952		

p3033		Chld transition point compensation Q1 positive zero range / Chld tr pt Q1 pos	
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01 [%]	95.00 [%]	0.01 [%]
Description:	Displays the flow rate Q for point 1 positive (zero range) of the transition point compensation from the characteristic identification. This value corresponds to p1833 of the drive data set selected for the identification.		
Dependency:	Refer to: p1833		

p3033		MotId: flux characteristic coefficient K02 identified / Psid_mod K02 ident	
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: PMSM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-100000.0000	100000.0000	0.0000
Description:	Coefficient K02 of the saturation characteristic determined from the motor data identification. This coefficient can be changed after the identification, and accepted in p2953 with p1910/p1960 = -3.		
Dependency:	Refer to: p1960, p2953		

p3034		ChID transition point compensation U1 positive zero range / Chld tr pt U1 pos	
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	95.00 [%]	0.00 [%]
Description:	Displays the voltage U for point 1 positive (zero range) of the transition point compensation from the characteristic identification. This value corresponds to p1834 of the drive data set selected for the identification.		
Dependency:	Refer to: p1834		

p3034		MotId: flux characteristic coefficient K03 identified / Psid_mod K03 ident	
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

Description:	Speed at the start of field weakening determined by the motor data identification. This start speed can be changed after the identification and accepted in p0348 with p1910/p1960 = -3.		
Dependency:	Refer to: p0348, p1910, p1960		
p3049[0...n]	Motld Speed at start of field weakening identified / v_Fieldweak ident		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.00000 [m/min]	Calculated: CALC_MOD_ALL Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 1300.00000 [m/min]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00000 [m/min]
Description:	Velocity at the start of field weakening determined by the motor data identification. This start velocity can be changed after the identification and accepted in p0348 with p1910/p1960 = -3.		
Dependency:	Refer to: p0348, p1910, p1960		

p3050[0...n]	MotorId stator resistance identified / R_stator ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: 16_1	Unit selection: p0349
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [ohm]	2000.00000 [ohm]	0.00000 [ohm]
Description:	Stator resistance determined by the motor data identification.		
	This stator resistance can be changed after the identification and accepted in p0350 with p1910/p1960 = -3.		
Dependency:	Refer to: p0350, p1910, r1912		
p3054[0...n]	MotId rotor resistance identified / R_rotor ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: 16_1	Unit selection: p0349
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [ohm]	300.00000 [ohm]	0.00000 [ohm]
Description:	Rotor resistance for an induction motor determined by the motor data identification.		
	This stator resistance can be changed after the identification and accepted in p0354 with p1910/p1960 = -3.		
Dependency:	Refer to: p0354, p0625, p1910, r1927, p1960		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
p3056[0...n]	MotId stator leakage inductance identified / L_stator leak		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: 15_1	Unit selection: p0349
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [mH]	1000.00000 [mH]	0.00000 [mH]
Description:	Stator leakage inductance determined by the motor data identification.		
	This stator leakage inductance can be changed after the identification and accepted in p0356 with p1910/p1960 = -3.		
Dependency:	Refer to: p0356, p1910, r1932		
p3058[0...n]	MotId rotor leakage inductance identified / L_rotor leak		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: 15_1	Unit selection: p0349
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [mH]	1000.00000 [mH]	0.00000 [mH]
Description:	Rotor leakage induction for an induction motor determined by the motor data identification.		
	This rotor leakage inductance can be changed after the identification and accepted in p0358 with p1910/p1960 = -3.		
Dependency:	Refer to: p0358, p1910, r1932		

2 Parameters

2.2 List of parameters

p3060[0...n]	Motld magnetizing inductance identified / Motld Lh ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: 15_1	Unit selection: p0349
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [mH]	10000.00000 [mH]	0.00000 [mH]
Description:	Magnetizing inductance for an induction motor determined by the motor data identification. This magnetizing inductance can be changed after the identification and accepted in p0360 with p1910/p1960 = -3.		
Dependency:	Refer to: p0360, p1910, r1936, p1960		
p3065	MotID periodic position error amplitude 1 / MotID pos err amp1		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0	20000.0	0.0
Description:	Determined amplitude to compensate periodic position errors in fine pulses for the error with one sinusoidal period per mechanical revolution. The value is determined by the motor data identification routine.		
Dependency:	Refer to: p5250, p5265		
Note:	This value can be changed after the identification and accepted in p5265 with p1910/p1960 = -3.		
p3066	MotID periodic position error angle 1 / MotID pos err ang1		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-180.00 [°]	180.00 [°]	0.00 [°]
Description:	Determined angle to compensate periodic position errors for the error with one sinusoidal period per mechanical revolution. The value is determined by the motor data identification routine.		
Dependency:	Refer to: p5250, p5266		
Note:	This value can be changed after the identification and accepted in p5266 with p1910/p1960 = -3.		
p3067	MotID periodic position error amplitude 2 / MotID pos err amp2		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0	20000.0	0.0
Description:	Determined amplitude to compensate periodic position errors in fine pulses for the error with two sinusoidal periods per mechanical revolution. The value is determined by the motor data identification routine.		
Dependency:	Refer to: p5250, p5267		
Note:	This value can be changed after the identification and accepted in p5267 with p1910/p1960 = -3.		

p3068	MotID periodic position error angle 2 / MotID pos err ang2			
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min -180.00 [°]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 180.00 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [°]	
Description:	Determined angle to compensate periodic position errors for the error with two sinusoidal periods per mechanical revolution. The value is determined by the motor data identification routine.			
Dependency:	Refer to: p5250, p5268			
Note:	This value can be changed after the identification and accepted in p5268 with p1910/p1960 = -3.			
p3070	MotID voltage emulation error final value identified / U_err final ident			
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.000 [V]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 100.000 [V]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [V]	
Description:	Final value of the voltage emulation error determined by the motor data identification. This final value can be changed after the identification and accepted in p1952 with p1910/p1960 = -3.			
Dependency:	Refer to: p1910, p1952, p1953, p3071			
p3071	MotID voltage emulation error current offset identified / U_error I_offset			
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.000 [A]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 100.000 [A]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [A]	
Description:	Current offset of the voltage emulation error determined by the motor data identification. This current offset can be changed after the identification and accepted in p1953 with p1910/p1960 = -3.			
Dependency:	Refer to: p1910, p1952, p1953, p3070			
p3072	MotID voltage emulation error semiconductor voltage identified / U_error_semi ident			
SERVO (Ext M_ctrl), SERVO_AC (Ext M_ctrl), SERVO_I_AC (Ext M_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min -10.000 [V]	Calculated: CALC_MOD_ALL Dyn. index: - Unit group: - Scaling: - Max 10.000 [V]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [V]	
Description:	Semiconductor voltage of the voltage emulation error determined by the motor data identification. This value can be changed after the identification and accepted in p1954 with p1910/p1960 = -3.			
Dependency:	Refer to: p1910, p1952, p1953, p3071			

2 Parameters

2.2 List of parameters

p3075	Chld velocity controller loop gain / Chld v loop_gain		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [mm/Vmin]	20000.0 [mm/Vmin]	0.0 [mm/Vmin]
Description:	Sets the loop gain of the velocity controller from the characteristic identification. This value corresponds to r1475 of the data set selected for the identification.		
Dependency:	Refer to: p1475		
p3080	Motld flux controller P gain identified / Flux ctrl Kp ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [A/Vs]	999999.0 [A/Vs]	0.0 [A/Vs]
Description:	P gain of the flux controller for an induction motor determined by the motor data identification. This P gain can be changed after the identification and accepted in p1590 with p1910/p1960 = -3.		
Dependency:	Refer to: p1590, p1910		
p3081	Motld flux controller integral time identified / Flux ctrl Tn ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: PMSM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	0 [ms]
Description:	Integral time of the flux controller for an induction motor determined by the motor data identification. This integral time can be changed after the identification and accepted in p1592 with p1910/p1960 = -3.		
Dependency:	Refer to: p1592, p1910		
p3082	Motld current controller P gain identified / I_ctrl Kp ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: 18_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [V/A]	100000.000 [V/A]	0.000 [V/A]
Description:	P gain of the current controller determined by the motor data identification. This P gain can be changed after the identification and accepted in p1715 with p1910/p1960 = -3.		
Dependency:	Refer to: p1715, p1910		

p3083	Chld maximum positive velocity / Chld v_max pos		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [m/min]	1300.000 [m/min]	0.000 [m/min]
Description:	Displays the maximum velocity for the positive direction from the characteristic identification. This value corresponds to the maximum possible value in p1083 of the drive data set selected for the identification.		
Dependency:	Refer to: p1083		
p3083	Motld current controller integral time identified / I_ctrl Tn ident		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	1000.00 [ms]	0.00 [ms]
Description:	Integral time of the current controller determined by the motor data identification. This integral time can be changed after the identification and accepted in p1717 with p1910/p1960 = -3.		
Dependency:	Refer to: p1717, p1910		
p3086	Chld maximum negative velocity / Chld v_max neg		
HLA	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1300.000 [m/min]	0.000 [m/min]	0.000 [m/min]
Description:	Displays the maximum velocity for the negative direction from the characteristic identification. This value corresponds to the minimum possible value in p1086 of the drive data set selected for the identification.		
Dependency:	Refer to: p1086		
p3088	Motld Motor model changeover speed operation with encoder ident. / MotMod n_chgSnsorl		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00000 [rpm]	210000.00000 [rpm]	0.00000 [rpm]
Description:	Changeover speed for the motor model with encoder determined by the motor data identification. This changeover speed can be changed after the identification and accepted in p1752 with p1910/p1960 = -3.		
Dependency:	Refer to: p1752, p1910		

2 Parameters

2.2 List of parameters

p3088	MotId Motor model changeover vel. operat. with encod. ident. / v_chg Ident encod			
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.00000 [m/min]	1300.00000 [m/min]	0.00000 [m/min]	
Description:	Changeover velocity for the motor model with encoder determined by the motor data identification. This changeover velocity can be changed after the identification and accepted in p1752 with p1910/p1960 = -3.			
Dependency:	Refer to: p1752, p1910			
p3090[0...n]	PolID elasticity-based configuration / PolID el config			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: Unsigned16	Dyn. index: MDS, p0130	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 bin	
Description:	Sets the configuration for the elasticity-based pole position identification. Depending on the mechanical design (sequence: motor - encoder - brake) and on the braking force, the pole position identification routine can result in deflections with a different control sense. For bit 00 = 0: The deflection caused by the pole position identification acts in the positive control sense. For bit 00 = 1: The deflection caused by the pole position identification acts in the negative control sense. This can only occur for a linear measuring system if a brake is installed between the machine and the measuring system and the brake is powerful enough to do this.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Sign change	Yes	No
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3091, p3092, p3093, p3094, p3095, p3096, r3097 Refer to: F07995			
Note:	PolID el: pole position identification, elasticity-based			
p3091[0...n]	PolID elasticity-based ramp time / PolID el t_ramp			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -	
	P-Group: Motor identification	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [ms]	1000.0 [ms]	250.0 [ms]	
Description:	Sets the ramp time for the current increase when executing the elasticity-based pole position identification. The current is ramped up in order to reduce the mechanical load on the machine.			
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3092, p3093, p3094, p3095, p3096, r3097 Refer to: F07995			
Note:	PolID el: pole position identification, elasticity-based			

p3092[0...n]	PolID elasticity-based wait time / PolID el t_wait		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.0 [ms]	Calculated: CALC_MOD_CON Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 1000.0 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [ms]
Description:	Sets the wait time between two measurements when executing the elasticity-based pole position identification. The wait time between two measurements is necessary in order to avoid mechanical resonance effects.		
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3093, p3094, p3095, p3096, r3097 Refer to: F07995		
Note:	PolID el: pole position identification, elasticity-based		
p3093[0...n]	PolID elasticity-based measurement number / PolID el meas		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: Unsigned16 P-Group: Motor identification Not for motor type: - Min 6	Calculated: CALC_MOD_CON Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 56	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 12
Description:	Sets the number of measuring operations when executing the elasticity-based pole position identification. When the value is increased, the result is more accurate, however, the identification takes longer.		
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3094, p3095, p3096, r3097 Refer to: F07995		
Note:	PolID el: pole position identification, elasticity-based		
p3094[0...n]	PolID elasticity-based deflection expected / PolID el defl exp		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.0000 [°]	Calculated: CALC_MOD_CON Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 90.0000 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0030 [°]
Description:	Sets the expected deflection when executing the elasticity-based pole position identification. The following setting makes sense: p3094 < p3095		
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3093, p3095, p3096, r3097 Refer to: F07995		
Note:	PolID el: pole position identification, elasticity-based		
p3094[0...n]	PolID elasticity-based deflection expected / PolID el defl exp		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor identification Not for motor type: - Min 0.0000 [mm]	Calculated: CALC_MOD_CON Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 90.0000 [mm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0030 [mm]
Description:	Sets the expected deflection when executing the elasticity-based pole position identification. The following setting makes sense: p3094 < p3095		

2 Parameters

2.2 List of parameters

Dependency: Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3093, p3095, p3096, r3097

p3095[0...n] PolID elasticity-based deflection permissible / PolID el defl exp

SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0000 [mm]	90.0000 [mm]	1.0000 [mm]

Description: Sets the permissible deflection when executing the elasticity-based pole position identification.
The following setting makes sense: p3094 < p3095

Dependency: Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3093, p3094, p3096, r3097
Refer to: F07995

Note: PolID el: pole position identification, elasticity-based

p3096[0...n] PolID elasticity-based current / PolID el curr

SERVO, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [Arms]	20000.000 [Arms]	0.000 [Arms]

Description: Sets the maximum permissible current when executing the elasticity-based pole position identification.
The following setting makes sense: p3096 <= min (p0305, p0640, p0209)

Dependency: Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3093, p3094, p3095, r3097
Refer to: F07995

Note: PolID el: pole position identification, elasticity-based

r3097.0...31		BO: PolID elasticity-based status / PolID el status			
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 4

	31	Time slice state machine bit 7	Active	Inactive	-
Dependency:	Refer to: p1980, p1981, p1982, p1983, r1984, r1985, r1986, r1987, p1990, r1992, p3090, p3091, p3092, p3093, p3094, p3095, p3096				
	Refer to: F07995				
Note:	PolID el: pole position identification, elasticity-based				
	For bit 00 ... 15:				
	Displays the actual status of the elasticity-based pole position identification.				
	For bits 16 ... 23:				
	Displays the status for the background state machine.				
	For bits 24 ... 31:				
	Displays the status for the time slices state machine.				

p3100	RTC time stamp mode / RTC t_stamp mode		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2

Description: Sets the mode for the time stamp

Value:
0: Operating hours
1: UTC format
2: Operating hours + 01.01.2000

Notice: For p3100 = 1:
The system prevents this setting from being changed. The parameter can only be influenced after "Set factory setting" or with a "Project download".

Note: RTC: Real-time clock
UTC: Universal Time Coordinates
For p3100 = 1:
Time of day synchronization is only possible with this setting.
The UTC time started, according to the definition on 01.01.1970 at 00:00:00 and is output in days and milliseconds.

p3101[0...1]	Setting UTC time / Set UTC time		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0

Description: Setting the UTC time.
This means that the drive system is synchronized to the time specified by the time master.
To start p3101[1] must be written to followed by p3101[0]. After writing to p3101[0], the UTC time is accepted.

Index: [0] = Milliseconds
[1] = Days

Dependency: Refer to: p3100

r3102[0...1]	Displaying UTC time / Display UTC time		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displaying the current UTC time.

Index: [0] = Milliseconds
[1] = Days

Dependency: Refer to: p3100

Notice: The time display depends on the selected mode (p3100).

p3103	UTC synchronization process / UTC sync_process		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0
Description:	Setting the synchronization process.		
Value:	0: PING/SNAP 1: Reserved 2: Parameter 3: Reserved		
Dependency:	Refer to: p3101, p3104		
Note:	For p3103 = 0: The PING/SNAP technique allows the UTC time to be set with a high degree of accuracy using p3104 and p3101. See the SINAMICS S120 Function Manual Drive Functions for more information. For p3103 = 2: Simply setting the UTC time via p3101. For p3103 = 4: Only for CU3x0-2 PN X150. Synchronization via Network Time Protocol (NTP).		

p3103	UTC synchronization process / UTC sync_process		
CU_S_AC_PN, CU_S120_PN, CU_S150_PN	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	99	0
Description:	Setting the synchronization process.		
Value:	0: PING/SNAP 1: Reserved 2: Parameter 3: Reserved 4: Network Time Protocol 99: No synchronization		
Dependency:	Refer to: p3101, p3104		
Note:	For p3103 = 0: The PING/SNAP technique allows the UTC time to be set with a high degree of accuracy using p3104 and p3101. See the SINAMICS S120 Function Manual Drive Functions for more information. For p3103 = 2: Simply setting the UTC time via p3101. For p3103 = 4: Only for CU3x0-2 PN X150. Synchronization via Network Time Protocol (NTP).		

2 Parameters

2.2 List of parameters

p3104	BI: UTC PING synchronization / UTC PING sync		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the PING event to set the UTC time.		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
<hr/>			
p3105[0...3]	NTP server IP address / NTP IP addr		
CU_S_AC_PN, CU_S120_PN, CU_S150_PN	Can be changed: U, T Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the IP address of the NTP server for time synchronization via Network Time Protocol (NTP).		
Dependency:	Refer to: p3103		
Note:	p3105[0...3] = 0 means: PROFINET controller is NTP server.		
<hr/>			
p3106	NTP time zone / Time zone		
CU_S_AC_PN, CU_S120_PN, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 38	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 14
Description:	Sets the local time zone for NTP (Network Time Protocol).		
Value:	0: UTC-12 (AOE) 1: UTC-11 (NURT) 2: UTC-10 (HAST) 3: UTC-9:30 (MART) 4: UTC-9 (AKST) 5: UTC-8 (PST) 6: UTC-7 (MST) 7: UTC-6 (CST) 8: UTC-5 (EST) 9: UTC-4 (VET) 10: UTC-3:30 (NST) 11: UTC-3 (ART) 12: UTC-2 (GST) 13: UTC-1 (CVT) 14: UTC+0 (GMT) 15: UTC+1 (CET) 16: UTC+2 (EEK) 17: UTC+3 (MISK) 18: UTC+3:30 (IRST) 19: UTC+4 (GST) 20: UTC+4:30 (AFT) 21: UTC+5 (UZT) 22: UTC+5:30 (IST) 23: UTC+5:45 (NPT) 24: UTC+6 (BST) 25: UTC+6:30 (MMT)		

- 26: UTC+7 (WIB)
- 27: UTC+8 (CST)
- 28: UTC+8:30 (PYT)
- 29: UTC+8:45 (ACWST)
- 30: UTC+9 (JST)
- 31: UTC+9:30 (ACST)
- 32: UTC+10 (AEST)
- 33: UTC+10:30 (ACDT)
- 34: UTC+11 (AEDT)
- 35: UTC+12 (ANAT)
- 36: UTC+13 (NZDT)
- 37: UTC+13:45 (CHADT)
- 38: UTC+14 (LINT)

Dependency: Refer to: p3103

r3107[0...3]	UTC synchronization time out of tolerance / UTC t_sync out tol		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the last synchronizing event that was out of tolerance.		
Index:	[0] = Milliseconds after sync [1] = Days after sync [2] = Milliseconds before sync [3] = Days before sync		
Dependency:	Refer to: p3109 Refer to: A01099		
Note:	For r3107[0, 1]: Displays the UTC time after synchronization. For 3107[2, 3]: Displays the UTC time before synchronization.		

r3108[0...1]	UTC synchronization deviation / UTC sync_dev		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the absolute value of the last synchronization deviation that was determined.		
Index:	[0] = Milliseconds [1] = Days		

p3109	UTC synchronization tolerance / UTC sync tol		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100 [ms]
Description:	Sets the tolerance for time of day synchronization. When this tolerance is exceeded, an appropriate alarm is output.		
Dependency:	Refer to: A01099		

p3110	External fault 3 switch-on delay / Ext fault 3 t_{on}		
All objects	Can be changed: U, T Data type: Unsigned16 P-Group: Messages Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000 [ms]	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 0 [ms]
Description:	Sets the delay time for external fault 3.		
Dependency:	Refer to: p2108, p3111, p3112 Refer to: F07862		
p3111	BI: External fault 3 enable / Ext fault 3 enab		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the enable signal of external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p2108, p3110, p3112 Refer to: F07862		
p3111[0...n]	BI: External fault 3 enable / Ext fault 3 enab		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the signal source for the enable signal of external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p2108, p3110, p3112 Refer to: F07862		

p3112	BI: External fault 3 enable negated / Ext flt 3 enab neg		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410, TM31, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: 2546 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the negated enable signal of external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p2108, p3110, p3111 Refer to: F07862		

p3112[0...n]	BI: External fault 3 enable negated / Ext flt 3 enab neg		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the negated enable signal of external fault 3. External fault 3 is initiated by the following AND logic operation: - BI: p2108 negated - BI: p3111 - BI: p3112 negated		
Dependency:	Refer to: p2108, p3110, p3111 Refer to: F07862		

r3113.0...15	CO/BO: NAMUR message bit bar / NAMUR bit bar				
All objects	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -		
Description:	Display and BICO output for the status of the NAMUR message bit bar. The faults and alarms are assigned to the appropriate signaling/message classes and influence a specific message bit.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Fault converter information electronics/software error	Yes	No	-
	01	Network fault	Yes	No	-
	02	DC link overvoltage	Yes	No	-
	03	Fault drive converter power electronics	Yes	No	-
	04	Drive converter overtemperature	Yes	No	-
	05	Ground fault	Yes	No	-

2 Parameters

2.2 List of parameters

06	Motor overload	Yes	No	-
07	Bus error	Yes	No	-
08	External safety-relevant shutdown	Yes	No	-
09	Mot encoder fault	Yes	No	-
10	Error communication internal	Yes	No	-
11	Fault infeed	Yes	No	-
15	Other faults	Yes	No	-

Note:

For bit 00:

Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.

For bit 01:

A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

For bit 02:

The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

For bit 03:

An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

For bit 04:

The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:

A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.

For bit 06:

The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:

The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is either faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:

A safety operation monitoring function (Safety) has detected an error.

For bit 09:

When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:

The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:

The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:

Group fault. Determine the precise cause of the fault using the commissioning tool.

r3114.9...11

CO/BO: Messages status word global / Msg ZSW global

Func. diagram: -

Unit selection: -

Expert list: 1

Factory setting

-

Description:

Displays the global status word for messages.

The appropriate bit is set if at least one message is present at the drive objects.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	09	Group alarm present	Yes	No	8065
	10	Group fault present	Yes	No	8060
	11	Safety group message present	Yes	No	-

Note: The status bits are displayed with delay.

r3115[0...63] Fault drive object initiating / Fit DO initiating

All objects	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: 8050, 8060
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the drive object number of the initiating drive object for this fault as integer number.
Value = 63:

The fault was initiated by the drive object itself.

Dependency: Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3120, r3122

Notice: The values of this parameter are only saved in a volatile fashion and are lost when switching off or for a warm restart.

Note: The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the fault buffer and the assignment of the indices is shown in r0945.

p3116 BI: Suppress automatic acknowledgment / Ackn suppress

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source for the automatic acknowledgment of Control Unit faults.

BI: p3116 = 0 signal

Acknowledgeable faults are automatically acknowledged on the Control Unit.

Control Unit faults with LOCAL propagation are passed on to the first active drive object.

BI: p3116 = 1 signal

Acknowledgeable faults are not automatically acknowledged on the Control Unit.

Control Unit faults with LOCAL propagation are not passed on.

Dependency: Refer to: p2102, p2103, p2104, p2105, p3981

Note: When selecting a standard telegram, the BICO interconnection for control signal STW1.10 (master control by PLC) is automatically established.

p3117 Change safety message type / Chg SI msg type

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: C1(1)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Sets the re-parameterization of all safety messages for faults and alarms.

The relevant message type during changeover is selected by the firmware.

0: Safety messages are not re-parameterized

1: Safety messages are re-parameterized

Note: A change only becomes effective after a POWER ON.

r3120[0...63]

Component fault / Comp fault

All objects

Can be changed: -	Calculated: -	Access level: 3
Data type: Unsigned32	Dyn. index: -	Func. diagram: 8060
P-Group: Messages	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	-

Description: Displays the component of the fault which has occurred.
Dependency: Refer to: r0945, r0947, r0948, r0949, r2109, r2130, r2133, r2136, r3122
Note: Value = 0: Assignment to a component not possible.
 The buffer parameters are cyclically updated in the background (refer to status signal in r2139).
 The structure of the fault buffer and the assignment of the indices is shown in r0945.

Description:

Displays the diagnostic attribute of the alarm which has occurred.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Hardware replacement recommended	Yes	No	-
11	Alarm class bit 0	High	Low	-
12	Alarm class bit 1	High	Low	-
13	Maintenance required	Yes	No	-
14	Maintenance urgently required	Yes	No	-
15	Message has gone	Yes	No	-
16	PROFIdrive fault class bit 0	High	Low	-
17	PROFIdrive fault class bit 1	High	Low	-
18	PROFIdrive fault class bit 2	High	Low	-
19	PROFIdrive fault class bit 3	High	Low	-
20	PROFIdrive fault class bit 4	High	Low	-

Dependency:

Refer to: r2110, r2122, r2123, r2124, r2125, r2134, r2145, r2146, r3121

Note:

The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

The structure of the alarm buffer and the assignment of the indices is shown in r2122.

For bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

For bits 20 ... 16:

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 0, 0 --> PROFIdrive message class 0: not assigned

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 0, 1 --> PROFIdrive message class 1: hardware fault/software error

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 1, 0 --> PROFIdrive message class 2: line fault

Bits 20, 19, 18, 17, 16 = 0, 0, 0, 1, 1 --> PROFIdrive message class 3: supply voltage fault

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 0, 0 --> PROFIdrive message class 4: DC link fault

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 0, 1 --> PROFIdrive message class 5: power electronics faulted

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 1, 0 --> PROFIdrive message class 6: overtemperature electronic components

Bits 20, 19, 18, 17, 16 = 0, 0, 1, 1, 1 --> PROFIdrive message class 7: ground fault/phase fault detected

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 0, 0 --> PROFIdrive message class 8: motor overload

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 0, 1 --> PROFIdrive message class 9: communication error to the higher-level control

2 Parameters

2.2 List of parameters

Bits 20, 19, 18, 17, 16 = 0, 1, 0, 1, 0 --> PROFIdrive message class 10: safe monitoring channel has identified an error
 Bits 20, 19, 18, 17, 16 = 0, 1, 0, 1, 1 --> PROFIdrive message class 11: incorrect position actual value/speed actual value or not available
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 0 --> PROFIdrive message class 12: internal (DRIVE-CLiQ) communication error
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 1 --> PROFIdrive message class 13: infeed unit faulted
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 1, 0 --> PROFIdrive message class 14: braking controller/Braking Module faulted
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 1, 1 --> PROFIdrive message class 15: line filter faulted
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 0, 0 --> PROFIdrive message class 16: external measured value/signal state outside the permissible range
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 0, 1 --> PROFIdrive message class 17: application/technology function faulted
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 1, 0 --> PROFIdrive message class 18: error in the parameterization/configuration/commissioning sequence
 Bits 20, 19, 18, 17, 16 = 1, 0, 0, 1, 1 --> PROFIdrive message class 19: general drive fault
 Bits 20, 19, 18, 17, 16 = 0, 1, 1, 0, 0 --> PROFIdrive message class 20: auxiliary unit faulted

r3131

CO: Actual fault value / Act fault val

All objects

Can be changed: -	Calculated: -	Access level: 3

P-Group: Messages	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	-

Description: Displays the fault value of the oldest active fault.

Dependency: Refer to: r2131, r3132

r3132

CO: Actual component number / Comp_no act

All objects

Can be changed: -	Calculated: -	Access level: 3
Data type: Integer32	Dyn. index: -	Func. diagram: 8060
P-Group: Messages	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	-

Description: Displays the component number of the oldest fault that is still active.

Dependency: Refer to: r2131, r3131

p3135

Suppress active fault / Supp act flt

SERVO, VECTOR,
HLA, SERVO_AC,
VECTOR_AC,
SERVO_I_AC,
VECTOR_I_AC,
A_INF, S_INF, R_INF,
B_INF, TM41

Can be changed: U, T	Calculated: -	Access level: 4
Data type: Unsigned32	Dyn. index: -	Func. diagram: 8060
P-Group: Messages	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	0000 0000 0000 0000 bin

Description: Sets the suppression of r2139.3 "Fault present" for certain fault responses.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	08	Suppression of fault response ENCODER	ON	OFF	-
	10	Suppression of fault response NONE	ON	OFF	-

Dependency: Refer to: p0491, r2139

Note: Depending on the suppression of a fault reaction in this parameter, r2139.1 "Acknowledgment required" is set when at least one fault occurs.

For bit 08:

The suppression is only effective if p0491 = 1.

p3201[0...n]	Excitation current outside the tolerance threshold value / I_exc n Tol thr		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1 [%]	100.0 [%]	10.0 [%]
Description:	Sets the threshold value for the "excitation current outside tolerance" message for the excitation current monitoring. If the absolute value of the difference between the excitation current setpoint and actual value (r1641 - r1626) exceeds the threshold value and the hysteresis is longer than the selected delay time, then fault F07913 is output. This fault is withdrawn when the threshold voltage is undershot.		
Dependency:	Refer to: r1626, r1641, p3202, p3203 Refer to: F07913		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5).		
p3202[0...n]	Excitation current outside the tolerance hysteresis / I_exc n Tol hyst		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3

	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1 [%]	100.0 [%]	10.0 [%]
Description:	Sets the hysteresis for the "excitation current outside tolerance" message for the excitation current monitoring.		
Dependency:	Refer to: p3201, p3203 Refer to: F07913		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5).		
p3203[0...n]	Excitation current outside the tolerance delay time / I_exc n Tol t_del		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [s]	10.0 [s]	1.0 [s]
Description:	Sets the delay time for the "excitation current outside tolerance" message for the excitation current monitoring.		
Dependency:	Refer to: p3201, p3202 Refer to: F07913		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5).		

2 Parameters

2.2 List of parameters

p3204[0...n]	Flux outside the tolerance threshold value / Flux n tol thr		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: ASM, PMSM, REL, RESM Min 0.1 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10.0 [%]
Description:	Sets the threshold value for the "flux outside the tolerance" message for the flux monitoring. If the absolute value of the difference between the flux setpoint and actual value (r0083 - r0084) falls below the threshold value with hysteresis longer than the selected delay time, then fault F07914 is output. This fault is withdrawn when the threshold voltage is undershot.		
Dependency:	Refer to: r0083, r0084, p3205, p3206 Refer to: F07914		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The flux monitoring is only active after magnetizing (r0056.4 = 1).		
<hr/>			
p3205[0...n]	Flux outside the tolerance hysteresis / Flux n tol hyst		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: ASM, PMSM, REL, RESM Min 0.1 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 50.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10.0 [%]
Description:	Sets the hysteresis for the "flux outside tolerance" message for the flux monitoring.		
Dependency:	Refer to: p3204, p3206 Refer to: F07914		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The flux monitoring is only active after magnetizing (r0056.4 = 1).		
<hr/>			
p3206[0...n]	Flux outside tolerance delay time / Flux n tol t_del		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: ASM, PMSM, REL, RESM Min 0.0 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10.0 [s]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 5.0 [s]
Description:	Sets the delay time for the "flux outside tolerance" message for the flux monitoring.		
Dependency:	Refer to: p3204, p3205 Refer to: F07914		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The flux monitoring is only active after magnetizing (r0056.4 = 1).		

p3207[0...n]	Zero current signal threshold value / I_0_sig_thr		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: 6_2	Unit selection: p0505
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min 0.01 [Arms]	Max 10000.00 [Arms]	Factory setting 1.00 [Arms]
Description:	Sets the threshold value for the zero current signal for the zero current monitoring. If the absolute current falls below the threshold value then r2199.6 is set to 1 after the delay time has expired. The bit is reset if the threshold value and the hysteresis are exceeded again.		
Dependency:	Refer to: r2199, p3208, p3209		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold value in p2161 (r2199.0 = 1).		
p3208[0...n]	Zero current signal hysteresis / I_0_sig_hyst		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: CALC_MOD_LIM_REF	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: 6_2	Unit selection: p0505
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min 0.01 [Arms]	Max 10000.00 [Arms]	Factory setting 1.00 [Arms]
Description:	Sets the hysteresis for the zero current signal for the zero current monitoring.		
Dependency:	Refer to: p3207, p3209		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold value in p2161 (r2199.0 = 1).		
p3209[0...n]	Zero current signal delay time / I_0_sig_t_del		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min 0.00 [s]	Max 10.00 [s]	Factory setting 0.02 [s]
Description:	Sets the delay time for the zero current signal for the zero current monitoring.		
Dependency:	Refer to: p3207, p3208		
Note:	The monitoring function is only carried out for separately excited synchronized motors (p0300 = 5). The monitoring is only carried out for speeds less than the speed threshold in p2161 (r2199.0 = 1).		
p3233[0...n]	Torque actual value filter time constant / M_act_filt Tc		
SERVO (Ext msg), VECTOR (Ext msg), SERVO_AC (Ext msg), VECTOR_AC (Ext msg), SERVO_I_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8013
	P-Group: Messages	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0 [ms]	Max 1000000 [ms]	Factory setting 0 [ms]
Description:	Sets the time constant for the PT1 element to smooth the torque actual value. The smoothed torque actual value is compared with the threshold values and is only used for messages and signals.		

p3235	Phase failure signal motor monitoring time / Ph_fail t_mon		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2000 [ms]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 320 [ms]
Description:	Sets the monitoring time for phase failure detection of the motor.		
Notice:	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
Note:	Monitoring is only effective for blocksize and booksize power units. For p3235 = 0 the function is deactivated. For VECTOR, the following applies: The monitoring is automatically deactivated during a flying restart for a motor that is still rotating.		
p3236[0...n]	Speed threshold value 7 / n_thr val 7		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: REL Min 0.00 [rpm]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 3000.00 [rpm]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 100.00 [rpm]
Description:	Sets the speed threshold value for the signal "speed deviation model/external in tolerance" (BO: r2199.7).		
Dependency:	Refer to: r1443, r2169, r2199, p3237		
p3237[0...n]	Hysteresis speed 7 / n_hysteresis 7		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: - Min 0.00 [rpm]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 200.00 [rpm]	Access level: 3 Func. diagram: 8012 Unit selection: p0505 Expert list: 1 Factory setting 2.00 [rpm]
Description:	Sets the hysteresis speed for the signal "speed deviation model/external" (BO: r2199.7).		
Dependency:	Refer to: r2199, p3236		
p3238[0...n]	OFF-delay n_act_motor model = n_act external / t_del n_a = n_ext		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Messages Not for motor type: REL Min 0.0 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.0 [s]	Access level: 3 Func. diagram: 8012 Unit selection: - Expert list: 1 Factory setting 3.0 [s]
Description:	Sets the OFF-delay for the signal "speed deviation model/external in tolerance" (BO: r2199.7). The smoothed actual speed of the motor model r2169 is compared with the externally measured speed r1443 (threshold value p3236).		
Dependency:	Refer to: p3236, p3237		

p3240[0...n]	CI: I2t input value signal source / I2t inp_val s_s		
VECTOR (Ext msg), VECTOR_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: T	Calculated: -	Access level: 4
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: CDS, p0170	Func. diagram: 8022
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the input value of the freely parameterizable I2t monitoring.		
Dependency:	Refer to: p3241, p3242, p3243, r3244		
Notice:	To activate the freely parameterizable I2t monitoring, the following applies: - the function module "Extended messages/monitoring" must be activated (r0108.17 = 1). - the maximum duration must be set greater than zero (p3242 > 0).		
Note:	Application example: Excitation current monitoring for the separately excited synchronous motor.		
p3241[0...n]	Permissible I2t continuous value / Perm I2t cont val		
VECTOR (Ext msg), VECTOR_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8022
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.00 [%]	200.00 [%]	100.00 [%]
Description:	Sets the permissible continuous value of the freely parameterizable I2t monitoring. The integrator value in r3244 decreases if the value received via connector input p3240 is higher than the value set in p3241. The integrator value in r3244 increases if the value received via connector input p3240 is less than the value set in p3241.		
Dependency:	Refer to: p3240, p3242, p3243, r3244		
p3242[0...n]	I2t maximum duration / I2t max_dur		
VECTOR (Ext msg), VECTOR_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8022
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [s]	3600.00 [s]	0.00 [s]
Description:	Sets the maximum duration for 100 % overload (corresponding to p3241 + 100 %) of the freely parameterizable I2t monitoring. Setting example: Operation should be possible at 150 % of the input quantity for a duration of 3 s for a permissible continuous value p3241 = 110 %. As a consequence, the following settings value is obtained: $p3242 = ((150 \times 150 - 110 \times 110) / ((100 + 110) \times (100 + 110) - 110 \times 110)) \times 3 \text{ s} = 0.975 \text{ s}$		
Dependency:	Refer to: p3240, p3241, p3243, r3244		
Notice:	For p3242 = 0, the freely parameterizable I2t monitoring is deactivated.		
Note:	After this time expires for 100 % overload, fault F07824 is output and status bit r2199.14 is set. For lower overload conditions, the permissible duration extends corresponding to the specified setting example.		

2 Parameters

2.2 List of parameters

p3243[0...n]	I2t alarm threshold / I2t alarm thr				
VECTOR (Ext msg), VECTOR_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: U, T	Calculated: -	Access level: 4		
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 8022		
	P-Group: -	Unit group: -	Unit selection: -		
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	0.00 [%]	99.90 [%]	50.00 [%]		
Description:	Sets the alarm threshold for the I2t integrator value (r3244) scaled to 100 %.				
	When the alarm threshold is reached, alarm A07823 is output and status bit r2199.13 is set.				
Dependency:	Refer to: p3240, p3241, p3242, r3244				
r3244	CO: Actual I2t integrator value / Act I2t integ_val				
VECTOR (Ext msg), VECTOR_AC (Ext msg), VECTOR_I_AC (Ext msg)	Can be changed: -	Calculated: -	Access level: 3		
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8022		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: ASM, PMSM, REL, RESM	Scaling: PERCENT	Expert list: 1		
	Min	Max	Factory setting		
	- [%]	- [%]	- [%]		
Description:	Display and connector output for the actual integrator value of the freely parameterizable I2t monitoring.				
	The value is scaled, so that the maximum permissible overload is reached at 100 %.				
Dependency:	Refer to: p3240, p3241, p3242, p3243				
p3290	Variable signaling function start / Var sig start				
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 5301		
	P-Group: -	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0010 bin		
Description:	Settings for start/stop and the comparison type for the variable signaling function.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activate function 1	Active	Not active	-
	01	Function 1 comparison with sign	With sign	Without sign	-
	02	Activate function 2	Active	Not active	-
	03	Function 2 comparison with sign	With sign	Without sign	-
	04	Activate function 3	Active	Not active	-
	05	Function 3 comparison with sign	With sign	Without sign	-
Dependency:	Refer to: p3291, p3292, p3293, r3294, p3295, p3296, p3297, p3298, p3299				
	Refer to: A02085				
Notice:	The parameters of the variable message function are only checked and become effective when starting. Otherwise, an alarm is output.				

p3291[0...2]	CI: Variable signaling function input signal signal source / Var sig inp s_s		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Integer16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the input signal of the variable message function.		
Index:	[0] = Function 1 [1] = Function 2 [2] = Function 3		
Dependency:	Refer to: p3290, p3292, p3293		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		
Note:	For p3291[0...2] = 1 (for internal Siemens use): In this case, the signal source is defined using the memory address (p3292[0...2]) and data type (p3293[0...2]). As the memory address can be different for each version, it must always be redetermined. Procedure: - set the memory address and data type (p3292[0...2], p3293[0...2]). - establish the BICO interconnection (p3291[0...2] = 1).		

p3292[0...2]	Variable signaling function signal source address / Var sig s_s addr		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0000 hex	FFFF FFFF hex	0000 hex
Description:	Sets the address of the signal source for the variable signaling function.		
Index:	[0] = Function 1 [1] = Function 2 [2] = Function 3		
Dependency:	Refer to: p3290, p3291		
Caution:	The software can crash if an incorrect address and data type are set.		
			
Notice:	This parameter is only checked and becomes effective when restarting the variable message function.		
Note:	This parameter should only be set for p3291[0...2] = 1.		

p3293[0...2]	Variable signaling function signal source data type / Var sig s_s type		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: Integer16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	7	0
Description:	Sets the data type of the signal source for the variable signaling function.		
Value:	0: Unknown 1: U8, Unsigned8 2: I8, Signed8 3: U16, Unsigned16 4: I16, Signed16 5: U32, Unsigned32 6: I32, Signed32 7: Float, FloatingPoint32		

2 Parameters

2.2 List of parameters

Index: [0] = Function 1
[1] = Function 2
[2] = Function 3

Dependency: Refer to: p3290, p3291

Caution: The software can crash if an incorrect address and data type are set.

Notice: This parameter is only checked and becomes effective when restarting the variable message function.

Note: This parameter should only be set for p3291[0...2] = 1.

r3294.0...2 **BO: Variable signaling function output signal / Var sig outp_sig**

SERVO, HLA,
SERVO_AC,
SERVO_I_AC

Can be changed: - **Calculated:** - **Access level:** 3
Data type: Unsigned8 **Dyn. index:** - **Func. diagram:** 5301
P-Group: - **Unit group:** - **Unit selection:** -
Not for motor type: - **Scaling:** - **Expert list:** 1
Min **Max** **Factory setting**
 - - -

Description: Display and binector output of the output signal for the variable signaling function.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Function 1 output signal	High	Low	-
01	Function 2 output signal	High	Low	-
02	Function 3 output signal	High	Low	-

Dependency: Refer to: p3290, p3291, p3295, p3296, p3297, p3298

p3295[0...2] **Variable signaling function threshold value / Var sig thr_val**

SERVO, HLA,
SERVO_AC,
SERVO_I_AC

Can be changed: U, T **Calculated:** - **Access level:** 3
Data type: FloatingPoint32 **Dyn. index:** - **Func. diagram:** 5301
P-Group: - **Unit group:** - **Unit selection:** -
Not for motor type: - **Scaling:** - **Expert list:** 1
Min **Max** **Factory setting**
 -340.28235E36 340.28235E36 0.000

Description: Sets the threshold value for the variable signaling function.

Index: [0] = Function 1
[1] = Function 2
[2] = Function 3

Dependency: Refer to: p3290

Notice: This parameter is only checked and becomes effective when restarting the variable message function.

p3296[0...2] **Variable signaling function hysteresis / Var sig hyst**

SERVO, HLA,
SERVO_AC,
SERVO_I_AC

Can be changed: U, T **Calculated:** - **Access level:** 3
Data type: FloatingPoint32 **Dyn. index:** - **Func. diagram:** 5301
P-Group: - **Unit group:** - **Unit selection:** -
Not for motor type: - **Scaling:** - **Expert list:** 1
Min **Max** **Factory setting**
 0.000 340.28235E36 0.000

Description: Sets the hysteresis for the variable signaling function.

Index: [0] = Function 1
[1] = Function 2
[2] = Function 3

Dependency: Refer to: p3290

Notice: This parameter is only checked and becomes effective when restarting the variable message function.

p3297[0...2]	Variable signaling function pickup delay / Var sig t_pickup		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	0 [ms]
Description:	Sets the pickup delay for the variable signaling function.		
Index:	[0] = Function 1 [1] = Function 2 [2] = Function 3		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. The following must apply for the value: Pickup delay (p3297[0...2]) >= sampling time (p3299[0...2])		
Note:	For a value of 0, the pickup delay is disabled. The output signal is set if the condition for the 1 signal is fulfilled for longer than the selected time.		
p3298[0...2]	Variable signaling function dropout delay / Var sig t_dropout		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	10000 [ms]	0 [ms]
Description:	Sets the dropout delay for the variable signaling function.		
Index:	[0] = Function 1 [1] = Function 2 [2] = Function 3		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. The following must apply for the value: Dropout delay (p3298[0...2]) >= sampling time (p3299[0...2])		
Note:	For a value of 0, the dropout delay is disabled. The output signal is reset if the condition for the 0 signal is fulfilled for longer than the selected time.		
p3299[0...2]	Variable signaling function sampling time / Var sig t_samp		
SERVO, HLA, SERVO_AC, SERVO_I_AC	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5301
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.000 [ms]	4.000 [ms]	4.000 [ms]
Description:	Sets the sampling time for the variable signaling function.		
Index:	[0] = Function 1 [1] = Function 2 [2] = Function 3		
Dependency:	Refer to: p3290		
Notice:	This parameter is only checked and becomes effective when restarting the variable message function. The following must apply for the setting: Sampling time (p3299[0...2]) <= pickup delay (p3297[0...2]), dropout delay (p3298[0...2])		
Note:	Only the following values can be set: 1.000, 2.000, 3.000, 4.000		

2 Parameters

2.2 List of parameters

r3313	Efficiency optimization 2 optimum flux / Optimum flux		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: PMSM, SESM, REL, RESM Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: r2004 Max - [%]	Access level: 3 Func. diagram: 6722, 6837 Unit selection: - Expert list: 1 Factory setting - [%]
Description:	Displays the calculated, optimum flux.		
Dependency:	Refer to: p1401, p3315, p3316		
Note:	The function is activated via p1401.14 = 1.		
p3315[0...n]	Efficiency optimization 2 minimum flux limit value / Min flux lim val		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: PMSM, SESM, REL, RESM Min 10.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 200.0 [%]	Access level: 3 Func. diagram: 6722, 6837 Unit selection: - Expert list: 1 Factory setting 50.0 [%]
Description:	Sets the minimal limit value for the calculated optimum flux.		
Dependency:	Refer to: p1401, r3313, p3316		
Note:	The function is activated via p1401.14 = 1.		
p3316[0...n]	Efficiency optimization 2 maximum flux limit value / Max flux lim val		
VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: PMSM, SESM, REL, RESM Min 10.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 200.0 [%]	Access level: 3 Func. diagram: 6722, 6837 Unit selection: - Expert list: 1 Factory setting 110.0 [%]
Description:	Sets the maximum limit value for the calculated optimum flux.		
Dependency:	Refer to: p1401, r3313, p3315		
Note:	The function is activated via p1401.14 = 1.		
p3320[0...n]	Fluid flow machine power point 1 / Fluid_mach P1		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.00	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 25.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the power (P) of point 1 as a [%]. The characteristic comprises the following value pairs: Power (P) / speed (n) p3320 / p3321 --> point 1 (P1 / n1) p3322 / p3323 --> point 2 (P2 / n2) p3324 / p3325 --> point 3 (P3 / n3) p3326 / p3327 --> point 4 (P4 / n4) p3328 / p3329 --> point 5 (P5 / n5)		

Dependency: Refer to: r0041, p3321, p3322, p3323, p3324, p3325, p3326, p3327, p3328, p3329
Note: The reference value for power and speed is the rated power/rated speed.
 The energy saved is displayed in r0041.

p3321[0...n]	Fluid flow machine speed point 1 / Fluid_mach n1		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	100.00	0.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the speed (n) of point 1 as a [%]. The characteristic comprises the following value pairs: Power (P) / speed (n) p3320 / p3321 --> point 1 (P1 / n1) p3322 / p3323 --> point 2 (P2 / n2) p3324 / p3325 --> point 3 (P3 / n3) p3326 / p3327 --> point 4 (P4 / n4) p3328 / p3329 --> point 5 (P5 / n5)		
Dependency:	Refer to: r0041, p3320, p3322, p3323, p3324, p3325, p3326, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.		

p3322[0...n]	Fluid flow machine power point 2 / Fluid_mach P2		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	100.00	50.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the power (P) of point 2 as a [%].		
Dependency:	Refer to: r0041, p3320, p3321, p3323, p3324, p3325, p3326, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.		

p3323[0...n]	Fluid flow machine speed point 2 / Fluid_mach n2		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00	100.00	25.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the speed (n) of point 2 as a [%].		
Dependency:	Refer to: r0041, p3320, p3321, p3322, p3324, p3325, p3326, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.		

2 Parameters

2.2 List of parameters

p3324[0...n]	Fluid flow machine power point 3 / Fluid_mach P3		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.00	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 77.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the power (P) of point 3 as a [%].		
Dependency:	Refer to: r0041, p3320, p3321, p3322, p3323, p3325, p3326, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.		
<hr/>			
p3325[0...n]	Fluid flow machine speed point 3 / Fluid_mach n3		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.00	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 50.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the speed (n) of point 3 as a [%].		
Dependency:	Refer to: r0041, p3320, p3321, p3322, p3323, p3324, p3326, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.		
<hr/>			
p3326[0...n]	Fluid flow machine power point 4 / Fluid_mach P4		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min 0.00	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.00	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 92.00
Description:	For the energy-saving display of a fluid-flow machine, a typical flow characteristic $P = f(n)$ with 5 points along the characteristic is required. This parameter specifies the power (P) of point 4 as a [%].		
Dependency:	Refer to: r0041, p3320, p3321, p3322, p3323, p3324, p3325, p3327, p3328, p3329		
Note:	The reference value for power and speed is the rated power/rated speed. The energy saved is displayed in r0041.

Description:	Sets the configuration word of the infeed.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Smart Mode	ON	OFF	-
	01	Flat-Top Mode	ON	OFF	-
	03	Vdc controller	ON	OFF	-
	05	Line supply voltage sensing with VSM	ON	OFF	-

2 Parameters

2.2 List of parameters

Dependency: Refer to: p0210

Notice: For bit 00:
The following applies for Active Infeed chassis:
When used with an Active Interface Module (AIM), it is not permissible to activate the Smart Mode.

Note: For bit 00:
In the Smart Mode, the DC link voltage is not controlled - however, infeed can still regenerate. The magnitude of the DC link voltage depends on the actual line supply voltage and the DC link load.
The following applies for Active Infeed booksize:
When setting the device supply voltage (p0210) to greater than 415 V, then the Smart Mode is automatically activated. This means that the 660 V limit can be maintained for the steady-state DC link voltage (p0280) up to a line supply voltage of 480 V. If higher DC link voltages are permissible, then p0280 can be increased and the Smart Mode deactivated (see p0210).
For a Smart Infeed (S_INF), the Smart Mode is automatically activated (p3400.0 = 1).
For bit 01:
If the Flat Top Mode is deactivated, switching losses are higher. This means that the full power is no longer continuously available.
For p3400.0 = 1 or p1810.15 = 1, this bit is not effective.
For bit 03:
If the Vdc controller is switched out, overvoltage or undervoltage conditions occur in the DC link if no other voltage-regulating component is located in the DC link.
For p3400.0 = 1, this bit is not effective.
For bit 05:
If a VSM is detected when commissioning the system, this bit is automatically set.
When the bit is set, the line supply voltage input of the VSM must be connected (connected at the line side of the line reactor).
The bit must be set in the case of chassis power units.
VSM: Voltage Sensing Module

r3402		Infeed internal state / INF status int		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2

r3405.0...7	CO/BO: Infeed status word / Inf ZSW		
SERVO (Tech_ctrl), SERVO_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8828, 8928
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description:	Display and BICO output for the status word of the infeed unit.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Smart Mode active	Yes	No	-
	01	Vdc controller active	Yes	No	-
	02	Phase failure detected	Yes	No	-
	03	Current limit reached	Yes	No	-
	04	Infeed operates in generator/motor mode	Regenerative mode	Motor mode	-
	05	Motor mode inhibited	Yes	No	-
	06	Generator mode inhibited	Yes	No	-
	07	DC link undervoltage alarm threshold undershot	Yes	No	-
Dependency:	Refer to: A06810				
Note:	For bit 00: Smart Mode is activated with p3400.0. For bit 01: The DC link voltage closed-loop control is activated with parameters p3400.3 and p3513. For bit 02: The bit is set if alarm A06205 (phase failure), A06206 (current asymmetry) or A06208 (voltage asymmetry) is output. The bit is reset for the following events: - the infeed had reached the normal operating state again after a phase failure has been bypassed/buffered (p3402 = 9). - the pulse enable is withdrawn due to a fault or switching off with OFF1/OFF2. - alarm A06206 is reset. - alarm A06208 is reset. For bit 03: The present current limit is displayed in r0067. For bit 04: An active current setting r0078 >= 0 means infeed operation in motor mode; an active current setting r0078 < 0 means regenerative operation in generator mode. For bit 05: The motor mode inhibit is activated with p3532. For bit 06: The generator mode inhibit is activated with p3533.				

2 Parameters

2.2 List of parameters

For bit 07:

When the alarm threshold is fallen below, alarm A06810 is output and r3405.7 is set = 1.

The alarm threshold is obtained from the sum of the undervoltage threshold r0296 and offset p0279. As a consequence, the alarm threshold is only effective for p0279 > 0.

