SI Motion P1 (CU): Parameter value not permitted for encoderless

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None

Propagation: GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The parameter cannot be set to this value if encoderless motion monitoring functions have been selected in p9506.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Parameter number with the incorrect value.

See also: p9501 (SI Motion enable safety functions (Control Unit))

Remedy:

- correct the parameter specified in the fault value.
- if necessary, deselect encoderless motion monitoring functions (p9506).

See also: p9501 (SI Motion enable safety functions (Control Unit))

Cause: Safety parameters have been changed; these will only take effect following a warm restart or POWER ON.
 Alarm value (r2124, interpret decimal):
 Parameter number of the safety parameter which has changed, necessitating a warm restart or POWER ON.

Remedy:

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).
- carry out a POWER ON (switch-off/switch-on) for all components.

Note:

Before performing an acceptance test, a POWER ON must be carried out for all components.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The firmware version of the Motor Module/Hydraulic Module is older than the version of the Control Unit.
 It is possible that safety functions are not available (r9771/r9871).
 Note:
 This message does not result in a safety stop response.
 This message can also occur, if after an automatic firmware update, a POWER ON was not carried out (Alarm A01007).

Remedy: Upgrade the firmware of the Motor Module/Hydraulic Module to a later version.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: A Sensor Module, which is used for safe motion monitoring functions, was replaced. The hardware replacement must be acknowledged. An acceptance test must be subsequently performed.
 Note:
 This message does not result in a safety stop response.

Remedy: Carry out the following steps using the STARTER commissioning tool:

- press the "Acknowledge hardware replacement" button in the safety screen form.
- execute the function "Copy RAM to ROM".
- carry out a POWER ON (switch-off/switch-on) for all components.

As an alternative, carry out the following steps in the expert list of the commissioning tool:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Then carry out an acceptance test (refer to the Safety Integrated Function Manual).
 For SINUMERIK, the following applies:
 HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).
 The precise procedure is given in the following document:

- Cause:** When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
- If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.
- The message value that resulted in a STOP F is displayed in r9725.
- If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:
- 1007: communication error with the PLC (sign-of-life).
 - 1008: communication error with the PLC (CRC).
- The following described message values involve the data cross-check between the two monitoring channels (safety functions integrated in the drive).
- The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:
- cycle times not uniformly parameterized (p9500/p9300 and p9511/p9311)
 - differently parameterized axis types (p9502/p9302).

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).

283: Acceleration actual value (fine resolution).

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1002:

User agreement after the timer has expired different.

The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.

1003:

Reference tolerance exceeded.

When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.

1004:

Plausibility error for user agreement.

1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.

2. The user agreement was set, although the axis has still not been referenced.

1005:

- for safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.

- for safe motion monitoring functions with encoder: STO already active for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the encoder actual value.

1014: Error when synchronizing the SGA for the "Safe cam" function.

1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.

1020: Cyc. communication failure between the monit. channels.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1022: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 1.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder

1024: Sign-of-life error for HTL/TTL encoders.

1032: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 2.

1033: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 1.

1034: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 2.

1035: offset between POS1 and POS2 for DRIVE-CLiQ encoder on one of the monitoring channels has changed since the last commissioning.

1039: Overflow when calculating the position.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Current actual values plausibility error.

5000 ... 5140:

PROFIsafe message values.

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

An internal software error has occurred (only for internal Siemens troubleshooting).

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

5025: The result of the F parameterization is different for the two controllers.

5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.

5065: A communications error was identified when receiving the PROFIsafe telegram.

5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.

7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

- if closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 15 ... 30 and 90 ... 229:

- the cam positions for function SCA in p9536/p9336, p9537/p9337 or the cam tolerance p9540/p9340 are not equal. Correct the values. Increase the cam tolerance p9540/p9340.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 274, 275:

- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 278, 279:

- check as to whether the same acceleration limit has been set for both channels. A different result depends on whether SLA is enabled and not selected - or enabled and selected. In this case, another message value is possible.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the KDV list is increased when setting p9567 > 0 . For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value ≥ 237). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
- increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9542) and/or cam tolerance (p9540).

For message value = 1020, 1021, 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1033, 1034:

- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

For message value = 1035, if one of the safety encoders was replaced:

- confirm the hardware replacement (p9700 = 29, p9701 = 236 or p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

For message value = 1039:

- check the conversion factors such as spindle pitch or gearbox ratios.

For message value = 1041:

- check whether the motor has sufficient current (>r9785[0]).
- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589). When operating a reluctance motor, the controller settings are generally set to be more dynamic. If this message is output for the factory setting of p9589, then the acceleration limit should be increased as countermeasure (p9589 = 500 ... 1000 %). From experience, this provides a rugged response.
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

For message value = 5013, 5025:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F_SIL, F_CRC_Length, F_Par_Version, F_Source_Add, F_Dest_add, F_WD_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For message value = 7000:

- increase the position tolerance (p9542/p9342).
- determine the actual position of CU (r9713[0] and the second channel r9713[1], and check the difference for plausibility.
- reduce the difference of the actual position from CU (r9713[0] and the second channel r9713[1] for a 2-encoder system.

For message value = 7001:

- increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- if required, reduce the traversing range.

For message value = 7002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

For message value = 7003, 7004:

- if required, adapt the settings for the times for Tdp, Ti and To - or increase the monitoring clock cycle p9500 (rule $Tdp = 2 \times n \times p9500$, $n = 1, 2, 3, \dots$).

C01711

SI Motion P1 (CU): Defect in a monitoring channel

Message value:

%1

Message class:

Safety monitoring channel has identified an error (10)

Drive object:

HLA

Component:

None

Propagation:

GLOBAL

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.

The message value that resulted in a STOP F is displayed in r9725.

If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:

- 1007: communication error with the PLC (sign-of-life)
- 1008: communication error with the PLC (CRC)

The following described message values involve the data cross-check between the two monitoring channels (safety functions integrated in the drive).

The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- cycle times not uniformly parameterized (p9500/p9300 and p9511/p9311)
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- For message values 3, 44 ... 57, 232 and 1-encoder system, differently set encoder parameters.
- For message values 3, 44 ... 57, 232 and 2-encoder system, encoder parameters that have not been correctly set.
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

Message values that are not subsequently listed are only for internal Siemens troubleshooting.

0: Stop request from another monitoring channel.

1: Status image of monitoring functions SOS, SLS, SAM/SBR, SDI or SLP (result list 1) (r9710[0], r9710[1]).

2: Status image of monitoring function SCA or $n < nx$ (result list 2) (r9711[0], r9711[1]).

- 3: The position actual value differential (r9713[0/1]) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.
- 4: Error when synchronizing the data cross-check between the two channels.
- 5: Enable safe functions (p9501/p9301). Safety monitoring clock cycle too small (p9500/p9300).
- 6: Limit value for SLS1 (p9531[0]/p9331[0])
- 7: Limit value for SLS2 (p9531[1]/p9331[1])
- 8: Limit value for SLS3 (p9531[2]/p9331[2])
- 9: Limit value for SLS4 (p9531[3]/p9331[3])
- 10: Standstill tol. (p9530/p9330)
- 11: Upper limit value for SLP1 (p9534[0]/p9334[0]).
- 12: Lower limit value for SLP1 (p9535[0]/p9335[0]).
- 13: Upper limit value for SLP2 (p9534[1]/p9334[1]).
- 14: Lower limit value for SLP2 (p9535[1]/p9335[1]).
- 31: Position tolerance (p9542/p9342) or (p9549/p9349) when actual value synchronization is enabled (p9501.3/p9301.3)
- 32: Position tolerance for safe referencing (p9544/p9344).
- 33: Time, velocity changeover (p9551/p9351)
- 35: Delay time, STOP A (p9556/p9356)
- 36: Checking time, STO (p9557/p9357)
- 37: Trans. time, STOP C to SOS (p9552/p9352)
- 38: Trans. time STOP D to SOS (p9553/p9353)
- 39: Trans. time, STOP E to SOS (p9554/p9354)
- 40: Stop response for SLS (p9561/p9361).
- 41: Stop response for SLP1 (p9562[0]/p9362[0]).
- 42: Shutdown speed, STO (p9560/p9360)
- 43: Memory test stop response (STOP A).
- 44 ... 57: General
- Possible cause 1 (during commissioning or parameter modification)
- The tolerance value for the monitoring function is not the same on the two monitoring channels.
- Possible cause 2 (during active operation)
- The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.
- Permissible deviation between the two monitoring channels: p9542/p9342.
- 44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).
- 45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) * safety monitoring clock cycle (p9500/p9300).
- 46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).
- 47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) * safety monitoring clock cycle (p9500/p9300).
- 48: Position actual value (r9713[0/1]) + limit value SLS3 (p9531[2]/p9331[2]) * safety monitoring clock cycle (p9500/p9300).
- 49: Position actual value (r9713[0/1]) - limit value SLS3 (p9531[2]/p9331[2]) * safety monitoring clock cycle (p9500/p9300).
- 50: Position actual value (r9713[0/1]) + limit value SLS4 (p9531[3]/p9331[3]) * safety monitoring clock cycle (p9500/p9300).
- 51: Position actual value (r9713[0/1]) - limit value SLS4 (p9531[3]/p9331[3]) * safety monitoring clock cycle (p9500/p9300).
- 52: Standstill position + tolerance (p9530/9330)
- 53: Standstill position - tolerance (p9530/9330)
- 54: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) * safety monitoring clock cycle (p9500/p9300) + tolerance (p9542/p9342).
- 55: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) * safety monitoring clock cycle (p9500/p9300).
- 56: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) * safety monitoring clock cycle (p9500/p9300).

- 57: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) * safety monitoring clock cycle (p9500/p9300) - tolerance (p9542/p9342).
- 58: Actual stop request.
- 75: Velocity limit nx (p9546, p9346).
When the function "n < nx: hysteresis and filtering" (p9501.16 = 1) is enabled, this message value is also output for a different hysteresis tolerance (p9547/p9347).
- 76: Stop response for SLS1 (p9563[0]/p9363[0]).
- 77: Stop response for SLS2 (p9563[1]/p9363[1]).
- 78: Stop response for SLS3 (p9563[2]/p9363[2]).
- 79: Stop response for SLS4 (p9563[3]/p9363[3]).
- 81: Velocity tolerance for SAM (p9548/p9348)
- 82: SGEs for SLS correction factor.
- 83: Acceptance test timer (p9558/p9358)

- 243: Function configuration (p9507/p9307).
- 246: Voltage tolerance acceleration (p9589/p9389).
- 247: SDI tolerance (p9564/p9364).
- 248: SDI positive upper limit (7FFFFFFF hex).
- 249: Position actual value (r9713[0/1]) - SDI tolerance (p9564/p9364).
- 250: Position actual value (r9713[0/1]) + SDI tolerance (p9564/p9364).
- 251: SDI negative lower limit (80000001 hex).
- 252: SDI stop response (p9566/p9366).
- 253: SDI delay time (p9565/p9365).
- 256: Status image of monitoring functions SOS, SLS, SLP, test stop, SBR, SDI (result list 1 ext) (r9710).
- 257: Safety functions for motion monitoring functions without selection (p9512/p9312) different.
- 259: Scaling factor for safe position via PROFIsafe (p9574/p9374) or PROFIsafe telegram (p9611/p9811) different.
- 260: Modulo value including scaling (p9505/p9305 and p9574/p9374) for SP with 16 bit.
- 263: Stop response for SLP2 (p9562[1]/p9362[1])
- 264: Position tolerance including scaling (p9542/p9342 and p9574/p9374) for SP with 16 bit.
- 265: Status image of all change functions (results list 1) (r9710).
- 266: The switchover speed to SOS differs (p9567/p9367).
- 267: The transition time to SOS after standstill differs (p9569/p9369).
- 268: SLP delay time differs (p9577/p9377).
- 269: Factor to increase the position tolerance when switching over the gearbox stage (p9543/9343).
- 270: Screen form for SGE image: all functions, which are not supported/enabled for the actual parameterization (p9501/p9301, p9601/p9801 and p9506/p9306)..
- 271: Screen form for SGE image: Deselect all bits for the "Safe gearbox switchover" function.
- 272: Activation of the increased position tolerance for the "Safe gearbox switchover" function different.
- 273: speed limit value for flattening the ramp for SAM/SBR different.
- 274: SGA SCA, cams 1 to 15.
- 275: SGA SCA, cams 16 to 30.
- 276: Limit value for SLA1 (p9578/p9378).

- 277: Stop response for SLA1 (p9579/p9379).
- 278: Upper limit value for SLA1.
- 279: Lower limit value for SLA1.
- 280: Upper limit value for SLA1 (fine resolution).
- 281: Lower limit value for SLA1 (fine resolution).
- 282: SLA filter time.
- 283: Acceleration actual value (fine resolution).
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:
User agreement after the timer has expired different.
The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:
Reference tolerance exceeded.
When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:
Plausibility error for user agreement.
1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.
2. The user agreement was set, although the axis has still not been referenced.
- 1005: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.
- 1012: Plausibility violation of the encoder actual value.
- 1014: fault when synchronizing the SGA for the "Safe cam" function
- 1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.
- 1020: Cyc. communication failure between the monit. channels.
- 1021: Cyc. communication failure between the monit. channel and Sensor Module.
- 1022: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 1.
- 1023: Error in the effectiveness test in the DRIVE-CLiQ encoder
- 1024: Sign-of-life error for HTL/TTL encoders.
- 1032: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 2.
- 1033: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 1.
- 1034: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 2.
- 1039: Overflow when calculating the position.
- 1041: Current absolute value too low (encoderless)
- 1042: Current/voltage plausibility error
- 1043: Too many acceleration phases
- 1044: Current actual values plausibility error.
- 5000 ... 5140:
PROFIsafe message values.
For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.
- 5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140: an internal software error has occurred (only for internal Siemens fault diagnostics).
- 5012: Error when initializing the PROFIsafe driver.
- 5013: The result of the initialization is different for the two controllers.
- 5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.
- 5025: The result of the F parameterization is different for the two controllers.
- 5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.
- 5065: A communications error was identified when receiving the PROFIsafe telegram.
- 5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (9612) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.

7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for HM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with HM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 274, 275:

- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 278, 279, 280, 281:

- check as to whether the same acceleration limit has been set for both channels. A different result depends on whether SLA is enabled and not selected - or enabled and selected. In this case, another message value is possible.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the KDV list is increased when setting p9567 > 0 . For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value ≥ 237). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Hydraulic Module software.

- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005: deselect checking the conditions for STO.

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.

- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.

- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- the parameterized encoder does not correspond to the connected encoder - replace the encoder.

- check the electrical cabinet design and cable routing for EMC compliance

- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).

- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9542) and/or cam tolerance (p9540).

For message value = 1020, 1021, 1024:

- check the communication link.

- if required, increase the monitoring cycle clock settings (p9500, p9511).

- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).

- replace the hardware.

For message value = 1033:

- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

For message value = 1039:

- check the conversion factors such as spindle pitch or gearbox ratios.

For message value = 1041:

- check whether the motor has sufficient current (>r9785[0]).

- reduce the minimum current (p9588).

- for synchronous motors increase the absolute value of p9783.

- check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).

- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.

- check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.

- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589). When operating a reluctance motor, the controller settings are generally set to be more dynamic. If this message is output for the factory setting of p9589, then the acceleration limit should be increased as countermeasure (p9589 = 500 ... 1000 %). From experience, this provides a rugged response.
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

For message value = 5013, 5025:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F_SIL, F_CRC_Length, F_Par_Version, F_Source_Add, F_Dest_add, F_WD_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For message value = 7000:

- increase the position tolerance (p9542/p9342).
- determine the actual position of CU (r9713[0]) and the second channel r9713[1], and check the difference for plausibility.
- reduce the difference of the actual position from CU (r9713[0]) and the second channel r9713[1] for a 2-encoder system.

For message value = 7001:

- increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- if required, reduce the traversing range.

For message value = 7002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

This message can be acknowledged as follows:

- motion monitoring functions integrated in the drive: Via Terminal Module 54F (TM54F) or PROFIsafe
- motion monitoring functions with SINUMERIK: Via the machine control panel

For message value = 7003, 7004:

- if required, adapt the settings for the times for Tdp, Ti and To - or increase the monitoring clock cycle p9500 (rule $Tdp = 2 \times n \times p9500$, $n = 1, 2, 3, \dots$).

C01770 SI Motion P1 (CU): Discrepancy error of the failsafe inputs/outputs

Message value: %1
Message class: Safety monitoring channel has identified an error (10)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)

Cause:	<p>The failsafe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002/p10102 - or too many switching operations took place within a monitoring cycle p10002.</p> <p>Fault value (r0949, interpret bitwise binary): yyyyxxxx bin xxxx: Discrepancy error for failsafe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for failsafe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.</p>
Remedy:	<p>- check the wiring of the F-DI (contact problems). - if the wiring is correct, and for example there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them). The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again.</p> <p>Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9507.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. Sets the discrepancy time for fast switching operations at the F-DIs: For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency: - the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down). - the time between two fast switching pulses should be longer than the discrepancy time (if necessary, round up). - the discrepancy time must be at least p9500 (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time p9500). If a debounce time has been parameterized (p10017 > 0), then the shortest possible discrepancy time is directly specified using the debounce time. - the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down). - the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up). - the discrepancy time must be at least p9500 The debounce time must always be set less than the discrepancy time. Example: If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows: $p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms} \rightarrow$ rounded-off, the following is obtained $p10002 \leq 36 \text{ ms}$ Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time. Basic secondary condition to set the discrepancy time: The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500). Note: F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output</p>

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy:

Check the wiring of the failsafe digital output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.

- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

Cause:

The time set in p10003 for the forced checking procedure (test stop) for the failsafe digital outputs has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

Note:

- this message does not result in a safety stop response.

- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p10003

Remedy: Carry out the forced checking procedure for the digital outputs.
The signal source to select the forced checking procedure is set via binector input p10007.

