Position monitoring functions (Page 88)

Configuration - Following error

In the "Following Error" configuration window, configure the permissible deviation of the actual position of the axis from the position setpoint. The following error can be dynamically adapted to the current velocity of the axis.

Enable following error monitoring

Select this check box, if you want to enable following error monitoring. When following error monitoring is enabled, the axis will be stopped in the error range (orange); in the warning range an alarm will be displayed.

When following error monitoring is disabled, the configured limits have no effect.

Maximum following error:

Configure the following error that is permissible at maximum velocity in this field.

Warning level:

Configure a percentage of the current following error limit, above which a following error warning should be output in this field.

Example: The current maximum following error is 100 mm; the warning level is configured at 90%. If the current following error exceeds a value of 90 mm, then a following error warning will be output.

Following error:

In this field, configure the permissible following error for low velocities (without dynamic adjustment of the following error).

Start of dynamic adjustment:

Configure the velocity starting from which the following error is to be dynamically adjusted in this field. Starting from this velocity, the following error up to the maximum velocity will be adjusted to the maximum following error.

Positioning axis technology object (Page 104)

Synchronous axis technology object (Page 105)

Position monitoring functions (Page 88)

Configuration - Standstill signal

In the "Standstill signal" configuration window, configure the criteria for standstill detection.

Standstill window:

Configure the size of the standstill window in this field. For standstill to be indicated, the velocity of the axis must be within this window.

Minimum dwell time in standstill window:

Configure the minimum dwell time in the standstill window in this field. The velocity of the axis must also be in the standstill window for the specified duration.

If both criteria are met, then the standstill of the axis is indicated.

Positioning axis technology object (Page 104)

Standstill signal (Page 90)

Synchronous axis technology object (Page 105)

5.4.4.7 Configuration - Control loop

In the "Control loop" configuration window, configure the precontrol and the gain Kv of the position control loop.

The Kv factor affects the following parameters:

- Positioning accuracy and stop control
- Uniformity of motion
- Positioning time

The better the mechanical conditions of the axis are (high stiffness), the higher the Kv factor can be configured. This reduces the following error, and a higher dynamic response is achieved.

For basic information, refer to the section Closed-loop control (Page 92).

Precontrol

Configure the percentage velocity precontrol in this field.

Speed control loop substitute time

Configure the speed control loop substitute time in this field (T_{vtc}).

When speed precontrol is activated, the setpoint is delayed by the speed control loop substitute time before the control deviation is established. This prevents an overshoot or a leading of the actual value compared with the position setpoint. The speed control loop substitute time is a simplified substitute model of the dynamic behavior of the speed control loop. The speed control loop substitute time is included in the balancing filter.

Gain (Kv factor)

In the input field, enter the gain Kv of the position control loop.

Dynamic Servo Control (DSC)

For position-controlled axes (positioning axes/synchronous axes), the closed loop position control can occur either in the CPU or in the drive, provided the drive supports Dynamic Servo Control (DSC). Select your preferred control process:

- **Position control in the drive (DSC enabled)**
  With the Dynamic Servo Control (DSC) function, the position controller is executed in the drive in the cycle clock of the speed control loop. This enables you to set a much larger position controller gain factor Kv. This increases the dynamics for setpoint sequence and disturbance variable correction for highly dynamic drives.
- **Position control in the PLC**

Note

Dynamic Servo Control (DSC) is only possible with one of the following PROFIdrive telegrams:

- Standard telegram 5 or 6
- SIEMENS telegram 105 or 106

5.5 Configuring the technology object external encoder

5.5.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the external encoder in this field. The technology object is listed under this name in the project tree. The tags of the external encoder can be used in the user program under this name.

External encoder type

In this selection, configure whether the external encoder records linear or rotary motions.

Units of measure

In the drop-down list, select the desired units of measure for the position and velocity of the external encoder.

Modulo

Select the check box "Enable modulo", if you want to use a recurring measuring system for the external encoder (e.g. 0-360° for an external encoder of the "rotary" type).

- **Modulo start value**

  In this field, define the position at which the modulo range should begin (e.g. 0° for an external encoder of the "rotary" type).

- **Modulo length**

  In this field, define the length of the modulo range (e.g. 360° for an external encoder of the "rotary" type).

See also

Units of measure (Page 32)

Modulo setting (Page 33)

Technology object external encoder (Page 110)

5.5.2 Hardware interface

5.5.2.1 Configuration - Encoder

The external encoder records the position of an externally controlled drive. The encoder required for this purpose communicates the encoder position to the controller by means of a PROFIdrive telegram. Configure the encoder and encoder type in the "Encoder" configuration window.

Data connection

In the drop-down list, select whether the data connection should be established directly with the encoder or via a data block that can be edited in the user program.

The selection is only possible for encoders that are connected via PROFIdrive and support parameter P979.

Encoder / Data block

Select the encoder you have configured in the device configuration in this area.

The following encoders can be used:

- **Encoder on technology module (TM)**

  In the "Encoder" configuration field, select a previously configured technology module and the channel to be used. Only technology modules set to the "Position input for Motion Control" mode are displayed for selection.

  You can operate the technology module centrally on an S7-1500 PLC or decentrally on a distributed I/O. Isochronous mode is not possible with central operation in the CPU.

  You can identify the technology modules suitable for position detection for Motion Control in the documentation for the technology module and the catalog data.

- **Encoder via PROFINET/PROFIBUS (PROFIdrive)**

  In the " Encoder" configuration field, select a configured encoder on the PROFINET/PROFIBUS.

If "Data block" was selected for the data connection, a previously created data block containing a variable structure of data type "PD_TELx" must be selected here ("x" stands for the telegram number used).

Encoder type

Select the encoder type in this configuration field. The following encoder types are available for selection:

- Incremental encoder
- Absolute encoder
- Absolute encoder cyclic absolute

Connect drive/encoder via data block (Page 269)

5.5.2.2 Configuration - Data exchange

Configuration - Data exchange

Configure detailed encoder parameters and the data exchange with the encoder in the "Data exchange with encoder" configuration window. The configuration varies according to the encoder connection:

- Encoder to technology module (Page 232)
- Encoder to PROFINET/PROFIBUS (Page 235)

See also

Technology object external encoder (Page 110)

Encoder to technology module

Data exchange with encoder

In this area, you can configure the encoder telegram and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder telegram

In the drop-down list for the technology module, select the telegram that you have configured in the technology module.

Automatic data exchange for encoder values (offline)

Select the check box if you want to transfer the offline values of the encoder to the configuration of the technology object in the project.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

Automatic data exchange for encoder values (online)

Select the check box if you want to transfer the effective values online in the encoder to the CPU during runtime. The encoder parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the encoder or the CPU.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

Alternatively, you must calibrate the following parameters manually:

Encoder type

Configure how the encoder data are to be evaluated in this area. The specifications must match those in the device configuration.

Encoder type	Rotary incremental
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Rotary absolute
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Rotary cyclic absolute
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.

Encoder type	Rotary cyclic absolute
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear incremental
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Linear absolute
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear cyclic absolute
Distance between two increments	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Technology object external encoder (Page 110)

Encoder to PROFINET/PROFIBUS

Data exchange with encoder

In this area, you can configure the encoder telegram and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder telegram

The telegram to the encoder that is set in the device configuration is preselected in the drop-down list.

Automatic data exchange for encoder values (offline)

Select the check box if you want to transfer the offline values of the encoder to the configuration of the technology object in the project.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

Automatic data exchange for encoder values (online)

Select the check box if you want to transfer the effective values online in the encoder to the CPU during runtime. The encoder parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the encoder or the CPU.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

Alternatively, you must calibrate the following parameters manually:

Encoder type

Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Increments per revolution	Configure the number of increments that the encoder resolves per revolution in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Rotary absolute
Increments per revolution	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Rotary cyclic absolute
Increments per revolution	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear incremental
Distance between two increments	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Linear absolute
Distance between two increments	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear cyclic absolute
Distance between two increments	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

5.5.3 Extended Parameters

5.5.3.1 Configuration - Mechanics

Configuration - Mechanics

Configure the encoder parameters for the position of the externally controlled drive in the "Mechanics" configuration window.

The configuration varies according to the type of encoder:

- Linear (Page 238)
- Rotary (Page 239)

See also

Technology object external encoder (Page 110)

Mechanics (Page 53)

Linear

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

Load gear

Number of motor revolutions / number of load revolutions

The gear ratio of the measuring gearbox is specified as the ratio between motor revolutions and load revolutions. Specify here an integer number of motor revolutions and the resulting number of load revolutions.

Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Position parameters

Leadscrew pitch

In this configuration field, configure the distance by which the load is moved when the leadscrew makes one revolution.

5.5.3.2 Homing

Configuration - Homing

Configure the parameters for homing the external encoder in the "Homing" configuration window. Homing is performed using the Motion Control instruction "MC_Home" Mode = 2, 8 and 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 155).

Select the homing mode

Select from among the following homing modes:

- Reference cam and zero mark via PROFIdrive telegram (Page 241)
- Use zero mark via PROFIdrive telegram (Page 242)
- Homing mark via digital input (Page 243)

See also

Technology object external encoder (Page 110)

Reference cam and zero mark via PROFIdrive telegram

Homing direction

Select the direction in which the zero mark should be approached for homing. The next zero mark after leaving the reference cam is used.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 155).

Configuration - Homing (Page 240)

Use zero mark via PROFIdrive telegram (Page 242)

Homing mark via digital input (Page 243)

Technology object external encoder (Page 110)

Use zero mark via PROFIdrive telegram

Homing direction

Select the direction in which the next zero mark should be approached for homing. The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.
- **Negative**

  Axis moves in the direction of lower position values.
- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 155).

Configuration - Homing (Page 240)

Reference cam and zero mark via PROFIdrive telegram (Page 241)

Homing mark via digital input (Page 243)

Technology object external encoder (Page 110)

Homing mark via digital input

Digital input homing mark

In this configuration field, select a digital input that is to act as a homing mark (reference cam). Also select the level at which the homing mark is to be detected.

Homing direction

Select the direction in which the homing mark for homing is to be approached.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.
- **Negative**

  Axis moves in the direction of lower position values.
- **Current**

  The currently effective approach direction is used for homing.

Homing mark

Select which switch position of the "digital input" is to be used as the homing mark.

When a "digital input" is crossed, two switching edges that are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated at the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 155).

5.6 Configuring the technology object measuring input

5.6.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the measuring input in this field. The technology object is listed under this name in the project tree. The tags of the measuring input can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the measuring input is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Unit of measure

The indicated unit of measure for the position of the measuring input corresponds to the unit of measure of the higher-level technology object.

See also

Units of measure (Page 32)

Technology object measuring input (Page 111)

5.6.2 Configuration - Hardware interface

Measuring input type

Select the measuring input type.

- Measuring using TM Timer DIDQ
- Measurement via SINAMICS measuring input
- Measurement using PROFIdrive telegram (drive or external encoder)

Measurement using TM Timer DIDQ

Select a measurement input for a measurement using a Timer DI. The selection box shows all channels that are configured correctly.

Measurement via SINAMICS measuring input

Select a measuring input for a measurement via SINAMICS measurement sensing input. The selection box shows all compatible telegram types. You are shown all terminals that can potentially be used as measuring inputs. For the assignment, note that the inputs of must be assigned to the measuring inputs (P680) in the telegram without gaps and in ascending order.

With P728.8 to P728.15, you configure all DI/DOs used as a measurement input on the control unit. Use P680 of the control unit to specify the terminals for the global measuring inputs.

Measurement using PROFIdrive telegram (drive or external encoder)

For a measurement via PROFIdrive telegram, select the number of the measuring input in the telegram in the "Number of the measuring input" drop-down list. The input field is preset with the value "1".

Two communication channels are available for the transmission of measured values in the PROFIdrive telegram. These communication channels are assigned to one measurement input/digital input each in the drive. Use the PROFIdrive parameters to configure the digital input on the drive that is to be used for the configured communication channel.

- Measurement input for the first communication channel

  (<TO>.Parameter.PROFIdriveProbeNumber = 1)

  If you use two encoders, you must select the associated DI in the SINAMICS for each encoder. Various results are the transferred to the technology object depending on the selected encoder. The sensors are configured using the parameters P488[0] and P488[1].

- Measurement input for the second communication channel

  (<TO>.Parameter.PROFIdriveProbeNumber = 2)

  If you use two encoders, you must select the associated DI in the SINAMICS for each encoder. Various results are the transferred to the technology object depending on the selected encoder. The sensors are configured using the parameters P489[0] and P489[1].

Correction time for the measuring signal

Specify a correction time if possible delay times in the measurement signal are to be compensated.

See also

Automatic transfer of drive and encoder parameters in the device (Page 42)

Technology object measuring input (Page 111)

Configuring technology modules for Motion Control (Page 255)

5.6.3 Configuration - Extended parameters

Adjustment for activation time of the measuring range

To adjust the activation time defined on the system side, enter an additional activation time here.

The configuration window also displays the following times calculated on the system side:

- Time after the measuring job request until the measuring event can be recoreded
- Time after the measuring event until the measurement result is displayed (for measuring of one or two edges)

See also

Measuring with measuring range (Page 121)

Time-related boundary conditions (Page 122)

Technology object measuring input (Page 111)

5.7 Configuring the cam technology object

5.7.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the output cam in this field. The technology object is listed under this name in the project tree. The tags of the output cam can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the output cam is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Output cam type

Select based on the desired switching behavior of an output cam type:

- Distance output cam (position-dependent switch-on/switch-off)
- Time-based output cam (position-dependent switch-on and position-independent or time-dependent switch-off)

Output cam reference

Configure in this selection whether the switching points of the output cam are to reference the actual position or the position setpoint.

Unit of measure

The indicated unit of measure for the position of the output cam corresponds to the unit of measure of the higher-level technology object.

When a time-based output cam is selected as the output cam type, the unit of measure for the switch-on duration and other times is also indicated. For output cams, this is always ms.

See also

Units of measure (Page 32)

Technology object output cam (Page 126)

5.7.2 Configuration - Hardware interface

Output cam output

Select whether the generated switching signals are to be output at the digital output.

- **Activate output**

  Select one of the following two output options for the output cam output:

  - **Output by TM Timer DIDQ**

    For output by TM Timer DIDQ, select a previously configured technology module and the channel to be used in the "Output" field.

    If no technology module is available for selection, change to the device configuration and add a technology module.

  - **Output by digital output module**

    For output by a digital output module, select this in the "Cam output" field. Only the digital outputs with previously defined PLC tags are displayed for selection.

  Select the logical operation of the output cam signal at the output. The logic operation relates to the last signal to be output after the set inversion, if any.

  All output cams that use the selected output are shown graphically.

- **Output deactivated**

  When the output is deactivated, the output cam is evaluated only in the software.

See also

Technology object output cam (Page 126)

Configuring technology modules for Motion Control (Page 255)

5.7.3 Extended parameters

5.7.3.1 Configuration - Activation time

The specified output cam type is indicated in the upper area of the "Activation time" configuration window.

Activation time and deactivation time

For a time shift of the switch-on and switch-off times of an output cam, enter an activation time and a deactivation time.

See also

Compensation of actuator switching times (Page 138)

Technology object output cam (Page 126)

5.7.3.2 Configuration - Hysteresis

To prevent unwanted changes in the switching state of the output cam of a cam track, enter a hysteresis value.

When using an output cam with reference to actual position, always enter a hysteresis value (> 0.0).

See also

Hysteresis (Page 136)

Technology object output cam (Page 126)

5.8 Configuring the cam track technology object

5.8.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the cam track in this field. The technology object is listed under this name in the project tree. The tags of the cam track can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the cam track is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Output cam type

Select based on the desired switching behavior of an output cam type for the cam track:

- Distance output cam (position-dependent switch-on/switch-off)
- Time-based output cam (position-dependent switch-on and position-independent or time-dependent switch-off)

Output cam reference

In this selection, configure whether the switching points of the cam track are to reference the actual position or the position setpoint.

Unit of measure

The indicated unit of measure for the position of the cam track corresponds to the unit of measure of the higher-level technology object.

When a time-based output cam is selected as the output cam type, the unit of measure for the switch-on duration and other times is also indicated. For output cams, this is always ms.

See also

Units of measure (Page 32)

Cam track technology object (Page 141)

5.8.2 Configuration - Hardware interface

Output cam track

Select whether the generated switching signals are to be output at the digital output.

- **Activate output**

  Select one of the following two output options for the output track:

  - **Output by TM Timer DIDQ**

    For output by TM Timer DIDQ, select a previously configured technology module and the channel to be used in the "Output" field.

    If no technology module is available for selection, change to the device configuration and add a technology module.

  - **Output by digital output module**

    For output by a digital output module, select this in the "Cam output" field. Only the digital outputs with previously defined PLC tags are displayed for selection.

- **Output deactivated**

  When the output is deactivated, the cam track is evaluated only in the software.

5.8.3 Extended parameters

5.8.3.1 Track data

Configuration - Activation time

The specified output cam type is displayed.

Activation time and deactivation time

Enter the activation time and the deactivation time.

For a time shift of the switch-on and switch-off times of the output cam of a cam track, enter an activation time and a deactivation time.

See also

Time offset of cam switching points (Page 153)

Cam track technology object (Page 141)

Configuration - Hysteresis

To prevent unwanted changes in the switching state of the output cam of a cam track, enter a hysteresis value.

When using an output cam with reference to actual position, always enter a hysteresis value (> 0.0).

See also

Hysteresis (Page 153)

Cam track technology object (Page 141)

Configuration - Track dimensions

Track length

Enter the corresponding track length.

Also take into account the output cam data of the individual output cams when defining the track length. Output cams, the start position of which lies outside the cam track length are not included. They become active only if the cam track length is increased so that at least the respective start position of an output cam is within the new track length.

Axis reference position

Enter the position of an axis or external encoder starting from which the output of the cam track is to occur. The start of the cam track is placed at the entered position.

You can enter a negative or positive value for the reference position.

Modulo length of the axis

When an axis with modulo function is used, the modulo length of the axis is displayed.

See also

Cam track technology object (Page 141)

5.8.3.2 Configuration - Output cam data

The specified output cam type is displayed.

Enter the properties for the output cams of the cam track that are to be output. You can set up to 32 individual output cams on a cam track.

Also take into account any previously defined track length when defining the output cam data. Output cams, the start position of which lies outside the cam track length are not included. They become active only if the cam track length is increased so that at least the respective start position of an output cam is within the new track length.

The input options described below are displayed in the Output cam data configuration window according to the configured output cam type.

- **Valid**

  Only output cams set as "valid" are output and have a status display.

- **Start position**
  - The start position may not be greater than the end position for distance output cams.
  - If the start position is equal to the end position, the distance output cam does not switch.
  - The switching ranges of individual output cams are permitted to overlap.

- **End position**
  - The "End position" column is only displayed when distance output cam is set for the output cam type.
  - The end position must not be less than the start position.

- **Switch-on duration**

  The "Switch-on duration" column is only displayed when time-based output cam is set for the cam type.

5.9 Configuring technology modules for Motion Control

5.9.1 Overview

Use of technology modules with Motion Control

You can use technology modules as well as compact CPUs with Motion Control. To use the technology functions for Motion Control, the parameters of the device configuration of the technology module or the compact CPU and the parameters of the configuration of the technology object must be configured accordingly. Which parameters are relevant for the function is described below. You can set additional parameters that are not listed here. The description of the parameters is found in the documentation of the respective technology module.

The following technology modules support Motion Control functionalities:

S7-1500/ET 200MP	ET 200 SP
TM Count 2x24V (Page 256)	TM Count 1x24V (Page 256)
TM PosInput 2 (Page 258)	TM PosInput 1 (Page 258)
TM Timer DIDQ 16x24V (Page 260) *	TM Timer DIDQ 10x24V (Page 260) *
–	TM Pulse 2x24V (Page 261)
TM PTO 4 (Page 262)	–
CPU 1511C-1 PN / CPU 1512C-1 PN (Page 264)	–

* ET 200MP and ET 200SP: Isochronous mode required

Isochronous mode

Technology modules can be used centrally or distributed in the system. However, isochronous mode is supported only in distributed operation with suitable PROFINET interface modules.

5.9.2 TM Count 1x24V / TM Count 2x24V

For use with Motion Control, the following parameters must be configured:

Configuration		
Technology module	**Technology object**	
TM Count 1x24V / TM Count 2x24V	**Axis**	**External encoder**
TM Count 1x24V / TM Count 2x24V > Channel 0/1 > Operating mode	–	–
Select "Position detection for Motion Control technology object" mode		
TM Count 1x24V / TM Count 2x24V > Channel 0/1 > Module parameters	**Hardware interface > Encoder**	**Hardware interface > Encoder**
–	Select "Encoder" data connection and the channel configured for Motion Control on the technology module as encoder	Select "Encoder" data connection and the channel configured for Motion Control on the technology module as encoder
Signal type • Incremental encoder	Select encoder type corresponding to configuration for technology module • Incremental	Select encoder type corresponding to configuration for technology module • Incremental
–	**Hardware interface > Data exchange with encoder**	**Hardware interface > Data exchange**
	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"	Disable "Automatic transfer of encoder parameter values"
	Select rotary or linear measuring system type	Select rotary or linear measuring system type
Signal evaluation • Single • Double • Quadruple	Select fine resolution corresponding to configuration for technology module • 0 = Single • 1 = Double • 2 = Quadruple	Select fine resolution corresponding to configuration for technology module • 0 = Single • 1 = Double • 2 = Quadruple
• Rotary type: Enter increments per revolution • Linear type: Configuration not relevant	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments

Configuration		
Technology module **TM Count 1x24V / TM Count 2x24V**	**Technology object**	
	Axis	**External encoder**
–	**Hardware interface > Data exchange with the drive**	–
• Rotary type: Enter reference speed corresponding to configuration for technology object (1:1) • Linear type: Configuration not relevant	Enter reference speed

Select the homing signal for homing mark 0: • Signal N of the incremental encoder • DI0	Use the homing mode "Use zero mark via PROFIdrive telegram".	Use the homing mode "Use zero mark via PROFIdrive telegram".
TM Count 2x24V > I/O addresses	–	–
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the channel in the encoder configuration at the technology object.		
Process image: PIP OB servo		

5.9.3 TM PosInput 1 / TM PosInput 2

For use with Motion Control, the following parameters must be configured:

Configuration		
Technology module	**Technology object**	
TM PosInput 1 / TM PosInput 2	**Axis**	**External encoder**
TM PosInput 1/2 > Channel 0/1 > Operating mode	–	–
Select "Position detection for Motion Control technology object" mode		
TM PosInput 1/2 > Channel 0/1 > Module parameters You set the parameters for the encoder signals of the channel under "Module parameters" in the "Position input for Motion Control" mode. The parameters must be set depending on the encoder used. The configuration of the encoder is required for use with an SSI absolute encoder. Information on the configuration is available in the documentation for the respective technology module.	**Hardware interface > Encoder**	**Hardware interface > Encoder**
–	Select "Encoder" data connection and the channel activated and configured as encoder on the technology module	Select "Encoder" data connection and the channel activated and configured as encoder on the technology module
Signal type • Incremental encoder • Absolute encoder	Select encoder type corresponding to configuration for technology module • Incremental • Absolute / cyclic absolute	Select encoder type corresponding to configuration for technology module • Incremental • Absolute / cyclic absolute
–	**Hardware interface > Data exchange with encoder**	**Hardware interface > Data exchange**
	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"	Disable "Automatic transfer of encoder parameter values"
	Select rotary or linear measuring system type	Select rotary or linear measuring system type

"–" No configuration for technology module/technology object is required for these parameters

5.9.4 TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V

You can operate the TM Timer DIDQ technology module centrally on an S7-1500 CPU or decentrally on a distributed I/O. For use with a measuring input, output cam or cam track, the technology module must be used decentrally and with isochronous mode.

For use with Motion Control, the following parameters must be configured:

Use with output cam / cam track technology object

Configuration	
Technology module	**Technology object**
TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V	**Output cam / Cam track**
Basic parameters	–
Select desired number of outputs under channel configuration (ET 200MP TM Timer DIDQ 16x24V only)	
Channel parameters	**Hardware interface > Output cam output / Output cam track**
–	Activate output
	Select output by TM Timer DIDQ
Select "Timer DQ" mode for the respective output	Select output cam output
I/O addresses	–
Select "Isochronous mode"	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are updated automatically for the input and output addresses by selecting the channel in the encoder configuration at the technology object.	

"–" No configuration for technology module/technology object is required for these parameters

Use with technology object measuring input

Configuration	
Technology module	**Technology object**
TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V	**Measuring input**
Basic parameters	–
Select desired number of inputs under channel configuration	
Channel parameters	**Hardware interface > Measuring input**
Configuration of DI group: Use inputs individually	–
Select "Timer DI" mode for the respective input	Select measuring using TM Timer DIDQ
–	Select measuring input
Select application-dependent input delay	–
I/O addresses	
Select "Isochronous mode"	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are updated automatically for the input and output addresses by selecting the channel in the input configuration at the technology object.	

"–" No configuration for technology module/technology object is required for these parameters

5.9.5 TM Pulse 2x24V

For use with Motion Control, the parameters described below must each be configured:

Drive connection using PWM (pulse width modulation)

Configuration	
TM Pulse 2x24V	**Technology object**
	Axis
TM Pulse 2x24V > Channel configuration	–
Select if you want to use 1 or 2 channels.	
TM Pulse 2x24V > Channel > Operating mode	
Select "Pulse width modulation PWM" or "PWM with DC motor" operating mode	
TM Pulse 2x24V > Channel > Parameters	**Hardware interface > Drive**
Select "S7 analog output" output format	Select analog drive connection For the selection of the analog output, create a PLC tag of the "Int" type with corresponding address. The offset for the PLC tag to the start address is 2. To activate the output of the PWM signal, set the following two bits of the control interface of the PWM channel in the user program: • SW_ENABLE (= Bit 0 in Byte 9) • TM_CTRL_DQ (= Bit 1 in Byte 9) The offset for byte 9 to the start address of the PWM channel is 9.
TM Pulse 2x24V > Channel > I/O addresses	–
Select the organization block "MC-Servo" for the input and output addresses. The "TPA OB Servo" process image is selected automatically for the input and output addresses by selecting the organization block.	

"–" No configuration for technology object is required for these parameters

5.9.6 TM PTO 4

For use with Motion Control, the following parameters must be configured.

Configuration	
Technology module **TM PTO 4**	**Technology object** **Axis**
TM PTO 4 > Channel configuration	–
Configure the number of channels (1 to 4) you want to use.	
TM PTO 4 > Channel 0…3 > Operating mode	
Select signal type: • PTO (pulse (P) and direction (D)) • PTO (count up (A) and count down (B)) • PTO (A, B phase-shifted) • PTO (A, B phase-shifted - quadruple)	
Select signal interface: • RS422, symmetrical / TTL (5V), asymmetrical • 24V asymmetric	
Configure the interpulse pause for direction reversal.	
–	**Hardware interface > Drive**
	Select drive type "PROFIdrive" and "Drive" data connection. Select the pulse output configured at the technology module as drive.
	Hardware interface > Encoder
	The encoder of the actuator telegram (simulated encoder) is automatically selected. Alternatively, an existing encoder interface can be selected.
TM PTO 4 > Channel 0...3 > Diagnostic interrupts	-
When the "Enable diagnostic interrupts" check box is selected, diagnostic interrupts are activated if: • No supply voltage • Errors occur at digital outputs The detected error is displayed for the respective channel with feedback bit Fault_Present and Sensor_Error.	
TM PTO 4 > Channel 0…3 > Axis parameters	**Data exchange with the drive**
–	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the drive.
	Deselect "Automatic transfer of drive parameter values"
Enter reference speed corresponding to configuration for technology object (1:1)	Enter reference speed of the drive
Enter maximum speed corresponding to configuration for technology object (1:1)	Enter maximum speed of the drive. If the maximum speed is exceeded, technology alarm 102 is triggered and displayed.

Configuration	
Technology module TM PTO 4	**Technology object** **Axis**
–	**Data exchange with encoder**
	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"
	Select rotary measuring system type.
Enter increments per revolution	Enter increments per revolution corresponding to configuration at technology module (1:1)
Configure fine resolution • 0 = Single • 2 = Quadruple	Configure fine resolution corresponding to configuration for technology module. • 0 = Single • 2 = Quadruple
Configure stop behavior • Quick stop time • Ramp stop time	-
TM PTO 4 > Channel 0…3 > Hardware inputs/outputs	–
If you want to use a hardware output to enable the drive, select the "Use drive enable" check box. Next select one of the two hardware outputs DQ0 or DIQ2.	No setting required at the technology object. The output is automatically controlled by the MC_Power.
	Homing
Activate the hardware input (DI0) for the reference cam.	Use the homing mode "Use zero mark via PROFIdrive telegram".
Select the edge of the hardware input for triggering the reference cam function.	
When using a measuring input, select the "Use DI1 check box as measuring input".	**"Measuring input > Configuration > Hardware interface" technology object**
	Select the measuring input type "Measurement using PROFIdrive telegram (drive or external encoder)". Select the measuring input "1" under hardware connection.
Select the "Use "drive ready"" check box. In the ""Drive ready" input", select the hardware input that is to be used to display whether the drive is ready.	No setting required at the technology object. When the input is used, MC_Power waits until the input signal is present before it sets the drive enable.
Configuring input delay	–
TM PTO 4 > Channel 0…3 > Sign-of-life error	
Configure tolerated number of sign-of-life errors	
TM PTO 4 > I/O addresses	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the PTO channel for the technology object.	

"–" No configuration required for these parameters at the technology module/technology object

5.9.7 CPU 1511C-1 PN / CPU 1512C-1 PN

For use with Motion Control, the parameters described below must be configured.

Drive connection via PTO (Pulse Train Output)

Configuration	
CPU 1511C-1 PN / CPU 1512C-1 PN	**Technology object** **Axis**
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > General	–
To activate a channel for PTO mode, select one of the following operating modes: • PTO (pulse (A) and direction (B)) • PTO (count up (A), count down (B)) • PTO (A,B phase shifted) • PTO (A,B phase shifted, quadruple)	
–	**Hardware interface > Drive**
	Select drive type "PROFIdrive" and "Drive" data connection. Select the pulse generator of the CPU configured for PTO mode as drive.
	Hardware interface > Encoder
	The encoder of the actuator telegram (simulated encoder) is automatically selected. Alternatively, an existing encoder interface can be selected.
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Axis parameters	**Hardware interface > Data exchange with the drive**
–	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the drive.
	Deselect "Automatic transfer of drive parameter values"
Enter reference speed corresponding to configuration for technology object (1:1)	Enter reference speed of the drive
Enter reference speed corresponding to configuration for technology object (1:1)	Enter maximum speed of the drive. If the maximum speed is exceeded, technology alarm 102 is triggered and displayed.
–	**Hardware interface > Data exchange with encoder**
	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"
	Select rotary measuring system type.
Enter increments per revolution	Enter increments per revolution corresponding to configuration for CPU (1:1)
The fine resolution has the fixed value "0 bit" (= single) and cannot be changed.	Enter the fine resolution corresponding to the configuration for CPU Bits in incr. actual value (G1_XIST1): 0 (= single)

Configuration	
CPU 1511C-1 PN / CPU 1512C-1 PN	**Technology object** **Axis**
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Hardware inputs/outputs	**Homing**
Select the hardware input for the reference switch In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Use the homing mode "Use zero mark via PROFIdrive telegram" for drive connection via PTO.
Select the edge of the hardware input for triggering the reference cam function.	
When using a measuring input, select the hardware input of the measuring input. The following table includes the configuration description.	–
Select the hardware input that is used to display whether the drive is ready. In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	
With selected "PTO (PTO (pulse (A) and direction (B))" mode, the hardware output for the PTO signal A ("Pulse output (A)") is automatically selected through the device configuration and cannot be changed. For PTO signal B ("Direction output (B)") select one of the hardware outputs offered in the selection box. The hardware outputs for the PTO signals are selected through the device configuration for the following operating modes and cannot be changed: • PTO (count up (A), count down (B)) • PTO (A,B phase shifted) • PTO (A,B phase shifted, quadruple)	
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > I/O addresses	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the PTO channel for the technology object.	

"–" No configuration for CPU/technology object is required for these parameters

Additional configuration for use with the technology object measuring input

Select the homing signal for homing mark 0: • Signal N of the incremental encoder • DI0 (can be set with the hardware inputs/outputs) In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Use the homing mode "Use zero mark via PROFIdrive telegram".	Use the homing mode "Use zero mark via PROFIdrive telegram".
High-speed counter (HSC) > HSC 1…6 > I/O addresses	–	–
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the HSC channel for the technology object.		

"–" No configuration for CPU/technology object is required for these parameters

Additional configuration for use with the technology object measuring input

Configuration	
Technology module CPU 1511C-1 PN / CPU 1512C-1 PN	Technology object Measuring input
High-speed counter (HSC) > HSC 1…6 > Hardware inputs/outputs	**Hardware interface > Measuring input**
Select the hardware input of the measuring input. In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Measuring using PROFIdrive telegram (drive or external encoder)
	In the "Number of the measuring input" selection box, select "1" (measuring input 1).

5.10 Connect drive/encoder via data block

Creating the data block for data connection

1. Create a new data block of type "Global DB".
2. Select the data block in the project tree and select "Properties" from the shortcut menu.
3. Disable the following attributes under Attributes and accept the change with "OK":
   - "Only store in load memory"
   - "Data block write-protected in the device"
   - "Optimized block access" for technology version < V4.0
4. Open the data block in the block editor.
5. Insert a tag structure of type "PD_TELx" textually in the block editor.

This tag structure contains the "Input" tag structure for the input area of the telegram and the "Output" tag structure for the output area of the telegram.

Note

"Input" and "Output" relate to the view of the closed loop position control. For example, the input area contains the actual values of the drive and the output area contains the setpoints for the drive.

The data block may contain the data structures of multiple axes and encoders and other contents.

Configuring data connection via a data block

1. Open the configuration window "Hardware interface > Drive" or "Hardware interface > Encoder".
2. In the Data block drop-down list, select "Data block".
3. In the "Data block" field, select the previously created data block.
   Open this data block and select the tag name defined for the drive and encoder.

Programming MC-PreServo and MC-PostServo

1. Assign the previously defined PLC tag of the input range of the data block to MC-PreServo .
2. Assign the previously defined PLC tag of the output range of the data block to MC-PostServo.

NOTICE
Machine damage Improper manipulation of drive and encoder telegrams may result in unwanted drive motions. Check your user program for consistency in the drive and encoder connection.

An application example for the use of MC-PreServo and MC-PostServo is available at:

https://support.industry.siemens.com/cs/document/109741575 (https://support.industry.siemens.com/cs/document/109741575)

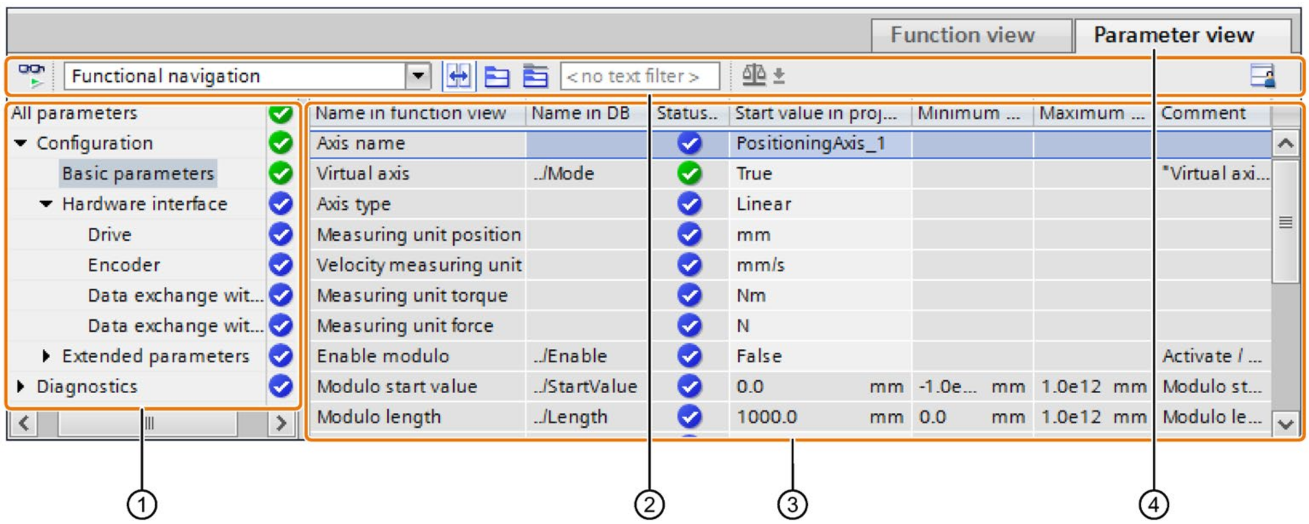
5.11 Parameter view

5.11.1 Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.



① Navigation (Page 273)
② Toolbar (Page 272)
③ Parameter table (Page 273)
④ "Parameter view" tab

Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies
- Display of all memory values of a parameter: Start value PLC, Start value in project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

5.11.2 Structure of the parameter view

5.11.2.1 Toolbar

The following functions can be selected in the toolbar of the parameter view.

Symbol	Function	Explanation
	Monitor all	Starts monitoring of the visible tags in the active table.
Functional navigation	Select navigation structure	Toggle between function-based navigation and the view of the data structure of the technology data block.
	Couples the function view and parameter view for the objects selected in the navigation	Enables the targeted toggling between the parameter view and function-based view.
	Collapse/expand all nodes and objects	Collapses or expands all nodes and objects of the navigation or the data structure in the currently active view.
	Collapse/expand the nodes below the marked nodes	Collapses or expands the marked nodes and objects of the navigation or the data structure in the currently active view.
< no text filter >	Text filter...	After entry of a character string: Display of all parameters containing the entered string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value in project, Start value PLC) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g. selected navigation structure, activated table columns, etc.)

5.11.2.2 Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation		In the functional navigation, the structure of the parameters is based on the structure in the configuration window ("Function view" tab), commissioning window and diagnostics window.
Data structure		In the "Data structure" navigation, the structure of the parameters is based on the structure of the technology data block.

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

5.11.2.3 Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in function view	Name of the parameter in the function view. The display field is empty for parameters that are not configured via the technology object.	X	X
Name in DB	Name of the parameter in the technology data block. If the parameter is part of a structure or UDT, the prefix "../" is added. The display field is empty for parameters that are not contained in the technology data block.	X	X
Full name in DB	Complete path of the parameter in the instance DB. The display field is empty for parameters that are not contained in the technology data block.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols.	X	
Compare result	Result of the "Compare values" function. This column is displayed when there is an online connection.		X

Column	Explanation	Offline	Online
Start value in project	Configured start value in project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Start value PLC	Start value in the CPU. This column is displayed when there is an online connection.		X
Monitor value	Current value in the CPU. This column is displayed when there is an online connection.		X
Modify value	Value that is to be used to change the monitor value. This column is displayed when there is an online connection.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: • Offline: by the start value in the project. • Online: by the monitor values.	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: • Offline: by the start value in the project. • Online: by the monitor values.	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

5.11.3 Opening the parameter view

Requirement

The technology object was added in the project navigator.

Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

5.11.4 Working with the parameter view

5.11.4.1 Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 276)	X	X
Sorting the parameter table (Page 277)	X	X
Transferring parameter data to other editors (Page 277)	X	X
Indicating errors (Page 278)	X	X
Editing start values in the project (Page 278)	X	X
Monitoring values online in the parameter view (Page 280)		X
Modifying values (Page 281)		X
Comparing values (Page 282)		X

5.11.4.2 Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

With the text filter

You can filter according to texts that are visible in the parameter table. This means that it can only be filtered by text in displayed parameter lines and displayed columns.

1. Enter the desired character string for filtering in the “Text filter...” input box.

   The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".

   The parameter table only shows the static parameters. You can select further subgroups for some groups of the navigation.
2. Click “All parameters” in the navigation if all parameters are to be shown again.

5.11.4.3 Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

Sort column-by-column

1. Position the cursor in the header cell of the desired column.

   The background of this cell turns blue.
2. Click the column header.

Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol "▲": Parameter table is sorted in ascending order.
- Symbol "▼": Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The "../" prefix in the "Name in DB" column is ignored when sorting.

5.11.4.4 Transferring parameter data to other editors

You can paste parameters of the parameter view in the following editors:

- Program editor
- Watch table
- Signal table for Trace

The following options are available for pasting:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

5.11.4.5 Indicating errors

Error display

Parameter assignment errors that result in compilation errors (e.g. limit violation) are indicated in the Parameter view.

Every time a value is entered in the Parameter view, a check is made for process-related and syntax errors and displayed with the following indicators:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns
- Table field with red background

  If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration window.

5.11.4.6 Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the "Start value in project" column of the parameter table.
- In the "Status of configuration" column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration window of the technology object.

Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value in project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter.
   The limits of the value range can be seen in the "Maximum value" and "Minimum value" columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive ("Retain" column).

Error display

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the "Start value in project" field
  If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Correcting bad start values

1. Correct bad start values using information from the roll-out error message.

   Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

5.11.4.7 Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

As soon as the Parameter view is online, the following columns are additionally displayed:

- Compare result
- Start value PLC
- Monitor value
- Modify value
- Selection for transmission

The "Monitor value" column shows the current parameter values on the CPU.

Display

All columns that are only available online have an orange background:

- Values in light-orange cells can be changed.
- Values in cells with a dark orange background cannot be changed.

See also

Parameter table (Page 273)

5.11.4.8 Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

DANGER

Danger when modifying:

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you use the "Modify" function.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

Procedure

To modify parameters immediately, follow these steps:

- Enter the desired modify values in the “Modify values” column of the parameter table.

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Monitor values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

Error display

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field

and

- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

5.11.4.9 Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value in project
- Start value PLC

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon .

   A selection list containing the comparison options opens:

   – Start value in project - Start value PLC (default setting)
2. Select the desired comparison option.

   The selected comparison option is executed as follows:

   – A scales symbol appears in the header cells of the two columns selected for comparison.

   – Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two compare values is not available (e.g., snapshot).

Symbol in the navigation

The symbols are shown in the same way in the navigation if the compare result applies to at least one of the parameters below the displayed navigation structure.

6 Programming

6.1 Introduction

The "Programming" section contains general information on supplying and evaluating the Motion Control instructions and on technology data blocks.

You can find an overview of the Motion Control instructions in the Functions (Page 27) section.

You can use Motion Control instructions in the user program to assign jobs to the technology object. You define the job using the input parameters of the Motion Control instructions. The current job status is indicated in the output parameters.

The technology data block is available to you as an additional interface to the technology object.

6.2 Technology data block

6.2.1 Introduction

The properties of real objects (e.g. drives) are configured by means of the technology objects and saved in a technology data block. The technology data block contains all configuration data, setpoint and actual values, and status information of the technology object. The TIA Portal automatically creates the technology data block when the technology object is created. You access the data of the technology data block (read/write access) with your user program.

A listing and description of the tags can be found in the Appendix (Page 431).

6.2.2 Evaluating the technology data block

Access to data in the technology data block occurs in accordance with the access to standard data blocks. Only tags with elementary data types can be accessed in the technology data block. It is not possible to access tags with composite data types (such as STRUCT, ARRAY).

Reading values from the technology data block

In your user program you can read actual values (e.g. current position) and status information, or detect error messages in the technology object. When you program a query in your user program (e.g. current velocity), the value is directly read from the technology object.

Reading values from the technology data block takes longer than for other data blocks. If you use these tags several times in a single cycle of your user program, it is recommended to copy the tag values to local tags, and use the local tags in your program.

Writing values to the technology data block

The configuration of the technology object in the TIA Portal is used to write the corresponding data to the technology data block. After they have been loaded into the CPU, these data are stored in the CPU on the SIMATIC Memory Card (load memory).

In the following cases, it may be necessary for the user program to write values to the technology data block:

- Adaptation of the configuration of the technology object (e.g. dynamic limits, software limit switches)
- Use of overrides
- Adaptation of position control (e.g. "Kv" parameter)

Changes to values in the technology data block by the user program can take effect at various points in time. The relevant property of the individual tags can be found in their descriptions in the Appendix (Page 431):

<table>
<tr><th>Effectiveness of changes</th><th colspan="2">Description</th></tr>
<tr><td rowspan="3">Direct (DIR)</td><td colspan="2">You write changes using direct assignments. The changes are applied only at the start of the next MC-Servo [OB91].
The changes are retained until the next POWER OFF of the CPU or restart of the technology object.</td></tr>
<tr><td>LREAL
(e.g. <TO>.Override.Velocity)</td><td>The technology object performs a range check on the written value, and immediately starts using the new value.
If range limits are violated when writing, the technology object automatically corrects the values. If the value is below the range, then the value is set to the low limit of the range; if the range is exceeded, then the value is set to the high limit of the range.</td></tr>
<tr><td>DINT/BOOL
(e.g. <TO>.PositionLimits_SW.Active)</td><td>Changes are only permitted in the defined value range. Value changes outside the value range are not applied.
If you enter invalid values, the programming error OB (OB 121) is started.</td></tr>
<tr><td>When Motion Control instruction is called (CAL)
(e.g. <TO>.Sensor[n].ActiveHoming.HomePositionOffset)</td><td colspan="2">You write changes using direct assignments. The changes are applied at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
The changes are retained until the next POWER OFF of the CPU or restart of the technology object.</td></tr>
<tr><td>Restart (RES)
(e.g. <TO>.Homing.AutoReversal)</td><td colspan="2">Since restart-relevant tags have dependencies on other tags, value changes cannot be applied at any arbitrary time. The changes are only used after reinitialization (restart) of the technology object.
During a restart the technology object is reinitialized with the data in load memory. You therefore write changes to the start value in the load memory with the extended instruction "WRIT_DBL" (write to data block in load memory).
You trigger the restart in your user program using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE. Additional information regarding the restart can be found in the Restarting technology objects (Page 314) section.</td></tr>
<tr><td>Read only (RON)
(e.g. <TO>.Position)</td><td colspan="2">The tag cannot and must not be changed during runtime of the user program.</td></tr>
</table>

Note

Save changes with "WRIT_DBL"

Changes to tags immediately in effect are lost on POWER OFF of the CPU, or restart of the technology object.

If changes in the technology data block should also be retained after POWER OFF of the CPU, or restart of the technology object, you must write the changes to the start value in the load memory with the extended instruction "WRIT_DBL".

Note

Using the "READ_DBL" and "WRIT_DBL" data block functions

The "READ_DBL" and "WRIT_DBL" data block functions may only be used on individual tags in conjunction with the tags of the technology object. The "READ_DBL" and "WRIT_DBL" data block functions must not be applied to data structures of the technology object.

Isochronous evaluation of data

If you want to process data of the technology data block in isochronous mode from a Motion Control application cycle, there is the option of evaluating this data in the MC-PreServo [OB67]/MC-PostServo [OB95] as of technology version V3.0.

See also

Organization Blocks for Motion Control (Page 95)

6.2.3 Evaluate StatusWord, ErrorWord and WarningWord

To be able to symbolically use individual status and error information from the "StatusWord", "ErrorWord" and "WarningWord" data double words, you can evaluate them as described below. For consistent evaluation, you should avoid using bit addressing to access these data double words in the technology data block. Access to an individual bit in the technology data block only lasts as long as the access to the entire data word.

When required, copy the required data double word to a tag of a data structure and query the individual bits of the tag.

The allocation of the individual bits in the data double words can be found in the Appendix (Page 431) in the description of the tags of the corresponding technology object.

Requirements

The technology object has been created.

Procedure

To evaluate the individual bits in the data word "StatusWord", follow these steps:

1. Crate a global data structure. Name the data structure, e.g. as "Status".
2. Create a double word (DWORD) in the data structure "Status". Name the double word, e.g. as "Temp".
3. Create 32 Boolean tags in the "Status" data structure. You can obtain a clearer overview by giving the individual Boolean tags identical names as the bits in the technology DB (e.g. name the fifth Boolean tag "HomingDone").
4. Copy the tag <TO>.StatusWord as needed from the technology data block to the double word "Temp" in your data structure.
5. Copy the individual bits of double word "Temp" to the corresponding Boolean tags with bit accesses.
6. Use the Boolean tags to query the status bits.

Evaluate the data words "ErrorWord" and "WarningWord" as specified in steps 1 to 6.

Example

The following example shows how you can read out and save the fifth bit "HomingDone" of the data word "StatusWord":

SCL	Explanation
`#Status.Temp := "TO".StatusWord;`	`//Copy status word`
`#Status.HomingDone := #Status.Temp.%X5;`	`//Copy individual bits per bit access`

STL	Explanation
`L "TO".StatusWord`	`//Copy status word`
`T #Status.Temp`	
`U #Status.Temp.%X5`	`//Copy individual bits per bit access`
`= #Status.HomingDone`	

6.2.4 Change restart-relevant data

In order to change restart-relevant data in the technology data block, write to the starting values of the tags in load memory using the extended instruction "WRIT_DBL". In order for the changes to be applied, a restart of the technology object must be performed.

Whether changes to the value of a tag are relevant for the restart can be found in the description of the tags in the Appendix (Page 445).

Requirement

The technology object has been created.

Procedure

To change restart-relevant data, proceed as follows:

1. Create a data block and fill it with the restart-relevant values, that you want to change in the technology data block. In doing so, the data types must match the tags to be changed.
2. Write the values from your data block to the starting values of the tags of the technology data block in load memory, using the extended instruction "WRIT_DBL".

   If restart-relevant data were changed, this will be indicated in the <TO>.StatusWord.X3 (OnlineStartValuesChanged) tag of the technology object.
3. Perform a restart of the technology object using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE.

After the restart of the technology object, the new value is transferred into the technology data block in work memory, and is effective.

6.3 Motion Control instructions

6.3.1 Motion Control instruction parameters

Description

The individual Motion Control instructions are described in detail in the section MC_Power V4 (Page 361).

When creating your user program, take the following explanations of the Motion Control instruction parameters into account.

Reference to the technology object

The technology object is specified for the Motion Control instruction as follows:

- **Parameter "Axis"**

  The "Axis" input parameter of a Motion Control instruction contains a reference to the technology object that is to execute the corresponding job.

  The corresponding technology object is also referenced in the following parameters:

  – Parameter "Master"

  – Parameter "Slave"

  – Parameter "Cam"

  – Parameter "MeasuringInput"

  – Parameter "OutputCam"

  – Parameter "CamTrack"

  As of technology version V3.0, the reference to the technology object can also be specified with the data type DB_ANY.

Job start and transfer of input parameters of a Motion Control instruction

For the start of jobs and the transfer of modified parameter values, a distinction is made between the following Motion Control instructions:

- **Motion Control instructions with "Execute" parameter**

  With a positive edge at the "Execute" parameter, the job is started and the existing values for the input parameters are transferred.

  Subsequently changed parameter values are not transferred until the next job start.

  Resetting the "Execute" parameter does not end the job, but it does affect the display duration of the job status. As long as "Execute" is set to TRUE, the output parameters will be updated. If "Execute" is reset before the completion of a job, the parameters "Done", "Error" and "CommandAborted" are correspondingly set for only one call cycle.

- **Motion Control instructions with "Enable" parameter**

  The job is started by setting the "Enable" parameter.

  As long as "Enable" = TRUE, the job remains active and changed parameter values will be transferred each time the instruction is called in the user program.

  The job is ended by resetting the "Enable" parameter.

  The input parameters "JogForward" and "JogBackward" of the Motion Control instruction "MC_MoveJog" correspond in their behavior to the "Enable" parameter.

Job status

The following output parameters indicate the status of the job execution:

- **Motion Control instructions with "Done" parameter**

  The normal completion of a job is indicated with parameter "Done" = TRUE.

- **Motion Control instructions without "Done" parameter**

  The achievement of the job objective is indicated by other parameters (e.g. "Status", "InVelocity"). For more information, refer to the section Tracking running jobs (Page 302).

- **Parameter "Busy"**

  As long as a job is being processed, the "Busy" parameter shows the value TRUE. If a job was ended or aborted, "Busy" shows the value FALSE.

- **Parameter "CommandAborted"**

  If a job was aborted by another job, the CommandAborted parameter shows the value "TRUE".

- **Parameter "Error"**

  If a Motion Control instruction error occurs, the "Error" parameter shows the value TRUE. The ErrorID parameter indicates the cause of the error.

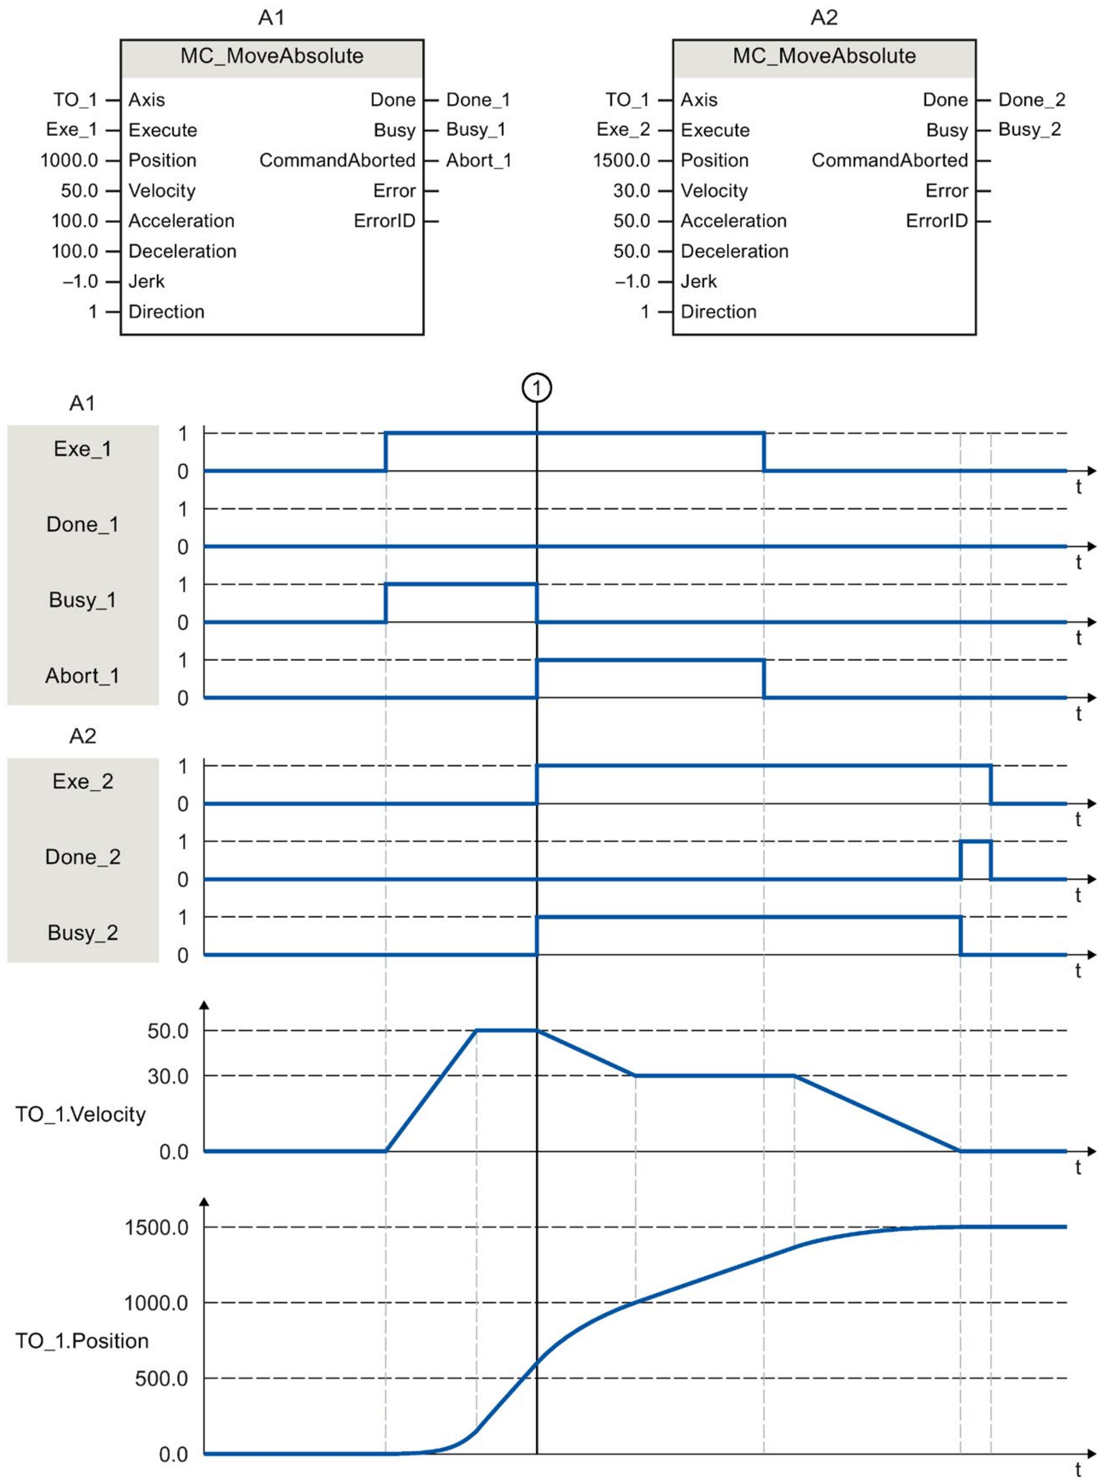
As long as the "Execute" or "Enable" parameter is set to TRUE, the output parameters will be updated. Otherwise the parameters "Done", "Error" and CommandAborted" are correspondingly set for only one cycle.

Abort of running jobs

An active Motion Control job is aborted by the start of a new Motion Control job. In the process, the current dynamic setpoints (acceleration, deceleration, jerk, velocity) are set to the values of the overriding job.

Example of parameter behavior

The behavior of the parameters of Motion Control instructions is shown in the following chart using the example of two "MC_MoveAbsolute" jobs.



Using "Exe_1", an "MC_MoveAbsolute" job (A1) with target position 1000.0 is initiated. "Busy_1" is set to TRUE. The axis is accelerated to the specified velocity and moved to the target position (see TO_1.Velocity and TO_1.Position). Before the target position is reached, the job is overridden at time ① by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1", and "Busy_1" is set to FALSE. The axis is braked to the velocity specified in A2 and moved to the new target position 1500.0. When the axis reaches the target position, this is signaled via "Done_2".

Non position-controlled operation

The position control of the axis can be deactivated with the following parameters:

- MC_Power.StartMode = 0
- MC_MoveVelocity.PositionControlled = FALSE
- MC_MoveJog.PositionControlled = FALSE

For more information, refer to the section " Non position-controlled operation (Page 298).

See also

Instructions (Page 361)

6.3.2 Add Motion Control instructions

You add Motion Control instructions to a program block in the same way as other instructions. You control all available functions of the technology object using the Motion Control instructions.

Requirements

The technology object was created.

Procedure

To add Motion Control instructions in your user program, proceed as follows:

1. Double click your program block in the project tree (the program block must be called in the cyclical program).

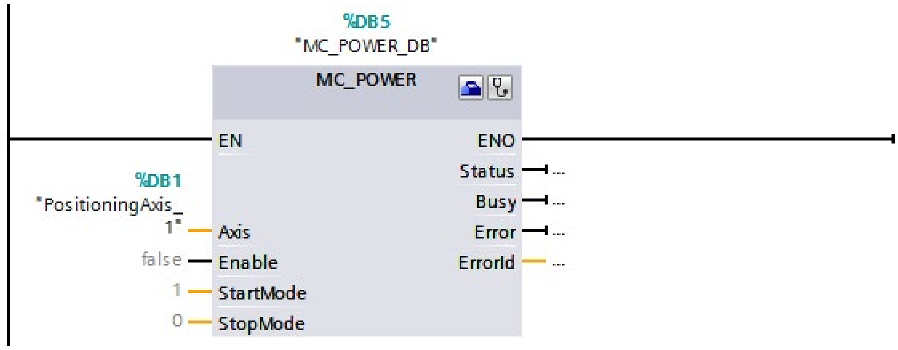
   The program block is opened in the programming editor, and the available instructions are displayed.
2. In the "Instructions" task card, open the "Technology > Motion Control" folder.
3. Using drag-and-drop, move the Motion Control instruction, e.g. "MC_Power", to the desired segment of the program block.

   The "Call options" dialog opens.
4. In the dialog, specify a name and a number for the instance data block of the Motion Control instruction.
5. Click "OK".

   The Motion Control instruction "MC_Power" is inserted into the network.

   
   The instance data block is automatically created under "Program Blocks > System Blocks > Program Resources".

6. Input parameters without a default value (e.g. "Axis"), must be assigned. Select the technology object in the project tree and move it onto <...> in the "Axis" parameter using drag-and-drop.



Once the technology object is specified in the "Axis" parameter, the following buttons are available to you:

	To open the configuration of the technology object, click on the toolbox icon.
	To open the diagnostics of the technology object, click on the stethoscope icon.

7. Add additional Motion Control instructions in accordance with steps 3 through 6.

See also

Tracking active jobs (Page 302)

Tags of the positioning axis/synchronous axis technology object (Page 445)

6.3.3 Parameter transfer for function blocks

If you want to reuse a function block with Motion Control instructions for different technology objects, create an input parameter of the data type of the respective technology object in the block interface of the calling function block. You assign the data type in the block interface with a direct input. The parameter is then transferred as reference to the technology object to the "Axis" parameter of the Motion Control instructions. The data types of technology objects correspond to the structure of the associated technology data block.

By specifying the data type, you can address the tags of the technology object in the function block (<parameters of the block interface>.<tag of the technology object>).

The data types for the reference to the technology objects are available in the appendix (Page 555).

Example 1

The following table shows the declaration of the tags used:

Tag	Declaration	Data type	Description
axis	Input	TO_PositioningAxis	Reference to the technology object
on	Input	BOOL	Signal to enable the axis
actPosition	Output	LReal	Query of the actual position from the technology data block
instMC_POWER	Static	MC_POWER	Multiinctance of the Motion Control instruction MC_Power

The following SCL program shows how to implement this task:

SCL	Explanation
`#instMC_POWER(Axis := #axis, Enable := #on);`	`//Call of the Motion Control instruction MC_Power with enable of the axis`
`#actPosition := #axis.ActualPosition;`	`//Query of the actual position from the technology data block`

Example 2

The data type "DB_Any" provides a further option for the transfer of specific data types of the technology object. Unlike the data types of the technology object in the program, "DB_Any" can be assigned during runtime.

This example shows how you can program variable switching of up to four cams at "MC_CamIn".

To do this, tags of the data type "DB_Any" are first created as input parameter of the block. The cam to be used is assigned by an additional input parameter.

The following table shows the declaration of the tags used:

Tag	Declaration	Data type	Description
cam1	Input	DB_ANY	Cam 1
cam2	Input	DB_ANY	Cam 2
cam3	Input	DB_ANY	Cam 3
cam4	Input	DB_ANY	Cam 4
camToUse	Input	Int	Selection of cam 1 to 4
instMC_CAMIN	Static	MC_CAMIN	Multi-instance of the MC_CamIn
tempCamSel	Temp	DB_ANY	Current cam

The example below shows the basic procedure:

SCL	Explanation
	//Selection of the desired cam 1..4
	//Using an input tag of data type Int
`CASE #camToUse OF`	
`     1:  #tempCamSel := #cam1;`	//Instruction for scenario 1
`     2:  #tempCamSel := #cam2;`	//Instruction for scenario 2
`     3:  #tempCamSel := #cam3;`	//Instruction for scenario 3
`     4:  #tempCamSel := #cam4;`	//Instruction for scenario 4
`   ELSE`	//Instruction for Int ≤ 0 or > 4
`     #tempCamSel := #cam1;`	//Corresponds to default cam 1
`END_CASE;`	
	//Calling of the MC_CamIn with variable transfer of the cam technology object using the temporary tag "tempCamSel"
`#instMC_CAMIN(Master := "PositioningAxis_1",`	//Direct assignment of the technology object of the leading axis
`              Slave := "SynchronousAxis_1",`	//Direct assignment of the technology object of the following axis
`              Cam := #tempCamSel);`	//Indirect assignment of the cam technology object

Additional information

You can find more program examples using the data type "DB_Any" in the following FAQ:

https://support.industry.siemens.com/cs/document/109750880 (https://support.industry.siemens.com/cs/ww/en/view/109750880)

6.3.4 Non position-controlled operation

The closed loop position control of an axis can be switched off/switched with the following Motion Control instructions:

- MC_Power
- MC_MoveVelocity
- MC_MoveJog

The non-position-controlled operation is displayed with <TO>.StatusWord.X28 (NonPositionControlled) = TRUE.

MC_Power

The axis is enabled without closed loop position control with "MC_Power" and the parameter "StartMode" = 0. The closed loop position control remain switched off until a different Motion Control instruction changes the status of the closed loop position control.

MC_MoveVelocity and MC_MoveJog

A "MC_MoveVelocity" or "MC_MoveJog" job with "PositionControlled" = FALSE forces non-position-controlled operation.

A "MC_MoveVelocity" or "MC_MoveJog" job with "PositionControlled" = TRUE forces position-controlled operation.

The selected mode remains in effect after the job is completed.

Influence of additional Motion Control instructions

Starting the following Motion Control instructions forces position-controlled operation of the axis:

- MC_Home with "Mode" = 3, 5
- MC_MoveAbsolute
- MC_MoveRelative
- MC_MoveSuperimposed
- MC_GearIn
- MC_GearInPos (S7-1500T)
- MC_CamIn (S7-1500T)

The closed loop position control remains active after completing the corresponding jobs.

The Motion Control instruction MC_Halt is executed in position-controlled and non-position-controlled operation. The status of the closed loop position control is not changed by "MC_Halt".

A torque limiting activated with "MC_TorqueLimiting" is in effect even with non-position-controlled operation.

Synchronous operation with setpoint coupling

A following axis is set into position-controlled operation with the start of a synchronous operation job. If the leading axis is in non-position-controlled operation at the start of the synchronous operation, the synchronous operation job remains waiting. Synchronization is started only after position control has been activated and the start position of the synchronization has been reached.

Note

If the leading axis is set to the non-position-controlled mode during active synchronization, your setpoint is then set to zero. A setpoint step change is obtained as a result of coupling the setpoint of following axis. The setpoint step change is compensated according to the constant function. The only limiting factor is the maximum speed of the drive.

Synchronous operation with actual value coupling (S7-1500T)

A following axis is set into position-controlled operation with the start of a synchronous operation job. If the leading axis is in non-position-controlled operation at the start of the synchronous operation and the actual values are valid, synchronization is started.

If the leading axis is set to the non-position-controlled mode during active synchronization, the synchronization remains active.

6.4 Starting Motion Control jobs

Description

Motion Control jobs are started by setting the "Execute" or "Enable" parameter of the Motion Control instruction. The call of the Motion Control instructions for a technology object should occur in an execution level.

When executing Motion Control jobs, you should also take note of the status of the technology object.

Starting Motion Control jobs should be performed in the following steps:

1. Query the status of the technology object.
2. Initiate new job for the technology object.
3. Check job status.

These steps are explained using the example of a job for absolute positioning.

1. Query the status of the technology object

Make sure that the technology object is in the appropriate status to perform the desired job:

- **Has the technology object been released?**

  To execute motion jobs, the technology object must be enabled.

  Enabling is performed using the Motion Control instruction "MC_Power".

  The "MC_Power.Status" parameter (<TO>.StatusWord.X0 (Enable)) must show the value TRUE.

- **Is a technology alarm pending?**

  To perform motion commands, no technology alarms or alarm responses may be pending. The tags of the technology objects <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction must show the value zero. After resolving the error, acknowledge any pending alarms using the Motion Control instruction "MC_Reset".

  A list of the technology alarms and alarm reactions can be found in the appendix, Technology alarms (Page 513).

- **Has the technology object been homed?**

  In order to perform a job for absolute positioning, the positioning axis/synchronous axis technology object must be homed. The referencing occurs via the Motion Control instruction "MC_Home". The "<TO>.StatusWord.X5 (HomingDone) " tag of the technology object must show the value TRUE .

2. Initiate new command for the technology object

In the "Position" parameter of the "MC_MoveAbsolute" instruction, specify the position to which the axis should be moved. Start the job with a positive edge at the "Execute" parameter.

3. Check command status

Parameter "Done" of the Motion Control instruction indicates successful completion of a job (target reached, in this case).

If an error is detected, the "Error" parameter of the Motion Control instruction is set to TRUE, and the job is rejected.

You can program an error handling routine for the Motion Control job. For this purpose, evaluate the error indicated in the "Error" parameter. The cause of the error is indicated in the ErrorID parameter. After resolving the cause of the error, restart the job.

Output of the "Error" = TRUE and "ErrorID" = 16#8001 status information during job processing indicates that a technology alarm was triggered.

You can find a list of the ErrorIDs in the Error detection (Page 542) appendix.

Additional information

An option for the evaluation of the individual status bits, error bits, and warning bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

6.5 Tracking active jobs

6.5.1 Introduction

The current status of the job processing is made available via the output parameters of the Motion Control instruction. These parameters are updated with each call of the Motion Control instruction.

When tracking jobs, a distinction is made between three groups:

- Motion Control instructions with "Done" parameter (Page 302)
- Motion Control instructions without "Done" parameter (Page 306)
- Motion Control instruction "MC_MoveJog" (Page 310)

6.5.2 Motion Control instructions with "Done" parameter

Description

Jobs of Motion Control instructions with the "Done" parameter are started with a positive edge at the "Execute" parameter. If the job was completed without errors or interruption by another job (e.g. "MC_MoveAbsolute": Target position reached), the "Done" parameter shows the value TRUE.

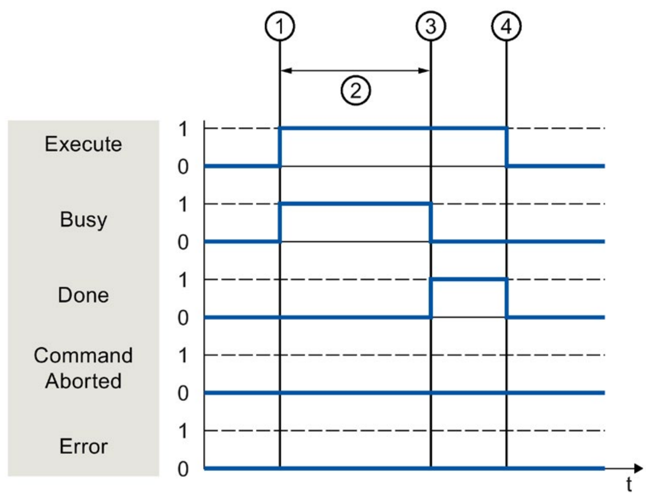
The following Motion Control instructions have a "Done" parameter:

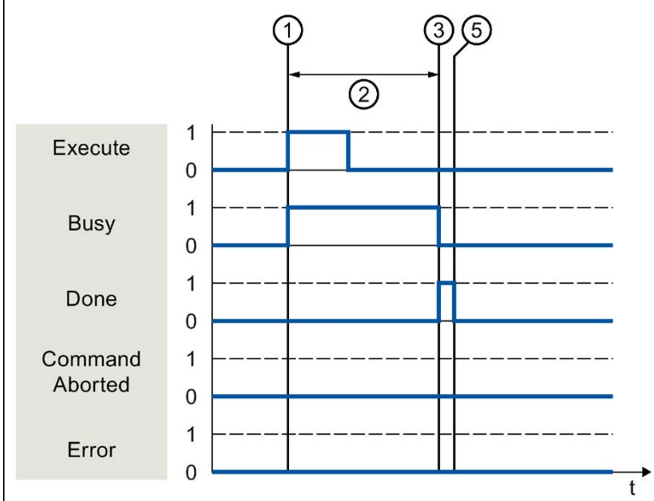
- MC_Home
- MC_MoveRelative
- MC_MoveAbsolute
- MC_MoveSuperimposed
- MC_Halt
- MC_Reset
- MC_MeasuringInput
- MC_AbortMeasuringInput

The behavior of the parameters is shown below by way of example for various situations:

Complete execution of the job

If the Motion Control job has been completely executed all the way to the end, this is indicated with parameter "Done" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Done" parameter:

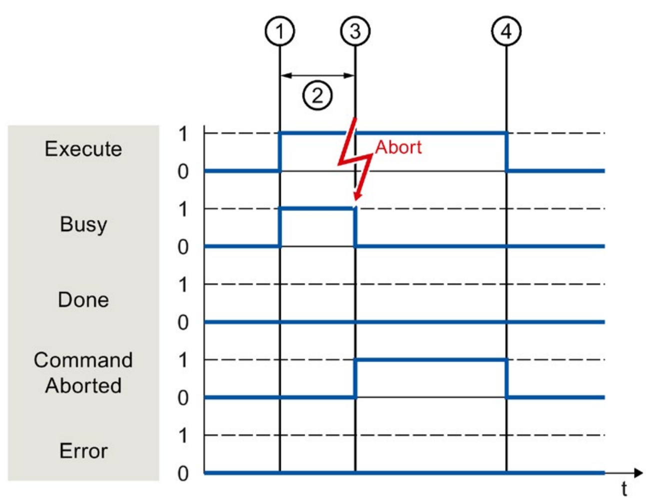
You set "Execute" **after completion** of the job to FALSE.	You set "Execute" **during processing** of the job to FALSE.
	


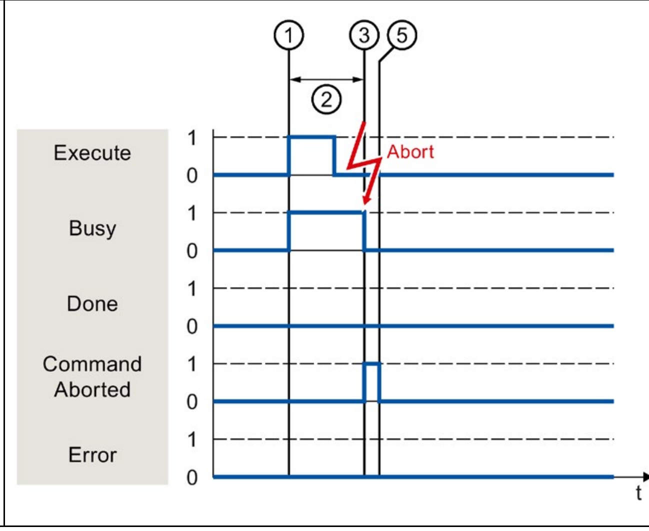


①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	At the completion of the job (for example, with Motion Control instruction "MC_MoveAbsolute": Target position reached), the "Busy" parameter changes to FALSE and the "Done" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Done" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before completion of the job, the "Done" parameter shows the value TRUE for only one execution cycle.

Job abort

If the Motion Control job is aborted during processing by another job, this is indicated in the "CommandAborted" parameter with the value TRUE. The signal state of the "Execute" parameter influences the display duration for the "CommandAborted" parameter:

You set "Execute" **after** the job is aborted to FALSE.	You set "Execute" **before** the job is aborted to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the parameter "Busy" shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "CommandAborted" parameter shows the value TRUE for only one execution cycle.

Error during job execution

If an error occurs during execution of the Motion Control job, this is indicated with parameter "Error" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Error" parameter:

<table>
<tr><td>You set "Execute" after the occurrence of the error to FALSE.</td><td>You set "Execute" before the occurrence of the error to FALSE.</td></tr>
<tr><td></td><td></td></tr>
</table>

①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after the occurrence of the error, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the occurrence of the error, the "Error" parameter shows the value TRUE for only one execution cycle.

6.5.3 Motion Control instructions without "Done" parameter

Description

Motion Control instructions without the "Done" parameter use a special parameter to indicate that the command objective (e.g. "InVelocity", "InGear") has been achieved. The target state or motion is stopped until the job is aborted or an error occurs.

The following Motion Control instructions have a special parameter for indicating the job status:

- MC_Power ("Status" parameter)
- MC_MoveVelocity ("InVeloctity" parameter)
- MC_GearIn ("InGear" parameter)
- MC_MoveJog ("InVelocity" parameter)

  The special behavior of "MC_MoveJog" is described in the section Motion Control instruction MC_MoveJog (Page 310).
- MC_TorqueLimiting ("InClamping" and "InLimitation") parameters

The following Motion Control instructions have no special parameter for indicating the job status: Feedback is provided via the following tags:

- MC_MeasuringInputCyclic

  The execution of a measuring job is indicated with parameter "Busy" = TRUE. Completed measuring events are indicated in the corresponding event counters <TO>.MeasuredValues.MeasuredValue1Counter and <TO>.MeasuredValues.MeasuredValue2Counter of the technology data block.
- MC_OutputCam

  The execution of a job is indicated with parameter "Busy" = TRUE. The CamOutput tag in the associated technology data block indicates the switching state of the output cam.
- MC_CamTrack

  The execution of a job is indicated with parameter "Busy" = TRUE. The TrackOutput tag in the associated technology data block indicates the switching state of the output cam.

The behavior of the parameter is shown for various situations using the Motion Control instruction "MC_MoveVelocity" as an example:

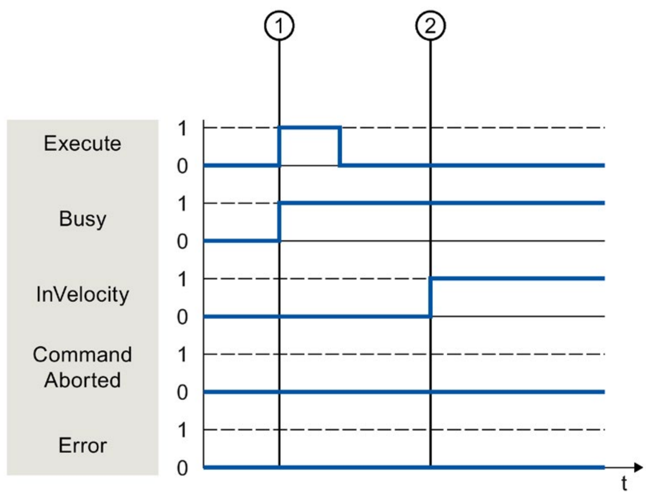
Example "MC_MoveVelocity"

An "MC_MoveVelocity" job is started with a positive edge at the "Execute" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

The motion of the axis can, for example, be stopped with an "MC_Halt" job.

The assigned velocity is reached and maintained

The achievement of the assigned velocity is indicated with parameter "InVelocity" = TRUE. The "Execute" parameter has no effect on the display duration for the "InVelocity" parameter.



①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE before or after the assigned velocity has been reached. While the job is being executed, the parameter "Busy" shows the value TRUE.
②	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE. The "Busy" and "InVelocity" parameters retain the value TRUE until another Motion Control job overrides the "MC_MoveVelocity" job.

The job is aborted before the assigned velocity is reached

If the Motion Control job is aborted by another job before the assigned velocity is reached, this is indicated with parameter "CommandAborted" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "CommandAborted" parameter.

<table>
<tr><td>You set "Execute" after the job is aborted to FALSE.</td><td>You set "Execute" before the job is aborted to FALSE.</td></tr>
<tr><td></td><td></td></tr>
</table>

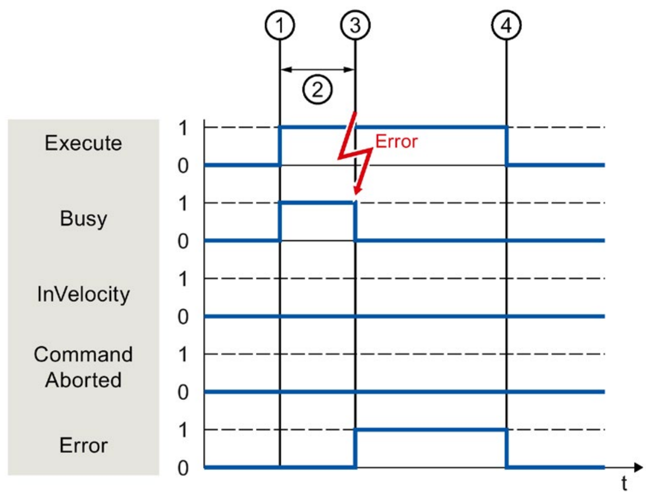
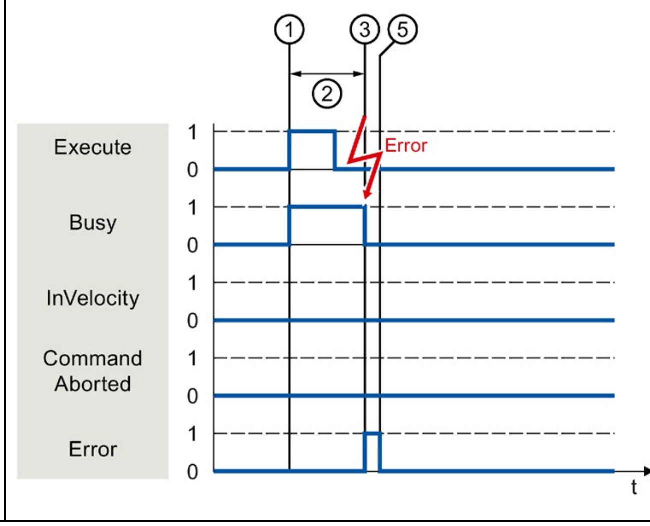
①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after the job is aborted.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "CommandAborted" parameter shows the value TRUE for only one execution cycle.

An error has occurred prior to reaching the assigned velocity

If an error occurs during execution of the Motion Control job before the assigned velocity has been reached, this is indicated with parameter "Error" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Error" parameter.

You set "Execute" **after** the occurrence of the error to FALSE.	You set "Execute" **before** the occurrence of the error to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after the error has occurred.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE, and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "Error" parameter shows the value TRUE for only one execution cycle.

6.5.4 Motion Control instruction "MC_MoveJog"

Description

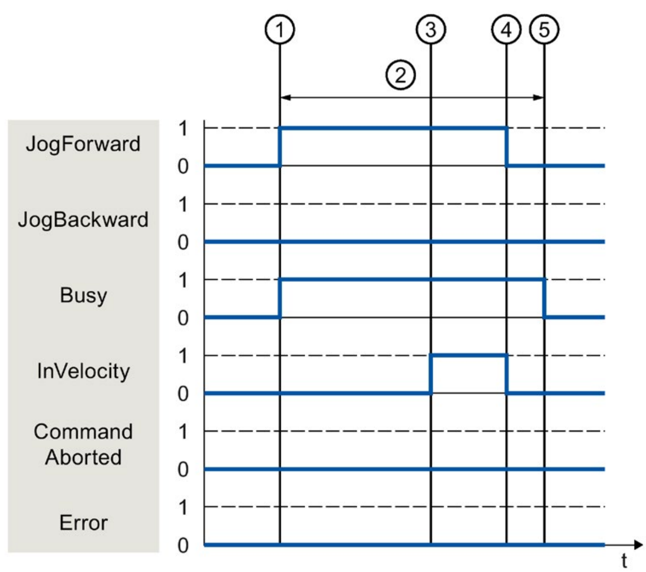
An "MC_MoveJog" job is started by setting the "JogForward" or "JogBackward" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

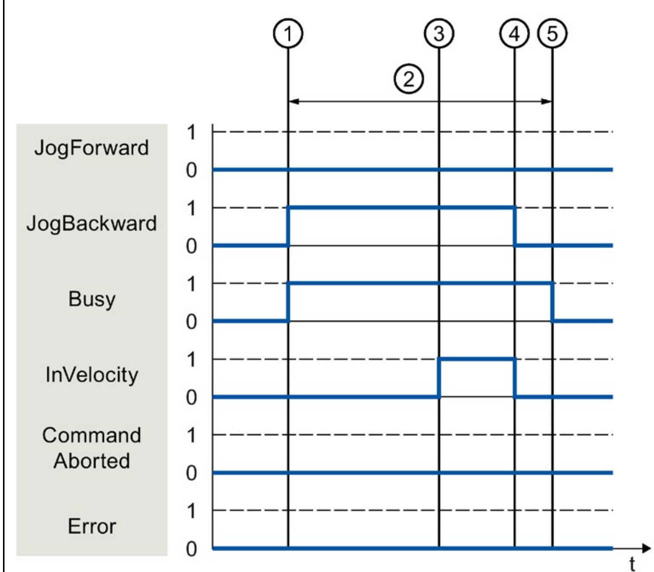
The job is complete when the "JogForward" or "JogBackward" parameter has been set to the value FALSE and the axis has come to a standstill.

The behavior of the parameters is presented below for various example situations:

The assigned velocity is reached and maintained

If the Motion Control job has been performed up to the point of reaching the assigned velocity, then this is indicated in the "InVelocity" parameter with the value TRUE.

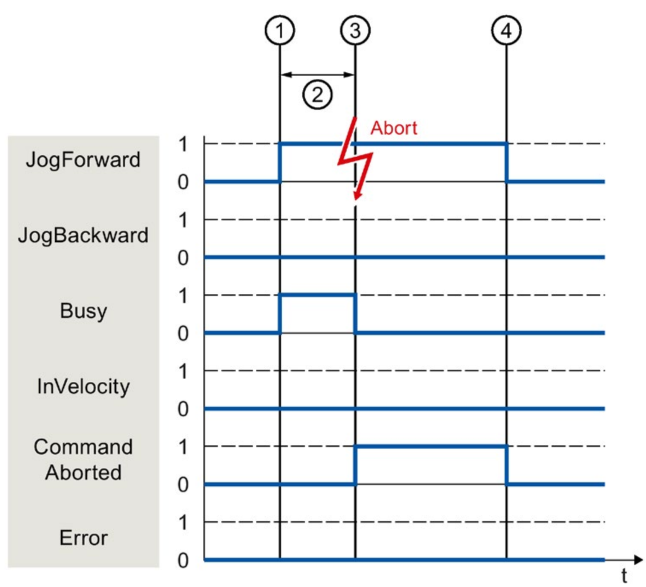
Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


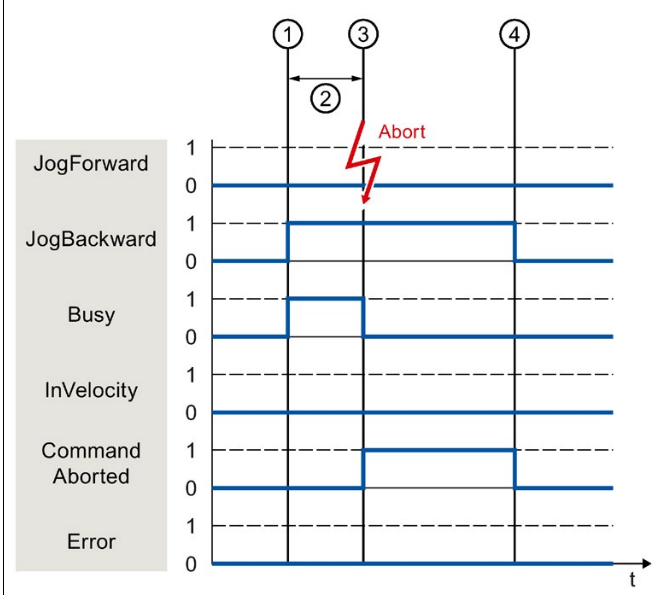


①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE.
④	When the "JogForward" or "JogBackward" parameter is reset, the motion of the axis ends. The axis decelerates. The "InVelocity" parameter changes to FALSE.
⑤	If the axis has come to a standstill, then the Motion Control job is complete and the "Busy" parameter changes to FALSE.

The job is aborted during execution

If the Motion Control job is aborted during processing by another job, this is indicated in the "CommandAborted" parameter with the value TRUE. The behavior of the "CommandAborted" parameter is independent of reaching the assigned velocity.

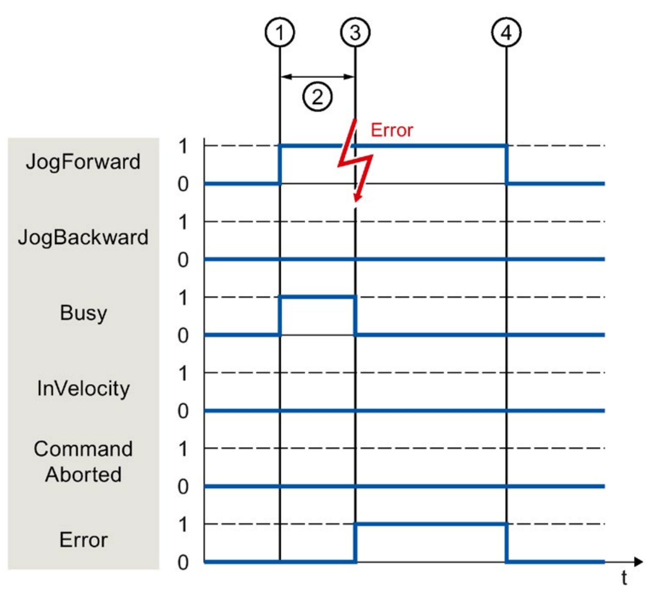
Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


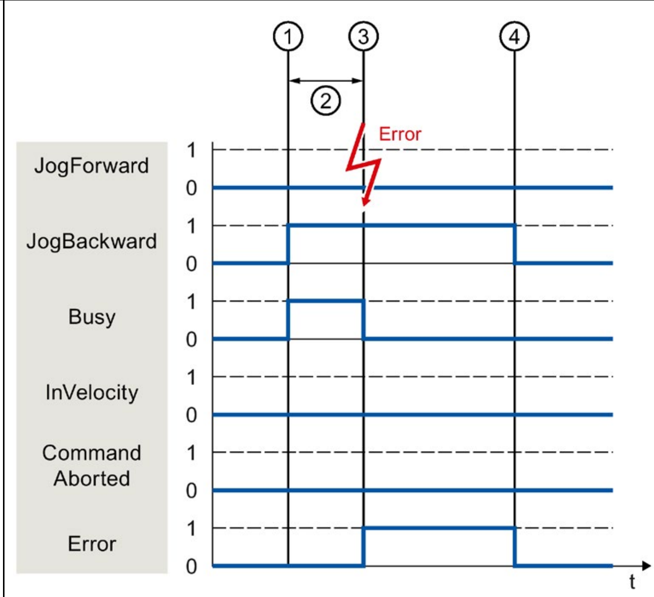


1	The job is started by setting the "JogForward" or "JogBackward" parameter.
2	While the job is processing, the "Busy" parameter shows the value TRUE.
3	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
4	When the "JogForward" or "JogBackward" parameter is reset, the "CommandAborted" parameter likewise changes to FALSE.

An error occurs during the execution of the job

If an error occurs during execution of the Motion Control job, this is indicated in the "Error" parameter with the value TRUE. The behavior of the "Error" parameter is independent of reaching the assigned velocity.

Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	




①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to "FALSE", and "Error" changes to TRUE.
④	When the "JogForward" or "JogBackward" is reset to the value FALSE, the "Error" parameter likewise changes to FALSE.

6.6 Ending Motion Control jobs

When a job is ended, a distinction is made between error-free completion of the job and a motion abort.

Completion of job

The completion of a Motion Control job is indicated as described in the Tracking running jobs (Page 302) section.

Job termination

The termination and substitution behavior are described in the section Override response of Motion Control jobs V4 (Page 428). Special pending jobs can be cancelled with "MC_Power".

Motion abort

If a motion must be aborted, you can perform the following measures:

- Execute "MC_Halt (Page 374)"

  To abort a motion and stop the axis, you can use the "MC_Halt" instruction.
- Deactivate "MC_Power (Page 361)"

  In an emergency, you can stop the axis via an emergency stop ramp. To do so, set the "Enable" parameter of the "MC_Power" instruction to FALSE. The axis is decelerated according to the selected "StopMode" and all jobs for the technology object are aborted.

Measuring job abort

With the Motion Control instruction "MC_AbortMeasuringInput", an active one-time or cyclic measuring job is aborted.

Cancellation of an active output cam/cam track

- "MC_OutputCam (Page 407)"

  An active output cam is disabled when the "Enable" parameter of Motion Control instruction "MC_OutputCam" is set to FALSE.
- "MC_CamTrack (Page 410)"

  An active cam track is disabled when the "Enable" parameter of Motion Control instruction "MC_CamTrack" is set to FALSE.

6.7 Restart of technology objects

Description

After the CPU is switched on, or after technology objects are downloaded into the CPU, the system automatically initializes the technology objects with the start values from the technology data blocks. If restart-relevant changes are detected during a reload into the CPU, a restart of the technology object is automatically performed.

If restart-relevant data have been changed in RUN mode by the user program, then the technology object must be reinitialized by the user in order for the changes to be used. At a RUN → STOP transition, the CPU automatically performs a restart of technology objects with restart-relevant changes.

If changes in the technology data block should also be retained after the restart of the technology object, then you must write the changes to the start value in load memory using the extended instruction "WRIT_DBL".

Restart required

A necessary TO restart is indicated at "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Online start value changed", as well as in the tag of technology object <TO>.StatusWord.X3 (OnlineStartValuesChanged).

Restarting a technology object

A restart of the technology object is triggered by the user by means of the "MC_Reset" Motion Control instruction, with parameter "Restart" = TRUE.

During a restart, all configuration data of the technology object are loaded from load memory into work memory. In the process, the actual values in the technology data block are overwritten.

Note the following during a restart of the technology object:

- A restart resets the "Referenced" status of a technology object with incremental actual values (<TO>.StatusWord.X5 (HomingDone).
- While a restart is being performed, the technology object cannot perform any jobs. An active restart will be indicated under "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Restart active", and in the <TO>.StatusWord.X2 (RestartActive) tag of the technology object.
- Motion Control jobs are rejected during a restart with the "Error" = TRUE and "ErrorID" = 16#800D parameters (job not executable, because a restart is active).
- While a restart is being executed, you cannot access the technology data block.

See also

Change restart-relevant data (Page 289)

7 Downloading to CPU

Description

When downloading to the CPU S7-1500, it is always verified that the project files are consistent online and offline after the download.

The data of the technology objects are saved in technology data blocks. The conditions for downloading blocks thus apply when loading new or modified technology objects.

Load in RUN mode

When loading in the CPU's RUN mode, it is checked whether a load without restart of the technology objects is possible.

If restart-relevant configuration values were changed, then a restart of the technology object is automatically performed after the load into the CPU.

Loading a technology object is only possible if the technology object is disabled.

You **cannot** download the following changes to the CPU in RUN mode:

- Changes to the MC-Servo clock speeds
- Changes to the hardware interface of the technology object in "Technology object > Configuration > Hardware interface"

Commissioning 8

8.1 Introduction

The following guidelines describe the steps that you should note when commissioning the Motion Control-specific components of your equipment.

The commissioning of other components of your automation system depends on the particular equipment configuration. Commissioning (not Motion Control) is described in the Automation System S7-1500 (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

8.2 Commissioning guidelines

These guidelines serve as recommendations for commissioning equipment with Motion Control. The procedure is described using the example of a positioning axis technology object.

Requirement

- The configuration of the following components is complete:
  - CPU
  - BUS communication
  - Drives
  - Technology objects
- The user program has been created.
- The wiring of the CPU and of the associated I/O is complete.
- The commissioning and optimization of the drive is complete.

Procedure

Proceed as follows to commission the Motion Control-specific components of your equipment:

Step	Action to be performed	Supported by TIA Portal
Turn on CPU	Turn on the power supply and the CPU.	-
"Disable" position controller	Set the gain (Kv factor) of the position control loop to zero. (This setting avoids unwanted drive movements that may be caused by incorrect parameterization of the position control loop.)	"Technology object > Configuration > Extended parameters > Control loop"
Activate precontrol	Set the precontrol to 100 %.	"Technology object > Configuration > Extended parameters > Control loop"
Load project into the CPU	Bring the CPU to the STOP mode. Download your project to the CPU (load hardware and software).	• "Toolbar > Stop CPU" • "Toolbar > Download to device"
Create online connection to the CPU	Select the "Receive messages" check box under "Online & Diagnostics > Online Access". Configure the interface of the TIA Portal, and create an online connection with the CPU.	• Device configuration • "Online & Diagnostics > Online Access"
Disable Motion Control specific user program	In order to avoid conflicts with the axis control panel, lock the enabling of technology objects in your user program (MC_Power.Enable = FALSE).	• PLC programming • Motion Control instructions
Evaluating pending messages	Evaluate the message display in the inspector window. Resolve the causes of pending technology alarms. Acknowledge the technology alarms (Page 333).	"Inspector window > Diagnostics > Message display"
Check hardware limit switches	Click the hardware limit switches. Check for correct message display (technology alarm 531). Acknowledge the technology alarm.	"Inspector window > Diagnostics > Message display"
Check the connection and configuration of the drive (setpoint)	Bring the CPU into the RUN mode. Open the Axis control panel (Page 319) and take over control. Perform the following steps: • Enable the technology object. ⇒ The drive must turn itself on, and where applicable release the brake. The position is held. • Move the axis in jog mode at low velocity in the positive direction. ⇒ The drive must move. The actual position value must increase (positive direction). • Disable the technology object. ⇒ The drive must turn itself off, and where applicable apply the brake.	"Technology object > Commissioning > Axis control panel"

Step	Action to be performed	Supported by TIA Portal
Check the connection and configuration of the encoder (actual value)	Check the scaling of the actual values (rotation direction, distance evaluation, and resolution of the encoder) ⇒ The change in the actual mechanical position must match the change in the actual values.	• "Technology object > Diagnostics > PROFIdrive frame" • "Technology object > Commissioning > Axis control panel"
Checking the reference speed	Traverse the axis in jog mode at low velocity in the positive direction. ⇒ The displayed current velocity must match the velocity setpoint. If the displayed current velocity deviates significantly from the velocity setpoint, adjust the reference speed.	• "Technology object > Hardware interface > Data exchange" • "Technology object > Commissioning > Axis control panel"
Optimize position controller	Use the Optimization (Page 325) commissioning function to optimize the gain (Kv) of the position control loop. For this purpose, adapt following error limits as needed.	"Technology object > Commissioning > Optimization"
Transfer the gain Kv to the project.	Enter the gain Kv that you determined by means of the optimization function in your configuration data. Load your project into the CPU.	"Technology object > Configuration > Extended parameters > Control loop"
Enable Motion Control specific user program	Unlock the enabling technology objects lock in your user program (MC_Power.Enable = TRUE).	• PLC programming • Motion Control instructions
Check the functioning of the user program	Check the programmed functions of your user program.	• Watch and force tables • Online and diagnostic functions
End of commissioning for a positioning axis technology object	To commission additional technology objects, perform the corresponding steps again.	See above.

8.3 Axis control panel

8.3.1 Function and structure of the axis control panel

You traverse individual axes with the axis control panel. A user program is not necessary for the operation of the axis control panel. With the axis control panel, you assume master control for a technology object and control the motions of the axis.

WARNING

Uncontrolled axis motions

During operation with the axis control panel, the axis can execute uncontrolled motions (e.g. due to erroneous configuration of the drive or the technology object). Furthermore, any synchronized following axis is moved as well when moving a leading axis with the axis control panel.

Therefore, perform the following protective measures before operation with the axis control panel:

- Ensure that the EMERGENCY OFF switch is within the reach of the operator.
- Enable the hardware limit switches.
- Enable the software limit switches.
- Ensure that following error monitoring is enabled.
- Make sure that no following axis is coupled to the axis to be moved.

The axis control panel of the speed axis, positioning axis and synchronous axis can be found in the project tree under "Technology object > Commissioning".

The axis control panel is divided into the following areas:

- Master control
- Axis
- Operating mode
- Modify
- Axis status
- Actual values

Elements of the axis control panel

The following table lists the elements of the axis control panel:

<table>
<tr><th>Area</th><th>Element</th><th>Description</th></tr>
<tr><td rowspan="2">Master control</td><td></td><td>In the "Master control" area, you assume master control of the technology object or return it to your user program.</td></tr>
<tr><td>"Activate" button</td><td>With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object.
To take over master control, the technology object must be disabled in the user program.
Any synchronized following axis is moved as well when moving a leading axis with the axis control panel.
If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program.
If the axis control panel is covered by a dialog, such as "Save as", during its operation with the axis control panel, the axis is stopped with maximum deceleration and the master control is returned to the user program.

If the "Stop" button is covered during operation with the axis control panel, for example by scrolling or by another window, the master control is retained but the axis is stopped with maximum deceleration.

If you change to another window within the TIA Portal, to the project tree for example, during operation with the axis control panel, the master control and motion of the axis is maintained, provided that the axis control panel is embedded in the TIA Portal. If the axis control panel is replaced by the TIA Portal and you change to another window within the TIA Portal, to the project tree for example, the master control is retained but the axis is stopped with maximum deceleration.

If you change to another window outside the TIA Portal during operation with the axis control panel, the master control is retained but the axis is stopped with maximum deceleration.
When you click the "Activate" button, a warning message is displayed. In the warning, you can adapt the sign-of-life monitoring (100 to 60000 ms).

If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the message "Error during commissioning" is entered in the message display log. Sign-of-life failure between controller and TIA Portal" is displayed.

To eliminate this error, adapt the sign-of-life monitoring in the warning.
Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with error ("ErrorID" = 16#8012: Axis control panel enabled).</td></tr>
</table>

Area	Element	Description
		• When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not take effect until leading control has been returned. Therefore, make any necessary changes before master control is assumed again. If master control has been taken over for the technology object, the axis control panel is blocked for access by another instance of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, you can enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object
Operating mode		Select the required mode in the "Operating mode" drop-down list.
Modify		The "Control" area displays the parameters for traversing with the axis control panel according to the selected operating mode.
	Position	Position to which the axis is homed. ("Homing" and "Set home position" modes only)
	Distance	Distance the axis is traversed. ("Relative positioning" mode only)
	Target position	Position to which the axis is traversed. ("Absolute positioning" mode only)
	Velocity/ Velocity setpoint	Velocity or speed at which the axis is traversed. Default: 10% of the default value (Velocity/speed setpoint, "Jog" and "Positioning" modes only)
	Acceleration	Acceleration with which the axis is traversed. Default: 10% of the default value
	Deceleration	Deceleration with which the axis is traversed. Default: 10% of the default value
	Jerk	Jerk with which the axis is traversed. Default: 100% of default value
	"Start" button	With the "Start" button, you start a job according to the selected operating mode.
	"Forward" button	With the "Forward" button, you start a motion in the positive direction according to the selected operating mode.
	"Backward" button	With the "Backward" button, you start a motion in the negative direction according to the selected operating mode.
	"Stop" button	With the "Stop" button, you cancel a job or stop the axis. If the "Stop" button is covered during operation with the axis control panel, for example by scrolling or by another window, the master control is retained but the axis is stopped with maximum deceleration.

Area	Element	Description
Axis status		The "Axis status" area displays the status of the axis and the status of the drive.
	Drive ready	Drive is ready to execute setpoints.
	Error	An error occurred at the technology object.
	Enabled	The technology object has been enabled. The axis can be moved with motion jobs.
	Homed	The technology object is homed.
	More	The "More" link takes you to the window "Technology object > Diagnostics > Status and error bits".
	Active errors	The error that occurred most recently is displayed in the "Active errors" text field.
	"Confirm" button	With the "Confirm" button, you acknowledge pending errors.
	Alarm display	You can access the alarm display in the Inspector window by clicking on the "Alarm display" link.
Actual values		The "Current values" area shows the actual values of the axis.
	Position	Actual position of the axis
	Velocity	Actual velocity of the axis

Note

No transfer of the parameters

The configured parameter values are discarded when master control is returned. Transfer the values as needed into your configuration.

If you have changed configuration values during operation with the axis control panel, these changes have no effect on the operation of the axis control panel.

Operating mode

The following table shows the operating modes of the axis control panel:

Operating mode	Description
Homing	This function corresponds to active homing. The parameters for homing (Page 69) must be configured. Homing is not possible with an absolute encoder. The technology object is not referenced when this mode is used with an absolute encoder.
Set home position	This function corresponds to direct homing (absolute). With the "Start" button, you set the actual position to the value specified in "Position" and the "Homed" status is set.
Jog	Motion commands occur by means of jogging. With the "Forward" or "Backward" button you start motion in the positive or negative direction. The motion runs for as long as you hold down the left mouse button.
Velocity specification/speed setpoint	The axis is moved at the specified velocity or speed until you stop the movement. The motion commands are performed according to the setpoints assigned under "Controller".
Positioning relative	The positioning is executed as a controlled, relative traversing motion according to the defaults assigned under "Controller".
Positioning absolute	The positioning is executed as a controlled, absolute traversing motion according to the defaults assigned under "Controller". If you have enabled the "Modulo" setting of the technology object, the buttons "Forward" and "Backward" are shown in the "Controller" area. The axis is positioned within the modulo range. Position settings outside the modular range are recalculated to the modulo range. If you have not enabled the "Modulo" setting of the technology object, only the "Start" button is shown in the "Controller" area. You can directly approach the entered position.

8.3.2 Using the axis control panel

You traverse individual axes with the axis control panel. You assume master control of a technology object and control the motions of the axis.

Requirement

- The project has been created and downloaded to the CPU.
- The CPU must be in the RUN mode.
- The technology object is disabled by your user program ("MC_Power.Enable" = FALSE).
- The axis control panel for the technology object is not used by another instance of the TIA Portal (Team Engineering as of CPU V1.5).

Procedure

Proceed as follows to enable control the axis using the axis control panel:

1. To assume master control of the technology object and to set up an online connection to the CPU, click "Activate" in the "Master control" area.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and click "OK".
3. To enable the technology object, click the "Enable" button in the "Axis" area.
4. In the drop-down list in the "Operation mode" area, select the desired function of the axis control panel.
5. In the "Control" area, specify the parameter values for your job.
6. Depending on the mode selected, click the "Start", "Forward" or "Backward" button to start the job.
7. Click the "Stop" button to stop the job.
8. Repeat steps 4 through 6 for additional jobs.
9. To disable the technology object, click the "Disable" button in the "Axis" area.
10. To return master control to your user program, click the "Deactivate" button in the "Master control" area.

8.4 Optimization

8.4.1 Function and structure of the optimization

Description

The "Optimization" function supports you in determining the optimal precontrol and gain (Kv factor) for the closed loop position control of the axis. The axis velocity profile is recorded by means of the Trace function for this purpose for the duration of a configurable positioning movement. You can then evaluate the recording, and adjust the precontrol and gain accordingly.

WARNING

Uncontrolled axis motions

During operation with the optimization, the axis can execute uncontrolled motions (for example, due to erroneous configuration of the drive or the technology object). In addition, when a leading axis is moved, any synchronized following axis is also moved.

Therefore, perform the following protective measures before operation with the optimization:

- Ensure that the EMERGENCY OFF switch is within the reach of the operator.
- Enable the hardware limit switches.
- Enable the software limit switches.
- Ensure that following error monitoring is enabled.
- Make sure that no following axis is coupled to the axis to be moved.

The "Optimization" function for the positioning axis and synchronous axis technology objects can be found in the project tree under "Technology object > Commissioning".

The "Tuning" dialog is divided into the following areas:

- Master control
- Axis
- Measurement configuration
- Optimize position controller
- Run measurement
- Trace

The following table lists the elements of optimization:

Area	Element	Description
Master control		In the "Master control" area, you take over master control of the technology object, or return it to your user program.
	"Activate" button	With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. • To take over master control, the technology object must be disabled in the user program. • Any synchronized following axis is moved as well when moving a leading axis with the axis control panel. • If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program. • When you click the "Activate" button, a warning message is displayed. You can adapt the sign-of-life monitoring here (100 to 60000 ms). If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the message "Error during commissioning" is entered in the message display log. Sign-of-life failure between controller and TIA Portal" is displayed. To eliminate this error, adapt the sign-of-life monitoring in the warning. • Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with error ("ErrorID" = 16#8012: Axis control panel enabled). • When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not take effect until master control has been returned. For this reason, make any necessary changes before master control is taken over. • If master control has been taken over for the technology object, the axis control panel is blocked for access by another installation of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object

Area	Element	Description
Measurement configuration		In the "Measurement configuration" area, you configure the settings for a test step.
	Distance	Travel distance for a test step
	Measurement duration	Time for a test step
	"Customize dynamics" check box	The "Dynamics adapt" check box allows you to adapt the acceleration, deceleration and maximum velocity. As long as the "Commissioning" working area is open, the previously set values are displayed when the check box is selected again.
	Acceleration	Presetting of the acceleration for a test step
	Deceleration	Default setting for delaying a test step
	Maximum velocity	Presetting of the maximum velocity for a test step
Optimize position controller		In the "Optimize position controller" area, you make the settings for optimization of the controller characteristics. You open a list of values using the symbol next to the field. The list of values contains the following values of the respective parameter: • Online actual value • Online start value • Project start value Enter the new value in the text field for the actual value. The new value is applied by clicking the "Forward" or "Backward" button in the "Run measurement" area.
	Precontrol	Current percentage velocity precontrol of the position controller
	Speed control loop substitute time	Current speed control loop substitute time With velocity precontrol, a simplified speed control loop model can be generated using the speed control loop substitute time. This prevents overmodulation by the position controller of the manipulated variable for velocity during the acceleration and deceleration phases. To accomplish this, the position setpoint of the position controller is delayed by the amount of the speed control loop substitute time in relation to the velocity precontrol.
	Gain	Current gain of the position controller (Kv)
Run measurement		In the "Run measurement" area, you perform the test steps.
	"Forward" button	With the "Forward" button, you start a test step for optimization in the positive direction.
	"Backward" button	With the "Backward" button, you start a test step for optimization in the negative direction.
	"Stop" button	You stop a test step with the "Stop" button. The axis decelerates with the configured maximum deceleration. If another window is superimposed on the "Stop" button, the axis stops.
Trace		The Trace function is displayed in the lower area of the "Tuning" dialog. With each test step, a Trace recording of the required parameters is automatically started and displayed after completion of the test step. After master control has been returned, the Trace recording is deleted. You can find a full description of the trace function in the section on using the trace and logic analyzer function.

Note

No automatic transfer of the parameters to the technology object

The configured parameter values are discarded after master control is returned.

Transfer the values as needed into your configuration. You can apply the values for the gain, precontrol and speed control loop substitute time in your configuration using the "Project start value" value.

Closed-loop control (Page 92)

8.4.2 Optimize position controller

Requirements

- The CPU must be in the RUN mode.
- The project has been created and downloaded to the CPU.
- The technology object is disabled by your user program (MC_Power.Enable = FALSE).
- The axis control panel for the technology object is not used by another installation of the TIA Portal (Team Engineering as of CPU V1.5).

Optimizing position control gain (Kv)

Proceed as follows to optimize the gain (Kv):

1. In the "Master control" area, click the "Activate" button to activate master control for the technology object, and to establish an online connection to the CPU.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and confirm with "OK".
3. In the "Axis" area, click the "Enable" button to enable the technology object.
4. If necessary, configure values for the distance, duration, and dynamics of a test step in the "Measurement configuration" area.
5. If necessary, configure values for the precontrol and speed control loop substitute time of a test step in the "Configure position controller" area.
6. Enter a start value for the gain. Start with a low value.
7. Click the "Forward" or "Start" button to start a test step for the optimization.
   For the specified duration, a setpoint is output according to the specified distance. The axis moves by the specified distance. A trace recording of the motion (setpoint and actual values) is created automatically.

   You can find a full description of the trace function in the section on using the trace and logic analyzer function.

   Note

   Adapt following error limits

   If error messages from following error monitoring are repeatedly displayed during optimization, temporarily adapt the following error limits.

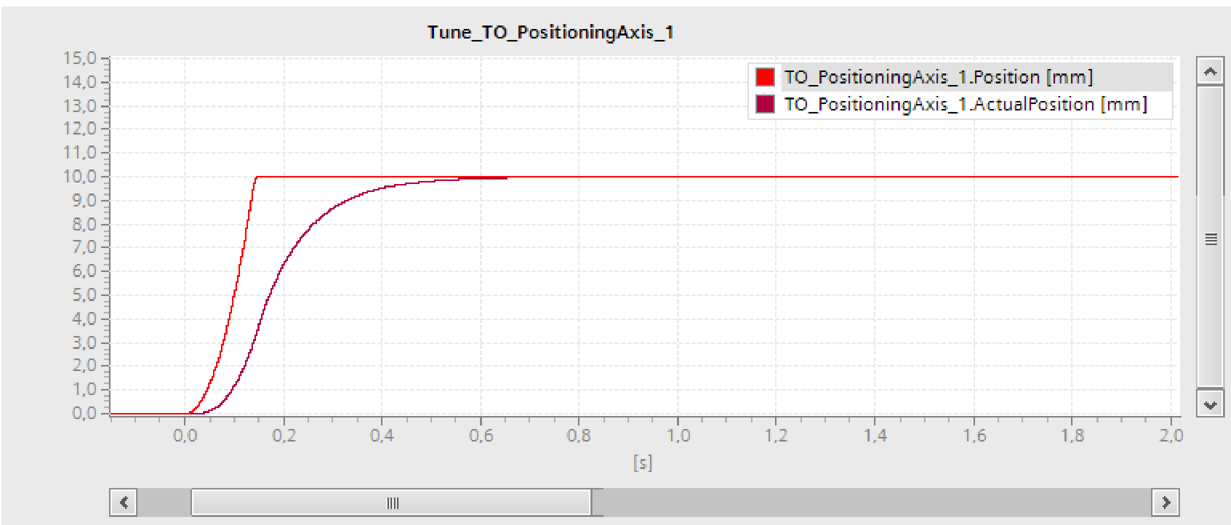
   ---

8. Evaluate the curve of the trace recording. Adapt the gain incrementally. Click the "Forward" or "Backward" button after each value you enter. This applies the value and start a new movement and trace recording each time.

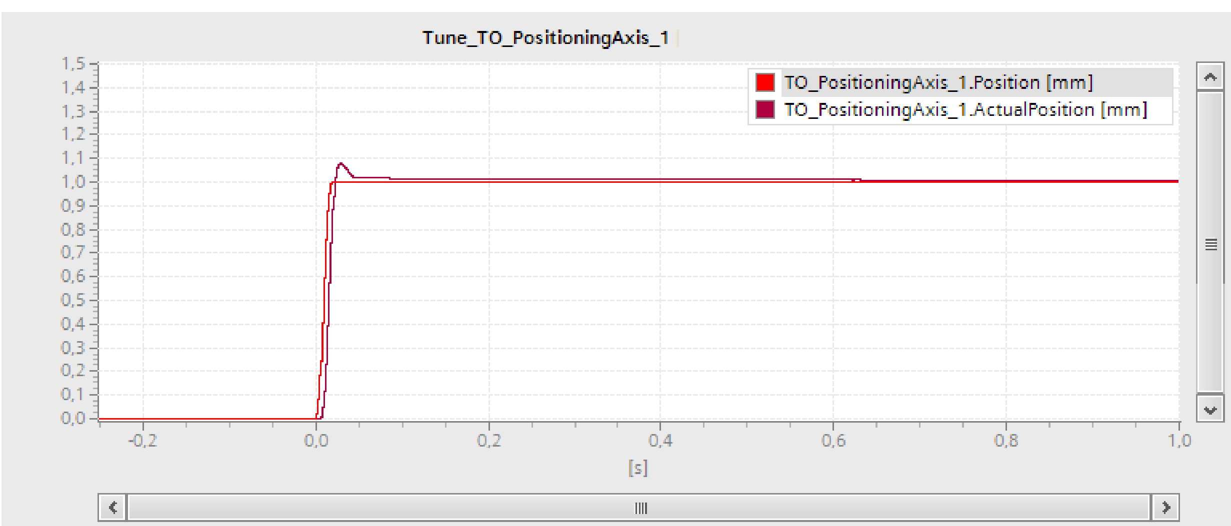
When adjusting the gain, pay attention to the following properties of the curve:

- The curve shows a brief compensation time.
- The curve does not show any motion reversal of the actual position.
- When approaching the position setpoint, no overshoot occurs.
- The curve shows a stable overall behavior (oscillation-free curve).

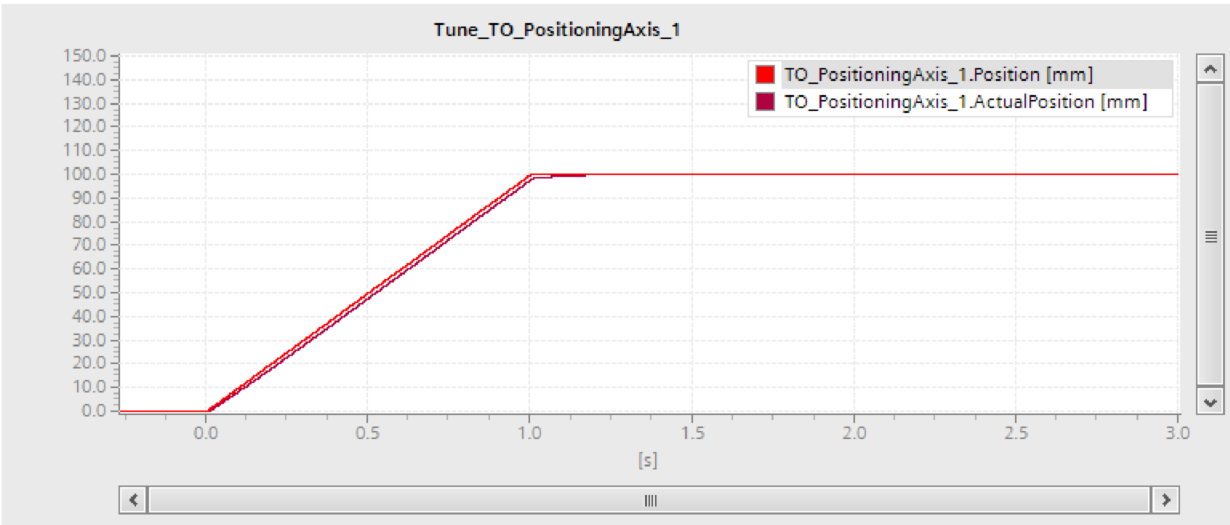
The following trace recording shows a curve with a long settling time:



The following trace recording shows a curve with overshoot when approaching the setpoint:



The following trace recording shows a curve in which the gain is optimal and the overall response is steady:



Transferring the parameter values of the position controller to the project

To transfer the determined parameter values of the position controller to your project, follow these steps:

1. Click the icon next to the field of the respective parameter.

   A list of values is displayed.
2. Enter the measured value in the "Project start value" field of the value list.
3. In the "Axis" area, click the "Disable" button to disable the technology object.
4. In the "Master control" area, click the "Deactivate" button to return master control to your user program.
5. Load your project into the CPU.

9 Diagnostics

9.1 Introduction

The Diagnostics section is limited to describing the diagnostic concept for Motion Control and describing the Diagnostics view of the individual technology objects in the TIA Portal.

For more information about system diagnostics with the S7-1500 CPU, refer to the "Diagnostics" (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

9.2 Diagnostic concept

The diagnostic concept encompasses alarms and associated messages, as well as error messages in the Motion Control instructions. The TIA Portal also supports you with consistency checks during configuration of the technology objects, and during the creation of your user program.

All alarms in runtime (from the CPU, technology, hardware etc.) are displayed in the Inspector window of the TIA Portal. Diagnostic information that relates to technology objects (technology alarms, status information) are additionally displayed in the Diagnostics window of the respective technology object.

During motion control, if an error occurs at a technology object (e.g. approaching a hardware limit switch), then a technology alarm (Page 333) is triggered, and a corresponding message is displayed in the TIA Portal as well as on HMI devices.

In your user program, technology alarms are generally signaled via error bits in the technology data block. The number of the technology alarm with the highest priority is also displayed. In order to simplify error evaluation, the "Error" and "ErrorID" parameters of the Motion Control instructions also indicate that a technology alarm is pending.

Program errors (Page 337) can occur during parameter assignment or during the processing sequence of the Motion Control instructions (e.g. invalid parameter specification when calling the instruction, initiation of a job without enable via MC_Power). Motion Control instruction errors are indicated at the call of instructions using the "Error" and "ErrorID" parameters.

9.3 Technology alarms

Description

If an error occurs at a technology object (e.g. approaching a hardware limit switch), a technology alarm is triggered and indicated. The impact of a technology alarm on the technology object is specified by the alarm reaction.

Alarm classes

Technology alarms are divided into three classes:

- **Acknowledgeable warning**

  The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.

- **Alarm requiring acknowledgment**

  Motion jobs are aborted in accordance with the alarm reaction. You must acknowledge the alarms in order to continue execution of new jobs after eliminating the cause of the error.

- **Fatal error**

  Motion jobs are aborted in accordance with the alarm reaction.

  To be able to use the technology object again after eliminating the cause of the error, you must restart the technology object (Page 314).

Display of technology alarms

A technology alarm is displayed in the following locations:

- **TIA Portal**
  - **"Technology object > Diagnostics > Status and error bits"**

    Display of pending technology alarms for each technology object.
  - **"Technology object > Commissioning > Axis control panel"**

    Display of the last pending technology alarm for each technology object.
  - **"Inspector window > Diagnostics > Message display"**

    Select the "Receive messages" check box under "Online & Diagnostics > Online Access" in order to display technology alarms via the message display.

    With an online connection to the CPU, the pending technology alarms for all technology objects are displayed. Additionally, the archive view is available to you.

    The message display can also be activated and displayed on a connected HMI.
  - **"CPU > Online & diagnostics"**

    Display of the technology alarms that have been entered in the diagnostic buffer.
- **User program**
  - **Tags <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction**

    Indication of the number and the reaction of the technology alarm with the highest priority.
  - **Tag <TO>.StatusWord**

    A pending technology alarm is indicated with bit 1 ("Error").
  - **Tag <TO>.ErrorWord**

    Indication of alarms and fatal errors.
  - **Tag <TO>.WarningWord**

    Indication of warnings.
  - **Parameter "Error" and "ErrorID"**

    In a Motion Control instruction, the parameters "Error" = TRUE and "ErrorID" = 16#8001 indicate that a technology alarm is pending.
- **Display of the CPU**

  In order to show technology alarms on the CPU display, make the following setting when loading to the CPU:
  In the "Load preview" dialog, select the action "Consistent download" for the "Text libraries" entry.

Alarm reaction

A technology alarm always contains an alarm reaction, which describes the impact on the technology object. The alarm reaction is specified by the system.

The following table shows possible alarm reactions:

Alarm reaction	Description
Axes (speed axis, positioning axis, synchronous axis)	
No reaction (warnings only) <TO>.ErrorDetail.Reaction = 0	The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.
Stop with current dynamic values <TO>.ErrorDetail.Reaction = 1	Active motion commands are aborted. The axis is braked with the dynamic values that present in the Motion Control instruction and brought to a standstill.
Stop with maximum dynamic values <TO>.ErrorDetail.Reaction = 2	Active motion commands are aborted. The axis is braked with the dynamic values configured under "Technology object > Extended parameters > Dynamic limits", and brought to a standstill. The configured maximum jerk is hereby taken into account.
Stop with emergency stop ramp <TO>.ErrorDetail.Reaction = 3	Active motion commands are aborted. The axis is braked with the emergency stop deceleration configured under "Technology object > Extended parameters > Emergency stop ramp", without any jerk limit, and brought to a standstill.
Remove enable <TO>.ErrorDetail.Reaction = 4	Active motion commands are aborted. The setpoint zero is output and the enable is removed. The axis is braked to a standstill according to the configuration in the drive.
Track setpoints <TO>.ErrorDetail.Reaction = 5	Active motion commands are aborted. The setpoint zero is output and the enable is removed. The actual values supplied by the drive are automatically tracked as setpoints.
Other technology objects (output cam, cam track, measuring input, cam, external encoder)	
No reaction (warnings only) <TO>.ErrorDetail.Reaction = 0	The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.
Terminate processing of the technology object: • Output cam <TO>.ErrorDetail.Reaction = 6 • Cam track <TO>.ErrorDetail.Reaction = 7 • Measuring input <TO>.ErrorDetail.Reaction = 8 • Cam <TO>.ErrorDetail.Reaction = 9 • External encoder <TO>.ErrorDetail.Reaction = 10	Processing of the technology object is terminated. All running Motion Control jobs are aborted.

Acknowledging technology alarms

You can acknowledge technology alarms as follows:

- **TIA Portal**
  - **"Technology object > Commissioning > Axis control panel"**

    Click "Confirm" to acknowledge all alarms and warnings pending for the selected technology object.
  - **"Inspector window > Diagnostics > Message display"**

    You can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **HMI**

  At an HMI with enabled message display, you can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **User program**

  Acknowledge pending technology alarms for a technology object with the Motion Control instruction "MC_Reset".

Additional information

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

9.4 Errors in Motion Control instructions

Description

Errors in Motion Control instructions (e.g. invalid parameter value setting) are indicated by the "Error" and "ErrorID" output parameters.

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated for the Motion Control instruction:

- Illegal status of the technology object, which prevents the execution of the job.
- Invalid parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm reaction for a technology object error.

Error display

If there is a Motion Control instruction error, the "Error" parameter shows the value TRUE. The cause of the error is given in the "ErrorID" parameter.

Jobs to the technology object are rejected when "Error" = TRUE. Running jobs are not influenced by rejected jobs.

If "Error" = TRUE and "ErrorID" = 16#8001 is indicated during job execution, a technology alarm has occurred. In this case, evaluate the indication of the technology alarm.

If "Error" = TRUE is displayed during execution of a "MC_MoveJog" job, the axis is braked and brought to a standstill. In this case, the deceleration configured for the "MC_MoveJog" instruction takes effect.

Acknowledge error

Acknowledging errors in Motion Control instructions is not required.

Restart a job after resolving the error.

Additional information

You can find a list of the ErrorIDs in the Error detection (Page 542) appendix.

9.5 Speed-controlled axis technology object

9.5.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Simulation active	The axis is simulated in the CPU. Setpoints are not output to the drive.
Enabled	The technology object has been enabled. The axis can be moved with motion jobs. (<TO>.StatusWord.X0 (Enable))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel enabled	The axis control panel is active. The axis control panel has master control over the technology object. The axis cannot be controlled from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	Drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no job running)	No motion job is running for the technology object. (<TO>.StatusWord.X6 (Done))
Jog	The axis is being moved with a job for jog mode of Motion Control instruction "MC_MoveJog" or from the axis control panel. (<TO>.StatusWord.X9 (JogCommand))
Speed setpoint	The axis is traversed with a job with speed setpoint of the Motion Control instruction "MC_MoveVelocity" or using the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Constant speed	The axis is moved with constant speed or is stationary. (<TO>.StatusWord.X12 (ConstantVelocity))
Accelerating	Axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))
Torque limiting enabled	The configured threshold for the force/torque affects the axis. (<TO>.StatusWord.X27 (InLimitation))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration	One or several configuration parameters are adapted internally at a given time. (<TO>.WarningWord.X1 (ConfigWarning))
Job rejected	A job cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	The dynamic values are limited to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Drive	An error occurred in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Data exchange	Communication with a connected device is faulty. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	An error occurred accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	A job cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met (e.g. technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Dynamic limitation	The dynamic values are limited to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

See also

StatusWord tag (speed axis) (Page 439)

ErrorWord tag (speed axis) (Page 441)

WarningWord tag (speed axis) (Page 443)

9.5.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Setpoints" area

The following table shows the meaning of the status data:

Status	Description
Speed setpoint	Speed setpoint of the axis (<TO>.Velocity)
Speed override	Speed setpoint correction as percentage The speed setpoint specified in motion control instructions or set by the axis control panel are superimposed with an override signal and corrected as a percentage. Valid speed correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Actual speed	Actual speed of the axis (<TO>.ActualSpeed)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Speed	Configured maximum speed (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)
Jerk	Configured maximum jerk (<TO>.DynamicLimits.MaxJerk)

9.5.3 PROFIdrive telegram

Description

The "Technology object > Diagnostics > PROFIdrive telegram" diagnostics function is used in the TIA Portal to monitor the PROFIdrive telegram that the drive returns to the controller. The Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive telegram from the drive to the controller:

- Status words "ZSW1" and "ZSW2"
- The speed setpoint (NSET) that was output to the drive
- The actual speed that was signaled from the drive (NACT)

9.6 Positioning axis/synchronous axis technology object

9.6.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Simulation active	The axis is simulated in the CPU. Setpoints are not output to the drive. (<TO>.StatusWord.X25 (AxisSimulation))
Enabled	The technology object has been enabled. You can move the axis with motion jobs. (<TO>.StatusWord.X0 (Enable))
Position-controlled mode	The axis is in position-controlled mode. (Inversion of <TO>.StatusWord.X28 (NonPositionControlled))
Homed	The technology object is homed. The relationship between the position in the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel enabled	The axis control panel is active. The axis control panel has master control over the technology object. You cannot control the axis from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	Drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Encoder values valid	The actual encoder values are valid. (<TO>.StatusSensor[n].State)
Active encoder	Current encoder on the axis (<TO>.OperativeSensor)
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Status limit switch

The following table shows the possibilities for enabling the software and hardware limit switches:

Status	Description
Negative SW limit switch approached.	The negative software limit switch was reached. (<TO>.StatusWord.X15 (SWLimitMinActive))
Positive SW limit switch approached.	The positive software limit switch was reached. (<TO>.StatusWord.X16 (SWLimitMaxActive))
Negative HW limit switch approached.	The negative hardware limit switch has been approached or overtraveled. (<TO>.StatusWord.X17 (HWLimitMinActive))
Positive HW limit switch approached.	The positive hardware limit switch has been approached or overtraveled. (<TO>.StatusWord.X18 (HWLimitMaxActive))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no job running)	No job active at technology object. (<TO>.StatusWord.X6 (Done))
Homing job	The technology object executes a homing job of the Motion Control instruction "MC_Home" or from the axis control panel. (<TO>.StatusWord.X11 (HomingCommand))
Jog	The axis is being moved with a command for jog mode of Motion Control instruction "MC_MoveJog". (<TO>.StatusWord.X9 (JogCommand))
Velocity specification	The axis is traversed with a job with velocity specification of the Motion Control instruction "MC_MoveVelocity" or from the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Positioning job	The axis is traversed with a positioning job of Motion Control instruction "MC_MoveAbsolute" or "MC_MoveRelative" or from the axis control panel. (<TO>.StatusWord.X8 (PositioningCommand))
Constant velocity	The axis is moved with constant velocity or is stationary. (<TO>.StatusWord.X12 (ConstantVelocity))
Standstill	The axis is in standstill. (<TO>.StatusWord.X7 (StandStill))
Accelerating	Axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))
Torque limiting enabled	The configured threshold for the force/torque affects the axis. (<TO>.StatusWord.X27 (InLimitation))

Status	Description
Synchronization	Synchronous axis only The axis is synchronized to the leading value of a leading axis. (<TO>.StatusWord.X21 (Synchronizing))
Synchronous operation	Synchronous axis only The axis is synchronized and moves synchronously to the leading axis. (<TO>.StatusWord.X22 (Synchronous))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration	One or several configuration parameters are adjusted internally at a certain time. (<TO>.WarningWord.X1 (ConfigWarning))
Job rejected	Job cannot be executed. You cannot execute a Motion Control instruction because necessary requirements are not fulfilled. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	The dynamic values are limited to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))
Synchronization	Synchronous axis only An error occurred during synchronization. The leading axis specified for the corresponding Motion Control instruction was not configured as a possible leading axis. (<TO>.WarningWord.X14 (SynchronousError))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Drive	An error occurred in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Encoder	An error occurred in the encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Communication with a connected device is faulty. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	An error occurred accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	A job cannot be executed. You cannot execute a Motion Control instruction because necessary requirements are not fulfilled (for example, technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Homing	An error occurred during a homing process. (<TO>.ErrorWord.X10 HomingFault))
Positioning	The positioning axis was not positioned correctly at the end of a positioning motion. (<TO>.ErrorWord.X12 (PositioningFault))
Dynamic limitation	The dynamic values are limited to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))
Following error	The maximum permitted following error has been exceeded. (<TO>.ErrorWord.X11 (FollowingErrorFault))
SW limit switch	A software limit switch has been reached. (<TO>.ErrorWord.X8 (SwLimit))
HW limit switch	A hardware limit switch has been reached or overtraveled. (<TO>.ErrorWord.X9 (HWLimit))
Adaptation	An error occurred during data adaption. (<TO>.ErrorWord.X15 (AdaptionError))
Synchronization	Synchronous axis only An error occurred during synchronization. The leading axis specified for the corresponding Motion Control instruction was not configured as a possible leading axis. (<TO>.ErrorWord.X14 (SynchronousError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

9.6.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Setpoints" area

The following table shows the meaning of the status data:

Status	Description
Target position	Current target position of an active positioning job The target position value is only valid during execution of a positioning job. (<TO>.StatusPositioning.TargetPosition)
Position setpoint	Setpoint position of the axis (<TO>.Position)
Velocity setpoint	Velocity setpoint of the axis (<TO>.Velocity)
Velocity override	Percentage correction of the velocity specification The velocity setpoint specified in Motion Control instructions or set by the axis control panel is superimposed with an override signal and corrected as a percentage. Valid velocity correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Operative encoder	Operative encoder of the axis
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)
Following error	Following error of the axis (<TO>.StatusPositioning.FollowingError)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Velocity	Configured maximum velocity (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)
Jerk	Configured maximum jerk (<TO>.DynamicLimits.Jerk)

9.6.3 PROFIdrive telegram

Description

The "Technology object > Diagnostics > PROFIdrive telegram" diagnostics function is used in the TIA Portal to monitor the PROFIdrive telegrams returned by the drive and encoder. The display of the Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive telegram from the drive to the controller:

- Status words "ZSW1" and "ZSW2"
- The speed setpoint (NSET) that was output to the drive
- The actual speed that was signaled from the drive (NACT)

"Encoder" area

This area displays the following parameters contained in the PROFIdrive telegram from the encoder to the controller:

- Status word "Gx_ZSW"
- The actual position value "Gx_XIST1" (cyclic actual encoder value)
- The actual position value "Gx_XIST2" (absolute encoder value)

The diagnostic functions contain expanded/additional displays for the S7-1500T technology CPU.

Status and error bits

The following table shows the expanded/additional displays of the status and error bits (Page 343):

Axis status	
Encoder values valid	The actual encoder values (encoder 1, encoder 2, encoder 3 or encoder 4) are valid. (<TO>.StatusSensor[n].State)
Active encoder	The encoder in effect operationally is encoder 1, encoder 2, encoder 3 or encoder 4. (<TO>.OperativeSensor)

Motion status

The following table shows the expanded/additional displays for the status of the motion (Page 347):

Current values	Description
Operative encoder	Operative encoder of the axis

PROFIdrive telegram

The "Encoder 1" to "Encoder 4" areas display the following parameters from the PROFIdrive telegram (Page 349) of the corresponding encoder to the controller:

- Status word "Gx_ZSW"
- The actual position value "Gx_XIST1" (cyclic actual encoder value)
- The actual position value "Gx_XIST2" (absolute encoder value)

9.7 Technology object external encoder

9.7.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Encoder status

The following table shows the possible external encoder status values:

Status	Description
Encoder enabled	The technology object has been enabled. (<TO>.StatusWord.X0 (Enable))
Homed	The technology object is homed. The relationship between the position in the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Encoder values valid	The actual encoder values are valid. (<TO>.StatusSensor[n].State)
Restart required	Data relevant for the restart has been changed. The changes are applied only after a re-start of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible states of the job execution:

Status	Description
Done (no job running)	No Motion Control job is running for the technology object. (Enable by "MC_Power" job excepted) (<TO>.StatusWord.X6 (Done))
Homing job	The technology object executes a homing job of the Motion Control instruction "MC_Home". (<TO>.StatusWord.X11 (HomingCommand))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 UserFault))
Encoder	An error occurred in the encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Missing or faulty communication. (<TO>.ErrorWord.X7 (CommunicationFault))
Adaptation	An error occurred during data adaption. (<TO>.ErrorWord.X15 (AdaptionError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

See also

9.7.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the actual encoder values. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)

9.7.3 PROFIdrive frame

Description

The "Technology object > Diagnostics > PROFIdrive interface" diagnostic function is used in the TIA Portal to monitor the PROFIdrive frame of the encoder. The display of the diagnostics function is available in the online mode TO.

"Encoder" area

This area displays the following parameters contained in the PROFIdrive frame that the encoder returns to the controller:

- Status word "G1_ZSW"
- The actual position value "G1_XIST1" (cyclic actual encoder value)
- The actual position value "G1_XIST2" (absolute value of the encoder)

9.8 Technology object measuring input

9.8.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Measuring input status

The following table shows the possible states of the measuring input:

Status	Description
Active	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Waiting for measuring event	The measuring input is waiting for a measuring event. The technology data block tag "<TO>.Status" has the value "1" ("WAITING_FOR_TRIGGER").
Measured value present	The measuring input has acquired one or more measured values. The technology data block tag "<TO>.Status" has the value "2" ("TRIGGER_OCCURRED").
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Measuring input ready	The measuring input is synchronized with the measuring module and can be used. (<TO>.StatusWord.X5 (CommunicationOK))
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	A job cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the measuring input is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	An error occurred accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

9.9 Technology object output cam

9.9.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Output cam status

The following table shows the possible states of the output cam:

Status	Description
Active	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Switched	The output cam is switched. (<TO>.CamOutput)
Inverted output cam output	The output cam output is inverted. (<TO>.StatusWord.X4 (OutputInverted))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Output cam output ready	The cam is synchronized with the output module and available for use. (<TO>.StatusWord.X5 (CommunicationOk))
Restart required	Data relevant for the restart has been changed. The changes are applied only after a re-start of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	A job cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the output cam is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	An error occurred accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

9.10 Cam track technology object

9.10.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Cam track status

The following table shows the possible states of the cam track:

Status	Description
Active	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Switched	A cam of cam track is switched. (<TO>.TrackOutput)
Inverted output cam output	The output cam output is inverted. (<TO>.StatusWord.X4 (OutputInverted))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Cam track output ready	The cam track is synchronized with the output module and available for use. (<TO>.StatusWord.X5 (CommunicationOk))
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	A configuration error has occurred. One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	An error occurred in the user program with a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	A job cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the cam track is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	An error occurred accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Alarm display

For additional information and to acknowledge the error, go to the Inspector window by clicking on the "Alarm display" link.

ErrorWord tag (cam track) (Page 511)

WarningWord tag (cam track) (Page 512)

9.10.2 Cam track status

Description

You use the "Technology object > Diagnostics > Cam track status" diagnostics function in the TIA Portal to monitor the status of the cam track. The Diagnostics function is available in online operation.

"Validity and masking of the output cams" area

The individual cams of a cam track are shown in this area along with the status for the following properties:

Status	Description
Valid	Validity of the individual cams of the cam track (<TO>.Parameter.Cam[1 … 32].Existent)
Masked	Bit masking of the individual cams of the cam track (<TO>.Parameter.CamMasking)
Effective	Switched on output cam (bit-masked) (<TO>.SingleCamState)

"Positions" area

The following status values are displayed in this area:

Status	Description
Current position in the cam track	Position during cam track processing within a cam track cycle The distance to the current reference position of the current cam track (<TO>.MatchPosition) is displayed. (<TO>.TrackPosition)
Current cam track start	Reference position of the current cam track During cyclic processing of the cam track, the continued reference position of the current cam track is displayed. The unique detection and output of the position is only possible when the assigned technology object is in motion. (<TO>.MatchPosition)

Instructions 10

10.1 MC_Power V4

10.1.1 MC_Power: Enable, disable technology object V4

Description

With the Motion Control instruction "MC_Power", a technology object is enabled or disabled.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis
- External encoder

Requirement

- The technology object has been configured correctly.
- Cyclic BUS communication is established between controller and encoder (<TO>.StatusSensor[n].CommunicationOK = TRUE).
- Cyclic BUS communication is established between controller and drive (<TO>.StatusDrive.CommunicationOK = TRUE).

Override response

- An "MC_Power" job cannot be aborted by any other Motion Control job.
- An "MC_Power" job with parameter "Enable"TRUE enables a technology object but does not thereby abort any other Motion Control instructions.
- Disabling the technology object (parameter "Enable" = FALSE) aborts all Motion Control jobs on the corresponding technology object in accordance with the selected "StopMode". This process cannot be canceled by the user.

Parameters

The following table shows the parameters of Motion Control instruction "MC_Power":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The technology object is enabled.
				FALSE	The technology object is disabled. All current jobs at the technology object are aborted in accordance with the configured "StopMode".
StartMode	INPUT	DINT	1	0	Enable positioning axis/synchronous axis not position-controlled
				1	Enable positioning axis/synchronous axis position-controlled
				The parameter initially takes effect when the positioning axis is enabled (Enable changes from FALSE to TRUE) and when the axis is enabled after acknowledgment of an interrupt that caused the axis to be disabled. This parameter is ignored when a speed axis or an external encoder is used.	
StopMode	INPUT	INT	0	Not applicable to the technology object external encoder If you disable a technology object with a negative edge at parameter "Enable", the axis decelerates in accordance with the selected "StopMode".	
				0	Emergency stop When the technology object is disabled, the axis brakes to a standstill without jerk limit, using the emergency stop deceleration configured in "Technology object > Configuration > Extended parameters > Emergency stop ramp". The enable is then canceled. (<TO>.DynamicDefaults.EmergencyDeceleration)
				1	Immediate stop When a technology object is disabled, the setpoint zero is output, and the enable is canceled. The axis is braked to a standstill according to the configuration in the drive.
				2	Stop with maximum dynamic values When the technology object is disabled, the axis is braked to a standstill using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits". The configured maximum jerk is hereby taken into account. The enable is then canceled. (<TO>.DynamicLimits.MaxDeceleration; <TO>.DynamicLimits.MaxJerk)

Parameters	Declaration	Data type	Default value	Description	
Status	OUTPUT	BOOL	FALSE	Technology object enable status	
				FALSE	Disabled • A positioning axis, synchronous axis or speed axis does not accept any motion control jobs. • Speed control and positioning control are not active. • The actual values of the technology object are not checked for validity.
				TRUE	Enabled • An enabled positioning axis, synchronous axis or speed axis accepts Motion Control jobs. • Speed control and positioning control are active. • The actual values of the technology object are valid.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction MC_Power. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Enabling technology objects

To enable a technology object, set the "Enable" parameter to TRUE.