Monitoring only takes place when operational.

The following applies for states r3402 ≤ 5 and r3402 = 12: r3405.7 = 0.

r3405.1...8		CO/BO: Status word DC link control / ZSW Vdc_ctrl		
VECTOR (Tech_ctrl), VECTOR_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: - Data type: Unsigned16 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Display and BICO output for the status word of the DC link voltage control.			
Bit field:	Bit	Signal name	1 signal	0 signal
	01	Vdc controller active	Yes	No
	08	Vdc controller selected	Yes	No
Dependency:	Refer to: A06810			
Note:	For bit 01: DC link voltage control is disabled and enabled with p3513. For bit 08 = 1: DC link voltage control is selected using p3513.			

r3405.7		CO/BO: Infeed status word / Inf ZSW		
B_INF	Can be changed: - Data type: Unsigned16 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Display and BICO output for the status word of the infeed unit.			
Bit field:	Bit	Signal name	1 signal	0 signal
	07	DC link undervoltage alarm threshold undershot	Yes	No
Dependency:	Refer to: A06810			
Note:	For bit 07: When the alarm threshold is fallen below, alarm A06810 is output and r3405.7 is set = 1. The alarm threshold is obtained from the sum of the undervoltage threshold r0296 and offset p0279. As a consequence, the alarm threshold is only effective for p0279 > 0. Monitoring only takes place when operational. The following applies for states r3402 ≤ 5 and r3402 = 12: r3405.7 = 0.			

p3409		Infeed line frequency setting / INF f_line_mode		
A_INF, S_INF, R_INF	Can be changed: T Data type: Integer16 P-Group: Closed-loop control Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1	
Description:	Sets the mode to detect the line supply frequency.			
Value:	0: Line supply frequency setting 50/60 Hz off 1: Line supply frequency setting 50/60 Hz on			

Dependency:	Refer to: p0211, p0284, p0285 Refer to: A06350, A06351, F06500
Note:	For p3409 = 1, the following applies: After operation has been enabled, the rated line supply frequency (p0211) is automatically set to a value of 50 Hz or 60 Hz corresponding to the currently measured frequency. This means that the parameter value of p0211 is, under certain circumstances, changed. For p3409 = 0, the following applies: The system does not change parameter p0211.

Not for motor type: -	Scaling: -	Expert list: 1																	
Min	Max	Factory setting																	
0	6	5																	
Description:	Sets the line and DC link parameter identification routine for the infeed module.																		
Value:	<ul style="list-style-type: none"> 0: Identification (Id) off 1: Activate identification (Id) 2: Set controller settings 3: Save identification and controller settings 4: Save identification and controller settings with L adaptation 5: Reset save Id and controller setting with L adaptation 6: Set robust current controller, C-identification and save 																		
Recommendation:	<p>For line supplies with very low fault rating (short-circuit power), the line and DC link parameter identification may not be able to be carried with the preset control parameter values. The reason for this is that overcurrent or overvoltage faults are output (e.g. F3000x, F06200).</p> <p>For these special cases, please carefully observe the explanations and setting recommendations provided in the following reference:</p> <p>SINAMICS S120 System Manual Line Infeed, Chapter "Notes for commissioning for line supplies with low short-circuit power and variable line parameters".</p>																		
Dependency:	Refer to: r3411, r3412, r3414, p3415, p3416, p3417, p3421, p3422, p3424, p3555, p3560, p3614 Refer to: A06400																		
Notice:	For p3410 = 1, 3, 4, 5, 6, alarm A06400 is output, indicating that after the next pulse enable the set identification will take place. The line and DC link adaptation is not permissible for Smart Line Modules in the chassis format. During identification, no additional loads may be switched-in/switched out. Mode p3410 = 6 is only permissible in conjunction with line filters p0220 >= 110.																		
Note:	<p>p3410 is automatically set to 0 after an identification run has been completed.</p> <p>When p3410 = 1 an identification run for the total inductance and DC link capacitance is initiated when the pulses are next enabled. The results are displayed in r3411 and r3412. If a Voltage Sensing Module (VSM) is connected, then the line inductance (r3414) is also measured. The infeed then goes into the ready for switching on state.</p> <p>For p3410 = 2, the data (r3411, r3412 and r3414) determined during the identification run (p3410 = 1) are transferred into p3421, p3422 and p3424. The control loop parameters are suitably scaled to achieve a rugged controller setting (p3425); the fast controller response (p3555[2]) and the current actual value smoothing (p3614) are pre-set. Calculations for the controller are then repeated. The user must save the data in a non-volatile fashion so that the new controller setting is effective the next time that the system is switched on.</p> <p>When p3410 = 3 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters.</p> <p>When p3410 = 4 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. The line inductance identification is then repeated, if p3415[1] > p3514[0]. If the inductance measured the second time is lower than the first, the parameters are written to the current controller adaptation (p3620, p3622). All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters.</p>																		

2 Parameters

2.2 List of parameters

For p3410 = 5, the same measurements and write operations are always carried-out as for p3410 = 4. However, initially the controller setting is reset by writing the default values dependent on the power unit to p3421, p3422 and p3424 - and setting p3425[0...1] = 100 %. Further, before the measurements are carried out, a brief identification run is executed to coarsely set the controller.

For p3410 = 6, with the next pulse enable, the system will initiate identification of the DC link capacitance. The data (r3412) determined during the identification is used to set the Vdc controller (p3422). All of the parameters for the infeed module are then automatically stored in a non-volatile fashion. The infeed continues to operate without any interruption with the new controller parameters. This identification mode is used to achieve a robust closed-loop control setting, and is only permissible in conjunction with p0220 > 110.

r3411[0...1]	Infeed identified inductance / INF L ident		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified total inductance.		
	The value corresponds to the total inductance between the rigid line supply and the infeed input terminals.		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		
Note:	The value measured in the first identification run is displayed in r3411[0] (for p3410 = 1, 3, 4, 5). This value is transferred to p3421.		
	The value measured in the second identification run (for p3410 = 4, 5) is displayed in r3411[1] - this value is used to set the current controller adaptation (p3622).		
	For a parallel connection, the inductance data corresponds to operation with just one power unit. A line-side filter reactor (p0228) is taken into account in the calculation.		
	For the inductance of the commutating reactor, the following applies. r3411 - r3414		

r3412[0...1]	Infeed DC link capacitance identified / INF C_DClink ident

Description:	Displays the identified total DC link capacitance.		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		
Note:	The value measured in the first identification run (for p3410 = 1, 3, 4, 5) is displayed in r3412[0]. For p3410 = 1, 3, this value is transferred to p3422.		
	The DC link capacitance is not measured at the second identification run.		
	The total DC link capacitance of a DC link group comprises the sum of the sub-capacitances of all motor/infeed modules and the additional DC link capacitors.		

r3414[0...1]	Infeed line supply inductance identified / INF L_line ident		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [mH]	- [mH]	- [mH]
Description:	Displays the identified line supply inductance. The value corresponds to the total inductance between the stiff line supply and the connection point of the Voltage Sensing Module (VSM). It includes a line-side reactor integrated in the line filter.		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410		
Notice:	The value is only automatically determined for the line supply identification (p3410 > 0), if operation with a Voltage Sensing Module is selected (p3400.5 = 1). Otherwise, r3414 = 0 is displayed.		
Note:	The value measured in the first identification run is displayed in r3414[0] (for p3410 = 1, 3, 4, 5). This value is transferred to p3421. The value measured in the second identification run is displayed in r3414[1] (for p3410 = 4, 5). For a parallel connection, the inductance data corresponds to operation with just one power unit. A line-side filter reactor (p0228) is taken into account in the calculation. For the inductance of the commutating reactor, the following applies. r3411 - r3414		

p3415[0...1]	Infeed excitation current L identification / INF I_exc L-ID		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.00 [%]	75.00 [%]	20.00 [%]
Description:	Sets the magnitude of the excitation frequency for the L identification. The setting is made as a percentage of the maximum power unit current (r0209).		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410, r3411, p3421, p3620, p3622		
Notice:	To correctly identify the current level (p3410 = 4, 5) depending on the reactor inductance, the following must apply: p3415[0] < p3415[1] For A_INF booksized units, the following applies: The interrelationship between the reactor inductance and the current magnitude should be measured. Generally, the factory setting of p3415[0] and p3415[1] should be kept. For chassis units and S_INF booksized units, the following applies: Generally, there is only a very low inter-relationship between the reactor inductance and the current magnitude. This means that for the factory setting p3415[0] = p3415[1] = 20 %, i.e. run 2 is not executed. For A_INF Chassis-2 devices, the following applies: For the factory setting p3415[0] = p3415[1] = 12 %, i.e. run 2 is not executed.		
Note:	The reactive current for identification run 1 is set in p3415[0] (basic controller setting). The reactive current for identification run 2 is set in p3415[1] (adaptation of the current controller when reducing the reactor inductance with increasing current magnitude).		

2 Parameters

2.2 List of parameters

p3416	Infeed excitation amplitude C identification / INF exc_amp C_ID		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.001 [mH]	2000.000 [mH]	1.000 [mH]
Description:	Sets the total effective inductance for the closed-loop current control from the sum of the line supply inductance and inductance of the line reactor. The parameter is preassigned depending on p0223 and p0228.		
Dependency:	Refer to: p0223, p0225, p3410, p3425, p3614, p3622		
Note:	The controller setting is derived from this value and p3425. The value can be automatically determined using the identification run (p3410). For a parallel circuit, the value corresponds to the inductance of a power unit. For the inductance of the commutating reactor, the following applies. p3421 - p3424		
<hr/>			
p3422	Infeed DC link capacitance / INF C_DCL		
SERVO (Tech_ctrl), SERVO_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.20 [mF]	2000.00 [mF]	2.00 [mF]
Description:	Sets the DC link capacitance for the closed-loop voltage control. This value is pre-set with p0227.		
Dependency:	Refer to: p0227, p3410, p3425		
Note:	The controller setting is derived from this value and p3425. A suitable value can be automatically determined using the identification run (p3410).		

p3422	DC link capacitance total / C_DC tot		
VECTOR (Tech_ctrl), VECTOR_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.20 [mF]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2000.00 [mF]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2.00 [mF]
Description:	Sets the total DC link capacitance for closed-loop voltage control. The capacitance of one power unit is pre-assigned to this value. The value should be adapted according to the number of power units.		
Note:	The controller setting for the DC link voltage controller is derived from this value.		
p3424	Infeed line supply inductance / INF L_line		
A_INF, S_INF, R_INF	Can be changed: T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.001 [mH]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.000 [mH]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.001 [mH]
Description:	Sets the line supply inductance. This parameter is preassigned depending on p0225 and p0228.		
Dependency:	Refer to: p0223, p0225, p3410, p3425, p3622		
Note:	The controller setting is derived from this value and p3425. The value can be automatically determined using the identification (p3410) if operation with a Voltage Sensing Module is selected. Otherwise, p3424 is set to p3421 - p0223. For a parallel connection, the inductance data is applicable for operation with just one power unit.		
p3425[0...5]	Infeed control loop parameter scaling / INF par scal		
A_INF, S_INF, R_INF	Can be changed: T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 1.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [%]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.00 [%]
Description:	Setting of the scaling factors for controller parameters p3421, p3422, p3424, p3562 and p3617.		
Index:	[0] = Inductance value for closed-loop control [1] = Capacitance value for closed-loop control [2] = Inductance value for decoupling [3] = Inductance value for line model [4] = Integral time current control [5] = Integral time Vdc control		
Dependency:	Refer to: p3410, p3421, p3422, p3424, p3614		
Note:	For index [0, 1]: p3425 is automatically and optimally set when setting the controller parameters with the line supply data identification p3410 >= 2. As the line supply inductance (p3424) increases in comparison to the total inductance (p3421), lower values must be selected for p3425. This means that the control is adapted to weak line supplies with high relative short-circuit voltage uk or high line supply inductance (refer to p3614). The scaled control loop parameters become effective for closed-loop control, i.e. the products p3421 * p3425[0] and p3422 * p3425[1] represent the controller setting.		

2 Parameters

2.2 List of parameters

For index [2]:

Sets the inductance value, which is used for the calculations in the decoupling block of the closed-loop current control.

The value of 100% corresponds to the inductance $p3421 * p3425[0]$.

Setting values between 100 % and 200 % are recommended for fluctuating line fault levels.

For index [3]:

Sets the value for the line inductance, which is used for the calculations in the line (grid) model of the PLL.

The value of 100 % corresponds to inductance $p3424$.

Setting values up to 4x of $p0223$ are recommended for fluctuating line fault levels.

For index [4]:

The dynamic performance of the current control is defined by the scaling $p3425[4] * p3617$.

An optimized setting of $p3425[4]$ is automatically realized by setting the controller parameters with the line data identification $p3410 \geq 2$.

For index [5]:

The dynamic performance of the Vdc control is defined by the scaling $p3425[5] * p3562$.

An optimized setting of $p3425[5]$ is automatically realized by setting the controller parameters with the line data identification $p3410 \geq 2$.

p3440

Smart Mode configuration / Smart Mode config

A_INF, S_INF, R_INF

Can be changed: T

Calculated: -

Access level: 3

Data type: Unsigned16

Dyn. index: -

Func. diagram: -

P-Group: Closed-loop control

Unit group: -

Unit selection: -

Not for motor type: -

Scaling: -

Expert list: 1

Min

Max

Factory setting

-

-

0001 bin

Description:

Sets the configuration of the Smart Mode.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Soft Pulse Mode	ON	OFF	-
01	Extended Smart Mode	ON	OFF	-
02	Deselect automatic line identification after POWER ON	Yes	No	-

Notice:

For bit 00:

This parameter influences the line harmonics for regenerative operation.

For operation with Active Interface Module (AIM) the soft-pulse mode must be activated.

For bit 01:

Operating BLM and SLM together (mixed operation) with bit 01 = 1 is not permissible.

Note:

For bit 00:

When the pulsed mode for Smart Mode is deactivated, when regenerating, higher phase current gradients occur.

For Smart Line Modules in the "chassis" format, pulsed operation is not effective.

Pulsed operation is not active for Active Line Modules in the "Chassis" format if bit 01 = 1.

For bit 01:

For active Extended Smart Mode, for partial load operation, the line reactive power requirement must be reduced and the average value of the DC link voltage increased.

At rated load and overload, the operating behavior is equivalent to the Smart Mode ($p3440.1 = 0$).

For bit 02 (only effective for bit 01 = 1):

This line supply identification is only effective in the Extended Smart Mode (it should not be confused with the line supply identification using $p3410$).

The values for inductance and DC link capacitance are required for the Extended Smart Mode ($p3448[0...1]$).

Automatic line supply identification must be deselected ($p3440.2 = 1$) when manually entering $p3448[0...1]$.

When automatic line supply identification is selected ($p3440.2 = 0$), these values are determined at the first pulse enable after each POWER ON and saved in $p3448[0...1]$.

A new line supply identification with the next pulse enable can be initiated by setting $p3440.2 = 1$ and then by setting $p3440.2$ back to $= 0$.

p3441[0...1]	Smart Mode Vdc ctrl Kp/Tn / SLM Vdc_ctrl Kp/Tn

	Min	Max	Factory setting
	0.00 [%]	1000.00 [%]	[0] 100.00 [%] [1] 200.00 [%]
Description:	Sets the current threshold values for the deactivation (index 0) and activation (index 1) of line commutation in Smart Mode.		
Index:	[0] = Deactivation [1] = Activation		
Note:	A value of 100% corresponds to the minimum feedback load current derived from the loop control parameters (p0210, p0211, p3409, p3448[0], p3432) without infeed components. To avoid frequent changeovers in operation close to the changeover point, the value for activation (index 1) must be significantly higher than the value for deactivation (index 0).		

p3444[0...3]	Smart Mode voltages / SLM voltages		
A_INF, S_INF, R_INF	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 105.00 [%]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 90.00 [%] [1] 100.50 [%] [2] 70.00 [%] [3] 70.00 [%]
Description:	Sets voltage values for the Extended Smart Mode (p3440.1 = 1).		
Index:	[0] = Minimum line voltage for feedback [1] = DC link voltage setpoint [2] = Line supply undervoltage threshold [3] = Line supply symmetry threshold		
Note:	For index [0]: Sets the minimum line voltage for regenerative feedback into the line supply (energy recovery). If the voltage threshold is fallen below, feedback is deactivated to prevent the DC link voltage decaying in the event of a significant system voltage dip. A value of 100% corresponds to the supply voltage set in p0210. For index [1]: Sets the DC link voltage setpoint. A value of 100% corresponds to the rectified value of the actual line voltage. The value must be greater than or equal to 100%. For index [2]: Sets the voltage threshold to identify a line supply undervoltage condition (A06205 with alarm value 32). A value of 100 % corresponds to the voltage threshold set using p0283. For index [3]: Sets the voltage threshold for monitoring line supply symmetry. A line supply undervoltage is signaled when this threshold is fallen below (A06205 with alarm value 32).		

r3445[0...1]	Smart Mode voltages display / SLM voltages disp		
A_INF, S_INF, R_INF	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [V]	Calculated: - Dyn. index: - Unit group: 5_2 Scaling: p2001 Max - [V]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [V]
Description:	Displays the various voltages in Smart Mode.		
Index:	[0] = DC link voltage smoothed [1] = DC link voltage setpoint		
Dependency:	Refer to: r0070, p3442		
Note:	The display values are only valid when the Smart Mode (p3400.0 = 1) has been activated and the pulses enabled. For index [0]: Displays the DC link voltage actual value measured and smoothed with p3442[0]. The smoothed value is used for the DC link voltage controller (Vdc controller) in Smart Mode. The DC link voltage is also available unsmoothed (r0070). For index [1]: Displays the DC link voltage setpoint for the DC link voltage controller (Vdc controller) in Smart Mode.		

r3446[0...2]	Smart Mode currents / SLM currents

	Min	Max	Factory setting
	10.00 [%]	10000.00 [%]	[0] 110.00 [%] [1] 100.00 [%]
Description:	Sets the inductance and/or the DC link capacitance for the Extended Smart Mode.		
Index:	[0] = Inductance referred to p0223 [1] = DC link capacitance referred to p0227		
Notice:	When automatic line supply identification is selected for the Extended Smart Mode (p3440.2 = 0), the following applies: - the inductance and DC link capacitance values are calculated at the first pulse enable after each POWER ON and saved in p3448[0...1]. - the value range of the automatic identification is limited (100 % <= p3448[0...1], p3448[0] <= 100 % + 100 % / p0120). As a consequence, the preassigned values for the commutation inductance (p0223) and the DC link capacitance (p0227) must be correctly entered. - values entered manually are overwritten after the next POWER ON. When automatic line supply identification is deselected for the Extended Smart Mode (p3440.2 = 1), the following applies: - the inductance and DC link capacitance values must be entered manually.		

2 Parameters

2.2 List of parameters

Note: For index [0]:
The value is used in the calculation of the reference value of p3443 and in the controller models.
A value of 100% corresponds to the inductance parameterized in p0223.
For a parallel circuit, the value corresponds to the inductance of a power unit.
Values less than 100% do not make sense - and indicate an incorrect setting of p0223 or unsuitable operating points for the line supply identification (p3440.2).
For index [1]:
The value is used in the calculation of the reference value of p3441 and in the controller models.
A value of 100% corresponds to the capacitance parameterized in p0227.
The value includes the capacitances of all modules connected on the DC link.
Values less than 100% do not make sense - and indicate an incorrect setting of p0227 or unsuitable operating points for the line supply identification (p3440.2).

r3452	Infeed PLL status / INF PLL status		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	7	-

Description: Displays the status of the line supply PLL.

Value:

- 0: Initialization running
- 1: Error when synchronizing
- 2: Line analysis
- 3: Calculation line data
- 4: Pulse enable missing
- 5: PLL calculation
- 6: Final status controlled / Smart Mode
- 7: Reserved

p3457[0...2]	Infeed PLL supplementary settings / INF PLL suppl_set		
A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	300.00 [%]	0.00 [%]

Description: Sets the scaling values for the line PLL of the infeed.

Index:

- [0] = Synchronization fixed voltage value
- [1] = Synchronization angular offset
- [2] = Synchronization angular linearity

Dependency: Refer to: A06205, F06500

Notice: The default settings only have to be changed in exceptional cases.
Unsuitable parameter values result in overcurrents and overvoltages.

Note: The setting values are only directly effective for pulse enable or for line synchronization. For adaptations, which are also effective in operation, the PLL can be switched over to the configurable transformer model (p5495).

For index [0]:

The setting value is used to finely adjust PLL line synchronization.

For setting values not equal to 0, p3457[0] * p0210 is set as output voltage for pulse enable. This is especially practical for booksize devices without VSM line voltage measurement.

For index [1]:

The setting value is used to finely adjust PLL line synchronization, and when the pulses are enabled, is added to the line angle that is measured.

The value of 100% corresponds to an angle of 180 °.

For index [2]:

When synchronizing, the linearity of the phase angle is determined in order to check the line quality, and for instance, to detect whether a phase has failed (A06205, F06500). The setting value is used to scale this linearity measured value.

Setting values less than 100 % reduce the sensitivity of the line supply check, for example.

A setting value of 0 % deactivates scaling.

p3458[0...1]	Infeed PLL smoothing time / INF PLL t_smth		
A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.0 [ms]	1000.0 [ms]	[0] 23.1 [ms] [1] 9.1 [ms]

Description: Sets the smoothing time for the line supply PLL.

Index: [0] = Encoderless operation line supply frequency smoothing time
[1] = VSM operation line supply frequency smoothing time

Note: It may be necessary to reduce the smoothing time for weak line supplies with high frequency fluctuations. There is otherwise a risk of brief orientation errors and the infeed could fail.

r3460	Infeed PLL system deviation / INF PLL SysDev		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [°]	- [°]	- [°]

Description: Displays the PLL system deviation.

r3461	Infeed PLL system deviation after filtering / INF PLL SysDev sm		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [°]	- [°]	- [°]

Description: Displays the PLL system deviation after filtering.

Dependency: Refer to: p3458

p3462[0...2]	Infeed phase failure detection times / INF ph_fail_det t		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [s]	10000.00 [s]	[0] 0.00 [s] [1] 3.00 [s] [2] 60.00 [s]

Description: Sets the time values for phase failure detection and current symmetry monitoring.

Index: [0] = Line fault max. duration
[1] = Current symmetry rms value smoothing time
[2] = Current symmetry fault delay time

2 Parameters

2.2 List of parameters

Dependency: Refer to: p3465, r3466
Refer to: F06200, A06205, A06206, F06207

Note: For index [0]:
Sets the maximum permissible wait time for the line supply to return after identifying a line fault.
This parameter is used to define how long alarm A06205 may be continuously present. Fault F06200 is output after the wait time has expired.
For p3462[0] = 0, the following applies:
The time monitoring is deactivated. Fault F06200 is only output, if in addition to A06205, an additional message is initiated with a stop response.

For index [1]:
Sets the smoothing time to calculate the rms phase current values (r3466) for the current symmetry monitoring (p3465).
The smoothing time is internally limited to 30 s.

For index [2]:
Sets the delay time between the Alarm A06206 being permanently active until Fault F06207 is output for the current symmetry monitoring (p3465).

p3463	Infeed phase failure detection line supply angle change / INF ph_fail phi		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-180.0 [°]	180.0 [°]	15.0 [°]

Description: If the line supply angle (angle between the line supply phases) suddenly changes by this value, then a phase failure is assumed. The pulses are then inhibited for 10 ms.

Dependency: Refer to: A06205

p3465[0...5]	Infeed current symmetry monitoring thresholds / INF I_sym thr		
A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	200.0 [%]	[0] 60.0 [%] [1] 100.0 [%] [2] 25.0 [%] [3] 90.0 [%] [4] 100.0 [%] [5] 12.5 [%]

Description: Sets scaling values for monitoring the symmetry between the phase currents (r3466).
The monitoring serves to identify continuous line phase failures in regular operation.
The monitoring for the current-controlled mode is deactivated if one of the indices 0, 1, 2 is set to zero.
The monitoring for the Smart Mode is deactivated if one of the indices 3, 4, 5 is set to zero.

Index: [0] = Closed-loop control activation minimum current
[1] = Closed-loop control activation maximum current
[2] = Closed-loop control alarm asymmetry
[3] = Smart Mode activation minimum current
[4] = Smart Mode activation maximum current
[5] = Smart Mode asymmetry alarm

Dependency: Refer to: p3462, r3466
Refer to: A06205, F06207

Notice: Current symmetry monitoring is deactivated if the dynamic grid support (p5501) or the grid droop control (p5401) is activated. In these operating cases, asymmetrical loads should also be supplied.
The negative phase sequence system control (p3640) controls the current asymmetry - and includes an additional symmetry monitoring of the output voltage (p3647).

Note: The smoothing time constant for the phase current rms values r3466[0, 1, 2] can be set with p3462[1].

For index [0, 1]:
Sets the current thresholds for activating symmetry monitoring in current-controlled operation (p3400.0 = 0).
Monitoring is active if at least one rms phase current value r3466 is greater than p3465[0] * r0207 - and at least one rms phase current value is less than p3465[1] * r0207.

For index [2]:
Sets the alarm threshold for the symmetry of the phase currents in the current-controlled mode.
The ratio between the lowest and highest rms phase current is monitored (r3466). The thus defined symmetry relationship decreases with increasing asymmetry – and always lies in the range of 0 ... 100 %.
In operation (r3452 >= 4) the following applies:
If the symmetry relationship is less than threshold p3465[2], then alarm A06206 is output and status bit r3405.2 = 1 is set.
If the alarm threshold is permanently exceeded for the time p3462[2], then the device is switched off with fault F06207.

For index [3, 4]:
Sets the current thresholds for activating symmetry monitoring in the Smart Mode (p3400.0 = 1).
The monitoring function is always active if at least one phase current rms value (r3466) is greater than p3465[3] * r0207 - and at least one phase current rms value is less than p3465[4] * r0207.

For index [5]:
Sets the alarm threshold for the symmetry of the phase currents in the Smart Mode.
The ratio between the lowest and highest rms phase current is monitored (r3466). The thus defined symmetry relationship decreases with increasing asymmetry – and always lies in the range of 0 ... 100 %.
In operation (r3452 >= 4) the following applies:
If the symmetry relationship is less than threshold p3465[5], then alarm A06206 is output and status bit r3405.2 = 1 is set.
If the alarm threshold is permanently exceeded for the time p3462[2], then the device is switched off with fault F06207.

r3466[0...2] CO: Infeed phase current rms value smoothed / INF I_ph rms smth

A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]

Description: Display and connector output for the smoothed rms values of the measured phase currents.

Index:
[0] = Phase U
[1] = Phase V
[2] = Phase W

Dependency:
Refer to: p3462, p3465
Refer to: A06206, F06207

Note: The smoothed rms values are used to monitor the symmetry of the phase currents (p3465).
The smoothing time constant is set with p3462[1].

r3467[0...3] CO: Infeed current alpha/beta / INF I a/b

A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [A]	- [A]	- [A]

Description: Display and connector output for the line current in alpha/beta components.

Index:
[0] = Alpha
[1] = Beta
[2] = Alpha
[3] = Beta

2 Parameters

2.2 List of parameters

Note: For index [0, 1]:
Displays the line current at the input terminals of the line filter.
For index [2, 3]:
Displays the line current at the input terminals of the power unit.

r3468[0...5]	CO: Infeed voltage alpha/beta / INF U a/b		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [V]	- [V]	- [V]
Description:	Display and connector output for the line supply voltage at the input terminals of the line filter in alpha/beta components.		
Index:	[0] = Alpha [1] = Beta [2] = Alpha [3] = Beta [4] = Alpha [5] = Beta		
Note:	For index [0, 1]: The input terminals of the line filter form, for infeeds, the connection point of the Voltage Sensing Module (VSM) to measure the line supply voltage. For operation with VSM (p3400.5 = 1), the following applies: The voltage measured values r3661 and r3662, transformed into the alpha/beta system are displayed in r3468. For encoderless operation without VSM (p3400.5 = 0), the following applies: The estimated values of the voltages from the line supply model of the PLL transformed into the alpha/beta system are displayed in r3468. For index [2, 3]: The basic fundamental amplitudes of the clocked inverter output voltages are displayed. The values are only valid when operation is enabled. For index [4, 5]: The basic fundamental amplitudes of the voltage source calculated using a line model are displayed. The values are only valid when operation is enabled.		

p3469[0...n]	Latch delay time correction, zero crossover detection / t_latch corr PLL		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: PDS, p0120	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10000.0 [μs]	10000.0 [μs]	0.0 [μs]
Description:	Calibration value for the RC filter of the zero crossover detection of the line supply voltage in the power unit. When p3469 = 0, a new calibration is performed the next time identification is carried out with p3410 = 4 or 5.		
Note:	The calibration value is stored in the EEPROM of the power unit because it is a characteristic of the power unit.		

r3470	CO: Infeed active current filter / INF I_act filter		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the active current requirement due to the line filter.		
Dependency:	Refer to: r0038, p0221, p0222		

Note: With respect to the line supply, the sum of the active currents of the power unit (p0078) and line filter (r3470) are effective.
The active current demand of the line filter is taken into account when calculating the power factor (r0038).
The magnitude of the line filter active current depends on the capacitance (p0221) and the resistance (p0222) of the line filter.

r3471	CO: Infeed reactive current filter / INF I_react filt		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the reactive current requirement as a result of the line filter. The reactive current requirement of a line filter is covered by the controlled infeed/regenerative feedback so that the converter always operates with a power factor of 1 compared to the line.		
Dependency:	Refer to: r0038, r0075, r0076, p0221		
Note:	With respect to the line supply, the sum of the reactive currents of the power unit (p0076) and line filter (r3471) are effective. The reactive current requirement of the line filter is taken into account when calculating the power factor (r0038). The amount of the reactive current depends on the capacitance (p0221) of the line filter that is automatically parameterized when a line filter is selected (p0220). If the line phases are reversed and the line voltage therefore has a negative orientation (r0066 < 0), it should be noted that the sign of the reactive current is reversed.		

p3472[0...4]	Line supply PLL line supply voltage smoothing time / Line PLL U_I t_sm		
A_INF, S_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.0 [ms]	30000.0 [ms]	[0] 200.0 [ms] [1] 100.0 [ms] [2] 5000.0 [ms] [3] 8.0 [ms] [4] 8.0 [ms]
Description:	Sets the smoothing time of the line supply voltage for the line supply PLL.		
Index:	[0] = Encoderless operation line supply voltage smoothing time [1] = VSM operation line supply voltage smoothing time [2] = Detection line supply undervoltage smoothing time [3] = Detection line supply overvoltage smoothing time [4] = Detection line supply voltage step smoothing time		
Dependency:	Refer to: p3400		
Note:	For the precontrol of the line supply voltage, a smoothed value of the line supply voltage is used in the closed-loop control. p3472[0]: Sets the PT1 time constant to smooth the line supply voltage for operation without VSM (p3400.5 = 0). p3472[1]: Sets the PT1 time constant to smooth the line supply voltage for operation with VSM (p3400.5 = 1). p3472[2]: Sets the smoothing time constant to slowly detect a line supply undervoltage (F06100). p3472[3]: Sets the smoothing time constant to quickly detect line supply overvoltages for phase failure (A06205). p3472[4]: Sets the smoothing time constant to quickly adapt the line supply precontrol for line supply voltage steps.		

p3473[0...3]	CI: cos phi display current signal source / cos phi I s_s		
A_INF (cos phi), R_INF (cos phi)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	-	-	[0] 3467[0] [1] 3467[1] [2] 3467[2] [3] 3467[3]
Description:	Sets the signal source for the current for the cos phi display.		
Index:	[0] = Alpha subsystem 1 [1] = Beta subsystem 1 [2] = Alpha subsystem 2 [3] = Beta subsystem 2		
Dependency:	Refer to: r3467		
Note:	Using p3475.1, the signal source format can be converted over from alpha/beta space vector coordinates to a 3-conductor representation. With this setting, measured values can be directly interconnected from the Voltage Sensing Module (VSM) (e.g. r5471[0]). For index [0]: Current alpha (current phase 1) for r3478[0] space vector 1. For index [1]: Current beta (current phase 2) for r3478[0] space vector 1. For index [2]: Current alpha (current phase 1) for r3478[1] space vector 2. For index [3]: Current beta (current phase 2) for r3478[1] space vector 2.		
p3474[0...3]	CI: cos phi display voltage signal source / cos phi U s_s		
A_INF (cos phi), R_INF (cos phi)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	-	-	[0] 3468[0] [1] 3468[1] [2] 3468[2] [3] 3468[3]
Description:	Sets the signal source for the voltage for the cos phi display.		
Index:	[0] = Alpha subsystem 1 [1] = Beta subsystem 1 [2] = Alpha subsystem 2 [3] = Beta subsystem 2		
Dependency:	Refer to: r3468		
Note:	Using p3475.1, the signal source format can be converted over from alpha/beta space vector coordinates to a 3-conductor representation. With this setting, measured values from the Voltage Sensing Module (VSM) can be directly interconnected (e.g. r5461[0]). For index [0]: Voltage alpha (voltage phase-phase 12) for r3478[0] space vector 1. For index [1]: Voltage beta (voltage phase-phase 23) for r3478[0] space vector 1. For index [2]: Voltage alpha (voltage phase-phase 12) for r3478[1] space vector 2. For index [3]: Voltage beta (voltage phase-phase 23) for r3478[1] space vector 2.		

p3475[0...1]	cos phi display configuration / cos phi config		
A_INF (cos phi), R_INF (cos phi)	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8951
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 bin
Description:	Sets the configuration for the cos phi display.		
Index:	[0] = Space vector 1 [1] = Space vector 2		
Bit field:	Bit	Signal name	1 signal
	00	cos phi display activation	ON
	01	Signal sources in 3-conductor coordinates	Yes
	02	Signal source phase sequence negated (negative frequency)	Yes
			0 signal
			OFF
			No
			No
			FP
			-
			-
			-
Note:	For bit 00: For p3475[0].0 = 1 the values in r3477[0] and p3478[0] are updated. For p3475[1].0 = 1 the values in r3477[1] and p3478[1] are updated. For bit 01: For p3475.1 = 0, the following applies: The format of the signal source in p3473 and p3474 is interpreted as alpha/beta space vector coordinates. For p3475.1 = 1, the following applies: The format of the signal source in p3473 and p3474 is interpreted as 3-conductor representation. For bit 02: When the bit is activated, the phase sequence of the signal source, interconnected via connector inputs p3473 and p3474, is negated with respect to the signals at the inputs of the infeed. For example, this is the case for a transformer with a phase rotation of 180 ° and the corresponding tapping of the signals. For p3475.2 = 0, the following applies: The phase sequence of the signal source in p3473 and p3474 is not negated. For p3475.2 = 1, the following applies: The phase sequence of the signal source in p3473 and p3474 is negated.		
p3476[0...1]	cos phi display smoothing time / cos phi t_smth		
A_INF (cos phi), R_INF (cos phi)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	2000.00 [ms]	200.00 [ms]
Description:	Sets the smoothing time for the cos phi display.		
Index:	[0] = Space vector 1 [1] = Space vector 2		
r3477[0...1]	CO: cos phi display actual value sign / cos phi ActV sign		
A_INF (cos phi), R_INF (cos phi)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Display and connector output for the sign of the offset factor (cos phi). The offset factor cos phi is defined as the cosine of the phase angle between the sinusoidal oscillation of the voltage and of the current of the fundamental frequency.		

2 Parameters

2.2 List of parameters

Note: The following definition of the signs corresponds with that used in the relevant standards relating to line supplies (e.g. VDE-AR-4105).
 For under-excited operation (negative reactive current: $r0076 < 0$), the following applies:
 Lower output voltage or lagging current is identified with a positive sign.
 For over-excited operation (positive reactive current: $r0076 > 0$), the following applies:
 Higher output voltage or leading current is identified with a negative sign.

r3478[0...1]	CO: cos phi display absolute actual value / cos phi ActV abs		
A_INF (cos phi), R_INF (cos phi)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and connector output for the absolute value of the offset factor (cos phi).
 The offset factor cos phi is defined as the cosine of the phase angle between the sinusoidal oscillation of the voltage and of the current of the fundamental frequency.

Index: [0] = Space vector 1
 [1] = Space vector 2

Notice: The current and voltage signals must come from the same line supply to which the Active Line Module is connected (identical line frequency).
 p3475.2 can be used to compensate if the phase sequence is reversed with respect to the Active Line Module connection terminals.

p3479[0...1]	cos phi display current measurement dead time / cos phi I_m t_dead		
A_INF (cos phi), R_INF (cos phi)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10000.000 [µs]	10000.000 [µs]	620.000 [µs]

Description: Sets a dead time for the current measurement.
 This means that a calibration of the current measuring instant ensures a precise cos phi measurement in 3-conductor coordinates.

Index: [0] = Space vector 1
 [1] = Space vector 2

Notice: A calibration is only required for signal sources in 3-conductor coordinates (p3475.1 = 1).

Note: A calibration value can be checked as follows:
 1. Set p3473[0, 1] = p3467[2, 3], configuration p3475[0] = 1.
 2. Determining a cos phi reference value.
 3. Set p3473[2, 3] = p3671, p3672, configuration p3475[1] = 3.
 4. When the calibration value is correctly set, both indices of "cos phi display actual absolute value" p3478[0, 1] contain the same value.

p3480	Infeed modulation depth limit / INF mod_depth lim		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	50.0 [%]	110.0 [%]	97.0 [%]

Description: Sets the maximum steady-state modulation depth.
 When this limit is reached, the DC link voltage is boosted to maintain the control margin. This means that the control reserve is maintained.

Dependency: Refer to: p3481, r3485

p3481	Infeed standby controller dynamic response / INF resp_ctrl dyn		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	1000.0 [ms]	7.5 [ms]
Description:	Sets the dynamic response of the reserve controller for the modulation depth. As the smoothing time increases, the response of the DC link voltage tracking becomes slower.		
Dependency:	Refer to: p3480, r3485		
r3485	Infeed standby controller output / INF res_ctrl outp		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [V]	- [V]	- [V]
Description:	Displays the reserve controller output for the modulation depth. The DC link voltage is increased by this voltage value - the summed setpoint for the DC link voltage is output in r0088. The summed setpoint is limited to the maximum steady-stage DC link voltage (p0280).		
Dependency:	Refer to: p3480, p3481		
p3490	Infeed delay time OFF1 command / INF t_del OFF1		
A_INF, S_INF, R_INF, B_INF	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8732, 8832, 8932
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [ms]	1000000.0 [ms]	0.0 [ms]
Description:	Sets the delay time for the ON/OFF1 command of the infeed. After ON/OFF1 = 0 the infeed remains in operation for the specified time		
Dependency:	Refer to: p0840		
Notice:	The ON/OFF1 command of the infeed can be interrupted.		
Note:	This parameter is only relevant if a Motor Module and the infeed are controlled by the same OFF command. In this case, the delay time and the stop ramp time of the motor can be coordinated with one another.		
p3491	Infeed I-offset measurement monitoring time / INF I_offs t_mon		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8832, 8932
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	65000 [ms]	2000 [ms]
Description:	Sets the monitoring time for the current-offset measurement of the power unit. The time is started with the normal end of the measurement. If the measurement is invalid and if no valid measurement can be taken within the monitoring period (phase currents too high), an appropriate message is generated.		
Note:	Set this parameter to 0 to allow variations in the delay when running-up.		

p3492	Infeed, line supply undervoltage delay time / INF U_line t_del		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [s]	300 [s]	0 [s]
Description:	Sets the delay time for shutdown due to a line supply undervoltage condition (F06100). After the line supply undervoltage is detected, the power unit is tripped (shut down) after this delay time has expired. If, during this delay time, the line supply undervoltage is no longer detected, then the power unit is not shut down. While the closed-loop control is being synchronized to the line supply (r3402 = 7) the delay time p3492 is not effective.		
Dependency:	Refer to: p0283 Refer to: F06100		
Note:	The degree of ruggedness of the infeed with respect to fluctuations in the line supply voltage can be increased by parameterizing this delay value. However, the following should be noted: - the infeed power decreases proportionally (linearly) with the line supply voltage. - when other components are connected, for low line supply voltage, operating faults or damage can occur. In this case, the specifications of the connected electrical components should always be carefully observed.		
r3496[0...1]	CO: cos phi display actual value / cos phi disp ActV		
A_INF (cos phi), R_INF (cos phi)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8951
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Display and connector output for offset factor cos phi. The offset factor cos phi is defined as the cosine of the phase angle between the sinusoidal oscillation of the voltage and of the current of the fundamental frequency.		
Index:	[0] = Space vector 1 [1] = Space vector 2		
Notice:	The current and voltage signals must come from the same line supply to which the Active Line Module is connected (identical line frequency). p3475.2 can be used to compensate if the phase sequence is reversed with respect to the Active Line Module connection terminals.		
p3508	Infeed step-up factor maximum / Step-up factor max		
A_INF, R_INF	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Converter	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.60	3.00	1.60
Description:	Sets the maximum permissible step-up factor for the power unit used in conjunction with the line filter parameterized in p0220[0].		
Dependency:	Refer to: p0210, p0220, p3510		

Note: The maximum step-up factor determines the maximum ratio between the DC link voltage setpoint (p3510) and the unit supply voltage (p0210).
 The input of the DC link voltage setpoint (p3510) is limited corresponding to the permissible step-up factor (p3508):
 $p3510 \leq p0210 * p3508$.
 Pre-setting values:
 380 ... 480 V booksize units without Active Interface Module: 1.60
 380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00
 380 ... 480 V chassis units: 2.00
 500 ... 690 V chassis units: 2.00
 Maximum values:
 380 ... 480 V booksize units without Active Interface Module: 1.60
 380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00
 380 ... 480 V chassis units: 2.00
 500 ... 690 V chassis units: 2.00
 When the filter setting (p0220) is changed, then the setting of the maximum step-up factor (p3508) is also automatically adapted.

p3510	Infeed DC link voltage setpoint / INF Vdc set		
SERVO (Tech_ctrl), SERVO_AC (Tech_ctrl), SERVO_I_AC (Tech_ctrl), A_INF, R_INF	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 100.00 [V]	Calculated: - Dyn. index: - Unit group: 5_2 Scaling: p2001 Max 1600.00 [V]	Access level: 2 Func. diagram: 8910, 8940 Unit selection: p0505 Expert list: 1 Factory setting 600.00 [V]

Description: Sets the setpoint for the DC link voltage.

Dependency: Refer to: p0210, p0280, p3400, p3508, p3511

Warning: Before increasing the voltage limit for pulsed operation of a controlled booksize infeed with line supply voltages p0210 > 415 V it should be checked whether the motors connected to the DC link are specified for the higher motor voltages.

The warning information associated with p0210 must be carefully observed.

Note: When the Smart Mode is activated (p3400.0 = 1) the DC link voltage is not regulated, i.e. the value entered here is in this case not effective.

The permissible range of the DC link voltage depends on the parameterized unit supply voltage (p0210) and the permissible, maximum continuous DC link voltage (p0280).

In voltage-controlled operation (p3400.0 = 0) the following applies:

$p3510 \geq 1.42 * p0210$ and

$p3510 \leq p3508 * p0210$ and

$p3510 \leq p0280$.

In the Smart Mode (p3400.0 = 1) the following applies:

The setpoint p3510 for the DC link voltage control is inactive. In order to permit an adapted display, deviating from voltage-controlled operation, the lower limit p3510 is $\geq 1.2 * p0210$.

p3510	DC link voltage setpoint / Vdc set		
VECTOR (Tech_ctrl), VECTOR_AC (Tech_ctrl), VECTOR_I_AC (Tech_ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 100.00 [V]	Calculated: - Dyn. index: - Unit group: 5_2 Scaling: p2001 Max 1600.00 [V]	Access level: 2 Func. diagram: 7960 Unit selection: p0505 Expert list: 1 Factory setting 600.00 [V]

Description: Sets the setpoint for the DC link voltage on the motor side.

	Min	Max	Factory setting
	1.00 [Arms]	100000.00 [Arms]	10000.00 [Arms]
Description:	Sets the motoring limit for the active line current. The currently effective current limit is displayed in r0067[0].		
Dependency:	Refer to: r0067, p3532		
Notice:	If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. Operating faults of the infeed can occur due to the resulting DC link undervoltage. For self-commutated infeeds, the DC link voltage decreases if more power is drawn from the DC link by the connected load than can be supplied by the line because of the power unit maximum current or a limit in p3530. If the DC link voltage decreases down to the rectified value, then the complete current - necessary to cover the required active power - flows, uncontrolled into the rectifier circuit via the diodes. This is the reason that, for physical reasons, the value in p3530 cannot act as current limit that is always maintained. The value forms a current threshold from which point onwards the DC link energy is used as buffer for brief power fluctuations.		
Note:	If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.		
p3531	Infeed active current limit generating / INF I_lim gen		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8940

p3555[0...5]	Infeed Vdc controller integral component fast intervention / Vdc_ctr I-compFast		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	200.00 [%]	[0] 2.00 [%] [1] 102.00 [%] [2] 0.00 [%] [3] 5.00 [%] [4] 100.00 [%] [5] 0.00 [%]
Description:	Sets the fast Vdc controller intervention for a step-like decrease of the DC link voltage due to a high motor load of the infeed. The Vdc controller fast intervention is deactivated for p3555[5] = 0 % or p3560 < 100% or p0225 > 0.5 * p0223. For a line supply and DC link identification (p3410 >= 2) the level of the fast controller intervention (p3555[2]) is automatically adapted to the line supply inductance.		
Recommendation:	Precise system knowhow is required when correctly changing this parameter! - generally, the fast controller intervention is used to improve the control behavior for high-speed load changes. The function can therefore always be deactivated with p3555[5] = 0 % if no peak load duty cycles are required in the application. - using p3555[0], the calculation of the modulation depth is determined in the case of high system deviations also when the controller intervention is deactivated. This is the reason that p3555[0] should generally not be changed.		
Index:	[0] = Intervention threshold 1: Vdc deviation from the setpoint [1] = Intervention threshold 2: Vdc difference to the rectified value [2] = Fast intervention automatic scaling [3] = Fast intervention precontrol [4] = Fast intervention timeout [5] = Fast intervention manual scaling		
Note:	p3555[0]: Vdc system deviation as a percentage of the setpoint of the DC link voltage (first condition to initiate fast controller intervention). The threshold is also used to internally change over the modulation depth calculation for high system deviations and should therefore generally not be changed! p3555[1]: Vdc threshold as a percentage of the rectified value of the actual line supply voltage (second condition to initiate the fast controller intervention). Both threshold conditions must be fulfilled to initiate the controller intervention. p3555[2]: Percentage overall level of the fast intervention (scaling factor). For a line supply identification with p3410 >= 2, the factor is automatically adapted or, for weak line supplies with a high inductance, set to 0. p3555[3]: Percentage correction of the precontrol for a fast voltage dip (dead time compensation). p3555[4]: Percentage minimum time between two controller interventions (100% corresponds to 100 ms). If high load change frequencies occur with the application, the minimum time between two controller interventions can be reduced using p3555[4].		

2 Parameters

2.2 List of parameters

p3555[5]:

Percentage overall level of the fast intervention (scaling factor). With p3555[5] = 0, the fast controller intervention is inhibited. For weak line supplies with a high inductance, it makes sense to deactivate the fast intervention.

Description:	Sets the ramp time for the DC link voltage (Vdc) when switching on and switching off. Switching on (enable pulses, r0898.3 = 1): During this time, the DC link voltage is increased from the rectifier value after precharging to the voltage setpoint (p3510, p3511). The voltage setpoint is increased, when necessary, so that the modulation depth reserve (p3481) is maintained. The reactive current is set to the value 0 while ramping. Switching off (inhibit pulses, r0898.3 = 0): During this time, the DC link voltage is reduced to the rectified value ($\sqrt{2}$ * line supply voltage). The reactive current value is set to the value 0 when the ramp starts.			
p3570	CI: Master/slave active current setpoint / I_act_set

Description: Display and connector output for the multiplexer output value.

The signal value is used as standard for the current distribution factor for the infeed master slave operation.

Dependency: Refer to: p3576, p3577, p3579

Note: If the multiplexer for the master/slave is not required, then it can also be used for another function.

p3579 CI: Master/Slave current distribution factor / I_dist_factor

A_INF (Master/Slave), R_INF (Master/Slave)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 8940
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	-	-	3578[0]

Description: Sets the factor to be multiplied by the active current setpoint for the current controller.

For a master/slave infeed configuration, the value reduced in this way can be distributed to the slave axes. The overall gain from the perspective of the voltage controller remains the same.

Dependency: Refer to: p3576, p3577, r3578

r3602 Infeed control status / INF ctrl status

A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	8	-

Description: Displays the status of the closed-loop infeed control.

Value:

- 0: Initialization running
- 1: Pulse enable missing
- 2: Ramp-up DC link voltage
- 3: Ramp-up reactive current
- 4: Shutdown running
- 5: Reset identification

6: Operation
7: Identification running
8: Smart Mode running

p3603**Infeed current precontrol factor D component / INF I_ctrl D comp**

A_INF, R_INF

Can be changed: U, T	Calculated: -	Access level: 3
Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
P-Group: Closed-loop control	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
0.00 [%]	500.00 [%]	100.00 [%]

Description:

The D component of the current precontrol is determined from the device data of the filter. p3603 can be used to weigh the precalculated D component. If no dynamic precontrol is to be used, set the factor to zero.

p3604**CI: Infeed current precontrol factor D component scaling / INF I_ctrl D scale**

A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)

Can be changed: T	Calculated: -	Access level: 3
Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: -
P-Group: -	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: PERCENT	Expert list: 1
Min	Max	Factory setting
-	-	1

Description:

Sets the signal source for scaling the current precontrol.

Dependency:

Refer to: p3603

Note:

The total, effective gain is given by the product p3604 * p3603
Internally, this product is limited to values greater than 0.

r3606**Infeed active current controller system deviation / INF I_act ctrl dev**

A_INF, R_INF

Can be changed: -	Calculated: -	Access level: 2
Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
Not for motor type: -	Scaling: p2002	Expert list: 1
Min	Max	Factory setting
- [Arms]	- [Arms]	- [Arms]

Description:

Displays the system deviation of the active current controller.

r3608**Infeed reactive current controller system deviation / INF I_reactCtrlDev**

A_INF, R_INF

Can be changed: -	Calculated: -	Access level: 2
Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
Not for motor type: -	Scaling: p2002	Expert list: 1
Min	Max	Factory setting
- [Arms]	- [Arms]	- [Arms]

Description:

Displays the system deviation of the reactive current controller.