Bit 24 = 1: the tested internal brake was opened while the brake test was active.
Bit 25 = 1: the tested external brake was opened while the brake test was active.
Bit 26 = 1: during the active brake test, the test torque left its tolerance bandwidth (20 %).
Cause for alarm value bit 17:
Bit 0 = 1: operation when selecting the brake test not enabled (r0899.2 = 0).
Bit 1 = 1: external fault occurred (e.g. the brake test that has already started is canceled by the user).
Bit 2 = 1: when selecting the brake test a brake is closed.
Bit 3 = 1: when determining the load torque a brake is closed.
Bit 4 = 1: A fault has occurred with stop response (e.g. OFF1, OFF2 or OFF3) - or the pulse enable was withdrawn (e.g. STO selected or operation no longer enabled).
Bit 5 = 1: when selecting the brake test the axis speed setpoint is too high.
Bit 6 = 1: the actual speed (r0063) of the axis is too high (e.g. brake does not hold during the brake test).
Bit 7 = 1: Incorrect speed controller mode (e.g. encoderless speed control or U/f operation).
Bit 8 = 1: closed-loop control not enabled or function generator active.
Bit 9 = 1: control does not switch over to the brake test (e.g. because PI speed control has not been parameterized).

- if required, restart the brake test.
For bit 17 = 1 with bit 6 = 1 or bit 23 = 1:
If the brake closing time of the motor holding brake (p1217) has been set too low, then at the start of the brake test, the brake is closed too late. The brake closing time should be adapted (p1217).

A01785	SBT brake test configuration error
Message value:	%1
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	None
Reaction:	NONE
Acknowledge:	NONE
	Propagation: GLOBAL

Cause: Error when parameterizing the brake test.
In this configuration, the brake test cannot be started or cannot be started without error.
Alarm value (r2124, interpret decimal):
1:
No motion monitoring functions have been enabled.
2:
Two internal brakes were configured (p10202).
4:
No internal brakes were configured (p10202).
8:
The brake test is configured for an internal brake, however the safety brake control is not enabled (p9602/p9802).
Note:
From firmware version 5.1, SBT without SBC is also permitted for the internal brake.
16:
The safe brake test and Safety without encoder are simultaneously enabled (p9306/p9506). This is not permissible.
32:
The Safe Brake Test and vector U/f control is enabled. The safe brake test is not possible in this control mode.
Note:
SBC: Safe Brake Control
SBT: Safe Brake Test

Remedy: Check parameterization of the brake test.

Message value:	-
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The automatic test stop (forced checking procedure) was not able to be carried out after powering up. Possible causes: - the STO function is selected via safe motion monitoring functions. - a safety message is present, that resulted in a STO. Note: STO: Safe Torque Off
Remedy:	- deselect STO via safe motion monitoring functions. - remove the cause of the safety messages and acknowledge the messages. Note: The automatic test stop is performed after removing the cause.
A01789	SI: Automatic test stop and brake test when test stop is selected not permitted
Message value:	-
Message class:	Safety monitoring channel has identified an error (10)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The parameterization of the automatic test stop (p9507.6/p9307.6) and the brake test when a test stop is selected (p10203 = 2) are not permissible. The test stop is not automatically carried out when the powering up.
Remedy:	- correct the parameter assignment. - set p10203 not equal to 2 or deactivate the automatic test stop. Note: A warm restart or POWER ON is required to carry out the automatic test stop.
A01794 (N)	SI Motion: check modulo value for safe position via PROFIsafe
Message value:	-
Message class:	Hardware/software error (1)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Control Unit (CU) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows. Range that can be represented: - 32-bit value: +/- 2048 revolutions - 16-bit value: +/- 2048 revolutions (depending on p9574)
Remedy:	Correct the parameter assignment. Set p9505 to 2^n revolutions - and to complete revolutions (i.e. a multiple of 360°). Note: This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of +/- 2048 revolutions that can be represented. To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization: - correct p9505 to " 2^n ". - re-parameterize the alarm using p2118 and p2119. - set p9505 back to the required value.

SI Motion P1 (CU): Wait time after exiting the safe pulse cancellation expired

Message value: -

Message class: Safety monitoring channel has identified an error (10)

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Control Unit (CU) **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: After exiting safe pulse cancellation, within the wait time of 5 seconds, encoderless actual value sensing was not able to be activated for the extended functions without selection.

A change is again made into the "safe pulse cancellation" state.

Remedy: - check missing enable signals, which prevent the drive control from being commissioned (r0046).

- evaluate possible fault messages of the encoderless actual value sensing and remove.

SI P1 (CU): Wait for communication

Message value: %1

Message class: Communication error to the higher-level control system (9)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The drive waits for communication to be established to execute the safety-relevant motion monitoring functions.

Note:

STO is active in this state.

Alarm value (r2124, interpret decimal):

1: Wait for communication to be established to SINUMERIK.

2: Wait for communication to be established to TM54F.

3: Wait for communication to be established to PROFIsafe F-Host.

Remedy: If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate:

For communication with SINUMERIK, the following applies:

- check any other PROFIBUS messages/signals present and remove their cause.

- check that assignment of the axes on the higher-level control to the drives in the drive unit is correct.

- check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it.

For communication with TM54F, the following applies:

- check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause.

- check the setting of p10010. All the drive objects controlled by the TM54F must be listed.

For communication with PROFIsafe F-Host, the following applies:

- check any other PROFIsafe communication messages/signals present and evaluate them.

- check the operating state of the F-Host.

- check the communication connection to the F Host.

- check the communication connection to the Motor Module/Hydraulic Module. It must be ensured that when the Control Unit powers up, the Motor Module/Hydraulic Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module/Hydraulic Module is subsequently inserted or switched on, a POWER ON must be performed at the Control Unit.

Cause:	The bus is in the data exchange state and clock synchronous operation has been selected using the parameterizing telegram. It was not possible to synchronize to the clock cycle specified by the master. - the master does not send a clock synchronous global control telegram although clock synchronous operation was selected when configuring the bus. - the master is using another clock synchronous DP clock cycle than was transferred to the slave in the parameterizing telegram. - at least one drive object has a pulse enable (also not controlled from PROFIBUS/PROFINET).
Remedy:	- check the master application and bus configuration. - check the consistency between the clock cycle input when configuring the slave and clock cycle setting at the master. - check that no drive object has a pulse enable. Only enable the pulses after synchronizing the PROFIBUS/PROFINET drives. Note: PB: PROFIBUS PN: PROFINET

Cause:	If DRIVE-CLiQ components with different application clock cycle are operated on a DRIVE-CLiQ port, this requires synchronization with the Control Unit. This synchronization routine was unsuccessful. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.

4 Faults and alarms

4.2 List of faults and alarms

- Remedy:**
- carry out a POWER ON (switch-off/switch-on) for all components.
 - upgrade the software of the DRIVE-CLiQ components.
 - upgrade the Control Unit software.

Note:

If a Controller Extension is being used (e.g. CX32, NX10), then the following applies:

Check whether the Controller Extension is issuing error messages, and if required, remove these.

F01952 CU DRIVE-CLiQ: Synchronization of component not supported

Message value: %1

Message class: Internal (DRIVE-CLiQ) communication error (12)

Drive object: All objects

Component: None

Propagation: DRIVE

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The existing system configuration requires that the connected DRIVE-CLiQ components support the synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and the application clock cycle.

However, not all DRIVE-CLiQ components have this functionality.

Fault value (r0949, interpret decimal):

Component number of the first faulty DRIVE-CLiQ component.

Remedy: Upgrade the firmware of the component specified in the fault value.

Note:

If required, also upgrade additional components in the DRIVE-CLiQ line.

Cause: After the drive system is switched on, the synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle was started but was not completed within the selected time tolerance.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy: Carry out a POWER ON (switch-off/switch-on) for all components.

If the error occurs after the drive sampling times were changed, and if a Terminal Module 31 (TM31) is being used, the sampling times (p0115, p4099) should be set as integer multiples to the drive clock cycles (p0115).

Cause: Synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle was started and was not able to be successfully completed (e.g. after switch-on).

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy: 1. Remove the cause of a possible DRIVE-CLiQ fault.

2. Initiate a new synchronization, e.g. as follows:

- remove the PROFIBUS master and re-insert again.

- restart the PROFIBUS master.

- switch off the Control Unit and switch on again.

- carry out a Control Unit hardware reset (RESET button, p0972).

- carry out a parameter reset and download the saved parameters (p0009 = 30, p0976 = 2, 3).

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The Terminal Module involved does not send a ready signal and no valid cyclic data.
Fault value (r0949, interpret decimal):
Drive object number of the Terminal Module involved.

Remedy:

- check the 24 V power supply.
- check the DRIVE-CLiQ wiring.
- check whether the sampling time of the drive object involved is not equal to zero (p4099[0]).

Cause: The alarm threshold for overtemperature at the inverter heat sink has been reached. The response is set using p0290.
If the heat sink temperature exceeds the value set in p0292[0], then fault F30004 is output.

Remedy: Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?

- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?
- pulse frequency too high?

Note:

If the alarm occurs after reducing the current controller sampling time (p0115[0]) during the motor data identification (standstill measurement), then it is recommended that this is initially performed using the standard sampling time and then the sampling time should be subsequently changed over.

F06000	Infeed: Precharging monitoring time expired		
Message value:	-		
Message class:	Infeed faulted (13)		
Drive object:	A_INF, B_INF, R_INF, S_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	OFF2 (OFF1)		
Acknowledge:	IMMEDIATELY		
Cause:	<p>After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857). The end of the DC link precharging was not able to be completed for one of the following reasons:</p> <ol style="list-style-type: none">1) There is no line supply voltage connected.2) The line contactor/line side switch has not been closed.3) The line supply voltage is too low.4) Line supply voltage incorrectly set (p0210).5) The precharging resistors are overheated as there were too many precharging operations per time unit.6) The precharging resistors are overheated as the DC link capacitance is too high.7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.9) The DC link has either a ground fault or a short-circuit.10) The precharging circuit is possibly defective (only for chassis units). <p>See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)</p>		

- Remedy:**
- In general:
- check the line supply voltage at the connecting terminals.
 - check the line supply voltage setting (p0210).
 - check the monitoring time and, if required, increase (p0857).
 - where relevant, observe additional power unit messages/signals (e.g. F30027).
 - the following applies to booksize units: Wait (approx. 8 min.) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
- For 5):
- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).
- For 6):
- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)
- For 7):
- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link
- For 8):
- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.
- For 9):
- check the DC link for ground faults or short circuits.

F06010 Infeed: Power unit EP 24 V missing in operation

- Cause:** In operation, the pulse enable via terminal EP at the Line Module (X21.3, X21.4) was withdrawn.
- Note:**
- EP: Enable Pulses (pulse enable)

F06050 Infeed: Smart Mode not supported

- Message value:** -
- Message class:** Error in the parameterization / configuration / commissioning procedure (18)
- Drive object:** A_INF, R_INF, S_INF
- Component:** Power Module **Propagation:** GLOBAL
- Reaction:** OFF2
- Acknowledge:** IMMEDIATELY (POWER ON)
- Cause:** The power unit does not support the Smart Mode or pulse frequency wobulation is activated (p1810).
- Remedy:**
- set the suitable sampling time $250 \mu\text{s} \leq p0115[0] \leq 400 \mu\text{s}$ (e.g. by setting p0112 and p0115 to the factory setting).
 - upgrade the power unit software and/or hardware for the Smart Mode. The availability of the Smart Mode function is displayed in r0192.
 - when the software gating unit is activated (p1810.2 = 1 or p1810.13 = 1), then the Smart Mode is not permissible. Either the Smart Mode must be deactivated (p3400.0 = 0) or the software gating unit must be deactivated.
 - for A_INF the following applies: deactivate the Smart Mode using p3400.0 = 0, and activate closed-loop voltage control with p3400.3 = 1. For booksize power units, it must be noted that for a supply voltage p0210 > 415 V only the Smart Mode is possible in the presetting. If DC link voltages above 660 V are permissible in the application, then voltage-controlled operation can be activated with p0280, p0210, p3400 and p3510. The information regarding p0210 should be carefully noted.

F06052	Infeed: Filter temperature evaluation not supported		
Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	A_INF, R_INF, S_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	OFF2 (NONE)		
Acknowledge:	IMMEDIATELY		
Cause:	The power unit does not support filter temperature evaluation. This feature (r0192.11) is required when an Active Interface Module is used as a line filter (p0220 = 41 ... 45).		
Remedy:	Upgrade the firmware for the power unit to a later version. See also: r0192 (Power unit firmware properties 1), p0220

Drive object:	A_INF, B_INF, R_INF, S_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF2 (OFF1)		
Acknowledge:	IMMEDIATELY (POWER ON)		
Cause:	The filtered (steady-state) value of the line supply voltage is less than the fault threshold (p0283). Fault condition: $V_{rms} < p0283 * p0210$ Fault value (r0949, floating point): Actual steady-state line supply voltage. Note: The occurrence of this fault is delayed by the time in p3492. If the fault is removed during this design time, then the power unit is not tripped (shut down). See also: p0283 (Line supply undervoltage shutdown (trip) threshold), p3492 (Infeed, line supply undervoltage delay time)		
Remedy:	- check the line supply. - check the line supply voltage (p0210). - check the threshold value (p0283).		

A06105 (F)	Infeed: Line supply undervoltage		
Message value:	%1		
Message class:	Network fault (2)		
Drive object:	A_INF, B_INF, R_INF, S_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		

Cause: The filtered (steady-state) value of line supply voltage is lower than the alarm threshold (p0282).
 Alarm condition: $V_{rms} < p0282 * p0210$
 Alarm value (r2124, floating point):
 Actual steady-state line supply voltage.

F06200 Infeed: One or several line phases failed

Message value: -

Message class: Network fault (2)

Drive object: A_INF, R_INF, S_INF

Component: None **Propagation:** GLOBAL

Reaction: OFF2 (OFF1)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: Failure overvoltage in one or several line supply phases.
 The fault can be output in two operating states:

1. During the switch-on phase of the infeed unit.
 The measured line supply angle deviates from the regular characteristic for a 3-phase system - the PLL cannot be synchronized.
 The fault occurs immediately after switch-on if, when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.
2. While the infeed is operational.
 During an active line voltage alarm (A06205) or current symmetry alarm (A06206), an additional fault occurred, which resulted in a shutdown. Alarm values A06205 and A06206 could provide additional information about the cause of the shutdown.
 Possible causes:
 - voltage dip on the line side or phase failure or overvoltage lasting longer than 10 ms.
 - overload condition on the load side with peak current.
 - line reactor missing.

Remedy:

- check the line supply, terminals and fuses.
- check the connection and size (rating) of the line line filter and/or the line commutating reactor.
- check and correct the phase assignment at the VSM (X521 or X522) and at the power unit.
- check the load.
- if failed in operation, carefully note the previous alarm messages A06205/A06206 with alarm values.

Drive object:	A_INF, R_INF, S_INF
Component:	Power Module
Propagation:	GLOBAL
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The smoothed total of the phase currents (i1 + i2 + i3) is greater than 4 % of the maximum power unit current (r0209). Possible causes: - the DC link has a ground fault that results in a high summation link current (r0069.6). The DC component in the line currents can damage/destroy the power unit, line reactor or line filter! - the zero point calibration of the current measurement was not carried out (p3491, A06602). - defective current measurement in the power unit. Fault value (r0949, floating point): Smoothed total of the phase currents.
Remedy:	- check the DC link for a low-ohmic or high-ohmic ground fault and if present, remove. - increase the monitoring time of the current offset measurement (p3491). - replace the power unit if necessary.

Cause:	The actual line frequency f_{line} is higher than the parameterized alarm threshold ($f_{line} > p0211 * p0284$). The alarm can be output in two operating states: 1. During the switch-on phase of the infeed unit. Consequence: Synchronization of the infeed to the line supply is interrupted and is restarted. The alarm is reissued if the line frequency remains higher than the parameterized alarm threshold. 2. While the infeed is operational. Consequence: The infeed still remains in the operating state, alarm A06350 is output. This signifies a critical operational fault. Alarm value (r2124, floating point): Actual line frequency determined. See also: p0284 (Line supply frequency exceeded alarm threshold)		
Remedy:	- check the parameterized line frequency and if required change (p0211). - check the alarm threshold (p0284). - check the line supply. - check the line supply quality. See also: p0211, p0284 (Line supply frequency exceeded alarm threshold)

Cause:	The actual line frequency f_{line} is lower than the parameterized alarm threshold ($f_{line} < p0211 * p0285$). The alarm can be output in two operating states: 1. During the switch-on phase of the infeed unit. Consequence: Synchronization of the infeed to the line supply is interrupted and is restarted. The alarm is reissued if the line frequency remains less than the parameterized alarm threshold. 2. While the infeed is operational. Consequence: The infeed remains in the "operating" (run) state and alarm A06351 is output. This signifies a critical operational fault. Message class:	Infeed faulted (13)		
Drive object:	A_INF, R_INF, S_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The line supply data identification is selected and active. The line inductance and the DC link capacitance are measured at the next pulse enable. See also: p3410 (Infeed identification method)		
Remedy:	Not necessary. This alarm is automatically withdrawn after the measurement has been completed.

4.2 List of faults and alarms

F06500	Infeed: Line synchronization not possible		
Message value:	-		
Message class:	Network fault (2)		
Drive object:	A_INF, R_INF, S_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	OFF2 (OFF1)		
Acknowledge:	IMMEDIATELY (POWER ON)		
Cause:	The line synchronization is not possible within the monitoring time. The infeed was re-synchronized to the line supply because it was interrupted due to an incorrect line frequency or due to excessively high line voltage distortion. After 20 attempts, synchronization - and therefore also the switching-on operation - were interrupted. Especially for ALM chassis units, one possible cause is that the bypass contactor or circuit breaker does not close.		
Remedy:	- check the parameterized line frequency and if required change (p0211). - check the setting of the threshold values (p0284, p0285). - check the line supply. - check the connecting terminals - check the bypass contactor (if one is being used) and its associated control. - check the state of the circuit breaker and its associated control. - for significant line voltage distortion, after assessment by experts, the tolerance threshold p3457[2] can be adapted. When using a Voltage Sensing Module (VSM): - check the line supply connection at the terminals (X521, X522). - check VSM activation (p0145, p3400). - check the line supply quality. Note: In the case of chassis power units, the availability of correct VSM voltage measured values is imperative for line synchronization. See also: p0211, p0284 (Line supply frequency exceeded alarm threshold), p0285 (Line supply frequency undershot alarm threshold), p3457 (Infeed PLL supplementary settings)		

A06502 (F, N)	Infeed: Unable to achieve line synchronization in transformer magnetization		
Message value:	-		
Message class:	Network fault (2)		
Drive object:	A_INF, R_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	NONE

F06503	Infeed: Line black start unsuccessful		
Message value:	%1		
Message class:	Network fault (2)		
Drive object:	A_INF, R_INF, S_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF1 (NONE, OFF2)		
Acknowledge:	IMMEDIATELY (POWER ON)		

Cause: The line black start was unsuccessful.
 Fault value (r0949, interpret decimal):
 State of the black start (corresponds to r5482).
 The following applies for fault value r0949 = 109:
 At the start of a black start (p5581 = 1), a line supply was identified (frequency and voltage within the specified limits p0281 to p0285).
 The following applies to all other fault values:
 The maximum time for a black start (p5581[2]) was exceeded.