The following two cases are differentiated:

- Enable at a standstill
- Enable in motion of axis

Enable at a standstill

Depending on the "StartMode" parameter, the position is held (StartMode = 1) or the velocity setpoint zero is output (StartMode = 0). When the "Status" parameter shows the value TRUE, the technology object is enabled.

Enable in motion of axis

If StartMode = 1, the position at the time of the setting of the enable input is effective as set position for the position controller. The axis is braked to a standstill and adjusted to the set position depending on the maximum deceleration configured under "Technology object > Configuration > Extended parameters > Dynamic limits". If monitoring operation or dynamic limits are hereby exceeded, this leads to corresponding alarm reactions.

If StartMode = 0, the axis is braked as much as possible by the specification of the velocity setpoint zero. Monitoring operations and dynamic limits are not active in this case.

When the "Status" parameter shows the value TRUE, the technology object is enabled.

Note

Automatic enable after acknowledgment of a technology alarm

If the technology object is disabled due to a technology alarm, the technology object will be enabled again automatically after the cause has been eliminated and the alarm has been acknowledged. This requires the "Enable" parameter to have retained the value TRUE during this process.

Disabling technology objects

To disable a technology object, set the "Enable" parameter to FALSE.

If an axis is in motion, it is braked to a standstill according to the selected "StopMode".

When the "Busy" and "Status" parameters show the value FALSE, the disabling of the technology object is complete.

Drive connection by means of PROFIdrive

When a drive is connected using PROFIdrive, the setpoint, enable and drive status are transmitted via the PROFIdrive telegram.

- **Enable technology object and activate drive**

  With parameter "Enable" = TRUE, the technology object is enabled. The drive is enabled according to the PROFIdrive standard.

  When the <TO>.StatusDrive.InOperation tag shows the value TRUE, the drive is ready to execute setpoints. The "Status" parameter is set to the value TRUE.

- **Disable technology object and deactivate drive**

  With "Enable" = FALSE parameter, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". The drive is disabled according to the PROFIdrive standard.

Analog drive connection

The setpoint is output via an analog output. Optionally, you can configure an enabling signal via digital output (<TO>.Actor.Interface.EnableDriveOutput), and a readiness signal via digital input (<TO>.Actor.Interface.DriveReadyInput).

- **Enable technology object and activate drive**

  With parameter "Enable" = TRUE, the enable output ("Enable drive output") is set.

  When the drive returns the readiness signal via the ready input ("Drive ready input"), the "Status" parameter and the technology object's <TO>.StatusDrive.InOperation tag are set to TRUE, and the setpoint is switched to the analog output.

- **Disable technology object and deactivate drive**

  With parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". When the setpoint zero is reached, the enable output is set to FALSE.

Additional information

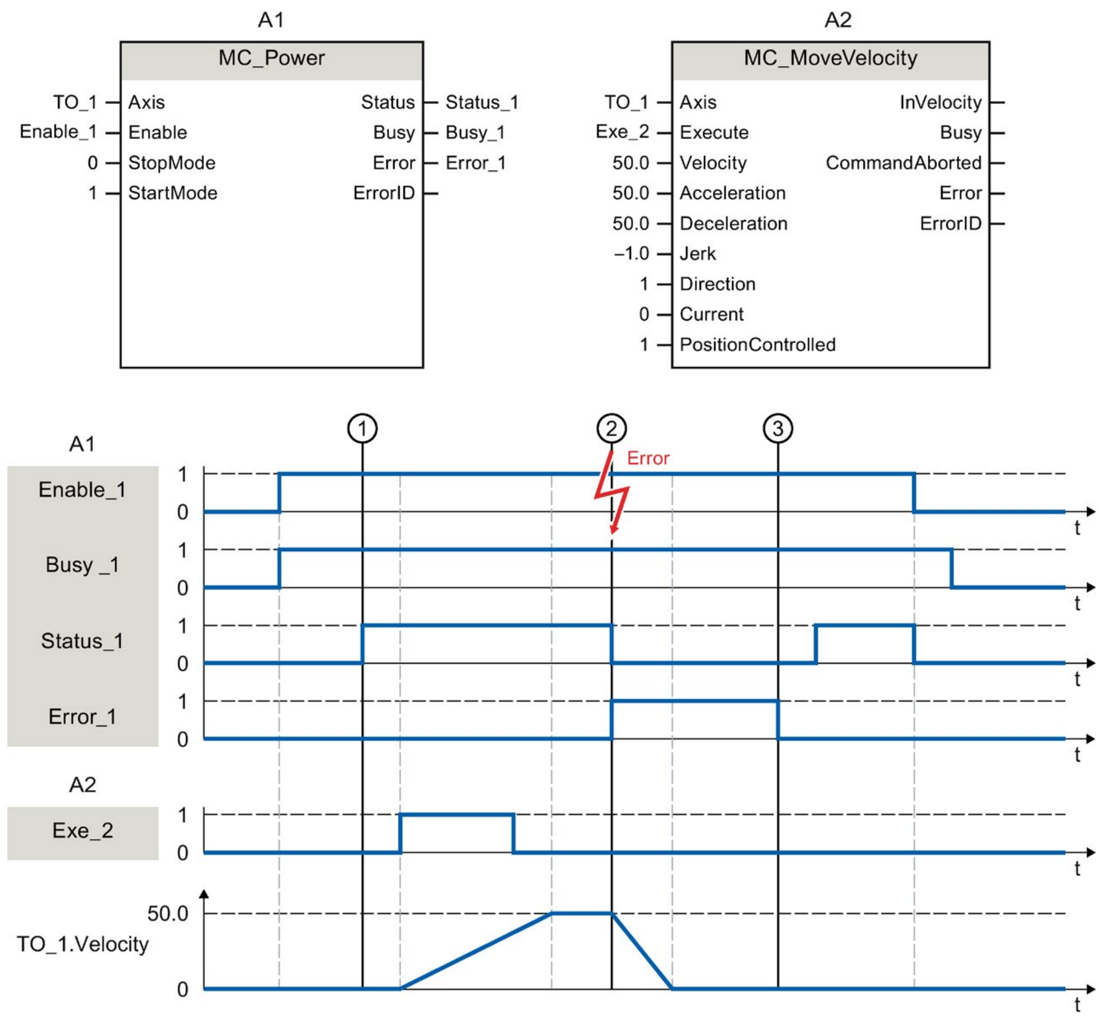
Additional information on enabling and disabling technology objects and drives can be found in the appendix, MC_Power Function Charts (Page 547).

See also

Error ID for Motion Control instructions (Page 542)

10.1.2 MC_Power: Function chart V4

Function chart: Enabling a technology object and example of alarm response



A technology object is enabled with "Enable_1= TRUE". The successful enable can be read from "Status_1" at time ①. The axis will then move with an "MC_MoveVelocity" job (A2). The velocity profile of the axis can be read from "TO_1.Velocity".

At time ② an error occurs in the technology object, which results in the disabling of the technology object (alarm response: remove enable). The axis is braked to a standstill according to the configuration in the drive. When the technology object is disabled, "Status_1" is reset. Since the axis was not disabled using "Enable_1" = FALSE, the selected "StopMode" does not apply. The cause of the error is corrected and the alarm is acknowledged at time ③.

Since "Enable_1" is still set, the technology object is enabled again. The successful enable can be read from "Status_1". Finally, the technology object is disabled with "Enable_1" = FALSE.

10.2 MC_Reset V4

10.2.1 MC_Reset: Acknowledge alarms, restart technology object V4

Description

With the Motion Control instruction "MC_Reset", you acknowledge all technology alarms that can be acknowledged in the user program. Acknowledgment also resets the "Error" and "Warning" bits in the technology data block.

With the Motion Control instruction "MC_Reset" with "Restart" = TRUE, you start reinitialization (restart) of technology objects. Upon restart of the technology object, the new configuration data are applied in the technology data block.

Applies to

- All technology objects

Requirement

- Positioning/synchronous axis, speed axis and external encoder technology objects:

  For a restart, the technology object must be disabled.

  ("MC_Power.Status" = FALSE and "MC_Power.Busy" = FALSE)

Override response

- Parameter "Restart" = FALSE:

  Processing of the "MC_Reset" instruction with parameter "Restart" = FALSE cannot be aborted by any other Motion Control job. The MC_Reset job does not abort any active motion control jobs.
- Parameter "Restart" = TRUE:

  Processing of the "MC_Reset" instruction with parameter "Restart" = TRUE cannot be aborted by any other Motion Control job.

Parameters

The following table shows the parameters of Motion Control instruction "MC_Reset":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Object	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Restart	INPUT	BOOL	FALSE	TRUE	"Restart" Reinitialization of the technology object and acknowledgment of pending technology alarms. The technology object is reinitialized with the configured start values.
				FALSE	Acknowledgment of queued technology alarms.
Done	OUTPUT	BOOL	FALSE	TRUE	Error has been acknowledged. Restart has been executed.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Acknowledging technology alarms

To acknowledge technology alarms, follow these steps:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = FALSE.
3. Start the acknowledgment of the error with a positive edge at parameter "Execute".

When the "Done" parameter shows the value TRUE, the error has been acknowledged.

Note

Acknowledge with "Restart" = FALSE

If only the technology alarms are to be acknowledged, set "Restart"FALSE. The technology object cannot be used during a restart.

Restarting a technology object

To restart a technology object, follow these steps:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = TRUE.
3. Perform the restart with a positive edge at parameter "Execute".

When the "Done" parameter shows the value TRUE, the restart of the technology object is complete.

Additional information regarding the restart can be found in the section "Restarting technology objects (Page 314)".

Error ID for Motion Control instructions (Page 542)

10.3 MC_Home V4

10.3.1 MC_Home: Home technology object, set home position V4

Description

With the Motion Control instruction "MC_Home", you create the relationship between the position in the technology object and the mechanical position. The actual position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

Homing is performed according to the mode selected with the "Mode" parameter and the configuration under "Technology object > Configuration > Extended parameters > Homing".

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and ≥ V2.0 is available in section "Version overview (Page 155)".

The preset values under "Technology object > Configuration > Extended parameters > Dynamic default values" are used for the dynamic values Acceleration, Deceleration and Jerk.

Applies to

- Synchronous axis
- Positioning axis
- External encoder

The following table shows which modes are possible with each of the technology objects:

Operating mode	Positioning axis/ synchronous axis with incremental encoder	Positioning axis/ synchronous axis with absolute encoder	External incremental encoder	External absolute encoder
Active homing ("Mode" = 3, 5)	X	-	-	-
Passive homing ("Mode" = 2, 8, 10)	X	-	X	-
Set actual position ("Mode" = 0)	X	X	X	X
Relative shift of the actual position ("Mode" = 1)	X	X	X	X
Absolute encoder adjustment ("Mode" = 6, 7)	-	X	-	X

Requirement

- The technology object has been configured correctly.
- "Mode" = 2, 3, 5, 8, 10
  The technology object is enabled.
- "Mode" = 0, 1, 6, 7, 8
  The actual encoder values are valid (<TO>.StatusSensor[n].State = 2).
- "Mode" = 6, 7

  The axis is in position-controlled mode.

Override response

The override response for "MC_Home" jobs is described in section "Override response V4: Homing and motion jobs (Page 428)".

Parameters

The following table shows the parameters of Motion Control instruction "MC_Home":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Position	INPUT	LREAL	0.0	The specified value is used according to the selected "Mode".	
Mode	INPUT	INT	0	Operating mode	
				0	Direct homing (absolute) The current position of the technology object is set to the value of parameter "Position".
				1	Direct homing (relative) The current position of the technology object is shifted by the value of parameter "Position".
				2	Passive homing (without reset) Functions like "Mode" 8, with the difference that the "homed" status is **not** reset when the function is enabled.
				3	Active homing The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After the completion of the motion, the axis is positioned at the value of the "Position" parameter.
				4	Reserved
				5	Active homing ("Position" parameter has no effect) The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After completion of the motion, the axis is positioned at the home position configured under "Technology object > Configuration > Extended parameters > Homing > Active homing". (<TO>.Homing.HomePosition)
				6	Absolute encoder adjustment (relative) The current position is shifted by the value of parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				7	Absolute encoder adjustment (absolute) The current position is set to the value of parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				8	Passive homing When the homing mark is detected, the actual value is set to the value of the "Position" parameter.

Parameter	Declaration	Data type	Default value	Description	
				9	Abort passive homing An active job for passive homing is aborted.
				10	Passive homing ("Position" parameter has no effect) When the homing mark is detected, the actual value is set to the home position configured under "Technology object > Configuration > Extended parameters > Homing > Passive homing". (<TO>.Homing.HomePosition)
Reference-MarkPosition	OUTPUT	LREAL	0.0	Display of the position at which the technology object was homed (valid when "Done" = TRUE)	
Done	OUTPUT	BOOL	FALSE	TRUE	Job is completed.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Command Aborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Resetting the "Homed" status

The "Homed" status of a technology object is reset under the following conditions (<TO>.StatusWord.X5 (HomingDone)):

- **Technology objects with incremental actual values:**
  - Starting an "MC_Home" job with "Mode" = 3, 5, 8, 10

    (After successful completion of the homing operation, the "Homed" status is reset.)
  - Error in the encoder system, or encoder failure
  - Restart of the technology object
  - After POWER OFF -> POWER ON of the CPU
  - Memory reset
  - Modification of the encoder configuration
- **Technology objects with absolute actual values:**
  - Error in sensor system/encoder failure
  - Replacement of the CPU
  - Modification of the encoder configuration
  - Restoration of the CPU factory settings
  - Transfer of a different project into the controller

Homing a technology object with "Mode" = 1..8, 10

To home a technology object, follow these steps:

1. Check the requirements indicated above.
2. Specify the desired homing function in the "Mode" parameter.
3. Initialize the necessary parameters with values, and start the homing operation with a positive edge at the "Execute" parameter.

When the "Done" parameter shows the value TRUE, the "MC_Home" job has been completed according to the selected "Mode". The "Homed" status of the technology object is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Homed" (<TO>.StatusWord.X5 (HomingDone)).

Abort of a passive homing with "Mode" = 9

With "Mode" = 9, the technology object is not homed. When an active "MC_Home" job for passive homing ("Mode" = 2, 8, 10) is overridden by another "MC_Home" job with "Mode" = 9, the running job is aborted with parameter "CommandAborted" = TRUE. The overriding job with "Mode" = 9 signals successful execution with parameter "Done" = TRUE.

Additional information

An option for the evaluation of the individual status bits can be found in the section "Evaluating StatusWord, ErrorWord and WarningWord (Page 288)".

Error ID for Motion Control instructions (Page 542)

Homing (Page 69)

10.4 MC_Halt V4

10.4.1 MC_Halt: Pause axis V4

Description

With the Motion Control instruction "MC_Halt", you brake an axis until it comes to a standstill.

You define the dynamic behavior of the braking operation with parameters "Jerk" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The override response for "MC_Halt" jobs is described in section "Override response V4: Homing and motion jobs (Page 428)".

Parameters

The following table shows the parameters of Motion Control instruction "MC_Halt":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
AbortAcceleration	INPUT	BOOL	FALSE	FALSE	The current acceleration at the start of the job is reduced using the configured jerk. Afterwards, the deceleration builds up
				TRUE	The acceleration is set to 0.0 at the start of the job, and the deceleration immediately builds up.
Done	OUTPUT	BOOL	FALSE	TRUE	Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Braking an axis with "MC_Halt"

Proceed as follows to decelerate an axis to a standstill:

1. Check the requirements indicated above.
2. Supply the parameters "Deceleration", "Jerk" and "AbortAcceleration" with the desired values.
3. Start the "MC_Halt" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error". The standstill of the axis is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Standstill" (<TO>.StatusWord.X7 (Standstill)).

Braking an axis with active force/torque limit

With active force/torque limiting the permitted torque may not be sufficient to move the calculated braking ramp. The "MC_Halt" command does not signal "Done" = TRUE.

To brake an axis with active force/torque limiting, use the Motion Control instruction "MC_MoveVelocity" with "MC_MoveVelocity.Velocity" = 0.0 and "MC_MoveVelocity.PositionControlled" = FALSE.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

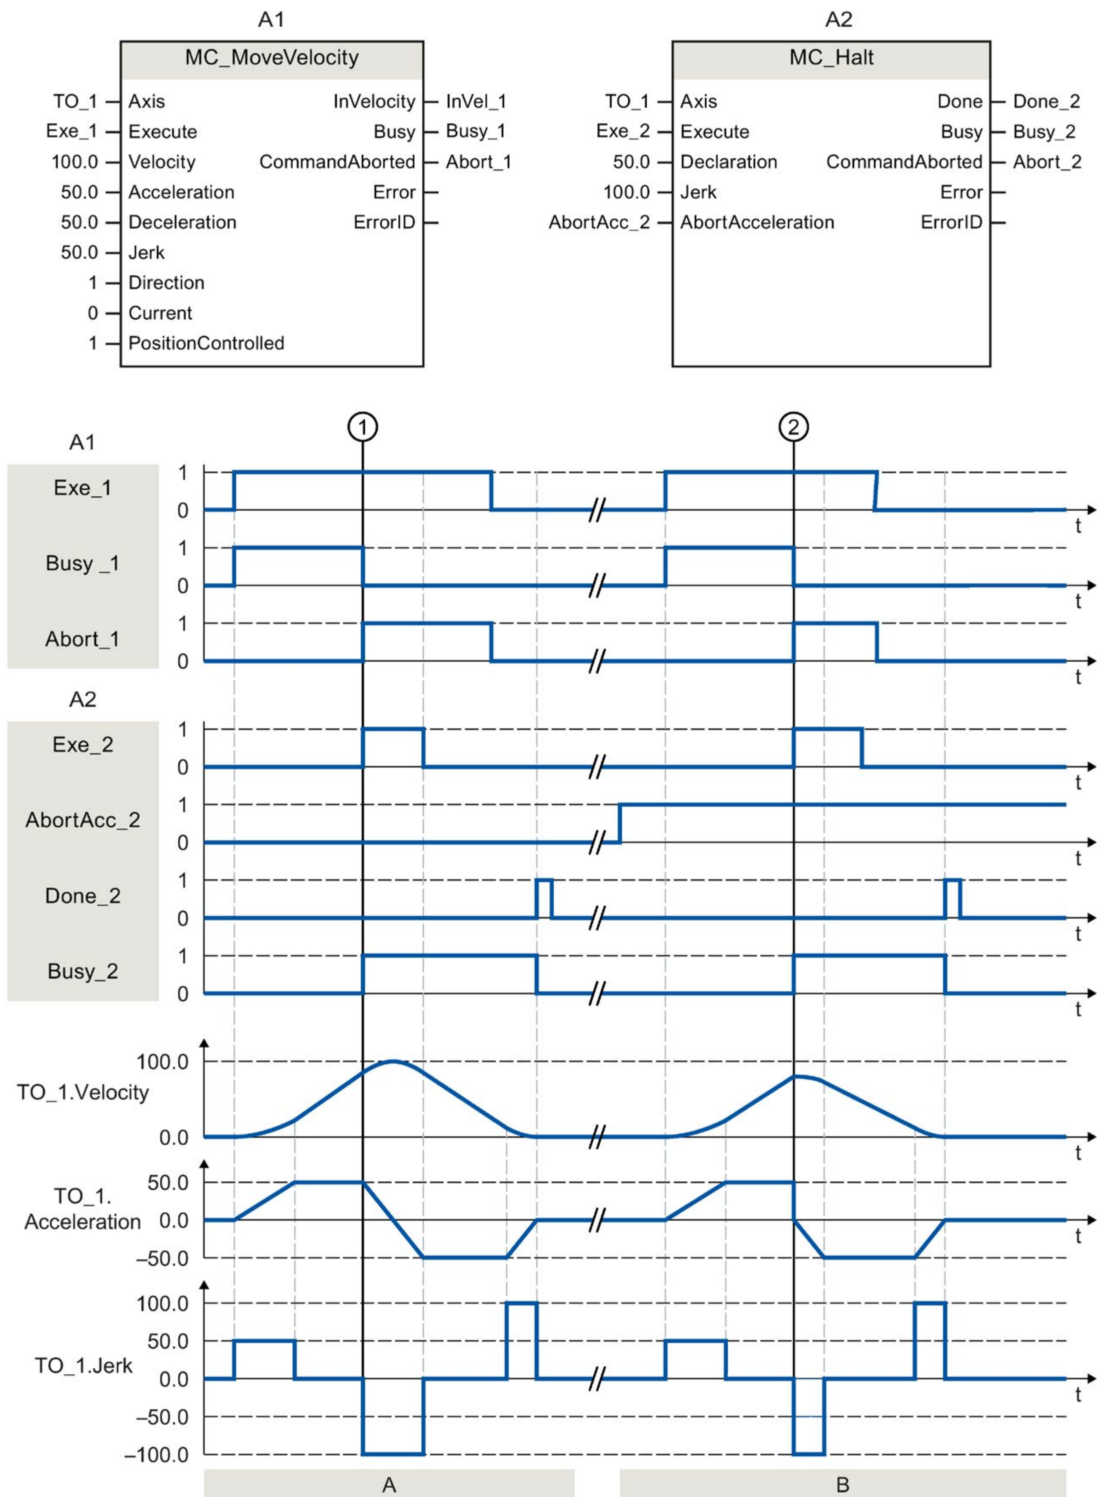
MC_MoveVelocity: Move axis at velocity/speed setpoint V4 (Page 386)

10.4.2 MC_Halt: Function chart V4

Function chart: Stopping an axis and the overriding job characteristics



Section A	An axis is moved with an "MC_MoveVelocity" job (A1). At time ①, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job abort is signaled via "Abort_1". With "AbortAcc_2" = FALSE, the current acceleration is reduced with the specified jerk. Afterward, the deceleration builds up and the axis is braked to a standstill. The completion of the "MC_Halt" job is reported via "Done_2".
Section B	The axis is moved with an "MC_MoveVelocity" job (A1). At time ②, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job abort is signaled via "Abort_1". With "AbortAcc_2" = TRUE, the current acceleration is set to zero immediately and the deceleration builds up. The axis is braked to a standstill. The completion of the "MC_Halt" job is reported via "Done_2".

10.5 MC_MoveAbsolute V4

10.5.1 MC_MoveAbsolute: Position axis absolutely V4

Description

With the Motion Control instruction "MC_MoveAbsolute", you can move an axis to an absolute position.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.
- The technology object is homed.

Override response

The override response for "MC_MoveAbsolute" jobs is described in section "Override response V4: Homing and motion jobs (Page 428)".

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveAbsolute":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_PositioningAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Position	INPUT	LREAL	0.0	Absolute target position	
Velocity	INPUT	LREAL	-1.0	Velocity setpoint for the positioning	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Direction	INPUT	INT	1	Motion direction of the axis Is only evaluated with "modulo" enabled. "Technology object > Configuration > Basic parameters > Enable modulo	
				1	Positive direction
				2	Negative direction
				3	Shortest distance
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached.

Parameters	Declaration	Data type	Default value	Description	
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Moving an axis to an absolute position

Proceed as follows to move an axis to an absolute position:

1. Check the requirements indicated above.
2. Specify the desired target position in the "Position" parameter.
3. Start the "MC_MoveAbsolute" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

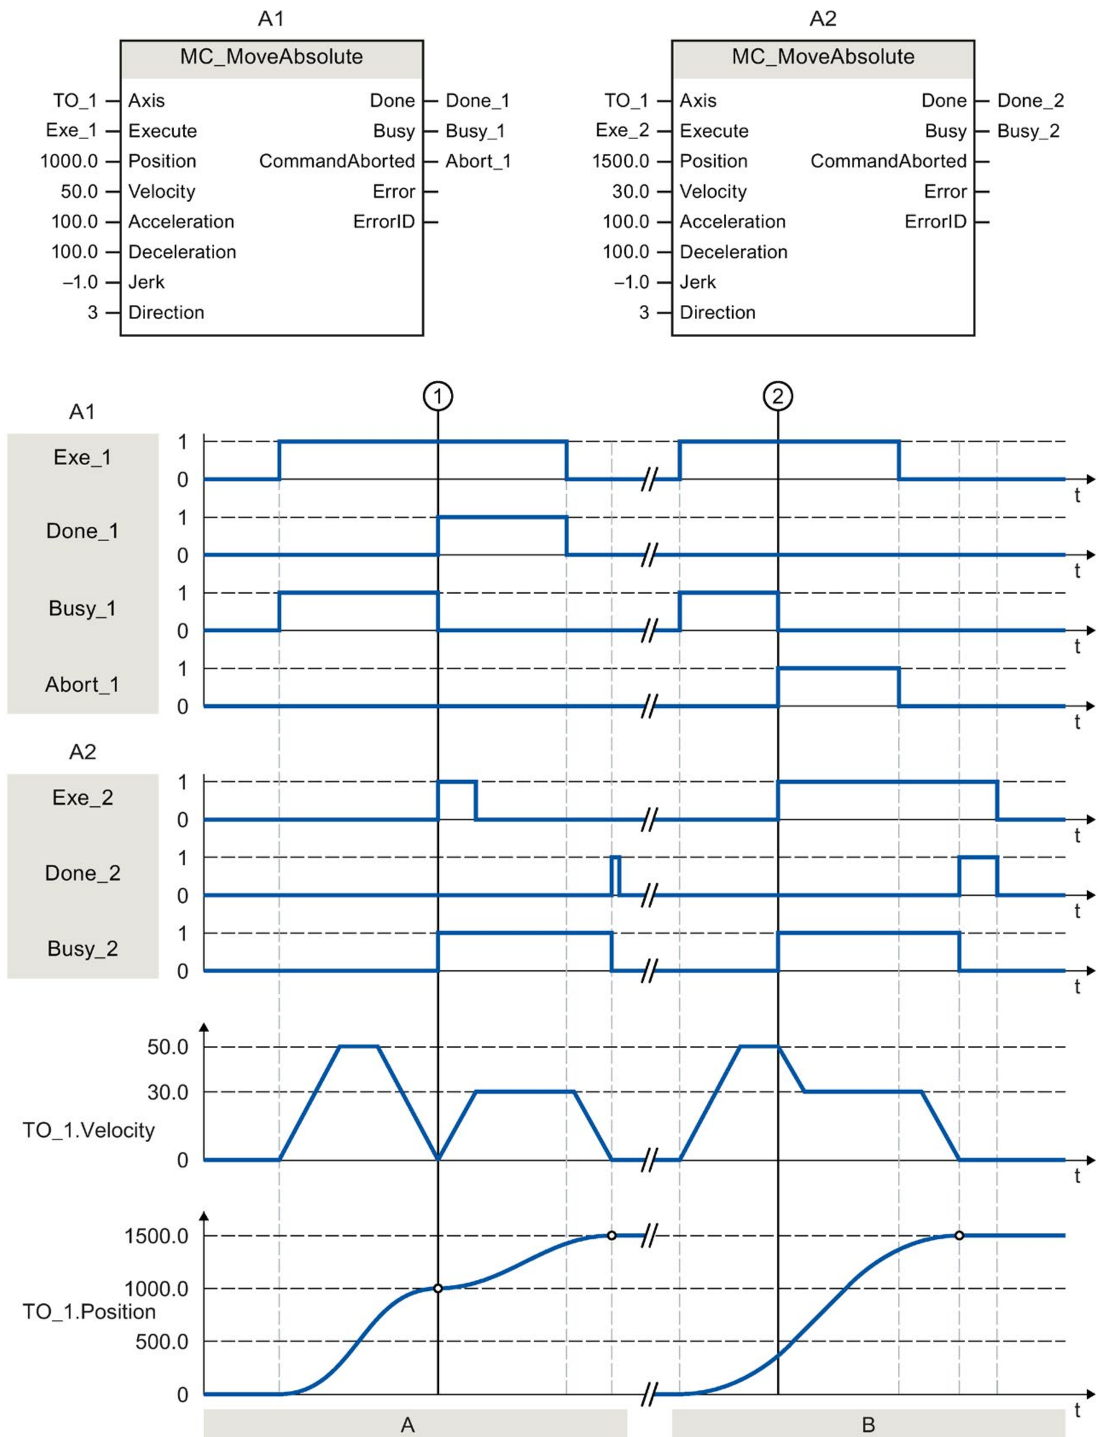
See also

Override response V4: Homing and motion jobs (Page 428)

Error ID for Motion Control instructions (Page 542)

10.5.2 MC_MoveAbsolute: Function chart V4

Function chart: Absolute positioning of an axis, and the response to an overriding job



Section A	An axis is moved to absolute position 1000.0 with an "MC_MoveAbsolute" job (A1). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveAbsolute" job (A2) with target position 1500.0 is started. When the axis reaches the target position 1500.0, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	An active "MC_MoveAbsolute" job (A1) is overridden at time ② by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1". The axis is braked to the changed velocity and moved to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

10.6 MC_MoveRelative V4

10.6.1 MC_MoveRelative: Position axis relatively V4

Description

With the Motion Control instruction "MC_MoveRelative", you move an axis relative to its position when execution of the job began.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The override response for "MC_MoveRelative" jobs is described in section "Override response V4: Homing and motion jobs (Page 428)".

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveRelative":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_PositioningAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Distance	INPUT	LREAL	0.0	Distance for the positioning process (negative or positive)	
Velocity	INPUT	LREAL	-1.0	Velocity setpoint for the positioning	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.

Parameter	Declaration	Data type	Default value	Description	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Moving an axis relative to the starting position

Proceed as follows to move an axis relative to the starting position:

1. Check the requirements indicated above.
2. Specify distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveRelative" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

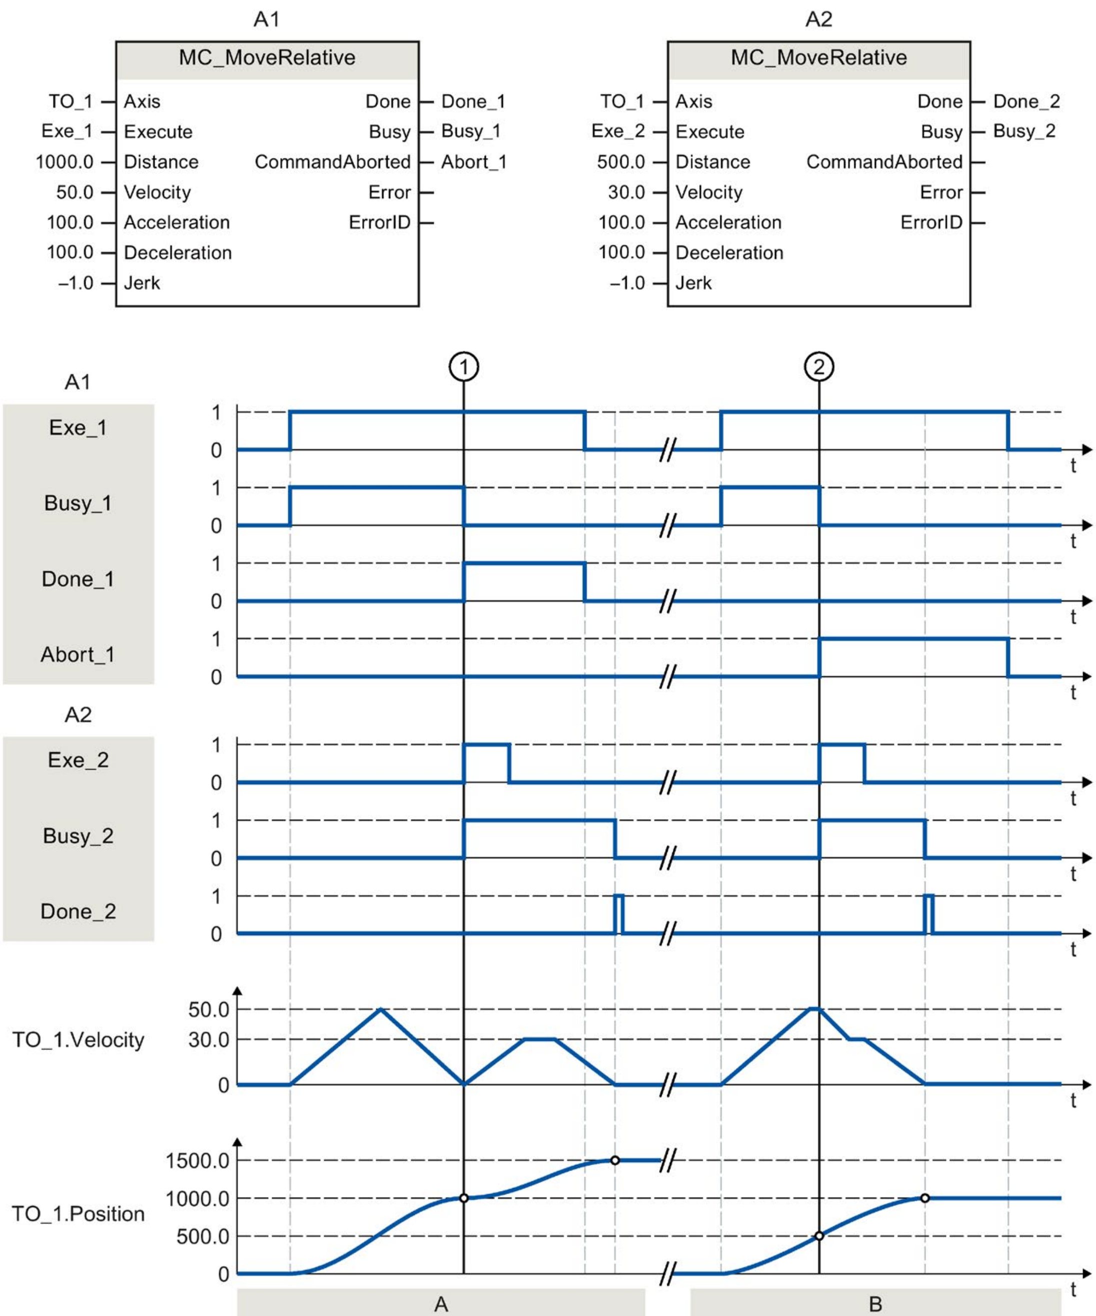
See also

Override response V4: Homing and motion jobs (Page 428)

Error ID for Motion Control instructions (Page 542)

10.6.2 MC_MoveRelative: Function chart V4

Function chart: Relative positioning of an axis, and the overriding job characteristics



Section A	The axis is moved by an "MC_MoveRelative" job (A1) by the distance ("Distance") 1000.0 (the starting position here is 0.0). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveRelative" job (A2) with distance 500.0 is started. When the new target position is reached, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	An active "MC_MoveRelative" job (A1) is overridden by another "MC_MoveRelative" job (A2). The abort is signaled at time ② via "Abort_1". The axis is then moved at the new velocity by the distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

10.7 MC_MoveVelocity V4

10.7.1 MC_MoveVelocity: Move axis at velocity/speed setpoint V4

Description

With the Motion Control instruction "MC_MoveVelocity", you move an axis at constant velocity/speed.

You define the dynamic behavior of the motion with parameters"Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified in the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The override response for "MC_MoveVelocity" jobs is described in section Override response V4: Homing and motion jobs (Page 428).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveVelocity":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Velocity	INPUT	LREAL	100.0	Velocity setpoint / speed setpoint for the motion ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used.
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Direction	INPUT	INT	0	Direction of rotation of the axis	
				0	The sign of the velocity specified at the "Velocity" parameter defines the direction of rotation.
				1	Positive direction of rotation Value of "Velocity" is used.
				2	Negative direction of rotation Value of "Velocity" is used.
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	Deactivated The values of parameters "Velocity" and "Direction" are taken into account.

Parameters	Declaration	Data type	Default value	Description	
				TRUE	activated The values at the parameters "Velocity" and "Direction" are not taken into account. The current velocity and direction at function start are retained. When the axis resumes motion at the velocity that was current at function start, the "InVelocity" parameter returns the value TRUE.
Position Controlled	INPUT	BOOL	TRUE	FALSE	Non position-controlled operation
				TRUE	Position-controlled mode
				The parameter applies as long as the "MC_MoveVelocity" job is being executed. After this, the setting of the following job applies. This parameter is ignored when a speed axis is used.	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The velocity setpoint / speed setpoint was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Command Aborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Behavior with velocity setpoint / speed setpoint zero ("Velocity" = 0.0)

An "MC_MoveVelocity" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the velocity setpoint / speed setpoint zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

The parameters "InVelocity" and "Busy" show the value TRUE until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Moving an axis with constant velocity / speed

Proceed as follows to move an axis with constant velocity / speed:

1. Check the requirements indicated above.
2. At the parameter "Velocity", specify the velocity / speed, with which the axis should be moved.
3. Start the "MC_MoveVelocity" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

If the "InVelocity" parameter shows the value TRUE, then the velocity setpoint / speed setpoint was reached. The axis continues moving at this constant velocity. The parameters "InVelocity" and "Busy" show the value TRUE until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Note

Response to a change in the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity / speed is reached ("Velocity" × "Override" %), then "InVelocity" is reset.

Additional information

An option for the evaluation of the individual status bits can be found in the section "Evaluating StatusWord, ErrorWord and WarningWord (Page 288)".

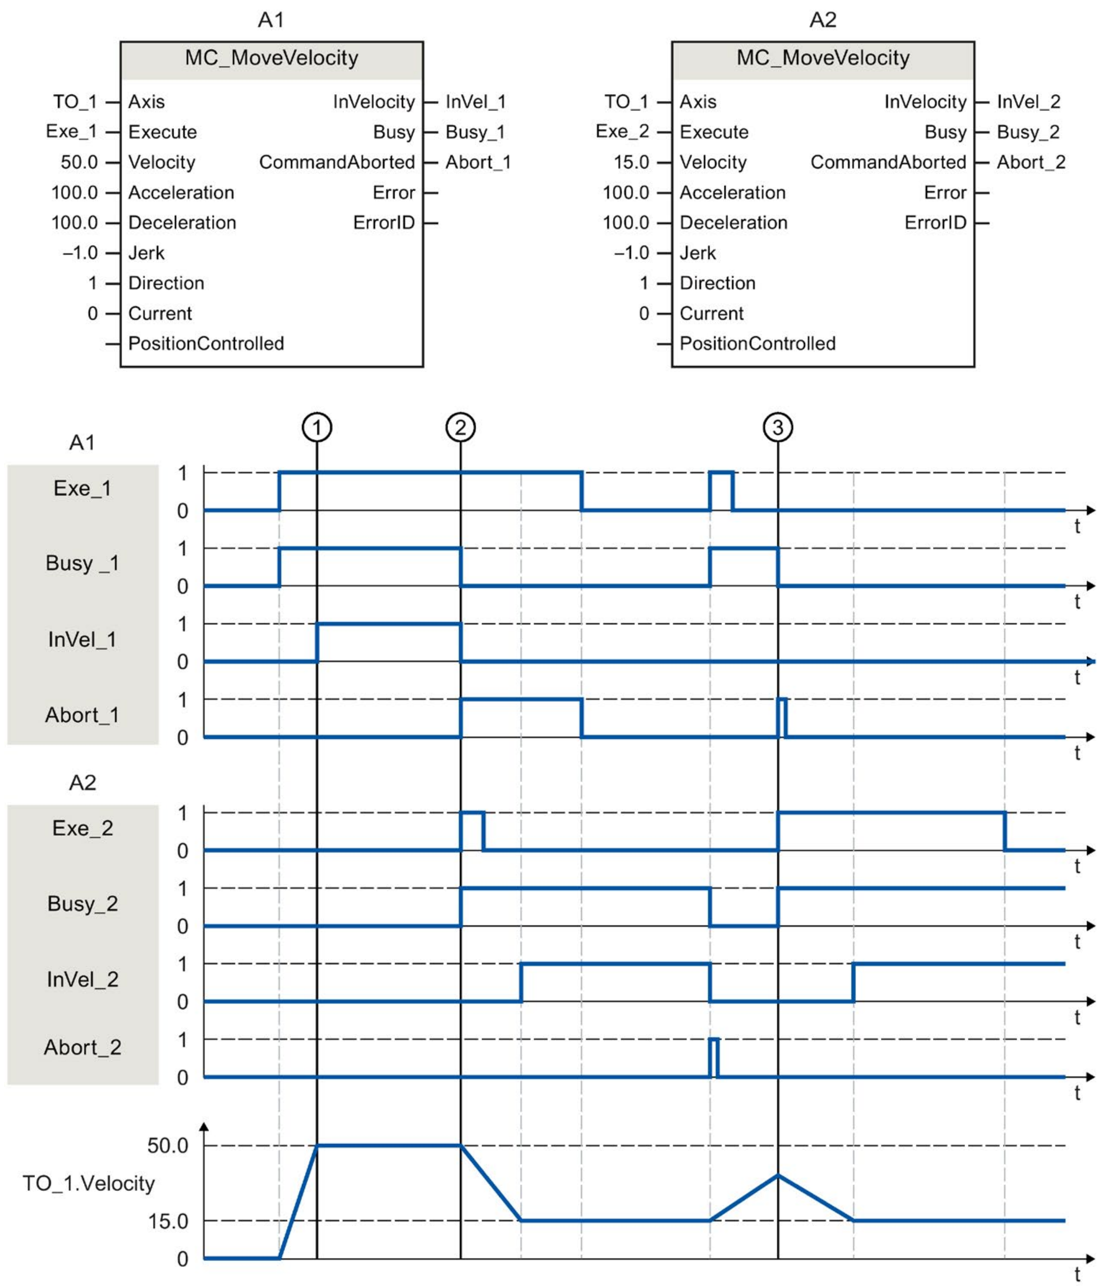
See also

Override response V4: Homing and motion jobs (Page 428)

Error ID for Motion Control instructions (Page 542)

10.7.2 MC_MoveVelocity: Function chart V4

Function chart: Moving an axis with velocity specification, and the response to an overriding job



An "MC_MoveVelocity" job (A1) initiated via "Exe_1" accelerates the axis and signals at time ① via "InVel_1" that the velocity setpoint 50.0 has been reached.

At time ②, the job is overridden by another "MC_MoveVelocity" job (A2). The abort is signaled via "Abort_1". When the new velocity setpoint 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

The running "MC_MoveVelocity" job (A2) is overridden by another "MC_MoveVelocity" job (A1). The abort is signaled via "Abort_2". The axis is accelerated to the new velocity setpoint 50.0. Before the velocity setpoint is reached, the current "MC_MoveVelocity" job (A1) is overridden at time ③ by another "MC_MoveVelocity" job A2). The abort is signaled via "Abort_1". When the new velocity setpoint 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

10.8 MC_MoveJog V4

10.8.1 MC_MoveJog: Move axis in jog mode V4

Description

With the Motion Control instruction "MC_MoveJog", you move an axis in jog mode.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified in the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The override response for "MC_MoveJog" jobs is described in section Override response V4: Homing and motion jobs (Page 428).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveJog":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
JogForward	INPUT	BOOL	FALSE	TRUE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".
JogBackward	INPUT	BOOL	FALSE	TRUE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".
Velocity	INPUT	LREAL	100.0	Velocity setpoint / speed setpoint for the motion	
				> 0.0	The specified value is used.
				< 0.0	The absolute value of the specified value is used.
				("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used.
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
PositionControlled	INPUT	BOOL	TRUE	FALSE	Non position-controlled operation
				TRUE	Position-controlled mode
				The parameter applies as long as the "MC_MoveJog" job is being executed. After this, the setting of the following job applies. This parameter is ignored when a speed axis is used.	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The velocity setpoint / speed setpoint was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.

Parameter	Declaration	Data type	Default value	Description	
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Behavior with zero setpoint velocity/speed ("Velocity" = 0.0)

An "MC_MoveJog" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the velocity setpoint / speed setpoint zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

Moving an axis in jog mode

Proceed as follows to move an axis in jog mode:

1. Check the requirements indicated above.
2. Move the axis in the positive direction with "JogForward", or in the negative direction with "JogBackward".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

If both "JogForward" and "JogBackward" are set to TRUE, the axis is braked at the last valid deceleration. The error 16#8007 (incorrect direction specification) is output.

Note

Response to a change in the override

If the velocity/speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity is reached ("Velocity" × "Override" %), then "InVelocity" is set again.

Additional information

An option for the evaluation of the individual status bits can be found in the section "Evaluating StatusWord, ErrorWord and WarningWord" (Page 288).

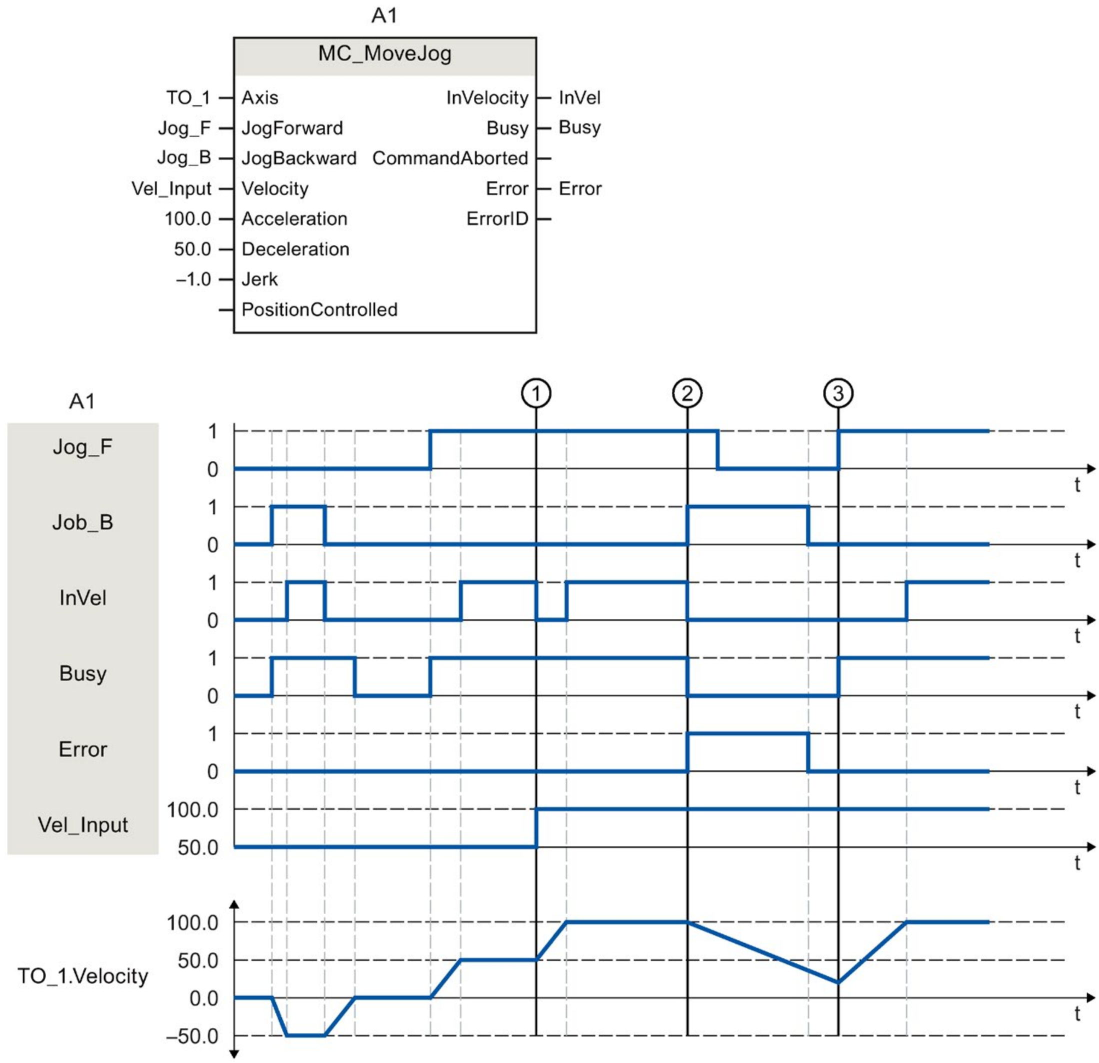
Override response V4: Homing and motion jobs (Page 428)

Error ID for Motion Control instructions (Page 542)

10.8.2 MC_MoveJog: Function chart V4

Function chart: Moving an axis in jog mode



The axis is moved in the negative direction in jog mode via "Jog_B". When the velocity setpoint -50.0 is reached, this is signaled via "InVel" = TRUE. After "Jog_B" is reset, the axis is braked and brought to a standstill. Then the axis is moved in the positive direction via "Jog_F". When the velocity setpoint 50.0 is reached, this is signaled via "InVel" = TRUE.

At time ①, if "Jog_F" is set, the velocity setpoint is changed to 100.0 by means of "Vel_Input". Alternatively, you can also change the velocity setpoint using the velocity override. "InVel" is reset. Axis is being accelerated. When the new velocity setpoint 100.0 is reached, this is signaled via "InVel" = TRUE.

If "Jog_F" is set, "Jog_B" is likewise set at time ②. If both "Jog_F" and "Jog_B" are set, then the axis is braked with the last applicable deceleration. An error is indicated via "Error", and the "ErrorID" of the error 16#8007 (incorrect direction specification) is output.

This error is resolved by resetting the two inputs "Jog_F" and "Jog_B".

During the braking ramp, "Jog_F" is set at time ③. The axis is accelerated to the last configured velocity. When the velocity setpoint 100.0 is reached, this is signaled via "InVel" = TRUE.

10.9 MC_MoveSuperimposed V4

10.9.1 MC_MoveSuperimposed: Position axes overlapping V4

Description

With the Motion Control instruction "MC_MoveSuperimposed", you start a relative positioning motion that is superimposed on a active basic motion.

You define the dynamic behavior of the motion with parameters "VelocityDiff", "Jerk", "Acceleration" and "Deceleration" . The dynamic values are added to the values of the basic motion. The duration of the basic motion is not extended by a superimposed motion.

The dynamics of the total axis motion is the sum of the dynamic values of the basic motion and the superimposed motion.

The behavior of the total motion depends on the type of basic motion:

- The basic motion is a single-axis motion:
  - The maximum dynamics of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The entire motion is limited to the configured dynamic limits.
- The basic motion is a synchronous motion:
  - The maximum dynamics of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The synchronous motion of the following axis is not limited to the dynamic limits of the following axis.
  - An "MC_MoveSuperimposed" job on a leading axis in synchronous operation affects the leading axis and the following axis.
  - An "MC_MoveSuperimposed" job on a following axis in synchronous operation only affects the following axis.

It is always the dynamics of the total motion that is displayed in the technology data block and in the TIA Portal.

Applies to

- Synchronous axis
- Positioning axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The override response for "MC_MoveSuperimposed" jobs is described in section Override response V4: Homing and motion jobs (Page 428).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveSuperimposed":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_PositioningAxis	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Distance	INPUT	LREAL	0.0	Additional distance for the overlapping positioning process (negative or positive)	
VelocityDiff	INPUT	LREAL	-1.0	Maximum velocity deviation compared to the active motion	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used
				= 0.0	Trapezoid velocity profile

Parameters	Declaration	Data type	Default value	Description	
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Done	OUTPUT	BOOL	FALSE	TRUE	Superimposed positioning complete
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 542) for parameter "ErrorID"	

Starting superimposed positioning motion

To start a superimposed positioning motion with Motion Control instruction "MC_MoveSuperimposed", follow these steps:

1. Check the requirements indicated above.
2. Specify the additional distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveSuperimposed" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

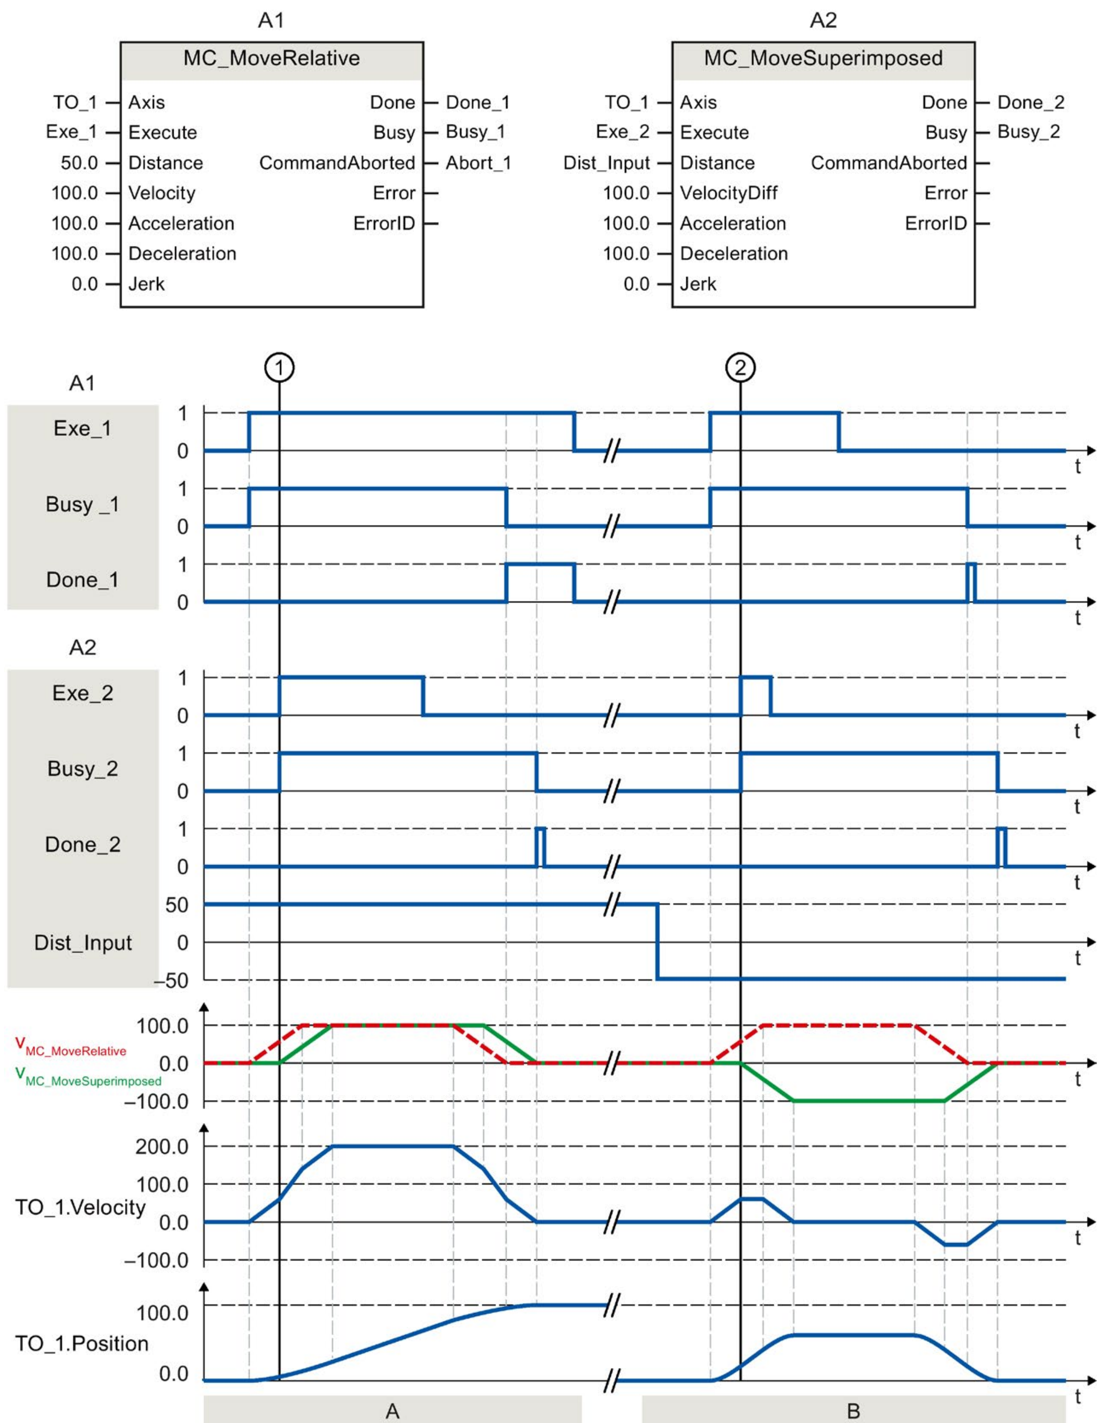
Override response V4: Homing and motion jobs (Page 428)

Error ID for Motion Control instructions (Page 542)

10.9.2 MC_MoveSuperimposed: Function chart V4

Function chart: Positioning axes overlapping



Section A	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At time ①, using "Exe_2", an MC_MoveSuperimposed job with a distance of 50.0 is initiated. The axis is moved with the added dynamic values of both jobs by the distance 50 + 50 = 100.0. When the axis reaches the target position, this is signaled via "Done_2".
Section B	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At time ②, using "Exe_2", a MC_MoveSuperimposed job with a distance of -50.0 is initiated. The axis reverses and is moved with the added dynamic values of both jobs by the distance 50.0 - 50.0 = 0.0. When the axis reaches the target position, this is signaled via "Done_2".

10.10 Measuring input, output cam, cam track

10.10.1 MC_MeasuringInput V4

10.10.1.1 MC_MeasuringInput: Start measuring once V4

Description

With the Motion Control instruction "MC_MeasuringInput", a one-time measuring is started.

With the one-time measuring, one or two edges can be detected with one measuring job. The position of the respective technology object axis or external encoder is assigned to the measuring event. The measurement result is indicated in the function block and in the technology data block and can be further processed in the user program. This completes the measuring job.

Another measuring job must be started again using "MC_MeasuringInput.Execute" = TRUE.

Applies to

- Measuring input

Requirement

- The technology object has been configured correctly.
- The encoder of the axis must have "valid" status (StatusSensor[1..4].State = valid). Otherwise, the measuring job is rejected in the function block with an error indication.
- Measuring using PROFIdrive is not possible during active or passive homing.

Override response

The override response for "MC_MeasuringInput" jobs is described in section Override response V4: Measuring input jobs (Page 430).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MeasuringInput":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_Measuring Input	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Mode	INPUT	DINT	0	Type of measurement	
				0	Measurement of next positive edge
				1	Measurement of next negative edge
				2	Measurement of next two edges
				3	Measurement of two edges, beginning with the positive edge • Rising edge = "MeasuredValue1" (measured value 1) • Falling edge = "MeasuredValue2" (measured value 2)
				4	Measurement of two edges, beginning with the negative edge • Falling edge = "MeasuredValue1" • Rising edge = "MeasuredValue2"
MeasuringRange	INPUT	BOOL	FALSE	Acquisition of measured values Observe the time-related boundary conditions (Page 122).	
				FALSE	Always acquire measured values
				TRUE	Acquire measured values only within the measuring range
StartPosition	INPUT	LREAL	0.0	Start position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
EndPosition	INPUT	LREAL	0.0	End position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Done	OUTPUT	BOOL	FALSE	TRUE	The block has been completely processed. Measured values are valid.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The measuring job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	
MeasuredValue1	OUTPUT	LREAL	0.0	First measured value	
MeasuredValue2	OUTPUT	LREAL	0.0	Second measured value (for measurement of two edges)

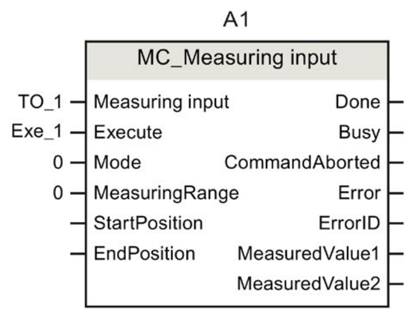
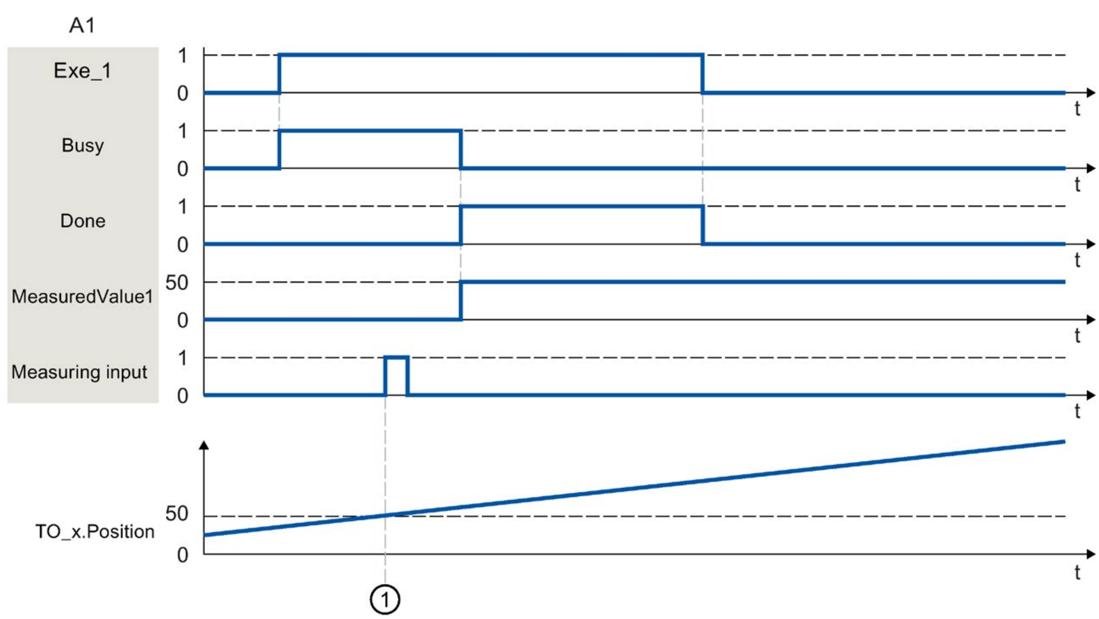
One-time measurement (Page 116)
Override response V4: Measuring input jobs (Page 430)

10.10.1.2 MC_MeasuringInput: Function chart V4

Function chart: Start measuring job once





A "MC_MeasuringInput" job with "Mode" = 0 initiated using "Execute" performs a measurement of the next positive edge. A successfully completed measurement is signaled with "Done" = TRUE. The determined measured value ① (in example: 50) is output using "MeasuredValue1".

10.10.2 MC_MeasuringInputCyclic V4

10.10.2.1 MC_MeasuringInputCyclic: Start cyclic measuring V4

Description

With the Motion Control instruction "MC_MeasuringInputCyclic", a cyclic measuring is started.

With cyclic measuring, up to two measuring events are detected by the system and the associated measuring positions displayed. The measurements are continued cyclically until they are ended per command.

Applies to

- Measuring input

Requirement

- The technology object has been configured correctly.
- Cyclic measuring is only possible when measuring using TM Timer DIDQ.
- The operationally active encoder of the axis must have "valid" status (StatusSensor[1..4].State = valid). Otherwise, the measuring job is rejected in the function block with an error indication.

Override response

The override response for "MC_MeasuringInputCyclic" jobs is described in section Override response V4: Measuring input jobs (Page 430).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MeasuringInputCyclic":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_Measuring Input	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Mode	INPUT	DINT	0	Type of measurement	
				0	Measurement of positive edges
				1	Measurement of negative edges
				2	Measurement of both edges
MeasuringRange	INPUT	BOOL	FALSE	Acquisition of measured values Observe the time-related boundary conditions (Page 122).	
				FALSE	Always acquire measured values
				TRUE	Acquire measured values only within the measuring range
StartPosition	INPUT	LREAL	0.0	Start position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
EndPosition	INPUT	LREAL	0.0	End position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The measuring job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	
MeasuredValue1	OUTPUT	LREAL		First measured value	
MeasuredValue2	OUTPUT	LREAL		Second measured value (when measuring multiple edges in one position control cycle)	
MeasuredValue1Counter	OUTPUT	UDINT	0	Count value for the first measured value	
MeasuredValue2Counter	OUTPUT	UDINT	0	Count value for the second measured value	
LostEdgeCounter1	OUTPUT	UDINT	0	Count value for the lost edges in the cycle clock of the first measured value acquisition	
LostEdgeCounter2	OUTPUT	UDINT	0	Count value for the lost edges in the cycle clock of the second measured value acquisition

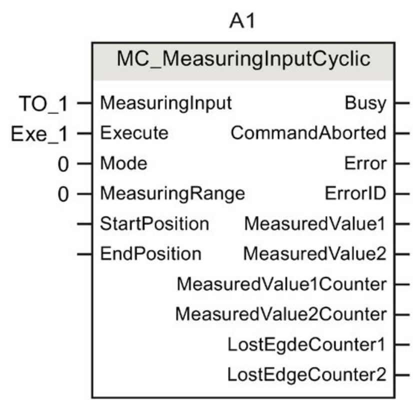
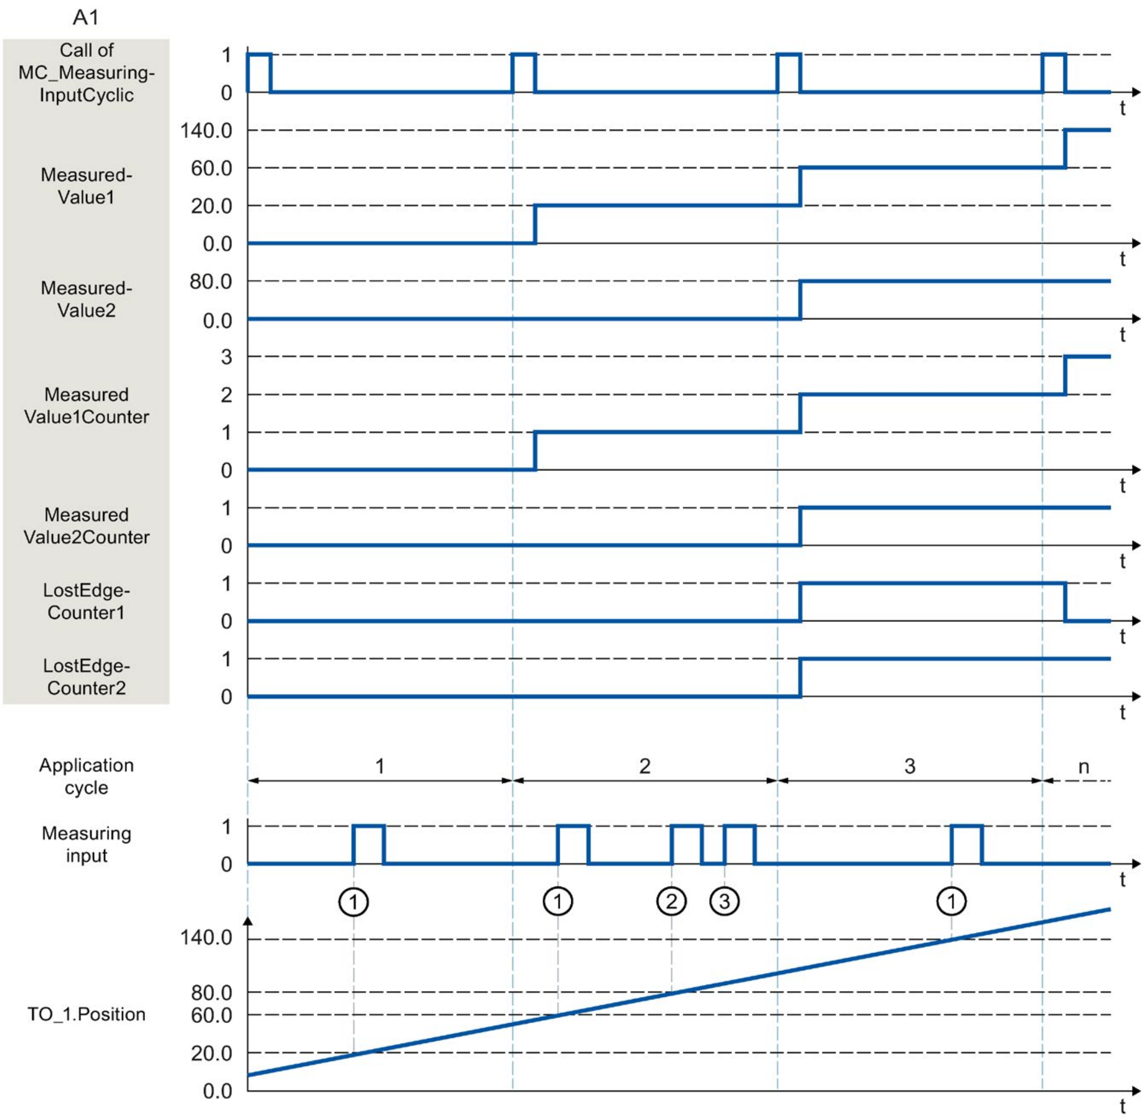
Cyclic measuring (Page 117)

Override response V4: Measuring input jobs (Page 430)

10.10.2.2 MC_MeasuringInputCyclic: Function chart V4

Function chart: Start cyclic measuring job





A "MC_MeasuringInputCyclic" command initiated using "Execute" (signal and start point not shown) (e.g. call in MC-PreServo [OB67]) with "Mode" = 0 and without specified measuring range "MeasuringRange" = FALSE performs a measurement of the positive edges. By calling the Motion Control instruction "MC_MeasuringInputCyclic" in MC-PreServo [OB67] or MC-PreServo [OB67], the measuring command as well as the measurement itself is called in the same application cycle.

The actual position determined at the time of the first positive edge ① in the position control cycle is output using "MeasuredValue1", and count tag "MeasuredValue1Counter" is incremented by "1".

The actual position determined at the time of the second positive edge ② in the position control cycle is output using "MeasuredValue2", and count tag "MeasuredValue2Counter" is incremented by "1".

If additional positive edges occur in the same position control cycle ③, these are recorded in LostEdgeCounter1 and LostEdgeCounter2.

10.10.3 MC_AbortMeasuringInput V4

10.10.3.1 MC_AbortMeasuringInput: Abort active measuring V4

Description

With the Motion Control instruction "MC_AbortMeasuringInput", an active one-time or cyclic measuring job is aborted.

Applies to

- Measuring input

Requirement

- The technology object has been configured correctly.

Override response

The override response for "MC_AbortMeasuringInput" jobs is described in section Override response V4: Measuring input jobs (Page 430).

Parameters

The following table shows the parameters of Motion Control instruction "MC_AbortMeasuringInput":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_MeasuringInput	-	Technology object	
Execute	INPUT	BOOL	FALSE	TRUE	Start job with a positive edge
Done	OUTPUT	BOOL	0	The function block has been processed. The measuring job has been deactivated.	
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"

Technology object measuring input (Page 111)

10.10.4 MC_OutputCam V4

10.10.4.1 MC_OutputCam: Activate/deactivate cam V4

Description

You use Motion Control instruction "MC_OutputCam" to activate the specified cam.

Depending on the cam type, the following input parameters are in effect:

- Distance output cam
  - "OnPosition"
  - "OffPosition"
- Time-based output cam
  - "OnPosition"
  - "Duration"

You define the operating mode and the effective direction of the cam with parameters "Mode" and "Direction".

When "MC_OutputCam.Enable" = TRUE, the input parameters are always read and take effect at the next position control cycle.

When a technological alarm occurs, the cam is processed again after error acknowledgment.

Applies to

- Output cam

Requirement

- The technology object has been configured correctly.
- The higher-level technology object must have a valid position.
- Setpoint output cams are not output for an axis in non-position-controlled operation.
- A setpoint output cam with the setting "MC_OutputCam.OnPosition" = 0 switches at position setpoint = 0.

Override response

The "MC_OutputCam" is canceled by:

- Disabling of the cam with "MC_OutputCam.Enable" = FALSE
- Only one instance of the "MC_OutputCam" function block can be active on an output cam in the user program. A second instance of the "MC_OutputCam" function block on a currently active output cam is rejected with an error.

Parameters

The following table shows the parameters of Motion Control instruction "MC_OutputCam":

Parameters	Declaration	Data type	Default value	Description	
OutputCam	INPUT	TO_OutputCam	-	Technology object	
Enable	INPUT	BOOL	FALSE	FALSE	Cam is disabled
				TRUE	Cam is being processed
OnPosition	INPUT	LREAL	0.0	Start position of the cam [unit of measurement of the interconnected technology object] For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
OffPosition	INPUT	LREAL	0.0	End position of the distance output cam [unit of measurement of the interconnected technology object] For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Duration	INPUT	LREAL	0.0	Switch-on duration of the time-based output cam [unit of measurement: ms] The value for the switch-on duration of a time-based output cam must be greater than 0.0.	
Mode	INPUT	DINT	1	Operating mode	
				1	Standard Cam functionality (output not inverted)
				2	Cam functionality with inverted output
				3	Cam always ON (while "Enable" = TRUE)
Direction	INPUT	DINT	1	Activation direction of the cam	
				1	Positive direction
				2	Negative direction
				3	Both directions
CamOutput	OUTPUT	BOOL	-	Status display based on last call of Motion Control instruction "MC_OutputCam"	
Busy	OUTPUT	BOOL	FALSE	TRUE	Processing of the cam is active.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

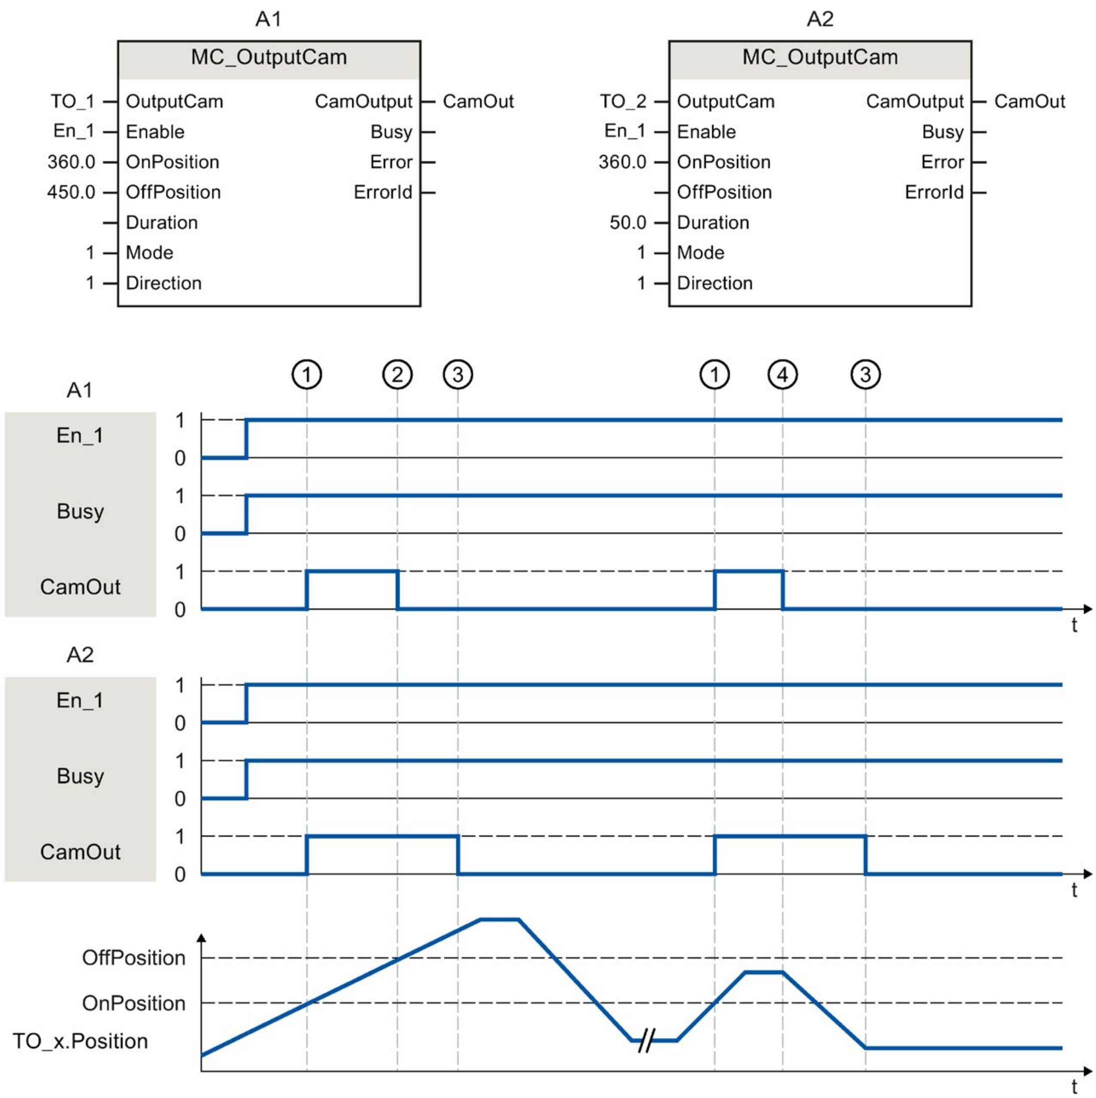
See also

Error ID for Motion Control instructions (Page 542)

Technology object output cam (Page 126)

10.10.4.2 MC_OutputCam: Function chart V4

Function chart: Activate the specified cam type



A1 Distance output cam

A2 Time-based output cam

A cam is activated with "Enable" = TRUE. The cam is output corresponding to the parameters.

The processing of the cam is indicated with "Busy" = TRUE.

When activation direction "Direction" = 1 (positive) is set, the cam behaves as follows, regardless of the cam type setting:

- The distance output cam switches on at "OnPosition" ① and switches off again at "OffPosition" ②. At a direction reversal the cam is switched off ④.
- The time-based output cam switches on at "OnPosition" ① and switches off again after expiration of the specified time "Duration" ③. A switched on time-based output cam remains active for the specified switch-on duration "Duration", even if overtravel of the start position occurs again in the reverse direction.

The switching state of the cam is output using "CamOutput".

With "Enable" = FALSE, the specified cam type is deactivated. "Busy" = FALSE shows that the cam is not being processed.

10.10.5 MC_CamTrack V4

10.10.5.1 MC_CamTrack: Activate/deactivate cam track V4

Description

With the Motion Control instruction "MC_CamTrack", the processing of a cam track is enabled.

Applies to

- Cam track

Requirement

- The technology object has been configured correctly.
- The higher-level technology object must have a valid position.
- Setpoint output cams are not output for an axis in non-position-controlled operation.

Override response

- The "MC_CamTrack" is aborted by the disabling of the cam track with "MC_CamTrack.Enable" = FALSE.
- Only one instance of the "MC_CamTrack" function block can be active on a cam track in the user program. A second instance of the "MC_CamTrack" function block on a currently active cam track is rejected with an error.
- The cam track is recalculated at a change of the parameters of the Motion Control instruction "MC_CamTrack" or in the technology data block. The cam track is processed in accordance with all parameter settings.

Parameters

The following table shows the parameters of Motion Control instruction "MC_CamTrack":

Parameters	Declaration	Data type	Default value	Description	
CamTrack	INPUT	TO_CamTrack	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	Cam track is processed
				FALSE	Cam track is disabled
Mode	INPUT	INT	1	0	When "Enable" = TRUE: Cam track processing is activated immediately Cam track data takes effect immediately Previously activated distance output cams are aborted if their track signal is not still set due to the changed cam track data. Previously activated time-based output cams are always aborted.
					When "Enable" = FALSE: Cam track processing is stopped immediately, distance output/time-based output cams are aborted immediately.
				1	When "Enable" = TRUE: Cam track processing is activated immediately/with the next track cycle: • When a cam track is activated for the first time, the cam track processing begins immediately. • If the cam track processing is already active, the current cam track is output up to the end of the track cycle. The new cam track data then takes effect.
					When "Enable" = FALSE: Cam track processing is ended at the end of the cam track
				2	When "Enable" = TRUE: Cam track output is switched on immediately and remains switched on
					When "Enable" = FALSE: Cam track output is switched off immediately
InvertOutput	INPUT	BOOL	FALSE	Inverted output	
				TRUE	Track output is output inverted
				FALSE	Track output is output not inverted
TrackOutput	OUTPUT	BOOL	-	Indicates the switching state of the cam track.	
Busy	OUTPUT	BOOL	FALSE	TRUE	Processing of the cam track is active.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"

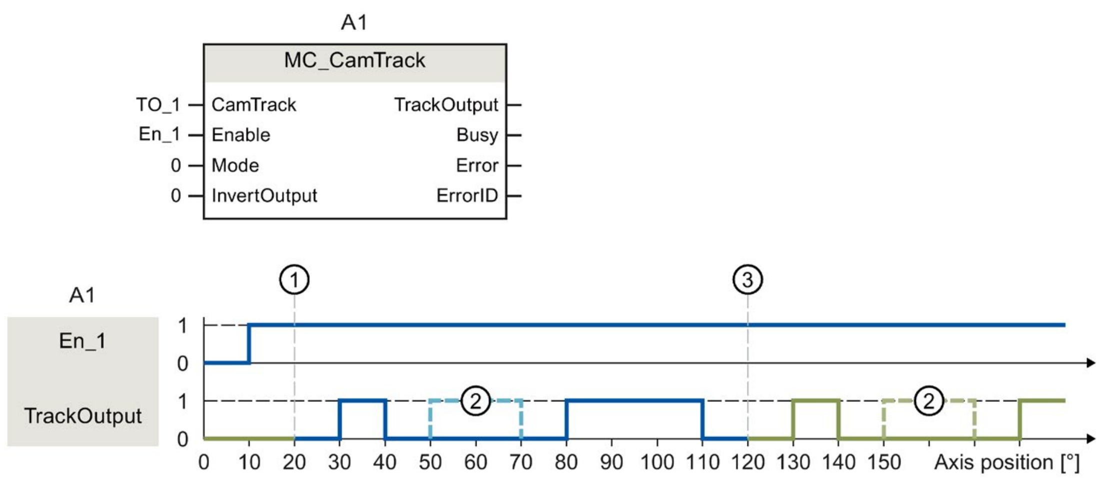
Cam track technology object (Page 141)

10.10.5.2 MC_CamTrack: Function chart V4

Function chart: Activate cam track



① Axis reference position
② Cam configured as invalid
③ Start of cyclically continued cam track

A cam track is activated with "Enable" = TRUE. The cam track is output in accordance with the parameters set in the technology data block.

Tag		Value	Description
<TO>Parameter.			
	CamTrackType	0	Specified cam type for the cam track is distance output cam
	ReferencePosition	20.0	Specified axis reference position for the cam track
	CamTrackLength	100.0	Specified length of the cam track
	CamTrack[1].Existent	TRUE	The first distance output cam of the cam track is specified as valid
	CamTrack[1].OnPosition	10.0	Start position for the first cam of the cam track
	CamTrack[1].OffPosition	20.0	End position for the first cam of the cam track
	CamTrack[2].Existent	FALSE	The second distance output cam of the cam track is specified as invalid
	CamTrack[2].OnPosition	30.0	Start position for the second cam of the cam track
	CamTrack[2].OffPosition	50.0	End position for the second cam of the cam track
	CamTrack[3].Existent	TRUE	The third distance output cam of the cam track is specified as valid
	CamTrack[3].OnPosition	60.0	Start position for the third cam of the cam track
	CamTrack[3].OffPosition	90.0	End position for the third cam of the cam track

10.11 Synchronous motion

10.11.1 MC_GearIn V4

10.11.1.1 MC_GearIn: Start gear synchronization V4

Description

With the Motion Control instruction "MC_GearIn", you start a gearing (Page 107) operation between a leading axis and a following axis.

You define the dynamic behavior of the following axis for synchronization with parameters "Jerk", "Acceleration" and "Deceleration".

The synchronization duration and distance are dependent on the following parameters:

- Start time of the "MC_GearIn" job
- Dynamics of the following axis at the start time
- Dynamic settings for synchronization
- Dynamics of the leading axis

You specify the gear ratio as the relationship between two integers (numerator/denominator) with the parameters "RatioNumerator" and "RatioDenominator".

The numerator of the gear ratio is specified as positive or negative. This yields the following behavior:

- **Positive gear ratio:**

  The leading and following axes move in the same direction.
- **Negative gear ratio**:

  The following axis moves in the opposite direction of the leading axis.

You can start synchronous operation when the leading axis is at a standstill or when it is in motion.

Applies to

- Synchronous axis

Requirement

- The technology objects of the leading axis and the following axis have been configured correctly.
- The leading axis is a positioning axis, synchronous axis, or external encoder.
- The following axis is a synchronous axis.
- The leading axis is specified as possible leading axis in the configuration of the following axis in "Technology object > Configuration > Leading value interconnections".
- The following axis is enabled.

Override response

The override response for "MC_GearIn" jobs is described in section Override response V4: Synchronous operation jobs (Page 429).

Disabling the following axis with "MC_Power.Enable" = FALSE aborts the synchronous operation in every status.

Disabling the leading axis with "MC_Power", in contrast, does not abort synchronous operation. The following axis follows the leading axis even during the braking ramp and after the leading axis is enabled again.

Parameters

The following table shows the parameters of Motion Control instruction "MC_GearIn":

<table>
<tr><th>Parameters</th><th>Declaration</th><th>Data type</th><th>Default value</th><th colspan="2">Description</th></tr>
<tr><td>Master</td><td>INPUT</td><td>TO_Axis</td><td>-</td><td colspan="2">Leading axis technology object</td></tr>
<tr><td>Slave</td><td>INPUT</td><td>TO_SynchronousAxis</td><td>-</td><td colspan="2">Following axis technology object</td></tr>
<tr><td>Execute</td><td>INPUT</td><td>BOOL</td><td>FALSE</td><td>TRUE</td><td>Start job with a positive edge</td></tr>
<tr><td>RatioNumerator</td><td>INPUT</td><td>DINT</td><td>1</td><td colspan="2">Gear ratio numerator
Permitted integer values:
-2147483648 to 2147483648
(value 0 not permitted)</td></tr>
<tr><td>RatioDenominator</td><td>INPUT</td><td>DINT</td><td>1</td><td colspan="2">Gear ratio denominator
Permitted integer values:
1 to 2147483648</td></tr>
<tr><td rowspan="4">Acceleration</td><td rowspan="4">INPUT</td><td rowspan="4">LREAL</td><td rowspan="4">-1.0</td><td colspan="2">Acceleration</td></tr>
<tr><td>> 0.0</td><td>The specified value is used.</td></tr>
<tr><td>= 0.0</td><td>Not permitted</td></tr>
<tr><td>< 0.0</td><td>The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used.
(<TO>.DynamicDefaults.Acceleration)</td></tr>
</table>

Parameters	Declaration	Data type	Default value	Description	
Deceleration	INPUT	LREAL	-1.0	Deceleration	
				> 0.0	The specified value is used.
				= 0.0	Not permitted
				< 0.0	The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk	
				> 0.0	Constant-acceleration velocity profile; the specified jerk is used
				= 0.0	Trapezoid velocity profile
				< 0.0	The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
InGear	OUTPUT	BOOL	FALSE	TRUE	Synchronous operation reached The following axis is synchronized and moves synchronously to the leading axis.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 542) for parameter "ErrorID"	

Starting synchronous operation

To start synchronous operation with the Motion Control instruction "MC_GearIn", follow these steps:

1. Check the requirements indicated above.
2. Specify the leading axis, the following axis and the gear ratio at the corresponding parameters.
3. Start the "MC_GearIn" job with a positive edge at parameter "Execute".

The following axis is synchronized to the leading value of the leading axis. If the "InGear" parameter shows the value TRUE, the following axis is synchronized and moves synchronously to the leading axis. The parameters "InGear" and "Busy" show the value TRUE until the "MC_GearIn" job is overridden by another Motion Control job.

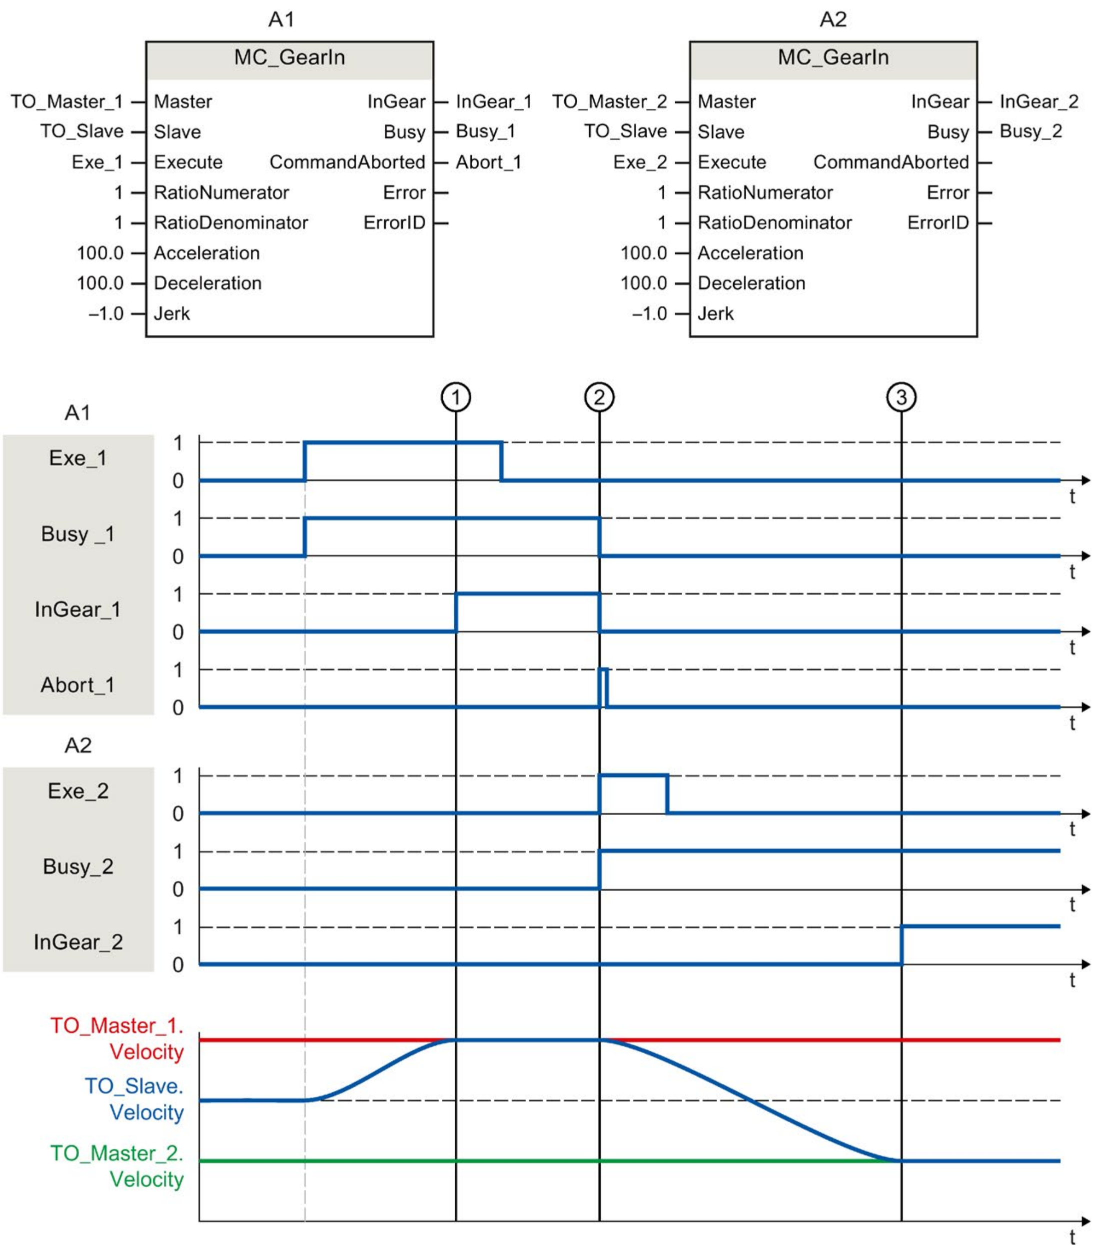
Error ID for Motion Control instructions (Page 542)

Override response V4: Synchronous operation jobs (Page 429)

10.11.1.2 MC_GearIn: Function chart V4

Function chart: Synchronizing and switching the leading value



Using "Exe_1", an "MC_GearIn" job (A1) is initiated. The following axis (TO_Slave) is synchronized to the leading axis (TO_Master_1). "InGear_1" signals at time ① that the following axis is synchronized and moves synchronously to the leading axis.

At time ②, synchronous operation is overridden by another "MC_GearIn" job (A2). The abort is signaled via "Abort_1". The following axis is synchronized to the new leading axis (TO_Master_2). "InGear_2" signals at time ③ that the following axis is synchronized and moves synchronously to the leading axis.

10.12 Torque data

10.12.1 MC_TorqueLimiting V4

10.12.1.1 MC_TorqueLimiting: Activate and deactivate force/torque limit / fixed stop detection V4

Description

With the Motion Control instruction "MC_TorqueLimiting", you activate and assign parameters for force/torque limiting and fixed stop detection. Together with a position-controlled motion job, a "Travel to fixed stop" can be realized with the fixed stop detection. In the axis configuration, you can configure whether the force/torque limiting is to relate to the drive side or the load side.

The functions of the Motion Control instruction "MC_TorqueLimiting" can be activated and deactivated before and during a motion job.

Force/torque limiting applies to

- Speed axis
- Positioning axis
- Synchronous axis

Requirements for force/torque limiting

- The technology object and the reference torque of the drive have been configured correctly.
- No enable-preventing errors are pending for the technology object (the technology object does not have to be enabled).
- The drive must support force/torque reduction. Only PROFIdrive drives with SIEMENS telegram 10x support force/torque limiting.
- Interconnection in the SINAMICS drive:
  - P1522 to a fixed value of 100%
  - P1523 to a fixed value of -100% (e.g. through interconnection to fixed value parameter P2902[i]).

Fixed stop detection applies to

- Positioning axis
- Synchronous axis

Requirement for fixed stop detection

- The fixed stop detection can only be applied to position-controlled axes. For fixed stop detection, the axis must be enabled as position-controlled axis; motion commands must be executed as position-controlled motion commands.
- The technology object has been configured correctly.
- When a drive and telegram that support force/torque limiting is used, the reference torque of the drive must be correctly configured for the technology object.
- No enable-preventing errors are pending for the technology object (the technology object does not have to be enabled).

Override response

- An "MC_TorqueLimiting" job cannot be aborted by any other Motion Control job.
- A new "MC_TorqueLimiting" job does not abort any active Motion Control jobs.
- If the high and low torque limiting is active via the "MC_TorqueRange" job, the "MC_TorqueLimiting" job is rejected with an error message and vice versa. The functions do not override one another.

Parameters

The following table shows the parameters of Motion Control instruction "MC_TorqueLimiting":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	Activate function corresponding to input parameter Mode
Limit	INPUT	LREAL	-1.0	Value of force/torque limiting (in the configured unit of measurement) If drive and telegram do not support force/torque limiting, the specified value is irrelevant.	
				≥ 0	Use the value specified in the parameter ("0" value is permissible)
				< 0	Use the value configured in the "Torque limiting" configuration window. Tag Torque Limit: <TO>.TorqueLimiting.LimitDefaults.Torque Tag Force Limit: <TO>.TorqueLimiting.LimitDefaults.Force
Mode	INPUT	DINT	0	0	Force/torque limiting
				1	Fixed stop detection If drive and telegram support force/torque limiting, this is applied.
InClamping	OUTPUT	BOOL	FALSE	TRUE	Mode = 1: The drive is kept at the fixed stop (clamping), the axis position is within the positioning tolerance.
InLimitation	OUTPUT	BOOL	FALSE	TRUE	Mode = 0 and 1: Drive is operating at the force/torque limit.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

Changes to input parameters "Limit" and "Mode" are also transferred at the cyclic call of the Motion Control instruction when "Enable = TRUE".

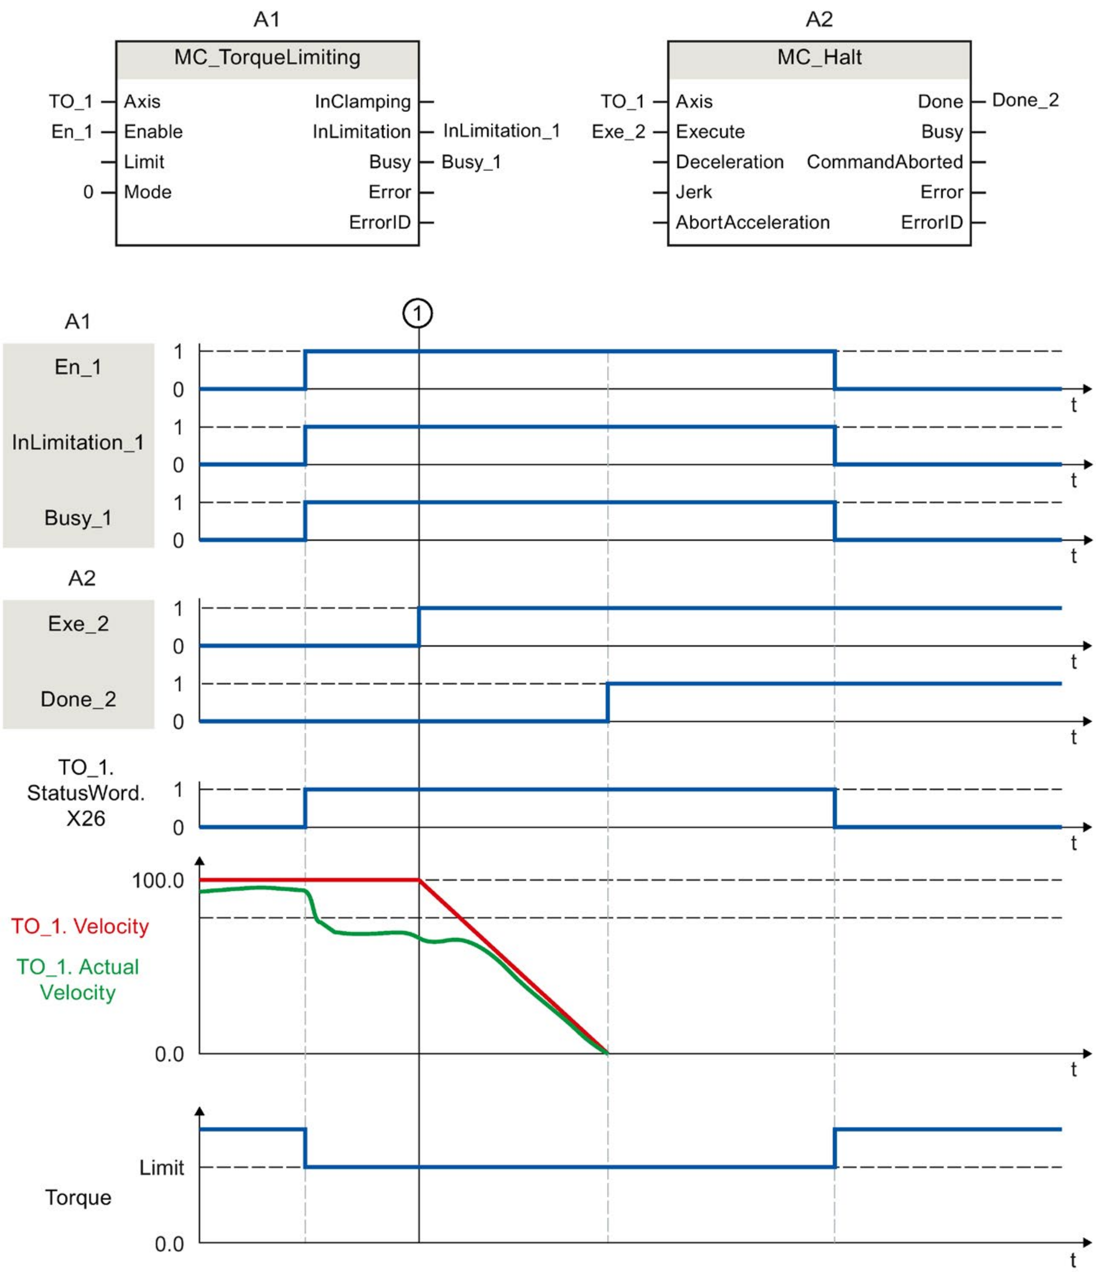
Error ID for Motion Control instructions (Page 542)

Fixed stop detection (Page 65)

Force/torque limiting (Page 63)

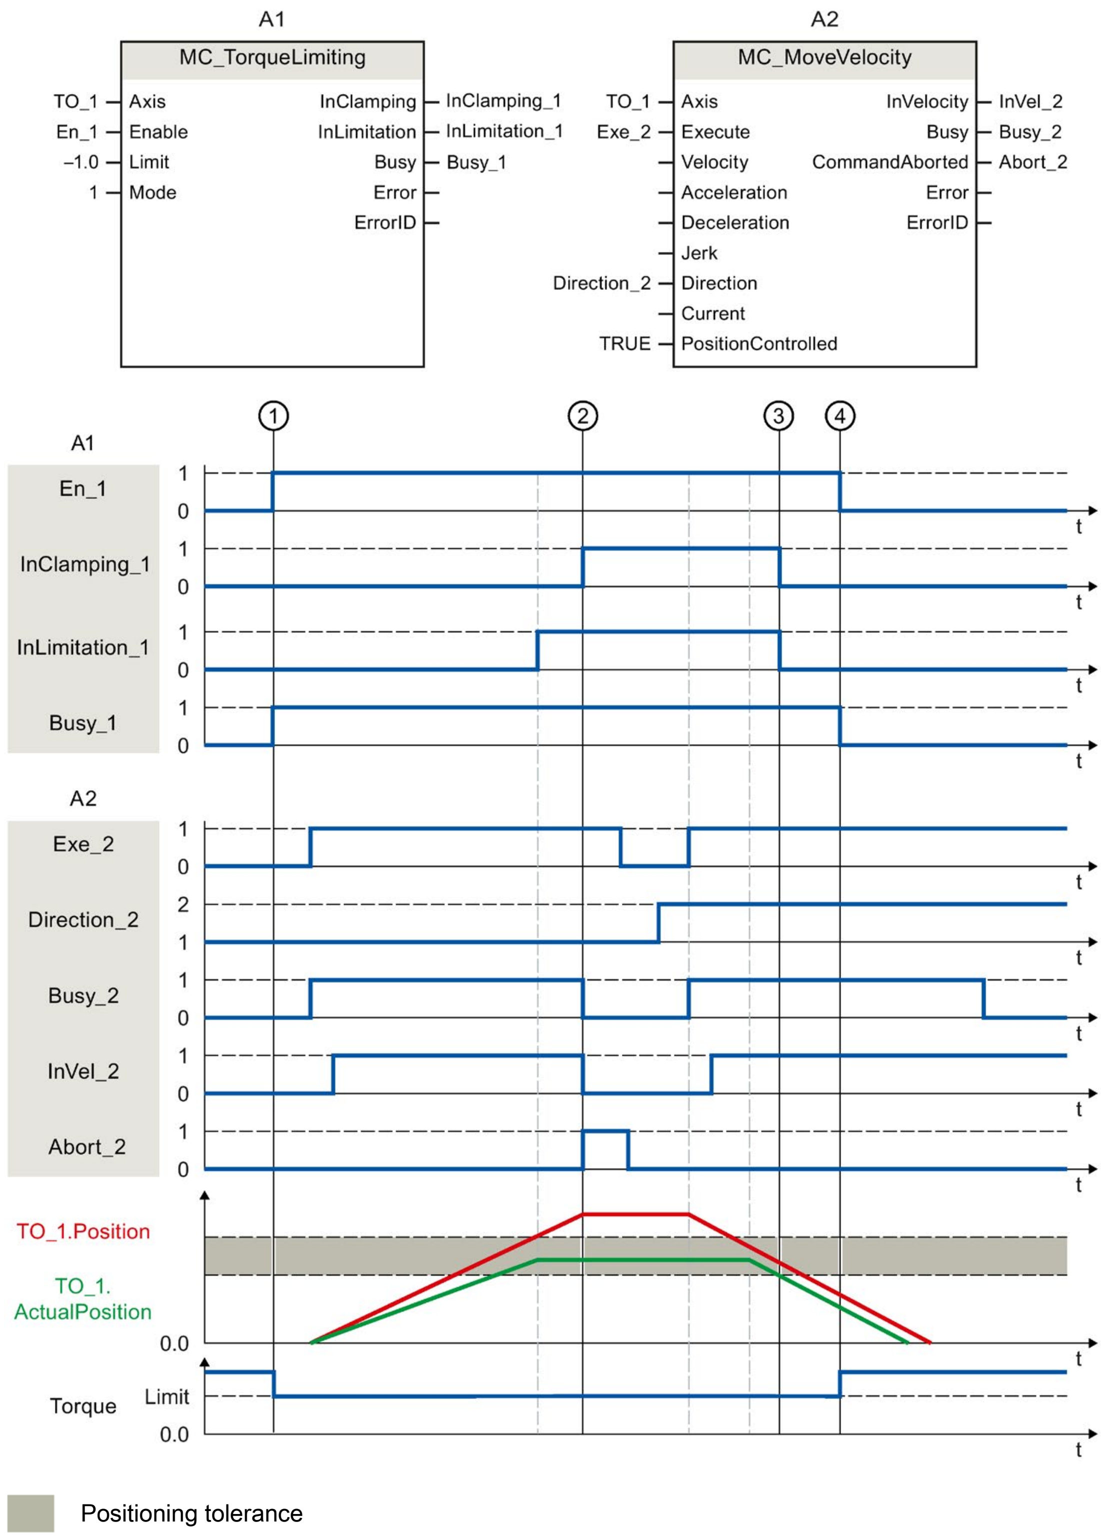
10.12.1.2 MC_TorqueLimiting: Function chart V4

Function chart: Stopping an axis when the torque limit is reached



At time ①, an "MC_Halt" job (A2) is executed on an axis with active torque limiting "MC_TorqueLimiting" (A1). Torque limiting is still active "MC_TorqueLimiting.Enable" = TRUE and any accumulated following error is retained and will be reduced with the time. When the actual velocity is "0.0" and the minimum dwell time in the standstill window has elapsed, the tag "MC_Halt.Done" shows = TRUE. When position monitoring is activated, reaching of the target position is also monitored.

Function chart: Torque limiting with fixed stop detection (mode = 1)



At time ①, a "MC_TorqueLimiting" job (A1) is initiated via "En_1". An "MC_MoveVelocity" job (A2) is executed on the axis with active torque limiting. The torque limiting is still active "MC_TorqueLimiting.Enable" = TRUE. When the following error limit ② is reached, the "MC_MoveVelocity" job is aborted with "Abort" = TRUE. The drive is kept at the fixed stop (clamping). The actual position of the axis is within the positioning tolerance. An "MC_MoveVelocity" job is once again called via the two tags "Execute" = TRUE and "Direction_2" = TRUE and the axis moves with constant velocity in the opposite direction. The clamping is hereby reduced when the positioning tolerance ③ is exited. At time ④, the torque limiting is cancelled.

10.12.2 MC_TorqueAdditive V4

10.12.2.1 MC_TorqueAdditive: Specify additive torque V4

Description

With the Motion Control instruction "MC_TorqueAdditive", you specify an additive torque for the drive to which the technology object is assigned. The torque data are transferred via the telegram 750.

With the "Value" parameter, you specify the additive setpoint torque. The specification of the additive torque setpoint is overriding. An additional torque may be positive or negative. If you invert the setpoint for the technology object, the value for the additive torque is also inverted and transferred inverted to the drive.

Applies to

- Positioning axis
- Speed axis
- Synchronous axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.
- The drive is connected via PROFIdrive telegram.
- Telegram 750 is configured.

  Telegram 750 is available for SINAMICS drives V4.9 and higher.

Override response

- An "MC_TorqueAdditive" job is not aborted by any other Motion Control job.
- A new "MC_TorqueAdditive" job does not abort any active Motion Control jobs.

Parameters

The following table shows the parameters of Motion Control instruction "MC_TorqueAdditive":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The specified setpoint is used as long as the parameter is set to TRUE.
				FALSE	The additive torque transferred to the drive is zero.
Value	INPUT	LREAL	0.0	Additive setpoint torque Permissible values: -1.0E12 to 1.0E12	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being processed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

See also

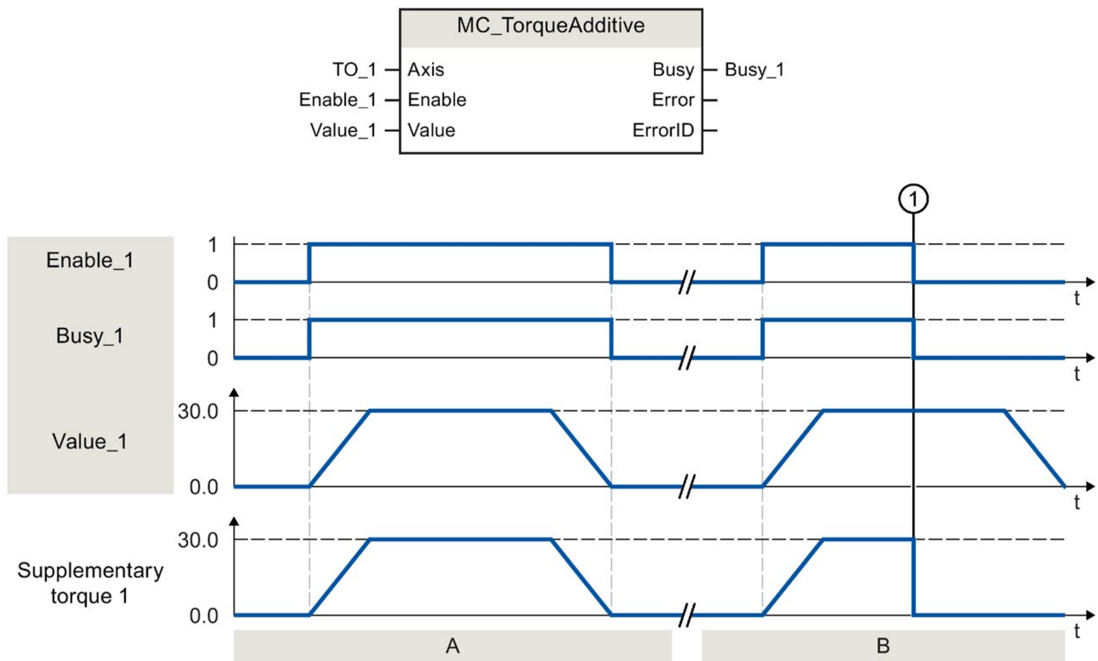
Error ID for Motion Control instructions (Page 542)

PROFIdrive telegrams (Page 36)

Additive setpoint torque (Page 66)

10.12.2.2 MC_TorqueAdditive: Function chart V4

Function chart: Activate/deactivate additive setpoint torque



Section A	With "Enable_1 = TRUE", an additive setpoint torque "Value_1" is specified for the drive assigned to the technology object. This setting is transferred to the drive parameter "p1511 - Supplementary torque 1" using telegram 750.
Section B	With "Enable_1 = TRUE", an additive setpoint torque "Value_1" is specified for the drive assigned to the technology object. This setting is transferred to the drive parameter "p1511 - Supplementary torque 1" using telegram 750. The additive setpoint torque is first built up. At time 1, "Enable_1" is already set to FALSE, before the additive setpoint torque is reduced again. The reduction of the torque setpoint is transmitted directly to the drive.

10.12.3 MC_TorqueRange V4

10.12.3.1 MC_TorqueRange: Set high and low torque limits V4

Description

With the Motion Control instruction "MC_TorqueRange", you can specify an upper and lower torque limit to the drive assigned to the technology object. The torque data are transferred via the telegram 750.

With the "UpperLimit" parameter you specify the upper torque limit and with "LowerLimit" the lower torque limit. The specification of the torque limits has smoothing effect on the movements. If you invert the setpoints for the technology object, the values for the high and low torque limit are also inverted and transferred inverted to the drive.

If the high and low torque limits are active, the following monitors and limits are disabled by default:

- Following error monitoring
- Time limitations for positioning and standstill monitoring

Monitoring remains in effect if you have selected the option "Leave position-related monitoring enabled" under "Technology object > Configuration > Extended parameters > Limits > Torque limit".

Applies to

- Positioning axis
- Speed axis
- Synchronous axis

Requirement

- The technology object has been configured correctly.
- The drive is connected via PROFIdrive telegram.
- Telegram 750 is configured.

  Telegram 750 is available for SINAMICS drives V4.9 and higher.

Override response

- An "MC_TorqueRange" job is not aborted by any other Motion Control job.
- A new "MC_TorqueRange" job does not abort any active Motion Control jobs.
- If the torque limiting is active via the "MC_TorqueLimiting" job, the "MC_TorqueRange" job is rejected with an error message and vice versa. The functions do not override one another.

Parameters

The following table shows the parameters of Motion Control instruction "MC_TorqueRange":

Parameter	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The specified values are used as long as the TRUE parameter is set.
				FALSE	No values for the high and low torque limit are transferred to the drive.
UpperLimit	INPUT	LREAL	1.0 E12	Upper torque limit (in the configured unit)	
				Permitted range of values: -1.0 E12 to 1.0 E12 The value of the parameter "UpperLimit" must not be greater than the value of the parameter "LowerLimit".	
LowerLimit	INPUT	LREAL	-1.0 E12	Lower torque limit (in the configured unit)	
				Permitted range of values: -1.0 E12 to 1.0 E12 The value of the parameter "LowerLimit" must not be less than the value of the parameter "UpperLimit".	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being processed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 542) for parameter "ErrorID"	

See also

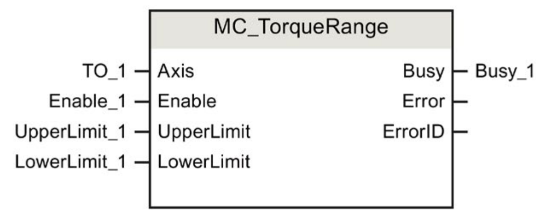
Error ID for Motion Control instructions (Page 542)

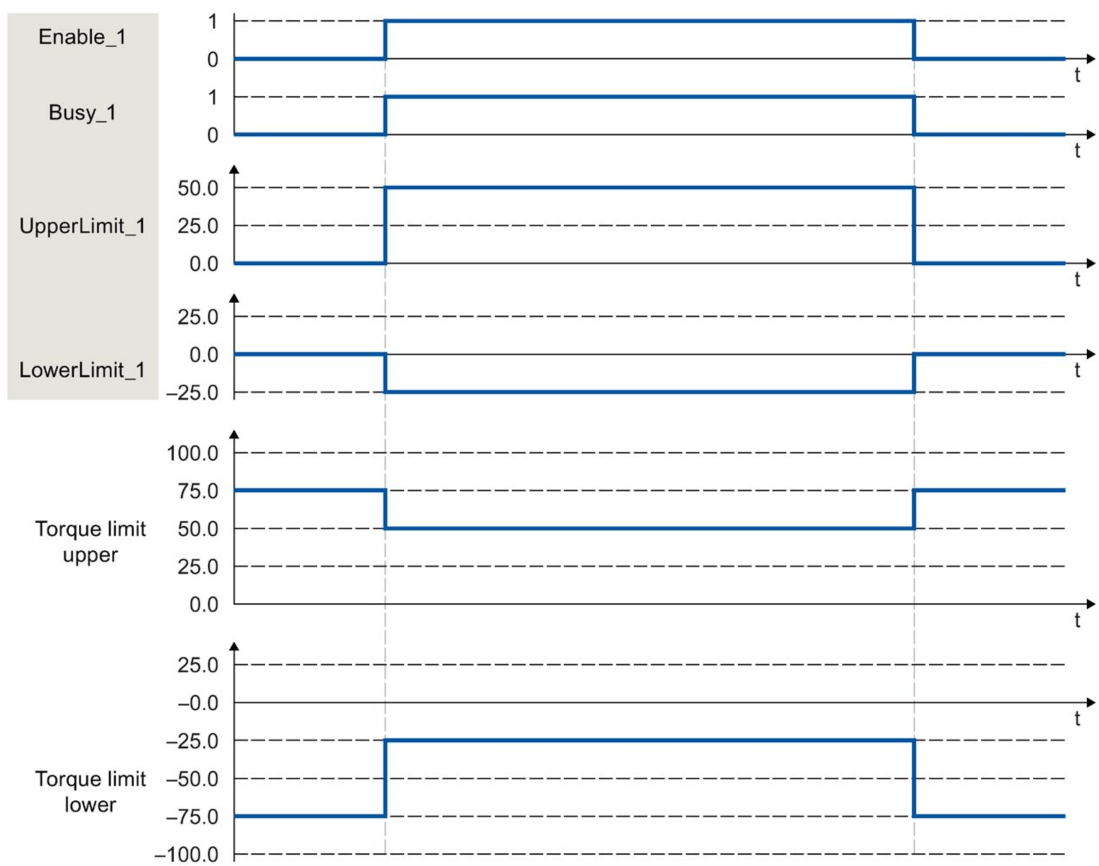
PROFIdrive telegrams (Page 36)

Permissible torque range (Page 67)

10.12.3.2 MC_TorqueRange: Function chart V4

Function chart: Set high and low torque limits





With "Enable_1 = TRUE" an upper torque limit "UpperLimit_1" and a lower torque limit "LowerLimit_1" are specified to the drive assigned to the technology object. These settings are transferred directly to the drive parameters "p1522 - Torque limit upper" and "p1523 - Torque limit lower" using telegram 750. If "Enable_1" is reset to FALSE, the upper and lower torque limits are no longer active.

10.13 Override response of Motion Control jobs V4

10.13.1 Override response V4: Homing and motion jobs

The following table shows how a new Motion Control job affects active homing and motion jobs:

⇒ Active job ⇓ New job	MC_Home "Mode" = 2, 8, 10	MC_Home ("Mode" = 3, 5)	MC_Halt MC_MoveAbsolute MC_MoveRelative MC_MoveVelocity MC_MoveJog	MC_MoveSuper-imposed	MC_MotionIn Velocity MC_MotionIn Position
MC_Home "Mode" = 3, 5	A	A	A	A	A
MC_Home "Mode" = 9	A	-	-	-	-
MC_Halt MC_MoveAbsolute MC_MoveRelative MC_MoveVelocity MC_MoveJog MC_MotionInVelocity MC_MotionInPosition	-	A	A	A	A
MC_MoveSuperimposed	-	-	-	A	-
MC_GearIn	-	A	A	A	-
MC_GearInPos pending1)	-	-	-	-	-
MC_GearInPos active2)	-	A	A	A	-
MC_CamIn pending1)	-	-	-	-	-
MC_CamIn active2)	-	A	A	A	-

A The running job is aborted with "CommandAborted" = TRUE.

- No effect. Running job continues to be executed.

1) "Busy" = TRUE, "StartSync" = FALSE, "InSync" = FALSE

2) "Busy" = TRUE, "StartSync" or "InSync" = TRUE

10.13.2 Override response V4: Synchronous operation jobs

The following table shows how a new Motion Control job affects the motion of the axis on active synchronous operation jobs:

⇒ Active job ⇓ New job	MC_GearIn	MC_GearInPos pending1)	MC_GearInPos active2)	MC_Phasing-Absolute MC_Phasing-Relative	MC_CamIn pending1)	MC_CamIn active2)
MC_Home "Mode" = 3, 5	A	-	-	-	-	-
MC_Halt	A	-	A	A	-	A
MC_MoveAbsolute MC_MoveRelative MC_MoveVelocity MC_MoveJog	A	-	A	A	-	A
MC_MotionInVelocity MC_MotionInPosition	A	A	A	-	A	A
MC_MoveSuperimposed	-	-	-	-	-	-
MC_GearIn	A	A	A	A	A	A
MC_GearInPos pending1)	-	A	-	-	A	-
MC_GearInPos active2)	A	A	A	A	A	A
MC_PhasingAbsolute MC_PhasingRelative	-	-	-	A	-	-
MC_CamIn pending1)	-	A	-	-	A	-
MC_CamIn active2)	A	A	A	A	A	A

A The running job is aborted with "CommandAborted" = TRUE.

- No effect. Running job continues to be executed.

1) A pending synchronous operation ("Busy" = TRUE, "StartSync" = FALSE, "InSync" = FALSE) does not cancel active commands. A pending synchronous operation job can only be overridden by a further synchronous operation job on the same following axis. Cancellation is possible with "MC_Power".

2) The status "Busy" = TRUE, "StartSync" or "InSync" = TRUE corresponds to active synchronous operation.

10.13.3 Override response V4: Measuring input jobs

The following table shows which new Motion Control jobs will override active measuring input jobs:

⇒ Active job ⇓ New job	MC_MeasuringInput	MC_MeasuringInputCyclic
MC_Home "Mode" = 2, 3, 5, 8, 9, 10	A	A
MC_Home "Mode" = 0, 1, 6, 7	-	-
MC_MeasuringInput MC_MeasuringInputCyclic MC_AbortMeasuringInput	A	A

A The running job is aborted with "CommandAborted" = TRUE.

- No effect. Running job continues to be executed.

Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

A.1.12 StatusDrive tags (speed axis)

The tag structure <TO>.StatusDrive.<tag name> indicates the status of the drive.

Tags

Legend (Page 431)

Tag		Data type	Values	W	Description
StatusDrive.		STRUCT			
	InOperation	BOOL	-	RON	Operational status of the drive FALSE: Drive not ready. Setpoints will not be executed. TRUE: Drive ready. Setpoints can be executed.
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and drive FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No drive error TRUE: Drive error
	AdaptionState	DINT	-	RON	Status of automatic data transfer of drive parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

A.1.13 StatusTorqueData tags (speed axis)

The tag structure <TO>.StatusTorqueData.<tag name> indicates the status of the torque.

Tags

Legend (Page 431)

Tag		Data type	Value range	W	Description
StatusTorqueData.		STRUCT			
	CommandAdditive TorqueActive	DINT	-	RON	Additive torque setpoint function 0: Deactivated 1: Activated
	CommandTorqueRange Active	DINT	-	RON	Torque range above high and low limit of the torque function 0: Deactivated 1: Activated
	ActualTorque	LREAL	-1.0E12 to 1.0E12	RON	Actual torque of the axis in the technological unit of the TO for torque

A.1.14 StatusMotionIn tags (speed axis)

The tag structure <TO>.StatusMotionIn.<tag name> indicates the motion status.

Tags

Legend (Page 431)

Tag		Data type	Value range	W	Description
StatusMotionIn.		STRUCT			
	FunctionState	DINT	-	RON	0: No MotionIn function active 1: MotionInVelocity active 2: MotionInPosition active

A.1.15 StatusWord tag (speed axis)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 0 "Enable") can be found in the section Evaluating StatusWord, ErrorWord and WarningWord (Page 288).

Tag

Legend (Page 431)

Tag	Data type	Values	W	Description
Status-Word	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"ControlPanelActive" Axis control panel 0: Deactivated 1: Activated
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"Done" 0: Motion job is running, or Axis control panel enabled 1: No motion job is running and axis control panel disabled
Bit 7	-	-	-	Reserved
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	"JogCommand" 0: No "MC_MoveJog" job running 1: "MC_MoveJog" job running
Bit 10	-	-	-	"VelocityCommand" 0: No "MC_MoveVelocity" job running 1: "MC_MoveVelocity" job running
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	"ConstantVelocity" 0: Axis is accelerating or decelerating. 1: Velocity setpoint reached. The axis is traversing at this constant velocity or is at a standstill.

Tag	Data type	Values	W	Description
Bit 13	-	-	-	"Accelerating" 0: No acceleration process active 1: Acceleration process active
Bit 14	-	-	-	"Decelerating" 0: No deceleration process active 1: Deceleration process active
Bit 15... Bit 24	-	-	-	Reserved
Bit 25	-	-	-	"AxisSimulation" 0: No simulation 1: Simulation is active
Bit 26	-	-	-	"TorqueLimitingCommand" 0: No "MC_TorqueLimiting" job is running 1: "MC_TorqueLimiting" job is running
Bit 27	-	-	-	"InLimitation" 0: Drive is not operating at the torque limit 1: Drive is operating at the torque limit
Bit 28... Bit 31	-	-	-	Reserved

A.1.16 ErrorWord tag (speed axis)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 431)

Tag	Data type	Values	W	Description
Error-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" System error
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveFault" Error in drive
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14	-	-	-	Reserved
Bit 15	-	-	-	"AdaptionError" Error during data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.1.17 ErrorDetail tags (speed axis)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

Tags

Legend (Page 431)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0 to 5	RON	Effective alarm reaction 0: No reaction 1: Stop with current dynamic values 2: Stop with maximum dynamic values 3: Stop with emergency stop ramp 4: Remove enable 5: Track setpoints

A.1.18 WarningWord tag (speed axis)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 13 "PeripheralWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 431)

Tag	Data type	Values	W	Description
Warning-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveWarning" Error in drive
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicWarning" Specified dynamic values are limited to permissible values.
Bit 7				"CommunicationWarning" Communication error Missing or faulty communication.
Bit 8... Bit 12				Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14				Reserved
Bit 15				"AdaptionWarning" Error in automatic data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.1.19 ControlPanel tags (speed axis)

The tag structure <TO>.ControlPanel.<tag name> contains no user-relevant data. This tag structure is internally used.

Tags

Legend (Page 431)

Value	LREAL	-	DIR	-

A.2 Tags of the positioning axis/synchronous axis technology object

A.2.1 Legend

<table>
<tr><td>Tag</td><td colspan="2">Name of the tag</td></tr>
<tr><td>Data type</td><td colspan="2">Data type of the tag</td></tr>
<tr><td>Values</td><td colspan="2">Value range of the tag - minimum value to maximum value
(L - linear specification R - rotary specification)
If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".</td></tr>
<tr><td rowspan="5">W</td><td colspan="2">Effectiveness of changes in the technology data block</td></tr>
<tr><td>DIR</td><td>Direct:
Values are changed directly and take effect at the start of the next MC-Servo [OB91].</td></tr>
<tr><td>CAL</td><td>At call of Motion Control instruction:
Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.</td></tr>
<tr><td>RES</td><td>Restart:
Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.</td></tr>
<tr><td>RON</td><td>Read only:
The tag cannot and must not be changed during runtime of the user program.</td></tr>
<tr><td>Description</td><td colspan="2">Description of the tag</td></tr>
</table>

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.2.2 Actual values and setpoints (positioning axis/synchronous axis)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 445)

Tag	Data type	Values	W	Description
Position	LREAL	-	RON	Position setpoint
Velocity	LREAL	-	RON	Velocity setpoint / speed setpoint
ActualPosition	LREAL	-	RON	Actual position
ActualVelocity	LREAL	-	RON	Actual velocity
ActualSpeed	LREAL	-	RON	Actual speed of the motor (with analog setpoint = 0.0)
Acceleration	LREAL	-	RON	Setpoint acceleration
ActualAcceleration	LREAL	-	RON	Actual acceleration
OperativeSensor	UDINT	1 to 4	RON	Operative encoder

A.2.3 Simulation tag (positioning axis / synchronous axis)

The tag structure <TO>.Simulation.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Simulation.		STRUCT			
	Mode	UDINT	-	RES1)	Simulation mode 0: No simulation, normal operation 1: Simulation mode

1) Technology version V2.0: RON

A.2.4 VirtualAxis tag (positioning axis/synchronous axis)

The tag structure <TO>.VirtualAxis.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
VirtualAxis.		STRUCT			
	Mode	UDINT	-	RON	Virtual axis 0: No virtual axis 1: Axis is always and exclusively operated as virtual axis

A.2.5 Actor tags (positioning axis/synchronous axis)

The tag structure <TO>.Actor.<tag name> contains the controller-side configuration of the drive.

Tags

Legend (Page 445)

Tag			Data type	Values	W	Description
Actor.			STRUCT			
	Type		DINT	-	RON	Drive connection 0: Analog output 1: PROFIdrive telegram
	InverseDirection		BOOL	-	RES	Inversion of the setpoint FALSE: no TRUE: Yes
	DataAdaption		DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
	Efficiency		LREAL	0.0 to 1.0	RES	Efficiency of mechanics (gear and leadscrew)
	Interface.		STRUCT			
		AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
		AddressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram or the analog setpoint

Tag	Data type	Values	W	Description
EnableDriveOutput	BOOL	-	RES	"Enable output" for analog drives FALSE: disabled TRUE: Activated
EnableDriveOutput Address	VREF	0 to 65535	RON	Address for the "Enable output" for analog set-point
DriveReadyInput	BOOL	-	RES	"Ready input" for analog drives The analog drive signals its readiness to receive speed setpoints. FALSE: disabled TRUE: Activated
DriveReadyInput Address	VREF	0 to 65535	RON	Address for the "Enable input" for analog set-point
EnableTorqueData	BOOL	-	RES	Torque data FALSE: Deactivated TRUE: Activated
TorqueDataAddressIn	VREF	0 to 65535	RON	Input address of the supplemental telegram
TorqueDataAddress Out	VREF	0 to 65535	RON	Output address of the supplemental telegram
DriveParameter.				
ReferenceSpeed	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the speed setpoint (N-set) of the drive The speed setpoint is transferred in the PROFIdrive telegram as a normalized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, provided the drive permits this.
MaxSpeed	LREAL	0.0 to 1.0E12	RES	Maximum value for the speed setpoint of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)
ReferenceTorque	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the drive torque

A.2.6 TorqueLimiting tag (positioning axis/synchronous axis)

The tag structure <TO>.TorqueLimiting.<tag name> contains the configuration of the torque limiting.

Tags

Legend (Page 445)

Tag			Data type	Values	W	Description
TorqueLimiting.			STRUCT			
	LimitBase		DINT	-	RES	Torque limiting 0: Motor side 1: Load side
	PositionBased Monitorings		DINT	-	RES	Positioning and following error monitoring 0: Monitoring deactivated 1: Monitoring activated
	LimitDefaults.		STRUCT			
		Torque	LREAL	0.0 to 1.0E12	CAL	Limiting torque
		Force	LREAL	0.0 to 1.0E12	CAL	Limiting force

A.2.7 Clamping tag (positioning axis/synchronous axis)

The tag structure <TO>.Clamping.<tag name> contains the configuration of the fixed stop detection.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Clamping.		STRUCT			
	FollowingErrorDeviation	LREAL	0.001 to 1.0E12	DIR	Value of the following error starting from which the fixed stop is detected.
	PositionTolerance	LREAL	0.001 to 1.0E12	DIR	Position tolerance for clamping monitoring

A.2.8 Sensor[n] tags (positioning axis/synchronous axis)

The tag structure <TO>.Sensor[n].<tag name> contains the controller-end configuration for the encoder, and the configuration for active and passive homing.

Tags

Legend (Page 445)

Tag	Data type	Values	W	Description
Sensor[n].	ARRAY [1..4] OF STRUCT			
Existent	BOOL	-	RON	Displaying created encoders
Type	DINT	-	RON	Encoder type 0: "INCREMENTAL" (incremental) 1: "ABSOLUTE" (absolute) 2: "CYCLIC_ABSOLUTE" (cyclic absolute)
InverseDirection	BOOL	-	RES	Inversion of the actual value FALSE: no TRUE: Yes
System	DINT	-	RES	Encoder system 0: "LINEAR" (linear encoder) 1: "ROTATORY" (rotary encoder)
MountingMode	DINT	-	RES	Mounting type of encoder 0: On motor shaft 1: On load side 2: External measuring system
DataAdaption	DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque in the device 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
Interface.				
AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
AddressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram
Number	UDINT	1 to 2	RON	Number of the encoder in the telegram
Parameter.				
Resolution	LREAL	1.0E-12 to 1.0E12	RES	Resolution of a linear encoder (offset between two encoder pulses)
StepsPerRevolution	UDINT	1 to 8388608	RES	Increments per rotary encoder revolution
FineResolutionXist1	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST1 (cyclic actual encoder value)
FineResolutionXist2	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST2 (absolute value of encoder)

Tag			Data type	Values	W	Description
		DeterminableRevolutions	UDINT	0 to 8388608	RES	Number of differentiable encoder revolutions for a multi-turn absolute encoder (For a single-turn absolute encoder = 1; for an incremental encoder = 0)
		DistancePerRevolution	LREAL	0.0 to 1.0E12	RES	Load distance per revolution of an externally mounted encoder
	ActiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of the digital input for active homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction
		DigitalInputAddress	VREF	0 to 65535	RON	Address of digital input
		HomePositionOffset	LREAL	-1.0E12 to 1.0E12	CAL	Home position offset
		SwitchLevel	BOOL	-	RES	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level
	PassiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of digital input during passive homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction 2: Current homing direction
		DigitalInputAddress	VREF	0 to 65535	RON	Address of digital input
		SwitchLevel	BOOL	-	RES	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level

A.2.9 Extrapolation tag (positioning axis/synchronous axis)

The tag structure <TO>.Extrapolation.<tag name> contains the configuration of the actual value extrapolation.

Tags

Legend (Page 445)

Tag			Data type	Values	W	Description
Extrapolation.			STRUCT			
	LeadingAxisDependent Time		LREAL	-	RON	Extrapolation time component (caused by leading axis) Results from the following times: • Time of actual value acquisition for the leading axis • Ipo cycle • Time of actual position filter of leading axis (T1 + T2)
	FollowingAxis DependentTime		LREAL	0.0 to 1.0E12	DIR	Extrapolation time component (caused by following axis) Results from the following times: • For a following axis with set velocity precontrol: – Communication cycle – Ipo cycle – Speed control loop substitute time for the following axis – Output time of the setpoint for the following axis • For a following axis without velocity precontrol: – Communication cycle – Ipo cycle – Position control loop equivalent time (1/Kv from <TO>.PositionControl.Kv) – Output time of the setpoint for the following axis
	PositionFilter.		STRUCT			
		T1	LREAL	0.0 to 1.0E12	DIR	Position filter time constant T1
		T2	LREAL	0.0 to 1.0E12	DIR	Position filter time constant T2
	VelocityFilter.		STRUCT			
		T1	LREAL	0.0 to 1.0E12	DIR	Velocity filter time constant T1
	VelocityTolerance.		STRUCT			
		Range	LREAL	0.0 to 1.0E12	DIR	Tolerance band width for velocity
	Hysteresis.		STRUCT			
		Value	LREAL	0.0 to 1.0E12	DIR	Hysteresis value

A.2.10 LoadGear tags (positioning axis/synchronous axis)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 445)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.2.11 Properties tags (positioning axis/synchronous axis)

The tag structure <TO>.Properties.<tag name> contains the configuration of the type of axis or motion.

Tags

Legend (Page 445)

Tag		Data type	Value range	W	Description
Properties.		STRUCT			
	MotionType	DINT	-	RON	Indication of axis or motion type: 0: Linear axis or motion 1: Rotary axis or motion

A.2.12 Units tag (positioning axis/synchronous axis)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	VelocityUnit	UDINT	-	RON	Unit for velocity	
					1521	°/s
					1522	°/min
					1086	rad/s
					1523	rad/min
					1062	mm/s
					1061	m/s
					1524	mm/min
					1525	m/min
					1526	mm/h
					1063	m/h
					1527	km/min
					1064	km/h
					1066	in/s
					1069	in/min
					1067	ft/s
					1070	ft/min
					1075	mi/h
	TimeUnit	UDINT	-	RON	Unit for time	
					1054	s
	TorqueUnit	UDINT	-	RON	Unit for torque	
					1126	Nm
					1128	kNm

Tag		Data type	Values	W	Description	
					1529	lbf in (pound-force-inch)
					1530	lbf ft
					1531	ozf in (ounce-force-inch)
					1532	ozf ft
					1533	pdl in (poundal-inch)
					1534	pdl ft
	ForceUnit	UDINT	-	RON	Unit for force	
					1120	N
					1122	kN
					1094	lbf (pound-force)
					1093	ozf (ounce-force)
					1535	pdl (poundals)

A.2.13 Mechanics tags (positioning axis/synchronous axis)

The tag structure <TO>.Mechanics.<tag name> contains the configuration of the mechanics.

Tags

Legend (Page 445)

Tag		Data type	Value range	W	Description
Mechanics.		STRUCT			
	LeadScrew	LREAL	0.0 to 1.0E12	RES	Leadscrew pitch

A.2.14 Modulo tags (positioning axis/synchronous axis)

The tag structure <TO>.Modulo.<tag name> contains the configuration of the modulo function.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Modulo.		STRUCT			
	Enable	BOOL	-	RES	FALSE: Modulo conversion disabled TRUE: Modulo conversion enabled When modulo conversion is enabled, a check is made for modulo length > 0.0
	Length	LREAL	0.001 to 1.0E12	RES	Modulo length
	StartValue	LREAL	-1.0E12 to 1.0E12	RES	Modulo start value

See also

Evaluating the technology data block (Page 285)

A.2.15 DynamicLimits tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicLimits.<tag name> contains the configuration of the dynamic limits. During Motion Control, no dynamic values greater than the dynamic limits are permitted. If you have specified greater values in a Motion Control instruction, then motion is performed using the dynamic limits, and a warning is indicated (alarm 501 to 503 - Dynamic values were limited).

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
DynamicLimits.		STRUCT			
	MaxVelocity	LREAL	0.0 to 1.0E12	RES	Maximum permissible velocity of the axis
	Velocity	LREAL	0.0 to 1.0E12	DIR	Current maximum velocity of the axis
	MaxAcceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible acceleration of the axis
	MaxDeceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible deceleration of the axis
	MaxJerk	LREAL	0.0 to 1.0E12	DIR	Maximum permissible jerk on the axis

See also

Evaluating the technology data block (Page 285)

A.2.16 DynamicDefaults tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicDefaults.<tag name> contains the configuration of the dynamic defaults. These settings will be used when you specify a dynamic value less than 0.0 in a Motion Control instruction (exceptions: MC_MoveJog.Velocity, MC_MoveVelocity.Velocity). Changes to the default dynamic values will be applied at the next positive edge at the "Execute" parameter of a Motion Control instruction.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
DynamicDefaults.		STRUCT			
	Velocity	LREAL	0.0 to 1.0E12	CAL	Default velocity
	Acceleration	LREAL	0.0 to 1.0E12	CAL	Default acceleration
	Deceleration	LREAL	0.0 to 1.0E12	CAL	Default deceleration
	Jerk	LREAL	0.0 to 1.0E12	CAL	Default jerk
	EmergencyDeceleration	LREAL	0.0 to 1.0E12	DIR	Emergency stop deceleration

See also

Evaluating the technology data block (Page 285)

A.2.17 PositionLimits_SW tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionLimits_SW.<tag name> contains the configuration for position monitoring with software limit switches. Software limit switches are used to limit the operating range of a positioning axis.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
PositionLimits_SW.		STRUCT			
	Active	BOOL	-	DIR	FALSE: Monitoring disabled TRUE: Monitoring enabled
	MinPosition	LREAL	-1.0E12 to 1.0E12	DIR	Position of negative software limit switches
	MaxPosition	LREAL	-1.0E12 to 1.0E12	DIR	Position of positive software limit switches ("MaxPosition" > "MinPosition")

Evaluating the technology data block (Page 285)

A.2.18 PositionLimits_HW tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionLimits_HW.<tag name> contains the configuration of position monitoring with hardware limit switches. Hardware limit switches are used to limit the traversing range of a positioning axis.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
PositionLimits_HW.		STRUCT			
	Active	BOOL	-	RES	FALSE: Monitoring disabled TRUE: Monitoring enabled With "Active", both (negative and positive) hardware limit switches are activated or deactivated.
	MinSwitchLevel	BOOL	-	RES	Level selection for activation of the negative hardware limit switch: FALSE: Low level (Low active) TRUE: High level (High active)
	MinSwitchAddress	VREF	0 to 65535	RON	Address for the negative hardware limit switch
	MaxSwitchLevel	BOOL	-	RES	Level selection for enabling of the positive hardware limit switch: FALSE: Low level (Low active) TRUE: High level (High active)
	MaxSwitchAddress	VREF	0 to 65535	RON	Address for the positive hardware limit switch

A.2.19 Homing tags (positioning axis/synchronous axis)

The tag structure <TO>.Homing.<tag name> contains the configuration for homing the TO.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Homing.		STRUCT			
	AutoReversal	BOOL	-	RES	Reversal at the hardware limit switches FALSE: no TRUE: Yes
	ApproachDirection	BOOL	-	CAL	Direction of approach to the homing position switch FALSE: positive direction TRUE: Negative direction
	ApproachVelocity	LREAL	L: 0.0 to 10000.0 mm/s R: 0.0 to 360000.0°/s	CAL	Approach velocity Velocity during active homing at which the reference cam and home position are approached.
	ReferencingVelocity	LREAL	L: 0.0 to 1000.0 mm/s R: 0.0 to 36000.0°/s	CAL	Homing velocity Velocity during active homing at which the home position is approached.
	HomePosition	LREAL	-1.0E12 to 1.0E12	CAL	Home position

Evaluating the technology data block (Page 285)

A.2.20 Override tags (positioning axis/synchronous axis)

The tag structure <TO>.Override.<tag name> contains the configuration for the override parameters. The override parameters are used to apply a correction percentage to default values. An override change takes effect immediately, and is performed with the dynamic settings in effect in the Motion Control instruction.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

Evaluating the technology data block (Page 285)

A.2.21 PositionControl tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionControl.<tag name> contains the settings of closed loop position control.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
PositionControl.		STRUCT			
	Kv	LREAL	0.0 to 2147480.0	DIR	Proportional gain of the closed loop position control ("Kv" > 0.0)
	Kpc	LREAL	0.0 to 150.0%	DIR	Velocity precontrol of the position control Recommended setting: • Isochronous drive connection via PROFIdrive: 100.0% • Non-isochronous drive connection via PROFIdrive: 0.0 to 100.0% • Analog drive connection: 0.0 to 100.0%
	EnableDSC	BOOL	-	RES	Dynamic Servo Control (DSC) FALSE: DSC disabled TRUE: DSC enabled DSC is only possible with one of the following PROFIdrive telegrams: • Standard telegram 5 or 6 • SIEMENS telegram 105 or 106
	SmoothingTimeBy-ChangeDifference	LREAL	0.0 to 1.0E+12	DIR	Manipulated variable ramp at step change of control deviation due to encoder switchover.
	InitialOperativeSensor	UDINT	-	RES	Active encoder after initialization of the axis. (encoder number 1 to 4) This encoder is used after startup of the CPU and after a restart of the technology object (Page 314). At an operating mode transition from STOP → RUN of the CPU (without restart of the technology object), the encoder that was also active before the STOP is still being used.
	ControlDifference Quantization.	STRUCT			

Tag			Data type	Values	W	Description
		Mode	DINT	-	RES	Type of quantification Configuration of a quantization when a drive with stepper motor interface is connected 0: No quantification 1: Quantization corresponding to encoder resolution 2: Quantization to a direct value (configuration is performed using the parameter view (data structure))
		Value	LREAL	0.001 to 1.0E+12	RES	Value of quantification Configuration of a value for quantization to a direct value (<TO>.PositionControl.ControlDifferenceQuantization.Mode = 2) (configuration is performed using the parameter view (data structure))

Evaluating the technology data block (Page 285)

A.2.22 DynamicAxisModel tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicAxisModel.<tag name> contains the settings of the balancing filter.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
DynamicAxisModel.		STRUCT			
	VelocityTimeConstant	LREAL	0.0 to 1.0E12	DIR	Speed control loop substitute time [s]
	AdditionalPosition-TimeConstant	LREAL	0.0 to 1.0E12	DIR	Additive position control loop substitute time [s]

A.2.23 FollowingError tags (positioning axis/synchronous axis)

The tag structure <TO>.FollowingError.<tag name> contains the configuration for following error monitoring.