2 Parameters

2.2 List of parameters

p3610	Infeed reactive current fixed setpoint / INF I_react set		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8910, 8946
	P-Group: Closed-loop control	Unit group: 6_2	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10000.0 [Arms]	10000.0 [Arms]	0.0 [Arms]
Description:	Sets the fixed setpoint for the reactive current. The permissible maximum absolute value for the reactive current is the device rated current r0207. The following applies: $ p3610 \leq r0207$		
Dependency:	Refer to: r0029, r0075, r0076		
Notice:	If the line phases are reversed and the line voltage therefore has a negative orientation ($r0066 < 0$), it should be noted that the sign of the reactive current is also reversed. The negated value of p3610 is effective in display parameters r0029, r0075, r0076 as appropriate.		
Note:	p3610 < 0: Inductive reactive current is produced, i. e. the current follows the voltage. p3610 > 0: Capacitive reactive current is produced, i. e. the current leads the voltage. This definition applies to 3AC voltage systems both with positive rotational orientation ($r0066 > 0$) and for negative rotational orientation ($r0066 < 0$).		
p3611	CI: Infeed reactive current supplementary setpoint / INF I_react Z_set		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2002	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the supplementary setpoint of the reactive current.		
p3612	CI: Infeed reactive power precontrol / INF P_react prectr		
A_INF (Dyn. grid support), R_INF (Dyn. grid support)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: 7997
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: r2004	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the precontrol of the reactive power.		
Dependency:	Refer to: p3520		
p3614[0...3]	Infeed current actual value filter smoothing time / INF I_ActV t_smth		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8950
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [ms]	2.000 [ms]	0.000 [ms]
Description:	Sets the time constant for the PT1 filtering of the active current actual value and reactive current actual value.		
Index:	[0] = Current actual value smoothing with dead time [1] = Current actual value smoothing without dead time [2] = System deviation smoothing without dead time [3] = Automatic system deviation smoothing		

Note: The current actual value filter is deactivated with p3614[0, 1, 2] = 0.
 For index [0]:
 The PT1 filter with a clock cycle dead time can be used to stabilize the closed-loop current control for extremely weak line supplies (with higher relative short-circuit voltage uk).
 For an automatic controller setting with p3410 >= 2, the current actual value filter is automatically pre-set.
 For index [1]:
 The PT1 filter without dead time can be used to optimize the closed-loop current control (e.g. in conjunction with frequency wobulation).
 For index [2]:
 The PT1 filter without dead time for the system deviation (r3606, r3608) can be used to stabilize the closed-current control for weak line supplies (with low line fault rating).
 For index [3]:
 For an automatic controller setting, the PT1 filter without dead time for the system deviation (r3606, r3608) is preset with p3410 >= 2.
 The filter is only active if the following applies: p3614[2] = 0.

p3615		Infeed current controller P gain / INF I_ctrl Kp		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 2	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.00 [%]	1000.00 [%]	100.00 [%]	
Description:	Sets the scaled P gain for closed-loop current control of the infeed.			
Note:	A value of 100 % corresponds to the basic setting derived from loop control parameters (p3421, p3422).			

p3616		CI: Infeed current controller P gain scaling / INF I_ctrl Kp scal		
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: PERCENT	Expert list: 1	
	Min	Max	Factory setting	
	-	-	1	
Description:	Sets the signal source for scaling the proportional gain of the current controller.			
Dependency:	Refer to: p3615			
Note:	The total, effective gain is given by the product p3616 * p3615. Internally, this product is limited to values greater than 0.			

p3617		Infeed current controller integral time / INF I_ctrl Tn		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 2	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.10 [%]	100000.00 [%]	100.00 [%]	
Description:	Sets the scaled integral time for the infeed current controller.			
Note:	A value of 100 % corresponds to the basic setting derived from loop control parameters (p3421, p3422).			

r3618	Infeed active current controller integral component / INF I_act_ctrl Tn		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the integral component of the active current controller.		
r3619	Infeed reactive current controller integral component / INF I_react_ctrlTn		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: 5_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [Vrms]	- [Vrms]	- [Vrms]
Description:	Displays the integral action component of the reactive current controller.		
p3620	Infeed current controller adaptation lower switch-in threshold / INF I_adpt thr low		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100.00 [%]	40.00 [%]
Description:	Sets the switch-in threshold for the current controller adaptation. The value refers to the maximum power unit current (r0209). From the starting threshold onwards, the inductance value (p3421) used for current control is reduced linearly as a function of the current value. The inductance value for the maximum power unit current is therefore p3421 * p3622.		
Dependency:	Refer to: p3410, p3415, p3622		
Note:	The parameter can be set automatically using the line supply identification (p3410 = 4, 5) (also refer to p3622). Prerequisite for a reliable measurement of p3622 is that the current magnitude for run 2 (p3415[1]) is at least 10 % higher than the current magnitude for run 1 of the line supply identification. Otherwise, the measurement result is rejected. In the case of a correct measurement, p3620 is set to 80% of the current magnitude for run 1 (p3415[0]). For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415. For booksize power units, p3620 and p3622 are automatically adapted with the then valid factory setting of the line identification p3415.		
p3622	Infeed current controller adaptation reduction factor / INF I_adpt factor		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.01 [%]	100.00 [%]	85.00 [%]
Description:	Sets the inductance of the line reactor at the maximum power unit current (r0209) as a percentage of the inductance (p3421) at the application threshold (p3620).		
Dependency:	Refer to: p3410, p3415, p3620		

Note: The parameter for a line supply identification (p3410 = 4, 5) automatically optimized, if the following applies:
 p3415[1] - p3415[0] > 10 %
 Otherwise, the measurement result is rejected.
 For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415.
 For booksize power units, p3620 and p3622 are automatically adapted with the then valid factory setting of the line identification p3415.

p3624[0...1]	Infeed harmonics controller order / INF harm_ctr order		
A_INF, R_INF	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	5	13	[0] 5 [1] 7

Description: Sets the Order of the line harmonics for the current harmonics controller.
 p3624[0]: Order of the line harmonics for the first harmonics controller.
 p3624[1]: Order of the line harmonics for the second harmonics controller.

Dependency: Refer to: p3625, r3626

Note: Harmonics in the line supply voltage can cause harmonics in the converter current. These types of current harmonics can be reduced by activating additional controller modules.
 Example:
 For a 50 Hz line supply harmonics at 250 Hz in the phase currents can be reduced by activating a harmonic controller with Order 5 (p3624[0] = 5).

p3625[0...1]	Infeed harmonics controller scaling / INF harm_ctrl scal		
A_INF, R_INF	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	300.0 [%]	100.0 [%]

Description: Sets the gain of the harmonics controller.
 p3625[0]: Gain of the first harmonics controller
 p3625[1]: Gain of the second harmonics controller
 0 %: Controller is deactivated
 100 %: Controller is activated with default gain setting

Dependency: Refer to: p3624, r3626

Note: The harmonics controller corrects the power unit voltages so that the line-side current harmonics are reduced.
 The order of a current harmonic, that is to be dampened using a harmonics controller, is defined using p3624.

r3626[0...1]	Infeed harmonics control output / INF harm_ctrl outp		
A_INF, R_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

Description:	Display and connector output for the angle of the input voltage (relative to the line supply angle).		

p3636[0...2] CI: Negative phase-sequence system controller phase current scaling / Neg_sys_ctr ph sc			
A_INF (Dyn. grid support), R_INF (Dyn. grid support)	Can be changed: U, T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for scaling the phase current using the negative phase-sequence system controller. Setpoints not equal to 0 result in shifting the corresponding phase currents to the two other phases. As a consequence, an identical scaling value for all 3 phases does not result in a change in the current.		
Index:	[0] = Phase U [1] = Phase V [2] = Phase W		
Caution: 	Unequal scaling values result in an oscillating line power and therefore in voltage fluctuations in the DC link and asymmetrical line supply load. As a consequence, additional thermal losses occur in the inverter Further, this can have a negative impact on adjacent systems and components - or even damage them. Depending on the magnitude of the asymmetry, increased harmonics can occur in the phase currents. It may be necessary to increase the capacitance in the DC link to reduce the amplitude of the DC link voltage fluctuations.		
Notice:	The phase current scaling requires the calculation of the line voltage negative-phase sequence system (p5500.3 = 1). Grid support (p5501) can be activated or deactivated. Internally, the value range of p3636 is limited depending on p3527. The following applies to the maximum absolute value of the scaling value: $(100 \% - p3527) * 2$ The complete value range [-1, 1] assumes that p3527 is set $\leq 50 \%$. For p3527 = 100 %, p3636 is not effective. Contrary to entering setpoint pointers (p3641), the phase current scaling becomes active with p3636 after the dynamic grid support has entered a setpoint (p5506, p5509). As a consequence, dynamic grid support is influenced by p3636. Inversely, it also applies that the current change as a result of p3636 is not taken into account in the dynamic grid support, and therefore the dynamic phase-by-phase current limiting must be deactivated (p5500.7 = 0).		
Note:	The scaling signals are internally limited by the value range [-1, 1]. Example: p3636[0] = 1 signal (corresponds to 100 %) results in a reduction of the current setpoint in phase U to approximately 0, if the following applies: p3636[1] = p3636[2] = 0 signal The current amplitudes of the two other phases V and W are then symmetrically increased by 50 %. The setpoints r5510[4, 6] and the negative phase-sequence system setpoint pointer calculated using p3636 are added.		

r3637[0...3] CO: Negative phase-sequence system controller current setpoint / Neg_seq_ctrl I_set			
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 3 Func. diagram: 7987 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Display and connector output for the current setpoints of the negative phase-sequence system controller. The setpoint for the positive phase-sequence system current is compensated in the displayed negative-phase sequence system current. The setpoint for the negative phase-sequence system current is compensated in the displayed positive-phase sequence system current.		
Index:	[0] = Negative phase-sequence system component active current [1] = Negative phase-sequence system component reactive current [2] = Positive phase-sequence system component active current [3] = Positive phase-sequence system component reactive current		

Note: The total active current setpoint in the positive phase-sequence system coordinates is displayed in r0077.
The total reactive current setpoint in the positive phase-sequence system coordinates is displayed in r0075.

r3638[0...3] CO: Negative phase-sequence system controller current actual value / Neg_seq ctr I_act			
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [Arms]	Calculated: - Dyn. index: - Unit group: 6_2 Scaling: p2002 Max - [Arms]	Access level: 3 Func. diagram: 7987 Unit selection: p0505 Expert list: 1 Factory setting - [Arms]
Description:	Display and connector output for the current actual values of the negative phase-sequence system controller. The setpoint for the positive phase-sequence system current is compensated in the displayed negative-phase sequence system current. The setpoint for the negative phase-sequence system current is compensated in the displayed positive-phase sequence system current.		
Index:	[0] = Negative phase-sequence system component active current [1] = Negative phase-sequence system component reactive current [2] = Positive phase-sequence system component active current [3] = Positive phase-sequence system component reactive current		
Note:	The total active current actual value in the positive phase-sequence system coordinates is displayed in r0078. The total reactive current actual value in the positive phase-sequence system coordinates is displayed in r0076.		

p3639[0...3] Negative phase-sequence system controller scaling values / Neg_sys_ctrl scal			
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 300.00 [%]	Access level: 3 Func. diagram: 7987 Unit selection: - Expert list: 1 Factory setting [0] 100.00 [%] [1] 0.10 [%] [2] 200.00 [%] [3] 1.00 [%]
Description:	Sets the scaling values for the negative phase-sequence system controller.		
Index:	[0] = Integral time [1] = Integrator feedback coupling [2] = DC link voltage extrapolation [3] = DC link voltage filter		
Note:	For index [0]: The value 100% corresponds to the integral time, which is active for the regular positive phase-sequence system current controller (p3617). With p3639[0] = 0, the integral component of the negative phase sequence system controller is deactivated. For index [1]: Sets an integrator feedback loop, which, for values greater than 0, results in a PT1 response. In the control, instead of an integrator, a 1st order delay element with time constant $[-p0115[0] / \ln(1 - p3639[1])]$ is active. This allows the negative phase-sequence system controller stability range to be extended. Internally, the setting value is limited to 10 %. We only recommend that this parameter is changed if stability problems are encountered. Typical setting values are in the range of 1%. For index [2]: Sets the extrapolation width for the actual value of the DC link voltage to compensate for Vdc oscillation. A value of 100% corresponds to an extrapolation of one current controller sampling time (p0115[0]). The extrapolated value is displayed in r3643[1].		

For index [3]:

Sets the scaling factor for the Vdc actual value filter.

At twice the line supply frequency, this component of the Vdc oscillation can pass through the bandstop and causes the Vdc controller to respond. As a consequence, the stability of the overall closed-loop control can be improved.

The setting values are internally limited to 100%.

p3640**Negative phase-sequence system controller configuration / Neg_sys ctr config**

Sets the configuration for the negative phase-sequence system current controller.

Recommendation:

Setting p3640 = 7 is recommended if the emphasis is not on correcting current asymmetry, but on identifying high-ohmic line supply phase failures.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Negative phase-sequence system current controller activated	Yes	No	-
01	Asymmetry monitoring activated	Yes	No	-
02	Output limiting activated	Yes	No	-

Note:

For bit 00:

The negative phase-sequence system controller controls negative phase-sequence components in the line current.

For asymmetry in the line supply, this means that current harmonics with 2x the line frequency can be compensated.

For bit 01:

Only active for bit 0 = 1.

For bit 1 = 1, the following applies:

The smoothed amplitude of the controller output is monitored, and when a threshold is exceeded (p3647[1]) an alarm is output (A06208) - and the signal bit for phase failure is set (r3405.2 = 1).

When compared to passive monitoring, this negative phase-sequence system control represents active phase failure detection; even under no load conditions, it can be guaranteed that single-phase, high-ohmic line supply faults are detected.

For bit 02:

Only active for bit 0 = 1.

For bit 2 = 1, the following applies:

In the case of high-ohmic line supply faults (e.g. phase failure), the line asymmetry that occurs can result in a significant increase in the controller integral components, and as a consequence in a fault shutdown (e.g. fault F06200).

If these types of line supply faults are to be ridden through without shutdown (as far as is possible), then the controller output voltage limiting must be activated (threshold p3647[0]).

When monitoring is active (bit 1), for example, after A06208 occurs, a higher-level control system can initially shut down the drives in a controlled fashion - and then switch off the Active Infeed.

p3641[0...1]**CI: Negative phase-sequence system controller setpoint pointer / Neg_seq ctrl set**

A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)

-

0

Description:

Sets the signal source for the setpoint pointer of the negative phase-sequence system current controller.

Index:

[0] = Active

[1] = Reactive

Warning:

Setpoints not equal to zero result in an oscillating line power and therefore in voltage fluctuations in the DC link and asymmetrical line supply load.

2 Parameters

2.2 List of parameters

Note: When the function module "dynamic grid support" (r0108.7 = 1) is activated, the following applies:
The setpoints r5510[4, 6] and the setpoints of the signal source are summed.

r3642[0...1]	CO: Negative phase-sequence system controller manipulated variable / NegSeqCtr ManipVar		
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [V]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [V]	Access level: 3 Func. diagram: 7987 Unit selection: - Expert list: 1 Factory setting - [V]

p3647[0...2]	Negative phase-sequence system controller phase asymmetry / Neg_seq ctrl asym		
A_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl), R_INF (Dyn. grid support, Line transf, Suppl cl-loop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 300.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 15.00 [%] [1] 10.00 [%] [2] 50.00 [%]
Description:	Sets the threshold limits and monitoring thresholds for the negative phase-sequence system controller.		
Index:	[0] = Threshold limit [1] = Signaling threshold [2] = Smoothing time		
Note:	For index [0]: Sets the limit threshold for the output amplitude of the negative phase-sequence system control. The value of 100 % corresponds to the smoothed line voltage (r0072[4]). For p3640.2 = 1, the following applies: The negative phase-sequence system integral components (r3645) are reduced if the set threshold is exceeded. For index [1]: Sets the signaling threshold for the output amplitude of the negative phase-sequence system control. The negative phase-sequence system output amplitude corresponds to the asymmetry of the line voltage. The value of 100 % corresponds to the smoothed line voltage (r0072[4]). The setting value is internally limited to a maximum of $0.9 * p3647[0]$. For p3640.1 = 1, the following applies: A06208 is output and r3405.2 is set = 1 if the set threshold is exceeded. This allows line asymmetry monitoring or phase failure detection to be implemented. For index [2]: Sets the smoothing time for identifying the asymmetry described under index 1. The 100% value corresponds to 1 second.		
r3648[0...1]	CO: Transformer DC component controller current actual value / Tr DC_ctrl I_act

Dependency:	Refer to: p3649, p3650, p3651, r3652, p3654		

2 Parameters

2.2 List of parameters

p3649	Transformer DC component controller integral time / Tr DC_ctrl Tn		
A_INF (Line transf), R_INF (Line transf)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7987
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	300.00 [%]	100.00 [%]
Description:	Sets the integral time Tn of the DC component controller.		
Dependency:	Refer to: r3648, p3650, p3651, r3652, p3654		
Note:	The 100% value corresponds to the standard setting With p3649 = 0, the integral component of the DC component controller is deactivated.		
p3650	Transformer DC component controller proportional gain / Tr DC_ctrl Kp		
A_INF (Line transf), R_INF (Line transf)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7987
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	300.00 [%]	0.00 [%]
Description:	Sets the proportional gain Kp of the DC component controller. The DC component control is a very precise control without any remaining system deviation under steady-state operating conditions. It calculates a supplementary voltage for the output voltage of a power unit so that any DC component in the current can be counteracted. The controller is designed analytically based on a model of the controlled system comprising converter, line filter and transformer.		
Dependency:	The prerequisite for the "DC component control" function is that the "Line transformer" function module is activated (r0108.4 = 1). Refer to: r3648, p3649, p3651, r3652, p3654		
Note:	The 100% value corresponds to the standard setting The DC component controller is deactivated with p3650 = 0.		
p3651	Transformer DC component controller limiting / Tr DC_ctrl lim		
A_INF (Line transf), R_INF (Line transf)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7987
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2.0 [%]	10.0 [%]	5.0 [%]
Description:	Sets the limit for the output voltage of the DC component controller. The value is referred to the device supply voltage (p0210).		
Dependency:	Refer to: r3648, p3649, p3650, r3652, p3654		
Note:	If this parameter is set too low, then a DC component can no longer be corrected.		
r3652[0...1]	CO: Transformer DC component controller manipulated variable / Tr DC_ctrl man_var		
A_INF (Line transf), R_INF (Line transf)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7987
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [V]	- [V]	- [V]
Description:	Display and connector output for the manipulated variable (output voltage) of the DC component controller.		
Index:	[0] = Alpha [1] = Beta		

Dependency: Refer to: r3648, p3649, p3650, p3651, p3654
Note: The manipulated variable is displayed in alpha/beta coordinates, and in comparison to the phase-to-phase rms supply voltage (p0210) is therefore evaluated with a factor of 0.8165.

p3654 Transformer DC component controller PT2 limit frequency / Tr DC_ctrl PT2 f

A_INF (Line transf), R_INF (Line transf)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7987
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.40 [Hz]	10.00 [Hz]	10.00 [Hz]

Description: Sets the limit frequency for the PT2 lowpass filter of the DC component controller.

Dependency: Refer to: r3648, p3649, p3650, p3651, r3652

p3660[0...n] VSM input line supply voltage voltage scaler / VSM inp U_scaler

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: p0150	Func. diagram: 9880
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100000.00 [%]	0.00 [%]

Description: Sets the voltage scaler for the Voltage Sensing Module (VSM).

Note: When the 690 V input is used (X522) without voltage scaler, 0 % should be entered.
 When the 100 V input (X521) is used with voltage scaler to measure medium voltages, the dividing (scaling) factor multiplied by 100% should be entered.
 Example:
 1000 V line supply voltage, voltage scaling, 10:1
 --> voltage at the VSM input is 100 V
 --> p3660 = 10 * 100 % = 1000 %

p3660 VSM input line supply voltage voltage scaler / VSM inp U_scaler

A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9880
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100000.00 [%]	0.00 [%]

Description: Sets the voltage scaler for the Voltage Sensing Module (VSM).

Note: When the 690 V input is used (X522) without voltage scaler, 0 % should be entered.
 When the 100 V input (X521) is used with voltage scaler to measure medium voltages, the dividing (scaling) factor multiplied by 100% should be entered.
 Example:
 1000 V line supply voltage, voltage scaling, 10:1
 --> voltage at the VSM input is 100 V
 --> p3660 = 10 * 100 % = 1000 %

	Min	Max	Factory setting
	-100 [°C]	301 [°C]	150 [°C]
Description:	Sets the alarm threshold for the temperature sensor of the Voltage Sensing Module (VSM) to monitor the line filter temperature. Prerequisite: A KTY/PT1000 temperature sensor is connected, and correspondingly p3665 is set = 2, 6.		
Dependency:	Refer to: p0220, p3665 Refer to: F06255, A34211		
Note:	For sensor type KTY (p3665 = 2) or PT1000 (p3665 = 6), values 181 ... 300 °C result in fault F06255. The monitoring is deactivated for p3667 = 301. Deactivating the monitoring (p3667 = 301) is only permissible, if, as line filter (p0220) a chassis AIM is not set.		

p3668[0...n]	VSM overtemperature shutdown threshold / VSM T F_thr		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: p0150	Func. diagram: 9886
	P-Group: -	Unit group: 21_1	Unit selection: p0505

	- [V]	- [V]	- [V]

Description: Displays the actual value of the voltage measured at the 10 V input 2 of the Voltage Sensing Module (VSM).

Dependency: Refer to: p3670

Note: 10 V input 2: Terminals X520.3 and X520.4

r3674	CO: VSM 10 V input 2 actual value / VSM inp 2 U_ActV		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9880
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2001	Expert list: 1
	Min	Max	Factory setting
	- [V]	- [V]	- [V]
Description:	Displays the actual value of the voltage measured at the 10 V input 2 of the Voltage Sensing Module (VSM).		
Dependency:	Refer to: p3670		
Note:	10 V input 2: Terminals X520.3 and X520.4		

p3676	VSM line filter capacitance alarm threshold / VSMfilt C A_thr		
A_INF, S_INF, R_INF	Can be changed: T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	100.00 [%]	0.00 [%]
Description:	Sets the alarm threshold for the change of the capacitance of the line filter. The monitoring of the filter capacitance is deactivated with p3676 = 0.00 %.		
Recommendation:	Set the value ≥ 20 % and dependent on the harmonic content of the line supply.		
Dependency:	Refer to: p3670 Refer to: A06250		
Notice:	The following must be ensured before activating monitoring (e.g. p3676 = 20 %): Measured filter capacitance (r3677[0...2]) = 3 x filter capacitance (p0221) Otherwise, to establish this ratio, p3670 must be appropriately set. Example: The filter capacitance is specified with p0221 = 39 μ F. In order that the measured capacitance is 3x so high, p3670 = 6.7 A must be set in the gain factor. p0221[0] = 39 μ F r3677[0...2] = 3 x 39 = 117 μ F --> p3670 = 6.7 A		
Note:	Prerequisites for monitoring the filter capacitance: The phase currents must be measured at two capacitors of the line filter. To do this, current transformers should be connected at the 10 V inputs of the Voltage Sensing Module (VSM).		

r3677[0...2]	CO: VSM line filter capacitance / VSM filt C		
A_INF, S_INF, R_INF	Can be changed: -	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [μ F]	- [μ F]	- [μ F]
Description:	Displays the capacitance of the line filter (for a star connection).		
Index:	[0] = Phase U [1] = Phase V [2] = Phase W		
Dependency:	Refer to: p3676		
Note:	Prerequisite: The monitoring of the filter capacitance is activated.		

p3678[0...1]	Filter monitoring threshold values / Filter mon thr		
A_INF (Line transf), R_INF (Line transf)	Can be changed: C2(1, 2)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7991
	P-Group: Converter	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	10000.00 [%]	[0] 0.00 [%] [1] 0.00 [%]
Description:	Sets the threshold values for filter monitoring. The voltage threshold value is referred to p0210. The current threshold value is referred to the nominal filter current. Nominal filter current = $2 \times PI \times p0211 \times 3 \times p0221[0] \times p0210 \times \sqrt{2} / \sqrt{3}$		
Index:	[0] = Voltage threshold value [1] = Current threshold value		
Dependency:	Refer to: r3671, r3672, r7310, r7311 Refer to: F06855		
Note:	The filter monitoring function is deactivated with p3678 = 0.00. Recommended setting for activation: Voltage threshold value: 5.0 % Current threshold value: 500 %		

p3679[0...1]	Transformer filter monitoring times / Filter mon times		
A_INF (Line transf), R_INF (Line transf)	Can be changed: C2(1, 2)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7991
	P-Group: Converter	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	40.00 [ms]	[0] 20.00 [ms] [1] 0.50 [ms]
Description:	Sets the times for filter monitoring. For index [0]: Smoothing time for the alpha and beta components of the filter voltage. For index [1]: An appropriate fault is output if the set current threshold value is exceeded for at least the set time.		
Index:	[0] = Voltage threshold value [1] = Current threshold value		
Dependency:	Refer to: F06855		

p3680	BI: Braking Module internal inhibit / BM int inhib		
B_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to inhibit the internal Braking Module. BI: p3680 = 1 signal: The Braking Module is inhibited. BI: p3680 = 0 signal: The Braking Module is enabled.		

Dependency: Refer to: A06904

Caution: When the Braking Module is inhibited, no energy can be dissipated in the braking resistor.

p3681 **BI: Activating Braking Module internal DC link fast discharge / BM intDCdischg act**

B_INF	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to activate the DC link fast discharge for an internal braking module.
When the following conditions apply, the DC link fast discharge is started later with delay time (p3682):

- BI: p3681 = 1 signal.
- an external line contactor is opened via r0863.1 "energize contactor".

The DC link fast discharge is interrupted when the following conditions apply:

- BI: p3681 = 0 signal.
- ON command for the infeed.

Recommendation: The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults can occur when precharging (e.g. F30027).

Dependency: Refer to: p3682

Refer to: F30027

Notice: The parameter is only effective for Basic Line Modules with the internal Braking Module (this is valid for Basic Line Modules with a power rating of less than 100 kW).

p3682 **Braking Module internal DC link fast discharge delay time / BM int DC dischg t**

B_INF	Can be changed: C1(3), T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Communications	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	500 [ms]	4294967295 [ms]	1000 [ms]

Description: Sets the delay time for switching in the DC link fast discharge for an internal Braking Module.

Dependency: Refer to: p3681

Notice: The parameter is only effective for Basic Line Modules with the internal Braking Module (this is valid for Basic Line Modules with a power rating of less than 100 kW).

p3683 **Braking Module internal activation threshold brake chopper / BM int act thr**

B_INF	Can be changed: C2(1, 2)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Converter	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	110.00 [V]	780.00 [V]	760.00 [V]

Description: Sets the activation threshold for the braking chopper.

Note: The activation threshold is only effective if the "Device supply voltage reduced" function (p0212.0 = 1) has been activated!

r3685	BO: Digital Braking Module: Pre-alarm I2t shutdown / Dig BM A I2t shutd		
B_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	The binector output uses a 1 signal to indicate that 80 % of the highest permissible I2t value has been reached in the Braking Module.		
Dependency:	Refer to: A06905		

r3686	BO: Digital Braking Module fault / Dig BM fault		
B_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	The binector output uses a 1 signal to indicate an overcurrent fault or an I2t shutdown in the Braking Module.		
Dependency:	Refer to: F06906		

r3687	BO: Digital Braking Module pre-alarm overtemperature / Dig BM A overtemp		
B_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays a fault due to the excessively high temperature. 1 signal: The connected temperature sensor (X21.1, X21.2) signals an overtemperature.		
Recommendation:	Measure the braking resistor temperature using the temperature sensor.		

r3688	BO: Braking Module internal overtemperature shutdown / BM int temp shutd		
B_INF	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the shutdown due to the excessively high temperature. 1 signal: The connected temperature sensor (X21.1, X21.2) signals an overtemperature. The highest permissible temperature at the connected temperature sensor has been exceeded and results in a shutdown.		
Dependency:	Refer to: F06908		

r3689	BO: Digital Braking Module Uce fault / Dig BM Uce fault			
B_INF	Can be changed: -	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays an Uce fault in the internal Braking Module. 1 signal: An Uce fault is present in the internal Braking Module.			
Dependency:	Refer to: F06909			
p3700	AVS/APC configuration / APC config			
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T	Calculated: -	Access level: 2	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 7012	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 0000 0000 0000 bin	
Description:	Sets the configuration for AVS and APC.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Activating APC	Yes	No
	01	APC acceleration sensor	Yes	No
	02	APC without sensor on the load side	Yes	No
	03	Take into account acceleration precontrol	Yes	No
	04	APC also acts on the I component	Yes	No
	08	Activating pulse de-coupling/speed weighting	Yes	No
	09	APC speed actual value via BICO input	Yes	No
Note:	APC: Advanced Positioning Control AVS: Active Vibration Suppression For bit 00: When the bit is set, the acceleration filter output is added to the speed setpoint. When the bit is not set, a value of 0 is entered. This must be used to evaluate the filter frequency characteristics. For bit 01: When the bit is set, the source of p3750 with high pass filtering is used as the APC acceleration actual value. When the bit is not set, the encoder actual value selected with p3701 is used as APC actual value. For bit 02: When the bit is set, a model value without sensor on the load side is used as APC actual value. In so doing, PT1 filtering with p3709 as smoothing time - and a high pass filter with p3751 as a high pass filter time constant apply. When the bit is not set, the encoder actual value selected with p3701 is used as APC actual value. For bit 03: When the bit is set, when calculating the acceleration, the speed precontrol value in p1432[1] is taken into account. For bit 04: When the bit is set, the acceleration filter output also acts on the I component of the speed controller. For bit 08: For bit 0 = 1 and bit 8 = 1 (pulse decoupling/speed weighting activated), the speed from the direct measuring system (p3701) selected for APC, weighted with p3702, and the motor speed is used as actual value for the speed controller. For bit 09: When the bit is set, instead of the selected encoder actual value, the source of p3749 weighted with p3748 is used. When the bit is not set, the encoder actual value selected with p3701 is used as APC actual value.			

p3701	APC encoder selection / APC enc sel		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: C1(4), C2(15)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Data sets	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2	3	2
Description:	Sets the number of the encoder used for for APC (Advanced Positioning Control).		
Value:	2: Encoder 2 3: Encoder 3		
Note:	Encoder 1 is the motor encoder and cannot be used for APC as APC requires a load measuring system. An encoder used for APC is, regarding its fault messages, treated just like a motor encoder - this means that its fault messages are assigned to the drive.		

p3702[0...n]	APC load speed/motor speed weighting / APC n_load/mot wt		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Setpoints	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.000	10.000	1.000
Description:	Sets the weighting factor to form the speed actual value from the load speed and motor speed. p3700.8 = 1 must be set to activate weighting.		
Dependency:	Refer to: p3700, p3701		
Note:	1.0: only corresponds to the load speed. 0.0: only corresponds to the motor speed. 0.5: corresponds to the average value from the load speed and motor speed.		

p3704[0...n]	APC filter activation / APC filter act				
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3		
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: REL	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0000 0000 0000 bin		
Description:	Setting to activate the filter for APC (Advanced Positioning Control).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activate filter 1.1	Yes	No	7012
	04	Activate filter 2.1	Yes	No	7012
	05	Activate filter 2.2	Yes	No	7012
	08	Activate filter 3.1	Yes	No	7012
	09	Activate filter 3.2	Yes	No	7012
	12	Activate torque setpoint filter 1	Yes	No	5060
	13	Activate torque setpoint filter 2	Yes	No	5060

2 Parameters

2.2 List of parameters

p3708[0...n]	APC speed actual value smoothing time encoder 2 / APCn_ActV t_smth 2		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 50.00 [ms]	Access level: 3 Func. diagram: 4711 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Sets the smoothing time constant (PT1) for the speed actual value of encoder 2 with APC (Advanced Positioning Control).		
Note:	The speed actual value should be smoothed for encoders with a low pulse number or for resolvers.		
p3709[0...n]	AVS/APC velocity actual value smoothing time encoder 3 / APCv_ActV t_smth 3		
SERVO (APC), AVS/APC-ECO, (Lin), SERVO_AC (APC), AVS/APC-ECO, (Lin), SERVO_I_AC (APC), AVS/APC-ECO, (Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00 [ms]	Access level: 3 Func. diagram: 4711 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Sets the smoothing time constant (PT1) for the velocity actual value of encoder 3 with AVS and APC. For p3700.2 = 1, the following applies: Sets the smoothing time constant (PT1) for the model for operation without encoder on the load side for APC.		
Note:	The speed actual value should be smoothed for encoders with a low pulse number or for resolvers. APC: Advanced Positioning Control AVS: Active Vibration Suppression		
p3709[0...n]	AVS/APC speed act value smoothing time encoder3/ w/o load sensor / APC n_act t_smth 3		
SERVO (APC), AVS/APC-ECO), SERVO_AC (APC), AVS/APC-ECO), SERVO_I_AC (APC), AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00 [ms]	Access level: 3 Func. diagram: 4711 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Sets the smoothing time constant (PT1) for the speed actual value of encoder 3 with AVS and APC. For p3700.2 = 1, the following applies: Sets the smoothing time constant (PT1) for the model for operation without encoder on the load side for APC.		
Note:	The speed actual value should be smoothed for encoders with a low pulse number or for resolvers. APC: Advanced Positioning Control AVS: Active Vibration Suppression		
p3711[0...n]	APC filter 1.1 denominator natural frequency / APC filt1.1 fn_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.5 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 16000.0 [Hz]	Access level: 3 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 2000.0 [Hz]
Description:	Sets the denominator natural frequency for filter 1.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		

p3712[0...n]	APC filter 1.1 denominator damping / APC Filt 1.1 D_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.050	10.000	0.700
Description:	Sets the denominator damping for filter 1.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3713[0...n]	APC filter 1.1 numerator natural frequency / APC filt 1 fn_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the numerator natural frequency for filter 1.1 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3714[0...n]	APC filter 1.1 numerator damping / APC Filt 1.1 D_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for filter 1.1 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3721[0...n]	APC filter 2.1 denominator natural frequency / APC filt2.1 fn_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the denominator natural frequency for filter 2.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3722[0...n]	APC filter 2.1 denominator damping / APC Filt 2.1 D_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.050	10.000	0.700
Description:	Sets the denominator damping for filter 2.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		

2 Parameters

2.2 List of parameters

p3723[0...n]	APC filter 2.1 numerator natural frequency / APC filt2.1 fn_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the numerator natural frequency for filter 2.1 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
<hr/>			
p3724[0...n]	APC filter 2.1 numerator damping / APC Filt 2.1 D_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for filter 2.1 (general 2nd Order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
<hr/>			
p3726[0...n]	APC filter 2.2 denominator natural frequency / APC filt2.2 fn_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the denominator natural frequency for filter 2.2 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
<hr/>			
p3727[0...n]	APC filter 2.2 denominator damping / APC Filt 2.2 D_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.050	10.000	0.700
Description:	Sets the denominator damping for filter 2.2 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
<hr/>			
p3728[0...n]	APC filter 2.2 numerator natural frequency / APC filt2.2 fn_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the numerator natural frequency for filter 2.2 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		

p3729[0...n]	APC filter 2.2 numerator damping / APC Filt 2.2 D_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7029
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for filter 2.2 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3731[0...n]	APC filter 3.1 denominator natural frequency / APC filt3.1 fn_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the denominator natural frequency for filter 3.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3732[0...n]	APC filter 3.1 denominator damping / APC Filt 3.1 D_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.050	10.000	0.700
Description:	Sets the denominator damping for filter 3.1 (PT2, general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3733[0...n]	APC filter 3.1 numerator natural frequency / APC filt3.1 fn_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the numerator natural frequency for filter 3.1 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		
p3734[0...n]	APC filter 3.1 numerator damping / APC Filt 3.1 D_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for filter 3.1 (general 2nd order filter) for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3704, p3705		

2 Parameters

2.2 List of parameters

p3736[0...n]	APC filter 3.2 denominator natural frequency / APC filt3.2 fn_den		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012

Description:	Sets the denominator damping for torque setpoint filter 2 for APC.		
Dependency:	This parameter is active for the following filter types: - general 2nd order filter (p3705.13 = 1). - PT2 (p3705.13 = 0). Refer to: p3704, p3705		
Note:	APC: Advanced Positioning Control		

p3746[0...n]	APC torque setpoint filter 2 numerator natural frequency / APC M fil 2 fn_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5060
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	2000.0 [Hz]
Description:	Sets the numerator natural frequency for torque setpoint filter 2 for APC.		
Dependency:	This parameter is active for the following filter type: - general 2nd order filter (p3705.13 = 1). Refer to: p3704, p3705		
Note:	APC: Advanced Positioning Control		

p3747[0...n]	APC torque setpoint filter 2 numerator damping / APC M fil 2 D_num		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5060
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000	10.000	0.700
Description:	Sets the numerator damping for torque setpoint filter 2 for APC.		
Dependency:	This parameter is active for the following filter type: - general 2nd order filter (p3705.13 = 1). Refer to: p3704, p3705		
Note:	APC: Advanced Positioning Control		

p3748[0...n]	APC velocity input scaling / APC v_input scale		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Setpoints	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000	1000000.000	1.000
Description:	Sets the scaling to adapt the velocity value via a connector input p3749.		
Dependency:	Refer to: p3749		
Note:	APC: Advanced Positioning Control		

p3749[0...n]	CI: APC velocity actual value external input / APC v_ActV ext inp		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: CDS, p0170	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the actual value of the external velocity actual value for APC.		
Recommendation:	When interconnecting a speed actual value from another axis, it is recommended to evaluate the bit "Speed information available" (r1992.11) (e.g. interconnect to an external fault p2106 - p2108). To avoid additional dead time as a result of the calculation sequence, it is recommended to set the drive object associated with the signal source of p3749 to a higher priority (p7900).		
Dependency:	Refer to: p3748		
Note:	APC: Advanced Positioning Control		

2 Parameters

2.2 List of parameters

p3750[0...n]	CI: APC acceleration sensor input / APC a input		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: p2007 Max -	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the signal source for the actual value of the acceleration sensor for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3700		
p3751[0...n]	AVS/APC acceleration sensor high pass time constant / APC a DT1 Tc		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10000.00 [ms]	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 100.00 [ms]
Description:	Sets the time constant of the high-pass filter for the acceleration sensor for AVS and APC.		
Dependency:	Refer to: p3700, p3750		
Note:	APC: Advanced Positioning Control AVS: Active Vibration Suppression		
p3752[0...n]	AVS controller preassignment natural oscillation frequency / AVS ctr_preassn fn		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.0 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0 [Hz]
Description:	Sets the natural oscillation frequency for preassignment of the AVS controller data (p3709, p3751, p3761). The value is only effective for operation without an encoder on the load side (p3700.2 = 1). The preassignment is started when writing p3752 > 0 (if p3700.2 = 1).		
Dependency:	Refer to: p3700, p3709, p3751, p3761		
Note:	The load moment of inertia is used for the calculation. Parameters p0342 and p1498 should be checked, and if required, corrected before the calculation.		
p3753[0...n]	APC torque setpoint preassignment natural oscillation frequency / APC M_filt def fn		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.0 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [Hz]	Access level: 3 Func. diagram: 5060 Unit selection: - Expert list: 1 Factory setting 0.0 [Hz]
Description:	Sets the natural oscillation frequency for pre-assigning the APC torque setpoint filter 1 to compensate mounting-related vibration. The following parameters are preassigned: p3740, p3741, p3742, p3743		
Dependency:	Refer to: p3740, p3741, p3742, p3743		
Note:	The procedure to preassign the filter is started with p3754 > 0.		

p3754[0...n]	APC torque setpoint filter preassignment gain / APC M_filt def V		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.0	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2.0	Access level: 3 Func. diagram: 5060 Unit selection: - Expert list: 1 Factory setting 0.0
Description:	Sets the gain for pre-assigning the APC torque setpoint filter 1 to compensate mounting-related vibration. The following parameters are preassigned: p3740, p3741, p3742, p3743		
Dependency:	Refer to: p3740, p3741, p3742, p3743		
Note:	The procedure to preassign the filter is started with p3754 > 0.		
p3755[0...n]	AVS/APC motor mass factor / APC mot_mass fact		
SERVO (APC, AVS/APC-ECO, Lin), SERVO_AC (APC, AVS/APC-ECO, Lin), SERVO_I_AC (APC, AVS/APC-ECO, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.25	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1.00
Description:	Sets the factor for the weight stiffly attached to the motor for APC without sensor on the load side (p3700.2). The value is referred to the motor weight (p0341)		
Dependency:	Refer to: p3700		
Note:	If the setting results in more than the total mass, then the value of p3755 is automatically limited to this. This can also be realized by changing p1498, p0341 and p0342.		
p3755[0...n]	AVS/APC motor moment of inertia factor / APC m_inert factor		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.25	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1.00
Description:	Sets the factor for the moment of inertia stiffly attached to the motor for APC without sensor on the load side (p3700.2). The value is referred to the motor moment of inertia (p0341).		
Dependency:	Refer to: p3700		
Note:	If the setting results in more than the total moment of inertia, then the value of p3755 is automatically limited to this. This can also be realized by changing p1498, p0341 and p0342.		
p3760[0...n]	APC load velocity controller 1 P gain / APC v_load ctr1 Kp		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -100.000	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.000	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0.000
Description:	Sets the proportional gain of the load velocity controller 1 for APC (Advanced Positioning Control). The gain acts on the difference between the velocity setpoint and load velocity in the branch for filter 2.1 and 2.2.		

2 Parameters

2.2 List of parameters

p3760[0...n]	APC load speed controller 1 P gain / APC n_load ctr1 Kp		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-100.000	100.000	0.000
Description:	Sets the proportional gain of the load speed controller 1 for APC (Advanced Positioning Control). The gain acts on the difference between the speed setpoint and load speed in the branch for filter 2.1 and 2.2.		
p3761[0...n]	AVS/APC load velocity controller 1 rate time / APC v_load ctr1 Tv		
SERVO (APC, AVS/APC-ECO, Lin), SERVO_AC (APC, AVS/APC-ECO, Lin), SERVO_I_AC (APC, AVS/APC-ECO, Lin)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-500.00 [ms]	500.00 [ms]	0.00 [ms]
Description:	Sets the rate time of load velocity controller 1 for AVS and APC. The rate time acts on the load acceleration in the branch for filter 2.1 and 2.2.		
Note:	APC: Advanced Positioning Control AVS: Active Vibration Suppression		
p3761[0...n]	AVS/APC load speed controller 1 rate time / APC n_load ctr1 Tv		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7012
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-500.00 [ms]	500.00 [ms]	0.00 [ms]
Description:	Sets the rate time of load speed controller 1 for AVS and APC. The rate time acts on the load acceleration in the branch for filter 2.1 and 2.2.		
Note:	APC: Advanced Positioning Control AVS: Active Vibration Suppression		
r3762	AVS/APC load speed controller 1 rate time active / APC n_ctr 1 Tv act		
SERVO (APC, AVS/APC-ECO), SERVO_AC (APC, AVS/APC-ECO), SERVO_I_AC (APC, AVS/APC-ECO)	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 5055
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [ms]	- [ms]	- [ms]
Description:	Displays the active rate time of the load speed controller 1 for AVS and APC. The rate time acts on the load acceleration in the branch for filter 2.1 and 2.2.		
Dependency:	Refer to: p2780, p2782, p2783, p2784, p2788, r2789		
Note:	APC: Advanced Positioning Control AVS: Active Vibration Suppression		

p3765[0...n]	APC load velocity controller 2 P gain / APC v_load ctr2 Kp		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -100.000	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.000	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0.000
Description:	Sets the proportional gain of the load velocity controller 2 for APC (Advanced Positioning Control). The gain acts on the difference between the velocity setpoint and load velocity in the branch for filter 3.1 and 3.2.		
p3765[0...n]	APC load speed controller 2 P gain / APC n_load ctr2 Kp		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -100.000	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.000	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0.000
Description:	Sets the proportional gain of the load speed controller 2 for APC (Advanced Positioning Control). The gain acts on the difference between the speed setpoint and load speed in the branch for filter 3.1 and 3.2.		
p3766[0...n]	APC load velocity controller 2 rate time / APC v_load ctr2 Tv		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -500.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00 [ms]	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Sets the rate time of the load velocity controller 2 for APC (Advanced Positioning Control). The rate time acts on the load acceleration in the branch for filter 3.1 and 3.2.		
p3766[0...n]	APC load speed controller 2 rate time / APC n_load ctr2 Tv		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -500.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 500.00 [ms]	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0.00 [ms]
Description:	Sets the rate time of the load speed controller 2 for APC (Advanced Positioning Control). The rate time acts on the load acceleration in the branch for filter 3.1 and 3.2.		
p3767[0...n]	APC differential position high pass time constant / APC s_dif DT1 Tc		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.00 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10000.00 [ms]	Access level: 2 Func. diagram: 7013 Unit selection: - Expert list: 1 Factory setting 100.00 [ms]
Description:	Sets the time constant of the high pass filter for the differential position gain for APC.		
Dependency:	Refer to: p3700, p3768		
Note:	APC: Advanced Positioning Control		

2 Parameters

2.2 List of parameters

p3768[0...n]	APC differential position gain factor / APC s_dif Kp		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -50000.00 [Nm/rad]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: 49_1 Scaling: - Max 50000.00 [Nm/rad]	Access level: 2 Func. diagram: 7013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm/rad]
Description:	Sets the gain factor Kp for the differential position controller for APC. The gain acts on the force setpoint (in front of the current setpoint filters).		
Dependency:	Refer to: p3700, p3767, r3769		
Note:	APC: Advanced Positioning Control		
p3768[0...n]	APC differential position gain factor / APC s_dif Kp		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -50000.00 [Nm/rad]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: 49_1 Scaling: - Max 50000.00 [Nm/rad]	Access level: 2 Func. diagram: 7013 Unit selection: p0505 Expert list: 1 Factory setting 0.00 [Nm/rad]
Description:	Sets the gain factor Kp for the differential position controller for APC. The gain acts on the torque setpoint (in front of the current setpoint filters). The differential position controller is deactivated with a value = 0.		
Dependency:	Refer to: p3700, p3767, r3769		
Note:	APC: Advanced Positioning Control		
r3769	CO: APC differential position force setpoint / APC s_dif F_set		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: - Data type: FloatingPoint32 P-Group: Setpoints Not for motor type: - Min - [N]	Calculated: - Dyn. index: - Unit group: 8_1 Scaling: p2003 Max - [N]	Access level: 2 Func. diagram: 5040, 7013 Unit selection: p0505 Expert list: 1 Factory setting - [N]
Description:	Display and connector output for the force setpoint from the differential position controller for APC. This value is added to the force setpoint of the velocity controller (r1480).		
Dependency:	Refer to: p3700, p3767, p3768		
Note:	APC: Advanced Positioning Control		
r3769	CO: APC differential position torque setpoint / APC s_dif M_set		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: - Data type: FloatingPoint32 P-Group: Setpoints Not for motor type: - Min - [Nm]	Calculated: - Dyn. index: - Unit group: 7_1 Scaling: p2003 Max - [Nm]	Access level: 2 Func. diagram: 5040, 7013 Unit selection: p0505 Expert list: 1 Factory setting - [Nm]
Description:	Display and connector output for the torque setpoint from the differential position controller for APC. This value is added to the torque setpoint of the speed controller (r1480).		
Dependency:	Refer to: p3700, p3767, p3768		
Note:	APC: Advanced Positioning Control		

r3770	CO: APC load velocity / APC v_load		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4711, 7012
	P-Group: Setpoints	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Display and connector output for the load velocity for APC (Advanced Positioning Control).		
Dependency:	Refer to: r3771		

r3770	CO: APC load speed / APC n_load		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4711, 7012
	P-Group: Setpoints	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Display and connector output for the load speed for APC (Advanced Positioning Control).		
Dependency:	Refer to: r3771		

r3771[0...1]	CO: APC velocity actual value / APC v_act		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4711, 5040, 5042
	P-Group: Setpoints	Unit group: 4_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Displays the load/motor velocity actual value weighted with p3702 for APC (Advanced Positioning Control). Displays the velocity actual values for APC (Advanced Positioning Control). For index [0]: Displays the smoothed load velocity. For index [1]: Displays the load/motor velocity actual value weighted with p3702 for p3700.8 = 1.		
Index:	[0] = Load actual value speed smoothed [1] = Load/motor actual speed weighted		
Dependency:	Refer to: p1441, r3770		

r3771[0...1]	CO: APC speed actual value / APC n_act		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 4711, 5040, 5042
	P-Group: Setpoints	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Display and connector output for the speed actual values for APC (Advanced Positioning Control). For index [0]: Displays the smoothed load speed. For index [1]: Displays the load/motor speed actual value weighted with p3702 for p3700.8=1.

p3778[0...n]	APC velocity limit / APC v_limit		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [m/min]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: 4_1 Scaling: - Max 1000.00 [m/min]	Access level: 2 Func. diagram: 7012 Unit selection: p0505 Expert list: 1 Factory setting 1000.00 [m/min]
Description:	Sets the velocity limit for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3779		
<hr/>			
p3778[0...n]	APC speed limit / APC n_limit		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00 [rpm]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: 3_1 Scaling: - Max 210000.00 [rpm]	Access level: 2 Func. diagram: 7012 Unit selection: p0505 Expert list: 1 Factory setting 210000.00 [rpm]
Description:	Sets the speed limit for APC (Advanced Positioning Control).		
Dependency:	Refer to: p3779		
<hr/>			
p3779[0...n]	APC velocity limit monitoring time / APC v_limit t		
SERVO (APC, Lin), SERVO_AC (APC, Lin), SERVO_I_AC (APC, Lin)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop control Not for motor type: REL Min 0 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000000 [ms]	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0 [ms]
Description:	Sets the monitoring time to limit the output for APC (Advanced Positioning Control). This monitoring time is started after the selected limit value (p3778) has been exceeded. A corresponding fault is output if the limit value is not undershot before this time expires.		
Dependency:	Refer to: p3778 Refer to: F07425		
<hr/>			
p3779[0...n]	APC speed limit monitoring time / APC n_limit t		
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T Data type: Unsigned32 P-Group: Closed-loop control Not for motor type: REL Min 0 [ms]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000000 [ms]	Access level: 2 Func. diagram: 7012 Unit selection: - Expert list: 1 Factory setting 0 [ms]
Description:	Sets the monitoring time to limit the output for APC (Advanced Positioning Control). This monitoring time is started after the selected limit value (p3778) has been exceeded. A corresponding fault is output if the limit value is not undershot before this time expires.		
Dependency:	Refer to: p3778 Refer to: F07425		

p3800[0...n]	Sync-line-drive activation / Sync act		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 7020
	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Sets the activation for line-drive synchronization		
Value:	0: Sync-line-drive deactivated 1: Sync-line-drive activated VSM-INT		
Dependency:	Refer to: p3801, p3802		
Caution:	 <p>If there is only one VSM being used, this can either be used for line synchronization or for a flying restart. If the VSM was connected to the line supply, then flying restart should be deselected in p1200. If the VSM was connected at the output (motor side), then line synchronization should be deactivated using p3800.</p> <p>Line synchronization (first VSM connected with the line supply) and also flying restart (second VSM connected to the motor terminals) can only be used if two VSMs are assigned to the Motor Module.</p>		
Note:	<p>When the ground fault monitoring initiates a fault for overlapping synchronizing the threshold value p0287[1] for the Motor Module and the associated infeed must be appropriately increased (e.g. p0287[1] = 100 %).</p> <p>For p3800 = 1, the following applies:</p> <p>The INTERNAL voltage actual values are used for synchronization. The effects that a (sine-wave) filter - that is connected between the Motor Module and motor - has on the voltage actual values are taken into account (theoretically) by appropriately selecting p0230.</p> <p>VSM: Voltage Sensing Module</p>		
p3801[0...n]	Sync-line-drive drive object number / Sync DO_no		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 7020
	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	62	1
Description:	Sets the drive object number of the drive whose VSM is used for line-drive synchronization.		
Dependency:	Refer to: p3800, p3802		
Notice:	The current controller sampling time p0115[0] of the drive object with the VSM used for synchronization must be identical to the current controller sampling time of the drive of the drive used to perform line synchronization.		
Note:	<p>VSM: Voltage Sensing Module</p> <p>The setting p3801 = 1 is always possible (no VSM selected).</p> <p>If the VSM is assigned subsequently to a Motor Module, its drive object number must be entered in p3801.</p> <p>The line voltage is always measured using the first VSM (p0151[0]).</p>		
p3802[0...n]	BI: Sync-line-drive enable / Sync enable		
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned32 / Binary	Dyn. index: CDS, p0170	Func. diagram: 7020
	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to switch in/switch out for the line-drive synchronization.		
	BI: p3802 = 1 signal: The line-drive synchronization is switched in.		
Dependency:	Refer to: p3800, p3801		

2 Parameters

2.2 List of parameters

r3803.0	CO/BO: Sync-line-drive control word / Sync STW			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: Unsigned32 P-Group: Functions Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the control word for the line-drive synchronization.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Sync-line-drive selected	Yes	No
Note:	For bit 00: For a 1 signal, p3800 > 0 is set.			
r3804	CO: Sync-line-drive target frequency / Sync f_target			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: p2000 Max - [Hz]	Access level: 2 Func. diagram: 3030, 7020 Unit selection: - Expert list: 1 Factory setting - [Hz]	
Description:	Displays the target frequency for the line-drive synchronization. The target frequency corresponds to the absolute value of the line frequency.			
Dependency:	Refer to: A07941			
r3805	CO: Sync-line-drive frequency difference / Sync f_diff			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: p2000 Max - [Hz]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting - [Hz]	
Description:	Displays the frequency difference between the measured target frequency and output frequency of the gating unit of the closed-loop control for line-drive synchronization.			
p3806[0...n]	Sync-line-drive frequency difference threshold value / Sync f_diff thr			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min 0.00 [Hz]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1.00 [Hz]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting 0.10 [Hz]	
Description:	Sets the threshold value of the frequency difference to activate the closed-loop phase control for line-drive synchronization. The closed-loop phase control is activated (r3819.6 = 1), if the frequency difference is less than the threshold value.			

r3808	CO: Sync-line-drive phase difference / Sync phase diff			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min - [°]	Calculated: - Dyn. index: - Unit group: - Scaling: p2005 Max - [°]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting - [°]	
Description:	Displays the phase difference between the measured target phase and phase of the gating unit of the closed-loop control for line-drive synchronization.			
p3809[0...n]	Sync-line-drive phase setpoint / Sync phase set			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min -180.00 [°]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 179.90 [°]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting 0.00 [°]	
Description:	Sets the phase setpoint for the line-drive synchronization.			
p3811[0...n]	Sync-line-drive frequency limiting / Sync f_lim			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min 0.00 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1.00 [Hz]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting 0.20 [Hz]	
Description:	Sets the frequency limiting of the phase controller output for the line-drive synchronization.			
r3812	CO: Sync-line-drive correction frequency / Sync f_corr			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: p2000 Max - [Hz]	Access level: 2 Func. diagram: 3080, 7020 Unit selection: - Expert list: 1 Factory setting - [Hz]	
Description:	Displays the correction frequency for the line-drive synchronization.			
p3813[0...n]	Sync-line-drive phase synchronism threshold value / Sync Ph_sync thr			
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min 1.00 [°]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 20.00 [°]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting 2.00 [°]	
Description:	Sets the threshold value of the phase synchronism for the line-drive synchronization. A prerequisite for synchronism is achieved if the phase difference is lower than the threshold value.			
Note:	Synchronism is reached (r3819.2 = 1), if the AND logic operation of the results from the phase measurement (p3813) and voltage measurement (p3815) is fulfilled.			