Remedy: - check the conditions of a line black start.
 - check the parameterization of the line black start.

Reaction: NONE (OFF1, OFF2)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The island line supply synchronization was unsuccessful.
 Alarm value (r2124, interpret decimal):
 State, in which the island line supply synchronization has remained (corresponds to r5482).
 See also: r5482 (Line synchronization status)

Remedy: - check the conditions for the island line supply synchronization.
 - check the parameterization of the island line supply synchronization.
 See also: p5581 (Island grid times)

F06505 Infeed: For transformer magnetization current limit exceeded

Message value: %1
Message class: Network fault (2)
Drive object: A_INF, R_INF, S_INF
Component: None **Propagation:** GLOBAL
Reaction: OFF1 (OFF2)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The current limit was exceeded when magnetizing the transformer (r0068 > p5494[1] * r0207).

Remedy: - check the setting of the current limit (p5494[1])
 - check the primary side of the transformer for a short-circuit.
 - check the control and feedback signal of the circuit breaker.
 See also: p5494 (Transformer magnetization scaling values)

A06601 (F) Infeed: Current offset measurement interrupted

Message value: %1
Message class: Infeed faulted (13)
Drive object: A_INF, R_INF, S_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: Defective current measurement or a DC current is present during the offset measurement.
 Alarm value (r2124, interpret decimal):
 1: Excessively high phase current has occurred during the current offset calibration.
 2: The measured current offset is greater than the 3% of the maximum permissible converter current (e.g. due to a ground fault in the DC link).

4 Faults and alarms

4.2 List of faults and alarms

Remedy: For alarm value = 1:
- possible counter-measure if there is no line contactor: Power up an adequately long time before OFF1 = 1.
For alarm value = 2:
- defective current measurement or a DC current is present during the offset measurement.
- check the DC link for a ground fault.

A06602 (F) Infeed: Current offset measurement not possible

Message value: -
Message class: Infeed faulted (13)
Drive object: A_INF, R_INF, S_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: After an OFF1 = 1 no valid current offset measurement was able to be made within the monitoring time (p3491) before closing the line contactor. The current offset is set to 0.
See also: p3491 (Infeed I-offset measurement monitoring time)

Remedy: - check the DC link for a ground fault. A ground fault can destroy parts and components!
- check the monitoring time setting and if required increase (p3491). At least 100 ms is required for a valid measurement (p3491 > 100 ms).
Notice:
If there is no valid measurement, then under certain circumstances the quality of the DC link control will be reduced.

F06700 (A) Infeed: Switch line contactor for load condition

Message value: -
Message class: Infeed faulted (13)
Drive object: A_INF, B_INF, R_INF, S_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE (OFF2)
Acknowledge: IMMEDIATELY
Cause: For an ON command, the infeed line contactor should be switched under load.

Remedy: - do not load the DC link if the infeed has not issued an operating signal (r0863.0 = 1).
- after the infeed has been switched off, all power units connected to the DC link should be switched off. To realize this, the operating signal of the infeed (r0863.0) must be suitably interconnected.

A06800 (F) Infeed: Maximum steady-state DC link voltage reached

Message value: -
Message class: Infeed faulted (13)
Drive object: A_INF, R_INF, S_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The DC link voltage setpoint has reached the maximum steady-state voltage parameterized in p0280. The DC link voltage is increased by the modulation depth reserve controller for the following reasons:
- modulation depth reserve is too low (p3480).
- line supply voltage is too high.
- supply voltage (p0210) parameterized to be too low.
- excessively high setpoint for the reactive line current.

Remedy:

- check the line supply voltage setting (p0210).
- check the line supply for an overvoltage condition.
- reduce the modulation depth reserve (p3480).
- reduce the reactive current setpoint.

A06810 (F) Infeed: DC link voltage alarm threshold fallen below

Message value: -

Message class: Infeed faulted (13)

Drive object: A_INF, B_INF, R_INF, S_INF

Component: Power Module **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: In operation, the DC link voltage has dropped to below the alarm threshold. The alarm threshold is obtained from the sum of p0279 and r0296.

Note:
When the alarm threshold is fallen below, this is also indicated using status bit r3405.7.

Possible causes:

- line supply voltage dip or another line supply fault.
- overload of the infeed.
- for Active Line Module: Controller incorrectly parameterized.

See also: p0279 (DC link voltage offset alarm threshold), r0296 (DC link voltage undervoltage threshold), r3405

Remedy:

- check the line voltage and line supply quality.
- reduce the power drawn, avoid step-like load changes
- for Active Line Module: Adapt the controller parameterization (e.g. automatic line supply identification (p3410 = 4, 5)).

A06849 (F, N) Infeed: Short-circuit operation active

Message value: -

Message class: Infeed faulted (13)

Drive object: A_INF, R_INF

Component: Power Module **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The current hysteresis controller sequence control has detected a short circuit (r5452, r5522). The absolute line supply voltage (r5444[0], r5512[0]) is below the short-circuit voltage limit (p5459[2], p5529[2]), and the current limitation is active (r5402.3 = 1, r5502.3 = 1).

Note:
The effective current limit is obtained from the parameterized overcurrent (p5453) and the hysteresis width (p5454).

Remedy:

- check the parameterization of the current hysteresis controller (p5453).
- check the line supply cables for a short-circuit.

Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	A_INF, R_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	Function module activation is not possible. The power unit used has at least one of the following features: - gating unit with current limiting control (r0192.19). - gating unit with all-phase current limiting (r0192.30). The affected function module is identified in fault value r0949 (the value of r0949 corresponds to the bit of parameter p0108). r0949 = 7 "Dynamic grid support" function module r0949 = 12: "Line droop control" function module See also: r0192 (Power unit firmware properties 1), p5401 (Line droop control activation)		
Remedy:	- check whether the power unit used has the "gating unit with current limiting control" feature (r0192.19) or "gating unit with all-phase current limiting" feature (r0192.30). - if necessary, use a power unit that has at least one of these features.

Message class:	Braking Module faulted (14)		
Drive object:	A_INF, B_INF, R_INF, S_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The Braking Module signals a fault (1 -> 0) via X21.4 ("booksize" format) or X21.5 ("chassis" format). This signal is wired to a system digital input and correspondingly interconnected using binector input p3866[0...7]. Possible causes: - wiring of the signal or BICO interconnection of the signal source incorrect. - overtemperature - electronics power supply missing. - ground fault/short-circuit. - internal component fault. See also: p3866 (Braking Module fault)		
Remedy:	- check binector input p3866[0...7] and the wiring from terminal X21.4 ("booksize" format) or X21.5 ("chassis" format). - reduce the number of braking operations. - check the 24 V power supply of the component. - check for a ground fault or short circuit. - replace the component if necessary.

Cause: An error was detected when evaluating the temperature sensor set in p0600 and p0601.
With the fault, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.
Possible causes:
- wire breakage or sensor not connected (KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).
Alarm value (r2124, interpret decimal):

Cause: Open-loop/closed-loop control parameters have had to be changed.
 Possible causes:
 1. As a result of other parameters, they have exceeded the dynamic limits.
 2. They cannot be used due to the fact that the hardware detected not having certain features.
 3. The value is estimated as the thermal time constant is missing.
 4. Motor temperature model 1 is activated as thermal motor protection is missing.
 Fault value (r0949, interpret decimal):

Cause:	The "master control by PLC" signal was missing in operation. - interconnection of the binector input for "master control by PLC" is incorrect (p0854). - the higher-level control has withdrawn the "master control by PLC" signal. - data transfer via the fieldbus (master/drive) was interrupted.		
Remedy:	- check the interconnection of the binector input for "master control by PLC" (p0854). - check the "master control by PLC" signal and, if required, switch in. - check the data transfer via the fieldbus (master/drive). Note: If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

Cause: Fault value (r0949, interpret bitwise binary):
Bit 1: Switch "Closed" feedback signal missing.
Bit 2: Switch "Open" feedback signal missing.
Bit 3: Switch feedback signal too slow.
After switching, the system waits for the positive feedback signal. If the feedback signal is received later than the specified time, then a fault trip (shutdown) is issued.

- Cause:** It is not possible to power up with the motor rotating (no flying restart).
In the following cases, the "flying restart" function is not supported:
Permanent-magnet synchronous motor (PMSM):
- operation with U/f characteristic.
- encoderless operation without a Voltage Sensing Module (VSM) being connected.
Separately excited synchronous motor (SESM):
- operation with U/f characteristic.
- Remedy:**
- deactivate the "flying restart" function (p1200 = 0).
- change the open-loop/closed-loop control mode (p1300).
- connect a Voltage Sensing Module (VSM) (voltage measurement).

A system deviation can occur between the setpoint and actual speed.
See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration)

Remedy: Not necessary.
This alarm is automatically withdrawn after the upper threshold has been distinctly exceeded.
Otherwise, apply the following measures:

Message value: -

Message class: Application/technological function faulted (17)

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282).

The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.

When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (U/f))

Remedy: If the controller is not to intervene:
- increase the ramp-down times.
- switch off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).
If the ramp-down times are not to be changed:
- use a chopper or regenerative feedback unit.

Cause:	The evaluation of the test pulse response indicated incorrect values. Fault value (r0949, interpret decimal): 0: An impermissible pulse technique configuration was detected during ramp-up. Possible causes: - the pulse technique was initially selected when the system powered up (p1750.5 = 1) but the power unit component does not support the current oversampling required (see r0192.23). As a consequence, p1750.0 was deselected automatically. 10: The pulse response is repeatedly implausible. Possible causes: - Strong oscillations have occurred. - the motor is short-circuited for high frequencies (output filter). - the motor is damaged.

4 Faults and alarms

4.2 List of faults and alarms

Remedy:

For fault value = 0:
Once the pulse technique has been deselected automatically (p1750.5 = 0), there are two possible options:
- acknowledge the fault and save parameter p1750.5 = 0 -> field-oriented control mode to standstill is not used and replaced by transition to open-loop control at low speeds.
- upgrade the power unit firmware (at least V4.3) -> field-oriented control mode to standstill is available.

For fault value = 10:
With active selection of the pulse technique (p1750.5 = 1):
- POWER ON (switch-off/switch-on) the Control Unit and the power unit together again.
or
- carry out a manual warm restart (p0009 = 30, p0976 = 2, 3).
If this does not solve the problem: Replace the power unit component.

For fault value = 20:
- control parameters might have been adjusted (factory setting, commissioning).
- filters must not be connected between motor and converter/inverter.
- check the motor.

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Component: None

Propagation: GLOBAL

Reaction: OFF1 (OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: An error has occurred when configuring or when using the "Current setpoint filter adaptation" function.

Fault value (r0949, interpret binary):

Bit 0: a filter has still not been assigned (p5281).

Bit 1: the assigned filter belongs to the "Extended current setpoint filter" function module that has not been activated (r0108.21).

Bit 2: the assigned filter is a type or has a characteristic, which is unsuitable for adaptation.

Bit 3: the assigned filter has not been activated (p1656, p5200).

Bit 4 ... 15: internal fault occurred.

Bit 16 ... 31: number of the drive data set with fault.

See also: p5280 (Current setpoint filter adaptation configuration), p5281 (Current setpoint filter adaptation assignment)

Remedy:

The message can always be removed by deactivating adaptation (p5280 = 0, -1).

If adaptation is to remain active, then the countermeasure should be applied depending on the particular fault value.

For bit 0:

Assign the filter (p5281).

For bit 1:

activate the "Extended current setpoint filter" function module (r0108.21).

For bit 2:

Set the filter type "General filter 2nd order" and set the characteristic of a bandstop filter.

For bit 3:

Activate filter (p1656, p5200).

For bits 4 ... 15:

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade firmware to later version.

F07422 Drive: Reference model natural frequency > Shannon frequency

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The natural filter frequency of the PT2 element for the reference model (p1433) is greater than the Shannon frequency.
The Shannon frequency is calculated according to the following formula: $0.5 / p0115[1]$

Remedy:

- reduce the natural frequency of PT2 element for reference model (p1433).
- reduce the speed controller sampling time (p0115[1]).

F07423 Drive: APC filter natural frequency > Shannon frequency

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: One of the filter natural frequencies is greater than the Shannon frequency.
The Shannon frequency is calculated according to the following formula: $0.5 / (p0115[1] * x)$
Fault value (r0949, interpret binary):
Bit 0: Filter 1.1 (p3711, p3713), x = 1
Bit 4: Filter 2.1 (p3721, p3723), x = p3706
Bit 5: Filter 2.2 (p3726, p3728), x = p3706
Bit 8: Filter 3.1 (p3731, p3733), x = p3707
Bit 9: Filter 3.2 (p3736, p3738), x = p3707
Bit 16 ... 32: Data set number (starting from zero)

Remedy:

- reduce the numerator or denominator natural frequency of the filter involved.
- reduce the speed controller sampling time (p0115[1]) or the sub-sampling (p3706, p3707).
- switch out the filter involved (p3704).

A07424 Drive: Operating condition for APC not valid

Message value: Fault cause: %1 bin

Message class: Application/technological function faulted (17)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The APC function (Advanced Positioning Control) has identified an invalid operating condition.
Alarm value (r2124, interpret binary):
Bit 0 = 1:
APC is operating without encoder
Bit 1 = 1:
Possible causes:
- the load measuring system for APC, selected using p3701, has a fault.
- the load measuring system selected using p3701 is in the park state (r0481[0...2].14).
The APC function is disabled.
Bit 2 = 1:
Possible causes:
- the load measuring system for APC, selected using p3701, has a fault.
- the load measuring system selected using p3701 is in the park state (r0481[0...2].14).
The pulse de-coupling is disabled, i.e. the speed of the motor measuring system is used as speed for the closed-loop motor speed control.

Remedy: For bit 0:
Only use the APC function in operation with an encoder.
For bit 1, 2:
Check the load measuring system.

F07432	Drive: Motor without overvoltage protection
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Component:	None
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system. Fault value (r0949, interpret hexadecimal): Associated Drive Data Set (DDS).
Remedy:	Overvoltage protection can be implemented in the following ways: 1. Limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: Rotary synchronous motors: $p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}$ Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * r0297/p0316 \text{ [N/A]}$ Rotary synchronous motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq 4.33165E9 * (-p0316 + \text{root}(p0316^2 + 4.86E-9 * (r0297 * r0313)^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}) / (r0297 * r0313^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Linear motor connected to the high-frequency converter: $p1082 \text{ [m/min]} \leq 689.403 * p0315 * (\text{root}(p0316^2 * p0315^2 + 0.191865 * r0297^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}) / (r0297 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Rotary induction motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq \text{maximum}(2.11383E5 / (r0313 * \text{root}((r0377 \text{ [mH]} + r0382 \text{ [mH]}) * p0234 \text{ [\mu F]})); 0.6364 * r0297 * p0311 \text{ [rpm]} / p0304)$ 2. Use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801 – only for synchronous motors). When using a synchronous motor with VPM at the high-frequency converter, the following must apply: $p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233$ When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM. When using a VPM, p0643 must be set to 1. 3. Activate the internal voltage protection (p1231 = 3, only for synchronous motors). In so doing, the following hardware preconditions must be fulfilled: - the infeed of the group must be capable of energy recovery (Active Line Module, Smart Line Module), and the energy recovery power of the infeed must not be less than the maximum utilized S1 power of the synchronous motor. - For Control Unit and infeed, a 24 V power supply other than that for the Motor Module must be used with the voltage protection activated. The 24 V power supply of this Motor Module must be DC link buffered (e.g. CSM). - a Braking Module with a correspondingly configured braking resistor must be available at the DC link. - the synchronous motor must be short-circuit proof. See also: p0643 (Overvoltage protection for synchronous motors), p1231 (Armature short-circuit / DC braking configuration)
F07433	Drive: Closed-loop control with encoder is not possible as the encoder has not been unparked
Message value:	%1
Message class:	Actual position/speed value incorrect or not available (11)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Component:	Sensor Module Encoder 1
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The changeover to closed-loop control with encoder is not possible as the encoder has not been unparked.