If the permissible following error is exceeded, then technology alarm 521 is output, and the technology object is disabled (alarm reaction: remove enable).

When the warning level is reached, a warning is output (technology alarm 522).

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
FollowingError.		STRUCT			
	EnableMonitoring	BOOL	-	RES	FALSE: Following error monitoring disabled TRUE: Following error monitoring enabled
	MinValue	LREAL	L: 0.0 to 1.0E12 R: 0.001 to 1.0E12	DIR	Permissible following error at velocities below the value of "MinVelocity".
	MaxValue	LREAL	L: 0.0 to 1.0E12 R: 0.002 to 1.0E12	DIR	Maximum permissible following error, which may be reached at the maximum velocity.
	MinVelocity	LREAL	0.0 to 1.0E12	DIR	"MinValue" is permissible below this velocity and is held constant.
	WarningLevel	LREAL	0.0 to 100.0	DIR	Warning level: Percentage value relative to the valid maximum following error.

Evaluating the technology data block (Page 285)

A.2.24 PositionMonitoring tags (positioning axis/synchronous axis)

The tag structure <TO>.PositioningMonitoring.<tag name> contains the configuration for position monitoring at the end of a positioning motion.

If the actual position value at the end of a positioning motion is reached within the tolerance time and remains in the positioning window for the minimum dwell time, then <TO>.StatusWord.X5 (Done) is set in the technology data block. This completes a Motion Control job.

If the tolerance time is exceeded, then technology alarm 541 "Positioning monitoring" with supplemental value 1: Display "Target range not reached".

If the minimum dwell time is not met, then technology alarm 541 "Positioning monitoring" with supplemental value 2: Display "Exit target range again".

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
PositioningMonitoring.		STRUCT			
	ToleranceTime	LREAL	0.0 to 1.0E12	DIR	Tolerance time Maximum permitted duration from reaching velocity setpoint zero, until entrance into the positioning window.
	MinDwellTime	LREAL	0.0 to 1.0E12	DIR	Minimum dwell time in the positioning window:
	Window	LREAL	0.0 to 1.0E12	DIR	Positioning window

Evaluating the technology data block (Page 285)

A.2.25 StandstillSignal tags (positioning axis/synchronous axis)

The tag structure <TO>.StandstillSignal.<tag name> contains the configuration for the standstill signal.

If the actual velocity value is below the velocity threshold, and does not exceed it during the minimum dwell time, then the standstill signal <TO>.StatusWord.X7 (Standstill) is set.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
StandstillSignal.		STRUCT			Configuration for the standstill signal
	VelocityThreshold	LREAL	0.0 to 1.0E12	DIR	Velocity threshold If velocity is below this threshold, then the minimum dwell time begins.
	MinDwellTime	LREAL	0.0 to 1.0E12	DIR	Minimum dwell time

Evaluating the technology data block (Page 285)

A.2.26 StatusPositioning tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusPositioning.<tag name> indicates the status of a positioning motion.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
StatusPositioning.		STRUCT			
	Distance	LREAL	-1.0E12 to 1.0E12	RON	Distance to the target position
	TargetPosition	LREAL	-1.0E12 to 1.0E12	RON	Target position
	FollowingError	LREAL	-1.0E12 to 1.0E12	RON	Current following error
	SetpointExecutionTime	LREAL	-1.0E12 to 1.0E12	RON	Setpoint execution time of the axis (Results from T_{Ipo}, T_{vtc} or 1/kv, T_{Send} and T_O of the axis)

See also

Evaluating the technology data block (Page 285)

A.2.27 StatusDrive tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusDrive.<tag name> indicates the status of the drive.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
StatusDrive.		STRUCT			
	InOperation	BOOL	-	RON	Operational status of the drive FALSE: Drive not ready. Setpoints will not be executed. TRUE: Drive ready. Setpoints can be executed.
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and drive FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No drive error TRUE: Drive error
	AdaptionState	DINT	-	RON	Status of automatic data transfer of drive parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

Evaluating the technology data block (Page 285)

A.2.28 StatusServo tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusServo.<tag name> indicates the status for the balancing filter.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
StatusServo.		STRUCT			
	BalancedPosition	LREAL	-	RON	Position after the balancing filter.
	ControlDifference	LREAL	-	RON	Control error

A.2.29 StatusSensor[n] tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusSensor[n].<tag name> indicates the status of the measuring system.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
StatusSensor[n].		ARRAY [1..4] OF STRUCT			
	State	DINT	-	RON	Status of actual encoder value 0: "NOT_VALID" (not valid) 1: "WAITING_FOR_VALID" (waiting for valid status) 2: "VALID" (valid)
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and encoder FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No error in the measuring system TRUE: Error in the measuring system.
	AbsEncoderOffset	LREAL	-	RON	Home point offset to the value of an absolute value encoder. The value will be retentively stored in the CPU.
	Control	BOOL	-	RON	FALSE: Encoder is not active TRUE: Encoder is active
	Position	LREAL	-	RON	Encoder position
	Velocity	LREAL	-	RON	Encoder velocity
	AdaptionState	DINT	-	RON	Status of automatic data transfer of encoder parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

A.2.30 StatusExtrapolation tag (positioning axis/synchronous axis)

The tag structure <TO>.StatusExtrapolation.<tag name> indicates the status of the actual value extrapolation.

Tags

Legend (Page 445)

Tag		Data type	Values	W	Description
Extrapolation.		STRUCT			
	FilteredPosition	LREAL	-1.0E12 to 1.0E12	RON	Position after position filter
	FilteredVelocity	LREAL	-1.0E12 to 1.0E12	RON	Velocity according to tolerance band
	ExtrapolatedPosition	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated position
	ExtrapolatedVelocity	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated velocity

A.2.31 StatusSynchronizedMotion tags (synchronous axis)

The tag structure <TO>.StatusSynchronizedMotion.<tag name> indicates the status of the synchronous operation.

Tags

Legend (Page 445)

Tag			Data type	Value range	W	Description
StatusSynchronizedMotion.			STRUCT			
	FunctionState		DINT	-	RON	Indication of which synchronous operation function is active 0: No synchronous operation active 1: Gearing (MC_GearIn) 2: Gearing with specified synchronous positions (MC_GearInPos) 3: Camming (MC_CamIn)
	PhaseShift		LREAL	-1.0E12 to 1.0E12	RON	Current absolute leading value shift
	ActualMaster		DB_ANY	0 to 65535	RON	At the start of a "MC_GearIn" job, the number of the technology data block of the currently used leading axis is displayed. "ActualMaster" = 0 when synchronous operation is inactive
	ActualCam		DB_ANY	0 to 65535	RON	Cam that is currently being used for camming
	MasterOffset		LREAL	-1.0E12 to 1.0E12	RON	Current shift of the leading value range of the cam
	MasterScaling		LREAL	-1.0E12 to 1.0E12	RON	Current scaling of the leading value range of the cam
	SlaveOffset		LREAL	-1.0E12 to 1.0E12	RON	Current shift of the following value range of the cam
	SlaveScaling		LREAL	-1.0E12 to 1.0E12	RON	Current scaling of the following value range of the cam
	StatusWord.		STRUCT			
	Bit 0	MaxVelocity-Exceeded	BOOL	-	RON	Configured maximum velocity is exceeded during synchronous operation.
	Bit 1	Max-Acceleration-Exceeded	BOOL	-	RON	Configured maximum acceleration is exceeded during synchronous operation.
	Bit 2	Max-Deceleration-Exceeded	BOOL	-	RON	Configured maximum deceleration is exceeded during synchronous operation.
	Bit 3	InSimulation	BOOL	-	RON	FALSE: Synchronous operation not simulated TRUE: Synchronous operation is being simulated
	Bit 4... Bit 31	-	BOOL	-	RON	Reserved

Synchronous axis technology object (Page 105)

A.2.32 StatusKinematicsMotion tag (positioning axis/synchronous axis)

The <TO>.StatusKinematicsMotion tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "MaxDecelerationExceeded") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 445)

Tag	Data type	Values	W	Description
StatusKinematics-Motion	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"MaxVelocityExceeded" 0: The TO Kinematics has a lower velocity setpoint calculated than the one configured on the axis 1: The TO Kinematics has a higher velocity setpoint calculated than the one configured on the axis.
Bit 1	-	-	-	"MaxAccelerationExceeded" 0: The TO Kinematics has a lower acceleration setpoint calculated as maxAcceleration of the axis. 1: The TO Kinematics has a higher acceleration setpoint calculated as maxAcceleration of the axis.
Bit 2	-	-	-	"MaxDecelerationExceeded" 0: The TO Kinematics has a lower delay setpoint calculated as maxDeceleration of the axis. 1: The TO Kinematics has a higher delay setpoint calculated as maxDeceleration of the axis.

A.2.33 StatusTorqueData tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusTorqueData.<tag name> indicates the status of the torque data.

Tags

Legend (Page 445)

Tag		Data type	Value range	W	Description
StatusTorqueData.		STRUCT			
	CommandAdditiveTorqueActive	DINT	-	RON	Additive torque setpoint active function 0: No 1: Yes
	CommandTorqueRangeActive	DINT	-	RON	Torque limits B +, B- active function 0: No 1: Yes
	ActualTorque	LREAL	-1.0E12 to 1.0E12	RON	Actual torque of the axis

A.2.34 StatusMotionIn tags (positioning axis/synchronous axis)

The tag structure <TO>.StatusMotionIn.<tag name> indicates the status of the MotionIn function.

Tags

Legend (Page 445)

Tag		Data type	Value range	W	Description
StatusMotionIn.		STRUCT			
	FunctionState	DINT	-	RON	0: No MotionIn function active 1: MotionInVelocity active 2: MotionInPosition active

A.2.35 StatusWord tag (positioning axis/synchronous axis)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 5 "HomingDone") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 445)

Tag	Data type	Values	W	Description
Status-Word	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: The technology object is disabled. 1: The technology object is enabled.
Bit 1	-	-	-	"Error" 0: No error present. 1: An error is present.
Bit 2	-	-	-	"RestartActive" 0: No "Restart" is active. 1: A "Restart" is active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: The "Restart" tags are unchanged. 1: The "Restart" tags were changed. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"ControlPanelActive" 0: The axis control panel is disabled. 1: The axis control panel is active.
Bit 5	-	-	-	"HomingDone" Homing status 0: The technology object is not homed. 1: The technology object is homed.
Bit 6	-	-	-	"Done" 0: A motion job is in progress or the axis control panel is activated. 1: No motion job is in progress and the axis control panel is deactivated.
Bit 7	-	-	-	"Standstill" Standstill signal 0: The axis is in motion. 1: The axis is at a standstill.
Bit 8	-	-	-	"PositioningCommand" 0: No positioning job is in progress. 1: A positioning job is running ("MC_MoveRelative", "MC_MoveAbsolute").

Tag	Data type	Values	W	Description
Bit 9	-	-	-	"JogCommand" 0: No "MC_MoveJog" job is running. 1: An "MC_MoveJog" job is running
Bit 10	-	-	-	"VelocityCommand" 0: No "MC_MoveVelocity" job is running. 1: An "MC_MoveVelocity" job is running
Bit 11	-	-	-	"HomingCommand" 0: No "MC_Home" job in progress. 1: An "MC_Home" job is being processed.
Bit 12	-	-	-	"ConstantVelocity" 0: The axis is accelerated or decelerated. 1: The setpoint velocity is reached. The axis is traversing at this constant velocity or is at a standstill.
Bit 13	-	-	-	"Accelerating" 0: No acceleration job is in progress. 1: An acceleration operation is active.
Bit 14	-	-	-	"Decelerating" 0: No deceleration process is running. 1: A deceleration operation is active.
Bit 15	-	-	-	"SWLimitMinActive" 0: No negative software limit switch was reached. 1: A negative software limit switch was reached or exceeded.
Bit 16	-	-	-	"SWLimitMaxActive" 0: No positive software limit switch was reached. 1: A positive software limit switch was reached or exceeded.
Bit 17	-	-	-	"HWLimitMinActive" 0: No negative hardware limit switch was reached. 1: A negative hardware limit switch was reached or exceeded.
Bit 18	-	-	-	"HWLimitMaxActive" 0: No positive hardware limit switch was reached. 1: A positive hardware limit switch was reached or exceeded.
Bit 19	-	-	-	Reserved
Bit 20	-	-	-	Reserved
Bit 21	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronizing" 0: The axis does not synchronize to a leading value. 1: The axis synchronizes to a leading value.

Tag	Data type	Values	W	Description
Bit 22	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronous" 0: The axis moves asynchronous to a leading value. 1: The axis moves synchronously to a leading value.
Bit 23	-	-	-	"SuperimposedMotionCommand" 0: No overlaid movement is active. 1: No overlaid movement is running.
Bit 24	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "PhasingCommand" 0: No Motion Control instruction for leading value shift is running. 1: A Motion Control instruction for leading value shift is active.
Bit 25	-	-	-	"AxisSimulation" 0: The simulation is not running. 1: The simulation is active.
Bit 26	-	-	-	"TorqueLimitingCommand" 0: No "MC_TorqueLimiting" job is running. 1: An "MC_TorqueLimiting" job is running
Bit 27	-	-	-	"InLimitation" 0: The drive does not operate at the torque limit. 1: The drive is operating at the torque limit.
Bit 28	-	-	-	"NonPositionControlled" 0: The axis is in position-controlled mode. 1: The axis is not in position-controlled mode.
Bit 29	-	-	-	"KinematicsMotionCommand" 0: The axis is not used for a kinematics job. 1: The axis is used for a kinematics job.
Bit 30	-	-	-	"InClamping" 0: The axis is not clamped at a fixed stop. 1: The axis is clamped at a fixed stop.
Bit 31	-	-	-	"MotionInCommand" 0: No MotionIn function is active. 1: The "MotionInVelocity" job is running. 2: The "MotionInPosition" job is running

A.2.36 ErrorWord tag (positioning axis/synchronous axis)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 445)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveFault" Error in drive
Bit 5	-	-	-	"SensorFault" Error in encoder system
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	"SWLimit" Software limit switch reached or overtraveled.
Bit 9	-	-	-	"HWLimit" Hardware limit switch reached or overtraveled.
Bit 10	-	-	-	"HomingError" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	"FollowingErrorFault" Following error limits exceeded
Bit 12	-	-	-	"PositioningFault" Positioning error
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address

Tag	Data type	Values	W	Description
Bit 14	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "SynchronousError" Error during synchronous operation The leading axis specified for the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis.
Bit 15	-	-	-	"AdaptionError" Error in automatic data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.3 Tags of the technology object external encoder

A.3.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.3.2 Actual values and setpoints (external encoder)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 479)

Tag	Data type	Values	W	Description
ActualPosition	LREAL	-	RON	Actual position
ActualVelocity	LREAL	-	RON	Actual velocity
ActualAcceleration	LREAL	-	RON	Actual acceleration

A.3.3 Sensor tags (external encoder)

The tag structure <TO>.Sensor.<tag name> contains the controller-end configuration for the encoder, and the configuration for active and passive homing.

Tags

Legend (Page 479)

Tag			Data type	Values	W	Description
Sensor.			STRUCT			
	Type		DINT	-	RES	Encoder type 0: "INCREMENTAL" (incremental) 1: "ABSOLUTE" (absolute) 2: "CYCLIC_ABSOLUTE" (cyclic absolute)
	InverseDirection		BOOL	-	RES	Inversion of the actual value FALSE: no TRUE: Yes
	System		DINT	-	RES	Encoder system 0: "LINEAR" (linear encoder) 1: "ROTATORY" (rotary encoder)
	MountingMode		DINT	-	RES	Mounting type of encoder 0: On motor shaft 1: On load side 2: External measuring system
	DataAdaption		DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque in the device 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
	Interface.					
		AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
		AddressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram
		Number	UDINT	1 to 2	RON	Number of the encoder in the telegram
	Parameter.					
		Resolution	LREAL	-1.0E12 to 1.0E12	RES	Resolution of a linear encoder (offset between two encoder pulses)
		StepsPerRevolution	UDINT	1 to 8388608	RES	Increments per rotary encoder revolution
		FineResolutionXist1	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST1 (cyclic actual encoder value)
		FineResolutionXist2	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST2 (absolute value of encoder)
		Determinable Revolutions	UDINT	0 to 8388608	RES	Number of differentiable encoder revolutions for a multi-turn absolute encoder (For a single-turn absolute encoder = 1; for an incremental encoder = 0)

Tag			Data type	Values	W	Description
		DistancePer Revolution	LREAL	0.0 to 1.0E12	RES	Load distance per revolution of an externally mounted encoder
	PassiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of digital input during passive homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction 2: Current homing direction
		DigitalInputAddress	VREF	0 to 65535	RES	Address of the digital input
		SwitchLevel	BOOL	-	RON	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level

A.3.4 Extrapolation tag (external encoder)

The tag structure <TO>.Extrapolation.<tag name> contains the configuration of the actual value extrapolation.

Tags

Legend (Page 479)

Tag			Data type	Values	W	Description
Extrapolation.			STRUCT			
	LeadingAxisDependent Time		LREAL	-	RON	Extrapolation time component (caused by leading axis) Results from the following times: • Time of actual value acquisition for the leading axis • Ipo cycle • Time of actual position filter of leading axis (T1 + T2)
	FollowingAxis DependentTime		LREAL	0.001 to 1.0E12	DIR	Extrapolation time component (caused by following axis) Results from the following times: • For a following axis with set velocity precontrol: – Communication cycle – Ipo cycle – Speed control loop substitute time for the following axis – Output time of the setpoint for the following axis • For a following axis without velocity precontrol: – Communication cycle – Ipo cycle – Position control loop equivalent time (1/Kv from <TO>.PositionControl.Kv) – Output time of the setpoint for the following axis
	PositionFilter.		STRUCT			
		T1	LREAL	0.001 to 1.0E12	DIR	Position filter time constant T1
		T2	LREAL	0.001 to 1.0E12	DIR	Position filter time constant T2
	VelocityFilter.		STRUCT			
		T1	LREAL	0.001 to 1.0E12	DIR	Velocity filter time constant T1
	VelocityTolerance.		STRUCT			
		Range	LREAL	0.001 to 1.0E12	DIR	Tolerance band width for velocity
	Hysteresis.		STRUCT			
		Value	LREAL	0.001 to 1.0E12	DIR	Hysteresis value

A.3.5 LoadGear tags (external encoder)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 479)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.3.6 Properties tags (external encoder)

The tag structure <TO>.Properties.<tag name> contains the configuration of the type of axis or motion.

Tags

Legend (Page 479)

Tag		Data type	Value range	W	Description
Properties.					
	MotionType	DINT	-	RON	Indication of axis or motion type: 0: Linear axis or motion 1: Rotary axis or motion

A.3.7 Units tag (external encoder)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	VelocityUnit	UDINT	-	RON	Unit for velocity	
					1521	°/s
					1522	°/min
					1086	rad/s
					1523	rad/min
					1062	mm/s
					1061	m/s
					1524	mm/min
					1525	m/min
					1526	mm/h
					1063	m/h
					1527	km/min
					1064	km/h
					1066	in/s
					1069	in/min
					1067	ft/s
					1070	ft/min
					1075	mi/h
	TimeUnit	UDINT	-	RON	Unit for time	
					1054	s

A.3.8 Mechanics tags (external encoder)

The tag structure <TO>.Mechanics.<tag name> contains the configuration of the mechanics.

Tags

Legend (Page 479)

Tag		Data type	Value range	W	Description
Mechanics.					
	LeadScrew	LREAL	0.0 to 1.0E12	RES	Leadscrew pitch

A.3.9 Modulo tags (external encoder)

The tag structure <TO>.Modulo.<tag name> contains the configuration of the modulo function.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
Modulo.		STRUCT			
	Enable	BOOL	-	RES	FALSE: Modulo conversion disabled TRUE: Modulo conversion enabled When modulo conversion is enabled, a check is made for modulo length > 0.0
	Length	LREAL	0.001 to 1.0E12	RES	Modulo length
	StartValue	LREAL	-1.0E12 to 1.0E12	RES	Modulo start value

A.3.10 Homing tags (external encoder)

The tag structure <TO>.Homing.<tag name> contains the configuration for homing the TO.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
Homing.		STRUCT			
	HomePosition	LREAL	-1.0E12 to 1.0E12	CAL	Home position

A.3.11 StatusSensor tags (external encoder)

The tag structure <TO>.StatusSensor.<tag name> indicates the status of the measuring system.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
StatusSensor.		STRUCT			
	State	DINT	-	RON	Status of actual encoder value 0: "NOT_VALID" (not valid) 1: "WAITING_FOR_VALID" (waiting for valid status) 2: "VALID" (valid)
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and encoder FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No error in the measuring system TRUE: Error in the measuring system.
	AbsEncoderOffset	LREAL	-	RON	Home point offset to the value of an absolute value encoder. The value will be retentively stored in the CPU.
	Control	BOOL	-	RON	FALSE: Encoder is not active TRUE: Encoder is active
	Position	LREAL	-	RON	Encoder position
	Velocity	LREAL	-	RON	Encoder velocity
	AdaptionState	DINT	-	RON	Status of automatic data transfer of encoder parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

A.3.12 StatusExtrapolation tag (external encoder)

The tag structure <TO>.StatusExtrapolation.<tag name> indicates the status of the actual value extrapolation.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
Extrapolation.		STRUCT			
	FilteredPosition	LREAL	-1.0E12 to 1.0E12	RON	Position after position filter
	FilteredVelocity	LREAL	-1.0E12 to 1.0E12	RON	Velocity according to tolerance band
	ExtrapolatedPosition	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated position
	ExtrapolatedVelocity	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated velocity

A.3.13 StatusWord tag (external encoder)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 5 "HomingDone") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 479)

Tag	Data type	Values	W	Description
Status Word	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"HomingDone" Homing status 0: Technology object not homed 1: Technology object homed
Bit 6	-	-	-	"Done" 0: Motion job is running, or Axis control panel enabled 1: No motion job is running and axis control panel disabled
Bit 7	-	-	-	Reserved
Bit 8	-		-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	"HomingCommand" 0: No "MC_Home" job is running 1: "MC_Home" job is running
Bit 12... Bit 31	-	-	-	Reserved

A.3.14 ErrorWord tag (external encoder)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 479)

Tag	Data type	Values	W	Description
Error-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"SensorFault" Error in encoder system
Bit 6	-	-	-	Reserved
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	"HomingError" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.3.15 ErrorDetail tags (external encoder)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 10	RON	Effective alarm reaction 0: No reaction 10: Remove enable For the technology object external encoder, only alarm reactions 0 and 4 are possible.

A.3.16 WarningWord tag (external encoder)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 13 "PeripheralWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 479)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"SensorWarning" Error in encoder system
Bit 6	-	-	-	Reserved
Bit 7	-	-	-	"CommunicationWarning" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	"HomingWarning" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.3.17 InternalToTrace tags (external encoder)

The tag structure <TO>.InternalToTrace.<tag name> contains no application-relevant data. This tag structure is internally used.

Tags

Legend (Page 479)

Tag		Data type	Values	W	Description
InternalToTrace.		ARRAY [1..4] OF STRUCT			
	Id	DINT	-	DIR	-
	Value	LREAL	-	RON	-

A.4 Tags of the measuring input technology object

A.4.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.4.2 Display data (measuring input)

The <TO>.Status and <TO>.InputState tags show the status of the measuring input function and the input of the measuring input.

Tags

Legend (Page 492)

Tag	Data type	Values	W	Description
Status	DINT	-	RON	Measuring input function status 0: "INACTIVE" (measurement is not active) 1: "WAITING_FOR_TRIGGER" (measuring input is waiting for measuring event) 2: "TRIGGER_OCCURRED" (one or more measured values have been acquired) 3: "MEASURING_ERROR" (error during the measurement)
InputState	BOOL	-	RON	Measuring input input status FALSE: Input of measuring input not active TRUE: Input of measuring input active

A.4.3 Parameter tags (measuring input)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the measuring input technology object.

Tags

Legend (Page 492)

Tag		Data type	Values	W	Description
Parameter.		STRUCT			
	MeasuringInputType	DINT	-	RON	Measuring input type 0: "TIME_BASED" (measurement using time stamp) 1: "PROFIDRIVE" (measuring event using PROFIdrive telegram)
	PROFIdriveProbe Number	UDINT	1, 2	RES	Number of the measuring input to be used for a measurement using PROFIdrive telegram
	MeasuringRangeActivation Time	LREAL	0.0 to 1.0E12	RON	System share for activation time of measuring range
	MeasuringRangeAdditional ActivationTime	LREAL	0.0 to 1.0E12	RES	Additional activation time when using measuring range limits [ms]
	CorrectionTime	LREAL	0.0 to 1.0E12	RES	Correction time for the measurement result [ms]

A.4.4 Interface tags (measuring input)

The tag structure <TO>.Interface.<tag name> contains the configuration of the input properties for the technology object measuring input.

Tags

Legend (Page 492)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	Address	VREF	-	RON	I/O address for the digital measuring input

A.4.5 Units tags (measuring input)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 492)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.4.6 MeasuredValues tags (measuring input)

The tag structure <TO>.MeasuredValues.<tag name> displays the measurement results.

Tags

Legend (Page 492)

Tag	Data type	Values	W	Description
MeasuredValues.	STRUCT			
MeasuredValue1	LREAL	-1.0E12 to 1.0E12	RON	First measured value
MeasuredValue2	LREAL	-1.0E12 to 1.0E12	RON	Second measured value
MeasuredValue1Counter	UDINT	0 to 2147483647	RON	Count value for the first measured value
MeasuredValue2Counter	UDINT	0 to 2147483647	RON	Count value for the second measured value
LostEdgeCounter1	UDINT	0 to 7	RON	LEC for measured value 1 (zero in the case of one-time measurement)
LostEdgeCounter2	UDINT	0 to 7	RON	LEC for measured value 2 (zero in the case of one-time measurement)

A.4.7 StatusWord tag (measuring input)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 492)

Tag	Data type	Values	W	Description
Status Word	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"CommunicationOK" Communication between measuring input and measuring module 0: Not established 1: Established
Bit 6... Bit 31	-	-	-	Reserved

A.4.8 ErrorWord tag (measuring input)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 492)

Tag	Data type	Values	W	Description
Error-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.4.9 ErrorDetail tags (measuring input)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

Tags

Legend (Page 492)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 8	RON	Effective alarm reaction 0: No reaction 8: End measuring input processing

A.4.10 WarningWord tag (measuring input)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 492)

Tag	Data type	Values	W	Description
Warning Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.5 Tags of the cam technology object

A.5.1 Legend

<table>
<tr><td>Tag</td><td colspan="2">Name of the tag</td></tr>
<tr><td>Data type</td><td colspan="2">Data type of the tag</td></tr>
<tr><td>Values</td><td colspan="2">Value range of the tag - minimum value to maximum value
If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".</td></tr>
<tr><td rowspan="5">W</td><td colspan="2">Effectiveness of changes in the technology data block</td></tr>
<tr><td>DIR</td><td>Direct:
Values are changed directly and take effect at the start of the next MC-Servo [OB91].</td></tr>
<tr><td>CAL</td><td>At call of Motion Control instruction:
Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.</td></tr>
<tr><td>RES</td><td>Restart:
Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.</td></tr>
<tr><td>RON</td><td>Read only:
The tag cannot and must not be changed during runtime of the user program.</td></tr>
<tr><td>Description</td><td colspan="2">Description of the tag</td></tr>
</table>

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.5.2 Display data (cam)

The <TO>.CamOutput tag indicates the switching state of the cam.

Tags

Legend (Page 500)

Tag	Data type	Values	W	Description
CamOutput	BOOL	-	RON	Switching state of output cam FALSE: not interconnected TRUE: Switched

A.5.3 Parameter tags (cam)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the output cam technology object.

Tags

Legend (Page 500)

Tag		Data type	Values	W	Description
Parameter.		STRUCT			
	OutputCamType	DINT	-	RES	Output cam type 0: Distance output cam 1: Time-based output cam
	PositionType	DINT	-	RES	Position reference 0: Position setpoint 1: Actual position
	OnCompensation	LREAL	0.0 to 1.0E12	DIR	Activation time Lead time for the switch-on edge
	OffCompensation	LREAL	0.0 to 1.0E12	DIR	Deactivation time Lead time for the switch-off edge
	Hysteresis	LREAL	0.0 to 1.0E12	DIR	Hysteresis value For output cams with reference to actual position, always enter a hysteresis value (> 0.0).

A.5.4 Interface tags (cam)

The tag structure <TO>.Interface.<tag name> contains the configuration of the output properties for the output cam technology object.

Tags

Legend (Page 500)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	EnableOutput	BOOL	-	RES	Activation of the output cam output FALSE: Output is deactivated TRUE: Output is activated
	Address	VREF	-	RON	I/O address of the output cam
	LogicOperation	DINT	-	RON	Logical operation of the output cam signals at the output 0: OR operation 1: AND operation

A.5.5 Units tags (cam)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 500)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.5.6 StatusWord tag (output cam)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 500)

Tag	Data type	Values	W	Description
Status Word	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"OutputInverted" 0: Output cam output not inverted 1: Output cam output inverted
Bit 5	-	-	-	"CommunicationOK" Communication between output cam and output module 0: Not established 1: Established
Bit 6... Bit 31	-	-	-	Reserved

A.5.7 ErrorWord tag (output cam)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 500)

Tag	Data type	Values	W	Description
Error-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.5.8 ErrorDetail tags (cam)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

Tags

Legend (Page 500)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 6	RON	Effective alarm reaction 0: No reaction 6: Output cam processing is complete.

A.5.9 WarningWord tag (output cam)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 500)

Tag	Data type	Values	W	Description
Warning Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because neces-sary requirements have not been met.

Tag	Data type	Values	W	Description
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.6 Tags of the cam track technology object

A.6.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.6.2 Display data (cam track)

The following tags indicate the status of the cam track:

Tags

Legend (Page 506)

Tag	Data type	Values	W	Description
Status	DINT	-	RON	0: "INACTIVE" (inactive) 1: "ACTIVE" (active) 2: "ACTIVE_WAITING_FOR_NEXT_CYCLE" (active and waiting for next track)
TrackOutput	BOOL	-	RON	FALSE: Cam track is not output. TRUE: Cam track is output.
SingleCamState	DWORD	16#0 to 16#FFFF_FFFF	RON	Switched on output cam (bit-masked) 0: Output cam is not switched on 1: Output cam is switched on
TrackPosition	LREAL	-1.0E12 to 1.0E12	RON	Display of the current position within the cam track
MatchPosition	LREAL	-1.0E12 to 1.0E12	RON	Reference position of the current cam track During cyclic processing of the cam track, the continued reference position of the current cam track is displayed. The unique detection and output of the position is only possible when the assigned technology object is in motion.

A.6.3 Parameter tags (cam track)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the cam track technology object.

Tags

Legend (Page 506)

Tag	Data type	Values	W	Description
Parameter.	STRUCT			
CamTrackType	DINT	-	RES	Output cam type 0: Distance output cam 1: Time-based output cam
PositionType	DINT	-	RES	Position reference 0: Position setpoint 1: Actual position
ReferencePosition	LREAL	-1.0E12 to 1.0E12	DIR	Reference position
CamTrackLength	LREAL	0.001 to 1.0E12	DIR	Track length
CamMasking	DWORD	16#0 to 16#FFFF_FFFF	DIR	Bit masking of individual output cams
OnCompensation	LREAL	0.0 to 1.0E12	DIR	Activation time Lead time for the switch-on edge
OffCompensation	LREAL	0.0 to 1.0E12	DIR	Deactivation time Lead time for the switch-off edge
Hysteresis	LREAL	0.0 to 1.0E12	DIR	Hysteresis value For output cams with reference to actual position, always enter a hysteresis value (> 0.0).
Cam[1 … 32].	STRUCT			
OnPosition	LREAL	0.0 to 1.0E12	CAL	Start position (distance and time-based output cams)
Offposition	LREAL	0.0 to 1.0E12	CAL	End position (distance output cam)
Duration	LREAL	0.001 to 1.0E12	CAL	Switch-on duration (time-based output cam)
Existent	BOOL	-	CAL	FALSE: Output cam not used TRUE: Output cam is used

A.6.4 Interface tags (cam track)

The tag structure <TO>.Interface.<tag name> contains the configuration of the output properties for the cam track technology object.

Tags

Legend (Page 506)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	EnableOutput	BOOL	-	RES	Output cam output at the bit specified under "<TO>.Interface.Address" FALSE: No output TRUE: Output
	Address	VREF	-	RON	I/O address for digital cam output

A.6.5 Units tags (cam track)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 506)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	μm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.6.6 StatusWord tag (cam track)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 506)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"OutputInverted" 0: Output cam output not inverted 1: Output cam output inverted
Bit 5	-	-	-	"CommunicationOK" Communication between cam track and output module 0: Not established 1: Established
Bit 6... Bit 31	-	-	-	Reserved

A.6.7 ErrorWord tag (cam track)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tags

Legend (Page 506)

Tag	Data type	Values	W	Description
Error-Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.6.8 ErrorDetail tags (cam track)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.

Tags

Legend (Page 506)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 7	RON	Effective alarm reaction 0: No reaction 7: Cam track processing Is complete.

A.6.9 WarningWord tag (cam track)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 288) section.

Tag

Legend (Page 492)

Tag	Data type	Values	W	Description
Warning Word	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.

Tag	Data type	Values	W	Description
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.7 Technology alarms

A.7.1 Overview

The following table shows an overview of the technology alarms and the corresponding alarm reactions. When a technology alarm occurs, evaluate the entire indicated alarm text, in order to find the precise cause.

Legend

No.	Number of the technology alarm (corresponds to <TO>.ErrorDetail.Number)
Reaction	Effective alarm reaction (corresponds to <TO>.ErrorDetail.Reaction)
Error bit	Bit that is set in <TO>.ErrorWord when the technology alarm occurs A description of the bits can be found in the appendix (Page 475).
Warning bit	Bit that is set in <TO>.WarningWord when the technology alarm occurs A description of the bits can be found in the appendix (Page 477).
Restart	To acknowledge the technology alarm, the technology object must be reinitialized (Restart).
Diagnostic buffer	The alarm is entered in the diagnostics buffer.
Alarm text	Displayed alarm test (limited)

List of the technology alarms

No.	Reaction	Error bit	Warn-ing bit	Restart	Diag-nostic buffer	Alarm text
101	Remove enable	X1	-	X	X	Configuration error.
102	Remove enable	X15	-	X	X	Drive configuration adaptation error.
103	Remove enable	X15	-	X	X	Encoder configuration adaptation error.
104	Stop with maximum dynamic values	X1	-	-	-	SW limit switch specification error.
105	Remove enable	X1	-	X	X	Drive configuration error.
106	Remove enable	X1	-	-	X	Drive connection configuration error.
107	Remove enable	X1	-	X	X	Encoder configuration error.
108	Remove enable	X1	-	-	X	Encoder connection configuration error.
109	Remove enable	X1	-	X	-	Configuration error.
110	No reaction	-	X1	-	-	Configuration is adjusted internally.
111	No reaction	-	X15	-	X	TO and drive configuration inconsistent.
112	No reaction	-	X15	-	X	TO and encoder configuration inconsistent.
113	Remove enable	X2	-	X	-	Isochronous mode not possible.
201	Remove enable	X0	-	X	X	Internal error.
202	No reaction	X0	-	X	-	Internal configuration error.
203	Remove enable	X0	-	X	-	Internal error.
204	Remove enable	X0	-	-	-	Commissioning error.
304	Stop with emergency stop ramp	X2	-	-	-	Velocity limit is zero.
305	Stop with emergency stop ramp	X2	-	-	-	• Acceleration limit is zero. • Deceleration limit is zero.
306	Stop with emergency stop ramp	X2	-	-	-	Jerk limit is zero.
307	Stop with maximum dynamic values	X2	-	-	X	• Negative numerical value range of the position reached. • Positive numerical value range of the position reached.
308	Remove enable	X2	-	-	X	• Negative numerical value range of the position exceeded. • Positive numerical value range of the position exceeded.
321	Stop with emergency stop ramp	X3	-	-	-	Axis not homed.
322	No reaction	-	X3	-	-	Restart not executed.
323	Remove enable	X3	-	-	-	MC_Home could not be performed.
341	Stop with maximum dynamic values	X10	-	-	-	Error in homing data.
342	Stop with emergency stop ramp	X10	-	-	-	Reference cam/encoder zero mark not found.

No.	Reaction	Error bit	Warning bit	Restart	Diagnostic buffer	Alarm text
343	Remove enable	X1	-	-	-	Homing function not supported by device.
401	Remove enable	X13	-	-	X	Error accessing logical address.
411	Remove enable	X5	-	-	X	Faulty encoder at the logical address.
412	Remove enable	X5	-	-	-	Permitted actual value range exceeded.
421	Remove enable	X4	-	-	X	Faulty drive at the logical address.
431	Remove enable	X7	-	-	X	Faulty communication with device at logical address.
501	No reaction	-	X6	-	-	Programmed velocity is limited.
502	No reaction	-	X6	-	-	• Programmed acceleration is being limited. • Programmed deceleration is being limited.
503	No reaction	-	X6	-	-	Programmed jerk is limited.
504	No reaction	-	X6	-	-	Speed setpoint monitoring active.
511	No reaction	-	X6	-	-	Dynamic limits are violated by the kinematics motion.
521	Remove enable	X11	-	-	-	Following error.
522	No reaction	-	X11	-	-	Warning following error tolerance.
531	Remove enable	X9	-	-	-	• Positive HW limit switch approached. • Negative HW limit switch approached. • Illegal free travel direction of active hardware limit switch. • HW limit switch polarity reversed, free travel not possible. • Both hardware limit switches active, retraction not possible.
533	Stop with maximum dynamic values	X8	-	-	-	• Negative SW limit switch approached. • Positive SW limit switch approached.
534	Remove enable	X8	-	-	-	• Negative SW limit switch is crossed. • Positive SW limit switch is crossed.
541	Remove enable	X12	-	-	-	Position monitoring error.
542	Remove enable	X2	-	-	-	Clamping monitoring error: Axis leaving clamping tolerance window.
550	Track setpoints	X4	-	-	-	Drive-autonomous motion is being executed.
551	No reaction	X2	X6	-	-	Maximum velocity cannot be reached with drive/axis parameters.
552	Remove enable	X15	-	-	-	Adaptation error of encoder during power-up.
601	Stop with maximum dynamic values	X14	-	-	-	Leading axis is not assigned or defective.
603	Remove enable	X14	-	-	-	Leading axis is not in position-controlled mode.
608	Stop with maximum dynamic values	X14	-	-	-	Error during synchronization.

No.	Reaction	Error bit	Warning bit	Restart	Diagnostic buffer	Alarm text
611	Remove enable	X2	-	-	-	The cam specified in the MC_CamIn.Cam parameter has not been configured or is not available or is not interpolated.
612	Remove enable	X2	-	-	-	Specified cam has not been interpolated.
700	Remove enable	X2	-	-	-	Output cam limiting error.
701	Remove enable	X13	-	-	-	I/O output error.
702	Remove enable	X2	-	-	-	Position value valid.
703	Remove enable	X2	-	-	-	Cam track data faulty.
704	Remove enable	X2	-	-	-	Output cam data faulty.
750	Remove enable	X2	-	-	-	Measuring job not possible during homing of assigned axis.
752	Remove enable	X2	-	-	-	Validity range of measuring job not recognized.
753	Remove enable	X2	-	-	-	Only one measuring input can access an encoder at a time.
754	Remove enable	X2	-	-	-	Measuring input configuration in external device is not correct.
755	Remove enable	X13	-	-	-	Measuring job not possible.
758	No reaction	X2	-	-	-	A measuring edge was not evaluated.

Technology alarms (Page 333)

A.7.2 Technology alarms 101-113

Technology alarm 101

Alarm reaction: Remove enable

Restart: Required

Alarm text	Remedy
Configuration error.	
Value in <tag> not allowed.	Adjust the specified value.
Faulty load gear factors.	Adjust the load gear factors in <TO>.LoadGear.Numerator and/or <TO>.LoadGear.Denominator .
At least one encoder required. Sensor[].existent	Configure at least one encoder.
Sensor[1] must be configured for DSC.	Configure Sensor[1]
Values in Sensor.Parameter.FineResolutionXist1 and P979 are not identical.	Set the identical fine resolution on the technology as on the drive.
Controller parameter incorrect.	Adjust the <TO>.PositionController.Kv value.
PROFIBUS parameter assignment is inconsistent; sum Ti and To greater than send clock.	Adjust the send clock in the hardware configuration.
Drive or drive telegram type or encoder not suitable for DSC.	Check whether the drive can be operated with DSC and adjust the drive telegram if required.
TimeOut parameter outside of limits.	Set the monitoring time of the axis control panel to a valid value.
Simulation.Mode parameter outside of limits.	Set the parameter to a valid value.
Telegram in Actor.Interface.AddressIn and AddressOut are not identical.	Set the identical drive telegram type for sending and receiving direction.
Illegal combination for referencing data incremental. encoder.	Check the active and passive homing settings.
Telegram in Sensor.Interface.AddressIn and AddressOut are not identical.	Set the identical encoder telegram type for sending and receiving direction.

Technology alarm 102

Alarm reaction: Remove enable

Restart: Required

Alarm text	Remedy
Drive configuration adaptation error.	
Drive is not assigned to a SINAMICS device.	The drive adaptation is only available for SINAMICS drives.
Drive is not interconnected directly to I/O area.	During configuration of the axis, the log addresses were set to a data block or bit memory, for example. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.
Adaptation canceled due to insufficient resources.	Check whether your device supports acyclic data communication according to PROFIdrive.
Parameter does not exist, value unreadable or invalid.	
Maximum speed	
Maximum torque/force (P1520)	
Maximum torque/force (P1521)	
Torque resolution	
Rated speed	
Rated torque	
Motor type	

Technology alarm 103

Alarm reaction: Remove enable

Restart: Required

Alarm text	Remedy
Encoder configuration adaptation error.	
Encoder is not assigned to a SINAMICS device.	The encoder adaptation is only available for SINAMICS devices and external Siemens encoders.
Encoder is not interconnected directly to I/O area.	During configuration of the axis, the log addresses were set to a data block or bit memory address area, for example. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.
Adaptation canceled due to insufficient resources.	Check whether your device supports acyclic data communication according to PROFIdrive.
Parameter does not exist, value unreadable or invalid.	
Encoder system	
Encoder resolution	
Encoder fine resolution Gx_XIST1	
Encoder fine resolution Gx_XIST2	
Encoder revolutions	

Technology alarm 104

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text		Remedy
SW limit switch specification error.		
	Neg. SW limit switch greater than pos. SW limit switch.	Change the position of the software limit switches.

Technology alarm 105

Alarm reaction: Remove enable

Restart: Required

Alarm text		Remedy
Drive configuration error.		
	HW Configuration. The TO needs a smaller servo cycle clock.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
	Error in internal communication.	• Check the project for consistency and download it to the controller again. • Contact customer service.
	Address for drive data does not exist in project.	Check the project for consistency and download it to the controller again.

Technology alarm 106

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Drive connection configuration error.	
System has no communication with drive.	Internal system error. • Check the project for consistency and download it to the controller again. • Contact customer service.
Drive not initialized during ramp-up.	• Ensure that the communication between the controller and drive is established. To do this, evaluate <TO>.StatusDrive.CommunicationOK before enabling the axis. • To enable a technology object, the drive initialization must be complete. Trigger the job again later.

Technology alarm 107

Alarm reaction: Remove enable

Restart: Required

Alarm text	Remedy
Encoder configuration error.	
HW Configuration The TO needs a smaller servo cycle clock.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
Error internal communication.	• Check the project for consistency and download it to the controller again. • Contact customer service.

Technology alarm 108

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Remedy
Encoder connection configuration error.		
	System without communication to encoder.	Internal system error. • Check the project for consistency and download it to the controller again. • Contact customer service.
	Encoder not initialized during ramp-up.	• Ensure that the communication between the controller and encoder is established. To do this, evaluate <TO>.StatusSensor[1..4].CommunicationOK before enabling the axis and also check if the status of the encoder actual value is <TO>.StatusSensor[1..4].State = VALID (2). • To enable a technology object, the encoder initialization must be complete. Trigger the job again later.
	Encoder data address missing in project.	Check the project for consistency and download it to the controller again.

Technology alarm 109

Alarm reaction: Remove enable

Restart: Required

Alarm text		Remedy
Configuration error.		
	Neg. HW limit switch.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
	Pos. HW limit switch	
	Reference cam "Active homing".	
	Reference cam "Passive homing".	
	Enable bit for the analog drive interface.	
	DriveReady bit of the analog drive interface.	
	Measurement sensing input is faulty.	
	Output cam output faulty.	

Technology alarm 110

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Configuration is adjusted internally.	
Actor.DriveParameter.MaxSpeed is limited.	• Correct the reference value in the drive and in the configuration of the technology object to <TO>.Actor.MaxSpeed /2. • With analog drive connection, correct the reference value in the drive and in the configuration of the technology object to <TO>.Actor.MaxSpeed /1.17. • The value can be set in the drive, for example, in p2000 = p1082.
PositioningMonitoring.ToleranceTime is limited.	Change the configuration data.
DynamicDefaults.EmergencyDeceleration is limited.	
DriveParameter.ReferenceTorque is too low.	

Technology alarm 111

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
TO and drive configuration inconsistent.	
Different telegram.	Match the telegram configuration for the technology object with the telegram configuration in the drive. (P922 in drive)
Incompatible torque resolution.	Adjust the high torque resolution for the drive.
Master application cycle and servo cycle clock not the same.	Adjust the cycle of the master application in the device configuration for the PROFIBUS slave.
Servo cycle clock and drive cycle clock not equal.	
Linear motor configured.	Set round-frame motor (P300) in the drive.

Technology alarm 112

Alarm reaction: No reaction

Restart: Not required

<table>
<tr><th>Alarm text</th><th>Remedy</th></tr>
<tr><td>TO and encoder configuration inconsistent.</td><td></td></tr>
<tr><td>Different telegram type.</td><td>Match the telegram configuration for the technology object with the telegram configuration in the drive. (P922 in drive)</td></tr>
<tr><td>Encoder is not an absolute encoder.</td><td>Configure the encoder for the technology object as an incremental encoder.</td></tr>
<tr><td>Master application cycle and servo cycle clock not the same.</td><td rowspan="2">Adjust the cycle of the master application in the device configuration for the PROFIBUS slave.</td></tr>
<tr><td>Servo cycle clock and drive cycle clock not equal.</td></tr>
</table>

Technology alarm 113

Alarm reaction: Remove enable

Restart: Required

Alarm text	Remedy
Isochronous mode not possible.	• The configured output for the cam or cam track technology object or the input for the technology object measuring input cannot be used in isochronous mode. Configure the I/O in the device configuration as isochronous I/O. • Make sure that the organization block MC_Servo [OB91] is called synchronously with the bus system.

A.7.3 Technology alarms 201-204

Technology alarm 201

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Internal error.	Contact customer service.

Technology alarm 202

Alarm reaction: No reaction

Restart: Required

Alarm text	Solution
Internal configuration error.	Contact customer service.

Technology alarm 203

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Internal error.	Contact customer service.

Technology alarm 204

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Commissioning error.	
Connection to the TIA Portal interrupted.	Check the connection properties.

A.7.4 Technology alarms 304-343

Technology alarm 304

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Remedy
Velocity limit is zero.	Enter a non-zero value for the maximum velocity (DynamicLimits.MaxVelocity) in the dynamic limits.

Technology alarm 305

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text		Remedy
Acceleration/deceleration limit is zero.		
	Acceleration	Enter a non-zero value for the maximum acceleration (DynamicLimits.MaxAcceleration) in the dynamic limits.
	Deceleration	Enter a non-zero value for the maximum deceleration (DynamicLimits.MaxDeceleration) in the dynamic limits.

Technology alarm 306

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Remedy
Jerk limit is zero.	Enter a non-zero value for the maximum jerk (DynamicLimits.MaxJerk) in the dynamic limits.

Technology alarm 307

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text		Remedy
Negative/positive numerical value range of the position reached.		
	Negative	Enable the "Modulo" setting for the technology object.
	Positive	

Technology alarm 308

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Remedy
Negative/positive numerical value range of the position exceeded.		
	Negative	Enable the "Modulo" setting for the technology object.
	Positive	

Technology alarm 321

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Remedy
Axis not homed.	To perform an absolute positioning motion, you must home the technology object.

Technology alarm 322

Alarm reaction: No reaction

Restart: Not required

Alarm text		Remedy
Restart not executed.		
	The technology object is not ready for restart.	Download the project again.
	The condition for restart of the technology object is not satisfied.	Disable the technology object.

Technology alarm 323

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
MC_Home could not be performed.	• Enable the "Modulo" setting for the technology object. • Adjust the position value for use of the Motion Control instruction "MC_Home".

Technology alarm 341

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text		Remedy
Error in homing data.		
	Approach velocity is zero.	Check the configuration for homing (Homing.ApproachVelocity).
	Homing velocity is zero.	Check the configuration for homing (Homing.ReferencingVelocity).

Technology alarm 342

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Remedy
Reference cam/encoder zero mark not found.	The reference cam configured for homing was not found in the traversing range of the axis.

Technology alarm 343

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Homing function not supported by device.	Configure a reference switch input for the pulse generator output used in the properties of the C-CPU. ("Pulse generators (PTO/PWM) > PTO[n]/PWN[n] > Hardware inputs/outputs") When homing across a zero mark, the CPU transfers the reference switch input as zero mark.

A.7.5 Technology alarms 401-431

Technology alarm 401

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Solution
Error accessing logical address.		
	Invalid address.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
	Input address is invalid.	
	Output address is invalid.	

Technology alarm 411

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Solution
Faulty encoder at the logical address.		
	Alarm message from encoder.	Check the function, connections and I/Os of the encoder.
	HW error encoder.	
	Encoder dirty.	
	Read error encoder absolute value.	Compare the encoder type in the drive or encoder parameter P979 with the configuration data of the technology object.
	Zero mark monitoring encoder.	Encoder signals error in zero mark monitoring (fault code 0x0002 in Gx_XIST2, see PROFIdrive profile).
	Encoder in Parking state.	• Search for the cause of the error in the connected drive or encoder. • Check whether the alarm was possibly triggered by a commissioning action involving the drive or encoder.

Technology alarm 412

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Remedy
Permitted actual value range exceeded.		
	Positive.	Home the axis/encoder in a valid actual value range.
	Negative.	
	Modulo length.	Adjust the modulo length to the utilized encoder.

Technology alarm 421

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Solution
Faulty encoder at the logical address.		
	Alarm message from drive.	• Check the functions and connections of the drive. • Enable and acknowledge safety function in the drive.
	No drive control required.	
	Drive has shut down.	
	Drive enable not possible.	

Technology alarm 431

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Faulty communication with device at logical address.	
Drive failed.	Check the function, connections and I/Os of the drive .
Signs of life of drive faulty.	• Check the function, connections and I/Os of the drive . • Compare the clock parameters in the device configuration (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be set to the same cycle time. (Incorrect parameter assignment is indicated by reason 0x0080.) • If you call the application cycle of the MC-Servo [OB91] reduced to the send clock of a PROFINET IO system and the technology alarm 431 (Signs of life of drive faulty) is repeatedly shown, increase the update time of the send clock.
Encoder failed.	Check the function, connections and I/Os of the encoder.
Signs of life of encoder faulty.	• Check the function, connections and I/Os of the encoder. • Compare the clock parameters in the device configuration (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be set to the same cycle time.

A.7.6 Technology alarms 501-552

Technology alarm 501

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Programmed velocity is limited.	• Check the value for the velocity of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 502

Alarm reaction: No reaction

Restart: Not required

Alarm text		Remedy
Programmed acceleration/deceleration is being limited.		
	Acceleration	• Check the value for the acceleration of the Motion Control instruction. • Check the configuration of the dynamic limits.
	Deceleration	• Check the value for the deceleration of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 503

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Programmed jerk is limited.	• Check the value for the jerk of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 504

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Speed setpoint monitoring active.	• Check the mechanical configuration. • Check the encoder connection. • Check the configuration of the speed setpoint interface. • Check the configuration of the control loop. • Check the value for the maximum velocity DynamicLimits.MaxVelocity.

Technology alarm 511

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Dynamic limits are violated by the kinematics motion.	
Velocity	Reduce the velocity of the kinematics motion.
Acceleration	Reduce the acceleration of the kinematics motion.
Deceleration	Reduce the deceleration of the kinematics motion.

Technology alarm 521

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Following error.	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of the following error monitoring.

Technology alarm 522

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Warning following error tolerance.	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of the following error monitoring.

Technology alarm 531

Alarm reaction: Remove enable

Restart: Not required

<table>
<tr><th>Alarm text</th><th>Solution</th></tr>
<tr><td></td><td></td></tr>
<tr><td>Pos. HW limit switch reached.</td><td>Acknowledge the alarm.
After the acknowledgment, motions in the negative direction are allowed.</td></tr>
<tr><td>Neg. HW limit switch reached.</td><td>Acknowledge the alarm.
After the acknowledgment, motions in the positive direction are allowed.</td></tr>
<tr><td>Illegal free travel direction of active hardware limit switch.</td><td>The programmed direction of movement is disabled due to the active hardware limit switch.
Retract the axis in the opposite direction.</td></tr>
<tr><td>HW limit switch polarity reversed, free travel not possible.</td><td rowspan="2">• Check the mechanical configuration of the hardware limit switch.
• Check the limit switches.
• The error can be acknowledged by switching the controller off and on or using "MC_Reset" with "Restart" = TRUE.</td></tr>
<tr><td>Both hardware limit switches active, retraction not possible.</td></tr>
</table>

Technology alarm 533

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Negative/positive SW limit switch approached.	
Negative	The software limit switch was reached from an active motion. Move the axis away from the software limit switch in the positive direction.
Positive	The software limit switch was reached from an active motion. Move the axis away from the software limit switch in the negative direction.

Technology alarm 534

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Negative/positive SW limit switch is crossed.	
Negative	The SW limit switch was crossed. Acknowledge the alarm. After the acknowledgment, motions in the positive direction are allowed.
Positive	The SW limit switch was crossed. Acknowledge the alarm. After the acknowledgment, motions in the negative direction are allowed.

Technology alarm 541

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Position monitoring error.	
Target range not reached.	The target range was not reached within the tolerance time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.
Exit target range again.	The target range was exited within the minimum dwell time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.

Technology alarm 542

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Clamping monitoring error: Axis leaving clamping tolerance window.	The axis has executed a motion greater than the permissible tolerance at the fixed stop. Check whether the fixed stop has broken away.

Technology alarm 550

Alarm reaction: Track setpoints

Restart: Not required

Alarm text	Solution
Drive-autonomous motion is being executed.	The drive is performing a motion that was not specified by the technology object. Check whether there is an active safety function in the drive.

Technology alarm 551

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Maximum velocity cannot be reached with drive/axis parameters.	The configured maximum velocity cannot be reached with the configured mechanics of the axis. Check the configuration of the mechanics and the set reference speed.

Technology alarm 552

Alarm reaction: Remove enable

Restart: Not required

<table>
<tr><th colspan="2">Alarm text</th><th>Solution</th></tr>
<tr><td colspan="2">Adaptation error of encoder during power-up.</td><td></td></tr>
<tr><td></td><td>Encoder is not assigned to a SINAMICS device.</td><td>The operationally active encoder could not be adapted. However, there are other encoders that can be used. Use the encoder switch (MC_SetSensor).
The encoder set as the operationally active encoder could not be adapted.
Specify a different sensor for the initialization of the technology object.</td></tr>
<tr><td></td><td>Encoder is not interconnected directly to I/O area.</td><td>During configuration of the axis, the log addresses were set to a data block area or bit memory area. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.</td></tr>
<tr><td></td><td>Adaptation canceled due to insufficient resources.</td><td rowspan="6">Check whether your device supports acyclic data communication according to PROFIdrive.</td></tr>
<tr><td></td><td>Parameter does not exist, value unreadable or invalid.</td></tr>
<tr><td></td><td>Encoder system</td></tr>
<tr><td></td><td>Encoder resolution</td></tr>
<tr><td></td><td>Encoder fine resolution</td></tr>
<tr><td></td><td>Encoder revolutions</td></tr>
</table>

A.7.7 Technology alarms 601-618

Technology alarm 601

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Leading axis is not assigned or defective.	Configure the possible leading value axes for the following axis under Configuration > Leading value interconnections.

Technology alarm 603

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Leading axis is not in position-controlled mode.	The following axis must be operated in position-controlled mode for synchronous operation functionality.

Technology alarm 608

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Error during synchronization.	Prevent a reversing leading value motion during the synchronization operation.

Technology alarm 611

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
The cam specified in the MC_CamIn.Cam parameter has not been configured or is not available.	Configure and interpolate the cam. Restart the job.

Technology alarm 612

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Specified cam has not been interpolated.	Interpolate the cam used for camming with the Motion Control instruction "MC_InterpolateCam".

A.7.8 Technology alarms 700-758

Technology alarm 700

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Output cam limiting error.	
Cam position: OnPosition	The position for the OnPosition could not be calculated. Invalid positions (e.g. OnPosition > OffPosition) were calculated due to lead times. The output cam cannot be switched due to the axis dynamics and compensation times.
Cam position: OffPosition	The position for the OffPosition could not be calculated. Invalid positions (e.g. OffPosition < OnPosition) were calculated due to lead times. The output cam cannot be switched due to the axis dynamics and compensation times.

Technology alarm 701

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
I/O output error.	The digital output for the output cam or cam track technology object cannot be addressed. Download the device configuration again.

Technology alarm 702

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Position value valid.	• A Motion Control job "MC_Reset" is being executed on the axis. Wait until the "Restart" of the technology object is complete. • The encoder values are invalid due to an encoder error. Check the encoder and adjust the configuration if necessary.

Technology alarm 703

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Output cam data faulty.	
Output cam: Output cam number	Check the configuration of the relevant output cam in the cam track and adjust the values if necessary. Examples of a correct configuration: • <TO>.Parameter.Cam[].OnPosition < <TO>.Parameter.Cam[].OffPosition • <TO>.Parameter.Cam[].Duration > <TO>.Parameter.OffCompensation - <TO>.Parameter.OnCompensation

Technology alarm 704

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Output cam data faulty.	Check the configuration of the output cam and adjust the values if necessary. Examples of a correct configuration: • MC_OutputCam.OnPosition < MC_OutputCam.OffPosition • MC_OutputCam.Duration > <TO>.Parameter.OffCompensation - <TO>.Parameter.OnCompensation

Technology alarm 750

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring job not possible during homing of assigned axis.	Do not use the motion instructions "MC_Home" and "MC_MeasuringInput" simultaneously.

Technology alarm 752

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Validity range of measuring job not recognized.	The measuring range specified in Motion Control instruction "MC_MeasuringInput" was not recognized. Adjust the measuring range.

Technology alarm 753

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Only one measuring input can access an encoder at a time.	Use only one Motion Control instruction "MC_MeasurinInput" for an encoder.

Technology alarm 754

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring input configuration in external device is not correct.	Check the configuration of the measuring inputs on the external device.

Technology alarm 755

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring job not possible.	
Device has reported an error.	The measurement was aborted with error. Check the measuring input functionality in the utilized device
Cyclic measuring is not possible with telegram 39x.	• Use the Motion Control instruction "MC_MeasuringInput" for starting a one-time measurement. • Cyclic measuring is only possible when measuring using TM Timer DIDQ. Change the configuration of the measuring input type to "TM Timer DIDQ".

Technology alarm 758

Alarm reaction: None

Restart: Not required

Alarm text	Remedy
A measuring edge was not evaluated.	An edge was already detected at the input of the measuring input even though the module was not yet ready. The measured value is provided at the next edge.

A.8 Error ID for Motion Control instructions

Errors in Motion Control instructions are signaled using the parameters "Error" and "ErrorID".

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated for the Motion Control instruction:

- Illegal status of the technology object, which prevents the execution of the job.
- Illegal parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm reaction for a technology object error.

The following tables list all "ErrorIDs" that can be indicated for Motion Control instructions. Besides the cause of the error, remedies for eliminating the error are also listed:

16#0000 - 16#800F

ErrorID	Description	Remedy
16#0000	No error	-
16#8001	A technology alarm (technology object error) occurred while processing the Motion Control instruction.	In the technology data block, an error message is output at the "ErrorDetail.Number" tag. You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 513) appendix.
16#8002	Illegal specification of the technology object	• Check the specification of the technology object for the "Axis", "Master", "SlaveOutputCamCamTrack-MeasuringInput" or "Cam" parameter. • You can use a kinematics technology object only for the "AxesGroup" parameter. • For MC_MeasuringInputCyclic: Specify a valid measuring input type for parameter "MeasuringInputType".
16#8003	Illegal velocity specification	Specify a permissible value for the velocity for parameter "Velocity".
16#8004	Illegal acceleration specification	Specify a permissible value for the acceleration for parameter "Acceleration".
16#8005	Illegal deceleration specification	Specify a permissible value for the deceleration for parameter "Deceleration".
16#8006	Illegal jerk specification	Specify a permissible value for the jerk for parameter "Jerk".
16#8007	Illegal direction specification	Specify a permissible value for the rotation direction for parameter "Direction" or "SyncDirection".
	Invalid entry Both the "JogForward" and "JogBackward" parameters are set to TRUE at the same time. The axis is braked at the last valid deceleration.	Reset both the "JogForward" parameter and the "JogBackward" parameter.
16#8008	Invalid distance specification	Set a valid distance value at parameter "Distance".
16#8009	Invalid position specification	Set a valid position value at parameter "Position".
16#800A	Illegal operating mode	Specify a permissible operating mode for parameter "Mode".

ErrorID	Description	Remedy
16#800B	Illegal stop mode specifications	Specify a permissible value for the stop mode at the "StopMode" parameter.
16#800C	Only one instance of the instruction per technology object is allowed.	The instruction is called at multiple points in the user program with identical value for parameter "Axis", "Master", "Slave" or "Cam". Ensure that only one instruction with the value for parameter "Axis", "Master", "Slave" or "Cam" is called.
16#800D	The job is not permitted in the current state. "Restart" is executed.	While a "Restart" is being performed, the technology object cannot perform any jobs. Wait until the "Restart" of the technology object is complete.
16#800E	If the technology object is enabled, a "Restart" is not possible.	Before a "Restart", deactivate the technology object with "MC_Power.Enable"FALSE.
16#800F	The job cannot be executed because the technology object is locked.	Enable the technology object with "MC_Power.Enable" = TRUE. Restart the job.

16#8010 - 16#802F

ErrorID	Description	Remedy
16#8010	Invalid homing mode for incremental encod-er	Absolute value adjustment is not possible with an incremental encoder ("Mode" = 6, 7). Start a homing process for an incremental encoder using parameter "Mode" = 0, 1, 2, 3, 5, 8, 10.
16#8011	Invalid homing mode for absolute encoder	Passive and active homing ("Mode" = 2, 3, 5, 8, 10) are not possible for an absolute value encoder. Start a homing process for an absolute encoder using parameter "Mode" = 0, 1, 6, 7.
16#8012	The job cannot be executed because the axis control panel is active.	Return master control to your user program. Restart the job.
16#8013	The online connection between the CPU and the TIA Portal is down.	Check the online connection to the CPU.
16#8014	No internal job memory available.	The maximum possible number of Motion Control job has been reached. Reduce the number of jobs to be executed (parameter "Execute" = FALSE).
16#8015	Error acknowledgment with "MC_Reset" is not possible. Error in the configuration of the technology object.	Check the configuration of the technology object.
16#8016	The actual values are not valid.	To execute a "MC_Home" or positioning job, the actual values must be valid. Check the status of the actual values. The technology object tag "<TO>.StatusSensor[n].State" must show the value 2 (valid).
16#8017	Illegal value for gear ratio numerator	Specify a permissible value for the gear ratio numerator for parameter "RatioNumerator". Permitted integer values: -2147483648 to 2147483648 (value 0 not permitted)

ErrorID	Description	Remedy
16#8018	Illegal value for gear ratio denominator	Specify a permissible value for the gear ratio denominator for parameter "RatioDenominator". Permitted integer values: 1 to 2147483648
16#8019	Job cannot be executed. The specified following axis is the original leading value for the synchronous operation chain.	Recursive interconnections are not possible. A leading axis cannot be interconnected as a following axis to its own leading value. Specify a permissible following axis for parameter "Slave".
16#8021	Illegal value for shift of the leading value range	Specify a permissible value for the shift of the leading value range for parameter "MasterOffset".
16#8022	Illegal value for shift of the following value range	Specify a permissible value for the shift of the leading value range for parameter "SlaveOffset".
16#8023	Illegal value for scaling of the leading value range	Specify a permissible value for the scaling of the leading value range for parameter "MasterScaling".
16#8024	Illegal value for scaling of the following value range	Specify a permissible value for the scaling of the following value range for parameter "SlaveScaling".
16#8026	Illegal value for leading value distance	Specify a permissible value for the leading value distance for parameter "MasterStartDistance".
16#8027	Illegal value for use of cam	Specify a permissible value for cyclic/acyclic use of the cam for parameter "ApplicationMode".

16#8030 - 16#807F

ErrorID	Description	Remedy
16#8034	Illegal value for synchronous position of the leading axis	Specify a permissible value for the synchronous position of the leading axis for parameter "MasterSyncPosition".
16#8035	Illegal value for synchronous position of the following axis	Specify a permissible value for the synchronous position of the following axis for parameter "SlaveSyncPosition".
16#8036	Illegal value for type of synchronization	Specify a permissible value for the type of synchronization for parameter "SyncProfileReference".
16#8040	Illegal value for start position of output cam	Specify a permissible value for the start position of the output cam for parameter "OnPosition".
16#8041	Illegal value for end position of distance output cam	Specify a permissible value for the end position of the distance output cam for parameter "OffPosition".
16#8042	Illegal value for switch-on duration of time-based output cam	Specify a permissible value for the switch-on duration of the time-based output cam for parameter "Duration".
16#8043	Illegal value for force/torque limiting	Specify a value within the permissible range at the "Limit" parameter. Permitted integer values: -2147483648 to 2147483648
16#8044	The axis is not configured for torque reduction.	Select drive telegram 102, 103, 105 or 106
16#8045	The job cannot be executed because a job for traveling to fixed stop is active.	Switchover to non-position-controlled mode is not possible during active travel to fixed stop.
16#8046	The "MC_TorqueLimiting" job cannot be deactivated in the "InClamping" state.	Retract the axis and deactivate "MC_TorqueLimiting".
16#8047	The motion results in a fixed stop.	Only motions away from the fixed stop are permitted.

ErrorID	Description	Remedy
16#804A	Illegal value for additive torque setpoint	Specify a permissible value for the additive torque setpoint at the "Value" parameter.
16#804B	Illegal value for torque high limit	Specify a permissible value for the high limit of the torque at the "UpperLimit" parameter.
16#804C	Illegal value for torque low limit	Specify a permissible value for the low limit of the torque at the "LowerLimit" parameter.
16#804D	The value of the high limit of the torque is less than or equal to the value of the low limit of the torque.	Adapt the values of the "UpperLimit" and "LowerLimit" parameters so that the high limit of the torque is greater than the value of the low limit of the torque.
16#804E	The job cannot be executed because the "MC_TorqueLimiting" job is active.	Stop the force / torque limit or fixed stop detection. Restart the "MC_TorqueRange" job.
	The job cannot be executed because a "MC_TorqueRange" job is active.	Exit the setting of the high and low torque limits. Restart the "MC_TorqueLimiting" job.
16#804F	The axis is not configured for additional torque values.	Use supplemental telegram 750.
16#8050	Illegal encoder number	Specify a permissible number of the new encoder (1 to 4) for parameter "MC_SetSensor.Sensor".
16#8051	Illegal number of the reference encoder	Specify a permissible number of the reference encoder for parameter "MC_SetSensor.ReferenceSensor".
16#8062	Illegal approach value	Specify a permissible approach value for the searched for leading value for parameter "ApproachLeadingValue".
16#8063	A valid mapping to the definition range (leading values) does not exist for the specified following value.	Specify a permissible following value for parameter "FollowingValue".
16#8064	A valid mapping to the range of the function (following values) does not exist for the specified leading value.	Specify a permissible leading value for parameter "LeadingValue".
16#8070	Illegal value for leading value shift	Specify a permissible value for the leading value shift for parameter "PhaseShift".
16#8071	The job cannot be executed because the axis is not in position-controlled mode.	Activate position-controlled mode.
16#8074	The job cannot be executed because the "MC_Home" job is active.	During active or passive homing, an encoder switchover is rejected. Wait until the "MC_Home" job is complete. Restart the job.
16#8075	The job cannot be executed because no synchronization operation is active on the axis.	Switch on the synchronous operation function. Restart the job.
16#8076	The job cannot be executed because synchronization is being simulated at the specified axis.	End the simulation of the synchronous operation. Restart the job.

16#80A0 - 16#8FFF

ErrorID	Description	Remedy
16#80A1	The order cannot be executed because a synchronous operation job is active.	A "MC_Home" job on a following axis is not executed when a "MC_CamIn" or "MC_GearInPos" job is active. Exit the synchronous operation job. Restart the job.
16#80A2	The measuring range is invalid with the configured modulo axis settings.	Check and adjust the measuring input and adjust the measuring range positions, if necessary.
16#80A3	The measuring input job via PROFIdrive telegram could not be started because a homing job is active.	Simultaneous execution of a homing job and a measuring input job via PROFIdrive telegram is not possible. Wait until the homing job has ended. Restart the measuring job via PROFIdrive telegram.
16#80A5	Illegal value for start position of measuring range	Specify a permissible value for the start position of the measuring range for parameter "MC_MeasuringInput.StartPosition" or MC_MeasuringInputCyclic.StartPosition.
16#80A6	Illegal value for end position of measuring range	Specify a permissible value for the end position of the measuring range for parameter "MC_MeasuringInput.EndPosition" or MC_MeasuringInputCyclic.EndPosition.
16#80A7	A measurement is performed when measuring with the measuring range, but the calculated position is outside the specified measuring range. The measured value is discarded.	Check and adjust the measuring input and adjust the measuring range positions, if necessary.
16#80A8	The job cannot be executed because camming is active on the axis.	The Motion Control instructions "MC_PhasingRelative" and "MC_PhasingAbsolute" can only be applied to active gearing with "MC_GearIn" or "MC_GearInPos" ("MC_GearIn.InGear" = TRUE or "MC_GearInPos.InSync" = TRUE).
16#80A9	The job cannot be executed because the following axis is synchronized ("MC_GearInPos.StartSync" = TRUE) or a kinematics motion is active.	The Motion Control instructions "MC_PhasingRelative" and "MC_PhasingAbsolute" can only be applied to active gearing with "MC_GearIn" or "MC_GearInPos" ("MC_GearIn.InGear" = TRUE or "MC_GearInPos.InSync" = TRUE).
16#80AA	The cam contains no points or segments and cannot be interpolated.	Fill the cam with points/segments. Restart the job.
16#80AB	The cam is currently being used and cannot be interpolated.	End the current use of the cam. Restart the job.
16#80AC	The cam contains incorrect points or segments and cannot be interpolated. (for example, the cam contains only one point.)	Fill the cam with permissible points/segments. Restart the job.
16#80AD	The specified synchronous position is outside the definition range of the cam.	Specify a permissible synchronous position for parameter "MasterSyncPosition". Restart the job.
16#80AE	The job cannot be executed because a kinematic motion is active.	End the current kinematic motion. Restart the job.
16#8FFF	Unspecified error	Contact your local Siemens representative or support center. You can find your contact at Industry Automation and Drive Technologies at: http://www.siemens.com/automation/partner)

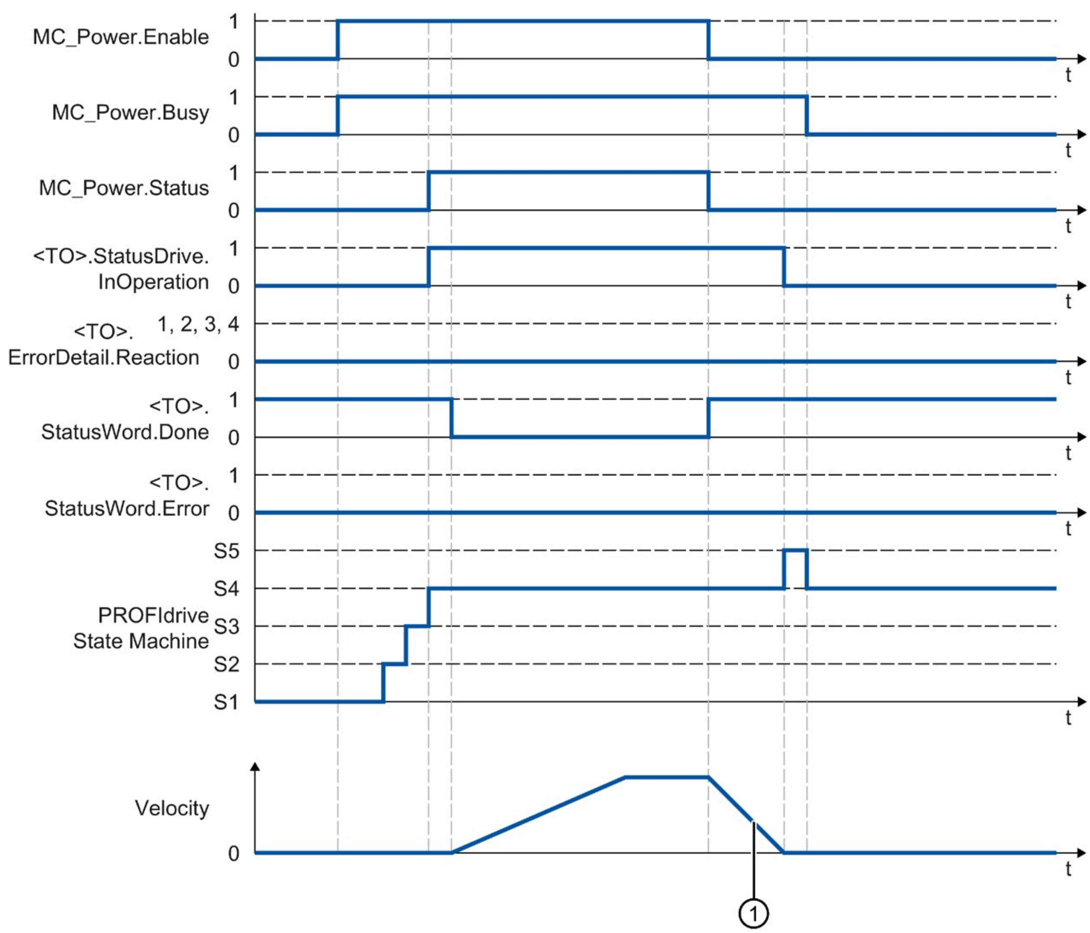
Errors in Motion Control instructions (Page 337)

A.9 MC_Power function chart

A.9.1 Drive connection via PROFIdrive

A.9.1.1 StopMode 0, 2

Function chart: Enabling a technology object and disabling with "StopMode" = 0, 2



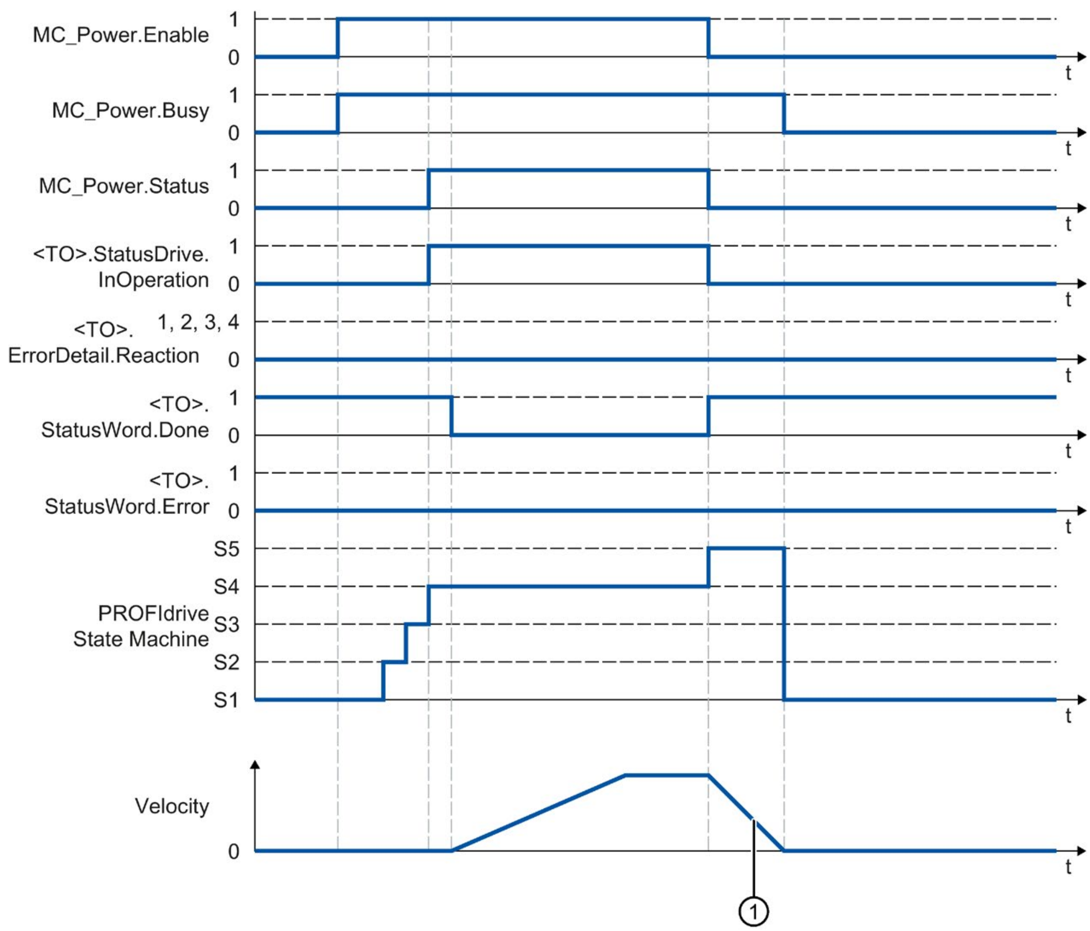
①
- "StopMode" = 0

  The axis is braked with the configured emergency stop deceleration.
- "StopMode" = 2

  The axis decelerates with the configured maximum deceleration.

A.9.1.2 StopMode 1

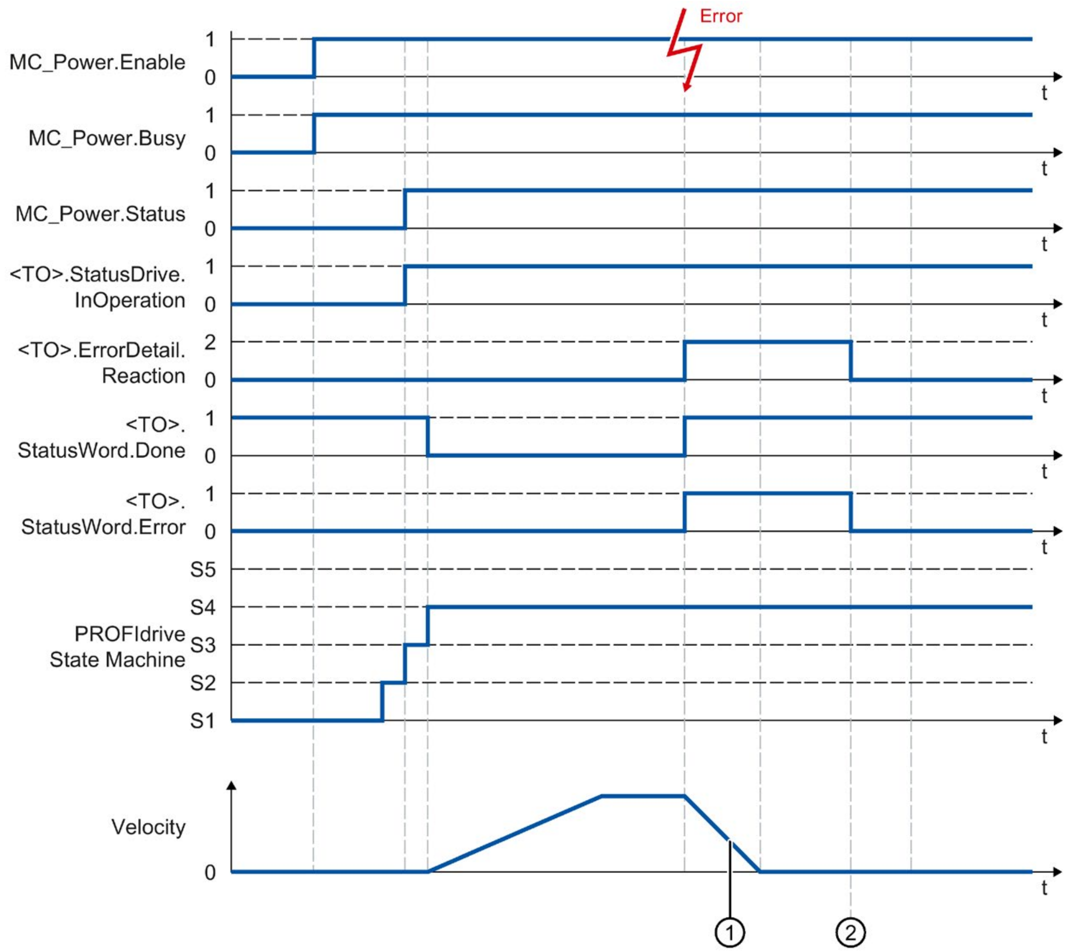
Function chart: Enabling a technology object and disabling with "StopMode" = 1



① The deceleration ramp depends on the configuration in the drive.

A.9.1.3 Alarm reactions with braking ramp via the technology object

Function chart: Enabling a technology object and occurrence of a technology alarm with braking ramp via the technology object



① The axis is braked based on the alarm reaction:

- Stop with current dynamic values (<TO>.ErrorDetail.Reaction = 1)

  The axis is braked with the deceleration in the Motion Control instruction.
- Stop with maximum dynamic values (<TO>.ErrorDetail.Reaction = 2)

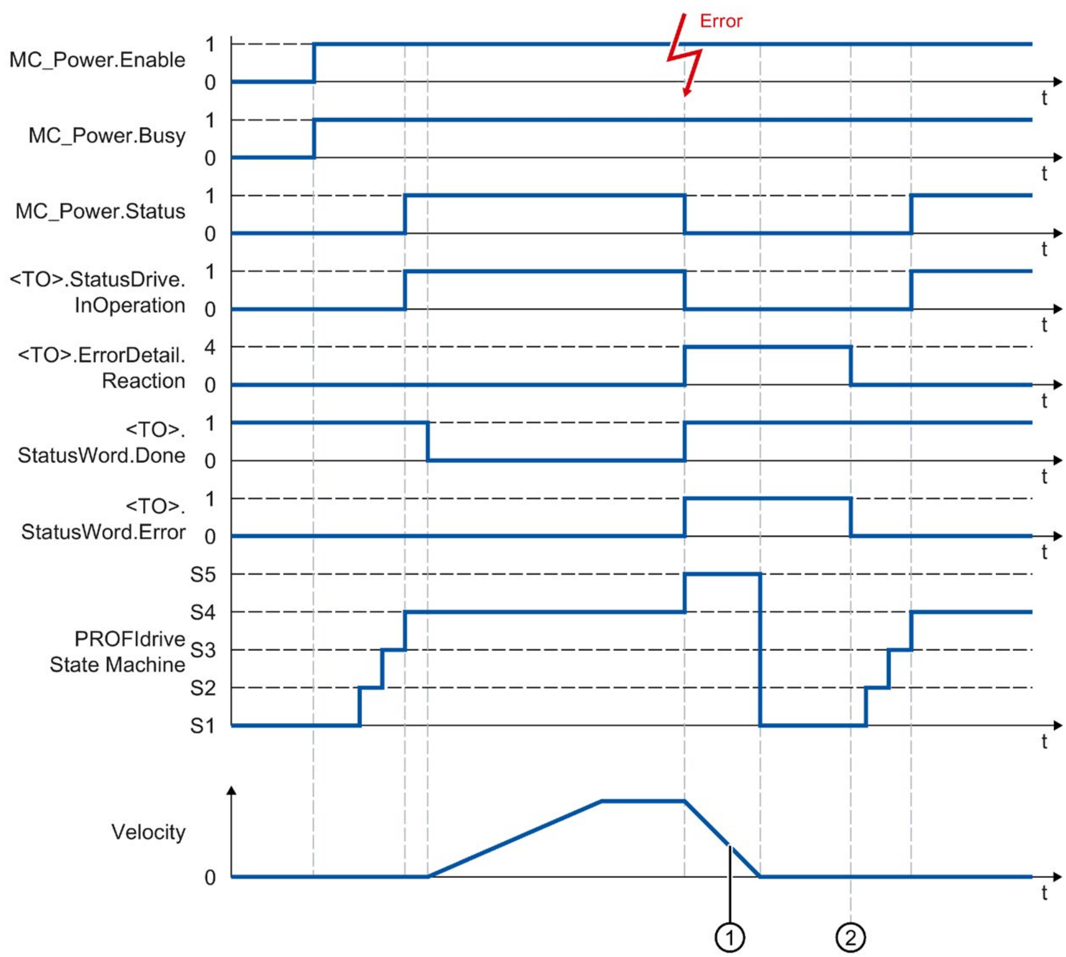
  The axis decelerates with the configured maximum deceleration.
- Stop with emergency stop ramp (<TO>.ErrorDetail.Reaction = 3)

  The axis is braked with the configured emergency stop deceleration.

② The technology alarm is acknowledged.

A.9.1.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm reaction "Remove enable"



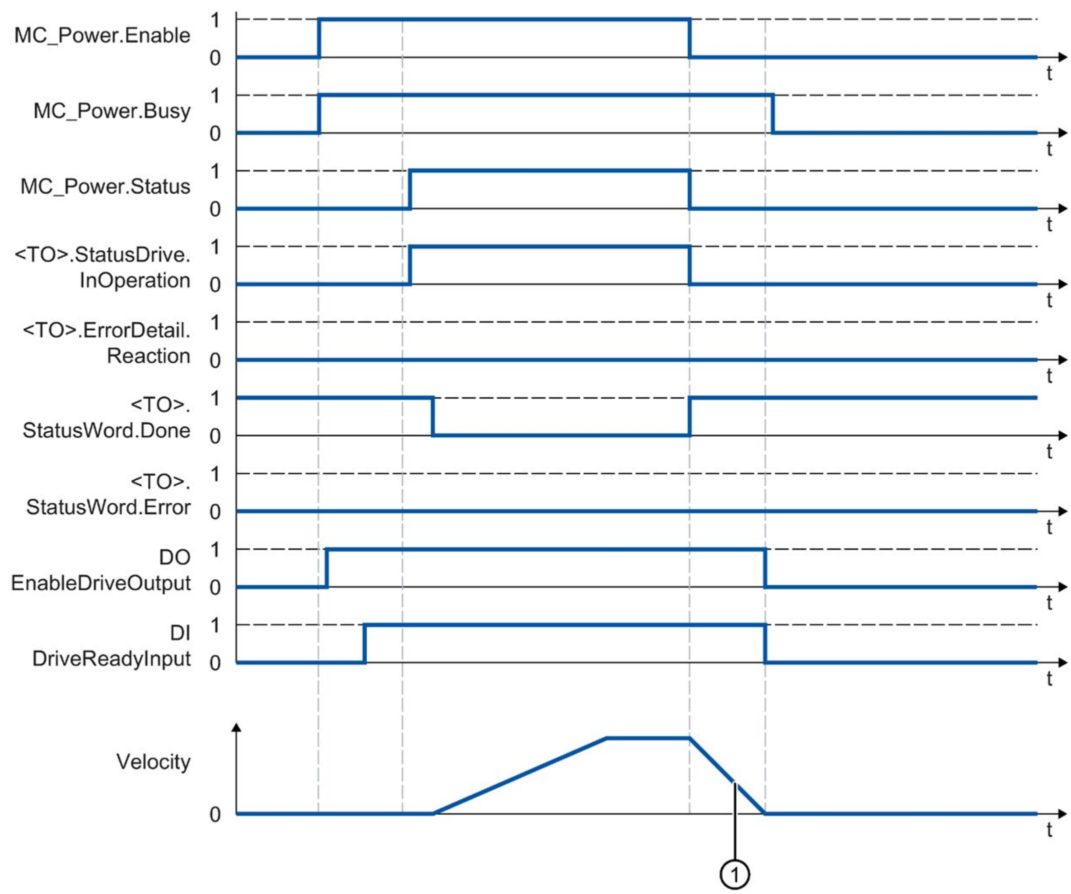
① The deceleration ramp depends on the configuration in the drive.

② The technology alarm is acknowledged at time ②.

A.9.2 Analog drive connection

A.9.2.1 StopMode 0, 2

Function chart: Enabling a technology object and disabling with "StopMode" = 0, 2



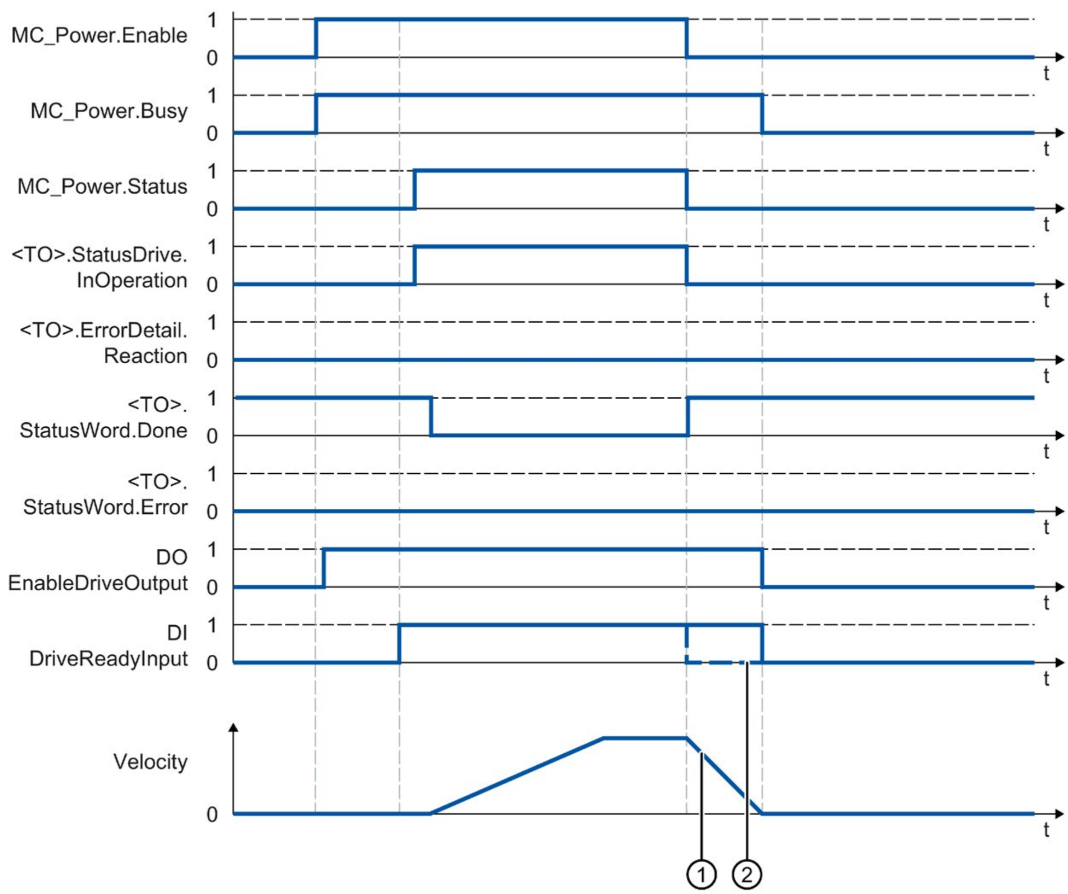
①
- "StopMode" = 0

  The axis is braked with the configured emergency stop deceleration.
- "StopMode" = 2

  The axis decelerates with the configured maximum deceleration.

A.9.2.2 StopMode 1

Function chart: Enabling a technology object and disabling with "StopMode" = 1

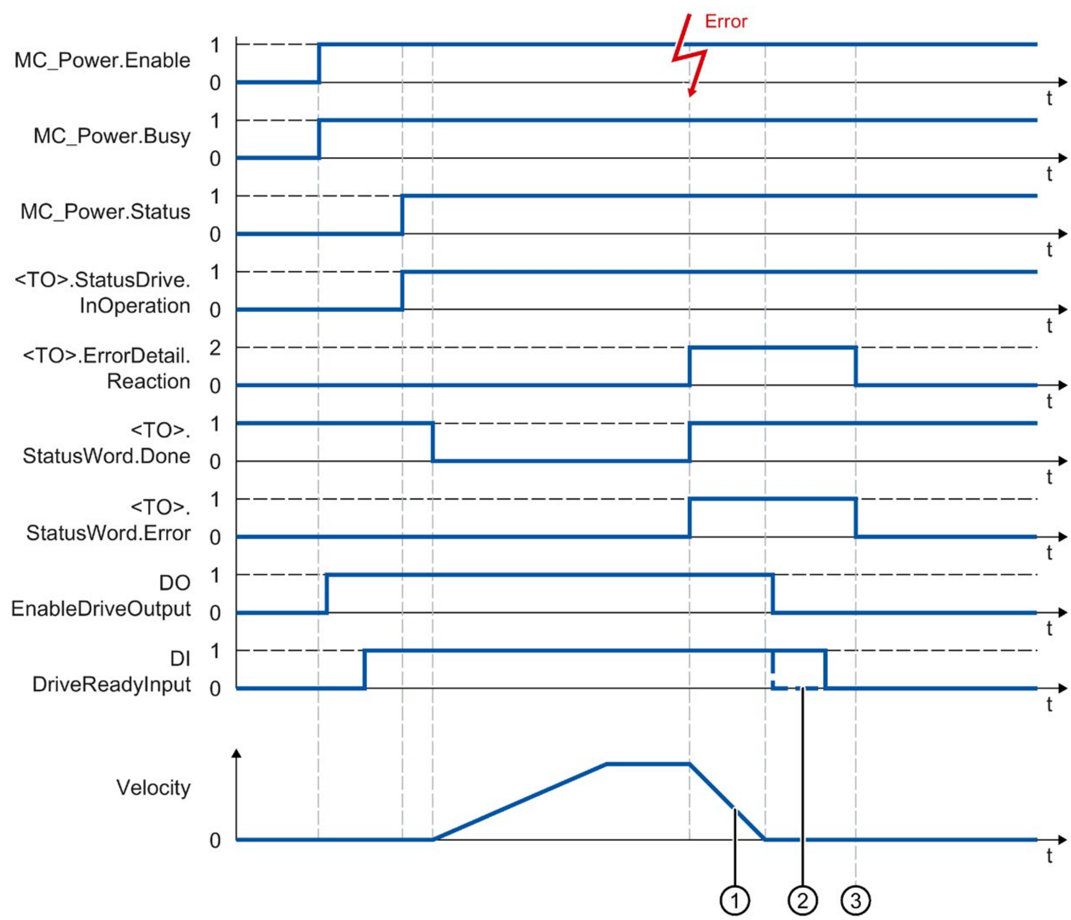


① The deceleration ramp depends on the configuration in the drive.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

A.9.2.3 Alarm reactions with braking ramp via the technology object

Function chart: Enabling a technology object and occurrence of a technology alarm with braking ramp via the technology object



① The axis is braked based on the alarm reaction:

- Stop with current dynamic values (<TO>.ErrorDetail.Reaction = 1)

  The axis is braked with the deceleration in the Motion Control instruction.
- Stop with maximum dynamic values (<TO>.ErrorDetail.Reaction = 2)

  The axis decelerates with the configured maximum deceleration.
- Stop with emergency stop ramp (<TO>.ErrorDetail.Reaction = 3)

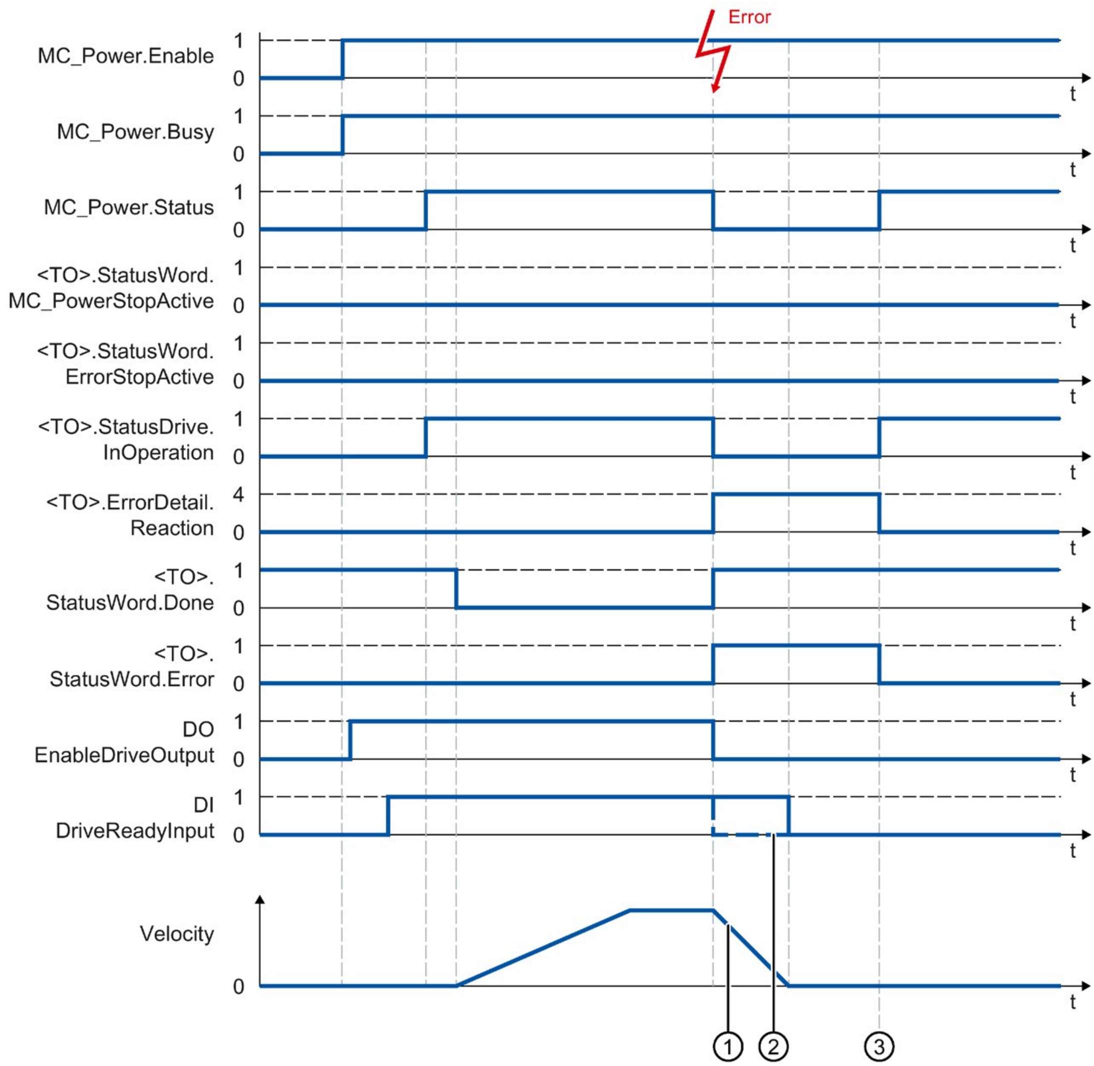
  The axis is braked with the configured emergency stop deceleration.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

③ The technology alarm is acknowledged at time ③.

A.9.2.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm reaction "Remove enable"



① The deceleration ramp depends on the configuration in the drive.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

③ The technology alarm is acknowledged at time ③.

A.10 SINAMICS drives

A.10.1 Compatibility list

An overview of drives that can be interconnected with an S7-1500 CPU is available at:

https://support.industry.siemens.com/cs/document/109750431 (https://support.industry.siemens.com/cs/ww/en/view/109750431)

A.10.2 Homing SINAMICS drives with external zero marks

For SINAMICS drives with external zero marks, synchronization during homing must always occur on the left side of the external zero mark's signal. That is to say, with a positive direction of travel synchronization is done on a positive edge, and with a negative direction of travel synchronization is done on a negative edge.

By inverting the signal, synchronization can also be done on the right sight of the signal of the external zero mark. The inversion can be configured in the drive using SINAMICS parameter P490.

Homing to an encoder zero mark or an external zero mark is configured in SINAMICS parameter P495.

A.11 Data types

Data type for use with technology as of V4.0

The table below contains the data types for reference to the respective technology object:

Data type	Structure
TO_SpeedAxis	Speed axis
TO_PositioningAxis	Positioning axis
TO_SynchronousAxis	Synchronous axis
TO_Encoder	External encoder
TO_OutputCam	Output cam
TO_CamTrack	Cam track
TO_MeasuringInput	Measuring input
TO_Cam	Cam (S7-1500T)
TO_Kinematics	Kinematics (S7-1500T)
PD_TELx	Telegram no. "x"
PD_STW1_611Umode	Control word 1 (STW1)
PD_STW2_611Umode	Control word 2 (STW2)
PD_ZSW1_611Umode	Status word 1 (ZSW1)
PD_ZSW2_611Umode	Status word 2 (ZSW2)

Glossary

Absolute synchronous operation

Function corresponds to the Motion Control instruction MC_GearInPos or MC_CamIn.

Absolute value encoder

Position encoder which outputs the position in the form of a digital numerical value. This numerical value is unique within the entire measuring range of the absolute value encoder.

Axis control panel

The axis control panel allows you to move the axis in manual mode, optimize the axis settings, and test the operation of the axis in your system.

Axis type

The axis type differs depending on the unit of measurement according to which the axis is positioned.

Depending on the execution of the mechanics, an axis is implemented as a linear axis or rotary axis:

- For linear axes, the position of the axis is specified as a linear measure, e.g. millimeters (mm).
- For rotary axes, the position of the axis is specified as an angular measure, e.g. degrees (°).

Communication processor (CP)

Module for expanded communications tasks covering special applications, for example in the area of security.

Communications module (CM)

Module for communications tasks which is used as an interface expansion of the CPU (for example PROFIBUS) or provides additional communications options (e.g. PtP) in an automation system.

Drive

The combination of motor (electric or hydraulic), actuator (converter, valve), control system, measuring system and supply (infeed, accumulator).

Dynamic Servo Control (DSC)

In drives that support DSC, you can optionally use the position controller in the drive. The position controller in the drive is usually implemented with a rapid speed-control cycle. This improves the control performance for digitally coupled drives.

Following error

The following error is the difference between the position setpoint and the actual position value. The transmission times of the setpoint to the drive, and of the actual position value to the controller, are taken into account in the calculation of the following error.

GSD file

As a Generic Station Description, this file contains all properties of a PROFINET or PROFIBUS device that are necessary for its configuration.

Hardware limit switch

Mechanical limit position switch that limits the maximum permissible traversing range of the axis.

Homing

With homing, you create the relationship between the position in the technology object and the mechanical position of the axis. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

Incremental encoder

Position encoder which outputs the position change incrementally in the form of a digital numerical value.

Kv factor

Gain factor of the position controller

Master value

Input value for synchronous operation

Motion Control instruction

Use the Motion Control instructions to start Motion Control jobs at technology objects in your user program and thus execute the desired functionality at the technology objects. You track the status of running jobs with the output parameters of the Motion Control instructions.

Override

Percentage correction of the velocity/speed

Processing cycle clock

The processing of a technology object in the servo cycle clock.

PROFIdrive

PROFIdrive is a profile specified by the PNO (PROFIBUS user organization) for PROFIBUS DP and PROFINET IO for speed- and position-controlled drives.

PROFIdrive frame

Frame for communication according to PROFIdrive.

Proximity switch

Position switch which is activated with the moving part without mechanical contact.

Relative gearing

Function corresponds to the Motion Control instruction MC_GearIn.

Restart

The technology object is reinitialized with the current configuration parameters.

Safe Stop 1 (SS1)

The Safe Stop 1 (SS1) safety function brings a drive to standstill quickly and safely via an internal rapid stop ramp. Safe Torque Off (STO) is activated after standstill. STO ensures that no more torque generating energy acts on a drive. This prevents unintended startup of the drive.

You can use the SS1 safety function when a fast stop of the drive with a subsequent transition to STO is required. SS1 is used, for example, to quickly stop high inertia loads or to brake drives quickly and safely at high speeds

Safe Stop 2 (SS2)

The Safe Stop 2 (SS2) safety function brings a drive to standstill quickly and safely via an internal rapid stop ramp. After standstill is reached, the standstill position is monitored on the drive side. The drive can deliver full torque to maintain the standstill.

SS2, for example, is used for processing machines and machine tools.

Safe Torque Off (STO)

The Safe Torque Off (STO) safety function is the most commonly used and most basic drive-internal safety function. STO ensures that no more torque generating energy acts on a drive. This prevents unintended startup of the drive. The pulses of the drive are eliminated. The drive is reliably torque-free. This state is monitored internally in the drive.

You can use STO when the drive comes to a standstill in a sufficiently short time on its own due to the load torque or due to friction. Other areas of use are where "coasting" of the drive has no relevance for safety.

Software limit switch

A programmable position which limits the traversing range of an axis.

Synchronization

The phase of the following axis to reach synchronous movement.

Synchronous operation

Defined synchronous movement after synchronization of a following axis to a leading axis.

Technology alarm

If an error occurs at a technology object (e.g. approaching a hardware limit switch), a technology alarm is triggered and indicated.

The impact of a technology alarm on the technology object is specified by the alarm reaction (e.g. remove enable). The alarm reaction is specified by the system.

Technology data block

The technology data block represents the technology object and contains all configuration data, setpoint and actual values, and status information of the technology object.

Technology module (TM)

Module for technological tasks, e.g. counting, measuring and positioning.

Zero mark

Position reference for the movement of rotary and linear incremental encoders. The zero mark of an incremental encoder is used as a homing mark, for example.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation will support you in configuring and programming control tasks with the S7-1200 and S7-1500 automation systems.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Experience of working with STEP 7 (TIA Portal)

Validity of the documentation

This documentation applies to the use of SW controllers on the CPUs of automation systems S7-1200 and S7-1500 together with STEP 7 (TIA Portal). Additional SW controllers that are not covered in this documentation are available for the use of S7-300 and S7-400 with STEP 7 (TIA Portal). Section Overview of software controller (Page 39) gives a complete overview of all SW controllers in STEP 7 (TIA Portal) and their possible applications.

Conventions

Please observe notes marked as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

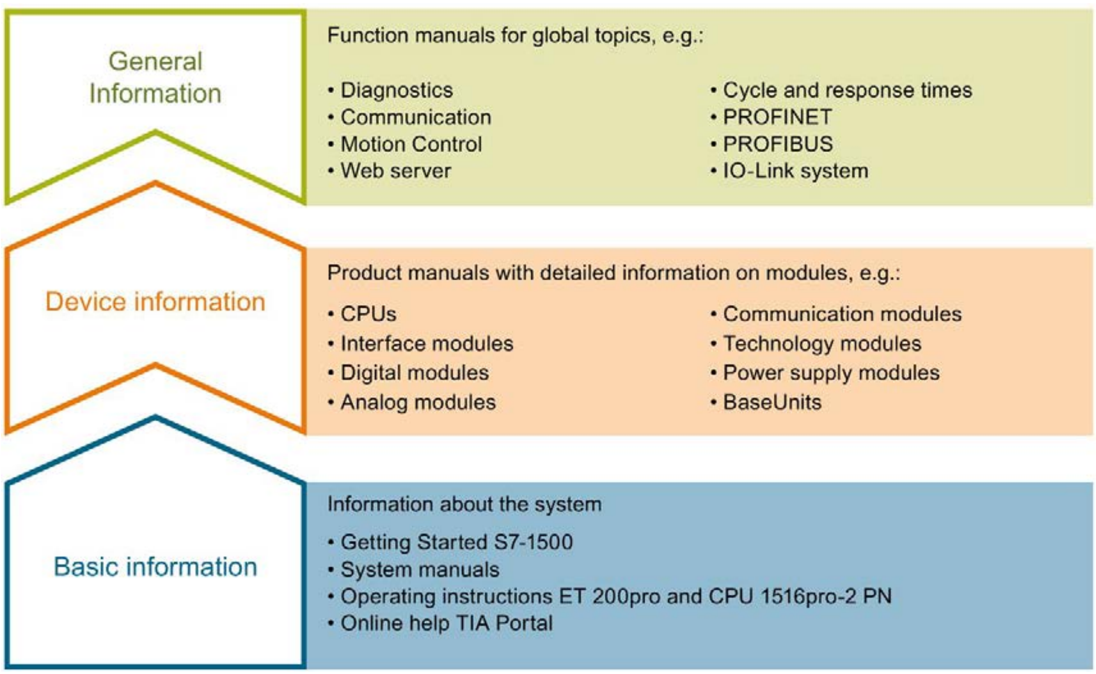
Additional assistance

- Information on the offers of our Technical Support are available in the appendix Service & Support (Page 566).
- The range of technical documentation for the individual SIMATIC products and automation systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

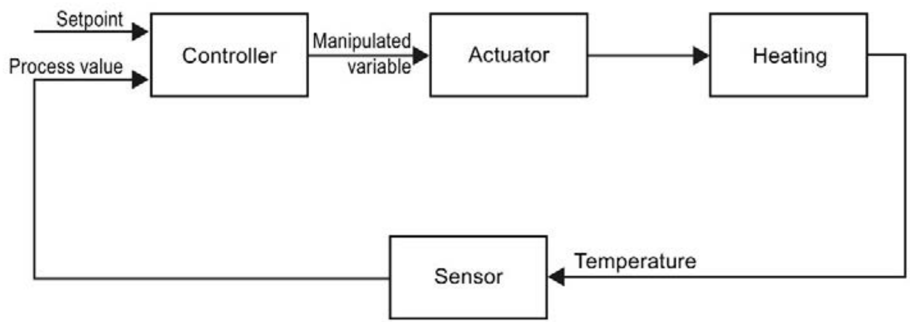
Principles for control

2

2.1 Controlled system and actuators

Controlled system

Room temperature control by means of a heating system is a simple example of a controlled system. A sensor measures the room temperature and transfers the value to a controller. The controller compares the current room temperature with a setpoint and calculates an output value (manipulated variable) for heating control.



A properly set PID controller reaches this setpoint as quickly as possible and then holds it a constant value. After a change in the output value, the process value often changes only with a time delay. The controller has to compensate for this response.

Actuators

The actuator is an element of the controlled system and is influenced by the controller. Its function modifies mass and energy flows.

The table below provides an overview of actuator applications.

Application	Actuator
Liquid and gaseous mass flow	Valve, shutter, gate valve
Solid mass flow, e.g., bulk material	Articulated baffle, conveyor, vibrator channel
Flow of electrical power	Switching contact, contactor, relay, thyristor
	Variable resistor, variable transformer, transistor

Actuators are distinguished as follows:

- Proportional actuators with constant actuating signal

  These elements set degrees of opening, angular positions or positions in proportion to the output value. The output value has an analog effect on the process within the control range.

  Actuators in this group include spring-loaded pneumatic drives, as well as motorized drives with position feedback for which a position control system is formed.

  An continuous controller, such as PID_Compact, generates the output value.

- Proportional actuators with pulse-width modulated signal

  These actuators are used to generate the output of pulses with a length proportional to the output value within the sampling time intervals. The actuator - e.g. a heating resistor or cooling apparatus - is switched on in isochronous mode for durations that differ depending on the output value.

  The actuating signal can assume unipolar "On" or "Off" states, or represent bipolar states such as "open/close", "forward/backward", "accelerate/brake".

  The output value is generated by a two-step controller such as PID_Compact with pulse-width modulation.

- Actuators with integral action and three-step actuating signal

  Actuators are frequently operated by motors with an on period that is proportional to the actuator travel of the choke element. This includes elements such as valves, shutters, and gate valves. In spite of their different design, all of these actuators follow the effect of an integral action at the input of the controlled system.

  A step controller, such as PID_3Step. generates the output value.

2.2 Controlled systems

The properties of a controlled system can hardly be influenced as these are determined by the technical requirements of the process and machinery. Acceptable control results can only be achieved by selecting a suitable controller type for the specific controlled system and adapting the controller to the time response of the controlled system. Therefore, it is is indispensable for the configuration of the proportional, integral and derivative actions of the controller to have precise knowledge of the type and parameters of the controlled system.

Controlled system types

Controlled systems are classified based on their time response to step changes of the output value.

We distinguish between the following controlled systems:

- Self-regulating controlled systems
  - Proportional-action controlled systems
  - PT1 controlled systems
  - PT2 controlled systems
- Non-self-regulating controlled systems
- Controlled systems with and without dead time

Self-regulating controlled systems

Proportional-action controlled systems

In proportional-action controlled systems, the process value follows the output value almost immediately. The ratio between the process value and output value is defined by the proportional Gain of the controlled system.

Examples:

- Gate valve in a piping system
- Voltage dividers
- Step-down function in hydraulic systems

PT1 controlled systems

In a PT1 controlled system, the process value initially changes in proportion to the change of the output value. The rate of change of the process value is reduced as a function of the time until the end value is reached, i.e., it is delayed.

Examples:

- Spring damping system
- Charge of RC elements
- Water container that is heated with steam.

The time constants are often identical for heating and cooling processes, or for charging and discharge characteristics. With different time constants, controlling is clearly more complex.

PT2 controlled systems

In a PT2 controlled system, the process value does not immediately follow a step change of the output value, i.e., it increases in proportion to the positive rate of rise and then approaches the setpoint at a decreasing rate of rise. The controlled system shows a proportional response characteristic with second order delay element.

Examples:

- Pressure control
- Flow rate control
- Temperature control

Non-self-regulating controlled systems

Non-self-regulating controlled systems have an integral response. The process value approaches an infinite maximum value.

Example:

- Liquid flow into a container

Controlled systems with dead time

A dead time always represents the runtime or transport time that has to expire before a change to the system input can be measured at the system output.

In controlled systems with dead time, the process value change is delayed by the amount of the dead time.

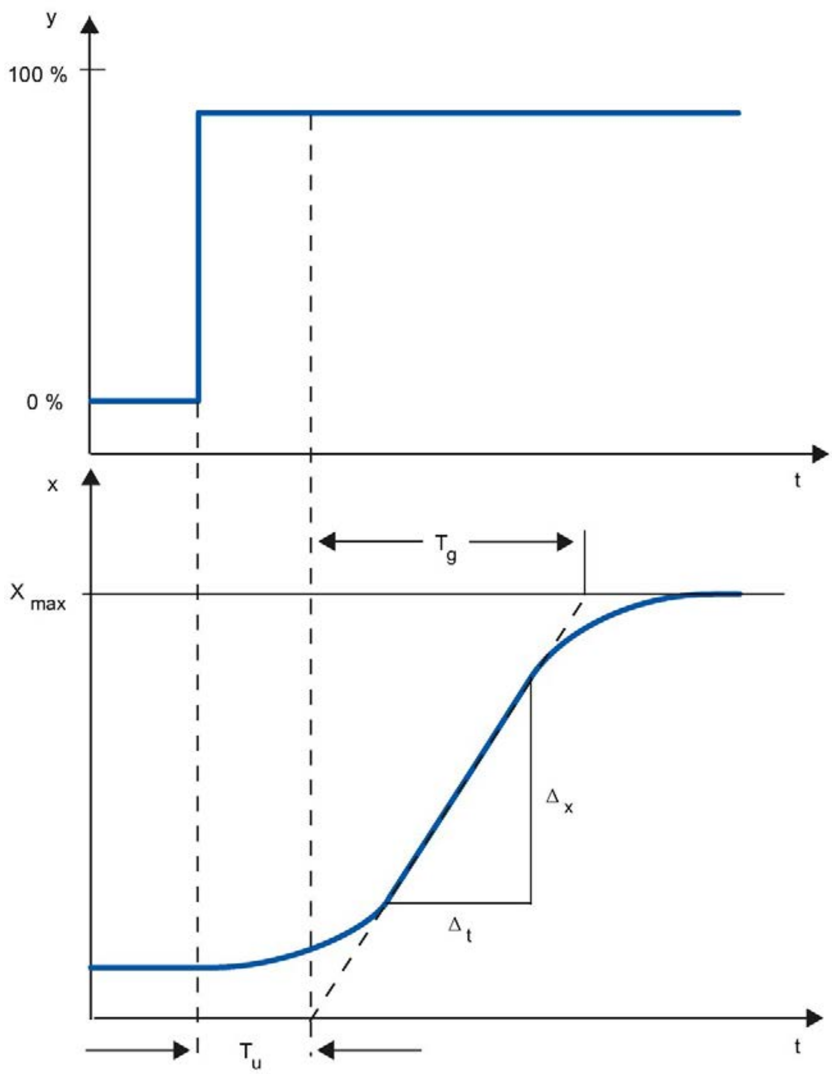
Example:

Conveyor

2.3 Characteristic values of the control section

Determining the time response from the step response

Time response of the controlled system can be determined based on the time characteristic of process value x following a step change of output value y. Most controlled systems are self-regulating controlled systems.



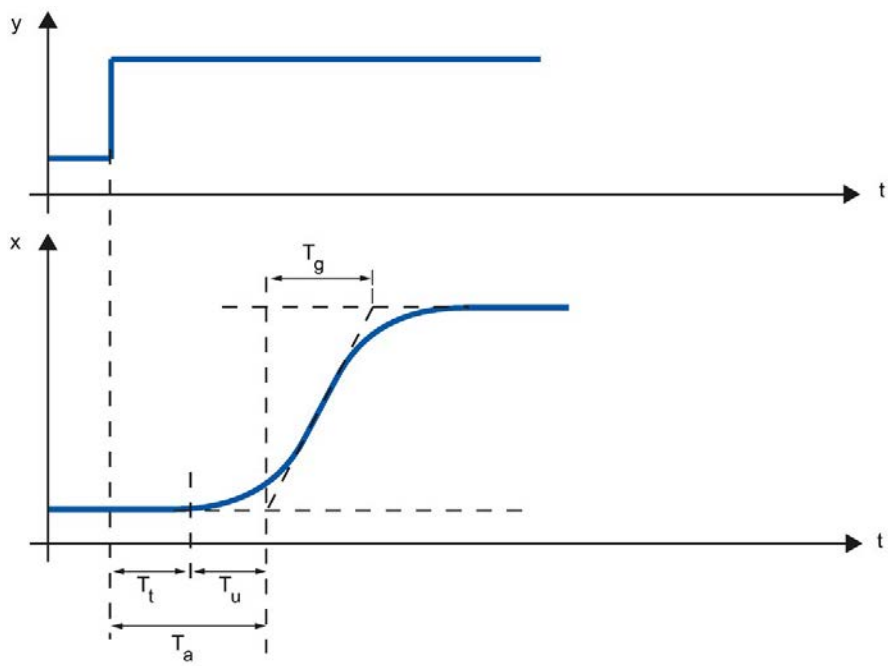
The time response can be determined by approximation using the variables Delay time T_u, Recovery time T_g and Maximum value X_{max}. The variables are determined by applying tangents to the maximum value and the inflection point of the step response. In many situations, it is not possible to record the response characteristic up to the maximum value because the process value cannot exceed specific values. In this case, the rate of rise v_{max} is used to identify the controlled system ($v_{max} = \Delta_x/\Delta_t$).

The controllability of the controlled system can be estimated based on the ratio T_u/T_g, or $T_u \times v_{max}/X_{max}$. Rule:

Process type	T_u / T_g	Suitability of the controlled system for controlling
I	< 0.1	can be controlled well
II	0.1 to 0.3	can still be controlled
III	> 0.3	difficult to control

Influence of the dead time on the controllability of a controlled system

A controlled system with dead time and recovery reacts as follows to a jump of the output value.



T_t	Dead time
T_u	Delay time
T_g	Recovery time
y	Output value
x	Process value

The controllability of a self-regulating controlled system with dead time is determined by the ratio of T_t to T_g. T_t must be small compared to T_g. Rule:

$T_t/T_g \leq 1$

Response rate of controlled systems

Controlled systems can be judged on the basis of the following values:

T_u < 0.5 min, T_g < 5 min = fast controlled system

T_u > 0.5 min, T_g > 5 min = slow controlled system

Parameters of certain controlled systems

Physical quantity	Controlled system	Delay time T_u	Recovery time T_g	Rate of rise v_{max}
Temperature	Small electrically heated furnace	0.5 to 1 min	5 to 15 min	Up to 60 K/min.
	Large electrically heated annealing furnace	1 to 5 min	10 to 20 min	Up to 20 K/min.
	Large gas-heated annealing furnace	0.2 to 5 min	3 to 60 min	1 to 30 K/min
	Distillation tower	1 to 7 min	40 to 60 min	0.1 to 0.5° C/s
	Autoclaves (2.5 m^3)	0.5 to 0.7 min	10 to 20 min	Not specified
	High-pressure autoclaves	12 to 15 min	200 to 300 min	Not specified
	Steam superheater	30 s to 2.5 min	1 to 4 min	2°C/s
	Injection molding machines	0.5 to 3 min	3 to 30 min	5 to 20 K/min
	Extruders	1 to 6 min	5 to 60 min	
	Packaging machines	0.5 to 4 min	3 to 40 min	2 to 35 K/min
	Room heating	1 to 5 min	10 to 60 min	1° C/min
Flow rate	Pipeline with gas	0 to 5 s	0.2 to 10 s	Not relevant
	Pipeline with liquid	None	None	
Pressure	Gas pipeline	None	0.1 s	Not relevant
	Drum boiler with gas or oil firing	None	150 s	Not relevant
	Drum boiler with impact grinding mills	1 to 2 min	2 to 5 min	Not relevant
Vessel level	Drum boiler	0.6 to 1 min	Not specified	0.1 to 0.3 cm/s
Speed	Small electric drive	None	0.2 to 10 s	Not relevant
	Large electric drive	None	5 to 40 s	Not relevant
	Steam turbine	None	Not specified	50 min^{-1}
Voltage	Small generators	None	1 to 5 s	Not relevant
	Large generators	None	5 to 10 s	Not relevant

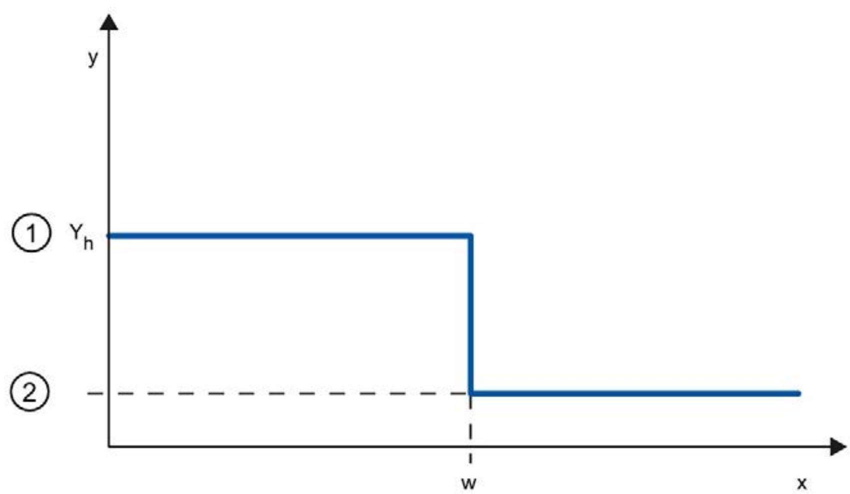
2.4 Pulse controller

Two-step controllers without feedback

Two-step controllers have the state "ON" and "OFF" as the switching function. This corresponds to 100% or 0% output. This behavior generates a sustained oscillation of process value x around setpoint w.

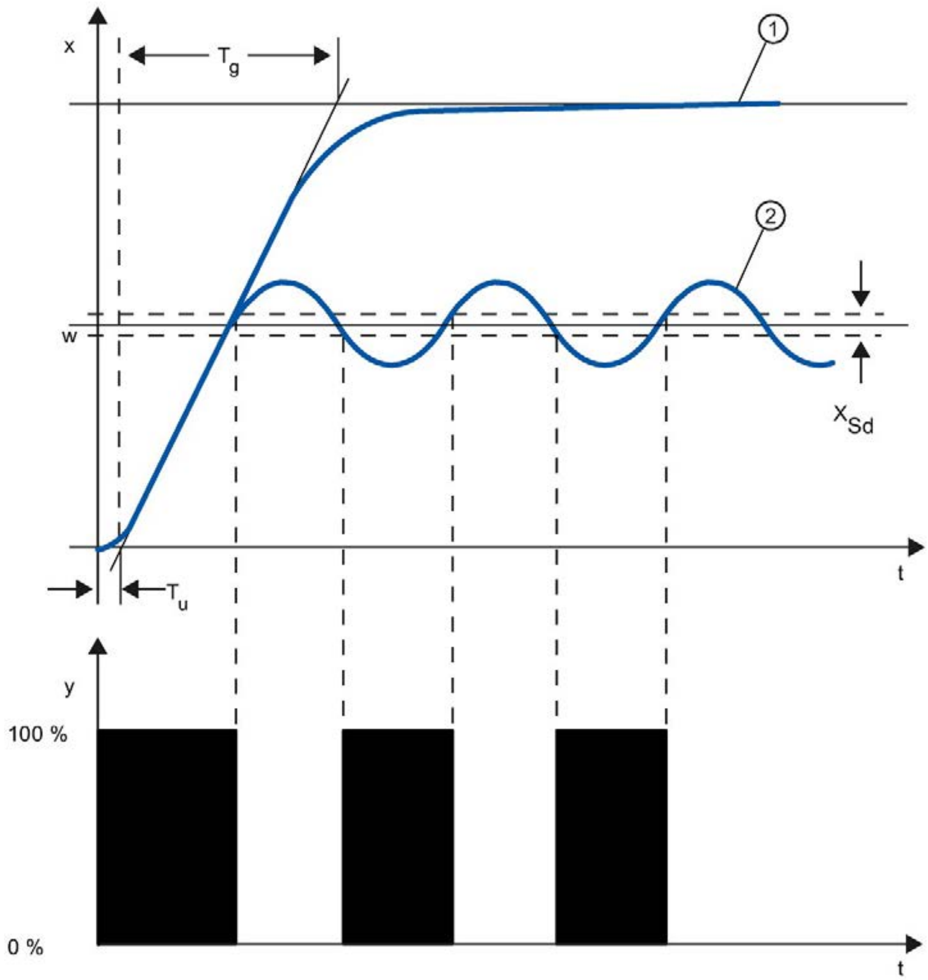
The amplitude and duration of the oscillation increase in proportion to the ratio between the delay time T_u and recovery time T_g of the controlled system. These controllers are used mainly for simple temperature control systems (such as electrically directly heated furnaces) or as limit-value signaling units.

The following diagram shows the characteristic of a two-step controller



①	ON
②	OFF
Y_h	Control range
w	Setpoint

The following diagram shows the control function of a two-step controller



①	Response characteristic without controller
②	Response characteristic with two-step controller
T_u	Delay time
T_g	Recovery time
X_{Sd}	Switching difference

Two-step controllers with feedback

The behavior of two-step controllers in the case of controlled systems with larger delay times, such as furnaces where the functional space is separated from the heating, can be improved by the use of electronic feedback.

The feedback is used to increase the switching frequency of the controller, which reduces the amplitude of the process value. In addition, the control-action results can be improved substantially in dynamic operation. The limit for the switching frequency is set by the output level. It should not exceed 1 to 5 switches per minute at mechanical actuators, such as relays and contactors. In the case of voltage and current outputs with downstream thyristor or Triac controllers high switching frequencies can be selected that exceed the limit frequency of the controlled system by far.

Since the switching pulses can no longer be determined at the output of the controlled system, results comparable with those of continuous controllers are obtained.

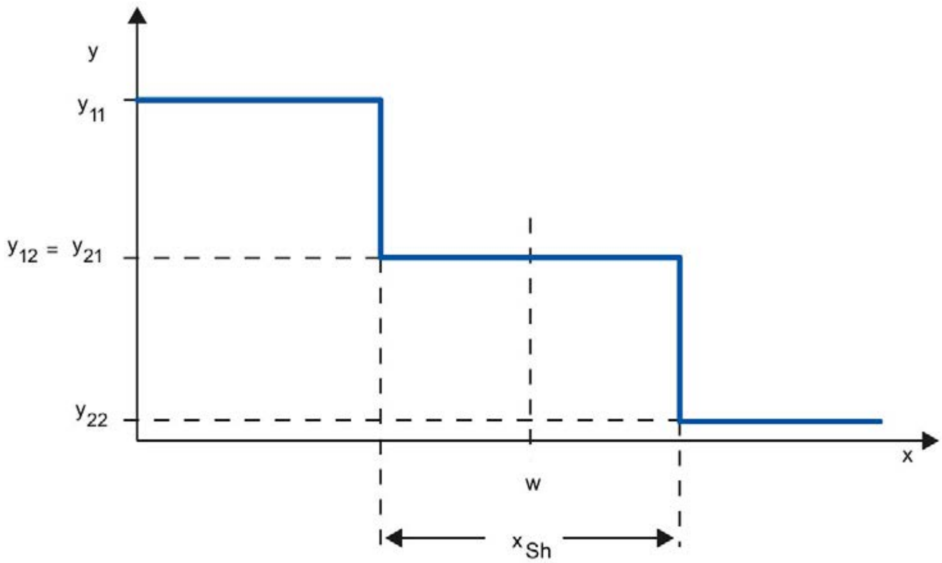
The output value is generated by pulse-width modulation of the output value of a continuous controller.

Two-step controllers with feedback are used for temperature control in furnaces, at processing machines in the plastics, textile, paper, rubber and foodstuff industries as well as for heating and cooling devices.

Three-step controllers

Three-step controllers are used for heating / cooling. These controllers have two switching points as their output. The control-action results are optimized through electronic feedback structures. Fields of applications for such controllers are heating, low-temperature, climatic chambers and tool heating units for plastic-processing machines.

The following diagram shows the characteristic of a three-step controller

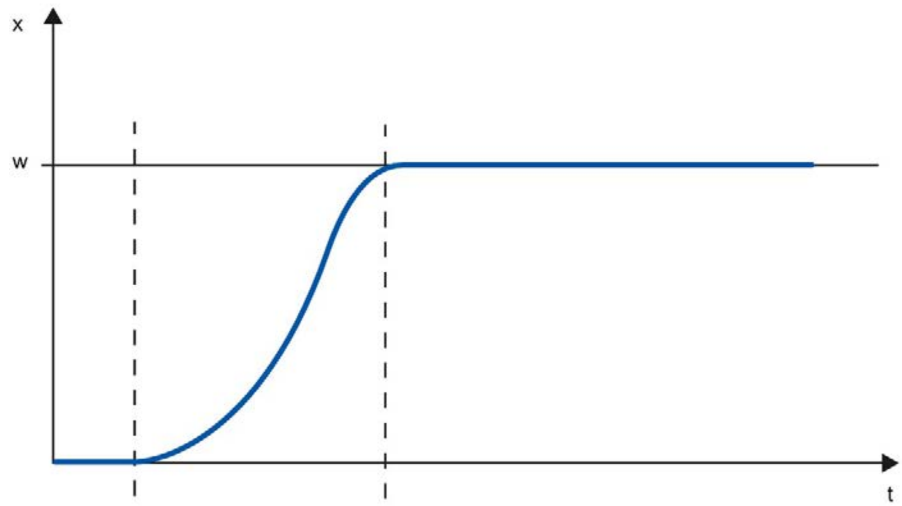


y	Output value, e.g. y11 = 100% heating y12 = 0% heating y21 = 0% cooling y22 = 100% cooling
x	Physical quantity of the process value, e.g., temperature in° C
w	Setpoint
x_{Sh}	Distance between Switching Point 1 and Switching Point 2

2.5 Response to setpoint changes and disturbances

Response to setpoint changes

The process value should follow a setpoint change as quickly as possible. The response to setpoint changes is improved by minimizing fluctuation of the process value and the time required to reach the new setpoint.

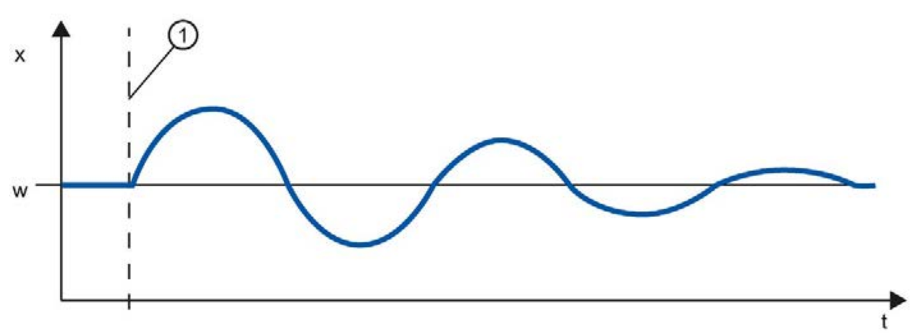


x Process value

w Setpoint

Response to disturbances

The setpoint is influenced by disturbance variables. The controller has to eliminate the resulting control deviations in the shortest time possible. The response to disturbances is improved by minimizing fluctuation of the process value and the time required to reach the new setpoint.



x Process value

w Setpoint

① Influencing a disturbance variable

Disturbance variables are corrected by a controller with integral action. A persistent disturbance variable does not reduce control quality because the control deviation is relatively constant. Dynamic disturbance variables have a more significant impact on control quality because of control deviation fluctuation. The control deviation is eliminated again only by means of the slow acting integral action.

A measurable disturbance variable can be included in the controlled system. This inclusion would significantly accelerated the response of the controller.

2.6 Control Response at Different Feedback Structures

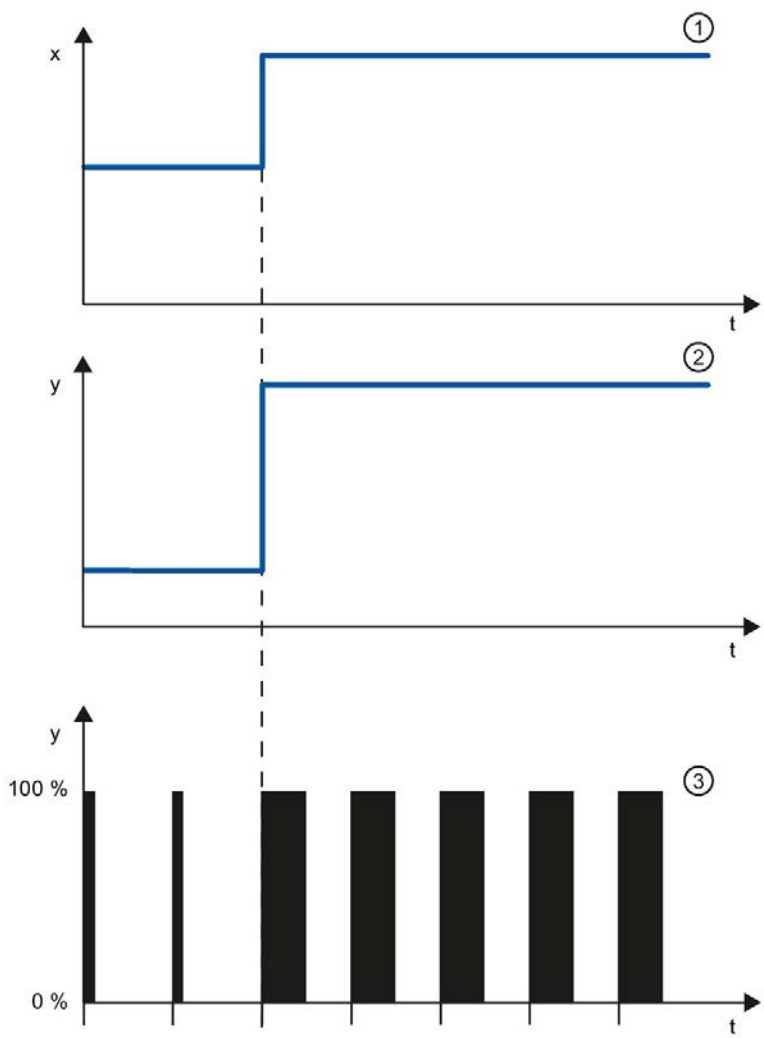
Control behavior of controllers

A precise adaptation of the controller to the time response of the controlled system is decisive for the controller's precise settling to the setpoint and optimum response to disturbance variables.

The feedback circuit can have a proportional action (P), proportional-derivative action (PD), proportional-integral action (PI), or proportional-integral-derivative action (PID).

If step functions are to be triggered by control deviations, the step responses of the controllers differ depending on their type.