2 Parameters

2.2 List of parameters

r3814	CO: Sync-line-drive voltage difference / Sync U_diff				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min - [Vrms]	Calculated: - Dyn. index: - Unit group: - Scaling: p2001 Max - [Vrms]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting - [Vrms]		
Description:	Display and connector output for the voltage difference between the measured target voltage and output voltage of the gating unit of the closed-loop control for line-drive synchronization.				
p3815[0...n]	Sync-line-drive voltage difference threshold value / Sync U_diff thr				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min 0.00 [%]	Calculated: CALC_MOD_LIM_REF Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 20.00 [%]	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting 10.00 [%]		
Description:	Sets the threshold value of the voltage difference for the line-drive synchronization. A prerequisite for synchronism is reached if the voltage difference is less than the threshold value.				
Note:	Synchronism is reached ($r3819.2 = 1$), if the AND logic operation of the results from the phase measurement (p3813) and voltage measurement (p3815) is fulfilled. For voltage manipulated quantity margin (reserve) of the drive converter, the amplitude difference (r3814) between the setpoint and actual value is controlled (corrected) to zero. The parameter is referred to the voltage setpoint amplitude.				
p3818[0...n]	Sync-line-drive synchronization time limit / Sync time lim				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: T Data type: FloatingPoint32 P-Group: Functions Not for motor type: - Min 0 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 900 [s]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 60 [s]		
Description:	Sets the time limit for achieving line-drive synchronism.				
Dependency:	Refer to: F07940				
Note:	For p3818 = 0, the time limit is deactivated.				
r3819.0...7	CO/BO: Sync-line-drive status word / Sync ZSW				
VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: - Data type: Unsigned32 P-Group: Functions Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 2 Func. diagram: 7020 Unit selection: - Expert list: 1 Factory setting -		
Description:	Displays the status word for the line-drive synchronization.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Sync-line-drive enabled	Yes	No	-
	02	Sync-line-drive synchronism reached	Yes	No	-
	03	Sync-line-drive synchronizing error	Yes	No	-
	05	Sync-line-drive frequency measurement active	Yes	No	-
	06	Sync-line-drive phase control active	Yes	No	-
	07	Synchronize without drive	Yes	No	-

p3820[0...n]	Friction characteristic value n0 / Friction n0		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	15.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 1st value pair of the friction characteristic.		
Dependency:	Refer to: p3830, p3845		

p3820[0...n]	Friction characteristic value v0 / Friction v0		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	1.50 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 1st value pair of the friction characteristic.		
Dependency:	Refer to: p3830, p3845		

p3821[0...n]	Friction characteristic value n1 / Friction n1		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	30.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 2nd value pair of the friction characteristic.		
Dependency:	Refer to: p3831, p3845		

p3821[0...n]	Friction characteristic value v1 / Friction v1		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	3.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 2nd value pair of the friction characteristic.		
Dependency:	Refer to: p3831, p3845		

2 Parameters

2.2 List of parameters

p3822[0...n]	Friction characteristic value n2 / Friction n2		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	60.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 3rd value pair of the friction characteristic.		
Dependency:	Refer to: p3832, p3845		

p3822[0...n]	Friction characteristic value v2 / Friction v2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	6.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 3rd value pair of the friction characteristic.		
Dependency:	Refer to: p3832, p3845		

p3823[0...n]	Friction characteristic value n3 / Friction n3		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010

	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	15.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 5th value pair of the friction characteristic.		
Dependency:	Refer to: p3834, p3845		

p3825[0...n]	Friction characteristic value n5 / Friction n5		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	300.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 6th value pair of the friction characteristic.		
Dependency:	Refer to: p3835, p3845		

p3825[0...n]	Friction characteristic value v5 / Friction v5		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	30.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 6th value pair of the friction characteristic.		
Dependency:	Refer to: p3835, p3845		

2 Parameters

2.2 List of parameters

p3826[0...n]	Friction characteristic value n6 / Friction n6		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	600.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 7th value pair of the friction characteristic.		
Dependency:	Refer to: p3836, p3845		

p3826[0...n]	Friction characteristic value v6 / Friction v6		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	60.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 7th value pair of the friction characteristic.		
Dependency:	Refer to: p3836, p3845		

p3827[0...n]	Friction characteristic value n7 / Friction n7		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	1200.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 8th value pair of the friction characteristic.		
Dependency:	Refer to: p3837, p3845		

p3827[0...n]	Friction characteristic value v7 / Friction v7		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	120.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 8th value pair of the friction characteristic.		
Dependency:	Refer to: p3837, p3845		

p3828[0...n]	Friction characteristic value n8 / Friction n8		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	1500.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 9th value pair of the friction characteristic.		
Dependency:	Refer to: p3838, p3845		

p3828[0...n]	Friction characteristic value v8 / Friction v8		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	150.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 9th value pair of the friction characteristic.		
Dependency:	Refer to: p3838, p3845		

p3829[0...n]	Friction characteristic value n9 / Friction n9		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 3_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [rpm]	210000.00 [rpm]	3000.00 [rpm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the n coordinate of the 10th value pair of the friction characteristic.		
Dependency:	Refer to: p3839, p3845		

p3829[0...n]	Friction characteristic value v9 / Friction v9		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: CALC_MOD_LIM_REF	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 4_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [m/min]	21000.00 [m/min]	300.00 [m/min]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the v coordinate of the 10th value pair of the friction characteristic.		
Dependency:	Refer to: p3839, p3845		

2 Parameters

2.2 List of parameters

p3830[0...n]	Friction characteristic value M0 / Friction M0		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 1st value pair of the friction characteristic.		
Dependency:	Refer to: p3820, p3845		

p3830[0...n]	Friction characteristic value F0 / Friction F0		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 1st value pair of the friction characteristic.		
Dependency:	Refer to: p3820, p3845		

p3831[0...n]	Friction characteristic value M1 / Friction M1		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 2nd value pair of the friction characteristic.		
Dependency:	Refer to: p3821, p3845		

p3831[0...n]	Friction characteristic value F1 / Friction F1		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 2nd value pair of the friction characteristic.		
Dependency:	Refer to: p3821, p3845		

p3832[0...n]	Friction characteristic value M2 / Friction M2		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 3rd value pair of the friction characteristic.		
Dependency:	Refer to: p3822, p3845		

p3832[0...n]	Friction characteristic value F2 / Friction F2		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 3rd value pair of the friction characteristic.		
Dependency:	Refer to: p3822, p3845		

p3833[0...n]	Friction characteristic value M3 / Friction M3		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 4th value pair of the friction characteristic.		
Dependency:	Refer to: p3823, p3845		

p3833[0...n]	Friction characteristic value F3 / Friction F3		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 4th value pair of the friction characteristic.		
Dependency:	Refer to: p3823, p3845		

2 Parameters

2.2 List of parameters

p3834[0...n]	Friction characteristic value M4 / Friction M4		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 5th value pair of the friction characteristic.		
Dependency:	Refer to: p3824, p3845		

p3834[0...n]	Friction characteristic value F4 / Friction F4		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 5th value pair of the friction characteristic.		
Dependency:	Refer to: p3824, p3845		

p3835[0...n]	Friction characteristic value M5 / Friction M5		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 6th value pair of the friction characteristic.		
Dependency:	Refer to: p3825, p3845		

p3835[0...n]	Friction characteristic value F5 / Friction F5		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 6th value pair of the friction characteristic.		
Dependency:	Refer to: p3825, p3845		

p3836[0...n]	Friction characteristic value M6 / Friction M6		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 7th value pair of the friction characteristic.		
Dependency:	Refer to: p3826, p3845		

p3836[0...n]	Friction characteristic value F6 / Friction F6		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 7th value pair of the friction characteristic.		
Dependency:	Refer to: p3826, p3845		

p3837[0...n]	Friction characteristic value M7 / Friction M7		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 8th value pair of the friction characteristic.		
Dependency:	Refer to: p3827, p3845		

p3837[0...n]	Friction characteristic value F7 / Friction F7		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 8th value pair of the friction characteristic.		
Dependency:	Refer to: p3827, p3845		

2 Parameters

2.2 List of parameters

p3838[0...n]	Friction characteristic value M8 / Friction M8		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 9th value pair of the friction characteristic.		
Dependency:	Refer to: p3828, p3845		

p3838[0...n]	Friction characteristic value F8 / Friction F8		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 9th value pair of the friction characteristic.		
Dependency:	Refer to: p3828, p3845		

p3839[0...n]	Friction characteristic value M9 / Friction M9		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 7_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [Nm]	1000000.0000 [Nm]	0.0000 [Nm]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the M coordinate of the 10th value pair of the friction characteristic.		
Dependency:	Refer to: p3829, p3845		

p3839[0...n]	Friction characteristic value F9 / Friction F9		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 7010
	P-Group: Functions	Unit group: 8_1	Unit selection: p0505
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.0000 [N]	1000000.0000 [N]	0.0000 [N]
Description:	The friction characteristic is defined by 10 value pairs. This parameter specifies the F coordinate of the 10th value pair of the friction characteristic.		
Dependency:	Refer to: p3829, p3845		

r3840.0...8		CO/BO: Friction characteristic status word / Friction ZSW		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 2	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 7010	
	P-Group: Functions	Unit group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	

Description: Display and BICO output for the status word of the friction characteristic.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Friction characteristic OK	Yes	No	-
	01	Record friction characteristic activated	Yes	No	-
	02	Record friction characteristic completed	Yes	No	-
	03	Record friction characteristic canceled	Yes	No	-
	08	Friction characteristic positive direction	Yes	No	-

Note: Bit 0 = 1:

All friction characteristic values (p3820 ... p3839) of all existing drive data sets are plausible.

Description: Display and BICO output for the status word of the friction characteristic.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Friction characteristic OK	Yes	No	-
	01	Record friction characteristic activated	Yes	No	-
	02	Record friction characteristic completed	Yes	No	-
	03	Record friction characteristic canceled	Yes	No	-
	08	Friction characteristic positive direction	Yes	No	-
	09	Friction torque model controlled status	Upper	Lower	-

Note: For bit 09:

For closed-control of an induction motors with encoder, the switchover between the current and observer model is displayed (see also r1751.19), if p3844 is > 0.

For bit 9 = 0 (observer model active), the following applies:

The frictional torque is calculated from the characteristic values from the characteristic point entered into p3844.

For bit 9 = 1 (current model active), the following applies:

The frictional torque is calculated from the characteristic values below the characteristic point entered into p3844.

	Min	Max	Factory setting
	0	4	0
Description:	<p>Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor.</p> <p>The speed of this changeover point is pre-assigned when automatically calculating with the changeover speed p1752. The changeover point located below is pre-assigned with the changeover speed $p1752 * (1 - p1753)$.</p> <p>Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3).</p> <p>Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.</p>		
Dependency:	<p>As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder.</p> <p>Refer to: p3843</p>		
Notice:	<p>If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).</p>		
Note:	<p>For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.</p>		

p3845	Record friction characteristic activation / Frict record act		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: 7010
	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0
Description:	<p>Setting for the friction characteristic record.</p> <p>After the next switch-on command, the friction characteristic is automatically recorded.</p>		
Value:	<p>0: Record friction characteristic deactivated 1: Record friction characteristic activated all directions 2: Record friction characteristic activated positive direction 3: Record friction characteristic activated negative direction</p>		
Dependency:	<p>When selecting the friction characteristic measurement, the drive data set changeover is suppressed.</p> <p>For linear drives (refer to r0108.12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.</p>		
Danger:	<p>For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.</p>		
			
Notice:	<p>To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).</p>		
Note:	<p>When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).</p> <p>When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.</p> <p>When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.</p>		

2 Parameters

2.2 List of parameters

p3846[0...n]	Record friction characteristic ramp-up/ramp-down time / Frict rec t_RU/RD		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T Data type: FloatingPoint32 P-Group: Functions Not for motor type: REL Min 0.000 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 999999.000 [s]	Access level: 2 Func. diagram: 7010 Unit selection: - Expert list: 1 Factory setting 10.000 [s]
Description:	Sets the ramp-up/ramp-down time of the ramp-up/ramp-down function generator to automatically Documenting the friction characteristic. The drive is accelerated from standstill (setpoint = 0) up to the maximum speed/velocity (p1082) in this time.		
Dependency:	Refer to: p3845		
p3847[0...n]	Record friction characteristic time to warm up / Frict rec t_warm		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T Data type: FloatingPoint32 P-Group: Functions Not for motor type: REL Min 0.000 [s]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 3600.000 [s]	Access level: 2 Func. diagram: 7010 Unit selection: - Expert list: 1 Factory setting 0.000 [s]
Description:	Sets the warm-up time. To start the automatic recording, the highest selected speed (p3829) is approached and this time is held. After this, the measurement is started with the highest speed.		
Dependency:	Refer to: p3829, p3845		
p3848[0...n]	CI: Friction characteristic speed actual value signal source / Frict n_act s_s		
SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC, VECTOR_I_AC (n/M)	Can be changed: T Data type: Unsigned32 / FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min -	Calculated: - Dyn. index: CDS, p0170 Unit group: - Scaling: p2000 Max -	Access level: 3 Func. diagram: 7010 Unit selection: - Expert list: 1 Factory setting 63[0]
Description:	Sets the signal source for the speed actual value of the friction characteristic.		
Dependency:	Refer to: r1443		
Notice:	The interconnected signal of the speed actual value must be approximately the same as the real motor speed so that when the motor model is replaced, no significant settling operations occur.		
p3860	Number of Braking Modules connected in parallel / BM qty para_cct		
A_INF (Brk Mod ext), S_INF (Brk Mod ext), R_INF (Brk Mod ext), B_INF (Brk Mod ext)	Can be changed: C2(2) Data type: Unsigned8 P-Group: Converter Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 8	Access level: 3 Func. diagram: 9951 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the number of Braking Modules connected in parallel in a DC link.		
Note:	The parameter can only be written to if the infeed is in the commissioning mode (p0010 = 2).		

r3861.0...7		BO: Braking Module inhibit/acknowledgment / BM inhib/ackn		
A_INF (Brk Mod ext), S_INF (Brk Mod ext), R_INF (Brk Mod ext), B_INF (Brk Mod ext)	Can be changed: -	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9951	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	

Description: Signal to energize terminal X21.1 "inhibit/acknowledgment" on the Braking Module.
This binector output is used as signal source to interconnect to a digital output.
For "booksize" formats the digital output must be connected to terminal X21.1 and for "chassis" formats the digital output must be connected to terminal X21.3 of the particular Braking Module.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Inhibit/acknowledge Braking Module 1	High	Low	-
	01	Inhibit/acknowledge Braking Module 2	High	Low	-
	02	Inhibit/acknowledge Braking Module 3	High	Low	-
	03	Inhibit/acknowledge Braking Module 4	High	Low	-
	04	Inhibit/acknowledge Braking Module 5	High	Low	-
	05	Inhibit/acknowledge Braking Module 6	High	Low	-
	06	Inhibit/acknowledge Braking Module 7	High	Low	-
	07	Inhibit/acknowledge Braking Module 8	High	Low	-

Warning:  It is crucial that you ensure the correct interconnection of binector outputs r3861.n - and/or the wiring of the corresponding digital outputs!
If the interconnections/connections are incorrect, and if the Braking Module develops a fault condition, then the software could execute a different (incorrect) function via binector outputs r3861.n.

p3862		Braking Module DC link fast discharge delay time / BM DC-dischg t_del		
A_INF (Brk Mod ext), S_INF (Brk Mod ext), R_INF (Brk Mod ext), B_INF (Brk Mod ext)	Can be changed: C1(3), T	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9951	
	P-Group: Communications	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	500 [ms]	4294967295 [ms]	1000 [ms]	

Description: Sets the delay time for switching in the DC link fast discharge.
Dependency: Refer to: p3863, r3864
Note: The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

p3863		BI: Activating Braking Module DC link fast discharge / BM DC-dischg act		
A_INF (Brk Mod ext), S_INF (Brk Mod ext), R_INF (Brk Mod ext), B_INF (Brk Mod ext)	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9951	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0	

Description: Sets the signal source to activate the DC link fast discharge.
The DC link fast discharge is started later with delay time (p3862) when the following conditions apply:
- BI: p3863 = 1 signal.
- an external line contactor is opened via r0863.1 "energize contactor".
The DC link fast discharge is interrupted when the following conditions apply:
- BI: p3863 = 0 signal.
- ON command for the infeed.
Recommendation: The DC link fast discharge should be activated if there is an external line contactor and is correctly interconnected (r0863.1, p0860). If the DC link fast discharge is not activated together with an external line contactor, then faults can occur when precharging (e.g. F30027).

2 Parameters

2.2 List of parameters

Dependency: Refer to: r3864
Refer to: F30027

Note: The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.

r3864.0...7	BO: Braking Module DC link fast discharge / BM DC link dischg				
A_INF (Brk Mod ext), S_INF (Brk Mod ext), R_INF (Brk Mod ext), B_INF (Brk Mod ext)	Can be changed: -	Calculated: -	Access level: 3		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9951		
	P-Group: Commands	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Signal to control (energize) terminal X21.2 "DC link fast discharge" on the Braking Module. This binector output is used as signal source to interconnect to a digital output. The digital output must be connected to terminal X21.2 of the particular Braking Module.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Fast discharge Braking Module 1	High	Low	-
	01	Fast discharge Braking Module 2	High	Low	-
	02	Fast discharge Braking Module 3	High	Low	-
	03	Fast discharge Braking Module 4	High	Low	-
	04	Fast discharge Braking Module 5	High	Low	-
	05	Fast discharge Braking Module 6	High	Low	-
	06	Fast discharge Braking Module 7	High	Low	-
	07	Fast discharge Braking Module 8	High	Low	-
Dependency:	Refer to: p3863 Refer to: F30027				
Warning:	It must be carefully ensured that the binector outputs BO: p3864.n are correctly interconnected and also that the appropriate digital outputs are correctly connected up.				
	If the interconnection/connection is incorrect, in the case of an active DC link fast discharge, the software could execute another function (incorrect function) via binector outputs BO: p3864.n or could also permanently control the DC link fast discharge even if the line contactor is closed.				
Note:	The DC link fast discharge is only possible for "booksize" formats. This function is not supported for "chassis" formats.				

p3865[0...7]	BI: Braking Module pre-alarm I2t shutdown / BM pre-A I2t shutd

	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to change over to closed-loop control with encoder.

Dependency: Refer to: p3870, p3871, p3872, p3874, r3875, p3876, p3878, p3879

Danger:  Setting an incorrect commutation angle can result in instability in the closed-loop control and in turn injure personnel or cause damage to the machine!

Note: BI: p3873 = 1 signal --> closed-loop control with encoder
BI: p3873 = 0 signal --> encoderless closed-loop control
For a 0/1 edge, the commutation angle is set from connector input p3874.

p3874	CI: Long stator signal source commutation angle oper. with encoder / s_s com angle enc		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: p2005	Expert list: 1
	Min	Max	Factory setting
	-	-	3879[0]

Description: Sets the signal source for the commutation angle for operation with encoder.

Dependency: Refer to: p3870, p3871, p3872, p3873, r3875, p3876, p3878, p3879

Note: This angle is set for a 0/1 signal edge via BI: p3873.

r3875.0...1	CO/BO: Long stator status word / Long stator ZSW		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and BICO output for the status word of the long stator motors.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Sensor Module is unparked	Yes	No	-
	01	Closed-loop speed control with encoder requested	Active	Inactive	-
Dependency:	Refer to: p3870, p3871, p3872, p3873, p3874, p3876, p3878, p3879				
Note:	The display is updated with a sampling time of 1 ms. For bit 00 = 1: The encoder is parked. Contrary to r0481.14, parking is also displayed here if the suppression of the parking bit is active in r0481.14 (p3870.1 = 1). For bit 01 = 1: The long-stator functions requested closed-loop speed control with encoder. In r1407.2, it is indicated as to whether an encoder is actually used for the closed-loop control.				

r3875.0...1	CO/BO: Long stator status word / Long stator ZSW

	P-Group: Functions	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0

Description: Sets the signal source to activate the essential service mode (ESM) via digital input. Using this function, when required the motor can be operated for as long as possible (e.g. to extract smoke).
 BI: p3880 = 1 signal:
 The essential service mode is activated.
 BI: p3880 = 0 signal:
 The essential service mode is deactivated.

Dependency: The function can only be activated for the following products:
 - SINAMICS G130/G150/S150 (VECTOR)
 - SINAMICS S120 AC drive (AC/AC, CU310-2 with PM240-2, VECTOR_AC)
 If the signal source for the ESM activation is interconnected (p3880 > 0), and a motor encoder is parameterized (p0187, p0400), then for an encoder fault, the fault response is automatically activated (p0491 = 1).
 Refer to: p3881, p3882, p3883, p3886, r3887, p3888, r3889

Warning:  When activating the essential service mode (BI: p3880 = 1 signal), the motor immediately runs according to the selected setpoint source. When the essential service mode is activated, the motor cannot be stopped using the OFF commands.

Note: ESM: Essential Service Mode
 Permissible signal sources:
 - BO: r0722.x (high active)
 - BO: r0723.x (low active), x = 0 ... 17, 20, 21

p3881	ESM setpoint source / ESM set_s		
VECTOR	Can be changed: T	Calculated: -	Access level: 3

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	7	0

Description: Sets the setpoint source for essential service mode (ESM).

Value:

- 0: Last known setpoint (r1078 smoothed)
- 1: Fixed speed setpoint 15 (p1015)
- 3: Fieldbus
- 5: TB30/TM31 analog input
- 6: Enable the response OFF1
- 7: Enable the response OFF2

Note: ESM: Essential Service Mode
 When the essential service mode is activated, the effective speed setpoint is displayed in r1114.
 For p3881 = 0:
 The last known setpoint value is only safely and reliably transferred if it was present for at least 30 s prior to activating the essential service mode.
 Speed setpoints from the jog mode (p1058, p1059) are not taken into account.
 For p3881 = 5:
 The signal source for the setpoint via analog input for TB30/TM31 is set via p3886.
 For p3881 = 6:
 n_act = 0: pulse suppression and switching on inhibited.
 n_active > 0: braking along the ramp-function generator down ramp (p1121), pulse cancellation and switching on inhibited.
 For p3881 = 7:
 n_act = 0: pulse suppression and switching on inhibited.
 n_act > 0: immediate pulse cancellation and switching on inhibited.

p3881	ESM setpoint source / ESM set_s		
VECTOR_AC	Can be changed: T	Calculated: -	Access level: 3

p3900 Completion of quick commissioning / Compl quick_com

HLA	Can be changed: C2(1)	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0

Description: Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning.

p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning.

The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1).

p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1.

p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1F.

Value:	0: No quick parameterization
	1: Quick parameterization after parameter reset
	2: Quick parameterization (only) for BICO and motor parameters
	3: Quick parameterization for motor parameters (only)

Notice: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.

Note: When the calculations have been completed, p3900 and p0010 are automatically reset to a value of zero. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten.

	04	Motor encoder adjustment carried out (p1960 = 1, p1990 = 1, 3)	Yes	No	-
	08	Identified motor data are automatically backed up	Yes	No	-
	10	Automatic parameterization only for U/f control (r0108.2 = 0)	Yes	No	-
	14	First motor commissioning	Yes	No	-
	15	Equivalent circuit diagram parameters changed	Yes	No	-
	16	Cable resistance measured	Yes	No	-
	18	Circle identification executed	Yes	No	-
Note:	The individual bits are only set if the appropriate action has been initiated and successfully completed. The identification final display is reset when changing the type plate parameters.				

2 Parameters

2.2 List of parameters

r3927[0...n] Motor data identification induction motor data determined / MotID ASM dat det

SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the data of an induction motor determined and accepted from the stationary motor data identification or rotating measurement.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	p0350 accepted	Yes	No	-
	01	p0354 accepted	Yes	No	-
	02	p0356 accepted	Yes	No	-
	03	p0358 accepted	Yes	No	-
	04	p0360 accepted	Yes	No	-
	05	p0320 accepted	Yes	No	-
	06	p0410 accepted	Yes	No	-
	11	p2952 - p2954 accepted	Yes	No	-
	12	p1715 accepted	Yes	No	-
	13	p1717 accepted	Yes	No	-
	14	p1590 accepted	Yes	No	-
	15	p1592 accepted	Yes	No	-
	22	p0341 accepted	Yes	No	-
	24	p0348 accepted	Yes	No	-
	25	p1752 accepted	Yes	No	-
	26	p5265 - p5268 accepted	Yes	No	-
	27	p0391 - p0393 accepted	Yes	No	-
	28	p2980 - p2983 accepted	Yes	No	-

Dependency: Refer to: r3925

r3927[0...n] Motor data identification control word / MotID STW

VECTOR, VECTOR_AC, VECTOR_I_AC	Can be changed: -	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Successfully completed component of the last motor data identification carried out.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Stator inductance estimate no measurement	Yes	No	-
	01	Cl.-loop current control w/ dead-beat controller	Yes	No	-
	02	Rotor time constant estimate no measurement	Yes	No	-
	03	Leakage inductance estimate no measurement	Yes	No	-
	04	Activates the identification dynamic leakage inductance	Yes	No	-
	05	Determine Tr and Lsig evaluation in the time range	Yes	No	-
	06	Activate vibration damping	Yes	No	-
	07	Deactivate vibration detection	Yes	No	-
	11	Deactivate pulse measurement Lq Ld	Yes	No	-
	12	Deactivate rotor resistance Rr measurement	Yes	No	-
	14	Deactivate valve interlocking time measurement	Yes	No	-

15	Determine only stator resistance, valve voltage fault, dead time	Yes	No	-
16	Short motor identification (lower quality)	Yes	No	-
17	Measurement without control parameter calculation	Yes	No	-
18	After motID direct transition into operation	Yes	No	-
19	After MotID automatically save results	Yes	No	-
20	Estimate cable resistance	Yes	No	-
21	Calibrate output voltage measurement	Yes	No	-
22	Only identify circle	Yes	No	-
23	Deactivate circle identification	Yes	No	-
24	Circle identification with 0 and 90 degrees	Yes	No	-
25	Deactivate gating unit switchover	Yes	No	-

Dependency: Refer to: r3925

Note: The parameter is a copy of p1909.

r3928[0...n] Motor data identification synchronous motor data determined / Motld PMSM dat det

SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Successfully completed component of the last rotating measurement carried out.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	p0350 accepted	Yes	No	-
	02	p0356 accepted	Yes	No	-
	06	p0410 accepted	Yes	No	-
	07	p0431 accepted	Yes	No	-
	08	p1952 accepted	Yes	No	-
	09	p1953 accepted	Yes	No	-
	10	p1954 accepted	Yes	No	-
	12	p1715 accepted	Yes	No	-
	13	p1717 accepted	Yes	No	-
	18	p0316 accepted	Yes	No	-
	19	p0317 accepted	Yes	No	-
	20	p0327 accepted	Yes	No	-
	21	p0328 accepted	Yes	No	-
	22	p0341 accepted	Yes	No	-
	23	KT characteristic parameter accepted	Yes	No	-
	24	p0348 accepted	Yes	No	-
	26	p5265 - p5268 accepted	Yes	No	-
	27	p0391 - p0393 accepted	Yes	No	-
	28	p2980 - p2983 accepted	Yes	No	-

Dependency: Refer to: r3925

r3928[0...n] Rotating measurement configuration / Rot meas config

VECTOR (n/M), VECTOR_AC (n/M), VECTOR_I_AC (n/M)	Can be changed: -	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor identification	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Successfully completed component of the last rotating measurement carried out.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Encoder test active	Yes	No	-
	01	Saturation characteristic identification	Yes	No	-
	02	Moment of inertia identification	Yes	No	-

2 Parameters

2.2 List of parameters

03	Re-calculates the speed controller parameters	Yes	No	-
04	Speed controller optimization (vibration test)	Yes	No	-
05	q leakage inductance ident. (for current controller adaptation)	Yes	No	-
11	Do not change the controller parameters during the measurement	Yes	No	-
12	Measurement shortened	Yes	No	-
13	After measurement direct transition into operation	Yes	No	-
14	Calculate speed actual value smoothing time	Yes	No	-

Dependency: Refer to: r3925

Note: The parameter is a copy of p1959.

p3940[0...n]

Motor/controller data calculation / Mot/ctrl_data calc

SERVO, VECTOR,
SERVO_AC,
VECTOR_AC,
SERVO_I_AC,
VECTOR_I_AC

Can be changed: T

Data type: Integer16

P-Group: All groups

Not for motor type: -

Min

0

Calculated: -

Description:

For service personnel only.

p3961

Fan operating hours counter / Fan op hr counter

CU_S_AC_DP,
CU_S_AC_PN

Can be changed: T

Data type: FloatingPoint32

P-Group: Displays, signals

Not for motor type: -

Min

0.000 [h]

Calculated: -

Dyn. index: -

Unit group: -

Scaling: -

Max

340.28235E36 [h]

Access level: 3

Func. diagram: -

Unit selection: -

Expert list: 1

Factory setting

0.000 [h]

Description:

Displays the measured operating hours since the last fan replacement.

r3974	Drive unit status word / Drv_unit ZSW		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displays the status word for the drive unit.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Software reset active	Yes	No	-
	01	Writing of parameters disabled as parameter save in progress	Yes	No	-
	02	Writing of parameters disabled as macro is running	Yes	No	-

r3977	BICO counter topology / BICO counter topo		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Commands Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displays the BICO interconnections that have been parameterized in the complete (overall) topology. The counter is incremented by one for each modified BICO interconnection.

Dependency: Refer to: r3978, r3979

r3978	BICO CounterDevice / BICO CounterDevice		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Commands Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displays the counter reading for modified BICO interconnections on this device. The counter is incremented by one for each modified BICO interconnection.

r3979	BICO counter drive object / BICO counter DO		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM31, TM41, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB, CU_LINK	Can be changed: - Data type: Unsigned32 P-Group: Commands Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Description: Displays the counter reading for modified BICO interconnections on this drive object. The counter is incremented by one for each modified BICO interconnection.

2 Parameters

2.2 List of parameters

p3981	Acknowledge drive object faults / Ackn DO faults		
All objects	Can be changed: U, T Data type: Unsigned8 P-Group: Messages Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 2 Func. diagram: 8060 Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to acknowledge all active faults of a drive object.		
Notice:	Safety messages cannot be acknowledged using this parameter.		
Note:	Parameter should be set from 0 to 1 to acknowledge. After acknowledgment, the parameter is automatically reset to 0.		
<hr/>			
p3985	Master control mode selection / PcCtrl mode select		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF	Can be changed: U, T Data type: Integer16 P-Group: Setpoints Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the mode to change over the master control / LOCAL mode.		
Value:	0: Change master control for STW1.0 = 0 1: Change master control in operation		
Danger:	When changing the master control in operation, the drive can manifest undesirable behavior - e.g. it can accelerate up to another setpoint.		
			
<hr/>			
r3986	Number of parameters / Par count		
All objects	Can be changed: - Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the number of parameters for this drive unit. The number comprises the device-specific and the drive-specific parameters.		
Dependency:	Refer to: r0980, r0981, r0989		
<hr/>			
r3988[0...1]	Boot state / Boot_state		
CU_I, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10800	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Index 0: Displays the boot state. Index 1: Displays the partial boot state.		

Value:	0:	Not active
	1:	Fatal fault
	10:	Fault
	20:	Reset all parameters
	30:	Drive object modified
	40:	Download using the commissioning tool
	50:	Parameter download using commissioning tool
	90:	Reset Control Unit and delete drive objects
	100:	Start initialization
	101:	Wait for topology input
	110:	Instantiate Control Unit basis
	111:	Insert drive object
	112:	Remove drive object
	113:	Change drive object number
	114:	Change component number
	115:	Parameter download using commissioning tool
	117:	Remove component
	150:	Wait until actual topology determined
	160:	Evaluate topology
	170:	Instantiate Control Unit reset
	180:	Initialization YDB configuration information
	190:	FW update for CU LINK slaves
	200:	First commissioning
	210:	Generate drive packages
	250:	Wait for topology acknowledge
	325:	Wait for input of drive type
	350:	Determine drive type
	360:	Write into topology-dependent parameters
	370:	Wait until p0009 = 0 is set
	380:	Check topology
	550:	Call conversion functions for parameter
	625:	Wait non-cyclic starting DRIVE-CLiQ
	650:	Start cyclic operation
	660:	Evaluate drive commissioning status
	670:	Automatic FW update DRIVE-CLiQ components
	680:	Wait for CU LINK slaves
	690:	Wait non-cyclic starting DRIVE-CLiQ
	700:	Save parameters
	725:	Wait until DRIVE-CLiQ cyclic
	740:	Check the ability to operate
	745:	Start of the time slices
	750:	Interrupt enable
	800:	Initialization finished
	10050:	Wait for synchronization
	10100:	Wait for CU LINK slaves
	10150:	Wait until actual topology determined
	10200:	Evaluate component status
	10250:	Call conversion functions for parameter
	10300:	Preparation cyclic operation
	10350:	Automatic FW update DRIVE-CLiQ components
	10400:	Wait for slave properties
	10450:	Check CX/NX status
	10500:	Wait until DRIVE-CLiQ cyclic
	10550:	Carry out warm start
	10600:	Evaluate, encoder status
	10800:	Partial boot completed
Index:	[0]	= System
	[1]	= Partial boot

r3988[0...1]	Boot state / Boot_state		
CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP	Can be changed: - Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10800	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Index 0: Displays the boot state. Index 1: Displays the partial boot state.		
Value:	0: Not active 1: Fatal fault 10: Fault 20: Reset all parameters 30: Drive object modified 40: Download using the commissioning tool 50: Parameter download using commissioning tool 90: Reset Control Unit and delete drive objects 100: Start initialization 101: Wait for topology input 110: Instantiate Control Unit basis 111: Insert drive object 112: Remove drive object 113: Change drive object number 114: Change component number 115: Parameter download using commissioning tool 117: Remove component 150: Wait until actual topology determined 160: Evaluate topology 170: Instantiate Control Unit reset 180: Initialization YDB configuration information 200: First commissioning 210: Generate drive packages 250: Wait for topology acknowledge 325: Wait for input of drive type 350: Determine drive type 360: Write into topology-dependent parameters 370: Wait until p0009 = 0 is set 380: Check topology 550: Call conversion functions for parameter 625: Wait non-cyclic starting DRIVE-CLiQ 650: Start cyclic operation 660: Evaluate drive commissioning status 670: Automatic FW update DRIVE-CLiQ components 680: Wait for CU LINK slaves 690: Wait non-cyclic starting DRIVE-CLiQ 700: Save parameters 725: Wait until DRIVE-CLiQ cyclic 740: Check the ability to operate 745: Start of the time slices 750: Interrupt enable 800: Initialization finished 10050: Wait for synchronization 10100: Wait for CU LINK slaves 10150: Wait until actual topology determined 10200: Evaluate component status 10250: Call conversion functions for parameter 10300: Preparation cyclic operation 10350: Automatic FW update DRIVE-CLiQ components 10400: Wait for slave properties 10450: Check CX/NX status		

	10500: Wait until DRIVE-CLiQ cyclic
	10550: Carry out warm start
	10600: Evaluate, encoder status
	10800: Partial boot completed
Index:	[0] = System [1] = Partial boot

r3996[0...1]	Parameter write inhibit status / Par_write inhib st

	-	-	0

Description: Sets the signal source for terminal DI/DO 0 (X520.2) of Terminal Module 15 (TM15).

Note: Prerequisite: The DI/DO must be set as an output (p4028.0 = 1).

DI/DO: Bidirectional Digital Input/Output

2 Parameters

2.2 List of parameters

p4030	BI: TM31 signal source for terminal DO 0 / TM31 s_s DO 0		
TM31	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9549, 9556
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the digital output DO 0 (X542.1, X542.2, X542.3) of Terminal Module 31 (TM31). Digital output 0 of TM31 is a relay output. If the signal at the binector input p4030 is low, then terminal COM 0 (X542.2) is connected to NC 0 (X542.1). This connection also matches the mechanical quiescent setting of the relay. If the signal at the binector input p4030 is high, then terminal COM 0 (X542.2) is connected to NO 0 (X542.3).		
Note:	DO: Digital Output NC: Normally Closed contact NO: Normally Open contact

Description:	Sets the signal source for terminal DI/DO 11 (X541.5) of Terminal Module 31 (TM31).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.11 = 1). DI/DO: Bidirectional Digital Input/Output		

p4041	BI: TM41 signal source for terminal DI/DO 3 / TM41 s_s DI/DO 3		
TM41	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9662
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 3 (X521.4) of Terminal Module 41 (TM41).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.11 = 1). DI/DO: Bidirectional Digital Input/Output		

p4042	BI: TM15DI/DO signal source for terminal DI/DO 12 / TM15D s_s DI/DO 12		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9401
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 12 (X521.6) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.12 = 1). DI/DO: Bidirectional Digital Input/Output		

p4043	BI: TM15DI/DO signal source for terminal DI/DO 13 / TM15D s_s DI/DO 13		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9401
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 13 (X521.7) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.13 = 1). DI/DO: Bidirectional Digital Input/Output		

p4044	BI: TM15DI/DO signal source for terminal DI/DO 14 / TM15D s_s DI/DO 14			
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9401	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0	
Description:	Sets the signal source for terminal DI/DO 14 (X521.8) of Terminal Module 15 (TM15).			
Note:	Prerequisite: The DI/DO must be set as an output (p4028.14 = 1). DI/DO: Bidirectional Digital Input/Output			
p4045	BI: TM15DI/DO signal source for terminal DI/DO 15 / TM15D s_s DI/DO 15			
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9401	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0	
Description:	Sets the signal source for terminal DI/DO 15 (X521.9) of Terminal Module 15 (TM15).			
Note:	Prerequisite: The DI/DO must be set as an output (p4028.15 = 1). DI/DO: Bidirectional Digital Input/Output			
p4046	TM31 digital outputs limit current / TM31 DO limit curr			
TM31	Can be changed: T	Calculated: -	Access level: 2	
	Data type: Integer16	Dyn. index: -	Func. diagram: 9560	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	1	0	
Description:	Sets the limit for the total output voltage of terminals X541.1, X541.2, X541.3 and X541.4 (DI/DO 8 ... 11) of Terminal Module 31 (TM31).			
Value:	0: 0.1 A total current limit DI/DO 8 ... 11 1: 1.0 A total current limit DI/DO 8 ... 11			
Dependency:	Refer to: p4028			
Warning:	Since the sum of the output currents at terminals X541.1, X541.2, X541.3 and X541.4 is limited, an overcurrent or short circuit at one output terminal can cause a dip in the signal at the other terminals.			
				
r4047	Digital outputs status / DO status			
SERVO (Dig IO)	Can be changed: -	Calculated: -	Access level: 1	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 2201	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays the status of digital outputs.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	DI/DO 0 distributed (X3.2)	High	Low
	01	DI/DO 1 distributed (X3.4)	High	Low
Note:	Inversion using p4048 has been taken into account. DI/DO: Bidirectional Digital Input/Output			

r4047 **TM15DI/DO digital outputs status / TM15D DO status**

TM15DI_DO	Can be changed: -	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9400, 9401, 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the status of the digital outputs of Terminal Module 15 (TM15).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 (X520.2)	High	Low	-
	01	DI/DO 1 (X520.3)	High	Low	-
	02	DI/DO 2 (X520.4)	High	Low	-
	03	DI/DO 3 (X520.5)	High	Low	-
	04	DI/DO 4 (X520.6)	High	Low	-
	05	DI/DO 5 (X520.7)	High	Low	-
	06	DI/DO 6 (X520.8)	High	Low	-
	07	DI/DO 7 (X520.9)	High	Low	-
	08	DI/DO 8 (X521.2)	High	Low	-
	09	DI/DO 9 (X521.3)	High	Low	-
	10	DI/DO 10 (X521.4)	High	Low	-
	11	DI/DO 11 (X521.5)	High	Low	-
	12	DI/DO 12 (X521.6)	High	Low	-
	13	DI/DO 13 (X521.7)	High	Low	-
	14	DI/DO 14 (X521.8)	High	Low	-
	15	DI/DO 15 (X521.9)	High	Low	-
	16	DI/DO 16 (X522.2)	High	Low	-
	17	DI/DO 17 (X522.3)	High	Low	-
	18	DI/DO 18 (X522.4)	High	Low	-
	19	DI/DO 19 (X522.5)	High	Low	-
	20	DI/DO 20 (X522.6)	High	Low	-
	21	DI/DO 21 (X522.7)	High	Low	-
	22	DI/DO 22 (X522.8)	High	Low	-
	23	DI/DO 23 (X522.9)	High	Low	-

Note: Inversion using p4048 has been taken into account.
 The setting of the DI/DO as either input or output is of no significance (p4028).
 DI/DO: Bidirectional Digital Input/Output

r4047 **TM31 digital outputs status / TM31 DO status**

TM31	Can be changed: -	Calculated: -	Access level: 1
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9556, 9560, 9562

p4056[0...1]		TM31 analog inputs type / TM31 AI type		
TM31	Can be changed: U, T Data type: Integer16 P-Group: Terminals Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5	Access level: 1 Func. diagram: 9566, 9568 Unit selection: - Expert list: 1 Factory setting 4	
Description:	Sets the type of analog inputs of Terminal Module 31 (TM31). p4056[x] = 0, 4 correspond to a voltage input (r4052, p4057, p4059 are displayed in V). p4056[x] = 2, 3, 5 correspond to a current input (r4052, p4057, p4059 are displayed in mA). In addition, the associated switch S5 must be appropriately set. AI 0: S5.0 = V --> voltage input, S5.0 = I --> current input (burden resistor = 250 Ohm) AI 1: S5.1 = V --> voltage input, S5.1 = I --> current input (burden resistor = 250 Ohm)			
Value:	0: Unipolar voltage input (0 V ... +10 V) 2: Unipolar current input (0 mA ... +20 mA) 3: Unipolar current input monitored (+4 mA to +20 mA) 4: Bipolar voltage input (-10 V ... +10 V) 5: Bipolar current input (-20 mA to +20 mA)			
Index:	[0] = AI 0 (X521.1/X521.2, S5.0) [1] = AI 1 (X521.3/X521.4, S5.1)			
Warning:	 The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V. For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.			
Notice:	For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set.			
Note:	When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values: For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %. For p4056 = 2, 5, p4057 is set to 0.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %. For p4056 = 3, p4057 is set to 4.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

	0	4	4
Description:	Sets the type of analog outputs of Terminal Module 31 (TM31). p4076[x] = 1, 4 correspond to a voltage output (p4074, p4078, p4080, p4083 are displayed in V). p4076[x] = 0, 2, 3 correspond to a current output (p4074, p4078, p4080, p4083 are displayed in mA).		
Value:	0: Current output (0 mA ... +20 mA) 1: Voltage output (0 V ... +10 V) 2: Current output (+4 mA ... +20 mA) 3: Current output (-20 mA ... +20 mA) 4: Voltage output (-10 V ... +10 V)		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
Dependency:	Refer to: p4077, p4078, p4079, p4080		
Note:	When changing p4076, the parameters of the scaling characteristic (p4077, p4078, p4079, p4080) are overwritten with the following default values: For p4076 = 0, 3, p4077 is set to 0.0 %, p4078 to 0.0 mA, p4079 to 100.0 % and p4080 to 20.0 mA. For p4076 = 1, 4, p4077 is set to 0.0 %, p4078 to 0.0 V, p4079 to 100.0 % and p4080 to 10.0 V. For p4076 = 2, p4077 is set to 0.0 %, p4078 to 4.0 mA, p4079 to 100.0 % and p4080 to 20.0 mA.		

2 Parameters

2.2 List of parameters

r4076[0...1]	TB30 analog outputs type / TB30 AO type		
TB30	Can be changed: - Data type: Integer16 P-Group: Terminals Not for motor type: - Min 4	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the type of analog outputs of the Terminal Board 30 (TB30).		
Value:	4: Voltage output (-10 V ... +10 V)		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
<hr/>			
p4077[0...1]	TM31 analog outputs characteristic value x1 / TM31 AO char x1		
TM31	Can be changed: U, T Data type: FloatingPoint32 P-Group: Terminals Not for motor type: - Min -1000.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [%]	Access level: 2 Func. diagram: 9572 Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Module 31 (TM31). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the x coordinate (percentage) of the 1st value pair of the characteristic.		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
Dependency:	Refer to: p4076		
Notice:	This parameter is automatically overwritten when changing p4076 (type of analog outputs).		
Note:	The parameters for the characteristic do not have a limiting effect.		
<hr/>			
p4077[0...1]	TB30 analog outputs characteristic value x1 / TB30 AO char x1		
TB30	Can be changed: U, T Data type: FloatingPoint32 P-Group: Terminals Not for motor type: - Min -1000.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000.00 [%]	Access level: 2 Func. diagram: 9106 Unit selection: - Expert list: 1 Factory setting 0.00 [%]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the x coordinate (percentage) of the 1st value pair of the characteristic.		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
Note:	The parameters for the characteristic do not have a limiting effect.		
<hr/>			
p4078[0...1]	TM31 analog outputs characteristic value y1 / TM31 AO char y1		
TM31	Can be changed: U, T Data type: FloatingPoint32 P-Group: Terminals Not for motor type: - Min -20.000	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 20.000	Access level: 2 Func. diagram: 9572 Unit selection: - Expert list: 1 Factory setting 0.000
Description:	Sets the scaling characteristic for the analog outputs of Terminal Module 31 (TM31). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the y coordinate (output voltage in V or output current in mA) of the 1st value pair of the characteristic.		

Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)
Dependency:	The unit of this parameter (V or mA) depends on the analog output type. Refer to: p4076
Notice:	This parameter is automatically overwritten when changing p4076 (type of analog outputs).
Note:	The parameters for the characteristic do not have a limiting effect.

p4078[0...1]	TB30 analog outputs characteristic value y1 / TB30 AO char y1		
TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9106
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-11.000 [V]	11.000 [V]	0.000 [V]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the y coordinate (output voltage in V) of the 1st value pair of the characteristic.		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
Note:	The parameters for the characteristic do not have a limiting effect.		

p4079[0...1]	TM31 analog outputs characteristic value x2 / TM31 AO char x2		
TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9572
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000.00 [%]	1000.00 [%]	100.00 [%]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Module 31 (TM31). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the x coordinate (percentage) of the 2nd value pair of the characteristic.		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
Dependency:	Refer to: p4076		
Notice:	This parameter is automatically overwritten when changing p4076 (type of analog outputs).		
Note:	The parameters for the characteristic do not have a limiting effect.		

p4079[0...1]	TB30 analog outputs characteristic value x2 / TB30 AO char x2		
TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9106
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000.00 [%]	1000.00 [%]	100.00 [%]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the x coordinate (percentage) of the 2nd value pair of the characteristic.		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
Note:	The parameters for the characteristic do not have a limiting effect.		

p4080[0...1]	TM31 analog outputs characteristic value y2 / TM31 AO char y2		
TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9572
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-20.000	20.000	10.000
Description:	Sets the scaling characteristic for the analog outputs of Terminal Module 31 (TM31). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the y coordinate (output voltage in V or output current in mA) of the 2nd value pair of the characteristic.		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
Dependency:	The unit of this parameter (V or mA) depends on the analog output type. Refer to: p4076		
Notice:	This parameter is automatically overwritten when changing p4076 (type of analog outputs).		
Note:	The parameters for the characteristic do not have a limiting effect.		
p4080[0...1]	TB30 analog outputs characteristic value y2 / TB30 AO char y2		
TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9106
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-11.000 [V]	11.000 [V]	10.000 [V]
Description:	Sets the scaling characteristic for the analog outputs of Terminal Board 30 (TB30). The scaling characteristic for the analog outputs is defined using 2 points. This parameter specifies the y coordinate (output voltage in V) of the 2nd value pair of the characteristic.		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
Note:	The parameters for the characteristic do not have a limiting effect.		
p4082[0...1]	BI: TM31 analog outputs invert signal source / TM31 AO inv s_s		
TM31	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9572
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to invert the analog output signals of Terminal Module 31 (TM31).		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
p4082[0...1]	BI: TB30 analog outputs invert signal source / TB30 AO inv s_s		
TB30	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9106
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for inverting the analog output signals of the Terminal Board 30 (TB30).		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		

p4083[0...1]	TM31 analog outputs offset / TM31 AO offset		
TM31	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9572
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-20.000	20.000	0.000
Description:	Sets the offset for the analog outputs of Terminal Module 31 (TM31). The offset is added to the output signal after the scaling characteristic.		
Index:	[0] = AO 0 (X522.1, X522.2, X522.3) [1] = AO 1 (X522.4, X522.5, X522.6)		
Dependency:	The unit of this parameter (V or mA) depends on the analog input type. Refer to: p4076		
Note:	This means, for example, the offset of a downstream isolating amplifier can be compensated.		
p4083[0...1]	TB30 analog outputs offset / TB30 AO offset		
TB30	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9106
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.000	10.000	0.000
Description:	Sets the offset for the analog outputs of Terminal Board 30 (TB30). The offset is added to the output signal after the scaling characteristic.		
Index:	[0] = AO 0 (X482.5/X482.6) [1] = AO 1 (X482.7/X482.8)		
p4086	BI: TM15DI/DO signal source for terminal DI/DO 16 / TM15D s_s DI/DO 16		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 16 (X522.2) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.16 = 1). DI/DO: Bidirectional Digital Input/Output		
p4087	BI: TM15DI/DO signal source for terminal DI/DO 17 / TM15D s_s DI/DO 17		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 17 (X522.3) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.17 = 1). DI/DO: Bidirectional Digital Input/Output		

2 Parameters

2.2 List of parameters

p4088	BI: TM15DI/DO signal source for terminal DI/DO 18 / TM15D s_s DI/DO 18		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 18 (X522.4) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.18 = 1). DI/DO: Bidirectional Digital Input/Output		

p4089	BI: TM15DI/DO signal source for terminal DI/DO 19 / TM15D s_s DI/DO 19		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 19 (X522.5) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.19 = 1). DI/DO: Bidirectional Digital Input/Output		

p4090	BI: TM15DI/DO signal source for terminal DI/DO 20 / TM15D s_s DI/DO 20		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 20 (X522.6) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.20 = 1). DI/DO: Bidirectional Digital Input/Output		

p4091	BI: TM15DI/DO signal source for terminal DI/DO 21 / TM15D s_s DI/DO 21		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 21 (X522.7) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.21 = 1). DI/DO: Bidirectional Digital Input/Output		

p4092	BI: TM15DI/DO signal source for terminal DI/DO 22 / TM15D s_s DI/DO 22		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 22 (X522.8) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.22 = 1). DI/DO: Bidirectional Digital Input/Output		

p4093	BI: TM15DI/DO signal source for terminal DI/DO 23 / TM15D s_s DI/DO 23		
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 9402
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for terminal DI/DO 23 (X522.9) of Terminal Module 15 (TM15).		
Note:	Prerequisite: The DI/DO must be set as an output (p4028.23 = 1). DI/DO: Bidirectional Digital Input/Output		

r4094.0...23	BO: TM15 digital inputs status inverted raw data internal / TM15 DI st raw dat		
TM15DI_DO	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the inverted status of the raw data of the digital inputs of the Terminal Module 15 (TM15).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 (X520.2)	High	Low	-
	01	DI/DO 1 (X520.3)	High	Low	-
	02	DI/DO 2 (X520.4)	High	Low	-
	03	DI/DO 3 (X520.5)	High	Low	-
	04	DI/DO 4 (X520.6)	High	Low	-
	05	DI/DO 5 (X520.7)	High	Low	-
	06	DI/DO 6 (X520.8)	High	Low	-
	07	DI/DO 7 (X520.9)	High	Low	-
	08	DI/DO 8 (X521.2)	High	Low	-
	09	DI/DO 9 (X521.3)	High	Low	-
	10	DI/DO 10 (X521.4)	High	Low	-
	11	DI/DO 11 (X521.5)	High	Low	-
	12	DI/DO 12 (X521.6)	High	Low	-
	13	DI/DO 13 (X521.7)	High	Low	-
	14	DI/DO 14 (X521.8)	High	Low	-
	15	DI/DO 15 (X521.9)	High	Low	-
	16	DI/DO 16 (X522.2)	High	Low	-
	17	DI/DO 17 (X522.3)	High	Low	-
	18	DI/DO 18 (X522.4)	High	Low	-
	19	DI/DO 19 (X522.5)	High	Low	-
	20	DI/DO 20 (X522.6)	High	Low	-
	21	DI/DO 21 (X522.7)	High	Low	-
	22	DI/DO 22 (X522.8)	High	Low	-
	23	DI/DO 23 (X522.9)	High	Low	-

2 Parameters

2.2 List of parameters

Notice: The raw data of the digital inputs is directly displayed (e.g. without any debounce).