Cause:	The power unit does not support the selected function. Fault value (r0949, interpret decimal): 1: The function "Current controller dynamic response higher" is selected (p1810.11 = 1), however, this is not supported by the power unit (r0192.27 = 0). - firmware of the booksize power unit is not up-to-date. - blocksize power unit was used. 2: The function "Current controller dynamic response higher" is selected (p1810.11 = 1), however, this is not supported by the safety technology without encoder (9506 = 1, 3). 3: The function "DC link voltage compensation in the power unit" is selected (p1810.1 = 1), however, this is not supported by the power unit (r0192.28 = 0).
Remedy:	For fault value = 1: - if necessary, upgrade the firmware of the booksize power unit to a later version (version >= 4.4). Note: If the firmware has already been automatically upgraded, then only a POWER ON (switch-off/switch-on) is required. - Use a booksize power unit (version >= 4.4). For fault value = 2: - if an encoder with Safety position actual values sensing is available (r0458[0...2].19 = 1), reparameterize the encoderless safety technology (p9506 = 1, 3) to safety technology with encoder (p9506 = 0). For fault value = 1, 2: - Deselect the function "Current controller dynamics higher" (p1810.11 = 0) and if required, set the current, speed and position controller again or calculate (p0340 = 4). For fault value = 3: - if necessary, upgrade the firmware of the blocksize power unit to a later version (version >= 4.6). - deselect the "DC link voltage compensation in the power unit" function (p1810.1 = 0). Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Component:	None
Propagation:	GLOBAL
Reaction:	NONE

Cause:	The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms. Note: The alarm is also output if jerk limiting is not active.
Remedy:	- increase the jerk limiting (p2574). - reduce maximum acceleration or maximum deceleration (p2572, p2573). See also: p2572 (EPOS maximum acceleration), p2573 (EPOS maximum deceleration), p2574 (EPOS jerk limiting)

4 Faults and alarms

4.2 List of faults and alarms

Cause:	The status of the absolute encoder adjustment has changed. In order to permanently save the determined position offset (p2525) and the determined number of the drive data set (p2733), they must be saved in a non-volatile fashion (p0971, p0977). Possible causes: - motor or encoder were replaced (applies to EQN and DQI). - position-relevant parameters were changed. - an encoder that was not adjusted was adjusted (save the project in a non-volatile fashion using "Copy RAM to ROM"). Note: This message is not output when switching-on the axis after having first moved it in the switched-off state, as long as the parameterizable monitoring window was not exited.
Remedy:	Readjust the encoder. See also: p2507 (LR absolute encoder adjustment status), p2525 (LR encoder adjustment offset)

F07442 (A)	LR: Multiturn does not match the modulo range		
Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF1 (OFF2, OFF3)		
Acknowledge:	IMMEDIATELY		
Cause:	The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number. This results in the adjustment being set back, as the position actual value cannot be reproduced after switch-off/switch-on.		
Remedy:	Make the ration between the multiturn resolution and the modulo range an integer number. The ratio v is calculated as follows: 1. Motor encoder without position tracking $v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$ 2. Motor encoder with position tracking for the measuring gear $v = (p0412 * p2506 * p2505) / (p2504 * p2576)$ 3. Motor encoder with position tracking for the load gear $v = (p2721 * p2506 * p0433) / (p0432 * p2576)$ 4. Motor encoder with position tracking for the load and measuring gear $v = (p2721 * p2506) / p2576$ 5. Direct encoder without position tracking $v = (p0421 * p2506 * p0433) / (p0432 * p2576)$ 6. 4 Faults and alarms

4.2 List of faults and alarms

Cause:	For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range. For the configured linear axis, the maximum traversing range is defined to be 64x (+/- 32x) of p0421. It should be read in p2721 and interpreted as the number of load revolutions. Note: Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in in p0187[x].
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset position tracking, position (p2720.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

4 Faults and alarms

4.2 List of faults and alarms

Cause:	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$
Remedy:	If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419). Note for fault value = 3: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow. For rotary encoders, the maximum possible absolute position (LU) is calculated as follows: 1. Motor encoder without position tracking $p2506 * p0433 * p2505 / (p0432 * p2504)$ $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders 2. Motor encoder with position tracking for measuring gear $p2506 * p0412 * p2505 / p2504$ 3. Motor encoder with position tracking for load gear $p2506 * p2721 * p0433 / p0432$ 4. Motor encoder with position tracking for load and measuring gear $p2506 * p2721$ 5. Direct encoder without position tracking $p2506 * p0433 / p0432$ $p2506 * p0433 * p0421 / p0432$ for multiturn encoders 6. Direct encoder with position tracking for measuring gear $p2506 * p0412$

4.2 List of faults and alarms

Cause:	When evaluating the measuring probe, an error occurred. Alarm value (r2124, interpret decimal): 6: The input terminal for the measuring probe is not set. 4098: Error when initializing the measuring probe. 4100: The measuring pulse frequency is too high. > 50000: The measuring clock cycle is not a multiple integer of the position controller clock cycle.
Remedy:	Deactivate the measuring probe evaluation (BI: p2509 = 0 signal). For alarm value = 6: Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518). For alarm value = 4098: Check the Control Unit hardware. For alarm value = 4100: Reduce the frequency of the measuring pulses at the measuring probe. For alarm value > 50000: Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple. To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows: $T_{meas} [125 \mu s] = \text{alarm value} - 50000$ With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]). Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced.

Cause: A motor data set is not assigned to a drive object.
All of the existing motor data sets in the drive data sets must be assigned using the MDS number (p0186[0...n]). There must be at least as many drive data sets as motor data sets.
Alarm value (r2124, interpret decimal):
Number of the motor data set that has not been assigned.

Remedy: In the drive data sets, assign the non-assigned motor data set using the MDS number (p0186[0...n]).
- check whether all of the motor data sets are assigned to drive data sets.
- if required, delete superfluous motor data sets.
- if required, set up new drive data sets and assign to the corresponding motor data sets.

Cause:	In at least two drive data sets (DDS), the same motor data set (MDS) is assigned different encoder data sets (EDS) for the motor encoder. In various DDSs, it is not permissible for an MDS to have different motor encoders. The following parameterization therefore results results in an error: DDS0: p0186[0] = 0, p0187[0] = 0 DDS1: p0186[1] = 0, p0187[1] = 1 Fault value (r0949, interpret decimal): The lower 16 bits indicate the first DDS. A07532 (N) Drive: Encoderless control not commissioned

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Component: None **Propagation:** DRIVE

Reaction: NONE

Acknowledge: NONE

Cause: Encoderless operation was set as fault response to encoder faults (p0491). However, the encoderless control has not yet been commissioned.

Note:
In at least one drive data set (DDS) the load moment of inertia is zero (p1498 = 0).
See also: p0491 (Motor encoder fault response ENCODER)

Remedy: Commission the encoderless control.
Perform the following steps to facilitate a simple setting:

- the speed controller must have already been optimized for operation with encoder (e.g. the optimized P gain is in p1460).
- set the load moment of inertia (p1498, e.g. using function module "Moment of inertia estimator/OBT" or "AST" for SINUMERIK).
- set the current setpoint for open-loop controlled operation without encoder (p1612) for static loads (e.g. vertical axis without weight compensation, preset value plus torque-generating current (r0077) for the base load).
- set the speed controller.

p1470 = optimized p1460/16 for sampling time = 125 µs (P gain)
p1470 = optimized p1460/25 for sampling time = 62.5 µs (P gain)
p1470 = optimized p1460/30 for sampling time = 31.25 µs (P gain)
p1472 = 140 ms (integral time, default value).
p1451 = 10 ms (speed actual value smoothing encoderless operation).

- set encoderless operation current reduction: p0642 = 2*p0318/p0640 (for a result > 100%, 100% should be entered).
- if the motor moment of inertia changes significantly, then the moment of inertia estimator should be activated using function module "Moment of inertia estimator/OBT".
- save the set values in a non-volatile fashion (copy RAM to ROM).
- test the function while moving with p4642 = 1 (encoder fault, test function).

Note:
The following must be set if Safety Extended Functions with encoder in the 1-encoder system are enabled:

- No STOP A after encoder fault for 1-encoder Safety (p9516.4 = 1).
- Transition time STOP F to STOP B is long enough to brake the motor (p9555).

If the result is not satisfactory, then encoderless operation must be manually optimized (e.g. temporarily switch over to encoderless operation using p1300 = 20).

Information about the moment of inertia estimator and encoderless operation is provided in the following reference:

4.2 List of faults and alarms

Remedy: For fault cause = 1:
- check the encoder parameterization (p0404).
- use an encoder with track C/D, EnDat interface of Hall sensors.
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) multiplied by the gear ratio (p0432/p0433) is less than the encoder pulse number (p0408) – or is an integer multiple of the encoder pulse number (p0408).

yyyy = 1 dec:
The motor encoder used does not supply an absolute commutation angle.
yyyy = 2 dec:
The selected ratio of the measuring gear does not match the motor pole pair number.
Remedy: For fault cause = 1:
- check the encoder parameterization (p0404).
- use an encoder with track C/D, EnDat interface of Hall sensors.
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) multiplied by the gear ratio (p0432/p0433) is less than the encoder pulse number (p0408) – or is an integer multiple of the encoder pulse number (p0408).
- activate the pole position identification routine (p1982 = 1) for motor encoders without absolute position information. Then, using an encoder adjustment (p1990), the angular commutation offset should be determined.
For fault cause = 2:
- the quotient of the pole pair number divided by the ratio of the measuring gear must be an integer number: $(p0314 * p0433) / p0432$.
Note:
For operation with track C/D, this quotient must be less than 8.

See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration)
Remedy:	For fault value 0: - use an absolute encoder. For fault value 1: - use a Control Unit with sufficient NVRAM. Cause: A valve with a valve feedback signal was parameterized (p0218.2 = 1), however the valve does not follow the setpoint.

Remedy:

- correct the configuration for the valve without valve feedback signal (p0218.2 = 0).
- check the valve natural frequency (p0216).
- for the incorrect sign, invert the valve actual value (p0218.3).
- check the valve and valve connection.

F07752 (A) Drive: Piston position not possible

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA

Cause: The piston was calibrated (p0476 not equal to 0) and the absolute position is available (p1407.3 = 1). However, the piston position (r0094) is not plausible (negative or higher than the stroke in p0313).

Remedy:

- check position inversion (p0410.1).
- check direction convention: piston position (r0094) must be zero, if the piston is located at the A side. When moving from the A to the B side, velocity and position increase must be positive.
- check the piston calibration, and if required, recalibrate the piston with the piston at the A side (p1909.1 = 1).
- when replacing the encoder, recalibrate the piston.
- when shifting the machine zero point, recalibrate the piston.

Note:

- the system pressure adaptation function for the speed controller is activated (p1400.15 = 1) and no system pressure measured value (r0069) is available. A system pressure measured value is required for this function.

Message class:	Motor overload (8)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Motor Propagation: GLOBAL
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY

- Cause:** The permissible motor limit current was exceeded.
- effective current limit set too low.
 - current controller not correctly set.
 - U/f operation: Up ramp was set too short or the load is too high.
 - U/f operation: Short-circuit in the motor cable or ground fault.
 - U/f operation: Motor current does not match current of power unit.
 - Switch to rotating motor without flying restart function (p1200).
- Note:**
Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306
- Remedy:**
- check the current limits (p0640).
 - vector control: Check the current controller (p1715, p1717).
 - U/f control: Check the current limiting controller (p1340 ... p1346).
 - increase the up ramp (p1120) or reduce the load.
 - check the motor and motor cables for short-circuit and ground fault.
 - check the motor for the star-delta configuration and rating plate parameterization.
 - check the power unit and motor combination.
 - Choose "flying restart" function (p1200) if switched to rotating motor.

Message value: -

Message class: Infeed faulted (13)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause: After an internal switch-on command, the infeed or drive does not signal ready.

- monitoring time is too short.
- DC link voltage is not present.
- associated infeed or drive of the signaling component is defective.
- supply voltage incorrectly set.

Remedy:

- increase the monitoring time (p0857).
- ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
- replace the associated infeed or drive of the signaling component.
- check the line supply voltage setting (p0210).

F07807 Drive: Short-circuit/ground fault detected

Message value: %1
Message class: Ground fault / inter-phase short-circuit detected (7)
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Motor **Propagation:** GLOBAL
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.
Fault value (r0949, interpret decimal):
0: Problem with the current measurement/current that is impressed
1: Short-circuit, phase UV.
2: Short-circuit, phase UW.
3: Short-circuit, phase VW.
4: Ground fault with overcurrent.
1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase V in per mille).
2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille).
Note:
Also when interchanging the line and motor cables is identified as a motor-side short circuit.
The ground fault test only functions when the motor is stationary.
Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.
Remedy:
- check the motor-side converter connection for a phase-phase short-circuit.
- rule-out interchanged line and motor cables.
- check for a ground fault.
For a ground fault the following applies:
- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).
- increase the de-energization time (p0347).
- increase pulse suppression delay time (p1228) to ensure standstill.
- if required, deactivate the monitoring (p1901).

Cause:	The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum). Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)
Remedy:	Connect the original power unit and switch on the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0. For infeeds, the following applies: Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units. For inverters, the following applies: If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same). If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ. See also: r0200 (Power unit code number actual)

A07899 (N) Drive: Stall monitoring not possible

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: Stall monitoring is not possible, because a change was made into the open-loop speed controlled mode before the wait time p2177 had expired.

This situation can only occur, if the following conditions apply:

p1300 = 20

p2177 > p1758

p1750.2 = 0

p1750.6 = 0

Remedy: - Deactivate the changeover into open-loop speed controlled operation when operating at the torque limit (p1750.6 = 0).

Condition:

No slow reversing through the open-loop speed controlled operating range p1755 within the time p1758 when operating at the torque limit.

- shorten the stall detection wait time (p2177 < p1758).

- Activate closed-loop controlled operation from standstill and higher (p1750.2 = 1).

Condition:

There is no active load, for example, a hoisting gear

- Use an operating mode with encoder (p1300 = 21).

F07902 (N, A) Drive: Motor stalled

Message value: %1

Message class: Application/technological function faulted (17)

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Component: Motor **Propagation:** GLOBAL

Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

Acknowledge: IMMEDIATELY

Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.
Fault value (r0949, interpret decimal):
1: Stall detection using r1408.11 (p1744, p0492).
2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084).
3: Stall detection using r0056.11 (only for separately excited synchronous motors).
See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)

Remedy:

For closed-loop speed and torque control with speed encoder, the following applies:

- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1744 and p0492) can be increased.

For closed-loop speed and torque control without speed encoder, the following applies:

- check whether the drive in the open-loop controlled mode (r1750.0) stalls under load. If yes, then increase the current setpoint using p1610.
- check whether the drive stalls due to the load if the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.
- if the motor excitation (magnetizing) time (r0346) was significantly reduced, then it should be increased again.
- check the current limits (p0640, r0067). If the current limits are too low, then the drive cannot be magnetized.
- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

For separately excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).
- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).
- check the excitation equipment and the interface to the closed-loop control.
- encoder the highest possible dynamic response of the closed-loop excitation current control.
- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.
- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

F07902 (N, A) Drive: Motor stalled

Message value: %1

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Motor **Propagation:** GLOBAL
Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge: IMMEDIATELY
Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.
 Fault value (r0949, interpret decimal):
 1: Stall detection using r1408.11 (p1744, p0492).
 2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084).
 3: Stall detection using r0056.11 (only for separately excited synchronous motors).
 See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)

Remedy: It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990).

For closed-loop speed and torque control with speed encoder, the following applies:

- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1744 or p0492) can be increased. For resolvers with a high signal ripple, for example p0492 should be increased and the speed signal smoothed (p1441, p1442).

If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 x p0311; p1753 = 5 %).

- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.

For closed-loop speed and torque control without speed encoder, the following applies:

- Check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750.2 = 1 (sensorless vector control to standstill for passive loads).
- if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401).
- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.
- if there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

The following generally apply for closed-loop and torque control:

- check whether the motor cables are disconnected.
- check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.
- if the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.

For separately excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).
- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).
- check the excitation equipment and the interface to the closed-loop control.
- encoder the highest possible dynamic response of the closed-loop excitation current control.
- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.
- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

Cause:	The absolute value of the speed difference from the two setpoints (p2151, p2154) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166). The alarm is only enabled for p2149.0 = 1. Possible causes could be: - the load torque is greater than the torque setpoint. - when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small. - for closed-loop torque control, the speed setpoint does not track the speed actual value. - for active Vdc controller. For U/f control, the overload condition is detected as the I _{max} controller is active. See also: p2149 (Monitoring configuration)
Remedy:	- increase p2163 and/or p2166. - increase the torque/current/power limits. - for closed-loop torque control: The speed setpoint should track the speed actual value. - deactivate alarm with p2149.0 = 0.

Cause:	Only for separately excited synchronous motors (p0300 = 5): The actual open-loop/closed-loop control mode is I/f control (open-loop) with a fixed current (p1300 = 18). The speed is entered via the setpoint channel and the current setpoint is given by the minimum current (p1620). It must be ensured that in this mode, the control dynamic performance is very limited. Cause:	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
Remedy:	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

- Cause:**
- The Control Unit has detected a brake control error.
 - motor cable is not shielded correctly.
 - defect in the brake control circuit of the Motor Module.
- Fault value (r0949, interpret decimal):
- 10, 11:
Fault in "open holding brake" operation.
- no brake connected or wire breakage (check whether brake opens for p1278 = 1).
 - ground fault in brake cable.
 - S120M: brake opened via terminal X4.1 for mounting purposes (this is only permissible when the power supply voltage is switched off).
- 20:
Fault in "brake open" state.
- short-circuit in brake winding.
- 30, 31:
Fault in "close holding brake" operation.
- no brake connected or wire breakage (check whether brake opens for p1278 = 1).
 - short-circuit in brake winding.
- 40:
Fault in "brake closed" state.
- 50:
Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics).
- 80:
When using the Safe Brake Adapter (SBA), a fault has occurred in the brake control of the Control Unit.
See also: p1278 (Brake control diagnostics evaluation)
- Remedy:**
- check the motor holding brake connection.
 - for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015).
 - check the function of the motor holding brake.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
 - replace the Motor Module involved.
- Operation with Safe Brake Module:
- check the Safe Brake Module connection.
 - replace the Safe Brake Module.
- Operation with Safe Brake Adapter (SBA):
- check the SBA connection and if required, replace the SBA.

Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly). Fault value (r0949, interpret decimal): 0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives). 1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive) - or there is more than one DRIVE-CLiQ motor with motor holding brake. 2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted for this software release. 3: An attempt was made to enable the function "Safe Brake Control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.
Remedy:	Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2). The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive. See also: p1215 (Motor holding brake configuration)

Cause: An incorrect motor holding brake configuration was detected.
 Fault value (r0949, interpret decimal):
 0:
 A motor holding brake was detected where the brake control has not been configured (p1215 = 0).
 The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time).
 For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time).
 For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time).
 1:
 A motor holding brake was detected where the brake control has not been configured (p1215 = 0).
 The brake control configuration was left at "No motor holding brake available" (p1215 = 0).
 11:
 The identification had detected more than one motor holding brake for a parallel connection.
 12:
 For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015.
 13:
 With the "Safe Brake Control" (SBC) function activated, an attempt was made to change the value in p7015.
 14:
 For a parallel connection, the power units set in p7015 cannot be addressed.

Remedy:
 For fault value = 0:
 - no remedy required.
 For fault value = 1:
 - if required change the motor holding brake configuration (p1215 = 1, 2).
 - if this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged.
 For fault value = 11:
 For a parallel connection, only connect one motor holding brake.
 For fault value = 12:
 Check the setting of the power unit data set for a parallel connection (p7015).
 For fault value = 13:
 Before changing p7015, deactivate the "Safe Brake Control" function (SBC) (p9602).
 For fault value = 14:
 Check whether the power unit supports the brake control for a parallel connection (r9771.14).
 Check whether there is a DRIVE-CLiQ communication error between the Control Unit and the power unit involved and, if required, carry out a diagnostics routine for the faults identified.

Drive object: SERVO, SERVO_AC, SERVO_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The rotating measurement is activated. For the rotating measurement, the motor can accelerate up to the maximum speed and with maximum torque. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).
The rotating measurement is carried out at the next switch-on command.