Step response of a proportional action controller



① Control deviation
② Output value of a continuous controller
③ Output value of a pulse controller

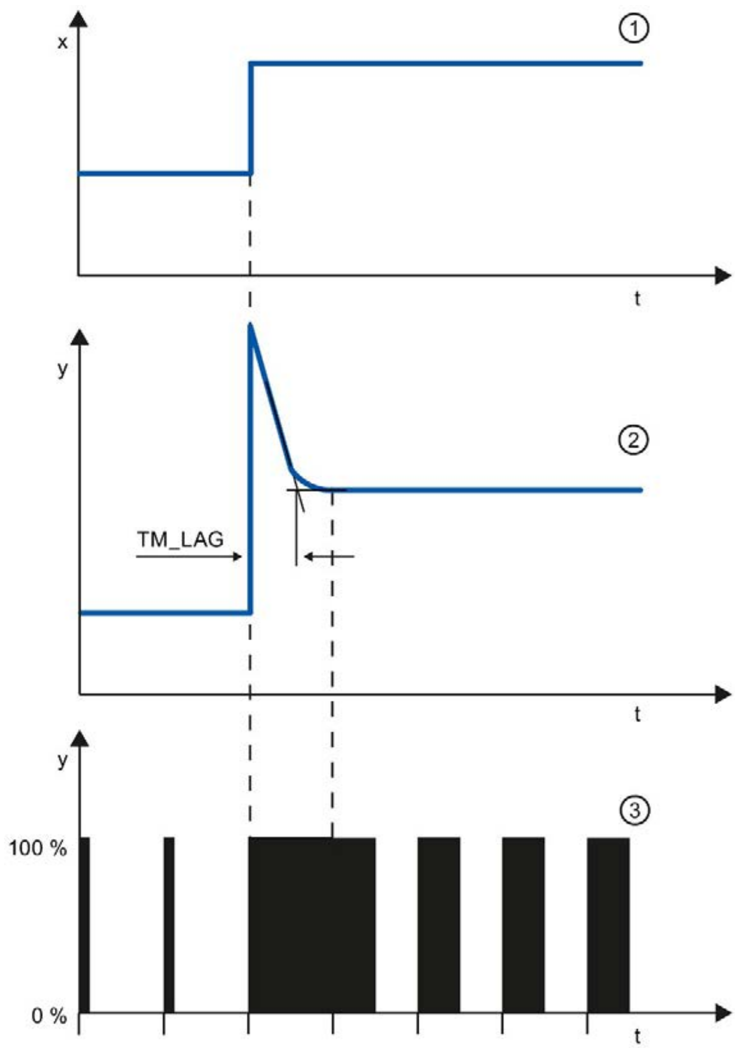
Equation for proportional action controller

Output value and control deviation are directly proportional, meaning:

Output value = proportional gain × control deviation

y = GAIN × x

Step response of a PD-action controller



①	Control deviation
②	Output value of a continuous controller
③	Output value of a pulse controller
TM_LAG	Delay of the Derivative action

Equation for PD-action controller

The following applies for the step response of the PD-action controller in the time range:

$$y = GAIN \cdot X_W \cdot \left(1 + \frac{TD}{TM\_LAG} \cdot e^{\frac{-t}{TM\_LAG}}\right)$$

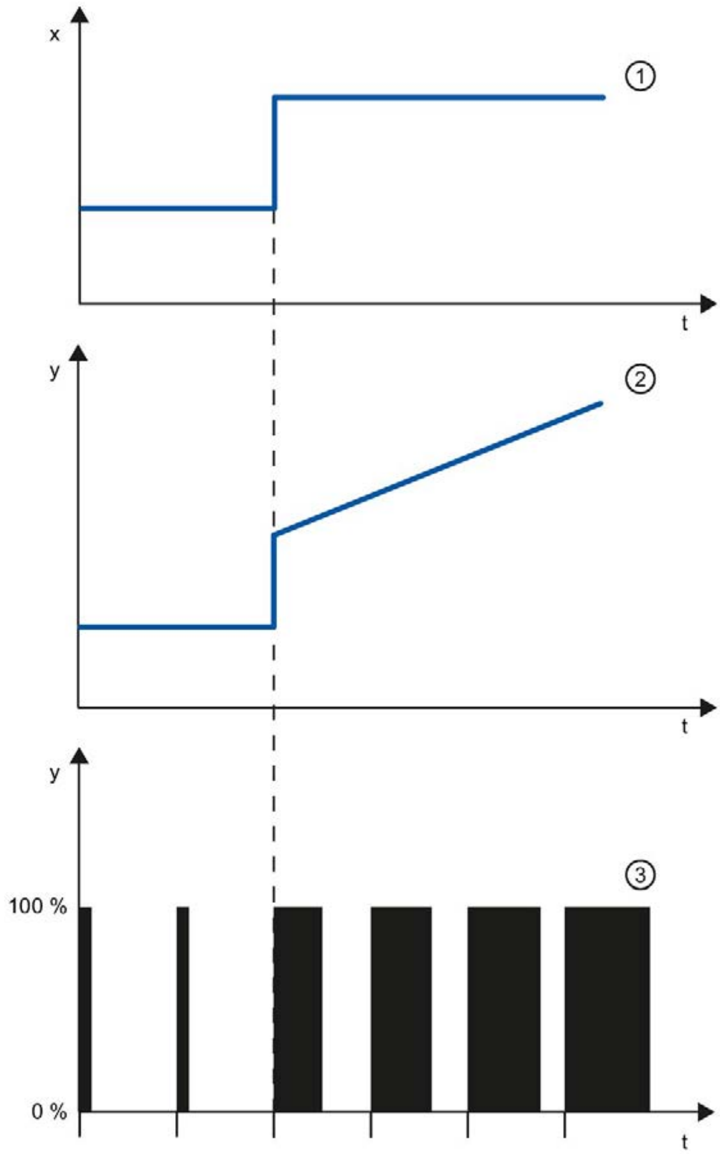
t = time interval since the step of the control deviation

The derivative action generates a output value as a function of the rate of change of the process value. A derivative action by itself is not suitable for controlling because the output value only follows a step of the process value. As long as the process value remains constant, the output value will no longer change.

The response to disturbances of the derivative action is improved in combination with a proportional action. Disturbances are not corrected completely. The good dynamic response is advantageous. A well attenuated, non-oscillating response is achieved during approach and setpoint change.

A controller with derivative action is not appropriate if a controlled system has pulsing measured quantities, for example, in the case of pressure or flow control systems.

Step response of a PI-action controller



① Control deviation
② Output value of a continuous controller
③ Output value of a pulse controller

An integral action in the controller adds the control deviation as a function of the time. This means that the controller corrects the system until the control deviation is eliminated. A sustained control deviation is generated at controllers with proportional action only. This effect can be eliminated by means of an integral action in the controller.

In practical experience, a combination of the proportional, integral and derivative actions is ideal, depending on the requirements placed on the control response. The time response of the individual components can be described by the controller parameters proportional gain GAIN, integral action time TI (integral action), and derivative action time TD (derivative action).

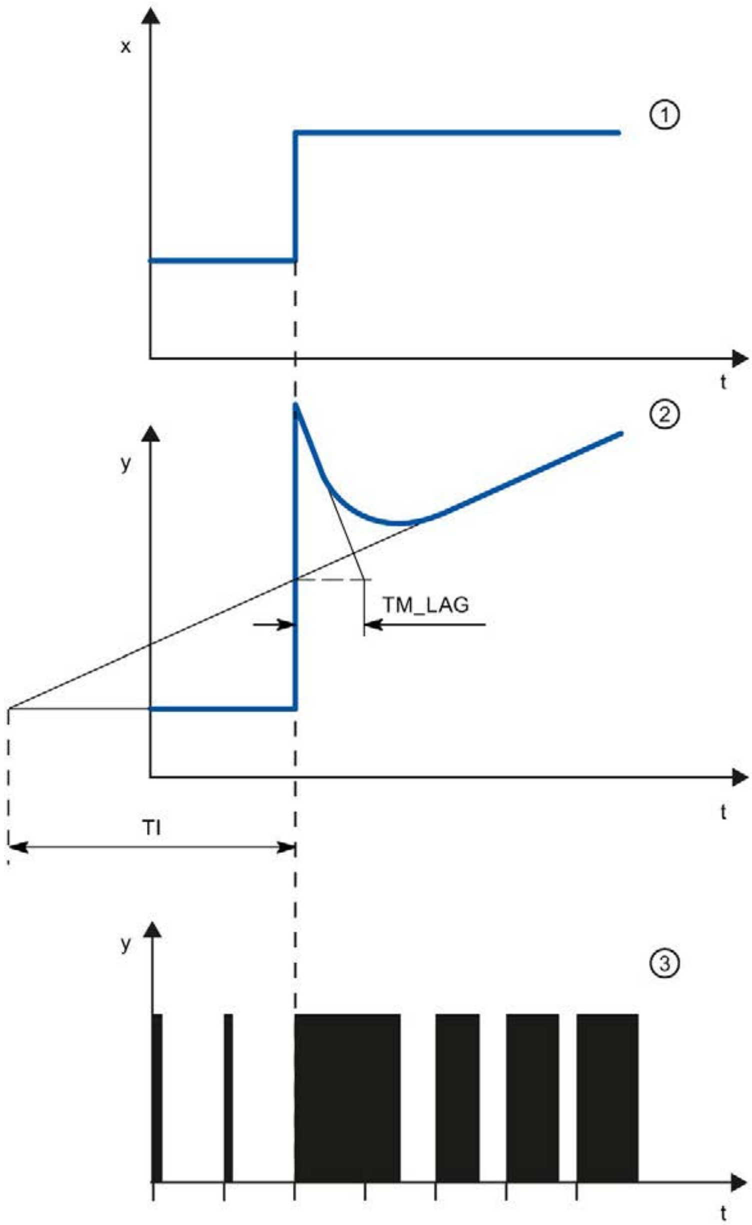
Equation for PI-action controller

The following applies for the step response of the PI-action controller in the time range:

$$y = GAIN \cdot X_W \cdot \left(1 + \frac{1}{TI \cdot t}\right)$$

t = time interval since the step of the control deviation

Step response of a PID controller



①	Control deviation
②	Output value of a continuous controller
③	Output value of a pulse controller
TM_LAG	Delay of the Derivative action
T_i	Integral action time

Equation for PID controller

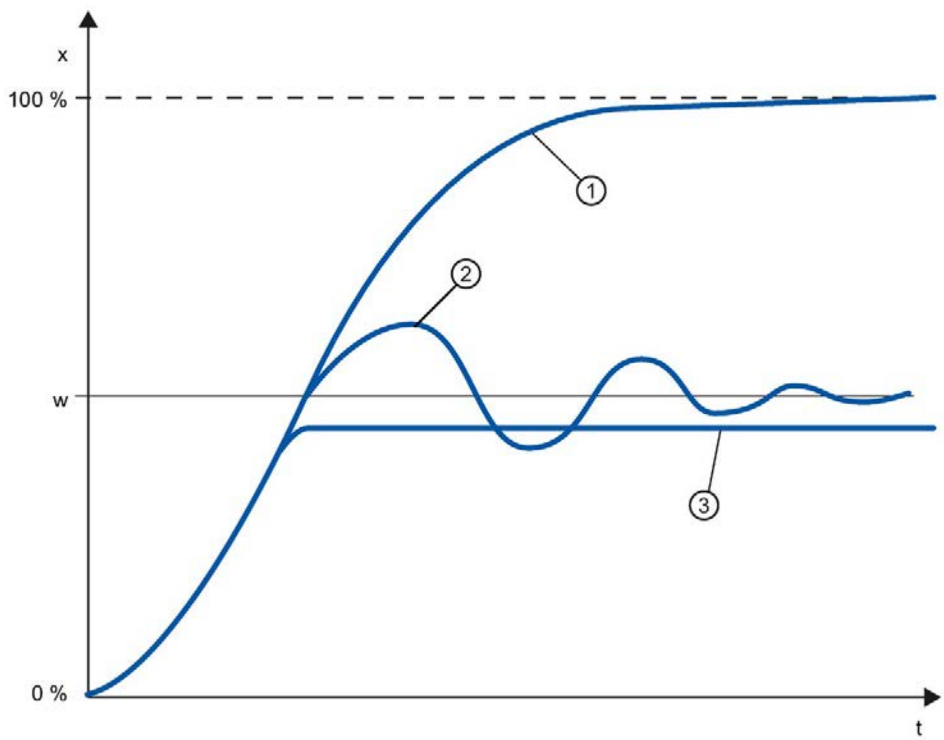
The following applies for the step response of the PID controller in the time range:

$$y = GAIN \cdot X_W \cdot \left(1 + \frac{1}{TI \cdot t} + \frac{TD}{TM\_LAG} \cdot e^{\frac{-t}{TM\_LAG}} \right)$$

t = time interval since the step of the control deviation

Response of a controlled system with different controller structures

Most of the controller systems occurring in process engineering can be controlled by means of a controller with PI-action response. In the case of slow controlled system with a large dead time, for example temperature control systems, the control result can be improved by means of a controller with PID action.



①	No controller
②	PID controller
③	PD-action controller
w	Setpoint
x	Process value

Controllers with PI and PID action have the advantage that the process value does not have any deviation from the setpoint value after settling. The process value oscillates over the setpoint during approach.

2.7 Selection of the controller structure for specified controlled systems

Selection of the Suitable Controller Structures

To achieve optimum control results, select a controller structure that is suitable for the controlled system and that you can adapt to the controlled system within specific limits.

The table below provides an overview of suitable combinations of a controller structure and controlled system.

Controlled system		Controller structure			
		P	PD	PI	PID
	With dead time only	Unsuitable	Unsuitable	Suitable	Unsuitable
	PT1 with dead time	Unsuitable	Unsuitable	Well suited	Well suited
	PT2 with dead time	Unsuitable	Suited conditionally	Well suited	Well suited
	Higher order	Unsuitable	Unsuitable	Suited conditionally	Well suited
	Not self-regulating	Well suited	Well suited	Well suited	Well suited

The table below provides an overview of suitable combinations of a controller structure and physical quantity.

Physical quantity	Controller structure			
	P	PD	PI	PID
	Sustained control deviation		No sustained control deviation	
Temperature	For low performance requirements and proportional action controlled systems with T_u/Tg < 0,1	Well suited	The most suitable controller structures for high performance requirements (except for specially adapted special controllers)	
Pressure	Suitable, if the delay time is inconsiderable	Unsuitable	The most suitable controller structures for high performance requirements (except for specially adapted special controllers)	
Flow rate	Unsuitable, because required GAIN range is usually too large	Unsuitable	Suitable, but integral action controller alone often better	Hardly required

2.8 PID parameter settings

Rule of Thumb for the Parameter Setting

Controller structure	Setting
P	GAIN ≈ v_{max} × T_u [° C]
PI	GAIN ≈ 1.2 × v_{max} × T_u [° C] TI ≈ 4 × T_u [min]
PD	GAIN ≈ 0.83 × v_{max} × T_u [° C] TD ≈ 0.25 × v_{max} × T_u [min] TM_LAG ≈ 0.5 × TD[min]
PID	GAIN ≈ 0.83 × v_{max} × T_u [° C] TI ≈ 2 × T_u [min] TD ≈ 0.4 × T_u [min] TM_LAG ≈ 0.5 × TD[min]
PD/PID	GAIN ≈ 0.4 × v_{max} × T_u [° C] TI ≈ 2 × T_u [min] TD ≈ 0.4 × T_u [min] TM_LAG ≈ 0.5 × TD[min]

Instead of $v_{max} = \Delta_x / \Delta_t$, you can use X_{max} / T_g.

In the case of controllers with PID structure the setting of the integral action time and differential-action time is usually coupled with each other.

The ratio TI / TD lies between 4 and 5 and is optimal for most controlled systems.

Non-observance of the differential-action time TD is uncritical at PD controllers.

In the case of PI and PID controllers, control oscillations occur if the integral action time TI has been select by more than half too small.

An integral action time that is too large slows down the settling times of disturbances. One cannot expect that the control loops operate "optimally" after the first parameter settings. Experience shows that adjusting is always necessary, when a system exists that is "difficult to control" with $T_u / T_g > 0.3$.

Configuring a software controller 3

3.1 Overview of software controller

For the configuration of a software controller, you need an instruction with the control algorithm and a technology object. The technology object for a software controller corresponds with the instance DB of the instruction. The configuration of the controller is saved in the technology object. In contrast to the instance DBs of other instructions, technology objects are not stored for the program resources, but rather under CPU > Technology objects.

Technology objects and instructions

CPU	Library	Instruction	Technology object	Description
S7-1200	Compact PID	PID_Compact V1.x	PID_Compact V1.x	Universal PID controller with integrated tuning
S7-1200		PID_3Step V1.x	PID_3Step V1.x	PID controller with integrated tuning for valves
S7-1500 S7-1200 V4.x		PID_Compact V2.x	PID_Compact V2.x	Universal PID controller with integrated tuning
S7-1500 S7-1200 V4.x		PID_3Step V2.x	PID_3Step V2.x	PID controller with integrated tuning for valves
S7-1500 ≥ V1.7 S7-1200 ≥ V4.1		PID_Temp V1.x	PID_Temp V1.x	Universal PID temperature controller with integrated tuning
S7-1500/300/400	PID basic functions	CONT_C	CONT_C	Continuous controller
S7-1500/300/400		CONT_S	CONT_S	Step controller for actuators with integrating behavior
S7-1500/300/400		PULSEGEN	-	Pulse generator for actuators with proportional behavior
S7-1500/300/400		TCONT_CP	TCONT_CP	Continuous temperature controller with pulse generator
S7-1500/300/400		TCONT_S	TCONT_S	Temperature controller for actuators with integrating behavior

CPU	Library	Instruction	Technology object	Description
S7-300/400	PID Self Tuner	TUN_EC	TUN_EC	Optimization of a continuous controller
S7-300/400		TUN_ES	TUN_ES	Optimization of a step controller
S7-300/400	Standard PID Control (PID Professional optional package)	PID_CP	PID_CP	Continuous controller with pulse generator
S7-300/400		PID_ES	PID_ES	Step controller for actuators with integrating behavior
S7-300/400		LP_SCHED	-	Distribute controller calls
S7-300/400	Modular PID Control (PID Professional optional package)	A_DEAD_B	-	Filter interfering signal from control deviation
S7-300/400		CRP_IN	-	Scale analog input signal
S7-300/400		CRP_OUT	-	Scale analog output signal
S7-300/400		DEAD_T	-	Delay output of input signal
S7-300/400		DEADBAND	-	Suppress small fluctuations to the process value
S7-300/400		DIF	-	Differentiate input signals over time
S7-300/400		ERR_MON		Monitor control deviation
S7-300/400		INTEG	-	Integrate input signals over time
S7-300/400		LAG1ST	-	First-order delay element
S7-300/400		LAG2ND	-	Second-order delay element
S7-300/400		LIMALARM	-	Report limit values
S7-300/400		LIMITER	-	Limiting the manipulated variable
S7-300/400		LMNGEN_C	-	Determine manipulated variable for continuous controller
S7-300/400		LMNGEN_S	-	Determine manipulated variable for step controller
S7-300/400		NONLIN	-	Linearize encoder signal
S7-300/400		NORM	-	Scale process value physically
S7-300/400		OVERRIDE	-	Switch manipulated variable from 2 PID controllers to 1 actuator
S7-300/400		PARA_CTL	-	Switch parameter sets
S7-300/400		PID	-	PID algorithm
S7-300/400		PUSLEGEN_M	-	Generate pulse for proportional actuators
S7-300/400		RMP_SOAK	-	Specify setpoint according to ramp / soak
S7-300/400		ROC_LIM	-	Limit rate of change
S7-300/400		SCALE_M	-	Scale process value
S7-300/400		SP_GEN	-	Specify setpoint manually
S7-300/400		SPLT_RAN	-	Split manipulated variable range
S7-300/400		SWITCH	-	Switch analog values
S7-300/400		LP_SCHED_M	-	Distribute controller calls

3.2 Steps for the configuration of a software controller

All SW-controllers are configured according to the same scheme:

Step	Description
1	Add technology object (Page 41)
2	Configure technology object (Page 42)
3	Call instruction in the user program (Page 43)
4	Download technology object to device (Page 44)
5	Commission software controller (Page 45)
6	Save optimized PID parameters in the project (Page 45)
7	Comparing values (Page 47)
8	Display instances of a technology object (Page 72)

3.3 Add technology objects

Add technology object in the project navigator

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement

A project with a CPU has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click "Add new object".
   The "Add new object" dialog box opens.
4. Click on the "PID" button.
   All available PID-controllers for this CPU are displayed.
5. Select the instruction for the technology object, for example, PID_Compact.
6. Enter an individual name for the technology object in the "Name" input field.
7. Select the "Manual" option if you want to change the suggested data block number of the instance DB.
8. Click "Further information" if you want to add own information to the technology object.
9. Confirm with "OK".

Result

The new technology object has been created and stored in the project tree in the "Technology objects" folder. The technology object is used if the instruction for this technology object is called in a cyclic interrupt OB.

Note

You can select the "Add new and open" check box at the bottom of the dialog box. This opens the configuration of the technology object after adding has been completed.

3.4 Configure technology objects

The properties of a technology object on a S7-1200 CPU can be configured in two ways.

- In the Inspector window of the programming editor
- In the configuration editor

The properties of a technology object on a S7-300/400 CPU can only be configured in the configuration editor.

Inspector window of the programming editor

In the Inspector window of the programming editor you can only configure the parameters required for operation.

The offline values of the parameters are also shown in online mode. You can only change the online values in the commissioning window.

To open the Inspector window of the technology object, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Double click the block (cyclic interrupt OB) in which you open the instruction of the SW-controller.
   The block is opened in the work area.
3. Click on the instruction of the SW-controller.
4. In the Inspector window, select the "Properties" and "Configuration" tabs consecutively.

Configuration window

For each technology object, there is a specific configuration window in which you can configure all properties.

To open the configuration window of the technology object, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.

Symbols

Icons in the area navigation of the configuration and in the Inspector window show additional details about the completeness of the configuration:

	The configuration contains default values and is complete. The configuration exclusively contains default values. With these default values the use of the technology object is possible without further changes.
	The configuration contains user-defined or automatically adjusted values and is complete All input fields of the configuration contain valid values and at least one default setting was changed.
	The configuration is incomplete or faulty At least one input field or a collapsible list contains no or one invalid value. The corresponding field or the drop-down list box has a red background. When clicked, the roll-out error message indicates the cause of the error.

The properties of a technology object are described in detail in the section for the technology object.

3.5 Call instruction in the user program

The instruction of the software controller must be called in a cyclic interrupt OB. The sampling time of the software controller is determined by the interval between the calls in the cyclic interrupt OB.

Requirement

The cyclic interrupt OB is created and the cycle time of the cyclic interrupt OB is correctly configured.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the cyclic interrupt OB.
   The block is opened in the work area.
4. Open the "Technology" group in the "Instructions" window and the "PID Control" folder.
   The folder contains all instructions for software controllers that can be configured on the CPU.
5. Select the instruction and drag it to your cyclic interrupt OB.
   The "Call options" dialog box opens.
6. Select a technology object or type the name for a new technology object from the "Name" list.

Result

If the technology object does not exist yet, it is added. The instruction is added in the cyclic interrupt OB. The technology object is assigned to this call of the instruction.

3.6 Downloading technology objects to device

A new or modified configuration of the technology object must be downloaded to the CPU for the online mode. The following characteristics apply when downloading retentive data:

- **Software (changes only)**
  - S7-1200, S7-1500:
    Retentive data is retained.
  - S7-300/400:
    Retentive data is updated immediately. CPU does not change to Stop.
- **Download PLC program to device and reset**
  - S7-1200, S7-1500:
    Retentive data is updated at the next change from Stop to RUN. The PLC program can only be downloaded completely.
  - S7-300/400:
    Retentive data is updated at the next change from Stop to RUN.

Downloading retentive data to an S7-1200 or S7-1500 CPU

Note

The download and reset of the PLC program during ongoing system operation can result in serious damages or injuries in the case of malfunctions or program errors.

Make sure that dangerous states cannot occur before you download and reset the PLC program.

Proceed as follows to download the retentive data:

1. Select the entry of the CPU in the project tree.
2. Select the command "Download and reset PLC program" from the "Online" menu.
   - If you have not established an online connection yet, the "Extended download" dialog opens. In this case, set all required parameters for the connection and click "Download".
   - If the online connection has been defined, the project data is compiled, if necessary, and the dialog "Load preview" opens. This dialog displays messages and recommends actions necessary for download.
3. Check the messages.

   As soon as download is possible, the "Download" button becomes active.
4. Click on "Download".

   The complete PLC program is downloaded and the "Load results" dialog opens. This dialog displays the status and the actions after the download.
5. If the modules are to restart immediately after the download, select the check box "Start all".
6. Close the dialog "Download results" with "Finish".

Result

The complete PLC program is downloaded to the device. Blocks that only exist online in the device are deleted. By downloading all affected blocks and by deleting any blocks in the device that are not required, you avoid inconsistencies between the blocks in the user program.

The messages under "Info > General" in the Inspector window indicate whether the download was successful.

3.7 Commissioning software controller

Procedure

To open the "Commissioning" work area of the technology object, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Commissioning" object.

The commissioning functions are specific for each controller and are described there.

3.8 Save optimized PID parameter in the project

The software controller is optimized in the CPU. Through this, the values in the instance-DB on the CPU no longer agree with those in the project.

To update the PID parameter in the project with the optimized PID parameters, proceed as follows:

Requirement

- An online connection to the CPU is established and the CPU is in "RUN" mode.
- The functions of the commissioning window have been enabled by means of the "Start" button.

Procedure

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Open a technology object.
4. Double click on "Commissioning".
5. Click on the  icon "Upload PID parameters".
6. Save the project.

Result

The currently active PID parameters are stored in the project data. When reloading the project data in the CPU, the optimized parameters are used.

3.9 Comparing values

3.9.1 Comparison display and boundary conditions

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

Icons and operator controls

The following icons and operator controls are available:

Icon	Function
	Start value PLC matches the configured Start value project
	Start value PLC does not match the configured Start value project
	The comparison of the Start value PLC with the configured Start value project cannot be performed
	At least one of the two comparison values has a process-related or syntax error.
	Transfers actual values to the offline project
	Transfers updated start values in the project to the CPU (initialize setting values)
	Opens the "Compare values" dialog

Boundary conditions

The "Compare values" function is available for S7-1200 and S7-1500 without limitations.

The following limitation applies to S7-300 and S7-400:

In monitoring mode, an S7-300/S7-400 cannot transfer the start values to the CPU. These values cannot be displayed online with "Compare values".

The actual values of the technology object are displayed and can be changed directly.

3.9.2 Comparing values

The procedure is shown in the following using "PID Parameters" as an example.

Requirements

- A project with a software controller is configured.
- The project is downloaded to the CPU.
- The configuration dialog is open in the project navigator.

Procedure

1. Open the desired software controller in the project navigation.
2. Double-click the "Configuration" object.
3. Navigate within the configuration window to the "PID Parameters" dialog.
4. Click the  icon to activate monitoring mode.

   The icons and operator controls (Page 46) of the "Compare values" function are shown behind the parameters.
5. Click the desired parameter in the input box and change the parameter values manually by entering them directly.
   – If the background of the input box is gray, this value is a read-only value and cannot be changed.
   – To change the values in the "PID Parameters" dialog, enable manual entry by selecting the "Enable manual entry" check box beforehand.
6. Click the  icon to open the dialog for the start values.

   This dialog indicates two values of the parameter:
   – Start value in CPU: The start value in the CPU is shown in the top part.
   – Start value in the project: The configured start value in the project is shown in the bottom part.
7. Enter the desired value in the input box for the project.

Error detection

The input of incorrect values is detected. Corrections are suggested in this case.

If you enter a value with incorrect syntax, a rollout containing the corresponding error message opens below the parameter. The incorrect value is not applied.

If you enter a value that is incorrect for the process, a dialog opens containing the error message and a suggested correction:

- Click "No" to accept this suggested correction and correct your input.
- Click "OK" to apply the incorrect value.

NOTICE
Malfunctions of the controller
Values incorrect for the process can result in controller malfunctions.

Backing up actual values

Click the icon to transfer the actual controller values to the start values of your configured project.

Transferring project values to the CPU

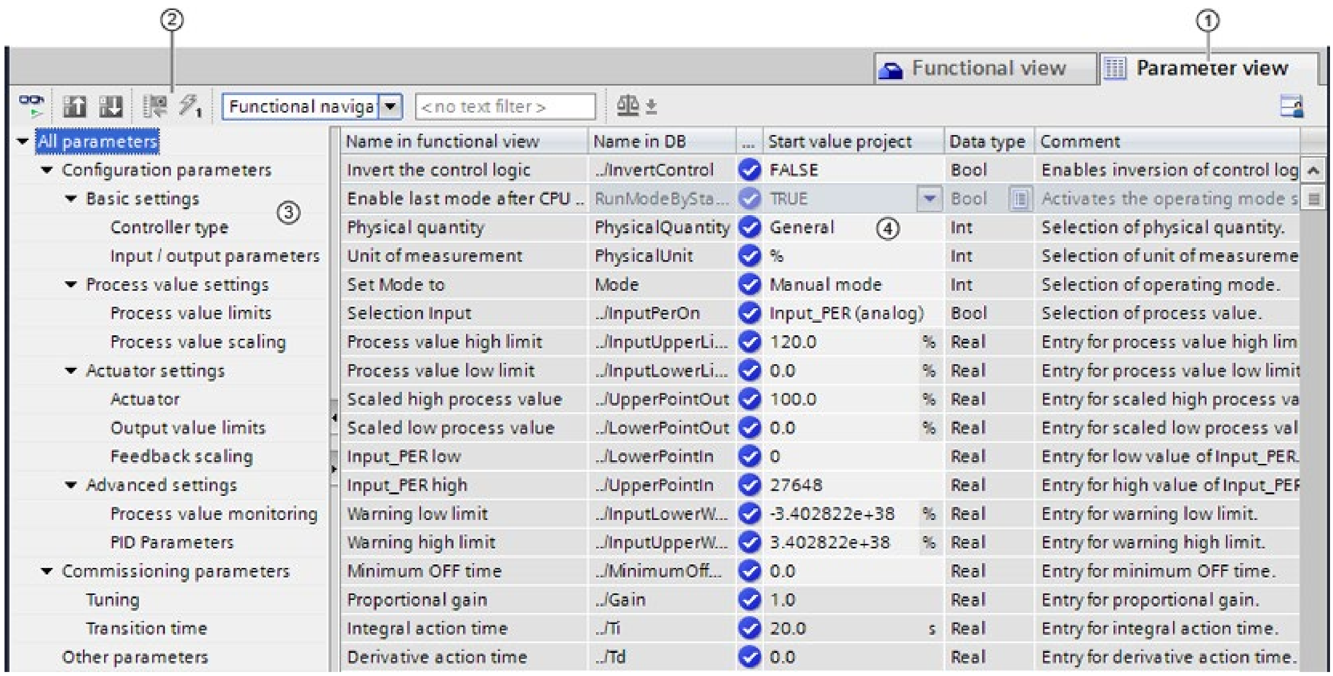
Click the icon to transfer the configured values of your project to the CPU.

⚠ CAUTION
Prevent personal injury and property damage!
Downloading and resetting of the user program while the plant is operating may result in significant property damage and severe personal injuries in the event of malfunctions or program errors.
Make sure that dangerous states cannot occur before you download and reset the user program.

3.10 Parameter view

3.10.1 Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.



① "Parameter view" tab

② Toolbar (Page 51)

③ Navigation (Page 51)

④ Parameter table (Page 52)

Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies

- Display of all memory values of a parameter: Start value PLC, Start value project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Change display format of value.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

Validity

The Parameter view described here is available for the following technology objects:

- PID_Compact
- PID_3Step
- PID_Temp
- CONT_C (S7-1500 only)
- CONT_S (S7-1500 only)
- TCONT_CP (S7-1500 only)
- TCONT_S (S7-1500 only)
- TO_Axis_PTO (S7-1200 Motion Control)
- TO_Positioning_Axis (S7-1200 Motion Control)
- TO_CommandTable_PTO (S7-1200 Motion Control)
- TO_CommandTable (S7-1200 Motion Control)

3.10.2 Structure of the parameter view

3.10.2.1 Toolbar

The following functions can be selected in the toolbar of the parameter view.

Icon	Function	Explanation
	Monitor all	Starts the monitoring of visible parameters in the active Parameter view (online mode).
	Create snapshot of monitor values and accept setpoints of this snapshot as start values	Applies the current monitor values to the “Snapshot” column and updates the start values in the project. Only in online mode for PID_Compact, PID_3Step and PID_Temp.
	Initialize setpoints	Transfers the start values updated in the project to the CPU. Only in online mode for PID_Compact, PID_3Step and PID_Temp.
	Create snapshot of monitor values	Applies the current monitor values to the “Snapshot” column. Only in online mode.
	Modify all selected parameters immediately and once	This command is executed once and as quickly as possible without reference to any particular point in the user program. Only in online mode.
Functional naviga	Select navigation structure	Toggles between functional navigation and data navigation.
< no text filter >	Text filter...	After entry of a character string: Display of all parameters containing the specified string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value project, Start value PLC, Snapshot) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g., selected navigation structure, activated table columns, etc.)

3.10.2.2 Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation	All parameters Configuration parameters Commissioning parameters Other parameters	In the functional navigation, the structure of the parameters is based on the structure in the configuration dialog ("Functional view" tab), commissioning dialog, and diagnostics dialog. The last group "Other parameters" contains all other parameters of the technology object.
Data navigation	All parameters Input Output InOut Static Other parameters	In the data navigation, the structure of the parameters is based on the structure in the instance DB / technology DB. The last group "Other parameters" contains the parameters that are not contained in the instance DB / technology DB.

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

3.10.2.3 Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in functional view	Name of the parameter in the functional view. The display field is empty for parameters that are not configured via the technology object.	X	X
Full name in DB	Complete path of the parameter in the instance DB / technology DB. The display field is empty for parameters that are not contained in the instance DB / technology DB.	X	X
Name in DB	Name of the parameter in the instance DB / technology DB. If the parameter is part of a structure or UDT, the prefix ". ./" is added. The display field is empty for parameters that are not contained in the instance DB / technology DB.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols. see Status of configuration (offline) (Page 62)	X	
Compare result	Result of the "Compare values" function. This column is shown if there is an online connection and the "Monitor all" button is selected.		X
Start value project	Configured start value in the project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the instance DB / technology DB.	X	X
Snapshot	Snapshot of the current values in the CPU (monitor values). Error indication if values have a process-related error.	X	X
Start value PLC	Start value in the CPU. This column is shown if there is an online connection and the "Monitor all" button is selected. Error indication if values have a process-related error.		X
Monitor value	Current value in the CPU. This column is shown if there is an online connection and the "Monitor all" button is selected. Error indication if values have a process-related error.		X
Modify value	Value that is to be used to change the monitor valuet. This column is shown if there is an online connection and the "Monitor all" button is selected. Error indication if entered values have a syntax or process-related error.		X

Column	Explanation	Offline	Online
Selection for trans-mission 	Selection of the Modify values that are to be transmitted using the "Modify all selected parameters immediately and once" button. This column is displayed together with the "Modify value" column.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: • Offline: By the Start value project. • Online: By the Monitor values.	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: • Offline: By the Start value project. • Online: By the Monitor values.	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the instance DB / technology DB.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

Comparing values (Page 46)

3.10.3 Opening the parameter view

Requirement

The technology object has been added in the project tree, i.e., the associated instance DB / technology DB of the instruction has been created.

Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

See also

Default setting of the parameter view (Page 55)

3.10.4 Default setting of the parameter view

Default settings

To enable you to work efficiently with the Parameter view, you can customize the parameter display and save your settings.

The following customizations are possible and can be saved:

- Show and hide columns
- Change column width
- Change order of the columns
- Toggle navigation
- Select parameter group in the navigation
- Selection of compare values

Show and hide columns

To show or hide columns in the parameter table, follow these steps:

1. Position the cursor in the header of the parameter table.
2. Select the "Show/Hide" command in the shortcut menu.
   The selection of available columns is displayed.
3. To show a column, select the check box for the column.
4. To hide a column, clear the check box for the column.

or

1. Position the cursor in the header of the parameter table.
2. Select the "Show all columns" command in the shortcut menu if all columns of the offline or online mode are to be displayed.

Some columns can only be displayed in online mode: see Parameter table (Page 52).

Change column width

To customize the width of a column so that all texts in the rows can be read, follow these steps:

1. Position the cursor in the header of the parameter table to the right of the column to be customized until the shape of the cursor changes to a cross.
2. Then double-click this location.

or

1. Open the shortcut menu on the header of the parameter table.
2. Click
   - "Optimize column width" or
   - "Optimize width of all columns".

If the column width setting is too narrow, the complete content of individual fields are shown if you hover the cursor briefly over the relevant field.

Change order of the columns

The columns of the parameter table can be arranged in any way.

To change the order of the columns, follow these steps:

1. Click on the column header and use a drag-and-drop operation to move it to the desired location.

   When you release the mouse button, the column is anchored to the new position.

Toggle navigation

To toggle the display form of the parameters, follow these steps:

1. Select the desired navigation in the “Select navigation structure” drop-down list.
   - Data navigation
   - Functional navigation

See also Navigation (Page 51).

Select parameter group in the navigation

Within the selected navigation, you choose between the “All parameters” display or the display of a subordinate parameter group of your choice.

1. Click the desired parameter group in the navigation.

   The parameter table only displays the parameters of the parameter group.

Selection of compare values (online)

To set the compare values for the “Compare values” function, follow these steps:

1. Select the desired compare values in the “Selection of compare values” drop-down list.
   – Start value project / Start value PLC
   – Start value project / Snapshot
   – Start value PLC / Snapshot

The “Start value project / Start value PLC” option is set by default.

Saving the default setting of the Parameter view

To save the above customizations of the Parameter view, follow these steps:

1. Customize the Parameter view according to your requirements.
2. Click the “Save window settings” button at the top right of the Parameter view.

3.10.5 Working with the parameter view

3.10.5.1 Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 58)	X	X
Sorting the parameter table (Page 59)	X	X
Transferring parameter data to other editors (Page 59)	X	X
Indicating errors (Page 60)	X	X
Editing start values in the project (Page 60)	X	X
Status of configuration (offline) (Page 62)	X	
Monitoring values online in the parameter view (Page 63)		X
Create snapshot of monitor values (Page 65)		X
Modifying values (Page 66)		X
Comparing values (Page 68)		X
Applying values from the online program as start values (Page 70)		X
Initializing setpoints in the online program (Page 71)		X

3.10.5.2 Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

With the text filter

Texts that are visible in the parameter table can be filtered. This means only texts in displayed parameter rows and columns can be filtered.

1. Enter the desired character string for filtering in the “Text filter...” input box.

   The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".

   The parameter table only shows the static parameters. You can select further subgroups for some groups of the navigation.
2. Click “All parameters” in the navigation if all parameters are to be shown again.

3.10.5.3 Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

Sorting by column

1. Position the cursor in the header cell of the desired column.

   The background of this cell turns blue.
2. Click the column header.

Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol "▲": Parameter table is sorted in ascending order.
- Symbol "▼": Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The "../" prefix in the "Name in DB" column is ignored when sorting.

3.10.5.4 Transferring parameter data to other editors

After selecting an entire parameter row of the parameter table, you can use the following:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

Transfer parameters to the following editors of the TIA Portal:

- Program editor
- Watch table
- Signal table for trace function

The parameter is inserted with its full name: See information in "Full name in DB" column.

3.10.5.5 Indicating errors

Error indication

Parameter assignment errors that result in compilation errors (e.g. limit violation) are indicated in the Parameter view.

Every time a value is input in the Parameter view, a check is made for process-related and syntax errors and the result is indicated.

Bad values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Table field with red background

  If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration dialog.

3.10.5.6 Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the “Start value project” column of the parameter table.
- In the “Status of configuration” column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration dialog of the technology object.

Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter. The limits of the value range can be seen in the “Maximum value” and “Minimum value” columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

See also Status of configuration (offline) (Page 62)

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive (“Retain” column).

Error indication

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the “Start value project” field
  If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Correcting bad start values

1. Correct bad start values using information from the roll-out error message.

   Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

3.10.5.7 Status of configuration (offline)

The status of the configuration is indicated by icons:

- In the “Status of configuration” column in the parameter table
- In the navigation structure of the functional navigation and data navigation

Symbol in “Status of configuration” column

Symbol	Meaning
	The start value of the parameter corresponds to the default value and is valid. A start value has not yet been defined by the user.
	The start value of the parameter contains a value defined by the user or an automatically adjusted value. The start value is different than the default value. The start value is error-free and valid.
	The start value of the parameter is invalid (syntax or process-related error). The input box has a red background. When clicked, the roll-out error message indicates the cause of the error.
	Only for S7-1200 Motion Control: The start value of the parameter is valid but contains warnings. The input box has a yellow background.
	The parameter is not relevant in the current configuration.

Symbol in the navigation

The symbols in the navigation indicate the progress of the configuration in the same way as in the configuration dialog of the technology object.

See also

Configure technology objects (Page 42)

3.10.5.8 Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.

Procedure

1. Start the monitoring by clicking .

   As soon as the Parameter view is online, the following columns are additionally displayed:

   – Compare result

   – Start value PLC

   – Monitor value

   – Modify value

   – Selection for transmission

   The "Monitor value" column shows the current parameter values on the CPU.

   Meaning of the additional columns: see Parameter table (Page 52)

2. Stop the monitoring by clicking  again.

Display

All columns that are only available online have an orange background:

- Values in light-orange cells can be changed.
- Values in cells with a dark orange background cannot be changed.

3.10.5.9 Change display format of value

The display format of the value can be selected via the shortcut menu of a table row in the Parameter view of the technology object.

The display format of the following values can be changed both in online mode and in offline mode:

- Start value project
- Start value PLC
- Maximum value
- Minimum value
- Snapshot
- Monitor value
- Default value
- Modify value

The set display format applies to all values of the table row.

The following display formats of the value can be changed:

- Default
- Hex
- Octal
- Bin
- Dec (+/-)
- DEC

Depending on the parameter selected in the parameter view, only the supported display formats can be selected.

Requirements

- The Parameter view of the technology object is open.

Procedure

To change the display format of the value, proceed as follows:

1. Select one or more table rows in which you want to change the display format.
2. Select the "Display format" command in the shortcut menu.
3. Select the desired display format.

Note

To change the display format of a certain data type in multiple table rows, sort the Parameter view by this data type. Then select the first and last table row with this data type while keeping the <Shift> key pressed and change the display format for the selected table rows.

3.10.5.10 Create snapshot of monitor values

You can back up the current values of the technology object on the CPU (monitor values) and display them in the Parameter view.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The “Monitor all” button is selected.

Procedure

To show the current parameter values, follow these steps:

1. In the Parameter view, click the “Create snapshot of monitor values" icon .

Result

The current monitor values are transferred once to the "Snapshot" column of the parameter table.

You can analyze the values "frozen" in this way while the monitor values continue to be updated in the "Monitor values" column.

3.10.5.11 Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

DANGER

Danger when modifying:

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you use the "Modify" function.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The “Monitor all” button is selected.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

Procedure

To modify parameters immediately, follow these steps:

1. Enter the desired modify values in the “Modify values” column of the parameter table.
2. Check whether the check box for modifying is selected in the "Select for transmission" column.

   The modify values and associated check boxes of dependent parameters are automatically adapted at the same time.
3. Click the “Modify all selected parameters immediately and once” icon .

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Modify values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

Error indication

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field

and

- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

3.10.5.12 Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value project
- Start value PLC
- Snapshot

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The “Monitor all” button is selected.

Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon.

   A selection list containing the comparison options opens:

   – Start value project - Start value PLC (default setting)

   – Start value project - Snapshot

   – Start value PLC - Snapshot

2. Select the desired comparison option.

   The selected comparison option is executed as follows:

   – A scales symbol appears in the header cells of the two columns selected for comparison.

   – Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two comparison values is not available (e.g. snapshot).
	Comparison of the value is inappropriate since it is not relevant in one of the configurations.

Symbol in the navigation

The symbols are shown in the same way in the navigation if the comparison result applies to at least one of the parameters below the displayed navigation structure.

3.10.5.13 Applying values from the online program as start values

In order to apply optimized values from the CPU to the project as start values, you create a snapshot of the monitor values. Values of the snapshot marked as a "Setpoint" are then applied to the project as start values.

Requirements

- The technology object is of type "PID_Compact" or "PID_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The “Monitor all” button  is selected.

Procedure

To apply optimized values from the CPU, follow these steps:

1. Click the "Create snapshot of monitor values and accept setpoints of this snapshot as start values" icon .

Result

The current monitor values are applied to the "Snapshot" column and their setpoints are copied to the "Start value project" column as new start values.

Note

Applying values of individual parameters

You can also apply the values of individual parameters that are not marked as a setpoint from the "Snapshot" column to the "Start values project" column. To do so, copy the values and insert them into the "Start value project" column using the "Copy" and "Paste" commands in the shortcut menu.

3.10.5.14 Initializing setpoints in the online program

You can initialize all parameters that are marked as a "Setpoint" in the Parameter view with new values in the CPU in one step. In so doing, the start values are downloaded from the project to the CPU. The CPU remains in "RUN" mode.

To avoid data loss on the CPU during a cold restart or warm restart, you must also download the technology object to the CPU.

DANGER

Danger when changing parameter values

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you reinitialize the setpoints.

Requirements

- The technology object is of type "PID_Compact" or "PID_3Step".
- There is an online connection.
- The technology object is downloaded to the CPU.
- The program execution is active (CPU in "RUN").
- The Parameter view of the technology object is open.
- The “Monitor all” button is selected.
- The parameters marked as a "Setpoint" have a "Start value project" that is free of process-related and syntax errors

Procedure

To initialize all setpoints, follow these steps:

1. Enter the desired values in the "Start value project" column.

   Ensure that the start values are free of process-related and syntax errors.
2. Click the "Initialize setpoints" icon .

Result

The setpoints in the CPU are initialized with the start values from the project.

3.11 Display instance DB of a technology object.

An instance DB, in which the parameter and static variables are saved, is created for each technology object.

Procedure

To display the instance DB of a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Highlight a technology object.
4. Select the command "Open DB editor" in the shortcut menu.

Using PID_Compact 4

4.1 Technology object PID_Compact

The technology object PID_Compact provides a continuous PID controller with integrated optimization. You can alternatively configure a pulse controller. Both manual and automatic mode are possible.

PID-Compact continuously acquires the measured process value within a control loop and compares it with the required setpoint. From the resulting control deviation, the instruction PID_Compact calculates an output value by which the process value is adapted as quickly and stable as possible to the setpoint. The output value for the PID controller consists of three actions:

- Proportional action

  The proportional action of the output value increases in proportion to the control deviation.

- I action

  The integral action of the output value increases until the control deviation has been balanced.

- D action

  The derivative action increases with the rate of change of control deviation. The process value is corrected to the setpoint as quickly as possible. The derivative action will be reduced again if the rate of change of control deviation drops.

The instruction PID_Compact calculates the proportional, integral and derivative parameters for your controlled system during pretuning. Fine tuning can be used to tune the parameters further. You do not need to manually determine the parameters.

Additional information

- Overview of software controller (Page 39)
- Add technology objects (Page 41)
- Configure technology objects (Page 42)
- Configuring PID_Compact V2 (Page 74)
- Configuring PID_Compact V1 (Page 98)

FAQ

For more information, see the following FAQs in the Siemens Industry Online Support:

- Entry ID 79047707 (https://support.industry.siemens.com/cs/ww/en/view/79047707)

4.2 PID_Compact V2

4.2.1 Configuring PID_Compact V2

4.2.1.1 Basic settings V2

Introduction V2

Configure the following properties of the "PID_Compact" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)

Setpoint, process value and output value

You can only configure the setpoint, process value and output value in the Inspector window of the programming editor. Select the source for each value:

- Instance DB

  The value saved in the instance DB is used.

  Value must be updated in the instance DB by the user program.

  There should be no value at the instruction.

  Change via HMI possible.

- Instruction

  The value connected to the instruction is used.
  The value is written to the instance DB each time the instruction is called.

  No change via HMI possible.

Control mode V2

Physical quantity

Select the physical quantity and unit of measurement for setpoint, process value, and disturbance variable in the "Controller type" group. Setpoint, process value, and disturbance variable is displayed in this unit of measurement.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID_Compact does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

Startup characteristics

1. To switch to "Inactive" mode after CPU restart, clear the "Activate Mode after CPU restart" check box.

   To switch to the operating mode saved in the Mode parameter after CPU restart, select the "Activate Mode after CPU restart" check box.
2. In the "Set Mode to" drop-down list, select the mode that is to be enabled after a complete download to the device.

   After a complete download to the device, PID_Compact starts in the selected operating mode. With each additional restart, PID_Compact starts in the mode that was last saved in Mode.

Example

You have selected the "Activate Mode after CPU restart" check box and the entry "Pretuning" in the "Set Mode to" list. After a complete download to the device, PID_Compact starts in the "Pretuning" mode. If pretuning is still active, PID_Compact starts in "Pretuning" mode again after restart of the CPU. If pretuning was successfully completed and automatic mode is active, PID_Compact starts in "Automatic mode" after restart of the CPU.

Setpoint V2

Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.

   Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

Process value V2

PID_Compact will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

Output value V2

PID_Compact offers three output values. Your actuator will determine which output value you use.

- Output_PER

  The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.

- Output

  The output value needs to be processed by the user program, for example because of nonlinear actuator response.

- Output_PWM

  The actuator is controlled via a digital output. Pulse width modulation creates minimum ON and minimum OFF times.

Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output_PER (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to process the output value using the user program:

1. Select the entry "Output" in the drop-down list "Output".
2. Select "Instance DB".

   The calculated output value is saved in the instance data block.
3. For the preparation of the output value, use the output parameter Output.
4. Transfer the processed output value to the actuator via a digital or analog CPU output.

Proceed as follows to use the digital output value:

1. Select the entry "Output_PWM" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the digital output.

4.2.1.2 Process value settings V2

Process value scaling V2

If you have configured the use of Input_PER in the basic setting, you must convert the value of the analog input to the physical quantity of the process value. The current configuration is displayed in the Input_PER display.

Input_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

Procedure

To scale the process value, follow these steps:

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are stored in the hardware configuration. To use the value pairs from the hardware configuration, follow these steps:

1. Select the PID_Compact instruction in the programming editor.
2. Interconnect Input_PER with an analog input in the basic settings.
3. Click the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

Process value limits V2

You must specify an appropriate absolute high limit and low limit for the process value as limit values for your controlled system. As soon as the process value violates these limits, an error occurs (ErrorBits = 0001h). Tuning is canceled when the process value limits are violated. You can configure how PID_Compact reacts to an error in automatic mode in the output value settings.

4.2.1.3 Advanced settings V2

Process value monitoring V2

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID_Compact instruction:

- At the InputWarning_H output parameter if the warning high limit has been exceeded
- At the InputWarning_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

Example

Process value high limit = 98 °C; warning high limit = 90 °C

Warning low limit = 10 °C; process value low limit = 0 °C

PID_Compact will respond as follows:

Process value	InputWarning_H	InputWarning_L	ErrorBits	Operating mode
> 98 °C	TRUE	FALSE	0001h	Inactive or Substitute output value with error monitoring
≤ 98 °C and > 90 °C	TRUE	FALSE	0000h	Automatic mode
≤ 90 °C and ≥ 10 °C	FALSE	FALSE	0000h	Automatic mode
< 10 °C and ≥ 0 °C	FALSE	TRUE	0000h	Automatic mode
< 0 °C	FALSE	TRUE	0001h	Inactive or Substitute output value with error monitoring

In the output value settings, you can specify the reaction of PID_Compact when the process value high limit or low limit is violated.

See also

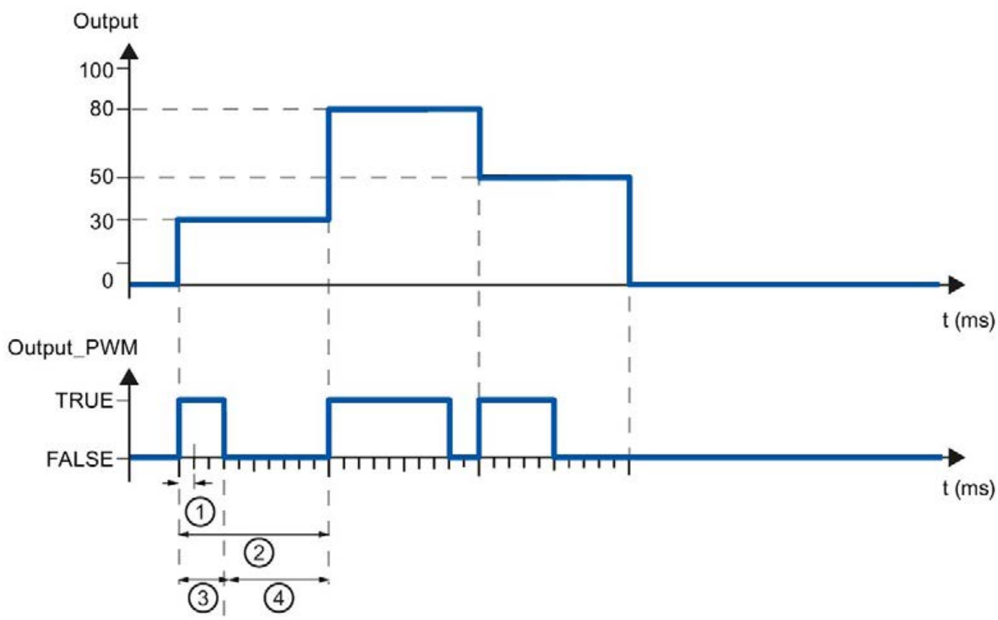
Parameters State and Mode V2 (Page 278)

PWM limits V2

The value at the output parameter Output is transformed into a pulse sequence that is output at output parameter Output_PWM by means of a pulse width modulation. Output is calculated in the PID algorithm sampling time, Output_PWM is output in the PID_Compact sampling time.

The PID algorithm sampling time is determined during pretuning or fine tuning. If manually setting the PID parameters, you will also need to configure the PID algorithm sampling time. The PID_Compact sampling time is equivalent to the cycle time of the calling OB.

The pulse duration is proportional to the value at Output and is always an integer multiple of the PID_Compact sampling time.



① PID_Compact sampling time
② PID algorithm sampling time
③ Pulse duration
④ Break time

The "Minimum ON time" and the "Minimum OFF time" are rounded to an integer multiple of the PID_Compact sampling time.

A pulse or a break is never shorter than the minimum ON or OFF time. The inaccuracies this causes are added up and compensated in the next cycle.

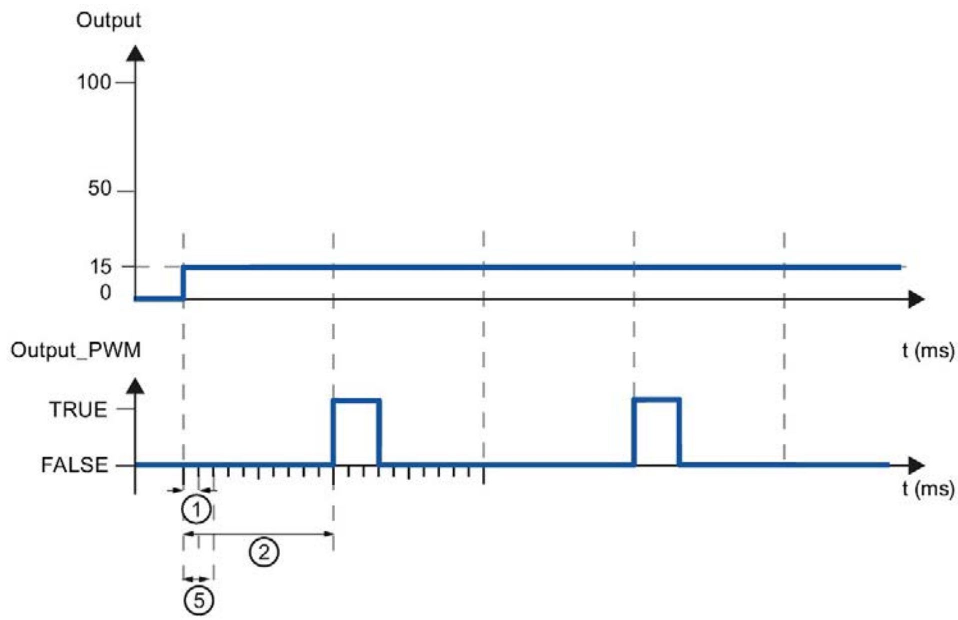
Example

PID_Compact sampling time = 100 ms

PID algorithm sampling time = 1000 ms

Minimum ON time = 200 ms

Output is a constant 15%. The smallest pulse that PID_Compact can output is 20%. In the first cycle, no pulse is output. In the second cycle, the pulse not output in the first cycle is added to the pulse of the second cycle.



①	PID_Compact sampling time
②	PID algorithm sampling time
⑤	Minimum ON time

In order to minimize operation frequency and conserve the actuator, extend the minimum ON and OFF times.

If you are using "Output" or "Output_PER", you must configure the value 0.0 for the minimum ON and OFF times.

Note

The minimum ON and OFF times only affect the output parameter Output_PWM and are not used for any pulse generators integrated in the CPU.

Output value V2

Output value limits

In the "Output value limits" configuration window, configure the absolute limits of your output value in percent. Absolute output value limits are not violated in neither manual mode nor automatic mode. If an output value outside the limits is specified in manual mode, the effective value is limited in the CPU to the configured limits.

The output value limits must match the control logic.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0%
Output_PER	-100.0 to 100.0%
Output_PWM	0.0 to 100.0%

Reaction to error

NOTICE
Your system may be damaged. If you output "Current value while error pending " or "Substitute output value while error pending" in the event of an error, PID_Compact remains in automatic mode. This may cause a violation of the process value limits and damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

PID_Compact is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

PID_Compact generates a programmable output value in response to an error:

- Zero (inactive)

  PID_Compact outputs 0.0 as output value for all errors and switches to "Inactive" mode. The controller is only reactivated by a falling edge at Reset or a rising edge at ModeActivate.

- Current value while error is pending

  If the following errors occur in **automatic mode**, PID_Compact returns to automatic mode as soon as the errors are no longer pending.

  If one or more of the following errors occur, PID_Compact stays in automatic mode:

  – 0001h: The "Input" parameter is outside the process value limits.

  – 0800h: Sampling time error

  – 40000h: Invalid value at Disturbance parameter.

  If one or more of the following errors occur in **automatic mode**, PID_Compact switches to "Substitute output value with error monitoring" mode and outputs the last valid output value:

  – 0002h: Invalid value at Input_PER parameter.

  – 0200h: Invalid value at Input parameter.

  – 0400h: Calculation of output value failed.

  – 1000h: Invalid value at Setpoint parameter.

  If an error occurs in **manual mode**, PID_Compact continues using the manual value as the output value. If the manual value is invalid, the substitute output value is used. If the manual value and substitute output value are invalid, the output value low limit is used.

  If the following error occurs during a **pretuning or fine tuning**, PID_Compact remains in active mode:

  – 0020h: Pretuning is not permitted during fine tuning.

  When any other error occurs, PID_Compact cancels the tuning and switches to the mode from which tuning was started.

  As soon as no errors are pending, PID_Compact returns to automatic mode.

- Substitute output value while error is pending

  PID_Compact outputs the substitute output value.

  If the following error occurs, PID_Compact stays in "Substitute output value with error monitoring" mode and outputs the output value low limit:

  – 20000h: Invalid value at SubstituteOutput tag.

  For all other errors, PID_Compact reacts as described for "Current value while error is pending".

See also

Parameters State and Mode V2 (Page 278)

PID parameters V2

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

Note

The currently active PID parameters are located for PID_Compact V1 in the sRet structure and for PID_Compact V2 in the Retain.CtrlParams structure.

Change the currently active PID parameters only in "Inactive" mode online to prevent malfunction of the PID controller.

If you want to change the PID parameters in "Automatic mode" or "Manual mode" online, change the PID parameters as follows:

- PID_Compact V1: Change the PID parameters in the sBackUp structure and apply these changes with sPid_Cmpt.b_LoadBackUp = TRUE to the sRet structure.
- PID_Compact V2: Change the PID parameters in the CtrlParamsBackUp structure and apply these changes with LoadBackUp = TRUE to the Retain.CtrlParams structure.

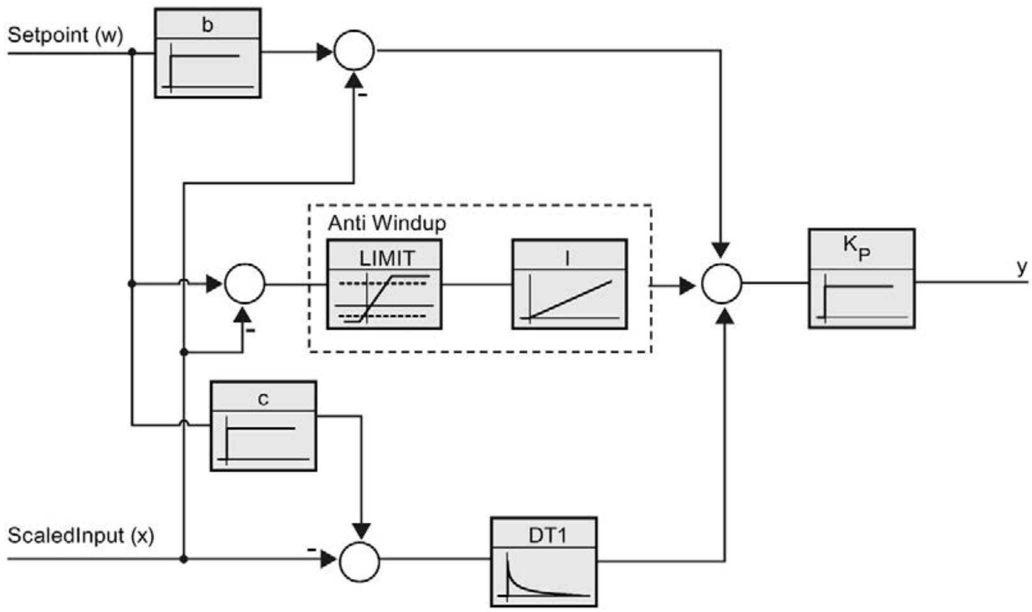
Online changes to the PID parameters in "Automatic mode" can result in jumps at the output value.

The PID algorithm operates according to the following equation:

$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

y	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
T_D	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:



All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID_Compact.

Downloading technology objects to device (Page 44)

Proportional gain

The value specifies the proportional gain of the controller. PID_Compact does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0. When the integral action time is changed from a different value to 0.0 online in "Automatic mode", the previous integral action is deleted and the output value jumps.

Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_Compact are executed at every call.

If you use Output_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The PID algorithm sampling time corresponds to the time period of the pulse width modulation. The cycle time should be at least 10 times the PID algorithm sampling time.

Rule for tuning

Select whether PI or PID parameters are to be calculated in the "Controller structure" drop-down list.

- **PID**

  Calculates PID parameters during pretuning and fine tuning.
- **PI**

  Calculates PI parameters during pretuning and fine tuning.
- **User-defined**

  The drop-down list displays "User-defined" if you have configured different controller structures for pretuning and fine tuning via a user program.

4.2.2 Commissioning PID_Compact V2

4.2.2.1 Pretuning V2

The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode". The PID parameters are backed up before being recalculated.

Requirement

- The "PID_Compact" instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- PID_Compact is in one of the following modes: "Inactive", "Manual mode", or "Automatic mode".
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is > 50% of the setpoint.

Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID_Compact > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list.
3. Click the "Start" icon.
   - An online connection will be established.
   - Value recording is started.
   - Pretuning is started.
   - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon when the progress bar has reached 100% and it can be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID_Compact responds with the configured reaction to errors.

See also

Parameters State and Mode V2 (Page 278)

4.2.2.2 Fine tuning V2

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.

PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

Requirement

- The PID_Compact instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The setpoint and the process value lie within the configured limits.
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID_Compact is in one of the following operating modes: Inactive, automatic mode, or manual mode.

Process depends on initial situation

Fine tuning can be started from the following operating modes: "Inactive", "automatic mode", or "manual mode". Fine tuning proceeds as follows when started from:

- Automatic mode

  Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning.

  PID_Compact controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

- Inactive or manual mode

  If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID_Compact responds with the configured reaction to errors.

  An attempt is made to reach the setpoint with the minimum or maximum output value if the process value for pretuning is already too near the setpoint. This can produce increased overshoot.

Procedure

To perform fine tuning, follow these steps:

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – The process of fine tuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed that tuning is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If no errors occurred during fine tuning, the PID parameters have been tuned. PID_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during "fine tuning", PID_Compact responds with the configured response to errors.

Parameters State and Mode V2 (Page 278)

4.2.2.3 "Manual" mode V1

The following section describes how you can use the "manual mode" operating mode in the commissioning window of the "PID_Compact" technology object. Manual mode is also possible when an error is pending.

Requirement

- The "PID_Compact" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established and the CPU is in the "RUN" mode.

Procedure

Use "Manual mode" in the commissioning window if you want to test the controlled system by specifying a manual value. To define a manual value, follow these steps:

1. Click the "Start" icon.
2. Select the "Manual mode" check box in the "Online status of controller" area.

   PID_Compact operates in manual mode. The most recent current output value remains in effect.
3. Enter the manual value in the "Output" field as a % value.
4. Click the  icon.

Result

The manual value is written to the CPU and immediately goes into effect.

Clear the "Manual mode" check box if the output value is to be specified again by the PID controller. The switchover to automatic mode is bumpless.

See also

Parameters State and Mode V2 (Page 278)

4.2.3 Override control with PID_Compact V2

Override control

In case of override control, two or more controllers share one actuator. Only one controller has access to the actuator at any time and influences the process.

A logic operation decides which controller has access to the actuator. This decision is often made based on a comparison of the output values of all controllers, for example, in case of a maximum selection, the controller with the largest output value gets access to the actuator.

The selection based on the output value requires that all controllers operate in automatic mode. The controllers that do not have an effect on the actuator are updated. This is necessary to prevent windup effects and their negative impacts on the control response and the switchover between the controllers.

PID_Compact supports override controls as of version 2.3 by offering a simple process for updating the controllers that are not active:

- By using the OverwriteInitialOutputValue and PIDCtrl.PIDInit tags, you can preassign the integral action of the controller in automatic mode as though the PID algorithm had calculated Output = OverwriteInititalOutputValue for the output value in the last cycle.
- To do this, OverwriteInitialOutputValue is interconnected with the output value of the controller that currently has access to the actuator.
- By setting the bit PIDCtrl.PIDInit, you trigger the pre-assignment of the integral action as well as the restart of the controller cycle and the PWM period.
- The subsequent calculation of the output value in the current cycle takes place based on the pre-assigned (and synchronized for all controllers) integral action as well as the proportional action and integral action from the current control deviation.
- The derivative action is not active during the call with PIDCtrl.PIDInit = TRUE and therefore does not contribute to the output value.

This procedure ensures that the calculation of the current output value and thus the decision on which controller is to have access to the actuator is only based on the current process state and the PI parameters. Windup effects for controllers that are not active and thus incorrect decisions of the switchover logic are prevented.

Requirements

- PIDCtrl.PIDInit is only effective if the integral action is activated (Retain.CtrlParams.Ti tag > 0.0).
- You must assign PIDCtrl.PIDInit and OverwriteInitialOutputValue in your user program yourself (see example below). PID_Compact does not automatically change these tags.
- PIDCtrl.PIDInit is only effective when PID_Compact is in automatic mode (parameter State = 3)
- If possible, select the sampling time of the PID algorithm (Retain.CtrlParams.Cycle tag) in such a way that it is identical for all controllers, and call all controllers in the same cyclic interrupt OB. In this way, you ensure that the switchover does not take place within a controller cycle or a PWM period.

Note

Constant adaptation of the output value limits

Instead of the active updating of the controllers without access to the actuator described here, this is implemented alternatively by constant adaptation of the output value limits in other controller systems.

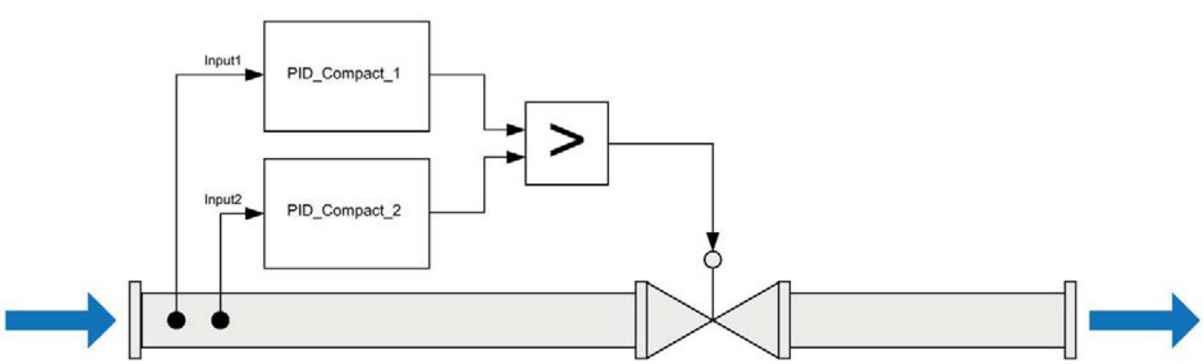
This is not possible with PID_Compact, because a change of the output value limits is not supported in automatic mode.

Example: Control of a gas pipeline

PID_Compact is used for control of a gas pipeline.

The main goal is to control the flow rate Input1. The controller PID_Compact_1 is used for this purpose. In addition, the pressure Input2 (measured in flow direction in front of the valve) is to be kept below the high limit with the limiting controller PID_Compact_2.

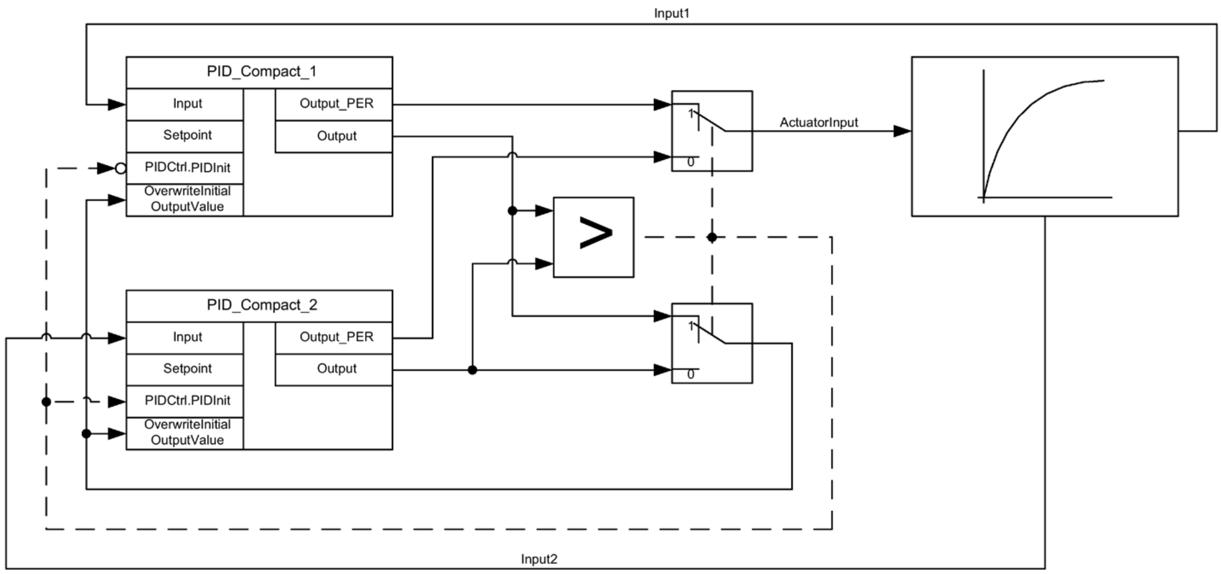
Flow rate and pressure are controlled by a single solenoid valve. The output value of the controller corresponds to the valve opening: The valve is opened when the output value increases. This means the flow rate increases (normal control logic) while the pressure drops (inverted control logic).



The valve is controlled with the output value of PID_Compact in I/O format (parameter Output_PER) by writing the program tag ActuatorInput.

The setpoint for the flow rate is specified at the parameter PID_Compact_1.Setpoint.

The pressure high limit is specified as setpoint at the parameter PID_Compact_2.Setpoint.



Both controllers must share one valve as shared actuator. The logic that decides which controller gets access to the actuator is implemented by a maximum selection of the output value (in Real format, parameter Output) in this case. Because the output value corresponds to the opening of the valve, the controller that requires the larger valve opening gets the control.

Note

Activate inversion of the control logic

Because a decrease of the actual value (pressure) is to be achieved with the pressure regulator PID_Compact_2 when the output value increases (valve opening), the inversion of the control logic must be activated: PID_Compact_2.Config.InvertControl = TRUE.

In normal operation of the plant, the actual value of the flow rate corresponds to the setpoint. The flow controller PID_Compact_1 has settled on a stationary output value PID_Compact_1.Output. The actual value of the pressure in normal operation is significantly below the high limit that is specified as setpoint for PID_Compact_2. The pressure regulator therefore wants to close the valve even further to increase the pressure, which means it will calculate an output value PID_Compact_2.Output that is smaller than the output value of the flow controller PID_Compact_1.Output. The maximum selection of the switchover logic therefore gives the flow controller PID_Compact_1 continued access to the actuator. In addition, it is ensured that PID_Compact_2 is updated by means of the assignments PID_Compact_2.OverwriteInitialOutputValue = PID_Compact_1.Output and PID_Compact_2.PIDCtrl.PIDInit = TRUE.

If the pressure now approaches the high limit or exceeds it, for example due to a fault, the pressure regulator PID_Compact_2 calculates a higher output value to open the valve even further and thus reduce the pressure. If PID_Compact_2.Output is greater than PID_Compact_1.Output, the pressure regulator PID_Compact_2 receives access to the actuator through the maximum selection and opens it. It is ensured that PID_Compact_1 is updated by means of the assignments PID_Compact_1.OverwriteInitialOutputValue = PID_Compact_2.Output and PID_Compact_1.PIDCtrl.PIDInit = TRUE.

The pressure is reduced while the flow rate increases and can no longer be kept at the setpoint.

Once the fault has been remedied, the pressure will continue to drop and the opening of the valve is reduced by the pressure regulator. If the flow controller calculates a larger opening as output value, the plant returns to normal operation so that the flow controller PID_Compact_1 once again has access to the actuator.

This example can be implemented with the following SCL program code:

```
"PID Compact 1"(Input := "Input1");
"PID Compact 2"(Input := "Input2");
IF "PID Compact 1".Output >= "PID Compact 2".Output THEN
  "ActuatorInput" := "PID_Compact_1".Output_PER;

  "PID_Compact_1".PIDCtrl.PIDInit := FALSE;

  "PID_Compact_2".PIDCtrl.PIDInit := TRUE;

  "PID_Compact_2".OverwriteInitialOutputValue := "PID_Compact_1".Output;

ELSE
  "ActuatorInput" := "PID_Compact_2".Output_PER;

  "PID_Compact_1".PIDCtrl.PIDInit := TRUE;

  "PID_Compact_2".PIDCtrl.PIDInit := FALSE;

  "PID_Compact_1".OverwriteInitialOutputValue := "PID_Compact_2".Output;

END IF;
```

4.2.4 Simulating PID_Compact V2 with PLCSIM

Note

Simulation with PLCSIM

The simulation of PID_Compact V2.x with PLCSIM for CPU S7-1200 is not supported.

PID_Compact V2.x can only be simulated for CPU S7-1500 with PLCSIM.

For the simulation with PLCSIM, the time behavior of the simulated PLC is not exactly identical to that of a "real" PLC. The actual cycle clock of a cyclic interrupt OB can have larger fluctuations with a simulated PLC than with "real" PLCs.

In the standard configuration, PID_Compact determines the time between calls automatically and monitors them for fluctuations.

For the simulation of PID_Compact with PLCSIM, for example, a sampling time error (ErrorBits = DW#16#00000800) can therefore be detected.

This results in ongoing tuning being aborted.

The response in automatic mode depends on the value of the ActivateRecoverMode tag.

To prevent this from happening, you should configure PID_Compact for simulation with PLCSIM as follows:

- CycleTime.EnEstimation = FALSE
- CycleTime.EnMonitoring = FALSE
- CycleTime.Value: Assign the cycle clock of the calling cyclic interrupt OB in seconds to this tag.

4.3 PID_Compact V1

4.3.1 Configuring PID_Compact V1

4.3.1.1 Basic settings V1

Introduction V1

Configure the following properties of the "PID_Compact" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)

Setpoint, process value and output value

You can only configure the setpoint, process value and output value in the Inspector window of the programming editor. Select the source for each value:

- Instance DB

  The value saved in the instance DB is used.

  Value must be updated in the instance DB by the user program.

  There should be no value at the instruction.

  Change via HMI possible.

- Instruction

  The value connected to the instruction is used.
  The value is written to the instance DB each time the instruction is called.

  No change via HMI possible.

Control mode V1

Physical quantity

Select the unit of measurement and physical quantity for the setpoint and process value in the "Controller type" group. The setpoint and process value will be displayed in this unit.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID_Compact does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

Start-up behavior after reset

To change straight to the last active mode after restarting the CPU, select the "Enable last mode after CPU restart" check box.

PID_Compact will remain in "Inactive" mode if the check box is cleared.

Setpoint V1

Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.

   Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

Process value V1

PID_Compact will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

Output value V1

PID_Compact offers three output values. Your actuator will determine which output value you use.

- Output_PER

  The actuator is triggered via an analog output and controlled with a continuous signal, e.g. 0...10V, 4...20mA.

- Output

  The output value needs to be processed by the user program, for example because of nonlinear actuator response.

- Output_PWM

  The actuator is controlled via a digital output. Pulse width modulation creates minimum ON and minimum OFF times.

Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output_PER (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to process the output value using the user program:

1. Select the entry "Output" in the drop-down list "Output".
2. Select "Instance DB".

   The calculated output value is saved in the instance data block.
3. For the preparation of the output value, use the output parameter Output.
4. Transfer the processed output value to the actuator via a digital or analog CPU output.

Proceed as follows to use the digital output value:

1. Select the entry "Output_PWM" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the digital output.

4.3.1.2 Process value settings V1

Configure the scaling of your process value and specify the process value absolute limits In the "Process value settings" configuration window.

Scaling the process value

If you have configured the use of Input_PER in the basic settings, you will need to convert the value of the analog input into the physical quantity of the process value. The current configuration will be displayed in the Input_PER display.

Input_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are saved in the hardware configuration. Proceed as follows to use the value pairs from the hardware configuration:

1. Select the instruction PID_Compact in the programming editor.
2. Connect Input_PER with an analog input in the basic settings.
3. Click on the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

Monitoring process value

Specify the absolute high and low limit of the process value. As soon as these limits are violated during operation, the controller switches off and the output value is set to 0%. You must enter reasonable limits for your controlled system. Reasonable limits are important during optimization to obtain optimal PID parameters.

The default for the "High limit process value" is 120 %. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer reported for a violation of the "High limit process value". Only a wire-break and a short-circuit are recognized and the PID_Compact switches to "Inactive" mode.

WARNING
If you set very high process value limits (for example $-3.4*10^{38}...+3.4*10^{38}$), process value monitoring will be disabled. Your system may then be damaged if an error occurs.

See also

Process value monitoring V1 (Page 103)

PWM limits V1 (Page 104)

Output value limits V1 (Page 106)

PID parameters V1 (Page 107)

4.3.1.3 Advanced settings V1

Process value monitoring V1

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID_Compact instruction:

- At the InputWarning_H output parameter if the warning high limit has been exceeded
- At the InputWarning_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID_Compact will respond as follows:

Process value	InputWarning_H	InputWarning_L	Operating mode
> 98° C	TRUE	FALSE	Inactive
≤ 98° C and > 90° C	TRUE	FALSE	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	Automatic mode
< 0° C	FALSE	TRUE	Inactive

Process value settings V1 (Page 102)

PWM limits V1 (Page 104)

Output value limits V1 (Page 106)

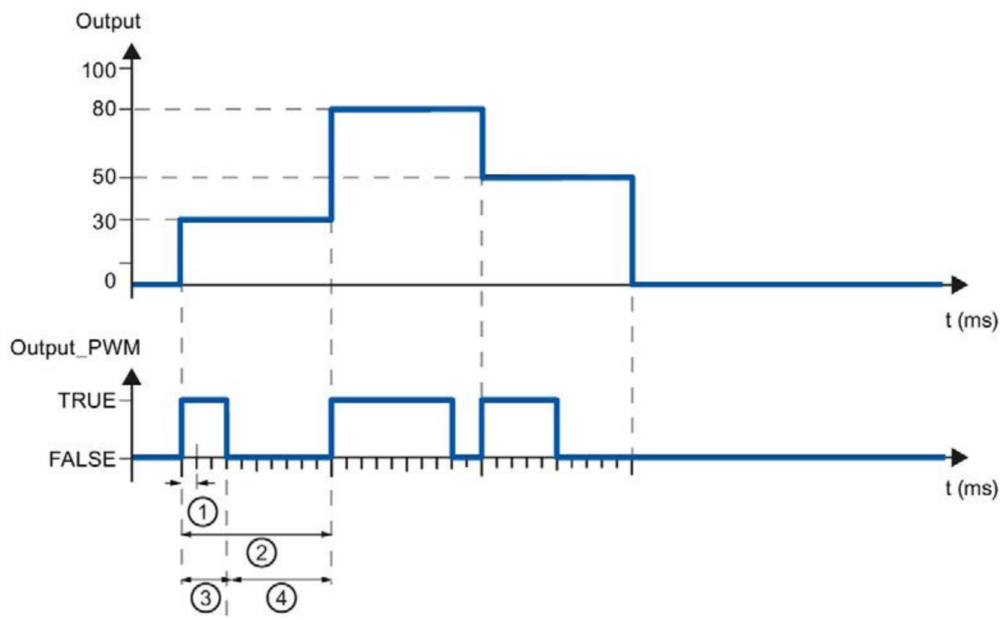
PID parameters V1 (Page 107)

PWM limits V1

The value at the output parameter Output is transformed into a pulse sequence that is output at output parameter Output_PWM by means of a pulse width modulation. Output is calculated in the PID algorithm sampling time, Output_PWM is output in the PID_Compact sampling time.

The PID algorithm sampling time is determined during pretuning or fine tuning. If manually setting the PID parameters, you will also need to configure the PID algorithm sampling time. The PID_Compact sampling time is equivalent to the cycle time of the calling OB.

The pulse duration is proportional to the value at Output and is always an integer multiple of the PID_Compact sampling time.



① PID_Compact sampling time

② PID algorithm sampling time

③ Pulse duration

④ Break time

The "Minimum ON time" and the "Minimum OFF time" are rounded to an integer multiple of the PID_Compact sampling time.

A pulse or a break is never shorter than the minimum ON or OFF time. The inaccuracies this causes are added up and compensated in the next cycle.

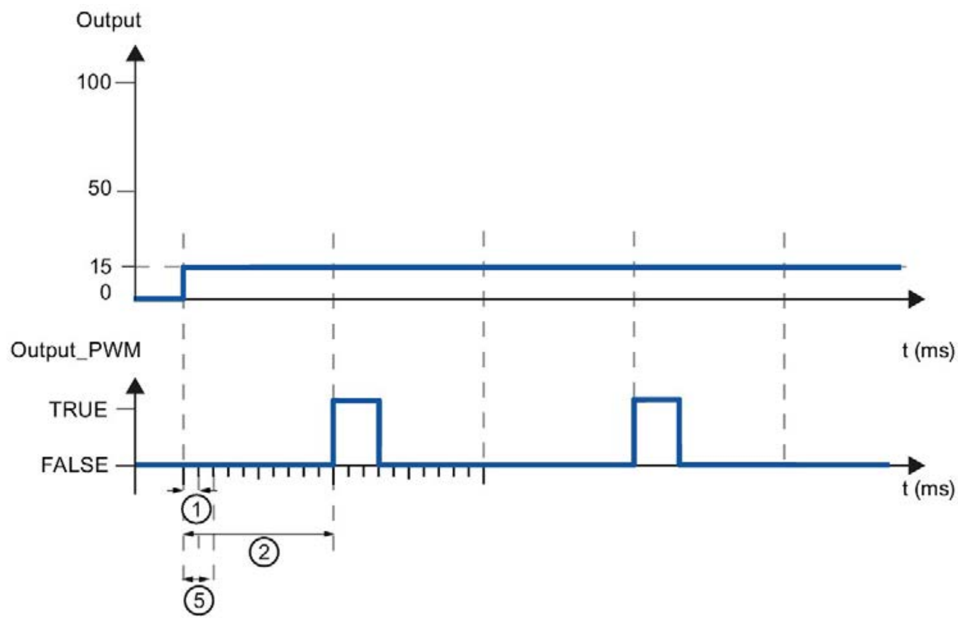
Example

PID_Compact sampling time = 100 ms

PID algorithm sampling time = 1000 ms

Minimum ON time = 200 ms

Output is a constant 15%. The smallest pulse that PID_Compact can output is 20%. In the first cycle, no pulse is output. In the second cycle, the pulse not output in the first cycle is added to the pulse of the second cycle.



①	PID_Compact sampling time
②	PID algorithm sampling time
⑤	Minimum ON time

In order to minimize operation frequency and conserve the actuator, extend the minimum ON and OFF times.

If you are using "Output" or "Output_PER", you must configure the value 0.0 for the minimum ON and OFF times.

Note

The minimum ON and OFF times only affect the output parameter Output_PWM and are not used for any pulse generators integrated in the CPU.

See also

Process value settings V1 (Page 102)

Process value monitoring V1 (Page 103)

Output value limits V1 (Page 106)

PID parameters V1 (Page 107)

Output value limits V1

In the "Output value limits" configuration window, configure the absolute limits of your output value in percent. Absolute output value limits are not violated in neither manual mode nor in automatic mode. If a output value outside the limits is specified in manual mode, the effective value is limited in the CPU to the configured limits.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0
Output_PER	-100.0 to 100.0
Output_PWM	0.0 to 100.0

PID_Compact sets the output value to 0.0 if an error occurs. 0.0 must therefore always be within the output value limits. You will need to add an offset to Output and Output_PER in the user program if you want an output value low limit of greater than 0.0.

See also

Process value settings V1 (Page 102)

Process value monitoring V1 (Page 103)

PWM limits V1 (Page 104)

PID parameters V1 (Page 107)

PID parameters V1

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

Note

The currently active PID parameters are located for PID_Compact V1 in the sRet structure and for PID_Compact V2 in the Retain.CtrlParams structure.

Change the currently active PID parameters only in "Inactive" mode online to prevent malfunction of the PID controller.

If you want to change the PID parameters in "Automatic mode" or "Manual mode" online, change the PID parameters as follows:

- PID_Compact V1: Change the PID parameters in the sBackUp structure and apply these changes with sPid_Cmpt.b_LoadBackUp = TRUE to the sRet structure.
- PID_Compact V2: Change the PID parameters in the CtrlParamsBackUp structure and apply these changes with LoadBackUp = TRUE to the Retain.CtrlParams structure.

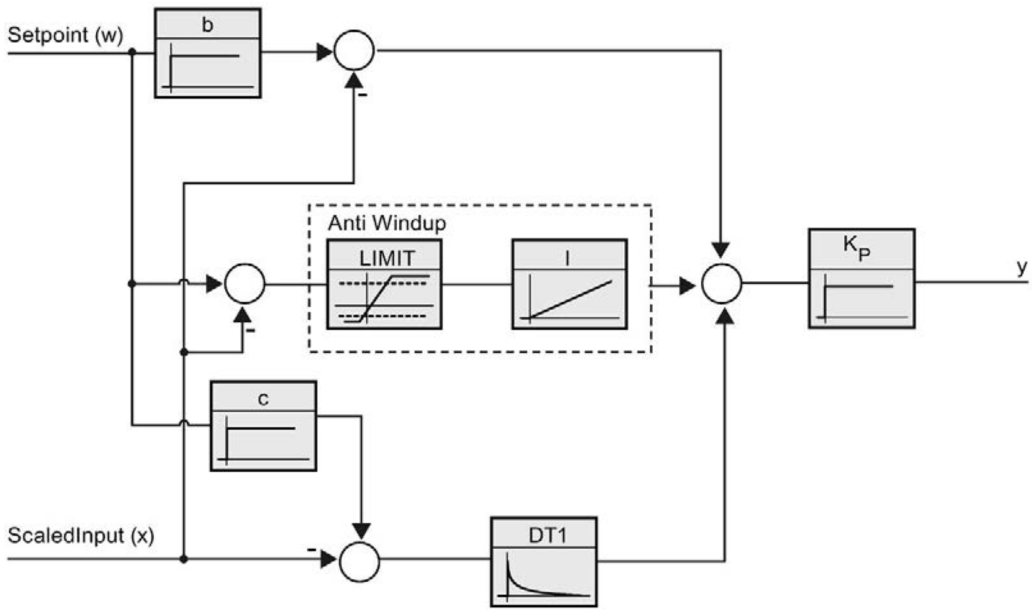
Online changes to the PID parameters in "Automatic mode" can result in jumps at the output value.

The PID algorithm operates according to the following equation:

$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

y	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
T_D	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:



All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID_Compact.

Downloading technology objects to device (Page 44)

Proportional gain

The value specifies the proportional gain of the controller. PID_Compact does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0. When the integral action time is changed from a different value to 0.0 online in "Automatic mode", the previous integral action is deleted and the output value jumps.

Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_Compact are executed at every call.

If you use Output_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The PID algorithm sampling time corresponds to the time period of the pulse width modulation. The cycle time should be at least 10 times the PID algorithm sampling time.

Rule for tuning

Select whether PI or PID parameters are to be calculated in the "Controller structure" drop-down list.

- **PID**

  Calculates PID parameters during pretuning and fine tuning.

- **PI**

  Calculates PI parameters during pretuning and fine tuning.

- **User-defined**

  The drop-down list displays "User-defined" if you have configured different controller structures for pretuning and fine tuning via a user program.

4.3.2 Commissioning PID_Compact V1

4.3.2.1 Commissioning V1

The commissioning window helps you commission the PID controller. You can monitor the values for the setpoint, process value and output value along the time axis in the trend view. The following functions are supported in the commissioning window:

- Controller pretuning
- Controller fine tuning

  Use fine tuning for fine adjustments to the PID parameters.
- Monitoring the current closed-loop control in the trend view
- Testing the controlled system by specifying a manual output value

All functions require an online connection to the CPU to have been established.

Basic handling

- Select the desired sampling time in the "Sampling time" drop-down list.

  All values in the commissioning window are updated in the selected update time.
- Click the "Start" icon in the measuring group if you want to use the commissioning functions.

  Value recording is started. The current values for the setpoint, process value and output value are entered in the trend view. Operation of the commissioning window is enabled.
- Click the "Stop" icon if you want to end the commissioning functions.

  The values recorded in the trend view can continue to be analyzed.

Closing the commissioning window will terminate recording in the trend view and delete the recorded values.

See also

Pretuning V1 (Page 112)

Fine tuning V1 (Page 114)

"Manual" mode V1 (Page 116)

4.3.2.2 Pretuning V1

The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. The PID parameters are backed up before being recalculated.

Requirement

- The "PID_Compact" instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- PID_Compact is in "inactive" or "manual" mode.
- The setpoint may not be changed during controller tuning. PID_Compact will otherwise be deactivated.
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is > 50% of the setpoint.

Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID_Compact > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list.
3. Click the "Start" icon.
   - An online connection will be established.
   - Value recording is started.
   - Pretuning is started.
   - The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

   Note

   Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID_Compact switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID_Compact will change to "Inactive" mode.

Parameters State and sRet.i_Mode V1 (Page 308)

Commissioning V1 (Page 111)

Fine tuning V1 (Page 114)

"Manual" mode V1 (Page 116)

4.3.2.3 Fine tuning V1

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning.

PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

Requirement

- The PID_Compact instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- The setpoint and the process value lie within the configured limits (see "Process value monitoring" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- The setpoint may not be changed during controller tuning.
- PID_Compact is in inactive mode, automatic mode or manual mode.

Process depends on initial situation

Fine tuning can be started in "inactive", "automatic" or "manual" mode. Fine tuning proceeds as follows when started in:

- Automatic mode

  Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning.

  PID_Comact will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

- Inactive or manual mode

  If the requirements for pretuning are met, pretuning is started. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID_Compact will change to "Inactive" mode.

  An attempt is made to reach the setpoint with a minimum or maximum output value if the process value for pretuning is already too near the setpoint. This can produce increased overshoot.

Procedure

Proceed as follows to carry out "fine tuning":

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – The process of fine tuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

The PID parameters will have been optimized if fine tuning has been executed without errors. PID_Compact changes to automatic mode and uses the optimized parameters. The optimized PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during "fine tuning", PID_Compact will change to "inactive" mode.

Parameters State and sRet.i_Mode V1 (Page 308)

Commissioning V1 (Page 111)

Pretuning V1 (Page 112)

"Manual" mode V1 (Page 116)

4.3.2.4 "Manual" mode V1

The following section describes how you can use the "Manual" operating mode in the commissioning window of the "PID Compact" technology object.

Requirement

- The "PID_Compact" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established and the CPU is in the "RUN" mode.
- The functions of the commissioning window have been enabled via the "Start" icon.

Procedure

Use "Manual mode" in the commissioning window if you want to test the process by specifying a manual value. To define a manual value, proceed as follows:

1. Select the check box "Manual mode" in the "Online status of the controller" area.

   PID_Compact operates in manual mode. The most recent current output value remains in effect.
2. Enter the manual value in the "Output" field as a % value.
3. Click the control icon .

Result

The manual value is written to the CPU and immediately goes into effect.

Note

PID_Compact continues to monitor the process value. If the process value limits are exceeded, PID_Compact is deactivated.

Clear the "Manual mode" check box if the output value is to be specified again by the PID controller. The change to automatic mode is bumpless.

4.3.3 Simulating PID_Compact V1 with PLCSIM

Note

Simulation with PLCSIM

For the simulation with PLCSIM, the time behavior of the simulated PLC is not exactly identical to that of a "real" PLC. The actual cycle clock of a cyclic interrupt OB can have larger fluctuations with a simulated PLC than with "real" PLCs.

In the standard configuration, PID_Compact determines the time between calls automatically and monitors them for fluctuations.

For a simulation of PID_Compact with PLCSIM, for example, a sampling time error (ErrorBits = DW#16#00000800) can therefore be detected.

PID_Compact switches to "Inactive" mode (State = 0) in this case.

To prevent this from happening, you should configure PID_Compact for simulation with PLCSIM as follows:

- sb_EnCyclEstimation = FALSE
- sb_EnCyclMonitoring = FALSE
- sPid_Calc.r_Cycle: Assign the cycle clock of the calling cyclic interrupt OB in seconds to this tag.

Using PID_3Step 5

5.1 Technology object PID_3Step

The technology object PID_3Step provides a PID controller with tuning for valves or actuators with integral response.

You can configure the following controllers:

- Three-point step controller with position feedback
- Three-point step controller without position feedback
- Valve controller with analog output value

PID_3Step continuously acquires the measured process value within a control loop and compares it with the setpoint. From the resulting control deviation, PID_3Step calculates an output value through which the process value reaches the setpoint as quickly and steadily as possible. The output value for the PID controller consists of three actions:

- **Proportional** action

  The proportional action of the output value increases in proportion to the control deviation.

- **I** action

  The integral action of the output value increases until the control deviation has been balanced.

- **D** action

  The derivative action increases with the rate of change of control deviation. The process value is corrected to the setpoint as quickly as possible. The derivative action will be reduced again if the rate of change of control deviation drops.

The instruction PID_3Step calculates the proportional, integral and derivative parameters for your controlled system during pretuning. Fine tuning can be used to tune the parameters further. You do not need to manually determine the parameters.

5.2 PID_3Step V2

5.2.1 Configuring PID_3Step V2

5.2.1.1 Basic settings V2

Introduction V2

Configure the following properties of the "PID_3Step" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)
- Position feedback (only in the Inspector window)

Setpoint, process value, output value and position feedback

You can only configure the setpoint, process value, output value and position feedback in the Inspector window of the programming editor. Select the source for each value:

- Instance DB

  The value saved in the instance DB is used.

  Value must be updated in the instance DB by the user program.

  There should be no value at the instruction.

  Change via HMI possible.

- Instruction

  The value connected to the instruction is used.
  The value is written to the instance DB each time the instruction is called.

  No change via HMI possible.

Control mode V2

Physical quantity

Select the physical quantity and unit of measurement for setpoint, process value, and disturbance variable in the "Controller type" group. Setpoint, process value, and disturbance variable is displayed in this unit of measurement.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID_3Step does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

Startup characteristics

1. To switch to "Inactive" mode after CPU restart, clear the "Activate Mode after CPU restart" check box.

   To switch to the operating mode saved in the Mode parameter after CPU restart, select the "Activate Mode after CPU restart" check box.
2. In the "Set Mode to" drop-down list, select the mode that is to be enabled after a complete download to the device.

   After a complete download to the device, PID_3Step starts in the selected operating mode. With each additional restart, PID_3Step starts in the mode that was last saved in Mode.

Example

You have selected the "Activate Mode after CPU restart" check box and the entry "Pretuning" in the "Set Mode to" list. After a complete download to the device, PID_3Step starts in the "Pretuning" mode. If pretuning is still active, PID_3Step starts in "Pretuning" mode again after restart of the CPU. If pretuning was successfully completed and automatic mode is active, PID_3Step starts in "Automatic mode" after restart of the CPU.

Setpoint V2

Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.

   Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

Process value V2

PID_3Step will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

Position feedback V2

Position feedback configuration depends upon the actuator used.

- Actuator without position feedback
- Actuator with digital endstop signals
- Actuator with analog position feedback
- Actuator with analog position feedback and endstop signals

Actuator without position feedback

Proceed as follows to configure PID_3Step for an actuator without position feedback:

1. Select the entry "No Feedback" in the drop-down list "Feedback".

Actuator with digital endstop signals

Proceed as follows to configure PID_3Step for an actuator with endstop signals:

1. Select the entry "No Feedback" in the drop-down list "Feedback".
2. Activate the "Actuator endstop signals" check box.
3. Select "Instruction" as source for Actuator_H and Actuator_L.
4. Enter the addresses of the digital inputs for Actuator_H and Actuator_L.

Actuator with analog position feedback

Proceed as follows to configure PID_3Step for an actuator with analog position feedback:

1. Select the entry "Feedback" or "Feedback_PER" in the drop-down list "Feedback".
   – Use the analog input value for Feedback_PER. Configure Feedback_PER scaling in the actuator settings.
   – Process the analog input value for Feedback using your user program.
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.

Actuator with analog position feedback and endstop signals

Proceed as follows to configure PID_3Step for an actuator with analog position feedback and endstop signals:

1. Select the entry "Feedback" or "Feedback_PER" in the drop-down list "Feedback".
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.
4. Activate the "Actuator endstop signals" check box.
5. Select "Instruction" as source for Actuator_H and Actuator_L.
6. Enter the addresses of the digital inputs for Actuator_H and Actuator_L.

Output value V2

PID_3Step offers an analog output value (Output_PER) and digital output values (Output_UP, Output_DN). Your actuator will determine which output value you use.

- Output_PER

  The actuator has a relevant motor transition time and is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V or 4...20 mA. The value at Output_PER corresponds to the target position of the valve, e.g. Output_PER = 13824, when the valve is to be opened by 50%.

  For auto-tuning and anti windup behavior, for example, PID_3Step takes into consideration that the analog output value has a delayed effect on the process due to the motor transition time. If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

- Output_UP, Output_DN

  The actuator has a relevant motor transition time and is controlled by two digital outputs.
  Output_UP moves the valve in the open state direction.
  Output_DN moves the valve in the closed state direction.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior. You should therefore configure the motor transition time under "Actuator settings" with the value that the motor requires to move the actuator from the closed to the opened state.

Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to use the digital output value:

1. Select the entry "Output (digital)" in the drop-down list "Output".
2. Select "Instruction" for Output_UP and Output_DN.
3. Enter the addresses of the digital outputs.

Proceed as follows to process the output value using the user program:

1. Select the entry corresponding to the actuator in the drop-down list "Output".
2. Select "Instruction".
3. Enter the name of the tag you are using to process the output value.
4. Transfer the processed output value to the actuator by means of an analog or digital CPU output.

5.2.1.2 Process value settings V2

Process value scaling V2

If you have configured the use of Input_PER in the basic setting, you must convert the value of the analog input to the physical quantity of the process value. The current configuration is displayed in the Input_PER display.

Input_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

Procedure

To scale the process value, follow these steps:

1. Enter the low pair of values in the "Scaled low process value" and "Low" text boxs.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are stored in the hardware configuration. To use the value pairs from the hardware configuration, follow these steps:

1. Select the PID_3Step instruction in the programming editor.
2. Interconnect Input_PER with an analog input in the basic settings.
3. Click the "Automatic setting" button in the process value settings.

The existing values will be overwritten with the values from the hardware configuration.

Process value limits V2

You must specify an appropriate absolute high limit and low limit for the process value as limit values for your controlled system. As soon as the process value violates these limits, an error occurs (ErrorBits = 0001h). Tuning is canceled when the process value limits are violated. You can specify how PID_3Step responds to errors in automatic mode in the actuator settings.

5.2.1.3 Final controlling element settings V2

Final controlling element V2

Actuator-specific times

Configure the motor transition time and the minimum ON and OFF times to prevent damage to the actuator. You can find the specifications in the actuator data sheet.

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. You can measure the motor transition time during commissioning.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior.

If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

The motor transition time is retentive. If you enter the motor transition time manually, you must completely download PID_3Step.

Downloading technology objects to device (Page 44)

If you are using "Output_UP" or "Output_DN", you can reduce the switching frequency with the minimum on and minimum OFF time.

The on or off times calculated are totaled in automatic mode and only become effective when the sum is greater than or equal to the minimum on or OFF time.

Manual_UP = TRUE or Manual_DN = TRUE in manual mode operates the actuator for at least the minimum ON or OFF time.

If you have selected the analog output value Output_PER, the minimum ON time and the minimum OFF time are not evaluated and cannot be changed.

Reaction to error

PID_3Step is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

NOTICE
Your system may be damaged. If you output "Current value while error pending" or "Substitute output value while error pending" in the event of an error, PID_3Step remains in automatic mode even if the process value limits are violated. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

PID_3Step generates a programmable output value in the case of an error:

- Current value

  PID_3Step is switched off and no longer modifies the actuator position.

- Current value for error while error is pending

  The controller functions of PID_3Step are switched off and the position of the actuator is no longer changed.

  If the following errors occur in automatic mode, PID_3Step returns to automatic mode as soon as the errors are no longer pending.

  – 0002h: Invalid value at Input_PER parameter.

  – 0200h: Invalid value at Input parameter.

  – 0400h: Calculation of output value failed.

  – 1000h: Invalid value at Setpoint parameter.

  – 2000h: Invalid value at Feedback_PER parameter.

  – 4000h: Invalid value at Feedback parameter.

  – 8000h: Error during digital position feedback.

  – 20000h: Invalid value at SavePosition tag.

If one or more of the following errors occur, PID_3Step stays in automatic mode:

- 0001h: The Input parameter is outside the process value limits.
- 0800h: Sampling time error
- 40000h: Invalid value at Disturbance parameter.

PID_3Step remains in manual mode if an error occurs in manual mode.

If an error occurs during tuning or transition time measurement, PID_3Step switches to the mode in which tuning or transition time measurement was started. Only in the event of the following error is tuning not aborted:

- 0020h: Pretuning is not permitted during fine tuning.

- Substitute output value

  PID_3Step moves the actuator to the substitute output value and then switches off.

- Substitute output value while error is pending

  PID_3Step moves the actuator to the substitute output value. When the substitute output value is reached, PID_3Step reacts as it does with "Current value for while error is pending".

Enter the substitute output value in "%".

Only substitute output values 0% and 100% can be approached precisely in the case of actuators without analog position feedback. A substitute output value not equal to 0% or 100% is approached via an internally simulated position feedback. This procedure does not, however, allow the exact approach of substitute output value.

All substitute output values can be approached precisely with actuators with analog position feedback.

Scaling V2 position feedback

Scaling position feedback

If you have configured the use of Feedback_PER in the basic settings, you will need to convert the value of the analog input into %. The current configuration will be displayed in the "Feedback" display.

Feedback_PER is scaled using a low and high value pair.

1. Enter the low pair of values in the "Low endstop" and "Low" input boxes.
2. Enter the high pair of values in the "High endstop" and "High" input boxes.

"Low endstop" must be less than "High endstop"; "Low" must be less than "High".

The valid values for "High endstop" and "Low endstop" depend upon:

- No Feedback, Feedback, Feedback_PER
- Output (analog), Output (digital)

Output	Feedback	Low endstop	High endstop
Output (digital)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (digital)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (digital)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (analog)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%

Output value limits V2

Limiting the output value

You can exceed or undershoot the output value limits during the transition time measurement and with mode = 10. The output value is limited to these values in all other modes.

Enter the absolute output value limits in the "Output value high limit" and "Output value low limit" input boxes. The output value limits must be within "Low endstop" and "High endstop".

If no Feedback is available and Output (digital) is set, you cannot limit the output value. Output_UP and Output_DN are then reset upon Actuator_H = TRUE or Actuator_L = TRUE. If no endstop signals are available, Output_UP and Output_DN are reset after a travel time of 150% of the motor actuating time.

The default value of 150% can be adjusted using the tagConfig.VirtualActuatorLimit. As of PID_3Step Version 2.3 the monitoring and limiting of the travel time can be deactivated with Config.VirtualActuatorLimit = 0.0.

5.2.1.4 Advanced settings V2

Actual value monitoring V2

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID_3Step instruction:

- At the InputWarning_H output parameter if the warning high limit has been exceeded
- At the InputWarning_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID_3Step will respond as follows:

Process value	InputWarning_H	InputWarning_L	ErrorBits	Operating mode
> 98° C	TRUE	FALSE	0001h	As configured
≤ 98° C and > 90° C	TRUE	FALSE	0000h	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	0000h	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	0000h	Automatic mode
< 0° C	FALSE	TRUE	0001h	As configured

In the actuator settings, you can configure the response of PID_3Step when the process value high limit or low limit is violated.

PID parameters V2

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

Note

The currently active PID parameters are located in the Retain.CtrlParams structure.

Change the currently active PID parameters only in "Inactive" mode online to prevent malfunction of the PID controller.

If you want to change the PID parameters in "Automatic mode" or "Manual mode" online, change the PID parameters in the CtrlParamsBackUp structure and apply these changes to the Retain.CtrlParams structure as follows:

- PID_3Step V1: Apply the changes with Config.LoadBackUp = TRUE
- PID_3Step V2: Apply the changes with LoadBackUp = TRUE

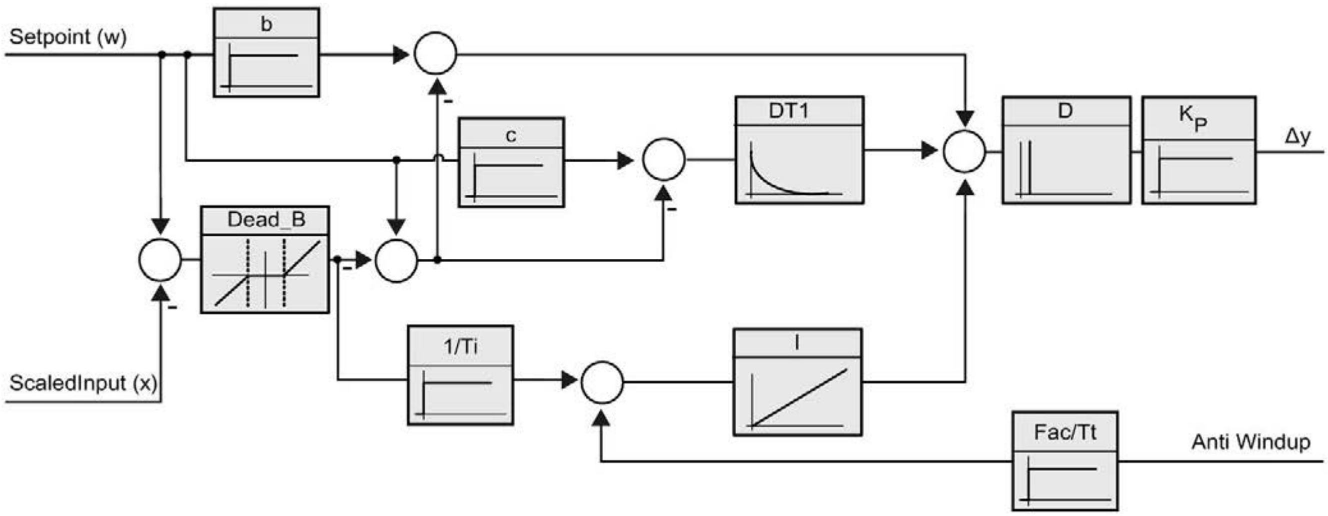
Online changes to the PID parameters in "Automatic mode" can result in jumps at the output value.

The PID algorithm operates according to the following equation:

$$\Delta y = K_p \cdot s \cdot \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Δy	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integration time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
T_D	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:



All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID_3Step.

Downloading technology objects to device (Page 44)

Proportional gain

The value specifies the proportional gain of the controller. PID_3Step does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

Integration time

The integration time determines the time behavior of the integral action. The integral action is deactivated with integration time = 0.0. When the integral action time is changed from a different value to 0.0 online in "Automatic mode", the previous integral action is deleted and the output value jumps.

Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the PID_3Step sampling time. All other functions of PID_3Step are executed at every call.

Dead band width

The deadband suppresses the noise component in the steady controller state. The dead band width specifies the size of the dead band. The dead band is off if the dead band width is 0.0.

If values not equal to 1.0 are configured for the proportional action weighting or the derivative action weighting, setpoint changes even within the dead zone affect the output value. Process value changes within the dead zone do not affect the output value, regardless of the weighting.

5.2.2 Commissioning PID_3Step V2

5.2.2.1 Pretuning V2

The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode". The PID parameters are backed up before being recalculated.

The setpoint is frozen during pretuning.

Requirement

- The PID_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.
- PID_3Step is in one of the following modes: "Inactive", "Manual mode", or "Automatic mode".
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID_3Step > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list in the working area "Tuning".
3. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – Pretuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

   Note

   Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID_3Step responds with the configured reaction to errors.

5.2.2.2 Fine tuning V2

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.

PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

The setpoint is frozen during fine tuning.

Requirement

- The PID_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID_3Step is in inactive mode, automatic mode or manual mode.

Process depends on initial situation

Fine tuning proceeds as follows when started from:

- Automatic mode

  Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning.

  PID_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

- Inactive or manual mode

  Pretuning is always started first. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

Procedure

To perform fine tuning, follow these steps:

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – The process of fine tuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If no errors occurred during fine tuning, the PID parameters have been tuned. PID_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during fine tuning, PID_3Step responds with the configured response to errors.

5.2.2.3 Commissioning with manual PID parameters V2

Requirement

- The PID_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The motor transition time has been configured or measured.
- PID_3Step is in "inactive" mode.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

Procedure

Proceed as follows to commission PID_3Step with manual PID parameters:

1. Double-click on "PID_3Step > Configuration" in the project tree.
2. Click on "Advanced settings > PID Parameters" in the configuration window.
3. Select the check box "Enable direct input".
4. Enter the PID parameters.
5. Double-click the "PID_3Step > Commissioning" entry in the project tree.
6. Establish an online connection to the CPU.
7. Load the PID parameters to the CPU.
8. Click the "Start PID_3Step" icon.

Result

PID_3Step changes to automatic mode and controls using the current PID parameters.

PID parameters V2 (Page 130)

5.2.2.4 Measuring the motor transition time V2

Introduction

PID_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ.

You can measure the motor transition time during commissioning if you are using actuators with position feedback or endstop signals. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time cannot be measured if neither position feedback nor endstop signals are available.

Actuators with analog position feedback

Proceed as follows to measure motor transition time with position feedback:

Requirement

- Feedback or Feedback_PER has been selected in the basic settings and the signal has been connected.
- An online connection to the CPU has been established.

1. Select the "Use position feedback" check box.
2. Enter the position to which the actuator is to be moved in the "Target position" input field.

   The current position feedback (starting position) will be displayed. The difference between "Target position" and "Position feedback" must be at least 50% of the valid output value range.
3. Click the "Start" icon.

Result

The actuator is moved from the starting position to the target position. Time measurement starts immediately and ends when the actuator reaches the target position. The motor transition time is calculated according to the following equation:

Motor transition time = (output value high limit – output value low limit) × Measuring time / AMOUNT (target position – starting position).

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. When the transition time measurement is ended and ActivateRecoverMode = TRUE, PID_3Step switches to the operating mode from which the transition time measurement was started. If the transition time measurement is ended and ActivateRecoverMode = FALSE, PID_3Step changes to "Inactive" mode.

Note

Click on the icon  "Upload measured transition time" to load the motor transition time measured to the project.

Actuators with endstop signals

Proceed as follows to measure the transition time of actuators with endstop signals:

Requirement

- The "Endstop signals" check box in the basic settings has been selected and Actuator_H and Actuator_L are connected.
- An online connection to the CPU has been established.

Proceed as follows to measure motor transition time with endstop signals:

1. Select the "Use actuator endstop signals" check box.
2. Select the direction in which the actuator is to be moved.
   - Open - Close - Open

     The actuator is moved first to the high endstop, then to the low endstop and then back to the high endstop.
   - Close - Open - Close

     The actuator is moved first to the low endstop, then to the high endstop and then back to the low endstop.
3. Click the "Start" icon.

Result

The actuator is moved in the selected direction. Time measurement will start once the actuator has reached the first endstop and will end when the actuator reaches this endstop for the second time. The motor transition time is equal to the time measured divided by two.

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. When the transition time measurement is ended and ActivateRecoverMode = TRUE, PID_3Step switches to the operating mode from which the transition time measurement was started. If the transition time measurement is ended and ActivateRecoverMode = FALSE, PID_3Step changes to "Inactive" mode.

Cancelling transition time measurement

PID_3Step switches to "Inactive" mode if you cancel transition time measurement by pressing the Stop button.

5.2.3 Simulating PID_3Step V2 with PLCSIM

Note

Simulation with PLCSIM

The simulation of PID_3Step V2.x with PLCSIM for CPU S7-1200 is not supported.

PID_3Step V2.x can only be simulated for CPU S7-1500 with PLCSIM.

For the simulation with PLCSIM, the time behavior of the simulated PLC is not exactly identical to that of a "real" PLC. The actual cycle clock of a cyclic interrupt OB can have larger fluctuations with a simulated PLC than with "real" PLCs.

In the standard configuration, PID_3Step determines the time between calls automatically and monitors them for fluctuations.

For a simulation of PID_3Step with PLCSIM, for example, a sampling time error ((ErrorBits = DW#16#00000800) can therefore be detected.

This results in ongoing tuning being aborted.

The response in automatic mode depends on the value of the ActivateRecoverMode tag.

To prevent this from happening, you should configure PID_3Step for simulation with PLCSIM as follows:

- CycleTime.EnEstimation = FALSE
- CycleTime.EnMonitoring = FALSE
- CycleTime.Value: Assign the cycle clock of the calling cyclic interrupt OB in seconds to this tag.

5.3 PID_3Step V1

5.3.1 Configuring PID_3Step V1

5.3.1.1 Basic settings V1

Introduction V1

Configure the following properties of the "PID_3Step" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Control logic
- Start-up behavior after reset
- Setpoint (only in the Inspector window)
- Process value (only in the Inspector window)
- Output value (only in the Inspector window)
- Position feedback (only in the Inspector window)

Setpoint, process value, output value and position feedback

You can only configure the setpoint, process value, output value and position feedback in the Inspector window of the programming editor. Select the source for each value:

- Instance DB

  The value saved in the instance DB is used.

  Value must be updated in the instance DB by the user program.

  There should be no value at the instruction.

  Change via HMI possible.

- Instruction

  The value connected to the instruction is used.
  The value is written to the instance DB each time the instruction is called.

  No change via HMI possible.

Control mode V1

Physical quantity

Select the unit of measurement and physical quantity for the setpoint and process value in the "Controller type" group. The setpoint and process value will be displayed in this unit.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic.

PID_3Step does not work with negative proportional gain. Select the check box "Invert control logic" to reduce the process value with a higher output value.

Examples

- Opening the drain valve will reduce the level of a container's contents.
- Increasing cooling will reduce the temperature.

Start-up behavior after reset

To change straight to the last active mode after restarting the CPU, select the "Enable last mode after CPU restart" check box.

PID_3Step will remain in "Inactive" mode if the check box is cleared.

Setpoint V1

Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL variable in which the setpoint is saved.

   Program-controlled assignment of various values to the REAL variable is possible, for example for the time controlled change of the setpoint.

Process value V1

PID_3Step will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

Position feedback V1

Position feedback configuration depends upon the actuator used.

- Actuator without position feedback
- Actuator with digital endstop signals
- Actuator with analog position feedback
- Actuator with analog position feedback and endstop signals

Actuator without position feedback

Proceed as follows to configure PID_3Step for an actuator without position feedback:

1. Select the entry "No Feedback" in the drop-down list "Feedback".

Actuator with digital endstop signals

Proceed as follows to configure PID_3Step for an actuator with endstop signals:

1. Select the entry "No Feedback" in the drop-down list "Feedback".
2. Activate the "Actuator endstop signals" check box.
3. Select "Instruction" as source for Actuator_H and Actuator_L.
4. Enter the addresses of the digital inputs for Actuator_H and Actuator_L.

Actuator with analog position feedback

Proceed as follows to configure PID_3Step for an actuator with analog position feedback:

1. Select the entry "Feedback" or "Feedback_PER" in the drop-down list "Feedback".
   - Use the analog input value for Feedback_PER. Configure Feedback_PER scaling in the actuator settings.
   - Process the analog input value for Feedback using your user program.
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.

Actuator with analog position feedback and endstop signals

Proceed as follows to configure PID_3Step for an actuator with analog position feedback and endstop signals:

1. Select the entry "Feedback" or "Feedback_PER" in the drop-down list "Feedback".
2. Select "Instruction" as source.
3. Enter the address of the analog input or the variable of your user program.
4. Activate the "Actuator endstop signals" check box.
5. Select "Instruction" as source for Actuator_H and Actuator_L.
6. Enter the addresses of the digital inputs for Actuator_H and Actuator_L.

Output value V1

PID_3Step offers an analog output value (Output_PER) and digital output values (Output_UP, Output_DN). Your actuator will determine which output value you use.

- Output_PER

  The actuator has a relevant motor transition time and is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V or 4...20 mA. The value at Output_PER corresponds to the target position of the valve, e.g. Output_PER = 13824, when the valve is to be opened by 50%.

  For auto-tuning and anti windup behavior, for example, PID_3Step takes into consideration that the analog output value has a delayed effect on the process due to the motor transition time. If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

- Output_UP, Output_DN

  The actuator has a relevant motor transition time and is controlled by two digital outputs.
  Output_UP moves the valve in the open state direction.
  Output_DN moves the valve in the closed state direction.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior. You should therefore configure the motor transition time under "Actuator settings" with the value that the motor requires to move the actuator from the closed to the opened state.

Procedure

Proceed as follows to use the analog output value:

1. Select the entry "Output (analog)" in the drop-down list "Output".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to use the digital output value:

1. Select the entry "Output (digital)" in the drop-down list "Output".
2. Select "Instruction" for Output_UP and Output_DN.
3. Enter the addresses of the digital outputs.

Proceed as follows to process the output value using the user program:

1. Select the entry corresponding to the actuator in the drop-down list "Output".
2. Select "Instruction".
3. Enter the name of the tag you are using to process the output value.
4. Transfer the processed output value to the actuator by means of an analog or digital CPU output.

5.3.1.2 Process value settings V1

Configure the scaling of your process value and specify the process value absolute limits In the "Process value settings" configuration window.

Scaling the process value

If you have configured the use of Input_PER in the basic settings, you will need to convert the value of the analog input into the physical quantity of the process value. The current configuration will be displayed in the Input_PER display.

Input_PER will be scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input boxes.

Default settings for the value pairs are saved in the hardware configuration. Proceed as follows to use the value pairs from the hardware configuration:

1. Select the instruction PID_3Step in the programming editor.
2. Connect Input_PER to an analog input in the basic settings.
3. Click on the "Automatic setting" button in the process value settings.

   The existing values will be overwritten with the values from the hardware configuration.

Monitoring process value

Specify the absolute high and low limit of the process value. You must enter reasonable limits for your controlled system. Reasonable limits are important during optimization to obtain optimal PID parameters. The default for the "High limit process value" is 120 %. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). This setting ensures that an error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_3Step reacts according to the configured reaction to error.

NOTICE
Your system may be damaged.
If you set very high process value limits (for example $-3.4*10^{38}...+3.4*10^{38}$), process value monitoring will be disabled. Your system may then be damaged if an error occurs. You need to configure useful process value limits for your controlled system.

5.3.1.3 V1 final controlling element setting

Actuator-specific times

Configure the motor transition time and the minimum ON and OFF times to prevent damage to the actuator. You can find the specifications in the actuator data sheet.

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The maximum time that the actuator is moved in one direction is 110% of the motor transition time. You can measure the motor transition time during commissioning.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior.

If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

If you are using "Output_UP" or "Output_DN", you can reduce the switching frequency with the minimum on and minimum OFF time.

The on or off times calculated are totaled in automatic mode and only become effective when the sum is greater than or equal to the minimum on or OFF time.

A rising edge at Manual_UP or Manual_DN in manual mode will operate the actuator for at least the minimum on or OFF time.

If you have selected the analog output value Output_PER, the minimum ON time and the minimum OFF time are not evaluated and cannot be changed.

Reaction to error

PID_3Step is preset so that the controller stays active in most cases in the event of an error. If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the Errorbits parameter and eliminate the cause of the error.

PID_3Step generates a programmable output value in response to an error:

- Current value

  PID_3Step is switched off and no longer modifies the actuator position.

- Current value for error while error is pending

  The controller functions of PID_3Step are switched off and the position of the actuator is no longer changed.

  If the following errors occur in automatic mode, PID_3Step returns to automatic mode as soon as the errors are no longer pending.

  – 0002h: Invalid value at Input_PER parameter.
  – 0200h: Invalid value at Input parameter.
  – 0800h: Sampling time error
  – 1000h: Invalid value at Setpoint parameter.
  – 2000h: Invalid value at Feedback_PER parameter.
  – 4000h: Invalid value at Feedback parameter.
  – 8000h: Error during digital position feedback.

  If one of these error occurs in manual mode, PID_3Step remains in manual mode.

  If an error occurs during the tuning or transition time measurement, PID_3Step is switched off.

- Substitute output value

  PID_3Step moves the actuator to the substitute output value and then switches off.

- Substitute output value while error is pending

  PID_3Step moves the actuator to the substitute output value. When the substitute output value is reached, PID_3Step reacts as it does with "Current value for while error is pending".

Enter the substitute output value in "%".

Only substitute output values 0% and 100% can be approached precisely in the case of actuators without analog position feedback. The actuator is moved in one direction at 110% of the motor transition time to ensure the high or low endstop is reached. There endstop signals take priority. A substitute output value not equal to 0% or 100% is approached via an internally simulated position feedback. This procedure does not, however, allow the exact approach of substitute output value.

All substitute output values can be approached precisely with actuators with analog position feedback.

Scaling position feedback

If you have configured the use of Feedback_PER in the basic settings, you will need to convert the value of the analog input into %. The current configuration will be displayed in the "Feedback" display.

Feedback_PER is scaled using a low and high value pair.

1. Enter the low pair of values in the "Low endstop" and "Low" input boxes.
2. Enter the high pair of values in the "High endstop" and "High" input boxes.

"Low endstop" must be less than "High endstop"; "Low" must be less than "High".

The valid values for "High endstop" and "Low endstop" depend upon:

- No Feedback, Feedback, Feedback_PER
- Output (analog), Output (digital)

Output	Feedback	Low endstop	High endstop
Output (digital)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (digital)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (digital)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	No Feedback	Cannot be set (0.0%)	Cannot be set (100.0%)
Output (analog)	Feedback	-100.0% or 0.0%	0.0% or +100.0%
Output (analog)	Feedback_PER	-100.0% or 0.0%	0.0% or +100.0%

Limiting the output value

You can only exceed or undershoot the output value limits during the transition time measurement. The output value is limited to these values in all other modes.

Enter the absolute output value limits in the "Output value high limit" and "Output value low limit" input boxes. The output value limits must be within "Low endstop" and "High endstop".

If no Feedback is available and Output (digital) is set, you cannot limit the output value. The digital outputs are reset with Actuator_H = TRUE or Actuator_L = TRUE, or after a travel time amounting to 110% of the motor transition time.

5.3.1.4 Advanced settings V1

Actual value monitoring V1

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning will be displayed at the PID_3Step instruction:

- At the InputWarning_H output parameter if the warning high limit has been exceeded
- At the InputWarning_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits will be used if you do not enter values.

Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID_3Step will respond as follows:

Process value	InputWarning_H	InputWarning_L	Operating mode
> 98° C	TRUE	FALSE	Inactive
≤ 98° C and > 90° C	TRUE	FALSE	Automatic mode
≤ 90° C and ≥ 10° C	FALSE	FALSE	Automatic mode
< 10° C and ≥ 0° C	FALSE	TRUE	Automatic mode
< 0° C	FALSE	TRUE	Inactive

PID parameters V1

The PID parameters are displayed in the "PID Parameters" configuration window. The PID parameters will be adapted to your controlled system during controller tuning. You do not need to enter the PID parameters manually.

Note

The currently active PID parameters are located in the Retain.CtrlParams structure.

Change the currently active PID parameters only in "Inactive" mode online to prevent malfunction of the PID controller.

If you want to change the PID parameters in "Automatic mode" or "Manual mode" online, change the PID parameters in the CtrlParamsBackUp structure and apply these changes to the Retain.CtrlParams structure as follows:

- PID_3Step V1: Apply the changes with Config.LoadBackUp = TRUE
- PID_3Step V2: Apply the changes with LoadBackUp = TRUE

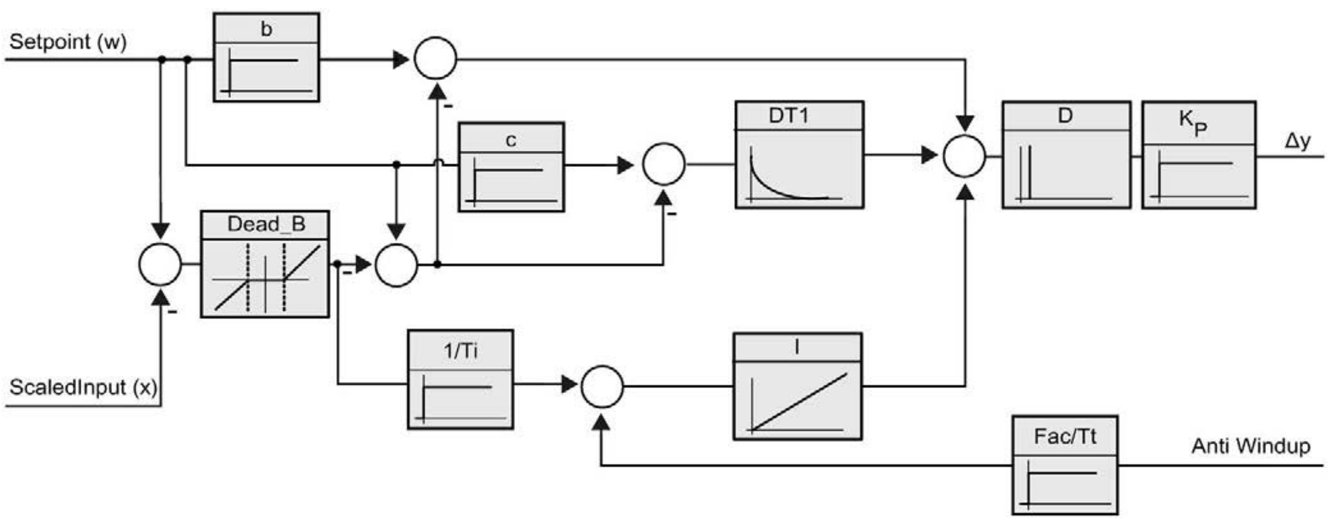
Online changes to the PID parameters in "Automatic mode" can result in jumps at the output value.

The PID algorithm operates according to the following equation:

$$\Delta y = K_p \cdot s \cdot \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Δy	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integration time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
T_D	Derivative action time
c	Derivative action weighting

The diagram below illustrates the integration of the parameters into the PID algorithm:



All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID_3Step.

Downloading technology objects to device (Page 44)

Proportional gain

The value specifies the proportional gain of the controller. PID_3Step does not work with a negative proportional gain. Control logic is inverted under Basic settings > Controller type.

Integration time

The integration time determines the time behavior of the integral action. The integral action is deactivated with integration time = 0.0. When the integral action time is changed from a different value to 0.0 online in "Automatic mode", the previous integral action is deleted and the output value jumps.

Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the PID_3Step sampling time. All other functions of PID_3Step are executed at every call.

Dead band width

The deadband suppresses the noise component in the steady controller state. The dead band width specifies the size of the dead band. The dead band is off if the dead band width is 0.0.

If values not equal to 1.0 are configured for the proportional action weighting or the derivative action weighting, setpoint changes even within the dead zone affect the output value. Process value changes within the dead zone do not affect the output value, regardless of the weighting.

5.3.2 Commissioning PID_3Step V1

5.3.2.1 Commissioning V1

You can monitor the setpoint, process value and output value over time in the "Tuning" working area. The following commissioning functions are supported in the curve plotter:

- Controller pretuning
- Controller fine tuning
- Monitoring the current closed-loop control in the trend view

All functions require an online connection to the CPU to have been established.

Basic handling

- Select the desired sampling time in the "Sampling time" drop-down list.

  All values in the tuning working area are updated in the selected update time.
- Click the "Start" icon in the measuring group if you want to use the commissioning functions.

  Value recording is started. The current values for the setpoint, process value and output value are entered in the trend view. Operation of the commissioning window is enabled.
- Click the "Stop" icon if you want to end the commissioning functions.

  The values recorded in the trend view can continue to be analyzed.
- Closing the commissioning window will terminate recording in the trend view and delete the recorded values.

5.3.2.2 Pretuning V1

The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. The PID parameters are backed up before being recalculated.

The setpoint is frozen during pretuning.

Requirement

- The PID_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- PID_3Step is in "inactive" or "manual" mode.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).

Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID_3Step > Commissioning" entry in the project tree.
2. Select the entry "Pretuning" in the "Tuning mode" drop-down list in the working area "Tuning".
3. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – Pretuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

   Note

   Click the "Stop" icon when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID_3Step switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID_3Step changes to "Inactive" mode.

5.3.2.3 Fine tuning V1

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized for the operating point from the amplitude and frequency of this oscillation. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning.

PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

The setpoint is frozen during fine tuning.

Requirement

- The PID_3Step instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- The motor transition time has been configured or measured.
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.
- No disturbances are expected.
- PID_3Step is in inactive mode, automatic mode or manual mode.

Process depends on initial situation

Fine tuning proceeds as follows when started in:

- Automatic mode

  Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning.

  PID_3Step will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.
- Inactive or manual mode

  Pretuning is always started first. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

Procedure

Proceed as follows to carry out "fine tuning":

1. Select the entry "Fine tuning" in the "Tuning mode" drop-down list.
2. Click the "Start" icon.
   – An online connection will be established.
   – Value recording is started.
   – The process of fine tuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon in the "Tuning mode" group when the progress bar has reached 100% and it is to be assumed the controller tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

The PID parameters will have been optimized if fine tuning has been executed without errors. PID_3Step changes to automatic mode and uses the optimized parameters. The optimized PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during fine tuning, PID_3Step will change to "inactive" mode.

5.3.2.4 Commissioning with manual PID parameters V1

Procedure

Proceed as follows to commission PID_3Step with manual PID parameters:

1. Double-click on "PID_3Step > Configuration" in the project tree.
2. Click on "Advanced settings > PID Parameters" in the configuration window.
3. Select the check box "Enable direct input".
4. Enter the PID parameters.
5. Double-click on "PID_3Step > Commissioning" in the project tree.
6. Establish an online connection to the CPU.
7. Load the PID parameters to the CPU.
8. Click on the "Activate controller" icon.

Result

PID_3Step changes to automatic mode and controls using the current PID parameters.

5.3.2.5 Measuring the motor transition time V1

Introduction

PID_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ.

You can measure the motor transition time during commissioning if you are using actuators with position feedback or endstop signals. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time cannot be measured if neither position feedback nor endstop signals are available.

Actuators with analog position feedback

Proceed as follows to measure motor transition time with position feedback:

Requirement

- Feedback or Feedback_PER has been selected in the basic settings and the signal has been connected.
- An online connection to the CPU has been established.

1. Select the "Use position feedback" check box.
2. Enter the position to which the actuator is to be moved in the "Target position" input field.

   The current position feedback (starting position) will be displayed. The difference between "Target position" and "Position feedback" must be at least 50% of the valid output value range.
3. Click the "Start transition time measurement" icon.

Result

The actuator is moved from the starting position to the target position. Time measurement starts immediately and ends when the actuator reaches the target position. The motor transition time is calculated according to the following equation:

Motor transition time = (output value high limit – output value low limit) × Measuring time / AMOUNT (target position – starting position).

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. PID_3Step will change to "Inactive" mode once transition time measurement is complete.

Note

Click on the icon "Upload measured transition time" to load the motor transition time measured to the project.

Actuators with endstop signals

Proceed as follows to measure the transition time of actuators with endstop signals:

Requirement

- The "Endstop signals" check box in the basic settings has been selected and Actuator_H and Actuator_L are connected.
- An online connection to the CPU has been established.

Proceed as follows to measure motor transition time with endstop signals:

1. Select the "Use actuator endstop signals" check box.
2. Select the direction in which the actuator is to be moved.
   – Open - Close - Open

     The actuator is moved first to the high endstop, then to the low endstop and then back to the high endstop.
   – Close - Open - Close

     The actuator is moved first to the low endstop, then to the high endstop and then back to the low endstop.
3. Click the "Start transition time measurement" icon.

Result

The actuator is moved in the selected direction. Time measurement will start once the actuator has reached the first endstop and will end when the actuator reaches this endstop for the second time. The motor transition time is equal to the time measured divided by two.

The progress and status of transition time measurement are displayed. The transition time measured is saved in the instance data block on the CPU and displayed in the "Measured transition time" field. PID_3Step will change to "Inactive" mode once transition time measurement is complete.

Cancelling transition time measurement

PID_3Step will change to "Inactive" mode immediately if you cancel transition time measurement. The actuator will stop being moved. You can reactive PID-3Step in the curve plotter.

5.3.3 Simulating PID_3Step V1 with PLCSIM

Note

Simulation with PLCSIM

For the simulation with PLCSIM, the time behavior of the simulated PLC is not exactly identical to that of a "real" PLC. The actual cycle clock of a cyclic interrupt OB can have larger fluctuations with a simulated PLC than with "real" PLCs.

In the standard configuration, PID_3Step determines the time between calls automatically and monitors them for fluctuations.

For a simulation of PID_3Step with PLCSIM, for example, a sampling time error (ErrorBits = DW#16#00000800) can therefore be detected.

This results in ongoing tuning being aborted.

The response in automatic mode depends on the value of the ActivateRecoverMode tag.

To prevent this from happening, you should configure PID_3Step for simulation with PLCSIM as follows:

- CycleTime.EnEstimation = FALSE
- CycleTime.EnMonitoring = FALSE
- CycleTime.Value: Assign the cycle clock of the calling cyclic interrupt OB in seconds to this tag.

---

6 Using PID_Temp

6.1 Technology object PID_Temp

The PID_Temp technology object provides a continuous PID controller with integrated tuning. PID_Temp is especially designed for temperature control and is suited for heating or heating/cooling applications. Two outputs are available for this purpose, one each for heating and cooling. PID_Temp can also be used for other control tasks. PID_Temp is cascadable and can be used in manual or automatic mode.

PID_Temp continuously acquires the measured process value within a control loop and compares it with the set setpoint. From the resulting control deviations, the instruction PID_Temp calculates the output value for heating and/or cooling which is used to adjust the process value to the setpoint. The output values for the PID controller consist of three actions:

- Proportional action

  The proportional action of the output value increases in proportion to the control deviation.

- Integral action

  The integral action of the output value increases until the control deviation has been balanced.

- Derivative action

  The derivative action increases with the rate of change of control deviation. The process value is corrected to the setpoint as quickly as possible. The derivative action will be reduced again if the rate of change of control deviation drops.

The instruction PID_Temp calculates the proportional, integral and derivative parameters for your controlled system during "pretuning". "Fine tuning" can be used to tune the parameters further. You do not need to manually determine the parameters.

Either a fixed cooling factor or two PID parameter sets can be used for heating-and-cooling applications.

Additional information

- Overview of software controller (Page 39)
- Add technology objects (Page 41)
- Configure technology objects (Page 42)
- Configuring PID_Temp (Page 162)

6.2 Configuring PID_Temp

6.2.1 Basic settings

6.2.1.1 Introduction

Configure the following properties of the "PID_Temp" technology object under "Basic settings" in the Inspector window or in the configuration window:

- Physical quantity
- Start-up behavior after reset
- Source and input of the setpoint (only in the Inspector window)
- Selection of the process value
- Source and input of the process value (only in the Inspector window)
- Selection of the heating output value
- Source and input of the heating output value (only in the Inspector window)
- Activation and selection of the cooling output value
- Source and input of the cooling output value (only in the Inspector window)
- Activation of PID_Temp as master or slave of a cascade
- Number of slaves
- Selection of the master (only in the Inspector window)

Setpoint, process value, heating output value and cooling output value

You can select the source and enter values or tags for the setpoint, process value, heating output value and cooling output value in the Inspector window of the programming editor.

Select the source for each value:

- Instance DB:

  The value saved in the instance DB is used. The value must be updated by the user program in the instance DB. There should be no value at the instruction. Can be changed using HMI.
- Instruction:

  The value connected to the instruction is used. The value is written to the instance DB each time the instruction is called. Cannot be changed using HMI.

6.2.1.2 Controller type

Physical quantity

Select the unit of measurement and physical quantity for the setpoint and the process value in the "Controller type" group. The setpoint and the process value are displayed in this unit.

Startup characteristics

1. To switch to "Inactive"mode after CPU restart, clear the "Activate Mode after CPU restart"check box.

   To switch to the operating mode saved in the Mode parameter after CPU restart, select the "Activate Mode after CPU restart" check box.

2. In the "Set Mode to" drop-down list, select the mode that is to be enabled after a complete download to the device.

   After a complete "Download to device", PID_Temp starts in the selected operating mode. With each additional restart, PID_Temp starts in the mode that was last saved in Mode.

   When selecting pretuning or fine tuning, you also have to set or reset the Heat.EnableTuning and Cool.EnableTuning tags in order to choose between tuning for heating and tuning for cooling.

Example:

You have selected the "Activate Mode after CPU restart" check box and the "Pretuning" entry in the "Set Mode to" list. After a complete "Download to device", PID_Temp starts in the "Pretuning" mode. If pretuning is still active, PID_Temp starts in "Pretuning" mode again after restart of the CPU (heating/cooling depends on the tags Heat.EnableTuning and Cool.EnableCooling). If pretuning was successfully completed and automatic mode is active, PID_Temp starts in "Automatic mode" after restart of the CPU.

6.2.1.3 Setpoint

Procedure

Proceed as follows to define a fixed setpoint:

1. Select "Instance DB".
2. Enter a setpoint, e.g. 80° C.
3. Delete any entry in the instruction.

Proceed as follows to define a variable setpoint:

1. Select "Instruction".
2. Enter the name of the REAL tag in which the setpoint is saved.

   Program-controlled assignment of various values to the REAL tag is possible, for example for the time-controlled change of the setpoint.

6.2.1.4 Process value

PID_Temp will scale the value of the analog input to the physical quantity if you use the analog input value directly.

You will need to write a program for processing if you wish first to process the analog input value. The process value is, for example, not directly proportional to the value at the analog input. The processed process value must be in floating point format.

Procedure

Proceed as follows to use the analog input value without processing:

1. Select the entry "Input_PER" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the address of the analog input.

Proceed as follows to use the processed process value in floating point format:

1. Select the entry "Input" in the drop-down list "Input".
2. Select "Instruction" as source.
3. Enter the name of the variable in which the processed process value is saved.

6.2.1.5 Heating and cooling output value

The PID_Temp instruction provides a PID controller with integrated tuning for temperature processes. PID_Temp is suitable for heating or heating-and-cooling applications.

PID_Temp provides the following output values. Your actuator will determine which output value you use.

- OutputHeat

  Heating output value (floating-point format): The output value for heating needs to be processed by the user program, for example, because of non-linear actuator response.
- OutputHeat_PER

  Analog heating output value: The actuator for heating is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V, 4...20 mA.
- OutputHeat_PWM

  Pulse-width modulated heating output value: The actuator for heating is controlled via a digital output. Pulse width modulation creates variable ON and OFF times.
- OutputCool

  Cooling output value (floating-point format): The output value for cooling needs to be processed by the user program, for example because of non-linear actuator response.
- OutputCool_PER

  Analog cooling output value: The actuator for cooling is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V, 4...20 mA.
- OutputCool_PWM

  Pulse-width modulated cooling output value: The actuator for cooling is controlled via a digital output. Pulse width modulation creates variable ON and OFF times.

The cooling output is only available if it was activated via the "Activate cooling" check box.

- If the check box is cleared, the output value of the PID algorithm (PidOutputSum) is scaled and output at the outputs for heating.
- If the check box is selected, positive output values of the PID algorithm (PidOutputSum) are scaled and output at the outputs for heating. Negative output values of the PID algorithm are scaled and output at the outputs for cooling. You can choose between two methods for output value calculation at the output settings.

Note

Note:

- The OutputHeat_PWM, OutputHeat_PER, OutputCool_PWM, OutputCool_PER outputs are only calculated if you select these correspondingly from the drop-down list.
- The OutputHeat output is always calculated.
- The OutputCool output is calculated if the check box for cooling is selected.
- The "Activate cooling" check box is only available if the controller is not configured as a master in a cascade.

Procedure

Proceed as follows to use the analog output value:

1. Select the entry "OutputHeat_PER" or "OutputCool_PER" in the drop-down list "OutputHeat" or "OutputCool".
2. Select "Instruction".
3. Enter the address of the analog output.