Note: Should only used for internal Siemens purposes (alternative r4022, r4023).

p4095		S120M digital inputs simulation mode / S120M DI sim_mode			
SERVO (Dig IO)	Can be changed: U, T	Calculated: -	Access level: 2		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -		
	P-Group: Terminals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 bin		
Description:	Sets the simulation mode for digital inputs of the S120M.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 distributed (X3.2)	Simulation	Terminal eval	-
	01	DI/DO 1 distributed (X3.4)	Simulation	Terminal eval	-
Dependency:	The setpoint for the input signals is specified using p4096.				
	Refer to: p4096				
Note:	This parameter is not saved when data is backed-up (p0971, p0977).				
	DI: Digital Input				

p4095		TM15DI/DO digital inputs simulation mode / TM15D DI sim_mode			
TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 2		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9400, 9401, 9402		
	P-Group: Terminals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0000 0000 0000 0000 0000 0000 0000 bin		
Description:	Sets the simulation mode for the digital inputs of Terminal Module 15 (TM15).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 (X520.2)	Simulation	Terminal eval	-
	01	DI/DO 1 (X520.3)	Simulation	Terminal eval	-
	02	DI/DO 2 (X520.4)	Simulation	Terminal eval	-
	03	DI/DO 3 (X520.5)	Simulation	Terminal eval	-
	04	DI/DO 4 (X520.6)	Simulation	Terminal eval	-
	05	DI/DO 5 (X520.7)	Simulation	Terminal eval	-
	06	DI/DO 6 (X520.8)	Simulation	Terminal eval	-
	07	DI/DO 7 (X520.9)	Simulation	Terminal eval	-
	08	DI/DO 8 (X521.2)	Simulation	Terminal eval	-
	09	DI/DO 9 (X521.3)	Simulation	Terminal eval	-
	10	DI/DO 10 (X521.4)	Simulation	Terminal eval	-
	11	DI/DO 11 (X521.5)	Simulation	Terminal eval	-
	12	DI/DO 12 (X521.6)	Simulation	Terminal eval	-
	13	DI/DO 13 (X521.7)	Simulation	Terminal eval	-
	14	DI/DO 14 (X521.8)	Simulation	Terminal eval	-
	15	DI/DO 15 (X521.9)	Simulation	Terminal eval	-
	16	DI/DO 16 (X522.2)	Simulation	Terminal eval	-
	17	DI/DO 17 (X522.3)	Simulation	Terminal eval	-
	18	DI/DO 18 (X522.4)	Simulation	Terminal eval	-
	19	DI/DO 19 (X522.5)	Simulation	Terminal eval	-
	20	DI/DO 20 (X522.6)	Simulation	Terminal eval	-
	21	DI/DO 21 (X522.7)	Simulation	Terminal eval	-
	22	DI/DO 22 (X522.8)	Simulation	Terminal eval	-
	23	DI/DO 23 (X522.9)	Simulation	Terminal eval	-

Dependency: The setpoint for the input signals is specified using p4096.

Refer to: p4096

Warning:

A drive that is moved by simulating the inputs of a Terminal Module is brought to a standstill while the Terminal Module is being activated or deactivated.

Note: This parameter is not saved when data is backed-up (p0971, p0977).
DI/DO: Bidirectional Digital Input/Output

p4095 TM31 digital inputs simulation mode / TM31 DI sim_mode

TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9549, 9550, 9552, 9560, 9562
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 bin

Description: Sets the simulation mode for the digital inputs of Terminal Module 31 (TM31).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI 0 (X520.1)	Simulation	Terminal eval	-
	01	DI 1 (X520.2)	Simulation	Terminal eval	-
	02	DI 2 (X520.3)	Simulation	Terminal eval	-
	03	DI 3 (X520.4)	Simulation	Terminal eval	-
	04	DI 4 (X530.1)	Simulation	Terminal eval	-
	05	DI 5 (X530.2)	Simulation	Terminal eval	-
	06	DI 6 (X530.3)	Simulation	Terminal eval	-
	07	DI 7 (X530.4)	Simulation	Terminal eval	-
	08	DI/DO 8 (X541.2)	Simulation	Terminal eval	-
	09	DI/DO 9 (X541.3)	Simulation	Terminal eval	-
	10	DI/DO 10 (X541.4)	Simulation	Terminal eval	-
	11	DI/DO 11 (X541.5)	Simulation	Terminal eval	-

Dependency: The setpoint for the input signals is specified using p4096.
Refer to: p4096

Warning: A drive that is moved by simulating the inputs of a Terminal Module is brought to a standstill while the Terminal Module is being activated or deactivated.

Note: This parameter is not saved when data is backed-up (p0971, p0977).
DI: Digital Input
DI/DO: Bidirectional Digital Input/Output

p4095 TM41 digital inputs simulation mode / TM41 DI sim_mode

TM41	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 bin

Description: Sets the simulation mode for the digital inputs of Terminal Module 41 (TM41).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI 0 (X522.1)	Simulation	Terminal eval	9660
	01	DI 1 (X522.2)	Simulation	Terminal eval	9660
	02	DI 2 (X522.3)	Simulation	Terminal eval	9660
	03	DI 3 (X522.4)	Simulation	Terminal eval	9660
	08	DI/DO 0 (X521.1)	Simulation	Terminal eval	9661
	09	DI/DO 1 (X521.2)	Simulation	Terminal eval	9661
	10	DI/DO 2 (X521.3)	Simulation	Terminal eval	9662
	11	DI/DO 3 (X521.4)	Simulation	Terminal eval	9662

Dependency: The setpoint for the input signals is specified using p4096.
Refer to: p4096

Warning: A drive that is moved by simulating the inputs of a Terminal Module is brought to a standstill while the Terminal Module is being activated or deactivated.

2 Parameters

2.2 List of parameters

Note: This parameter is not saved when data is backed-up (p0971, p0977).
 DI: Digital Input
 DI/DO: Bidirectional Digital Input/Output

p4095 TB30 digital inputs simulation mode / TB30 DI sim_mode

TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9099, 9100
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 bin

Description: Sets the simulation mode for the digital inputs of the Terminal Board 30 (TB30).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI 0 (X481.1)	Simulation	Terminal eval	-
	01	DI 1 (X481.2)	Simulation	Terminal eval	-
	02	DI 2 (X481.3)	Simulation	Terminal eval	-
	03	DI 3 (X481.4)	Simulation	Terminal eval	-

Dependency: The setpoint for the input signals is specified using p4096.
 Refer to: p4096

Warning: A drive that is moved by simulating the inputs of a Terminal Board is brought to a standstill while the Terminal Module is being activated or deactivated.

Note: This parameter is not saved when data is backed-up (p0971, p0977).
 DI: Digital Input

p4096 S120M digital inputs simulation mode setpoint / S120M DI sim set

SERVO (Dig IO)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 bin

Description: Sets the setpoint for the input signals in the digital input simulation mode of the S120M.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 distributed (X3.2)	High	Low	2201
	01	DI/DO 1 distributed (X3.4)	High	Low	2201

Dependency: The simulation of a digital input is selected using p4095.
 Refer to: p4095

Note: This parameter is not saved when data is backed-up (p0971, p0977).
 DI: Digital Input

p4096 TM15DI/DO digital inputs simulation mode, setpoint / TM15D DI sim set

TM15DI_DO	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9400, 9401, 9402
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 0000 0000 0000 0000 bin

Description: Sets the setpoint for the input signals in the simulation mode of the digital inputs of Terminal Module 15 (TM15).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI/DO 0 (X520.2)	High	Low	-
	01	DI/DO 1 (X520.3)	High	Low	-
	02	DI/DO 2 (X520.4)	High	Low	-

03	DI/DO 3 (X520.5)	High	Low	-
04	DI/DO 4 (X520.6)	High	Low	-
05	DI/DO 5 (X520.7)	High	Low	-
06	DI/DO 6 (X520.8)	High	Low	-
07	DI/DO 7 (X520.9)	High	Low	-
08	DI/DO 8 (X521.2)	High	Low	-
09	DI/DO 9 (X521.3)	High	Low	-
10	DI/DO 10 (X521.4)	High	Low	-
11	DI/DO 11 (X521.5)	High	Low	-
12	DI/DO 12 (X521.6)	High	Low	-
13	DI/DO 13 (X521.7)	High	Low	-
14	DI/DO 14 (X521.8)	High	Low	-
15	DI/DO 15 (X521.9)	High	Low	-
16	DI/DO 16 (X522.2)	High	Low	-
17	DI/DO 17 (X522.3)	High	Low	-
18	DI/DO 18 (X522.4)	High	Low	-
19	DI/DO 19 (X522.5)	High	Low	-
20	DI/DO 20 (X522.6)	High	Low	-
21	DI/DO 21 (X522.7)	High	Low	-
22	DI/DO 22 (X522.8)	High	Low	-
23	DI/DO 23 (X522.9)	High	Low	-

Dependency: The simulation of a digital input is selected using p4095.
Refer to: p4095

Note: This parameter is not saved when data is backed-up (p0971, p0977).
DI/DO: Bidirectional Digital Input/Output

p4096**TM31 digital inputs simulation mode setpoint / TM31 DI sim set**

TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9549, 9550, 9552, 9560, 9562
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 bin

Description: Sets the setpoint for the input signals in the simulation mode of the digital inputs of Terminal Module 31 (TM31).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	DI 0 (X520.1)	High	Low	-
	01	DI 1 (X520.2)	High	Low	-
	02	DI 2 (X520.3)	High	Low	-
	03	DI 3 (X520.4)	High	Low	-
	04	DI 4 (X530.1)	High	Low	-
	05	DI 5 (X530.2)	High	Low	-
	06	DI 6 (X530.3)	High	Low	-
	07	DI 7 (X530.4)	High	Low	-
	08	DI/DO 8 (X541.2)	High	Low	-
	09	DI/DO 9 (X541.3)	High	Low	-
	10	DI/DO 10 (X541.4)	High	Low	-
	11	DI/DO 11 (X541.5)	High	Low	-

Dependency: The simulation of a digital input is selected using p4095.
Refer to: p4095

Note: This parameter is not saved when data is backed-up (p0971, p0977).
DI: Digital Input
DI/DO: Bidirectional Digital Input/Output

p4096 TM41 digital inputs simulation mode setpoint / TM41 DI sim set

TM41	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 0000 0000 bin

Description: Sets the setpoint for the input signals in the simulation mode of the digital inputs of Terminal Module 41 (TM41).

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	DI 0 (X522.1)	High	Low	9660
01	DI 1 (X522.2)	High	Low	9660
02	DI 2 (X522.3)	High	Low	9660
03	DI 3 (X522.4)	High	Low	9660
08	DI/DO 0 (X521.1)	High	Low	9661
09	DI/DO 1 (X521.2)	High	Low	9661
10	DI/DO 2 (X521.3)	High	Low	9662
11	DI/DO 3 (X521.4)	High	Low	9662

Dependency: The simulation of a digital input is selected using p4095.

Refer to: p4095

Note: This parameter is not saved when data is backed-up (p0971, p0977).

DI: Digital Input

DI/DO: Bidirectional Digital Input/Output

p4096 TB30 digital inputs simulation mode setpoint / TB30 DI sim set

TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9099, 9100
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 bin

Description: Sets the setpoint for the input signals in the simulation mode of the digital inputs of the Terminal Board 30 (TB30).

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	DI 0 (X481.1)	High	Low	-
01	DI 1 (X481.2)	High	Low	-
02	DI 2 (X481.3)	High	Low	-
03	DI 3 (X481.4)	High	Low	-

Dependency: The simulation of a digital input is selected using p4095.

Refer to: p4095

Note: This parameter is not saved when data is backed-up (p0971, p0977).

DI: Digital Input

p4097[0...1] TM31 analog inputs simulation mode / TM31 AI sim_mode

TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: 9566, 9568
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Sets the simulation mode for the analog inputs of Terminal Module 31 (TM31).

Value: 0: Terminal evaluation for analog input x

1: Simulation for analog input x

Index: [0] = AI 0 (X521.1/X521.2, S5.0)

[1] = AI 1 (X521.3/X521.4, S5.1)

Dependency: The setpoint for the input voltage is specified via p4098.
Refer to: p4098

Note: This parameter is not saved when data is backed-up (p0971, p0977).
AI: Analog Input

p4097[0] TM41 analog input simulation mode / TM41 AI sim_mode

TM41	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: 9663
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Sets the simulation mode for the analog input of Terminal Module 41 (TM41).

Value: 0: Terminal evaluation for analog input x
1: Simulation for analog input x

Index: [0] = AI 0 (X523.1/X523.2)

Dependency: The setpoint for the input voltage is specified via p4098.
Refer to: p4098

Note: This parameter is not saved when data is backed-up (p0971, p0977).
AI: Analog Input

p4097[0...1] TB30 analog inputs simulation mode / TB30 AI sim_mode

TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: 9104
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Sets the simulation mode for the analog inputs of the Terminal Board 30 (TB30).

Value: 0: Terminal evaluation for analog input x
1: Simulation for analog input x

Index: [0] = AI 0 (X482.1/X482.2)
[1] = AI 1 (X482.3/X482.4)

Dependency: The setpoint for the input voltage is specified via p4098.
Refer to: p4098

Note: This parameter is not saved when data is backed-up (p0971, p0977).
AI: Analog Input

p4098[0...1] TM31 analog inputs simulation mode setpoint / TM31 AI sim set

TM31	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9566, 9568
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-20.000	20.000	0.000

Description: Sets the setpoint for the input value in simulation mode of the analog inputs of Terminal Module 31 (TM31).

Index: [0] = AI 0 (X521.1/X521.2, S5.0)
[1] = AI 1 (X521.3/X521.4, S5.1)

Dependency: The simulation of an analog input is selected using p4097.
If AI x is parameterized as voltage input (p4056), then the setpoint is a voltage in V.
If AI x is parameterized as current input (p4056), then the setpoint is a current in mA.
Refer to: p4056, p4097

Note: This parameter is not saved when data is backed-up (p0971, p0977).
AI: Analog Input

p4098[0]	TM41 analog input simulation mode setpoint / TM41 AI sim set		
TM41	Can be changed: U, T	Calculated: -	Access level: 2

	Min	Max	Factory setting
	-20.000 [V]	20.000 [V]	0.000 [V]
Description:	Sets the setpoint for the input value in simulation mode of the analog input of Terminal Module 41 (TM41).		
Index:	[0] = AI 0 (X523.1/X523.2)		
Dependency:	The simulation of the analog input is selected using p4097. If AI x is parameterized as voltage input (p4056), then the setpoint is a voltage in V. If AI x is parameterized as current input (p4056), then the setpoint is a current in mA. Refer to: p4097		
Note:	This parameter is not saved when data is backed-up (p0971, p0977). AI: Analog Input		
p4098[0...1]	TB30 analog inputs simulation mode setpoint / TB30 AI sim set		
TB30	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9104
	P-Group: Terminals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-11.000 [V]	11.000 [V]	0.000 [V]
Description:	Sets the setpoint for the input voltage in the simulation mode of the analog inputs of Terminal Board 30 (TB30).		
Index:	[0] = AI 0 (X482.1/X482.2) [1] = AI 1 (X482.3/X482.4)		
Dependency:	The simulation of an analog input is selected using p4097. Refer to: p4097		
Note:	This parameter is not saved when data is backed-up (p0971, p0977). AI: Analog Input		
p4099	Inputs/outputs sampling time / I/O t_samp		
SERVO (Dig IO)	Can be changed: C1(3)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Commands	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	125.00 [µs]	5000.00 [µs]	4000.00 [µs]
Description:	Sets the sampling time for the inputs and outputs.		
Dependency:	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the SERVO clock cycle (p0115). Refer to: p0009		
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).		

p4099	TM15 inputs/outputs sampling time / TM15 I/O t_samp		
TM15	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 31.25 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 500.00 [µs]	Access level: 3 Func. diagram: 9389 Unit selection: - Expert list: 1 Factory setting 125.00 [µs]
Description:	The sampling time of the Terminal Module 15 (TM15) is determined by the DRIVE-CLiQ clock cycle of the line to which the component is attached. It is not possible to specify this using p4099. When switching on, parameter p4099 is correctly set to the resulting sampling time.		
p4099	TM15DI/DO inputs/outputs sampling time / TM15D I/O t_samp		
TM15DI_DO	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5000.00 [µs]	Access level: 3 Func. diagram: 9399, 9400 Unit selection: - Expert list: 1 Factory setting 4000.00 [µs]
Description:	Sets the sampling time for the inputs and outputs of Terminal Module 15 (TM15).		
Dependency:	The parameter can only be modified for p0009 = 3, 29. The following applies for the sampling time: The sampling times at a DRIVE-CLiQ line must be integral multiples of one another. The sampling times of this TM must be an integral multiple of a servo or vector drive that exists in the system. The minimum permissible sampling time is 125 µs. Refer to: p0009, r0110, r0111		
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). Parameter p4099[0] must never be equal to zero.		
p4099	TM17 inputs/outputs sampling time / TM17 I/O t_samp		
TM17	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 31.25 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 500.00 [µs]	Access level: 3 Func. diagram: 9419 Unit selection: - Expert list: 1 Factory setting 125.00 [µs]
Description:	The sampling time of the Terminal Module 17 (TM17) is determined by the DRIVE-CLiQ clock cycle of the line to which the component is attached. It is not possible to specify this using p4099. When switching on, parameter p4099 is correctly set to the resulting sampling time.		
p4099[0...2]	TM31 inputs/outputs sampling time / TM31 I/O t_samp		
TM31	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5000.00 [µs]	Access level: 3 Func. diagram: 9549, 9550 Unit selection: - Expert list: 1 Factory setting 4000.00 [µs]
Description:	Sets the sampling time for the inputs and outputs of Terminal Module 31 (TM31).		
Index:	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)		

2 Parameters

2.2 List of parameters

- Dependency:** The parameter can only be modified for p0009 = 3, 29.
The following applies for the sampling time:
The sampling times at a DRIVE-CLiQ line must be integral multiples of one another.
The sampling times of this TM must be an integral multiple of a servo or vector drive that exists in the system.
The minimum permissible sampling time for index 0 (digital inputs/outputs) is 125 µs.
The minimum permissible sampling time for index 1 (analog inputs) and index 2 (analog outputs) is 62.5 µs.
The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).
Refer to: p0009, r0110, r0111
- Notice:** The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).
- Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).
Parameter p4099[0] must never be equal to zero.

p4099[0...3]	TM41 inputs/outputs sampling time / TM41 I/O t _{samp}		
TM41	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5000.00 [µs]	Access level: 3 Func. diagram: 9659, 9660 Unit selection: - Expert list: 1 Factory setting [0] 4000.00 [µs] [1] 4000.00 [µs] [2] 0.00 [µs] [3] 125.00 [µs]
Description:	Sets the sampling time for the inputs and outputs of Terminal Module 41 (TM41).		
Index:	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Not present [3] = Incremental encoder emulation		
Dependency:	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the DRIVE-CLiQ clock cycle. The minimum permissible sampling time for index 0 (digital inputs/outputs) is 125 µs. The minimum permissible sampling time for index 1 (analog inputs) is 62.5 µs. Refer to: p0009, r0110, r0111 Refer to: A35228		
Note:	The value of the sampling time of the incremental encoder emulation p4099[3] can be pre-set in both operating modes (p4400). The next time that the system boots, the validity of the value is checked. For an invalid value, message F35228 and/or A01223 is output. The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). The sampling time of a TM41 in the SINAMICS mode (p4400 = 1) must be the same as that of the emulated encoder. The sampling time of a TM41 in the SIMOTION mode (p4400 = 0) is determined by the topology used		

p4099[0...2]	TB30 inputs/outputs sampling time / TB30 I/O t _{samp}		
TB30	Can be changed: C1(3) Data type: FloatingPoint32 P-Group: Commands Not for motor type: - Min 0.00 [µs]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5000.00 [µs]	Access level: 3 Func. diagram: 9099, 9100 Unit selection: - Expert list: 1 Factory setting [0] 4000.00 [µs] [1] 4000.00 [µs] [2] 4000.00 [µs]
Description:	Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).		
Index:	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)		

Dependency: The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the lowest basic sampling time (r0110[0]).
Refer to: p0009, r0110, r0111

Note: The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).
For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. analog/digital converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is switched off. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

p4100	Spindle supplementary temperature sensor type / Sup_temp sens type		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	6	0

Description: Sets the sensor type to evaluate the spindle supplementary temperature.

Value:
0: Evaluation disabled
2: KTY84
6: PT1000

Dependency: Refer to: p4102, p4103, r4104, r4105, r4107

p4100[0...3]	TM120 temperature evaluation, sensor type / TM120 sensor type		
TM120	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: 9605, 9606
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	6	1

Description: Sets the sensor type for temperature evaluation via Terminal Module 120 (TM120).
This means that the temperature sensor type is selected and the evaluation is switched in.

Value:
0: Evaluation disabled
1: PTC thermistor
2: KTY84
4: Bimetallic NC contact
6: PT1000

Index:
[0] = Temperature channel 0
[1] = Temperature channel 1
[2] = Temperature channel 2
[3] = Temperature channel 3

Notice: For p4102[0...7] = 251 °C, evaluation of the corresponding threshold is deactivated.
For sensor type "PTC thermistor" (p4100[0...3] = 1), the following applies:
To activate the corresponding alarm or fault, p4102[0...7] must be set <= 250 °C.

Note: The temperature sensors are connected to the following terminals:
X521.2(+) and X521.1(-) = channel 0
X521.4(+) and X521.3(-) = channel 1
X521.6(+) and X521.5(-) = channel 2
X521.8(+) and X521.7(-) = channel 3

p4100[0...11]		TM150 sensor type / TM150 sensor type	
TM150	Can be changed: T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6	Access level: 1 Func. diagram: 9626, 9627 Unit selection: - Expert list: 1 Factory setting 5
Description:	Sets the sensor type for Terminal Module 150 (TM150) This means that the temperature sensor type is selected and the evaluation is switched in.		
Value:	0: Evaluation disabled 1: PTC thermistor 2: KTY84 4: Bimetallic NC contact 5: PT100 6: PT1000		
Index:	[0] = Temperature channel 0 [1] = Temperature channel 1 [2] = Temperature channel 2 [3] = Temperature channel 3 [4] = Temperature channel 4 [5] = Temperature channel 5 [6] = Temperature channel 6 [7] = Temperature channel 7 [8] = Temperature channel 8 [9] = Temperature channel 9 [10] = Temperature channel 10 [11] = Temperature channel 11		
Notice:	For p4102[0...23] = 251 °C, evaluation of the corresponding threshold is deactivated. For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies: To activate the corresponding alarm or fault, p4102[0...23] must be set <= 250 °C.		
Note:	The temperature sensors are connected to the following terminals: X531 = channel 0 (for 2x2 wire evaluation, additionally channel 6) X532 = channel 1 (for 2x2 wire evaluation, additionally channel 7) X533 = channel 2 (for 2x2 wire evaluation, additionally channel 8) X534 = channel 3 (for 2x2 wire evaluation, additionally channel 9) X535 = channel 4 (for 2x2 wire evaluation, additionally channel 10) X536 = channel 5 (for 2x2 wire evaluation, additionally channel 11) Details on the wiring are included in the parameter description for p4108.		

p4100		TM31 sensor type / TM31 sensor type	
TM31	Can be changed: T Data type: Integer16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6	Access level: 1 Func. diagram: 9576 Unit selection: - Expert list: 1 Factory setting 0

0.000 [ms]

Description:

Sets the delay time for the output of the fault for the Terminal Module 31 (TM31).
 The timer is started when the alarm threshold (p4102[0]) is exceeded.
 If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F35207 is output.
 The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.
 For sensor type "KTY84" "PT1000" (p4100 = 2, 6), the following applies:
 If the fault threshold (p4102[1]) is exceeded before the delay time has expired, then fault F35207 is immediately output.
 For sensor type "PTC thermistor" (p4100 = 1), the following applies:
 - Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

Dependency:

Refer to: r4104

Warning:

Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

Note:

With p4103 = 0, the timer is deactivated and only the fault threshold is effective.

	0	3	1
Description:	Sets the measuring method for the terminal block X531 ... X536 for the Terminal Module 150 (TM150). For p4108[0...5] = 0 (1x2 wire evaluation): - the temperature sensor is connected at terminals 1(+) and 2(-). For p4108[0...5] = 1 (2x2 wire evaluation): - the first temperature sensor is connected at terminals 1(+) and 2(-). - the second temperature sensor is connected at terminals 3(+) and 4(-). For p4108[0...5] = 2 (3 wire evaluation): - the temperature sensor is connected at terminals 3(+) and 4(-). - the measuring conductor is connected at terminal 1(+). - terminals 2(-) and 4(-) must be jumpered. For p4108[0...5] = 3 (4 wire evaluation): - the temperature sensor is connected at terminals 3(+) and 4(-). - the measuring conductor is connected at terminals 1(+) and 2(-).		
Value:	0: 1x2 wire evaluation 1: 2x2 wire evaluation 2: 3 wire evaluation 3: 4 wire evaluation		
Index:	[0] = X531 [1] = X532 [2] = X533 [3] = X534 [4] = X535 [5] = X536		

2 Parameters

2.2 List of parameters

Note: The temperature sensors are connected to the following terminals:
X531 = channel 0 (for 2x2 wire evaluation, additionally channel 6)
X532 = channel 1 (for 2x2 wire evaluation, additionally channel 7)
X533 = channel 2 (for 2x2 wire evaluation, additionally channel 8)
X534 = channel 3 (for 2x2 wire evaluation, additionally channel 9)
X535 = channel 4 (for 2x2 wire evaluation, additionally channel 10)
X536 = channel 5 (for 2x2 wire evaluation, additionally channel 11)
For p4108[0...5] = 0, 2, 3 (1x2, 3, 4 wire evaluation):
The temperature channel belonging to the terminal block with the higher number is automatically deactivated (e.g. for X531 with 3-wire evaluation, channel 6 is deactivated).

p4109[0...11]	TM150 wire resistance measurement / TM150 R_wire meas		
TM150	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: 9626, 9627
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Setting to start the measurement of the wire resistance for a channel for the Terminal Module 150 (TM150).
For a 2 wire evaluation, the total wire resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured wire resistance.

Procedure:

1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1).
2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).
3. Jumper the sensor to be connected (short-circuit the sensor cable close to the sensor).
4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).
5. For the corresponding channel, start the measurement of the wire resistance (p4109[x] = 1).
6. After p4109[x] = 0, check the measured resistance value in p4110[x].
7. Remove the jumper across the temperature sensor.

Value:
0: Inactive
1: Start

Index:
[0] = Temperature channel 0
[1] = Temperature channel 1
[2] = Temperature channel 2
[3] = Temperature channel 3
[4] = Temperature channel 4
[5] = Temperature channel 5
[6] = Temperature channel 6
[7] = Temperature channel 7
[8] = Temperature channel 8
[9] = Temperature channel 9
[10] = Temperature channel 10
[11] = Temperature channel 11

Dependency: Refer to: p4100, p4108, p4110

Notice: Wire resistance measurement is only possible for 1x2 or 2x2 wire evaluation (p4108[0...5] = 0, 1).

Note: The wire resistance value can be also directly entered into p4110[0...11].
The automatic conductor calibration for 1x2 and 2x2 wire evaluation is always performed with the value in p4110[0...11].

2 Parameters

2.2 List of parameters

- Notice:** When forming groups, it must be ensured that in one particular group, only temperature channels with the following sensor types are included:
- "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6), real temperature actual value
or alternatively
- "PTC thermistor", "bimetallic NC contact" (p4100[0...11] = 1, 4), fictitious temperature actual value (-50 °C, 250 °C)
If these sensor types are combined within one group, then the calculated values for maximum, minimum and average value will be falsified.
- Note:** Active and inactive temperature channels can be included in one group. However, when calculating the values (r4112, r4113, r4114) only the active temperature channels with valid actual value are taken into account (r4105[0...11] not equal to -300 °C).

r4112[0...2] **CO: TM150 group temperature actual value maximum value / TM150 grp temp max**

Description: Sets the rated line frequency for the filter to skip the line frequency for Terminal Module 150 (TM150).

Value:
 0: 50 Hz
 1: 60 Hz

p4122[0...11] TM150 smoothing time constant / TM150 Tc

TM150	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 9626, 9627
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	100 [ms]	10000 [ms]	100 [ms]

Description: Sets the smoothing time constant for the 1st order lowpass filter of the temperature channels.
 The effective smoothing time constant depends on the number of channels that are simultaneously active and is displayed in r4120.

In order that the value becomes effective, p4122 must be set $\geq 2 \cdot$ channel sampling time.

The following applies:

Channel sampling time = active number of channels * 50ms

For lower values, a smoothing of $2 \cdot$ channel sampling time.

Index:
 [0] = Temperature channel 0
 [1] = Temperature channel 1

Description:	Is used to synchronize the timer of Terminal Module 15 (TM15) with the system time of the DP master. Bit 12 ... 15: After synchronization with the DP master, the module sends its sign-of-life in the form of a counter. Bit 0: This SYNC signal is set if the module has aligned its time to the system time of the DP master. Bit 9: This bit is set if a fault has occurred on the module (r0945).

	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	1111 0011 bin		
Description:	Sets the mode for the incremental encoder emulation.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Zero mark enable	Yes	No	9674
	01	Zero marks synchronized with zero position of absolute encoders	Yes	No	9674
	04	Activate higher actual value resolution	Yes	No	-

05	Activate higher setpoint resolution	Yes	No	-
06	Deactivate residual value handling in the setpoint channel	Yes	No	-
07	Activate output frequencies greater than 750 kHz	Yes	No	-

Note:

For bit 00, 01:

This bit is used to configure the zero mark via X520.

When the TM41 is operated in the SINAMICS mode (p4400 = 1), the following applies:

A new zero mark search is initiated by switching in the zero mark at the TM41 (p4401.0 = 1). The zero mark is output at the TM41 as soon as it was synchronized with the zero position/zero mark of the leading encoder.

For p4401.1 = 1, the following applies:

The zero pulse is only output via X520 when the absolute encoder passes the zero position of the absolute position (modulo converted).

For p4401.1 = 0, the following applies:

The zero pulse is output via X520 compatible with previous firmware versions (< V4.3). The zero pulse is output when the TM41 (modulo converted) passes the position it was in when the 24 V supply was switched on.

For bit 07:

For hardware versions A and B, this bit has no significance (output frequency = 512 kHz).

For p4401.7 = 0, the following applies:

The maximum output frequency is 750 kHz (from hardware version C).

For p4401.7 = 1, the following applies:

The maximum output frequency is 1024 kHz (from hardware version C).

r4402.0...2**CO/BO: TM41 encoder emulation status / Enc_emulat status**

TM41

-

-

-

Description:

Displays the actual operating mode of Terminal Module 41 (TM41).

Dependency:

Refer to: p4400

p4404 **TM41 encoder emulation controller options / Enc_emul ctrl_opt**

TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0001 bin

Description: Sets the controller option for incremental encoder emulation on Terminal Module 41 (TM41).
 p4404.0 = 1:
 Control with minimum following error (precontrol active) for synchronous position and synchronous zero-mark emulation.
 p4404.1 = 1:
 In the case of TTL encoders, the control response improves at slow velocities.
 p4404.0 = p4404.1 = 0
 Control with fixed following error.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Precontrol	Active	Inactive	-
	01	Precontrol with adaptation for TTL encoder	Active	Inactive	-

Note: The parameter is only effective in the "SINAMICS" operating mode (p4400 = 1).

p4408 **TM41 encoder emulation pulse number leading encoder / TM41 enc puls no.**

TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9674, 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	16384	0

Description: Parameters p4408 and p4418 define the position setpoint format for the TM41 (CI: p4420).
 The two parameters p4408 and p4418 of the TM41 must be set the same as parameters p0408 and p0418 of the encoder interconnected at connector input p4420. The zero mark is only correctly output if this condition is maintained.
 For p4408 = 0, the following applies:
 Parameters p0408 and p0418 in addition assume the function of p4408 and p4418.

p4418 **TM41 encoder emulation fine resolution leading encoder / TM41 fine res**

TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned8	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2	18	11

Description: Parameters p4408 and p4418 define the position setpoint format for the TM41 (CI: p4420).
 The two parameters p4408 and p4418 of the TM41 must be set the same as parameters p0408 and p0418 of the encoder interconnected at connector input p4420. The zero mark is only correctly output if this condition is maintained.
 For p4408 = 0, the following applies:
 Parameters p0408 and p0418 in addition assume the function of p4408 and p4418.

r4419	TM41 encoder emulation diagnostics position setpoint / TM41 diag s_set		
TM41	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the position setpoint after taking into account the step up / step down. The format of this parameter is defined by p0408/p0418.		
p4420	CI: TM41 encoder emulation position setpoint / Enc_emul s_set		
TM41	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32 / Integer32	Dyn. index: -	Func. diagram: 9676
	P-Group: Setpoints	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for the incremental encoder emulation position setpoint.		
Recommendation:	The position actual value of the leading encoder in the current controller clock cycle is available in r0479. This is the reason that the following BICO interconnection should be preferably set: CI: p4420 (TM41) = r0479 (e.g. SERVO)		
Dependency:	Refer to: p4400, r4403		
Notice:	General conditions for incremental encoder emulation can be found in the following literature: SINAMICS S120 Function Manual Drive Functions		
Note:	The parameter is not effective in the SIMOTION operating mode (p4400 = 0). An encoder actual value (r0479) can only be interconnected once on a TM41. For p4401.0 = 1(enable zero mark), the following applies: In this case, p4420 must be interconnected with r0479 of the leading encoder. After successful internal, automatic synchronization, the zero mark of the incremental encoder emulation is output in synchronism to the zero position/zero mark of the leading encoder. The zero position of the leading encoder depends on the encoder type and the selected referencing technique (p0493, p0494, p0495).		
p4421	TM41 encoder emulation deadtime compensation / Enc_emul t_dead		
TM41	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 9676
	P-Group: Setpoints	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.00	10.00	0.00
Description:	Sets the deadtime compensation for incremental encoder emulation. This factor defines the multiplier in which the encoder position setpoint of the incremental encoder emulation is shifted depending on the velocity.		
Dependency:	For p4421 = 0, the deadtime compensation for the position setpoint is switched out. For p4421 <> 0, the deadtime compensation is taken into account as follows: Setpoint new = setpoint via CI: p4420 + delta s * p4421 delta s: Position change per sampling time (p4099[3]), internally smoothed Refer to: p4400		
Note:	The parameter is not effective in the SIMOTION operating mode (p4400 = 0).		

p4422	TM41 encoder emulation position setpoint inversion / Enc_emul s_set inv		
TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Setting to invert the position setpoint for Terminal Module 41 (TM41). 0 -> Position setpoint (CI: p4420) is evaluated as normal. 1 -> Position setpoint (CI: p4420) is processed inverted.		
Dependency:	Refer to: p4420		
p4423	TM41 encoder emulation standstill adaptation / Enc_standst_adpt		
TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2000	4
Description:	Sets standstill adaptation on Terminal Module 41 (TM41). p4423 is used to specify the number of clock cycles (one clock cycle = p4099[3]) used for encoder standstill detection. Once this time has elapsed, any potential deviation is compensated when adaptation is active. Parameter value = 0: adaptation inactive Parameter value > 0: adaptation active		
Dependency:	Refer to: r4403, p4404, p4420		
Danger:	The option p4404.1 = 1 is only effective if TM41 DAC is being used. If the possibility of a TM41 DAC (new) being replaced by a TM41 SAC (old) cannot be excluded, this option should not be set. TM41 SAC: Article No. = 6SL3055-0AA00-3PA0 TM41 DAC: Article No. = 6SL3055-0AA00-3PA1		
			
Note:	The parameter is only effective in the SINAMICS operating mode (p4400 = 1). The parameter value must be assigned a value of 4 or more to ensure that the system functions properly. This parameter is only relevant in the following cases: - TTL encoder is available - the controller option "Precontrol with adaptation for TTL encoder" has been activated (p4404.1 = 1)		
p4426	TM41 encoder emulation pulses for zero mark / Enc_emul pulses ZM		
TM41	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: 9674, 9676
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	16384	0
Description:	Sets pulse number to output the zero mark for the incremental encoder simulation/emulation. Example: p0408 = 2048 (encoder pulses) p4426 = 512 (pulses for the zero mark) --> Position direction: The zero mark is output after 512 pulses. --> Negative direction: The zero mark is output after 1536 pulses.		
Dependency:	Refer to: p0408		
Note:	The pulses for the zero mark (p4426) must be less than the encoder pulse number (p0408).		

r4427	TM41 encoder emulation zero mark position / TM41 NM_position		
TM41	Can be changed: -	Calculated: -	Access level: 4
	Data type: Integer32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the position of the next zero mark in a positive traversing direction.
The format of this parameter is defined by p0408/p0418 (the same as the position actual value Xact1).

p4600[0...n]	Motor temperature sensor 1 sensor type / Temp_sens 1 type		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: EDS, p0140	Func. diagram: 8016
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	60	0

Description: Sets the sensor type of the first temperature sensor for the motor temperature monitoring.

Value:

- 0: No sensor
- 10: PTC fault
- 11: PTC alarm
- 12: PTC alarm & timer
- 20: KTY84
- 30: Bimetallic NC contact fault
- 31: Bimetallic NC contact alarm
- 32: Bimetallic NC contact alarm & timer
- 60: PT1000

Dependency: Refer to: r0458, p0600, p0601

Note: This parameter is effective only when p0601 = 10.
PTC thermistor: Tripping resistance = 1650 Ohm
Information on using temperature sensors is provided in the following literature:
- hardware description of the appropriate components
- SINAMICS S120 Commissioning Manual

p4601[0...n]	Motor temperature sensor 2 sensor type / Temp_sens 2 type		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: EDS, p0140	Func. diagram: 8016
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	60	0

Description: Sets the sensor type of the second temperature sensor for the motor temperature monitoring.

Value:

- 0: No sensor
- 10: PTC fault
- 11: PTC alarm
- 12: PTC alarm & timer
- 20: KTY84
- 30: Bimetallic NC contact fault
- 31: Bimetallic NC contact alarm
- 32: Bimetallic NC contact alarm & timer
- 60: PT1000

Dependency: Refer to: r0458, p0600, p0601

2 Parameters

2.2 List of parameters

Note: This parameter is effective only when p0601 = 10.
Terminals for KTY84/PT1000: X200.1, X200.2
PTC thermistor: Tripping resistance = 1650 Ohm
Information on using temperature sensors is provided in the following literature:
- hardware description of the appropriate components
- SINAMICS S120 Commissioning Manual

p4602[0...n]	Motor temperature sensor 3 sensor type / Temp_sens 3 type		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: EDS, p0140	Func. diagram: 8016
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	60	0

Description: Sets the sensor type of the third temperature sensor for the motor temperature monitoring.

Value:

0:	No sensor
10:	PTC fault
11:	PTC alarm
12:	PTC alarm & timer
20:	KTY84
30:	Bimetallic NC contact fault
31:	Bimetallic NC contact alarm
32:	Bimetallic NC contact alarm & timer
60:	PT1000

Dependency: Refer to: r0458, p0600, p0601

Note: This parameter is effective only when p0601 = 10.
Terminals for PTC triplet and bimetallic: X200.3, X200.4
PTC thermistor: Tripping resistance = 1650 Ohm
Information on using temperature sensors is provided in the following literature:
- hardware description of the appropriate components
- SINAMICS S120 Commissioning Manual

p4603[0...n]	Motor temperature sensor 4 sensor type / Temp_sens 4 type		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: EDS, p0140	Func. diagram: 8016
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	60	0

Description: Sets the sensor type of the fourth temperature sensor for the motor temperature monitoring.

Value:

0:	No sensor
10:	PTC fault
11:	PTC alarm
12:	PTC alarm & timer
20:	KTY84
30:	Bimetallic NC contact fault
31:	Bimetallic NC contact alarm
32:	Bimetallic NC contact alarm & timer
60:	PT1000

Dependency: Refer to: r0458, p0600, p0601

Note: This parameter is effective only when p0601 = 10.
Terminals for PTC triplet: X200.5, X200.6
PTC thermistor: Tripping resistance = 1650 Ohm
Information on using temperature sensors is provided in the following literature:
- hardware description of the appropriate components
- SINAMICS S120 Commissioning Manual

p4610[0...n]	Motor temperature sensor 1 sensor type MDS / Temp sens1 typ MDS		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2

Note:	This parameter is effective only when p0601 = 11. PTC thermistor: Tripping resistance = 1650 Ohm Information on using temperature sensors is provided in the following literature: - hardware description of the appropriate components - SINAMICS S120 Commissioning Manual		

p4618	Motor Module temperature sensor type / MM temp_sens type		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	6	0
Description:	Sets the type of temperature sensor connected to the Motor Module. The temperature actual value is displayed via connector output r4619.		

Value:	0: No sensor 2: KTY84 5: PT100 6: PT1000
Dependency:	The parameter can only be set if the motor temperature sensor is not connected to the Motor Module (p0600 = 11, X21, X22). Refer to: r4619
Notice:	Users must evaluate the temperature actual value (CO: r4619).

r4619	CO: Motor Module temperature sensor actual value / MM temp_sens actV		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [°C]	Calculated: - Dyn. index: - Unit group: 21_1 Scaling: p2006 Max - [°C]	Access level: 2 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [°C]
Description:	Display and connector output for the temperature sensor connected to the Motor Module		
Dependency:	Refer to: p4618		
Note:	For r4619 equal to -200.0 °C, the following applies: This temperature display is not valid (temperature sensor error).		

r4620[0...3]	Motor temperature measured / Mot_temp meas		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°C]	Calculated: - Dyn. index: - Unit group: 21_1 Scaling: p2006 Max - [°C]	Access level: 3 Func. diagram: 8016 Unit selection: p0505 Expert list: 1 Factory setting - [°C]
Description:	Displays the actual temperature in the motor measured through temperature channels 1 ... 4.		
Index:	[0] = Temperature channel 1 [1] = Temperature channel 2 [2] = Temperature channel 3 [3] = Temperature channel 4		
Note:	For a value not equal to -200.0 °C, the following applies: - this temperature display is valid. - a KTY/PT1000 temperature sensor is connected. For a value equal to -200.0 °C, the following applies: - this temperature display is not valid (temperature sensor error). - a PTC sensor or bimetallic NC contact is connected. - the temperature sensor evaluation is deactivated (p0600 = 0 or p0601 = 0). - the sensor channel is deactivated (p460x = 0 or p461x = 0).		

p4622[0...n]	Temperature sensor error lower threshold / Temp_sens low thr		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -140 [°C]	Calculated: - Dyn. index: MDS, p0130 Unit group: 21_1 Scaling: - Max 20 [°C]	Access level: 3 Func. diagram: 8016 Unit selection: p0505 Expert list: 1 Factory setting -140 [°C]
Description:	Sets the minimum temperature to identify a temperature sensor error. A temperature sensor error is output below this threshold.		
Dependency:	Refer to: A07015, F07016		

p4630[0...n]	Absolute encoder linear measuring step factor / Abs_enc meas fact		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 1	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the resolution of the absolute position for a linear absolute encoder as factor from p0407.		
Note:	The serial protocol of an absolute encoder provides the position with a certain resolution (e.g. 100 nm). The resolution is calculated from p0407/p4630.		

p4631[0...n]	Cylinder distance per encoder revolution / x_cyl per rev		
HLA	Can be changed: C2(1, 4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0 [µm]	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 4294967295 [µm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0 [µm]
Description:	Setting to convert rotary motion into linear motion for hydraulic drives. The value corresponds to the distance in µm for one encoder revolution.		
Note:	For a linear drive (r0108.12 = 1) with rotary encoder (p0404.0 = 0) this factor defines the conversion of the encoder information for the linear motion of the velocity control.		

p4635[0...n]	Encoder scaling factor acceleration / Scale factor accel		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: T Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min -340.28235E36 [rev/s ²]	Calculated: - Dyn. index: EDS, p0140 Unit group: 39_1 Scaling: - Max 340.28235E36 [rev/s ²]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting 0.000 [rev/s ²]
Description:	Sets the scaling factor for acceleration values 1 to 3. The set value specifies the acceleration for sensor value 32767.		

r4636[0...2]	CO: Encoder acceleration value 1 / Acceleration 1		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min - [rev/s ²]	Calculated: - Dyn. index: - Unit group: 39_1 Scaling: p2007 Max - [rev/s ²]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [rev/s ²]
Description:	Displays the first acceleration value, which is transferred via the extended DQ telegram.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		

r4637[0...2]	CO: Encoder acceleration value 2 / Acceleration 2		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: 39_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2007	Expert list: 1
	Min	Max	Factory setting
	- [rev/s ²]	- [rev/s ²]	- [rev/s ²]
Description:	Displays the second acceleration value, which is transferred via the extended DQ telegram.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		

r4638[0...2]	CO: Encoder acceleration value 3 / Acceleration 3		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: 39_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2007	Expert list: 1
	Min	Max	Factory setting
	- [rev/s ²]	- [rev/s ²]	- [rev/s ²]
Description:	Displays the third acceleration value, which is transferred via the extended DQ telegram.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		

r4639[0...2]	CO: Encoder supplementary value / Suppl value		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3

	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the optional supplementary value, which is transferred via the extended DQ telegram.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		

r4640[0...95]	Encoder diagnostics state machine / Enc diag stat_ma		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the encoder diagnostics for the PROFIdrive interface.		

p4641[0...2]	OEM encoder diagnostic signal selection / OEM enc diag sel		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned16 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the trace functionality for OEM encoder manufacturers.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		

p4642	Encoder fault test function / Encoder fault test		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: Unsigned8 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	<p>Test function to initiate an encoder fault</p> <p>For p4642 = 1: When setting, an encoder fault is output once at the currently used motor encoder. Depending on the configuration in p0491, the drive switches over to encoderless operation. This means that encoderless motor stopping can be tested.</p> <p>For p4642 = 2: When setting, an encoder fault is output once at the currently used motor encoder. For braking, the drive still uses the commutation position of the encoder. This means that a faster motor stopping with encoder can be tested (only functions with SMx modules, otherwise the same response as for p4642 = 1).</p> <p>The following generally applies: After acknowledgment, the encoder fault that was issued is cleared and p4642 is set = 0.</p>		
Notice:	It is not permissible that a data set is switched over between an encoder fault being issued and its deletion.		

p4643[0...n]	DRIVE-CLiQ encoder repeat telegram / DQ enc repeat		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: C1(3), C2(4) Data type: Unsigned16 P-Group: Encoder Not for motor type: - Min -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0001 0000 0001 bin
Description:	<p>Sets the telegram repeats for the DRIVE-CLiQ encoder telegram.</p> <p>For bits 02, 01, 00 or 10, 09, 08: Sets the number of maximum tolerated transfer errors in the particular direction before a fault is output. The higher set value between p4643 and p9915 or p9916 is effective.</p> <p>0 0 0 = 0 0 0 1 = 1 0 1 0 = 2 ... 1 1 1 = 7</p> <p>For bits 04, 12: When the bit is set, the telegrams are sent twice in the particular direction. This therefore reduces the probability of telegram failure.</p>		

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Actual value direction data transfer error number bit 0	Yes	No	-
	01	Actual value direction data transfer error number bit 1	Yes	No	-
	02	Actual value direction data transfer error number bit 2	Yes	No	-
	04	Actual value direction activate repeat telegram	Yes	No	-
	08	Setpoint direction data transfer error number bit 0	Yes	No	-
	09	Setpoint direction data transfer error number bit 1	Yes	No	-
	10	Setpoint direction data transfer error number bit 2	Yes	No	-
	12	Setpoint direction activate telegram repeat	Yes	No	-

p4644**Simulated motor encoder configuration / Sim mot_enc config**

SERVO, VECTOR (n/M), SERVO_AC, VECTOR_AC (n/M), SERVO_I_AC

Can be changed: T**Calculated:** -**Access level:** 4**Data type:** Unsigned16**Dyn. index:** -**Func. diagram:** -**P-Group:** -**Unit group:** -**Unit selection:** -**Not for motor type:** -**Scaling:** -**Expert list:** 1**Min****Max****Factory setting**

-

-

0010 bin

Description:

Sets the configuration for the simulated motor encoder.

Using these configuration bits, the response of the encoder status bit "Parking encoder active" (r0481.14) can be set for a pulse inhibit.

For bit 00:

When the bit is set, after a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is temporarily set and then withdrawn. When r0481.14 = 1 is set, the higher-level control system is signaled that the position must be re-referenced. When r0481.14 = 0 is reset, then the higher-level control system can switch the system on again.

For bit 01:

When the bit is set, a brake is being used (p1215 = 1, 3) and the pulses are canceled for absolute speeds less than the standstill speed (SERVO: p1226, VECTOR: 2 * p1226), then the encoder status bit "Parking encoder active" (r0481.14) is not set. This means that the position is not re-referenced after switching on again.

For bit 02:

This bit can be used for diagnostics.

When the bit is set, encoder status bit "Parking encoder active" (r0481.14) is not set as a result of the pulse inhibit.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	For a pulse inhibit, temporarily set bit r0481.14	Yes	No	-
01	Bit r0481.14 = 0 for pulse inhibit at standstill with brake	Yes	No	-
02	For a pulse inhibit, do not set bit r0481.14	Yes	No	-

Dependency:

Refer to: r0481

Danger:

For bit 02 = 1:

If it cannot be excluded that the motor shaft turns while the pulses are inhibited, then after the pulse enable, the position calculated by the simulated motor encoder can be offset and not detected using encoder status bit "Parking encoder active" (r0481.14). Hazardous operating states can subsequently occur.

Note:

Function "Simulated motor encoder" is activated using p0400 = 9010.

For bit 00, 01, 02 = 0, the following applies:

For a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is set. The system must be referenced after switching on again.

For bit 02 = 1, the following applies:

This bit has priority over the other bits.

p4644	Simulated motor encoder configuration / Sim mot_enc config			
VECTOR_I_AC (n/M)	Can be changed: T	Calculated: -	Access level: 4

Description:	Sets the configuration for the simulated motor encoder. Using these configuration bits, the response of the encoder status bit "Parking encoder active" (r0481.14) can be set for a pulse inhibit. For bit 00: When the bit is set, after a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is temporarily set and then withdrawn. When r0481.14 = 1 is set, the higher-level control system is signaled that the position must be re-referenced. When r0481.14 = 0 is reset, then the higher-level control system can switch the system on again. For bit 01: When the bit is set, a brake is being used (p1215 = 1, 3) and the pulses are canceled for absolute speeds less than the standstill speed (SERVO: p1226, VECTOR: 2 * p1226), then the encoder status bit "Parking encoder active" (r0481.14) is not set. This means that the position is not re-referenced after switching on again. For bit 02: This bit can be used for diagnostics. When the bit is set, encoder status bit "Parking encoder active" (r0481.14) is not set as a result of the pulse inhibit.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	For a pulse inhibit, temporarily set bit r0481.14	Yes	No
	01	Bit r0481.14 = 0 for pulse inhibit at standstill with brake	Yes	No
	02	For a pulse inhibit, do not set bit r0481.14	Yes	No
Dependency:	Refer to: r0481			
Danger:	For bit 02 = 1: If it cannot be excluded that the motor shaft turns while the pulses are inhibited, then after the pulse enable, the position calculated by the simulated motor encoder can be offset and not detected using encoder status bit "Parking encoder active" (r0481.14). Hazardous operating states can subsequently occur.			
				