Remedy:	For fault value = 1: - check the motor parameters. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF1 (NONE, OFF2)		
Acknowledge:	IMMEDIATELY		

Cause:	A fault has occurred while determining the saturation characteristic. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The rotor flux did not reach a steady-state condition. 3: The adaptation circuit did not reach a steady-state condition. 4: The adaptation circuit was not enabled. 5: Field weakening active. 6: The speed setpoint was not able to be approached as the minimum limiting is active. 7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 8: The speed setpoint was not able to be approached as the maximum limiting is active. 9: Several values of the determined saturation characteristic are not plausible. 10: Saturation characteristic could not be sensibly determined because load torque too high.
Remedy:	For fault value = 1: - the total drive moment of inertia is far higher than that of the motor (p0341, p0342). Deselect rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement. For fault value = 1 ... 2: - increase the measuring speed (p1961) and repeat the measurement. For fault value = 1 ... 4: - check the motor parameters (rating plate data). For fault value = 9, 10: - the measurement was carried out at an operating point where the load torque is too high. Select a more suitable operating point, either by changing the speed setpoint (p1961) or by reducing the load torque. The load torque may not be varied while making measurements. Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF1 (NONE, OFF2)		
Acknowledge:	IMMEDIATELY		
Cause:	An error has occurred while measuring the dynamic leakage inductance. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: The 100% flux setpoint was not reached. 6: No Lq measurement possible because field weakening is active. 7: Speed actual value exceeds the maximum speed p1082 or 75% of the rated motor speed. 8: Speed actual value is below 2 % of the rated motor speed.		
Remedy:	For fault value = 1: - check the motor parameters. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). For fault value = 3: - adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101). For fault value = 4: - adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086). For fault value = 5: - flux setpoint p1570 = 100 % and current setpoint p1610 = 0 % kept during the Lq measurement. For fault value = 6: - reduce the regenerative load so that the drive does not reach field weakening when accelerating. - reduce p1965 so that the q leakage inductance is recorded at lower speeds. For fault value = 7: - increase p1082, if this is technically permissible. - reduce p1965 so that the q leakage inductance is recorded at lower speeds. For fault value = 8: - reduce the load when motoring so that the drive is not braked. - increase p1965 so that the measurement may be taken at higher speeds. Note: The measurement of the q leakage inductance can be disabled using p1959.5. If only p1959.5 is set, then only this measurement is carried out if p1960 is set to 1, 2 and the drive is switched on. See also: p1959

Cause:

A fault has occurred during the identification routine.

Fault value (r0949, interpret decimal):

- 10: Data set changeover during motor data identification.
- 101: Voltage amplitude even at 30% maximum current amplitude is too low to measure the inductance.
- 102, 104: Voltage limiting while measuring the inductance.
- 103: Maximum frequency exceeded during the rotating inductance measurement.
- 110: Motor not finely synchronized before the rotating measurement.
- 111: The zero mark is not received within 2 revolutions.
- 112: Fine synchronization is not realized within 8 seconds after the zero mark has been passed.
- 113: The power, torque or current limit is zero.
- 115: U/f control is active.
- 120: Error when evaluating the magnetizing inductance.
- 125: Cable resistance greater than the total resistance.
- 126: Series inductance greater than the total leakage inductance.
- 127: Identified leakage inductance negative.
- 128: Identified stator resistance negative.
- 129: Identified rotor resistance negative.
- 130: Drive data set changeover during the motor data identification routine.
- 140: The setpoint channel inhibits both directions.
- 150: The holding brake is closed using command "Unconditionally close holding brake" (p0858).
- 151: The determined force due to weight is higher than the rated motor torque (p0333).
- 152: The torque precontrol channel (CI: p1511) is already interconnected.
- 153: The saturation characteristic cannot be approximated and evaluated.
- 154: The optimum flux characteristic cannot be determined from the saturation characteristic.
- 160: Accelerating time when determining kT, moment of inertia or reluctance torque too short or too long.
- 161: When measuring the kT characteristic, constants kT1, kT3, kT5 and kT7 were not able to be determined (p0645 ... p0648), as too few points were measured.
- 165: The current limit was reduced below the measurement current while determining the reluctance torque.
- 173: Internal problem.
- 180: identification speed (maximum speed, rated speed, $0.9 \times p0348$) less than p1755 or no DC link voltage available.
- 181: Zero speed at the end of the measurement of periodic position errors.
- 182: No complete mechanical revolution at to the end of the measurement of periodic position errors.
- 190: Speed setpoint not equal to zero.
- 191: An actual speed of zero is not reached.
- 192: Speed setpoint not reached.
- 193: Inadmissible motion of the motor when identifying the voltage emulation error.
- 194: Supplementary torque (r1515) not equal to zero.
- 195: Closed-loop torque control active.
- 200, 201: Not possible to identify the voltage emulation error characteristic of the drive converter (p1952, p1953).

Remedy:

For fault value = 10:

- do not initiate a data set changeover during the motor data identification.

For fault value = 101:

- increase current limit (p0640) or torque limit (p1520, p1521).
- check current controller gain (p1715).
- reduce current controller sampling time (p0115).

It may be impossible to completely identify the L characteristic, as required current amplitude is too high.

- suppress meas. (p1909, p1959).

For fault value = 102, 104:

- reduce current limit (p0640).
- check current controller P gain.
- suppress meas. (p1909, p1959).

For fault value = 103:

- increase external moment of inertia (if possible).
- reduce current controller sampling time (p0115).
- suppress meas. (p1909, p1959).

For fault value = 110:

- before rotating measurement, traverse motor over zero mark.

For fault value = 111:

- it is possible that encoder does not have zero mark. Correct setting in p0404.15.
- encoder pulse number was incorrectly entered. Correct setting in p0408.
- if zero mark signal is defective, replace encoder.

For fault value = 112:

- upgrade encoder software.

For fault value = 113:

- check the limits (p0640, p1520, p1521, p1530, p1531), correct the zero values.

For fault value = 115:

- deselect U/f control (p1317 = 0).

For fault value = 120:

- check current controller P gain (p1715) and if required, reduce.
- increase the pulse frequency (p1800).

For fault value = 125:

- reduce cable resistance (p0352).

For fault value = 126:

- reduce series inductance (p0353).

For fault = 127, 128, 129:

- it is possible that current controller is oscillating. Reduce the P gain (p1715).
- if required, reduce the current limit (p0640).

For fault value = 130:

- do not initiate a drive data set changeover during motor ident. routine.

For fault value = 140:

- before the measurement, enable at least one direction (p1110 = 0 or p1111 = 0 or p1959.14 = 1 or p1959.15 = 1).

For fault value = 150:

- if necessary withdraw command "Unconditionally close holding brake" (BI: p0858 = 0 signal).

For fault value = 151:

- the motor cannot continuously hold the force due to weight. Either reduce the force due to weight or use a motor with a higher rated torque.

For fault value = 152:

- add the measured force due to weight (p1532) to the signal source of p1511.
- if necessary withdraw the BICO interconnection from p1511 (p1511 = 0), and repeat the measurement.

For fault value = 153/154:

- optimum characteristic was not able to be evaluated and activated. If necessary contact the service department, and attach the values of r1962[0...9] and r1963[0...9].

For fault value = 160:

- extend accelerating time when determining kT, moment of inertia and reluctance torque, e.g. by increasing max. speed (p1082), increasing moment of inertia or reducing max. current (p0640).
- in encoderless operation with load moment of inertia, parameterize the load moment of inertia (p1498).
- reduce the ramp-up time (p1958).
- increase speed controller P gain (p1460).
- suppress meas. (p1959).

For fault value = 161:

- reduce the ramp-up time (p1958).
- increase max. speed (p1082).
- reduce current limit (p0640).
- if required, do not activate the kT characteristic (p1780.9 = 0).

For fault value = 165:

- decrease max. current (p0640).

For fault value = 173:

-

For fault value = 180:

- switch-on the infeed
- increase max. speed (p1082).
- reduce p1755.
- suppress meas. (p1909, p1959).

For fault value = 181, 182:

- increase max. speed (p1082).
- if required, deactivate the measurement (p1959.0 = 0).

Note:

- to measure periodic position errors, the encoder must have absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver p5263.10).

For fault value = 190:

- set speed setpoint to zero.

For fault value = 191:

- do not start motor data identification routine while motor is still rotating.

For fault value = 192:

- check closed-loop speed control (motor rotor may be locked or closed-loop speed control is not functioning).
- for p1215 = 1, 3 (brake the same as the sequence control) check the control sense (p0410.0).
- ensure that enable signals are present during measurement.
- remove any pulling loads from motor.
- increase max. current (p0640).
- reduce max. speed (p1082).
- suppress meas. (p1959).

For fault value = 193:

- the motor has moved through more than 5 ° electrical (r0093). Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-5 °) and then start identification.

For fault value = 194:

- switch out all supplementary torques (e.g. CI: p1511).
- for hanging/suspended axes: Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-1 °) and then start identification.

For fault value = 195:

- deselect closed-loop torque control (p1300 = 21 or 20, or set the signal source in p1501 to a 0 signal).

For fault value = 200, 201:

- set pulse frequency to 0.5 x current controller frequency (e.g. 4 kHz for a current controller sampling time = 125 us).
- reduce cable length between Motor Module and motor.
- read-out measured values (r1950, r1951) and therefore determine suitable values for p1952, p1953 according to your own estimation.

- Remedy:**
- For fault value = 1:
 - reference (home) the drive before calibrating the piston (p1407.3 must be = 1).
 - For fault value = 2, 3:
 - drive must be able to be moved.
 - check system pressure and shutoff valves.
 - increase the settling time (p1958[1]).
 - For fault value = 4:
 - drive must be able to be moved.
 - check system pressure and shutoff valves.
 - For fault value = 5:
 - reference (home) the drive before the traversing range identification (p1407.3 must be = 1) and calibrate the piston (p1909.1 = 1 or p1959.2 = 1 and p1960 = 1).
 - For fault value = 6:
 - there is an obstruction in the traversing range. If necessary, remove the obstruction. If the measuring travel with obstruction is sufficient, no measure has to be applied.
 - the piston stroke was incorrectly parameterized. If the actual piston stroke is less than the parameterized stroke, correct it (p0313). A piston stroke that has been parameterized too low, is automatically corrected.
 - the selected search voltage is not sufficient for one direction in order to overcome the existing piston or guide friction. Check the setting of the search voltage to identify the valve characteristic, and if required, increase (p1955[2, 3]).
 - For fault value = 7:
 - piston calibration was incorrectly carried out. Correct the piston calibration or automatically calibrate it (p1959.2 = 1 and p1960 = 1).
 - the minimum or maximum parameterized measuring travel cannot be traversed as there is an obstruction in the path or the piston stroke was incorrectly parameterized. If required, correct the measuring travel (p1956[0], p1956[1]), correct the piston stroke or automatically calibrate it (p1959.x = 1 and p1960 = 1).
 - drive cannot be traversed, because the shutoff valve does not open, the system pressure is not available, encoder or valve are not connected. Check the shutoff valve, system pressure, encoder and valve connection.
 - For fault value = 8:
 - interchange the connectors of pressure sensors A and B or invert the direction of motion (p1820, p0410) and repeat the complete moving measurement.
 - check the reference values for pressure sensors (p0240, p0242).
 - For fault value = 10:
 - check the connection between the encoder and cylinder.
 - measuring distance too short, if required lengthen (p1956[0], p1956[1]).
 - measuring time too long, if required shorten (p1958[0], p1958[1], p1958[2]).
 - increase the number of measuring points to a minimum of 20 (p1957[0]).
 - For fault value = 100:
 - set the position and speed actual value inversion the same (p0410 = 0 or p0410 = 3).
 - For fault value = 101:
 - start of measuring range must be parameterized less than the end of measuring range (p1955[0] > p1955[1]).
 - For fault value = 102:
 - minimum measuring distance must be parameterized less than the maximum measuring distance (p1956[0] > p1956[1]).
 - For fault value = 190:
 - during the identification, the velocity setpoint must be zero.

F07993 Drive: Incorrect direction of rotation of the field or encoder actual value inversion

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY

Cause:	Either the direction of the rotating field or the encoder actual value has an incorrect sign. The motor data identification automatically changed the actual value inversion (p0410) in order to correct the control sense. This can result in a direction of rotation change. Note: To acknowledge this fault, the correctness of the direction of rotation must first be acknowledged with p1910 = -2.
Remedy:	Check the direction of rotation (also for the position controller, if one is being used). If the direction of rotation is correct, the following applies: No additional measures are required (except set p1910 = -2 and acknowledge fault). If the direction of rotation is incorrect, the following applies: To change the direction of rotation, two phases must be interchanged and the motor identification routine must be repeated.

A07994 (F, N)	Drive: motor data identification not performed
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	None Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The "vector control" mode has been selected and a motor data identification has still not been performed. The alarm is initiated when changing the drive data set (see r0051) in the following cases: - vector control is parameterized in the actual drive data set (p1300 >= 20). and - motor data identification has still not been performed in the actual drive data set (see r3925). Note: A check can be made and this alarm output also when exiting commissioning and when the system runs up.
Remedy:	- Perform motor data identification (see p1900). - if required, parameterize "U/f control" (p1300 < 20). - switch over to a drive data set, in which the conditions do not apply.

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Component:	None Propagation: GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The pole position identification routine was unsuccessful. Fault value (r0949, interpret decimal): 1: No current is established. 2: The starting current is not zero. 3: The selected max. distance was exceeded (p1981). 4x: The measuring signal does not permit a clear evaluation. 5: The max. current was exceeded during the measurement. 6: The current measurement must be re-calibrated. 7x: The Sensor Module does not support the pole position identification routine. 8: The pole position identification routine current required is greater than the max. current. 9: The set pole position identification routine current is zero. 10: Data set changeover during the pole position identification. 11: The encoder adjustment to determine the commutation angle is active (p1990 = 1) and the encoder without zero mark is not finely synchronized or does not have any valid data.

- 100: motion-based pole position identification, 1st and 2nd Measurements differ. Motor blocked or current (p1993) too low.
- 101: Motion-based position position identification, insufficient motion, motor blocked or current (p1993) too low.
- 102: Motion-based pole position identification, brake is being used and is closed. The motion-based position position identification in conjunction with the brake is not permitted.
- 103: Motion-based pole position identification without encoder.
- 104: Motion-based pole position identification, speed actual value not zero after stabilizing time.
- 200: Elasticity-based pole position identification, internal error in the arctan calculation (0/0).
- 201: Elasticity-based pole position identification, too few measuring points that can be evaluated.
- 202: Elasticity-based pole position identification, outliers in the measurement series.
- 203: Elasticity-based pole position identification, maximum rotation without current.
- 204: Elasticity-based pole position identification, no positive edge found.
- 205: Elasticity-based pole position identification, the result of the Fourier transformation differs by more than 480° electrical / p3093 from the rough estimate.
- 206: Elasticity-based pole position identification, plausibility test unsuccessful.
- 207: Elasticity-based pole position identification, no negative measured value found.
- It is possible that all measured values are identical. The expected deflection was not able to be reached, either because the expectation is too high or not enough current was able to be established.
- 208: Elasticity-based pole position identification, measuring current is 0.
- 209: Elasticity-based pole position identification, the selected max. distance was exceeded (p3095).
- 210: Elasticity-based pole position identification without encoder.
- 250 ... 260:
Elasticity-based pole position identification, more than 3 attempts have been made and fault value 200 ... 210 output.
- Example:

Fault value= 253 --> more than 3 attempts have been made and fault value 203 output.

Remedy:

For fault value = 1:

- check the motor connection and DC link voltage.
- for the following parameters, set practical values that are not zero (p0325, p0329).

For fault value = 1, 2:

- in the case of a large computing time load (e.g. 6 drives with Safety Integrated), set the computing dead time of the current controller to late transfers (p0117 = 3).

For fault value = 3:

- increase the max. distance (p1981).
- reduce the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.

For fault value = 5:

- reduce the currents for the pole position identification routine (p0325, p0329).

For fault value = 6:

- re-calibrate the Motor Module.

For fault value = 8:

- reduce the currents for the pole position identification routine (p0329, p0325, p1993).
- the power unit cannot provide the necessary pole position identification routine current (p0209 < p0329, p0325, p1993), replace the power unit with a power unit with a higher max. current.

For fault value = 9:

- enter a value not equal to zero in the pole position identification routine current (p0329, p0325, p1993).

For fault value = 10:

- do not initiate a data set changeover during the pole position identification.

For fault value = 11:

- for incremental encoders without commutation with zero mark (p0404.15 = 0), it does not make sense to adjust the encoder to determine the commutation angle (p1990 = 1). In this case, the function should be deselected (p1990 = 0) or, for an encoder with suitable zero mark, commutation with zero mark should be selected (p0404.15 = 1).
- for absolute encoders, only adjust the encoder to determine the commutation angle (p1990 = 1) if the encoder supplies commutation information and is finely synchronized (p1992.8 = 1 and p1992.10 = 1). The encoder is possibly parked, deactivated (p0145), not ready for operation or signals a fault condition.
- deselect the encoder adjustment to determine the commutation angle (set p1990 to 0).

For fault value = 40 ... 49:

- increase the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.
- select another technique for pole position identification routine (p1980).
- use another motor, absolute encoder or Hall sensors.

For fault value = 70 ... 79:

- upgrade the software in the Sensor Module.

For fault value = 100, 101:

- check and ensure that the motor is free to move.
- increase the current for motion-based pole position identification (p1993).

For fault value = 102:

- if the motor is to be operated with a brake: Select a different technique to identify the pole position (p1980).
- if the motor can be operated without a brake: Open the brake (p1215 = 2).

For fault value = 103:

F07996	Drive: Pole position identification routine not carried out		
Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	SERVO, SERVO_AC, SERVO_I_AC		
Component:	None	Propagation:	GLOBAL
Reaction:	ENCODER (OFF2)		
Acknowledge:	IMMEDIATELY		
Cause:	In operation, the operating mode that requires a pole position identification was changed over, which is not possible in this state. - the drive was changed over, flying, from encoderless operation to operation with encoder without having previously carried out a pole position identification for the encoder. p1404 is then at a value between zero and the max. speed and the pulses in the speed range above p1404 were enabled without a pole position ident. routine having been previously carried out in operation with encoder. - in operation, an EDS changeover was made to an encoder where it is necessary to carry out a pole position identification. However, this has still not been carried out (p1982 = 1 or 2 and p1992.7 = 0).		
Remedy:	- for a flying changeover between operation with and without encoder with pole position identification after POWER ON or commissioning (p0010 not equal to zero) enable the pulses once at zero speed. This means that the pole position identification routine is carried out and the result is available for operation. - carry out the EDS changeover with the pulses inhibited, or, before the changeover, carry out a pole position identification using this data set.