Proceed as follows to use the pulse-width modulated output value:

1. Select the entry "OutputHeat_PWM" or "OutputCool_PWM" in the drop-down list "OutputHeat" or "OutputCool".
2. Select "Instruction".
3. Enter the address of the digital output.

Proceed as follows to process the output value using the user program:

1. Select the entry "OutputHeat" or "OutputCool" in the drop-down list "OutputHeat" or "OutpuCool".
2. Select "Instruction".
3. Enter the name of the variable you are using to process the output value.
4. Transfer the processed output value to the actuator by means of an analog or digital CPU output.

6.2.1.6 Cascade

If a PID_Temp instance receives its setpoint from a higher-level master controller and outputs its output value in turn to a subordinate slave controller, this PID_Temp instance is both a master controller and a slave controller simultaneously. Both configurations listed below then have to be carried out for such a PID_Temp instance. This is the case, for example, for the middle PID_Temp instance in a cascade control system with three concatenated measured variables and three PID_Temp instances.

Configuring a controller as master in a cascade

A master controller defines the setpoint of a slave controller with its output.

In order to use PID_Temp as master in a cascade, you have to deactivate the cooling in the basic settings. In order to configure this PID_Temp instance as a master controller in a cascade, activate the "Controller is master" check box. The selection of the output value for heating is set automatically to OutputHeat.

OutputHeat_PWM and OutputHeat_PER cannot be used at a master in a cascade.

Subsequently specify the number of directly subordinate slave controllers that receive their setpoint from this master controller.

If no own scaling function is used when assigning the OutputHeat parameter of the master to the Setpoint parameter of the slave, it may be necessary to adapt the output value limits and the output scaling of the master to the setpoint/process value range of the slave. This can be done in the output settings of the master in the "OutputHeat / OutputCool" section.

Configuring a controller as a slave in a cascade

A slave controller receives its setpoint (Setpoint parameter) from the output of its master controller (OutputHeat parameter).

In order to configure this PID_Temp instance as a slave controller in a cascade, activate the "Controller is slave" check box in the basic settings.

Subsequently select the PID_Temp instance that is to be used as the master controller for this slave controller in the Inspector window of the programming editor. The Master and Setpoint parameters of the slave controller are interconnected with the selected master controller through this selection (the existing interconnections at these parameters are overwritten). This interconnection allows the exchange of information and the setpoint specification between master and slave. If required, the interconnection can be changed subsequently at the Setpoint parameter of the slave controller in order, for example, to insert an additional filter. The interconnection at the parameter Master may not be changed subsequently.

The "Controller is master" check box has to be selected and the number of slaves has to be configured correctly at the selected master controller. The master controller has to be called before the slave controller in the same cyclic interrupt OB.

Additional information

Additional information about program creation, configuration and commissioning when PID_Temp is used in cascade control systems is available under Cascade control with PID_Temp (Page 195).

6.2.2 Process value settings

6.2.2.1 Process value limits

You must specify an appropriate absolute high limit and low limit for the process value as limit values for your controlled system. As soon as the process value violates these limits, an error occurs (ErrorBits = 0001h). Tuning is canceled when the process value limits are violated. You can specify how PID_Temp responds to errors in automatic mode in the output settings.

6.2.2.2 Process value scaling

If you have configured the use of Input_PER in the basic settings, you will need to convert the value of the analog input into the physical quantity of the process value. The current configuration is displayed in the Input_PER display.

Input_PER is scaled using a low and high value pair if the process value is directly proportional to the value of the analog input.

Procedure

To scale the process value, follow these steps:

1. Enter the low pair of values in the "Scaled low process value" and "Low" input fields.
2. Enter the high pair of values in the "Scaled high process value" and "High" input fields.

Default settings for the value pairs are saved in the hardware configuration. Proceed as follows to use the value pairs from the hardware configuration:

1. Select the instruction PID_Temp in the programming editor.
2. Interconnect Input_PER with an analog input in the basic settings.
3. Click on the "Automatic setting" button in the process value settings.

The existing values are overwritten with the values from the hardware configuration.

6.2.3 Output settings

6.2.3.1 Basic settings of output

Method for heating and cooling

If cooling is activated in the basic settings, two methods are available for calculating the PID output value:

- PID parameter switching (Config.AdvancedCooling = TRUE):

  The output value calculation for cooling takes place by means of a separate PID parameter set. Based on the calculated output value and the control deviation, the PID algorithm decides whether the PID parameter for heating or cooling is used. This method is suitable if the heating and cooling actuators have different time responses and different gains.

  Pretuning and fine tuning for cooling are only available if this method is selected.

- Cooling factor (Config.AdvancedCooling = FALSE):

  Output value calculation for cooling is effected with the PID parameters for heating under consideration of the configurable cooling factor Config.CoolFactor. This method is suitable if the heating and cooling actuators have a similar time response but different gains. If this method is selected, pretuning and fine tuning for cooling as well as the PID parameter set for cooling are not available. You can only execute the tuning for heating.

Cooling factor

If the cooling factor is selected as the method for heating/cooling, this factor is used in the calculation of the output value for cooling. This allows different gains of heating and cooling actuators to be taken into account.

The cooling factor is not set automatically or adjusted during tuning. You have to configure the correct cooling factor manually by using the ratio "Heating actuator gain/Cooling actuator gain".

Example: Cooling factor = 2.0 means that the heating actuator gain is twice as high as the cooling actuator gain.

The cooling factor is only effective and can only be changed if "Cooling factor" is selected as the method for heating/cooling.

Reaction to error

NOTICE
Your system may be damaged.
If you output "Current value while error is pending " or "Substitute output value while error is pending" in the event of an error, PID_Temp remains in automatic mode or in manual mode. This may cause a violation of the process value limits and damage your system.
It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

PID_Temp is preset so that the controller stays active in most cases in the event of an error.

If errors occur frequently in controller mode, this default reaction has a negative effect on the control response. In this case, check the ErrorBits parameter and eliminate the cause of the error.

PID_Temp generates a programmable output value in response to an error:

- Zero (inactive)

  At all errors, PID_Temp switches to the "Inactive" operating mode and outputs the following:

  – 0.0 as PID output value (PidOutputSum)

  – 0.0 as output value for heating (OutputHeat) and output value for cooling (OutputCool)

  – 0 as analog output value for heating (OutputHeat_PER) and analog output value for cooling (OutputCool_PER)

  – FALSE as PWM output value for heating (OutputHeat_PWM) and PWM output value for cooling (OutputCool_PWM)

  This is independent of the configured output value limits and the scaling. The controller is only reactivated by a falling edge at Reset or a rising edge at ModeActivate.

- Current value while error is pending

  The error response depends on the error occurring and the operating mode.

  If one or more of the following errors occur in automatic mode, PID_Temp stays in automatic mode:

  – 0000001h: The Input parameter is outside the process value limits.

  – 0000800h: Sampling time error

  – 0040000h: Invalid value at Disturbance parameter.

  – 8000000h: Error during the calculation of the PID parameters.

If one or more of the following errors occur in automatic mode, PID_Temp switches to "Substitute output value with error monitoring" mode and outputs the last valid PID output value (PidOutputSum):

– 0000002h: Invalid value at Input_PER parameter.

– 0000200h: Invalid value at Input parameter.

– 0000400h: Calculation of output value failed.

– 0001000h: Invalid value at Setpoint or SubstituteSetpoint parameter.

The values at the outputs for heating and cooling resulting from the PID output value are produced by the configured output scaling.

As soon as the errors are no longer pending, PID_Temp switches back to automatic mode.

If an error occurs during manual mode, PID_Temp remains in manual mode and continues to use the manual value as the PID output value.

If the manual value is invalid, the configured substitute output value is used.

If the manual value and substitute output value are invalid, the low limit of the PID output value for heating (Config.Output.Heat.PidLowerLimit) is used.

If the following error occurs during pretuning or fine tuning, PID_Temp remains in active mode:

– 0000020h: Pretuning is not permitted during fine tuning.

When any other error occurs, PID_Temp cancels the tuning and switches to the mode from which tuning was started.

- Substitute output value while error is pending

  PID_Temp behaves as described at "Current value while error is pending", but outputs the configured substitute output value (SubstituteOutput) as a PID output value (PidOutputSum) in "Substitute output value with error monitoring" operating mode.

  The values at the outputs for heating and cooling resulting from the PID output value are produced by the configured output scaling.

  In the case of controllers with activated cooling output (Config.ActivateCooling = TRUE), enter:

  – A positive substitute output value to output the value at the outputs for heating.

  – A negative substitute output value to output the value at the outputs for cooling.

  If the following error occurs, PID_Temp stays in "Substitute output value with error monitoring" mode and outputs the low limit of the PID output value for heating (Config.Output.Heat.PidLowerLimit):

  – 0020000h: Invalid value at SubstituteOutput tag.

6.2.3.2 Output value limits and scaling

Depending on the operating mode, the PID output value (PidOutputSum) is calculated automatically by the PID algorithm or by the manual value (ManualValue) or the configured substitute output value (SubstituteOutput).

The PID output value is limited depending on the configuration:

- If the cooling is deactivated in the basic settings (Config.ActivateCooling = FALSE), the value is limited to the high limit of the PID output value (heating) (Config.Output.Heat.PidUpperLimit) and the low limit of the PID output value (heating) (Config.Output.Heat.PidLowerLimit).

  You can configure both limits at the horizontal axis of the scaling characteristic line in the "OutputHeat / OutputCool" section. These are displayed in the "OutputHeat_PWM / OutputCool_PWM" and "OutputHeat_PER / OutputCool_PER" sections, but cannot be changed.

- If the cooling is activated in the basic settings (Config.ActivateCooling = TRUE), the value is limited to the high limit of the PID output value (Config.Output.Heat.PidUpperLimit) and the low limit of the PID output value (cooling) (Config.Output.Cool.PidLowerLimit).

  You can configure both limits at the horizontal axis of the scaling characteristic line in the "OutputHeat / OutputCool" section. These are displayed in the "OutputHeat_PWM / OutputCool_PWM" and "OutputHeat_PER / OutputCool_PER" sections, but cannot be changed.

  The low limit of the PID output value (heating) (Config.Output.Heat.PidLowerLimit) and the high limit of the PID output value (cooling) (Config.Output.Cool.PidUpperLimit) cannot be changed and have to be assigned the value 0.0.

The PID output value is scaled and output at the outputs for heating and cooling. Scaling can be specified separately for each output and is specified across 2 value pairs each, consisting of a limit value of the PID output value and a scaling value:

Output	Value pair	Parameter
OutputHeat	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high output value (heating) Config.Output.Heat.UpperScaling
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low output value (heating) Config.Output.Heat.LowerScaling
OutputHeat_PWM	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high PWM output value (heating) Config.Output.Heat.PwmUpperScaling
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low PWM output value (heating) Config.Output.Heat.PwmLowerScaling

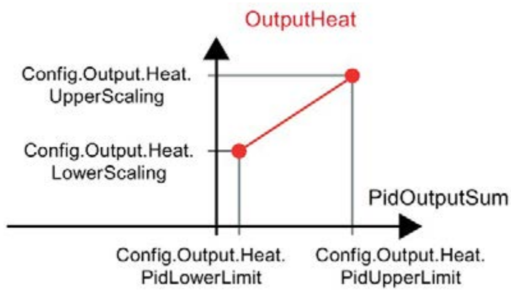
Output	Value pair	Parameter
OutputHeat_PER	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high analog output value (heating) Config.Output.Heat.PerUpperScaling
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low analog output value (heating) Config.Output.Heat.PerLowerScaling
OutputCool	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high output value (cooling) Config.Output.Cool.UpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low output value (cooling) Config.Output.Cool.LowerScaling
OutputCool_PWM	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high PWM output value (cooling) Config.Output.Cool.PwmUpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low PWM output value (cooling) Config.Output.Cool.PwmLowerScaling
OutputCool_PER	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high analog output value (cooling) Config.Output.Cool.PerUpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low analog output value (cooling) Config.Output.Cool.PerLowerScaling

The low limit of PID output value (heating) (Config.Output.Heat.PidLowerLimit) has to have the value 0.0, if the cooling is activated (Config.ActivateCooling = TRUE).

The high limit of PID output value (cooling) (Config.Output.Cool.PidUpperLimit) must always have the value 0.0.

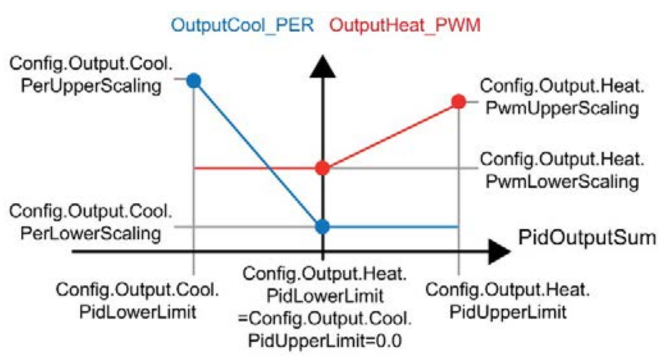
Example:

Output scaling when the OutputHeat output is used (cooling deactivated. The low limit of PID output value (heating) (Config.Output.Heat.PidLowerLimit) may be unequal to 0.0):



Example:

Output scaling when the OutputHeat_PWM and OutputCool_PER outputs are used (cooling activated. The low limit of PID output value (heating) (Config.Output.Heat.PidLowerLimit) must be 0.0):



With the exception of the "Inactive" operating mode, the value at an output always lies between its scaled high output value and the scaled low output value, for example for OutputHeat always between the scaled high output value (heating) (Config.Output.Heat.UpperScaling) and the scaled low output value (heating) (Config.Output.Heat.LowerScaling).

If you want to limit the value at the associated output, you therefore have to adapt these scaling values as well.

You can configure the scaling values of an output at the vertical axes of the scaling characteristic line. Each output has two separate scaling values. These can only be changed for OutputHeat_PWM, OutputCool_PWM, OutputHeat_PER and OutputCool_PER if the corresponding output is selected in the basic settings. The cooling has to be activated additionally in the basic settings at all the outputs for cooling.

The trend view in the commissioning dialog box only records the values of OutputHeat and OutputCool, irrespective of the selected output in the basic settings. Therefore, if necessary, adapt the scaling values for OutputHeat or OutputCool if you use OutputHeat_PWM or OutputHeat_PER or OutputCool_PWM or OutputCool_PER and want to use the trend view in the commissioning dialog.

6.2.4 Advanced settings

6.2.4.1 Process value monitoring

Configure a warning high and low limit for the process value in the "Process value monitoring" configuration window. If one of the warning limits is exceeded or undershot during operation, a warning is displayed at the PID_Temp instruction:

- At the InputWarning_H output parameter if the warning high limit has been exceeded
- At the InputWarning_L output parameter if the warning low limit has been undershot

The warning limits must be within the process value high and low limits.

The process value high and low limits are used if you do not enter values.

Example

Process value high limit = 98° C; warning high limit = 90° C

Warning low limit = 10° C; process value low limit = 0° C

PID_Temp will respond as follows:

Process value	InputWarning_H	InputWarning_L	ErrorBits
> 98 °C	TRUE	FALSE	0001h
≤ 98° C and > 90° C	TRUE	FALSE	0000h
≤ 90° C and ≥ 10° C	FALSE	FALSE	0000h
< 10° C and ≥ 0° C	FALSE	TRUE	0000h
< 0° C	FALSE	TRUE	0001h

You can configure the response of PID_Temp when the process value high limit or low limit is violated in the output settings.

6.2.4.2 PWM limits

The PID output value PidOutputSum is scaled and transformed via a pulse width modulation into a pulse train that is output at the output parameter OutputHeat_PWM or OutputCool_PWM. The "Sampling time of PID algorithm" represents the time between two calculations of the PID output value. The sampling time is used as time period of the pulse width modulation.

During heating, the PID output value is always calculated in the "Sampling time of PID algorithm for heating".

Calculation of the PID output value during cooling depends on the type of cooling selected in "Basic settings Output":

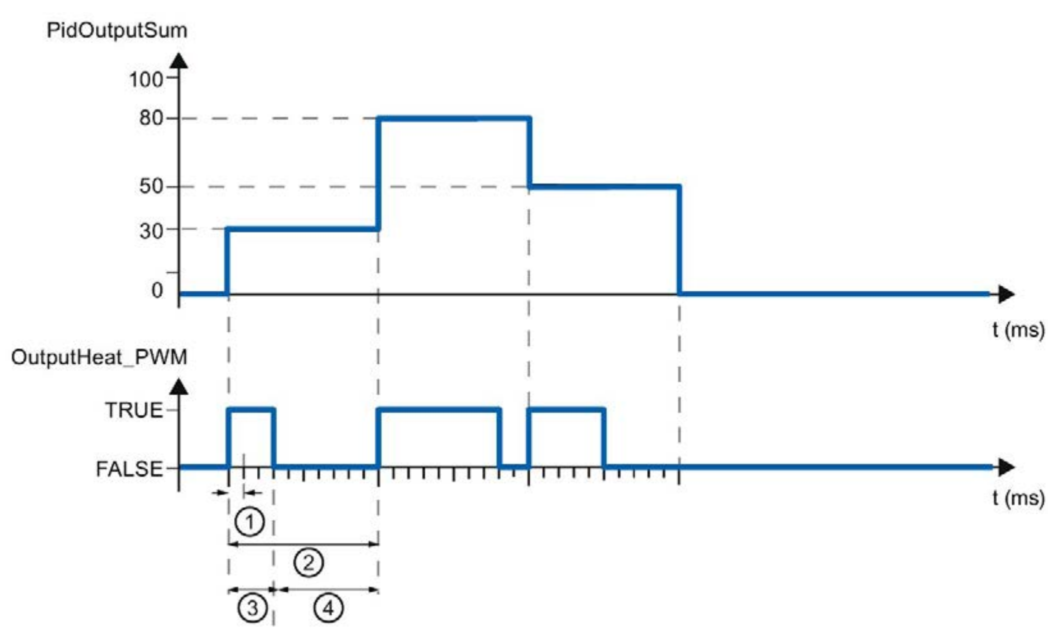
- If the cooling factor is used, the "Sampling time of PID algorithm for heating" applies.
- If the PID parameter switching is used, the "Sampling time of PID algorithm for cooling" applies.

OutputHeat_PWM and OutputCool_PWM are output in the sampling time PID_Temp (corresponds to the cycle time of the calling OB).

The PID algorithm sampling time for heating or cooling is determined during pretuning or fine tuning. If you set the PID parameters manually, you will also need to configure the PID algorithm sampling time for heating or cooling. The PID_Temp sampling time is equivalent to the cycle time of the calling OB.

The pulse duration is proportional to the PID output value and is always an integer multiple of the PID_Temp sampling time.

Example for OutputHeat_PWM



① PID_Temp sampling time
② PID algorithm sampling time for heating
③ Pulse duration
④ Break time

The "Minimum ON time" and the "Minimum OFF time" can be set separately for heating and cooling, rounded to an integer multiple of the PID_Temp sampling time.

A pulse or a break is never shorter than the minimum ON or OFF time. The inaccuracies this causes are added up and compensated in the next cycle.

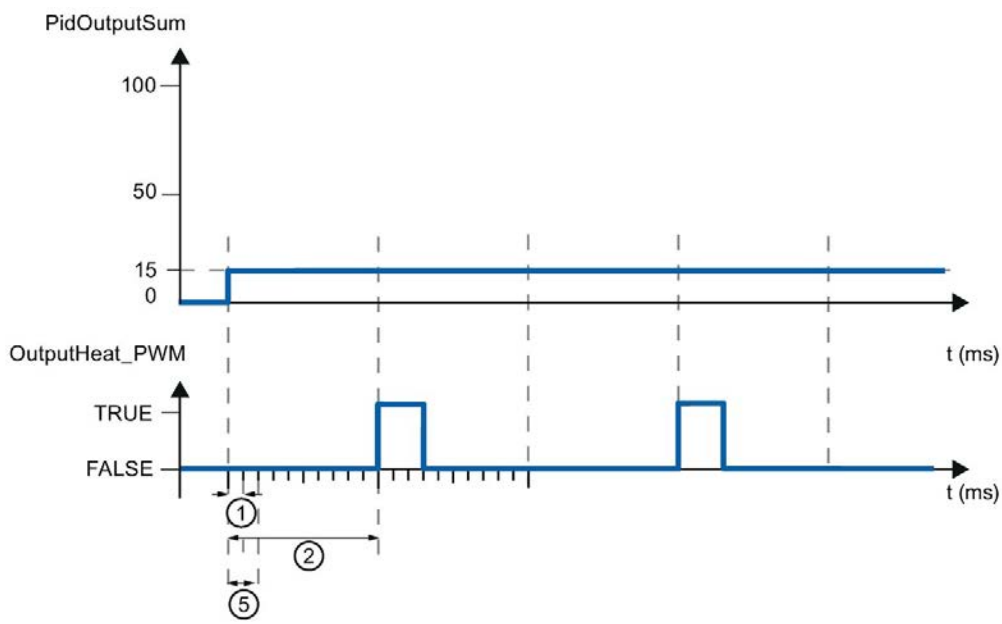
Example for OutputHeat_PWM

PID_Temp sampling time = 100 ms

PID algorithm sampling time = 1000 ms

Minimum ON time = 200 ms

The PID output value PidOutputSum amounts to 15% constantly. The smallest pulse that PID_Temp can output corresponds to 20%. In the first cycle, no pulse is output. In the second cycle, the pulse not output in the first cycle is added to the pulse of the second cycle.



①	PID_Temp sampling time
②	PID algorithm sampling time for heating
⑤	Minimum ON time

In order to minimize operation frequency and conserve the actuator, extend the minimum ON and OFF times.

If you have selected OutputHeat/OutputCool or OutputHeat_PER/OutputCool_PER as the output in the basic settings, the minimum ON time and the minimum OFF time are not evaluated and cannot be changed.

If the "Sampling time of PID algorithm" (Retain.CtrlParams.Heat.Cycle or Retain.CtrlParams.Cool.Cycle) and thus the period duration of the pulse width modulation is very high when OutputHeat_PWM or OutputCool_PWM is used, you can specify a deviating shorter period duration at the parameters Config.Output.Heat.PwmPeriode or Config.Output.Cool.PwmPeriode in order to improve smoothness of the process value (see also AUTOHOTSPOT).

Note

The minimum ON and OFF times only affect the output parameters OutputHeat_PWM or OutputCool_PWM and are not used for any pulse generators integrated in the CPU.

6.2.4.3 PID parameters

The PID parameters are displayed in the "PID Parameters" configuration window.

If cooling is activated in the basic settings and PID parameter switching is selected as the method for heating/cooling in the output settings, two parameter sets are available: One for heating and one for cooling.

In this case, the PID algorithm decides on the basis of the calculated output value and the control deviation whether the PID parameters for heating or cooling are used.

If cooling is deactivated or the cooling factor is selected as the method for heating/cooling, the parameter set for heating is always used.

During tuning, the PID parameters are adapted to the controlled system with the exception of the dead zone width that has to be configured manually.

Note

The currently active PID parameters are located in the Retain.CtrlParams structure.

Change the currently active PID parameters only in "Inactive" mode online to prevent malfunction of the PID controller.

If you want to change the PID parameters in "Automatic mode" or "Manual mode" online, change the PID parameters in the CtrlParamsBackUp structure and apply these changes with LoadBackUp = TRUE to the Retain.CtrlParams structure.

Online changes to the PID parameters in "Automatic mode" can result in jumps at the output value.

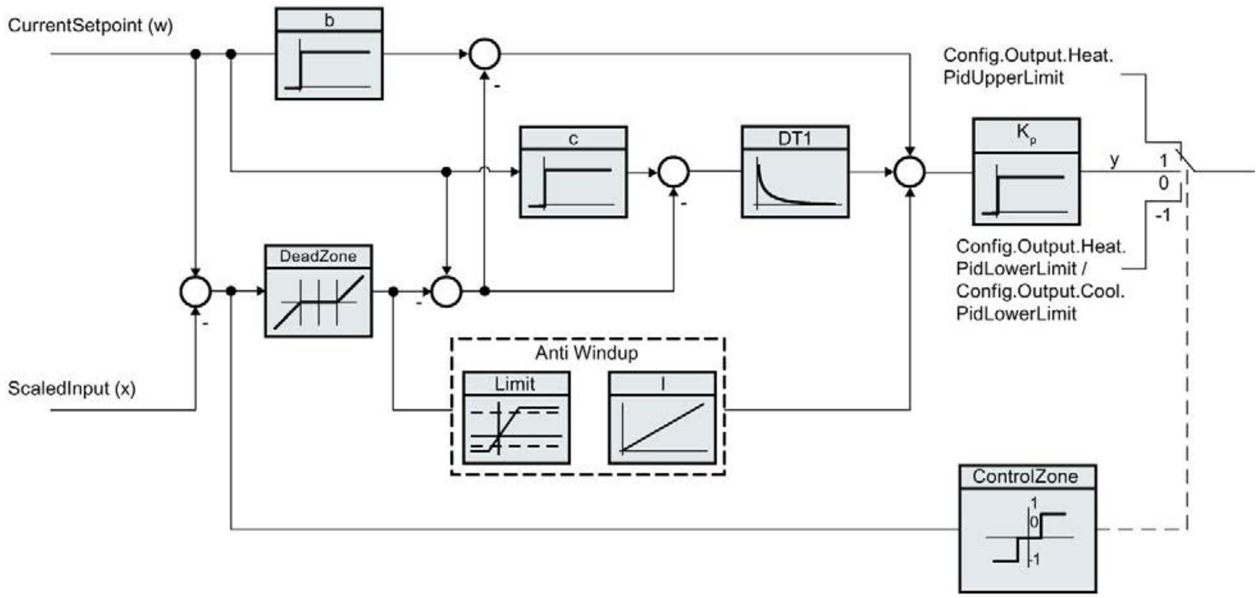
PID_Temp is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions.

The PID algorithm operates according to the following equation (control zone and dead zone deactivated):

$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description	Associated parameters of the PID_Temp instruction
y	Output value of the PID algorithm	-
K_p	Proportional gain	Retain.CtrlParams.Heat.Gain Retain.CtrlParams.Cool.Gain CoolFactor
s	Laplace operator	-
b	Proportional action weighting	Retain.CtrlParams.Heat.PWeighting Retain.CtrlParams.Cool.PWeighting
w	Setpoint	CurrentSetpoint
x	Process value	ScaledInput
T_I	Integral action time	Retain.CtrlParams.Heat.Ti Retain.CtrlParams.Cool.Ti
T_D	Derivative action time	Retain.CtrlParams.Heat.Td Retain.CtrlParams.Cool.Td
a	Coefficient for derivative-action delay (Derivative delay T1 = a × T_D)	Retain.CtrlParams.Heat.TdFiltRatio Retain.CtrlParams.Cool.TdFiltRatio
c	Derivative action weighting	Retain.CtrlParams.Heat.DWeighting Retain.CtrlParams.Cool.DWeighting
DeadZone	Dead zone width	Retain.CtrlParams.Heat.DeadZone Retain.CtrlParams.Cool.DeadZone
ControlZone	Control zone width	Retain.CtrlParams.Heat.ControlZone Retain.CtrlParams.Cool.ControlZone

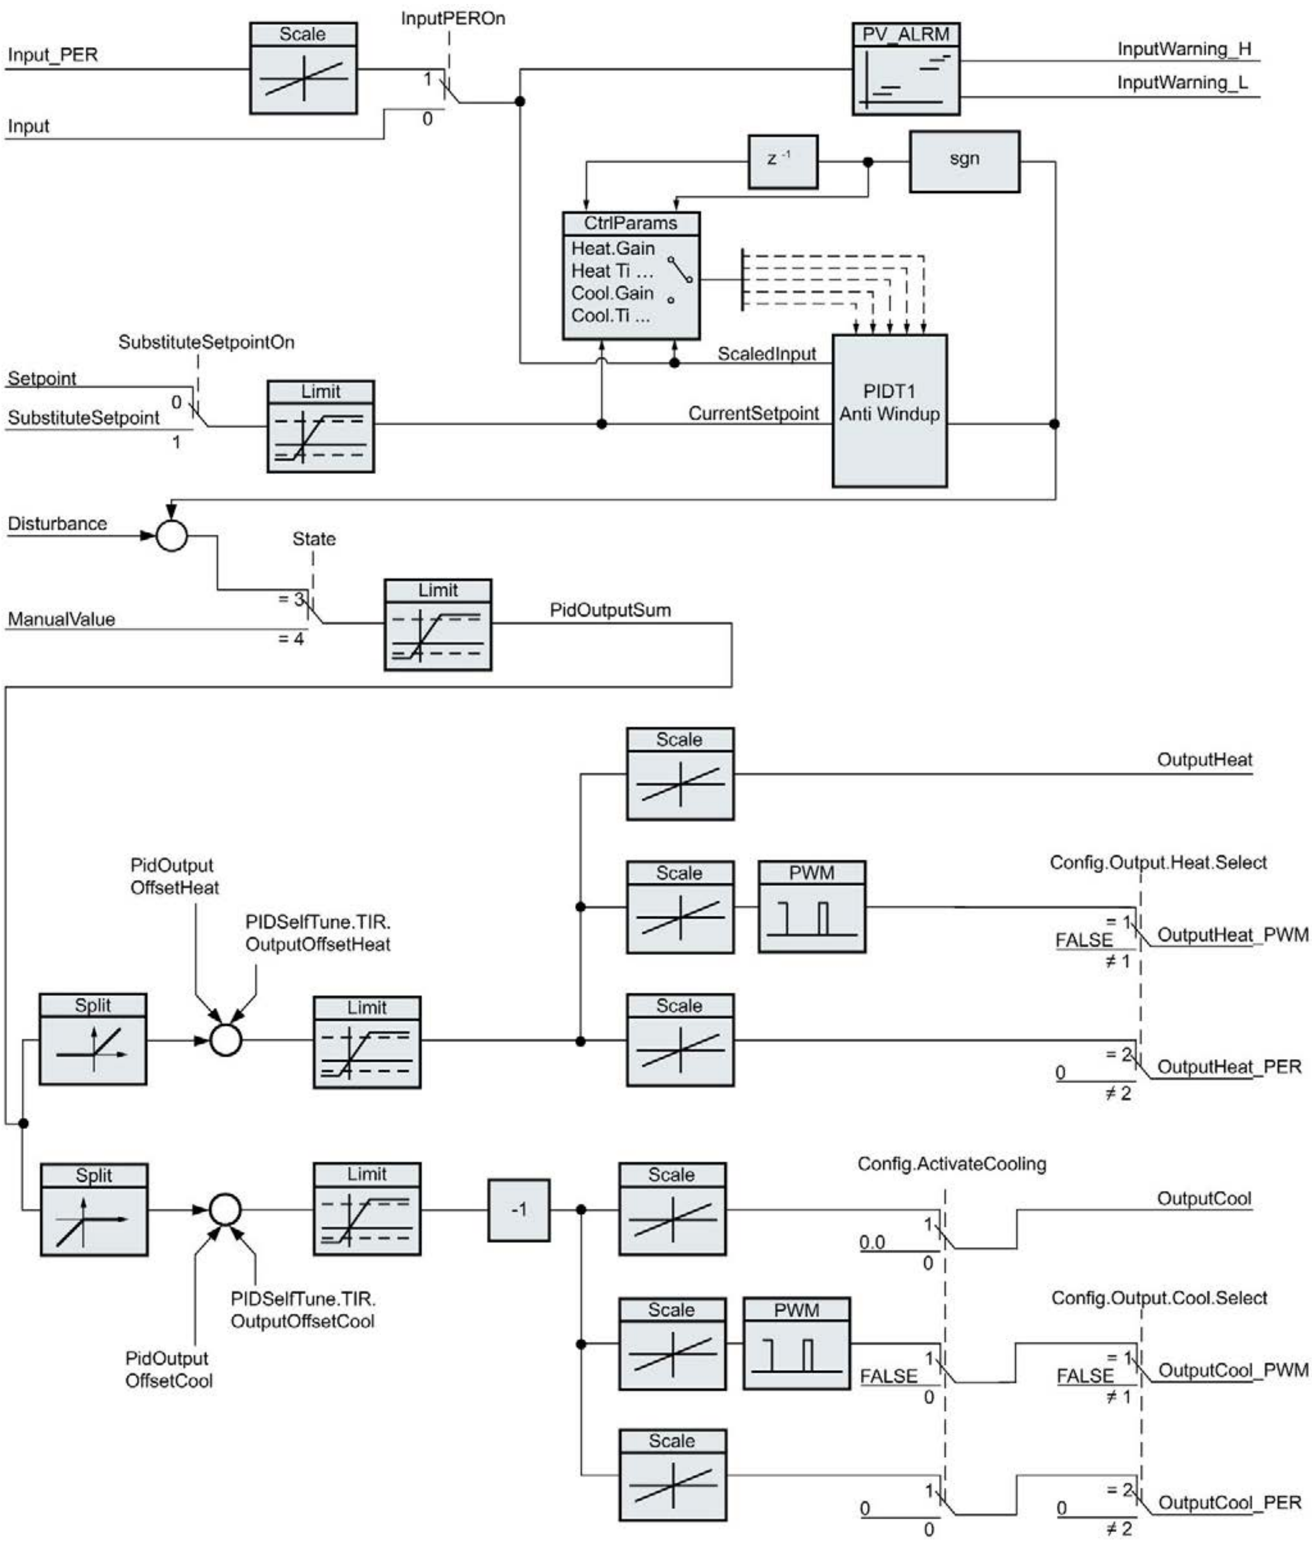
The diagram below illustrates the integration of the parameters into the PID algorithm:



All PID parameters are retentive. If you enter the PID parameters manually, you must completely download PID_Temp (Downloading technology objects to device (Page 44)).

PID_Temp block diagram

The following block diagram shows how the PID algorithm is integrated in the PID_Temp.



Proportional gain

The value specifies the proportional gain of the controller. PID_Temp does not operate with a negative proportional gain and only supports the normal control direction, meaning that an increase in the process value is achieved by an increase in the PID output value (PidOutputSum).

Integral action time

The integral action time determines the time behavior of the integral action. The integral action is deactivated with integral action time = 0.0. When the integral action time is changed from a different value to 0.0 online in "Automatic mode", the previous integral action is deleted and the output value jumps.

Derivative action time

The derivative action time determines the time behavior of the derivative action. Derivative action is deactivated with derivative action time = 0.0.

Derivative delay coefficient

The derivative delay coefficient delays the effect of the derivative action.

Derivative delay = derivative action time × derivative delay coefficient

- 0.0: Derivative action is effective for one cycle only and therefore almost not effective.
- 0.5: This value has proved useful in practice for controlled systems with one dominant time constant.
- > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed.

Proportional action weighting

The proportional action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Proportional action for setpoint change is fully effective
- 0.0: Proportional action for setpoint change is not effective

The proportional action is always fully effective when the process value is changed.

Derivative action weighting

The derivative action may weaken with changes to the setpoint.

Values from 0.0 to 1.0 are applicable.

- 1.0: Derivative action is fully effective upon setpoint change
- 0.0: Derivative action is not effective upon setpoint change

The derivative action is always fully effective when the process value is changed.

PID algorithm sampling time

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of "PID algorithm" represents the time between two calculations of the PID output value. It is calculated during tuning and rounded to a multiple of the PID_Temp sampling time (cycle time of the cyclic interrupt OB). All other functions of PID_Temp are executed at every call.

If you use OutputHeat_PWM or OutputCool_PWM, the sampling time of the PID algorithm is used as the period duration of the pulse width modulation. The accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The cycle time should be no more than a tenth of the PID algorithm sampling time.

The sampling time of the PID algorithm that is used as the period duration of the pulse width modulation at OutputCool_PWM depends on the method for heating/cooling selected in "Basic settings Output":

- If the cooling factor is used, the "sampling time of the PID algorithm for heating" also applies to OutputCool_PWM.
- If PID parameter switching is used, the "sampling time PID algorithm for cooling" applies as the period duration for OutputCool_PWM.

If the sampling time of the PID algorithm and thus the period duration of the pulse width modulation is very high when OutputHeat_PWM or OutputCool_PWM is used, you can specify a deviating shorter period duration at the parameters Config.Output.Heat.PwmPeriode or Config.Output.Cool.PwmPeriode in order to improve smoothness of the process value.

Dead zone width

If the process value is affected by noise, the noise can also have an effect on the output value. The output value may fluctuate considerably when controller gain is high and the derivative action is activated. If the process value lies within the dead zone around the setpoint, the control deviation is suppressed so that the PID algorithm does not react and unnecessary fluctuations of the output value are reduced.

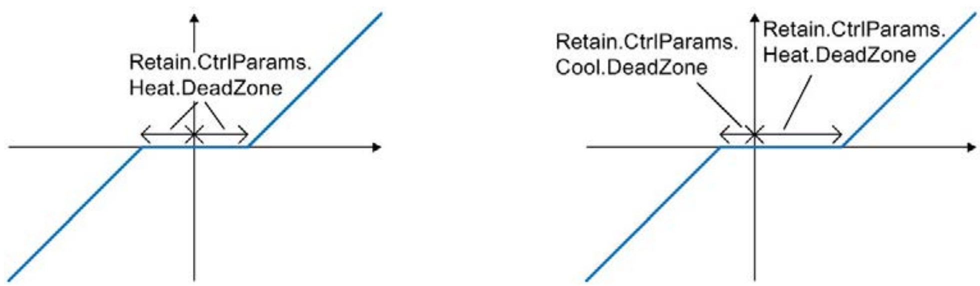
The dead zone width for heating or cooling is not set automatically during tuning. You have to correctly configure the dead zone width manually. The dead zone is deactivated by setting the dead zone width = 0.0.

When the dead zone is switched on, the result can be a permanent control deviation (deviation between setpoint and process value). This can have a negative effect on fine tuning.

If cooling is activated in the basic settings and PID parameter switching is selected as the method for heating/cooling in the output settings, the dead zone lies between "Setpoint - dead zone width (heating)" and "Setpoint + dead zone width (cooling)".

If cooling is deactivated in the basic settings or the cooling factor is used, the dead zone lies symmetrically between "Setpoint - dead zone width (heating)" and "Setpoint + dead zone width (heating)".

If values not equal to 1.0 are configured for the proportional action weighting or the derivative action weighting, setpoint changes even within the dead zone affect the output value. Process value changes within the dead zone do not affect the output value, regardless of the weighting.



Dead zone with deactivated cooling or cooling factor (left) or activated cooling and PID parameter switching (right). The x / horizontal axis displays the control deviation = setpoint - process value. The y / vertical axis shows the output signal of the dead zone that is passed to the PID algorithm.

Control zone width

If the process value exits the control zone around the setpoint, the minimum or maximum output value is output. This means that the process value reaches the setpoint faster.

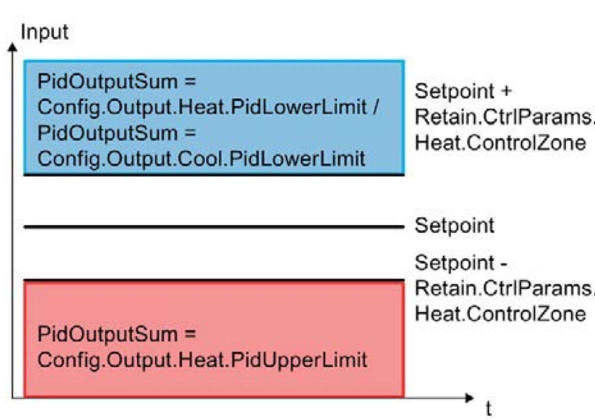
If the process value lies within the control zone around the setpoint, the output value is calculated by the PID algorithm.

The control zone width for heating or cooling is only set automatically during the pretuning, if "PID (temperature)" is selected as the controller structure for cooling or heating.

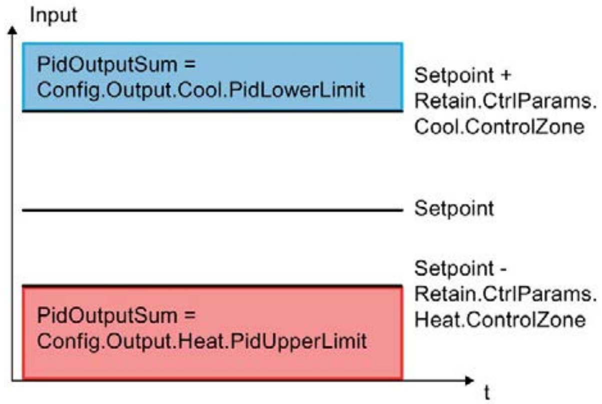
The control zone is deactivated by setting the control zone width = 3.402822e+38.

If cooling is deactivated in the basic settings or the cooling factor is used, the control zone lies symmetrically between "Setpoint - control zone width (heating)" and "Setpoint + control zone width (heating)".

If cooling is activated in the basic settings and PID parameter switching is selected as the method for heating/cooling in the output settings, the control zone lies between "Setpoint - control zone width (heating)" and "Setpoint + control zone width (cooling)".



Control zone with deactivated cooling or cooling factor.



Control zone with activated cooling and PID parameter switching.

Rule for tuning

Select whether PI or PID parameters are to be calculated in the "Controller structure" drop-down list. You can specify the rules for tuning for heating and for tuning for cooling separately.

- PID (temperature)

  Calculates PID parameters during pretuning and fine tuning.

  Pretuning is designed for temperature processes and results in a slower and rather asymptotic control response with lower overshoot than with the "PID" option. Fine tuning is identical to the "PID" option.

  The control zone width is determined automatically during pretuning only if this option is selected.

- PID

  Calculates PID parameters during pretuning and fine tuning.

- PI

  Calculates PI parameters during pretuning and fine tuning.

- User-defined

  The drop-down list displays "User-defined" if you have configured different controller structures for pretuning and fine tuning via a user program or the parameter view.

6.3 Commissioning PID_Temp

6.3.1 Commissioning

The commissioning window helps you commission the PID controller. You can monitor the values for the setpoint, process value and the output values for heating and cooling along the time axis in the trend view. The following functions are supported in the commissioning window:

- Controller pretuning
- Controller fine tuning

  Use fine tuning for fine adjustments to the PID parameters.
- Monitoring the current closed-loop control in the trend view
- Testing the controlled system by specifying a manual PID output value and a substitute setpoint
- Saving the actual values of the PID parameters to an offline project.

All functions require an online connection to the CPU.

The online connection to the CPU is established, if it does not exist already, and operation of the commissioning window is enabled by means of the "Monitor all" or "Start" buttons of the trend view.

Operation of the trend view

- Select the desired sampling time in the "Sampling time" drop-down list.

  All the values of the trend view are updated in the selected sampling time.
- Click the "Start" icon in the Measurement group if you want to use the trend view.

  Value recording is started. The current values for the setpoint, process value and output values for heating and cooling are entered in the trend view.
- Click the "Stop" icon if you want to end the trend view.

  The values recorded in the trend view can continue to be analyzed.

Closing the commissioning window will terminate recording in the trend view and delete the recorded values.

6.3.2 Pretuning

The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The tuned PID parameters are calculated as a function of the maximum slope and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning.

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" or "Manual mode". The PID parameters are backed up before being recalculated.

PID_Temp offers different pretuning types depending on the configuration:

- Pretuning heating

  A jump is output at the output value heating, the PID parameters for heating are calculated and then the setpoint is used as the control variable in automatic mode.

- Pretuning heating and cooling

  A jump is output at the output value heating.

  As soon as the process value is close to the setpoint, a jump change is output at the output value cooling.

  The PID parameters for heating (Retain.CtrlParams.Heat structure) and cooling (Retain.CtrlParams.Cool structure) are calculated and then the setpoint is used as the control variable in automatic mode.

- Pretuning cooling

  A jump is output at the output value cooling.

  The PID parameters for cooling are calculated and then the setpoint is used as the control variable in automatic mode.

If you want to tune the PID parameters for heating and cooling, you can expect a better control response with "Pretuning heating" followed by "Pretuning cooling" rather than with "Pretuning heating and cooling". However, carrying out pretuning in two steps takes more time.

General requirements

- The PID_Temp instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- PID_Temp is in one of the following modes: "Inactive", "Manual mode", or "Automatic mode".
- The setpoint and the process value lie within the configured limits (see Process value monitoring (Page 174) configuration).

Requirements for pretuning heating

- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is greater than 50% of the setpoint.
- The setpoint is greater than the process value.

Requirements for pretuning heating and cooling

- The cooling output in the "Basic settings" is activated (Config.ActivateCooling = TRUE).
- The PID parameter switching in the "Basic settings of output value" is activated (Config.AdvancedCooling = TRUE).
- The difference between setpoint and process value is greater than 30% of the difference between process value high limit and process value low limit.
- The distance between the setpoint and the process value is greater than 50% of the setpoint.
- The setpoint is greater than the process value.

Requirements for pretuning cooling

- The cooling output in the "Basic settings" is activated (Config.ActivateCooling = TRUE).
- The PID parameter switching in the "Basic settings of output value" is activated (Config.AdvancedCooling = TRUE).
- "Pretuning heating" or "Pretuning heating and cooling" has been carried out successfully (PIDSelfTune.SUT.ProcParHeatOk = TRUE). The same setpoint should be used for all tunings.
- The difference between setpoint and process value is smaller than 5% of the difference between process value high limit and process value low limit.

Procedure

To perform pretuning, follow these steps:

1. Double-click the "PID_Temp > Commissioning" entry in the project tree.
2. Activate the "Monitor all" button or start the trend view.

   An online connection will be established.
3. Select the desired pretuning entry from the "Tuning mode" drop-down list.
4. Click the "Start" icon.
   – Pretuning is started.
   – The "Status" field displays the current steps and any errors that may have occurred. The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon when the progress bar ("Progress" tag) has not changed for a long period and it is to be assumed that the tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

Result

If pretuning was performed without an error message, the PID parameters have been tuned. PID_Temp switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If pretuning is not possible, PID_Temp responds with the configured reaction to errors.

6.3.3 Fine tuning

Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. The PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning.

PID_Temp automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before being recalculated.

PID_Temp offers different fine tuning types depending on the configuration:

- Fine tuning heating:

  PID_Temp generates an oscillation of the process value with periodic changes at the output value heating and calculates the PID parameters for heating.

- Fine tuning cooling:

  PID_Temp generates an oscillation of the process value with periodic changes at the output value cooling and calculates the PID parameters for cooling.

Temporary tuning offset for heating/cooling controllers

If PID_Temp is used as a heating/cooling controller (Config.ActivateCooling = TRUE), the PID output value (PidOutputSum) at the setpoint has to fulfill the following requirements so that process value oscillation can be generated and fine tuning can be carried out successfully:

- Positive PID output value for fine tuning heating
- Negative PID output value for fine tuning cooling

If this condition is not fulfilled, you can specify a temporary offset for fine tuning that is output at the opposing output.

- Offset for cooling output (PIDSelfTune.TIR.OutputOffsetCool) with fine tuning heating.

  Before starting tuning, enter a negative tuning offset cooling that is smaller than the PID output value (PidOutputSum) at the setpoint in the stationary state.

- Offset for heating output (PIDSelfTune.TIR.OutputOffsetHeat) at fine tuning cooling

  Before starting tuning, enter a positive tuning offset heating that is greater than the PID output value (PidOutputSum) at the setpoint in the stationary state.

The defined offset is balanced by the PID algorithm so that the process value remains at the setpoint. The height of the offset allows the PID output value to be adapted correspondingly so that it fulfills the requirement mentioned above.

To avoid larger overshoots of the process value when defining the offset, it can also be increased in several steps.

If PID_Temp exits the fine tuning mode, the tuning offset is reset.

Example: Specification of an offset for fine tuning cooling

- Without offset
  - Setpoint = Process value (ScaledInput) = 80 °C
  - PID output value (PidOutputSum) = 30.0
  - Output value heating (OutputHeat) = 30.0
  - Output value cooling (OutputCool) = 0.0

    Oscillation of the process value around the setpoint cannot be generated with the cooling output alone. Fine tuning would fail here.
- With offset for heating output (PIDSelfTune.TIR.OutputOffsetHeat) = 80.0
  - Setpoint = Process value (ScaledInput) = 80 °C
  - PID output value (PidOutputSum) = -50.0
  - Output value heating (OutputHeat) = 80.0
  - Output value cooling (OutputCool) = -50.0

    Thanks to the specification of an offset for the heating output, the cooling output can now generate oscillation of the process value around the setpoint. Fine tuning can now be carried out successfully.

General requirements

- The PID_Temp instruction is called in a cyclic interrupt OB.
- ManualEnable = FALSE
- Reset = FALSE
- The setpoint and the process value lie within the configured limits (see "Process value settings" configuration).
- The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint.

  When the dead zone is switched on, the result can be a permanent control deviation (deviation between setpoint and actual value). This can have a negative effect on fine tuning.
- No disturbances are expected.
- PID_Temp is in inactive mode, automatic mode or manual mode.

Requirements for fine tuning heating

- Heat.EnableTuning = TRUE
- Cool.EnableTuning = FALSE
- If PID_Temp is configured as a heating-and-cooling controller (Config.ActivateCooling = TRUE), the heating output has to be active at the operating point where tuning is to be carried out.

  PidOutputSum > 0.0 (see tuning offset)

Requirements for fine tuning cooling

- Heat.EnableTuning = FALSE
- Cool.EnableTuning = TRUE
- The cooling output is activated (Config.ActivateCooling = TRUE).
- The PID parameter switching is activated (Config.AdvancedCooling = TRUE).
- The cooling output has to be active at the operating point where tuning is to be carried out.

  PidOutputSum < 0.0 (see tuning offset)

Process depends on initial situation

Fine tuning can be started from the following operating modes: "Inactive", "automatic mode", or "manual mode".

Fine tuning proceeds as follows when started from:

- Automatic mode with PIDSelfTune.TIR.RunIn = FALSE (default)

  Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning.

  PID_Temp controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start.

- Inactive, manual mode or automatic mode with PIDSelfTune.TIR.RunIn = TRUE

  An attempt is made to reach the setpoint with the minimum or maximum output value (two-point control):

  – With minimum or maximum output value heating at fine tuning heating.

  – With minimum or maximum output value cooling for fine tuning cooling.

  This can produce increased overshoot. Fine tuning starts when the setpoint is reached.

  If the setpoint cannot be reached, PID_Temp does not automatically abort tuning.

Procedure

To perform fine tuning, follow these steps:

1. Double-click the "PID_Temp > Commissioning" entry in the project tree.
2. Activate the "Monitor all" button or start the trend view.

   An online connection will be established.
3. Select the desired fine tuning entry from the "Tuning mode" drop-down list.

4. If required (see tuning offset), specify a tuning offset and wait until the stationary state is reached again.
5. Click the "Start" icon.
   - The process of fine tuning is started.
   - The "Status" field displays the current steps and any errors that may have occurred.

     The progress bar indicates the progress of the current step.

Note

Click the "Stop" icon in the "Tuning mode" group if the progress bar ("Progress" tag) has not changed for a long period and it is to be assumed that the tuning function is blocked. Check the configuration of the technology object and, if necessary, restart controller tuning.

In the following phases in particular, tuning is not aborted automatically if the setpoint cannot be reached.

- "Attempting to reach setpoint for heating with two-point control."
- "Attempting to reach setpoint for cooling with two-point control."

Result

If fine tuning was performed without errors, the PID parameters have been tuned. PID_Temp switches to automatic mode and uses the tuned parameters. The tuned PID parameters will be retained during power OFF and a restart of the CPU.

If errors occurred during fine tuning, PID_Temp responds with the configured response to errors.

6.3.4 "Manual" mode

The following section describes how you can use "Manual mode" in the commissioning window of the "PID_Temp" technology object.

Manual mode is also possible when an error is pending.

Requirement

- The "PID_Temp" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established.
- The CPU is in "RUN" mode.

Procedure

If you want to test the controlled system by specifying a manual value, use "Manual mode" in the commissioning window.

To define a manual value, follow these steps:

1. Double-click the "PID_Temp > Commissioning" entry in the project tree.
2. Activate the "Monitor all" button or start the trend view.

   An online connection will be established.
3. Select the "Manual mode" check box in the "Online status of controller" area.

   PID_Temp operates in manual mode. The most recent current output value remains in effect.
4. Enter the manual value in the editable field as a % value.

   If cooling is activated in the basic settings, enter the manual value as follows:
   - Enter a positive manual value to output the value at the outputs for heating.
   - Enter a negative manual value to output the value at the outputs for cooling.
5. Click the icon.

Result

The manual value is written to the CPU and immediately goes into effect.

Clear the "Manual mode" check box if the output value is to be specified again by the PID controller.

The switchover to automatic mode is bumpless.

6.3.5 Substitute setpoint

The following section describes how you can use the substitute setpoint in the commissioning window of the "PID_Temp" technology object.

Requirement

- The "PID_Temp" instruction is called in a cyclic interrupt OB.
- An online connection to the CPU has been established.
- The CPU is in "RUN" mode.

Procedure

If you want to use a different value as the setpoint than that specified at the "Setpoint" parameter (for example to tune a slave in a cascade), use the substitute setpoint in the commissioning window.

Proceed as follows to specify a substitute setpoint:

1. Double-click the "PID_Temp > Commissioning" entry in the project tree.
2. Activate the "Monitor all" button or start the trend view.

   An online connection will be established.
3. Select the "Subst.Setpoint" check box in the "Online status of controller" section.

   The substitute setpoint (SubstituteSetpoint tag) is initialized with the most recently updated setpoint and now used.
4. Enter the substitute setpoint in the editable field.
5. Click the icon.

Result

The substitute setpoint is written to the CPU and immediately goes into effect.

Clear the "Subst.Setpoint" check box if the value at the "Setpoint" parameter is to be used again as setpoint.

The switchover is not bumpless.

6.3.6 Cascade commissioning

Information about cascade commissioning with PID_Temp is available under Commissioning (Page 201).

6.4 Cascade control with PID_Temp

6.4.1 Introduction

In cascade control, several control loops are nested within each other. In the process, slaves receive their setpoint (Setpoint) from the output value (OutputHeat) of the respective higher-level master.

A prerequisite for establishing a cascade control system is that the controlled system can be divided into subsystems, each with its own measured variable.

Setpoint specification for the controlled variable is carried out at the outmost master.

The output value of the innermost slave is applied to the actuator and thus acts on the controlled system.

The following major advantages result from the use of a cascade control system in comparison with a single-loop control system:

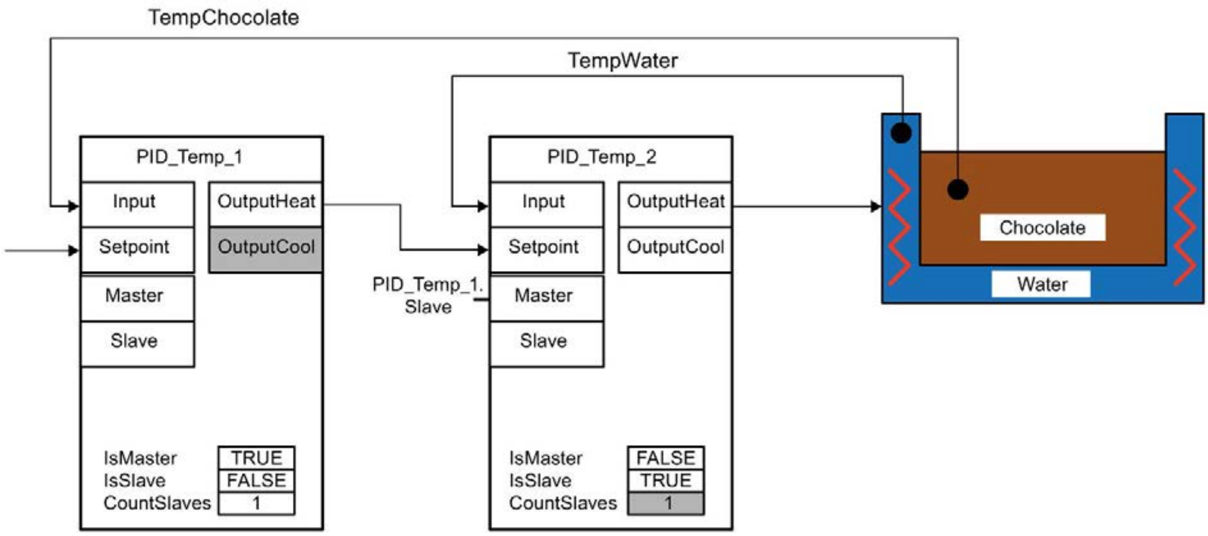
- Thanks to the additional subordinate control loops, disturbances which occur there are corrected quickly. Their influence on the controlled variable is reduced considerably. The disturbance behavior is thus improved.
- The subordinate control loops act in linearizing form. The negative effects of such non-linearities on the controlled variable are thus moderated.

PID_Temp offers the following functionality especially for use in cascade control systems:

- Specification of a substitute setpoint
- Exchange of status information between master and slave (for example, current operating mode)
- Different Anti-Wind-Up modes (response of the master to limitation of its slave)

Example

The following block diagram shows a cascade control system with PID_Temp using the simplified example of a chocolate melting unit:



The PID_Temp_1 master compares the process value of the chocolate temperature (TempChocolate) with the setpoint specification by the user at the Setpoint parameter. Its output value OutputHeat forms the setpoint of the slave PID_Temp_2.

PID_Temp_2 attempts to regulate the process value of the water-bath temperature (TempWater) to this setpoint. The output value of PID_Temp_2 acts directly on the actuator of the controlled system (heating of the water bath) and thus influences the water-bath temperature. The water-bath temperature in turn has an effect on the chocolate temperature.

FAQ

For more information, see the following FAQs in the Siemens Industry Online Support:

Program creation (Page 197)

6.4.2 Program creation

Observe the following points during program creation:

- Number of PID_Temp instances

  The number of different PID_Temp instances called up in a cyclic interrupt OB has to agree with the number of concatenated measured variables in the process.

  There are two concatenated measured variables in the example: TempChocolate and TempWater. Therefore two PID_Temp instances are required.

- Call sequence

  A master has to be called before its slaves in the same cyclic interrupt OB.

  The outermost master at which the user setpoint is specified is called first.

  The slave whose setpoint is specified by the outermost master is called next, etc.

  The innermost slave that acts on the actuator of the process with its output value is called last.

  In the example, PID_Temp_1 is called before PID_Temp_2.

- Interconnection of the measured variables

  The outermost master is interconnected with the outermost measured variable that is to be regulated to the user setpoint.

  The innermost slave is interconnected with the innermost measured variable that is influenced directly by the actuator.

  Interconnection of the measured variables with PID_Temp is carried out with the parameters Input or Input_PER.

  In the example, the outermost measured variable TempChocolate is interconnected with PID_Temp_1 and the innermost measured variable TempWater with PID_Temp_2.

- Interconnection of the output value of the master to the setpoint of the slave

  The output value (OutputHeat) of a master has to be assigned to the setpoint (Setpoint) of its slave.

  This interconnection can be carried out in the programming editor or automatically in the Inspector window of the slave in the basic settings via the selection of the master.

  If required, you can insert your own filter or scaling functions, for example in order to adapt the output value range of the master to the setpoint/process value range of the slave.

  In the example, OutputHeat of PID_Temp_1 is assigned to Setpoint of PID_Temp_2.

- Interconnection of the interface for information exchange between master and slave

  The "Slave" parameter of a master has to be assigned to the "Master" parameter of all its directly subordinate slaves (which receive their setpoint from this master). The assignment should be carried out via the interface of the slave in order to allow the interconnection of a master with multiple slaves and the display of the interconnection in the Inspector window of the slave in the basic settings.

  This interconnection can be carried out in the programming editor or automatically in the Inspector window of the slave in the basic settings via the selection of the master.

  The Anti-Wind-Up functionality and the evaluation of the slave operating modes at the master can only function correctly if this interconnection is carried out.

  In the example, the "Slave" parameter of PID_Temp_1 is assigned to the "Master" parameter of PID_Temp_2.

Program code of the example using SCL (without assignment of the output value of the slave to the actuator):

```
"PID_Temp_1"(Input:="TempChocolate");

"PID_Temp_2"(Input:="TempWater", Master := "PID_Temp_1".Slave, Setpoint :=
"PID_Temp_1".OutputHeat);
```

PID_Temp ActivateRecoverMode tag (Page 458)

6.4.3 Configuration

You can carry out the configuration via your user program, the configuration editor or the Inspector window of the PID_Temp call.

When using PID_Temp in a cascade control system, ensure the correct configuration of the settings specified below.

If a PID_Temp instance receives its setpoint from a superior master controller and outputs its output value in turn to a subordinate slave controller, this PID_Temp instance is both a master controller and a slave controller simultaneously. Both configurations listed below have to be carried out for such a PID_Temp instance. This is the case, for example, for the middle PID_Temp instance in a cascade control system with three concatenated measured variables and three PID_Temp instances.

Configuration of a master

Setting in the configuration editor or Inspector window	DB parameter	Explanation
Basic settings → Cascade: Activate "Controller is master" check box	Config.Cascade.IsMaster = TRUE	Activates this controller as a master in a cascade
Basic settings → Cascade: Number of slaves	Config.Cascade.CountSlaves	Number of directly subordinate slaves that receive their setpoint directly from this master
Basic settings → Input/output parameters: Selection of the output value (heating) = OutputHeat	Config.Output.Heat.Select = 0	The master only uses the output parameter OutputHeat. OutputHeat_PWM and OutputHeat_PER are deactivated.
Basic settings → Input/output parameters: Clear "Activate cooling" check box	Config.ActivateCooling = FALSE	The cooling has to be deactivated at a master.

Setting in the configuration editor or Inspector window	DB parameter	Explanation
Output settings → Output limits and scaling → OutputHeat / OutputCool: PID output value low limit (heating), PID output value high limit (heating), Scaled low output value (heating), Scaled high output value (heating)	Config.Output.Heat .PidLowerLimit, Config.Output.Heat .PidUpperLimit, Config.Output.Heat .LowerScaling, Config.Output.Heat .UpperScaling	If no own scaling function is used when assigning OutputHeat of the master to Setpoint of the slave, it may be necessary to adapt the output value limits and the output scaling of the master to the setpoint/process value range of the slave.
This tag is not available in the Inspector window or in the functional view of the configuration editor. You can change it via the parameter view of the configuration editor.	Config.Cascade .AntiWindUpMode	The Anti-Wind-Up mode determines how the integral action of this master is treated if directly subordinate slaves reach their output value limits. Options are: • AntiWindUpMode = 0: The AntiWindUp functionality is deactivated. The master does not react to the limitation of its slaves. • AntiWindUpMode = 1 (default): The integral action of the master is reduced in the relationship "Slaves in limitation/Number of slaves". This reduces the effects of the limitation on the control behavior. • AntiWindUpMode = 2: The integral action of the master is held as soon as a slave is in limitation.

Configuration of a slave

Setting in the configuration editor or Inspector window	DB parameter	Explanation
Basic settings → Cascade: Select the "Controller is slave" check box	Config.Cascade.IsSlave = TRUE	Activates this controller as a slave in a cascade

6.4.4 Commissioning

After compiling and loading of the program, you can start commissioning of the cascade control system.

Begin with the innermost slave at commissioning (implementation of tuning or change to automatic mode with existing PID parameters) and continue outwards until the outermost master has been reached.

In the above example, commissioning starts with PID_Temp_2 and is continued with PID_Temp_1.

Tuning the slave

Tuning of PID_Temp requires a constant setpoint. Therefore, activate the substitute setpoint of a slave (SubstituteSetpoint and SubstituteSetpointOn tags) to tune the slave or set the associated master to manual mode with a corresponding manual value. This ensures that the setpoint of the slave remains constant during tuning.

Tuning the master

In order for a master to influence the process or to carry out tuning, all the downstream slaves have to be in automatic mode and their substitute setpoint has to be deactivated. A master evaluates these conditions through the interface for information exchange between master and slave (Master parameter and Slave parameter) and displays the current state at the AllSlaveAutomaticState and NoSlaveSubstituteSetpoint tags. Corresponding status messages are output in the commissioning editor.

<table>
<tr><th>Status message in the commissioning editor of the master</th><th>DB parameter of the master</th><th>Correction</th></tr>
<tr><td>One or more slaves are not in automatic mode.</td><td>AllSlaveAutomaticState = FALSE,
NoSlaveSubstituteSetpoint = TRUE</td><td rowspan="3">First, carry out commissioning of all downstream slaves.
Ensure that the following conditions are fulfilled before carrying out tuning or activating manual mode or automatic mode of the master:
• All downstream slaves are in automatic mode (state = 3).
• All downstream slaves have deactivated the substitute setpoint (SubstituteSetpointOn = FALSE).</td></tr>
<tr><td>One or more slaves have activated the substitute setpoint.</td><td>AllSlaveAutomaticState = TRUE,
NoSlaveSubstituteSetpoint = FALSE</td></tr>
<tr><td>One or more slaves are not in automatic mode and have activated the substitute setpoint.</td><td>AllSlaveAutomaticState = FALSE,
NoSlaveSubstituteSetpoint = FALSE</td></tr>
</table>

If pretuning or fine tuning is started for a master, PID_Temp aborts tuning in the following cases and displays an error with ErrorBits = DW#16#0200000:

- One or more slaves are not in automatic mode (AllSlaveAutomaticState = FALSE)
- One or more slaves have activated the substitute setpoint (NoSlaveSubstituteSetpoint = FALSE).

The subsequent operating mode changeover depends on ActivateRecoverMode.

6.4.5 Substitute setpoint

In order to specify a setpoint, PID_Temp offers a substitute setpoint at the SubstituteSetpoint tag in addition to the Setpoint parameter. This can be activated by setting SubstituteSetpointOn = TRUE or by selecting the corresponding check box in the commissioning editor.

The substitute setpoint allows you to specify the setpoint temporarily directly at the slave, for example during commissioning or tuning.

In this case, the interconnection of the output value of the master with the setpoint of the slave that is required for normal operation of the cascade control system does not have to be changed in the program

In order for a master to influence the process or to carry out tuning, the substitute setpoint has to be deactivated at all downstream slaves.

You can monitor the currently effective setpoint as it is used by the PID algorithm for calculation at the CurrentSetpoint tag.

6.4.6 Operating modes and fault response

The master or slave of a PID_Temp instance does not change the operating mode of this PID_Temp instance.

If a fault occurs at one of its slaves, the master remains in its current operating mode.

If a fault occurs at its master, the slave remains in its current operating mode. However, further operation of the slave then depends on the fault and the configured fault response of the master since the output value of the master is used as the setpoint of the slave:

- If ActivateRecoverMode = TRUE is configured at the master. and the fault does not prevent the calculation of OutputHeat, the fault does not have any effect on the slave.
- If ActivateRecoverMode = TRUE is configured at the master and the fault prevents the calculation of OutputHeat, the master outputs the last output value or the configured substitute output value SubstituteOutput, depending on SetSubstituteOutput. This is then used by the slave as the setpoint.

  PID_Temp is preconfigured so that the substitute output value 0.0 is output in this case (ActivateRecoverMode = TRUE, SetSubstituteOutput = TRUE, SubstituteOutput = 0.0). Configure a suitable substitute output value for your application or activate the use of the last valid PID output value (SetSubstituteOutput = FALSE).
- If ActivateRecoverMode = FALSE is configured at the master, the master changes to the "Inactive" mode when a fault occurs and outputs OutputHeat = 0.0. The slave then uses 0.0 as the setpoint.

The fault response is located in the output settings in the configuration editor.

6.5 Multi-zone controlling with PID_Temp

Introduction

In a multi-zone control system, several sections, so-called zones, of a plant are controlled simultaneously to different temperatures. A multi-zone control system is characterized by the mutual influence of the temperature zones through thermal coupling, i.e. the process value of one zone can influence the process value of a different zone through thermal coupling. The strength that this influence has depends on the structure of the plant and the selected operating points of the zones.

Example: Extrusion plant as it is used, for example, in plastics processing.

The substance mixture that passes through the extruder has to be controlled to different temperatures for optimal processing. For example, different temperatures can be required at the filling point of the extruder than at the outlet nozzle. The individual temperature zones mutually influence each other through thermal coupling.

When PID_Temp is used in multi-zone control systems, each temperature zone is controlled by a separate PID_Temp instance.

Observe the following explanations if you want to use the PID_Temp in a multi-zone control system.

Separate pretuning for heating and cooling

Initial commissioning of a plant as a rule begins with the carrying out of pretuning in order to carry out initial setting of the PID parameters and control to the operating point. The pretuning for multi-zone control systems is often carried out simultaneously for all zones.

PID_Temp offers the possibility of carrying out pretuning for heating and cooling in one step (Mode = 1, Heat.EnableTuning = TRUE, Cool.EnableTuning = TRUE) for controllers with activated cooling and PID parameter switching as the method for heating/cooling (Config.ActivateCooling = TRUE, Config.AdvancedCooling = TRUE).

However, it is advisable not to use this tuning for simultaneous pretuning of several PID_Temp instances in a multi-zone control system. Instead, first carry out the pretuning for heating (Mode = 1, Heat.EnableTuning = TRUE, Cool.EnableTuning = FALSE) and the pretuning for cooling (Mode = 1, Heat.EnableTuning = FALSE, Cool.EnableTuning = TRUE) separately.

Pretuning for cooling should not be started until all zones have completed pretuning for heating and have reached their operating points.

This reduces mutual influencing through thermal coupling between the zones during tuning.

Adapting the delay time

If PID_Temp is used in a multi-zone control system with strong thermal couplings between the zones, you should ensure that the adaption of the delay time is deactivated for pretuning with PIDSelfTune.SUT.AdaptDelayTime = 0. Otherwise, the determination of the delay time can be incorrect if the cooling of a zone is prevented by the thermal influence of other zones during the adapting of the delay time (heating is deactivated in this phase).

Temporary deactivation of cooling

PID_Temp offers the possibility of deactivating cooling temporarily in automatic mode for controllers with active cooling (Config.ActivateCooling = TRUE) by setting DisableCooling = TRUE.

This ensures that this controller does not cool in automatic mode during commissioning while the controllers of other zones have not yet completed tuning of heating. The tuning could otherwise be influenced negatively by the thermal coupling between the zones.

Procedure

You can proceed as follows during the commissioning of multi-zone control systems with relevant thermal couplings:

1. Set DisableCooling = TRUE for all controllers with activated cooling.
2. Set PIDSelfTune.SUT.AdaptDelayTime = 0 for all controllers.
3. Specify the desired setpoints (Setpoint parameter) and start pretuning for heating (Mode = 1, Heat.EnableTuning = TRUE, Cool.EnableTuning = FALSE) simultaneously for all controllers.
4. Wait until all the controllers have completed pretuning for heating.
5. Set DisableCooling = FALSE for all controllers with activated cooling.
6. Wait until the process values of all the zones are steady and close to the respective setpoint.

   If the setpoint cannot be reached permanently for a zone, the heating or cooling actuator is too weak.
7. Start pretuning for cooling (Mode = 1, Heat.EnableTuning = FALSE, Cool.EnableTuning = TRUE) for all controllers with activated cooling.

Note

Limit violation of the process value

If the cooling is deactivated in automatic mode with DisableCooling = TRUE, this can cause the process value to exceed the setpoint and the process value limits while DisableCooling = TRUE. Observe the process values and intervene, if appropriate, if you use DisableCooling.

Note

Multi-zone control systems

For multi-zone control systems, the thermal couplings between the zones can result in increased overshoots, permanent or temporary violation of limits and permanent or temporary control deviations during commissioning or operation. Observe the process values and be ready to intervene. Depending on the system, it can be necessary to deviate from the procedure described above.

Synchronization of several fine tuning processes

If fine tuning is started from automatic mode with PIDSelfTune.TIR.RunIn = FALSE, PID_Temp tries to reach the setpoint with PID controlling and the current PID parameters. The actual tuning does not start until the setpoint is reached. The time required to reach the setpoint can be different for the individual zones of a multi-zone control system.

If you want to carry out fine tuning for several zones simultaneously, PID_Temp offers the possibility to synchronize these by waiting with the further tuning steps after the setpoint has been reached.

Procedure

This ensures that all the controllers have reached their setpoint when the actual tuning steps start. This reduces mutual influencing through thermal coupling between the zones during tuning.

Proceed as follows for controllers for whose zones you want to carry out fine tuning simultaneously:

1. Set PIDSelfTune.TIR.WaitForControlIn = TRUE for all controllers.

   These controllers have to be in automatic mode with PIDSelfTune.TIR.RunIn = FALSE.
2. Specify the desired setpoints (Setpoint parameters) and start fine tuning for all controllers.
3. Wait until PIDSelfTune.TIR.ControlInReady = TRUE at all controllers.
4. Set PIDSelfTune.TIR.FinishControlIn = TRUE for all controllers.

All controllers then start the actual tuning simultaneously.

6.6 Override control with PID_Temp

Override control

In case of override control, two or more controllers share one actuator. Only one controller has access to the actuator at any time and influences the process.

A logic operation decides which controller has access to the actuator. This decision is often made based on a comparison of the output values of all controllers, for example, in case of a maximum selection, the controller with the largest output value gets access to the actuator.

The selection based on the output value requires that all controllers operate in automatic mode. The controllers that do not have an effect on the actuator are updated. This is necessary to prevent windup effects and their negative impacts on the control response and the switchover between the controllers.

PID_Temp supports override controls as of version 1.1 by offering a simple process for updating the controllers that are not active: By using the tags OverwriteInitialOutputValue and PIDCtrl.PIDInit, you can pre-assign the integral action of the controller in automatic mode as though the PID algorithm had calculated PidOutputSum = OverwriteInititalOutputValue for the PID output value in the last cycle. To do this, OverwriteInitialOutputValue is interconnected with the PID output value of the controller that currently has access to the actuator. By setting the bit PIDCtrl.PIDInit, you trigger the pre-assignment of the integral action as well as the restart of the controller cycle and the PWM period. The subsequent calculation of the PID output value in the current cycle takes place based on the pre-assigned (and synchronized for all controllers) integral action as well as the proportional action and integral action from the current control deviation. The derivative action is not active during the call with PIDCtrl.PIDInit = TRUE and therefore does not contribute to the output value.

This procedure ensures that the calculation of the current PID output value and thus the decision on which controller is to have access to the actuator is only based on the current process state and the PI parameters. Windup effects for controllers that are not active and thus incorrect decisions of the switchover logic are prevented.

Requirement

- PIDCtrl.PIDInit is only effective if the integral action is activated (tags Retain.CtrlParams.Heat.Ti and Retain.CtrlParams.Cool.Ti > 0.0).
- You must assign PIDCtrl.PIDInit and OverwriteInitialOutputValue in your user program yourself (see example below). PID_Temp does not automatically change these tags.
- PIDCtrl.PIDInit is only effective when PID_Temp is in automatic mode (parameter State = 3).
- If possible, select the sampling time of the PID algorithm (Retain.CtrlParams.Heat.Cycle and Retain.CtrlParams.Cool.Cycle tags) so that it is identical for all controllers, and call all controllers in the same cyclic interrupt OB. In this way, you ensure that the switchover does not take place within a controller cycle or a PWM period.

Note

Constant adaptation of the output value limits

Instead of the active updating of the controllers without access to the actuator described here, this is implemented alternatively by constant adaptation of the output value limits in other controller systems.

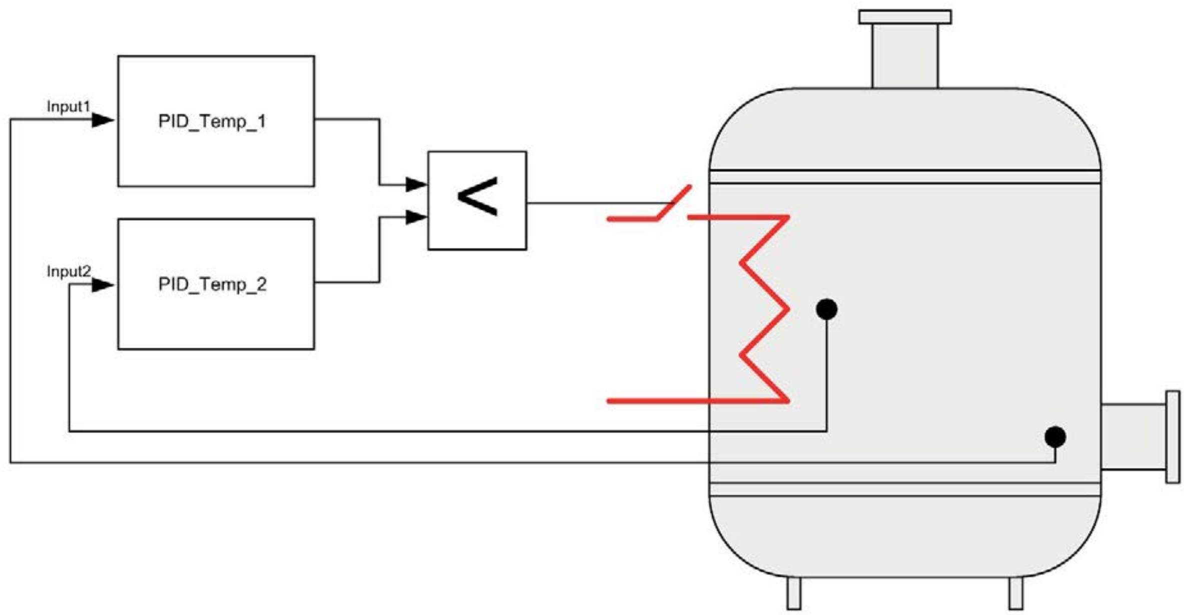
This is not possible with PID_Temp, because a change of the output value limits is not supported in automatic mode.

Example: Control of a large boiler

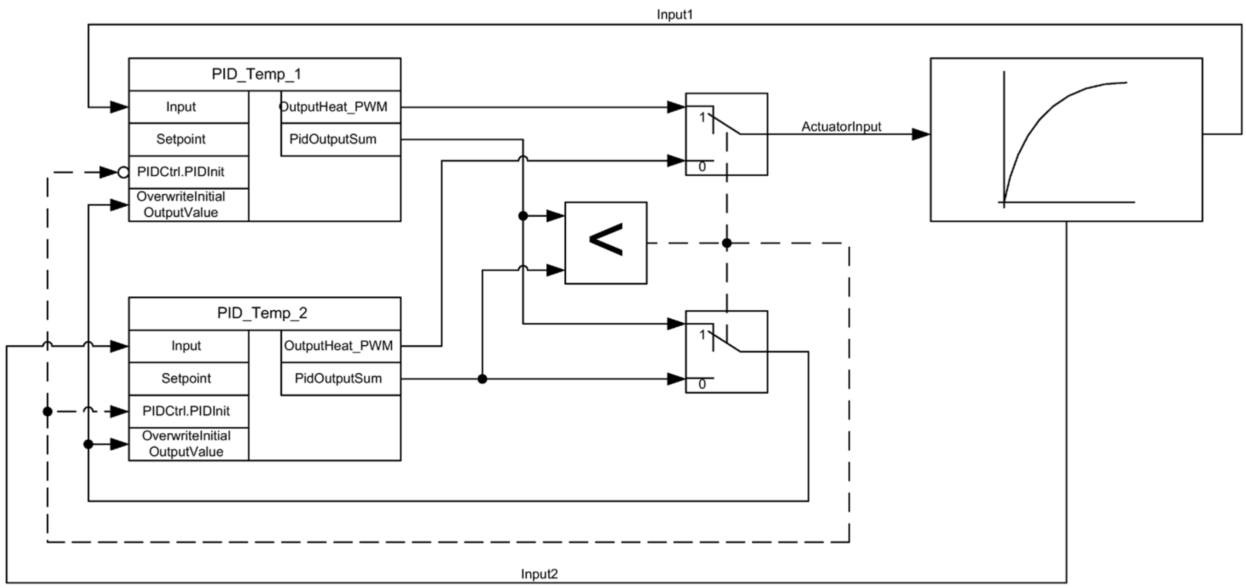
PID_Temp is used for control of a large boiler.

The main goal is to control the temperature Input1. The controller PID_Temp_1 is used for this purpose. In addition, the temperature Input2 is to be kept below a high limit at an additional measuring point with the limiting controller PID_Temp_2.

Both temperatures are influenced by only one heater. The output value of the controller corresponds to the heating power.



The heater is controlled with the pulse-width modulated output value of PID_Temp (parameter OutputHeat_PWM) by writing the program tag ActuatorInput. The setpoint for the temperature Input1 is specified at the parameter PID_Temp_1.Setpoint. The temperature high limit for the additional measuring point is specified as setpoint at the parameter PID_Temp_2.Setpoint.



Both controllers must share one heater as shared actuator. The logic that decides which controller gets access to the actuator is implemented by a minimum selection of the PID output value (in Real format, parameter PidOutputSum) in this case. Because the PID output value corresponds to the heating power, the controller that requires lower heating power gets the control.

In normal operation of the plant, the process value of the main controlled variable corresponds to the setpoint. The main controller PID_Temp_1 has settled on a stationary PID output value PID_Temp_1.PidOutputSum. The process value of the limiting controller Input2 in normal operation is significantly below the high limit that is specified as setpoint for für PID_Temp_2. The limiting controller therefore wants to increase the heating power to increase its process value, which means it will calculate a PID output value PID_Temp_2.PidOutputSum that is greater than the main controller PID_Temp_1.PidOutputSum. The minimum selection of the switchover logic therefore gives the main controller PID_Temp_1 continued access to the actuator. In addition, it is ensured that PID_Temp_2 is updated by means of the assignments PID_Temp_2.OverwriteInitialOutputValue = PID_Temp_1.PidOutputSum and PID_Temp_2.PIDCtrl.PIDInit = TRUE.

If Input2 now approaches the high limit or exceeds it, for example due to a fault, the limiting controller PID_Temp_2 calculates a smaller PID output value to restrict the heating power and thus reduce Input2. If PID_Temp_2.PidOutputSum is smaller than PID_Temp_1.PidOutputSum, the limiting controller PID_Temp_2 receives access to the actuator through the minimum selection and reduces the heating power. It is ensured that PID_Temp_1 is updated by means of the assignments PID_Temp_1.OverwriteInitialOutputValue = PID_Temp_2.PidOutputSum and PID_Temp_1.PIDCtrl.PIDInit = TRUE.

The temperature at the additional measuring point Input2 drops. The temperature of the main controlled variable Input1 drops as well and cannot be held at the setpoint any longer.

Once the fault has been remedied, the Input2 will continue to drop and the heating power is further increased by the limiting controller. As soon as the main controller has calculated a lower heating power as output value, the plant returns to normal operation so that the main controller PID_Temp_1 once again has access to the actuator. This example can be implemented with the following SCL program code:

```
"PID_Temp_1"(Input := "Input1");
"PID_Temp_2"(Input := "Input2");
IF "PID_Temp_1".PidOutputSum <= "PID_Temp_2".PidOutputSum THEN
  "ActuatorInput" := "PID_Temp_1".OutputHeat_PWM;

  "PID_Temp_1".PIDCtrl.PIDInit := FALSE;

  "PID_Temp_2".OverwriteInitialOutputValue := "PID_Temp_1".PidOutputSum;

ELSE
  "ActuatorInput" := "PID_Temp_2".OutputHeat_PWM;

  "PID_Temp_1".PIDCtrl.PIDInit := TRUE;

  "PID_Temp_2".PIDCtrl.PIDInit := FALSE;

  "PID_Temp_1".OverwriteInitialOutputValue := "PID_Temp_2".PidOutputSum;

END_IF;
```

6.7 Simulating PID_Temp with PLCSIM

Note

Simulation with PLCSIM

The simulation of PID_Temp with PLCSIM for CPU S7-1200 is not supported.

PID_TEMP can be simulated only for CPU S7-1500 with PLCSIM.

For the simulation with PLCSIM, the time behavior of the simulated PLC is not exactly identical to that of a "real" PLC. The actual cycle clock of a cyclic interrupt OB can have larger fluctuations with a simulated PLC than with "real" PLCs.

In the standard configuration, PID_Temp determines the time between calls automatically and monitors them for fluctuations.

For the simulation of PID_Temp with PLCSIM, for example, a sampling time error (ErrorBits = DW#16#00000800) can therefore be detected.

This results in ongoing tuning being aborted.

The response in automatic mode depends on the value of the ActivateRecoverMode tag.

To prevent this from happening, you should configure PID_Temp for simulation with PLCSIM as follows:

- CycleTime.EnEstimation = FALSE
- CycleTime.EnMonitoring = FALSE
- CycleTime.Value: Assign the cycle clock of the calling cyclic interrupt OB in seconds to this tag.

Using PID basic functions 7

7.1 CONT_C

7.1.1 Technology object CONT_C

The technology object CONT_C provides a continual PID-controller for automatic and manual mode. It corresponds to the instance data block of the instruction CONT_C. You can configure a pulse controller using the PULSEGEN instruction.

The proportional, integral (INT) and differential components (DIF) are switched parallel to each other and can be turned on and off individually. With this, P-, I, PI-, PD- and PID-controller can be set.

S7-1500
All parameters and tags of the technology object are retentive and can only be changed during download to the device if you completely download CONT_C.

Add technology objects (Page 41)

Configure technology objects (Page 42)

Downloading technology objects to device (Page 44)

CONT_C (Page 466)

7.1.2 Configure controller difference CONT_C

Use process value periphery

To use the process value in the periphery format at the PV_PER input parameter, follow these steps:

1. Select the "Enable I/O" check box.
2. If the process value is available as a physical size, enter the factor and offset for the scaling in percent.
   The process value is then determined according to the following formula:
   PV = PV_PER × PV_FAC + PV_OFF

Use internal process values

To use the process value in the floating-point format at the PV_IN input parameter, follow these steps:

1. Clear the "Enable I/O" check box.

Control deviation

Set a dead zone range under the following requirement:

- The process value signal is noisy.
- The controller gain is high.
- The derivative action is activated.

The noise component of the process value causes strong deviations of the output value in this case. The dead zone suppresses the noise component in the steady controller state. The dead zone range specifies the size of the dead zone. With a dead zone range of 0.0, the dead zone is turned off.

How CONT_C works (Page 467)

7.1.3 Configure the controller algorithm CONT_C

General

To determine which components of the control algorithm are activated, proceed as follows:

1. Select an entry from the "Controller structure" list.
   You can only specify required parameters for the selected controller structure.

Proportional action

1. If the controller structure contains a proportional action, enter the "proportional gain".

Integral action

1. If the controller structure contains an integral action, enter the integral action time.
2. To give the integral action an initialization value, select the check box "Initialize integral action" and enter the initialization value.
3. In order to permanently set the integral action to this initialization value, select the "Integral action hold" check box.

Derivative action

1. If the controller structure contains a derivative action, enter the derivative action time, the derivative action weighting and the delay time.

See also

How CONT_C works (Page 467)

7.1.4 Configure the output value CONT_C

General

You can set CONT_C in the manual or automatic mode.

1. To set a manual manipulated value, activate the option "Activate manual mode" option check box.
   You can specify a manual manipulated value on the input parameter MAN.

Manipulated value limits

The manipulated value is limited at the top and bottom so that it can only accept valid values. You cannot turn off the limitation. Exceeding the limits is displayed through the output parameters QLMN_HLM and QLMN_LLM.

1. Enter a value for the high and low manipulated value limits.
   If the manipulated value is a physical size, the units for the high and low manipulated value limits must match.

Scaling

The manipulated value can be scaled for output as a floating point and periphery value through a factor and an offset according to the following formula.

Scaled manipulated value = manipulated value x factor + offset

Default is a factor of 1.0 and an offset of 0.0.

1. Enter a value for the factor and offset.

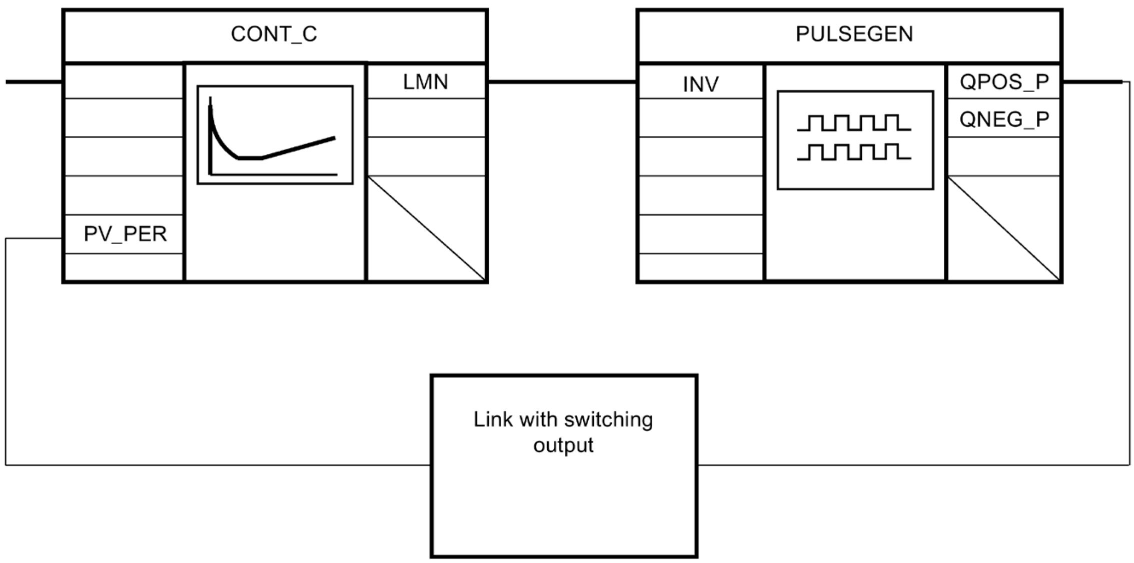
How CONT_C works (Page 467)

7.1.5 Programming a pulse controller

With the continuous controller CONT_C and the pulse shaper PULSEGEN, you can implement a fixed setpoint controller with a switching output for proportional actuators. The following figure shows the signal flow of the control loop.



The continuous controller CONT_C forms the output value LMN that is converted by the pulse shaper PULSEGEN into pulse/break signals QPOS_P or QNEG_P.

PULSEGEN (Page 478)

7.1.6 Commissioning CONT_C

Requirements

- The instruction and the technology object are loaded on the CPU.

Procedure

In order to manually determine the optimal PID parameter, proceed as follows:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. Enter new PID parameters in the "P", "I", "D" and "Delay time" fields.
3. Click on the icon "Send parameter to CPU" in the "Tuning" group.
4. Select the "Change setpoint" check box in the "Current values" group.
5. Enter a new setpoint and click in the "Current Values" group on the icon .
6. Clear the "Manual mode" check box.

   The controller works with the new PID parameters and controls the new setpoint.
7. Check the quality of the PID parameter to check the curve points.
8. Repeat steps 2 to 6 until you are satisfied with the controller results.

7.2 CONT_S

7.2.1 Technology object CONT_S

The technology object CONT_S provides a step controller for actuators with integrating behavior and is used to control technical temperature processes with binary output value output signals. The technology object corresponds to the instance data block of the CONT_S instruction. The operating principle is based on the PI control algorithm of the sampling controller. The step controller operates without a position feedback signal. Both manual and automatic mode are possible.

S7-1500
All parameters and tags of the technology object are retentive and can only be changed during download to the device if you completely download CONT_S.

Overview of software controller (Page 39)

Add technology objects (Page 41)

Configure technology objects (Page 42)

Downloading technology objects to device (Page 44)

CONT_S (Page 473)

7.2.2 Configure controller difference CONT_S

Use process value periphery

To use the process value in the periphery format at the PV_PER input parameter, follow these steps:

1. Select the "Enable I/O" check box.
2. If the process value is available as a physical quantity, enter the factor and offset for the scaling in percent.
   The process value is then determined according to the following formula:
   PV = PV_PER × PV_FAC + PV_OFF

Use internal process values

To use the process value in the floating-point format at the PV_IN input parameter, follow these steps:

1. Clear the "Enable I/O" check box.

Control deviation

Set a deadband range under the following requirement:

- The process value signal is noisy.
- The controller gain is high.
- The derivative action is activated.

The noise component of the process value causes strong deviations of the manipulated variable in this case. The deadband suppresses the noise component in the steady controller state. The deadband range specifies the size of the deadband. With a deadband range of 0.0, the deadband is turned off.

See also

Mode of operation CONT_S (Page 474)

7.2.3 Configuring control algorithm CONT_S

PID algorithm

1. Enter the "proportional amplification" for the P-component.
2. Enter the integration time for the time behavior of the I-component.
   With an integration time of 0.0, the I-component is switched off.

See also

Mode of operation CONT_S (Page 474)

7.2.4 Configure manipulated value CONT_S

General

You can set CONT_S in the manual or automatic mode.

1. To set a manual manipulated value, activate the "Activate manual mode" option check box.
   Enter a manual manipulated value for the input parameters LMNUP and LMNDN.

Pulse generator

1. Enter the minimum impulse duration and minimum pause duration.
   The values must be greater than or equal to the cycle time for the input parameter CYCLE. The frequency of operation is reduced through this.
2. Enter the motor setting time.
   The value must be greater than or equal to the cycle time of the input parameter CYCLE.

See also

Mode of operation CONT_S (Page 474)

7.2.5 Commissioning CONT_S

Requirements

- The instruction and the technology object have been loaded to the CPU.

Procedure

To manually determine the optimal PID parameters, proceed as follows:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. In the fields "P" and "I", enter a new proportional value and a new integration time.
3. Click on the icon "Send parameter to CPU" in the "Tuning" group.
4. Select the "Change setpoint" check box in the "Current values" group.
5. Enter a new setpoint and click in the "Current Values" group on the icon .
6. Clear the "Manual mode" check box.

   The controller works with the new parameters and controls the new setpoint.
7. Check the quality of the PID parameter to check the curve points.
8. Repeat steps 2 to 6 until you are satisfied with the controller results.

7.3 TCONT_CP

7.3.1 Technology object TCONT_CP

The technology object TCONT_CP provides a continual temperature controller with pulse generator. It corresponds to the instance data block of the instruction TCONT_CP. The operation is based on the PID control algorithm of the sampling controller. Both manual and automatic mode are possible.

The instruction TCONT_CP calculates the proportional, integral and derivative parameters for your controlled system during pretuning. "Fine tuning" can be used to tune the parameters further. You can also enter the PID parameters manually.

S7-1500
All parameters and tags of the technology object are retentive and can only be changed during download to the device if you completely download TCONT_CP.

Downloading technology objects to device (Page 44)

TCONT_CP (Page 489)

7.3.2 Configure TCONT_CP

7.3.2.1 Controller difference

Use process value periphery

To use the input parameter PV_PER, proceed as follows:

1. Select the entry "Periphery" from the "Source" list.
2. Select the "sensor type".
   Depending on the sensor type, the process value is scaled according to different formulas.
   – Standard
     Thermoelements; PT100/NI100

     PV = 0.1 × PV_PER × PV_FAC + PV_OFFS
   – Cooling;
     PT100/NI100

     PV = 0.01 × PV_PER × PV_FAC + PV_OFFS
   – Current/voltage

     PV = 100/27648 × PV_PER × PV_FAC + PV_OFFS
3. Enter the factor and offset for the scaling of the process value periphery.

Use internal process values

To use the input parameter PV_IN, proceed as follows:

1. Select the entry "Internal" from the "Source" list.

Control deviation

Set a deadband range under the following requirement:

- The process value signal is noisy.
- The controller gain is high.
- The derivative action is activated.

The noise component of the process value causes strong deviations of the manipulated variable in this case. The deadband suppresses the noise component in the steady controller state. The deadband range specifies the size of the deadband. With a deadband range of 0.0, the deadband is turned off.

See also

Mode of operation TCONT_CP (Page 490)

7.3.2.2 Controlling algorithm

General

1. Enter the "Sampling time PID algorithm".
   A controller sampling time should not exceed 10 % of the determined integratl action time of the controller (TI).
2. If the controller structure contains a proportional action, enter the "proportional gain".
   A negative proportional gain inverts the rule meaning.

Proportional action

For changes of the setpoint, it may lead to overshooting of the proportional action. Through the weighting of the proportional action, you can select how strongly the proportional action should react when setpoint changes are made. The weakening of the proportional action is reached through a compensation of the integral action.

1. To weaken the proportional action for setpoint changes, enter a "Proportional action weighting".
   - 1.0: Proportional action for setpoint change is fully effective
   - 0.0: Proportional action for setpoint change is not effective

Integral action

With a limitation of the manipulated value, the integral action is stopped. With a control deviation that moves the integral action in the direction of an internal setting range, the integral action is released again.

1. If the controller structure contains an integral action, enter the "integral action time".
   With an integral action time of 0.0, the integral action is switched off.
2. To give the integral action an initialization value, select the "Initialize integral action" check box and enter the "Initialization value".
   Upon restart or COM_RST = TRUE, the integral action is set to this value.

Derivative action

1. If the controller structure contains a derivative action, enter the derivative action time (TD) and the coefficients DT1 (D_F).
   With switched derivative action, the following equation should be maintained:
   TD = 0.5 × CYCLE× D_F.
   The delay time is calculated from this according to the formula:
   delay time = TD/D_F

Set PD-controller with operating point

1. Enter the integral action time 0.0.
2. Activate the "Initialize integral action" check box.
3. Enter the operating point as the initialization value.

Set P-controller with operating point

1. Set a PD-controller with an operating point.
2. Enter the derivative action time 0.0.
   The derivative action is disabled.

Control zone

The control zone limits the value range of the control deviation. If the control deviation is outside of this value range, the manipulated value limits are used.

With an occurrence in the control zone, the derivative action leads to a very quick reduction of the manipulated variable. Thus, the control zone only makes sense for switched on derivative actions. Without control zone, only the reducing proportional action would reduce the manipulated value. The control zone leads to a quick oscillation without over/under shooting if the emitted minimum or maximum manipulated values are removed from the manipulated value required for the new operating point.

1. Activate the "Activate" check box in the "control zone" group.
2. Enter a setpoint value in the "Width" input field from which the process value may deviate above or below.

See also

Mode of operation TCONT_CP (Page 490)

7.3.2.3 Manipulated value continual controller

Manipulated value limits

The manipulated value is limited at the top and bottom so that it can only accept valid values. You cannot turn off the limitation. Exceeding the limits is displayed through the output parameters QLMN_HLM and QLMN_LLM.

1. Enter a value for the high and low manipulated value limits.

Scaling

The manipulated value can be scaled for output as a floating point and periphery value through a factor and an offset according to the following formula.

Scaled manipulated value = manipulated value x factor + offset

Default is a factor of 1.0 and an offset of 0.0.

1. Enter a value for the factor and offset.

Pulse generator

The pulse generator must be turned on for a continual controller.

1. Disable the "Activate" option check box in the "Pulse generator" group.

See also

Mode of operation TCONT_CP (Page 490)

7.3.2.4 Manipulated value pulse controller

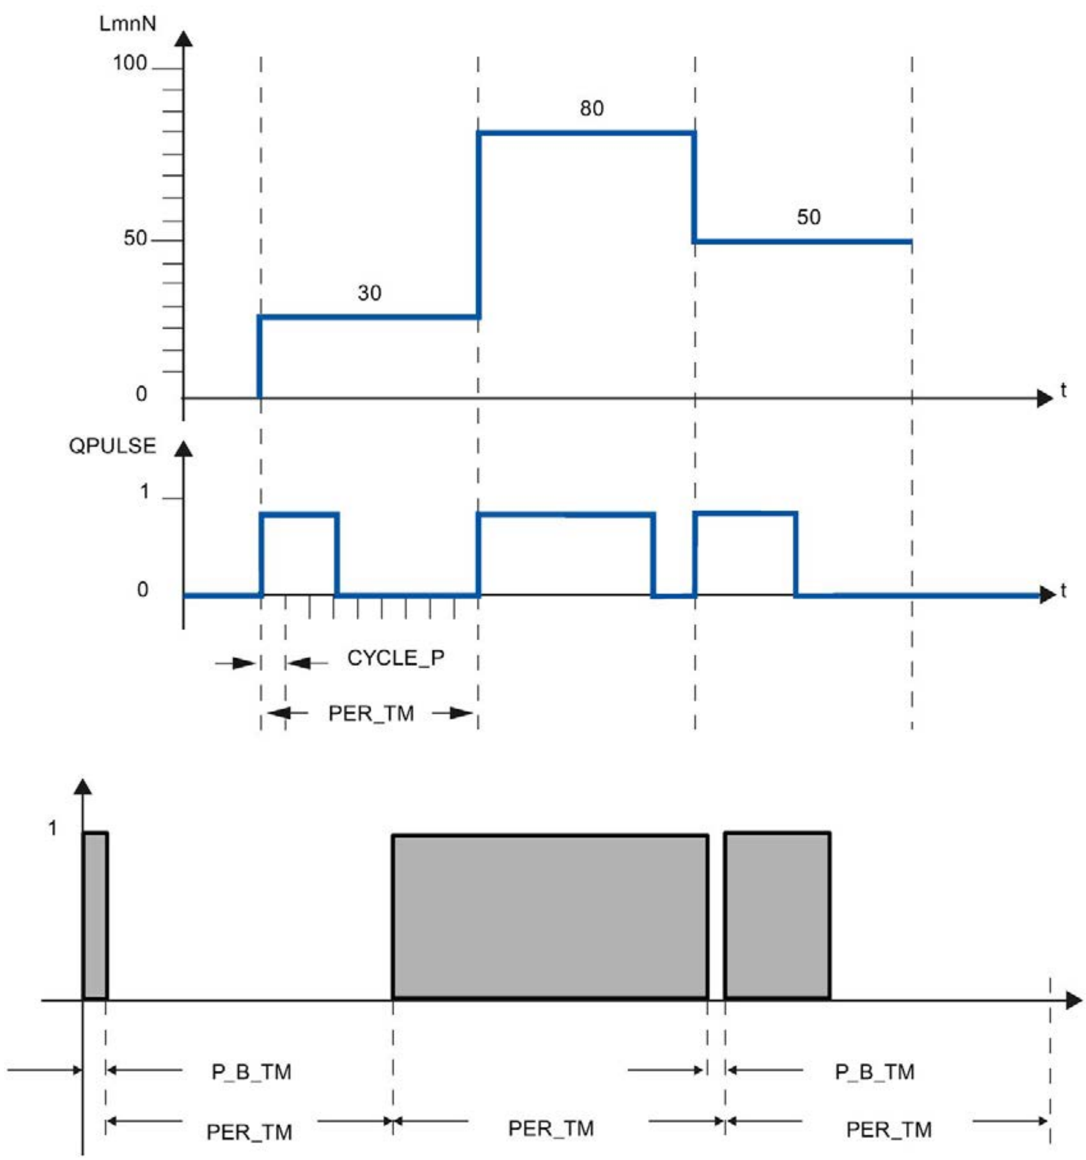
Pulse generator

The analog manipulated value (LmnN) can be emitted through pulse-duration modulation on the output parameter QPULSE as an impulse sequence.

To use the pulse generator, proceed as follows:

1. Activate the "Activate" option check box in the "pulse generator" group.
2. Enter the "sampling time pulse generator", the "minimum impulse/break duration" and the "period duration".

The following graphics clarify the connection between the "sampling pulse generator" (CYCLE_P), the "minimum impulse/break duration" (P_B_TM) and the "period duration" (PER_TM):



Sampling time pulse generator

The sampling time pulse generator must agree with the time tact of the cyclic interrupt OB being called. The duration of the created impulse is always a whole number factor of this value. For an adequately precise manipulated value resolution, the following relationship should apply:
CYCLE_P ≤ PER_TM/50

Minimum impulse/break duration

Through the minimum impulse/break duration, short on or off times on the actuator are avoided. An impulse smaller than P_B_TM is suppressed.

Recommended are values P_B_TM ≤ 0.1 × PER_TM.

Period duration

The period duration should not exceed 20% of the determined integration time of the controller (TI):
PER_TM ≤ TI/5

Example for the effect of the parameter CYCLE_P, CYCLE and PER_TM:

Period duration PER_TM = 10 s

Sampling time PID-algorithm CYCLE = 1 s

Sampling time pulse generator CYCLE_P = 100 ms.

Every second, a new manipulated value, every 100 ms the comparison of the manipulated value occurs with the previously emitted impulse length and break length.

- If an impulse is emitted, there are 2 possibilities:
  - The calculated manipulated value is larger than the previous impulse length/PER_TM. Then the impulse is extended.
  - The calculated manipulated value is less than or equal to the previous impulse length/PER_TM. Then no impulse signal will be emitted.
- If no impulse is emitted, there are also 2 possibilities:
  - The value (100 % - calculated manipulated value) is greater than the previous break length / PER_TM. Then the break is extended.
  - The value (100 % - calculated manipulated value) is less than or equal to the previous break length / PER_TM. Then an impulse signal will be emitted.

Operating principle of the pulse generator (Page 499)

7.3.3 Commissioning TCONT_CP

7.3.3.1 Optimization of TCONT_CP

Application possibilities

The controller optimization for heating or cooling processes from process type I is applicable. But you can use the block for processes with higher levels like process type II or III.

The PI/PID parameters are automatically determined and set. The controller draft is designed for an optimal disruption behavior The "precise" parameters resulting from this lead to overshooting of 10% to 40% of the jump height for setpoint jump heights.

Phases of controller optimization

For the controller optimization, individual phases are run through, which you can read on the parameter PHASE .

PHASE = 0

No tuning is running. TCONT_CP works in automatic or manual mode.

During PHASE = 0, you can make sure that the controlled system fulfills the requirements for an optimization.

At the end of the optimization, TCONT_CP changes back into PHASE = 0.

PHASE = 1

TCONT_CP is prepared for optimization. PHASE = 1 may only be started if the requirements for an optimization are fulfilled.

During PHASE = 1, the following values are determined:

- Process value noise NOISE_PV
- Initial slope PVDT0
- Average of the manipulated variable
- Sampling time PID algorithm CYCLE
- Sampling time pulse generator CYCLE_P

PHASE = 2

In phase 2, the process value attempts to detect the point of inflection with a constant manipulated variable. This method prevents the point of inflection from being found too early as a result of process variable noise.

With the pulse controller, the process variable is averaged over N pulse cycles and then made available to the controller stage. There is a further averaging of the process variable in the controller stage: Initially, this averaging is inactive; in other words, averaging always takes place over 1 cycle. As long as the noise exceeds a certain level, the number of cycles is doubled.

The period and amplitude of the noise are calculated. The search for the point of inflection is canceled and phase 2 is exited only when the gradient is always smaller than the maximum rise during the estimated period. TU and T_P_INF are, however, calculated at the actual point of inflection.

Tuning, however, is only ended when the following two conditions are met:

1. The process value is more than 2*NOISE_PV away from the point of inflection.
2. The process value has exceeded the point of inflection by 20%.

Note

When exciting the process using a setpoint step change, tuning is ended at the latest when the process value exceeds 75% of the setpoint step change (SP_INT-PV0) (see below).

PHASE = 3, 4, 5

The phases 3, 4 and 5 last 1 cycle each.

In Phase 3, the valid PI/PID parameters are saved before the optimization and the process parameter is calculated.

In Phase 4, the new PI/PID parameters are calculated.

In Phase 5, the new manipulated variable is calculated and the controlled system is given.

PHASE = 7

The process type is inspected in Phase 7, because TCONT_CP always changes to automatic mode after optimization. The automatic mode starts with LMN = LMN0 + 0.75*TUN_DLMN as a manipulated variable. The testing of the process type occurs **in the automatic mode** with the recently recalculated controller parameters and ends at the latest 0.35*TA (equilibrium time) after the point of inflection. If the process order deviates strongly from the estimated value, the controller parameters are newly calculated and STATUS_D is counted up by 1, otherwise, the controller parameters remain unchanged.

Then the optimization mode is complete and TCONT_CP is back in PHASE = 0. At the STATUS_H parameter, you can identify whether the tuning was successfully completed.

Premature cancellation of the optimization

In Phase 1, 2 or 3, you can cancel the optimization by resetting TUN_ON = FALSE without calculating new parameters. The controller starts in the automatic mode with LMN = LMN0 + TUN_DLMN. If the controller was in manual mode before the tuning, the old manual manipulated variable is output.

If the tuning is canceled in Phase 4, 5 or 7 with TUN_ON = FALSE, the determined controlled parameters are contained until then.

7.3.3.2 Requirements for an optimization

Transient response

The process must have a stable, asymptotic transient response with time lag.

The process value must settle to steady state after a step change of the manipulated variable. This therefore excludes processes that already show an oscillating response without control, as well as processes with no recovery (integrator in the control system).

> **WARNING**
>
> This may result in death, severe injury or considerable property damage.
>
> During an tuning, the parameter MAN_ON is ineffective. Through this, the output value or process value may take on undesired - even extreme - values.
>
> The output value is defined through the tuning. To cancel the tuning, you first have to set TUN_ON = FALSE. This makes MAN_ON effective again.

Guaranteeing a stationary initial state (phase 0)

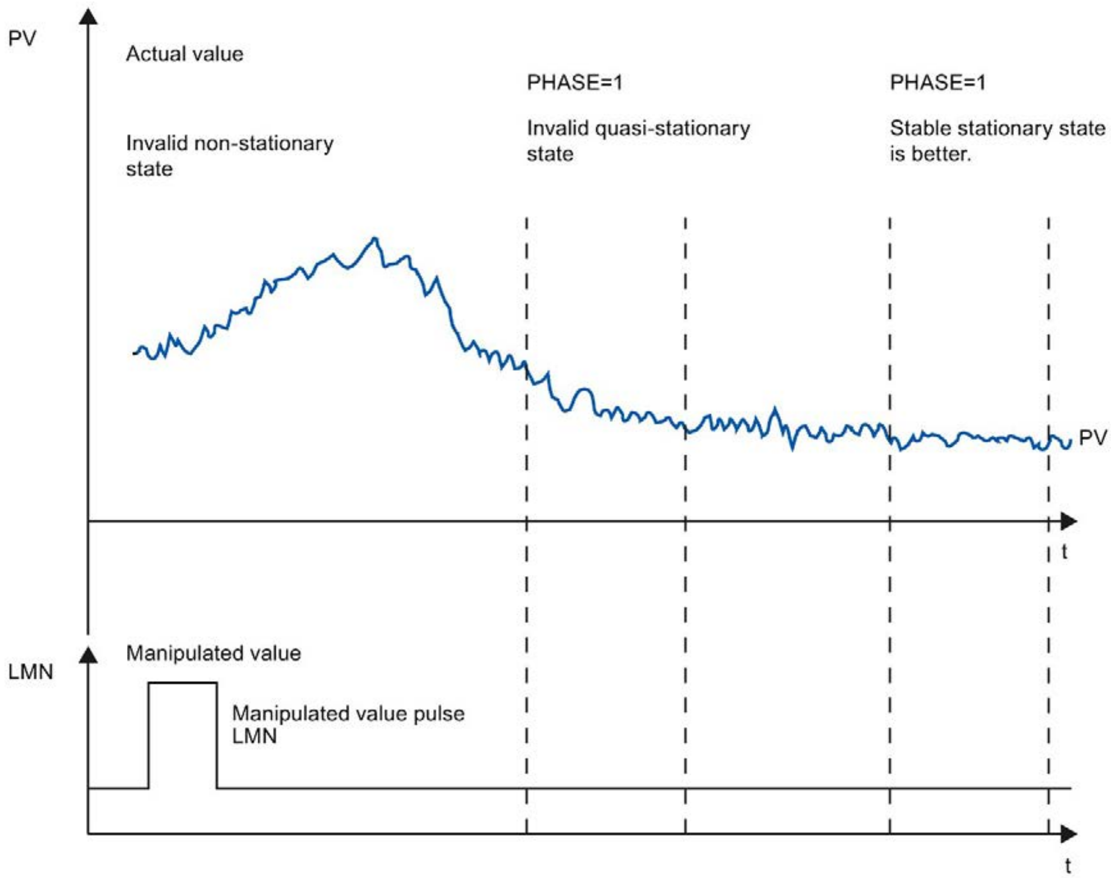
With lower-frequency oscillations of the process value, for example, due to incorrect controller parameters, the controller must be put in manual mode before the tuning is started and wait for the oscillation to stop. Alternatively, you could switch to a "soft" set PI controller (small loop gain large integration time).

Now you have to wait until the stationary state is reached, this means, until the process value and output value have a steady state. It is also permissible to have an asymptotic transient oscillation or slow drifting of the process value (stationary state, see the following image). The output value must be constant or fluctuate by a constant average.

Note

Avoid changing the manipulated variable shortly before starting the tuning. A change of the manipulated variable can occur in an unintended manner through the establishment of the test conditions (for example, closing an oven door)! If this does happen, you have to at least wait until the process value has an asymptotic transient oscillation in a stationary state again. Better controller parameters can be reached if you wait until the transient effect has completely subsided.

In the following image, the transient oscillation is illustrated in the stationary state:



Linearity and operating range

The process response must be linear across the operating range. Non-linear response occurs, for example, when an aggregation state changes. Tuning must take place in a linear part of the operating range.

This means, during tuning and normal control operation non-linear effects within the operating range must be insignificant. It is, however possible to retune the process when the operating point changes, providing tuning is repeated in the close vicinity of the new operating point and non-linearity does not occur during tuning.

If a specific static non-linearity (e.g., valve characteristics) is known, it is always advisable to compensate this with a polyline to linearize the process response.

Disturbance in temperature processes

Disturbances such as the transfer of heat to neighboring zones must not affect the overall temperature process too much. For example, when optimizing the zones of an extruder, all zones must be heated simultaneously.

7.3.3.3 Possibilities for optimization

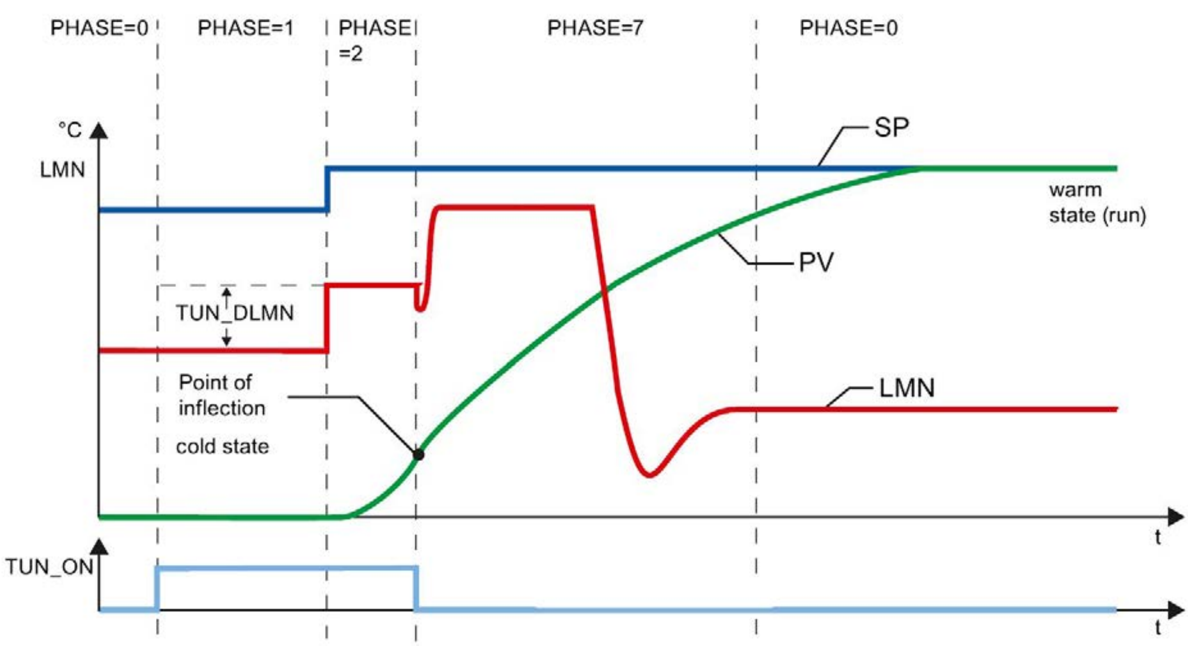
The following possibilities for tuning exist:

- Pretuning
- Fine tuning
- Manual fine-tuning in control mode

Pretuning

During this tuning, the working point is approached from the cold state through a setpoint jump.

With TUN_ON = TRUE, you can establish the tuning readiness. The controller switches from PHASE = 0 to PHASE = 1.



The tuning manipulated variable (LMN0 + TUN_DLMN) is activated by a setpoint change (transition phase 1 -> 2). The setpoint is not effective until the inflection point has been reached (automatic mode is not enabled until this point is reached).

The user is responsible for defining the output excitation delta (TUN_DLMN) according to the permitted process value change. The sign of TUN_DLMN must be set depending on the intended process value change (take into account the direction in which the control is operating).

The setpoint step change and TUN_DLMN must be suitably matched. If the value of TUN_DLMN is too high, there is a risk that the point of inflection will not be found before 75% of the setpoint step change is reached.

TUN_DLMN must nonetheless be high enough to ensure that the process value reaches at least 22 % of the setpoint step change. Otherwise, the process will remain in tuning mode (phase 2).

Remedy: Reduce the setpoint value during the inflection point search.

Note

If processes are extremely sluggish, it is advisable during tuning to specify a target setpoint that is somewhat lower than the desired operating point and to monitor the status bits and PV closely (risk of overshooting).

Tuning only in the linear range:

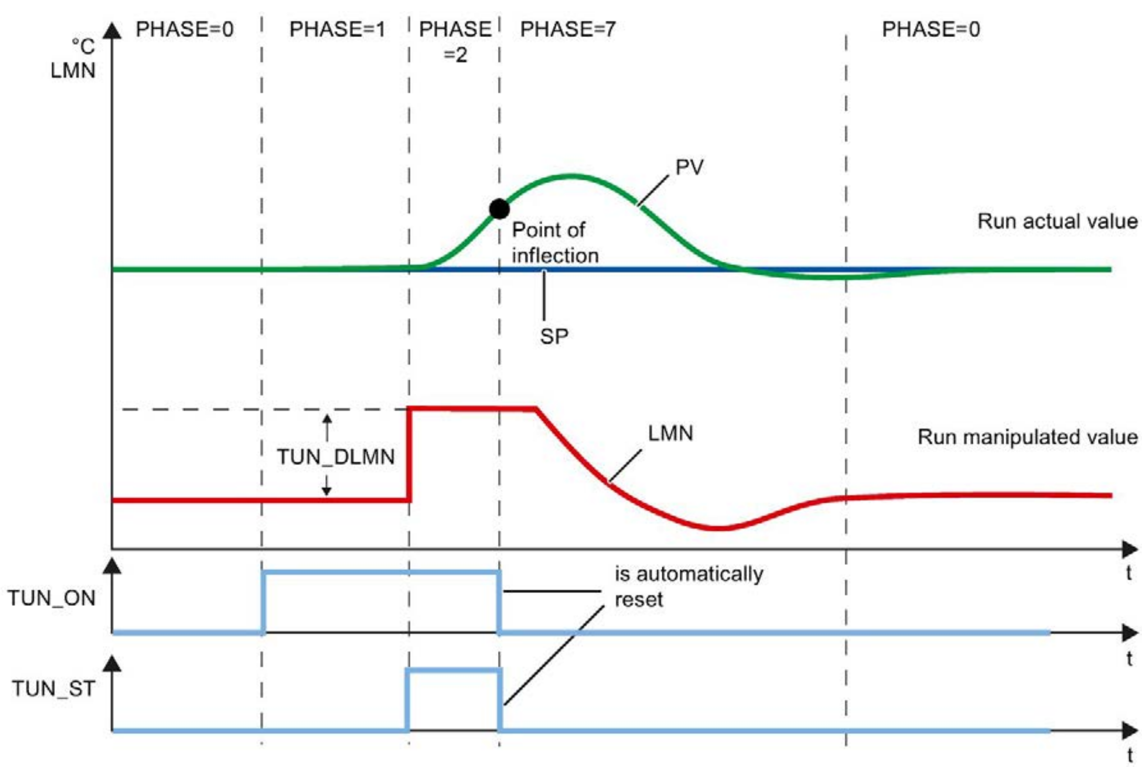
The signals of certain processes (e.g., zinc or magnesium smelters) will pass a non-linear area at the approach of the operating range (change in the state of aggregation).

By selecting a suitable setpoint step change, tuning can be limited to the linear range. When the process value has passed 75% of the setpoint step change (SP_INT-PV0), tuning is ended.

At the same time, TUN_DLMN should be reduced to the extent that the point of inflection is guaranteed to be found before 75% of the setpoint step change is reached.

Fine tuning

During this tuning, the process with a constant setpoint is activated through a output value jump.



The tuning manipulated variable (LMN0 + TUN_DLMN) is activated by setting the start bit TUN_ST (transition from phase 1 -> 2). When you modify the setpoint value, the new value will not take effect until the point of inflection has been reached (automatic mode will not be enabled until this point has been reached).

The user is responsible for defining the output excitation delta (TUN_DLMN) according to the permitted process value change. The sign of TUN_DLMN must be set depending on the intended process value change (take into account the direction in which the control is operating).

NOTICE
Safety off at 75% is not available when you excite the process via TUN_ST. Tuning is ended when the point of inflection is reached. However, in noisy processes the point of inflection may be significantly exceeded.

Manual fine-tuning in control mode

The following measures can be employed to achieve an overshoot-free setpoint response:

- Adapting the control zone
- Optimize command action
- Attenuation of control parameters
- Modifying control parameters

7.3.3.4 Tuning result

The left cipher of STATUS_H displays the tuning status

STATUS_H	Result
0	Default, i.e., new controller parameters have not (yet) been found.
10000	Suitable control parameters found.
2xxxx	Control parameters have been found via estimated values; check the control response or check the STATUS_H diagnostic message and repeat controller tuning.
3xxxx	An operator error has occurred; check the STATUS_H diagnostic message and repeat controller tuning.

The CYCLE and CYCLE_P sampling times were already checked in phase 1.

The following controller parameters are updated on TCONT_CP:

- P (proportional GAIN)
- I (integration time TI)
- D (derivative time TD)
- Weighting of the proportional action PFAC_SP
- Coefficient DT1 (D_F)
- Control zone on/off CONZ_ON
- Control zone width CON_ZONE

The control zone is only activated if the process type is suitable (process type I and II) and a PID controller is used (CONZ_ON = TRUE).

Depending on PID_ON, control is implemented either with a PI or a PID controller. The old controller parameters are saved and can be retrieved with UNDO_PAR. A PI parameter record and a PID parameter record are saved additionally in the PI_CON and PID_CON structures. Using LOAD_PID and making a suitable setting for PID_ON, it is also possible to switch later between the tuned PI or PID parameters.

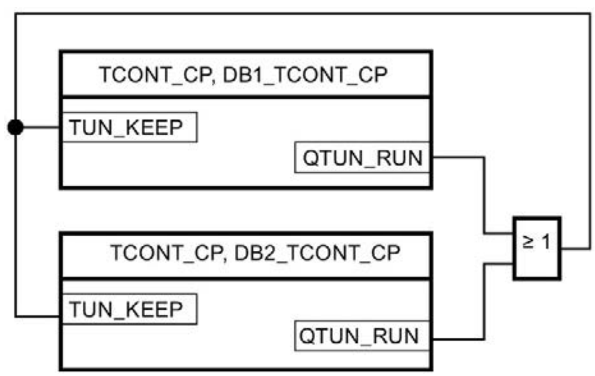
7.3.3.5 Parallel tuning of controller channels

Adjacent zones (strong heat coupling)

If two or more controllers are controlling the temperature, on a plate, for example (in other words, there are two heaters and two measured process values with strong heat coupling), proceed as follows:

1. OR the two outputs QTUN_RUN.
2. Interconnect each TUN_KEEP input with the output of the OR element.
3. Start both controllers by specifying a setpoint step change at the same time or by setting TUN_ST at the same time.

The following schematic illustrates the parallel tuning of controller channels.



Advantage:

Both controllers output LMN0 + TUN_DLMN until both controllers have left phase 2. This prevents the controller that completes tuning first from falsifying the tuning result of the other controller due to the change in its manipulated variable.

NOTICE
Reaching 75% of the setpoint step change causes an exiting of phase 2 and resetting of output QTUN_RUN. However, automatic mode does not start until TUN_KEEP is also 0.

Adjacent zones (weak heat coupling)

In general terms, tuning should be carried out to reflect the way in which the controller will operate subsequently. If zones are operated together during production such that the temperature differences between the zones remain the same, the temperature of the adjacent zones ought to be increased accordingly during tuning.

Differences in temperature at the beginning of the tuning are irrelevant since they will be compensated by the initial heating (-> initial rise = 0).

7.3.3.6 Fault descriptions and corrective measures

Compensating operator errors

Operator error	STATUS and action	Comment
TUN_ON and setpoint step change or TUN_ST are set simultaneously	Transition to phase 1; however, tuning is not started. • $SP\_INT = SP_{old}$ or • TUN_ST = FALSE	The setpoint change is canceled. This prevents the controller from settling to the new setpoint value and from leaving the stationary operating point unnecessarily.
Effective TUN_DLMN < 5% (end of phase 1)	STATUS_H = 30002 • Transition to phase 0 • TUN_ON = FALSE • $SP = SP_{old}$	Tuning is canceled. The setpoint change is canceled. This prevents the controller from settling to the new setpoint value and from leaving the stationary operating point unnecessarily.

Point of inflection not reached (only if excited by setpoint step change)

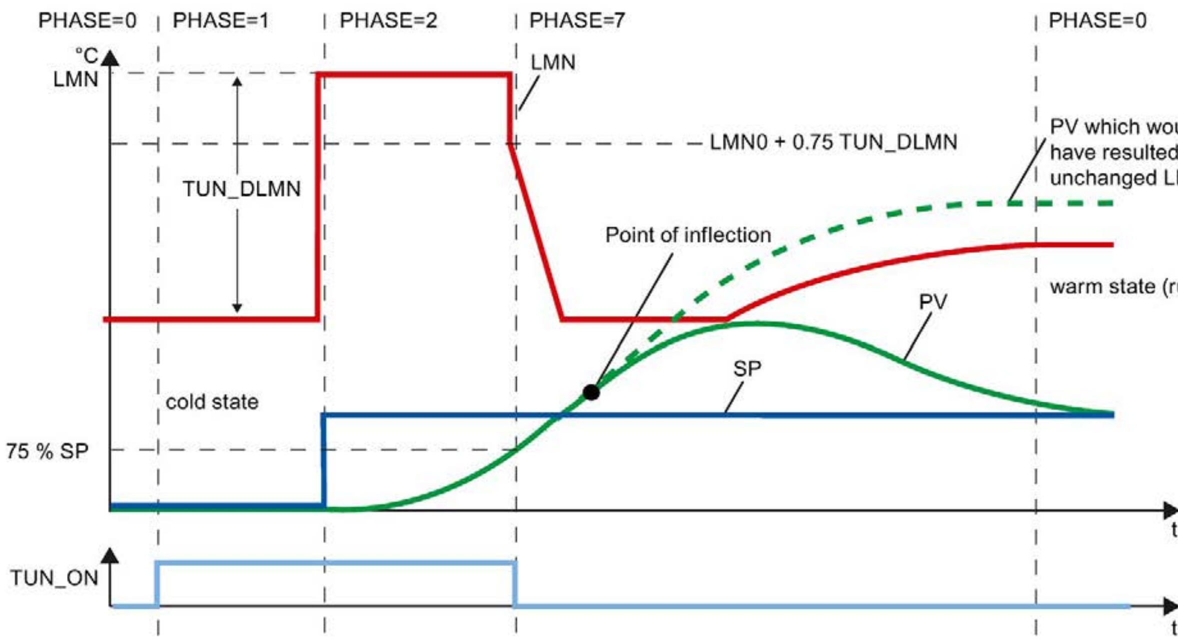
At the latest, tuning is ended when the process value has passed 75% of the setpoint step change (SP_INT-PV0). This is signaled by "inflection point not reached" in STATUS_H (2xx2x).

The currently valid setpoint always applies. By reducing the setpoint, it is possible to achieve an earlier end of the tuning function.

In typical temperature processes, cancelation of tuning at 75% of the setpoint step change is normally adequate to prevent overshoot. However, **caution** is advised, particularly in processes with a greater delay (TU/TA > 0.1, process type III). If manipulated variable excitation is too strong compared to the setpoint step change, the process value can overshoot heavily (up to a factor of 3).

In higher-order processes, if the point of inflection is still a long way off after reaching 75% of the setpoint step change, there will be significant overshoot. In addition, the controller parameters are too stringent. In this case, you should reduce the controller parameters or repeat the attempt.

The following schematic illustrates the overshoot of the process variable when the excitation is too strong (process type III):



In typical temperature processes, cancelation shortly before reaching the point of inflection is not critical in terms of the controller parameters.

If you repeat the attempt, reduce TUN_DLMN or increase the setpoint step change.

Principle: The value of the manipulated variable used for tuning must be suitable for the setpoint step change.

Error estimating the delay time or order

The delay time (STATUS_H = 2x1xx or 2x3xx) or order (STATUS_H = 21xxx or 22xxx) were not acquired correctly. Operation continues with an estimate that can lead to non-optimum controller parameters.

Repeat the tuning procedure and ensure that disturbances do not occur at the process value.

Note

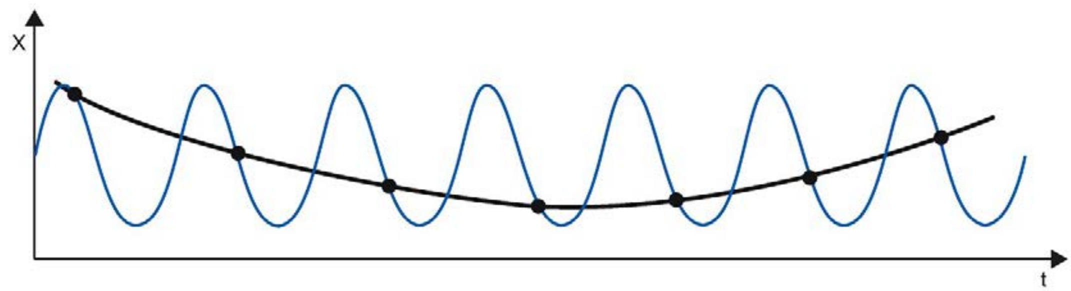
The special case of a PT1-only process is also indicated by STATUS_H = 2x1xx (TU <= 3*CYCLE). In this case, it is not necessary to repeat the attempt. Reduce the controller parameters if the control oscillates.

Quality of measuring signals (measurement noise, low-frequency interference)

The results of tuning can be distorted by measurement noise or by low-frequency interference. Note the following:

- If you encounter measurement noise, set the sampling frequency higher rather than lower. During one noise period, the process value should be sampled at least twice. In pulse mode, integrated mean value filtering can be helpful. This assumes, however, that the process variable PV is transferred to the instruction in the fast pulse cycle. The degree of noise should not exceed 5% of the useful signal change.
- High-frequency interference cannot be filtered out by TCONT_CP. This should be filtered earlier in the measuring sensor to prevent the aliasing effect.

  The following schematic illustrates the aliasing effect when the sampling time is too long:



- With low-frequency interference, it is relatively easy to ensure an adequately high sampling rate. However, the TCONT_CP must then generate a uniform measuring signal by having a large interval in the mean value filtering. Mean value filtering must extend over at least two noise periods. Internally in the block, this soon results in higher sampling times such that the accuracy of the tuning is adversely affected. Adequate accuracy is guaranteed with at least 40 noise periods up to the point of inflection.

  Possible remedy when repeating the attempt:

  Increase TUN_DLMN.

Overshoot

Overshoot can occur in the following situations:

Situation	Cause	Remedy
End of tuning	• Excitation by a too high manipulated value change compared with the setpoint step change (see above). • PI controller activated by PID_ON = FALSE.	• Increase the setpoint step change or reduce the manipulated value step change. • If the process permits a PID controller, start tuning with PID_ON = TRUE.
Tuning in phase 7	Initially, less aggressive controller parameters were determined (process type III); these can lead to an overshoot in phase 7.	-
Control mode	PI controller with PFAC_SP = 1.0 for process type I.	If the process permits a PID controller, start tuning with PID_ON = TRUE.

7.3.3.7 Performing pretuning

Requirements

- The instruction and the technology object are loaded on the CPU.

Procedure

To manually determine the optimum PID parameters for initial commissioning, follow these steps:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. Select "Pretuning" from the "Mode" drop-down list.

   TCONT_CP is ready for tuning.
3. In the "Output value jump" field, specify how much the output value should be increased.
4. Enter a setpoint in the "Setpoint" field. The output value jump only takes effect when another setpoint is entered.
5. Click the "Start tuning" icon.

   The pretuning starts. The status of the tuning is displayed.

7.3.3.8 Performing fine tuning

Requirements

- The instruction and the technology object are loaded on the CPU.

Procedure

To determine the optimal PID parameters at the operating point, follow these steps:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. Select "Fine tuning" from the "Mode" drop-down list.

   TCONT_CP is ready for tuning.
3. In the "Output value jump" field, specify how much the output value should be increased.
4. Click the "Start tuning" icon.

   Fine tuning starts. The status of the tuning is displayed.

7.3.3.9 Cancelling pretuning or fine tuning

To cancel pretuning or fine tuning, click on the ■ icon, "Stop tuning".

If the PID parameters have not yet been calculated and stored, TCONT_CP starts in automatic mode LMN = LMN0 + TUN_DLMN. If the controller was in manual mode before the tuning, the old manual manipulated variable is output.

If the calculated PID parameters have already been saved, TCONT_CP starts in automatic mode and works with the previously determined PID parameters.

7.3.3.10 Manual fine-tuning in control mode

The following measures can be employed to achieve an overshoot-free setpoint response:

Adapting the control zone

During tuning, "TCONT_CP" determines a control zone CON_ZONE and activated if the process type is suitable (process type I and II) and a PID controller is used (CONZ_ON = TRUE). In control mode, you can modify the control zone or switch it off completely (with CONZ_ON = FALSE).

Note

Activating the control zone with higher-order processes (process type III) does not normally provide any benefit since the control zone is then larger than the control range that can be achieved with a 100% manipulated variable. There is also no advantage in activating the control zone for PI controllers.

Before you switch on the control zone manually, make sure that the control zone is not too narrow. If the control zone is set too narrow, oscillations occur in the manipulated variable and the process value.

Continuous attenuation of the control response with PFAC_SP

The control response can be attenuated with the PFAC_SP parameter. This parameter specifies the percentage of proportional component that is effective for setpoint step changes.

Regardless of the process type, PFAC_SP is set to a default value of 0.8 by the tuning function; you can later modify this value if required. To limit overshoot during setpoint step changes (with otherwise correct controller parameters) to approximately 2%, the following values are adequate for PFAC_SP:

	Process type I	**Process type II**	**Process type III**
	Typical temperature process	Intermediate range	Higher-order temperature process
PI	0.8	0.82	0.8
PID	0.6	0.75	0.96

Adjust the default factor (0.8) in the following situations, in particular:

- Process type I with PID (0.8 →0.6): Setpoint step changes within the control zone still lead to approximately 18% overshoot with PFAC_SP = 0.8.
- Process type III with PID (0.8 →0.96): Setpoint step changes with PFAC_SP = 0.8 are attenuated too strongly. This leads to a significantly slower response time.

Attenuation of control parameters

When a closed-loop control circuit oscillates or if overshoot occurs after setpoint step changes, you can reduce the controller GAIN (e.g., to 80% of the original value) and increase integral time TI (e.g., to 150% of the original value). If the analog output value of the continuous controller is converted to binary actuating signals by a pulse shaper, quantization noise may cause minor permanent oscillation. You can eliminate this by increasing the controller deadband DEADB_W.

Modifying control parameters

Proceed as follows to modify control parameters:

1. Save the current parameters with SAVE_PAR.
2. Modify the parameters.
3. Test the control response.

If the new parameter settings are worse than the old ones, retrieve the old parameters with UNDO_PAR.

7.3.3.11 Performing fine tuning manually

Requirements

- The instruction and the technology object have been loaded to the CPU.

Procedure

To manually determine the optimal PID parameters, proceed as follows:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. Select "Manual" from the "Mode" drop-down list.
3. Enter the new PID parameters.
4. Click on the icon "Send parameter to CPU" in the "Tuning" group.
5. Select the "Change setpoint" check box in the "Current values" group.
6. Enter a new setpoint and click in the "Current Values" group on the icon .
7. Clear the "Manual mode" check box.

   The controller works with the new PID parameters and controls the new setpoint.
8. Check the quality of the PID parameter to check the curve points.
9. Repeat steps 3 to 8 until you are satisfied with the controller results.

7.4 TCONT_S

7.4.1 Technology object TCONT_S

The technology object TCONT_S provides a step controller for actuators with integrating behavior and is used to control technical temperature processes with binary output value output signals. The technology object corresponds to the instance data block of the TCONT_S instruction. The operating principle is based on the PI control algorithm of the sampling controller. The step controller operates without a position feedback signal. Both manual and automatic mode are possible.

S7-1500
All parameters and tags of the technology object are retentive and can only be changed during download to the device if you completely download TCONT_S.

Add technology objects (Page 41)

Configure technology objects (Page 42)

Downloading technology objects to device (Page 44)

TCONT_S (Page 514)

7.4.2 Configure controller difference TCONT_S

Use process value periphery

To use the input parameter PV_PER, proceed as follows:

1. Select the entry "Periphery" from the "Source" list.
2. Select the "sensor type".
   Depending on the sensor type, the process value is scaled according to different formulas.
   - Standard
     Thermoelements; PT100/NI100

     PV = 0.1 × PV_PER × PV_FAC + PV_OFFS
   - Cooling;
     PT100/NI100

     PV = 0.01 × PV_PER × PV_FAC + PV_OFFS
   - Current/voltage

     PV = 100/27648 × PV_PER × PV_FAC + PV_OFFS
3. Enter the factor and offset for the scaling of the process value periphery.

Use internal process values

To use the input parameter PV_IN, proceed as follows:

1. Select the entry "Internal" from the "Source" list.

Control deviation

Set a dead zone range under the following requirement:

- The process value signal is noisy.
- The controller gain is high.
- The derivative action is activated.

The noise component of the process value causes strong deviations of the output value in this case. The dead zone suppresses the noise component in the steady controller state. The dead zone range specifies the size of the dead zone. With a dead zone range of 0.0, the dead zone is turned off.

Mode of operation TCONT_S (Page 515)

7.4.3 Configure controller algorithm TCONT_S

General

1. Enter the "Sampling time PID algorithm".
   A controller sampling time should not exceed 10 % of the determined integral action time of the controller (TI).
2. If the controller structure contains a proportional action, enter the "proportional gain".
   A negative proportional gain inverts the rule meaning.

Proportional action

For changes of the setpoint, it may lead to overshooting of the proportional action. Through the weighting of the proportional action, you can select how strongly the proportional action should react when setpoint changes are made. The weakening of the proportional action is reached through a compensation of the integral action.

1. To weaken the proportional action for setpoint changes, enter a "Proportional action weighting".
   – 1.0: Proportional action for setpoint change is fully effective
   – 0.0: Proportional action for setpoint change is not effective

Integral action

1. If the controller structure contains an integral action, enter the "integral action time".
   With an integral action time of 0.0, the integral action is switched off.

Mode of operation TCONT_S (Page 515)

7.4.4 Configure manipulated value TCONT_S

Pulse generator

1. Enter the minimum impulse duration and minimum pause duration.
   The values must be greater than or equal to the cycle time for the input parameter CYCLE. The frequency of operation is reduced through this.
2. Enter the motor setting time.
   The value must be greater than or equal to the cycle time of the input parameter CYCLE.

Mode of operation TCONT_S (Page 515)

7.4.5 Commissioning TCONT_S

Requirements

- The instruction and the technology object have been loaded to the CPU.

Procedure

To manually determine the optimal PID parameters, proceed as follows:

1. Click the "Start" icon.

   If there is no online connection, this will be established. The current values for the setpoint, process value and output value are recorded.
2. Enter new PID parameters in the "P", "I" and weighting proportional action fields.
3. Click on the icon "Send parameter to CPU" in the "Tuning" group.
4. Select the "Change setpoint" check box in the "Current values" group.
5. Enter a new setpoint and click in the "Current Values" group on the icon .
6. Clear the "Manual mode" check box.

   The controller works with the new parameters and controls the new setpoint.
7. Check the quality of the PID parameter to check the curve points.
8. Repeat steps 2 to 6 until you are satisfied with the controller results.

8 Auxiliary functions

8.1 Polyline

Polyline

The Polyline instruction provides a function with the characteristic curve of the polyline whose points can be used, for example, to linearize the behavior of non-linear sensors.

The Polyline instruction can be used with an S7-1500 CPU Firmware 2.0 and higher and an S7-1200 CPU Firmware 4.2 and higher.

Additional information

Description Polyline (Page 525)

Operating principle Polyline (Page 529)

Input parameters of Polyline (Page 533)

Output parameters of Polyline (Page 533)

Static tags of Polyline (Page 534)

ErrorBits parameter (Page 536)

8.2 SplitRange

SplitRange

The SplitRange instruction splits the output value range of the PID controller into multiple subranges. These subranges enable control of a process that is influenced by multiple actuators.

The SplitRange instruction can be used with an S7-1500 CPU Firmware 2.0 and higher and an S7-1200 CPU Firmware 4.2 and higher.