Note:	Function "Simulated motor encoder" is activated using p0400 = 9010. For bit 00, 01, 02 = 0, the following applies: For a pulse inhibit, encoder status bit "Parking encoder active" (r0481.14) is set. The system must be referenced after switching on again. For bit 02 = 1, the following applies: This bit has priority over the other bits.			

r4648.0	CO/BO: Encoder status word / Enc status word			
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -	
	P-Group: Encoder	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Display and BICO output for the encoder status word. For bit 00: The bit is a group message for all encoders of the axis, and is set for the following alarms: A3x407: "Function limit reached" A3x415: "Signal level track A or B out of tolerance (alarm)" A3x419: "Track A or B out of tolerance" A3x442: "Battery voltage alarm threshold reached" x = encoder 1, 2, 3			

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Encoder maintenance required	Yes	No	-

Notice: Maintenance work may have to be carried out on the encoder.

Note: For bit 00:

For test purposes, the bit can be set using p4642 = 3.

The bit is reset using p4642 = 0.

p4649[0...n] Encoder function reserve amplitude limit incremental signals / Enc fct amp inc

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: EDS, p0140	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	500	0

Description: Amplitude threshold of the incremental signals for the function reserve.

If the set amplitude threshold on the incremental signals is fallen below, then alarm A3x407 "Encoder x; function limit reached " is output.

Note: An amplitude threshold of 230 mV can be used as default value.

p4650 Encoder functional reserve component number / Enc fct_res no

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	399	0

Description: Sets the component number (p0141) of the encoder whose functional reserve is to be displayed (r4651).

Dependency: Refer to: r4651

r4651[0...3] Encoder functional reserve / Enc fct_reserve

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]

Description: Displays the functional reserve of the encoder selected via p4650.

0 ... 25 %:

The function limit has been reached. A service is recommended.

26 ... 100 %:

The encoder is working in the specified range.

Index:
 [0] = Function reserve 1
 [1] = Function reserve 2
 [2] = Function reserve 3
 [3] = Function reserve 4

Dependency: Refer to: p4650

Note: Value = 999 means:

- the component specified in p4650 is not connected

- the encoder does not support the display of the functional reserve

Description:	Setting for coefficient K1 to calculate the characteristic (p4662).		
Dependency:	Refer to: p4662, p4663, p4665, p4666		
p4665[0...n]	Encoder characteristic K2 / Enc char K2		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Setting for coefficient K2 to calculate the characteristic (p4662).		
Dependency:	Refer to: p4662, p4663, p4664, p4666		

p4666[0...n]		Encoder characteristic K3 / Enc char K3		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Setting for coefficient K3 to calculate the characteristic (p4662).			
Dependency:	Refer to: p4662, p4663, p4664, p4665			

p4670[0...n]		Analog sensor configuration / Ana_sens config		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0000 0000 0000 0000 0000 bin	
Description:	Sets the configuration for evaluation on the analog sensor.			

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	06	Set velocity to 0	Yes	No	-
	08	Position value range	0.0 / 1.0 pulse	-0.5 / +0.5 pulse	-
	09	Fault/alarm messages	Alarm	Fault	-
	10	Channel B act	Yes	No	-
	11	Channel A act	Yes	No	-
	13	Commutation angle constant	Yes	No	-
	14	Suppress faults	Yes	No	-
	15	Two-channel evaluation	Yes	No	-
	31	Extrapolation	ON	OFF	-

Notice: For bit 06:
Setting the bit sets the velocity actual value (r0061) permanently to 0.

For bit 13:
Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).

Note: For bit 09:
A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.
A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.

For bits 10, 11:
If both channels are activated, the actual value is generated from the average value of both channels. If a channel fails (actual value invalid), it is not included when the average value is generated.

For bit 14:
The bit is only evaluated for encoder 1. Otherwise no effect.

For bit 15:
When the bit is set, both input signals are separately evaluated and transferred.

Prerequisite:
Function "Extended cyclic DRIVE-CLiQ telegram" is activated (p0454.4 = 1).

2 Parameters

2.2 List of parameters

p4671[0...n]	Analog sensor input / Ana_sens inp		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Integer16 P-Group: Encoder Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min 0	Max 3	Factory setting 0
Description:	Sets the input circuit for the analog sensor.		
Value:	0: Differential 1: Single-ended A, B 2: Single-ended A*, B* 3: Single-ended A, B sensitive		
Note:	p4671 = 0: The two signals on a track are evaluated differentially. p4671 = 1: Only the non-inverted signal on a track is evaluated. p4671 = 2: Only the inverted signal on a track is evaluated. p4671 = 3: Only the non-inverted signal on a track (high resolution) is evaluated.		
p4672[0...n]	Analog sensor channel A voltage at actual value zero / Ana_sens A U at 0		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min -10.0000 [V]	Max 10.0000 [V]	Factory setting 0.0000 [V]
Description:	Sets the voltage when the connected sensor is at actual value zero. At this voltage channel A supplies an actual value of zero.		
p4673[0...n]	Analog sensor channel A voltage per encoder period / Ana_sens A U/per		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min -10.0000 [V]	Max 10.0000 [V]	Factory setting 6.0000 [V]
Description:	Sets the output voltage range to be mapped for the connected analog sensor. The voltage range is determined by the following parameters: - p4672 (voltage at actual value 0) - p4673 (voltage per encoder period)		
Note:	The minimum actual value which can be mapped is equal to p4672 - p4673/2. The maximum actual value which can be mapped is equal to p4672 + p4673/2.		

p4674[0...n] Analog sensor channel B voltage at actual value zero / Ana_sens B U at 0

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: EDS, p0140	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.0000 [V]	10.0000 [V]	0.0000 [V]

Description: Sets the voltage when the connected sensor is at actual value zero.
At this voltage channel B supplies an actual value of zero.

p4675[0...n] Analog sensor channel B voltage per encoder period / Ana_sens B U/per

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: EDS, p0140	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.0000 [V]	10.0000 [V]	6.0000 [V]

Description: Sets the output voltage range to be mapped for the connected analog sensor.
The voltage range is determined by the following parameters:
- p4674 (voltage at actual value 0)
- p4675 (voltage per encoder period)

Note: The minimum actual value which can be mapped is equal to p4674 - p4675/2.
The maximum actual value which can be mapped is equal to p4674 + p4675/2.

p4676[0...n] Analog sensor range limit threshold / Ana_sens lim thr

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: EDS, p0140	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	100.0 [%]	100.0 [%]

Description: Sets the threshold for limit monitoring of the absolute actual value on the analog sensor.
If this threshold is overshoot by the actual value of a channel, a corresponding fault/alarm (p4670.9) is output.

Dependency: Refer to: p4673, p4675

p4677[0...n] Analog sensor LVDT configuration / Ana_sens LVDT conf

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4)	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: EDS, p0140	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 bin

Description: Sets the configuration for LVDT mode on the analog sensor.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	LVDT ON	Yes	No	-
	01	Track B excitation	Yes	No	-
	02	Fixed value amplitude	Yes	No	-
	03	Fixed value amplitude and phase	Yes	No	-

2 Parameters

2.2 List of parameters

p4678[0...n]	Analog sensor LVDT ratio / An_sens LVDT ratio		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 200.00 [%]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 50.00 [%]
Description:	Sets the ratio for the LVDT sensor.		
<hr/>			
p4679[0...n]	Analog sensor LVDT phase / An_sens LVDT ph		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: T Data type: FloatingPoint32 P-Group: Encoder Not for motor type: - Min -360.00 [°]	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 360.00 [°]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.00 [°]
Description:	Sets the phase for the LVDT sensor.		
<hr/>			
p4680[0...n]	Zero mark monitoring tolerance permissible / ZM_mon tol perm		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4
Description:	Sets the permissible tolerance in encoder pulses for the zero mark distance in the context of zero mark monitoring. Causes fault F3x100 to appear less frequently.		
Dependency:	Refer to: F31100		
<hr/>			
p4681[0...n]	Zero mark monitoring tolerance window limit 1 positive / ZM tol lim 1 pos		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2
Description:	Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. The pulse number is corrected if the deviation is less than this limit. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to an alarm (A) or no message (N), then the encoder pulses that are not corrected are transferred to the accumulator (p4688). The accumulator can be deactivated using p0437.7.		
Dependency:	Refer to: p0437, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC.		

p4682[0...n]	Zero mark monitoring tolerance window limit 1 negative / ZM tol lim 1 neg		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Integer32 P-Group: Encoder Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min -1001	Max 0	Factory setting -1001
Description:	Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. The pulse number is corrected if the deviation is less than this limit. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to an alarm (A) or no message (N), then the encoder pulses that are not corrected are transferred to the accumulator (p4688). The accumulator can be deactivated using p0437.7.		
Dependency:	Refer to: p0437, p4681, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 becomes active. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.		
p4683[0...n]	Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min 0	Max 100000	Factory setting 0
Description:	Sets the positive tolerance window in encoder pulses for limit 2 for the zero mark monitoring. Accumulator (p4688) is compared with this parameter, and where relevant, alarm A3x422 is output for 5 seconds.		
Dependency:	Refer to: p0437, p4681, p4682, p4688 Refer to: F31131, A31422		
Note:	Zero mark monitoring is activated by setting p0437.2 = 1 (position actual value correction).		
p4684[0...n]	Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Integer32 P-Group: Encoder Not for motor type: -	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	Min -100001	Max 0	Factory setting -100001
Description:	Sets the negative tolerance window in encoder pulses for limit 2 for the zero mark monitoring. Accumulator (p4688) is compared with this parameter, and where relevant, alarm A3x422 is output for 5 seconds.		
Dependency:	Refer to: p0437, p4683, p4688 Refer to: F31131, A31422		
Note:	Zero mark monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -100001, the negated value of p4683 is effective.		

2 Parameters

2.2 List of parameters

p4685[0...n]	Speed actual value average value generation / n_act mean val		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 20	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the number of current controller sampling times for average value generation of the speed actual value.		
Note:	Value = 0, 1: No average value generation. Higher values also mean higher dead times for the speed actual value.		
p4686[0...n]	Zero mark minimum length / ZM min length		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, ENC	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dyn. index: EDS, p0140 Unit group: - Scaling: - Max 10	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the minimum length for the zero mark in 1/4 encoder pulses.		
Dependency:	Refer to: p0425, p0437		
Note:	The minimum length of the zero mark must be less than the zero mark distance (p4686 < p0425). The parameter is activated using p0437.1 = 1 (zero mark edge detection).		
p4688[0...2]	CO: Zero mark monitoring differential pulse count / ZM diff_puls qty		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: T Data type: Integer32 P-Group: - Not for motor type: - Min -2147483648	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Display and connector output for the identified incorrect pulses in lines. Also see p0437.7 (do not accumulate number of incorrect pulses).		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		
Dependency:	Refer to: p0437, p4681, p4682, p4683, p4684		
Note:	The display can only be reset to zero.		
p4688	CO: Zero mark monitoring differential pulse count / ZM diff_puls qty		
ENC	Can be changed: T Data type: Integer32 P-Group: - Not for motor type: - Min -2147483648	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Display and connector output for the identified incorrect pulses in lines. Also see p0437.7 (do not accumulate number of incorrect pulses).		
Dependency:	Refer to: p0437, p4681, p4682, p4683, p4684		
Note:	The display can only be reset to zero.		

r4689[0...2]	CO: Square-wave encoder diagnostics / Sq wave enc diag		
SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the encoder status according to PROFIdrive for a square-wave encoder.		
Index:	[0] = Encoder 1 [1] = Encoder 2 [2] = Encoder 3		
Dependency:	Refer to: A31422		
Note:	After alarm A3x422 is output, this parameter is set for 100 ms.		

r4689	CO: Square-wave encoder diagnostics / Sq wave enc diag		
ENC	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Encoder	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the encoder status according to PROFIdrive for a square-wave encoder.		
Dependency:	Refer to: A31422		
Note:	After alarm A3x422 is output, this parameter is set for 100 ms.		

p4690	SMI spare part component number / SMI comp_no		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T	Calculated: -	Access level: 1
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	399	0
Description:	Sets the component number for the SMI/DQI for which motor and/or encoder data should be saved, deleted or downloaded.		
Dependency:	Refer to: p4691, p4692, p4693		
Note:	DQI: DRIVE-CLiQ Sensor Integrated SMI: SINAMICS Sensor Module Integrated		

p4691	SMI spare part save/download data / Save/DL SMI data		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Integer16 P-Group: Displays, signals Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 39	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting for the saving/downloading/deletion of motor and/or encoder data for the component specified in p4690 (SMI/DQI). A backup of this data can be saved to non-volatile memory. The backup procedure is performed automatically as part of the function for saving to non-volatile memory (p0977 = 1 or "Copy RAM to ROM"). If a part is replaced, the saved data can be reloaded. Procedure: p4690 = set component number p4691 = 1, 2, 30: Set the required procedure (save/download/delete). p4691 = 9, 10, 36: Feedback signal on successful completion of the procedure. p4691 = 11... 22, 37, 38: Error values if the procedure could not be executed successfully.		
Value:	0: Inactive 1: Save SMI data 2: Download SMI data 9: SMI data downloaded and POWER ON required for component 10: SMI data backup complete 11: SMI data backup for selected component not found 12: Selected component not available or not connected 13: Insufficient memory space for backup 14: Format of saved data is incompatible 15: Transfer fault during data download 16: Transfer fault during data backup 17: Data backup does not match parameterized encoder/motor 18: Data backup directory not permissible 19: Component already contains data 20: Component does not contain any data 21: Component is not an SMI or a DQI 22: SMI data cannot be downloaded for component 30: Delete SMI data 35: Confirmation of SMI data delete required 36: SMI data deleted and POWER ON required for component 37: Access level not sufficient for delete 38: Delete SMI data not permitted for component 39: SMI data for component cannot be deleted		
Dependency:	Refer to: p4690, p4692, p4693		
Notice:	Once SMI/DQI data has been deleted or downloaded successfully, the component has to be switched on (POWER ON).		
Note:	SMI: SINAMICS Sensor Module Integrated DQI: DRIVE-CLiQ Sensor Integrated Help for error value = 11: - Save the data for the original SMI on the memory card. - Use an SMI with a suitable hardware version. Help for error value = 12: - set the correct component number or connect the component. Help for error value = 13: - Use a memory card with more memory space. Help for error value = 14: - Create a data backup on the memory card corresponding to the SMI type. Help for error value = 15: - check the DRIVE-CLiQ wiring for the component.		

Remedy for fault value = 16:

- check the DRIVE-CLiQ wiring for the component.

Help for error value = 17:

- Save the data for the original SMI on the memory card.

Remedy for fault value = 18:

- set parameter p4693 to an appropriate value.

Remedy for fault value = 19:

- Perform an SMI delete or use a blank SMI.

Remedy for fault value = 20:

- Use an SMI that is not blank.

Remedy for fault value = 21:

- set the correct component number (p4690).

Note for error value = 22:

- Data cannot be downloaded for component.

Remedy for fault value = 35:

- Reset parameter p4691 to 30.

Remedy for fault value = 37:

- set the access level to Expert or higher.

Help for error value = 38:

- insert the SMI/DQI into the actual topology as an additional component (component number ≥ 200).

- set the component number from the actual topology (p4690 ≥ 200).

- set the correct component number (p4690 ≥ 200).

Note for error value = 39:

- SMI already deleted or too old. Delete not possible.

p4692

SMI spare part save data of all SMIs / Save SMI data

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	29	0

Description:

Setting to back up the data of all SMIs and DQIs featured in the target topology.

Value:

- 0: Inactive
- 1: Save data of all SMIs and DQIs
- 10: Save all data successful
- 13: Insufficient memory space for backup
- 16: Transfer fault during data backup
- 20: Component does not contain any data
- 29: Not all components from target topology saved

Note:

SMI: SINAMICS Sensor Module Integrated

p4692 = 10: Automatic on successful completion of backup procedure.

p4692 = 13, 16, 20, 29: Error values if the procedure could not be executed successfully.

The procedure must be repeated if the data save operation was interrupted (e.g. if the power supply voltage failed).

Help for error value = 13:

- Use a memory card with more memory space.

Remedy for fault value = 16:

- check the DRIVE-CLiQ wiring.

Remedy for fault value = 20:

- Use an SMI that is not blank.

Help for error value = 29:

- check and correct the target and actual topologies for the SMIs.
- Repeat the save procedure.

p4693[0...1]		SMI spare part data backup directory / SMI dat_bkup dir		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Unsigned16 P-Group: Displays, signals Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 399	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0	
Description:	Sets the directory for downloading and saving data. Example: The SMI has the component number 5 and the SMI data (motor/encoder data) is to be stored in subdirectory C205. --> p4690 = 5, p4693[0] = 205, p4691 = 1 [0] = Subdirectory selection [1] = Reserved			
Index:	Refer to: p4691, r4694			
Dependency:	If p4693[0] is not equal to 0 and p4693[0] is not equal to p4690, the following applies: - Only a number >= 200 may be selected for the subdirectory when saving. - in the case of downloads, a selection for the subdirectory may only be made for an SMI/DQI with a component number >= 200 (preliminary component number) (p4690 >= 200).			
Notice:	DQI: DRIVE-CLiQ Sensor Integrated SMI: SINAMICS Sensor Module Integrated For index [0]: This index is used to select the subdirectory for saving and downloading data. The motor article number (MLFB) of the corresponding data backup is displayed in r4694. For p4693[0] = 0, the following applies: The directory is determined by the setting of p4690.			

r4694[0...19]		SMI spare part data backup motor article number / SMI dat_bkup MLFB		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned8 P-Group: Displays, signals Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the motor article number (MLFB) of the data backup selected with p4693.			
Dependency:	Refer to: p4691, p4692			
Caution:	If the selected subdirectory contains a number of data sets, "More Datasets" is displayed in r4694[0...19]. If there is no SMI data (motor/encoder data) in the selected subdirectory or if the selected subdirectory does not exist, the following applies: - the number of the next subdirectory located is displayed. - this subdirectory is not checked for valid SMI data. - if another subdirectory cannot be located, nothing is displayed in r4694[0...19].			
Note:	SMI: SINAMICS Sensor Module Integrated			

p4700[0...1]	Trace control / Trace control			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0	
Description:	Setting to control the trace function.			
Value:	0: Stop trace 1: Start trace			
Index:	[0] = Trace 0 [1] = Trace 1			
p4701	Measuring function control / Meas fct ctrl			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0	
Description:	Setting to control the measurement function.			
Value:	0: Stop measuring function 1: Start measuring function 2: Measuring function check parameterization 3: Start measuring function without enable signals			
p4703[0...1]	Trace options / Trace options			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Unsigned16 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin	
Description:	Sets the options for the trace.			
Index:	[0] = Trace 0 [1] = Trace 1			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Automatically start trace with time slices	Yes	No
FP				-
Dependency:	Refer to: p4700			
Note:	For bit 00: 0: The trace starts with p4700 as before. 1: When powering up, the trace starts immediately with the saved parameter settings with the start of the time slices.			

r4705[0...1]	Trace status / Trace status		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the actual status of the trace.		
Value:	0: Trace inactive 1: Trace is recording presamples 2: Trace is waiting for trigger event 3: Trace is recording 4: Recording (trace) ended 5: Trace inactive with permissible configuration data 6: Trace inactive with inadmissible configuration data		
Index:	[0] = Trace 0 [1] = Trace 1		

r4706	Measuring function status / Meas fct status		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the actual status of the measuring function.		
Value:	0: Measurement function inactive 1: Measuring function parameterization checked 2: Measuring function waits for stabilizing time 3: Measuring function recording (tracing) 4: Measuring function trace ended with error 5: Measuring function trace successfully completed		

p4707	Measurement function configuration / Meas fct config		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Setting to configure the measurement function.		
Value:	0: Standard 1: Free measurement function		
Dependency:	The parameter cannot be changed when the measurement function has been started (r4706 = 2, 3).		
Note:	This parameter involves free measurement functions, and is only active for p4810 = 6. For value = 0: The free measuring function is parameterized with master control. For value = 1: The free measuring function is parameterized without master control.		

r4708[0...1]	Trace memory space required / Trace mem required		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the required memory in bytes for the actual parameterization.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: r4799		
r4709[0...1]	Trace memory space required for measuring functions / Trace mem required		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the required memory in bytes for the actual parameterization. This applies, if the trace for the measurement functions is used.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: r4799		
p4710[0...1]	Trace trigger condition / Trace Trig_cond		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 8	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 2
Description:	Sets the trigger condition for the trace.		
Value:	1: Immediate trace start 2: Positive edge 3: Negative edge 4: Entry to hysteresis band 5: Leaving hysteresis band 6: Trigger at bit mask 7: Start with function generator 8: Trigger at bit mask with edge		
Index:	[0] = Trace 0 [1] = Trace 1		

p4711[0...5]	Trace trigger signal / Trace trig_signal		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the trigger signal for the trace.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
Dependency:	Only effective when p4710 does not equal 1.		
Note:	It only makes sense to trace the PINs using the commissioning tool. For index 2(4) and 3(5) equal to zero, index 0(1) can only be written and vice versa. For index [0...1]: Here, the trigger signal for trace 0 or 1 is entered as parameter in the BICO format. For trace with a physical address (p4789), the data type of the trigger signal is set here. For index [2...3]: The triggering PIN for trace 0 is entered here. Index 2 bit 31 ... 16: Number of the Drive Object (DO), bit 15 ... 0: Number of the chart Index 3 bit 31 ... 16: Number of the block, bit 15 ... 0: Number of the PIN For index [4...5]: The triggering PIN for trace 1 is entered here. Index 4 bit 31 ... 16: Number of the Drive Object (DO), bit 15 ... 0: Number of the chart Index 5 bit 31 ... 16: Number of the block, bit 15 ... 0: Number of the PIN		
p4712[0...1]	Trace trigger threshold / Trace trig_thr		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.00
Description:	Sets the trigger threshold for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only effective when p4710 = 2, 3.		
p4713[0...1]	Trace tolerance band trigger threshold 1 / Trace trig_thr 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.00
Description:	Sets the first trigger threshold for trigger via tolerance band.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only effective when p4710 = 4, 5.		

p4714[0...1]	Trace tolerance band trigger threshold 2 / Trace trig thr 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.00
Description:	Sets the second trigger threshold for trigger via tolerance band		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only effective when p4710 = 4, 5.		
p4715[0...1]	Trace bit mask trigger, bit mask / Trace trig mask		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the bit mask for the bit mask trigger.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only effective when p4710 = 6 or p4710 = 8.		
p4716[0...1]	Trace bit mask trigger trigger condition / Trace Trig_cond		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the trigger condition for bit mask trigger.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only effective when p4710 = 6.		
p4717	Measuring function number of averaging operations / Meas fct avg qty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned8 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the number of averaging operations for the measuring function.		

2 Parameters

2.2 List of parameters

p4718	Measuring function number of stabilizing periods / MeasFct StabPerQty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned8 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the number of stabilizing periods for the measuring function.		
r4719[0...1]	Trace trigger index / Trace Trig_index		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trigger index in the trace buffer. The trigger event occurred at this point.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only valid when p4705 = 4.		
p4720[0...1]	Trace recording cycle / Trace record_cyc		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.000 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60000.000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1.000 [ms]
Description:	Sets the recording cycle for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
p4721[0...1]	Trace recording time / Trace record_time		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.000 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1000.000 [ms]
Description:	Sets the recording time for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4722[0...1]	Trace trigger delay / Trace trig_delay		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.000 [ms]
Description:	Sets the trigger delay for the trace. Trigger delay < 0: Pretrigger: Tracing (recording) starts the selected time before the trigger event actually occurs. Trigger delay > 0: Post trigger: Tracing does not start until the set time after the trigger event.		
Index:	[0] = Trace 0 [1] = Trace 1		
p4723[0...1]	Trace time slice cycle / Trace cycle		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.03125 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4.00000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.12500 [ms]
Description:	Sets the time slice cycle in which the trace is called.		
Index:	[0] = Trace 0 [1] = Trace 1		
p4724[0...1]	Trace average in the time range / Trace average		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned8 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 0001 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the averaging in the time range for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
r4725[0...1]	Trace data type 1 traced / Trace rec type 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 1 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		

2 Parameters

2.2 List of parameters

r4726[0...1]	Trace data type 2 traced / Trace rec type 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 2 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
<hr/>			
r4727[0...1]	Trace data type 3 traced / Trace rec type 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 3 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
<hr/>			
r4728[0...1]	Trace data type 4 traced / Trace rec type 4		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 4 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
<hr/>			
r4729[0...1]	Trace number of recorded values / Trace rec values		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the number of traced values for each signal.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Only valid when p4705 = 4.		

p4730[0...5]	Trace record signal 0 / Trace record sig 0		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the first signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
p4731[0...5]	Trace record signal 1 / Trace record sig 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the second signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
p4732[0...5]	Trace record signal 2 / Trace record sig 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the third signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		

p4733[0...5]	Trace record signal 3 / Trace record sig 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the fourth signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
p4734[0...5]	Trace record signal 4 / Trace record sig 4		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the fifth signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
p4735[0...5]	Trace record signal 5 / Trace record sig 5		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the sixth signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		

p4736[0...5]	Trace record signal 6 / Trace record sig 6		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the seventh signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
p4737[0...5]	Trace record signal 7 / Trace record sig 7		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Selects the eighth signal to be traced.		
Index:	[0] = Trace 0 parameter in BICO format [1] = Trace 1 parameter in BICO format [2] = Trace 0 PINx with DO Id and chart Id [3] = Trace 0 PINx with block Id and PIN Id [4] = Trace 1 PINy with DO Id and chart Id [5] = Trace 1 PINy with block Id and PIN Id		
r4740[0...16383]	Trace 0 trace buffer signal 0 floating point / Trace 0 rec sig 0		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].		
Dependency:	Refer to: p4795		

2 Parameters

2.2 List of parameters

r4741[0...16383]	Trace 0 trace buffer signal 1 floating point / Trace 0 rec sig 1
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 1.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4742[0...16383]	Trace 0 trace buffer signal 2 floating point / Trace 0 rec sig 2
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 2.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4743[0...16383]	Trace 0 trace buffer signal 3 floating point / Trace 0 rec sig 3
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 3.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4744[0...16383]	Trace 0 trace buffer signal 4 floating point / Trace 0 rec sig 4
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 4.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4745[0...16383]	Trace 0 trace buffer signal 5 floating point / Trace 0 rec sig 5
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - Calculated: - Dyn. index: - Unit group: - Scaling: - Max - Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 5.
Dependency:	Refer to: r4740, p4795

r4746[0...16383]	Trace 0 trace buffer signal 6 floating point / Trace 0 rec sig 6																		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	<table border="0"> <tr> <td>Can be changed: -</td> <td>Calculated: -</td> <td>Access level: 3</td> </tr> <tr> <td>Data type: FloatingPoint32</td> <td>Dyn. index: -</td> <td>Func. diagram: -</td> </tr> <tr> <td>P-Group: Trace and function generator</td> <td>Unit group: -</td> <td>Unit selection: -</td> </tr> <tr> <td>Not for motor type: -</td> <td>Scaling: -</td> <td>Expert list: 0</td> </tr> <tr> <td>Min</td> <td>Max</td> <td>Factory setting</td> </tr> <tr> <td>-</td> <td>-</td> <td>-</td> </tr> </table>	Can be changed: -	Calculated: -	Access level: 3	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	P-Group: Trace and function generator	Unit group: -	Unit selection: -	Not for motor type: -	Scaling: -	Expert list: 0	Min	Max	Factory setting	-	-	-
Can be changed: -	Calculated: -	Access level: 3																	
Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -																	
P-Group: Trace and function generator	Unit group: -	Unit selection: -																	
Not for motor type: -	Scaling: -	Expert list: 0																	
Min	Max	Factory setting																	
-	-	-																	
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 6.																		
Dependency:	Refer to: r4740, p4795																		

r4747[0...16383]	Trace 0 trace buffer signal 7 floating point / Trace 0 rec sig 7																		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	<table border="0"> <tr> <td>Can be changed: -</td> <td>Calculated: -</td> <td>Access level: 3</td> </tr> <tr> <td>Data type: FloatingPoint32</td> <td>Dyn. index: -</td> <td>Func. diagram: -</td> </tr> <tr> <td>P-Group: Trace and function generator</td> <td>Unit group: -</td> <td>Unit selection: -</td> </tr> <tr> <td>Not for motor type: -</td> <td>Scaling: -</td> <td>Expert list: 0</td> </tr> <tr> <td>Min</td> <td>Max</td> <td>Factory setting</td> </tr> <tr> <td>-</td> <td>-</td> <td>-</td> </tr> </table>	Can be changed: -	Calculated: -	Access level: 3	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	P-Group: Trace and function generator	Unit group: -	Unit selection: -	Not for motor type: -	Scaling: -	Expert list: 0	Min	Max	Factory setting	-	-	-
Can be changed: -	Calculated: -	Access level: 3																	
Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -																	
P-Group: Trace and function generator	Unit group: -	Unit selection: -																	
Not for motor type: -	Scaling: -	Expert list: 0																	
Min	Max	Factory setting																	
-	-	-																	
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 7.																		
Dependency:	Refer to: r4740, p4795																		

r4750[0...16383]	Trace 1 trace buffer signal 0 floating point / Trace 1 rec sig 0																		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	<table border="0"> <tr> <td>Can be changed: -</td> <td>Calculated: -</td> <td>Access level: 3</td> </tr> <tr> <td>Data type: FloatingPoint32</td> <td>Dyn. index: -</td> <td>Func. diagram: -</td> </tr> <tr> <td>P-Group: Trace and function generator</td> <td>Unit group: -</td> <td>Unit selection: -</td> </tr> <tr> <td>Not for motor type: -</td> <td>Scaling: -</td> <td>Expert list: 0</td> </tr> <tr> <td>Min</td> <td>Max</td> <td>Factory setting</td> </tr> <tr> <td>-</td> <td>-</td> <td>-</td> </tr> </table>	Can be changed: -	Calculated: -	Access level: 3	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	P-Group: Trace and function generator	Unit group: -	Unit selection: -	Not for motor type: -	Scaling: -	Expert list: 0	Min	Max	Factory setting	-	-	-

Description:	Displays the trace buffer (record buffer) for trace 1 and signal 2.																		
Dependency:	Refer to: r4740, p4795																		

2 Parameters

2.2 List of parameters

r4753[0...16383]	Trace 1 trace buffer signal 3 floating point / Trace 1 rec sig 3
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -
	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 3.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4754[0...16383]	Trace 1 trace buffer signal 4 floating point / Trace 1 rec sig 4
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -
	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 4.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4755[0...16383]	Trace 1 trace buffer signal 5 floating point / Trace 1 rec sig 5
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -
	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 5.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4756[0...16383]	Trace 1 trace buffer signal 6 floating point / Trace 1 rec sig 6
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -
	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 6.
Dependency:	Refer to: r4740, p4795
<hr/>	
r4757[0...16383]	Trace 1 trace buffer signal 7 floating point / Trace 1 rec sig 7
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -
	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -
	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 7.
Dependency:	Refer to: r4740, p4795

r4760[0...16383] Trace 0 trace buffer signal 0 / Trace 0 rec sig 0			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 0 as integer number.		
Note:	For signals, data type I32 or U32, the trace buffer is assigned as follows: r4760[0] = value 0 r4760[1] = value 1 ... r4760[8191] = value 8191 For signals, data type I16 or U16, the trace buffer is assigned as follows: r4760[0] = value 1 (bit 31 ... 16) and value 0 (bit 15 ... 0) r4760[1] = value 3 (bit 31 ... 16) and value 2 (bit 15 ... 0) ... r4760[8191] = value 16383 (bit 31 ... 16) and value 16382 (bit 15 ... 0) For signals, data type I8 or U8, the trace buffer is assigned as follows: r4760[0] = value 3 (bit 31 ... 24) value 2 (bit 23 ... 16) value 1 (bit 15 ... 8) value 0 (bit 7 ... 0) r4760[1] = value 7 (bit 31 ... 24) value 6 (bit 23 ... 16) value 5 (bit 15 ... 8) value 4 (bit 7 ... 0) ... r4760[8191] = value 32767 (bit 31 ... 24) value 32766 (bit 23 ... 16) value 32765 (bit 15 ... 8) value 32764 (bit 7 ... 0)		

r4761[0...16383] Trace 0 trace buffer signal 1 / Trace 0 rec sig 1			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 1.		
Dependency:	Refer to: r4760		

r4762[0...16383] Trace 0 trace buffer signal 2 / Trace 0 rec sig 2			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 2.		
Dependency:	Refer to: r4760		

2 Parameters

2.2 List of parameters

r4763[0...16383]	Trace 0 trace buffer signal 3 / Trace 0 rec sig 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 3.		
Dependency:	Refer to: r4760		
<hr/>			
r4764[0...16383]	Trace 0 trace buffer signal 4 / Trace 0 rec sig 4		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 4.		
Dependency:	Refer to: r4760		
<hr/>			
r4765[0...16383]	Trace 0 trace buffer signal 5 / Trace 0 rec sig 5		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 5.		
Dependency:	Refer to: r4760		
<hr/>			
r4766[0...16383]	Trace 0 trace buffer signal 6 / Trace 0 rec sig 6		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 6.		
Dependency:	Refer to: r4760		
<hr/>			
r4767[0...16383]	Trace 0 trace buffer signal 7 / Trace 0 rec sig 7		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 0 and signal 7.		
Dependency:	Refer to: r4760		

r4770[0...16383]	Trace 1 trace buffer signal 0 / Trace 1 rec sig 0		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 0.		
Dependency:	Refer to: r4760		
r4771[0...16383]	Trace 1 trace buffer signal 1 / Trace 1 rec sig 1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 1.		
Dependency:	Refer to: r4760		
r4772[0...16383]	Trace 1 trace buffer signal 2 / Trace 1 rec sig 2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 2.		
Dependency:	Refer to: r4760		
r4773[0...16383]	Trace 1 trace buffer signal 3 / Trace 1 rec sig 3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 3.		
Dependency:	Refer to: r4760		
r4774[0...16383]	Trace 1 trace buffer signal 4 / Trace 1 rec sig 4		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 4.		
Dependency:	Refer to: r4760		

r4775[0...16383] Trace 1 trace buffer signal 5 / Trace 1 rec sig 5			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 5.		
Dependency:	Refer to: r4760		
<hr/>			
r4776[0...16383] Trace 1 trace buffer signal 6 / Trace 1 rec sig 6			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 6.		
Dependency:	Refer to: r4760		
<hr/>			
r4777[0...16383] Trace 1 trace buffer signal 7 / Trace 1 rec sig 7			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the trace buffer (record buffer) for trace 1 and signal 7.		
Dependency:	Refer to: r4760		
<hr/>			
p4780[0...1] Trace physical address signal 0 / Trace PhyAddr Sig0			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the first signal to be traced. The data type is defined using p4730.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4781[0...1]	Trace physical address signal 1 / Trace PhyAddr Sig1		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the second signal to be traced. The data type is defined using p4731.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4782[0...1]	Trace physical address signal 2 / Trace PhyAddr Sig2		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the third signal to be traced. The data type is defined using p4732.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4783[0...1]	Trace physical address signal 3 / Trace PhyAddr Sig3		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the fourth signal to be traced. The data type is defined using p4733.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4784[0...1]	Trace physical address signal 4 / Trace PhyAddr Sig4		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the fifth signal to be traced. The data type is defined using p4734.		
Index:	[0] = Trace 0 [1] = Trace 1		

2 Parameters

2.2 List of parameters

p4785[0...1]	Trace physical address signal 5 / Trace PhyAddr Sig5		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the sixth signal to be traced. The data type is defined using p4735.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4786[0...1]	Trace physical address signal 6 / Trace PhyAddr Sig6		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the seventh signal to be traced. The data type is defined using p4736.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4787[0...1]	Trace physical address signal 7 / Trace PhyAddr Sig7		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 bin	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1111 1111 1111 1111 1111 1111 1111 1111 bin	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 bin
Description:	Sets the physical address for the eighth signal to be traced. The data type is defined using p4737.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4789[0...1]	Trace physical address trigger signal / Trace PhyAddr Trig		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0000 hex	Calculated: - Dyn. index: - Unit group: - Scaling: - Max FFFF FFFF hex	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0000 hex
Description:	Sets the physical address for the trigger signal. The data type is defined by making the appropriate selection in p4711.		
Index:	[0] = Trace 0 [1] = Trace 1		

r4790[0...1]	Trace data type 5 traced / Trace rec type 5		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 5 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
r4791[0...1]	Trace data type 6 traced / Trace rec type 6		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 6 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
r4792[0...1]	Trace data type 7 traced / Trace rec type 7		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 7 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
r4793[0...1]	Trace data type 8 traced / Trace rec type 8		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the recorded data type 8 for the trace.		
Index:	[0] = Trace 0 [1] = Trace 1		

p4795	Trace memory bank changeover / Trace mem chgov		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 500	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Changes over the memory bank to read out the contents of the trace buffer.		
Dependency:	Refer to: r4740, r4741, r4742, r4743, r4750, r4751, r4752, r4753		
r4797[0...1]	Trace 0 trigger instant / Trace 0 t_trigger		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the instant in time for fulfilling the trigger condition for trace recorder 0. The time comprises milliseconds (index 0) and days (index 1).		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r2114, r3102, r4719		
Notice:	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a μs accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.		
Note:	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).		
r4798[0...1]	Trace 1 trigger instant / Trace 1 t_trigger		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the instant in time for fulfilling the trigger condition for trace recorder 1. The time comprises milliseconds (index 0) and days (index 1).		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r2114, r3102, r4719		
Notice:	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a μs accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.		
Note:	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).		

r4799	Trace memory location free / Trace mem free		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the free memory for the trace in bytes.		
Dependency:	Refer to: r4708		
p4800	Function generator control / FG control		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 3	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	The function generator is started with p4800 = 1. The signal is only generated for a 1 signal of binector input p4819.		
Value:	0: Stop function generator 1: Start function generator 2: Check function generator parameterization 3: Start function generator without enable signals		
Dependency:	Refer to: p4819		
r4805	Function generator status / FG status		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 6	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the actual status of the function generator.		
Value:	0: Inactive 1: Generate accelerating ramp to offset 2: Generate parameterized signal shape 3: Generate brake ramp 4: Function generator stopped due to missing enable signals 5: Function generator waits for BI: p4819 6: Function generator parameterization has been checked		
Dependency:	Refer to: p4800, p4819		
r4806.0	BO: Function generator status signal / FG status signal		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the status of the function generator. 0 signal: Function generator inactive 1 signal: Function generator running		

2 Parameters

2.2 List of parameters

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Bit 0	ON	OFF	-
p4810	Function generator mode / FG operating mode				
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T		Calculated: -	Access level: 3	
	Data type: Integer16		Dyn. index: -	Func. diagram: -	
	P-Group: Trace and function generator		Unit group: -	Unit selection: -	
	Not for motor type: -		Scaling: -	Expert list: 0	
	Min		Max	Factory setting	
	0		99	0	
Description:	Sets the operating mode of the function generator.				
Value:	0: Connection at connector output r4818 1: Connection at current setpoint after filter and r4818 2: Connection as disturbing torque and r4818 3: Connection at speed setpoint after filter and r4818 4: Connection at current setpoint before filter and r4818 5: Connection at speed setpoint before filter and r4818 6: Connection for free measurement function r4818 and r4834 99: Connection at physical address and r4818				
p4812	Function generator physical address / FG phys address				
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T		Calculated: -	Access level: 3	
	Data type: Unsigned32		Dyn. index: -	Func. diagram: -	
	P-Group: Trace and function generator		Unit group: -	Unit selection: -	
	Not for motor type: -		Scaling: -	Expert list: 0	
	Min		Max	Factory setting	
	0		4294967295	0	
Description:	Sets the physical address where the function generator is to be connected.				
Dependency:	Only effective when p4810 = 99.				
p4813	Function generator physical address reference value / FG phys addr ref				
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T		Calculated: -	Access level: 3	
	Data type: FloatingPoint32		Dyn. index: -	Func. diagram: -	
	P-Group: Trace and function generator		Unit group: -	Unit selection: -	
	Not for motor type: -		Scaling: -	Expert list: 0	
	Min		Max	Factory setting	
	1.00		1000000.00	1.00	
Description:	Sets the reference value for 100 % for referred inputs.				
Dependency:	Only effective when p4810 = 99.				
p4815[0...2]	Function generator drive number / FG drive number				
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T		Calculated: -	Access level: 3	
	Data type: Unsigned16		Dyn. index: -	Func. diagram: -	
	P-Group: Trace and function generator		Unit group: -	Unit selection: -	
	Not for motor type: -		Scaling: -	Expert list: 0	
	Min		Max	Factory setting	
	0		65535	0	
Description:	Selects the required drive where the function generator is to be connected.				
Index:	[0] = First drive for connection [1] = Second drive for connection [2] = Third drive for connection				
Dependency:	Only effective when p4810 = 1, 2, 3, 4 or 5.				
Note:	For the function generator, only type SERVO, VECTOR or DC_CTRL type drives can be used.				

p4816	Function generator output signal integer number scaling / FG outp integ scal		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer32 P-Group: - Not for motor type: - Min -2147483648	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2147483647	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the scaling for the integer number of the output signal for the function generator.		
Dependency:	Refer to: r4805, r4817		
Note:	The parameter can only be changed in the following operating states: r4805 = 0, 4, 6		
r4817	CO: Function generator output signal integer number / FG outp integ no		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Display and connector output for the integer number of the output signal for the function generator.		
Dependency:	Refer to: p4816		
Note:	The value is output independent of the function generator operating mode.		
r4818	CO: Function generator output signal / FG outp_sig		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min - [%]	Calculated: - Dyn. index: - Unit group: - Scaling: PERCENT Max - [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting - [%]
Description:	Displays the output signal for the function generator.		
Dependency:	Refer to: p4810		
Note:	The value is displayed independently of the function generator mode.		
p4819	BI: Function generator control / FG control		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1
Description:	Sets the signal source to control the function generator. When the function generator is running, signal generation is stopped with binector p4819 = 0 signal and p4800 is set = 0.		
Dependency:	Refer to: p4800		

p4820	Function generator signal shape / FG signal shape		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: - Min 1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 5	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1

Description: Sets the signal to be generated for the function generator.
Value:
 1: Square-wave
 2: Staircase
 3: Delta
 4: Binary noise - PRBS (Pseudo Random Binary Signal)
 5: Sine-wave

p4821	Function generator period / FG period duration		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 1000.00 [ms]

Description: Sets the period of the signal to be generated for the function generator.
Dependency: Ineffective when p4820 = 4 (PRBS).

p4822	Function generator pulse width / FG pulse width		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 60000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 500.00 [ms]

Description: Sets the pulse width for the signal to be generated for the function generator.
Dependency: Only effective when p4820 = 1 (square-wave).

p4823	Function generator bandwidth / FG bandwidth		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.0025 [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 16000.0000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 4000.0000 [Hz]

Description: Sets the bandwidth for the signal to be generated for the function generator.
Dependency: Only effective when p4820 = 4 (PRBS).
 Refer to: p4830
 Refer to: A02041

p4824	Function generator amplitude / FG amplitude		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 5.00 [%]
Description:	Sets the amplitude for the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		
p4825	Function generator 2nd amplitude / FG 2nd amplitude		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 7.00 [%]
Description:	Sets the second amplitude for the signal to be generated for the function generator.		
Dependency:	Only effective for p4820 = 2 (staircase). Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		
p4826	Function generator offset / FG offset		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -1600.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1600.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.00 [%]
Description:	Sets the offset (DC component) of the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The offset is referred to p2002 (reference current). If p4810 = 3, 5: The offset is referred to p2000 (reference speed). If p4810 = 2: In order to avoid the undesirable effects of play (backlash), the offset does not act on the current setpoint, but instead on the speed setpoint.		
p4827	Function generator ramp-up time to offset / FG ramp-up offset		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 100000.00 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 32.00 [ms]
Description:	Sets the ramp-up time to the offset for the function generator.		

2 Parameters

2.2 List of parameters

p4828	Function generator lower limit / FG lower limit		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -10000.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 0.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -100.00 [%]
Description:	Sets the lower limit for the function generator.		
Dependency:	For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).		
p4829	Function generator upper limit / FG upper limit		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10000.00 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00 [%]
Description:	Sets the upper limit for the function generator.		
Dependency:	For p4810 = 2 the limit only applies to the current setpoint, but not the speed setpoint (offset).		
p4830	Function generator time slice cycle / FG time slice		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.03125 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2.00000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0.12500 [ms]
Description:	Sets the time slice cycle in which the function generator is called.		
p4831	Function generator amplitude scaling / FG amplitude scal		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min 0.00000 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 200.00000 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]
Description:	Sets the scaling for the amplitude of the signal waveforms for all output channels. The value can be changed while the function generator is running.		
p4832[0...2]	Function generator amplitude scaling / FG amplitude scal		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: - Min -340.28235E36 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 340.28235E36 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 100.00000 [%]
Description:	Sets the scaling for the amplitude of the signal waveforms separately for each output channel. The value cannot be changed while the function generator is running.		

Index: [0] = First drive for connection
[1] = Second drive for connection
[2] = Third drive for connection

p4833[0...2]**Function generator offset scaling / FG offset scal**

CU_I, CU_NX_CX,	Can be changed: U, T	Calculated: -	Access level: 3
CU_S_AC_DP,	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
CU_S_AC_PN,	P-Group: Trace and function generator	Unit group: -	Unit selection: -
CU_S120_PN,	Not for motor type: -	Scaling: -	Expert list: 0
CU_S150_PN,	Min	Max	Factory setting
CU_S120_DP,	-340.28235E36 [%]	340.28235E36 [%]	100.00000 [%]
CU_S150_DP,			
CU_I_D410			

Description: Sets the scaling for the offset of the signal waveforms separately for each output channel.
The value cannot be changed while the function generator is running.

Index: [0] = First drive for connection
[1] = Second drive for connection
[2] = Third drive for connection

r4834[0...4]**CO: Function generator free measurement output signal / FG fr MeasFct outp**

CU_I, CU_NX_CX,	Can be changed: -	Calculated: -	Access level: 3
CU_S_AC_DP,	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
CU_S_AC_PN,	P-Group: Trace and function generator	Unit group: -	Unit selection: -
CU_S120_PN,	Not for motor type: -	Scaling: PERCENT	Expert list: 0
CU_S150_PN,	Min	Max	Factory setting
CU_S120_DP,	- [%]	- [%]	- [%]
CU_S150_DP,			
CU_I_D410			

Description: Displays the output signal for the free measurement function.

Index: [0] = Signal 1
[1] = Signal 2
[2] = Signal 3
[3] = Signal 4
[4] = Signal 5

Dependency: Refer to: p4810

Note: The signals are only output in the "free measurement function" operating mode (p4810 = 6)

p4835[0...4]**Function generator free measurement function scaling / FG fr MeasFct scal**

CU_I, CU_NX_CX,	Can be changed: U, T	Calculated: -	Access level: 3
CU_S_AC_DP,	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
CU_S_AC_PN,	P-Group: Trace and function generator	Unit group: -	Unit selection: -
CU_S120_PN,	Not for motor type: -	Scaling: -	Expert list: 0
CU_S150_PN,	Min	Max	Factory setting
CU_S120_DP,	-200.00000 [%]	200.00000 [%]	100.00000 [%]
CU_S150_DP,			
CU_I_D410			

Description: Sets the scaling of the output signals for the free measurement function.

Index: [0] = Signal 1
[1] = Signal 2
[2] = Signal 3
[3] = Signal 4
[4] = Signal 5

Note: The parameter cannot be changed when the measurement function has been started (r4706 = 2, 3).

2 Parameters

2.2 List of parameters

p4840[0...1]	MTrace cycle number setting / Cycle number		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 4294967295	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the number of cycles of a multiple trace. The multiple trace is deactivated with a value = 0. The multiple trace is permanently activated for a value >= 100000.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: r4841, p4844 Refer to: A02097, A02098		
Notice:	A multiple trace can have a negative impact on the total system performance. From their inherent principle of operation, flash memory cards are subject to wear as a result of write operations. As a consequence, the lifetime of flash memory cards is reduced when using the multiple trace functionality.		
r4841[0...1]	MTrace cycle actual display / Cycle act display		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: Trace and function generator Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting -
Description:	Displays the currently running cycle (including deadtime) of the multiple trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: p4840, p4844		
p4844[0...1]	MTrace ring buffer files number / Ring buff file qty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: T Data type: Unsigned16 P-Group: Trace and function generator Not for motor type: - Min 10	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 10
Description:	Sets the number of ring buffer files for the measurement results of the multiple trace.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: p4840, r4841		

2 Parameters

2.2 List of parameters

Note: The GUID of a Technology Extension comprises 16 characters plus 1 character major information plus 1 character, minor information.
GUID: Globally Unique Identifier
TEC: Technology Extension

r4955[0...n]	TEC DO-specific identifier / TEC DO ident		
All objects	Can be changed: - Data type: Unsigned8 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4951 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the identifier of the Technology Extensions installed on this drive object. r4955[0...8]: Identifier of Technology Extension 1 r4955[9...17]: Identifier of Technology Extension 2, ...		
Dependency:	Refer to: r4950, r4951, r4952, p4956, r4957, r4958, r4959, r4960		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension		

p4956[0...n]	TEC DO-specific activation / TEC DO act		
All objects	Can be changed: C1, T Data type: Integer16 P-Group: OEM range Not for motor type: - Min 0	Calculated: - Dyn. index: r4950 Unit group: - Scaling: - Max 1	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Setting to activate the Technology Extensions installed on this drive object. r4956[0]: Activation of Technology Extension 1 r4956[1]: Activation of Technology Extension 2, ...		
Value:	0: Technology Extension inactive 1: Technology Extension active		
Dependency:	Refer to: r4950, r4951, r4952, r4955, r4957, r4958, r4959, r4960		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension		

r4957[0...n]	TEC DO-specific version / TEC DO version		
All objects	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min 0	Calculated: - Dyn. index: r4950 Unit group: - Scaling: - Max 4294967295	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the version of the Technology Extensions installed on this drive object. r4957[0]: Version of Technology Extension 1 r4957[1]: Version of Technology Extension 2, ...		
Dependency:	Refer to: r4950, r4951, r4952, r4955, p4956, r4958, r4959, r4960		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension Example: The value 1010100 should be interpreted as V01.01.01.00.		

r4958[0...n]	TEC DO-specific interface version / TEC DO intf_vers		
All objects	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: r4950	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the interface version of Technology Extensions installed on this drive object. r4958[0]: Interface version of Technology Extension 1 r4958[1]: Interface version of Technology Extension 2, ...		
Dependency:	Refer to: r4950, r4951, r4952, r4955, p4956, r4957, r4959, r4960		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension Example: The value 1010100 should be interpreted as V01.01.01.00.		
r4959[0...n]	TEC DO-specific GUID / TEC DO GUID		
All objects	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned8	Dyn. index: r4952	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the GUIDs of the Technology Extensions installed on this drive object. r4959[0...15]: GUID of Technology Extension 1 r4959[16]: Major information of Technology Extension 1 r4959[17]: Minor information of Technology Extension 1 r4959[18...33]: GUID of Technology Extension 2 r4959[34]: Major information of Technology Extension 2 r4959[35]: Minor information of Technology Extension 2, ...		
Dependency:	Refer to: r4950, r4951, r4952, r4955, p4956, r4957, r4958, r4960		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension		
r4960[0...n]	TEC DO-specific GUID drive object / TEC DO GUID DO		
All objects	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned8	Dyn. index: r4952	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the GUIDs of this drive object of the Technology Extensions installed on the memory card/device memory. r4960[0...15]: GUID of this drive object of Technology Extension 1 r4960[16]: Major information of this drive object of Technology Extension 1 r4960[17]: Minor information of this drive object of Technology Extension 1 r4960[18...33]: GUID of this drive object of Technology Extension 2 r4960[34]: Major information of this drive object of Technology Extension 2 r4960[35]: Minor information of this drive object of Technology Extension 2, ...		
Dependency:	Refer to: r4950, r4951, r4952, r4955, p4956, r4957, r4958, r4959		
Notice:	This parameter is only indexed if at least one drive object-specific Technology Extension exists (p4950 > 0).		
Note:	TEC: Technology Extension		

2 Parameters

2.2 List of parameters

p4961[0...n]	TEC DO-specific logbook module selection / TEC DO log module		
All objects	Can be changed: T	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: r4950	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0000 hex	FFFF FFFF hex	0000 hex
Description:	Only for service purposes.		
Note:	TEC: Technology Extension		
<hr/>			
r4975	TEC invalid number / TEC inv qty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the number of invalid Technology Extensions installed on the memory card/device memory.		
Dependency:	Refer to: r4976, r4978, r4979		
Note:	TEC: Technology Extension		
<hr/>			
r4976	TEC invalid identifier total length / TEC inval ID tot_l		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the total length of the IDs of all the invalid Technology Extensions installed on the memory card/device memory.		
Dependency:	Refer to: r4975, r4978, r4979		
Note:	TEC: Technology Extension The identifier of an invalid Technology Extension comprises a maximum of 8 characters plus separator.		
<hr/>			
r4978[0...n]	TEC invalid identifier / TEC inval ID		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned8	Dyn. index: r4976	Func. diagram: -
	P-Group: OEM range	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the IDs of all the invalid Technology Extensions installed on the memory card/device memory. r4978[0...8]: Identifier of invalid Technology Extension 1 r4978[9...17]: Identifier of invalid Technology Extension 2, ...		
Dependency:	Refer to: r4975, r4976, r4979		
Notice:	This parameter is only indexed if at least one invalid Technology Extension exists (p4975 > 0).		
Note:	TEC: Technology Extension		

r4979[0...n]	TEC invalid error code / TEC inv error code		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4975 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the error code of the invalid Technology Extensions installed on the memory card/device memory. r4979[0]: error code from Technology Extension 1 r4979[1]: error code from Technology Extension 2, ...		
Dependency:	Refer to: r4975, r4976, r4978		
Notice:	This parameter is only indexed if at least one invalid Technology Extension exists (p4975 > 0).		
Note:	TEC: Technology Extension The value in the error code must be interpreted in binary form. The bits have the following meaning: Bit 00: Incompatible version of the TEC interface. Bit 01: Technology Extension could not be loaded. Bit 02: Incorrect description files. Bit 03: Technology Extension does not define a CPU type. Bit 04: Technology Extension for this device not available (incorrect CPU type). Bit 05: Technology Extension for this device not available (incorrect type ID). Bit 06: Incorrect description files (Const/Startup incompatible). Bit 07: Number range of the Technology Extension overlaps with the number range of another Technology Extension Bit 08: No compatible custom interface was found. Bit 09: The custom interface defined by the Technology Extension already exists. Bit 10: The version of the System Technology Extension differs from the SINAMICS firmware version.		
r4985	TEC number / TEC qty		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned16 P-Group: OEM range Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 32	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the number of Technology Extensions installed on the memory card/device memory.		
Dependency:	Refer to: r4986, r4987, r4988, r4989, r4990, r4991, r4992, r4993, r4994

Dependency:	Refer to: r4985, r4987, r4988, r4989, r4990, r4991, r4992, r4993, r4994		
Note:	TEC: Technology Extension The identifier of a Technology Extension comprises a maximum of 8 characters plus separator.		