4 Faults and alarms

4.2 List of faults and alarms

Cause: A consistency error was detected when activating the configuration (p8925) for the PROFINET interface.
Alarm value (r2124, interpret decimal):
0: general consistency error
1: error in the IP configuration (IP address, subnet mask or standard gateway).
2: Name of station error.
3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.
4: a cyclic PROFINET connection is not possible as DHCP is activated.
5: standard gateway is also set at the Industrial Ethernet interface (X127).
6: standard station name is also set at the Industrial Ethernet interface (X127).
7: IP address is located in the same subnet as the IP address of the Industrial Ethernet interface (X127).
Note:
For alarm value = 0, 1, 2, 3, 4, 5, 7, the following applies: the configuration was not changed.
For alarm value = 6 the following applies: The new configuration was however activated.
DHCP: Dynamic Host Configuration Protocol
See also: p8920 (PN name of station), p8921 (PN IP address), p8922 (PN Default Gateway), p8923 (PN Subnet Mask)

Remedy: - check the required interface configuration (p8940 and following), correct if necessary, and activate (p8945).
or
- reinitialize the station using the "Edit Ethernet node" screen form (e.g. with STARTER commissioning tool).

Cause: A syntax error has been detected in the ASCII configuration file for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41). The saved configuration file has not been loaded.

Remedy: - Correct and activate the CBExx configuration (p8940 and following) (p8945 = 2).
- Reinitialize the CBExx (e.g. using the STARTER commissioning tool)

Note:
The configuration is not applied until the next POWER ON!

0: general consistency error
1: error in the IP configuration (IP address, subnet mask or standard gateway).
2: Error in the station names.
3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.
4: a cyclic PROFINET connection is not possible as DHCP is activated.
Note:
For all alarm values, the following applies: currently set configuration has not been activated.
DHCP: Dynamic Host Configuration Protocol
See also: p8940 (CBExx name of station), p8941 (CBExx IP address), p8942 (CBExx default gateway), p8943 (CBExx subnet mask), p8944 (CBExx DHCP mode)

Servo: OFF3 (NONE, OFF1, OFF2)
Vector: OFF3 (NONE, OFF1, OFF2)
Hla: OFF3 (NONE, OFF1, OFF2)

Acknowledge: IMMEDIATELY

Cause: A CAN communications error has occurred.
Fault value (r0949, interpret decimal):
1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller.
- bus cable short circuit.
- incorrect baud rate.
- incorrect bit timing.
2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]).
- bus cable interrupted.
- bus cable not connected.
- incorrect baud rate.
- incorrect bit timing.
- master fault.
See also r8843.2 IF2 PZD status - fieldbus running.
Note:
The fault response can be set as required using p8641.
See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code), r8843 (IF2 PZD state)

Remedy:
- check the bus cable
- check the baud rate (p8622).
- check the bit timing (p8623).
- check the master.
The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved!

Drive object: A_INF, B_INF, CU_LINK, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: An attempt was made to exceed the maximum number of valid PDO.
Alarm value (r2124, interpret decimal):
1:
An attempt was made to exceed the total number of valid RPDO of all CANopen supported drive objects.
As a result of the hardware, the limit is 25 valid RPDO.
2:
An attempt was made to exceed the total number of valid TPDO of all CANopen supported drive objects.
The limit is defined by the following ratio:
CAN sampling time (p8848) / CAN minimum processing time (r8739)
Note:
RPDO: Receive Process Data Object
TPDO: Transmit Process Data Object
See also: r8739 (Minimum CAN processing time), r8742 (CAN PDO available number)

Remedy: Comply with the limit for the maximum number of valid RPDO or TPDO.
Apply one of the following options to delete the alarm:
- successfully write to the COB ID index of a PDO communication parameter (p870x[0], p872x[0]).
- change CANopen NMT state.
- execute CANopen NMT command reset node.
- execute CANopen NMT command reset communication.
- carry out a warm restart (p0009 = 30, p0976 = 2).
- carry out a POWER ON (switch-off/switch-on).
Note:
The remaining available RPDO or TPDO are indicated in r8742.

Component: None **Propagation:** LOCAL

Reaction: OFF1

Acknowledge: IMMEDIATELY

Cause:	At least one function module requiring a license is not licensed. Fault value (r0949, interpret hexadecimal): Bit x = 1: The corresponding function module does not have a license. Note: Assigning bit number to function module, see p0108 or r0108.
Remedy:	- enter and activate the license key for function modules that require a license license (p9920, p9921). - if necessary, deactivate unlicensed function modules (p0108, r0108). See also: p9920 (Licensing enter license key), p9921 (Licensing activate license key)

Cause:	For the drive unit, the options that require a license are being used but the licenses are not sufficient.
Remedy:	- enter and activate the license key for options that require a license. - if necessary, deactivate unlicensed options.

A13021	Licensing for output frequencies > 550 Hz missing
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	Control Unit (CU)
Reaction:	NONE
Acknowledge:	NONE
Cause:	Configuring the converter results in an output frequency greater than 550 Hz. This function requires a license. The "High Output Frequency" license is required. Note: - in this specific case, the output frequency is limited to 550 Hz. - the "Trial License" function is not effective for license "High Output Frequency".
Remedy:	- enter and activate the license key for "High Output Frequency" and activate (p9920, p9921). - if necessary operate the motor below the output frequency of 550 Hz.

F13100	Know-how protection: Copy protection error
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	Control Unit (CU)
Reaction:	OFF1
Acknowledge:	IMMEDIATELY

Cause: The know-how protection with copy protection for the memory card is active.
An error has occurred when checking the memory card.
Fault value (r0949, interpret decimal):
0: A memory card is not inserted.
2: An invalid memory card is inserted.
3: The memory card is being used in another Control Unit.
12: An invalid memory card is inserted (OEM input incorrect, p7769).
13: The memory card is being used in another Control Unit (OEM input incorrect, p7759).
See also: p7765 (KHP configuration)

Remedy: For fault value = 0:
- insert the correct memory card and carry out POWER ON.
For fault value = 2, 3, 12, 13:
- contact the responsible OEM.
- Deactivate copy protection (p7765) and acknowledge the fault (p3981).
- Deactivate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981).
Note:
In general, the copy protection can only be changed when know-how protection is deactivated.

Power unit: Overcurrent

Message value: Fault cause: %1 bin
Message class: Power electronics faulted (5)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Power Module **Propagation:** LOCAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit has detected an overcurrent condition.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging currents for line voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at switch-on as there is no commutating reactor.
- power cables are not correctly connected.
- the power cables exceed the maximum permissible length.
- power unit defective.
- line phase interrupted.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.
Bit 1: Phase V.
Bit 2: Phase W.
Bit 3: Overcurrent in the DC link.

Note:

Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).

- Remedy:**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star/delta).
 - U/f operation: Increase up ramp.
 - U/f operation: Check the assignment of the rated currents of the motor and Motor Module.
 - infeed: Check the line supply quality.
 - infeed: Reduce the motor load.
 - infeed: Check the correct connection of the line filter and the line commutating reactor.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.
 - check the line supply phases.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
 - check the setting of the closed-loop circulating current control (p7036, p7037).

Power unit: DC link voltage overvoltage

Message value: %1
Message class: DC link overvoltage (4)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC
Component: Power Module **Propagation:** LOCAL
Reaction: OFF2
Acknowledge: IMMEDIATELY

Cause: The power unit has detected overvoltage in the DC link.
 - motor regenerates too much energy.
 - device supply voltage too high.
 - when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.
 - line phase interrupted.
 Fault value (r0949, interpret decimal):
 DC link voltage at the time of trip [0.1 V].

Remedy:
 - increase the ramp-down time
 - activate the DC link voltage controller (p1240)
 - use a brake resistor or Active Line Module
 - increase the current limit of the infeed or use a larger component (for the Active Line Module)
 - check the device supply voltage
 - check and correct the phase assignment at the VSM and at the power unit
 - check the line supply phases.

Component:	Power Module
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Thyristor Control Board (TCB) of the Basic Line Module signals a fault. - there is no line supply voltage. - the line contactor is not closed. - the line supply voltage is too low. - line supply frequency outside the permissible range (45 ... 66 Hz). - there is a DC link short-circuit. - there is a DC link short-circuit (during the precharging phase). - the motor either has a short-circuit or insulation fault (from an inverter connected to the DC link). - voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V. - there is an internal fault in the Thyristor Control Board.
Remedy:	The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s! - check the line supply voltage - check or energize the line contactor. - check the monitoring time and, if required, increase (p0857). - if required, observe additional power unit messages/signals. - check the DC link regarding short-circuit or ground fault. - check the motor regarding short-circuit or ground fault. - evaluate diagnostic LEDs for the Thyristor Control Board.

Cause:	At the power unit, the DC link voltage ripple has exceeded the permissible limit value. Possible causes: <ul style="list-style-type: none">- a line phase has failed.- the 3 line phases are inadmissibly asymmetrical.- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.- the fuse of a phase of a main circuit has ruptured.- a motor phase has failed.- for power units operated on a single phase, the permissible active power was exceeded. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	<ul style="list-style-type: none">- check the main circuit fuses.- check whether a single-phase load is distorting the line voltages.- Detune the resonant frequency with the line inductance by using an upstream line reactor.- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.- check the motor feeder cables.

Cause:	A configuration is requested that is not supported by the power unit. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: xxxx = fault cause, yyyy = additional information (internal Siemens) xxxx = 0: Autonomous operation is requested but is not supported. xxxx = 1: The requested DRIVE-CLiQ timing is not permissible. xxxx = 2: A PM260 has been detected with PS-ASIC version 2. This combination is not supported. xxxx = 3: Initialization was not able to be successfully completed. It is possible that the Control Unit was withdrawn from the Power Module before or during power up. xxxx = 4: The combination of power unit and Control Unit or Control Unit Adapter is not supported. xxxx = 5: The higher current controller dynamic performance is not supported. xxxx = 6: it is not permitted to operate the Motor Module with this Control Unit and firmware version.
Remedy:	For fault cause = 0: If required, deactivate an active internal voltage protection (p1231). For fault cause = 1: Update the Control Unit firmware or change the DRIVE-CLiQ topology. For fault cause = 2: Replace the power unit with a PM260 with PS-ASIC version 3 (or higher). For fault cause = 3, 4: Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Unit Adapter. For fault cause = 5: - use a booksize format power unit. - for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time. - if required, deselect the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller. For fault cause = 6: - use a suitable Motor Module. - use a Control Unit with approved firmware version. See also: p0115, p1231, p1810

- Cause:** The power has detected a ground fault.
Possible causes:
- ground fault in the power cables.
 - ground fault at the motor.
 - CT defective.
 - when the brake closes, this causes the hardware DC current monitoring to respond.
 - short-circuit at the braking resistor.
 - the closed-loop circulating current control for devices connected in parallel ($r0108.15 = 1$) is either too slow or has been set too fast.
- Note:
For power units, a ground fault is also emulated in $r3113.5$.
Fault value ($r0949$, interpret decimal):
0:
- the hardware DC current monitoring has responded.
- short-circuit at the braking resistor.
> 0:
Absolute value, total current amplitude [$20479 = r0209 * 1.4142$].
- Remedy:**
- check the power cable connections.
 - check the motor.
 - check the CT.
 - check the cables and contacts of the brake connection (a wire is possibly broken).
 - check the braking resistor.
- For parallel switching devices ($r0108.15 = 1$) the following additionally applies:
- check the ground fault monitoring thresholds ($p0287$).
 - check the setting of the closed-loop circulating current control ($p7036$, $p7037$).

Bit 13: Vce fault detected, transistor de-saturated due to overcurrent/short-circuit.
Bit 14: Undervoltage detected.
See also: p0210 (Drive unit line supply voltage)

Remedy:

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).

For booksize drive units, the following applies:

- wait (approx. 8 minutes) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Manual).

For 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Manual).

For 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

For 8):

- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.

For 9):

- check the DC link for ground faults or short circuits.

For 11):

- check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).

If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

4.2 List of faults and alarms

Cause:	The feedback signal from a fan indicates a fault. <ul style="list-style-type: none">- fan defective.- fan blocked.- feedback signal inaccurate.- fan power supply interrupted (only for r0193.13 = 1 and heat sink fan) Alarm value (r2124, interpret binary): Bit 0 = 1: heat sink fan Bit 1 = 1: fan inside the device Note: <ul style="list-style-type: none">- for firmware version < 5.1 of the power unit, the alarm value is always 0. The alarm then refers to the heat sink fan.- for r0193.13 = 1, fault F30058 is output instead of this alarm for heat sink fans, if the pulses are inhibited or the fault occurs within 10 s after the fan runs up when the pulses are enabled.- for r0193.13 = 1, fault F30059 is output instead of this alarm for fans inside the unit, if the air intake temperature (r0037[3]) has exceeded a specific threshold.
Remedy:	<ul style="list-style-type: none">- check the fan involved.- if required, replace the fan.- check the fan power supply and if required switch on (only for r0193.13 = 1 and heat sink fan). Note: If the alarm has been withdrawn, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

Message class:	Network fault (2)
Drive object:	A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Power Module
	Propagation: LOCAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011.

F30078 Power unit: defective fan or line reactor has overheated
Message value: -
Message class: Overtemperature of the electronic components (6)
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Component: Power Module **Propagation:** LOCAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature monitoring of the internal braking resistor or the line reactor has responded. In addition to the OFF2 response, the use of the internal braking resistor was inhibited.
Note:
- an overtemperature condition of the internal braking resistor can only be initiated as a result of a defective fan.
- an overtemperature condition of the line reactor can occur when a DC link coupling is used – and if the power when motoring, which is fed into the DC link - is not evenly distributed across the rectifiers of the power units.
Remedy:
- check the converter fan and replace if necessary.
- reduce the motoring power.

Cause: The alarm is output if the following conditions are simultaneously satisfied:
1. The device supply voltage (p0210) was reduced.
2. A DC link voltage is present, which is too high when referred to the new supply voltage.
DC link precharging cannot be completed as this could place some converter components at risk.
Alarm value (r2124, interpret decimal):
Voltage value to which the DC link voltage must, in the meantime, be reduced in order to complete precharging [V].

4 Faults and alarms

4.2 List of faults and alarms

- Cause:**
- The power unit has executed too many switching operations for current limitation.
 - closed-loop control is incorrectly parameterized.
 - motor has a short-circuit or fault to ground (frame).
 - U/f operation: Up ramp set too low.
 - U/f operation: rated current of motor much greater than that of power unit.
 - infeed: High discharge and post-charging currents for line voltage dip.
 - infeed: High post-charging currents for overload when motoring and DC link voltage dip.
 - infeed: Short-circuit currents at switch-on as there is no commutating reactor.
 - power cables are not correctly connected.
 - power cables exceed the maximum permissible length.
 - power unit defective.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

- Remedy:**
- check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star-delta)
 - U/f operation: Increase up ramp.
 - U/f operation: Check assignment of rated currents of motor and power unit.
 - infeed: Check the line supply quality.
 - infeed: Reduce the motor load.
 - infeed: Correct connection of the line reactor.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
 - check the setting of the closed-loop circulating current control (p7036, p7037).

Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The drive-integrated "Safety Integrated" function in monitoring channel 2 has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of monitoring channel 2). - forced checking procedure (test stop) of the safety switch-off signal path of monitoring channel 2 unsuccessful. - subsequent response to fault F30611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: Stop request from the Control Unit. 1005: - STO active, although STO not selected and there is no internal STOP A active. - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0). 1010: STO inactive although STO is selected or an internal STOP A is present. 1011: internal error for STO deselected in monitoring channel 2. 1020: Internal software error in the "Internal voltage protection" function. The "internal voltage protection" function is withdrawn. A STOP A that cannot be acknowledged is initiated. 9999: Subsequent response to fault F30611.

- Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.
- As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).
- Fault value (r0949, interpret decimal):
- 0: Stop request from another monitoring channel.

- the signal at terminal EP of the Motor Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
 - via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).
 - safe pulse cancellation (r9723.9 - also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

- 2004: Forced checking procedure of the switch-off signal path of the second channel unsuccessful.
- 2005: Forced checking procedure of the switch-off signal path of the second channel unsuccessful.
- 6000 ... 6999:
- Error in the PROFIsafe control.
- For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.
- The significance of the individual message values is described in safety message C01611.

Remedy:

For fault value = 1 ... 5 and 7 ... 999:

Cause: The drive-integrated "Safety Integrated" function in monitoring channel 2 has detected an error in the sign-of-life of the safety data between the two monitoring channels and initiated a STOP A.

- there is either a DRIVE-CLiQ communication error or communication has failed.

- a time slice overflow of the safety software has occurred.

- the enable of the safety functions in both monitoring channels is inconsistent (p9601 = 0, p9801 <> 0).

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

- Remedy:**
- select Safe Torque Off and deselect again.
 - carry out a POWER ON (switch-off/switch-on) for all components.
 - check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
 - deselect all drive functions that are not absolutely necessary.
 - reduce the number of drives.
 - check the electrical cabinet design and cable routing for EMC compliance

- Remedy:**
- re-commission the safety functions.
 - upgrade the Control Unit software.
 - upgrade the Motor Module/Hydraulic Module software.
 - replace the memory card or Control Unit.
- For fault value = 129:
- activate the safety commissioning mode (p0010 = 95).
 - adapt the PROFIsafe address (p9610).
 - start the copy function for SI parameters (p9700 = D0 hex).
 - acknowledge data change (p9701 = DC hex).
 - exit the safety commissioning mode (p0010 = 0).
 - save all parameters (p0977 = 1 or "copy RAM to ROM").
 - carry out a POWER ON (switch-off/switch-on) for all components.

4 Faults and alarms

4.2 List of faults and alarms

Cause: At least one enabled "Safety Cam" (SCA) is parameterized in p9336 or p9337 too close to the tolerance range around the modulo position.

- the minus position value of a cam must be greater than the lower modulo limit + cam tolerance (p9340) + position tolerance (p9342).
- the plus position value of a cam must be less than the upper modulo limit - cam tolerance (p9340) - position tolerance (p9342).
- when the modulo position is parameterized (p9305 > 0), the lower modulo limit = 0, the upper modulo limit = p9305.
- the cam length of cam x = p9336[x] - p9337[x] is less than the cam tolerance + position tolerance (= p9340 + p9342).

This also means that cams of the minus position value must be less than the plus position value.

Note:
This fault does not result in a safety stop response.
Fault value (r0949, interpret decimal):
Number of the "Safe Cam" with an illegal position.
See also: p9501 (SI Motion enable safety functions (Control Unit))

Remedy: Correct the cam position and carry out a POWER ON.