Additional information

SplitRange description (Page 541)

SplitRange input parameters (Page 544)

SplitRange static tags (Page 545)

SplitRange output parameters (Page 544)

ErrorBits parameter (Page 546)

8.3 RampFunction

RampFunction

The RampFunction instruction limits the slew rate of a signal. A signal jump at the input is output as ramp function of the output value, to achieve a smoother response, for example, without influencing the disturbance reaction.

The RampFunction instruction can be used with an S7-1500 CPU Firmware 2.0 and higher and an S7-1200 CPU Firmware 4.2 and higher.

Instructions 9

9.1 PID_Compact

9.1.1 New features of PID_Compact

PID_Compact V2.4

- **Initialization of the integral action**

  PID_Compact now initializes the integral action if you use OverwriteInitialOutputValue together with inverted control logic.

  If you have been using OverwriteInitialOutputValue together with inverted control logic up to now, please note that the sign of the output value changes with PID_Compact V2.4.

PID_Compact V2.3

- **Response of the output value when switching from "Inactive" operating mode to "Automatic mode"**

  The new option IntegralResetMode = 4 was added and defined as default. With IntegralResetMode = 4, the integral action is automatically pre-assigned when switching from "Inactive" operating mode to "Automatic mode" so that a control deviation results in a jump of the output value with identical sign.

- **Initialization of the integral action in automatic mode**

  The integral action can be initialized in automatic mode with the tags OverwriteInitialOutputValue and PIDCtrl.PIDInit. This simplifies the use of PID_Compact for override controls.

PID_Compact V2.2

- **Use with S7-1200**

  As of PID_Compact V2.2, the instruction with V2 functionality can also be used on S7-1200 with firmware version 4.0 or higher.

PID_Compact V2.0

- **Reaction to error**

  The reaction to error has been completely overhauled. PID_Compact now reacts in a more fault-tolerant manner in the default setting. This reaction is set when copying PID_Compact V1.X from an S7-1200 CPU to an S7-1500 CPU.

NOTICE
Your system may be damaged. If you use the default setting, PID_Compact remains in automatic mode when the process value limits are exceeded. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

  The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred. Use ErrorAck to acknowledge the errors and warnings without restarting the controller or clearing the integral action. Switching operating modes no longer clears errors that are no longer pending.

  You can configure the reaction to error with SetSubstituteOutput and ActivateRecoverMode.

- **Substitute output value**

  You can configure a substitute output value that is to be output if an error occurs.

- **Switching the operating mode**

  You specify the operating mode at the Mode in/out parameter and use a rising edge at ModeActivate to start the operating mode. The sRet.i_Mode tag has been omitted.

- **Multi-instance capability**

  You can call up PID_Compact as multi-instance DB. No technology object is created in this case and no parameter assignment interface or commissioning interface is available. You must assign parameters for PID_Compact directly in the multi-instance DB and commission it via a watch table.

- **Startup characteristics**

  The operating mode specified at the Mode parameter is also started on a falling edge at Reset and during a CPU cold restart, if RunModeByStartup = TRUE.

- **ENO characteristics**

  ENO is set depending on the operating mode.

  If State = 0, then ENO = FALSE.

  If State ≠ 0, then ENO = TRUE.

- **Setpoint value specification during tuning**

  You configure the permitted fluctuation of the setpoint during tuning at the CancelTuningLevel tag.

- **Value range for output value limits**

  The value 0.0 no longer has to fall within the output value limits.
- **Pre-assigning the integral action**

  Using the tags IntegralResetMode and OverwriteInitialOutputValue, you can determine the pre-assignment of the integral action when switching from "Inactive" operating mode to "Automatic mode".
- **Switching a disturbance variable on**

  You can switch a disturbance variable on at the Disturbance parameter.
- **Default value of PID parameters**

  The following default settings have been changed:

  – Proportional action weighting (PWeighting) from 0.0 to 1.0

  – Derivative action weighting (DWeighting) from 0.0 to 1.0

  – Coefficient for derivative delay (TdFiltRatio) from 0.0 to 0.2
- **Renaming tags**

  The static tags have been given new names that are compatible with PID_3Step.

PID_Compact V1.2

- **Manual mode on CPU startup**

  If ManualEnable = TRUE when the CPU starts, PID_Compact starts in manual mode. A rising edge at ManualEnable is not necessary.
- **Pretuning**

  If the CPU is switched off during pretuning, pretuning starts again when the CPU is switched back on.

PID_Compact V1.1

- **Manual mode on CPU startup**

  When the CPU starts up, PID_Compact only switches to manual mode with a rising edge at ManualEnable. Without rising edge, PID_Compact starts in the last operating mode in which ManualEnable was FALSE.
- **Reaction to reset**

  A rising edge at Reset resets the errors and warnings and clears the integral action. A falling edge at Reset triggers a switchover to the most recently active operating mode.
- **Default of process value high limit**

  The default value of r_Pv_Hlm has been changed to 120.0.

- **Monitoring the sampling time**
  - An error is no longer output when the current sampling time is ≥ 1.5 x current mean value or when the current sampling time is ≤ 0.5 x current mean value. The sampling time may deviate much more in automatic mode.
  - PID_Compact is compatible with FW, V2.0 or higher.
- **Access to tags**

  The following tags can now be used in the user program.
  - i_Event_SUT
  - i_Event_TIR
  - r_Ctrl_Ioutv
- **Troubleshooting**

  PID_Compact now outputs the correct pulses when the shortest ON time is not equal to the shortest OFF time.

9.1.2 Compatibility with CPU and FW

The following table shows which version of PID_Compact can be used on which CPU.

CPU	FW	PID_Compact
S7-1200	V4.2 or higher	V2.3 V2.2 V1.2
	V4.0 to V4.1	V2.2 V1.2
	V3.x	V1.2 V1.1
	V2.x	V1.2 V1.1
	V1.x	V1.0
S7-1500	as of V2.5	V2.4 V2.3 V2.2 V2.1 V2.0
	V2.0 and V2.1	V2.3 V2.2 V2.1 V2.0
	V1.5 to V1.8	V2.2 V2.1 V2.0
	V1.1	V2.1 V2.0
	V1.0	V2.0

9.1.3 CPU processing time and memory requirement PID_Compact V2.x

CPU processing time

Typical CPU processing times of the PID_Compact technology object as of Version V2.0, depending on CPU type.

CPU	Typ. CPU processing time PID_Compact V2.x
CPU 1211C ≥ V4.0	300 µs
CPU 1215C ≥ V4.0	300 µs
CPU 1217C ≥ V4.0	300 µs
CPU 1505S ≥ V1.0	45 µs
CPU 1510SP-1 PN ≥ V1.6	85 µs
CPU 1511-1 PN ≥ V1.5	85 µs
CPU 1512SP-1 PN ≥ V1.6	85 µs
CPU 1516-3 PN/DP ≥ V1.5	50 µs
CPU 1518-4 PN/DP ≥ V1.5	4 µs

Memory requirement

Memory requirement of an instance DB of the PID_Compact technology object as of Version V2.0.

Memory requirement	Memory requirement of the instance DB of PID_Compact V2.x
Load memory requirement	Approx. 12000 bytes
Total work memory requirement	788 bytes
Retentive work memory requirement	44 bytes

9.1.4 PID_Compact V2

9.1.4.1 Description of PID_Compact V2

Description

The PID_Compact instruction provides a PID controller with integrated tuning for actuators with proportional action.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Substitute output value with error monitoring

For a more detailed description of the operating modes, see the State parameter.

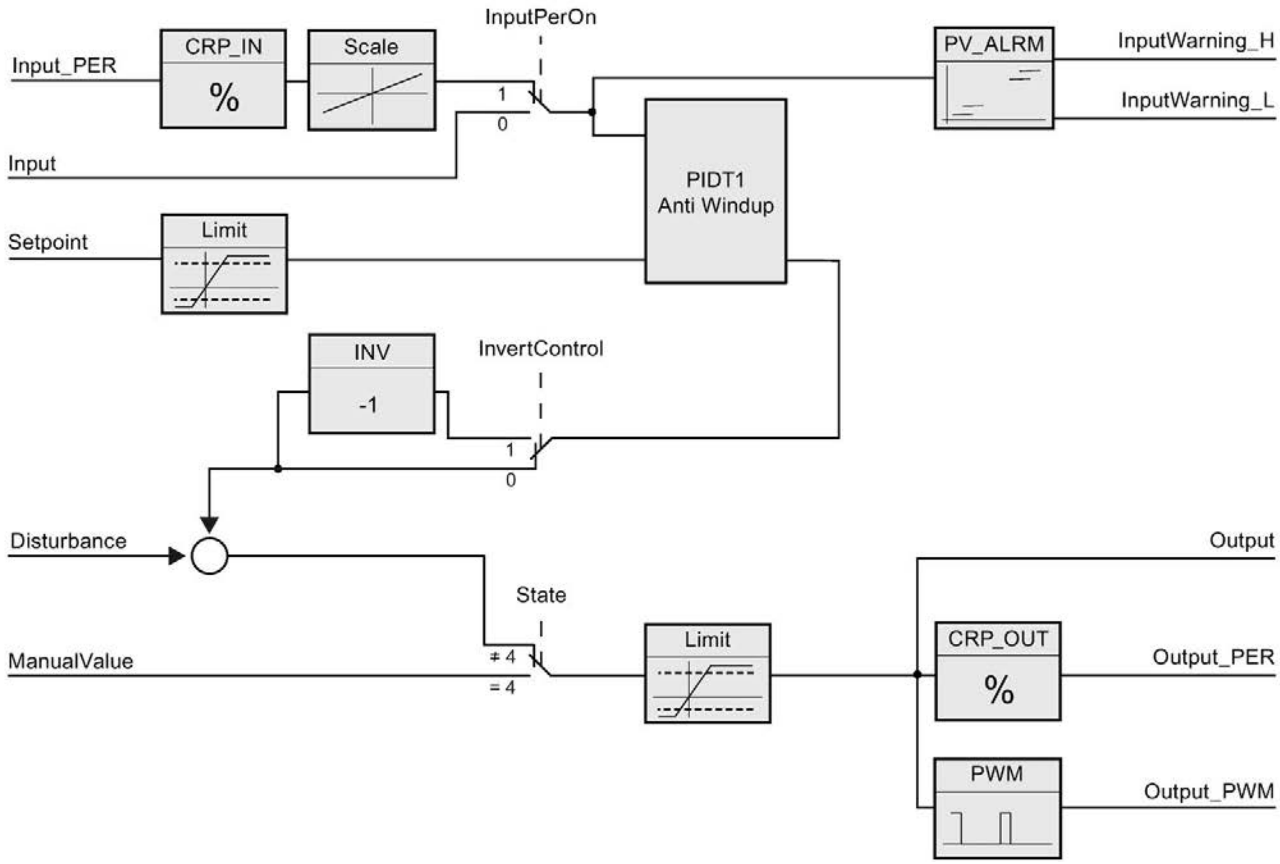
PID algorithm

PID_Compact is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The PID algorithm operates according to the following equation:

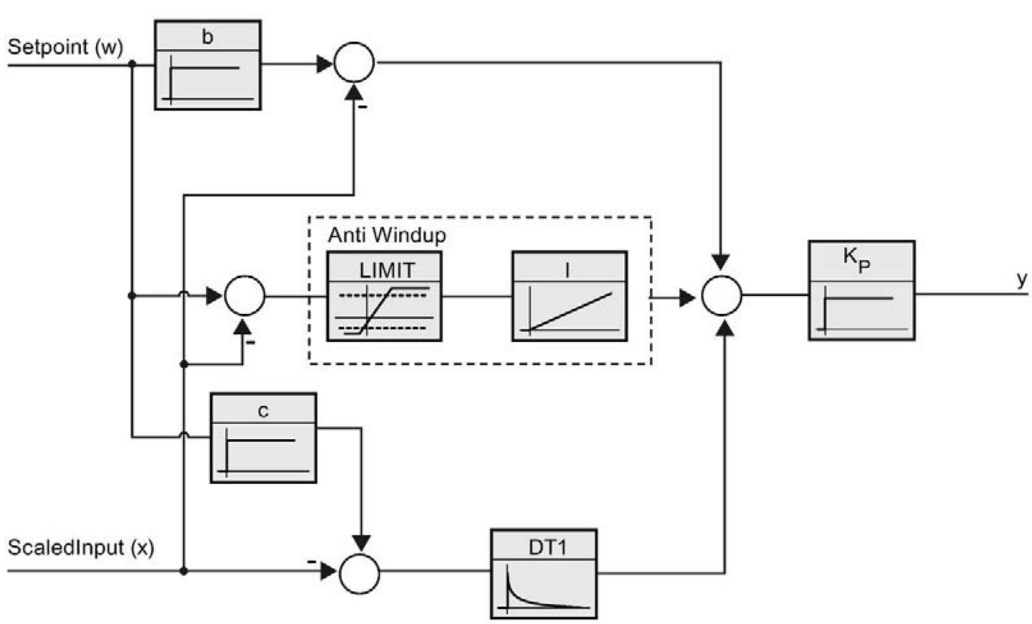
$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
T_D	Derivative action time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
c	Derivative action weighting

Block diagram of PID_Compact



Block diagram of PIDT1 with anti-windup



Call

PID_Compact is called in the constant time scale of a cycle interrupt OB.

If you call PID_Compact as a multi-instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for PID_Compact directly in the multi-instance DB and commission it via a watch table.

Download to device

The actual values of retentive variables are only updated when you download PID_Compact completely.

Downloading technology objects to device (Page 44)

Startup

When the CPU starts up, PID_Compact starts in the operating mode that is saved in the Mode in/out parameter. To switch to "Inactive" operating mode during startup, set RunModeByStartup = FALSE.

Reaction to error

In automatic mode and during commissioning, the reaction to error depends on the SetSubstituteOutput and ActivateRecoverMode variables. In manual mode, the reaction is independent of SetSubstituteOutput and ActivateRecoverMode. If ActivateRecoverMode = TRUE, the reaction additionally depends on the error that occurred.

SetSubstitute-Output	Acti-vateRecov-erMode	Configuration editor > output value > Set Output to	Reaction
Not relevant	FALSE	Zero (inactive)	Switch to "Inactive" mode (State = 0) The value 0.0 0 is transferred to the actuator.
FALSE	TRUE	Current output value while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The current output value is transferred to the actuator while the error is pending.
TRUE	TRUE	Substitute output value while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The value at SubstituteOutput is transferred to the actuator while the error is pending.

In manual mode, PID_Compact uses ManualValue as output value, unless ManualValue is invalid. If ManualValue is invalid, SubstituteOutput is used. If ManualValue and SubstituteOutput are invalid, Config.OutputLowerLimit is used.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is reset by a rising edge at Reset or ErrorAck.

9.1.4.2 Mode of operation of PID_Compact V2

Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0001h).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warning = 0040h), and the InputWarning_H or InputWarning_L output parameter changes to TRUE.

Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID_Compact automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID_Compact checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit_H or SetpointLimit_L is set to TRUE.

The setpoint is limited in all operating modes.

Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit tags. Output, ManualValue and SubstituteOutput are limited to these values. The output value limits must match the control logic.

The valid output value limit values depend on the Output used.

Output	-100.0 to 100.0%
Output_PER	-100.0 to 100.0%
Output_PWM	0.0 to 100.0%

Rule:

OutputUpperLimit > OutputLowerLimit

Note

Use with two or more actuators

PID_Compact is not suitable for use with two or more actuators (for example, in heating/cooling applications), because different actuators need different PID parameters to achieve a good control response. Use PID_Temp for applications with two actuators acting in opposite directions.

Substitute output value

In the event of an error, PID_Compact can output a substitute output value that you define at the SubstituteOutput tag. The substitute output value must be within the output value limits.

Monitoring signal validity

The values of the following parameters are monitored for validity when used:

- Setpoint
- Input
- Input_PER
- Disturbance
- ManualValue
- SubstituteOutput
- Output
- Output_PER
- Output_PWM

Monitoring of the sampling time PID_Compact

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID_Compact instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (Error = 0800h).

The error occurs during tuning if:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value

The error occurs in automatic mode if:

- New mean value >= 1.5 x old mean value
- New mean value <= 0.5 x old mean value

If you deactivate the sampling time monitoring (CycleTime.EnMonitoring = FALSE), you can also call PID_Compact in OB1. You must then accept a lower control quality due to the deviating sampling time.

Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_Compact are executed at every call.

If you use Output_PWM, the accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The cycle time should be at least 10 times the PID algorithm sampling time.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID_Compact does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

9.1.4.3 Input parameters of PID_Compact V2

Table 9- 1 Input parameters of PID_Compact V2

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A tag of the user program is used as source for the process value. If you are using parameter Input, then Config.InputPerOn = FALSE must be set.
Input_PER	INT	0	An analog input is used as the source of the process value. If you are using parameter Input_PER, then Config.InputPerOn = TRUE must be set.
Disturbance	REAL	0.0	Disturbance variable or precontrol value
ManualEnable	BOOL	FALSE	• A FALSE -> TRUE edge activates "manual mode", while State = 4, Mode remains unchanged. As long as ManualEnable = TRUE, you cannot change the operating mode via a rising edge at ModeActivate or use the commissioning dialog. • A TRUE -> FALSE edge activates the operating mode that is specified by Mode. We recommend that you change the operating mode using ModeActivate only.
ManualValue	REAL	0.0	Manual value This value is used as the output value in manual mode. Values from Config.OutputLowerLimit to Config .OutputUpperLimit are permitted.
ErrorAck	BOOL	FALSE	• FALSE -> TRUE edge ErrorBits and Warning are reset.

Parameter	Data type	Default	Description
Reset	BOOL	FALSE	Restarts the controller. • FALSE -> TRUE edge – Switch to "Inactive" mode – ErrorBits and Warnings are reset. • As long as Reset = TRUE, – PID_Compact remains in "Inactive" mode (State = 0). – You cannot change the operating mode with Mode and ModeActivate or ManualEnable. – You cannot use the commissioning dialog. • TRUE -> FALSE edge – If ManualEnable = FALSE, PID_Compact switches to the operating mode that is saved in Mode. – If Mode = 3, the integral action is treated as configured with the tag IntegralResetMode.
ModeActivate	BOOL	FALSE	• FALSE -> TRUE edge PID_Compact switches to the operating mode that is saved in the Mode parameter.

9.1.4.4 Output parameters of PID_Compact V2

Table 9- 2 Output parameters of PID_Compact V2

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
The "Output", "Output_PER", and "Output_PWM" outputs can be used concurrently.			
Output	REAL	0.0	Output value in REAL format
Output_PER	INT	0	Analog output value
Output_PWM	BOOL	FALSE	Pulse-width-modulated output value The output value is formed by by variable On and Off times.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached (Setpoint ≥ Config.SetpointUpperLimit). The setpoint is limited to Config.SetpointUpperLimit .
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached (Setpoint ≤ Config.SetpointLowerLimit). The setpoint is limited to Config.SetpointLowerLimit .
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.
State	INT	0	The State parameter (Page 278) shows the current operating mode of the PID controller. You can change the operating mode using the input parameter Mode and a rising edge at ModeActivate. • State = 0: Inactive • State = 1: Pretuning • State = 2: Fine tuning • State = 3: Automatic mode • State = 4: Manual mode • State = 5: Substitute output value with error monitoring
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending in this cycle.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 282) shows which error messages are pending. ErrorBits is retentive and is reset upon a rising edge at Reset or ErrorAck.

9.1.4.5 In/out parameters of PID_Compact V2

Table 9- 3 In/out parameters of PID_Compact V2

Parameter	Data type	Default	Description
Mode	INT	4	At Mode, specify the operating mode to which PID_Compact is to switch. Options are: • Mode = 0: Inactive • Mode = 1: Pretuning • Mode = 2: Fine tuning • Mode = 3: Automatic mode • Mode = 4: Manual mode The operating mode is activated by: • Rising edge at ModeActivate • Falling edge at Reset • Falling edge at ManualEnable • Cold restart of CPU if RunModeBy-Startup = TRUE Mode is retentive. A detailed description of the operating modes can be found in Parameters State and Mode V2 (Page 278).

Parameters State and Mode V2 (Page 278)

9.1.4.6 Static tags of PID_Compact V2

Note

Change the tags identified with (1) only in "Inactive" mode to prevent malfunction of the PID controller.

Tag	Data type	Default	Description
IntegralResetMode	INT	Up to V2.2: 1, V2.3 or higher: 4	The IntegralResetMode V2 tag (Page 287) determines how the integral actionPIDCtrl.IntegralSum is pre-assigned when switching from "Inactive" operating mode to "Automatic mode". This setting only works for one cycle. Options are: • IntegralResetMode = 0: Smooth • IntegralResetMode = 1: Delete • IntegralResetMode = 2: Hold • IntegralResetMode = 3: Pre-assign • IntegralResetMode = 4: Like setpoint change (only for PID_Compact with version ≥ 2.3)
OverwriteInitialOutputValue	REAL	0.0	If one of the following conditions is met, the integral action PIDCtrl.IntegralSum is pre-assigned automatically as if Output = OverwriteInitialOutputValue in the previous cycle: • IntegralResetMode = 3 when switching from "Inactive" operating mode to "Automatic mode". • TRUE -> FALSE edge at parameter Reset and parameter Mode = 3 • PIDCtrl.PIDInit = TRUE in "Automatic mode" (available as of PID_Compact version 2.3)
RunModeByStartup	BOOL	TRUE	Activate operating mode at Mode parameter after CPU restart If RunModeByStartup = TRUE, PID_Compact starts in the operating mode saved in the Mode parameter after CPU startup. If RunModeByStartup = FALSE, PID_Compact remains in "Inactive" mode after CPU startup.
LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded. The set was saved prior to the last tuning. LoadBackUp is automatically set back to FALSE.
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., ºC, or ºF.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature.
ActivateRecoverMode	BOOL	TRUE	The Tag ActivateRecoverMode V2 (Page 284) determines the reaction to error.

Tag	Data type	Default	Description
Warning	DWORD	0	Tag Warning V2 (Page 286) shows the warnings since Reset = TRUE or ErrorAck =TRUE. Warning is retentive.
Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
CurrentSetpoint	REAL	0.0	CurrentSetpoint always displays the current setpoint. This value is frozen during tuning.
CancelTuningLevel	REAL	10.0	Permissible fluctuation of setpoint during tuning. Tuning is not canceled until: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel
SubstituteOutput	REAL	0.0	Substitute output value When the following conditions are met, the substitute output value is used: • An error has occurred in automatic mode. • SetSubstituteOutput = TRUE • ActivateRecoverMode = TRUE
SetSubstituteOutput	BOOL	TRUE	If SetSubstituteOutput = TRUE and ActivateRecoverMode = TRUE, the substitute output value configured is output as long as an error is pending. If SetSubstituteOutput = FALSE and ActivateRecoverMode = TRUE, the actuator remains at the current output value as long as an error is pending. If ActivateRecoverMode = FALSE, SetSubstituteOutput is not effective. If SubstituteOutput is invalid (ErrorBits = 20000h), the substitute output value cannot be output.
Config.InputPerOn(1)	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.InvertControl(1)	BOOL	FALSE	Invert control logic If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.
Config.InputUpperLimit(1)	REAL	120.0	High limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). This pre-assignment ensures that an error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_Compact reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit

Tag	Data type	Default	Description
Config.InputLowerLimit(1)	REAL	0.0	Low limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. InputLowerLimit < InputUpperLimit
Config.InputUpperWarning(1)	REAL	3.402822e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit
Config.InputLowerWarning(1)	REAL	-3.402822e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit(1)	REAL	100.0	High limit of output value For details, see OutputLowerLimit OutputUpperLimit > OutputLowerLimit
Config.OutputLowerLimit(1)	REAL	0.0	Low limit of output value For Output and Output_PER, the range of values from -100.0 to +100.0, including zero, is valid. At -100.0, Output_PER = -27648; at +100.0, Output_PER = 27648. For Output_PWM, the value range 0.0 to +100.0 applies. The output value limits must match the control logic. OutputLowerLimit < OutputUpperLimit
Config.SetpointUpperLimit(1)	REAL	3.402822e+38	High limit of setpoint If you configure SetpointUpperLimit outside the process value limits, the configured process value absolute high limit is used as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.
Config.SetpointLowerLimit(1)	REAL	-3.402822e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured process value absolute low limit is used as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.

Tag	Data type	Default	Description
Config.MinimumOnTime(1)	REAL	0.0	The minimum ON time of the pulse width modulation in seconds is rounded to MinimumOnTime = n×CycleTime.Value
Config.MinimumOffTime(1)	REAL	0.0	The minimum OFF time of the pulse width modulation in seconds is rounded to MinimumOffTime = n×CycleTime.Value
Config.InputScaling.UpperPointIn(1)	REAL	27648.0	Scaling Input_PER high Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling.LowerPointIn(1)	REAL	0.0	Scaling Input_PER low Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling .UpperPointOut(1)	REAL	100.0	Scaled high process value Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
Config.InputScaling .LowerPointOut(1)	REAL	0.0	Scaled low process value Input_PER is converted to percent based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn.
CycleTime.StartEstimation	BOOL	TRUE	If CycleTime.StartEstimation = TRUE, the automatic determination of the cycle time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If CycleTime.EnEstimation = TRUE, the PID_Compact sampling time is calculated. If CycleTime.EnEstimation = FALSE, the PID_Compact sampling time is not calculated and you need to correct the configuration of CycleTime.Value manually.
CycleTime.EnMonitoring	BOOL	TRUE	If CycleTime.EnMonitoring = FALSE, the PID_Compact sampling time is not monitored. If it is not possible to execute PID_Compact within the sampling time, no error (ErrorBits=0800h) is output and PID_Compact does not switch to "Inactive" mode.
CycleTime.Value(1)	REAL	0.1	PID_Compact sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain You can reload values from the CtrlParamsBackUp structure with LoadBackUp = TRUE.
CtrlParamsBackUp.Ti	REAL	20.0	Saved integral action time [s]
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time [s]
CtrlParamsBackUp.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient
CtrlParamsBackUp.PWeighting	REAL	1.0	Saved proportional action weighting factor

Tag	Data type	Default	Description
CtrlParamsBackUp.DWeighting	REAL	1.0	Saved derivative action weighting factor
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm
PIDSelfTune.SUT.CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If SUT.CalculateParams = TRUE, the parameters for pretuning are recalculated according to these properties. This enables you to change the parameter calculation method without having to repeat controller tuning. SUT.CalculateParams is set to FALSE after the calculation.
PIDSelfTune.SUT.TuneRule	INT	0	Methods used to calculate parameters during pretuning: • SUT.TuneRule = 0: PID according to Chien, Hrones and Reswick • SUT.TuneRule = 1: PI according to Chien, Hrones and Reswick
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretuning: • State = 0: Initialize pretuning • State = 100: Calculate the standard deviation • State = 200: Find the point of inflection • State = 9900: Pretuning successful • State = 1: Pretuning not successful
PIDSelfTune.TIR.RunIn	BOOL	FALSE	With the RunIn tag, you can specify that fine tuning can also be performed without pretuning. • RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If the requirements for pretuning are not met, PID_Compact reacts as if RunIn = TRUE. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_Compact switches to the mode from which tuning was started. • RunIn = TRUE The pretuning is skipped. PID_Compact tries to reach the setpoint with minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. RunIn is set to FALSE after fine tuning.

Tag	Data type	Default	Description
PIDSelfTune.TIR.CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If TIR.CalculateParams = TRUE, the parameters for fine tuning are recalculated according to these properties. This enables you to change the parameter calculation method without having to repeat controller tuning. TIR.CalculateParams is set to FALSE after the calculation.
PIDSelfTune.TIR.TuneRule	INT	0	Methods used to calculate parameters during fine tuning: • TIR.TuneRule = 0: PID automatic • TIR.TuneRule = 1: PID fast • TIR.TuneRule = 2: PID slow • TIR.TuneRule = 3: Ziegler-Nichols PID • TIR.TuneRule = 4: Ziegler-Nichols PI • TIR.TuneRule = 5: Ziegler-Nichols P
PIDSelfTune.TIR.State	INT	0	The TIR.State tag indicates the current phase of fine tuning: • State = -100 Fine tuning is not possible. Pretuning will be performed first. • State = 0: Initialize fine tuning • State = 200: Calculate the standard deviation • State = 300: Attempt to reach setpoint • State = 400: Attempt to reach setpoint with existing PID parameters (if pretuning was successful) • State = 500: Determine oscillation and calculate parameters • State = 9900: Fine tuning successful • State = 1: Fine tuning not successful
PIDCtrl.IntegralSum(1)	REAL	0.0	Current integral action
PIDCtrl.PIDInit	BOOL	FALSE	PIDCtrl.PIDInit is available as of PID_Compact version 2.3. If PIDCtrl.PIDInit = TRUE in "Automatic mode", the integral action PIDCtrl.IntegralSum is pre-assigned automatically as if Output = OverwriteInitialOutputValue in the previous cycle. This can be used for a Override control with PID_Compact V2 (Page 93).
Retain.CtrlParams.Gain(1)	REAL	1.0	Active proportional gain To invert the control logic, use the Config.InvertControl tag. Negative values at Gain also invert the control logic. We recommend you use only InvertControl to set the control logic. The control logic is also inverted if InvertControl = TRUE and Gain < 0.0. Gain is retentive.

Tag	Data type	Default	Description
Retain.CtrlParams.Ti(1)	REAL	20.0	• CtrlParams.Ti > 0.0: Active integral action time • CtrlParams.Ti = 0.0: Integral action is deactivated Ti is retentive.
Retain.CtrlParams.Td(1)	REAL	0.0	• CtrlParams.Td > 0.0: Active derivative action time • CtrlParams.Td = 0.0: Derivative action is deactivated Td is retentive.
Retain.CtrlParams.TdFiltRatio(1)	REAL	0.2	Active derivative delay coefficient The derivative delay coefficient delays the effect of the derivative action. Derivative delay = derivative action time × derivative delay coefficient • 0.0: Derivative action is effective for one cycle only and therefore almost not effective. • 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant. • > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed. TdFiltRatio is retentive.
Retain.CtrlParams.PWeighting(1)	REAL	1.0	Active proportional action weighting The proportional action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Proportional action for setpoint change is fully effective • 0.0: Proportional action for setpoint change is not effective The proportional action is always fully effective when the process value is changed. PWeighting is retentive.

Tag	Data type	Default	Description
Retain.CtrlParams.DWeighting(1)	REAL	1.0	Active derivative action weighting The derivative action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Derivative action is fully effective upon set-point change • 0.0: Derivative action is not effective upon set-point change The derivative action is always fully effective when the process value is changed. DWeighting is retentive.
Retain.CtrlParams.Cycle(1)	REAL	1.0	Active sampling time of the PID algorithm CtrlParams.Cycle is calculated during tuning and rounded to an integer multiple of CycleTime .Value.CtrlParams.Cycle is used as time period of the pulse width modulation. Cycle is retentive.

9.1.4.8 Parameters State and Mode V2

Correlation of the parameters

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

With a rising edge at ModeActivate, PID_Compact switches to the operating mode saved in the Mode in-out parameter.

When the CPU is switched on or switches from Stop to RUN mode, PID_Compact starts in the operating mode that is saved in the Mode parameter. To leave PID_Compact in "Inactive" mode, set RunModeByStartup = FALSE.

Meaning of values

State / Mode	Description of operating mode
0	Inactive In "Inactive" operating mode, the output value 0.0 is always output, regardless of Config.OutputUpperLimit and Config.OutputLowerLimit. Pulse width modulation is off.
1	Pretuning The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning. Pretuning requirements: • Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3) • ManualEnable = FALSE • Reset = FALSE • The process value must not be too close to the setpoint. |Setpoint - Input| > 0.3 * | Config.InputUpperLimit - Config.InputLowerLimit| and |Setpoint - Input| > 0.5 * |Setpoint| • The setpoint and the process value lie within the configured limits. The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp. The controller switches to automatic mode following successful pretuning. If pretuning is unsuccessful, the switchover of the operating mode is dependent on ActivateRecoverMode. The phase of pretuning is indicated with PIDSelfTune.SUT.State.

State / Mode	Description of operating mode
2	Fine tuning Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are recalculated based on the amplitude and frequency of this oscillation. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning. PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp. Requirements for fine tuning: • No disturbances are expected. • The setpoint and the process value lie within the configured limits. • ManualEnable = FALSE • Reset = FALSE • Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode Fine tuning proceeds as follows when started from: • Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_Compact controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. • Inactive (State = 0) or manual mode (State = 4) If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If the process value for pretuning is already too near the setpoint or PIDSelfTune.TIR.RunIn = TRUE, an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Only then will fine tuning start. The controller switches to automatic mode following successful fine tuning. If fine tuning is unsuccessful, the switchover of the operating mode is dependent on ActivateRecoverMode. The "Fine tuning" phase is indicated with PIDSelfTune.TIR.State.
3	Automatic mode In automatic mode, PID_Compact corrects the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is fulfilled: • Pretuning successfully completed • Fine tuning successfully completed • Changing of the Mode in-out parameter to the value 3 and a rising edge at ModeActivate. The switchover from automatic mode to manual mode is only bumpless if carried out in the commissioning editor. The ActivateRecoverMode tag is taken into consideration in automatic mode.

<table>
<tr><th>State / Mode</th><th>Description of operating mode</th></tr>
<tr><td>4</td><td>Manual mode
In manual mode, you specify a manual output value in the ManualValue parameter.
You can also activate this operating mode using ManualEnable = TRUE. We recommend that you change the operating mode using Mode and ModeActivate only.
The switchover from manual mode to automatic mode is bumpless. Manual mode is also possible when an error is pending.</td></tr>
<tr><td>5</td><td>Substitute output value with error monitoring
The control algorithm is deactivated. The SetSubstituteOutput tag determines which output value is output in this operating mode.
• SetSubstituteOutput = FALSE: Last valid output value
• SetSubstituteOutput = TRUE: Substitute output value
You cannot activate this operating mode using Mode = 5.
In the event of an error, it is activated instead of "Inactive" operating mode if all the following conditions are met:
• Automatic mode (Mode = 3)
• ActivateRecoverMode = TRUE
• One or more errors have occurred in which ActivateRecoverMode is effective.
As soon as the errors are no longer pending, PID_Compact switches back to automatic mode.</td></tr>
</table>

ENO characteristics

If State = 0, then ENO = FALSE.

If State ≠ 0, then ENO = TRUE.

Automatic switchover of operating mode during commissioning

Automatic mode is activated following successful pretuning or fine tuning. The following table shows how Mode and State change during successful pretuning.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning successfully completed
n	3	3	Automatic mode is started

PID_Compact automatically switches the operating mode in the event of an error. The following table shows how Mode and State change during pretuning with errors.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning canceled
n	4	4	Manual mode is started

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated. At the start of pretuning or fine tuning, PID_Compact has saved the value of State in the Mode in/out parameter. PID_Compact therefore switches to the operating mode from which tuning was started.

If ActivateRecoverMode = FALSE, the system switches to "Inactive" operating mode.

Output parameters of PID_Compact V2 (Page 266)

9.1.4.9 Parameter ErrorBits V2

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 0003h, for example, indicates that the errors 0001h and 0002h are pending simultaneously.

In manual mode, PID_Compact uses ManualValue as output value. The exception is Errorbits = 10000h.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. • Input > Config.InputUpperLimit or • Input < Config.InputLowerLimit If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0004	Error during fine tuning. Oscillation of the process value could not be maintained. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0008	Error at start of pretuning. The process value is too close to the setpoint. Start fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0010	The setpoint was changed during tuning. You can set the permitted fluctuation of the setpoint at the CancelTuningLevel tag. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0020	Pretuning is not permitted during fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact remains in fine tuning mode.
0080	Error during pretuning. The output value limits are not configured correctly or the actual value does not react as expected. Check whether the limits of the output value are configured correctly and match the control logic. Also make sure that the actual value does not oscillate strongly before starting pretuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0100	Error during fine tuning resulted in invalid parameters. If ActivateRecoverMode = TRUE before the error occurred, PID_Compact cancels the tuning and switches to the operating mode that is saved in the Mode parameter.

ErrorBits (DW#16#...)	Description
0200	Invalid value at "Input" parameter: Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0400	Calculation of output value failed. Check the PID parameters. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
0800	Sampling time error: PID_Compact is not called within the sampling time of the cyclic interrupt OB. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter. If this error occurred during simulation with PLCSIM, see the notes under Simulating PID_Compact V2 with PLCSIM (Page 97).
1000	Invalid value at "Setpoint" parameter: Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact outputs the configured substitute output value. As soon as the error is no longer pending, PID_Compact switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Compact switches to the operating mode that is saved in the Mode parameter.
10000	Invalid value at ManualValue parameter. Value has an invalid number format. If ActivateRecoverMode = TRUE before an error occurred, PID_Compact uses SubstituteOutput as the output value. As soon as you specify a valid value in ManualValue, PID_Compact uses it as the output value.
20000	Invalid value at SubstituteOutput tag. Value has an invalid number format. PID_Compact uses the output value low limit as the output value. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_Compact switches back to automatic mode.
40000	Invalid value at Disturbance parameter. Value has an invalid number format. If automatic mode was active and ActivateRecoverMode = TRUE before the error occurred, Disturbance is set to zero. PID_Compact remains in automatic mode. If pretuning or fine tuning mode was active and ActivateRecoverMode = TRUE before the error occurred, PID_Compact switches to the operating mode saved in the Mode parameter. If Disturbance in the current phase has no effect on the output value, tuning is not be canceled.

9.1.4.10 Tag ActivateRecoverMode V2

The ActivateRecoverMode tag determines the reaction to error. The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred.

Automatic mode

NOTICE
Your system may be damaged. If ActivateRecoverMode = TRUE, PID_Compact remains in automatic mode even if there is an error and the process limit values are exceeded. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

ActivateRecov-erMode	Description
FALSE	PID_Compact automatically switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	If errors occur frequently in automatic mode, this setting has a negative effect on the control response, because PID_Compact switches between the calculated output value and the substitute output value at each error. In this case, check the ErrorBits parameter and eliminate the cause of the error. If one or more of the following errors occur, PID_Compact stays in automatic mode: • 0001h: The "Input" parameter is outside the process value limits. • 0800h: Sampling time error • 40000h: Invalid value at parameter Disturbance. If one or more of the following errors occur, PID_Compact switches to "Substitute output value with error monitoring" mode: • 0002h: Invalid value at Input_PER parameter. • 0200h: Invalid value at Input parameter. • 0400h: Calculation of output value failed. • 1000h: Invalid value at Setpoint parameter. If the following error occurs, PID_Compact switches to "Substitute output value with error monitoring" mode and moves the actuator to Config.OutputLowerLimit: • 20000h: Invalid value at SubstituteOutput tag. Value has an invalid number format. This characteristics are independent of SetSubstituteOutput. As soon as the errors are no longer pending, PID_Compact switches back to automatic mode.

Pretuning and fine tuning

ActivateRecov-erMode	Description
FALSE	PID_Compact automatically switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	If the following error occurs, PID_Compact remains in the active mode: • 0020h: Pretuning is not permitted during fine tuning. The following errors are ignored: • 10000h: Invalid value at ManualValue parameter. • 20000h: Invalid value at SubstituteOutput tag. When any other error occurs, PID_Compact cancels the tuning and switches to the mode from which tuning was started.

Manual mode

ActivateRecoverMode is not effective in manual mode.

9.1.4.11 Tag Warning V2

If several warnings are pending simultaneously, the values of the Warning tag are displayed with binary addition. The display of warning 0003h, for example, indicates that the warnings 0001h and 0002h are pending simultaneously.

Warning (DW#16#....)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. Instead, the PID parameters were calculated using the TIR.TuneRule = 3 method.
0010	The operating mode could not be changed because Reset = TRUE or ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The specified rule for tuning is not supported. No PID parameters are calculated.
1000	The substitute output value cannot be reached because it is outside the output value limits.

The following warnings are deleted as soon as the cause is eliminated:

- 0001h
- 0004h
- 0008h
- 0040h
- 0100h

All other warnings are cleared with a rising edge at Reset or ErrorAck.

9.1.4.12 IntegralResetMode V2 tag

The IntegralResetMode tag determines how the integral action PIDCtrl.IntegralSum is pre-assigned:

- When switching from "Inactive" operating mode to "Automatic mode"
- With edge TRUE -> FALSE at parameter Reset and parameter Mode = 3

This setting only works for one cycle and is only effective if the integral action is activated (Retain.CtrlParams.Ti > 0.0 tag).

IntegralReset-Mode	Description
0	Smooth The value of PIDCtrl.IntegralSum is pre-assigned so that the switchover is bumpless, which means "Automatic mode" starts with the output value = 0.0 (parameter Output) and there is no jump of the output value regardless of the control deviation (setpoint – actual value).
1	Delete We recommend setting the weighting of the proportional action (Retain.CtrlParams.PWeighting) to 1.0 if this option is used. The value of PIDCtrl.IntegralSum is deleted. Any control deviation will cause a jump change of the output value. The direction of the output value jump depends on the configured weighting of the proportional action (Retain.CtrlParams.PWeighting tag) and the control deviation: • Proportional action weighting = 1.0: Output value jump and control deviation have identical signs. Example: If the actual value value is smaller than the setpoint (positive control deviation), the output value jumps to a positive value. • Proportional action weighting < 1.0: For large control deviations, the output value jump and control deviation have identical signs. Example: If the actual value is much smaller than the setpoint (positive control deviation), the output value jumps to a positive value. For small control deviations, the output value jump and control deviation have different signs. Example: If the actual value value is just below the setpoint (positive control deviation), the output value jumps to a negative value. This is usually not desirable, because it results in a temporary increase in the control deviation. The smaller the configured weighting of the proportional action, the greater the control deviation must be to receive an output value jump with identical sign. We recommend setting the weighting of the proportional action (Retain.CtrlParams.PWeighting) to 1.0 when this option is used. Otherwise, you may experience the undesirable behavior described for small control deviations. Alternatively, you can also use IntegralResetMode = 4. This option guarantees identical signs of the output value jump and control deviation independent of the configured weighting of the proportional action and the control deviation.
2	Hold The value of PIDCtrl.IntegralSum is not changed. You can define a new value using the user program.

IntegralReset-Mode	Description
3	Pre-assign The value of PIDCtrl.IntegralSum is automatically pre-assigned as if Output = OverwriteInitialOutput-Value in the last cycle.
4	Like setpoint change (only for PID_Compact with version ≥ 2.3) The value of PIDCtrl.IntegralSum is automatically pre-assigned so that a similar output value jump results as for a PI controller in automatic mode in case of a setpoint change from the current actual value to the current setpoint. Any control deviation will cause a jump of the output value. Output value jump and control deviation have identical signs. Example: If the actual value value is smaller than the setpoint (positive control deviation), the output value jumps to a positive value. This is independent of the configured weighting of the proportional action and the control deviation.

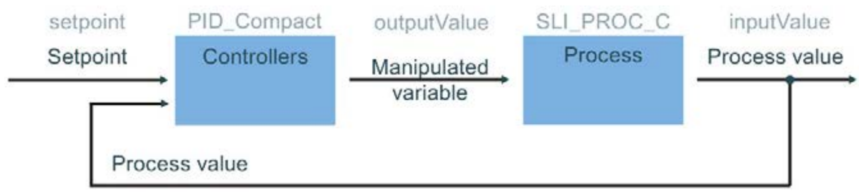
If IntegralResetMode is assigned a value outside the valid value range, PID_Compact behaves as with the pre-assignment of IntegralResetMode:

- PID_Compact up to V2.2: IntegralResetMode = 1
- PID_Compact V2.3 and higher: IntegralResetMode = 4

All statements made above regarding the sign of the output value jump are based on a normal control logic (Config.InvertControl = FALSE tag). With an inverted control logic (Config.InvertControl = TRUE), the output value jump will have a reverse sign.

9.1.4.13 Sample program for PID_Compact

In the following example, you are controlling temperature values with the technology object of the instruction "PID_Compact". The temperature values are simulated based on a block which simulates a delay element of the third order (PT3 element). The PID parameters of the technology object can be set automatically via the pretuning.



Data storage

Create seven tags in a global data block for storage of the interconnection data.

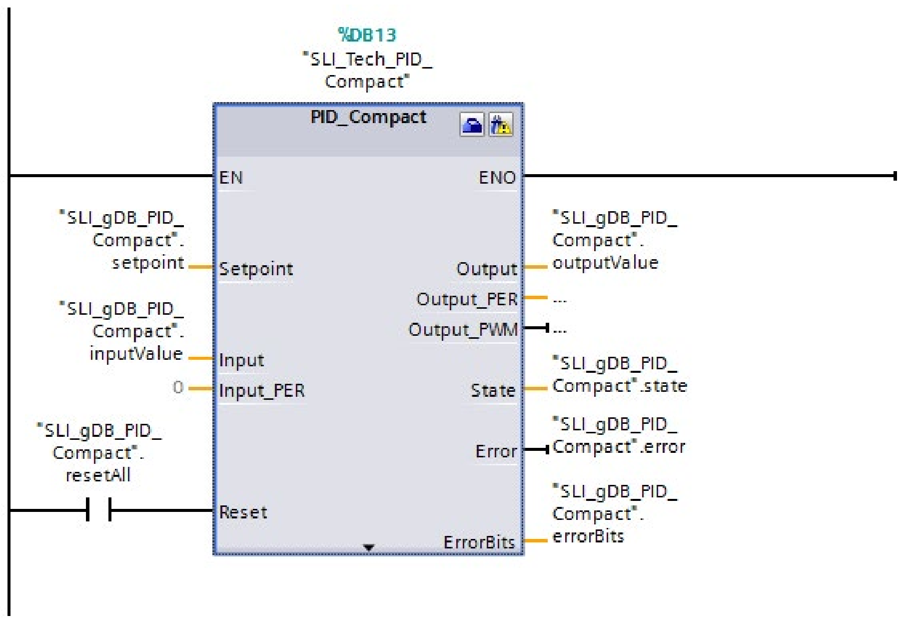
SLI_gDB_PID_Compact

	Name	Data type	Start value
1	Static		
2	setpoint	Real	75.0
3	inputValue	Real	0.0
4	outputValue	Real	0.0
5	state	Int	0
6	error	Bool	false
7	errorBits	DWord	16#0
8	resetAll	Bool	false

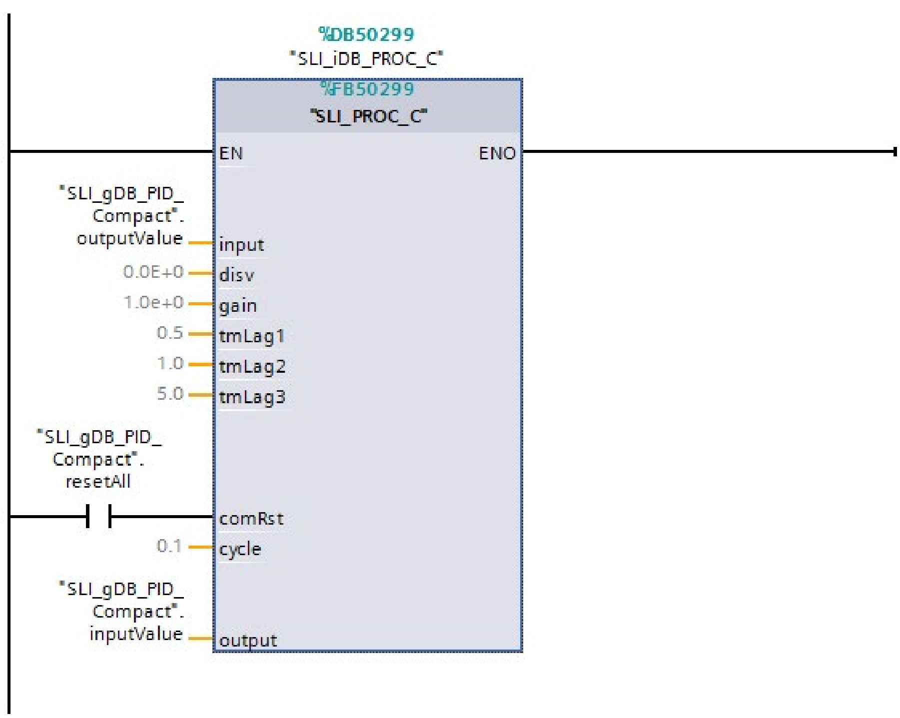
Interconnection of the parameters

You call the following interconnections in a cyclic interrupt OB.

Network 1: You interconnect the parameters of the instruction "PID_Compact" as follows.

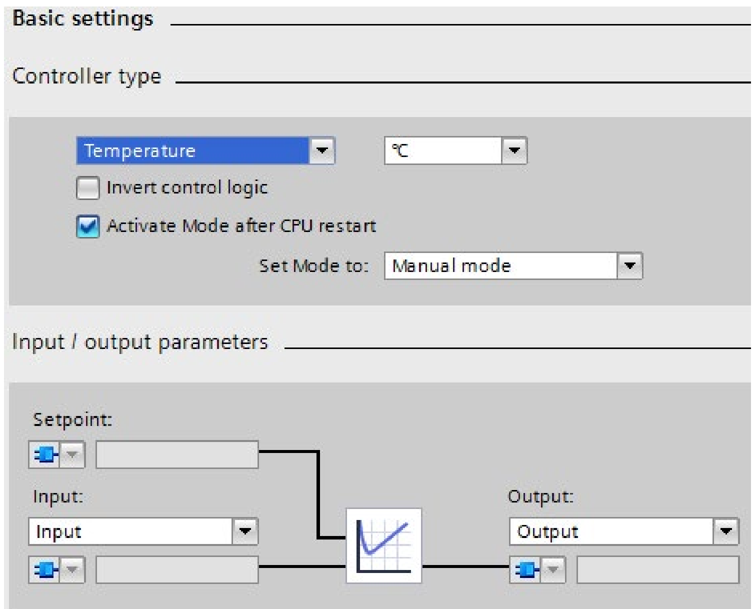


Network 2: You interconnect the parameters of the block simulating the temperature values "SLI_PROC_C" as follows.



Technology object

You configure the technology object with the properties of the instruction "PID_Compact" or by using the path Technology object > Configuration. The controller type and the input/output parameters are important for the example. With the controller type, you make a preselection for the unit of the value to the controlled. In this example, "Temperature" with the unit "°C" is used as controller type. The parameters of the "PID_Compact" are already interconnected with global tags. Therefore, the information on use of the parameters Input and Output is sufficient.



Procedure for starting the control

After the download to the CPU the PID_Compact is in manual mode with manual value 0.0. To start the control, follow these steps:

1. Open the Commissioning of the technology object "SLI_Tech_PID_Compact".
2. Click the "Start" button in the "Measurement" area.

   Measurement starts and PID_Compact can be activated.

3. Pretuning is selected.

   Click the "Start" button in the "Tuning mode" area.

   A pretuning is performed. The PID parameters are automatically adjusted to the process. After the completion of the pretuning PID_Compact switches to automatic mode.

Note

Alternative to start PID_Compact

Alternatively, you can switch PID_Compact to automatic mode in the "Online status of controller" area with the "Stop PID_Compact" / "Start PID_Compact" without pretuning. In this case the controller uses default values for the PID parameters and shows a worse controller behavior for the application case.

Procedure for stopping control

To stop and exit PID_Compact and the program, follow these steps:

1. Click the "Stop PID_Compact" button in the technology object "SLI_Tech_PID_Compact" in the "Online status of controller" area.

   
   The instruction "PID_Compact" exits the control and outputs the value "0.0" as manipulated variable.

2. Click the "Stop" button in the "Measurement" area.
3. To set the process value immediately to the value "0.0", follow these steps:

   In the block "SLI_OB_PID_Compact", set the "resetAll" tag to the value "TRUE", and then to the value "FALSE".

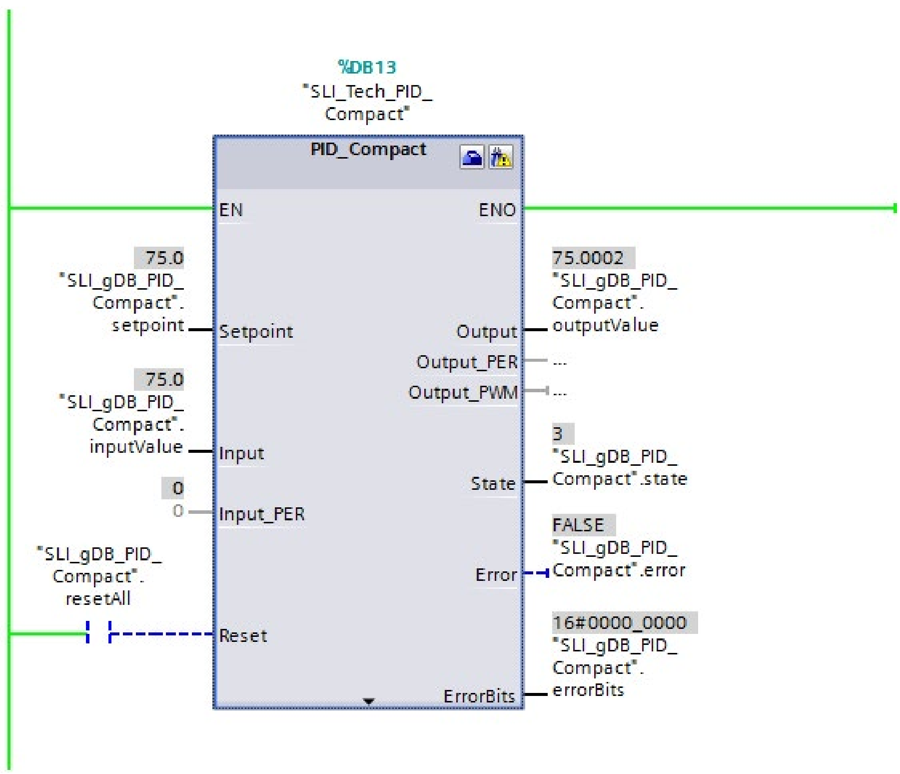
"PID_Compact" instruction

The setpoint for the temperature that is to be controlled is specified at the parameter Setpoint ("setpoint"). The control is started when the instruction "PID_Compact" was started with the technology object. The instruction "PID_Compact" outputs a manipulated variable at the output parameter Output ("outputValue"). The process value of the temperature is transferred to the instruction "PID_Compact" with the input parameter Input ("inputValue").

The instruction "PID_Compact" adjusts the manipulated variable ("outputValue") depending on the history of the difference between setpoint ("setpoint") and process value ("inputValue") . The process is repeated so that the process value ("inputValue") approaches the setpoint ("setpoint") through the manipulated variable ("outputValue").

The current operating mode of the instruction "PID_Compact" is displayed at the output parameter State ("state"). After pretuning (the value of "state" is "1"), the PID_Compact switches to automatic mode (the value is "3").

The output parameter Error ("error") currently shows that no error is pending. The output parameter ErrorBits ("errorBits") provides information on the error type in case of error. If an error occurs, this can be acknowledged in the technology object, in the optimization status area with the "ErrorAck" button.

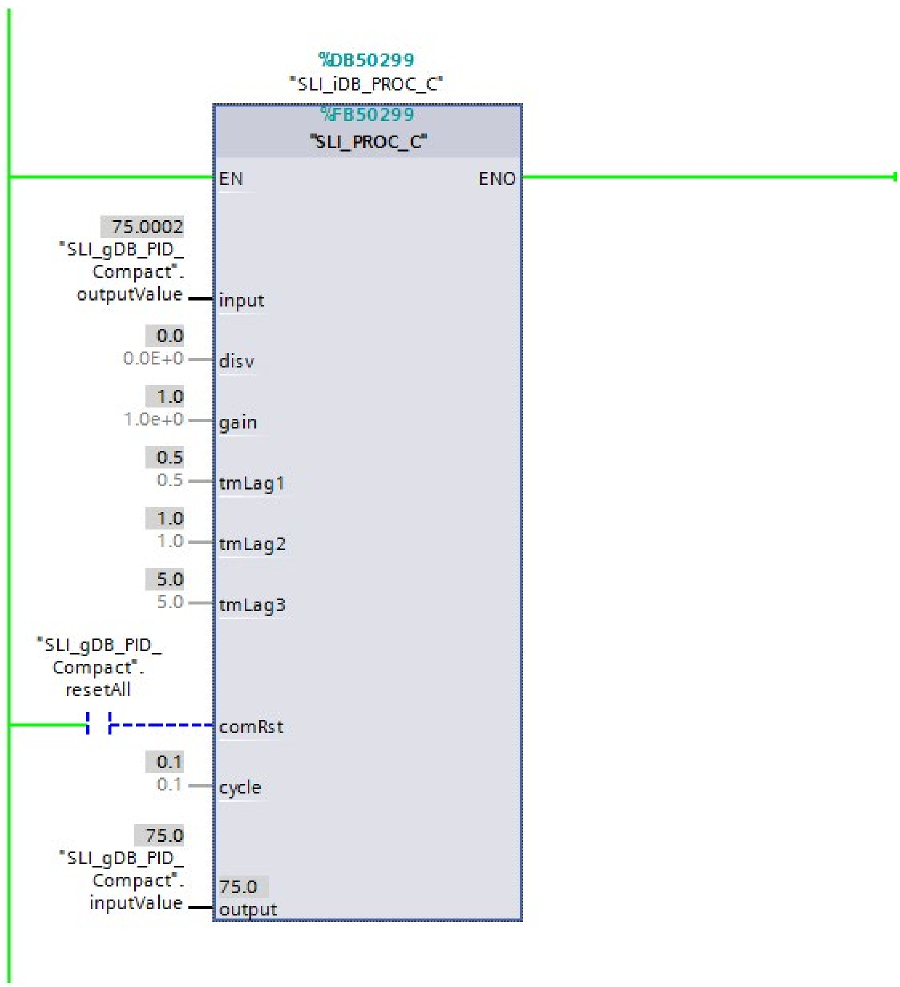


"SLI_PROC_C" block

The "SLI_PROC_C" block simulates the process value ("inputValue") of the rising temperature of a plant. The block "SLI_PROC_C" contains the manipulated variable of the controller ("outputValue) and simulates the temperature behavior of the process. This temperature is fed as process value ("inputValue") into the controller.

A change in the values of the "resetAll" tag (of the comRst parameter) has the following effects:

Parameter comRst ("resetAll")	The instruction "PID_Compact" is running	The instruction "PID_Compact" was stopped
comRst ("resetAll") remains set to the value "FALSE"	The "SLI_PROC_C" block outputs a new process value ("inputValue") based on a manipulated variable ("outputValue").	The "SLI_PROC_C" block does not receive a manipulated variable > "0.0", but it still outputs a new process value > "0.0".
comRst ("resetAll"): Change from "FALSE" to the value "TRUE"	Both manipulated variable ("outputValue") and output process value ("inputValue") are reset to "0.0".	The output process value ("inputValue") / the temperature of the "SLI_PROC_C" block is reset to "0.0".
comRst ("resetAll"): Change from "TRUE" to the value "FALSE"	Temperature control starts again.	The output process value / the temperature ("inputValue") remains "0.0".



Program code

You can find additional information about the program code for the above-named example under the keyword "Sample Library for Instructions".

9.1.5 PID_Compact V1

9.1.5.1 Description of PID_Compact V1

Description

The PID_Compact instruction provides a PID controller with integrated tuning for automatic and manual mode.

Call

PID_Compact is called in the constant interval of the cycle time of the calling OB (preferably in a cyclic interrupt OB).

Download to device

The actual values of retentive tags are only updated when you download PID_Compact completely.

Downloading technology objects to device (Page 44)

Startup

At the startup of the CPU, PID_Compact starts in the operating mode that was last active. To retain PID_ Compact in "Inactive" mode, set sb_RunModeByStartup = FALSE.

Monitoring of the sampling time PID_Compact

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID_Compact instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. If the current sampling time deviates too much from this mean value, Error = 0800 hex occurs and PID_Compact switches to "Inactive" mode.

PID_Compact, Version 1.1 or higher is set to "Inactive" mode during controller tuning under the following conditions:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value

In automatic mode, PID_Compact, Version 1.1 or higher, is set to "Inactive" mode under the following conditions:

- New mean value >= 1.5 x old mean value
- New mean value <= 0.5 x old mean value

During controller tuning and in automatic mode, PID_Compact 1.0 is set to "Inactive" operating mode under the following conditions:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value
- Current sampling time >= 1.5 x current mean value
- Current sampling time <= 0.5 x current mean value

Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_Compact are executed at every call.

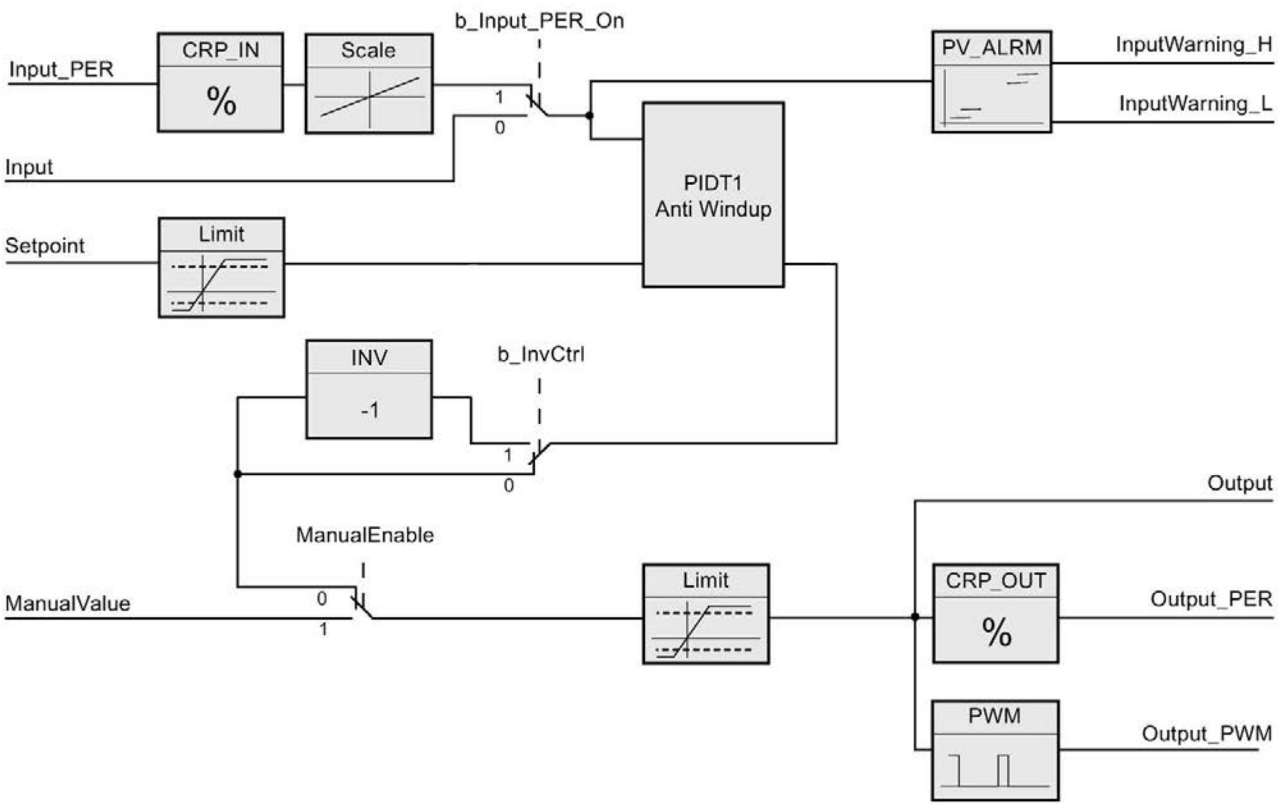
PID algorithm

PID_Compact is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The following equation is used to calculate the output value.

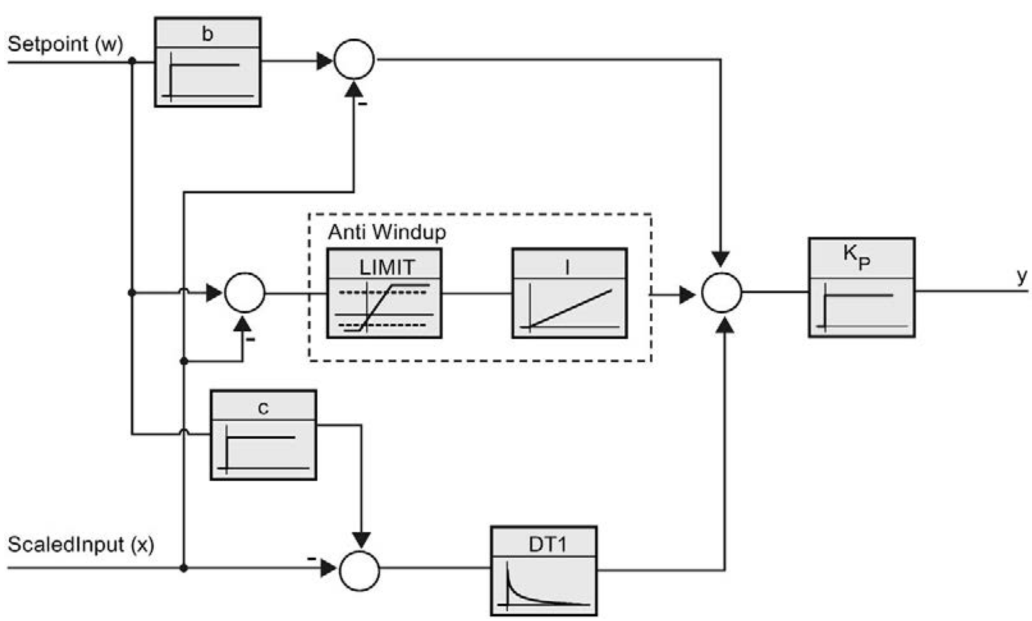
$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Symbol	Description
y	Output value
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
a	Derivative delay coefficient ($T1 = a \times T_D$)
	Derivative action time
c	Derivative action weighting

Block diagram of PID_Compact



Block diagram of PIDT1 with anti-windup



Reaction to error

If errors occur, they are output in parameter Error, and PID_Compact changes to "Inactive" mode. Reset the errors using the Reset parameter.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID_Compact does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

9.1.5.2 Input parameters of PID_Compact V1

Table 9- 4 Input parameters of PID_Compact V1

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A variable of the user program is used as source for the process value. If you are using parameter Input, then sPid_Cmpt.b_Input_PER_On = FALSE must be set.
Input_PER	WORD	W#16#0	Analog input as the source of the process value If you are using parameter Input_PER, then sPid_Cmpt.b_Input_PER_On = TRUE must be set.
ManualEnable	BOOL	FALSE	• A FALSE -> TRUE edge selects "Manual mode", while State = 4, sRet.i_Mode remains unchanged. • A TRUE -> FALSE edge selects the most recently active operating mode, State =sRet.i_Mode A change of sRet.i_Mode will not take effect during ManualEnable = TRUE. The change of sRet.i_Mode will only be considered upon a TRUE -> FALSE edge at ManualEnable . **PID_Compact V1.2 und PID_Compact V1.0** If at start of the CPU ManualEnable = TRUE, PID_Compact starts in manual mode. A rising edge (FALSE > TRUE) at ManualEnable is not necessary. **PID_Compact V1.1** At the start of the CPU, PID_Compact only switches to manual mode with a rising edge (FALSE->TRUE) at ManualEnable . Without rising edge, PID_Compact starts in the last operating mode in which ManualEnable was FALSE.
ManualValue	REAL	0.0	Manual value This value is used as the output value in manual mode.
Reset	BOOL	FALSE	The Reset parameter (Page 313) restarts the controller.

9.1.5.3 Output parameters of PID_Compact V1

Table 9- 5 Output parameters of PID_Compact V1

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Output of the scaled process value
Outputs "Output", "Output_PER", and "Output_PWM" can be used concurrently.			
Output	REAL	0.0	Output value in REAL format
Output_PER	WORD	W#16#0	Analog output value
Output_PWM	BOOL	FALSE	Pulse-width-modulated output value The output value is formed by minimum On and Off times.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the setpoint absolute high limit is reached. The setpoint in the CPU is limited to the configured setpoint absolute high limit. The configured process value absolute high limit is the default for the setpoint high limit. If you set sPid_Cmpt.r_Sp_Hlm to a value within the process value limits, this value is used as the setpoint high limit.
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the setpoint absolute low limit has been reached. In the CPU, the setpoint is limited to the configured setpoint absolute low limit. The configured process value absolute low limit is the default setting for the setpoint low limit. If you set sPid_Cmpt.r_Sp_Llm to a value within the process value limits, this value is used as the setpoint low limit.
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.
State	INT	0	The State parameter (Page 308) shows the current operating mode of the PID controller. To change the operating mode, use variable sRet.i_Mode. • State = 0: Inactive • State = 1: pretuning • State = 2: fine tuning • State = 3: Automatic mode • State = 4: Manual mode
Error	DWORD	W#16#0	The Error parameter (Page 312) indicates the error messages. Error = 0000: No error pending.

9.1.5.4 Static tags of PID_Compact V1

Note

You must not change tags that are not listed. These are used for internal purposes only.

Change the tags identified with (1) only in "Inactive" mode to prevent malfunction of the PID controller. "Inactive" mode is forced by setting the "sRet.i_Mode" tag to "0".

Table 9- 6 Static tags of PID_Compact V1

Tag	Data type	Default	Description
sb_GetCycleTime	BOOL	TRUE	If sb_GetCycleTime = TRUE, the automatic determination of the cycle time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
sb_EnCyclEstimation	BOOL	TRUE	If sb_EnCyclEstimation = TRUE, the PID_Compact sampling time is not monitored.
sb_EnCyclMonitoring	BOOL	TRUE	If sb_EnCyclMonitoring = FALSE, the PID_Compact sampling time is not monitored. If it is not possible to execute PID_Compact within the sampling time, an 0800 error is not output and PID_Compact does not change to "Inactive" mode.
sb_RunModeByStartup	BOOL	TRUE	Activate Mode after CPU restart If sb_RunModeByStartup = FALSE, the controller will remain inactive after a CPU startup. After a CPU startup and if sb_RunModeByStartup = TRUE, the controller will return to the most recently active operating mode.
si_Unit	INT	0	Unit of measurement of the process value and setpoint, e.g., ºC, or ºF.
si_Type	INT	0	Physical quantity of the process value and setpoint, e.g., temperature.
sd_Warning	DWORD	DW#16#0	Variable sd_warning (Page 315) displays the warnings generated since the reset, or since the last change of the operating mode.
sBackUp.r_Gain	REAL	1.0	Saved proportional gain You can reload values from the sBackUp structure with sPid_Cmpt.b_LoadBackUp = TRUE.
sBackUp.r_Ti	REAL	20.0	Saved integral action time [s]
sBackUp.r_Td	REAL	0.0	Saved derivative action time [s]
sBackUp.r_A	REAL	0.0	Saved derivative delay coefficient
sBackUp.r_B	REAL	0.0	Saved proportional action weighting factor
sBackUp.r_C	REAL	0.0	Saved derivative action weighting factor
sBackUp.r_Cycle	REAL	1.0	Saved sampling time of PID algorithm

Tag	Data type	Default	Description
sPid_Calc.r_Cycle(1)	REAL	0.1	Sampling time of the PID_Compact instruction r_Cycle is determined automatically and is usually equivalent to the cycle time of the calling OB.
sPid_Calc.b_RunIn	BOOL	FALSE	• b_RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If the requirements for pretuning are not met, PID_Compact reacts as if b_RunIn = TRUE. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_Compact switches to "Inactive" mode. • b_RunIn = TRUE The pretuning is skipped. PID_3Compact tries to reach the setpoint with minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. b_RunIn is set to FALSE after fine tuning.
sPid_Calc.b_CalcParamSUT	BOOL	FALSE	The parameters for pretuning will be recalculated if b_CalcParamSUT = TRUE. This enables you to change the parameter calculation method without having to repeat controller tuning. b_CalcParamSUT is set to FALSE after the calculation.
sPid_Calc.b_CalcParamTIR	BOOL	FALSE	The parameters for fine tuning will be recalculated if b_CalcParamTIR = TRUE. This enables you to change the parameter calculation method without having to repeat controller tuning. b_CalcParamTIR will be set to FALSE after calculation.
sPid_Calc.i_CtrlTypeSUT	INT	0	Methods used to calculate parameters during pretuning: • i_CtrlTypeSUT = 0: PID according to Chien, Hrones and Reswick • i_CtrlTypeSUT = 1: PI according to Chien, Hrones and Reswick

Tag	Data type	Default	Description

9.1.5.5 Parameters State and sRet.i_Mode V1

Correlation of the parameters

The State parameter indicates the current operating mode of the PID controller. You cannot modify the State parameter.

You need to modify the sRet.i_Mode tag to change the operating mode. This also applies when the value for the new operating mode is already in sRet.i_Mode. First set sRet.i_Mode = 0 and then sRet.i_Mode = 3. Provided the current operating mode of the controller supports this change, State is set to the value of sRet.i_Mode.

When PID_Compact automatically switches the operating mode, the following applies: State != sRet.i_Mode.

Examples:

- Successful pretuning
  State = 3 and sRet.i_Mode = 1
- Error
  State = 0 and sRet.i_Mode remains at the same value, e.g sRet.i_Mode = 3
- ManualEnalbe = TRUE
  State = 4 and sRet.i_Mode remain at the previous value, for example, sRet.i_Mode = 3

Note

You wish to repeat successful fine tuning without exiting automatic mode with i_Mode = 0.

Setting sRet.i_Mode to an invalid value such as 9999 for one cycle has no effect on State. Set Mode = 2 in the next cycle. You can generate a change to sRet.i_Mode without first switching to "inactive" mode.

Meaning of values

State / sRet.i_Mode	Description of the operating mode
0	Inactive The controller is switched off. The controller was in "inactive" mode before pretuning was performed. The PID controller will change to "inactive" mode when running if an error occurs or if the "Deactivate controller" icon is clicked in the commissioning window.
1	Pretuning The pretuning determines the process response to a jump of the output value and searches for the point of inflection. The optimized PID parameters are calculated as a function of the maximum rate of rise and dead time of the controlled system. Pretuning requirements: • The controller is in inactive mode or manual mode • ManualEnable = FALSE • The process value must not be too close to the setpoint. |Setpoint - Input| > 0.3 * |sPid_Cmpt.r_Pv_Hlm - sPid_Cmpt.r_Pv_Llm| and |Setpoint - Input| > 0.5 * |Setpoint| • The setpoint may not be changed during pretuning. The higher the stability of the process value, the easier it is to calculate the PID parameters and increase precision of the result. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. PID parameters are backed up before they are recalculated and can be reactivated with sPid_Cmpt.b_LoadBackUp. There is a change to automatic mode following successful pretuning and to "inactive" mode following unsuccessful pretuning. The phase of pretuning is indicated with Tag i_Event_SUT V1 (Page 315).

State / sRet.i_Mode	Description of the operating mode
2	Fine tuning Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are optimized based on the amplitude and frequency of this oscillation. The differences between the process response during pretuning and fine tuning are analyzed. All PID parameters are recalculated on the basis of the findings. PID parameters from fine tuning usually have better master control and disturbance behavior than PID parameters from pretuning. PID_Compact automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. PID parameters are backed up before they are recalculated and can be reactivated with sPid_Cmpt.b_LoadBackUp. Requirements for fine tuning: • No disturbances are expected. • The setpoint and the process value lie within the configured limits. • The setpoint may not be changed during fine tuning. • ManualEnable = FALSE • Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode Fine tuning proceeds as follows when started in: • Automatic mode (State = 3) Start fine tuning in automatic mode if you wish to improve the existing PID parameters using controller tuning. PID_Comact will regulate using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. • Inactive (State = 0) or manual (State = 4) mode If the requirements for pretuning are met, pretuning is started. The PID parameters established will be used for adjustment until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. If pretuning is not possible, PID_Compact will change to "Inactive" mode. An attempt is made to reach the setpoint with a minimum or maximum output value if the process value for pretuning is already too near the setpoint or sPid_Calc.b_RunIn = TRUE. This can produce increased overshoot. The controller will change to "automatic mode" after successfully completed "fine tuning" and to "inactive" mode if "fine tuning" has not been successfully completed. The "Fine tuning" phase is indicated with Tag i_Event_TIR V1 (Page 316).

State / sRet.i_Mode	Description of the operating mode
3	Automatic mode In automatic mode, PID_Compact corrects the controlled system in accordance with the parameters specified. The controller changes to automatic mode if one the following conditions is fulfilled: • Pretuning successfully completed • Fine tuning successfully completed • Change of variable sRet.i_Mode to the value 3. After CPU startup or change from Stop to RUN mode, PID_Compact will start in the most recently active operating mode. To retain PID_Compact in "Inactive" mode, set sb_RunModeByStartup = FALSE.
4	Manual mode In manual mode, you specify a manual output value in the ManualValue parameter. This operating mode is enabled if sRet.i_Mode = 4, or at the rising edge on ManualEnable. If ManualEnable changes to TRUE, only State will change. sRet.i_Mode will retain its current value. PID_Compact will return to the previous operating mode upon a falling edge at ManualEnable. The change to automatic mode is bumpless.

9.1.5.6 Parameter Error V1

If several errors are pending simultaneously, the values of the error codes are displayed with binary addition. The display of error code 0003, for example, indicates that the errors 0001 and 0002 are pending simultaneously.

Error (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. • Input > sPid_Cmpt.r_Pv_Hlm or • Input < sPid_Cmpt.r_Pv_Llm You cannot move the actuator again until you eliminate the error.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input.
0004	Error during fine tuning. Oscillation of the process value could not be maintained.
0008	Error at start of pretuning. The process value is too close to the setpoint. Start fine tuning.
0010	The setpoint was changed during tuning.
0020	Pretuning is not permitted in automatic mode or during fine tuning.
0080	Error during pretuning. The output value limits are not configured correctly or the actual value does not react as expected. Check whether the limits of the output value are configured correctly and match the control logic. Also make sure that the actual value does not oscillate strongly before starting pretuning.
0100	Error during tuning resulted in invalid parameters.
0200	Invalid value at "Input" parameter: Value has an invalid number format.
0400	Calculation of output value failed. Check the PID parameters.
0800	Sampling time error: PID_Compact is not called within the sampling time of the cyclic interrupt OB. If this error occurred during simulation with PLCSIM, see the notes under Simulating PID_Compact V1 with PLCSIM (Page 117).
1000	Invalid value at "Setpoint" parameter: Value has an invalid number format.

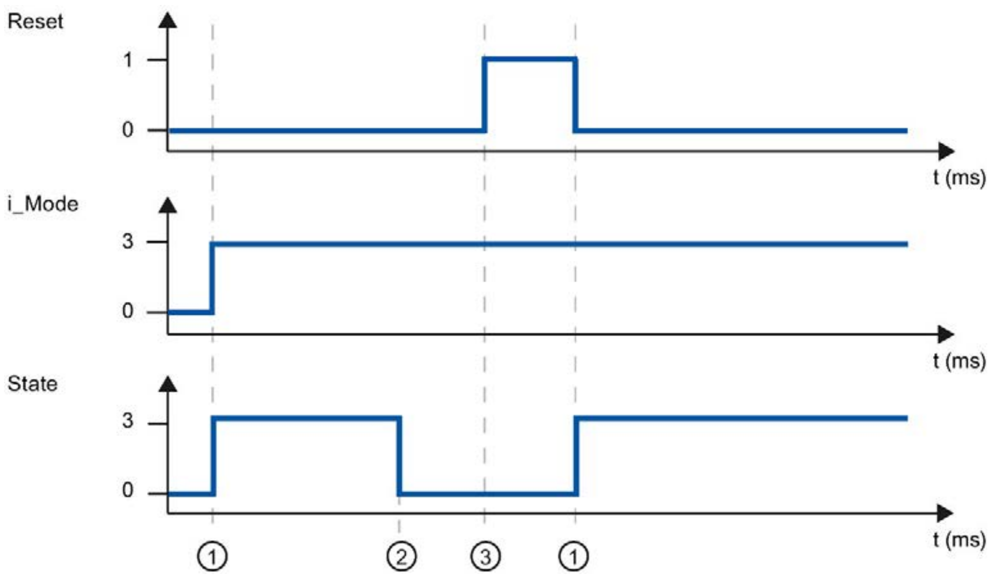
Output parameters of PID_Compact V1 (Page 302)

9.1.5.7 Parameter Reset V1

The response to Reset = TRUE depends on the version of the PID_Compact instruction.

Reset response PID_Compact V.1.1 or higher

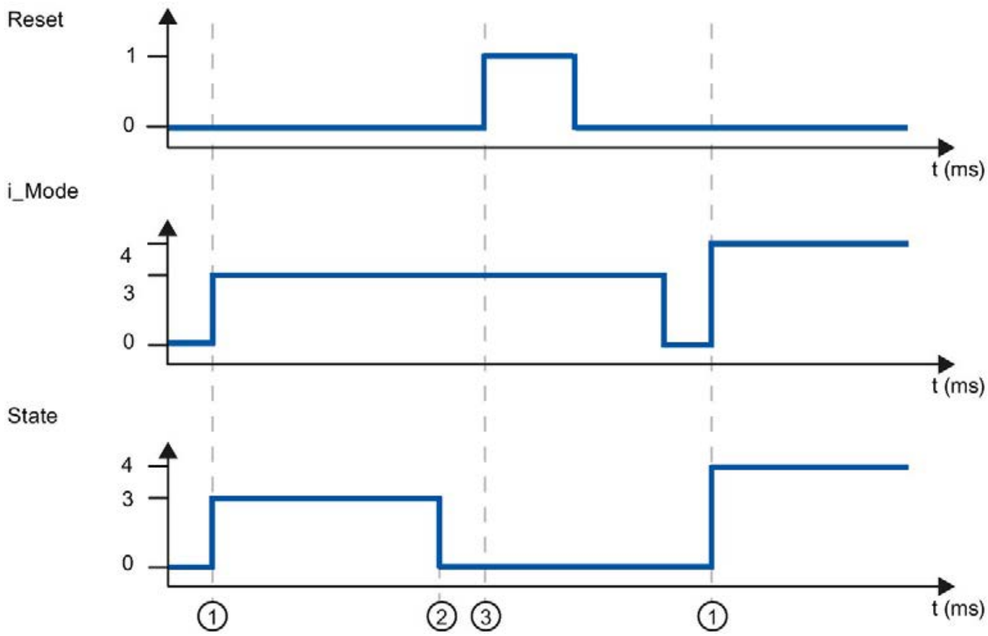
A rising edge at Reset triggers a change to "Inactive" mode; errors and warnings are reset and the integral action is deleted. A falling edge at Reset triggers a change to the most recently active operating mode. If automatic mode was active before, the integral action is pre-assigned in such a way that the switchover is bumpless.



① Activation
② Error
③ Reset

Reset response PID_Compact V.1.0

A rising edge at Reset triggers a change to "Inactive" mode; errors and warnings are reset and the integral action is deleted. The controller is not reactivated until the next edge at i_Mode.



①	Activation
②	Error
③	Reset

9.1.5.8 Tag sd_warning V1

If several warnings are pending, the values of variable sd_warning are displayed by means of binary addition. The display of warning 0003, for example, indicates that the warnings 0001 and 0002 are also pending.

sd_warning (DW#16#....)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0002	Oscillation increased during fine tuning.
0004	The setpoint was outside the set limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. The PID parameters were instead calculated using the "i_CtrlTypeTIR = 3" method.
0010	The operating mode could not be changed because ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.

The following warnings are deleted as soon as the cause is dealt with:

- 0004
- 0020
- 0040

All other warnings are cleared with a rising edge at Reset.

9.1.5.9 Tag i_Event_SUT V1

i_Event_SUT	Name	Description
0	SUT_INIT	Initialize pretuning
100	SUT_STDABW	Calculate the standard deviation
200	SUT_GET_POI	Find the point of inflection
9900	SUT_IO	Pretuning successful
1	SUT_NIO	Pretuning not successful

9.2 PID_3Step

9.2.1 New features of PID_3Step

PID_3Step V2.3

- As of PID_3Step Version 2.3 the monitoring and limiting of the travel time can be deactivated with Config.VirtualActuatorLimit = 0.0.

PID_3Step V2.2

- **Use with S7-1200**

  As of PID_3Step V2.2, the instruction with V2 functionality can also be used on S7-1200 with firmware version 4.0 or higher.

PID_3Step V2.0

- **Reaction to error**

  The reaction to ActivateRecoverMode = TRUE has been completely overhauled. PID_3Step reacts in a more fault tolerant manner in the default setting.

NOTICE
Your system may be damaged. If you use the default setting, PID_3Step remains in automatic mode even if the process value limits are exceeded. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

  You use the ErrorAck input parameter to acknowledge the errors and warnings without restarting the controller or clearing the integral action.

  Switching operating modes does not acknowledge errors that are no longer pending.

- **Switching the operating mode**

  You specify the operating mode at the Mode in/out parameter and use a positive edge at ModeActivate to start the operating mode. The Retain.Mode tag has been omitted.

  The transition time measurement can no longer be started with GetTransitTime.Start, but only with Mode = 6 and a positive edge at ModeActivate.

- **Multi-instance capability**

  You can call up PID_3Step as multi-instance DB. No technology object is created in this case and no parameter assignment interface or commissioning interface is available. You must assign parameters for PID_3Step directly in the multi-instance DB and commission it via a watch table.

- **Startup characteristics**

  The operating mode specified at the Mode parameter is also started on a negative edge at Reset and during a CPU cold restart, if RunModeByStartup = TRUE.

- **ENO characteristics**

  ENO is set depending on the operating mode.

  If State = 0, then ENO = FALSE.

  If State ≠ 0, then ENO = TRUE.

- **Manual mode**

  The Manual_UP and Manual_DN input parameters no longer function as edge-triggered parameters. Edge-triggered manual mode continues to be possible using the ManualUpInternal and ManualDnInternal tags.

  In "Manual mode without endstop signals" (Mode = 10), the endstop signals Actuator_H and Actuator_L are ignored even though they are activated.

- **Default value of PID parameters**

  The following default settings have been changed:

  – Proportional action weighting (PWeighting) from 0.0 to 1.0

  – Derivative action weighting (DWeighting) from 0.0 to 1.0

  – Coefficient for derivative delay (TdFiltRatio) from 0.0 to 0.2

- **Limiting of motor transition time**

  You configure the maximum percentage of the motor transition time that the actuator will travel in one direction in the Config.VirtualActuatorLimit tag.

- **Setpoint value specification during tuning**

  You configure the permitted fluctuation of the setpoint during tuning at the CancelTuningLevel tag.

- **Switching a disturbance variable on**

  You can switch a disturbance variable on at the Disturbance parameter.

- **Troubleshooting**

  If the endstop signals are not activated (ActuatorEndStopOn = FALSE), ScaledFeedback is determined without Actuator_H or Actuator_L.

PID_3Step V1.1

- **Manual mode on CPU startup**

  If ManualEnable = TRUE when the CPU starts, PID_3Step starts in manual mode. A positive edge at ManualEnable is not necessary.

- **Reaction to error**

  The ActivateRecoverMode tag is no longer effective in manual mode.

- **Troubleshooting**

  The Progress tag is reset following successful tuning or transition time measurement.

9.2.2 Compatibility with CPU and FW

The following table shows which version of PID_3Step can be used on which CPU.

CPU	FW	PID_3Step
S7-1200	V4.2 or higher	V2.3 V2.2 V1.1
	V4.0 to V4.1	V2.2 V1.1
	V3.x	V1.1 V1.0
	V2.x	V1.1 V1.0
	V1.x	-
S7-1500	V2.0 or higher	V2.3 V2.2 V2.1 V2.0
	V1.5 to V1.8	V2.2 V2.1 V2.0
	V1.1	V2.1 V2.0
	V1.0	V2.0

9.2.3 CPU processing time and memory requirement PID_3Step V2.x

CPU processing time

Typical CPU processing times of the PID_3Step technology object as of Version V2.0, depending on CPU type.

CPU	Typ. CPU processing time PID_3Step V2.x
CPU 1211C ≥ V4.0	410 µs
CPU 1215C ≥ V4.0	410 µs
CPU 1217C ≥ V4.0	410 µs
CPU 1505S ≥ V1.0	50 µs
CPU 1510SP-1 PN ≥ V1.6	120 µs
CPU 1511-1 PN ≥ V1.5	120 µs
CPU 1512SP-1 PN ≥ V1.6	120 µs
CPU 1516-3 PN/DP ≥ V1.5	65 µs
CPU 1518-4 PN/DP ≥ V1.5	5 µs

Memory requirement

Memory requirement of an instance DB of the PID_3Step technology object as of Version V2.0.

Memory requirement	Memory requirement of the instance DB of PID_3Step V2.x
Load memory requirement	Approx. 15000 bytes
Total work memory requirement	1040 bytes
Retentive work memory requirement	60 bytes

9.2.4 PID_3Step V2

9.2.4.1 Description of PID_3Step V2

Description

You use the PID_3Step instruction to configure a PID controller with self tuning for valves or actuators with integrating behavior.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Approach substitute output value
- Transition time measurement
- Error monitoring
- Approach substitute output value with error monitoring
- Manual mode without endstop signals

For a more detailed description of the operating modes, see the State parameter.

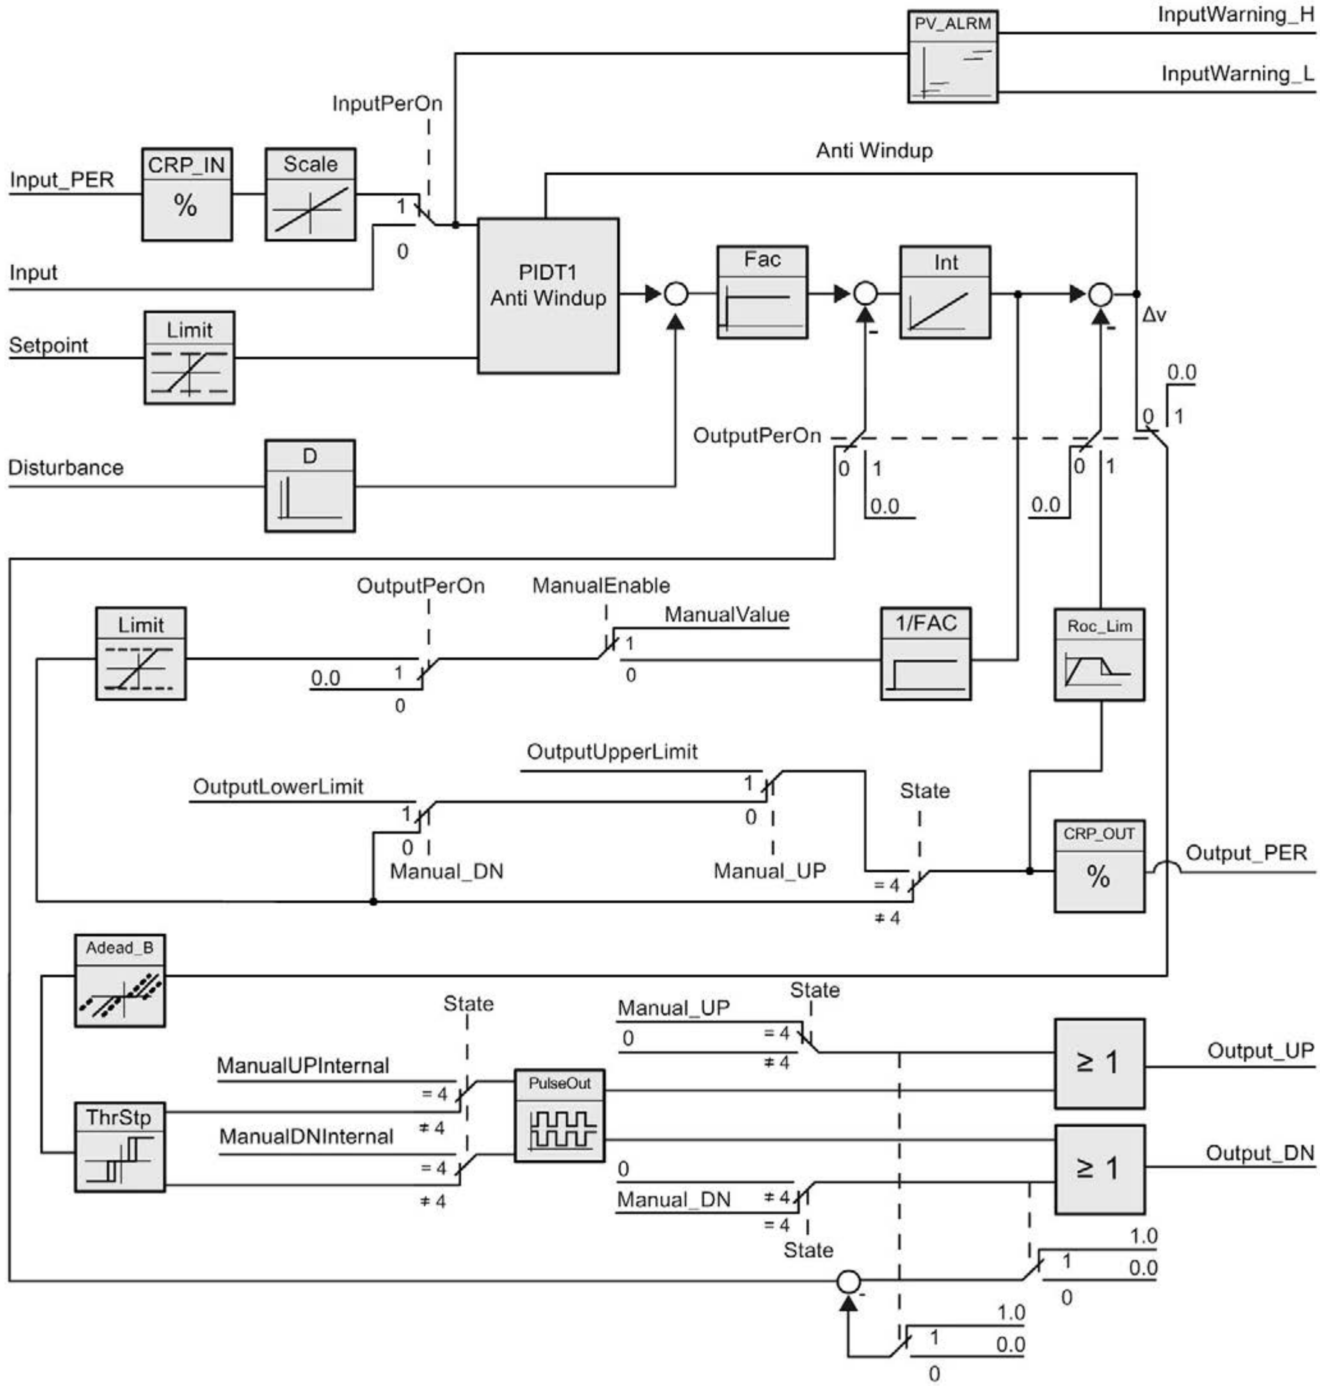
PID algorithm

PID_3Step is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The PID algorithm operates according to the following equation:

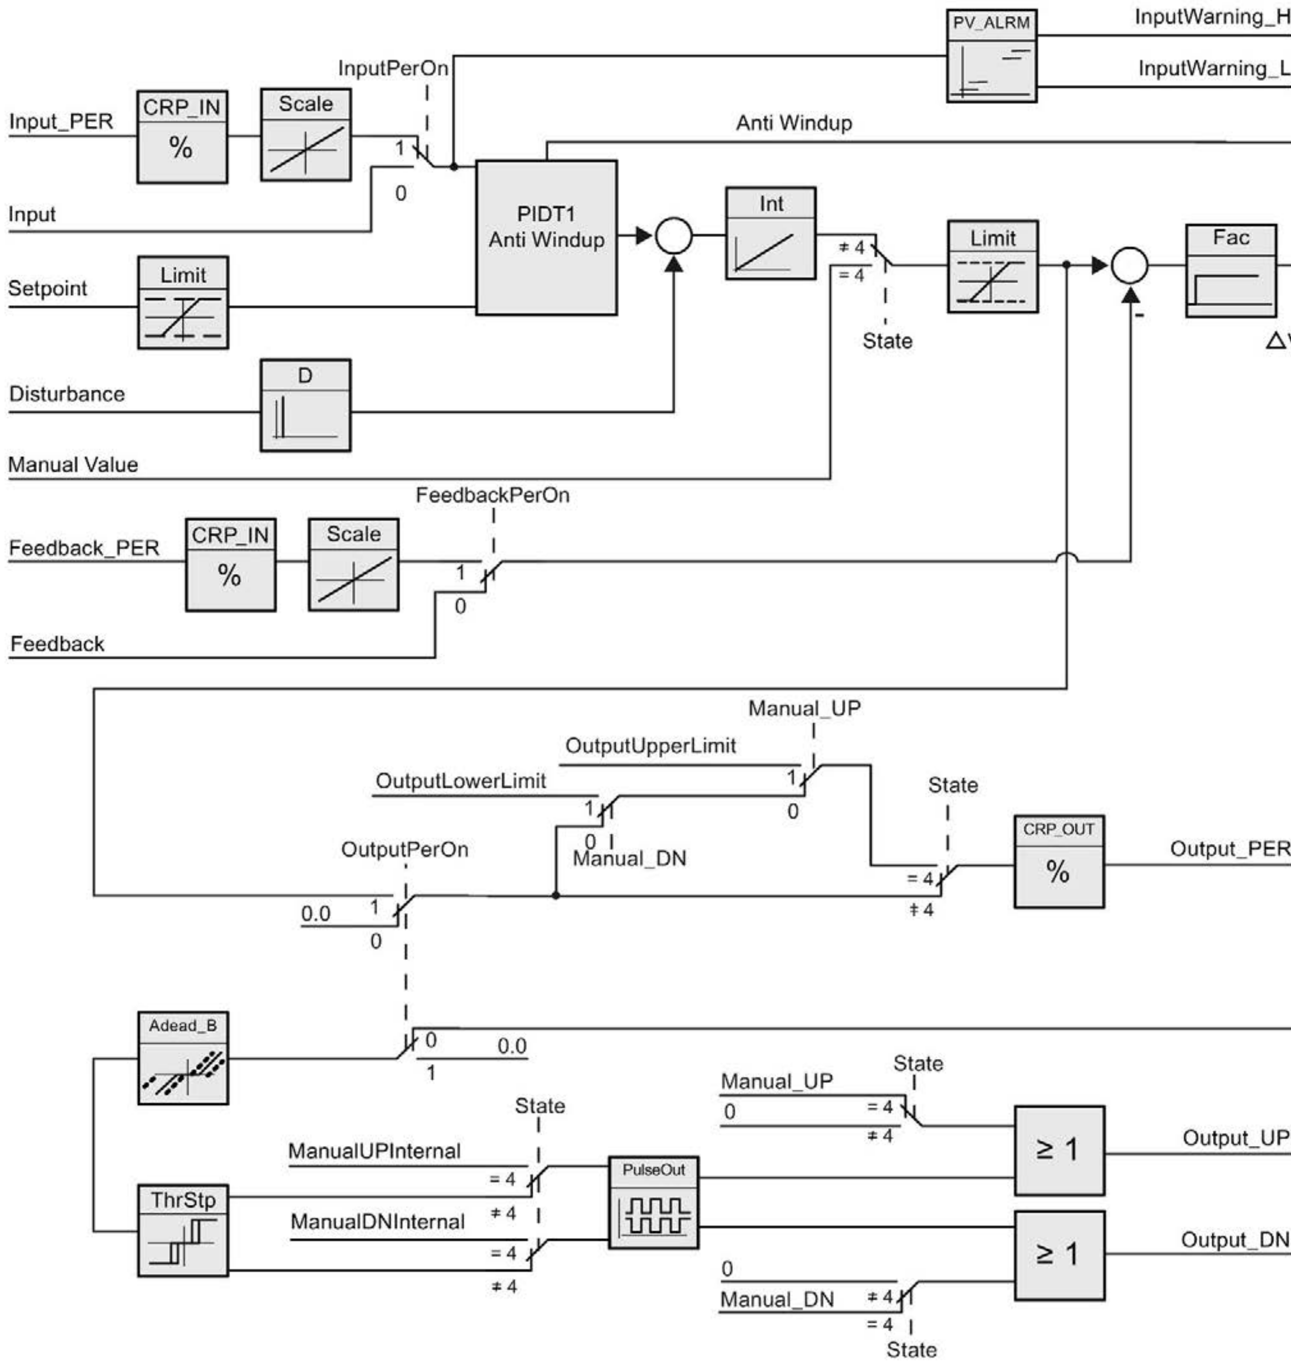
$$\Delta y = K_p \cdot s \cdot \left[(b \cdot w - x) + \frac{1}{T_I \cdot s} (w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1} (c \cdot w - x) \right]$$

Δy	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
T_D	Derivative action time
a	Derivative delay coefficient (derivative delay T1 = a × T_D)
c	Derivative action weighting

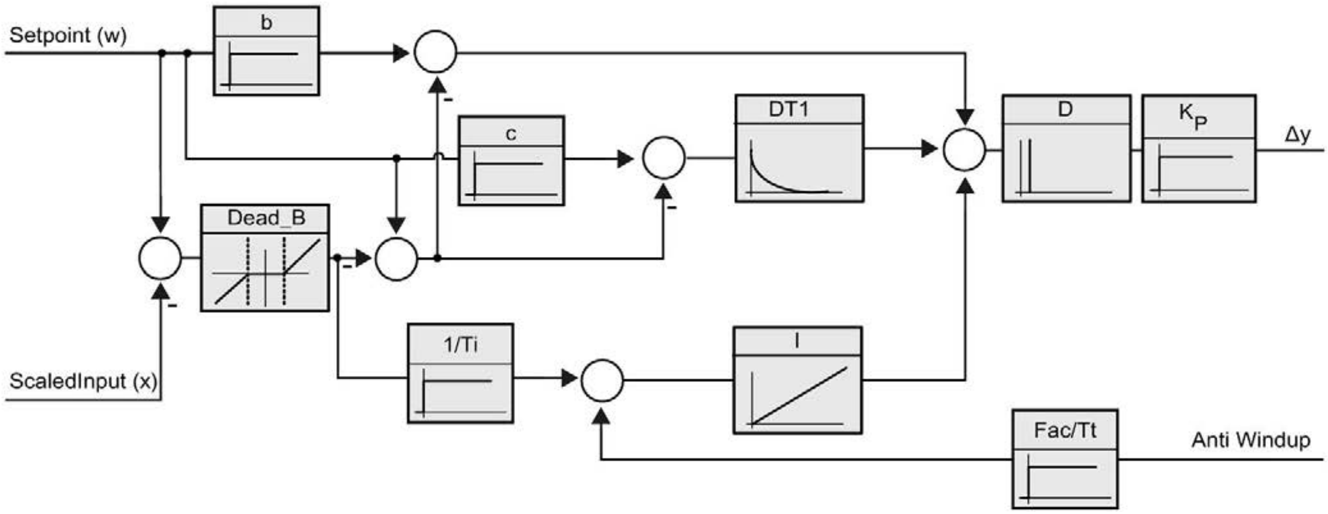
Block diagram without position feedback



Block diagram with position feedback



Block diagram of PIDT1 with anti-windup



Call

PID_3Step is called in the constant time scale of a cycle interrupt OB.

If you call PID_3Step as a multi-instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for PID_3Step directly in the multi-instance DB and commission it via a watch table.

Download to device

The actual values of retentive tags are only updated when you download PID_3Step completely.

Downloading technology objects to device (Page 44)

Startup

When the CPU starts up, PID_3Step starts in the operating mode that is saved in the Mode in/out parameter. To leave PID_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

Reaction to error

In automatic mode and during commissioning, the reaction to error depends on the ErrorBehaviour and ActivateRecoverMode tags. In manual mode, the reaction is independent of ErrorBehaviour and ActivateRecoverMode. If ActivateRecoverMode = TRUE, the reaction additionally depends on the error that occurred.

ErrorBe-haviour	Acti-vateRecover-Mode	Configuration editor > actuator setting > Set Output to	Reaction
FALSE	FALSE	Current output value	Switch to "Inactive" mode (State = 0) The actuator remains in the current position.
FALSE	TRUE	Current output value while error is pending	Switch to "Error monitoring" mode (State = 7) The actuator remains in the current position while the error is pending.
TRUE	FALSE	Substitute output value	Switch to "Approach substitute output value" mode (State = 5) The actuator moves to the configured substitute output value. Switch to "Inactive" mode (State = 0) The actuator remains in the current position.
TRUE	TRUE	Substitute output value while error is pending	Switch to "Approach substitute output value with error monitoring" mode (State = 8) The actuator moves to the configured substitute output value. Switch to "Error monitoring" mode (State = 7)

In manual mode, PID_3Step uses ManualValue as output value, unless the following errors occur:

- 2000h: Invalid value at Feedback_PER parameter.
- 4000h: Invalid value at Feedback parameter.
- 8000h: Error during digital position feedback.

You can only change the position of the actuator with Manual_UP and Manual_DN, not with ManualValue.

The Error parameter indicates whether an error has occurred in this cycle. The ErrorBits parameter shows which errors have occurred. ErrorBits is reset by a rising edge at Reset or ErrorAck.

See also

Parameters State and Mode V2 (Page 346)

Parameter ErrorBits V2 (Page 351)

Configuring PID_3Step V2 (Page 119)

9.2.4.2 Mode of operation of PID_3Step V2

Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0001h).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warning = 0040h), and the InputWarning_H or InputWarning_L output parameter changes to TRUE.

Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID_3Step automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID_3Step checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit_H or SetpointLimit_L is set to TRUE.

The setpoint is limited in all operating modes.

Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit tags. The output value limits must be within "Low endstop" and "High endstop".

- High endstop: Config.FeedbackScaling.UpperPointOut
- Low endstop: Config.FeedbackScaling.LowerPointOut

Rule:

UpperPointOut ≥ OutputUpperLimit > OutputLowerLimit ≥ LowerPointOut

The valid values for "High endstop" and "Low endstop" depend upon:

- FeedbackOn
- FeedbackPerOn
- OutputPerOn

OutputPerOn	FeedbackOn	FeedbackPerOn	LowerPointOut	UpperPointOut
FALSE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
FALSE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
FALSE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
TRUE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%

If OutputPerOn = FALSE and FeedbackOn = FALSE, you cannot limit the output value. Output_UP and Output_DN are then reset upon Actuator_H = TRUE or Actuator_L = TRUE. If endstop signals are also not present, Output_UP and Output_DN are reset after a travel time of Config.VirtualActuatorLimit × Retain.TransitTime/100. As of PID_3Step Version 2.3 the monitoring and limiting of the travel time can be deactivated with Config.VirtualActuatorLimit = 0.0.

The output value is 27648 at 100% and -27648 at -100%. PID_3Step must be able to completely close the valve.

Note

Use with two or more actuators

PID_3 Step is not suitable for use with two or more actuators (for example, in heating/cooling applications), because different actuators need different PID parameters to achieve a good control response.

Substitute output value

If an error has occurred, PID_3Step can output a substitute output value and move the actuator to a safe position that is specified in the SavePosition tag. The substitute output value must be within the output value limits.

Monitoring signal validity

The values of the following parameters are monitored for validity when used:

- Setpoint
- Input
- Input_PER
- Input_PER
- Feedback
- Feedback_PER
- Disturbance
- ManualValue
- SavePosition
- Output_PER

Monitoring the PID_3Step sampling time

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID_3Step instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (ErrorBits = 0800h).

The error occurs during tuning if:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value

The error occurs in automatic mode if:

- New mean value >= 1.5 x old mean value
- New mean value <= 0.5 x old mean value

If you deactivate the sampling time monitoring (CycleTime.EnMonitoring = FALSE), you can also call PID_3Step in OB1. You must then accept a lower control quality due to the deviating sampling time.

Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_3Step are executed at every call.

Measuring the motor transition time

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The actuator is moved in one direction for a maximum time of Config.VirtualActuatorLimit × Retain.TransitTime/100. PID_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ. You can measure the motor transition time during commissioning. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior. You should therefore configure the motor transition time with the value that the motor requires to move the actuator from the closed to the opened state.

If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID_3Step does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

9.2.4.3 Changing the PID_3Step V2 interface

The following table shows what has changed in the PID_3Step instruction interface.

PID_3Step V1	PID_3Step V2	Change
Input_PER	Input_PER	Data type from Word to Int
Feedback_PER	Feedback_PER	Data type from Word to Int
	Disturbance	New
Manual_UP	Manual_UP	Function
Manual_DN	Manual_DN	Function
	ErrorAck	New
	ModeActivate	New
Output_PER	Output_PER	Data type from Word to Int
	ManualUPInternal	New
	ManualDNInternal	New
	CancelTuningLevel	New
	VirtualActuatorLImit	New
Config.Loadbackup	Loadbackup	Renamed
Config.TransitTime	Retain.TransitTime	Renamed and retentivity added
GetTransitTime.Start		Replaced by Mode and ModeActivate
SUT.CalculateSUTParams	SUT.CalculateParams	Renamed
SUT.TuneRuleSUT	SUT.TuneRule	Renamed
TIR.CalculateTIRParams	TIR.CalculateParams	Renamed
TIR.TuneRuleTIR	TIR.TuneRule	Renamed
Retain.Mode	Mode	Function Declaration of static for in-out parameters

9.2.4.4 Input parameters of PID_3Step V2

Table 9- 7 Input parameters of PID_3Step V2

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A tag of the user program is used as source for the process value. If you are using parameter Input, then Config.InputPerOn = FALSE must be set.
Input_PER	INT	0	An analog input is used as the source of the process value. If you are using parameter Input_PER, then Config.InputPerOn = TRUE must be set.
Actuator_H	BOOL	FALSE	Digital position feedback of the valve for the high endstop If Actuator_H = TRUE, the valve is at the high endstop and is no longer moved towards this direction.
Actuator_L	BOOL	FALSE	Digital position feedback of the valve for the low endstop If Actuator_L = TRUE, the valve is at the low endstop and is no longer moved towards this direction.
Feedback	REAL	0.0	Position feedback of the valve If you are using parameter Feedback, then Config.FeedbackPerOn = FALSE must be set.
Feedback_PER	INT	0	Analog position feedback of a valve If you are using parameter Feedback_PER, then Config.FeedbackPerOn = TRUE must be set. Feedback_PER is scaled based on the tags: • Config.FeedbackScaling.LowerPointIn • Config.FeedbackScaling.UpperPointIn • Config.FeedbackScaling.LowerPointOut • Config.FeedbackScaling.UpperPointOut
Disturbance	REAL	0.0	Disturbance variable or precontrol value
ManualEnable	BOOL	FALSE	• A FALSE -> TRUE edge activates "manual mode", while State = 4, Mode remains unchanged. As long as ManualEnable = TRUE, you cannot change the operating mode via a rising edge at ModeActivate or use the commissioning dialog. • A TRUE -> FALSE edge activates the operating mode that is specified by Mode. We recommend that you change the operating mode using ModeActivate only.
ManualValue	REAL	0.0	In manual mode, the absolute position of the valve is specified. ManualValue is only evaluated if you are using Output_PER, **or** if position feedback is available.

Parameter	Data type	Default	Description
Manual_UP	BOOL	FALSE	• Manual_UP = TRUE The valve is opened even if you are using Output_PER or a position feedback. The valve is no longer moved if the high endstop has been reached. See also Config.VirtualActuatorLimit • Manual_UP = FALSE If you are using Output_PER or a position feedback, the valve is moved to ManualValue. Otherwise, the valve is no longer moved. If Manual_UP and Manual_DN are set to TRUE simultaneously, the valve is not moved.
Manual_DN	BOOL	FALSE	• Manual_DN = TRUE The valve is closed even if you are using Output_PER or a position feedback. The valve is no longer moved if the low endstop has been reached. See also Config.VirtualActuatorLimit • Manual_DN = FALSE If you are using Output_PER or a position feedback, the valve is moved to ManualValue. Otherwise, the valve is no longer moved.
ErrorAck	BOOL	FALSE	• FALSE -> TRUE edge ErrorBits and Warning are reset.
Reset	BOOL	FALSE	Restarts the controller. • FALSE -> TRUE edge – Switch to "Inactive" mode – ErrorBits and Warnings are reset. • As long as Reset = TRUE, – PID_3Step remains in "Inactive" mode (State = 0). – You cannot change the operating mode with Mode and ModeActivate or ManualEnable. – You cannot use the commissioning dialog. • TRUE -> FALSE edge – If ManualEnable = FALSE, PID_3Step switches to the operating mode that is saved in Mode. – If Mode = 3, the integral action is treated as configured with the tag IntegralResetMode.
ModeActivate	BOOL	FALSE	• FALSE -> TRUE edge PID_3Step switches to the operating mode that is saved in the Mode parameter.

9.2.4.5 Output parameters of PID_3Step V2

Table 9- 8 Output parameters of PID_3Step V2

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
ScaledFeedback	REAL	0.0	Scaled position feedback For an actuator without position feedback, the position of the actuator indicated by ScaledFeedback is very imprecise. ScaledFeedback may only be used for rough estimation of the current position in this case.
Output_UP	BOOL	FALSE	Digital output value for opening the valve If Config.OutputPerOn = FALSE, the Output_UP parameter is used.
Output_DN	BOOL	FALSE	Digital output value for closing the valve If Config.OutputPerOn = FALSE, the Output_DN parameter is used.
Output_PER	INT	0	Analog output value If Config.OutputPerOn = TRUE, Output_PER is used. Use Output_PER if you are using a valve as actuator which is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V or 4...20 mA. The value at Output_PER corresponds to the target position of the valve, e.g. Output_PER = 13824, when the valve is to be opened by 50%.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached (Setpoint ≥ Config.SetpointUpperLimit). The setpoint is limited to Config.SetpointUpperLimit .
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached (Setpoint ≤ Config.SetpointLowerLimit). The setpoint is limited to Config.SetpointLowerLimit .
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.

Parameter	Data type	Default	Description
State	INT	0	The State parameter (Page 346) shows the current operating mode of the PID controller. You can change the operating mode using the input parameter Mode and a rising edge at ModeActivate. • State = 0: Inactive • State = 1: Pretuning • State = 2: Fine tuning • State = 3: Automatic mode • State = 4: Manual mode • State = 5: Approach substitute output value • State = 6: Transition time measurement • State = 7: Error monitoring • State = 8: Approach substitute output value with error monitoring • State = 10: Manual mode without endstop signals
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending in this cycle.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 351) shows which error messages are pending. ErrorBits is retentive and is reset upon a rising edge at Reset or ErrorAck.

9.2.4.6 In/out parameters of PID-3Step V2

Table 9- 9 In/out parameters of PID-3Step V2

Parameter	Data type	Default	Description
Mode	INT	4	At the Mode parameter, you specify the operating mode to which PID_3Step is to switch. Options are: • Mode = 0: Inactive • Mode = 1: Pretuning • Mode = 2: Fine tuning • Mode = 3: Automatic mode • Mode = 4: Manual mode • Mode = 6: Transition time measurement • Mode = 10: Manual mode without endstop signals The operating mode is activated by: • Rising edge at ModeActivate • Falling edge at Reset • Falling edge at ManualEnable • Cold restart of CPU if RunModeByStartup = TRUE Mode is retentive. A detailed description of the operating modes can be found in Parameters State and Mode V2 (Page 346).

9.2.4.7 Static tags of PID_3Step V2

Note

Change the tags identified with (1) only in "Inactive" mode to prevent malfunction of the PID controller.

Tag	Data type	Default	Description
ManualUpInternal	BOOL	FALSE	In manual mode, each rising edge opens the valve by 5% of the total control range or for the duration of the minimum motor transition time. ManualUpInternal is only evaluated if you are not using Output_PER or a position feedback. This tag is used in the commissioning dialog.
ManualDnInternal	BOOL	FALSE	In manual mode, every rising edge closes the valve by 5% of the total control range or for the duration of the minimum motor transition time. ManualDnInternal is only evaluated if you are not using Output_PER or position feedback. This tag is used in the commissioning dialog.
ActivateRecoverMode	BOOL	TRUE	The ActivateRecoverMode V2 (Page 354) tag determines the reaction to error.
RunModeByStartup	BOOL	TRUE	Activate operating mode at Mode parameter after CPU restart If RunModeByStartup = TRUE, PID_3Step starts in the operating mode saved in the Mode parameter after CPU startup. If RunModeByStartup = FALSE, PID_3Step remains in "In-active" mode after CPU startup.
LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded. The set was saved prior to the last tuning. Load-BackUp is automatically set back to FALSE.
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., ºC, or ºF.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature
ErrorBehaviour	BOOL	FALSE	If ErrorBehaviour = FALSE and an error has occurred, the valve stays at its current position and the controller switches directly to "Inactive" or "Error monitoring" mode. If ErrorBehaviour = TRUE and an error occurs, the actuator moves to the substitute output value and only then switches to "Inactive" or "Error monitoring" mode. If the following errors occur, you can no longer move the valve to a configured substitute output value. • 2000h: Invalid value at Feedback_PER parameter. • 4000h: Invalid value at Feedback parameter. • 8000h: Error during digital position feedback. • 20000h: Invalid value at SavePosition tag.

Tag	Data type	Default	Description
Warning	DWORD	DW#16#0	The Warning tag (Page 346) shows the warnings since Reset = TRUE or ErrorAck =TRUE. Warning is retentive. Cyclic warnings (for example, process value warning) are shown until the cause of the warning is removed. They are automatically deleted once their cause has gone. Non-cyclic warnings (for example, point of inflection not found) remain and are deleted like errors.
SavePosition	REAL	0.0	Substitute output value If ErrorBehaviour = TRUE, the actuator is moved to a position that is safe for the plant when an error occurs. As soon as the substitute output value has been reached, PID_3Step switches the operating mode according to ActivateRecoverMode.
CurrentSetpoint	REAL	0.0	Currently active setpoint. This value is frozen at the start of tuning.
CancelTuningLevel	REAL	10.0	Permissible fluctuation of setpoint during tuning. Tuning is not canceled until: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel
Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
Config.InputPerOn(1)	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.OutputPerOn(1)	BOOL	FALSE	If OutputPerOn = TRUE, the Output_PER parameter is used. If OutputPerOn = FALSE, the Ouput_UP and Output_DN parameters are used.
Config.InvertControl(1)	BOOL	FALSE	Invert control logic If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.
Config.FeedbackOn(1)	BOOL	FALSE	If FeedbackOn = FALSE, a position feedback is simulated. Position feedback is generally activated when FeedbackOn = TRUE.
Config.FeedbackPerOn(1)	BOOL	FALSE	FeedbackPerOn is only effective when FeedbackOn = TRUE. If FeedbackPerOn = TRUE, the analog input is used for the position feedback (Feedback_PER parameter). If FeedbackPerOn = FALSE, the Feedback parameter is used for the position feedback.
Config.ActuatorEndStopOn(1)	BOOL	FALSE	If ActuatorEndStopOn = TRUE, the digital position feedback Actuator_L and Actuator_H are taken into consideration.

Tag	Data type	Default	Description
Config.InputUpperLimit(1)	REAL	120.0	High limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_3Step reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit(1)	REAL	0.0	Low limit of the process value InputLowerLimit < InputUpperLimit
Config.InputUpperWarning(1)	REAL	+3.402822e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit
Config.InputLowerWarning(1)	REAL	-3.402822e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit(1)	REAL	100.0	High limit of output value The following value range is permitted: UpperPointOut ≥ OutputUpperLimit > OutputLowerLimit For more details, see OutputLowerLimit.
Config.OutputLowerLimit(1)	REAL	0.0	Low limit of output value The following value range is permitted: OutputUpperLimit > OutputLowerLimit ≥ LowerPointOut When using Output_PER, an output value limit of -100% corresponds to the value Output_PER = -27648; 100% correspond to the value Output_PER = 27648. If OutputPerOn = FALSE and FeedbackOn = FALSE, OutputLowerLimit and OutputUpperLimit are not evaluated. Output_UP and Output_DN are then reset at Actuator_H = TRUE or Actuator_L = TRUE (if ActuatorEndStopOn = TRUE) or after a travel time of Config.VirtualActuatorLimit * Retain.TransitTime/100 (if ActuatorEndStopOn = FALSE).

Tag	Data type	Default	Description
Config.SetpointUpperLimit(1)	REAL	+3.402822e+38	High limit of setpoint If you set SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is preassigned as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.
Config.SetpointLowerLimit(1)	REAL	- 3.402822e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured absolute process value low limit is preassigned as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.
Config.MinimumOnTime(1)	REAL	0.0	Minimum ON time Minimum time in seconds for which the servo drive must be switched on. Config.MinimumOnTime is only effective if Output_UP and Output_DN are used (Config.OutputPerOn = FALSE).
Config.MinimumOffTime(1)	REAL	0.0	Minimum OFF time Minimum time in seconds for which the servo drive must be switched off. Config.MinimumOffTime is only effective if Output_UP and Output_DN are used (Config.OutputPerOn = FALSE).
Config.VirtualActuatorLimit(1)	REAL	150.0	If all the following conditions have been satisfied, the actuator is moved in one direction for the maximum period of VirtualActuatorLimit × Retain.TransitTime/100 and the warning 2000h is output: • Config.OutputPerOn = FALSE • Config.ActuatorEndStopOn = FALSE • Config.FeedbackOn = FALSE If Config.OutputPerOn = FALSE and Config.ActuatorEndStopOn = TRUE or Config.FeedbackOn = TRUE, only the warning 2000h is output. If Config.OutputPerOn = TRUE, VirtualActuatorLimit is not taken into consideration. As of PID_3Step Version 2.3 the monitoring and limiting of the travel time can be deactivated with Config.VirtualActuatorLimit = 0.0.
Config.InputScaling .UpperPointIn(1)	REAL	27648.0	Scaling Input_PER high Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling .LowerPointIn(1)	REAL	0.0	Scaling Input_PER low Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn of the InputScaling structure.

Tag	Data type	Default	Description
Config.InputScaling .UpperPointOut(1)	REAL	100.0	Scaled high process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling .LowerPointOut(1)	REAL	0.0	Scaled low process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.FeedbackScaling .UpperPointIn(1)	REAL	27648.0	Scaling Feedback_PER high Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling .LowerPointIn(1)	REAL	0.0	Scaling Feedback_PER low Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling .UpperPointOut(1)	REAL	100.0	High endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure. The permitted value range is determined by the configura-tion. • FeedbackOn = FALSE: UpperPointOut = 100.0 • FeedbackOn = TRUE: UpperPointOut = 100.0 or 0.0 UpperPointOut ≠ LowerPointOut
Config.FeedbackScaling .LowerPointOut(1)	REAL	0.0	Low endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure. The permitted value range is determined by the configura-tion. • FeedbackOn = FALSE: LowerPointOut = 0.0 • FeedbackOn = TRUE: LowerPointOut = 0.0 or -100.0 LowerPointOut ≠ UpperPointOut
GetTransitTime.InvertDirection	BOOL	FALSE	If InvertDirection = FALSE, the valve is fully opened, closed, and then reopened in order to determine the valve transition time. If InvertDirection = TRUE, the valve is fully closed, opened, and then closed again.

Tag	Data type	Default	Description
GetTransitTime .SelectFeedback	BOOL	FALSE	If SelectFeedback = TRUE, then Feedback_PER, or Feedback is taken into consideration in the transition time measurement. If SelectFeedback = FALSE, then Actuator_H and Actuator_L are taken into consideration in the transition time measurement.
GetTransitTime.State	INT	0	Current phase of the transition time measurement • State = 0: Inactive • State = 1: Open valve completely • State = 2: Close valve completely • State = 3: Move valve to target position (NewOutput) • State = 4: Transition time measurement successfully completed • State = 5: Transition time measurement canceled
GetTransitTime.NewOutput	REAL	0.0	Target position for transition time measurement with position feedback The target position must be between "High endstop" and "Low endstop". The difference between NewOutput and ScaledFeedback must be at least 50% of the permissible control range.
CycleTime.StartEstimation	BOOL	TRUE	If StartEstimation = TRUE, the measurement of the PID_3Step sampling time is started. CycleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If EnEstimation = TRUE, the PID_3Step sampling time is calculated. If CycleTime.EnEstimation = FALSE, the PID_3Step sampling time is not calculated and you need to correct the configuration of CycleTime.Value manually.
CycleTime.EnMonitoring	BOOL	TRUE	If EnMonitoring = TRUE, the PID_3Step sampling time is monitored. If it is not possible to execute PID_3Step within the sampling time, the error 0800h is output and the operating mode is switched. ActivateRecoverMode and ErrorBehaviour determine which operating mode is switched to. If EnMonitoring = FALSE, the PID_3Step sampling time is not monitored, the error 0800h is not output, and the operating mode is not switched.
CycleTime.Value(1)	REAL	0.1	PID_3Step sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
CtrlParamsBackUp.SetByUser	BOOL	FALSE	Saved value of Retain.CtrlParams.SetByUser You can reload values from the CtrlParamsBackUp structure with LoadBackUp = TRUE.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain
CtrlParamsBackUp.Ti	REAL	20.0	Saved integration time in seconds
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time in seconds
CtrlParamsBackUp.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient

Tag	Data type	Default	Description
CtrlParamsBackUp .PWeighting	REAL	1.0	Saved proportional action weighting
CtrlParamsBackUp .DWeighting	REAL	1.0	Saved derivative action weighting
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm in seconds
CtrlParamsBackUp .InputDeadBand	REAL	0.0	Saved dead band width of the control deviation
PIDSelfTune.SUT .CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If CalculateParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRule. CalculateParams is set to FALSE following calculation.
PIDSelfTune.SUT.TuneRule	INT	1	Methods used to calculate parameters during pretuning: • SUT.TuneRule = 0: PID fast I • SUT.TuneRule = 1: PID slow I • SUT.TuneRule = 2: Chien, Hrones and Reswick PID • SUT.TuneRule = 3: Chien, Hrones, Reswick PI • SUT.TuneRule = 4: PID fast II • SUT.TuneRule = 5: PID slow II
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretuning: • State = 0: Initialize pretuning • State = 50: Determine start position without position feedback • State = 100: Calculate the standard deviation • State = 200: Find the point of inflection • State = 300: Determine the rise time • State = 9900: Pretuning successful • State = 1: Pretuning not successful

Tag	Data type	Default	Description
PIDSelfTune.TIR.RunIn	BOOL	FALSE	With the RunIn tag, you can specify that fine tuning can also be performed without pretuning. • RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_3Step switches to the mode from which tuning was started. • RunIn = TRUE The pretuning is skipped. PID_3Step attempts to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Only then will fine tuning start. RunIn is set to FALSE after fine tuning.
PIDSelfTune.TIR .CalculateParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If CalculateParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRule. CalculateParams is set to FALSE following calculation.
PIDSelfTune.TIR.TuneRule	INT	0	Methods used to calculate parameters during fine tuning: • TIR.TuneRule = 0: PID automatic • TIR.TuneRule = 1: PID fast • TIR.TuneRule = 2: PID slow • TIR.TuneRule = 3: Ziegler-Nichols PID • TIR.TuneRule = 4: Ziegler-Nichols PI • TIR.TuneRule = 5: Ziegler-Nichols P
PIDSelfTune.TIR.State	INT	0	The TIR.State tag indicates the current phase of fine tuning: • State = -100 Fine tuning is not possible. Pretuning will be performed first. • State = 0: Initialize fine tuning • State = 200: Calculate the standard deviation • State = 300: Attempt to reach the setpoint with the maximum or minimum output value • State = 400: Attempt to reach the setpoint with existing PID parameters (if pretuning was successful) • State = 500: Determine oscillation and calculate parameters • State = 9900: Fine tuning successful • State = 1: Fine tuning not successful

Tag	Data type	Default	Description
Retain.TransitTime(1)	REAL	30.0	Motor transition time in seconds Time in seconds the actuating drive requires to move the valve from the closed to the opened state. TransitTime is retentive.
Retain.CtrlParams .SetByUser(1)	BOOL	FALSE	If SetByUser = FALSE, the PID parameters are determined automatically and PID_3Step operates with a dead zone at the output value. The dead band width is calculated during tuning on the basis of the standard deviation of the output value and saved in Retain.CtrlParams.OutputDeadBand. If SetByUser = TRUE, the PID parameters are entered manually and PID_3 Step operates without a dead zone at the output value. Retain.CtrlParams.OutputDeadBand = 0.0 SetByUser is retentive.
Retain.CtrlParams.Gain(1)	REAL	1.0	Active proportional gain To invert the control logic, use the Config.InvertControl tag. Negative values at Gain also invert the control logic. We recommend you use only InvertControl to set the control logic. The control logic is also inverted if InvertControl = TRUE and Gain < 0.0. Gain is retentive.
Retain.CtrlParams.Ti(1)	REAL	20.0	• Ti > 0.0: Active integration time in seconds • Ti = 0.0: Integral action is deactivated Ti is retentive.
Retain.CtrlParams.Td(1)	REAL	0.0	• Td > 0.0: Active derivative action time in seconds • Td = 0.0: Derivative action is deactivated Td is retentive.
Retain.CtrlParams .TdFiltRatio(1)	REAL	0.2	Active derivative delay coefficient The derivative delay coefficient delays the effect of the derivative action. Derivative delay = derivative action time × derivative delay coefficient • 0.0: Derivative action is effective for one cycle only and therefore almost not effective. • 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant. • > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed. TdFiltRatio is retentive.

Tag	Data type	Default	Description
Retain.CtrlParams .PWeighting(1)	REAL	1.0	Active proportional action weighting The proportional action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Proportional action for setpoint change is fully effective • 0.0: Proportional action for setpoint change is not effective The proportional action is always fully effective when the process value is changed. PWeighting is retentive.
Retain.CtrlParams .DWeighting(1)	REAL	1.0	Active derivative action weighting The derivative action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Derivative action is fully effective upon setpoint change • 0.0: Derivative action is not effective upon setpoint change The derivative action is always fully effective when the process value is changed. DWeighting is retentive.
Retain.CtrlParams.Cycle(1)	REAL	1.0	Active sampling time of PID algorithm in seconds, rounded to an integer multiple of the cycle time of the calling OB. Cycle is retentive.
Retain.CtrlParams .InputDeadBand(1)	REAL	0.0	Dead band width of the control deviation InputDeadBand is retentive.

9.2.4.8 Parameters State and Mode V2

Correlation of the parameters

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

With a rising edge at ModeActivate, PID_3Step switches to the operating mode saved in the Mode in-out parameter.

When the CPU is switched on or switches from Stop to RUN mode, PID_3Step starts in the operating mode that is saved in the Mode parameter. To leave PID_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

Meaning of values

State	Description of operating mode
0	Inactive The controller is switched off and no longer changes the valve position.
1	Pretuning The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning. Pretuning requirements: • The motor transition time has been configured or measured. • Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3) • ManualEnable = FALSE • Reset = FALSE • The setpoint and the process value lie within the configured limits. The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher as compared to the noise. This is most likely the case in operating modes "Inactive" and "manual mode". The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel Before the PID parameters are recalculated, they are backed up and can be reactivated with LoadBackUp. The controller switches to automatic mode following successful pretuning. If pretuning is unsuccessful, the switchover of operating mode is dependent on ActivateRecoverMode and ErrorBehaviour. The pretuning phase is indicated with the SUT.State tag.

State	Description of operating mode
2	Fine tuning Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are recalculated based on the amplitude and frequency of this oscillation. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning. PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel The PID parameters are backed up before fine tuning. They can be reactivated with LoadBackUp. Requirements for fine tuning: • The motor transition time has been configured or measured. • The setpoint and the process value lie within the configured limits. • ManualEnable = FALSE • Reset = FALSE • Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode Fine tuning proceeds as follows when started from: • Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. • Inactive (State = 0) or manual mode (State = 4) If the requirements for pretuning are met, pretuning is started. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If PIDSelfTune.TIR.RunIn = TRUE, pretuning is skipped and an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. The controller switches to automatic mode following successful fine tuning. If fine tuning is unsuccessful, the switchover of operating mode is dependent on ActivateRecoverMode and ErrorBehaviour. The fine tuning phase is indicated with the TIR.State tag.
3	Automatic mode In automatic mode, PID_3Step controls the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is fulfilled: • Pretuning successfully completed • Fine tuning successfully completed • Changing of the Mode in-out parameter to the value 3 and a rising edge at ModeActivate. The switchover from automatic mode to manual mode is only bumpless if carried out in the commissioning editor. The ActivateRecoverMode tag is taken into consideration in automatic mode.

State	Description of operating mode
4	Manual mode In manual mode, you specify manual output values in the Manual_UP and Manual_DN parameters or ManualValue parameter. Whether or not the actuator can be moved to the output value in the event of an error is described in the ErrorBits parameter. You can also activate this operating mode using ManualEnable = TRUE. We recommend that you change the operating mode using Mode and ModeActivate only. The switchover from manual mode to automatic mode is bumpless. Manual mode is also possible when an error is pending.
5	Approach substitute output value This operating mode is activated in the event of an error, if Errorbehaviour = TRUE and ActivateRecoverMode = FALSE.. PID_3Step moves the actuator to the substitute output value and then switches to "Inactive" mode.
6	Transition time measurement The time that the motor needs to completely open the valve from the closed condition is determined. This operating mode is activated when Mode = 6 and ModeActivate = TRUE is set. If endstop signals are used to measure the transition time, the valve will be opened completely from its current position, closed completely, and opened completely again. If GetTransitTime.InvertDirection = TRUE, this behavior is inverted. If position feedback is used to measure the transition time, the actuator will be moved from its current position to a target position. The output value limits are not taken into consideration during the transition time measurement. The actuator can travel to the high or the low endstop.
7	Error monitoring The control algorithm is switched off and no longer changes the valve position. This operating mode is activated instead of "Inactive" mode in the event of an error. All the following conditions must be met: • Automatic mode (Mode = 3) • Errorbehaviour = FALSE • ActivateRecoverMode = TRUE • One or more errors have occurred in which ActivateRecoverMode (Page 354) is effective. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.
8	Approach substitute output value with error monitoring This operating mode is activated instead of "approach substitute output value" mode when an error occurs. PID_3Step moves the actuator to the substitute output value and then switches to "error monitoring" mode. All the following conditions must be met: • Automatic mode (Mode = 3) • Errorbehaviour = TRUE • ActivateRecoverMode = TRUE • One or more errors have occurred in which ActivateRecoverMode (Page 354) is effective. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.
10	Manual mode without endstop signals The endstop signals are **not** taken into consideration, even though Config.ActuatorEndStopOn = TRUE. The output value limits are not taken into consideration. Otherwise, PID_3Step behaves the same as in manual mode.

ENO characteristics

If State = 0, then ENO = FALSE.

If State ≠ 0, then ENO = TRUE.

Automatic switchover of operating mode during commissioning

Automatic mode is activated following successful pretuning or fine tuning. The following table shows how Mode and State change during successful pretuning.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning successfully completed
n	3	3	Automatic mode is started

PID_3Step automatically switches the operating mode in the event of an error. The following table shows how Mode and State change during pretuning with errors.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning canceled
n	4	4	Manual mode is started

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated. At the start of transition time measurement, pretuning, or fine tuning, PID_3Step saved the value of State in the Mode in/out parameter. PID_3Step therefore switches to the operating mode from which transition time measurement or tuning was started.

If ActivateRecoverMode = FALSE, "Inactive" or "Approach substitute output value" mode is activated.

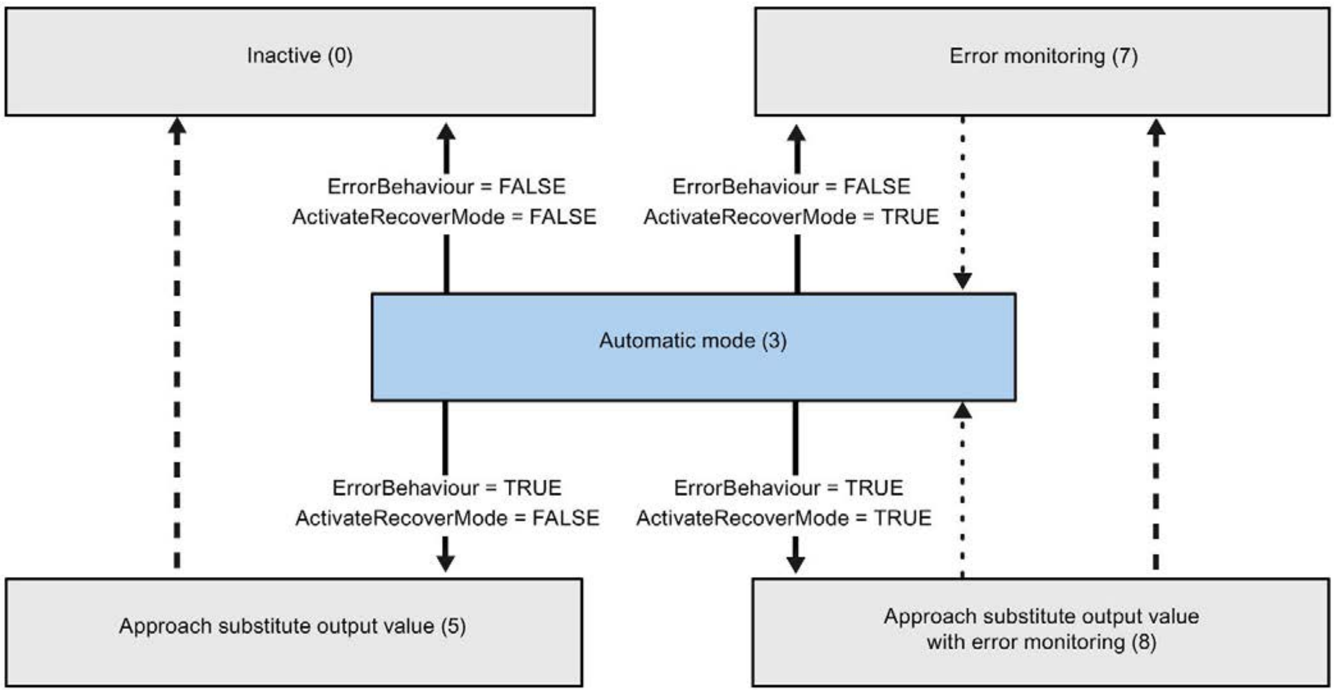
Automatic switchover of operating mode after transition time measurement

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated after successful transition time measurement.

If ActivateRecoverMode = FALSE, the system switches to "Inactive" operating mode after successful transition time measurement.

Automatic switchover of operating mode in automatic mode

PID_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour and ActivateRecoverMode on this switchover of operating mode.



Automatic switchover of operating mode in the event of an error

Automatic switchover of operating mode once the current operation has been completed.

Automatic switchover of operating mode when error is no longer pending.

Parameter ErrorBits V2 (Page 351)

9.2.4.9 Parameter ErrorBits V2

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 0003h, for example, indicates that the errors 0001h and 0002h are pending simultaneously.

If there is a position feedback, PID_3Step uses ManualValue as output value in manual mode. The exception is Errorbits = 10000h.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. • Input > Config.InputUpperLimit or • Input < Config.InputLowerLimit If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
0004	Error during fine tuning. Oscillation of the process value could not be maintained. If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0010	The setpoint was changed during tuning. You can set the permitted fluctuation of the setpoint at the CancelTuningLevel tag. If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0020	Pretuning is not permitted during fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_3Step remains in fine tuning mode.
0080	Error during pretuning. The output value limits are not configured correctly or the actual value does not react as expected. Check whether the limits of the output value are configured correctly and match the control logic. Also make sure that the actual value does not oscillate strongly before starting pretuning. If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0100	Error during fine tuning resulted in invalid parameters. If ActivateRecoverMode = TRUE before the error occurred, PID_3Step cancels the tuning and switches to the operating mode that is saved in the Mode parameter.

ErrorBits (DW#16#...)	Description
0200	Invalid value at "Input" parameter: Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
0400	Calculation of output value failed. Check the PID parameters. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
0800	Sampling time error: PID_3Step is not called within the sampling time of the cyclic interrupt OB. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter. If this error occurred during simulation with PLCSIM, see the notes under Simulating PID_3Step V2 with PLCSIM (Page 141).
1000	Invalid value at "Setpoint" parameter: Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode. As soon as the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
2000	Invalid value at Feedback_PER parameter. Check whether an error is pending at the analog input. The actuator cannot be moved to the substitute output value and remains in its current position. In manual mode, you can change the position of the actuator only with Manual_UP and Manual_DN, and not with ManualValue. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
4000	Invalid value at Feedback parameter. Value has an invalid number format. The actuator cannot be moved to the substitute output value and remains in its current position. In manual mode, you can change the position of the actuator only with Manual_UP and Manual_DN, and not with ManualValue. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.

ErrorBits (DW#16#...)	Description
8000	Error during digital position feedback. Actuator_H = TRUE and Actuator_L = TRUE. The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state. In order to move the actuator from this state, you must deactivate the "Actuator endstop" (Config.ActuatorEndStopOn = FALSE) or switch to manual mode without endstop signals (Mode = 10). If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode. If pretuning, fine tuning, or transition time measurement mode and ActivateRecoverMode = TRUE were active before the error occurred, PID_3Step switches to the operating mode that is saved in the Mode parameter.
10000	Invalid value at ManualValue parameter. Value has an invalid number format. The actuator cannot be moved to the manual value and remains in its current position. Specify a valid value in ManualValue or move the actuator in manual mode with Manual_UP and Manual_DN.
20000	Invalid value at SavePosition tag. Value has an invalid number format. The actuator cannot be moved to the substitute output value and remains in its current position.
40000	Invalid value at Disturbance parameter. Value has an invalid number format. If automatic mode was active and ActivateRecoverMode = TRUE before the error occurred, Disturbance is set to zero. PID_3Step remains in automatic mode. If pretuning or fine tuning mode was active and ActivateRecoverMode = TRUE before the error occurred, PID_3Step switches to the operating mode saved in the Mode parameter. If Disturbance in the current phase has no effect on the output value, tuning is not be canceled. The error has no effect during transition time measurement.