2 Parameters

2.2 List of parameters

r4987	TEC GUID total length / TEC GUID tot_lgth			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned16 P-Group: OEM range Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 576	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the total length of the GUIDs of all the Technology Extensions installed on the memory card/device memory.			
Dependency:	Refer to: r4985, r4986, r4988, r4989, r4990, r4991, r4992, r4993, r4994			
Note:	The GUID of a Technology Extension comprises 16 characters plus 1 character major information plus 1 character, minor information. GUID: Globally Unique Identifier TEC: Technology Extension			
r4988[0...n]	TEC identifier / TEC ident			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned8 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4986 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the IDs of all the Technology Extensions installed on the memory card/device memory. r4988[0...8]: Identifier of Technology Extension 1 r4988[9...17]: Identifier of Technology Extension 2, ...			
Dependency:	Refer to: r4985, r4986, r4987, r4989, r4990, r4991, r4992, r4993, r4994			
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).			
Note:	TEC: Technology Extension			
r4989[0...n]	TEC version / TEC version			
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4985 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the version of all the Technology Extensions installed on the memory card/device memory. r4989[0]: Version of Technology Extension 1 r4989[1]: Version of Technology Extension 2, ...			
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4990, r4991, r4992, r4993, r4994			
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).			
Note:	TEC: Technology Extension Example: The value 1010100 should be interpreted as V01.01.01.00.			

r4990[0...n]	TEC interface version / TEC intf_vers		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4985 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the interface version of all the Technology Extensions installed on the memory card/device memory. r4990[0]: Interface version of Technology Extension 1 r4990[1]: Interface version of Technology Extension 2, ...		
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4989, r4991, r4992, r4993, r4994		
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).		
Note:	TEC: Technology Extension Example: The value 1010100 should be interpreted as V01.01.01.00.		
r4991[0...n]	TEC GUID / TEC GUID		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned8 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4987 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the GUIDs of all the Technology Extensions installed on the memory card/device memory. r4991[0...15]: GUID of Technology Extension 1 r4991[16]: Major information of Technology Extension 1 r4991[17]: Minor information of Technology Extension 1 r4991[18...33]: GUID of Technology Extension 2 r4991[34]: Major information of Technology Extension 2 r4991[35]: Minor information of Technology Extension 2, ...		
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4989, r4990, r4992, r4993, r4994		
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).		
Note:	TEC: Technology Extension		
r4992[0...n]	TEC GUID ES / TEC GUID ES		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned8 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4987 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the GUIDs of all the Technology Extensions installed on the memory card/device memory. r4992[0...15]: GUID of Technology Extension 1 r4992[16]: Major information of Technology Extension 1 r4992[17]: Minor information of Technology Extension 1 r4992[18...33]: GUID of Technology Extension 2 r4992[34]: Major information of Technology Extension 2 r4992[35]: Minor information of Technology Extension 2, ...		
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4989, r4990, r4991, r4993, r4994		
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).		
Note:	TEC: Technology Extension		

r4993[0...n]		TEC activation status / TEC act stat		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Integer16 P-Group: OEM range Not for motor type: - Min 0	Calculated: - Dyn. index: r4985 Unit group: - Scaling: - Max 1	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the activation status of the Technology Extensions installed on the memory card/device memory. r4993[0]: Activation of Technology Extension 1 r4993[1]: Activation of Technology Extension 2, ...			
Value:	0: Technology Extension inactive 1: Technology Extension active			
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4989, r4990, r4991, r4992, r4994			
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).			
Note:	TEC: Technology Extension			

r4994[0...n]		TEC properties / TEC properties																																											
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4985 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -

Dependency:	Refer to: r4985, r4986, r4987, r4988, r4989, r4990, r4991, r4992, r4993																																												
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).																																												
Note:	TEC: Technology Extension The parameter is only for internal Siemens diagnostics.																																												

r4995[0...n]		TEC external version / TEC ext version		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: - Data type: Unsigned32 P-Group: OEM range Not for motor type: - Min -	Calculated: - Dyn. index: r4985 Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the external version of all the Technology Extensions installed on the memory card/device memory. r4995[0]: External version of Technology Extension 1 r4995[1]: External version of Technology Extension 2, ...			
Dependency:	Refer to: r4985, r4986, r4987, r4988, r4990, r4991, r4992, r4993, r4994			
Notice:	This parameter is only indexed if at least one Technology Extension exists (p4985 > 0).			

Note: Example:
The value 1010100 should be interpreted as V01.01.01.00.

r5000	CO: Spindle properties/status / Prop/status		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the properties supported by the spindle hardware and status.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Spindle functionality available	Yes	No	-
	01	Sensor S1 available	Yes	No	-
	04	Sensor S4 available	Yes	No	-
	05	Sensor S5 available	Yes	No	-
	06	Sensor S6 available	Yes	No	-
	10	State machine enabled	Yes	No	-
	11	Parameter p5043 changed	State 2	State 1	-

Note: This display value is contained in the manufacturer-specific telegram 139 (SP_CONFIG).
For bit 11:
After each change in p5043[0...6] the signal level of this bit is changed.

r5001	CO: Spindle clamp state / Clamp state		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	11	-

Description: Display and connector output for the clamped state.
Message A3x940 is output in states 2 and 11.
The voltage threshold values for the states can be set using parameter p5041. The hysteresis is adapted using parameter p5040.
The transition from state 4 to states 7, 8 or 10 can be influenced by the wait time p5042[0].
A transition is made into state 10 if the analog value in p5002 falls below the voltage threshold value in p5041[4].
However, if the analog value p5002 lies below the voltage threshold value in p5041[2] and the wait time in p5042[0] has expired, then a transition is made into state 7 or 8 - otherwise state 4 is kept.

Value:

- 0: System being initialized
- 1: State being initialized
- 2: Released with message
- 3: Released without message
- 4: Clamping
- 5: Releasing
- 6: Releasing without tool
- 7: Clamped with tool (S4 inactive)
- 8: Clamped with tool (S4 active)
- 9: Clamping without tool
- 10: Clamped without tool
- 11: Clamped with message

Dependency: Refer to: r5002, r5003, p5040, p5041, p5042

Note: This display value is contained in the manufacturer-specific telegram 139 (SP_ZSW).

2 Parameters

2.2 List of parameters

r5002	CO: Spindle analog sensor S1 measured value / Ana_sensS1 MeasVal		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and connector output for the measured value from analog sensor S1 (1 increment = 1 mV).

Note: This display value is contained in the manufacturer-specific telegram 139 (SP_XIST_A).

r5003	CO: Spindle digital sensors status / Dig_sens status		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 1
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and connector output for the status of the digital sensors.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	04	Sensor S4 piston end position reached	Yes	No	-
	05	Sensor S5 axis position OK	Yes	No	-
	06	Sensor S6 reserved	-	-	-

Note: This display value is contained in the manufacturer-specific telegram 139 (SP_XIST_D).

r5004	CO: Spindle supplementary value / Spindle suppl_val		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Display and connector output for the measured value from sensor S5 (1 increment = 1 mV).

Note: This display value is contained in the manufacturer-specific telegram 139.

r5005	Spindle file system status / File sys stat		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the status for the file system on the non-volatile memory.

The individual result data and characteristic data are summarized in a corresponding file.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Result data clamping cycle thresholds available	Yes	No	-
	02	Result data clamping cycle counter available	Yes	No	-
	03	Result data operating hours counter available	Yes	No	-
	04	Result data temperature diagnostics available	Yes	No	-
	05	Result data real time clock synchronization available	Yes	No	-

06	Result data speed/torque matrix available	Yes	No	-
10	Result data collision detection available	Yes	No	-
11	Result data system detection available	Yes	No	-
16	Characteristic data spindle available	Yes	No	-
17	Characteristic data clamping cycle counter available	Yes	No	-
19	Characteristic data operating hours counter available	Yes	No	-
20	Characteristic data temperature diagnostics available	Yes	No	-
22	Characteristic data speed/torque matrix available	Yes	No	-
30	Characteristic data sensor description available	Yes	No	-
31	Characteristic data sensor calibration data available	Yes	No	-

Note: This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).

0000 0000 0000 0000 0000
0000 0000 0000 bin

Description: Sets the files to adapt the file system.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
01	Result data clamping cycle thresholds selected	Yes	No	-
02	Result data clamping cycle counter selected	Yes	No	-
03	Result data operating hours counter selected	Yes	No	-
04	Result data temperature diagnostics selected	Yes	No	-
05	Result data real time clock synchronization selected	Yes	No	-
06	Result data speed/torque matrix selected	Yes	No	-
10	Result data collision detection selected	Yes	No	-
11	Result data system detection selected	Yes	No	-
17	Characteristic data clamping cycle counter selected	Yes	No	-
19	Characteristic data operating hours counter selected	Yes	No	-
20	Characteristic data temperature diagnostics selected	Yes	No	-
22	Characteristic data speed/torque matrix selected	Yes	No	-

Note: This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).

The action to adapt the selected files is selected in p5009.

For bit 01:

The action selected in p5009 only becomes immediately effective for this bit.

For bit 02 ... 22:

Only for internal Siemens use.

For these bits, after setting p5009 a hardware reset is required.

p5009	Adapt spindle file system / Adpt file sys		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	53	0
Description:	Setting to adapt the file system on the non-volatile memory. Example: The result data "clamping cycle thresholds" are available (r5005.1 = 1) and should be reset. --> set p5007.1 = 1: select result data "clamping cycle thresholds". --> set p5009 = 1: initiate "reset" function for the file selected in p5007. --> p5009 = 40: feedback signal during "operation running". --> p5009 = 20: feedback signal for a successfully completed operation. --> p5009 = 51 ... 53: fault values if the operation was not able to be successfully completed. --> carry out a POWER ON (switch-off/switch-on).		
Value:	0: No function 1: Reset 2: Set invalid 3: Reserved 5: Set valid 20: Operation successfully completed. 40: Operation running 51: Function not supported 52: File access unsuccessful 53: Operation unsuccessful		
Note:	This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24). Help for fault value = 51 ... 53: - repeat the operation.		

r5012	Spindle Sensor Module properties / SM properties				
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 4		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -		
	P-Group: -	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the Sensor Module Integrated 24 (SMI24) properties.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Display diagnostics stamp in UTC	Yes	No	-
	01	Clamping state counter extended	Yes	No	-
	02	Release times display available	Yes	No	-
	03	Release times available	Yes	No	-

p5016	Enable spindle commissioning / Enable com		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: All groups	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Setting to enable/inhibit spindle commissioning. Enabling spindle commissioning results in the spindle parameters being reset after commissioning has been initiated (e.g. via p0340 > 0 or p3900 > 0). Depending on the spindle configuration, the following parameters are reset: p0353, p0410, p0431, p0922, p1231, p1300, p1980, p1981, p1982		
Value:	0: Spindle commissioning enabled 1: Spindle commissioning inhibited		
Dependency:	Refer to: p0340, p3900		
Note:	This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24). The parameter is automatically set to a value of 1 after exiting commissioning (p0009 = 0).		
p5019	Spindle password / Password		
CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Sets the password for the spindle diagnostics write parameters. Number range for spindle diagnostics: 5000 ... 5169		
Note:	This parameter can only be used in conjunction with a Sensor Module Integrated 24 (SMI24).		
r5020	Spindle manufacturer / Manufacturer		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -

	Min	Max	Factory setting
	0	48	-
Description:	Displays the spindle manufacturer.		
Value:	0: Unknown 1: Siemens AG Automation and Drives 32: Reserved 33: Reserved 48: WEISS Spindeltechnologie GmbH		
r5021[0...18]	Spindle article number / Article no		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned8	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the article number (MLFB) or drawing number of the spindle.		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.		

2 Parameters

2.2 List of parameters

r5022[0...15]	Spindle serial number / Serial_no			
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: - Data type: Unsigned8 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the spindle serial number.			
Note:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.			
<hr/>				
r5023	Spindle production date / Prod_date			
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: - Data type: Unsigned32 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the production date of the spindle.			
Note:	Format: yyyyymmdd			
<hr/>				
r5032	Maximum spindle speed / n_max			
SERVO (Lin, Spin_diag), SERVO_AC (Lin, Spin_diag), SERVO_I_AC (Lin, Spin_diag)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [m/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [m/min]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [m/min]	
Description:	Displays the maximum spindle speed.			
Note:	The highest possible (maximum) speed is set using p1082 (p1082 <= r5032).			
<hr/>				
r5032	Maximum spindle speed / n_max			
SERVO (Spin_diag), SERVO_AC (Spin_diag), SERVO_I_AC (Spin_diag)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [rpm]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [rpm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [rpm]	
Description:	Displays the maximum spindle speed.			
Note:	The highest possible (maximum) speed is set using p1082 (p1082 <= r5032).			
<hr/>				
r5033	Spindle angular commutation offset / Commut_ang_offs			
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [°]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [°]	
Description:	Displays the angular commutation offset for the spindle encoder.			
Note:	When exiting commissioning, the value is transferred into p0431.			

r5034	Spindle current controller sampling time maximum / I_ctrl t_samp max		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [µs]	- [µs]	- [µs]
Description:	Displays the maximum recommended sampling time for the spindle current controller. The current controller sampling time must be set greater than the value in p0112 or p0115[0]. For r5034 < p0115[0], alarm A07140 is output.		
Dependency:	Refer to: A07140		
p5040	Spindle voltage threshold values tolerance / U_thr tol		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [mV]	1000.0 [mV]	0.0 [mV]
Description:	Sets the voltage tolerance for the voltage threshold values. The tolerance acts symmetrically around the individual voltage threshold values (p5041[0...5]).		
Dependency:	Refer to: r5001, r5002, p5041		
p5041[0...5]	Spindle voltage threshold values / U_thresh		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [mV]	340.28235E36 [mV]	0.0 [mV]
Description:	Sets the voltage threshold values for the spindle.		
Index:	[0] = Released (upper limit) [1] = Released (lower limit) [2] = Clamped with tool (upper limit) [3] = Clamped with tool (lower limit) [4] = Clamped without tool (upper limit) [5] = Clamped without tool (lower limit)		
Dependency:	Refer to: r5001, r5002, p5040		
Note:	Only values can be entered, which do not overlap, taking into consideration the set tolerance (p5040).		

p5042[0...1]		Spindle transition times / t_transition		
SERVO (Spin_diag), SERVO_AC (Spin_diag)	Can be changed: T	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [µs]	340.28235E36 [µs]	0.0 [µs]	
Description:	Sets the transition times for the clamping state machine of the spindle. For index [0]: Sets the maximum time for staying in the state r5001 = 4, before a transition is made to state r5001 = 10 or 7/8. A higher value can force a direct transition from state r5001 = 4 to 10 without passing through the states r5001 = 7/8 and 9. For index [1]: Sets the maximum time for clamping without tool (see clamping operations inside and outside the tolerance in p5045).			
Index:	[0] = Stabilization time for "clamped with tool" [1] = Maximum time to clamp			
Dependency:	Refer to: r5001, r5002			
Note:	The input is limited to a maximum value of 20 seconds.			
p5043[0...6]		Spindle speed limits / n_limits		
SERVO (Lin, Spin_diag), SERVO_AC (Lin, Spin_diag), SERVO_I_AC (Lin, Spin_diag)	Can be changed: T	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0.0 [m/min]	65535.0 [m/min]	0.0 [m/min]	
Description:	Sets the speed limits for the clamping state machine of the spindle. For index [0]: Valid for state r5001 = 3. For index [1]: Valid for state r5001 = 4. For index [2]: Valid for state r5001 = 5. For index [3]: Valid for state r5001 = 6. For index [4]: Valid for state r5001 = 7/8. For index [5]: Valid for state r5001 = 9. For index [6]: Valid for state r5001 = 10.			
Index:	[0] = Released [1] = Clamping [2] = Releasing from the state "clamped with tool" [3] = Releasing from the state "clamped without tool" [4] = Clamped with tool [5] = Clamping without tool [6] = Clamped without tool			
Dependency:	Refer to: r5001			
Note:	For state r5001 = 0, 1, 2 or 11, the fixed speed limit 0 applies.			

p5043[0...6]	Spindle speed limits / n_limits		
SERVO (Spin_diag), SERVO_AC (Spin_diag), SERVO_I_AC (Spin_diag)	Can be changed: T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [rpm]	65535.0 [rpm]	0.0 [rpm]
Description:	Sets the speed limits for the clamping state machine of the spindle. For index [0]: Valid for state r5001 = 3. For index [1]: Valid for state r5001 = 4. For index [2]: Valid for state r5001 = 5. For index [3]: Valid for state r5001 = 6. For index [4]: Valid for state r5001 = 7/8. For index [5]: Valid for state r5001 = 9. For index [6]: Valid for state r5001 = 10.		
Index:	[0] = Released [1] = Clamping [2] = Releasing from the state "clamped with tool" [3] = Releasing from the state "clamped without tool" [4] = Clamped with tool [5] = Clamping without tool [6] = Clamped without tool		
Dependency:	Refer to: r5001		
Note:	For state r5001 = 0, 1, 2 or 11, the fixed speed limit 0 applies.		

r5044	Maximum permissible spindle velocity limit / Sp v_lim MaxPerm		
SERVO (Lin, Spin_diag), SERVO_AC (Lin, Spin_diag), SERVO_I_AC (Lin, Spin_diag)	Can be changed: -	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [m/min]	- [m/min]	- [m/min]
Description:	Displays the maximum permissible velocity limit.		
Dependency:	Refer to: r5001, p5043		
Note:	Currently, the velocity limit is only displayed for the state "clamped without tool". The velocity limit set in p5043[6] is effective. Value = 65535: velocity limit not active.		

r5044	Maximum permissible spindle speed limit / Sp n_lim MaxPerm		
SERVO (Spin_diag), SERVO_AC (Spin_diag), SERVO_I_AC (Spin_diag)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [rpm]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [rpm]	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [rpm]
Description:	Displays the maximum permissible speed limit.		
Dependency:	Refer to: r5001, p5043		
Note:	Currently, the speed limit is only displayed for the state "clamped without tool". The speed limit set in p5043[6] is effective. Value = 65535: speed limit not active.		
r5170[0...5]	HF phase current actual values / HF I_ph ActV		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [A]	Calculated: - Dyn. index: - Unit group: 6_5 Scaling: p2002 Max - [A]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [A]
Description:	Displays the measured phase currents as peak value.		
Index:	[0] = Phase U motor current [1] = Phase V motor current [2] = Phase W motor current [3] = Phase U capacitor current [4] = Phase V capacitor current [5] = Phase W capacitor current		
Dependency:	Refer to: r0069		
Note:	HF: High Frequency Drive For index [0...2]: The 3 motor phase currents are displayed. For index [3...5]: The currents in the filter capacitors of the 3 phases are displayed.		
r5171	CO: HF damping voltage actual value / HF U_damp ActV		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [V]	Calculated: - Dyn. index: - Unit group: 5_2 Scaling: p2001 Max - [V]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [V]
Description:	Displays the actual value of the damping voltage.		
Dependency:	Refer to: F37002		
Note:	HF: High Frequency Drive		

r5172[0...3]	CO: HF temperatures / HF temp		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: 21_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2006	Expert list: 1
	Min	Max	Factory setting
	- [°C]	- [°C]	- [°C]
Description:	Displays the temperatures in the HF Choke Module and HF Damping Module.		
Index:	[0] = HF Choke Module heat sink [1] = HF Damping Module heat sink [2] = HF Damping Module assembly [3] = HF Damping Module depletion layer		
Note:	The value of -200 indicates that there is no measuring signal. HF Choke Module (reactor module) HF Damping Module HF: High Frequency Drive		

r5173	CO: HF Damping Module I2t overload / HF DM overl I2t		
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	- [%]	- [%]	- [%]
Description:	Displays the overload of the filter capacitors of the HF Damping Module determined using an I2t calculation.		
Note:	HF Damping Module		

p5174	HF control word / HF control word				
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: T	Calculated: CALC_MOD_REG	Access level: 4		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 bin		
Description:	Setting the HF control word.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Supplementary capacitor active	Yes	No	-
	01	Activate damping	Continuously	For pulse enable	-
Note:	For bit 00: This bit can be used to compensate the filter resonance frequency shift for low motor inductances. For bit 01: Is used for diagnostic purposes.				

2 Parameters

2.2 List of parameters

r5175[0...1]	HF diagnostics / HF diag				
SERVO, SERVO_AC, SERVO_I_AC	Can be changed: -	Calculated: -	Access level: 4		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Displays the status and control word for the HF Damping Module.				
Index:	[0] = HF Damping Module status word [1] = HF Damping Module control word				
Note:	HF Damping Module				
p5200[0...n]	Current setpoint filter 5 ... 10 activation / I_set_filt act				
SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3		
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: 5711		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0000 bin		
Description:	Setting for activating/deactivating the current setpoint filter.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Filter 5	Active	Inactive	-
	01	Filter 6	Active	Inactive	-
	02	Filter 7	Active	Inactive	-
	03	Filter 8	Active	Inactive	-
	04	Filter 9	Active	Inactive	-
	05	Filter 10	Active	Inactive	-
Dependency:	The individual current setpoint filters are parameterized from p5201 and higher.				
Note:	If not all of the filters are required, then the filters should be used consecutively starting from filter 1.				
p5200	Signal filter activation / Sig_filt act				
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8946		
	P-Group: Closed-loop control	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 bin		
Description:	Setting for activating/deactivating the signal filter.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Filter 5	Active	Inactive	-
	02	Filter 7	Active	Inactive	-
Dependency:	Filter 5 is parameterized from p5201 and higher. Filter 7 is parameterized from p5211 and higher.				

p5201[0...n]	Current setpoint filter 5 type / I_set_filt 5 type		
SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T Data type: Integer16 P-Group: Closed-loop control Not for motor type: REL Min 1	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: 5711 Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets current setpoint filter 5 as lowpass filter (PT2) or general 2nd order filter.		
Value:	1: PT2 low pass 2: General 2nd order filter		
Dependency:	Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.		
Note:	For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$		
p5201	Output voltage setpoint filter 5 type / U_set_filt 5 type		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T Data type: Integer16 P-Group: Closed-loop control Not for motor type: - Min 1	Calculated: CALC_MOD_CON Dyn. index: - Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: 8946 Unit selection: - Expert list: 1 Factory setting 2
Description:	Sets the type for the output voltage setpoint filter 5.		
Value:	1: PT2 low pass 2: General 2nd order filter		
Dependency:	Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.		
Note:	For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$		
p5202[0...n]	Current setpoint filter 5 denominator natural frequency / I_set_filt5 fn_den		
SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.5 [Hz]	Calculated: CALC_MOD_CON Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 16000.0 [Hz]	Access level: 3 Func. diagram: 5711 Unit selection: - Expert list: 1 Factory setting 1999.0 [Hz]
Description:	Sets the denominator natural frequency for current setpoint filter 5 (PT2, general filter).		
Dependency:	Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.		

2 Parameters

2.2 List of parameters

p5202 Output voltage setpoint filter 5 denominator natural frequency / U_set_filt5 fn_den

A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.5 [Hz]	Max 16000.0 [Hz]	Factory setting 1000.0 [Hz]

Description: Sets the denominator natural frequency for the output voltage setpoint filter 5.

Dependency: This parameter is active for the following filter type:
 - "PT2 lowpass" (p5201 = 1).
 - "general 2nd order filter" (p5201 = 2).
 Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

p5203[0...n] Current setpoint filter 5 denominator damping / I_set_filt 5 D_den

SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5711
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min 0.001	Max 10.000	Factory setting 0.700

Description: Sets the denominator damping for current setpoint filter 5 (PT2, general filter).

Dependency: Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

p5203 Output voltage setpoint filter 5 denominator damping / U_set_filt 5 D_den

A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.001	Max 10.000	Factory setting 0.700

Description: Sets the denominator damping for the output voltage setpoint filter 5.

Dependency: This parameter is active for the following filter type:
 - "PT2 lowpass" (p5201 = 1).
 - "general 2nd order filter" (p5201 = 2).
 Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

p5204[0...n] Current setpoint filter 5 numerator natural frequency / I_set_filt5 fn_num

SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5711
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min 0.5 [Hz]	Max 16000.0 [Hz]	Factory setting 1999.0 [Hz]

Description: Sets the numerator natural frequency for current setpoint filter 5 (general filter).

Dependency: Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

p5204 Output voltage setpoint filter 5 numerator natural frequency / U_set_filt5 fn_num

A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.5 [Hz]	Max 16000.0 [Hz]	Factory setting 1000.0 [Hz]

Description: Sets the numerator natural frequency for the output voltage setpoint filter 5.

Dependency: This parameter is active for the following filter type:
- "general 2nd order filter" (p5201 = 2).
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

p5205[0...n] Current setpoint filter 5 numerator damping / I_set_filt 5 D_num

SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5711
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min 0.000	Max 10.000	Factory setting 0.700

Description: Sets the numerator damping for current setpoint filter 5 (general filter).

Dependency: Current setpoint filter 5 is activated via p5200.0 and parameterized via p5202 ... p5205.

p5205 Output voltage setpoint filter 5 numerator damping / U_set_filt 5 D_num

A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000	Max 10.000	Factory setting 0.010

Description: Sets the numerator damping for the output voltage setpoint filter 5.

Dependency: This parameter is active for the following filter type:
- "general 2nd order filter" (p5201 = 2).
Filter 5 is activated via p5200.0, and parameterized via p5202 ... p5205.

p5206[0...n] Current setpoint filter 6 type / I_set_filt 6 type

SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: 5711
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min 1	Max 2	Factory setting 1

Description: Sets current setpoint filter 6 as lowpass filter (PT2) or general 2nd order filter.

Value:
1: PT2 low pass
2: General 2nd order filter

Dependency: Current setpoint filter 6 is activated via p5200.1 and parameterized via p5207 ... p5210.

Note: For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{denominator} * f_{bandstop} \text{ frequency}$$

	Data type: Integer16	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2	2

Description: Sets the type for current actual value filter 7.

Value:
 1: PT2 low pass
 2: General 2nd order filter

Dependency: Filter 7 is activated via p5200.2, and parameterized via p5212 ... p5215.

Note: For a general 2nd order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed.

The denominator damping can be determined from the equation for the 3 dB bandwidth:

$$f_{3dB} \text{ bandwidth} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$$

p5212[0...n]	Current setpoint filter 7 denominator natural frequency / I_set_filt7 fn_den		
SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: 5711
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1999.0 [Hz]

Description: Sets the denominator natural frequency for current setpoint filter 7 (PT2, general filter).

Dependency: Current setpoint filter 7 is activated via p5200.2 and parameterized via p5212 ... p5215.

p5212	Current actual value filter 7 denominator natural frequency / I_act_filt7 fn_den		
A_INF (Suppl cl-loop ctrl), R_INF (Suppl cl-loop ctrl)	Can be changed: U, T	Calculated: CALC_MOD_CON	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8946
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.5 [Hz]	16000.0 [Hz]	1000.0 [Hz]

Description: Sets the denominator natural frequency for current actual value filter 7.

Dependency: This parameter is active for the following filter type:

- "PT2 lowpass" (p5201 = 1).
- "general 2nd order filter" (p5211 = 2).

Filter 7 is activated via p5200.2, and parameterized via p5212 ... p5215.

Dependency:	Current setpoint filter 10 is activated via p5200.5 and parameterized via p5227 ... p5230.		

p5230[0...n]	Current setpoint filter 10 numerator damping / I_set_filt10 D_num		
SERVO (Ext I_setp_filt), SERVO_AC (Ext I_setp_filt), SERVO_I_AC (Ext I_setp_filt)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: REL Min 0.000	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10.000	Access level: 3 Func. diagram: 5711 Unit selection: - Expert list: 1 Factory setting 0.700
Description:	Sets the numerator damping for current setpoint filter 10 (general filter).		
Dependency:	Current setpoint filter 10 is activated via p5200.5 and parameterized via p5227 ... p5230.		

p5250[0...n]		Compensation configuration / Comp config		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: Unsigned8 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 bin	
Description:	Sets the configuration of the cogging torque compensation.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Activate cogging torque compensation	Yes	No
	01	Cogging torque compensation direction-dependent	Yes	No
	02	Compensate periodic position error	Yes	No
Dependency:	Refer to: p5252, p5253, r5254, r5255, p5256, p5260, p5261			
Notice:	After replacing the encoder and/or motor, the torque table of the cogging torque compensation must be learned again.			
Note:	For bit 01: When the bit is set, a separate table is used for each direction of motion (p5260, p5261). Both directions must be learned. When the bit is not set, one table is used for both directions of motion (p5260). Learning is only required in one direction. For bit 02: The position error is determined with the motor data identification routine (p1959, p1960). When the bit is set, periodic position errors are compensated with one or two periods per mechanical revolution (p5265 ... p5268). For bit 03: When the bit is set, the cogging torque component is compensated with 6x the pole pair number (p0314) periods per mechanical revolution, depending on the load. The following parameters must contain a practical value for load-dependent cogging torque compensation: p5340 ... p5345 (if necessary, the values are taken from the motor data)			

p5251		Activate learn cogging torque compensation / Cog_M_comp_learn		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: Unsigned8 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 bin	
Description:	Setting for activating/deactivating learning for cogging torque compensation.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Reactivate slow learning	Yes	No
	01	Activate slow learning as supplement	Yes	No
	02	Remove average value	Yes	No
	04	Generate cogging torque table from frequency values	Yes	No
Dependency:	Refer to: p5252, p5253, r5254, r5255, p5260			
Notice:	After replacing the encoder and/or motor, the torque table of the cogging torque compensation must be learned again.			

p5252 Cogging torque compensation table length / Cog_M_comp length			
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: T Data type: Unsigned8 P-Group: Closed-loop control Not for motor type: - Min 6	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 12	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 10
Description:	Sets the table length in bits for cogging torque compensation. 10 corresponds to $2^{10} = 1024$ values.		
Dependency:	Refer to: p5250, p5253, r5254, r5255, p5260		

p5253 Cogging torque compensation periodicity factor / Cog_M_comp_period			
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min 0.00000	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 32768.00000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1.00000
Description:	Sets the factor for the periodicity for the cogging torque compensation. For rotating motors, the reference value is one mechanical revolution, for linear motors, the pole pair width.		
Dependency:	Refer to: p5250, p5252, r5254, r5255, p5260		
Note:	For values < 1, several table periods are passed through for each mechanical revolution or pole pair width, for values > 1 several revolutions or pole pair widths are required for one table period. The following must apply for endlessly rotating machines: $p0408$ and $p0408 * p5253 * 2^{p0418}$ must have a power of two less than 2^{24} .		

r5254[0...3] Cogging torque compensation diagnostics / Cog_M_comp diag			
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: - Data type: Integer16 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays diagnostics data for the cogging torque compensation.		
Index:	[0] = Average values for slowly learning [1] = Actual table index [2] = Table index when starting learning [3] = Table index when ending learning		
Dependency:	Refer to: p5250, p5252, p5253, r5255, p5260		
Note:	For index [0]: Average values for slowly learning the cogging torque compensation. During learning, the average value is incremented by 1 for each table period passed. For index [1]: Currently used table index. For index [2]: Table index when starting slow learning. For index [3]: Table index when ending slow learning. For index [2, 3]: If the actual index when learning is decremented, then the table index at start and end is interchanged.		

r5255[0...1]	CO: Cogging torque compensation input/output / Cog_M_comp I/O		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [N]	Calculated: - Dyn. index: - Unit group: 8_1 Scaling: p2003 Max - [N]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [N]
Description:	Display and connector output for input and output of the cogging torque compensation.		
Index:	[0] = Input [1] = Output		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, p5256, p5260, p5261		
r5255[0...1]	CO: Cogging torque compensation input/output / Cog_M_comp I/O

Description:	Sets the hysteresis for the direction-dependent switchover of the cogging torque tables.		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5260, p5261		
Note:	This setting is only active for p5250.1 = 1.		

2 Parameters

2.2 List of parameters

p5257[0...19]	Cogging torque compensation frequency range real part / Cog_M_comp f real		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 8_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000000 [N]	1000000.000000 [N]	0.000000 [N]

Description: Display or setting of the real part of the multiple of the table for the cogging torque compensation (FFT from p5260). After learning (p5251), this table is automatically populated from the values in p5260 or p5261. With p5251.4 = 1, they can also be used to generate a cogging torque compensation table for p5260. Parameters p5257, p5258 and p5259 of the same index describe one frequency point. Only 20 values with the highest absolute value are displayed.

Dependency: Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5258, p5259, p5260, p5261

p5257[0...19]	Cogging torque compensation frequency range real part / Cog_M_comp f real		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 7_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000000 [Nm]	1000000.000000 [Nm]	0.000000 [Nm]

Description: Display or setting of the real part of the multiple of the table for the cogging torque compensation (FFT from p5260). After learning (p5251), this table is automatically populated from the values in p5260 or p5261. With p5251.4 = 1, they can also be used to generate a cogging torque compensation table for p5260. Parameters p5257, p5258 and p5259 of the same index describe one frequency point. Only 20 values with the highest absolute value are displayed.

Dependency: Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5258, p5259, p5260, p5261

p5258[0...19]	Cogging torque compensation frequency range imaginary part / Cog_M_comp f imag		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 8_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000000 [N]	1000000.000000 [N]	0.000000 [N]

Description: Display or setting of the imaginary part of the multiple of the table for the cogging torque compensation (FFT from p5260).

Dependency: Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5257, p5259, p5260, p5261

p5258[0...19]	Cogging torque compensation frequency range imaginary part / Cog_M_comp f imag		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 7_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000000 [Nm]	1000000.000000 [Nm]	0.000000 [Nm]

Description: Display or setting of the imaginary part of the multiple of the table for the cogging torque compensation (FFT from p5260).

Dependency: Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5257, p5259, p5260, p5261

p5259[0...19]	Cogging torque compensation frequency range multiplicity / Cog_M_comp f multi		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: Unsigned16 P-Group: Closed-loop control Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2048	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Display or setting of the multiple of the table for the cogging torque compensation (index of FFT from p5260).		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5257, p5258, p5260, p5261		

p5260[0...4095]	Cogging torque compensation table / Cog_M_comp table		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -1000000.000000 [N]	Calculated: - Dyn. index: - Unit group: 8_1 Scaling: - Max 1000000.000000 [N]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting 0.000000 [N]
Description:	Display or setting of the compensation values for the cogging torque compensation For p5250.1 = 1, the following applies: The table contains compensation values for the positive direction. For p5250.1 = 0, the following applies: The table contains compensation values for the both directions.		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5261		
Note:	The table length used is set using p5252.		

p5260[0...4095]	Cogging torque compensation table / Cog_M_comp table		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -1000000.000000 [Nm]	Calculated: - Dyn. index: - Unit group: 7_1 Scaling: - Max 1000000.000000 [Nm]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting 0.000000 [Nm]
Description:	Display or setting of the compensation values for the cogging torque compensation For p5250.1 = 1, the following applies: The table contains compensation values for the positive direction. For p5250.1 = 0, the following applies: The table contains compensation values for the both directions.		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5261		
Note:	The table length used is set using p5252.		

p5261[0...4095]	Cogging torque compensation table negative direction / Cog_M_comp tab neg		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -1000000.000000 [N]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1000000.000000 [N]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000000 [N]
Description:	Display or setting of the compensation values for the negative direction of the cogging torque compensation.		
Dependency:	Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5260		
Note:	The table length used is set using p5252. This setting is only active for p5250.1 = 1.		

p5261[0...4095] Cogging torque compensation table negative direction / Cog_M_comp tab neg

SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1000000.000000 [Nm]	1000000.000000 [Nm]	0.000000 [Nm]

Description: Display or setting of the compensation values for the negative direction of the cogging torque compensation.

Dependency: Refer to: p5250, p5251, p5252, p5253, r5254, r5255, p5256, p5260

Note: The table length used is set using p5252.
This setting is only active for p5250.1 = 1.

r5263 Cogging torque compensation status word / Cog_M_comp ZSW

SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: -	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the status word for the cogging torque compensation.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Compensation with external table active	Yes	No	-
	01	Internal table available	Yes	No	-
	02	Direction-dependent compensation active	Yes	No	-
	03	Modulo calculation necessary	Yes	No	-
	04	Absolute position from zero mark	Yes	No	-
	05	Absolute position lost after POWER ON	Yes	No	-
	06	Internal table deactivated due to an error	Yes	No	-
	07	Compensation periodic position errors active	Yes	No	-
	08	Slow learning active	Yes	No	-
	09	At least one table index learned	Yes	No	-
	10	Absolute position available	Yes	No	-
	11	Absolute position with modulo available	Yes	No	-
	12	Read again data integrated in motor	Yes	No	-
	13	Table negative motion direction active	Yes	No	-
	14	Read data integrated in the motor initiated	Yes	No	-
	15	Load-dependent compensation active	Yes	No	-

Dependency: Refer to: p5250, p5252, p5253, r5255, p5260

p5265[0...n] Periodic position error compensation amplitude 1 / Pos err comp ampl1

SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0	20000.0	0.0

Description: Amplitude to compensate periodic position errors in fine pulses for the error with one sinusoidal period per mechanical revolution.

The value is determined with the motor data identification routine (p1960).

Dependency: Refer to: p5250, p5266

Note: Prerequisites:
 - "Cogging torque compensation" function module activated (r0108.22 = 1).
 - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1).
 - compensation periodic position errors activated (p5250.2 = 1).
 - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)

p5266[0...n]	Periodic position error compensation angle 1 / Pos err comp ang 1		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	-180.00 [°]	180.00 [°]	0.00 [°]
Description:	Angle to compensate periodic position errors for the error with one sinusoidal period per mechanical revolution. The value is determined with the motor data identification routine (p1960).		
Dependency:	Refer to: p5250, p5265		
Note:	Prerequisites: - "Cogging torque compensation" function module activated (r0108.22 = 1). - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1). - compensation periodic position errors activated (p5250.2 = 1). - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)		

p5267[0...n]	Periodic position error compensation amplitude 2 / Pos err comp ampl2		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	0.0	20000.0	0.0
Description:	Amplitude to compensate periodic position errors in fine pulses for the error with two sinusoidal periods per mechanical revolution. The value is determined with the motor data identification routine (p1960).		
Dependency:	Refer to: p5250, p5268		
Note:	Prerequisites: - "Cogging torque compensation" function module activated (r0108.22 = 1). - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1). - compensation periodic position errors activated (p5250.2 = 1). - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)		

p5268[0...n]	Periodic position error compensation angle 2 / Pos err comp ang 2		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	-180.00 [°]	180.00 [°]	0.00 [°]
Description:	Angle to compensate periodic position errors for the error with two sinusoidal periods per mechanical revolution. The value is determined with the motor data identification routine (p1960).		
Dependency:	Refer to: p5250, p5267		

2 Parameters

2.2 List of parameters

Note: Prerequisites:
 - "Cogging torque compensation" function module activated (r0108.22 = 1).
 - motor data identification carried out with transfer (p1959.0 = 1, p1960 = 1).
 - compensation periodic position errors activated (p5250.2 = 1).
 - encoder with absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver)

p5271[0...n]	Online / One Button Tuning configuration / Ot OBT config		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: T Data type: Unsigned16 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 1100 bin

Description: Sets the configuration for online tuning / One Button Tuning.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	PD controller for large load moments of inertia	Yes	No	-
	01	Reduce gain at low speeds	Yes	No	-
	02	Load adaptation Kp	Yes	No	5045
	03	Setting the speed precontrol	Yes	No	5045
	04	Setting the torque precontrol	Yes	No	5045
	05	Setting the maximum acceleration for the basic positioner	Yes	No	5045
	06	Do not change Kp	Yes	No	-
	07	Setting the voltage precontrol	Yes	No	-

Dependency: Refer to: p5272, p5273, r5274, p5275

Note: For bit 00:
 For significant differences between the motor mass and load mass, or for low dynamic performance of the controller, then the P controller becomes a PD controller in the position control loop. As a consequence, the dynamic performance of the position controller is increased.
 This function should only be set when the velocity precontrol (bit 3 = 1) or the force precontrol (bit 4 = 1) is active.

For bit 01:
 At low velocities, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.

For bit 02:
 The estimated load mass is taken into account for the velocity controller gain (see p5273).

For bit 03:
 Activates the velocity precontrol for the basic positioner (EPOS).

For bit 04:
 Activates the force precontrol for the basic positioner (EPOS).

For bit 05:
 The maximum acceleration (p2572) and maximum deceleration (p5273) for the basic positioner (EPOS) are determined using the estimated mass. This is only realized once by setting the bit.

Prerequisite:
 The drive pulses are inhibited and the mass was previously determined.

For bit 06:
 The velocity controller gain set in p1460 is not changed when calculating the controller data.

For bit 07:
 Activation of the voltage precontrol.

p5271[0...n]	Online / One Button Tuning configuration / Ot OBT config				
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: T	Calculated: -	Access level: 3

Description:	Sets the configuration for online tuning / One Button Tuning.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	PD controller for large load moments of inertia	Yes	No	-
	01	Reduce gain at low speeds	Yes	No	-
	02	Load adaptation Kp	Yes	No	5045
	03	Setting the speed precontrol	Yes	No	5045
	04	Setting the torque precontrol	Yes	No	5045
	05	Setting the maximum acceleration for the basic positioner	Yes	No	5045
	06	Do not change Kp	Yes	No	-
	07	Setting the voltage precontrol	Yes	No	-
Dependency:	Refer to: p5272, p5273, r5274, p5275				
Note:	For bit 00: For significant differences between the motor moment of inertia and load moment of inertia - or for a low controller dynamic response - the P controller in the position control loop is transformed into a PD controller. As a consequence, the dynamic performance of the position controller is increased. This function should only be set when the speed precontrol (bit 3 = 1) or the torque precontrol (bit 4 = 1) is active.				
	For bit 01: At low speeds, the controller gain factors are automatically reduced in order to avoid noise and oscillation at standstill.				
	For bit 02: The estimated load moment of inertia is taken into account for the speed controller gain (see p5273).				
	For bit 03: Activates the speed precontrol for the basic positioner (EPOS).				
	For bit 04: Activation of the torque precontrol for the basic positioner (EPOS); if this is not active, then the internal drive speed/torque precontrol is parameterized.				
	For bit 05: The maximum acceleration (p2572) and maximum deceleration (p5273) for the basic positioner (EPOS) are determined using the estimated moment of inertia. This is only realized once by setting the bit. Prerequisite: The drive pulses are inhibited and the moment of inertia was previously determined.				
	For bit 06: The speed controller gain set in p1460 is not changed when calculating the controller data.				
	For bit 07: Activation of the voltage precontrol.

SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 5.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [%]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [%]	
Description:	Sets the dynamic factor for the proportional gain of the velocity controller for online tuning.			
Dependency:	Refer to: p5271, p5273, r5274, p5275			
Notice:	The velocity control can become unstable for excessively high values.			
Note:	The stiffer the mechanical load coupling, the higher the dynamic factor can be set.			
p5272[0...n]	Online tuning dynamic factor / Ot dyn_factor			
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 5.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1000.0 [%]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100.0 [%]	
Description:	Sets the dynamic factor for the proportional gain of the speed controller for online tuning.			
Dependency:	Refer to: p5271, p5273, r5274, p5275			
Notice:	The speed control can become unstable for excessively high values.			
Note:	The stiffer the mechanical load coupling, the higher the dynamic factor can be set.			
p5273[0...n]	Online tuning dynamic factor load / Ot dyn_factor load			
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting 30.0 [%]	
Description:	Sets the dynamic factor for the proportional gain of the velocity controller for online tuning. The value specifies which component of the estimated load mass is taken into account when adapting the velocity controller.			

Dependency: Refer to: p5271, p5272, r5274, p5275
Notice: The velocity control can become unstable for excessively high values.

p5273[0...n]	Online tuning dynamic factor load / Ot dyn_factor load		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100.0 [%]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting 30.0 [%]

Description: Sets the dynamic factor for the proportional gain of the speed controller for online tuning. The value specifies which component of the estimated load moment of inertia is taken into account when adapting the speed controller.

Dependency: Refer to: p5271, p5272, r5274, p5275
Notice: The speed control can become unstable for excessively high values.

r5274	CO: Online / One Button Tuning dynamic response estimated / Ot dyn estimate		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min - [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [ms]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting - [ms]

Description: Display and connector output for the estimated dynamic response of the velocity control loop as PT1 time constant for online tuning.

Dependency: Refer to: p5271, p5272, p5273, p5275

r5274	CO: Online / One Button Tuning dynamic response estimated / Ot dyn estimate		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min - [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max - [ms]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting - [ms]

Description: Display and connector output for the estimated dynamic response of the speed control loop as PT1 time constant for online tuning/One Button Tuning.

This position controller setting is required if the closed-loop position control is in an external control system.

Dependency: Refer to: p5271, p5272, p5273, p5275

p5275[0...n]	Online / One Button Tuning dynamic response time constant / Ot dyn Tc		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.0 [ms]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 60.0 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 7.5 [ms]

Description: Sets the time constant for the precontrol symmetrization for online tuning / One Button Tuning. As a consequence, the drive is allocated a defined, dynamic response via its precontrol. For axes, which must interpolate with one another, the same value must be entered.

Examples:

0 ms = travel without following error (Kv factor is infinity)

5 ms = settling behavior as for PT1 with 5 ms (Kv factor = 12 [1000/min])

Dependency: Refer to: p5271, p5272, p5273, r5274

2 Parameters

2.2 List of parameters

Note: This time constant is only effective if p5302.7 is set = 1.
Otherwise, the precontrol symmetrization is adapted to the estimated dynamic response, therefore setting positioning without any overshoot.

r5276[0...n]	Online / One Button Tuning maximum Kv factor estimated / Ot Kv estimated		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.00 [1000 rpm]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100000.00 [1000 rpm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [1000 rpm]
Description:	Displays the estimated maximum position controller gain for online tuning/One Button Tuning.		
Dependency:	Refer to: p5271, p5272, p5273, p5275		
Warning:	The calculation assumes that the DSC is activated in the drive and is controlled on the motor measuring system. If this is not the case, then excessively high values are displayed. The value that is displayed does not take into account low-frequency resonance effects in the drive train. If necessary, the value must be significantly reduced.		
			
Note:	The value for the closed-loop position control is required by a higher-level control system.		

r5277[0...n]	Online/One Button Tuning precontrol symmetrizing time estimated / Ot FFW estim		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 0.00 [ms]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 100000.00 [ms]	Access level: 3 Func. diagram: 5045 Unit selection: - Expert list: 1 Factory setting - [ms]
Description:	Displays the estimated time constant for symmetrization of the speed precontrol. This is required to symmetrize the position controller for online tuning / One Button Tuning if the position control is realized in an external control system.		
Dependency:	Refer to: p5271, p5272, p5273, p5275		
Warning:	The calculation assumes that the DSC is activated in the drive and is controlled on the motor measuring system. If this is not the case, then the time is not correctly calculated.		
			

p5280[0...n]	Current setpoint filter adaptation configuration / Filt adpt config		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min -1	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the configuration for the adaptive current setpoint filter. The adaptation acts on the filter set using p5281.		
Value:	-1: Inactive and filter deactivated 0: Inactive 1: Active		
Dependency:	The prerequisite for the adaptation of the current setpoint filter is that the "Moment of inertia estimator" function module is activated (r0108.10). Refer to: p5281, p5282, p5283, p5284, r5285		
Notice:	If, when activating adaptation (p5280 = 1), the filter assigned via p5281 is still not active, then it is automatically activated.		

Note: If p5280 = -1:
The adaptation is deactivated and the assigned filter deactivated.

If p5280 = 0:
The adaptation is inactive. The actual setting of the filter parameters is kept in a volatile memory. To permanently save the values that have been determined, the parameters must be saved in a non-volatile memory (p0977 = 1).

If p5280 = 1:
The adaptation is active. When a mechanical resonant frequency is excited, the filter frequency is adapted. Adaptation is temporarily inactive while the function generator generates a noise signal (p4820 = 4).

p5281[0...n] Current setpoint filter adaptation assignment / Filt adpt assign			
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the current setpoint filter that is to be adapted. Value = 0: No assignment Value = 1: Current setpoint filter 1 assigned (basic system) ... Value = 4: Current setpoint filter 4 assigned (basic system) Value = 5: Current setpoint filter 5 assigned (function module, r0108.21) ... Value = 10: Current setpoint filter 10 assigned (function module, r0108.21)		
Dependency:	Refer to: p5280, p5282, p5283, p5284, r5285 Refer to: F07419		
Notice:	Fault F07419 is output if this setting is changed when adaptation is active.		
Note:	If, when activating adaptation (p5280 = 1), the selected filter is still not active, then it is automatically activated.		

p5282[0...n] Current setpoint filter adaptation limit frequency lower / Filt adpt f lower			
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 50 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 5000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 250 [Hz]
Description:	Sets the lower limit frequency for the current setpoint filter adaptation. If the actual frequency of the adapted filter falls below the lower limit frequency, then the frequency of the adapted filter is set to the lower limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation.		
Dependency:	Refer to: p5280, p5281, p5283, p5284, r5285		
Note:	If a value is entered which exceeds the upper limit frequency (p5283), then the value is rejected.		

2 Parameters

2.2 List of parameters

p5283[0...n]	Current setpoint filter adaptation limit frequency upper / Filt adpt f upper		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 200 [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10000 [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1500 [Hz]
Description:	Sets the upper limit frequency for the current setpoint filter adaptation. If the actual frequency of the adapted filter exceeds the upper limit frequency, then the frequency of the adapted filter is set to the upper limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation. There is an internal maximum value for the upper limit frequency; this depends on the damping (attenuation) of the adapted filter and the current controller sampling time. If the parameterized value exceeds the internal maximum value, then the following applies: - this parameter is immediately limited to the internal maximum value if adaptation is active. - this parameter is limited to the internal maximum value the next time that adaptation is activated (p5280).		
Dependency:	Refer to: p5280, p5281, p5282, p5284, r5285		
Note:	If a value is entered which falls below the lower limit frequency (p5282), then the value is rejected.		
p5284[0...n]	Current setpoint filter adaptation activation threshold / Filt adpt thr		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0 [%]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 10000 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 100 [%]
Description:	Sets the activation threshold for the current setpoint filter adaptation.		
Dependency:	Refer to: p5280, p5281, p5282, p5283, r5285		
Note:	The value should be increased if, in operation, the filter frequency continuously changes significantly although the resonance frequency does not change. The value should be reduced if the filter frequency adaptation cannot be set so that mechanical resonance is suppressed.		
r5285[0...n]	Current setpoint filter adaptation actual frequency / Filt adpt act f		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: - Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max - [Hz]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [Hz]
Description:	Displays the actual frequency of the adapted current setpoint filter.		
Dependency:	Refer to: p5280, p5281, p5282, p5283, p5284		
p5291	FFT tuning configuration / FFT tun config		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0000 0000 0000 0011 1001 bin
Description:	Sets the configuration for the "FFT tuning" function. This function is used for One Button Tuning (p5300 = 1).		