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

- it is not permissible to enable actual value synchronization for a 1-encoder system.
- it is not permissible to simultaneously enable actual value synchronization and a monitoring function with absolute reference (SCA/SLP).
- it is not permissible to simultaneously enable actual value synchronization and safe position via PROFIsafe.

Note:
This fault results in a STOP A that cannot be acknowledged.

Remedy:

- either deselect the "actual value synchronization" function or parameterize a 2-encoder system.
- either deselect the function "actual value synchronization" or the monitoring functions with absolute reference (SCA/SLP) and carry out a POWER ON.
- either deselect the "actual value synchronization" function or do not enable "Safe position via PROFIsafe".

PROFIsafe message values.

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

Remedy:

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.

- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.

- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.

- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- the parameterized encoder does not correspond to the connected encoder - replace the encoder.

- check the electrical cabinet design and cable routing for EMC compliance

- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).

- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9342) and/or the cam tolerance (p9340).

For message value = 1024:

- check the communication link.

- if required, increase the monitoring cycle clock settings (p9500, p9511).

- carry out a POWER ON (switch-off/switch-on) for all components.

- replace the hardware.

For message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Adapt the encoder parameterization for the second channel as follows:

- set the encoder type (p0400).
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for encoder parameters (p9700 = 46).
- exit the safety commissioning mode (p0010 = 0).
- save the parameters in a non-volatile fashion (copy RAM to ROM).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1040:

- deselect encoderless monitoring functions, select and deselect STO.
- if monitoring function "SLS" is active, issue a pulse enable within 5 s of deselecting STO.

For message value = 6000 ... 6999:

- the significance of the individual message values is described in safety fault F01611 of the Control Unit.

For other message values:

- the significance of the individual message values is described in safety message C01711.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

4.2 List of faults and alarms

Cause:	<p>The failsafe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002/p10102.</p> <p>Fault value (r0949, interpret hexadecimal): yyyyxxxx hex xxxx: Discrepancy error for failsafe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for failsafe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.</p>
Remedy:	<p>- check the wiring of the F-DI (contact problems).</p> <p>Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9307.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked: - $p10102 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10102 \geq p9300$ (discrepancy time must be at least p9300) - $p10102 > td$ (discrepancy time must be greater than the switch discrepancy time that may actually occur) td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9300). tp = period for a switching operation in ms. When debounce p10017 is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p11002 < p10117 + 1 \text{ ms} - td$ - $p10102 > td$ - $p10102 \geq p9300$ Example: For a 12 ms SI monitoring cycle and a switching frequency of 110 ms (p10117 = 0), the maximum discrepancy time which can be set is as follows: $p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$ Rounded-off, $p10102 \leq 36 \text{ ms}$ is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle). Note: F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output</p>

 R: Reserved.
 V: Actual state of the DO channel concerned (see X) on processor 2 (corresponds to the states read back from the hardware, bit 0 = DO 0, bit 1 = DO 1, etc.).
 W: Required state of the DO channel concerned (see X, bit 0 = DO 0, bit 1 = DO 1, etc.).
 X: DO channels involved, which indicate an error (bit 0 = DO 0, bit 1 = DO 1, etc.).
 Y: Reason for the test stop fault.
 Z: State of the test stop in which the fault has occurred.
 Y: Reason for the test stop fault
 Y = 1: Processor 1 in incorrect test stop state (internal fault).
 Y = 2: Expected states of the DOs were not fulfilled (CU305: readback via DI 22 / CU240 readback DI 2).
 Y = 3: Incorrect timer state on processor 1 (internal fault)
 Y = 4: Expected states of the diag DOs were not fulfilled (CU305: internal readback on processor 2).
 Y = 5: Expected states of the second diag DOs were not fulfilled (CU305: internal readback on processor 1).
 X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).
 In the event of multiple test stop faults, the first one that occurred is shown.
 Z: Test stop state and associated test actions
 Z = 0 ... 3: Synchronization phase of test stop between processor 1 and processor 2 no switching operations
 Z = 4: DO + OFF and DO - OFF
 Z = 5: Check to see if states are as expected
 Z = 6: DO + ON and DO - ON
 Z = 7: Check to see if states are as expected

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy:

Check the wiring of the failsafe digital output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.

- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

Automatic test stop: wait for STO deselection via SMM

Message value:

-

Message class:

Safety monitoring channel has identified an error (10)

Drive object:

HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component:

Motor

Propagation:

GLOBAL

Reaction:

NONE

Acknowledge:

NONE

Cause:

The automatic test stop was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via Safety Extended Functions.

- a safety message is present, that resulted in a STO.

Note:

STO: Safe Torque Off

Remedy:

- Deselect STO via Safety Extended Functions.

- remove the cause of the safety messages and acknowledge the messages.

Note:

The automatic test stop is performed after removing the cause.

F31100 (N, A)	Encoder 1: Zero mark distance error

Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

Cause: The unipolar level (AP/AN or BP/BN) for encoder 1 is outside the permissible tolerance.
 Fault value (r0949, interpret binary):
 Bit 0 = 1: Either AP or AN outside the tolerance.
 Bit 16 = 1: Either BP or BN outside the tolerance.
 The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.
 The response thresholds are < 1700 mV and > 3300 mV.

Note:

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

- make sure that the encoder cables and shielding are installed in an EMC-compliant manner.
- check the plug connections and contacts of the encoder cable.
- check the short-circuit of a signal cable with mass or the operating voltage.
- replace the encoder cable.

Cause: The signal level (root from $A^2 + B^2$) of the encoder exceeds the permissible limit value.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms).

The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Cause:	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. For equidistant zero marks, the following applies: - the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark. For distance-coded zero marks, the following applies: - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair. Fault value (r0949, interpret decimal): Deviation in quadrants (1 pulse = 4 quadrants). Cause: The signal level ($C^2 + D^2$) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.
Alarm value (r2124, interpret hexadecimal):
yyyyxxxx hex:
yyyy = Signal level, track D (16 bits with sign).
xxxx = Signal level, track C (16 bits with sign).
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).
The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.
Note:

Cause: The signal level (root from $A^2 + B^2$) of the encoder is outside the permissible tolerance.
 Alarm value (r2124, interpret hexadecimal):
 yyyyxxxx hex:
 yyyy = Angle
 xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign)
 The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).
 The response threshold is < 230 mV (observe the frequency response of the encoder).
 A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.
 The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.
 Note for Sensor Modules for resolvers (e.g. SMC10):
 The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).
 A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.
 Note:
 The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.
 See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

4.2 List of faults and alarms

Cause: A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

4.2 List of faults and alarms

Cause:	The configuration for encoder 1 is incorrect. Alarm value (r2124, interpret decimal): 1: Re-parameterization between fault/alarm is not permissible. 2: The cyclic DQ receive telegram is too long and is limited. 3: The cyclic DQ send telegram is too long and is limited. 419: When the fine resolution Gx_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.
Remedy:	For alarm value = 1: No re-parameterization between fault/alarm. For alarm value = 419: Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

Drive object:	ENC
Component:	Sensor Module Encoder 1
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A parameter of encoder 1 was detected as being incorrect. In the case of the ENCODER drive object, the selected encoder type (rotary/linear) might not match the function module setting (r0108.12). The parameter involved can be determined as follows: - determine the parameter number using the fault value (r0949). - determine the parameter index (p0187). Cause: For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.

The diagnostics data is saved in the following folder:
/USER/SINAMICS/DATA/SMTRC00.BIN
...
/USER/SINAMICS/DATA/SMTRC07.BIN
/USER/SINAMICS/DATA/SMTRCIDX.TXT

The following information is contained in the TXT file:

- Display of the last written BIN file.
- Number of write operations that are still possible (from 10000 downwards).

Note:
Only Siemens can evaluate the BIN files.

Remedy: Not necessary.
This alarm is automatically withdrawn.

F32100 (N, A)	Encoder 2: Zero mark distance error
Message value:	%1
Message class:	Actual position/speed value incorrect or not available (11)

Component:	Encoder 2 Propagation: LOCAL

Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

Cause:	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the clearance between zero marks (p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - when p0437.1 is active, check p4686. - replace the encoder or encoder cable.

Acknowledge:	IMMEDIATELY
Cause:	The zero mark signal level (track R) does not lie within the tolerance bandwidth for encoder 2. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot. Fault value (r0949, interpret hexadecimal): yyyyxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign) The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV). The signal level is not evaluated unless the following conditions are satisfied: - Sensor Module properties available (r0459.31 = 1). - monitoring active (p0437.31 = 1).
Remedy:	- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - check the encoder type (encoder with zero marks). - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly (not connected with the incorrect polarity). - replace the encoder cable. - if the coding disk is soiled or the lighting aged, replace the encoder.

For SMC30 (only Article Number 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1), the following applies:

- check the setting of p0405 (p0405.2 = 1 is only possible if the encoder is connected at X520).

For a square-wave encoder without track R, the following jumpers must be set for the connection at X520 (SMC30), X220 (CUA32) or X23 (CU310-2):

- pin 10 (reference signal R) <--> pin 7 (encoder power supply, ground)
- pin 11 (reference signal R inverted) <--> pin 4 (encoder power supply)

Cause: An encoder power supply fault was detected.
 Fault value (r0949, interpret binary):
 Bit 0: Undervoltage condition on the sense line.
 Bit 1: Overcurrent condition for the encoder power supply.
 Bit 2: Overcurrent condition for encoder power supply on cable resolver excitation negative.
 Bit 3: Overcurrent condition for encoder power supply on cable resolver excitation positive.
 Bit 4: The 24 V power supply through the Power Module (PM) is overloaded.
 Bit 5: Overcurrent at the EnDat connection of the converter.
 Bit 6: Overvoltage at the EnDat connection of the converter.
 Bit 7: Hardware fault at the EnDat connection of the converter.
 Note:
 If the encoder cables 6FX2002-2EQ00-.... and 6FX2002-2CH00-.... are interchanged, this can result in the encoder being destroyed because the pins of the operating voltage are reversed.

Remedy:
 For fault value, bit 0 = 1:
 - correct encoder cable connected?
 - check the plug connections of the encoder cable.
 - SMC30: Check the parameterization (p0404.22).
 For fault value, bit 1 = 1:

Acknowledge:	PULSE INHIBIT
Cause:	The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical. One period of track C/D corresponds to 360 ° mechanical. One period of the Hall signal corresponds to 360 ° electrical. The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough. After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A32429. Fault value (r0949, interpret decimal): For track C/D, the following applies: Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °). For Hall signals, the following applies: Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).
Remedy:	- track C or D not connected. - correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D. - check that the encoder cables are routed in compliance with EMC. - check the adjustment of the Hall sensor.

Cause:	After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out. When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical. When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical. F32131 (N, A) Encoder 2: Position deviation incremental/absolute too high

Acknowledge: PULSE INHIBIT

Cause: Absolute encoder:

When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).

- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

Remedy:

- check that the encoder cables are routed in compliance with EMC.

- check the plug connections.

- replace the encoder or encoder cable.

- check whether the coding disk is dirty or there are strong ambient magnetic fields.

- adapt the parameter for the clearance between zero marks (p0425).

- if message output above speed threshold, reduce filter time if necessary (p0438).

4 Faults and alarms

4.2 List of faults and alarms

Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.

A32429 (F, N) Encoder 2: Position difference hall sensor/track C/D and A/B too large

Message value: %1

Message class: Actual position/speed value incorrect or not available (11)

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Encoder 2 **Propagation:** LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.
One period of track C/D corresponds to 360 ° mechanical.
One period of the Hall signal corresponds to 360 ° electrical.
The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

Alarm value (r2124, interpret decimal):
For track C/D, the following applies:
Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).
For Hall signals, the following applies:
Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).

Remedy:

- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Encoder 2 **Propagation:** LOCAL

Reaction: NONE

Cause: When the zero pulse is passed, a deviation in the incremental position was detected.
 For equidistant zero marks, the following applies:
 - the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.
 For distance-coded zero marks, the following applies:
 - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.
 Alarm value (r2124, interpret decimal):
 Deviation in quadrants (1 pulse = 4 quadrants).

Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- Clean coding disk or remove strong magnetic fields.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.
 For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.
 For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy: The fault should be resolved as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and the absolute encoder adjusted.

Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
 - check the plug connections.
 - check the encoder type (encoder with equidistant zero marks).
 - adapt the parameter for the distance between zero marks (p0424, p0425).
 - if message output above speed threshold, reduce filter time if necessary (p0438).
 - replace the encoder or encoder cable.

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Encoder 3 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE

Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance.
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
Alarm value (r2124, interpret decimal):
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).
The sign designates the direction of motion when detecting the zero mark distance.

Remedy:

- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).

Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Encoder 3 **Propagation:** LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: The signal level ($C^2 + D^2$) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.

Alarm value (r2124, interpret hexadecimal):
yyyyxxxx hex:
yyyy = Signal level, track D (16 bits with sign).
xxxx = Signal level, track C (16 bits with sign).
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).
The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:
If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- check the Hall sensor box.

Cause: The signal level (root from $A^2 + B^2$) of the encoder is outside the permissible tolerance.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Remedy:

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

Component: None **Propagation:** GLOBAL
Reaction: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.
 For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.
 For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy: The fault should be resolved as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and the absolute encoder adjusted.

A33811 (F, N) Encoder 3: Encoder serial number changed

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Encoder 3 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).
 - the encoder was replaced.
 Note:
 With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).
 When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).
 Proceed as follows to hide serial number monitoring:
 - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.
Remedy: Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Cause:	An encoder parameter was detected as being incorrect. It is possible that the parameterized encoder type does not match the connected encoder. The parameter involved can be determined as follows: - determine the parameter number using the fault value (r0949). - determine the parameter index (p0187). Fault value (r0949, interpret decimal): Parameter number.
Remedy:	- check whether the connected encoder type matches the encoder that has been parameterized. - correct the parameter specified by the fault value (r0949) and p0187.

Drive object:	HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component:	Sensor Module Encoder 3 Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card. The diagnostics data is saved in the following folder: /USER/SINAMICS/DATA/SMTRC00.BIN ... /USER/SINAMICS/DATA/SMTRC07.BIN /USER/SINAMICS/DATA/SMTRCIDX.TXT The following information is contained in the TXT file: - Display of the last written BIN file. - Number of write operations that are still possible (from 10000 downwards). Note: Only Siemens can evaluate the BIN files.
Remedy:	Not necessary. This alarm is automatically withdrawn. The data logger is ready to record the next fault case.

Reaction:

Infeed: OFF2 (NONE, OFF1)

Servo: NONE (OFF1, OFF2)

Vector: NONE (OFF1, OFF2)

Hla: NONE (OFF1, OFF2)

Acknowledge:

IMMEDIATELY

Cause: Fault detected on the DRIVE-CLiQ component (Voltage Sensing Module) involved. Faulty hardware cannot be excluded.
 Fault cause:
 32 (= 20 hex):
 Error in the telegram header.
 35 (= 23 hex):
 Receive error: The telegram buffer memory contains an error.
 66 (= 42 hex):
 Send error: The telegram buffer memory contains an error.
 67 (= 43 hex):
 Send error: The telegram buffer memory contains an error.
 96 (= 60 hex):
 Response received too late during runtime measurement.
 97 (= 61 hex):
 Time taken to exchange characteristic data too long.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

F34895 VSM DRIVE-CLiQ (CU): Alternating cyclic data transfer error

4 Faults and alarms

4.2 List of faults and alarms

Cause: The properties of the DRIVE-CLiQ component (Voltage Sensing Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.
Fault value (r0949, interpret decimal):
Component number.

Remedy: - carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

Acknowledge: IMMEDIATELY (POWER ON)

Cause: A fault occurred on the Voltage Sensing Module that cannot be interpreted by the Control Unit firmware.

This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Fault value (r0949, interpret decimal):

Fault number.

Note:

If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

Remedy: - replace the firmware on the Voltage Sensing Module by an older firmware version (r0158).
- upgrade the firmware on the Control Unit (r0018).

4.2 List of faults and alarms

Cause: A fault has been detected during the forced checking procedure (test stop) of the failsafe digital inputs/outputs on the TM54F. Failsafe control signals (Failsafe Values) are transferred to the safety functions.

Fault value (r0949, interpret hexadecimal):
aaaabbcc hex:
aaaa: DO or F-DI (dependent on test step cc), where the expected state was not assumed (bit 0 = F-DI 0 or F-DO 0, bit 1 = F-DI 1 or F-DO 1, etc.).
bb: Fault cause
bb = 01 hex: Internal fault.
bb = 02 hex: Fault when comparing the switching signals of the two channels (F-DI or DI).
bb = 03 hex: Internal fault.
bb = 04 hex: Fault when comparing the switching signals of the two channels (Diag-DO).
cc: State of the test stop in which the fault has occurred.

The display format is as follows:
Slave fault state: (test actions)(test actions) | corresponding step for the master: (test actions)(test actions) | Description

00 hex: (L1+OFF)(L2+ON) | 0A hex: () () | Synchronization / switching step

62 hex: (DO OFF)() | 6D hex: (DO ON)() | 1.) Check diag-DO or diag-DI 2.) Switch step
6D hex: (DO OFF)() | 78 hex: (DO ON)() | Wait step
78 hex: (DO ON)() | 83 hex: (DO OFF)() | 1.) Check diag-DO or diag-DI 2.) Switch step
83 hex: (DO ON)() | 8E hex: (DO OFF)() | Wait step
8E hex: (DO OFF)() | 99 hex: (DO OFF)() | 1.) Check diag-DO or diag-DI 2.) Switch step
99 hex: (DO OFF)() | A4 hex: (DO OFF)() | Wait step
A4 hex: (DO OFF)() | AF hex: (DO OFF)() | Check Diag-DO or Diag-DI
AF hex: (DO original state)() | C5 hex: (DO original state)() | Switching step
C5 hex: End of test

The expected states to be checked depend on the parameterized test mode (p10047).
The following expected states are tested in the test steps when testing the F-DOs:
The display format is as follows:
Test step (SL MA): Expected Diag-DO mode 1 | Expected DI 20 ... 23 mode 2 | Expected DI 20 ... 23 mode 3
(4C hex 57 hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V
(62 hex 6D hex): Diag-DO = 0 V | DI = 0 V | DI = 0 V
(78 hex 83 hex): Diag-DO = 0 V | DI = 0 V | DI = 24 V
(8E hex 99 hex): Diag-DO = 24 V | DI = 0 V | DI = 24 V
(A4 hex AF hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

Example:
If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.
Master signals fault value 0001_04AF and slave signals fault value 0001_04A4.
aaaa = 1 --> F-DO 0 is involved.
bb = 04 hex --> the test of the Diag-DO was unsuccessful.
cc = The expected states were tested in test stop step AF on the master and A4 on the slave.
The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V.
The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

Remedy: Check the wiring of the F-DIs and F-DOs and restart the test stop.
Note:
 The fault is withdrawn if the test stop is successfully completed.
 For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:
 These fault values occur together with fault F35152.
Possible countermeasure:
 - check all parameters for the test stop.
 - you should also check whether the firmware version of the TM54F matches that of the Control Unit.
 - check p10001, p10017, p10046 and p10047.
 A POWER ON must be carried out after correcting the parameters.