9.2.4.10 Tag ActivateRecoverMode V2

The ActivateRecoverMode tag determines the reaction to error. The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred.

NOTICE
Your system may be damaged. If ActivateRecoverMode = TRUE, PID_3Step remains in automatic mode even if the process limit values are exceeded. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

Automatic mode

ActivateRecov-erMode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" mode. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	If errors occur frequently in automatic mode, this setting has a negative effect on the control response, because PID_3Step switches between the calculated output value and the substitute output value at each error. In this case, check the ErrorBits parameter and eliminate the cause of the error. If one or more of the following errors occur, PID_3Step stays in automatic mode: • 0001h: The "Input" parameter is outside the process value limits. • 0800h: Sampling time error • 40000h: Invalid value at Disturbance parameter. If one or more of the following errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode: • 0002h: Invalid value at Input_PER parameter. • 0200h: Invalid value at Input parameter. • 0400h: Calculation of output value failed. • 1000h: Invalid value at Setpoint parameter. If one or more of the following errors occur, PID_3Step can no longer move the actuator: • 2000h: Invalid value at Feedback_PER parameter. • 4000h: Invalid value at Feedback parameter. • 8000h: Error during digital position feedback. • 20000h: Invalid value at SavePosition tag. Value has an invalid number format. The characteristics are independent of ErrorBehaviour. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.

Pretuning, fine tuning, and transition time measurement

ActivateRecov-erMode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" mode. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate. The controller changes to "Inactive" mode after successful transition time measurement.
TRUE	If the following error occurs, PID_3Step remains in the active mode: • 0020h: Pretuning is not permitted during fine tuning. The following errors are ignored: • 10000h: Invalid value at ManualValue parameter. • 20000h: Invalid value at SavePosition tag. When any other error occurs, PID_3Step cancels the tuning and switches to the mode from which tuning was started.

Manual mode

ActivateRecoverMode is not effective in manual mode.

Static tags of PID_3Step V2 (Page 336)

Parameters State and Mode V2 (Page 346)

9.2.4.11 Tag Warning V2

If several warnings are pending simultaneously, their values are displayed with binary addition. The display of warning 0005h, for example, indicates that the warnings 0001h and 0004h are pending simultaneously.

Warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. Instead, the PID parameters were calculated using the TIR.TuneRule = 3 method.
0010	The operating mode could not be changed because Reset = TRUE or ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The specified rule for tuning is not supported. No PID parameters are calculated.
0400	The transition time cannot be measured because the actuator settings do not match the selected measuring method.
0800	The difference between the current position and the new output value is too small for transition time measurement. This can produce incorrect results. The difference between the current output value and new output value must be at least 50% of the entire control range.
1000	The substitute output value cannot be reached because it is outside the output value limits.
2000	The actuator was moved in one direction for longer than Config.VirtualActuatorLimit × Retain .TransitTime. Check whether the actuator has reached an endstop signal.

The following warnings are deleted as soon as the cause is eliminated:

- 0001h
- 0004h
- 0008h
- 0040h
- 0100h
- 2000h

All other warnings are cleared with a rising edge at Reset or ErrorAck.

9.2.5 PID_3Step V1

9.2.5.1 Description PID_3Step V1

Description

You use the PID_3Step instruction to configure a PID controller with self tuning for valves or actuators with integrating behavior.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Approach substitute output value
- Transition time measurement
- Approach substitute output value with error monitoring
- Error monitoring

For a more detailed description of the operating modes, see the State parameter.

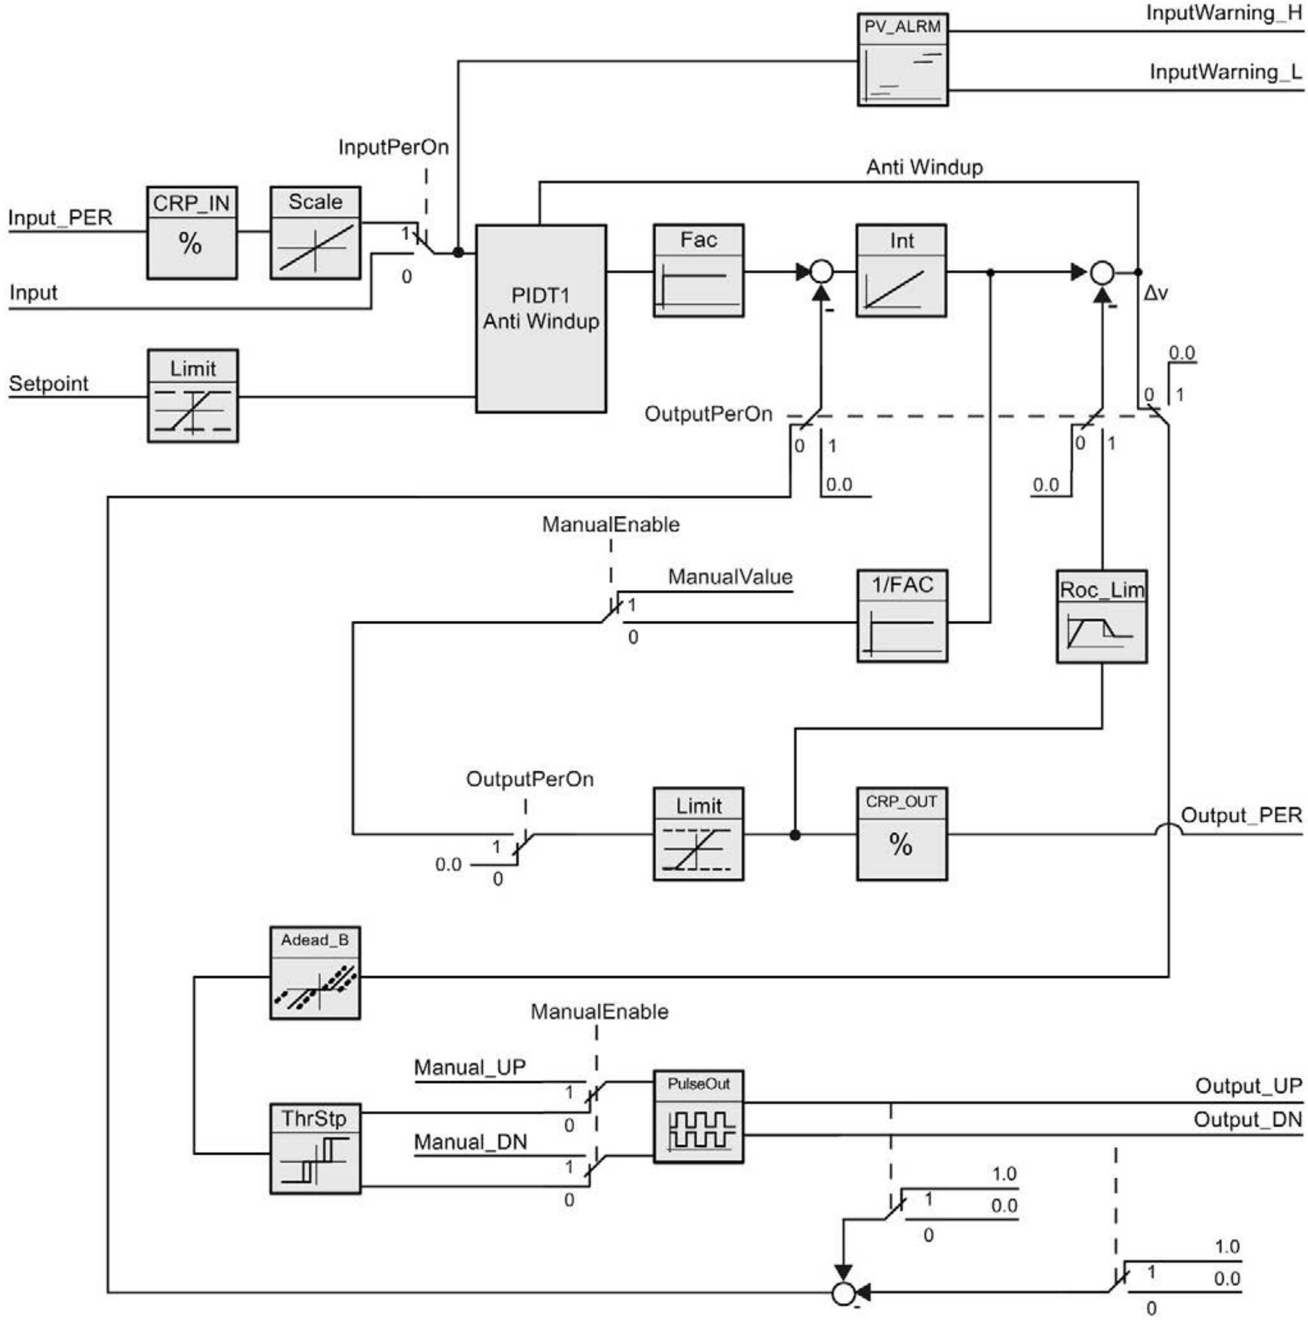
PID algorithm

PID_3Step is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The following equation is used to calculate the output value.

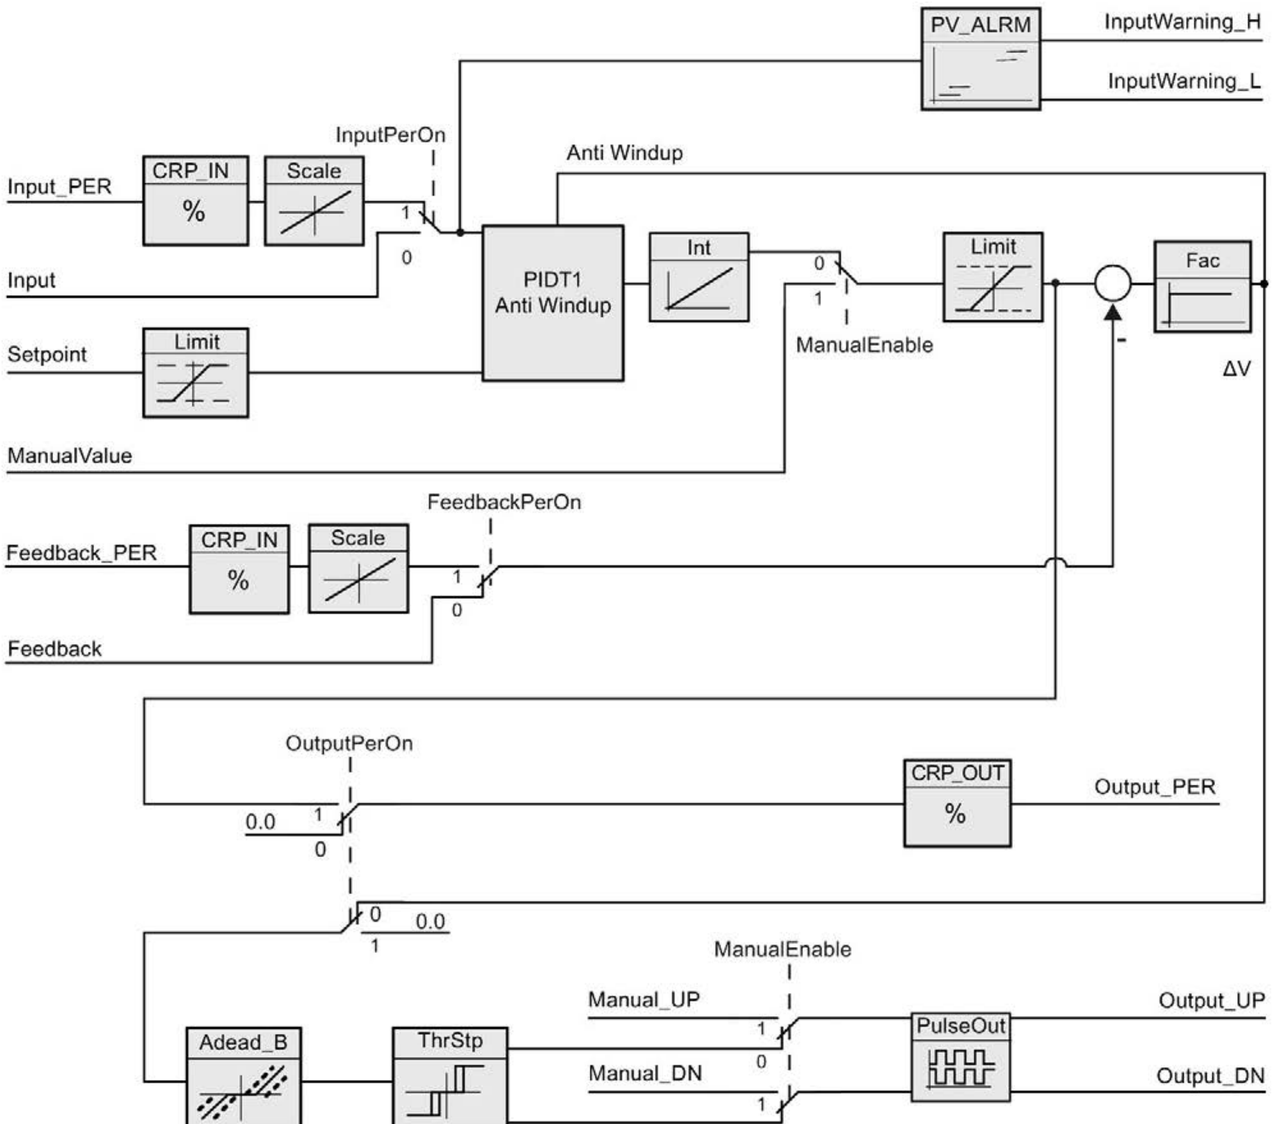
$$\Delta y = K_p \cdot s \cdot \left[(b \cdot w - x) + \frac{1}{T_I \cdot s}(w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1}(c \cdot w - x) \right]$$

Δy	Output value of the PID algorithm
K_p	Proportional gain
s	Laplace operator
b	Proportional action weighting
w	Setpoint
x	Process value
T_I	Integral action time
a	Derivative delay coefficient ($T1 = a \times T_D$)
T_D	Derivative action time
c	Derivative action weighting

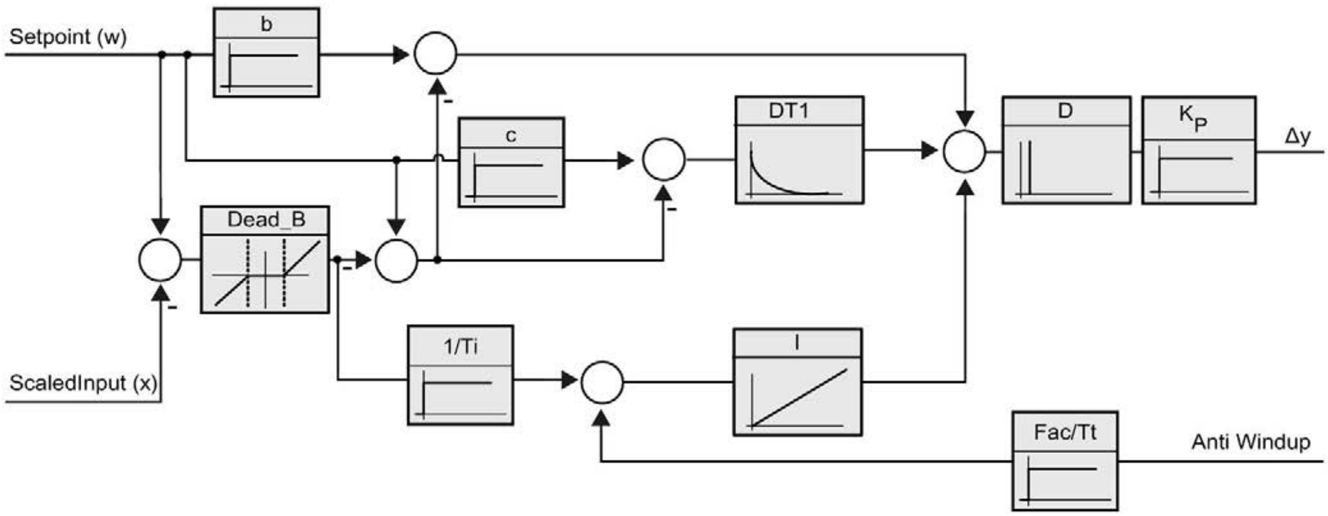
Block diagram without position feedback



Block diagram with position feedback



Block diagram of PIDT1 with anti-windup



Call

PID_3Step is called in a constant time interval of the cycle time of the calling OB (preferably in a cyclic interrupt OB).

Download to device

The actual values of retentive tags are only updated when you download PID_3Step completely.

Downloading technology objects to device (Page 44)

Startup

At the startup of the CPU, PID_3Step starts in the operating mode that was last active. To leave PID_3Step in "Inactive" mode, set RunModeByStartup = FALSE.

Reaction to error

If errors occur, these are output in the Error parameter. You configure the reaction of PID_3Step using the ErrorBehaviour and ActivateRecoverMode tags.

ErrorBehaviour	ActivateRecoverMode	Actuator setting configuration Set Output to	Reaction
0	FALSE	Current output value	Switch to "Inactive" mode (Mode = 0)
0	TRUE	Current output value while error is pending	Switch to "Error monitoring" mode (Mode = 7)
1	FALSE	Substitute output value	Switch to "Approach substitute output value" mode (Mode = 5) Switch to "Inactive" mode (Mode = 0)
1	TRUE	Substitute output value while error is pending	Switch to "Approach substitute output value with error monitoring" mode (Mode = 8) Switch to "Error monitoring" mode (Mode = 7)

The ErrorBits parameter shows which errors have occurred.

Parameter State and Retain.Mode V1 (Page 378)

Parameter ErrorBits V1 (Page 385)

Configuring PID_3Step V1 (Page 142)

9.2.5.2 Operating principle PID_3Step V1

Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0001hex).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warnings = 0040hex), and the InputWarning_H or InputWarning_L output parameter changes to TRUE.

Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID_3Step automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller range. PID_3Step checks whether this range falls within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit_H or SetpointLimit_L is set to TRUE.

The setpoint is limited in all operating modes.

Limiting the output value

You specify a high limit and low limit of the output value in the Config.OutputUpperLimit and Config.OutputLowerLimit tags. The output value limits must be within "Low endstop" and "High endstop".

- High endstop: Config.FeedbackScaling.UpperPointOut
- Low endstop: Config.FeedbackScaling.LowerPointOut

Rule:

UpperPointOut ≥ OutputUpperLimit > OutputLowerLimit ≥ LowerPointOut

The valid values for "High endstop" and "Low endstop" depend upon:

- FeedbackOn
- FeedbackPerOn
- OutputPerOn

OutputPerOn	FeedbackOn	FeedbackPerOn	LowerPointOut	UpperPointOut
FALSE	FALSE	FALSE	Cannot be set (0.0%)	Cannot be set (100.0%)
FALSE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
FALSE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	FALSE	FALSE	Cannot be set (100.0%)	Cannot be set (100.0%)
TRUE	TRUE	FALSE	-100.0% or 0.0%	0.0% or +100.0%
TRUE	TRUE	TRUE	-100.0% or 0.0%	0.0% or +100.0%

If OutputPerOn = FALSE and FeedbackOn = FALSE, you cannot limit the output value. The digital outputs are reset with Actuator_H = TRUE or Actuator_L = TRUE, or after a travel time amounting to 110% of the motor transition time.

The output value is 27648 at 100% and -27648 at -100%. PID_3Step must be able to completely close the valve. Therefore, zero must be included in the output value limits.

Note

Use with two or more actuators

PID_3 Step is not suitable for use with two or more actuators (for example, in heating/cooling applications), because different actuators need different PID parameters to achieve a good control response.

Substitute output value

If an error has occurred, PID_3Step can output a substitute output value and move the actuator to a safe position that is specified in the SavePosition tag. The substitute output value must be within the output value limits.

Monitoring signal validity

The values of the following parameters are monitored for validity:

- Setpoint
- Input
- Input_PER
- Feedback
- Feedback_PER
- Output

Monitoring the PID_3Step sampling time

Ideally, the sampling time is equivalent to the cycle time of the calling OB. The PID_3Step instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (ErrorBits = 0800 hex).

PID_3Step is set to "Inactive" mode during tuning under the following conditions:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value

In automatic mode, PID_3Step is set to "Inactive" mode under the following conditions:

- New mean value >= 1.5 x old mean value
- New mean value <= 0.5 x old mean value

Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time. All other functions of PID_3Step are executed at every call.

Measuring the motor transition time

The motor transition time is the time in seconds the motor requires to move the actuator from the closed to the opened state. The maximum time that the actuator is moved in one direction is 110% of the motor transition time. PID_3Step requires the motor transition time to be as accurate as possible for good controller results. The data in the actuator documentation contains average values for this type of actuator. The value for the specific actuator used may differ. You can measure the motor transition time during commissioning. The output value limits are not taken into consideration during the motor transition time measurement. The actuator can travel to the high or the low endstop.

The motor transition time is taken into consideration in the calculation of the analog output value as well as in the calculation of the digital output values. It is mainly required for correct operation during auto-tuning and the anti-windup behavior. You should therefore configure the motor transition time with the value that the motor requires to move the actuator from the closed to the opened state.

If no relevant motor transition time is in effect in your process (e.g. with solenoid valves), so that the output value has a direct and full effect on the process, use PID_Compact instead.

Control logic

An increase of the output value is generally intended to cause an increase in the process value. This is referred to as a normal control logic. For cooling and discharge control systems, it may be necessary to invert the control logic. PID_3Step does not work with negative proportional gain. If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value. The control logic is also taken into account during pretuning and fine tuning.

Configuring PID_3Step V1 (Page 142)

9.2.5.3 PID_3Step V1 input parameters

Table 9- 10 PID_3Step V1 input parameters

Parameters	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode
Input	REAL	0.0	A tag of the user program is used as source for the process value. If you are using parameter Input, then Config.InputPerOn = FALSE must be set.
Input_PER	WORD	W#16#0	An analog input is used as the source of the process value. If you are using parameter Input_PER, then Config.InputPerOn = TRUE must be set.
Actuator_H	BOOL	FALSE	Digital position feedback of the valve for the high endstop If Actuator_H = TRUE, the valve is at the high endstop and is no longer moved towards this direction.
Actuator_L	BOOL	FALSE	Digital position feedback of the valve for the low endstop If Actuator_L = TRUE, the valve is at the low endstop and is no longer moved towards this direction.
Feedback	REAL	0.0	Position feedback of the valve If you are using parameter Feedback, then Config.FeedbackPerOn = FALSE must be set.
Feedback_PER	WORD	W#16#0	Analog position feedback of a valve If you are using parameter Feedback_PER, then Config.FeedbackPerOn = TRUE must be set. Feedback_PER is scaled based on the tags: • Config.FeedbackScaling.LowerPointIn • Config.FeedbackScaling.UpperPointIn • Config.FeedbackScaling.LowerPointOut • Config.FeedbackScaling.UpperPointOut
ManualEnable	BOOL	FALSE	• A FALSE -> TRUE edge selects "Manual mode", while State = 4, Retain.Mode remains unchanged. • A TRUE -> FALSE edge selects the most recently active operating mode A change of Retain.Mode will not take effect during ManualEnable = TRUE. The change of Retain.Mode will only be considered upon a TRUE -> FALSE edge at ManualEnable . **PID_3Step V1.1**If ManualEnable = TRUE when the CPU starts, PID_3Step starts in manual mode. A rising edge (FALSE > TRUE) at ManualEnable is not necessary. **PID_3Step V1.0** At the start of the CPU, PID_3Step only switches to manual mode with a rising edge (FALSE->TRUE) at ManualEnable . Without rising edge, PID_3Step starts in the last operating mode in which ManualEnable was FALSE.
ManualValue	REAL	0.0	In manual mode, you specify the absolute position of the valve. ManualValue will only be evaluated if you are using OutputPer, **or** if position feedback is available.

Parameters	Data type	Default	Description
Manual_UP	BOOL	FALSE	In manual mode, every rising edge opens the valve by 5% of the total control range, or for the duration of the minimum motor transition time. Manual_UP is evaluated only if you are not using Output_PER and there is no position feedback available.
Manual_DN	BOOL	FALSE	In manual mode, every rising edge closes the valve by 5% of the total control range, or for the duration of the minimum motor transition time. Manual_DN is evaluated only if you are not using Output_PER and there is no position feedback available.
Reset	BOOL	FALSE	Restarts the controller. • FALSE -> TRUE edge – Switch to "Inactive" mode – ErrorBits and Warning are reset – Intermediate controller values are reset (PID parameters are retained) • TRUE -> FALSE edge – Change in most recent active mode – If automatic mode was active before, switchover to automatic mode is bumpless.

9.2.5.4 PID_3Step V1 output parameters

Table 9- 11 PID_3Step V1 output parameters

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
ScaledFeedback	REAL	0.0	Scaled position feedback For an actuator without position feedback, the position of the actuator indicated by ScaledFeedback is very imprecise. ScaledFeedback may only be used for rough estimation of the current position in this case.
Output_UP	BOOL	FALSE	Digital output value for opening the valve If Config.OutputPerOn = FALSE, the Output_UP parameter is used.
Output_DN	BOOL	FALSE	Digital output value for closing the valve If Config.OutputPerOn = FALSE, the Output_DN parameter is used.
Output_PER	WORD	W#16#0	Analog output value If Config.OutputPerOn = TRUE, Output_PER is used. Use Output_PER if you are using a valve as actuator which is triggered via an analog output and controlled with a continuous signal, e.g. 0...10 V or 4...20 mA. The value at Output_PER corresponds to the target position of the valve, e.g. Output_PER = 13824, when the valve is to be opened by 50%.
SetpointLimit_H	BOOL	FALSE	If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached. In the CPU, the setpoint is limited to the configured absolute setpoint high limit. The configured absolute process value high limit is the default for the setpoint high limit. If you configure Config.SetpointUpperLimit to a value within the process value limits, this value is used as the setpoint high limit.
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the absolute setpoint low limit has been reached. In the CPU, the setpoint is limited to the configured absolute setpoint low limit. The configured absolute process value low limit is the default setting for the setpoint low limit. If you configure Config.SetpointLowerLimit to a value within the process value limits, this value is used as the setpoint low limit.
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit.
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit.

Parameter	Data type	Default	Description
State	INT	0	The State parameter (Page 378) shows the current operating mode of the PID controller. You change the operating mode with the Retain.Mode tag. • State = 0: Inactive • State = 1: Pretuning • State = 2: Fine tuning • State = 3: Automatic mode • State = 4: Manual mode • State = 5: Approach substitute output value • State = 6: Transition time measurement • State = 7: Error monitoring • State = 8: Approach substitute output value with error monitoring
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 385) indicates the error messages.

9.2.5.5 PID_3Step V1 static tags

Note

You must not change tags that are not listed. These are used for internal purposes only.

Change the tags identified with (1) only in "Inactive" mode to prevent malfunction of the PID controller. "Inactive" mode is forced by setting the "Retain.Mode" tag to "0".

Table 9- 12 PID_3Step V1 static tags

Tag	Data type	Default	Description
ActivateRecoverMode	BOOL	TRUE	The ActivateRecoverMode tag (Page 388) determines the reaction to error.
RunModeByStartup	BOOL	TRUE	Activate Mode after CPU restart If RunModeByStartup = TRUE, the controller returns to the last active operating mode after a CPU restart. If RunModeByStartup = FALSE, the controller remains inactive after a CPU restart.
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., ºC, or ºF.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature.
ErrorBehaviour	INT	0	If ErrorBehaviour = 0 and an error has occurred, the valve stays at its current position and the controller switches directly to "Inactive" or "Error monitoring" mode. If ErrorBehaviour = 1 and an error occurs, the actuator moves to the substitute output value and only then switches to "Inactive" or "Error monitoring" mode. If the following errors occur, you can no longer move the valve to a configured substitute output value. • 2000h: Invalid value at Feedback_PER parameter. • 4000h: Invalid value at Feedback parameter. • 8000h: Error during digital position feedback.
Warning	DWORD	DW#16#0	The Warning tag (Page 378) displays the warnings generated since a Reset or since the last operating mode switchover. Cyclic warnings (for example, process value warning) are shown until the cause of the warning is removed. They are automatically deleted once their cause has gone. Non-cyclic warnings (for example, point of inflection not found) remain and are deleted like errors.
SavePosition	REAL	0.0	Substitute output value If ErrorBehaviour = 1 and an error occurs, the actuator moves to a safe position for the plant and only then switches to "Inactive" mode.
CurrentSetpoint	REAL	0.0	Currently active setpoint. This value is frozen at the start of tuning.

Tag	Data type	Default	Description
Progress	REAL	0.0	Progress of tuning as a percentage (0.0 - 100.0)
Config.InputPerOn(1)	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used. If InputPerOn = FALSE, the Input parameter is used.
Config.OutputPerOn(1)	BOOL	FALSE	If OutputPerOn = TRUE, the Output_PER parameter is used. If OutputPerOn = FALSE, the Ouput_UP and Output_DN parameters are used.
Config.LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded. The set was saved prior to the last tuning. LoadBackUp is automatically set back to FALSE.
Config.InvertControl(1)	BOOL	FALSE	Invert control logic If InvertControl = TRUE, an increasing control deviation causes a reduction in the output value.
Config.FeedbackOn(1)	BOOL	FALSE	If FeedbackOn = FALSE, a position feedback is simulated. Position feedback is generally activated when FeedbackOn = TRUE.
Config.FeedbackPerOn(1)	BOOL	FALSE	FeedbackPerOn is only effective when FeedbackOn = TRUE. If FeedbackPerOn = TRUE, the analog input is used for the position feedback (Feedback_PER parameter). If FeedbackPerOn = FALSE, the Feedback parameter is used for the position feedback.
Config.ActuatorEndStopOn(1)	BOOL	FALSE	If ActuatorEndStopOn = TRUE, the digital position feedback Actuator_L and Actuator_H are taken into consideration.
Config.InputUpperLimit(1)	REAL	120.0	High limit of the process value At the I/O input, the process value can be a maximum of 18% higher than the standard range (overrange). An error is no longer signaled due to a violation of the "Process value high limit". Only a wire-break and a short-circuit are recognized and PID_3Step reacts according to the configured reaction to error. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit(1)	REAL	0.0	Low limit of the process value InputLowerLimit < InputUpperLimit
Config.InputUpperWarning(1)	REAL	+3.402822e+38	Warning high limit of the process value If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning InputUpperWarning ≤ InputUpperLimit

Tag	Data type	Default	Description
Config.InputLowerWarning(1)	REAL	-3.402822e+38	Warning low limit of the process value If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning InputLowerWarning ≥ InputLowerLimit
Config.OutputUpperLimit(1)	REAL	100.0	High limit of output value The following value range is permitted: UpperPointOut ≥ OutputUpperLimit > OutputLowerLimit For more details, see OutputLowerLimit.
Config.OutputLowerLimit(1)	REAL	0.0	Low limit of output value The following value range is permitted: OutputUpperLimit > OutputLowerLimit ≥ LowerPointOut When using Output_PER, an output value limit of -100% corresponds to the value Output_PER = -27648; 100% correspond to the value Output_PER = 27648. If OutputPerOn = FALSE and FeedbackOn = FALSE, OutputLowerLimit and OutputUpperLimit are not evaluated. Output_UP and Output_DN are then reset at Actuator_H = TRUE or Actuator_L = TRUE (if ActuatorEndStopOn = TRUE) or after a travel time of 110% * Config.TransitTime (if ActuatorEndStopOn = FALSE).
Config.SetpointUpperLimit(1)	REAL	+3.402822e+38	High limit of setpoint If you set SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is preassigned as the setpoint high limit. If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit.
Config.SetpointLowerLimit(1)	REAL	- 3.402822e+38	Low limit of the setpoint If you set SetpointLowerLimit outside the process value limits, the configured absolute process value low limit is preassigned as the setpoint low limit. If you set SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit.
Config.MinimumOnTime(1)	REAL	0.0	Minimum ON time Minimum time in seconds for which the servo drive must be switched on. Config.MinimumOnTime is only effective if Output_UP and Output_DN are used (Config.OutputPerOn = FALSE).
Config.MinimumOffTime(1)	REAL	0.0	Minimum OFF time Minimum time in seconds for which the servo drive must be switched off. Config.MinimumOffTime is only effective if Output_UP and Output_DN are used (Config.OutputPerOn = FALSE).

Tag	Data type	Default	Description
Config.TransitTime(1)	REAL	30.0	Motor transition time Time in seconds the actuating drive requires to move the valve from the closed to the opened state.
Config.InputScaling .UpperPointIn(1)	REAL	27648.0	Scaling Input_PER high Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling .LowerPointIn(1)	REAL	0.0	Scaling Input_PER low Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling .UpperPointOut(1)	REAL	100.0	Scaled high process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.InputScaling .LowerPointOut(1)	REAL	0.0	Scaled low process value Input_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the InputScaling structure.
Config.FeedbackScaling .UpperPointIn(1)	REAL	27648.0	Scaling Feedback_PER high Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling .LowerPointIn(1)	REAL	0.0	Scaling Feedback_PER low Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure.
Config.FeedbackScaling .UpperPointOut(1)	REAL	100.0	High endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure. The permitted value range is determined by the configura-tion. • FeedbackOn = FALSE: UpperPointOut = 100.0 • FeedbackOn = TRUE: UpperPointOut = 100.0 or 0.0 UpperPointOut ≠ LowerPointOut

Tag	Data type	Default	Description
Config.FeedbackScaling .LowerPointOut(1)	REAL	0.0	Low endstop Feedback_PER is converted to a percentage based on the two value pairs UpperPointOut, UpperPointIn and Lower-PointOut, LowerPointIn of the FeedbackScaling structure. The permitted value range is determined by the configura-tion. • FeedbackOn = FALSE: LowerPointOut = 0.0 • FeedbackOn = TRUE: LowerPointOut = 0.0 or -100.0 LowerPointOut ≠ UpperPointOut
GetTransitTime.InvertDirection	BOOL	FALSE	If InvertDirection = FALSE, the valve is fully opened, closed, and then reopened in order to determine the valve transition time. If InvertDirection = TRUE, the valve is fully closed, opened, and then closed again.
GetTransitTime .SelectFeedback	BOOL	FALSE	If SelectFeedback = TRUE, then Feedback_PER, or Feedback is taken into consideration in the transition time measurement. If SelectFeedback = FALSE, then Actuator_H and Actua-tor_L are taken into consideration in the transition time measurement.
GetTransitTime.Start	BOOL	FALSE	If Start = TRUE, the transition time measurement is start-ed.
GetTransitTime.State	INT	0	Current phase of the transition time measurement • State = 0: Inactive • State = 1: Open valve completely • State = 2: Close valve completely • State = 3: Move valve to target position (NewOutput) • State = 4: Transition time measurement successfully completed • State = 5: Transition time measurement canceled
GetTransitTime.NewOutput	REAL	0.0	Target position for transition time measurement with posi-tion feedback The target position must be between "High endstop" and "Low endstop". The difference between NewOutput and ScaledFeedback must be at least 50% of the permissible control range.
CycleTime.StartEstimation	BOOL	TRUE	If StartEstimation = TRUE, the measurement of the PID_3Step sampling time is started. Cy-cleTime.StartEstimation = FALSE once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If EnEstimation = TRUE, the PID_3Step sampling time is calculated.

Tag	Data type	Default	Description
CycleTime.EnMonitoring	BOOL	TRUE	If EnMonitoring = TRUE, the PID_3Step sampling time is monitored. If it is not possible to execute PID_3Step within the sampling time, the error 0800h is output and the operating mode is switched. ActivateRecoverMode and ErrorBehaviour determine which operating mode is switched to. If EnMonitoring = FALSE, the PID_3Step sampling time is not monitored, the error 0800h is not output, and the operating mode is not switched.
CycleTime.Value(1)	REAL	0.1	PID_3Step sampling time in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
CtrlParamsBackUp.SetByUser	BOOL	FALSE	Saved value of Retain.CtrlParams.SetByUser. You can reload values from the CtrlParamsBackUp structure with Config.LoadBackUp = TRUE.
CtrlParamsBackUp.Gain	REAL	1.0	Saved proportional gain
CtrlParamsBackUp.Ti	REAL	20.0	Saved integral action time
CtrlParamsBackUp.Td	REAL	0.0	Saved derivative action time
CtrlParamsBackUp.TdFiltRatio	REAL	0.0	Saved derivative delay coefficient
CtrlParamsBackUp.PWeighting	REAL	0.0	Saved proportional action weighting
CtrlParamsBackUp .DWeighting	REAL	0.0	Saved derivative action weighting
CtrlParamsBackUp.Cycle	REAL	1.0	Saved sampling time of PID algorithm
CtrlParamsBackUp .InputDeadBand	REAL	0.0	Saved dead zone width of the control deviation
PIDSelfTune.SUT .CalculateSUTParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If CalculateSUTParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRuleSUT. CalculateSUTParams is set to FALSE following calculation.
PIDSelfTune.SUT .TuneRuleSUT	INT	1	Methods used to calculate parameters during pretuning: • TuneRuleSUT = 0: PID fast I • TuneRuleSUT = 1: PID slow I • TuneRuleSUT = 2: Chien, Hrones and Reswick PID • TuneRuleSUT = 3: Chien, Hrones, Reswick PI • TuneRuleSUT = 4: PID fast II • TuneRuleSUT = 5: PID slow II
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretuning:

Tag	Data type	Default	Description
PIDSelfTune.TIR.RunIn	BOOL	FALSE	• RunIn = FALSE Pretuning is started when fine tuning is started from inactive or manual mode. If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint. Only then will fine tuning start. If pretuning is not possible, PID_3Step switches to "Inactive" mode. • RunIn = TRUE The pretuning is skipped. PID_3Step attempts to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Only then will fine tuning start. RunIn is set to FALSE after fine tuning.
PIDSelfTune.TIR .CalculateTIRParams	BOOL	FALSE	The properties of the controlled system are saved during tuning. If CalculateTIRParams = TRUE, the PID parameters are recalculated on the basis of these properties. The PID parameters are calculated using the method set in TuneRuleTIR. CalculateTIRParams is set to FALSE following calculation.
PIDSelfTune.TIR .TuneRuleTIR	INT	0	Methods used to calculate parameters during fine tuning: • TuneRuleTIR = 0: PID automatic • TuneRuleTIR = 1: PID fast • TuneRuleTIR = 2: PID slow • TuneRuleTIR = 3: Ziegler-Nichols PID • TuneRuleTIR = 4: Ziegler-Nichols PI • TuneRuleTIR = 5: Ziegler-Nichols P
PIDSelfTune.TIR.State	INT	0	The TIR.State tag indicates the current phase of "fine tuning":

Tag	Data type	Default	Description
Retain.Mode	INT	0	A change to the value of Retain.Mode initiates a switch to another operating mode. The following operating mode is enabled upon a change of Mode to: • Mode = 0: Inactive • Mode = 1: Pretuning • Mode = 2: Fine tuning • Mode = 3: Automatic mode • Mode = 4: Manual mode • Mode = 5: Approach substitute output value • Mode = 6: Transition time measurement • Mode = 7: Error monitoring • Mode = 8: Approach substitute output value with error monitoring Mode is retentive.
Retain.CtrlParams .SetByUser(1)	BOOL	FALSE	If SetByUser = FALSE, the PID parameters are determined automatically and PID_3Step operates with a dead zone at the output value. The dead zone width is calculated during tuning on the basis of the standard deviation of the output value and saved in Retain.CtrlParams.OutputDeadBand. If SetByUser = TRUE, the PID parameters are entered manually and PID_3 Step operates without a dead zone at the output value. Retain.CtrlParams.OutputDeadBand = 0.0 SetByUser is retentive.
Retain.CtrlParams.Gain(1)	REAL	1.0	Active proportional gain Gain is retentive.
Retain.CtrlParams.Ti(1)	REAL	20.0	• Ti > 0.0: Active integral action time • Ti = 0.0: Integral action is deactivated Ti is retentive.
Retain.CtrlParams.Td(1)	REAL	0.0	• Td > 0.0: Active derivative action time • Td = 0.0: Derivative action is deactivated Td is retentive.
Retain.CtrlParams .TdFiltRatio(1)	REAL	0.0	Active derivative delay coefficient TdFiltRatio is retentive.
Retain.CtrlParams .PWeighting(1)	REAL	0.0	Active proportional action weighting PWeighting is retentive.
Retain.CtrlParams .DWeighting(1)	REAL	0.0	Active derivative action weighting DWeighting is retentive.
Retain.CtrlParams .Cycle(1)	REAL	1.0	Active sampling time of PID algorithm in seconds, rounded to an integer multiple of the cycle time of the calling OB. Cycle is retentive.
Retain.CtrlParams .InputDeadBand(1)	REAL	0.0	Dead zone width of the control deviation InputDeadBand is retentive.

Downloading technology objects to device (Page 44)

9.2.5.6 Parameter State and Retain.Mode V1

Correlation of the parameters

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

To switch from one operating mode to another, you must change the Retain.Mode tag. This also applies when the value for the new operating mode is already in Retain.Mode. For example, set Retain.Mode = 0 first and then Retain.Mode = 3. Provided the current operating mode of the controller permits this switchover, State will be set to the value of Retain.Mode.

When PID_3Step automatically switches from one operating mode to another, the following applies: State != Retain.Mode.

Examples:

- After successful pretuning
  State = 3 and Retain.Mode = 1
- In the event of an error
  State = 0 and Retain.Mode remain at the previous value, for example, Retain.Mode = 3
- ManualEnalbe = TRUE
  State = 4 and Retain.Mode remain at the previous value, e.g., Retain.Mode = 3

Note

You want, for example, to repeat successful fine tuning without exiting automatic mode with Mode = 0.

Setting Retain.Mode to an invalid value such as 9999 for one cycle has no effect on State. Set Mode = 2 in the next cycle. In this way, you can generate a change to Retain.Mode without first switching to "Inactive" mode.

Meaning of values

State / Retain.Mode	Description
0	Inactive The controller is switched off and no longer changes the valve position.
1	Pretuning The pretuning determines the process response to a pulse of the output value and searches for the point of inflection. The optimized PID parameters are calculated as a function of the maximum rate of rise and dead time of the controlled system. Pretuning requirements: • State = 0 or State = 4 • ManualEnable = FALSE • The motor transition time has been configured or measured. • The setpoint and the process value lie within the configured limits. The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher as compared to the noise. Before the PID parameters are recalculated, they are backed up and can be reactivated with Config.LoadBackUp. The setpoint is frozen in the CurrentSetpoint tag. The controller switches to automatic mode following successful pretuning and to "Inactive" mode following unsuccessful pretuning. The pretuning phase is indicated with the SUT.State tag.
2	Fine tuning Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned based on the amplitude and frequency of this oscillation. The differences between the process response during pretuning and fine tuning are analyzed. All PID parameters are recalculated from the results. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. PID_3Step automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. The PID parameters are backed up before fine tuning. They can be reactivated with Config.LoadBackUp. The setpoint is frozen in the CurrentSetpoint tag. Requirements for fine tuning: • The motor transition time has been configured or measured. • The setpoint and the process value lie within the configured limits. • ManualEnable = FALSE • Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode

State / Retain.Mode	Description
2	Fine tuning proceeds as follows when started from: • Automatic mode (State = 3) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_3Step controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. • Inactive (State = 0) or manual mode (State = 4) Pretuning is always started first. The determined PID parameters will be used for control until the control loop has stabilized and the requirements for fine tuning have been met. If PIDSelfTune.TIR.RunIn = TRUE, pretuning is skipped and an attempt is made to reach the setpoint with the minimum or maximum output value. This can produce increased overshoot. Fine tuning then starts automatically. The controller switches to automatic mode following successful fine tuning. If fine tuning was not successful, the controller switches to "Inactive" mode. The fine tuning phase is indicated with the TIR.State tag.
3	Automatic mode In automatic mode, PID_3Step controls the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is fulfilled: • Pretuning successfully completed • Fine tuning successfully completed • Changing the Retain.Mode tag to the value 3. When the CPU is switched on or switches from Stop to RUN mode, PID_3Step starts in the most recently active operating mode. To leave PID_3Step in "Inactive" mode, set RunModeByStartup = FALSE. The ActivateRecoverMode tag is taken into consideration in automatic mode.
4	Manual mode In manual mode, you specify manual output values in the Manual_UP and Manual_DN parameters or ManualValue parameter. Whether or not the actuator can be moved to the output value in the event of an error is described in the ErrorBits parameter. This operating mode is enabled if Retain.Mode = 4, or on a rising edge at ManualEnable. If ManualEnable changes to TRUE, only State changes. Retain.Mode retains its current value. On a falling edge at ManualEnable, PID_3Step returns to the previous operating mode. The switchover to automatic mode is bumpless. **PID_3Step V1.1** Manual mode is always possible in the event of an error. **PID_3Step V1.0** Manual mode is dependent on the ActivateRecoverMode tag in the event of an error.
5	Approach substitute output value This operating mode is activated in the event of an error or when Reset = TRUE if Errorbehaviour = 1 and ActivateRecoverMode = FALSE.. PID_3Step moves the actuator to the substitute output value and then switches to "Inactive" mode.

State / Retain.Mode	Description
6	Transition time measurement The time that the motor needs to completely open the valve from the closed condition is determined. This operating mode is activated when GetTransitTime.Start = TRUE is set. If endstop signals are used to measure the transition time, the valve will be opened completely from its current position, closed completely, and opened completely again. If GetTransitTime.InvertDirection = TRUE, this behavior is inverted. If position feedback is used to measure the transition time, the actuator will be moved from its current position to a target position. The output value limits are not taken into consideration during the transition time measurement. The actuator can travel to the high or the low endstop.
7	Error monitoring The control algorithm is switched off and no longer changes the valve position. This operating mode is activated instead of "Inactive" mode in the event of an error. All the following conditions must be met: • Mode = 3 (automatic mode) • Errorbehaviour = 0 • ActivateRecoverMode = TRUE • One or more errors have occurred in which ActivateRecoverMode (Page 388) is effective. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.
8	Approach substitute output value with error monitoring This operating mode is activated instead of "Approach substitute output value" mode in the event of an error. PID_3Step moves the actuator to the substitute output value and then switches to "Error monitoring" mode. All the following conditions must be met: • Mode = 3 (automatic mode) • Errorbehaviour = 1 • ActivateRecoverMode = TRUE • One or more errors have occurred in which ActivateRecoverMode (Page 388) is effective. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.

Automatic switchover of operating mode during commissioning

PID_3Step automatically switches the operating mode in the event of an error. The following diagram illustrates the influence of ErrorBehaviour on the switchover of operating mode from transition time measurement, pretuning, and fine tuning modes.

Parameter ErrorBits V1 (Page 385)

9.2.5.7 Parameter ErrorBits V1

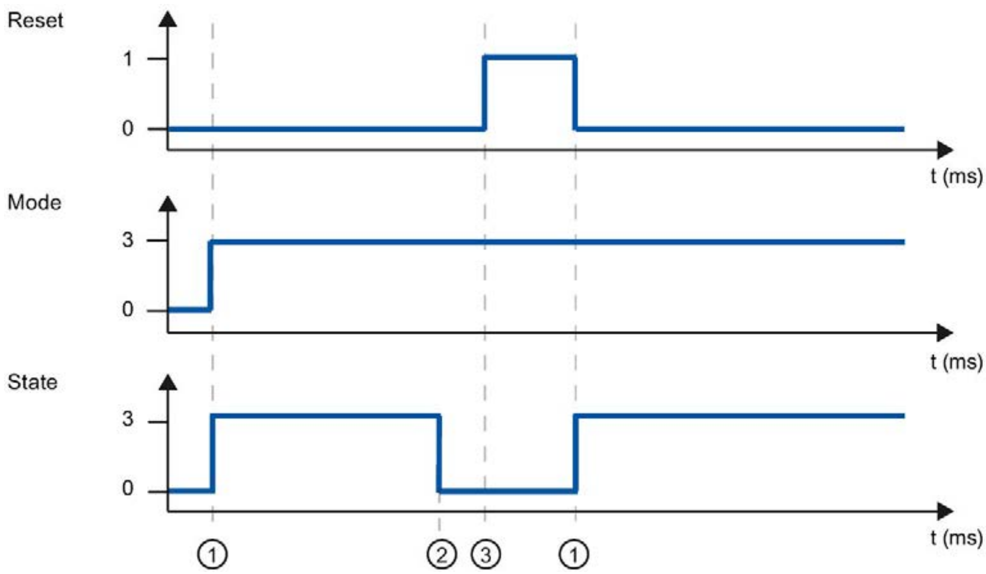
If several errors are pending simultaneously, the values of the error codes are displayed with binary addition. The display of error code 0003, for example, indicates that the errors 0001 and 0002 are pending simultaneously.

ErrorBits (DW#16#...)	Description
0000	There is no error.
0001	The "Input" parameter is outside the process value limits. • Input > Config.InputUpperLimit or • Input < Config.InputLowerLimit If ActivateRecoverMode = TRUE and ErrorBehaviour = 1, the actuator moves to the substitute output value. If ActivateRecoverMode = TRUE and ErrorBehaviour = 0, the actuator stops in its current position. If ActivateRecoverMode = FALSE, the actuator stops in its current position. PID_3Step V1.1 You can move the actuator in manual mode. PID_3Step V1.0 Manual mode is not possible in this state. You cannot move the actuator again until you eliminate the error.
0002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.
0004	Error during fine tuning. Oscillation of the process value could not be maintained.
0020	Pretuning is not permitted in automatic mode or during fine tuning.
0080	Error during pretuning. The output value limits are not configured correctly or the actual value does not react as expected. Check whether the limits of the output value are configured correctly and match the control logic. Also make sure that the actual value does not oscillate strongly before starting pretuning.
0100	Error during fine tuning resulted in invalid parameters.
0200	Invalid value at "Input" parameter: Value has an invalid number format. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.
0400	Calculation of output value failed. Check the PID parameters.
0800	Sampling time error: PID_3Step is not called within the sampling time of the cyclic interrupt OB. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode. If this error occurred during simulation with PLCSIM, see the notes under Simulating PID_3Step V1 with PLCSIM (Page 160).
1000	Invalid value at "Setpoint" parameter: Value has an invalid number format. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.

ErrorBits (DW#16#...)	Description
2000	Invalid value at Feedback_PER parameter. Check whether an error is pending at the analog input. The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state. You must deactivate position feedback (Config. FeedbackOn = FALSE) to move the actuator from this state. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.
4000	Invalid value at Feedback parameter. Value has an invalid number format. The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state. You must deactivate position feedback (Config. FeedbackOn = FALSE) to move the actuator from this state. If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.
8000	Error during digital position feedback. Actuator_H = TRUE and Actuator_L = TRUE. The actuator cannot be moved to the substitute output value and remains in its current position. Manual mode is not possible in this state. In order to move the actuator from this state, you must deactivate the "Actuator endstop" (Config.ActuatorEndStopOn = FALSE). If automatic mode was active before the error occurred, ActivateRecoverMode = TRUE, and the error is no longer pending, PID_3Step switches back to automatic mode.

9.2.5.8 Parameter Reset V1

A rising edge at Reset triggers a change to "Inactive" mode, and errors and warnings are reset. A falling edge at Reset triggers a change to the most recently active operating mode. If automatic mode was active before, switchover to automatic mode is bumpless.



① Activation
② Error
③ Reset

9.2.5.9 Tag ActivateRecoverMode V1

The effect of the ActivateRecoverMode variable depends on the version of the PID_3Step.

Behavior in version 1.1

The ActivateRecoverMode variable determines the behavior in the event of an error in automatic mode. ActivateRecoverMode is not effective during pretuning, fine tuning and transition time measurement.

ActivateRecov-erMode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" operating mode. The controller is activated by a reset or a change in Retain.Mode.
TRUE	If errors occur frequently in automatic mode, this setting has a negative effect on the control response. In this case, check the ErrorBits parameter and eliminate the cause of the error. If one or more errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode: • 0002h: Invalid value at parameter Input_PER. • 0200h: Invalid value at parameter Input. • 0800h: Sampling time error • 1000h: Invalid value at parameter Setpoint. • 2000h: Invalid value at parameter Feedback_PER. • 4000h: Invalid value at parameter Feedback. • 8000h: Error in digital position feedback. With errors 2000h, 4000h and 8000h, PID_3Step **cannot** approach the configured substitute output value. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode.

Behavior in version 1.0

The ActivateRecoverMode variable determines the behavior in the event of an error in automatic and manual mode. ActivateRecoverMode is not effective during pretuning, fine tuning and transition time measurement.

ActivateRecoverMode	Description
FALSE	In the event of an error, PID_3Step switches to "Inactive" or "Approach substitute output value" operating mode. The controller is activated by a reset or a change in Retain.Mode.
TRUE	**Errors in automatic mode** If errors occur frequently in automatic mode, this setting has a negative effect on the control response. In this case, check the ErrorBits parameter and eliminate the cause of the error. If one or more errors occur, PID_3Step switches to "Approach substitute output value with error monitoring" or "Error monitoring" mode: • 0002h: Invalid value at parameter Input_PER. • 0200h: Invalid value at parameter Input. • 0800h: Sampling time error • 1000h: Invalid value at parameter Setpoint. • 2000h: Invalid value at parameter Feedback_PER. • 4000h: Invalid value at parameter Feedback. • 8000h: Error in digital position feedback. With errors 2000h, 4000h and 8000h, PID_3Step **cannot** approach the configured substitute output value. As soon as the errors are no longer pending, PID_3Step switches back to automatic mode. **Errors in manual mode** If one or more of the following errors occur, PID_3Step stays in manual mode: • 0002h: Invalid value at parameter Input_PER. • 0200h: Invalid value at parameter Input. • 0800h: Sampling time error • 1000h: Invalid value at parameter Setpoint. • 2000h: Invalid value at parameter Feedback_PER. • 4000h: Invalid value at parameter Feedback. • 8000h: Error in digital position feedback. With errors 2000h, 4000h and 8000h, you **cannot** move the valve to a suitable position.

Parameter State and Retain.Mode V1 (Page 378)

9.2.5.10 Tag Warning V1

If several warnings are pending simultaneously, their values are displayed with binary addition. The display of warning 0003, for example, indicates that the warnings 0001 and 0002 are pending simultaneously.

Warning (DW#16#...)	Description
0000	No warning pending.
0001	The point of inflection was not found during pretuning.
0002	Oscillation increased during fine tuning.
0004	The setpoint was limited to the configured limits.
0008	Not all the necessary controlled system properties were defined for the selected method of calculation. The PID parameters were instead calculated using the TuneRuleTIR = 3 method.
0010	The operating mode could not be changed because ManualEnable = TRUE.
0020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0040	The process value exceeded one of its warning limits.
0080	Invalid value at Retain.Mode. The operating mode is not switched.
0100	The manual value was limited to the limits of the controller output.
0200	The rule used for tuning produces an incorrect result, or is not supported.
0400	Method selected for transition time measurement not suitable for actuator. The transition time cannot be measured because the actuator settings do not match the selected measuring method.
0800	The difference between the current position and the new output value is too small for transition time measurement. This can produce incorrect results. The difference between the current output value and new output value must be at least 50% of the entire control range.
1000	The substitute output value cannot be reached because it is outside the output value limits.

The following warnings are deleted as soon as the cause is eliminated:

- 0004
- 0020
- 0040
- 0100

All other warnings are cleared with a rising edge at Reset.

9.2.5.11 Tag SUT.State V1

SUT.State	Name	Description
0	SUT_INIT	Initialize pretuning
50	SUT_TPDN	Determine start position without position feedback
100	SUT_STDABW	Calculate the standard deviation
200	SUT_GET_POI	Find the point of inflection
300	SUT_GET_RISETM	Determine the rise time
9900	SUT_IO	Pretuning successful
1	SUT_NIO	Pretuning not successful

9.2.5.12 Tag TIR.State V1

TIR.State	Name	Description
-100	TIR_FIRST_SUT	Fine tuning is not possible. Pretuning will be executed first.
0	TIR_INIT	Initialize fine tuning
200	TIR_STDABW	Calculate the standard deviation
300	TIR_RUN_IN	Attempt to reach the setpoint with the maximum or minimum output value
400	TIR_CTRLN	Attempt to reach the setpoint with the existing PID parameters (if pretuning has been successful)
500	TIR_OSZIL	Determine oscillation and calculate parameters
9900	TIR_IO	Fine tuning successful
1	TIR_NIO	Fine tuning not successful

9.3 PID_Temp

9.3.1 New features of PID_Temp

PID_Temp V1.1

- **Response of the output value on switchover from "Inactive" operating mode to "Automatic mode"**

  The new option IntegralResetMode = 4 was added and defined as default. With IntegralResetMode = 4, the integral action is automatically pre-assigned when switching from "Inactive" operating mode to "Automatic mode" so that a control deviation results in a jump of the PID output value with identical sign.

- **Initialization of the integral action in automatic mode**

  The integral action can be initialized in automatic mode with the tags OverwriteInitialOutputValue and PIDCtrl.PIDInit. This simplifies the use of PID_Temp for override controls.

9.3.2 Compatibility with CPU and FW

The following table shows which version of PID_Temp can be used on which CPU.

CPU	FW	PID_Temp
S7-1200	V4.2 or higher	V1.1 V1.0
	V4.1	V1.0
S7-1500	V2.0 or higher	V1.1 V1.0
	V1.7 to V1.8	V1.0

9.3.3 CPU processing time and memory requirement PID_Temp V1

CPU processing time

Typical CPU processing times of the PID_Temp technology object as of Version 1.0, depending on CPU type.

CPU	Typ. CPU processing time PID_Temp V1
CPU 1211C ≥ V4.1	580 µs
CPU 1215C ≥ V4.1	580 µs
CPU 1217C ≥ V4.1	580 µs
CPU 1505S ≥ V1.0	50 µs
CPU 1510SP-1 PN ≥ V1.7	130 µs
CPU 1511-1 PN ≥ V1.7	130 µs
CPU 1512SP-1 PN ≥ V1.7	130 µs
CPU 1516-3 PN/DP ≥ V1.7	75 µs
CPU 1518-4 PN/DP ≥ V1.7	6 µs

Memory requirement

Memory requirement of an instance DB of the PID_Temp technology object as of Version V1.0.

	Memory requirement of the instance DB of PID_Temp V1
Load memory requirement	Approx. 17000 bytes
Total work memory requirement	1280 bytes
Retentive work memory requirement	100 bytes

9.3.4 PID_Temp

9.3.4.1 Description of PID_Temp

Description

The PID_Temp instruction provides a PID controller with integrated tuning for temperature processes. PID_Temp can be used for pure heating or heating/cooling applications.

The following operating modes are possible:

- Inactive
- Pretuning
- Fine tuning
- Automatic mode
- Manual mode
- Substitute output value with error monitoring

For a more detailed description of the operating modes, see the State parameter.

PID algorithm

PID_Temp is a PIDT1 controller with anti-windup and weighting of the proportional and derivative actions. The PID algorithm operates according to the following equation (control zone and dead zone deactivated):

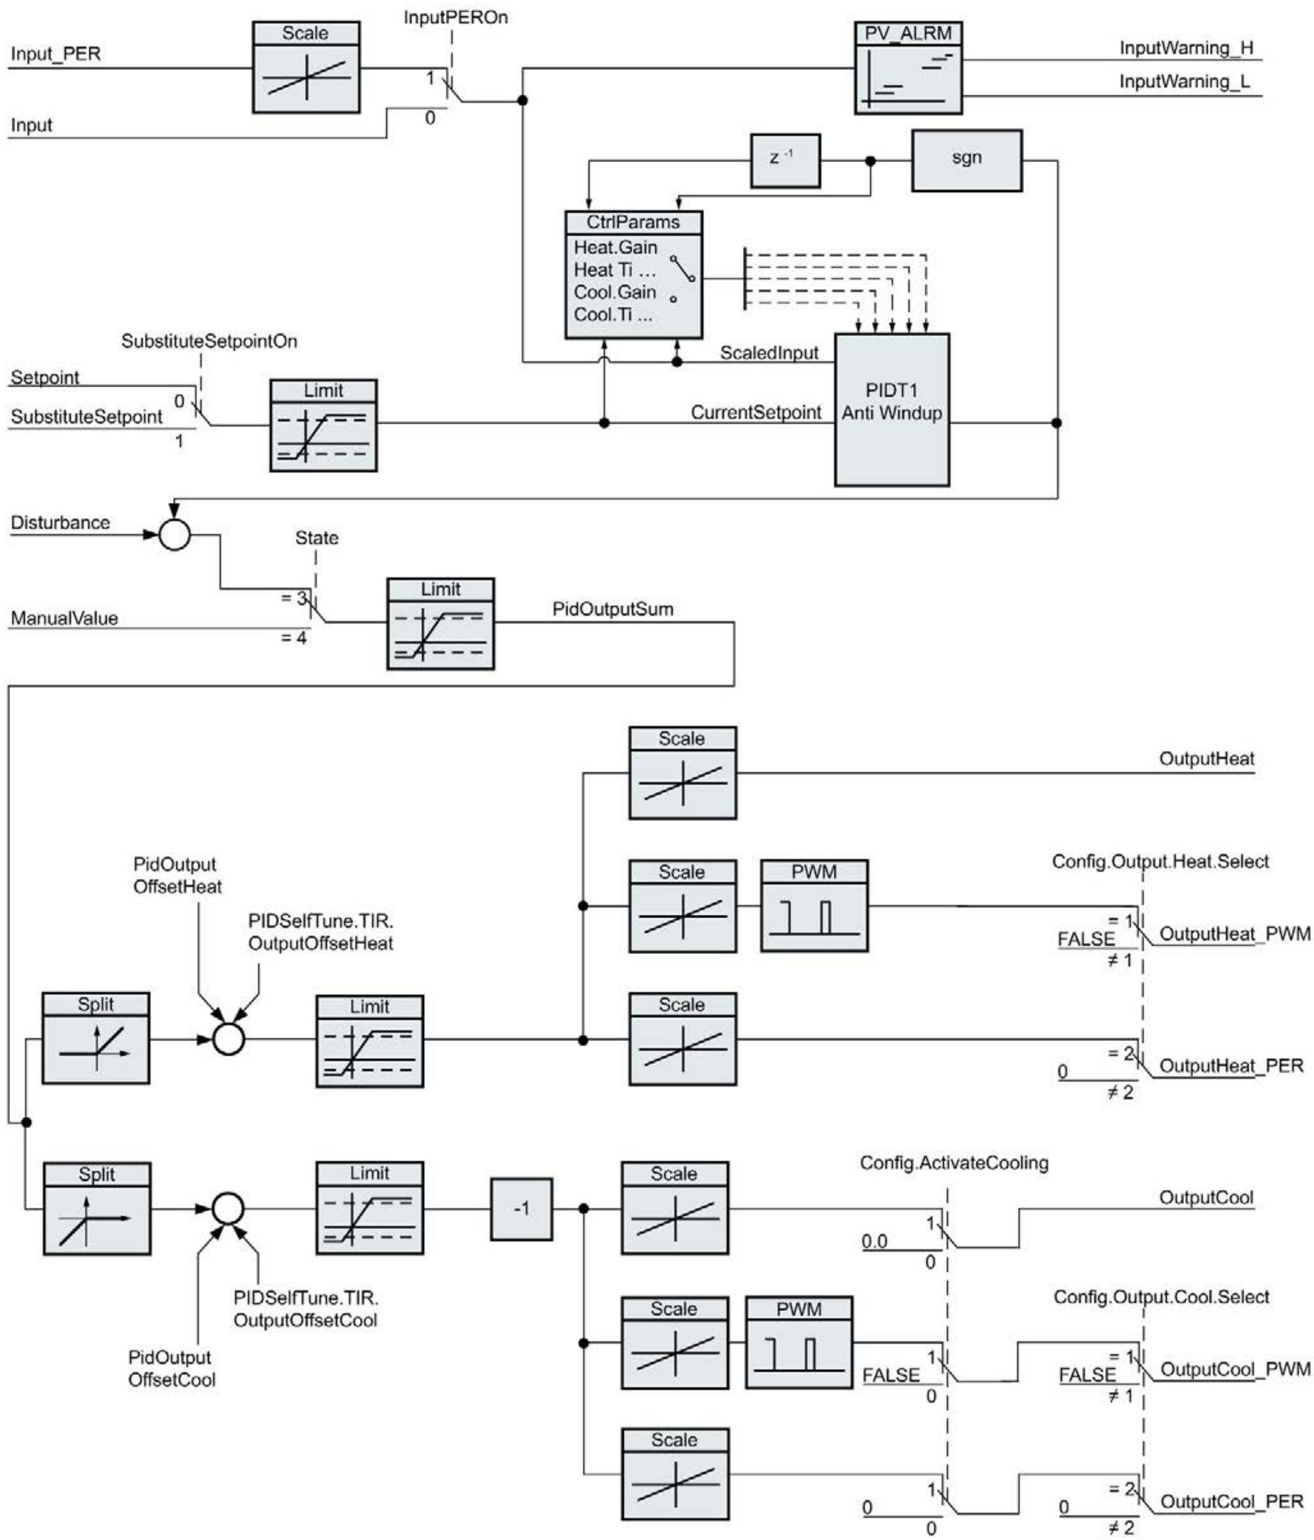
$$y = K_p \left[(b \cdot w - x) + \frac{1}{T_I \cdot s}(w - x) + \frac{T_D \cdot s}{a \cdot T_D \cdot s + 1}(c \cdot w - x) \right]$$

The table below shows the meaning of the icons used in the equation and in the subsequent figures.

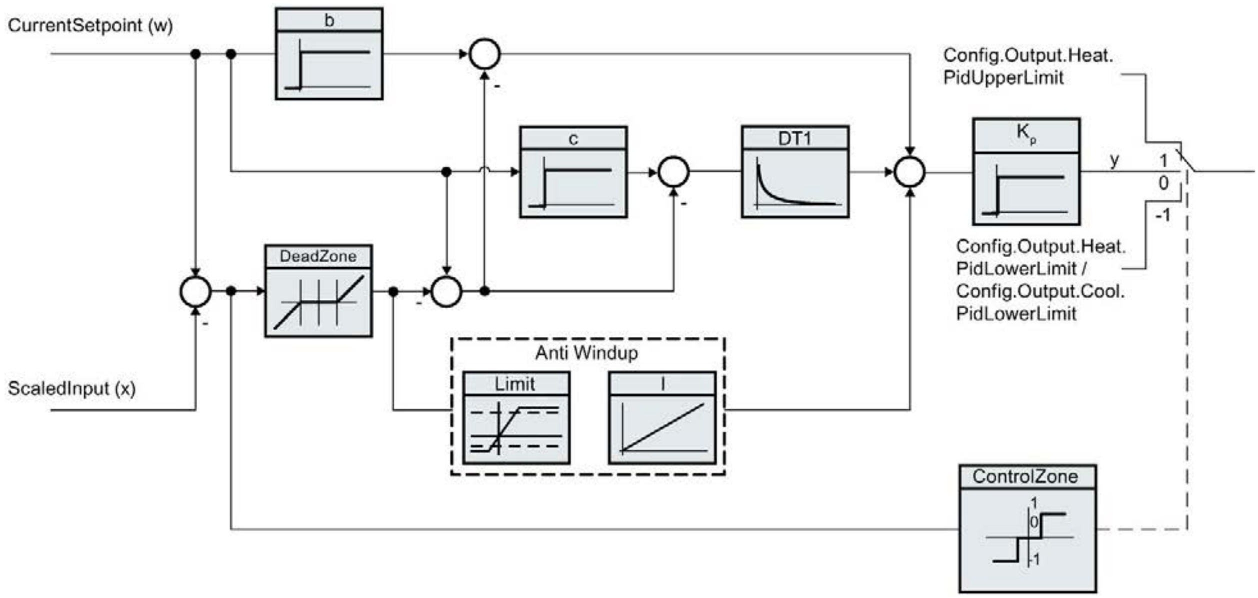
Icon	Description	Associated parameters of the PID_Temp instruction
y	Output value of the PID algorithm	-
K_p	Proportional gain	Retain.CtrlParams.Heat.Gain Retain.CtrlParams.Cool.Gain CoolFactor
s	Laplace operator	-
b	Proportional action weighting	Retain.CtrlParams.Heat.PWeighting Retain.CtrlParams.Cool.PWeighting
w	Setpoint	CurrentSetpoint
x	Process value	ScaledInput
T_I	Integral action time	Retain.CtrlParams.Heat.Ti Retain.CtrlParams.Cool.Ti

Icon	Description	Associated parameters of the PID_Temp instruction
T_D	Derivative action time	Retain.CtrlParams.Heat.Td Retain.CtrlParams.Cool.Td
a	Derivative delay coefficient (derivative delay T1 = a × T_D)	Retain.CtrlParams.Heat.TdFiltRatio Retain.CtrlParams.Cool.TdFiltRatio
c	Derivative action weighting	Retain.CtrlParams.Heat.DWeighting Retain.CtrlParams.Cool.DWeighting
DeadZone	Dead zone width	Retain.CtrlParams.Heat.DeadZone Retain.CtrlParams.Cool.DeadZone
ControlZone	Control zone width	Retain.CtrlParams.Heat.ControlZone Retain.CtrlParams.Cool.ControlZone

PID_Temp block diagram



Block diagram of PIDT1 with anti-windup



Call

PID_Temp is called in the constant time scale of a cyclic interrupt OB.

If you call PID_Temp as a multi-instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for PID_Temp directly in the multi-instance DB and commission it via a watch table.

Download to device

The process values of retentive tags are only updated when you download PID_Temp completely.

Download technology object to device (Page 44)

Startup

When the CPU starts up, PID_Temp starts in the operating mode that is saved in the Mode in/out parameter. To switch to "Inactive" operating mode during startup, set RunModeByStartup = FALSE.

Reaction to error

The behavior in the case of an error is determined by the tags SetSubstituteOutput and ActivateRecoverMode. If ActivateRecoverMode = TRUE, the behavior also depends on the error that occurred.

SetSubstitute-Output	Acti-vateRecov-erMode	Configuration editor > Basic settings of output > Set PidOutputSum to	Reaction
Not relevant	FALSE	Zero (inactive)	Switch to "Inactive" (State = 0) mode The output value of the PID algorithm and all outputs for heating and cooling are set to 0. The scaling of the outputs for heating and cooling is not active.
FALSE	TRUE	Current value for error while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The current output value is transferred to the actuator while the error is pending.
TRUE	TRUE	Substitute output value while error is pending	Switch to "Substitute output value with error monitoring" mode (State = 5) The value at SubstituteOutput is transferred to the actuator while the error is pending.

In manual mode, PID_Temp uses ManualValue as output value, unless ManualValue is invalid.

- If ManualValue is invalid, SubstituteOutput is used.
- If ManualValue and SubstituteOutput are invalid, Config.Output.Heat.PidLowerLimit is used.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is reset by a rising edge at Reset or ErrorAck.

9.3.4.2 Mode of operation of PID_Temp

Monitoring process value limits

You specify the high limit and low limit of the process value in the Config.InputUpperLimit and Config.InputLowerLimit tags. If the process value is outside these limits, an error occurs (ErrorBits = 0000001h).

You specify a high and low warning limit of the process value in the Config.InputUpperWarning and Config.InputLowerWarning tags. If the process value is outside these warning limits, a warning occurs (Warning = 0000040h), and the InputWarning_H or InputWarning_L output parameter changes to TRUE.

Limiting the setpoint

You specify a high limit and low limit of the setpoint in the Config.SetpointUpperLimit and Config.SetpointLowerLimit tags. PID_Temp automatically limits the setpoint to the process value limits. You can limit the setpoint to a smaller area. PID_Temp checks whether this area is within the process value limits. If the setpoint is outside these limits, the high or low limit is used as the setpoint, and output parameter SetpointLimit_H or SetpointLimit_L is set to TRUE.

The setpoint is limited in all operating modes.

Substitute setpoint

You can specify a substitute setpoint at the SubstituteSetpoint tag and activate it with SubstituteSetpointOn = TRUE. In this way, you can temporarily specify the setpoint directly, for example for a slave controller in a cascade, without having to change the user program. The limits set for the setpoint also apply to the substitute setpoint.

Heating and cooling

With the default setting, PID_Temp only uses the outputs for heating (OutputHeat, OutputHeat_PWM, OutputHeat_PER). The output value of the PID algorithm (PidOutputSum) is scaled and output at the outputs for heating. You specify with Config.Output.Heat.Select if OutputHeat_PWM or OutputHeat_PER is calculated. OutputHeat is always calculated.

With Config.ActivateCooling = TRUE, you can also activate the outputs for cooling (OutputCool, OutputCool_PWM, OutputCool_PER). Positive output values of the PID algorithm (PidOutputSum) are scaled and output at the outputs for heating. Negative output values of the PID algorithm are scaled and output at the outputs for cooling. You specify with Config.Output.Cool.Select if OutputCool_PWM or OutputCool_PER is calculated. OutputCool is always calculated.

Two methods are available to calculate the PID output value with activated cooling:

- Cooling factor (Config.AdvancedCooling = FALSE):

  The output value calculation for cooling takes place with the PID parameters for heating, taking into consideration the configurable cooling factor Config.CoolFactor. This method is suitable if the heating and cooling actuators have a similar time response but different gains. If this method is selected, pretuning and fine tuning for cooling as well as the PID parameter set for cooling are not available. You can only execute the tuning for heating.

- PID parameter switching (Config.AdvancedCooling = TRUE):

  The output value calculation for cooling takes place by means of a separate PID parameter set. Based on the calculated output value and the control deviation, the PID algorithm decides whether the PID parameter for heating or cooling is used. This method is suitable if the heating and cooling actuator have different time responses and different gains. Pretuning and fine tuning for cooling are only available if this method is selected.

Output value limits and scaling

Depending on the operating mode, the PID output value (PidOutputSum) is calculated automatically by the PID algorithm or defined by the manual value (ManualValue) or the configured substitute output value (SubstituteOutput).

The PID output value is limited according to the configuration:

- If cooling is deactivated (Config.ActivateCooling = FALSE), Config.Output.Heat.PidUpperLimit is the high limit and Config.Output.Heat.PidLowerLimit the low limit.
- If cooling is activated (Config.ActivateCooling = TRUE), Config.Output.Heat.PidUpperLimit is the high limit and Config.Output.Cool.PidLowerLimit the low limit.

The PID output value is scaled and output at the outputs for heating and cooling. Scaling can be defined separately for each output and is specified in the structures Config.Output.Heat or Config.Output.Cool with 2 value pairs each:

Output	Value pair	Parameter
OutputHeat	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high output value (heating) Config.Output.Heat.UpperScaling
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low output value (heating) Config.Output.Heat.LowerScaling
OutputHeat_PWM	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high PWM output value (heating) Config.Output.Heat.PwmUpperScaling

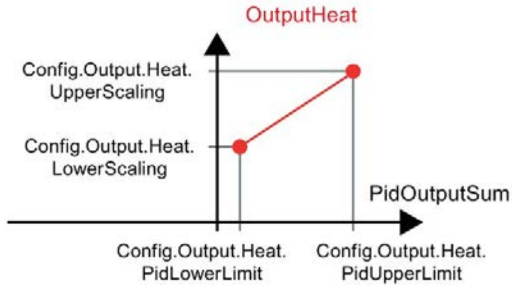
Output	Value pair	Parameter
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low PWM output value (heating) Config.Output.Heat.PwmLowerScaling
OutputHeat_PER	Value pair 1	PID output value high limit (heating) Config.Output.Heat.PidUpperLimit, Scaled high analog output value (heating) Config.Output.Heat.PerUpperScaling
	Value pair 2	PID output value low limit (heating) Config.Output.Heat.PidLowerLimit, Scaled low analog output value (heating) Config.Output.Heat.PerLowerScaling
OutputCool	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high output value (cooling) Config.Output.Cool.UpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low output value (cooling) Config.Output.Cool.LowerScaling
OutputCool_PWM	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high PWM output value (cooling) Config.Output.Cool.PwmUpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low PWM output value (cooling) Config.Output.Cool.PwmLowerScaling
OutputCool_PER	Value pair 1	PID output value low limit (cooling) Config.Output.Cool.PidLowerLimit, Scaled high analog output value (cooling) Config.Output.Cool.PerUpperScaling
	Value pair 2	PID output value high limit (cooling) Config.Output.Cool.PidUpperLimit, Scaled low analog output value (cooling) Config.Output.Cool.PerLowerScaling

If cooling is activated (Config.ActivateCooling = TRUE), Config.Output.Heat.PidLowerLimit must have the value 0.0.

Config.Output.Cool.PidUpperLimit must always have the value 0.0.

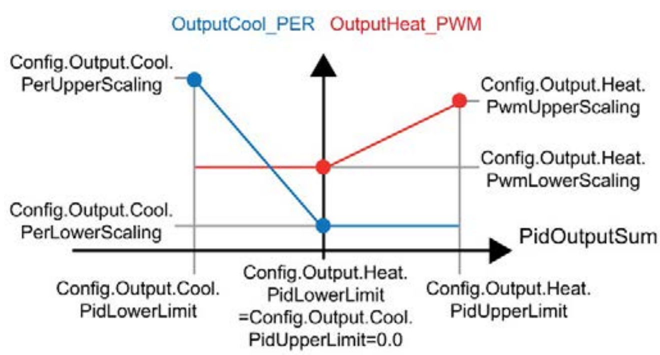
Example:

Output scaling when using output OutputHeat (cooling deactivated; Config.Output.Heat.PidLowerLimit may be unequal to 0.0):



Example:

Output scaling when using output OutputHeat_PWM and OutputCool_PER (cooling activated; Config.Output.Heat.PidLowerLimit must be 0.0):



With the exception of the "Inactive" operating mode, the value at an output is always located between its scaled high output value and scaled low output value, for example, for OutputHeat always between Config.Output.Heat.UpperScaling and Config.Output.Heat.LowerScaling.

If you want to limit the value at the associated output, you therefore have to adapt these scaling values as well.

Cascading

PID_Temp supports you when you use cascade control (see: Program creation (Page 197)).

Substitute output value

In the event of an error, PID_Temp can output a substitute output value that you define at the SubstituteOutput tag. The substitute output value must be within the limits for the PID output value. The values at the outputs for heating and cooling resulting from the substitute output value are the result of the configured output scaling.

Monitoring signal validity

The values of the following parameters are monitored for validity when used:

- Setpoint
- SubstituteSetpoint
- Input
- Input_PER
- Disturbance
- ManualValue
- SubstituteOutput
- PID parameters in the structures Retain.CtrlParams.Heat and Retain.CtrlParams.Cool.

Monitoring the sampling time PID_Temp

Ideally, the sampling time is equivalent to the cycle time of the cyclic interrupt OB. The PID_Temp instruction measures the time interval between two calls. This is the current sampling time. On every switchover of operating mode and during the initial startup, the mean value is formed from the first 10 sampling times. Too great a difference between the current sampling time and this mean value triggers an error (Error = 0000800h).

The error occurs during tuning if:

- New mean value >= 1.1 x old mean value
- New mean value <= 0.9 x old mean value

The error occurs in automatic mode if:

- New mean value >= 1.5 x old mean value
- New mean value <= 0.5 x old mean value

If you deactivate the sampling time monitoring (CycleTime.EnMonitoring = FALSE), you can also call PID_Temp in OB1. You must then accept a lower control quality due to the deviating sampling time.

Sampling time of the PID algorithm

The controlled system needs a certain amount of time to respond to changes in the output value. It is therefore not advisable to calculate the output value in every cycle. The sampling time of the PID algorithm represents the time between two calculations of the output value. It is calculated during tuning and rounded to a multiple of the cycle time of the cyclic interrupt OB (sampling time PID_Temp). All other functions of the PID_Temp are executed at every call.

If cooling and PID parameter switching are activated, PID_Temp uses a separate sampling time of the PID algorithm for heating and cooling. In all other configurations, only the sampling time of the PID algorithm for heating is used.

If you use OutputHeat_PWM or OutputCool_PWM, the sampling time of the PID algorithm is used as time period of the pulse width modulation. The accuracy of the output signal is determined by the ratio of the PID algorithm sampling time to the cycle time of the OB. The cycle time should be no more than a tenth of the PID algorithm sampling time.

If the PID algorithm sampling time and thus the time period of the pulse width modulation is very high when you use OutputHeat_PWM or OutputCool_PWM, you can define a deviating shorter period duration at the Config.Output.Heat.PwmPeriode or Config.Output.Cool.PwmPeriode parameters to improve the smoothness of the process value.

Control logic

PID_Temp can be used for heating or heating/cooling applications and always works with normal control logic.

An increase of the PID output value (PidOutputSum) is intended to increase the process value. The values at the outputs for heating and cooling resulting from the PID output value are the result of the configured output scaling.

An inverted control logic or negative proportional gain are not supported.

If you only need an output value for your application in which an increase is to reduce the process value (for example, discharge control), you can use PID_Compact with inverted control logic.

9.3.4.3 Input parameters of PID_Temp

Parameter	Data type	Default	Description
Setpoint	REAL	0.0	Setpoint of the PID controller in automatic mode Valid range of values: Config.SetpointUpperLimit ≥ Setpoint ≥ Config.SetpointLowerLimit Config.InputUpperLimit ≥ Setpoint ≥ Config.InputLowerLimit
Input	REAL	0.0	A tag of the user program is used as source for the process value. If you are using the Input parameter, Config.InputPerOn = FALSE must be set.
Input_PER	INT	0	An analog input is used as the source of the process value. If you are using the Input_PER parameter, Config.InputPerOn = TRUE must be set.
Disturbance	REAL	0.0	Disturbance variable or precontrol value
Manual-Enable	BOOL	FALSE	• A FALSE -> TRUE edge activates "Manual mode", whileState = 4, Mode remains unchanged. As long as ManualEnable = TRUE, you cannot change the operating mode via a rising edge at ModeActivate or use the commissioning dialog. • A TRUE -> FALSE edge activates the operating mode that is specified by Mode. We recommend that you change the operating mode using Mode and ModeActivate only.
ManualValue	REAL	0.0	Manual value This value is used in manual mode as PID output value (PidOutputSum). The values at the outputs for heating and cooling resulting from this manual value are the result of the configured output scaling (structures Config.Output.Heat and Config.Output.Cool). For controllers with activated cooling output (Config.ActivateCooling = TRUE), define: • a positive manual value to output the value at the outputs for heating • a negative manual value to output the value at the outputs for cooling The permitted value range is determined by the configuration. • Cooling output deactivated (Config.ActivateCooling = FALSE): Config.Output.Heat.PidUpperLimit ≥ ManualValue ≥ Config.Output.Heat.PidLowerLimit • Cooling output activated (Config.ActivateCooling = TRUE): Config.Output.Heat.PidUpperLimit ≥ ManualValue ≥ Config.Output.Cool.PidLowerLimit
ErrorAck	BOOL	FALSE	• FALSE -> TRUE edge ErrorBits and Warning are reset.

Parameter	Data type	Default	Description
Reset	BOOL	FALSE	Restarts the controller. • FALSE -> TRUE edge – Switch to "Inactive" mode – ErrorBits and Warning are reset. • As long as Reset = TRUE, – PID_Temp remains in "Inactive" mode (State = 0). – you cannot change the operating mode with Mode and ModeActivate or ManualEnable – You cannot use the commissioning dialog. • TRUE -> FALSE edge – If ManualEnable = FALSE, PID_Temp switches to the operating mode that is saved in Mode. – If Mode = 3 (automatic mode), the integral action is treated as configured with the tag IntegralResetMode.
Mode-Activate	BOOL	FALSE	• FALSE -> TRUE edge PID_Temp switches to the operating mode that is saved at the Mode input.

9.3.4.4 Output parameters of PID_Temp

Parameter	Data type	Default	Description
ScaledInput	REAL	0.0	Scaled process value
OutputHeat	REAL	0.0	Output value (heating) in REAL format The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Heat.PidUpperLimit, Config.Output.Heat.UpperScaling and Config.Output.Heat.PidLowerLimit, Config.Output.Heat.LowerScaling and output in REAL format at OutputHeat. OutputHeat is always calculated.
OutputCool	REAL	0.0	Output value (cooling) in REAL format The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Cool.PidUpperLimit, Config.Output.Cool.LowerScaling and Config.Output.Cool.PidLowerLimit, Config.Output.Cool.UpperScaling and output in REAL format at OutputCool. OutputCool is only calculated if the cooling output is activated (Con-fig.ActivateCooling = TRUE).
OutputHeat _PER	INT	0	Analog output value (heating) The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Heat.PidUpperLimit, Config.Output.Heat.PerUpperScaling and Config.Output.Heat.PidLowerLimit, Config.Output.Heat.PerLowerScaling and output as analog value at OutputHeat_PER. OutputHeat_PER is only calculated if Config.Output.Heat.Select = 2.
OutputCool _PER	INT	0	Analog output value (cooling) The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Cool.PidUpperLimit, Config.Output.Cool.PerLowerScaling and Config.Output.Cool.PidLowerLimit, Config.Output.Cool.PerUpperScaling and output as analog value at OutputCool_PER. OutputCool_PER is only calculated if the cooling output is activated (Config .ActivateCooling = TRUE) and Config.Output.Cool.Select = 2.
OutputHeat _PWM	BOOL	FALSE	Pulse-width modulated output value (heating) The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Heat.PidUpperLimit, Config.Output.Heat.PwmUpperScaling and Config.Output.Heat.PidLowerLimit, Config.Output.Heat .PwmLowerScaling and output as pulse-width modulated value (variable switch on and switch off times) at OutputHeat_PWM. OutputHeat_PWM is only calculated if Config.Output.Heat.Select = 1.
OutputCool _PWM	BOOL	FALSE	Pulse-width modulated output value (cooling) The PID output value (PidOutputSum) is scaled with the two value pairs Config.Output.Cool.PidUpperLimit, Config.Output.Cool.PwmLowerScaling and Config.Output.Cool.PidLowerLimit, Config.Output.Cool .PwmUpperScaling and output as pulse-width modulated value (variable switch on and switch off times) at OutputCool_PWM. OutputCool_PWM is only calculated if the cooling output is activated (Config .ActivateCooling = TRUE) and Config.Output.Cool.Select = 1.
SetpointLimit _H	BOOL	FALSE	If SetpointLimit_H = TRUE, the absolute setpoint high limit is reached (Set-point ≥ Config.SetpointUpperLimit) or Setpoint ≥ Config.InputUpperLimit. The setpoint high limit is the minimum of Config.SetpointUpperLimit and Config.InputUpperLimit.

Parameter	Data type	Default	Description
SetpointLimit_L	BOOL	FALSE	If SetpointLimit_L = TRUE, the absolute setpoint low limit is reached (Setpoint ≤ Config.SetpointLowerLimit) or Setpoint ≤ Config.InputLowerLimit. The setpoint low limit is the maximum of Config.SetpointLowerLimit and Config.InputLowerLimit.
InputWarning_H	BOOL	FALSE	If InputWarning_H = TRUE, the process value has reached or exceeded the warning high limit (ScaledInput ≥ Config.InputUpperWarning).
InputWarning_L	BOOL	FALSE	If InputWarning_L = TRUE, the process value has reached or fallen below the warning low limit (ScaledInput ≤ Config.InputLowerWarning).
State	INT	0	The PID_Temp state and mode parameters (Page 446) shows the current operating mode of the PID controller. You can change the operating mode using the input parameter Mode and a rising edge at ModeActivate. For pretuning and fine tuning, you specify with Heat.EnableTuning and Cool.EnableTuning whether tuning takes place for heating or cooling. • State = 0: Inactive • State = 1: Pretuning • State = 2: Fine tuning • State = 3: Automatic mode • State = 4: Manual mode • State = 5: Substitute output value with error monitoring
Error	BOOL	FALSE	If Error = TRUE, at least one error message is pending in this cycle.
ErrorBits	DWORD	DW#16#0	The PID_Temp ErrorBits parameter (Page 455) shows the pending error messages. ErrorBits is retentive and is reset with a rising edge at Reset or ErrorAck.

9.3.4.5 In/out parameters of PID_Temp V2

Parameter	Data type	Default	Description
Mode	INT	4	At Mode, specify the operating mode to which PID_Temp is to switch. Options are: • Mode = 0: Inactive • Mode = 1: Pretuning • Mode = 2: Fine tuning • Mode = 3: Automatic mode • Mode = 4: Manual mode The operating mode is activated by: • Rising edge at ModeActivate • Falling edge at Reset • Falling edge at ManualEnable • Cold restart of CPU if RunModeByStartup = TRUE For pretuning and fine tuning, you specify with Heat.EnableTuning and Cool.EnableTuning whether tuning takes place for heating or cooling. Mode is retentive. A detailed description of the operating modes can be found in State and Mode parameters (Page 446).
Master	DWORD	DW#16#0	Interface for cascade control If this PID_Temp instance is used as slave controller in a cascade (Config.Cascade.IsSlave = TRUE), assign the Master parameter at the instruction call with the Slave parameter of the master controller. Example: Call of a slave controller "PID_Temp_2" with master controller "PID_Temp_1" in SCL: -- `"PID_Temp_2"(Master := "PID_Temp_1".Slave, Setpoint := "PID_Temp_1".OutputHeat);` -- You use this interface to exchange slave controller information about operating mode, limit and substitute setpoint with your master controller. Keep in mind that the call of the master controller has to take place before the call of the slave controller in the same cyclic interrupt OB.

Parameter	Data type	Default	Description
Master	DWORD	DW#16#0	Assignment: • Bits 0 to 15: Unassigned • Bits 16 to 23 – Limit counter: A slave controller whose output value is limited increments this counter. Depending on the configured number of slaves (Config.Cascade.CountSlaves) and of the anti-windup mode (Config.Cascade.AntiWindUpMode), the master controller reacts accordingly. • Bit 24 – Automatic mode of the slave controllers: TRUE, if all slave controllers are in automatic mode • Bit 25 – Substitute setpoint of the slave controllers: TRUE, if a slave controller has activated the substitute setpoint (SubstituteSetpointOn = TRUE)
Slave	DWORD	DW#16#0	Interface for cascade control You use this interface to exchange slave controller information about operating mode, limit and substitute setpoint with your master controller. See description of Master parameter

9.3.4.6 PID_Temp static tags

Note

Change the tags identified with (1) only in "Inactive" mode to prevent malfunction of the PID controller.

Tag	Data type	Default	Description
IntegralResetMode	Int	V1.0: 1, V1.1 or higher: 4	The IntegralResetMode tag (Page 464) determines how the integral action PIDCtrl.IOutputOld is pre-assigned when switching from "Inactive" operating mode to "Automatic mode". This setting only works for one cycle. • IntegralResetMode = 0: Smooth • IntegralResetMode = 1: Delete • IntegralResetMode = 2: Hold • IntegralResetMode = 3: Pre-assign • IntegralResetMode = 4: Like setpoint change (only for PID_Temp with version ≥ 1.1)
OverwriteInitialOutputValue	REAL	0.0	If one of the following conditions is met, the integral action PIDCtrl.IOutputOld is pre-assigned automatically as if PIDOutputSum = OverwriteInitialOutputValue in the previous cycle: • IntegralResetMode = 3 when switching from "Inactive" operating mode to "Automatic mode" • TRUE -> FALSE edge at parameter Reset and parameter Mode = 3 • PIDCtrl.PIDInit = TRUE in "Automatic mode" (available as of PID_Temp version 1.1)
RunModeByStartup	BOOL	TRUE	Activate operating mode at Mode parameter after CPU restart • If RunModeByStartup = TRUE, PID_Temp starts in the operating mode saved in the Mode parameter after CPU startup. • If RunModeByStartup = FALSE, PID_Temp remains in "Inactive" mode after CPU startup.
LoadBackUp	BOOL	FALSE	If LoadBackUp = TRUE, the last set of PID parameters is reloaded from the CtrlParamsBackUp structure. The set was saved prior to the last tuning. LoadBackUp is automatically set back to FALSE. The acceptance is bumpless.

Tag	Data type	Default	Description
SetSubstituteOutput	BOOL	TRUE	Selection of the output value while an error is pending (State = 5): • If SetSubstituteOutput = TRUE and ActivateRecov-erMode = TRUE, the configured substitute output value SubstituteOutput is output as PID output value as long as an error is pending. • If SetSubstituteOutput = FALSE and ActivateRecov-erMode = TRUE, the actuator remains at the current PID output value as long as an error is pending. • If ActivateRecoverMode = FALSE, SetSubstituteOut-put is not effective. • If SubstituteOutput is invalid (ErrorBits = 0020000h), the substitute output value cannot be output. In this case, the low limit of the PID output value for heating (Config.Output.Heat.PidLowerLimit) is used as PID output value.
PhysicalUnit	INT	0	Unit of measurement of the process value and setpoint, e.g., ºC, or ºF. This parameter is used for display in the editors and does not influence the control algorithm.
PhysicalQuantity	INT	0	Physical quantity of the process value and setpoint, e.g., temperature. This parameter is used for display in the editors and does not influence the control algorithm.
ActivateRecoverMode	BOOL	TRUE	The ActivateRecoverMode tag determines the reaction to error.
Warning	DWORD	0	The Warning tag shows the warnings since Reset = TRUE or ErrorAck =TRUE. Warning is retentive.
Progress	REAL	0.0	Progress of current tuning phase as a percentage (0.0 - 100.0)
CurrentSetpoint	REAL	0.0	CurrentSetpoint always displays the currently effective setpoint. This value is frozen during tuning.
CancelTuningLevel	REAL	10.0	Permissible fluctuation of setpoint during tuning. Tuning is not canceled until: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel

Tag	Data type	Default	Description
SubstituteOutput	REAL	0.0	The substitute output value is used as PID output value as long as the following conditions are met: • One or more errors are pending in automatic mode for which ActivateRecoverMode is in effect • SetSubstituteOutput = TRUE • ActivateRecoverMode = TRUE The values at the outputs for heating and cooling resulting from the substitute output value are the result of the configured output scaling (structures Config.Output.Heat and Config.Output.Cool). For controllers with activated cooling output (Config.ActivateCooling = TRUE), define: • a positive substitute output value to output the value at the outputs for heating • a negative substitute output value to output the value at the outputs for cooling The permitted value range is determined by the configuration. • Cooling output deactivated (Config.ActivateCooling = FALSE): Config.Output.Heat.PidUpperLimit ≥ SubstituteOutput ≥ Config.Output.Heat.PidLowerLimit • Cooling output activated (Config.ActivateCooling = TRUE): Config.Output.Heat.PidUpperLimit ≥ SubstituteOutput ≥ Config.Output.Cool.PidLowerLimit
PidOutputSum	REAL	0.0	PID output value PidOutputSum displays the output value of the PID algorithm. Depending on the operating mode, it is either calculated automatically or defined by the manual value or the configured substitute output value. The values at the outputs for heating and cooling resulting from the PID output value are the result of the configured output scaling (structures Config.Output.Heat and Config.Output.Cool). The PidOutputSum is limited as defined in the configuration. • Cooling output deactivated (Config.ActivateCooling = FALSE): Config.Output.Heat.PidUpperLimit ≥ PidOutputSum ≥ Config.Output.Heat.PidLowerLimit • Cooling output activated (ConfigActivateCooling = TRUE): Config.Output.Heat.PidUpperLimit ≥ PidOutputSum ≥ Config.Output.Cool.PidLowerLimit

Tag	Data type	Default	Description
PidOutputOffsetHeat	REAL	0.0	Offset of the PID output value heating PidOutputOffsetHeat is added to the value that results from PidOutputSum for the heating branch. Enter a positive value for PidOutputOffsetHeat to receive a positive offset at the outputs for heating. The resulting values at the outputs for heating are the result of the configured output scaling (Config.Output.Heat structure). This offset can be used for actuators which need a fixed minimum value, for example, fans with minimum speed.
PidOutputOffsetCool	REAL	0.0	Offset of the PID output value cooling PidOutputOffsetCool is added to the value that results from PidOutputSum for the cooling branch. Enter a negative value for PidOutputOffsetCool to receive a positive offset at the outputs for cooling. The resulting values at the outputs for cooling are the result of the configured output scaling (Config.Output.Cool structure). This offset can be used for actuators which need a fixed minimum value, for example, fans with minimum speed.
SubstituteSetpointOn	BOOL	FALSE	Activates the substitute setpoint as controller setpoint. • FALSE = the Setpoint parameter is used. • TRUE = the SubstituteSetpoint parameter is used as setpoint SubstituteSetpointOn can be used to specify the setpoint of a slave controller in a cascade directly without having to change the user program.
SubstituteSetpoint	REAL	0.0	Substitute setpoint If SubstituteSetpointOn = TRUE, the SubstituteSetpoint parameter is used as setpoint. Valid range of values: Config.SetpointUpperLimit ≥ SubstituteSetpoint ≥ Config.SetpointLowerLimit, Config.InputUpperLimit ≥ SubstituteSetpoint ≥ Config.InputLowerLimit
DisableCooling	BOOL	FALSE	DisableCooling = TRUE deactivates the cooling branch for heating/cooling controllers (Config.ActivateCooling = TRUE) in Automatic mode by setting PidOutputSum to 0.0 as low limit. PidOutputOffsetCool and the output scaling for the cooling outputs remain active. DisableCooling can be used for tuning of multi-zone applications to temporarily deactivate the cooling branch as long as all controllers have not completed their tuning yet. This parameter is set/reset by the user manually and is not automatically reset by the PID_Temp instruction.

Tag	Data type	Default	Description
AllSlaveAutomaticState	BOOL	FALSE	If this PID_Temp instance is used as master controller in a cascade (Config.Cascade.IsMaster = TRUE), All-SlaveAutomaticState = TRUE indicates that all slave controllers are in automatic mode. Tuning, manual mode or automatic mode of the master controller can only be executed accurately if all slave controllers are in automatic mode. AllSlaveAutomaticState is only determined if you inter-connect the master controller and slave controller with the Master and Slave parameters. For details, see the Master parameter.
NoSlaveSubstituteSetpoint	BOOL	FALSE	If this PID_Temp instance is used as master controller in a cascade (Config.Cascade.IsMaster = TRUE), No-SlaveSubstituteSetpoint = TRUE indicates that no slave controller has activated its substitute setpoint. Tuning, manual mode or automatic mode of the master controller can only be executed accurately if no slave controller has activated its substitute setpoint. NoSlaveSubstituteSetpoint is only determined if you interconnect the master controller and slave controller with the Master and Slave parameters. For details, see the Master parameter.
Heat.EnableTuning	BOOL	TRUE	Enabling of tuning for heating Heat.EnableTuning must be set for the following tunings (at the same time or prior to the start with Mode and ModeActivate): • Pretuning heating • Pretuning heating and cooling • Fine tuning heating This parameter is not automatically reset by the PID_Temp instruction.
Cool.EnableTuning	BOOL	FALSE	Enabling of tuning for cooling Cool.EnableTuning must be set for the following tunings (simultaneously with or prior to the start with Mode and ModeActivate): • Pretuning cooling • Pretuning heating and cooling • Fine tuning cooling Only effective if the cooling output and PID parameter switching are activated ("Config.ActivateCooling" = TRUE and "Config.AdvancedCooling" = TRUE). This parameter is not automatically reset by the PID_Temp instruction.
Config.InputPerOn(1)	BOOL	TRUE	If InputPerOn = TRUE, the Input_PER parameter is used for detecting the process value. If InputPerOn = FALSE, the Input parameter is used.

Tag	Data type	Default	Description
Config.InputUpperLimit(1)	REAL	120.0	High limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. If the limit is exceeded, an error is output and the reaction is determined by ActivateRecoverMode. At the I/O input, the process value can be a maximum of 18% higher than the nominal range (overrange). This means the limit cannot be exceeded when you use an I/O input with the pre-setting for high limit and process value scaling. When pretuning is started, the difference between high and low limit of the process value is checked to determine whether the distance between setpoint and process value meets the necessary requirements. InputUpperLimit > InputLowerLimit
Config.InputLowerLimit(1)	REAL	0.0	Low limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. If the limit is undershot, an error is output and the reaction is determined by ActivateRecoverMode. InputLowerLimit < InputUpperLimit
Config.InputUpperWarning(1)	REAL	3.402822e+38	Warning high limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. If the limit is exceeded, a warning is output at the Warning parameter. • If you set InputUpperWarning outside the process value limits, the configured absolute process value high limit is used as the warning high limit. • If you configure InputUpperWarning within the process value limits, this value is used as the warning high limit. InputUpperWarning > InputLowerWarning
Config.InputLowerWarning(1)	REAL	-3.402822e+38	Warning low limit of the process value Input and Input_PER are monitored to ensure adherence to this limit. If the limit is undershot, a warning is output at the Warning parameter. • If you set InputLowerWarning outside the process value limits, the configured absolute process value low limit is used as the warning low limit. • If you configure InputLowerWarning within the process value limits, this value is used as the warning low limit. InputLowerWarning < InputUpperWarning

Tag	Data type	Default	Description
Config.SetpointUpperLimit(1)	REAL	3.402822e+38	High limit of setpoint Setpoint and SubstituteSetpoint are monitored to ensure adherence to this limit. If the limit is exceeded, a warning is output at the Warning parameter. • If you configure SetpointUpperLimit outside the process value limits, the configured absolute process value high limit is used as the setpoint high limit. • If you configure SetpointUpperLimit within the process value limits, this value is used as the setpoint high limit. SetpointUpperLimit > SetpointLowerLimit
Config.SetpointLowerLimit(1)	REAL	-3.402822e+38	Low limit of the setpoint Setpoint and SubstituteSetpoint are monitored to ensure adherence to this limit. If the limit is undershot, a warning is output at the Warning parameter. • If you set SetpointLowerLimit outside the process value limits, the configured process value absolute low limit is used as the setpoint low limit. • If you configure SetpointLowerLimit within the process value limits, this value is used as the setpoint low limit. SetpointLowerLimit < SetpointUpperLimit
Config.ActivateCooling(1)	BOOL	FALSE	Activate cooling output • Config.ActivateCooling = FALSE Only the outputs for heating are used. • Config.ActivateCooling = TRUE The outputs for heating and cooling are used. If you are using the cooling output, the controller must not be configured as master controller (Config.Cascade.IsMaster must be FALSE) .

Tag	Data type	Default	Description
Config.AdvancedCooling[1]	BOOL	TRUE	Method for heating/cooling • Cooling factor (Config.AdvancedCooling = FALSE) The output value calculation for cooling takes place with the PID parameters for heating (Retain.CtrlParams.Heat structure) taking into consideration the configurable cooling factor Config.CoolFactor. This method is suitable if the heating and cooling actuators have a similar time response but different gains. Pretuning and fine tuning for cooling are not available when you select this method. You can only execute the tuning for heating. • PID parameter switching (Config.AdvancedCooling = TRUE) The output value calculation for cooling takes place by means of a separate PID parameter set (Retain.CtrlParams.Cool structure). This method is suitable if the heating and cooling actuator have different time responses and different gains. Pretuning and fine tuning for cooling are only available when you select this method (Mode = 1 or 2, Cool.EnableTuning = TRUE). Config.AdvancedCooling is only calculated if the cooling output is activated (Config.ActivateCooling = TRUE).
Config.CoolFactor[1]	REAL	1.0	Cooling factor If Config.AdvancedCooling = FALSE, Config.CoolFactor is considered as factor in the calculation of the output value for cooling. This allows different gains of heating and cooling actuators to be taken into account. Config.CoolFactor is not set automatically or adjusted during tuning. You must correctly configure Config.CoolFactor manually with the ratio "heating actuator gain/cooling actuator gain". Example: Config.CoolFactor = 2.0 means that the gain of the heating actuator is twice as high as the gain of the cooling actuator. Config.CoolFactor is only effective if the cooling output is activated (Config.ActivateCooling = TRUE) and cooling factor is selected as method for heating/cooling (Config.AdvancedCooling = FALSE). Config.CoolFactor > 0.0

Tag	Data type	Default	Description
Config.InputScaling .UpperPointIn(1)	REAL	27648.0	Scaling Input_PER high Input_PER is scaled based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn. Only effective if Input_PER is used for process value detection (Config.InputPerOn = TRUE). UpperPointIn > LowerPointIn
Config.InputScaling .LowerPointIn(1)	REAL	0.0	Scaling Input_PER low Input_PER is scaled based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn. Only effective if Input_PER is used for process value detection (Config.InputPerOn = TRUE). LowerPointIn < UpperPointIn
Config.InputScaling .UpperPointOut(1)	REAL	100.0	Scaled high process value Input_PER is scaled based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn. Only effective if Input_PER is used for process value detection (Config.InputPerOn = TRUE). UpperPointOut > LowerPointOut
Config.InputScaling .LowerPointOut(1)	REAL	0.0	Scaled low process value Input_PER is scaled based on the two value pairs UpperPointOut, UpperPointIn and LowerPointOut, LowerPointIn. Only effective if Input_PER is used for process value detection (Config.InputPerOn = TRUE). LowerPointOut < UpperPointOut
Config.Output.Heat.Select(1)	INT	1	Selecting the output value for heating Config.Output.Heat.Select specifies which outputs are used for heating: • Heat.Select = 0 - OutputHeat is used • Heat.Select = 1 - OutputHeat and OutputHeat_PWM are used • Heat.Select = 2 -OutputHeat and OutputHeat_PER are used Outputs that are not used are not calculated and remain at their default value.

Tag	Data type	Default	Description
Config.Output.Heat .PwmPeriode(1)	REAL	0.0	Period duration of the pulse width modulation (PWM) for heating (OutputHeat_PWM output) in seconds: • Heat.PwmPeriode = 0.0 The sampling time of the PID algorithm for heating (Retain.CtrlParams.Heat.Cycle) is used as period duration of the PWM. • Heat.PwmPeriode > 0.0 The value is rounded off to an integer multiple of the PID_Temp sampling time (CycleTime.Value) and used as period duration of the PWM. This setting can be used to improve the smoothing of the process value with a long sampling time of the PID algorithm. The value must meet the following conditions: – Heat.PwmPeriode ≤ Retain.CtrlParams.Heat.Cycle, – Heat.PwmPeriode > Config.Output.Heat.MinimumOnTime – Heat.PwmPeriode > Config.Output.Heat.MinimumOffTime
Config.Output.Heat .PidUpperLimit(1)	REAL	100.0	High limit of the PID output value for heating The PID output value (PidOutputSum) is limited to the high limit. Heat.PidUpperLimit forms a value pair together with the following parameters for scaling of the PID output value (PidOutputSum) to the outputs for heating: • Heat.UpperScaling for OutputHeat • Heat.PwmUpperScaling for OutputHeat_PWM • Heat.PerUpperScaling for OutputHeat_PER If you want to limit the value at the associated output, you must also adjust these scaling values. Heat.PidUpperLimit > Heat.PidLowerLimit

Tag	Data type	Default	Description
Config.Output.Heat .PidLowerLimit(1)	REAL	0.0	Low limit of the PID output value for heating For controllers with **deactivated** cooling output (Config.ActivateCooling = FALSE), the PID output value (PidOutputSum) is limited to this low limit. For controllers with **activated** cooling output (Config.ActivateCooling = TRUE), the value must be 0.0. Heat.PidLowerLimit forms a value pair together with the following parameters for scaling of the PID output value (PidOutputSum) to the outputs for heating: • Heat.LowerScaling for OutputHeat • Heat.PwmLowerScaling for OutputHeat_PWM • Heat.PerLowerScaling for OutputHeat_PER If you want to limit the value at the associated output, you must also adjust these scaling values. The permitted value range is determined by the configuration. • Cooling output deactivated (Config.ActivateCooling = FALSE): Heat.PidLowerLimit < Heat.PidUpperLimit • Cooling output activated (Config.ActivateCooling = TRUE): Heat.PidLowerLimit = 0.0
Config.Output.Heat .UpperScaling(1)	REAL	100.0	Scaled high output value for heating Heat.UpperScaling and Heat.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the output value for heating (OutputHeat). The OutputHeat value is always located between Heat.UpperScaling and Heat.LowerScaling. Heat.UpperScaling ≠ Heat.LowerScaling
Config.Output.Heat .LowerScaling(1)	REAL	0.0	Scaled low output value for heating Heat.LowerScaling and Heat.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the output value for heating (OutputHeat). The OutputHeat value is always located between Heat.UpperScaling and Heat.LowerScaling. Heat.UpperScaling ≠ Heat.LowerScaling

Tag	Data type	Default	Description
Config.Output.Heat .PwmUpperScaling(1)	REAL	100.0	Scaled high PWM output value for heating Heat.PwmUpperScaling and Heat.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the pulse-width modulated output value for heating (OutputHeat_PWM). The OutputHeat_PWM value is always located between Heat.PwmUpperScaling and Heat.PWMLowerScaling. Heat.PwmUpperScaling is only effective if OutputHeat_PWM is selected as output for heating (Heat.Select = 1) 100.0 ≥ Heat.PwmUpperScaling ≥ 0.0 Heat.PwmUpperScaling ≠ Heat.PwmLowerScaling
Config.Output.Heat .PwmLowerScaling(1)	REAL	0.0	Scaled low PWM output value for heating Heat.PwmLowerScaling and Heat.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the pulse-width modulated output value for heating (OutputHeat_PWM). The OutputHeat_PWM value is always located between Heat.PwmUpperScaling and Heat.PwmLowerScaling. Heat.PwmLowerScaling is only effective if OutputHeat_PWM is selected as output for heating (Heat.Select = 1) 100.0 ≥ Heat.PwmLowerScaling ≥ 0.0 Heat.PwmUpperScaling ≠ Heat.PwmLowerScaling
Config.Output.Heat .PerUpperScaling(1)	REAL	27648.0	Scaled high analog output value for heating Heat.PerUpperScaling and Heat.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the analog output value for heating (OutputHeat_PER). The OutputHeat_PER value is always located between Heat.PerUpperScaling and Heat.PerLowerScaling. Heat.PerUpperScaling is only effective if OutputHeat_PER is selected as output for heating (Heat.Select = 2) 32511.0 ≥ Heat.PerUpperScaling ≥ -32512.0 Heat.PerUpperScaling ≠ Heat.PerLowerScaling
Config.Output.Heat .PerLowerScaling(1)	REAL	0.0	Scaled low analog output value for heating Heat.PerLowerScaling and Heat.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the analog output value for heating (OutputHeat_PER). The OutputHeat_PER value is always located between Heat.PerUpperScaling and Heat.PerLowerScaling. Heat.PerLowerScaling is only effective if OutputHeat_PER is selected as output for heating (Heat.Select = 2) 32511.0 ≥ Heat.PerLowerScaling ≥ -32512.0 Heat.PerUpperScaling ≠ Heat.PerLowerScaling

Tag	Data type	Default	Description
Config.Output.Heat .MinimumOnTime(1)	REAL	0.0	Minimum on time of the pulse width modulation for heating (OutputHeat_PWM output) A PWM pulse is never shorter than this value. The value is rounded off to: Heat.MinimumOnTime = n × CycleTime.Value Heat.MinimumOnTime is only effective if the output for heating OutputHeat_PWM is selected (Heat.Select = 1)". 100000.0 ≥ Heat.MinimumOnTime ≥ 0.0
Config.Output.Heat .MinimumOffTime(1)	REAL	0.0	Minimum off time of the pulse width modulation for heating (OutputHeat_PWM output) A PWM pause is never shorter than this value. The value is rounded off to: Heat.MinimumOffTime = n × CycleTime.Value Heat.MinimumOffTime is only effective if the output for heating OutputHeat_PWM is selected (Heat.Select = 1)". 100000.0 ≥ Heat.MinimumOffTime ≥ 0.0
Config.Output.Cool.Select(1)	INT	1	Selecting the output value for cooling Config.Output.Cool.Select specifies which outputs are used for cooling: • Cool.Select = 0 - OutputCool is used • Cool.Select = 1 -OutputCool and OutputCool_PWM are used • Cool.Select = 2 - OutputCool and OutputCool_PER are used Outputs that are not used are not calculated and remain at their default value. Only effective if the cooling output is activated (Config.ActivateCooling = TRUE).

Tag	Data type	Default	Description
Config.Output.Cool .PwmPeriode(1)	REAL	0.0	Period duration of the pulse width modulation for cooling (OutputCool_PWM output) in seconds: • Cool.PwmPeriode = 0.0 and Config.AdvancedCooling = FALSE: sampling time of the PID algorithm for heating (Retain.CtrlParams.Heat.Cycle) is used as period duration of the PWM. • Cool.PwmPeriode = 0.0 and Config.AdvancedCooling = TRUE: The sampling time of the PID algorithm for cooling (Retain.CtrlParams.Cool.Cycle) is used as period duration of the PWM. • Cool.PwmPeriode > 0.0: The value is rounded off to an integer multiple of the PID_Temp sampling time (CycleTime.Value) and used as period duration of the PWM. This setting can be used to improve the smoothing of the process value with a long sampling time of the PID algorithm. The value must meet the following conditions: – Cool.PwmPeriode ≤ Retain.CtrlParams.Cool.Cycle or Retain.CtrlParams.Heat.Cycle – Cool.PwmPeriode > Config.Output.Cool.MinimumOnTime – Cool.PwmPeriode > Config.Output.Cool.MinimumOffTime Only effective if the cooling output is activated (Config.ActivateCooling = TRUE).
Config.Output.Cool .PidUpperLimit(1)	REAL	0.0	High limit of the PID output value for cooling The value must be 0.0. Cool.PidUpperLimit forms a value pair together with the following parameters for scaling of the PID output value (PidOutputSum) to the outputs for cooling: • Cool.LowerScaling for OutputCool • Cool.PwmLowerScaling for OutputCool_PWM • Cool.PerLowerScaling for OutputCool_PER If you want to limit the value at the associated output, you must also adjust these scaling values. Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). Cool.PidUpperLimit = 0.0

Tag	Data type	Default	Description
Config.Output.Cool .PidLowerLimit(1)	REAL	-100.0	Low limit of the PID output value for cooling For controllers with activated cooling output (Config.ActivateCooling = TRUE), the PID output value (PidOutputSum) is limited to this low limit. Cool.PidLowerLimit forms a value pair together with the following parameters for scaling of the PID output value (PidOutputSum) to the outputs for cooling: • Cool.UpperScaling for OutputCool • Cool.PwmUpperScaling for OutputCool_PWM • Cool.PerUpperScaling for OutputCool_PER If you want to limit the value at the associated output, you must also adjust these scaling values. Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). Cool.PidLowerLimit < Cool.PidUpperLimit
Config.Output.Cool .UpperScaling(1)	REAL	100.0	Scaled high output value for cooling Cool.UpperScaling and Cool.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the output value for cooling (OutputCool). The OutputCool value is always located between Cool.UpperScaling and Cool.LowerScaling. Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). Cool.UpperScaling ≠ Cool.LowerScaling
Config.Output.Cool .LowerScaling(1)	REAL	0.0	Scaled low output value for cooling Cool.LowerScaling and Cool.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the output value for cooling (OutputCool). The OutputCool value is always located between Cool.UpperScaling and Cool.LowerScaling. Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). Cool.UpperScaling ≠ Cool.LowerScaling
Config.Output.Cool .PwmUpperScaling(1)	REAL	100.0	Scaled high PWM output value for cooling Cool.PwmUpperScaling and Cool.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the pulse-width modulated output value for cooling (OutputCool_PWM). The OutputCool_PWM value is always located between Cool.PwmUpperScaling and Cool.PwmLowerScaling. Cool.PwmUpperScaling is only effective if the cooling output is activated (Config.ActivateCooling = TRUE) and OutputCool_PWM is selected as output for cooling (Cool.Select = 1). 100.0 ≥ Cool.PwmUpperScaling ≥ 0.0 Cool.PwmUpperScaling ≠ Cool.PwmLowerScaling

Tag	Data type	Default	Description
Config.Output.Cool .PwmLowerScaling(1)	REAL	0.0	Scaled low PWM output value for cooling Cool.PwmLowerScaling and Cool.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the pulse-width modulated output value for cooling (OutputCool_PWM). The OutputCool_PWM value is always located between Cool.PwmUpperScaling and CoolPwm.LowerScaling. Cool.PwmLowerScaling is only effective if the cooling output is activated (Config.ActivateCooling = TRUE) and OutputCool_PWM is selected as output for cooling (Cool.Select = 1). 100.0 ≥ Cool.PwmLowerScaling ≥ 0.0 Cool.PwmUpperScaling ≠ Cool.PwmLowerScaling
Config.Output.Cool .PerUpperScaling(1)	REAL	27648.0	Scaled high analog output value for cooling Cool.PerUpperScaling and Cool.PidLowerLimit form a value pair for scaling of the PID output value (PidOutputSum) to the analog output value for cooling (OutputCool_PER). The OutputCool_PER value is always located between Cool.PerUpperScaling and Cool.PerLowerScaling. Cool.PerUpperScaling is only effective if the cooling output is activated (Config.ActivateCooling = TRUE) and OutputCool_PER is selected as output for cooling (Cool.Select = 2). 32511.0 ≥ Cool.PerUpperScaling ≥ -32512.0 Cool.PerUpperScaling ≠ Cool.PerLowerScaling
Config.Output.Cool .PerLowerScaling(1)	REAL	0.0	Scaled low analog output value for cooling Cool.PerLowerScaling and Cool.PidUpperLimit form a value pair for scaling of the PID output value (PidOutputSum) to the analog output value for cooling (OutputCool_PER). The OutputCool_PER value is always located between Cool.PerUpperScaling and Cool.PerLowerScaling. Cool.PerLowerScaling is only effective if the cooling output is activated (Config.ActivateCooling = TRUE) and OutputCool_PER is selected as output for cooling (Cool.Select = 2). 32511.0 ≥ Cool.PerLowerScaling ≥ -32512.0 Cool.PerUpperScaling ≠ Cool.PerLowerScaling
Config.Output.Cool .MinimumOnTime(1)	REAL	0.0	Minimum on time of the pulse width modulation for cooling (OutputCool_PWM output) A PWM pulse is never shorter than this value. The value is rounded off to: Cool.MinimumOnTime = n × CycleTime.Value Cool.MinimumOnTime is only effective if the output for cooling OutputCool_PWM is selected (Cool.Select = 1). Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). 100000.0 ≥ Cool.MinimumOnTime ≥ 0.0

Tag	Data type	Default	Description
Config.Output.Cool .MinimumOffTime(1)	REAL	0.0	Minimum off time of the pulse width modulation for cooling (OutputCool_PWM output) A PWM pause is never shorter than this value. The value is rounded off to: Cool.MinimumOffTime = n × CycleTime.Value Cool.MinimumOffTime is only effective if the output for cooling OutputCool_PWM is selected (Cool.Select = 1). Only effective if the cooling output is activated (Config.ActivateCooling = TRUE). 100000.0 ≥ Cool.MinimumOffTime ≥ 0.0
If you are using PID_Temp in a cascade, the master controller and slave controller exchange information via the Master and Slave parameters. You need to make the interconnection. For details, see the Master parameter.			
Config.Cascade.IsMaster(1)	BOOL	FALSE	The controller is master in a cascade and provides the slave setpoint. Set IsMaster = TRUE if you are using this PID_Temp instance as master controller in a cascade. A master controller defines the setpoint of a slave controller with its output. A PID_Temp instance can be master controller and slave controller at the same time. If the controller is used as master controller, the cooling output must be deactivated (Config.ActivateCooling = FALSE).
Config.Cascade.IsSlave(1)	BOOL	FALSE	The controller is slave in a cascade and receives its setpoint from the master. Set IsSlave = TRUE if you are using this PID_Temp instance as slave controller in a cascade. A slave controller receives its setpoint (Setpoint parameter) from the output of its master controller (OutputHeat parameter). A PID_Temp instance can be master controller and slave controller at the same time.
Config.Cascade .AntiWindUpMode(1)	INT	1	Anti-windup behavior in the cascade Options are: • Anti-windup = 0 The AntiWindUp functionality is deactivated. The master controller does not respond to the limit of its slave controllers. • Anti-windup = 1 The integral action of the master controller is reduced in the ratio "Slaves in limit" to "Number of slaves" ("CountSlaves" parameter). This reduces the effects of the limitation on the control behavior. • Anti-windup = 2 The integral action of the master controller is held as soon as a slave controller is in the limit. Only effective if the controller is configured as master controller (Config.Cascade.IsMaster = TRUE).

Tag	Data type	Default	Description
Config.Cascade.CountSlaves(1)	INT	1	Number of subordinate slaves Here you enter the number of directly subordinate slave controllers which receive their setpoint from this master controller. Only effective if the controller is configured as master controller (Config.Cascade.IsMaster = TRUE). 255 ≥ CountSlaves ≥ 1
CycleTime.StartEstimation	BOOL	TRUE	If CycleTime.EnEstimation = TRUE, CycleTime.StartEstimation = TRUE starts automatic determination of the PID_Temp sampling time (cycle time of the calling OB). CycleTime.StartEstimation = FALSE is set once measurement is complete.
CycleTime.EnEstimation	BOOL	TRUE	If CycleTime.EnEstimation = TRUE, the PID_Temp sampling time is determined automatically. If CycleTime.EnEstimation = FALSE, the sampling time PID_Temp is not determined automatically and must be configured correctly manually with CycleTime.Value.
CycleTime.EnMonitoring	BOOL	TRUE	If CycleTime.EnMonitoring = FALSE, the PID_Temp sampling time is not monitored. If PID_Temp cannot be executed within the sampling time, no error (ErrorBits=0000800h) is output and PID_Temp does not respond as configured with ActivateRecoverMode.
CycleTime.Value(1)	REAL	0.1	PID_Temp sampling time (cycle time of the calling OB) in seconds CycleTime.Value is determined automatically and is usually equivalent to the cycle time of the calling OB.
You can reload values from the CtrlParamsBackUp structure with LoadBackUp = TRUE.			
CtrlParamsBackUp.SetByUser	BOOL	FALSE	Saved value of Retain.CtrlParams.SetByUser
CtrlParamsBackUp.Heat.Gain	REAL	1.0	Saved proportional gain for heating
CtrlParamsBackUp.Heat.Ti	REAL	20.0	Saved integral action time for heating in seconds
CtrlParamsBackUp.Heat.Td	REAL	0.0	Saved derivative action time for heating in seconds
CtrlParamsBackUp .Heat.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient for heating
CtrlParamsBackUp .Heat.PWeighting	REAL	1.0	Saved weighting of the proportional action for heating
CtrlParamsBackUp .Heat.DWeighting	REAL	1.0	Saved weighting of the derivative action for heating
CtrlParamsBackUp.Heat.Cycle	REAL	1.0	Saved sampling time of the PID algorithm for heating in seconds
CtrlParamsBackUp .Heat.ControlZone	REAL	3.402822e+38	Saved control zone width for heating
CtrlParamsBackUp.Heat.DeadZone	REAL	0.0	Saved dead zone width for heating
CtrlParamsBackUp.Cool.Gain	REAL	1.0	Saved proportional gain for cooling
CtrlParamsBackUp.Cool.Ti	REAL	20.0	Saved integral action time for cooling in seconds
CtrlParamsBackUp.Cool.Td	REAL	0.0	Saved derivative action time for cooling in seconds

Tag	Data type	Default	Description
CtrlParamsBack-Up.Cool.TdFiltRatio	REAL	0.2	Saved derivative delay coefficient for cooling
CtrlParamsBack-Up.Cool.PWeighting	REAL	1.0	Saved proportional action weighting factor for cooling
CtrlParamsBack-Up.Cool.DWeighting	REAL	1.0	Saved derivative action weighting factor for cooling
CtrlParamsBackUp.Cool.Cycle	REAL	1.0	Saved sampling time of the PID algorithm for cooling in seconds
CtrlParamsBackUp.Cool .ControlZone	REAL	3.402822e+38	Saved control zone width for cooling
CtrlParamsBackUp.Cool .DeadZone	REAL	0.0	Saved dead zone width for cooling
PIDSelfTune.SUT .CalculateParamsHeat	BOOL	FALSE	The properties of the heating branch of the controlled system are saved during pretuning for heating. If SUT.CalculateParamsHeat = TRUE, the PID parameters for heating (Retain.CtrlParams.Heat structure) are recal-culated on the basis of these properties. This enables you to change the parameter calculation method (PID-SelfTune.SUT.TuneRuleHeat parameter) without having to repeat the tuning. SUT.CalculateParamsHeat is set to FALSE after the calculation. Only possible if the pretuning was successful (SUT.ProcParHeatOk = TRUE).
PIDSelfTune.SUT .CalculateParamsCool	BOOL	FALSE	The properties of the cooling branch of the controlled system are saved during tuning for cooling. If SUT.CalculateParamsCool = TRUE, the PID parameters for cooling (Retain.CtrlParams.Cool structure) are recal-culated on the basis of these properties. This enables you to change the parameter calculation method (PID-SelfTune.SUT.TuneRuleCool parameter) without having to repeat the tuning. SUT.CalculateParamsCool is set to FALSE after the calculation. Only possible if the pretuning was successful (SUT.ProcParCoolOk = TRUE). Only effective if Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE.

Tag	Data type	Default	Description
PIDSelfTune.SUT .TuneRuleHeat	INT	2	Method for PID parameter calculation with pretuning for heating Options are: • SUT.TuneRuleHeat = 0: PID according to CHR • SUT.TuneRuleHeat = 1: PI according to CHR • SUT.TuneRuleHeat = 2: PID for temperature processes according to CHR (results in a slower and rather asymptomatic control response with lower overshoot than SUT.TuneRuleHeat = 0) (CHR = Chien, Hrones and Reswick) Only with SUT.TuneRuleHeat = 2 is the control zone Retain.CtrlParams.Heat.ControlZone automatically set during pretuning for heating.
PIDSelfTune.SUT .TuneRuleCool	INT	2	Method for PID parameter calculation with pretuning for cooling Options are: • SUT.TuneRuleCool = 0: PID according to CHR • SUT.TuneRuleCool = 1: PI according to CHR • SUT.TuneRuleCool = 2: PID for temperature processes according to CHR (results in a slower and rather asymptomatic control response with lower overshoot than SUT.TuneRuleCool = 0) (CHR = Chien, Hrones and Reswick) Only with SUT.TuneRuleCool = 2 is the control zone Retain.CtrlParams.Cool.ControlZone automatically set during pretuning for cooling. SUT.TuneRuleCool is only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE, Config.AdvancedCooling = TRUE).

Tag	Data type	Default	Description
PIDSelfTune.SUT.State	INT	0	The SUT.State tag indicates the current phase of pretun-ing: • State = 0: Initialize pretuning • State = 100: Calculate standard deviation for heating • State = 200: Calculate standard deviation for cooling • State = 300: Determine point of inflection for heating • State = 400: Determine point of inflection for cooling • State = 500: Set heating to setpoint after reaching point of inflection • State = 600: Set cooling to setpoint after reaching point of inflection • State = 700: Compare efficiency of the heating ac-tuator and cooling actuator • State = 800: Heating and cooling activated • State = 900: Cooling activated • State = 1000: Determine delay time after switching off heating • State = 9900: Pretuning successful • State = 1: Pretuning not successful
PIDSelfTune.SUT .ProcParHeatOk	BOOL	FALSE	TRUE: The calculation of the process parameters for pretuning heating was successful. This tag is set during tuning. It must be TRUE for calculation of the PID parameters for heating.
PIDSelfTune.SUT .ProcParCoolOk	BOOL	FALSE	TRUE: The calculation of the process parameters for pretuning cooling was successful. This tag is set during tuning. It must be TRUE for calculation of the PID parameters for cooling.

Tag	Data type	Default	Description
PIDSelfTune.SUT .AdaptDelayTime	INT	0	The AdaptDelayTime tag determines the adaptation of the delay time for heating at the operating point (for "Pretuning heating" and "Pretuning heating and cool-ing"). Options are: • SUT.AdaptDelayTime = 0: No adaptation of delay time. The SUT.State = 1000 phase is skipped. This option results in a shorter tun-ing time than with SUT.AdaptDelayTime = 1. • SUT.AdaptDelayTime = 1: Adaptation of the delay time to the setpoint in SUT.State = 1000 phase by switching off heating temporarily. This option results in a longer tuning time than withSUT.AdaptDelayTime = 0. It can improve the control response if the process behavior depends significantly on the operating point (non-linearity). This option should not be used for multi-zone appli-cations with strong thermal connections.

Tag	Data type	Default	Description
PIDSelfTune.SUT.CoolingMode	INT	0	The CoolingMode tag determines the manipulated variable output to determine the cooling parameters (for pretuning heating and cooling). Options are: • SUT.CoolingMode = 0: Switch off heating and switch on cooling after reaching the setpoint. The SUT.State = 700 phase is skipped. Phase SUT.State = 500 is followed by phase SUT.State = 900. This option can improve the control response if the gain of the cooling actuator is low compared to the gain of the heating actuator. It results in a shorter tuning time than with SUT.CoolingMode = 1 or 2. • SUT.CoolingMode = 1: Switch on cooling in addition to heating after reaching the setpoint. The SUT.State = 700 phase is skipped. Phase SUT.State = 500 is followed by phase SUT.State = 800. This option can improve the control response if the gain of the cooling actuator is high compared to the gain of the heating actuator. • SUT.CoolingMode = 2: After heating up to the setpoint, a decision is automatically made in phase SUT.State = 700 as to whether heating is switched off. Phase SUT.State = 500 is followed by phase SUT.State = 700 and then SUT.State = 800 or SUT.State = 900. This option requires more time than options 0 and 1.

Tag	Data type	Default	Description
PIDSelfTune.TIR.RunIn	BOOL	FALSE	Use the RunIn tag to specify the sequence of fine tuning during start from automatic mode. • RunIn = FALSE If fine tuning is started from automatic mode, the system uses the existing PID parameters to control to the setpoint (TIR.State = 500 or 600). Only then will fine tuning start. • RunIn = TRUE PID_Temp tries to reach the setpoint with minimum or maximum output value (TIR.State = 300 or 400). This can produce increased overshoot. Fine tuning then starts automatically. RunIn is set to FALSE after fine tuning. During start of fine tuning from Inactive or Manual mode, PID_Temp reacts as described under RunIn = TRUE.
PIDSelfTune.TIR .CalculateParamsHeat	BOOL	FALSE	The properties of the heating branch of the controlled system are saved during fine tuning for heating. If TIR.CalculateParamsHeat= TRUE, the PID parameters for heating (Retain.CtrlParams.Heat structure) are recalculated on the basis of these properties. This enables you to change the parameter calculation method (PIDSelfTune.TIR.TuneRuleHeat parameter) without having to repeat the tuning. TIR.CalculateParamsHeat is set to FALSE after the calculation. Only possible if fine tuning heating was successful beforehand (TIR.ProcParHeatOk = TRUE).
PIDSelfTune.TIR .CalculateParamsCool	BOOL	FALSE	The properties of the cooling branch of the controlled system are saved during fine tuning for cooling. If TIR.CalculateParamsCool= TRUE, the PID parameters for cooling (Retain.CtrlParams.Cool structure) are recalculated on the basis of these properties. This enables you to change the parameter calculation method (PIDSelfTune.TIR.TuneRuleCool parameter) without having to repeat the tuning. TIR.CalculateParamsCool is set to FALSE after the calculation. Only possible if fine tuning cooling was successful beforehand (TIR.ProcParCoolOk = TRUE). Only effective if Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE

Tag	Data type	Default	Description
PIDSelfTune.TIR .TuneRuleHeat	INT	0	Method for parameter calculation during fine tuning for heating Options are: • TIR.TuneRuleHeat = 0: PID automatic • TIR.TuneRuleHeat = 1: PID fast (faster control response with higher amplitudes of the output value than with TIR.TuneRuleHeat = 2) • TIR.TuneRuleHeat = 2: PID slow (slower control response with lower amplitudes of the output value than with TIR.TuneRuleHeat = 1) • TIR.TuneRuleHeat = 3: ZN PID • TIR.TuneRuleHeat = 4: ZN PI • TIR.TuneRuleHeat = 5: ZN P (ZN=Ziegler-Nichols) To be able to repeat the calculation of the PID parameters for heating with TIR.CalculateParamsHeat and TIR.TuneRuleHeat = 0, 1 or 2, the previous fine tuning also has to have been executed with TIR.TuneRuleHeat = 0, 1 or 2. If this is not the case, TIR.TuneRuleHeat = 3 is used. The recalculation of the PID parameters for heating with TIR.CalculateParamsHeat and TIR.TuneRuleHeat = 3, 4 or 5 is always possible.

Tag	Data type	Default	Description
PIDSelfTune.TIR .TuneRuleCool	INT	0	Method for parameter calculation during fine tuning for cooling Options are: • TIR.TuneRuleCool = 0: PID automatic • TIR.TuneRuleCool = 1: PID fast (faster control response with higher amplitudes of the output value than with TIR.TuneRuleCool = 2) • TIR.TuneRuleCool = 2: PID slow (slower control response with lower amplitudes of the output value than with TIR.TuneRuleCool = 1) • TIR.TuneRuleCool = 3: ZN PID • TIR.TuneRuleCool = 4: ZN PI • TIR.TuneRuleCool = 5: ZN P (ZN=Ziegler-Nichols) To be able to repeat the calculation of the PID parameters for cooling with TIR.CalculateParamsCool and TIR.TuneRuleCool = 0, 1 or 2, the previous fine tuning also has to have been executed with TIR.TuneRuleCool = 0, 1 or 2. If this is not the case, TIR.TuneRuleCool = 3 is used. The recalculation of the PID parameters for cooling with TIR.CalculateParamsCool and TIR.TuneRuleCool = 3, 4 or 5 is always possible. Only effective if the cooling output and PID parameter switching are activated (ConfigActivateCooling = TRUE and Config.AdvancedCooling = TRUE).

Tag	Data type	Default	Description
PIDSelfTune.TIR.State	INT	0	The TIR.State tag indicates the current phase of "fine tuning": • State = 0: Initialize fine tuning • State = 100: Calculate standard deviation for heating • State = 200: Calculate standard deviation for cooling • State = 300: Attempting to reach setpoint for heating with two-step control using heating • State = 400: Attempting to reach setpoint for cooling with two-step control using cooling • State = 500: Attempting to reach setpoint for heating with PID control • State = 600: Attempting to reach setpoint for cooling with PID control • State = 700: Calculate standard deviation for heating • State = 800: Calculate standard deviation for cooling • State = 900: Determine oscillation and calculate parameters for heating • State = 1000: Determine oscillation and calculate parameters for cooling • State = 9900: Fine tuning successful • State = 1: Fine tuning not successful
PIDSelfTune.TIR .ProcParHeatOk	BOOL	FALSE	TRUE: The calculation of the process parameters for fine tuning heating was successful. This tag is set during tuning. It must be met for calculation of the PID parameters for heating.
PIDSelfTune.TIR .ProcParCoolOk	BOOL	FALSE	TRUE: The calculation of the process parameters for fine tuning cooling was successful. This tag is set during tuning. It must be met for calculation of the PID parameters for cooling.