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Noise excitation after pulse enable	Yes	No	-
	01	Set current setpoint filter (HF)	Yes	No	-
	02	Set speed controller gain (HF)	Yes	No	-
	03	Length of FFT window bit 0 (LF, HF)	Yes	No	-
	04	Length of FFT window bit 1 (LF, HF)	Yes	No	-
	05	Windowing the time signals using a Hamming window (LF, HF)	Yes	No	-
	06	Measure current controller	Yes	No	-
	07	Bandwidth bit 0 (LF)	Yes	No	-
	08	Bandwidth bit 1 (LF)	Yes	No	-
	09	Bandwidth bit 2 (LF)	Yes	No	-
	10	Measuring periods bit 0	Yes	No	-
	11	Measuring periods bit 1	Yes	No	-
	12	Inject noise onto speed setpoint	Yes	No	-
	13	Do not reduce Kp for measurement	Yes	No	-
	14	Set the current setpoint filter with loop compensation	Yes	No	-
	16	Torque in front of the current setpoint filter	Yes	No	-

Dependency: Refer to: r5293, r5294, r5295, p5296, p5297

Note: HF: high frequency

LF: low frequency

For bit 00:

A PRBS signal (pseudo random binary signal) is superimposed on the current setpoint to be able to better identify the mechanical controlled system.

For bit 01:

The identified mechanical resonance points are suppressed using current setpoint filters.

For bit 02:

The maximum velocity controller gain is determined from the identified mechanical controlled system.

For bits 03, 04:

The measured value buffer length is set using these bits:

Bit 04 = 0 and bit 03 = 0 -> buffer length = 256

Bit 04 = 0 and bit 03 = 1 -> buffer length = 512

Bit 04 = 1 and bit 03 = 0 -> buffer length = 1024

Bit 04 = 1 and bit 03 = 1 -> buffer length = 2048

For bit 05:

A Hamming window is used to filter the measured time signals.

For bit 06:

The measurement checks the current controller frequency characteristic. For high amplitudes in p5298, it is possible that the check is unsuccessful, as the converter reaches its voltage limit.

For bits 07, 08:

An aliasing filter is used for the measured values.

Bit 08 = 0 and bit 07 = 0 -> filter frequency = 50 Hz

Bit 08 = 0 and bit 07 = 1 -> filter frequency = 100 Hz

Bit 08 = 1 and bit 07 = 0 -> filter frequency = 200 Hz

Bit 08 = 1 and bit 07 = 1 -> filter frequency = 400 Hz

For bit 09:

Evaluation can be switched over from correlation to differential filter.

For bits 10, 11:

Number of measuring periods.

Bit 11 = 0 and bit 10 = 0 -> number of measurements = 1

Bit 11 = 0 and bit 10 = 1 -> number of measurements = 2

Bit 11 = 1 and bit 10 = 0 -> number of measurements = 4

Bit 11 = 1 and bit 10 = 1 -> number of measurements = 8

For bit 12:

The PRBS signal is switched to the velocity setpoint (in front of the filter).

For bit 13:

The input signal for the force actual value is taken from in front of the current setpoints filters.

p5291	FFT tuning configuration / FFT tun config		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0000 0000 0000 0011 1001 bin

Description: Sets the configuration for the "FFT tuning" function. This function is used for One Button Tuning (p5300 = 1).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Noise excitation after pulse enable	Yes	No	-
	01	Set current setpoint filter (HF)	Yes	No	-
	02	Set speed controller gain (HF)	Yes	No	-

	11	Measuring periods bit 1	Yes	No	-
	12	Inject noise onto speed setpoint	Yes	No	-
	13	Do not reduce Kp for measurement	Yes	No	-
	14	Set the current setpoint filter with loop compensation	Yes	No	-
	16	Torque in front of the current setpoint filter	Yes	No	-

Dependency: Refer to: r5293, r5294, r5295, p5296, p5297

Note: HF: high frequency
LF: low frequency
For bit 00:
A PRBS signal (pseudo random binary signal) is superimposed on the current setpoint to be able to better identify the mechanical controlled system.
For bit 01:
The identified mechanical resonance points are suppressed using current setpoint filters.
For bit 02:
The maximum speed controller gain is determined from the identified mechanical controlled system.
For bits 03, 04:
The measured value buffer length is set using these bits:
Bit 04 = 0 and bit 03 = 0 -> buffer length = 256
Bit 04 = 0 and bit 03 = 1 -> buffer length = 512
Bit 04 = 1 and bit 03 = 0 -> buffer length = 1024
Bit 04 = 1 and bit 03 = 1 -> buffer length = 2048
For bit 05:
A Hamming window is used to filter the measured time signals.
For bit 06:
The measurement checks the current controller frequency response and this is taken into account in the speed controller loop. For high amplitudes in p5298, it is possible that the measurement is unsuccessful, as the converter reaches its voltage limit.

For bits 07, 08, 09:

The measurement bandwidth is set using these bits:

Bit 09 = 0, bit 08 = 0, bit 07 = 0 -> bandwidth = 50 Hz

Bit 09 = 0, bit 08 = 0, bit 07 = 1 -> bandwidth = 100 Hz

Bit 09 = 0, bit 08 = 1, bit 07 = 0 -> bandwidth = 200 Hz

Bit 09 = 0, bit 08 = 1, bit 07 = 1 -> bandwidth = 400 Hz

Bit 09 = 1, bit 08 = 0, bit 07 = 0 -> bandwidth = 800 Hz

Bit 09 = 1, bit 08 = 0, bit 07 = 1 -> bandwidth = 1600 Hz

For bits 10, 11:

Number of measuring periods.

Bit 11 = 0 and bit 10 = 0 -> number of measurements = 1

Bit 11 = 0 and bit 10 = 1 -> number of measurements = 2

Bit 11 = 1 and bit 10 = 0 -> number of measurements = 4

Bit 11 = 1 and bit 10 = 1 -> number of measurements = 8

For bit 12:

The PRBS signal is switched to the speed setpoint (in front of the filter).

For bit 13:

The input signal for the torque actual value is taken from in front of the current setpoints filters.

For bit 14:

When the bit is set, a current setpoint filter is used to partially compensate the mechanical system.

This is recommended for the following machine attributes:

- the load moment of inertia is significantly higher than the motor moment of inertia (e.g. > 6x).
- the coupling between the machine elements has almost no backlash (no play).
- the stiffness of the mechanical transmission elements does not change significantly in the traversing range.

p5292	FFT tuning dynamic factor / FFT tun dyn_factor		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 25.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 125.0 [%]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 80.0 [%]
Description:	Sets the dynamic factor for the proportional gain of the velocity controller for FFT tuning.		
Dependency:	Refer to: p5291		
Notice:	The velocity control can become unstable for excessively high values.		

p5292	FFT tuning dynamic factor / FFT tun dyn_factor

Dependency:	Refer to: p5291		

2 Parameters

2.2 List of parameters

r5293

Velocity controller gain identified / FFT tun Kp ident

SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 24_2	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min - [Ns/m]	Max - [Ns/m]	Factory setting - [Ns/m]

Description: Displays the maximum possible Kp gain of the velocity controller iterated from the FFT measurement.

Dependency: Refer to: p5291

r5293

FFT tuning speed controller P gain identified / FFT tun Kp ident

SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 17_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min - [Nms/rad]	Max - [Nms/rad]	Factory setting - [Nms/rad]

Description: Displays the determined proportional gain Kp of the speed controller before FFT tuning.
This function is used for One Button Tuning (p5300 = 1).

Dependency: Refer to: p5291

r5294[0...5]

FFT tuning zero position identified / FFT tun zero ident

SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 2_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min - [Hz]	Max - [Hz]	Factory setting - [Hz]

Description: Displays the identified mechanical zero points.
One Button Tuning must be carried out beforehand (p5300 = 1).

Dependency: Refer to: p5291

Note: For r5294[0...2]:
Displays the zero positions for the "Load oscillation detection" function (p5301.4 = 1) or "Suppress detected load oscillation" (p5301.5 = 1).
For r5294[3...5]:
Displays the zero positions for the "Set proportional gain Kp" function (p5301.0 = 1) or "Set current setpoint filter" (p5301.1 = 1).

r5295[0...5]

FFT tuning pole position identified / FFT tun pole ident

SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Closed-loop control	Unit group: 2_1	Unit selection: p0505
	Not for motor type: -	Scaling: -	Expert list: 1
	Min - [Hz]	Max - [Hz]	Factory setting - [Hz]

Description: Displays the identified mechanical pole positions.
One Button Tuning must be carried out beforehand (p5300 = 1).

Dependency: Refer to: p5291

Note: For r5295[0...2]:
Displays the pole positions for the "Load oscillation detection" function (p5301.4 = 1) or "Suppress detected load oscillation" (p5301.5 = 1).
For r5295[3...5]:
Displays the pole positions for the "Set proportional gain Kp" function (p5301.0 = 1) or "Set current setpoint filter" (p5301.1 = 1).

p5296[0...2]	FFT tuning PRBS amplitude / FFT tun PRBS ampl		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 1.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 300.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 10.0 [%] [1] 30.0 [%] [2] 5.0 [%]

Description: Sets the amplitude of the PRBS signal.
The value refers to the rated motor voltage (r0333) and to the motor standstill force (r0319).

Dependency: Refer to: p5291

p5296[0...2]	FFT tuning PRBS amplitude / FFT tun PRBS ampl		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min 1.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 300.0 [%]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 10.0 [%] [1] 30.0 [%] [2] 5.0 [%]

Description: Sets the amplitude of the PRBS signal.
The value refers to the motor rated torque (r0333) and to the motor standstill torque (r0319).
This function is used for One Button Tuning (p5300 = 1).

Dependency: Refer to: p5291

p5297[0...2]	FFT tuning PRBS offset / FFT tun PRBS offs		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min -210000.0000 [m/min]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 210000.0000 [m/min]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0000 [m/min]

Description: Setting the motor velocity offset.
The offset is intended to prevent non-linear effects, such as backlash or stiction from influencing the measured values

Recommendation: If the "Identify high frequencies" function (p5290 = 1) is used together with a TTL/HTL encoder, then the following applies to the offset velocity (p5297):

p5297 > 15 / motor encoder pulse number / velocity controller sampling time

p5297 = 15 / p0408 / p0115[2]

Dependency: Refer to: p5291

2 Parameters

2.2 List of parameters

p5297[0...2]	FFT tuning PRBS offset / FFT tun PRBS offs		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: REL Min -210000.0000 [rpm]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 210000.0000 [rpm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.0000 [rpm]
Description:	Sets the speed offset for the motor. The offset is intended to prevent non-linear effects, such as backlash or stiction from influencing the measured values This function is used for One Button Tuning (p5300 = 1).		
Recommendation:	If the "Identify high frequencies" function (p5290 = 1) is used together with a TTL/HTL encoder, then the following applies to the offset speed (p5297): $p5297 > 15 / \text{motor encoder pulse number} / \text{speed controller sampling time}$ $p5297 = 15 / p0408 / p0115[1]$		
Dependency:	Refer to: p5291		
r5298	FFT tuning amplitude response / FFT tun ampl_resp		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Amplitude response of the speed control loop in dB (units rpm/Nm or m/min/N). During the One Button Tuning function, 1024 measured values are generated, and are then output in the speed controller sampling time. For p5301.0 = 1 or p5301.1 = 1, in the representation, a measured value corresponds to $(1/p0115[1])/2048$ in [Hz]. For p5301.4 = 1 or p5301.5 = 1 in the representation, a measured value corresponds to $250/2048$ in [Hz]. A trigger condition is required to trace the measured values (e.g. amplitude response r5298 <> 0).		
r5299	FFT tuning phase response / FFT tun ph_resp		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: - Data type: FloatingPoint32 P-Group: Closed-loop control Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Phase response of the speed control loop in degrees. During the One Button Tuning function, 1024 measured values are generated, and are then output in the speed controller sampling time. For p5301.0 = 1 or p5301.1 = 1, in the representation, a measured value corresponds to $(1/p0115[1])/2048$ in [Hz]. For p5301.4 = 1 or p5301.5 = 1 in the representation, a measured value corresponds to $250/2048$ in [Hz]. A trigger condition is required to trace the measured values (e.g. amplitude response r5298 <> 0).		

p5300[0...n]	Autotuning selection / Autotuning sel		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: T	Calculated: -	Access level: 2
	Data type: Integer16	Dyn. index: DDS, p0180	Func. diagram: -

Value:	<p>-1: Reset controller parameters 0: Inactive 1: One Button Tuning 2: Online tuning</p>		
Dependency:	<p>The prerequisite for the "auto tuning" function is that the "Moment of inertia estimator" function module is activated (r0108.10).</p> <p>The "Autotuning" function can only be selected for "Servo" control mode with position encoder.</p> <p>The motor must have already been commissioned so that autotuning functions error-free. A motor identification may be necessary beforehand (p1900 and following).</p> <p>One Button Tuning: p5301 configures the "One Button Tuning" function. p5292 if the required dynamic response of the control loops is set. p5308 is used to parameterize the traversing distance for the test signal. Other relevant parameters: p5309, p5296, p5297, p5275, r5274, r5393, r5394, r5395</p> <p>Online tuning: p5302 configures the "Online tuning" function. p5272 if the required dynamic response of the control loops is set. Other relevant parameters: p5271, p5275, r5274</p> <p>Refer to: p5271, p5272, p5273, r5274, p5275, p5292, r5293, r5294, r5295, p5296, p5297, p5301, p5302, p5308, p5309</p>		
Warning:	<p> Only the motor measuring system is taken into account when optimizing the position controller. If an external measuring system is used for the position control, then this can result in an unstable controller setting.</p> <p>The "One Button Tuning" function does not support different sampling times for current and velocity controllers. For p0112 =2, in some instances different stability criteria are obtained. It is recommended that "One Button Tuning" is not used for this configuration.</p>		
Caution:	<p> For some drive trains, the "online tuning" function can result in unstable settings (motor makes a whistling sound). This is especially the case for large load masses that are connected to the motor through a low-frequency coupling/connection. In this case, parameter p5272 or p5273 must be reduced.</p>		
Notice:	<p>When executing One Button Tuning, the motor can be accelerated with its rated torque if the torque limit (p1520, p1521) does not limit this to lower values. If the mechanical system is sensitive, then it is recommended that the torque limits are appropriately reduced before executing One Button Tuning.</p>		
Note:	<p>If p5300 = -1: Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the velocity and position controller are restored.</p> <p>If p5300 = 0: Online tuning is inactive.</p> <p>To permanently back up the values determined for the velocity controller and position controller, the parameters must be saved in a non-volatile fashion (p0977 = 1 or "Copy RAM to ROM").</p> <p>The results of the moment of inertia estimator can be reset using p5300 = 0. After p5300 > 0, the parameters for moment of inertia and tuning must be determined again.</p>		

If p5300 = 1:

One Button Tuning is active.

The mass is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source.

If p5300 = 2:

Online tuning is active.

The mass is estimated. The controller parameters are recalculated if the mass noticeably changes.

p5300[0...n]	Autotuning selection / Autotuning sel		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: T Data type: Integer16 P-Group: - Not for motor type: REL Min -1	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 2	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets activation/deactivation of the "auto tuning" function. If p5300 = 1: The "One button tuning" function is configured using p5301. If p5300 = 2: The "Online tuning" function is configured using p5302. The following parameters are written to for the two functions: p0430, p1160, p1400, p1413 - p1426, p1428, p1429, p1433 - p1435, p1441, p1460 - p1465, p1498, p1513, p1656 - p1676, p2533 - p2539, p2567, p2572, p2573, p5280		
Value:	-1: Reset controller parameters 0: Inactive 1: One Button Tuning 2: Online tuning		
Recommendation:	If p5300 = 1 "One Button Tuning" is used together with an TTL/HTL encoder, then the following applies: $\text{Offset speed (p5297)} > 15 / \text{motor encoder pulse number} / \text{speed controller sampling time}$ $\text{p5297} > 15 / \text{p0408} / \text{p0115}[2]$		
Dependency:	The prerequisite for the "auto tuning" function is that the "Moment of inertia estimator" function module is activated (r0108.10). The "Autotuning" function can only be selected for "Servo" control mode with position encoder. The motor must have already been commissioned so that autotuning functions error-free. A motor identification may be necessary beforehand (p1900 and following). One Button Tuning: p5301 configures the "One Button Tuning" function. p5292 if the required dynamic response of the control loops is set. p5308 is used to parameterize the traversing distance for the test signal. Other relevant parameters: p5309, p5296, p5297, p5275, r5274, r5393, r5394, r5395 Online tuning: p5302 configures the "Online tuning" function. p5272 if the required dynamic response of the control loops is set. Other relevant parameters: p5271, p5275, r5274 Refer to: p5271, p5272, p5273, r5274, p5275, p5292, r5293, r5294, r5295, p5296, p5297, p5301, p5302, p5308, p5309		
Warning:	Only the motor measuring system is taken into account when optimizing the position controller. If an external measuring system is used for the position control, then this can result in an unstable controller setting. The "One Button Tuning" function does not support different sampling times for current and speed controllers. For p0112 = 2, in some instances different stability criteria are obtained. It is recommended that "One Button Tuning" is not used for this configuration.		
Caution:	For some drive trains, the "online tuning" function can result in unstable settings (motor makes a whistling sound). This is especially the case for high load moments of inertia, which are coupled to the motor through a low-frequency connection/coupling. In this case, the values in parameter p5272 or p5273 must be reduced.		
Notice:	When executing One Button Tuning, the motor can be accelerated with its rated torque if the torque limit (p1520, p1521) does not limit this to lower values. If the mechanical system is sensitive, then it is recommended that the torque limits are appropriately reduced before executing One Button Tuning.		

Note: If p5300 = -1:
Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the speed and position controller are restored.

If p5300 = 0:
Online tuning is inactive.
To permanently save the values determined for the speed and position controllers, the parameters must be saved in a non-volatile manner (p0977 = 1 or "copy RAM to ROM").

If p5300 = 1:
One Button Tuning is active.
The moment of inertia is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source. The steps to be executed can be configured using p5301.

If p5300 = 2:
Online tuning is active.
The moment of inertia is estimated. The controller parameters are recalculated if the moment of inertia noticeably changes. The steps to be executed can be configured using p5302.

p5301[0...n]	One Button Tuning configuration / OBT config		
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting
	-	-	0000 0000 0000 0111 bin

Description: Setting the functions for One Button Tuning (p5300 = 1).
A test signal is required for some functions. Here, parameters p5307 to p5309 must be taken into consideration.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Setting the proportional gain Kp	Yes	No	-
	01	Setting current setpoint filter	Yes	No	-
	02	Estimate moment of inertia	Yes	No	-
	04	Load oscillation detection	Yes	No	-
	05	Suppress detected load oscillation	Yes	No	-
	07	Activating synchronized axes	Yes	No	-
	08	Moment of inertia determination from frequency response	Yes	No	-

Dependency: It is only possible to change the configuration if autotuning is not active (p5300 = 0).
Refer to: p5292, r5293, r5294, r5295, p5296, p5297, p5300, p5308, p5309

Note: For bit 00:
The velocity controller gain is determined and set using a noise signal.

For bit 01:
Possibly required current setpoint filters are determined and set using a noise signal.
As a consequence, a higher dynamic performance can be achieved in the velocity control loop.

For bit 02:
Using this bit, the mass is determined using a test signal. If this bit is not set, then the load mass must be manually set using parameter p1498. The test signal must have been previously set using parameters p5308 and p5309.

For bit 07:
With this function, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

2 Parameters

2.2 List of parameters

p5301[0...n]	One Button Tuning configuration / OBT config				
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 0111 bin		
Description:	Setting the functions for One Button Tuning (p5300 = 1). A test signal is required for some functions. Here, parameters p5307 to p5309 must be taken into consideration.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Setting the proportional gain Kp	Yes	No	-
	01	Setting current setpoint filter	Yes	No	-
	02	Estimate moment of inertia	Yes	No	-
	04	Load oscillation detection	Yes	No	-
	05	Suppress detected load oscillation	Yes	No	-
	07	Activating synchronized axes	Yes	No	-
	08	Moment of inertia determination from frequency response	Yes	No	-
Dependency:	It is only possible to change the configuration if autotuning is not active (p5300 = 0). Refer to: p5292, r5293, r5294, r5295, p5296, p5297, p5300, p5308, p5309				
Note:	For bit 00: The speed controller gain is determined and set using a noise signal.				
	For bit 01: Possibly required current setpoint filters are determined and set using a noise signal. As a consequence, a higher dynamic performance can be achieved in the speed control loop.				
	For bit 02: When the bit is set, the moment of inertia is determined using a test signal via the moment of inertia estimator. If this bit is not set, then the load moment of inertia must be manually set using parameter p1498. The test signal must have been previously set using parameters p5308 and p5309.				
	For bit 04: Using this bit, load oscillation detection is determined using a test signal. The traversing path must first be set using parameter p5308.				
	For bit 05: Using this bit, load oscillation detection is determined using a test signal, and transferred to p3752. The precondition is function module "APC" (r0108.7 = 1) and p3700.2 = 1. After executing the function, APC must be activated via p3700.0 = 1. The traversing path must first be set using parameter p5308.				
	For bit 07: With this function, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.				
	For bit 08: Using this bit, the moment of inertia is determined from the frequency characteristic using a test signal. If bit 02 is inactive, then the moment of inertia is also transferred to p1498. The traversing path for the measurement can be set beforehand using parameter p5308. This is recommended in order to be able to determine a more accurate moment of inertia. The frequency range for the measurement can be restricted using parameters p5323 and p5324.				

p5302[0...n]	Online tuning configuration / Ot config				
SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 1100 bin		
Description:	Setting the functions for online tuning (p5300 = 2).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	02	Estimate moment of inertia	Yes	No	-
	03	Configuring the moment of inertia estimator	Cyclic	Once	-
	06	Activating the current setpoint filter adaptation	Yes	No	-
	07	Activating synchronized axes	Yes	No	-
	08	Moment of inertia determination from frequency response	Yes	No	-
Dependency:	It is only possible to change the configuration if autotuning is not active (p5300 = 0). Refer to: p5271, p5272, p5273, r5274, p5275, p5300				
Caution:	Please note the general conditions for the moment of inertia estimator, online tuning as well as adaptive resonance filter in the following reference: SINAMICS S120 Function Manual Drive Functions				
					
Note:	For bit 02: When the bit is set, the mass is determined while traversing (moment of inertia estimator). If this bit is not set, then the load mass must be manually set using parameter p1498. For bit 03: If p5302.3 = 0, "Once" applies: After having successfully determined the load mass (p1498), the moment of inertia estimator is deactivated. If p5302.3 = 1, "Cyclic" applies: The mass is continually determined and the controller parameters adapted. After the mass has been successfully determined (r1407.26 = 1), we recommend that the parameters are saved in a non-volatile fashion. As a consequence, the controllers do not have to restabilize after the next switch on. For bit 06: The adaptation of a current setpoint filter can be set here (see p5280 - p5285). This adaptation may be necessary if a mechanical resonance frequency changes in operation. It can also be used to dampen a fixed resonance frequency. Once the control loop has stabilized, this bit should be deactivated and the determined parameters saved in a non-volatile fashion. For bit 07: When the function is activated, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.				

p5302[0...n]	Online tuning configuration / Ot config				
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: REL Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 0000 0000 1100 bin		
Description:	Setting the functions for online tuning (p5300 = 2).				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	02	Estimate moment of inertia	Yes	No	-
	03	Configuring the moment of inertia estimator	Cyclic	Once	-
	06	Activating the current setpoint filter adaptation	Yes	No	-
	07	Activating synchronized axes	Yes	No	-
	08	Moment of inertia determination from frequency response	Yes	No	-

2 Parameters

2.2 List of parameters

- Dependency:** It is only possible to change the configuration if autotuning is not active (p5300 = 0).
Refer to: p5271, p5272, p5273, r5274, p5275, p5300
- Caution:** Please note the general conditions for the moment of inertia estimator, online tuning as well as adaptive resonance filter in the following reference:
 SINAMICS S120 Function Manual Drive Functions
- Note:** For bit 02:
When the bit is set, the moment of inertia is determined while traversing (moment of inertia estimator). If this bit is not set, then the load moment of inertia must be manually set using parameter p1498.
- For bit 03:
If p5302.3 = 0, "Once" applies:
After having successfully determined the moment of inertia (p1498), the moment of inertia estimator is deactivated.
If p5302.3 = 1, "Cyclic" applies:
The moment of inertia is continually determined and the control parameters adapted. After the moment of inertia has been successfully determined (r1407.26 = 1), we recommend that the parameters are saved in a non-volatile fashion. As a consequence, the controllers do not have to restabilize after the next switch on.
- For bit 06:
The adaptation of a current setpoint filter can be set here (see p5280 - p5285).
This adaptation may be necessary if a mechanical resonance frequency changes in operation. It can also be used to dampen a fixed resonance frequency. Once the control loop has stabilized, this bit should be deactivated and the determined parameters saved in a non-volatile fashion.
- For bit 07:
When the function is activated, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

r5306[0...n]

Autotuning status / Autotuning stat

SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: -	Calculated: -	Access level: 2
	Data type: Unsigned16	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the status of the auto tuning functions performed - "Online tuning" and "One Button Tuning".
The functions can be activated via p5300.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Proportional gain Kp set	Yes	No	-
	01	Current setpoint filter set	Yes	No	-
	02	Moment of inertia estimation carried out	Yes	No	-
	04	Load vibration detection performed	Yes	No	-
	05	Detected load oscillation set	Yes	No	-
	06	Current setpoint filter adaptation active	Yes	No	-
	12	Online tuning active	Yes	No	-
	13	One Button Tuning successfully completed	Yes	No	-
	14	Controller parameters reset due to fault	Yes	No	-

Dependency: Refer to: p5300, p5301, p5302

- Note:** For bit 00 = 1: The speed controller gain was set using One Button Tuning.
For bit 01 = 1: The current setpoint filter was set using One Button Tuning
For bit 02 = 1: The moment of inertia was determined.
For bit 04 = 1: Load oscillation detection was performed using One Button Tuning
For bit 05 = 1: Detected load oscillation suppression was set using One Button Tuning.
For bit 06 = 1: Adaptive resonance filters of the online tuning are active.
For bit 12 = 1: Online tuning is active and modifies the controller.

p5307[0...n] Activate One Button Tuning test signal / Act OBT test sig

SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

- - 0000 bin

Description: Setting to activate the test signal.
For bit 01:
As setpoint velocity, the rated motor velocity is entered, alternating in the positive and negative directions.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Triangular test signal	ON	OFF	-

Dependency: Refer to: p5308, p5309

Note: For bit 01:
This test signal can only be activated for p5308 > 0 and p5309 > 0.
Speed control with encoder is required to activate the test signal.

p5307[0...n] Activate One Button Tuning test signal / Act OBT test sig

SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

- - 0000 bin

Description: Setting to activate the test signal.
For bit 01:
As setpoint speed, a triangular signal is entered, alternating in the positive and negative directions. Distance p5308 and duration p5309 are kept.
This function is used for One Button Tuning p5300 = 1.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	01	Triangular test signal	ON	OFF	-

Dependency: Refer to: p5308, p5309

Note: For bit 01:
This test signal can only be activated for p5308 > 0 and p5309 > 0.
Speed control with encoder is required to activate the test signal.

p5308[0...n] One Button Tuning test signal distance limiting / OBT test sig lim

SERVO (J_estimator / OBT, Lin), SERVO_AC (J_estimator / OBT, Lin), SERVO_I_AC (J_estimator / OBT, Lin)	Can be changed: T	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

-30000 [mm] 30000 [mm] 0 [mm]

Description: Sets the distance limiting for the "Square wave with a rated velocity" test signal (p5307.1).
After activating the test signal (p5307.1), the traversing range is limited in the positive and negative directions to the set distance limit in mm.

Dependency: Refer to: p5307

Note: The position before the pulse enable is used as zero point.

2 Parameters

2.2 List of parameters

p5308[0...n]	One Button Tuning test signal distance limiting / OBT test sig lim																		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: T Data type: Integer32 P-Group: - Not for motor type: - Min -30000 [°]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 30000 [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0 [°]																
Description:	Sets the distance limiting for the "Triangular test signal" (p5307.1). After activating the test signal (p5307.1), the traversing range is limited in the positive and negative directions to the set distance limit (p5308). This function is used for One Button Tuning p5300 = 1 to identify the total moment of inertia of the drive train.																		
Dependency:	Refer to: p5307																		
Note:	A value of 360 degrees corresponds to one motor revolution. The position before the pulse enable is used as zero point.																		
p5309[0...n]	One Button Tuning test signal duration / OBT test sig dur																		
SERVO (J_estimator / OBT), SERVO_AC (J_estimator / OBT), SERVO_I_AC (J_estimator / OBT)	Can be changed: T Data type: Unsigned32 P-Group: - Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max 5000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2000 [ms]																
Description:	Sets the test signal sequence duration (several acceleration operations). This function is used for One Button Tuning (p5300 = 1) to identify the total moment of inertia of the drive train.																		
Dependency:	Refer to: p5307 Refer to: F07093																		
p5310[0...n]	Moment of inertia precontrol configuration / J_est config																		
VECTOR (J_estimator / OBT), VECTOR_AC (J_estimator / OBT), VECTOR_I_AC (J_estimator / OBT)	Can be changed: U, T Data type: Unsigned32 P-Group: Motor Not for motor type: - Min -	Calculated: - Dyn. index: DDS, p0180 Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 bin																
Description:	Configuration of the moment of inertia precontrol when the moment of inertia estimator is active.																		
Bit field:	<table border="1"> <thead> <tr> <th>Bit</th> <th>Signal name</th> <th>1 signal</th> <th>0 signal</th> <th>FP</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>Activating calculations</td> <td>Yes</td> <td>No</td> <td>-</td> </tr> <tr> <td>01</td> <td>Activating the moment of inertia precontrol</td> <td>Yes</td> <td>No</td> <td>-</td> </tr> </tbody> </table>	Bit	Signal name	1 signal	0 signal	FP	00	Activating calculations	Yes	No	-	01	Activating the moment of inertia precontrol	Yes	No	-			
Bit	Signal name	1 signal	0 signal	FP															
00	Activating calculations	Yes	No	-															
01	Activating the moment of inertia precontrol	Yes	No	-															
Dependency:	The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function. Refer to: r5311, p5312, p5313, p5314, p5315																		
Note:	Possible bit combinations: Bit 1, 0 = 0, 0 --> function not active = 0, 1 --> cyclic calculation of the coefficients without moment of inertia precontrol (commissioning) = 1, 0 --> moment of inertia precontrol activated (without cyclic calculation of the coefficients) = 1, 1 --> moment of inertia precontrol activated (with cyclic calculation of the coefficients) For bit 00: Calculation for the constant and linear coefficients of the moment of inertia precontrol is activated. The results are written to parameters (p5312, p5313, p5314, p5315).																		

For bit 01:

The moment of inertia precontrol is activated.

The moment of inertia is calculated from the currently measured load torque and the saved coefficients (p5312, p5313, p5314, p5315).

r5311[0...n] Moment of inertia precontrol status word / J_prectrl ZSW

VECTOR (J_estimator / OBT), VECTOR_AC (J_estimator / OBT), VECTOR_I_AC (J_estimator / OBT)	Can be changed: -	Calculated: -	Access level: 3

	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

Description: Displays the status word for the moment of inertia precontrol.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	New measuring points are available	Yes	No	-
	01	New parameters being calculated	Yes	No	-
	02	Moment of inertia precontrol active	Yes	No	-
	03	Calculation of positive coefficients completed	Yes	No	-
	04	Calculation of negative coefficients completed	Yes	No	-
	05	Results are being written to parameter	Yes	No	-

Dependency: The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function.

Refer to: p5310, p5312, p5313, p5314, p5315

p5312[0...n] Moment of inertia precontrol linear positive / J_est lin pos

VECTOR (J_estimator / OBT), VECTOR_AC (J_estimator / OBT), VECTOR_I_AC (J_estimator / OBT)	Can be changed: U, T	Calculated: CALC_MOD_ALL	Access level: 3
	Data type: FloatingPoint32	Dyn. index: DDS, p0180	Func. diagram: -
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting

Description: Sets the linear coefficients for moment of inertia precontrol in the positive direction when the moment of inertia estimator is active.

The estimated moment of inertia is obtained according to the following formula:

Moment of inertia (J) = linear coefficient (p5312) * load torque + constant coefficient (p5313)

Dependency: The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function.

Refer to: p5310, r5311, p5313, p5314, p5315

p5313[0...n] Moment of inertia precontrol constant positive / J_est cons pos

SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -180.000 [°]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 180.000 [°]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [°]
Description:	Phase for negative torque for the load-dependent cogging torque compensation.		
Dependency:	Refer to: p5250, p5340, p5341, p5342, p5344, p5345		
Note:	For a motor listed in the catalog, the value is taken from the motor data.		

p5344[0...n]	Cogging torque compensation load-dependent phase linear / CTC loadDep ph lin		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min -360.000 [°]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 360.000 [°]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [°]
Description:	Gradient of the phase for the load-dependent cogging torque compensation.		
Dependency:	Refer to: p5250, p5340, p5341, p5342, p5343, p5345		
Note:	For a motor listed in the catalog, the value is taken from the motor data.		

p5345[0...n]	Cogging torque compensation load-dependent shutdown velocity / CTC loadDep shutd		
SERVO (Cog_M_comp, Lin), SERVO_AC (Cog_M_comp, Lin), SERVO_I_AC (Cog_M_comp, Lin)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0.0 [m/min]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 2000.0 [m/min]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 200.0 [m/min]
Description:	Sets the shutdown speed for the load-dependent cogging torque compensation.		
Dependency:	Refer to: p5250, p5340, p5341, p5342, p5343, p5344		
Note:	The load-dependent cogging torque compensation is deactivated above the shutdown velocity For a motor listed in the catalog, the value is taken from the motor data.		

p5345[0...n]	Cogging torque compensation load-dependent shutdown speed / CTC loadDep shudt		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0.0 [rpm]	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 210000.0 [rpm]	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1500.0 [rpm]
Description:	Sets the shutdown speed for the load-dependent cogging torque compensation.		
Dependency:	Refer to: p5250, p5340, p5341, p5342, p5343, p5344		
Note:	The load-dependent cogging torque compensation is deactivated above the shutdown speed. For a motor listed in the catalog, the value is taken from the motor data.		
p5346[0...6]	Cogging torque compensation serial numbers after learning / CTC ser_noAftLearn		
SERVO (Cog_M_comp), SERVO_AC (Cog_M_comp), SERVO_I_AC (Cog_M_comp)	Can be changed: U, T Data type: Unsigned32 P-Group: - Not for motor type: - Min 0000 hex	Calculated: - Dyn. index: - Unit group: - Scaling: - Max FFFF FFFF hex	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0000 hex
Description:	Displays the encoder and motor serial numbers. This data is identified when learning the cogging torque compensation. This means that it can be identified if the encoder or motor has been replaced.		
Index:	[0] = Encoder serial number [1] = Motor serial number Part 1 [2] = Motor serial number Part 2 [3] = Motor serial number Part 3 [4] = Motor serial number Part 4 [5] = Motor serial number Part 5 [6] = Motor serial number Part 6		
Dependency:	Refer to: p5250, p5251 Refer to: A07356		
p5350[0...n]	Mot_temp_mod 1/3 boost factor at standstill / Standst boost_fact		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: ASM, SESM, REL Min 1.0000	Calculated: - Dyn. index: MDS, p0130 Unit group: - Scaling: - Max 2.0000	Access level: 2 Func. diagram: 8017 Unit selection: - Expert list: 1 Factory setting 2.0000
Description:	Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3. The entered factor is active for speed $n = 0$ [rpm]. This factor is linearly reduced down to 1 between speeds $n = 0 \dots 1$ [rpm]. The following values are required to calculate the boost factor: - stall current (I_0 , p0318, catalog value) - thermal stall current (I_{th0} , catalog value) The boost factor is calculated as follows: - $p5350 = (I_0 / I_{th0})^2$		
Dependency:	Refer to: p0318, p0351, p0612, p5390, p5391 Refer to: F07011, A07012, F07013, A07014		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		

2 Parameters

2.2 List of parameters

Note: Temperature model 1 (I2t):
The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:
- parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.
The following applies from firmware version 4.7 SP6 and p0612.8 = 1:
- parameter p5350 becomes active as described above.

p5350[0...n]	Mot_temp_mod 1/3 boost factor at standstill / Standst boost_fact		
SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8017
	P-Group: Motor	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.0000	2.0000	2.0000

Description: Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3.

The entered factor is active for velocity $n = 0$ [m/min].

This factor is linearly reduced down to 1 between velocities $n = 0 \dots 1$ [m/min].

The following values are required to calculate the boost factor:

- stall current (I_{0} , p0318, catalog value)
- thermal stall current (I_{th0} , catalog value)

The boost factor is calculated as follows:

$$- p5350 = (I_{0} / I_{th0})^2$$

Dependency: Refer to: p0318, p0351, p0612, p5390, p5391

Refer to: F07011, A07012, F07013, A07014

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: Temperature model 1 (I2t):
The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:
- parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.
The following applies from firmware version 4.7 SP6 and p0612.8 = 1:
- parameter p5350 becomes active as described above.

r5386[0...4]	CO: Mot_temp remaining time until fault / t_remain to fault		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [s]	- [s]	- [s]

Description: Display and connector output for the remaining time until a fault is output due to motor overtemperature.

With the motor load remaining the same, the values specify the time remaining until a fault is output.

For index [0]:

The value indicates the active remaining time until a fault is output.

This value is the minimum from indices [1] to [4]; whereby, value -1 is not taken into account.

For index [1]:

The value indicates the calculated time that remains until a fault is output for the model.

For index [2]:

The value indicates the time that remains until a fault is output after an alarm has occurred for the model (p0605, p5387).

For index [3]:

The value indicates the calculated time that remains until a fault is output for the measurement.

For index [4]:

The value indicates the time that remains until a fault is output after an alarm has occurred for the measurement (p0606).

Index: [0] = Active time
 [1] = Thermal time according to the model-based calculation
 [2] = Timer time after alarm from the model
 [3] = Timer time after calculation for measurement
 [4] = Timer time after alarm from the measurement

Note: Value = 120 s means that there is no thermal restriction.
 Value = -1 s means that a prediction is not possible.

r5387[0...n]	Mot_temp_mod 3 timer / Mod 3 timer		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8019
	P-Group: Displays, signals	Unit group: -	Unit selection: -
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [s]	- [s]	- [s]
Description:	Displays the timer for monitoring the motor temperature for motor temperature model 3. This timer is started when the temperature alarm threshold (p5390) is exceeded. If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output. If the temperature fault threshold (p5391) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.		

p5388	BI: Mot_temp current reduction inhibit signal source / I_red inhib s_s		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 8016
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source to inhibit current reduction for thermal overload (p0610 = 1). BI: p5388 = 1 signal: Current reduction is inhibited. BI: p5388 = 0 signal: Current reduction is enabled.		
Dependency:	This parameter is only active for p0610 = 1 (messages, reducing I_max). Refer to: p0604, p0605, p0610, p5390		

r5389.0...8	CO/BO: Mot_temp status word faults/alarms / Mot_temp ZSW F/A				
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 8015		
	P-Group: Displays, signals	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	-		
Description:	Display and BICO output for faults and alarms of the motor temperature monitoring.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Motor temperature measurement fault active	Yes	No	-
	01	Motor temperature model fault active	Yes	No	-
	02	Encoder temperature measurement fault active	Yes	No	-
	04	Motor temperature measurement alarm active	Yes	No	-
	05	Motor temperature measurement alarm active	Yes	No	-
	08	Current reduction active	Yes	No	-
Dependency:	Refer to: r0034, p0612, r0632 Refer to: F07011, A07012, A07910				

2 Parameters

2.2 List of parameters

Note: For bit 00, 04:
The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 01, 05:
The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 02:
The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.
For bit 08:
When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

p5390[0...n]	Mot_temp_mod 1/3 alarm threshold / A thr		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8017
	P-Group: Motor	Unit group: 21_1	Unit selection: p0505
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [°C]	200.0 [°C]	110.0 [°C]
Description:	Sets the alarm threshold for monitoring the motor temperature for motor temperature models 1 and 3. The stator winding temperature (r0632) is used to initiate the signal. The following applies for temperature model 1 (I2t): - only effective from firmware version 4.7 SP6 and p0612.8 = 1. - Alarm A07012 is output after the alarm threshold is exceeded. - when commissioning a catalog motor for the first time, the threshold value is copied from p0605 to p5390. The following applies for temperature model 3: - after the alarm threshold is exceeded, alarm A07012 is output and a calculated delay time (t = p5371/p5381) is started. - if the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output.		
Dependency:	Refer to: r0034, p0605, p0612, r0632, p5391 Refer to: F07011, A07012, F07013, A07014		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The hysteresis is 2 K.		

p5391[0...n]	Mot_temp_mod 1/3 fault threshold / F thr		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8017
	P-Group: Motor	Unit group: 21_1	Unit selection: p0505
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [°C]	200.0 [°C]	120.0 [°C]
Description:	Sets the fault threshold for monitoring the motor temperature for motor temperature models 1 and 3. Fault F07011 is output after the fault threshold is exceeded. The stator winding temperature (r0632) is used to initiate the signal. The following applies for temperature model 1 (I2t): - only effective from firmware version 4.7 SP6 and p0612.8 = 1. - when commissioning a catalog motor for the first time, the threshold value is copied from p0615 to p5391.		
Dependency:	Refer to: r0034, p0612, p0615, r0632, p5390 Refer to: F07011, F07013, A07014		
Notice:	When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.		
Note:	The hysteresis is 2 K.		

r5397	Mot_temp_mod 1/3 ambient temperature image p0613 / AmbTmp image p613		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 8019
	P-Group: Displays, signals	Unit group: 21_1	Unit selection: p0505
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [°C]	- [°C]	- [°C]
Description:	Displays the ambient temperature for motor temperature models 1 and 3. This value is used to calculate the utilization display (p0034). The parameter value is an image of p0613.		
Dependency:	Refer to: r0034		
Note:	The following applies for firmware version < 4.7 SP6: Users cannot see parameter p0613 (only Siemens internal).		

r5398[0...n]	Mot_temp_mod 1/3 alarm threshold image p5390 / A thr image p5390		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8019
	P-Group: Displays, signals	Unit group: 21_1	Unit selection: p0505
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [°C]	- [°C]	- [°C]
Description:	Displays the alarm threshold for monitoring the motor temperature for motor temperature models 1 and 3. This value is used to calculate the utilization display (p0034). The parameter value is an image of p5390.		
Dependency:	Refer to: p5390 Refer to: F07011, A07012, F07013, A07014		
Note:	The following applies for firmware version < 4.7 SP6: Users cannot see parameter p5390 (only Siemens internal).		

r5399[0...n]	Mot_temp_mod 1/3 fault threshold image p5391 / F thr image p5391		
SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dyn. index: MDS, p0130	Func. diagram: 8019
	P-Group: Displays, signals	Unit group: 21_1	Unit selection: p0505
	Not for motor type: ASM, SESM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [°C]	- [°C]	- [°C]
Description:	Sets the fault threshold for monitoring the motor temperature for motor temperature models 1 and 3. Fault F07011 is output after the fault threshold is exceeded. The parameter value is an image of p5391.		
Dependency:	Refer to: p5391 Refer to: F07011, A07012, F07013, A07014		
Note:	The following applies for firmware version < 4.7 SP6: Users cannot see parameter p5391 (only Siemens internal).		

2 Parameters

2.2 List of parameters

p5400	Grid droop control configuration / Grid drp ctrl cfg			
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: T	Calculated: -	Access level: 4	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: Closed-loop control	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 bin	
Description:	Sets the configuration for the line droop control.			
Recommendation:	We recommend that the factory setting setting is kept.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Q-U droop	Yes	No
	01	dq transformation with grid droop angle	Yes	No
Dependency:	Refer to: r5412, r5421, r5422, r5449			
Note:	For bit 00: For p5400.0 = 0, the reactive current (r5421) is used as input variable for the voltage droop (r5420). Using this reactive current voltage droop, also in the case of line/grid voltage dips, a stable operating point for common operation with additional power generators in the island grid is obtained. This is also true if these generating units employ a reactive power voltage droop. For p5400.0 = 1, the reactive power (r5422) is used as input variable for the voltage droop (r5420), therefore implementing a reactive power-voltage droop functionality. For bit 01: For p5400.1 = 0, the line angle from the transformer model and PLL (r0094) are used to calculate the active current and reactive current (r5421, r5449). For p5400.1 = 1, the grid supply angle from the grid supply droop (r5412) is used to calculate the active and reactive current (r5421, r5449).			
p5401[0...1]	BI: Line droop control activation / Ldrp act			
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 7982, 7986, 7988	
	P-Group: Commands	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	[0] 0 [1] 1	
Description:	For index [0]: Sets the signal source to activate line droop control for the infeed. BI: p5401[0] = 1 signal: Activation of line droop control and deactivation of closed-loop DC link voltage control/closed-loop current control. BI: p5401[0] = 0 signal: Activation of closed-loop DC link voltage control/closed-loop current control and deactivation of line droop control. For index [1]: Setting the signal source to activate the line droop setpoints (p5405, p5406, p5415, p5416). BI: p5401[1] = 1 signal: Activates the setpoints. BI: p5401[1] = 0 signal: Deactivates the setpoints.			
Index:	[0] = Line regulation [1] = Droop setpoints			
Dependency:	For p5401[0], the following applies: The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source. Refer to: r5402			

Notice: Line droop control can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

We urgently recommend at least one measure to dampen power oscillations (p5413, p5476) if, in an island grid, several generating sources are simultaneously active – and power is exchanged via the frequency droop (p5405).

Note: For index [0]:

So that closed-loop DC link voltage control is activated by the VECTOR drive object's technology controller (due to closed-loop DC link voltage control for the infeed being deactivated) the following BICO interconnection must be set:

BI: p3513 (VECTOR) = r5402.0 (A_INF)

For index [1]:

When the setpoints are deactivated, the smoothed actual values of these variables are used for the no-load values of frequency and voltage. As a consequence, the average power is controlled so that it approaches zero. However, when the line frequency or line voltage changes, brief peak powers can occur according to the current limits that have been set (r5479).

As the power is controlled to zero, in island grids continuous operation is only possible with p5401[1] = 0 if the grid is supplied by other generating units. Otherwise, line frequency and line voltage decreases to the shutdown limits.

However, brief exceptions with the appropriate low frequency and amplitude deviations are possible and make sense (e.g. for switchover transitions in hot standby applications).

r5402.0...6 CO/BO: Line droop control status word / Ldrp ZSW

A_INF (Line droop ctrl), R_INF (Line droop ctrl)

Can be changed: -	Calculated: -	Access level: 3
Data type: Unsigned16	Dyn. index: -	Func. diagram: -
P-Group: Closed-loop control	Unit group: -	Unit selection: -
Not for motor type: -	Scaling: -	Expert list: 1
Min	Max	Factory setting
-	-	-

Description: Display and BICO output for the status word of the grid droop control of the infeed unit.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Line droop control not active	Yes	No	-
	01	Line droop control active	Yes	No	-
	02	Line droop control in single mode	Yes	No	-
	03	Current limitation control active	Yes	No	7986
	04	Operating state line short circuit active	Yes	No	-
	05	Wobulation modulation type active	Yes	No	-
	06	Line droop f-U setpoints active	Yes	No	-

Note: For bit 00, 01:

The line droop control is activated via binector input p5401[0].

The grid and DC link parameter identification must be deselected (p3410 = 0) in order to do this.

For bit 02:

The operating mode of the current hysteresis controller is specified via binector input p5451.

For bit 04:

The status word of the sequence control is displayed in r5452.

For bit 05:

The pulse frequency wobulation is activated via p1810.2 = 1, and the wobulation amplitude p1811 is enabled via p5456[0...2].4 = 0.

For bit 06:

The no-load setpoints for frequency and voltage are activated using binector input p5401[1].

Description:	Sets the smoothing time for the output frequency of the active power frequency droop (r5410).		
Dependency:	Refer to: p5405		

2 Parameters

2.2 List of parameters

Note: When the load changes, mechanical energy generation units induce a delayed change in frequency on account of their inertia. The converter tries to emulate this response with the assistance of the smoothing time.
For the line to remain stable, all the energy generation units in a separate network have to respond in a similar manner during operation.

r5410	CO: Line droop control frequency droop output / Ldrp f outp		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [Hz]	Calculated: - Dyn. index: - Unit group: - Scaling: p2000 Max - [Hz]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [Hz]
Description:	Displays the smoothed output frequency of the active power frequency droop. Droop formula (without smoothing): $r5410 = (p5405 + p5406 + p5407 * r5411[0] / r0206) * p0211$		
Dependency:	Refer to: p5405		

r5411[0...1]	CO: Line droop control frequency droop active power / Ldrp f P_act		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [kW]	Calculated: - Dyn. index: - Unit group: - Scaling: r2004 Max - [kW]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [kW]
Description:	Displays the input active power of the active power frequency droop. The active power is calculated for the currents and voltages defined with connector inputs p5403 and p5404.		
Index:	[0] = Unsmoothed [1] = Smoothed		
Dependency:	Refer to: p5409		
Note:	For index [1]: The value is smoothed using a PT1 filter (smoothing time: p0045).		

r5412	CO: Line droop control line angle / Ldrp angle		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: - Data type: FloatingPoint32 P-Group: Displays, signals Not for motor type: - Min - [°]	Calculated: - Dyn. index: - Unit group: - Scaling: p2005 Max - [°]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting - [°]
Description:	Displays the actual line angle for line droop control. The value is calculated by integrating the output frequency of the active power frequency droop (r5410).		

p5413	Line droop control additional frequency droop gradient / Ldrp add-f		
A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T Data type: FloatingPoint32 P-Group: - Not for motor type: - Min 0.0 [%]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 10000.0 [%]	Access level: 3 Func. diagram: 7982 Unit selection: - Expert list: 1 Factory setting 0.0 [%]
Description:	Sets the gradient for the additional, fast frequency droop. The reference quantity is the gradient for the regular frequency droop (p5407). The settings for the regular frequency droop (p5405 onwards) apply to the other droop parameters. As a result of the short smoothing time, the supplementary frequency droop acts similar to a D component – and therefore as damping factor for the closed-loop line control.		

Recommendation: Typical setting values lie between 50 % and 100 %.

Dependency: Refer to: p5414, p5476

Note: For example, a strong frequency dip can be generated when the load is connected with the additional frequency droop, and this can be used to emulate the behavior of a diesel generator.
The frequency is initially changed with the smoothing time p5414 in accordance with the additional droop, reaching the stationary end value in accordance with the time constant p5409 for the regular frequency droop.
The additional droop is deactivated with p5413 = 0.

p5414 Line droop control additional frequency droop smoothing time / Ldrp add-t

A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7982
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0 [%]	100.0 [%]	10.0 [%]

Description: Sets the smoothing time for the additional, fast frequency droop.
The reference quantity is the smoothing time for the regular frequency droop (p5409).

Recommendation: Typical setting values lie between 10 % and 20 %.

Dependency: Refer to: p5413

Note: The smoothing time for the additional, fast frequency droop is less than or equal to the time constant for the regular frequency droop.

p5415 Line droop control voltage droop no-load voltage / Ldrp U_no-ld

A_INF (Line droop ctrl), R_INF (Line droop ctrl)	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 7982
	P-Group: Closed-loop control	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min	Max	Factory setting
	30.00 [%]	300.00 [%]	100.00 [%]

Description: Sets the no-load voltage for the voltage droop and grid droop control.
This value is entered as a % referred to the device supply voltage (p0210)
Using the voltage droop, the currently required output voltage can be calculated for stable grid operation.
The no-load voltage is defined as the setpoint output voltage for the case that the reactive current or the reactive power at the selected connection point (p5403, p5404) assumes a value of 0.

Dependency: Refer to: p5419

Note: For the reactive current voltage droop (p5400.0 = 0), the following applies:

The droop characteristic input variable is the reactive power r5421[0] at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

$$r5420 = (p5415 + p5416 + p5417 * r5421[0] / r0207) * p0210$$

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

For the reactive power voltage droop (p5400.0 = 1), the following applies:

The input variable of the droop characteristic is the reactive power (r5422[0]) at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

$$p5420 = (p5415 + p5416 - p5417 * r5422[0] / (1.732 * r0207 * p0210)) * p0210$$

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.