Message class: Safety monitoring channel has identified an error (10)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Terminal Module (TM) **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The time set in p10003 for the forced checking procedure (test stop) for the digital inputs/outputs has been exceeded. A new forced checking procedure is required.
 After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.
Note:
 - this message does not result in a safety stop response.
 - the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.
 See also: p10003

Remedy: Carry out the forced checking procedure for the digital inputs/outputs.
 The signal source to select the forced checking procedure is set via binector input p10007.

A35015 **TM54F: Motor/Hydraulic Module replaced or configuration inconsistent**

Message value: Fault cause: %1 bin

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

- Cause:** Cyclic communication of at least one drive with the Terminal Module 54F (TM54F) is not active.
Possible causes:
- at least one Motor Module/Hydraulic Module was replaced (e.g. hardware was replaced).
 - the parameterization of the TM54F (p10010) is inconsistent with the number of drives, which have drive-based motion monitoring functions activated with TM54F.
 - for the signaled drive, it is not permissible that the "Safe motion monitoring without selection" (p9601.5 = 1) is parameterized.
 - And activated drive has no communication via DRIVE-CLiQ.
 - p10010 of the TM54F master module is not the same as p10010 of the TM54F slave module (in this case, F35051 is also output).
 - in p10010 of the TM54F master or slave module, the number of a drive object was entered several times.
 - the control of the Basis Functions via TM54F was parameterized, and simultaneously the Extended Safety Functions or ncSI were parameterized.
- Alarm value (r2124, interpret binary):
yyyy yyyy xxxx xxxx bin
xxxx xxxx bin: inconsistent configuration
Bit 0 = 1: No communication with drive 1.
...
Bit 5 = 1: No communication with drive 6.
yyyy yyyy bin: Motor Module/Hydraulic Module replaced or a DRIVE-CLiQ cable of a Motor/Hydraulic Module not inserted.
Bit 8 = 1: Motor Module/Hydraulic Module from drive 1 was replaced or does not communicate.
...
Bit 13 = 1: Motor Module/Hydraulic Module from drive 6 was replaced or does not communicate.
- Note:**
When this alarm is active, none of the drives listed in the alarm value, which have drive-based motion monitoring functions operating with TM54F, are enabled.
For alarm value = 0:
The number of drive objects specified in p10010 is not equal to the number of drives that have drive-based motion monitoring functions that have been enabled.
See also: p10010 (SI TM54F drive object assignment)
- Remedy:** For all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).
Check as to whether F35051 is also output and remove the cause.
Check whether each drive object number is listed only once in the indices of p10010.
- Note:**
If a drive was deactivated and activated without first having established the DRIVE-CLiQ connection, then this alarm is also output.
When replacing a Motor Module/Hydraulic Module, carry out the following steps:
- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
 - acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
 - save all parameters (p0977 = 1).
 - carry out a POWER ON (switch-off/switch-on) for all components.
- For SINUMERIK, the following applies:
HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).
The precise procedure is given in the following document:

Remedy:

Carry out the following steps on the TM54F:

- check the specified parameters for incorrect parameterization.
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for SI parameters (p9700 = 57 hex).
- acknowledge complete data change (p9701 = AC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1).
- carry out safe acknowledgment (p10006).

For an internal software error (aaaa > 0):

- For TM54F, upgrade the firmware to a later version.
- contact Technical Support.
- replace the TM54F.

F35151

TM54F: Discrepancy error

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Terminal Module (TM)

Propagation: GLOBAL

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The safe input terminals or output terminals have a different state for longer than the time parameterized in p10002 - or too many switching operations were carried out within a monitoring cycle p10002.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex

xxxx: The safety-relevant input terminals F-DI indicate a discrepancy.

Bit 0: Discrepancy for F-DI 0

...

Bit 9: Discrepancy for F-DI 9

yyyy: The safety-relevant output terminals F-DO indicate a discrepancy.

Bit 0: Discrepancy for F-DO 0

...

Bit 3: Discrepancy for F-DO 3

Note:

If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.

The following options are available to analyze all of the discrepancy errors:

- using the commissioning tool, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here.
- compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.

Remedy: Check the wiring of the corresponding F-DI (contact problems).
 If the wiring is correct, and for example there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them).
 The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again.
 Discrepancy errors in the failsafe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgment was carried out (see p10006). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.
 Sets the discrepancy time for fast switching operations at the F-DIs:
 For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down).
- the time between two switching pulses should be longer than the discrepancy time (if necessary, round up).
- the discrepancy time must be at least r10003 (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time r10003). If a debounce time has been parameterized (p10017 > 0), then the shortest possible discrepancy time is directly specified using the debounce time.
- the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down).
- the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up).
- the discrepancy time must be at least r10003.

The debounce time must always be set less than the discrepancy time.
 Example:
 If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:
 $p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms} \rightarrow$ rounded-off, the following is obtained $p10002 \leq 36 \text{ ms}$
 Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.
 Basic secondary condition to set the discrepancy time:
 The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500).

Cause:	The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint. SIMOTION (p4400 = 0) operating mode: - if the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520. SINAMICS (p4400 = 1) operating mode: - the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420 - the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed - the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).
Remedy:	SIMOTION (p4400 = 0) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). - check track A/B for short-circuits. SINAMICS (p4400 = 1) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). 4 Faults and alarms

4.2 List of faults and alarms

- Cause:** There is no frequency setpoint for the Terminal Module 41 (TM41). The output of tracks A/B has been held (frozen).
Possible causes:
- connector input p4420 is not interconnected.
 - the leading encoder is not in the "ready" state (parking encoder or encoder data set not parameterized).
 - TM41 has a fault.
 - the TM41 is in the commissioning mode (p0010 > 0).
 - the TM41 component is not connected to DRIVE-CLiQ.
- Remedy:**
- appropriately interconnect connector input p4420.
 - bring the leading encoder into the "ready" state.
 - remove any TM41 faults.

EDS changeover/encoder data set change not supported

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause:

Terminal Module 41 (TM41) does not support the following application cases:

- the encoder interconnected via connector input p4420 has carried out an EDS changeover.
- the encoder interconnected with the TM41 was re-parameterized so that the position actual value of the encoder must be newly interpreted.

For example, this is the case when changing the direction of rotation of the motor (p0410, p1821) or when changing the fine resolution (p0418). This may result in a sudden change in the position actual value of the encoder (position setpoint of the TM41), which must not be output at the TM41.

See also: p4420 (TM41 encoder emulation position setpoint)

Remedy:

Set connector input p4420 = 0 and re-wire.

TM: Sampling time p4099[3] invalid

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause:

The sampling time set in p4099[3] for incremental encoder emulation in Terminal Module 41 (TM41) does not correspond to the valid value. To resolve the problem, correct the setting of p4099[3]. The system automatically performs a warm restart/sub-boot.

Alarm value (r2124, interpret decimal):

1:

A sampling time p4099[3] < 125 µs was set.

2:

An integer multiple of the DRIVE-CLiQ clock cycle was not entered in p4099[3].

3:

- in the SINAMICS mode (p4400 = 1), the sampling time in p4099[3] is not an integer multiple of the current controller sampling time (p0115[0]) of the drive object, which supplies the position setpoint (CI: p4420) for the incremental encoder simulation.

- the encoder interconnected via connector input p4420 (e.g. an SSI encoder) is sampled in a slower clock cycle.

Remedy:

- if necessary, cancel the BICO interconnection via connector input p4420.
- check the rules specified under cause for setting the sampling time in p4099[3].
- if necessary, set the BICO interconnection via connector input p4420 again.

Note:

Every time the BICO interconnection is reset via connector input p4420, the sampling time is checked in p4099[3] and, where necessary, this message is output.

4 Faults and alarms

4.2 List of faults and alarms

Cause:	The "master control by PLC" signal was missing in operation. <ul style="list-style-type: none">- interconnection of the binector input for "master control by PLC" is incorrect (p0854).- the higher-level control has withdrawn the "master control by PLC" signal.- data transfer via the fieldbus (master/drive) was interrupted. Note: This alarm is only decisive in the "SIMOTION" operating mode (p4400 = 0). In the "SINAMICS" operating mode (p4400 = 1), the setpoints at p4420 are evaluated independent of binector input p0854.
Remedy:	<ul style="list-style-type: none">- check the interconnection of the binector input for "master control by PLC" (p0854).- check the "master control by PLC" signal and, if required, switch in.- check the data transfer via the fieldbus (master/drive).- check the setting of parameter p2037.

Cause:	SINAMICS (p4400 = 1) operating mode: When parameterizing a Terminal Module 41 (TM41) or when operating a TM41 Module, an operating state was reached which required a POWER ON. These include: <ul style="list-style-type: none">- changing the encoder pulse number (p0408).- changing the fine resolution (p0418).- withdrawing the DRIVE-CLiQ cable without first deactivating TM41 via p0105. If this alarm was output, then the zero mark of the TM41 can no longer be output in synchronism to that of the encoder interconnected at p4420. SIMOTION (p4400 = 0) operating mode: A previously set zero mark position (p4426) no longer matches encoder position (r0479) due to the change in the pulse number (p0408).		
Remedy:	The incremental position at output X520 of TM41 can still be evaluated independent of the zero mark. A POWER ON must be carried out if the TM41 zero mark is evaluated.

4 Faults and alarms

4.2 List of faults and alarms

Cause: Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

F37903 HF Damping Module: I2C bus error occurred

Message value: %1
Message class: Hardware/software error (1)
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Component: None **Propagation:** LOCAL
Reaction: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)
Acknowledge: IMMEDIATELY
Cause: Communications error with an EEPROM or an analog/digital converter.
 Fault value (r0949, interpret hexadecimal):
 80000000 hex:
 - internal software error.
 00000001 hex ... 0000FFFF hex:
 - module fault.

Remedy:

- For fault value = 80000000 hex:
- upgrade firmware to later version.
- For fault value = 00000001 hex ... 0000FFFF hex:
- replace the module.

F49151 Cooling unit: Conductivity has exceeded the fault threshold

Message value: -

Message class: Auxiliary unit faulted (20)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The conductivity of the cooling liquid has exceeded the selected fault threshold (p0269[2]).
See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source)

Remedy: Check the device to de-ionize the cooling liquid.

F49152 Cooling unit: ON command feedback signal missing

Message value: -

Message class: Auxiliary unit faulted (20)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The feedback signal of the ON command of the cooling unit is missing.
- after the ON command, the feedback signal has not been received within the selected starting time (p0260).
- the feedback signal has failed in operation.
- the cooling unit was stopped by an external signal.
See also: p0260 (Cooling unit starting time 1), r0267 (Cooling unit status word)

Remedy:

- check the wiring between the cooling unit and the input terminal (Terminal Module).
- check the wiring between the output terminal (Terminal Module) and the cooling unit.
- check the external control device for the cooling unit.

F49153 Cooling unit: Liquid flow too low

Message value: -

Message class: Auxiliary unit faulted (20)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The drive converter cooling unit signals that the cooling liquid flow is too low.
- after the ON command, the feedback signal has not been received within the selected starting time (p0260).
- in operation, the feedback signal has failed for longer than the permitted failure time (p0263).
See also: p0260 (Cooling unit starting time 1), p0263 (Cooling unit fault liquid flow delay time), r0267 (Cooling unit status word)

Remedy:

- check the wiring between the cooling unit and the input terminal (Terminal Module).
- check the external control device for the cooling unit.

F49154 (A) Cooling unit: Liquid leak is present

Message value: -

Message class: Auxiliary unit faulted (20)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The liquid leakage monitoring function has responded.
Caution:
 If this fault is reparameterized as an alarm, then using other monitoring functions it must be ensured that when cooling water is lost, the drive is switched off!
 See also: r0267 (Cooling unit status word)

Remedy:

- check the cooling system for leaks in the cooling circuit.
- check the wiring of the input terminal (Terminal Module) used to monitor leaking fluid.

F49155 Cooling unit: Power Stack Adapter, firmware version too old

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: POWER ON
Cause: The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.
Remedy: Upgrade the firmware. Check EEPROM data.

F49156 Cooling unit: Cooling liquid temperature has exceeded the fault threshold

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The cooling liquid intake temperature has exceeded the specified fault threshold.
Note:
 The value for the fault threshold depends on the power unit (hardware description data, e.g. 52 ... 55 °C).
Remedy: Check the cooling system and the ambient conditions.

A49170 Cooling unit: Alarm has occurred

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The cooling unit signals a general alarm.
Remedy:

- check the wiring between the cooling unit and the input terminal (Terminal Module).
- check the external control device for the cooling unit.

A49171 (N) Cooling unit: Conductivity has exceeded the alarm threshold

Message value: -
Message class: Auxiliary unit faulted (20)
Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The conductivity of the cooling liquid has exceeded the selected alarm threshold (p0269[1]).
Note:
 The threshold cannot be set higher than the fault threshold specified in the equipment description.
Remedy: Check the device to de-ionize the cooling liquid.

Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.		
Remedy:	- check the wiring between the cooling unit and the Power Stack Adapter (PSA). - check the function of the sensor to measure the conductivity.		

A49173	Cooling unit: Cooling liquid temperature has exceeded the alarm threshold

A.2 List of abbreviations

Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

Abbreviation	Derivation of abbreviation	Significance
A		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS-Interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
AVS	Active Vibration Suppression	Active load vibration damping
B		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
C		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	PROFINET communication module (Ethernet)
CD	Compact Disc	Compact disc
CDS	Command Data Set	Command data set
CF Card	CompactFlash Card	CompactFlash card

Abbreviation	Derivation of abbreviation	Significance
CI	Connector Input	Connector input
CLC	Clearance Control	Clearance control
CNC	Computerized Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output/Binector Output	Connector output/Binector output
COB-ID	CAN Object-Identification	CAN object identification
CoL	Certificate of License	Certificate of License
COM	Common contact of a change-over relay	Center contact of a changeover contact
COMM	Commissioning	Startup
CP	Communication Processor	Communication processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC	Control Unit DC
D		
DAC	Digital Analog Converter	Digital analog converter
DC	Direct Current	DC current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDC	Dynamic Drive Control	Dynamic Drive Control
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input/Digital Output	Digital input/output, bidirectional
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual Ported Random Access Memory	Dual-Port Random Access Memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic Random Access Memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DSM	Doppelsubmodul	Double submodule
DTC	Digital Time Clock	Timer

Abbreviation	Derivation of abbreviation	Significance
E		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder Data Set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatically sensitive devices
EIP	EtherNet/IP	EtherNet Industrial Protocol (realtime Ethernet)
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Elektrostatisch gefährdete Baugruppen
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
F		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Fail-safe digital input
F-DO	Failsafe Digital Output	Fail-safe digital output
FEPRM	Flash-EPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field Programmable Gate Array
FW	Firmware	Firmware
G		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)

Abbreviation	Derivation of abbreviation	Significance
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)
GSD	Gerätstammdatei	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally Unique Identifier
H		
HF	High frequency	High frequency
HFD	Hochfrequenzdrossel	Radio frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear actuator
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with high interference threshold
HW	Hardware	Hardware
I		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Startup
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
J		
JOG	Jogging	Jogging
K		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-how protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor

Abbreviation	Derivation of abbreviation	Significance
L		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
M		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
N		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Interessengemeinschaft Automatisierungstechnik der Prozessindustrie	User Association of Automation Technology in Process Industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization association in USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NTP	Network Time Protocol	Standard for synchronization of the time of day
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory

Abbreviation	Derivation of abbreviation	Significance
O		
OA	Open Architecture	Software component which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware as of which the OA-application can be used
OASP	Open Architecture Support Package	Extends the commissioning tool to include the corresponding OA-application
OC	Operating Condition	Operation condition
OCC	One Cable Connection	One-cable technology
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
P		
p...	-	Adjustable parameters
P1	Processor 1	Processor 1
P2	Processor 2	Processor 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDC	Precision Drive Control	Precision Drive Control
PDS	Power unit Data Set	Power unit data set
PDS	Power Drive System	Drive system
PE	Protective Earth	Protective ground
PELV	Protective Extra Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logical Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PMI	Power Module Interface	Power Module Interface
PMSM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point to Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point To Point	Point-to-point

Abbreviation	Derivation of abbreviation	Significance
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
Q		
R		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Memory for reading and writing
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance synchronous motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a transmitter and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of transmitters and receivers, also known as EIA485)
RTC	Real Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
S		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SCSE	Single Channel Safety Encoder	Single-channel safety encoder
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch

Abbreviation	Derivation of abbreviation	Significance
SESM	Separately-excited synchronous motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety integrity level
SITOP	-	Siemens power supply system
SLA	Safely-Limited Acceleration	Safety limited acceleration
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely-limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Sensorless vector control
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe Stop 1 (time-monitored, ramp-monitored)
SS1E	Safe Stop 1 External	Safe Stop 1 with external stop
SS2	Safe Stop 2	Safe Stop 2
SS2E	Safe Stop 2 External	Safe Stop 2 with external stop
SSI	Synchronous Serial Interface	Synchronous serial interface
SSL	Secure Sockets Layer	Encryption protocol for secure data transfer (new TLS)
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
T		
TB	Terminal Board	Terminal Board
TEC	Technology Extension	Software component which is installed as an additional technology package and which expands the functionality of SINAMICS (previously OA-application)

Abbreviation	Derivation of abbreviation	Significance
TIA	Totally Integrated Automation	Totally Integrated Automation
TLS	Transport Layer Security	Encryption protocol for secure data transfer (previously SSL)
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TSN	Time-Sensitive Networking	Time-Sensitive Networking
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor-Logic	Transistor-transistor logic
Tv	-	Rate time
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
V		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
W		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
X		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
Y		
Z		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word