Tag	Data type	Default	Description
PIDSelfTune.TIR .OutputOffsetHeat	REAL	0.0	Tuning offset heating of the PID output value TIR.OutputOffsetHeat is added to the value that results from PidOutputSum for the heating branch. To receive a positive offset at the outputs for heating, define a positive value for TIR.OutputOffsetHeat. The resulting values at the outputs for heating are the result of the configured output scaling (Struktur Config.Output.Heat). This tuning offset can be used in controllers with activated cooling output and PID parameter switching (Config.ActivateCooling = TRUE, Config.AdvancedCooling = TRUE) for fine tuning cooling. If the outputs for cooling are not active at the setpoint that is to be tuned (PidOutputSum > 0.0), fine tuning cooling is not possible. In this case, define a positive tuning offset heating which is greater than the PID output value (PidOutputSum) at the setpoint in the steady state before you start tuning. This step increases the values at the outputs for heating and activates the outputs for cooling (PidOutputSum < 0.0). Fine tuning cooling is now possible. When fine tuning is complete, TIR.OutputOffsetHeat is reset to 0.0. Major changes at TIR.OutputOffsetHeat in one step can result in temporary overshoots. Config.Output.Heat.PidUpperLimit ≥ PIDSelfTune.TIR.OutputOffsetHeat ≥ Config.Output.Heat.PidLowerLimit

Tag	Data type	Default	Description
PIDSelfTune.TIR .OutputOffsetCool	REAL	0.0	Tuning offset cooling of the PID output value TIR.OutputOffsetCool is added to the value that results from PidOutputSum for the cooling branch. To receive a positive offset at the outputs for cooling, define a negative value for TIR.OutputOffsetCool. The resulting values at the outputs for cooling are the result of the configured output scaling (Struktur Config.Output.Coool). This tuning offset can be used in controllers with activated cooling output (Config.ActivateCooling = TRUE) for fine tuning heating. If the outputs for heating are not active at the setpoint that is to be tuned (PidOutputSum < 0.0), fine tuning heating is not possible. In this case, define a negative tuning offset cooling which is less than the PID output value (PidOutputSum) at the setpoint in the steady state before you start tuning. This step increases the values at the outputs for cooling and activates the outputs for heating (PidOutputSum > 0.0). Fine tuning heating is now possible. When fine tuning is complete, TIR.OutputOffsetCool is reset to 0.0. Major changes at TIR.OutputOffsetCool in one step can result in temporary overshoots. Config.Output.Cool.PidUpperLimit ≥ PIDSelfTune.TIR.OutputOffsetCool ≥ Config.Output.Cool.PidLowerLimit
PIDSelfTune.TIR .WaitForControlIn	BOOL	FALSE	Waiting with fine tuning after reaching the setpoint If TIR.WaitForControlIn = TRUE, fine tuning waits in between reaching the setpoint (TIR.State = 500 or 600) and calculation of the standard deviation (TIR.State = 700 or 800) until a FALSE -> TRUE edge is given at TIR.FinishControlIn. TIR.WaitForControlIn can be used for simultaneous fine tuning of several controllers in multi-zone applications to synchronize tuning of the individual zones. It ensures that all zones have reached their setpoints before the actual tuning starts. The influence of thermal connections between the zones on tuning can be reduced in this way. TIR.WaitForControlIn is only effective if fine tuning is started from automatic mode with PIDSelfTune.TIR.RunIn = FALSE.
PIDSelfTune.TIR .ControlInReady	BOOL	FALSE	If TIR.WaitForControlIn = TRUE, PID_Temp sets TIR.ControlInReady = TRUE as soon as the setpoint has been reached and waits with additional tuning steps until a FALSE -> TRUE edge is given at TIR.FinishControlIn.
PIDSelfTune.TIR .FinishControlIn	BOOL	FALSE	If TIR.ControlInReady = TRUE, a FALSE -> TRUE edge at TIR.FinishControlIn stops the wait and fine tuning resumes.
PIDCtrl.IOutputOld[(1)]	REAL	0.0	Integral action in last cycle

Tag	Data type	Default	Description
PIDCtrl.PIDInit	BOOL	FALSE	PIDCtrl.PIDInit is available as of PID_Temp version 1.1. If PIDCtrl.PIDInit = TRUE in "Automatic mode", the integral action PIDCtrl.IOutputOld is pre-assigned automatically as if PidOutputSum = OverwriteInitialOutputValue in the previous cycle. This can be used for a Override control with PID_Temp (Page 206).
Retain.CtrlParams.SetByUser(1)	BOOL	FALSE	If the PID parameters are entered manually in the configuration editor, SetByUser = TRUE. This parameter is used for display in the editors and does not influence the control algorithm. SetByUser is retentive.
Retain.CtrlParams.Heat.Gain(1)	REAL	1.0	Active proportional gain for heating Heat.Gain is retentive. Heat.Gain ≥ 0.0
Retain..CtrlParams.Heat.Ti(1)	REAL	20.0	Active integral action time for heating in seconds The integral action for heating is switched off with Heat.CtrlParams.Ti = 0.0. Heat.Ti is retentive. 100000.0 ≥ Heat.Ti ≥ 0.0
Retain.CtrlParams.Heat.Td(1)	REAL	0.0	Active derivative action time for heating in seconds The derivative action for heating is switched off with Heat.CtrlParams.Td = 0.0. Heat.Td is retentive. 100000.0 ≥ Heat.Td ≥ 0.0
Retain.CtrlParams.Heat .TdFiltRatio(1)	REAL	0.2	Active derivative delay coefficient for heating The derivative delay coefficient delays the effect of the derivative action. Derivative delay = derivative action time × derivative delay coefficient • 0.0: Derivative action is effective for one cycle only and therefore almost not effective. • 0.5: This value has proved useful in practice for controlled systems with **one** dominant time constant. • > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed. Heat.TdFiltRatio is retentive. Heat.TdFiltRatio ≥ 0.0

Tag	Data type	Default	Description
Retain.CtrlParams.Heat .PWeighting(1)	REAL	1.0	Active weighting of the proportional action for heating The proportional action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Proportional action for setpoint change is fully effective • 0.0: Proportional action for setpoint change is not effective The proportional action is always fully effective when the process value is changed. Heat.PWeighting is retentive. 1.0 ≥ Heat.PWeighting ≥ 0.0
Retain.CtrlParams.Heat .DWeighting(1)	REAL	1.0	Active weighting of the derivative action for heating The derivative action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Derivative action is fully effective upon setpoint change • 0.0: Derivative action is not effective upon setpoint change The derivative action is always fully effective when the process value is changed. Heat.DWeighting is retentive. 1.0 ≥ Heat.DWeighting ≥ 0.0
Retain.CtrlParams.Heat.Cycle(1)	REAL	1.0	Active sampling time of the PID algorithm for heating in seconds CtrlParams.Heat.Cycle is calculated during tuning and rounded to an integer multiple of CycleTime.Value. If Config.Output.Heat.PwmPeriode = 0.0, Heat.Cycle is used as period duration of the pulse width modulation for heating. If Config.Output.Cool.PwmPeriode = 0.0 and Config.AdvancedCooling = FALSE, Heat.Cycle is used as period duration of the pulse width modulation for cooling. Heat.Cycle is retentive. 100000.0 ≥ Heat.Cycle > 0.0

Tag	Data type	Default	Description
Retain.CtrlParams.Heat .ControlZone(1)	REAL	3.402822e+38	Active control zone width for heating The control zone for heating is switched off with Heat.ControlZone = 3.402822e+38. Heat.ControlZone is only set automatically during pre-tuning heating or pretuning heating and cooling if PID-SelfTune.SUT.TuneRuleHeat = 2 is selected as method of the parameter calculation. For controllers with deactivated cooling output (Config.ActivateCooling = FALSE) or controllers with activated cooling output and cooling factor (Config.AdvancedCooling = FALSE), the control zone is symmetrically located between Setpoint – Heat.ControlZone and Setpoint + Heat.ControlZone. For controllers with activated cooling output and PID parameter switching (Config.ActivateCooling = TRUE, Config.AdvancedCooling = TRUE), the control zone is located between Setpoint – Heat.ControlZone and Setpoint + Cool.ControlZone. Heat.ControlZone is retentive. Heat.ControlZone > 0.0
Retain.CtrlParams.Heat .DeadZone(1)	REAL	0.0	Active dead zone width for heating (see PID parameters (Page 177)) The dead zone for heating is switched off with Heat.DeadZone = 0.0. Heat.DeadZone is not set automatically or adjusted during tuning. You must correctly configure Heat.DeadZone manually. When the dead zone is switched on, the result can be a permanent control deviation (deviation between setpoint and process value). This can have a negative effect on fine tuning. For controllers with deactivated cooling output (Config.ActivateCooling = FALSE) or controllers with activated cooling output and cooling factor (Config.AdvancedCooling = FALSE), the dead zone is symmetrically located between Setpoint – Heat.DeadZone and Setpoint + Heat.DeadZone. For controllers with activated cooling output and PID parameter switching (Config.ActivateCooling = TRUE, Config.AdvancedCooling = TRUE), the dead zone is located between Setpoint – Heat.DeadZone and Setpoint + Cool.DeadZone. Heat.DeadZone is retentive. Heat.DeadZone ≥ 0.0
Retain.CtrlParams.Cool.Gain(1)	REAL	1.0	Active proportional gain for cooling Cool.Gain is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). Cool.Gain ≥ 0.0

Tag	Data type	Default	Description
Retain.CtrlParams.Cool.Ti(1)	REAL	20.0	Active integral action time for cooling in seconds The integral action for cooling is switched off with Cool.CtrlParams.Ti = 0.0. Cool.Ti is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). 100000.0 ≥ Cool.Ti ≥ 0.0
Retain.CtrlParams.Cool.Td(1)	REAL	0.0	Active derivative action time for cooling in seconds The derivative action for cooling is switched off with Cool.CtrlParams.Td = 0.0. Cool.Td is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). 100000.0 ≥ Cool.Td ≥ 0.0
Retain.CtrlParams.Cool .TdFiltRatio(1)	REAL	0.2	Active derivative delay coefficient for cooling The derivative delay coefficient delays the effect of the derivative action. Derivative delay = derivative action time × derivative delay coefficient • 0.0: Derivative action is effective for one cycle only and therefore almost not effective. • 0.5: This value has proved useful in practice for controlled systems with one dominant time constant. • > 1.0: The greater the coefficient, the longer the effect of the derivative action is delayed. Cool.TdFiltRatio is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). Cool.TdFiltRatio ≥ 0.0
Retain.CtrlParams.Cool .PWeighting(1)	REAL	1.0	Active weighting of the proportional action for cooling The proportional action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Proportional action for setpoint change is fully effective • 0.0: Proportional action for setpoint change is not effective The proportional action is always fully effective when the process value is changed. Cool.PWeighting is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). 1.0 ≥ Cool.PWeighting ≥ 0.0

Tag	Data type	Default	Description
Retain.CtrlParams.Cool .DWeighting(1)	REAL	1.0	Active weighting of the derivative action for cooling The derivative action may weaken with changes to the setpoint. Values from 0.0 to 1.0 are applicable. • 1.0: Derivative action is fully effective upon setpoint change • 0.0: Derivative action is not effective upon setpoint change The derivative action is always fully effective when the process value is changed. Cool.DWeighting is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). 1.0 ≥ Cool.DWeighting ≥ 0.0
Retain.CtrlParams.Cool.Cycle(1)	REAL	1.0	Active sampling time of the PID algorithm for cooling in seconds CtrlParams.Cool.Cycle is calculated during tuning and rounded off to an integer multiple of CycleTime.. If Config.Output.Cool.PwmPeriode = 0.0 and Config.AdvancedCooling = TRUE, Cool.Cycle is used as period duration of the pulse width modulation for cooling. If Config.Output.Cool.PwmPeriode = 0.0 and Config.AdvancedCooling = FALSE, Heat.Cycle is used as period duration of the pulse width modulation for cooling. Cool.Cycle is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). 100000.0 ≥ Cool.Cycle > 0.0

Tag	Data type	Default	Description
Retain.CtrlParams.Cool .ControlZone(1)	REAL	3.402822e+38	Active control zone width for cooling The control zone for cooling is switched off with Cool.ControlZone = 3.402822e+38. Cool.ControlZone is only set automatically during pretuning cooling or pretuning heating and cooling if PIDSelf-Tune.SUT.TuneRuleCool = 2 is selected as method of the parameter calculation. Cool.ControlZone is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). Cool.ControlZone > 0.0
Retain.CtrlParams.Cool .DeadZone(1)	REAL	0.0	Active dead zone width for cooling (see PID parameters (Page 177)) The dead zone for cooling is switched off with Cool.DeadZone = 0.0. Cool.DeadZone is not set automatically or adjusted during tuning. You must correctly configure Cool.DeadZone manually. When the dead zone is switched on, the result can be a permanent control deviation (deviation between setpoint and process value). This can have a negative effect on fine tuning. Cool.DeadZone is retentive. Only effective if the cooling output and PID parameter switching are activated (Config.ActivateCooling = TRUE and Config.AdvancedCooling = TRUE). Cool.DeadZone ≥ 0.0

9.3.4.7 PID_Temp state and mode parameters

Correlation of the parameters

The State parameter shows the current operating mode of the PID controller. You cannot change the State parameter.

With a rising edge at ModeActivate, PID_Temp switches to the operating mode saved in the Mode in-out parameter.

Heat.EnableTuning and Cool.EnableTuning specify for pretuning and fine tuning, if tuning takes place for heating or cooling.

If the CPU is switched on or switches from Stop to RUN mode, PID_Temp starts in the operating mode that is saved in the Mode parameter. To leave PID_Temp in "Inactive" mode, set RunModeByStartup = FALSE.

Meaning of values

State / Mode	Description of operating mode
0	**Inactive** The following output values are output in "Inactive" mode: • 0.0 as PID output value (PidOutputSum) • 0.0 as output value for heating (OutputHeat) and output value for cooling (OutputCool) • 0 as analog output value for heating (OutputHeat_PER) and analog output value for cooling (OutputCool_PER) • FALSE as PWM output value for heating (OutputHeat_PWM) and PWM output value for cooling (OutputCool_PWM) This does not depend on the configured output value limits and scaling in the structures Config.Output.Heat and Config.Output.Cool.
1	**Pretuning** The pretuning determines the process response to a jump change of the output value and searches for the point of inflection. The PID parameters are calculated from the maximum rate of rise and dead time of the controlled system. You obtain the best PID parameters when you perform pretuning and fine tuning. PID_Temp offers different pretuning types depending on the configuration: • Pretuning heating: A jump change is output at the output value heating, the PID parameters for heating are calculated (Retain.CtrlParams.Heat structure), and control to the setpoint then takes place in automatic mode. If the process behavior strongly depends on the operating point, an adaptation of the delay time can be activated at the setpoint with PIDSelfTune.SUT.AdaptDelayTime. • Pretuning heating and cooling: A jump is output at the output value heating. As soon as the process value is close to the setpoint, a jump change is output at the output value cooling. The PID parameters for heating (Retain.CtrlParams.Heat structure) and cooling (Retain.CtrlParams.Cool structure) are calculated. Then, control to the setpoint takes place in automatic mode. If the process behavior strongly depends on the operating point, an adaptation of the delay time can be activated at the setpoint with PIDSelfTune.SUT.AdaptDelayTime. Depending on the effect of the cooling actuator compared to the heating actuator, the quality of tuning can be influenced by whether or not the heating and cooling outputs are operated simultaneously during tuning. You can specify this with PIDSelfTune.SUT.CoolingMode. • Pretuning cooling: A jump change is output at the output value cooling and the PID parameters for cooling are calculated (Struktur Retain.CtrlParams.Cool). Then, control to the setpoint takes place in automatic mode. If you want to tune the PID parameters for heating and cooling, you can expect a better control response with "Pretuning heating" followed by "Pretuning cooling" rather than with "Pretuning heating and cooling". However, carrying out pretuning in two steps takes more time.

<table>
<tr><th>State / Mode</th><th>Description of operating mode</th></tr>
<tr><td>1</td><td>
General requirements for pretuning:

The PID_Temp instruction is called in a cyclic interrupt OB.
Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3)
ManualEnable = FALSE
Reset = FALSE
The setpoint and the process value lie within the configured limits.

Requirements for pretuning heating:

Heat.EnableTuning = TRUE
Cool.EnableTuning = FALSE
The process value must not be too close to the setpoint.
|Setpoint - Input| > 0.3 * |Config.InputUpperLimit - Config.InputLowerLimit| and
|Setpoint - Input| > 0.5 * |Setpoint|
The setpoint is greater than the process value.
Setpoint > Input

Requirements for pretuning heating and cooling:

Heat.EnableTuning = TRUE·
Cool.EnableTuning = TRUE
The cooling output is activated (Config.ActivateCooling = TRUE).
The PID parameter switching is activated (Config.AdvancedCooling = TRUE).
The process value must not be too close to the setpoint.
|Setpoint - Input| > 0.3 * |Config.InputUpperLimit - Config.InputLowerLimit| and
|Setpoint - Input| > 0.5 * |Setpoint|
The setpoint is greater than the process value.
Setpoint > Input

Requirements for pretuning cooling:

Heat.EnableTuning = FALSE·
Cool.EnableTuning = TRUE·
The cooling output is activated (Config.ActivateCooling = TRUE).
The PID parameter switching is activated (Config.AdvancedCooling = TRUE).
A "pretuning heating" or "pretuning heating and cooling" has been successful (PIDSelf-Tune.SUT.ProcParHeatOk = TRUE), if possible at the same setpoint.
The process value must be close to the setpoint.
|Setpoint - Input| < 0.05 * |Config.InputUpperLimit - Config.InputLowerLimit|

The more stable the process value is, the easier it is to calculate the PID parameters and the more precise the result will be. Noise on the process value can be tolerated as long as the rate of rise of the process value is significantly higher compared to the noise. This is most likely the case in operating modes "Inactive" or "Manual mode".
</td></tr>
</table>

State / Mode	Description of operating mode
1	The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel The method for calculation of the PID parameters can be specified separately for heating and cooling with PIDSelfTune.SUT.TuneRuleHeat and PIDSelfTune.SUT.TuneRuleCool. Before the PID parameters are recalculated, they are backed up in the CtrlParamsBackUp structure and can be reactivated with LoadBackUp. After successful pretuning, the switch is made to automatic mode. After unsuccessful pretuning, the switch to the mode is determined by ActivateRecoverMode. The phase of pretuning is indicated with PIDSelfTune.SUT.State.
2	**Fine tuning** Fine tuning generates a constant, limited oscillation of the process value. The PID parameters are tuned for the operating point from the amplitude and frequency of this oscillation. PID parameters from fine tuning usually have better master control and disturbance characteristics than PID parameters from pretuning. You obtain the best PID parameters when you perform pretuning and fine tuning. PID_Temp automatically attempts to generate an oscillation greater than the noise of the process value. Fine tuning is only minimally influenced by the stability of the process value. PID_Temp offers different fine tuning types depending on the configuration: • Fine tuning heating: PID_Temp generates an oscillation of the process value with periodic changes at the output value heating and calculates the PID parameters for heating (Struktur Retain.CtrlParams.Heat). • Fine tuning cooling: PID_Temp generates an oscillation of the process value with periodic changes at the output value cooling and calculates the PID parameters for cooling (Struktur Retain.CtrlParams.Cool).

<table>
<tr><th>State / Mode</th><th>Description of operating mode</th></tr>
<tr><td>2</td><td>

Temporary tuning offset for heating/cooling controllers

If PID_Temp is used as heating/cooling controller (Config.ActivateCooling = TRUE), the PID output value (PidOutputSum) at the setpoint must meet the following requirements for a process value oscillation to be generated and fine tuning to be successful:

- Positive PID output value for fine tuning heating
- Negative PID output value for fine tuning cooling

If this requirement is not met, you can define a temporary offset for fine tuning which is output at the output with the opposite effect:

- Offset for cooling output (PIDSelfTune.TIR.OutputOffsetCool) with fine tuning heating.

  Define a negative tuning offset cooling which is less than the PID output value (PidOutputSum) at the setpoint in the steady state before you start tuning.
- Offset for heating output (PIDSelfTune.TIR.OutputOffsetHeat) with fine tuning cooling.

  Define a positive tuning offset heating which is greater than the PID output value (PidOutputSum) at the setpoint in the steady state before you start tuning.

The defined offset is balanced by the PID algorithm so that the process value remains at the setpoint. The height of the offset allows the PID output value to be adapted correspondingly so that it fulfills the requirement mentioned above.

To avoid larger overshoots of the process value when defining the offset, it can also be increased in several steps.

If PID_Temp exits the fine tuning mode, the tuning offset is reset.

</td></tr>
<tr><td></td><td>

Example for definition of an offset for fine tuning cooling:

- Without offset:
  - Setpoint = Process value (ScaledInput) = 80°C
  - PID output value (PidOutputSum) = 30.0
  - Output value heating (OutputHeat) = 30.0
  - Output value cooling (OutputCool) = 0.0

    Oscillation of the process value around the setpoint cannot be generated with the cooling output alone.

    Fine tuning would fail here.
- With definition of an offset for heating output (PIDSelfTune.TIR.OutputOffsetHeat) = 80.0
  - Setpoint = process value (ScaledInput) = 80°C
  - PID output value (PidOutputSum) = -50.0
  - Output value heating (OutputHeat) = 80.0
  - Output value cooling (OutputCool) = -50.0

    By defining an offset for the heating output, the cooling output can now create an oscillation of the process value around the setpoint.

    Fine tuning can now be carried out successfully.

</td></tr>
</table>

State / Mode	Description of operating mode
2	**General requirements for fine tuning:** • The PID_Temp instruction is called in a cyclic interrupt OB. • No disturbances are expected. • The setpoint and the process value lie within the configured limits. • The control loop has stabilized at the operating point. The operating point is reached when the process value corresponds to the setpoint. When the dead zone is switched on, the result can be a permanent control deviation (deviation between setpoint and actual value). This can have a negative effect on fine tuning. • ManualEnable = FALSE • Reset = FALSE • Automatic (State = 3), inactive (State = 0) or manual (State = 4) mode **Requirements for fine tuning heating:** • Heat.EnableTuning = TRUE • Cool.EnableTuning = FALSE • If PID_Temp is configured as heating/cooling controller (Config.ActivateCooling = TRUE), the heating output must be active at the operating point at which tuning is to take place (PidOutputSum > 0.0 (see tuning offset)). **Requirements for fine tuning cooling:** • Heat.EnableTuning = FALSE • Cool.EnableTuning = TRUE • The cooling output is activated (Config.ActivateCooling = TRUE). • The PID parameter switching is activated (Config.AdvancedCooling = TRUE) • The cooling output must be active at the operating point at which tuning is to take place (PidOutputSum < 0.0 (see tuning offset)).

State / Mode	Description of operating mode
2	**The course of fine tuning is determined by the mode from which it is started:** • Automatic mode (State = 3) with PIDSelfTune.TIR.RunIn = FALSE (default) Start fine tuning from automatic mode if you wish to improve the existing PID parameters through tuning. PID_Temp controls the system using the existing PID parameters until the control loop has stabilized and the requirements for fine tuning have been met. Only then will fine tuning start. • Inactive (State = 0), manual mode (State = 4), or automatic mode (State = 3) with PIDSelf-Tune.TIR.RunIn = TRUE Attempts are made to reach the setpoint with the minimum or maximum output value: – with minimum or maximum output value heating for fine tuning heating – With minimum or maximum output value cooling for fine tuning cooling. This can produce increased overshoot. Fine tuning starts when the setpoint is reached. If the setpoint cannot be reached, PID_Temp does not automatically abort tuning. The setpoint is frozen in the CurrentSetpoint tag. Tuning is canceled when: • Setpoint > CurrentSetpoint + CancelTuningLevel or • Setpoint < CurrentSetpoint - CancelTuningLevel The method for calculation of the PID parameters can be specified separately for heating and cooling with PIDSelfTune.TIR.TuneRuleHeat and PIDSelfTune.TIR.TuneRuleCool. Before the PID parameters are recalculated, they are backed up in the CtrlParamsBackUp structure and can be reactivated with LoadBackUp. The controller changes to automatic mode after successful fine tuning. After unsuccessful fine tuning, the switch to the mode is determined by ActivateRecoverMode. The "Fine tuning" phase is indicated with PIDSelfTune.TIR.State.
3	**Automatic mode** In automatic mode, PID_Temp corrects the controlled system in accordance with the parameters specified. The controller switches to automatic mode if one the following requirements is met: • Pretuning successfully completed • Fine tuning successfully completed • Changing of the Mode in-out parameter to the value 3 and a rising edge at ModeActivate. The switchover from automatic mode to manual mode is only bumpless if carried out in the commissioning editor. The ActivateRecoverMode tag is taken into consideration in automatic mode.

State / Mode	Description of operating mode
4	**Manual mode** In manual mode, you specify a manual PID output value in the ManualValue parameter. The values at the outputs for heating and cooling resulting from this manual value are the result of the configured output scaling. You can also activate this operating mode using ManualEnable = TRUE. We recommend that you change the operating mode using Mode and ModeActivate only. The switchover from manual mode to automatic mode is bumpless. The ActivateRecoverMode tag is taken into consideration in manual mode.
5	**Substitute output value with error monitoring** The control algorithm is deactivated. The SetSubstituteOutput tag determines which PID output value (PidOutputSum) is output in this operating mode. • SetSubstituteOutput = FALSE: Last valid PID output value • SetSubstituteOutput = TRUE: Substitute output value (SubstituteOutput) You cannot activate this operating mode using Mode = 5. In the event of an error, it is activated instead of "Inactive" operating mode if all the following conditions are met: • Automatic mode (State = 3) • ActivateRecoverMode = TRUE • One or more errors have occurred in which ActivateRecoverMode is effective. As soon as the errors are no longer pending, PID_Temp switches back to automatic mode.

ENO characteristics

If State = 0, then ENO = FALSE.

If State ≠ 0, then ENO = TRUE.

Automatic switchover of operating mode during commissioning

Automatic mode is activated following successful pretuning or fine tuning. The following table shows how Mode and State change during successful pretuning.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning successfully completed
n	3	3	Automatic mode is started

PID_Temp automatically switches the operating mode in the event of an error.

The following table shows how Mode and State change during pretuning with errors.

Cycle no.	Mode	State	Action
0	4	4	Set Mode = 1
1	1	4	Set ModeActivate = TRUE
1	4	1	Value of State is saved in Mode parameter Pretuning is started
n	4	1	Pretuning canceled
n	4	4	Manual mode is started

If ActivateRecoverMode = TRUE, the operating mode that is saved in the Mode parameter is activated. When you start pretuning or fine tuning, PID_Temp has saved the value of State in the Mode in-out parameter. This means PID_Temp switches to the mode from which tuning was started.

If ActivateRecoverMode = FALSE, the system switches to "Inactive" operating mode.

9.3.4.8 PID_Temp ErrorBits parameter

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 0000003h, for example, indicates that the errors 0000001h and 0000002h are pending simultaneously.

ErrorBits (DW#16#...)	Description
0000000	There is no error.
0000001	The "Input" parameter is outside the process value limits. • Input > Config.InputUpperLimit or • Input < Config.InputLowerLimit If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in automatic mode. If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.
0000002	Invalid value at "Input_PER" parameter. Check whether an error is pending at the analog input. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp outputs the configured substitute output value. As soon as the error is no longer pending, PID_Temp switches back to automatic mode. If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.
0000004	Error during fine tuning. Oscillation of the process value could not be maintained. If PID_Temp is used as heating-cooling controller (Config.ActivateCooling = TRUE), to be able to generate actual value oscillation, the PID output value (PidOutputSum) at the setpoint must be • positive for fine tuning heating • negative for fine tuning cooling If this requirement is not met, use the tuning offsets (PIDSelfTune.TIR.OutputOffsetCool and PIDSelfTune.TIR.OutputOffsetHeat tags), see Fine tuning (Page 189). If ActivateRecoverMode was = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0000008	Error at start of pretuning. The process value is too close to the setpoint or greater than the setpoint. Start fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0000010	The setpoint was changed during tuning. You can set the permitted fluctuation of the setpoint at the CancelTuningLevel tag. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0000020	Pretuning is not permitted during fine tuning. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp remains in fine tuning mode.
0000040	Error during pretuning. Cooling could not reduce the process value. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.

ErrorBits (DW#16#...)	Description
0000100	Error during fine tuning resulted in invalid parameters. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0000200	Invalid value at "Input" parameter: Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp outputs the configured substitute output value. As soon as the error is no longer pending, PID_Temp switches back to automatic mode. If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.
0000400	Calculation of output value failed. Check the PID parameters. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp outputs the configured substitute output value. As soon as the error is no longer pending, PID_Temp switches back to automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.
0000800	Sampling time error: PID_Temp is not called within the sampling time of the cyclic interrupt OB. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in automatic mode. If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter. If this error occurred during simulation with PLCSIM, see the notes under Simulating PID_Temp with PLCSIM (Page 211).
0001000	Invalid value at "Setpoint" parameter or "SubstituteSetpoint": Value has an invalid number format. If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp outputs the configured substitute output value. As soon as the error is no longer pending, PID_Temp switches back to automatic mode. If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.
0010000	Invalid value at ManualValue parameter. Value has an invalid number format. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp remains in manual mode and uses SubstituteOutput as PID output value. As soon as you specify a valid value in ManualValue, PID_Temp uses it as the PID output value.
0020000	Invalid value at SubstituteOutput tag. Value has an invalid number format. PID_Temp remains in the "Substitute output value with error monitoring" mode or manual mode and uses the low limit of the PID output value for heating (Config.Output.Heat.PidLowerLimit) as PID output value. As soon as you specify a valid value in SubstituteOutput, PID_Temp uses it as the PID output value.

ErrorBits (DW#16#...)	Description
0040000	Invalid value at Disturbance parameter. Value has an invalid number format. If automatic mode was active and ActivateRecoverMode = TRUE before the error occurred, Disturbance is set to zero. PID_Temp remains in automatic mode. If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter. If Disturbance in the current phase has no effect on the output value, tuning is not be canceled.
0200000	Error in master in the cascade: Slaves are not in automatic mode or have activated substitute setpoint and prevent tuning of the master. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0400000	Pretuning heating is not permitted while cooling is active. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
0800000	The process value must be close to the setpoint to start pretuning cooling. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
1000000	Error at start of tuning: Heat.EnableTuning and Cool.EnableTuning are not set or do not match the configuration. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
2000000	Pretuning cooling requires successful pretuning heating. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
4000000	Error at start of fine tuning: Heat.EnableTuning and Cool.EnableTuning must not be set simultaneously. If ActivateRecoverMode = TRUE before the error occurred, PID_Temp cancels the tuning and switches to the operating mode that is saved in the Mode parameter.
8000000	Error during calculation of the PID parameters resulted in invalid parameters. The invalid parameters are discarded and the original PID parameters are retained unchanged. We can distinguish between the following cases: • If automatic mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in automatic mode. • If manual mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp remains in manual mode. • If pretuning or fine tuning mode was active before the error occurred and ActivateRecoverMode = TRUE, PID_Temp switches to the operating mode that is saved in the Mode parameter.

9.3.4.9 PID_Temp ActivateRecoverMode tag

The ActivateRecoverMode tag determines the reaction to error. The Error parameter indicates if an error is pending. When the error is no longer pending, Error = FALSE. The ErrorBits parameter shows which errors have occurred.

Automatic mode and manual mode

NOTICE
Your system may be damaged. If ActivateRecoverMode = TRUE, PID_Temp remains in automatic mode or in manual mode even if there is an error and the process limit values are exceeded. This may damage your system. It is essential to configure how your controlled system reacts in the event of an error to protect your system from damage.

ActivateRecoverMode	Description
FALSE	PID_Temp switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	**Automatic mode** If errors occur frequently in automatic mode, this setting has a negative effect on the control response, because PID_Temp switches between the calculated PID output value and the substitute output value at each error. In this case, check the ErrorBits parameter and eliminate the cause of the error. If one or several of the following errors occur and automatic mode was active before the error occurred, PID_Temp remains in automatic mode: • 0000001h: The "Input" parameter is outside the process value limits. • 0000800h: Sampling time error • 0040000h: Invalid value at Disturbance parameter. • 8000000h: Error during calculation of the PID parameters If one or several of the following errors occur and automatic mode was active before the error occurred, PID_Temp switches to "Substitute output value with error monitoring" mode: • 0000002h: Invalid value at Input_PER parameter. • 0000200h: Invalid value at Input parameter. • 0000400h: Calculation of output value failed. • 0001000h: Invalid value at Setpoint parameter or SubstituteSetpoint. As soon as the errors are no longer pending, PID_Temp switches back to automatic mode. If the following error occurs in "Substitute output value with error monitoring" mode, PID_Temp sets the PID output value to Config.Output.Heat.PidLowerLimit as long as this error is pending: • 0020000h: Invalid value at SubstituteOutput tag. Value has an invalid number format. This behavior is independent of SetSubstituteOutput.

ActivateRecoverMode	Description
TRUE	**Manual mode** If one or several errors occur and manual mode was active before the error occurred, PID_Temp remains in manual mode. If the following error occurs in manual mode, as long as this error is pending, PID_Temp sets the PID output value to SubstituteOutput: • 0010000h: Invalid value at ManualValue parameter. Value has an invalid number format. If the error 0010000h is pending in manual mode and the following error occurs, PID_Temp sets the PID output value to Config.Output.Heat.PidLowerLimit as long as this error is pending: • 0020000h: Invalid value at SubstituteOutput tag. Value has an invalid number format. This behavior is independent of SetSubstituteOutput.

Pretuning and fine tuning

ActivateRecoverMode	Description
FALSE	PID_Temp switches to "Inactive" mode in the event of an error. The controller is only activated by a falling edge at Reset or a rising edge at ModeActivate.
TRUE	If the following error occurs, PID_Temp remains in the active mode: • 0000020h: Pretuning is not permitted during fine tuning. The following errors are ignored: • 0010000h: Invalid value at ManualValue parameter. • 0020000h: Invalid value at SubstituteOutput tag. When any other error occurs, PID_Temp cancels the tuning and switches to the mode from which tuning was started.

9.3.4.10 PID_Temp Warning tag

If several warnings are pending simultaneously, the values of the Warning tag are displayed with binary addition. If the warning 0000003h is displayed, for example, the warnings 0000001h and 0000002h are pending simultaneously.

Warning (DW#16#....)	Description
0000000	No warning pending.
0000001	The point of inflection was not found during pretuning.
0000004	The setpoint was limited to the configured limits.
0000008	Not all the necessary controlled system properties were defined for the selected method of calculation. Instead, the PID parameters were calculated using the method TIR.TuneRuleHeat = 3 or TIR.TuneRuleCool = 3.
0000010	The operating mode could not be changed because Reset = TRUE or ManualEnable = TRUE.
0000020	The cycle time of the calling OB limits the sampling time of the PID algorithm. Improve results by using shorter OB cycle times.
0000040	The process value exceeded one of its warning limits.
0000080	Invalid value at Mode. The operating mode is not switched.
0000100	The manual value was limited to the limits of the PID output value.
0000200	The specified rule for tuning is not supported. No PID parameters are calculated.
0001000	The substitute output value cannot be reached because it is outside the output value limits.
0004000	The specified selection of the output value for heating and/or cooling is not supported. Only the output OutputHeat or OutputCool is used.
0008000	Invalid value at PIDSelfTune.SUT.AdaptDelayTime. The default value 0 is used.
0010000	Invalid value at PIDSelfTune.SUT.CoolingMode. The default value 0 is used.
0020000	The activation of cooling (Config.ActivateCooling tag) is not supported by the controller that is used as master (Config.Cascade.IsMaster tag). PID_Temp works as heating controller. Set the Config.ActivateCooling tag to FALSE.
0040000	Invalid value at Retain.CtrlParams.Heat.Gain, Retain.CtrlParams.Cool.Gain oder Config.CoolFactor. PID_Temp supports only positive values for proportional gain (heating and cooling) and cooling factor. Automatic mode remains active with PID output value 0.0. The integral component is stopped.

The following warnings are deleted as soon as the cause has been remedied or you repeat the action with valid parameters:

- 0000001h
- 0000004h
- 0000008h
- 0000040h
- 0000100h

All other warnings are cleared with a rising edge at Reset or ErrorAck.

9.3.4.11 PwmPeriode tag

If the PID algorithm sampling time (Retain.CtrlParams.Heat.Cycle or Retain.CtrlParams.Heat.Cycle) and thus the time period of the pulse width modulation is very high when you use OutputHeat_PWM or OutputCool_PWM, you can define a deviating shorter time period at the Config.Output.Heat.PwmPeriode or Config.Output.Cool.PwmPeriode parameters to improve the smoothness of the process value.

Time period of the pulse width modulation at OutputHeat_PWM

Time period of the PWM at output OutputHeat_PWM depending on Config.Output.Heat.PwmPeriode:

- Heat.PwmPeriode = 0.0 (default)

  The sampling time of the PID algorithm for heating (Retain.CtrlParams.Heat.Cycle) is used as time period of the PWM.

- Heat.PwmPeriode > 0.0

  The value is rounded off to an integer multiple of the PID_Temp sampling time (CycleTime.Value) and used as time period of the PWM.

  The value must meet the following conditions:

  – Heat.PwmPeriode ≤ Retain.CtrlParams.Heat.Cycle

  – Heat.PwmPeriode > Config.Output.Heat.MinimumOnTime

  – Heat.PwmPeriode > Config.Output.Heat.MinimumOffTime

Time period of the pulse width modulation at OutputCool_PWM

Time period of the PWM at output OutputCool_PWM depending on Config.Output.Cool.PwmPeriode and the method for heating/cooling:

- Cool.PwmPeriode = 0.0 and cooling factor (Config.AdvancedCooling = FALSE):

  The sampling time of the PID algorithm for heating (Retain.CtrlParams.Heat.Cycle) is used as time period of the PWM.

- Cool.PwmPeriode = 0.0 and PID parameter switching (Config.AdvancedCooling = TRUE):

  The sampling time of the PID algorithm for cooling (Retain.CtrlParams.Cool.Cycle) is used as time period of the PWM.

- Cool.PwmPeriode > 0.0:

  The value is rounded off to an integer multiple of the PID_Temp sampling time (CycleTime.Value) and used as time period of the PWM.

  The value must meet the following conditions:

  – Cool.PwmPeriode ≤ Retain.CtrlParams.Cool.Cycle or Retain.CtrlParams.Heat.Cycle

  – Cool.PwmPeriode > Config.Output.Cool.MinimumOnTime

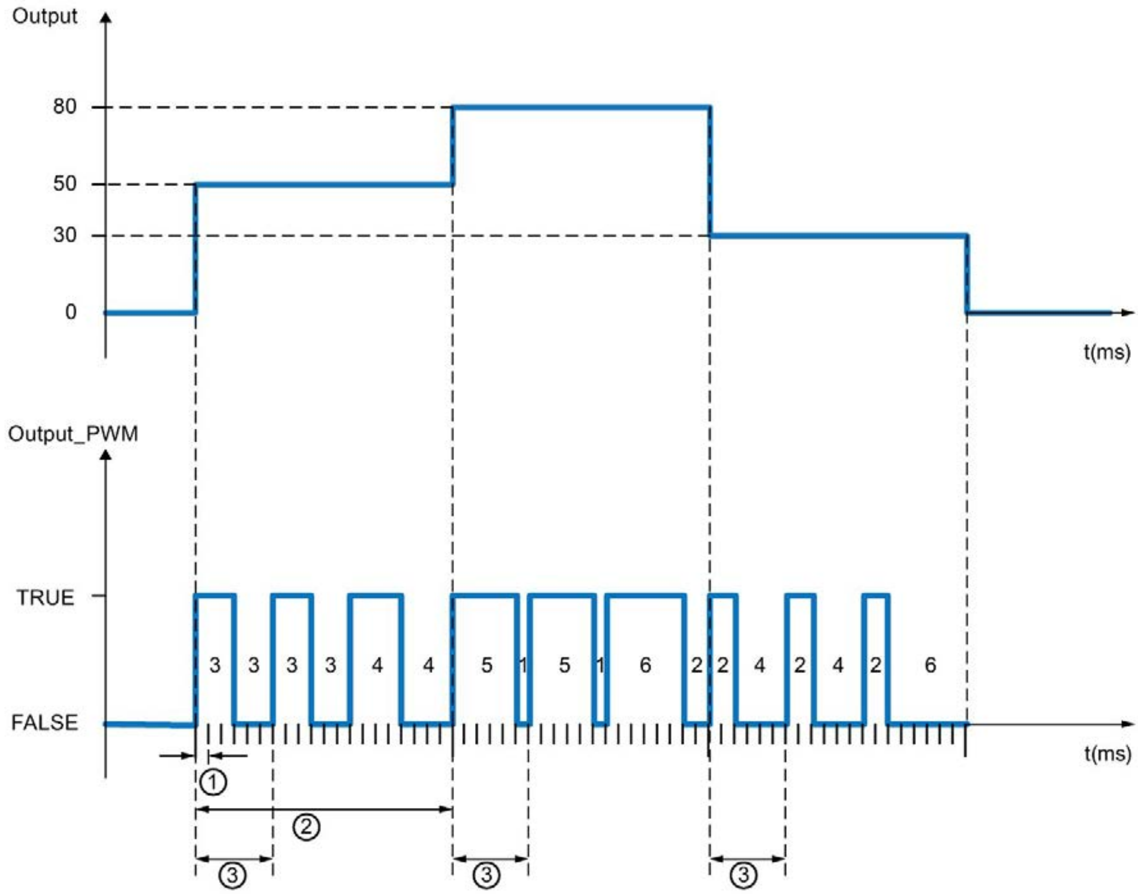
  – Cool.PwmPeriode > Config.Output.Cool.MinimumOffTime

Config.Output.Cool.PwmPeriode is only effective if the cooling output is activated (Config.ActivateCooling =TRUE).

When you use PwmPeriode, the accuracy of the PWM output signal is determined by the relationship of PwmPeriode to the PID_Temp sampling time (cycle time of the OB). PwmPeriode should be at least 10 times the PID_Temp sampling time.

If the sampling time of the PID algorithm is not an integer multiple of PwmPeriode, each last period of the PWM within the sampling time of the PID algorithm is extended accordingly.

Example for OutputHeat_PWM



①	PID_Temp sampling time = 100.0 ms (cycle time of the calling cyclic interrupt OB, CycleTime.Value tag)
②	PID algorithm sampling time = 2000.0 ms (Retain.CtrlParams.Heat.Cycle tag)
③	Time period of the PWM for heating = 600.0 ms (Config.Output.Heat.PwmPeriode tag)

9.3.4.12 IntegralResetMode tag

The IntegralResetMode tag determines how the integral action PIDCtrl.IOutputOld is pre-assigned:

- When switching from "Inactive" operating mode to "Automatic mode"
- With edge TRUE -> FALSE at parameter Reset and parameter Mode = 3

This setting only works for one cycle and is only effective if the integral action is activated (Retain.CtrlParams.Heat.Ti and Retain.CtrlParams.Cool.Ti > 0.0 tags).

IntegralResetMode	Description
0	Smooth The value of PIDCtrl.IOutputOld is pre-assigned so that the switchover is bumpless, which means "Automatic mode" starts with the output value = 0.0 (parameter PidOutputSum) and there is no jump of the output value regardless of the control deviation (setpoint – process value).
1	Delete We recommend setting the weighting of the proportional action (Retain.CtrlParams.Heat.PWeighting and Retain.CtrlParams.Cool.PWeighting tags) to 1.0 if this option is used. The value of PIDCtrl.IOutputOld is deleted. Any control deviation will cause a jump of the PID output value. The direction of the output value jump depends on the active weighting of the proportional action (Retain.CtrlParams.Heat.PWeighting and Retain.CtrlParams.Cool.PWeighting tags) and the control deviation: • Active proportional action weighting = 1.0: Output value jump and control deviation have identical signs. Example: If the process value value is smaller than the setpoint (positive control deviation), the PID output value jumps to a positive value. • Active proportional action weighting < 1.0: For large control deviations, the PID output value jump and control deviation have identical signs. Example: If the process value is much smaller than the setpoint (positive control deviation), the PID output value jumps to a positive value. For small control deviations, the PID output value jump and control deviation have different signs. Example: If the process value is just below the setpoint (positive control deviation), the PID output value jumps to a negative value. This is usually not desirable, because it results in a temporary increase in the control deviation. The smaller the configured weighting of the proportional action, the greater the control deviation must be to receive a PID output value jump with identical sign. We recommend setting the weighting of the proportional action (Retain.CtrlParams.Heat.PWeighting and Retain.CtrlParams.Cool.PWeighting tags) to 1.0 when this option is used. Otherwise, you may experience the undesirable behavior described for small control deviations. Alternatively, you can also use IntegralResetMode = 4. This option guarantees identical signs of the PID output value jump and control deviation independent of the configured weighting of the proportional action and the control deviation.

IntegralReset-Mode	Description
2	Hold The value of PIDCtrl.IOutputOld is not changed. You can define a new value using the user program.
3	Pre-assign The value of PIDCtrl.IOutputOld is automatically pre-assigned as if PidOutputSum = OverwriteI-nitialOutputValue in the last cycle.
4	Like setpoint change (only for PID_Temp with version ≥ 1.1) The value of PIDCtrl.IOutputOld is automatically pre-assigned so that a similar PID output value jump results as for a PI controller in automatic mode in case of a setpoint change from the current process value to the current setpoint. Any control deviation will cause a jump of the PID output value. The PID output value jump and control deviation have identical signs. Example: If the process value value is smaller than the setpoint (positive control deviation), the PID output value jumps to a positive value. This is independent of the configured weighting of the proportional action and the control deviation.

If IntegralResetMode is assigned a value outside the valid value range, PID_Temp behaves as with the pre-assignment of IntegralResetMode:

- PID_Temp up to V1.0: IntegralResetMode = 1
- PID_Temp as of V1.1: IntegralResetMode = 4

9.4 PID basic functions

9.4.1 CONT_C

9.4.1.1 Description CONT_C

The CONT_C instruction is used on SIMATIC S7 automation systems to control technical processes with continuous input and output variables. You can assign parameters to enable or disable sub-functions of the PID controller and adapt it to the process. In addition to the functions in the setpoint and process value branches, the instruction implements a complete PID controller with continuous output value output and the option of manually influencing the value of the output value.

Application

You can use the controller as a PID fixed setpoint controller, or in multi-loop control systems, also as a cascade, blending or ratio controller. The functions of the controller are based on the PID control algorithm of the sampling controller with an analog signal, if necessary extended by including a pulse shaper stage to generate pulse-width modulated output signals for two or three step controllers with proportional actuators.

Call

The CONT_C instruction has an initialization routine that is run through when input parameter COM_RST = TRUE is set. During initialization, the integral action is set to the initialization value I_ITVAL. All the signal outputs are set to zero. COM_RST = FALSE has to be set after the initialization routine has been completed.

The calculation of the values in the control blocks is only correct if the block is called at regular intervals. You should therefore call the control blocks in a cyclic interrupt OB (OB 30 to OB 38). Enter the sampling time in the CYCLE parameter.

If you call the instruction CONT_C as a multiple instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for CONT_C directly in the multiple instance DB and commission it via a watch table.

Error information

The error message word RET_VAL is not evaluated by the block.

9.4.1.2 How CONT_C works

Setpoint branch

The setpoint is entered in floating-point format at the SP_INT input.

Process value branch

The process value can be input in I/O or floating-point format. The function CRP_IN converts the I/O value PV_PER to a floating-point format -100 to +100 % in accordance with the following rule:

Output of CRP_IN = PV_PER * 100 / 27648

The PV_NORM function scales the output of CRP_IN according to the following rule:

Output of PV_NORM = (output of CRP_IN) *PV_FAC + PV_OFF

PV_FAC has a default of 1 and PV_OFF a default of 0.

Forming the error signal

The difference between the setpoint and process value is the error signal. To suppress a minor sustained oscillation due to manipulated variable quantization (e.g. with a pulse width modulation with PULSEGEN), the error signal is applied to a dead band (DEADBAND). With DEADB_W = 0, the dead band is switched off.

PID Algorithm

The PID algorithm operates as a position algorithm. The proportional, integral (INT), and differential (DIF) actions are connected in parallel and can be activated or deactivated individually. This allows P, PI, PD, and PID controllers to be configured. Pure I controllers are also possible.

Manual value processing

It is possible to switch over between manual and automatic mode. In manual mode, the manipulated variable is corrected to a manually selected value.

The integral action (INT) is set internally to LMN - LMN_P - DISV and the derivative action (DIF) is set to 0 and synchronized internally. Changeover to automatic mode is therefore bumpless.

Manipulated value processing

You can use the LMNLIMIT function to limit the manipulated value to selected values. Alarm bits indicate when a limit is exceeded by the input variable.

The LMN_NORM function normalizes the output of LMNLIMIT according to the following rule:

LMN = (output of LMNLIMIT) * LMN_FAC + LMN_OFF

LMN_FAC has a default of 1 and LMN_OFF a default of 0.

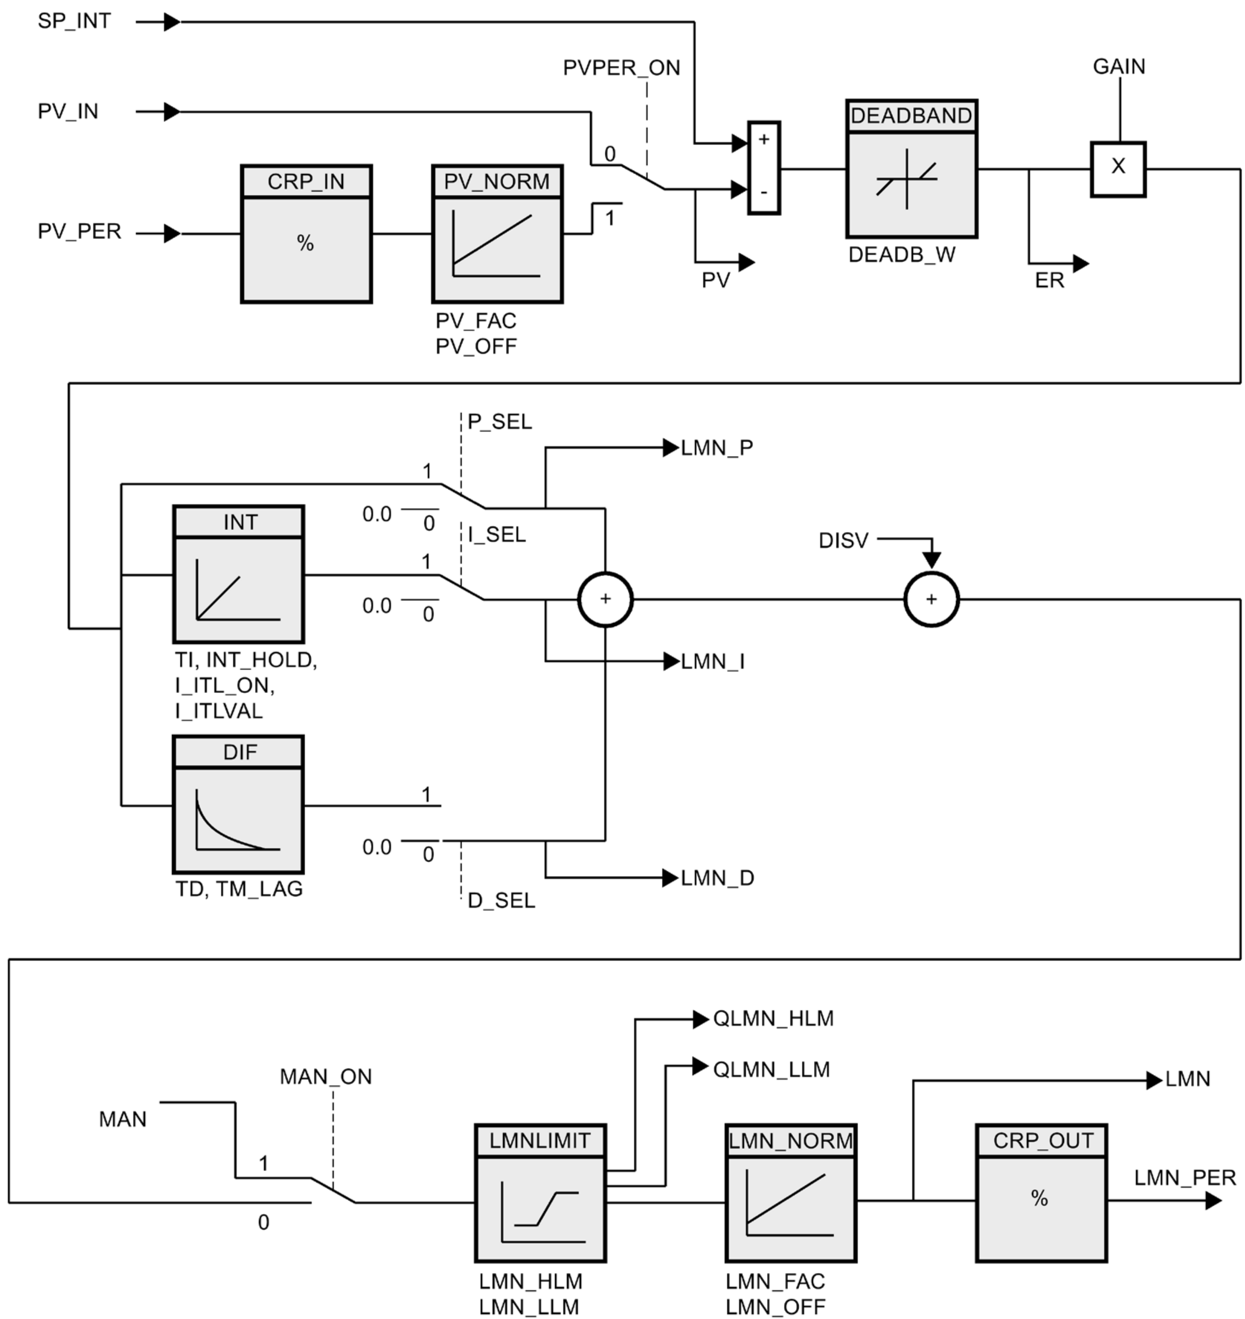
The manipulated value is also available in I/O format. The CRP_OUT function converts the LMN floating-point value to a I/O value according to the following rule:

LMN_PER = LMN * 27648 / 100

Feedforward control

A disturbance variable can be added at the DISV input.

9.4.1.3 CONT_C block diagram



9.4.1.4 Input parameter CONT_C

Table 9- 13 Input parameter CONT_C

Parameters	Data type	Default	Description
COM_RST	BOOL	FALSE	The instruction has an initialization routine that is processed when the "Restart" input is set.
MAN_ON	BOOL	TRUE	If the input "Enable manual mode" is set then the control loop is interrupted. A manual value is set as the manipulated value.
PVPER_ON	BOOL	FALSE	If the process value is to be read in from the I/Os, the PV_PER input must be interconnected with the I/Os and the "Enable process value I/Os" input must be set.
P_SEL	BOOL	TRUE	The PID actions can be switched on and off individually in the PID algorithm. P-action is on when the "Enable P-action" input is set.
I_SEL	BOOL	TRUE	The PID actions can be switched on and off individually in the PID algorithm. I action is on when the input "I-action on" is set.
INT_HOLD	BOOL	FALSE	The output of the integral action can be frozen. For this the input "I-action hold" must be set.
I_ITL_ON	BOOL	FALSE	The output of the integral action can be set at the I_ITLVAL input. For this the input "Set I-action" must be set.
D_SEL	BOOL	FALSE	The PID actions can be switched on and off individually in the PID algorithm. D-action is on when the input "Enable D-action" is set.
CYCLE	TIME	T#1s	The time between block calls must be constant. The "Sampling time" input specifies the time between block calls. CYCLE >= 1ms
SP_INT	REAL	0.0	The input "Internal setpoint" is used to specify a setpoint. Permissible are values from -100 to 100 % or a physical variable 1).
PV_IN	REAL	0.0	At the "Process value input" you can assign parameters to a commissioning value or you can interconnect an external process value in floating-point format. Permissible are values from -100 to 100 % or a physical variable 1).
PV_PER	WORD	W#16#0000	The process value in I/O format is interconnected with the controller at the "Process value I/0" input.
MAN	REAL	0.0	The "Manual value" input is used to set a manual value using the operator interface functions. Permissible are values from -100 to 100 % or a physical variable 2).
GAIN	REAL	2.0	The "Proportional gain" input specifies controller amplification.
TI	TIME	T#20s	The "Integration time" input determines the time response of the integral action. TI >= CYCLE
TD	TIME	T#10s	The "Derivative action time" input determines the time response of the derivative action. TD >= CYCLE
TM_LAG	TIME	T#2s	Time lag of the D-action The algorithm of the D-action contains a delay for which parameters can be assigned at the input "Time lag of the D-action". TM_LAG >= CYCLE/2

Parameters	Data type	Default	Description
DEADB_W	REAL	0.0	A dead band is applied to the system deviation. The "Dead band width" input determines the size of the dead band. DEADB_W >= 0.0 (%) or a physical variable 1)
LMN_HLM	REAL	100.0	The manipulated value is always restricted to a high limit and low limit. The "High limit of manipulated value" input specifies the high limit. Permissible are real values starting at LMN_LLM (%) or a physical variable 2).
LMN_LLM	REAL	0.0	The manipulated value is always restricted to a high limit and low limit. The "Low limit of manipulated value" input specifies the low limit. Permissible are real values up to LMN_HLM (%) or a physical variable 2).
PV_FAC	REAL	1.0	The "Process value factor" input is multiplied by the process value. The input is used to scale the process value range.
PV_OFF	REAL	0.0	The input "Process value offset" is added to the process value. The input is used to scale the process value range.
LMN_FAC	REAL	1.0	The "Manipulated value factor" input is multiplied with the manipulated value. The input is used to scale the manipulated value range.
LMN_OFF	REAL	0.0	The input "Manipulated value offset" is added to the process value. The input is used to scale the manipulated value range.
I_ITLVAL	REAL	0.0	The output of the integral action can be set at the I_ITL_ON input. The initialization value is applied to the input "Initialization value of the I-action." Permissible are values of -100.0 to 100.0 (%) or a physical variable 2).
DISV	REAL	0.0	For feedforward control, the disturbance variable is interconnected to the "Disturbance variable" input. Permissible are values of -100.0 to 100.0 (%) or a physical variable 2).

1) Parameters in the setpoint and process value branches with the same unit

2) Parameters in the manipulated value branch with the same unit

9.4.1.5 Output parameters CONT_C

Table 9- 14 Output parameters CONT_C

Parameter	Data type	Default	Description
LMN	REAL	0.0	The effective "Manipulated value" is output in floating point format at the "Manipulated value" output.
LMN_PER	WORD	W#16#0000	The manipulated value in I/O format is interconnected on the input "Manipulated value I/O" with the controller.
QLMN_HLM	BOOL	FALSE	The manipulated value is always restricted to a high limit and low limit. The output "High limit of manipulated value reached" indicates that the high limit has been reached.
QLMN_LLM	BOOL	FALSE	The manipulated value is always restricted to a high limit and low limit. The output "Low limit of manipulated value reached" indicates that the low limit has been reached.
LMN_P	REAL	0.0	The "P-action" output contains the proportional action of the manipulated variable.
LMN_I	REAL	0.0	The "I-action" output contains the integral action of the manipulated variable.
LMN_D	REAL	0.0	The "D-action" output contains the derivative action of the manipulated variable.
PV	REAL	0.0	The effective process value is output at the "Process value" output.
ER	REAL	0.0	The effective system deviation is output at the "Error signal" output.

9.4.2 CONT_S

9.4.2.1 Description CONT_S

The CONT_S instruction is used on SIMATIC S7 automation systems to control technical processes with binary output value output signals for actuators with integrating behavior. During parameter assignment, you can activate or deactivate sub-functions of the PI step controller to adapt the controller to the controlled system. In addition to the functions in the process value branch, the instruction implements a complete proportional-plus-integral-action controller with binary output value output and the option of manually influencing the value of the output value. The step controller operates without a position feedback signal.

Application

You can use the controller as a PI fixed setpoint controller or in secondary control loops in cascade, blending or ratio controllers, however you cannot use it as the primary controller. The functions of the controller are based on the PI control algorithm of the sampling controller supplemented by the functions for generating the binary output signal from the analog actuating signal.

Call

The CONT_S instruction has an initialization routine that is run through when input parameter COM_RST = TRUE is set. All the signal outputs are set to zero. COM_RST = FALSE has to be set after the initialization routine has been completed.

The calculation of the values in the control blocks is only correct if the block is called at regular intervals. You should therefore call the control blocks in a cyclic interrupt OB (OB 30 to OB 38). Enter the sampling time in the CYCLE parameter.

If you call the instruction CONT_S as a multiple instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for CONT_S directly in the multiple instance DB and commission it via a watch table.

Error information

The error message word RET_VAL is not evaluated by the block.

9.4.2.2 Mode of operation CONT_S

Setpoint branch

The setpoint is entered in floating-point format at the SP_INT input.

Process value branch

The process value can be input in I/O or floating-point format. The function CRP_IN converts the I/O value PV_PER to a floating-point format -100 to +100 % in accordance with the following rule:

Output of CRP_IN = PV_PER * 100 / 27648

The PV_NORM function normalizes the output of CRP_IN according to the following rule:

Output of PV_NORM = (output of CRP_IN) * PV_FAC + PV_OFF

PV_FAC has a default of 1 and PV_OFF a default of 0.

Forming the error signal

The difference between the setpoint and process value is the error signal. To suppress a small constant oscillation due to the manipulated variable quantization (for example, due to a limited resolution of the manipulated value by the control valve), a dead band is applied to the error signal (DEADBAND). With DEADB_W = 0, the dead band is switched off.

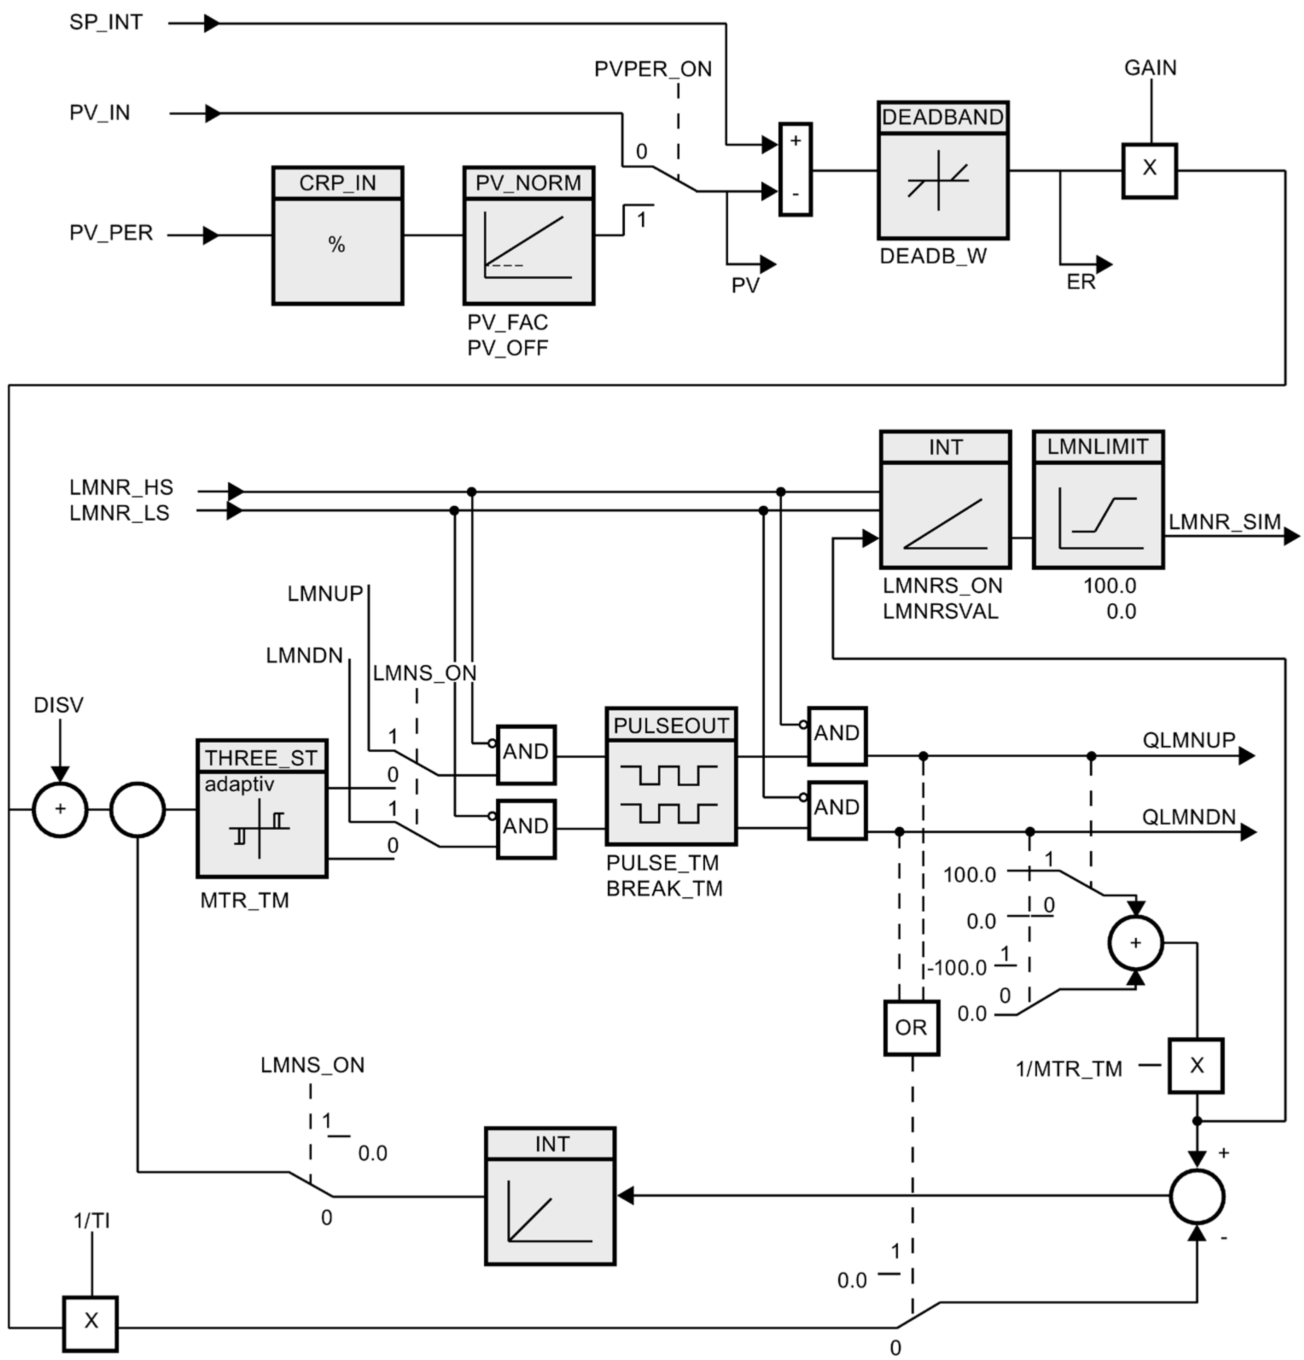
PI step algorithm

The instruction operates without position feedback. The I-action of the PI algorithm and the assumed position feedback signal are calculated in **one** integral action (INT) and compared with the remaining P-action as a feedback value. The difference is applied to a three-step element (THREE_ST) and a pulse shaper (PULSEOUT) that generates the pulses for the control valve. The switching frequency of the controller can be reduced by adapting the response threshold of the three-step element.

Feedforward control

A disturbance variable can be added at the DISV input.

9.4.2.3 Block diagram CONT_S



9.4.2.4 Input parameters CONT_S

Table 9- 15 Input parameters CONT_S

Parameters	Data type	Default	Description
COM_RST	BOOL	FALSE	The block has an initialization routine that is processed when the "Restart" input is set.
LMNR_HS	BOOL	FALSE	The signal "Control valve at high endstop" is interconnected at the input "High endstop signal of position feedback". LMNR_HS=TRUE means: The control valve is at high endstop.
LMNR_LS	BOOL	FALSE	The signal "Control valve at low endstop" is interconnected on the input "Low endstop signal of position feedback". LMNR_LS=TRUE means The control valve is at low endstop.
LMNS_ON	BOOL	FALSE	Manipulated value signal processing is switched to manual mode at the "Enable manual mode of manipulated signal".
LMNUP	BOOL	FALSE	The output signal QLMNUP is operated in manual mode of the manipulated value signals at the input "Manipulated value signal up".
LMNDN	BOOL	FALSE	The output signal QLMNDN is operated in manual mode of the manipulated value signals at the input "Manipulated value signal down"
PVPER_ON	BOOL	FALSE	If the process value is to be read from the I/O then the input PV_PER must be interconnected with the I/O and the input "Enable process value I/O" must be set.
CYCLE	TIME	T#1s	The time between block calls must be constant. The "Sampling time" input specifies the time between block calls. CYCLE >= 1ms
SP_INT	REAL	0.0	The input "Internal setpoint" is used to specify a setpoint. Permissible are values from -100 to 100 % or a physical variable 1).
PV_IN	REAL	0.0	At the "Process value input" you can assign parameters to a commissioning value or you can interconnect an external process value in floating-point format. Permissible are values from -100 to 100 % or a physical variable 1).
PV_PER	WORD	W#16#0000	The process value in I/O format is interconnected with the controller at the "Process value I/O" input.
GAIN	REAL	2.0	The "Proportional gain" input specifies controller amplification.
TI	TIME	T#20s	The "Integration time" input determines the time response of the integral action. TI >= CYCLE
DEADB_W	REAL	1.0	A dead band is applied to the system deviation. The "Dead band width" input determines the size of the dead band. Permissible are values from 0 to 100 % or a physical variable 1).
PV_FAC	REAL	1.0	The "Process value factor" input is multiplied by the process value. The input is used to scale the process value range.
PV_OFF	REAL	0.0	The input "Process value offset" is added to the process value. The input is used to scale the process value range.
PULSE_TM	TIME	T#3s	You can assign a minimum pulse time at the parameter "Minimum pulse time". PULSE_TM >= CYCLE
BREAK_TM	TIME	T#3s	You can assign a minimum break time at the parameter "Minimum break time". BREAK_TM >= CYCLE

Parameters	Data type	Default	Description
MTR_TM	TIME	T#30s	The time required by the actuator to move from limit stop to limit stop is entered at the "Motor actuating time" parameter. MTR_TM >= CYCLE
DISV	REAL	0.0	For feedforward control, the disturbance variable is interconnected to the "Disturbance variable" input. Permissible are values from -100 to 100 % or a physical variable [2].

[1] Parameters in setpoint and process value branches with identical unit

[2] Parameters in the manipulated value branch with same unit

9.4.2.5 Output parameters CONT_S

Table 9- 16 Output parameters CONT_S

Parameters	Data type	Default	Description
QLMNUP	BOOL	FALSE	If the output "Manipulated value signal up" is set then the control valve should be open.
QLMNDN	BOOL	FALSE	If the output "Manipulated value signal down" is set then the control valve should be closed.
PV	REAL	0.0	The effective process value is output at the "Process value" output.
ER	REAL	0.0	The effective system deviation is output at the "Error signal" output.

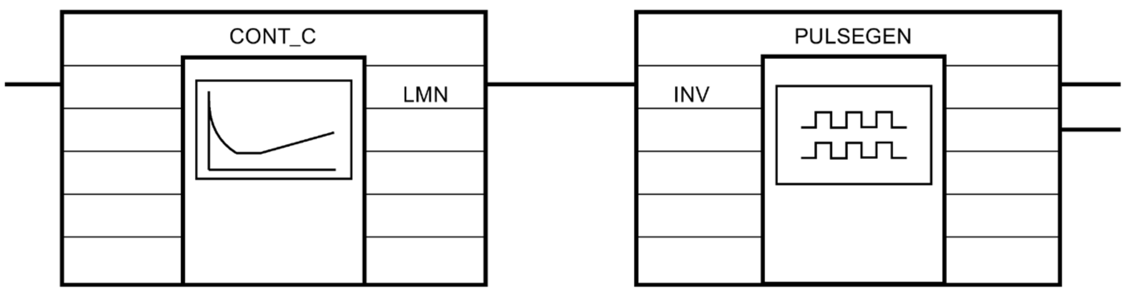
9.4.3 PULSEGEN

9.4.3.1 Description PULSEGEN

The instruction PULSEGEN serves as the structure of a PID controller with impulse output for proportional actuators. PULSEGEN transforms the input value INV (= LMN of the PID controller) through modulation of the impulse width in an impulse sequence with a constant period duration, which corresponds with the cycle time with which the input value is updated.

Application

You can use the PULSEGEN instruction to configure two- or three-step PID controllers with pulse width modulation. The function is normally used in conjunction with the continuous controller CONT_C.



Call

The PULSEGEN instruction has an initialization routine that is run through when input parameter COM_RST = TRUE is set. All the signal outputs are set to zero. COM_RST = FALSE has to be set after the initialization routine has been completed.

The calculation of the values in the control blocks is only correct if the block is called at regular intervals. You should therefore call the control blocks in a cyclic interrupt OB (OB 30 to OB 38). Enter the sampling time in the CYCLE parameter.

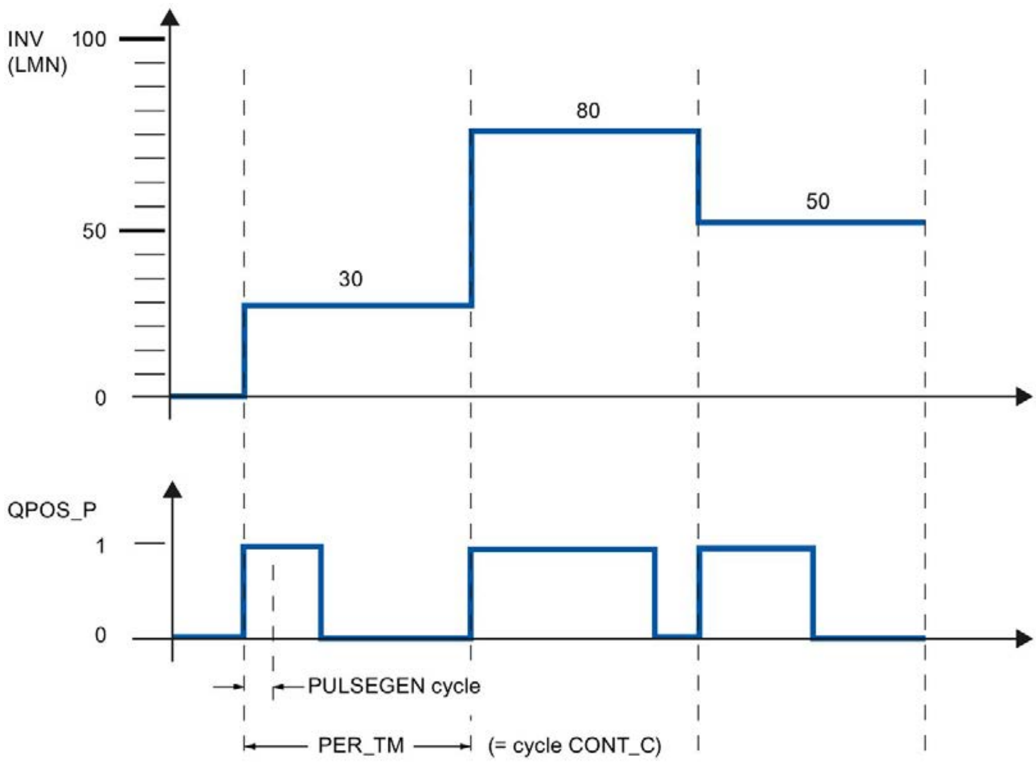
Responses in the event of an error

The error message word RET_VAL is not evaluated by the block.

9.4.3.2 Mode of operation PULSEGEN

Impulse width modulation

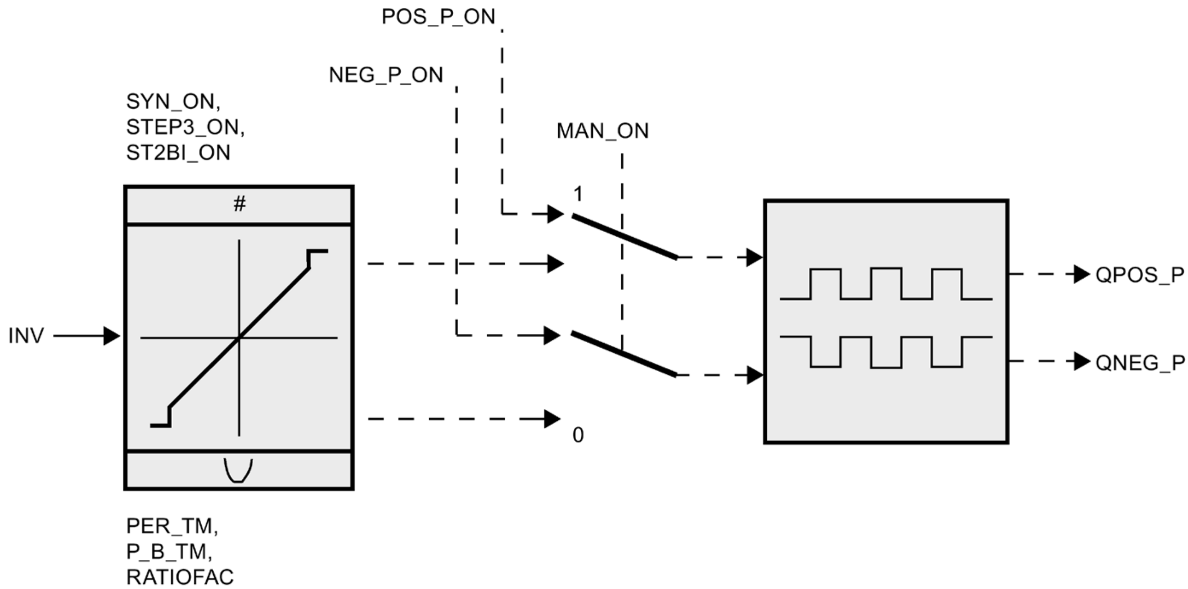
The duration of a pulse per period duration is proportional to the input variable. The cycle assigned via PER_TM is not identical to the processing cycle of the PULSEGEN instruction. Rather, a PER_TM cycle is made up of several processing cycles of the PULSEGEN instruction, whereby the number of PULSEGEN calls per PER_TM cycle determines the accuracy of the pulse width.



An input variable of 30% and 10 PULSEGEN calls per PER_TM mean the following:

- "One" at the QPOS_P output for the first three calls of PULSEGEN (30% of 10 calls)
- "Zero" at the QPOS_P output for seven further calls of PULSEGEN (70% of 10 calls)

Block diagram



Accuracy of the manipulated value

With a "Sampling ratio" of 1:10 (CONT_C calls to PULSEGEN calls) the accuracy of the manipulated value in this example is restricted to 10%, in other words, set input values INV can only be simulated by a pulse duration at the QPOS_P output in steps of 10 %.

The accuracy is increased as the number of PULSEGEN calls per CONT_C call is increased.

If PULSEGEN is called, for example, 100 times more often than CONT_C, a resolution of 1 % of the manipulated value range is achieved.

Note

The reduction ratio of the call frequency must be programmed by the user.

Automatic synchronization

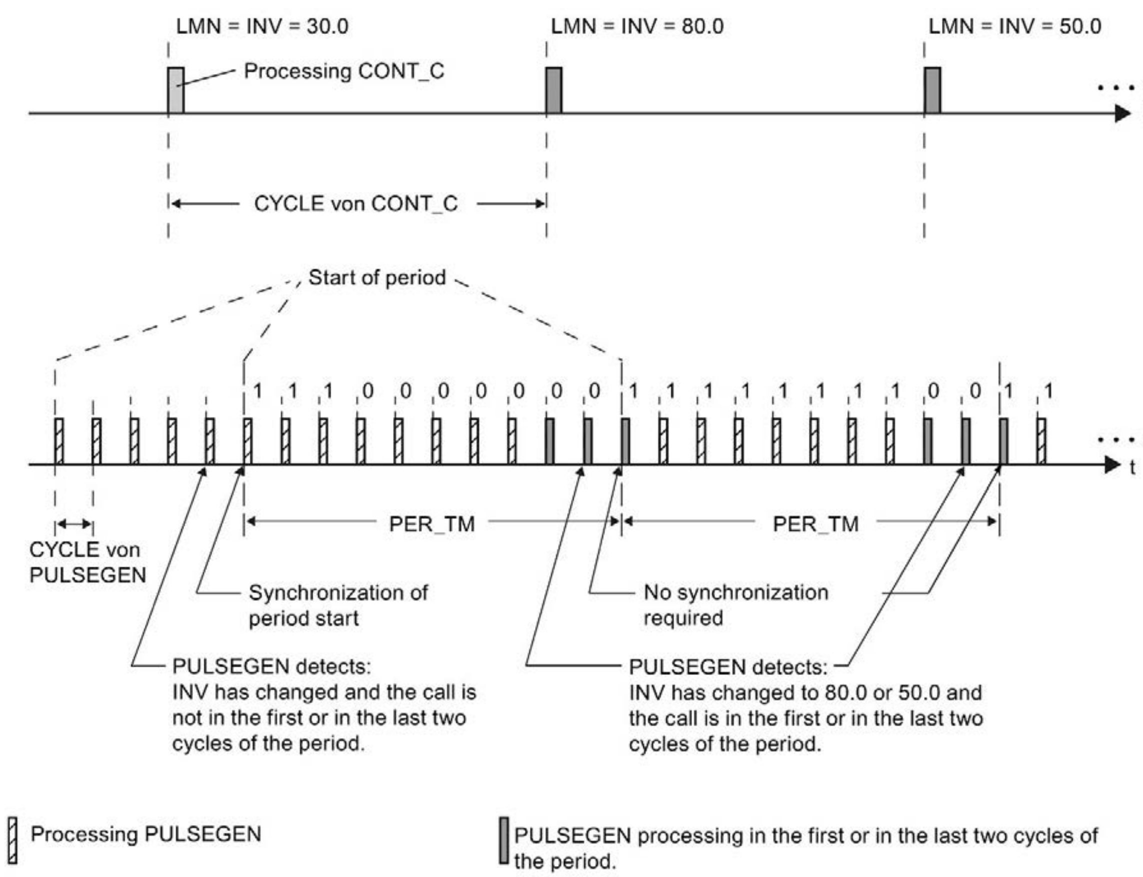
It is possible to automatically synchronize the pulse output with the instruction that updates the input variable INV (e.g. CONT_C). This ensures that a change in the input variable is output as quickly as possible as a pulse.

The pulse shaper evaluates the input value INV at intervals corresponding to the period duration PER_TM and converts the value into a pulse signal of corresponding length.

Since, however, INV is usually calculated in a slower cyclic interrupt class, the pulse shaper should start the conversion of the discrete value into a pulse signal as soon as possible after the updating of INV.

To allow this, the block can synchronize the start of the period using the following procedure:

If INV changes and if the block call is not in the first or last two call cycles of a period, a synchronization is performed. The pulse duration is recalculated and in the next cycle is output with a new period.



The automatic synchronization is switched off, if SYN_ON = FALSE.

Note

The start of a new period and subsequent synchronization usually leads to a certain imprecision when the old value of INV (i.e. of LMN) is mapped to the pulse signal.

9.4.3.3 Mode of operation PULSEGEN

Modes

Depending on the parameters assigned to the pulse shaper, PID controllers with a three-step output or with a bipolar or unipolar two-step output can be configured. The following table illustrates the setting of the switch combinations for the possible modes.

Mode	MAN_ON	STEP3_ON	ST2BI_ON
Three-step control	FALSE	TRUE	Any
Two-step control with bi-polar Manipulating range (-100 % to 100 %)	FALSE	FALSE	TRUE
Two-step control with unipolar Manipulating range (0 % to 100 %)	FALSE	FALSE	FALSE
Manual mode	TRUE	Any	Any

Manual mode in two/three-step control

In the manual mode (MAN_ON = TRUE), the binary outputs of the three-step or two-step controller can be set using the signals POS_P_ON and NEG_P_ON regardless of INV.

Control	POS_P_ON	NEG_P_ON	QPOS_P	QNEG_P
Three-step control	FALSE	FALSE	FALSE	FALSE
	TRUE	FALSE	TRUE	FALSE
	FALSE	TRUE	FALSE	TRUE
	TRUE	TRUE	FALSE	FALSE
Two-step control	FALSE	Any	FALSE	TRUE
	TRUE	Any	TRUE	FALSE

9.4.3.4 Three-step control

Three-step control

In "Three-step control" mode, it is possible to generate three statuses of the actuating signal. For this, the status values of the binary output signals QPOS_P and QNEG_P are assigned to the respective operating statuses of the actuator. The table shows the example of a temperature control:

Output signals	Heat	Off	Cool
QPOS_P	TRUE	FALSE	FALSE
QNEG_P	FALSE	FALSE	TRUE

The pulse duration is calculated from the input variable via a characteristic curve. The form of the characteristic curve is defined by the minimum pulse duration or minimum interval and the ratio factor. The normal value for the ratio factor is 1.

The "doglegs" in the curves are caused by the minimum pulse duration or minimum interval.

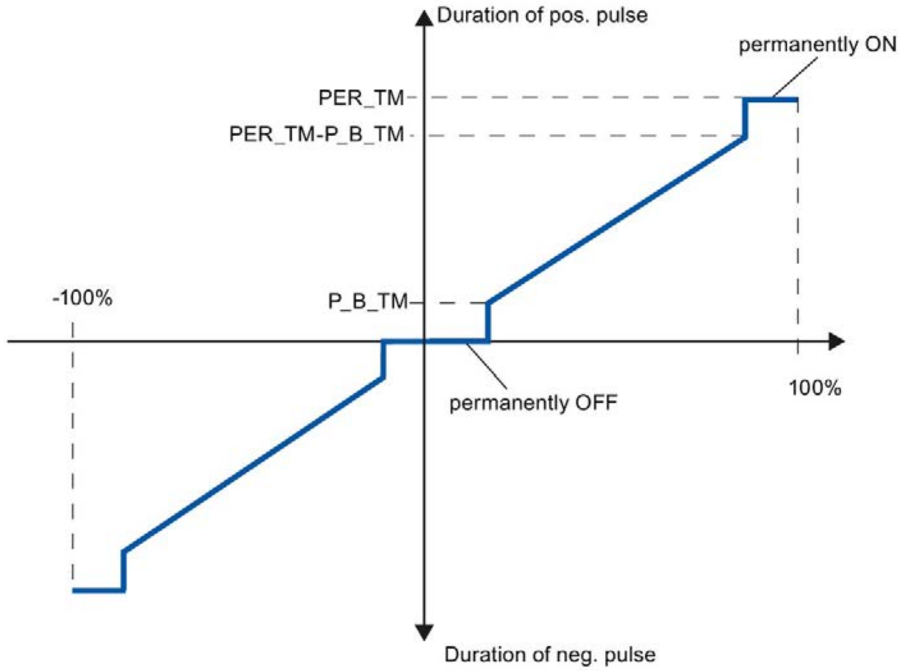
Minimum pulse duration or minimum interval

A correctly assigned minimum pulse duration or minimum interval P_B_TM can prevent short on/off times, which reduce the working life of switching elements and actuators. Small absolute values of input variable LMN that would otherwise generate a pulse duration shorter than P_B_TM are suppressed. Large input values that would generate a pulse duration longer than PER_TM - P_B_TM are set to 100% or -100%.

The duration of positive or negative pulses is calculated by multiplying the input variable (in %) by the period duration:

Pulse duration = INV / 100 * PER_TM

The following figure shows a symmetrical characteristic curve of the three-step controller (ratio factor = 1).



Asymmetrical three-step control

Using the ratio factor RATIOFAC, the ratio of the duration of positive to negative pulses can be changed. In a thermal process, for example, this would allow different system time constants for heating and cooling.

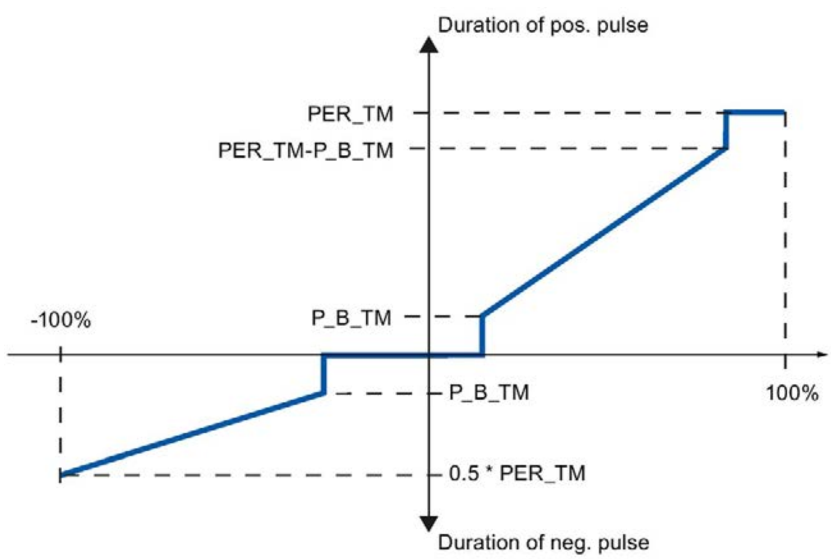
Ratio factor < 1

The pulse duration at the negative pulse output, calculated by multiplying the input variable by the period duration, is multiplied by the ratio factor.

Positive pulse duration = INV /100 * PER_TM

Negative pulse duration = INV / 100 * PER_TM * RATIOFAC

The following figure shows the asymmetrical characteristic curve of the three-step controller (ratio factor = 0.5):



Ratio factor > 1

The pulse duration at the positive pulse output, calculated by multiplying the input variable by the period duration, is divided by the ratio factor.

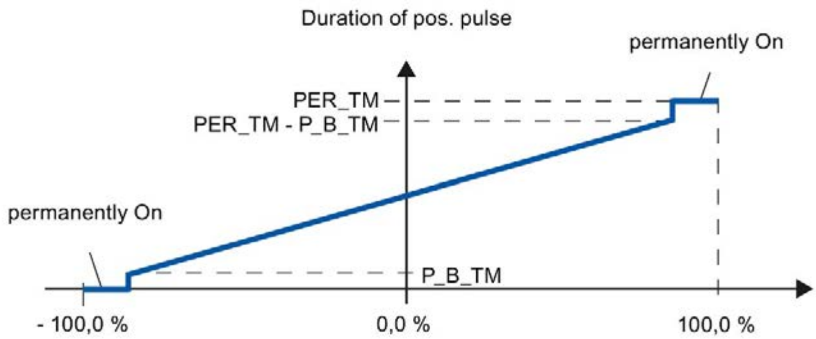
Positive pulse duration = INV / 100 * PER_TM / RATIOFAC

Negative pulse duration = INV / 100 * PER_TM

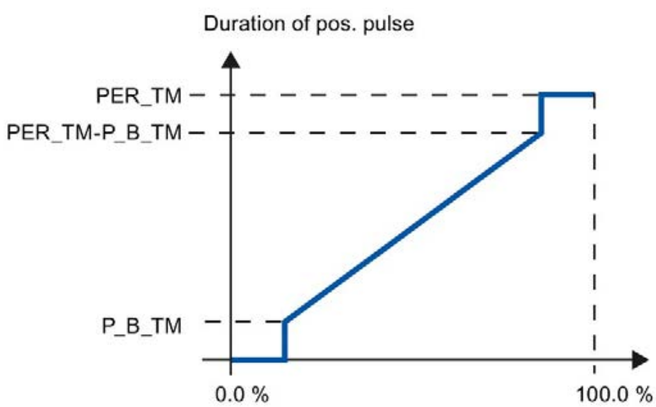
9.4.3.5 Two-step control

In two-step control, only the positive pulse output QPOS_P of PULSEGEN is connected to the on/off actuator. Depending on the manipulated value range used, the two-step controller has a bipolar or a unipolar manipulated value range.

Two-step control with bipolar manipulated variable range (-100% to 100%)



Two-step control with unipolar manipulated variable range (0% to 100%)



The negated output signal is available at QNEG_P if the connection of the two-step controller in the control loop requires a logically inverted binary signal for the actuating pulses.

Pulse	Actuator On	Actuator Off
QPOS_P	TRUE	FALSE
QNEG_P	FALSE	TRUE

9.4.3.6 Input parameters PULSEGEN

The values of the input parameters are not limited in the block. There is no parameter check.

Table 9- 17 Input parameters PULSEGEN

Parameters	Data type	Default	Description
INV	REAL	0.0	At the input parameter "Input variable" an analog manipulated variable is connected. Values from -100 to 100 % are permitted.
PER_TM	TIME	T#1s	At the parameter "Period duration" the constant period duration of the pulse width modulation is entered. This corresponds to the sampling time of the controller. The ratio between the sampling time of the pulse shaper and the sampling time of the controller determines the accuracy of the pulse width modulation. PER_TM >=20*CYCLE
P_B_TM	TIME	T#50 ms	You can assign a minimum pulse/break time at the parameter "Minimum pulse/break time". P_B_TM >= CYCLE
RATIOFAC	REAL	1.0	Using the "Ratio factor" input parameter the ratio of the duration of positive to negative pulses can be changed. In a thermal process, this would, for example, allow different time constants for heating and cooling to be compensated (for example, in a process with electrical heating and water cooling). Values from 0.1 to 10.0 are permitted.
STEP3_ON	BOOL	TRUE	At the input parameter "Enable three-step control" the appropriate mode is activated. In three-step control both output signals are active.
ST2BI_ON	BOOL	FALSE	At the input parameter "Enable two-step control for bipolar manipulated value range" you can select from the modes "Two-step control for bipolar manipulated value range" and "Two-step control for unipolar manipulated value range". STEP3_ON = FALSE is required.
MAN_ON	BOOL	FALSE	Setting the input parameter "Enable manual mode" allows the output signals to be set manually.
POS_P_ON	BOOL	FALSE	For manual mode three-step control, the output signal QPOS_P can be operated on the input parameter "Positive pulse on". In manual mode with two-step control, QNEG_P is always set inversely to QPOS_P.
NEG_P_ON	BOOL	FALSE	For manual mode three-step control, the output signal QNEG_P can be operated on the input parameter "Negative pulse on". In manual mode with two-step control, QNEG_P is always set inversely to QPOS_P.
SYN_ON	BOOL	TRUE	By setting the input parameter "Enable synchronization", it is possible to synchronize the pulse output automatically with the block that updates the input variable INV. This ensures that a change in the input variable is output as quickly as possible as a pulse.
COM_RST	BOOL	FALSE	The block has an initialization routine that is processed when the input "Restart" is set.
CYCLE	TIME	T#10ms	The time between block calls must be constant. The "Sampling time" input specifies the time between block calls. CYCLE >= 1ms

9.4.3.7 Output parameter PULSEGEN

Table 9- 18 Output parameter PULSEGEN

Parameters	Data type	Default	Description
QPOS_P	BOOL	FALSE	The output parameter "Output signal positive pulse" is set if a pulse will be output. In three-step control, this is always the positive pulse. In two-step control, the QNEG_P is always set inversely to QPOS_P.
QNEG_P	BOOL	FALSE	The output parameter "Output signal negative pulse" is set if a pulse will be output. In three-step control, this is always the negative pulse. In two-step control, QNEG_P is always set inversely to QPOS_P.

9.4.4 TCONT_CP

9.4.4.1 Description TCONT_CP

The instruction TCONT_CP is used to control temperature processes with continuous or pulsed control signals. The controller functionality is based on the PID control algorithm with additional functions for temperature processes. To improve the control response with temperature processes, the block includes a control zone and reduction of the proportional component if there is a setpoint step change.

The instruction can set the PI/PID parameters itself using the controller optimization function.

Application

The controller controls one actuator; in other words, with one controller you can either heat or cool but not both. If you use the block for cooling, GAIN must be assigned a negative value. This inversion of the controller means that if the temperature rises, for example, the manipulated variable LMN and with it the cooling action is increased.

Call

The instruction TCONT_CP must be called equidistant. To achieve this, use a cyclic interrupt priority class (for example, OB35 for an S7-300).

The TCONT_CP instruction has an initialization routine that is run through when input parameter COM_RST = TRUE is set. During initialization, the integral action is set to the initialization value I_ITVAL. All the signal outputs are set to zero. Following execution of the initialization routine, the block sets COM_RST back to FALSE. If you require initialization when the CPU restarts, call the block in OB100 with COM_RST = TRUE.

If you call the instruction TCONT_CP as a multiple instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for TCONT_CP directly in the multiple instance DB and commission it via a watch table.

Operating principle of the pulse generator (Page 499)

Block diagram TCONT_CP (Page 502)

9.4.4.2 Mode of operation TCONT_CP

Setpoint branch

The setpoint is entered at input SP_INT in floating-point format as a physical value or percentage. The setpoint and process value used to form the control deviation must have the same unit.

Process value options (PVPER_ON)

Depending on PVPER_ON, the process value can be read in, in the I/O or floating-point format.

PVPER_ON	Process Value Input
TRUE	The process value is read in via the analog I/Os (PIW xxx) at input PV_PER.
FALSE	The process value is acquired in floating-point format at input PV_IN.

Process value format conversion CRP_IN (PER_MODE)

The CRP_IN function converts the I/O value PV_PER to floating-point format depending on the PER_MODE switch according to the following rules:

PER_MODE	Output of CRP_IN	Analog Input Type	Unit
0	PV_PER * 0.1	Thermoelements; PT100/NI100; standard	°C;°F
1	PV_PER * 0.01	PT100/NI100; climate;	°C;°F
2	PV_PER * 100/27648	Voltage/current	%

Process value scaling PV_NORM (PF_FAC, PV_OFFS)

The PV_NORM function calculates the output of CRP_IN according to the following rule:

"Output of PV_NORM" = "Output of CRP_IN)" * PV_FAC + PV_OFFS

It can be used for the following purposes:

- Process value adjustment with PV_FAC as process value factor and PV_OFFS as process value offset.
- Scaling of temperature to percentage

  You want to enter the setpoint as a percentage and must now convert the measured temperature value to a percentage.
- Scaling of percentage to temperature

  You want to enter the setpoint in the physical temperature unit and must now convert the measured voltage/current value to a temperature.

Calculation of the parameters:

- PV_FAC = range of PV_NORM/range of CRP_IN;
- PV_OFFS = LL (PV_NORM) - PV_FAC * LL(CRP_IN);

  where LL: Low limit

The scaling is switched off with the default values (PV_FAC = 1.0 and PV_OFFS = 0.0). The effective process value is output at the PV output.

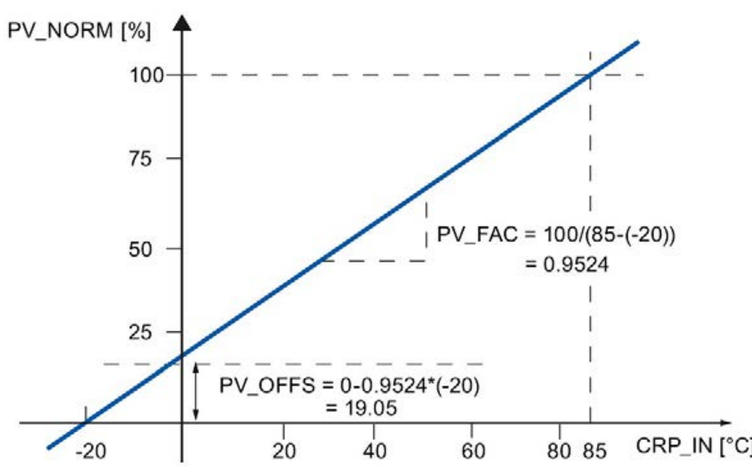
Note

With pulse control, the process value must be transferred to the block in the fast pulse call (reason: mean value filtering). Otherwise, the control quality can deteriorate.

Example of Process Value Scaling

If you want to enter the setpoint as a percentage, and you have a temperature range of -20 to 85 °C applied to , CRP_IN you must normalize the temperature range as a percentage.

The diagram below shows an example of adapting the temperature range -20 to 85 °C to an internal scale of 0 to 100 %:



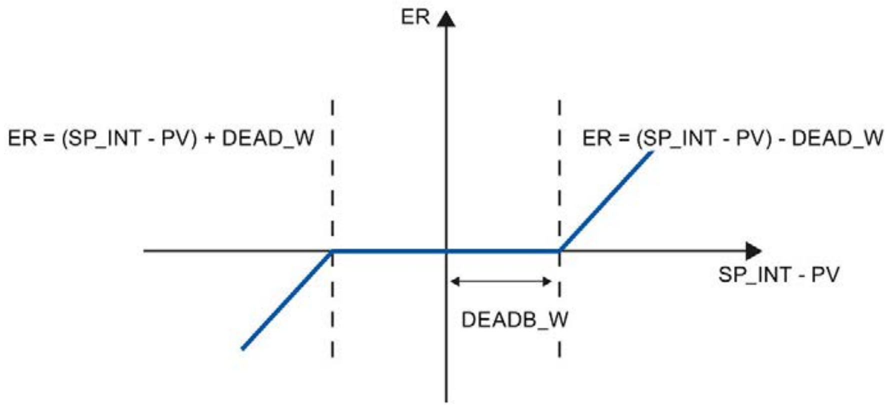
Forming the control deviation

The difference between the setpoint and process value is the control deviation before the dead band.

The setpoint and process value must exist in the same unit.

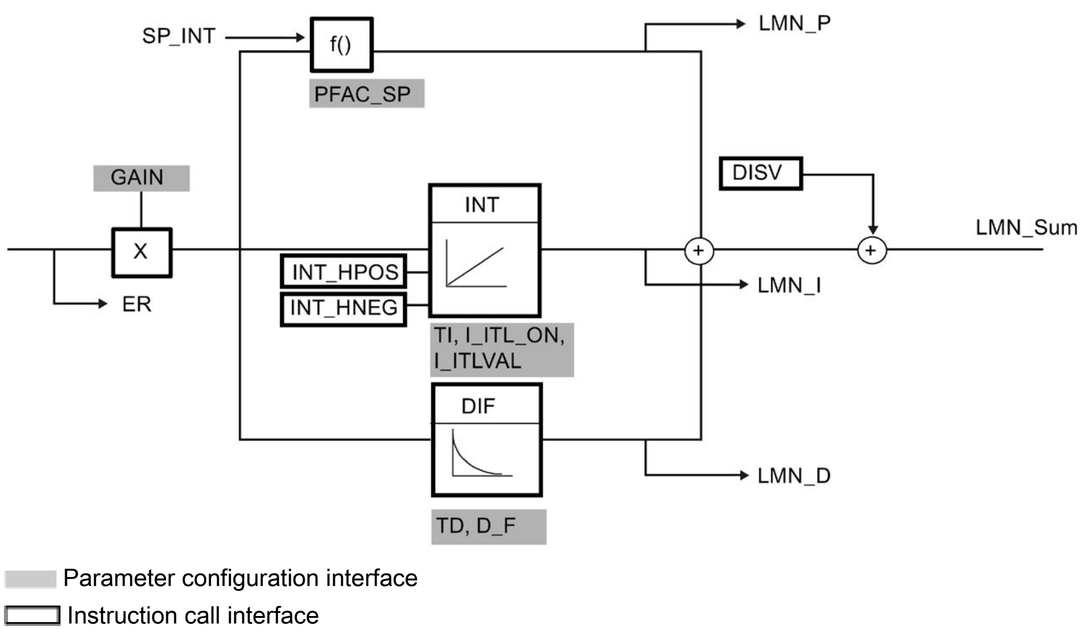
Dead band (DEADB_W)

To suppress a minor sustained oscillation due to the manipulated variable quantization (for example, in pulse width modulation with PULSEGEN) a dead band is applied to the (DEADBAND) control deviation. With DEADB_W = 0.0, the dead band is disabled. The effective control deviation is indicated by the ER parameter.



PID Algorithm

The following figure shows the block diagram of the PID algorithm.



PID Algorithm (GAIN, TI, TD, D_F)

The PID algorithm operates as a position algorithm. The proportional, integral (INT), and derivative (DIF) actions are connected in parallel and can be activated or deactivated individually. This allows P, PI, PD, and PID controllers to be configured.

Controller tuning supports PI and PID controllers. Controller inversion is implemented using a negative GAIN (cooling controller).

If you set TI and TD to 0.0, you obtain a pure P controller at the operating point.

The step response in the time range is:

$$LMN\_Sum(t) = GAIN \cdot ER(0) \cdot \left(1 + \frac{1}{TI} \cdot t + D\_F \cdot e^{\frac{-t}{TD / D\_F}} \right)$$

Where:

LMN_Sum(t) the manipulated variable in the controller's automatic mode

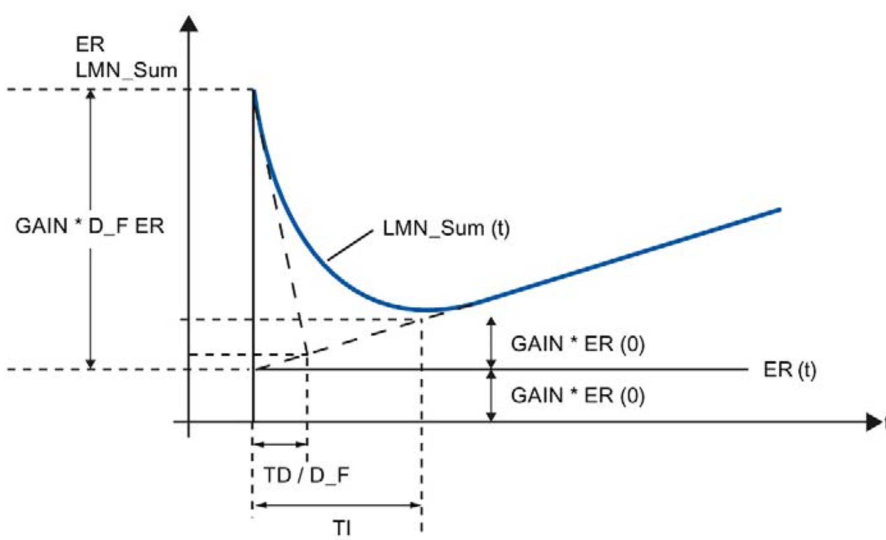
ER (0) is the step height of the normalized control deviation

GAIN is the controller gain

TI is the integration time

TD is the derivative action time

D_F is the derivative factor



Integral action (TI, I_ITL_ON, I_ITLVAL)

In manual mode, it is corrected as follows: LMN_I = LMN - LMN_P - DISV.

If the output value is limited, the integral action is halted. If the control deviation moves the integral action back in the direction of the output range, the integral action is enabled again.

The integral action is also modified by the following measures:

- The integral action of the controller is deactivated by TI = 0.0
- Weakening of the proportional action when setpoint changes occur
- Control zone
- The output value limits can be modified online

Weakening of the proportional action when setpoint changes occur (PFAC_SP)

To prevent overshoot, you can weaken the proportional action using the parameter "Proportional factor for setpoint changes" (PFAC_SP). Using PFAC_SP, you can select continuously between 0.0 and 1.0 to decide the effect of the proportional action when the setpoint changes:

- PFAC_SP = 1.0: Proportional action has full effect if the setpoint changes
- PFAC_SP = 0.0: Proportional action has no effect if the setpoint changes

The weakening of the proportional action is achieved by compensating the integral action.

Derivative action (TD, D_F)

- The derivative action of the controller is deactivated by TD = 0.0
- If the derivative action is active, the following relationship should apply:

  TD = 0.5 * CYCLE * D_F

Parameter Settings of a P or PD Controller with Operating Point

In the user interface, deactivate the integral action (TI = 0.0) and possibly also the derivative action (TD = 0.0). Then make the following parameter settings:

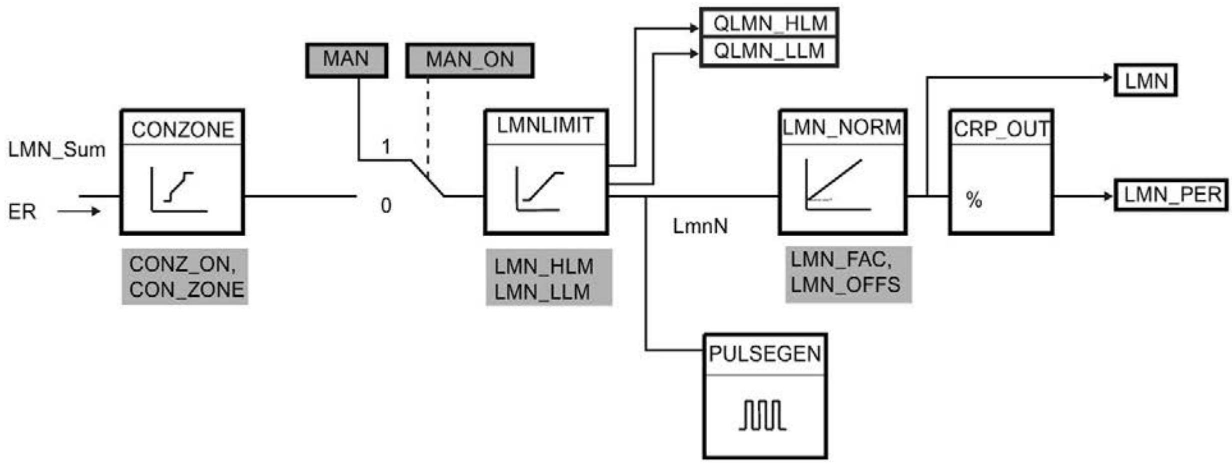
- I_ITL_ON = TRUE
- I_ITLVAL = operating point;

Feedforward control (DISV)

A disturbance variable can be added at the DISV input.

Calculating the output value

The diagram below is the block diagram of the output value calculation:



Parameter configuration interface
Instruction call interface
Parameter configuration interface, call interface

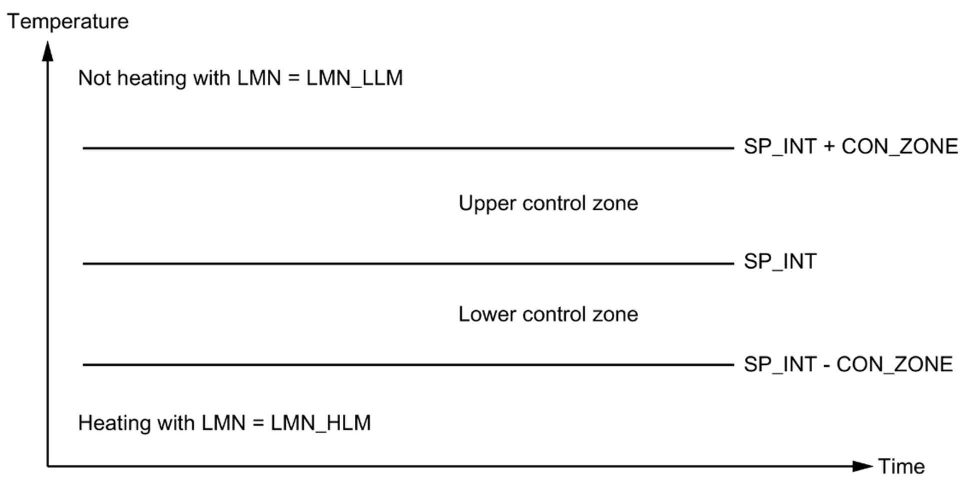
Control zone (CONZ_ON, CON_ZONE)

If CONZ_ON = TRUE, the controller operates with a control zone. This means that the controller operates according to the following algorithm:

- If process value PV exceeds the setpoint SP_INT by more than CON_ZONE, the value LMN_LLM is output as the manipulated variable.
- If the process value PV falls below setpoint SP_INT by more than CON_ZONE, LMN_HLM is output.
- If the process value PV is within the control zone (CON_ZONE), the output value takes its value from the PID algorithm LMN_Sum.

Note

Changing the manipulated variable from LMN_LLM or LMN_HLM to LMN_Sum occurs under compliance of a hysteresis of 20% of the control zone.



Note

Before enabling the control zone manually, make sure that the control zone band is not too narrow. If the control zone band is too small, oscillations will occur in the manipulated variable and process value.

Advantage of the Control Zone

When the process value enters the control zone, the D-action causes an extremely fast reduction of the manipulated variable. This means that the control zone is only useful when the D-action is activated. Without a control zone, only the reducing P-action would essentially reduce the manipulated variable. The control zone leads to faster settling without overshoot or undershoot if the output minimum or maximum manipulated variable is a long way from the manipulated variable required for the new operating point.

Manual value processing (MAN_ON, MAN)

You can change over between manual and automatic mode. In manual mode, the manipulated variable is corrected to a manually selected value.

The integral action (INT) is set internally to LMN - LMN_P - DISV and the derivative action (DIF) is set to 0 and synchronized internally. Changeover to automatic mode is therefore bumpless.

Note

The MAN_ON parameter has no effect during tuning.

Output value limit LMNLIMIT (LMN_HLM, LMN_LLM)

The LMNLIMIT function is used to limit the output value to the limits LMN_HLM and LMN_LLM. If these limits are reached, this is indicated by the message bits QLMN_HLM and QLMN_LLM.

If the output value is limited, the integral action is halted. If the control deviation moves the integral action back in the direction of the output range, the integral action is enabled again.

Changing the Manipulated Value Limits Online

If the range of the output value is reduced and the new unlimited value of the output value is outside the limits, the integral action and therefore the output value shifts.

The output value is reduced by the same amount as the output value limit changed. If the output value was unlimited prior to the change, it is set exactly to the new limit (described here for the high output value limit).

Scaling of output value LMN_NORM (LMN_FAC, LMN_OFFS)

The LMN_NORM function normalizes the output value according to the following rule:

LMN = LmnN * LMN_FAC + LMN_OFFS

It can be used for the following purposes:

- Output value scaling with LMN_FAC as output value factor and LMN_OFFS as output value offset.

The output value is also available in I/O format. The CRP_OUT function converts the LMN floating-point value to an I/O value according to the following rule:

LMN_PER = LMN * 27648/100

The scaling is switched off with the default values (LMN_FAC = 1.0 and LMN_OFFS = 0.0). The effective output value is sent to output LMN.

Save controller parameters SAVE_PAR

If you classify the current controller parameters as utilizable, you can save these before a manual change in structure parameters provided specifically for this in the instance DB of the instruction TCONT_CP. If you optimize the controller, the saved parameters are overwritten by the values that were valid prior to tuning.

PFAC_SP, GAIN, TI, TD, D_F, CONZ_ON and CONZONE are written to the structure PAR_SAVE.

Reloading Saved Controller Parameters UNDO_PAR

The last controller parameter settings you saved can be activated for the controller again using this function (in manual mode only).

Change between PI and PID parameters LOAD_PID (PID_ON)

Following tuning, the PI and PID parameters are stored in the PI_CON and PID_CON structures. Depending on PID_ON, you can use LOAD_PID in manual mode to write the PI or PID parameters to the effective controller parameters.

PID parameters PID_ON = TRUE	PI parameters PID_ON = FALSE
• GAIN = PID_CON.GAIN • TI = PID_CON.TI • TD = PID_CON.TD	• GAIN = PI_CON.GAIN • TI = PI_CON.TI

Note

The controller parameters are only written back to the controller with UNDO_PAR or LOAD_PID, if the controller gain is not equal to 0:

With LOAD_PID, the parameters are only copied if the corresponding GAIN <> 0 is (either the PI or PID parameters). This strategy takes into account the situation that no tuning has yet been made or that PID parameters are missing. If PID_ON = TRUE and PID.GAIN = FALSE, PID_ON is set to FALSE and the PI parameter is copied.

- D_F, PFAC_SP are preset by the the tuning. These can then be modified by the user. LOAD_PID does not change these parameters.
- With LOAD_PID, the control zone is always recalculated (CON_ZONE = 250/GAIN), even if CONZ_ON = FALSE.

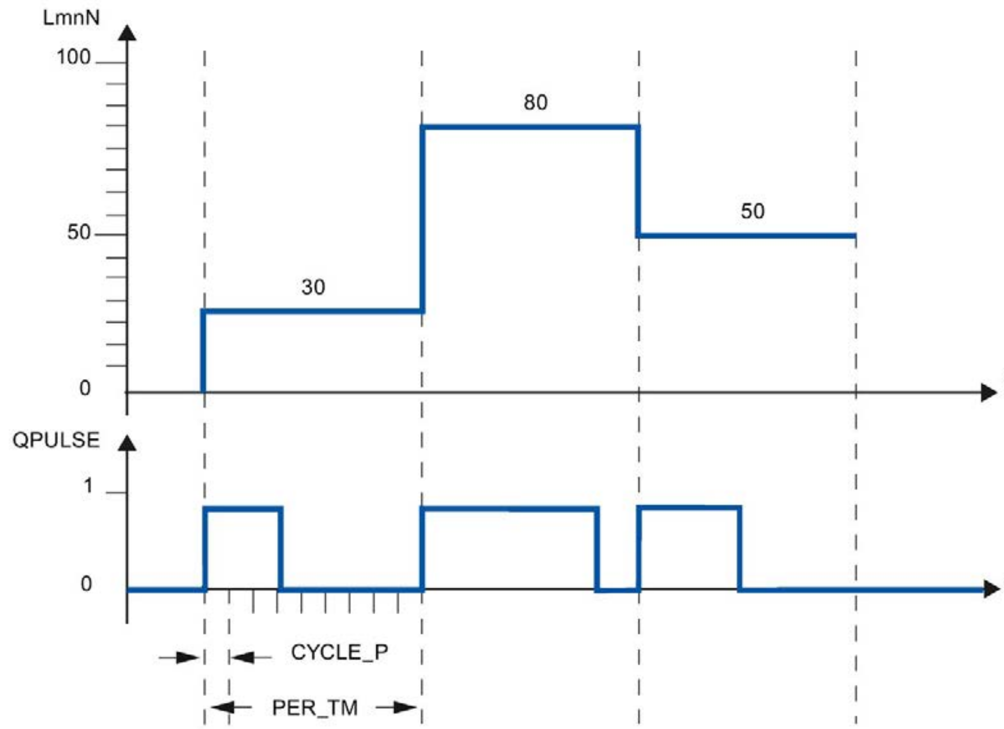
Operating principle of the pulse generator (Page 499)

Block diagram TCONT_CP (Page 502)

9.4.4.3 Operating principle of the pulse generator

The function PULSEGEN transforms the analog manipulated value LmnN through pulse width module into an impulse sequence with the period duration PER_TM. PULSEGEN is switched on with PULSE_ON = TRUE and is processed in the cycle CYCLE_P.



A manipulated value of LmnN = 30% and 10 PULSEGEN calls per PER_TM therefore means:

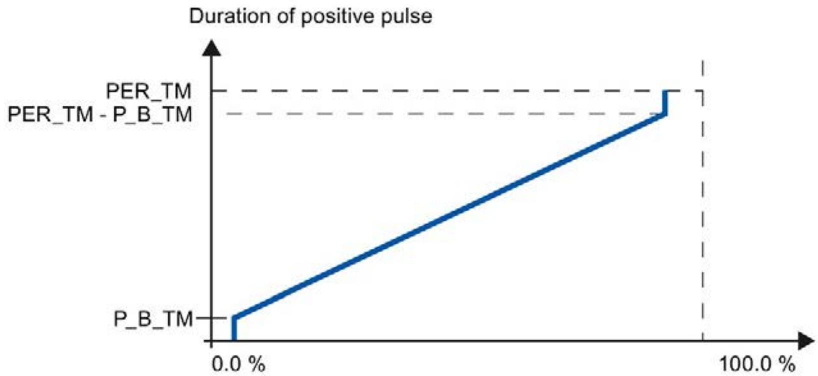
- TRUE at output QPULSE for the first three PULSEGEN calls
  (30% of 10 calls)
- FALSE at output QPULSE for seven further PULSEGEN calls
  (70% of 10 calls)

The duration of a pulse per pulse repetition period is proportional to the manipulated variable and is calculated as follows:

Pulse duration = PER_TM * LmnN /100

By suppressing the minimum pulse or break time, the characteristic curve of the conversion develops "knees" in the start and end regions.

The following diagram illustrates two-step control with a unipolar manipulated variable range (0% to 100%):



Minimum pulse or minimum break time (P_B_TM)

Short on or off times hinder the lifespan of actuators and fine controlling units. These can be avoided by setting a minimum pulse duration or minimum break time P_B_TM.

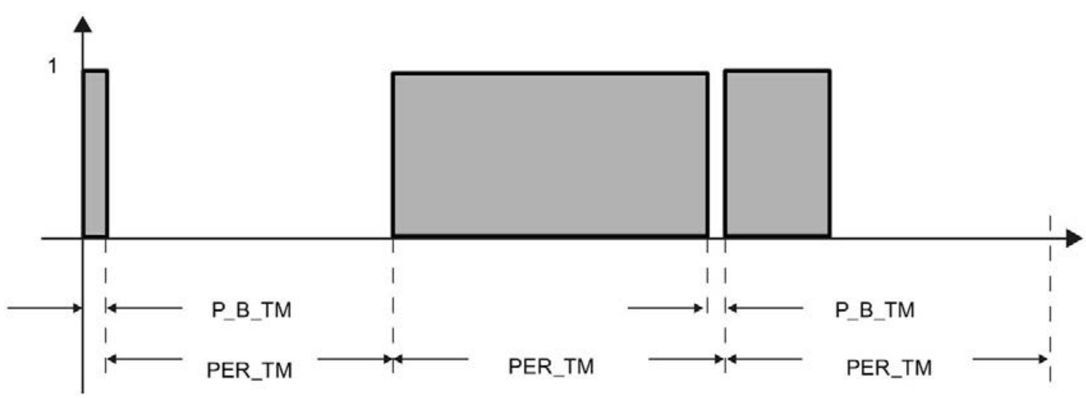
Small absolute values at the input variable LmnN that could otherwise generate a pulse duration shorter than P_B_TM are suppressed.

Large input values that would generate a pulse duration greater than PER_TM - P_B_TM are set to 100%. This reduces the dynamics of pulse generation.

Set values of P_B_TM ≤ 0,1 * PER_TM are recommended for the minimum pulse duration and the minimum break duration.

The "knees" in the curves in the diagram above are caused by the minimum pulse or minimum break times.

The following schematic illustrates the switching response of the pulse output:



Accuracy of pulse generation

The smaller the pulse generator CYCLE_P is compared to the period duration PER_TM, the more precise the pulse width modulation is. To achieve sufficiently accurate control, the following relationship should apply:

CYCLE_P ≤ PER_TM/50

The manipulated value is transformed with a resolution of ≤ 2 % into an impulse.

Note

When calling the controller in the pulse shaper cycle, you must note the following:

Calling the controller in the pulse shaper cycle will cause the process value to be averaged. As a result, at output PV, different values may be at input PV_IN and PV_PER. If you want to track the setpoint value, you must save the process value at input parameter PV_IN at the call times for complete controller processing (QC_ACT = TRUE). For pulse shaper calls occurring between these times, you must supply the input parameters PV_IN and SP_INT with the saved process value.

9.4.4.5 Input parameters TCONT_CP

Table 9- 19 Input parameters TCONT_CP

Parameters	Address	Data type	Default	Description
PV_IN	0.0	REAL	0.0	At the "Process value input" you can assign parameters to a commissioning value or you can interconnect an external process value in floating-point format. The valid values depend on the sensors used.
PV_PER	4.0	INT	0	The process value in I/O format is interconnected with the controller at the "Process value I/O" input.
DISV	6.0	REAL	0.0	For feedforward control, the disturbance variable is interconnected to the "Disturbance variable" input.
INT_HPOS	10.0	BOOL	FALSE	The output of the integral action can be held in the positive direction. For this, the input INT_HPOS must be set to TRUE. In a cascade control, INT_HPOS of the primary controller is connected to QLMN_HLM of the secondary controller.
INT_HNEG	10.1	BOOL	FALSE	The output of the integral action can be held in the negative direction. For this, the input INT_HNEG must be set to TRUE. In a cascade control, INT_HNEG of the primary controller is connected to QLMN_LLM of the secondary controller.
SELECT	12.0	INT	0	If the pulse shaper is on, there are several ways of calling the PID algorithm and pulse shaper: • SELECT = 0: The controller is called in a fast cyclic interrupt priority class and the PID algorithm and pulse shaper are processed. • SELECT = 1: The controller is called in OB1 and only the PID algorithm is processed. • SELECT = 2: The controller is called in a fast cyclic interrupt priority class and only the pulse shaper is processed. • SELECT = 3: The controller is called a slow cyclic interrupt priority class and only the PID algorithm is processed.

9.4.4.6 Output parameters TCONT_CP

Table 9- 20 Output parameters TCONT_CP

Parameter	Ad-dress	Data type	Default	Description
PV	14.0	REAL	0.0	The effective process value is output at the "Process value" output. The valid values depend on the sensors used.
LMN	18.0	REAL	0.0	The effective "Manipulated value" is output in floating point format at the "Manipulated value" output.
LMN_PER	22.0	INT	0	The manipulated value in I/O format is interconnected with the controller on the output "Manipulated value I/O".
QPULSE	24.0	BOOL	FALSE	The manipulated value is pulse-width-modulated at the QPULSE output.
QLMN_HLM	24.1	BOOL	FALSE	The manipulated value is always restricted to a high limit and low limit. The output QLMN_HLM signals that the high limit has been reached.
QLMN_LLM	24.2	BOOL	FALSE	The manipulated value is always restricted to a high limit and low limit. The output QLMN_LLM signals that the low limit has been reached.
QC_ACT	24.3	BOOL	TRUE	This parameter indicates whether continuous control component will be processed the next time the block is called (relevant only when SELECT has the value 0 or 1).

9.4.4.7 In/out parameters TCONT_CP

Table 9- 21 In/out parameters TCONT_CP

Parameters	Ad-dress	Data type	Default	Description
CYCLE	26.0	REAL	0.1 s	Sets the sampling time for the PID algorithm. In phase 1, the tuner calculates the sampling time and enters it in CYCLE. CYCLE > 0.001 s
CYCLE_P	30.0	REAL	0.02 s	At this input, you set the sampling time for the pulse shaper action. In phase 1, the TCONT_CP instruction calculates the sampling time and enters it in CYCLE_P. CYCLE_P > 0.001 s
SP_INT	34.0	REAL	0.0	The input "Internal setpoint" is used to specify a setpoint. The valid values depend on the sensors used.
MAN	38.0	REAL	0.0	The "Manual value" input is used to set a manual value. In automatic mode, it tracks the manipulated value.
COM_RST	42.0	BOOL	FALSE	The block has an initialization routine that is processed when the COM_RST input is set.
MAN_ON	42.1	BOOL	TRUE	If the input "Enable manual mode" is set then the control loop is interrupted. The manual value MAN is set as manipulated value.

9.4.4.8 Static variables TCONT_CP

Table 9- 22 Static variables TCONT_CP

Parameters	Address	Data type	Default	Description
DEADB_W	44.0	REAL	0.0	A deadband is applied to the control deviation. The "Deadband width" input determines the size of the deadband. The valid values depend on the sensors used.
I_ITLVAL	48.0	REAL	0.0	The output of the integrator can be set at the I_ITL_ON input. The initialization value is applied to the "Initialization value of the I-action" input. During a restart COM_RST = TRUE, the I-action is set to the initialization value. Values from -100 to 100 % are permitted.
LMN_HLM	52.0	REAL	100.0	The output value is always restricted to a high limit and low limit. The "Manipulated value high limit" input specifies the high limit. LMN_HLM > LMN_LLM
LMN_LLM	56.0	REAL	0.0	The output value is always restricted to a high limit and low limit. The "Manipulated value low limit" input specifies the low limit. LMN_LLM < LMN_HLM
PV_FAC	60.0	REAL	1.0	The "Process value factor" input is multiplied by the "Process value I/O". The input is used to scale the process value range.
PV_OFFS	64.0	REAL	0.0	The "Process value offset" input is added to the "Process value I/O". The input is used to scale the process value range.
LMN_FAC	68.0	REAL	1.0	The "Output value factor" input is multiplied with the output value. The input is used to scale the output value range.
LMN_OFFS	72.0	REAL	0.0	The "Output value offset" input is added to the output value. The input is used to scale the output value range.
PER_TM	76.0	REAL	1.0 s	The period duration of the pulse width modulation is entered at the PER_TM parameter. The relationship of the period duration to the sampling time of the pulse shaper determines the accuracy of the pulse width modulation. PER_TM ≥ CYCLE
P_B_TM	80.0	REAL	0.02 s	You can assign a minimum pulse or break time at the parameter "Minimum pulse/break time". P_B_TM is internally limited to > CYCLE_P.
TUN_DLMN	84.0	REAL	20.0	Process excitation for controller tuning results from a output value step change at TUN_DLMN. Values from -100 to 100 % are permitted.

Parameters	Address	Data type	Default	Description
PER_MODE	88.0	INT	0	You can use this switch to enter the type of I/O module. The process value at input PV_PER is then scaled as follows at the PV output. • PER_MODE = 0: Thermoelements; PT100/NI100; standard PV_PER * 0.1 Unit: °C, °F • PER_MODE = 1: PT100/NI100; climate PV_PER * 0.01 Unit: °C, °F • PER_MODE = 2: Current/voltage PV_PER * 100/27648 Unit: %
PVPER_ON	90.0	BOOL	FALSE	If the process value is to be read in from the I/Os, the PV_PER input must be interconnected with the I/Os and the "Enable process value I/Os" input must be set.
I_ITL_ON	90.1	BOOL	FALSE	The output of the integrator can be set at the I_ITLVAL input. The "Set I-action" input must be set for this.
PULSE_ON	90.2	BOOL	FALSE	If PULSE_ON = TRUE is set, the pulse shaper is activated.
TUN_KEEP	90.3	BOOL	FALSE	The mode changes to automatic only when TUN_KEEP changes to FALSE.
ER	92.0	REAL	0.0	The effective control deviation is output at the "Control deviation" output. The valid values depend on the sensors used.
LMN_P	96.0	REAL	0.0	The "P-action" output contains the proportional action of the manipulated tag.
LMN_I	100.0	REAL	0.0	The "integral action" output contains the integral action of the manipulated tag.
LMN_D	104.0	REAL	0.0	The "D-action" output contains the derivative action of the manipulated tag.
PHASE	108.0	INT	0	The current phase of controller tuning is indicated at the PHASE output. • PHASE = 0: No tuning mode; automatic or manual mode • PHASE = 1: Ready to start tuning; check parameters, wait for excitation, measure the sampling times • PHASE = 2: Actual tuning: Searching for point of inflection with constant output value. Entering the sampling time in instance DB. • PHASE = 3: Calculating process parameters. Saving valid controller parameters prior to tuning. • PHASE = 4: Controller design • PHASE = 5: Following up the controller to the new manipulated tag • PHASE = 7: Validating the process type
STATUS_H	110.0	INT	0	STATUS_H indicates the diagnostic value via the search for the point of inflection during the heating process.
STATUS_D	112.0	INT	0	STATUS_D indicates the diagnostic value via the controller design during the heating process.

Parameters	Address	Data type	Default	Description
QTUN_RUN	114.0	BOOL	0	The tuning manipulated tag has been applied, tuning has started and is still in phase 2 (searching for point of inflection).
PI_CON	116.0	STRUCT		PI controller parameters
GAIN	+0.0	REAL	0.0	PI controller gain %/phys. unit
TI	+4.0	REAL	0.0 s	PI integration time [s]
PID_CON	124.0	STRUCT		PID controller parameters
GAIN	+0.0	REAL	0.0	PID controller gain
TI	+4.0	REAL	0.0s	PID integration time [s]
TD	+8.0	REAL	0.0s	PID derivative action time [s]
PAR_SAVE	136.0	STRUCT		The PID parameters are saved in this structure.
PFAC_SP	+0.0	REAL	1.0	Proportional factor for setpoint changes Values from 0.0 to 1.0 are permitted.
GAIN	+4.0	REAL	0.0	Controller gain %/phys. unit
TI	+8.0	REAL	40.0 s	Integration time [s]
TD	+12.0	REAL	10.0 s	Derivative action time (s)
D_F	+16.0	REAL	5.0	Derivative factor Values from 5.0 to 10.0 are permitted.
CON_ZONE	+20.0	REAL	100.0	Control zone band If the control deviation is greater than the control zone band, the high output value limit is output as output value. If the control deviation is less than the negative control zone band, the low output value limit is output as the output value. CON_ZONE ≥ 0.0
CONZ_ON	+24.0	BOOL	FALSE	Enable control zone
PFAC_SP	162.0	REAL	1.0	PFAC_SP specifies the effective P-action when there is a setpoint change. This is set between 0 and 1. • 1: P-action has full effect if the setpoint changes. • 0: P-action has no effect if the setpoint changes. Values from 0.0 to 1.0 are permitted.
GAIN	166.0	REAL	2.0	The "Proportional gain" input specifies controller amplification. The direction of control can be reversed by giving GAIN a negative sign. %/phys. unit
TI	170.0	REAL	40.0 s	The "Integration time" (integral-action time) input defines the integrator's time response.
TD	174.0	REAL	10.0 s	The "Derivative-action time" (rate time) input decides the time response of the differentiator.
D_F	178.0	REAL	5.0	The derivative factor decides the lag of the D-action. D_F = derivative-action time/"Lag of the D-action" Values from 5.0 to 10.0 are permitted.

Parameters	Address	Data type	Default	Description
CON_ZONE	182.0	REAL	100.0	If the control deviation is greater than the control zone band, the high output value limit is output as output value. If the control deviation is less than the negative control zone band, the low output value limit is output as the output value. The valid values depend on the sensors used.
CONZ_ON	186.0	BOOL	FALSE	You can use CONZ_ON =TRUE to enable the control zone.
TUN_ON	186.1	BOOL	FALSE	If TUN_ON=TRUE, the output value is averaged until the output value excitation TUN_DLMN is enabled either by a setpoint step-change or by TUN_ST=TRUE.
TUN_ST	186.2	BOOL	FALSE	If the setpoint is to remain constant during controller tuning at the operating point, a output value step-change by the amount of TUN_DLMN is activated by TUN_ST=1.
UNDO_PAR	186.3	BOOL	FALSE	Loads the controller parametersPFAC_SP, GAIN, TI, TD, D_FCONZ_ON and CON_ZONE from the data structure PAR_SAVE (only in manual mode).
SAVE_PAR	186.4	BOOL	FALSE	Saves the controller parameters PFAC_SP, GAIN, TI, TD, D_F, CONZ_ON and CON_ZONE in the data structure PAR_SAVE.
LOAD_PID	186.5	BOOL	FALSE	Loads the controller parametersGAIN, TI,TD depending on PID_ON from the data structure PI_CON or PID_CON (only in manual mode)
PID_ON	186.6	BOOL	TRUE	At the PID_ON input, you can specify whether or not the tuned controller will operate as a PI or PID controller. • PID controller: PID_ON = TRUE • PI controller: PID_ON = FALSE With certain process types it is nevertheless possible that only a PI controller will be designed despite PID_ON = TRUE.
GAIN_P	188.0	REAL	0.0	Identified process gain. In the case of process type I, GAIN_P tends to be estimated too low.
TU	192.0	REAL	0.0	Identified time lag of the process. TU ≥ 3*CYCLE
TA	196.0	REAL	0.0	Identified recovery time of the process. In the case of process type I, TA tends to be estimated too low.
KIG	200.0	REAL	0.0	Maximum process value rise at manipulated tag excitation from 0 to 100 % [1/s] GAIN_P = 0.01 * KIG * TA
N_PTN	204.0	REAL	0.0	The parameter specifies the order of the process. "Non-integer values" are also possible. Values from 1.01 to 10.0 are permitted.
TM_LAG_P	208.0	REAL	0.0	Time constants of a PTN model (practical values only for N_PTN >= 2).
T_P_INF	212.0	REAL	0.0	Time from process excitation until the point of inflection.
P_INF	216.0	REAL	0.0	Process value change from process excitation until the point of inflection. The valid values depend on the sensors used.
LMN0	220.0	REAL	0.0	Output value at the start of tuning Detected in phase 1 (mean value). Values from 0 to 100 % are permitted.
PV0	224.0	REAL	0.0	Process value at the start of tuning

Parameters	Address	Data type	Default	Description
PVDT0	228.0	REAL	0.0	Process value slew rate at start of tuning [1/s] Sign adapted.
PVDT	232.0	REAL	0.0	Current process value slew rate [1/s] Sign adapted.
PVDT_MAX	236.0	REAL	0.0	Max. change in the process value per second [1/s] Maximum derivative of the process value at the point of inflection (sign adapted, always > 0); is used to calculate TU and KIG.
NOI_PVDT	240.0	REAL	0.0	Noise action in PVDT_MAX in % The higher the noise action, the less accurate (less aggressive) the control parameters.
NOISE_PV	244.0	REAL	0.0	Absolute noise in process value Difference between maximum and minimum process value in phase 1.
FIL_CYC	248.0	INT	1	Number of cycles of the mean value filter The process value is determined through FIL_CYC cycles. FIL_CYC is increased from 1 to a max. of 1024 if needed.
POI_CMAX	250.0	INT	2	Maximum number of cycles after point of inflection This time is used to find another (i.e. better) inflection point for measuring noise. The tuning is completed only after this time.
POI_CYCL	252.0	INT	0	Number of cycles after inflection point

9.4.4.9 Parameter STATUS_H

STATUS_H	Description	Remedy
0	Default, or no/no new controller parameters	
10000	Tuning completed + suitable controller parameters found	
2xxxx	Tuning completed + controller parameters uncertain	
2xx2x	Point of inflection not reached (only if excited via setpoint step-change)	If the controller oscillates, weaken the controller parameters, or repeat the test with a smaller manipulated value difference TUN_DLMN.
2x1xx	Estimation error (TU < 3*CYCLE)	Reduce CYCLE and repeat attempt. Special case for PT1-only process: Do not repeat test, if necessary reduce controller parameters.
2x3xx	Estimation error TU too high	Repeat test under better conditions.
21xxx	Estimation error N_PTN < 1	Repeat test under better conditions.
22xxx	Estimation error N_PTN > 10	Repeat test under better conditions.
3xxxx	Tuning canceled in phase 1 owing to faulty parameter assignment:	
30002	Effective manipulated value differential < 5%	Correct manipulated value differential TUN_DLMN.
30005	The sampling times CYCLE and CYCLE_P differ by more than 5% of the measured values.	Compare CYCLE and CYCLE_P with the cycle time of the cyclic interrupt priority class and note any loop scheduler. Check CPU load. An excessively loaded CPU can result in prolonged sampling times that are inconsistent with CYCLE or CYCLE_P.

Note

If you cancel tuning in phase 1 or 2, STATUS_H = 0 is set. However, STATUS_D still displays the status of the last controller calculation.

The higher the value of STATUS_D, the higher the order of the control process, the greater the TU/TA ratio and the gentler the controller parameters will be.

9.4.4.10 Parameters STATUS_D

STATUS_D	Description
0	No controller parameters were calculated.
110	N_PTN <= 1.5 Process type I fast
121	N_PTN > 1.5 Process type I
200	N_PTN > 1.9 Process type II (transition range)
310	N_PTN >= 2.1 Process type III fast
320	N_PTN > 2.6 Process type III
111, 122, 201, 311, 321	Parameters have been corrected from phase 7.

Note

The higher the value of STATUS_D, the higher the order of the control process, the greater the TU/TA ratio and the gentler the controller parameters will be.

9.4.5 TCONT_S

9.4.5.1 Description TCONT_S

The TCONT_S instruction is used on SIMATIC S7 automation systems to control technical temperature processes with binary manipulated value output signals for actuators with integrating behavior. The functionality is based on the PI control algorithm of the sampling controller. The step controller operates without a position feedback signal.

Application

You can also use the controller in a cascade control as a secondary position controller. You specify the actuator position via the setpoint input SP_INT. In this case, you must set the process value input and the parameter TI (integration time) to zero. An application might be, for example, temperature control with heating power control using pulse-break activation and cooling control using a butterfly valve. To close the valve completely, the manipulated variable (ER*GAIN) should be negative.

Call

The instruction TCONT_S must be called equidistant. To achieve this, use a cyclic interrupt priority class (for example, OB35 for an S7-300). The sampling time is specified at the CYCLE parameter.

If you call the instruction TCONT_S as a multiple instance DB, no technology object is created. No parameter assignment interface or commissioning interface is available. You must assign parameters for TCONT_S directly in the multiple instance DB and commission it via a watch table.

CYCLE sampling time

The CYCLE sampling time match the time difference between two calls (cycle time of the cyclic interrupt OB taking into account the reduction ratios).

The controller sampling time should not exceed 10% of the calculated integration time of the controller (TI). Generally, you must set the sampling time to a much lower value to achieve the required accuracy of the step controller.

Required accuracy G	MTR_TM	CYCLE = MTR_TM*G	Comment
0.5 %	10 s	0.05 s	The sampling time is determined by the required accuracy of the step controller.

Start-up

The TCONT_S instruction has an initialization routine that is run through when input parameter COM_RST = TRUE is set. Following execution of the initialization routine, the block sets COM_RST back to FALSE. All outputs are set to their initial values. If you require initialization when the CPU restarts, call the block in OB100 with COM_RST = TRUE.

Block diagram TCONT_S (Page 519)

9.4.5.2 Mode of operation TCONT_S

Setpoint branch

The setpoint is entered at input SP_INT in floating-point format as a physical value or percentage. The setpoint and process value used to form the control deviation must have the same unit.

Process value options (PVPER_ON)

Depending on PVPER_ON, the process value can be read in, in the I/O or floating-point format.

PVPER_ON	Process Value Input
TRUE	The process value is read in via the analog I/Os (PIW xxx) at input PV_PER.
FALSE	The process value is acquired in floating-point format at input PV_IN.

Process value format conversion CRP_IN (PER_MODE)

The CRP_IN function converts the I/O value PV_PER to floating-point format depending on the PER_MODE switch according to the following rules:

PER_MODE	Output of CRP_IN	Analog Input Type	Unit
0	PV_PER * 0.1	Thermoelements; PT100/NI100; standard	°C;°F
1	PV_PER * 0.01	PT100/NI100; climate;	°C;°F
2	PV_PER * 100/27648	Voltage/current	%

Process value scaling PV_NORM (PF_FAC, PV_OFFS)

The PV_NORM function calculates the output of CRP_IN according to the following rule:

"Output of PV_NORM" = "Output of CRP_IN)" * PV_FAC + PV_OFFS

It can be used for the following purposes:

- Process value adjustment with PV_FAC as process value factor and PV_OFFS as process value offset.
- Normalization of temperature to percentage

  You want to enter the setpoint as a percentage and must now convert the measured temperature value to a percentage.
- Normalization of percentage to temperature

  You want to enter the setpoint in the physical temperature unit and must now convert the measured voltage/current value to a temperature.

Calculation of the parameters:

- PV_FAC = range of PV_NORM/range of CRP_IN;
- PV_OFFS = LL (PV_NORM) - PV_FAC * LL(CRP_IN);

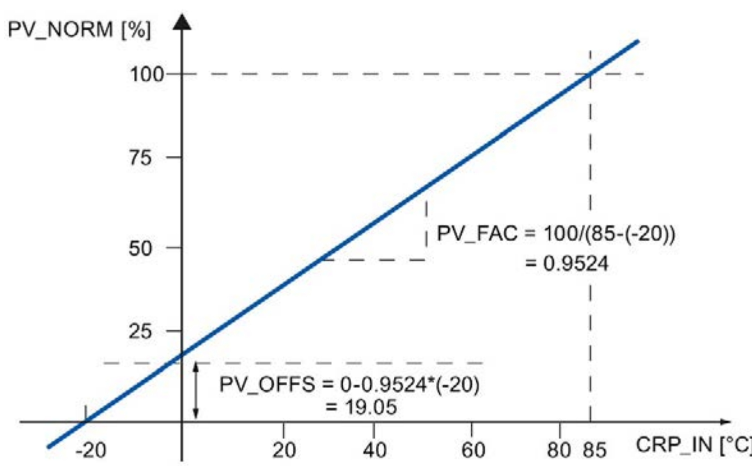
  where LL: low limit

The normalization is switched off with the default values (PV_FAC = 1.0 and PV_OFFS = 0.0). The effective process value is output at the PV output.

Example of Process Value Normalization

If you want to enter the setpoint as a percentage, and you have a temperature range of -20 to 85 °C applied to , CRP_IN you must normalize the temperature range as a percentage.

The following diagram shows an example of adapting the temperature range -20 to 85 °C to an internal scale of 0 to 100 %:



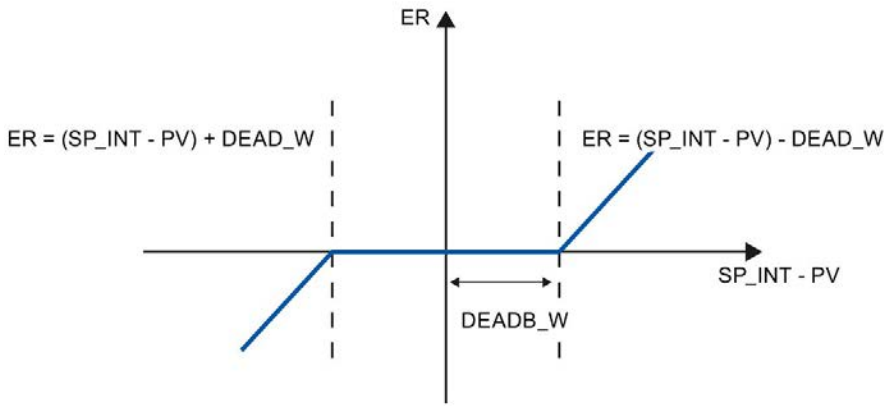
Forming the control deviation

The difference between the setpoint and process value is the control deviation before the dead band.

The setpoint and process value must exist in the same unit.

Dead band (DEADB_W)

To suppress a minor sustained oscillation due to the manipulated variable quantization (for example, in pulse width modulation with PULSEGEN) a dead band is applied to the (DEADBAND) control deviation. With DEADB_W = 0.0, the dead band is switched off.



PI step controller algorithm

The instruction TCONT_S operates without position feedback. The I-action of the PI algorithm and the assumed position feedback signal are calculated in an integrator (INT) and compared as a feedback value with the remaining P-action. The difference is applied to a three-step element (THREE_ST) and a pulse shaper (PULSEOUT) that generates the pulses for the control valve. Adapting the response threshold of the three-step element reduces the switching frequency of the controller.

Weakening of the P-action when setpoint changes occur

To prevent overshoot, you can weaken the P-action using the "Proportional factor for setpoint changes" parameter (PFAC_SP). Using PFAC_SP, you can now select continuously between 0.0 and 1.0 to decide the effect of the P-action when the setpoint changes:

- PFAC_SP = 1.0: Proportional action for setpoint change is fully effective
- PFAC_SP = 0.0: Proportional action has no effect in the setpoint change

As in the case of the continuous controller, a value of PFAC_SP < 1.0 can reduce the overshoot if the motor run time MTR_TM is small compared with the recovery time TA and the ratio is TU/TA < 0.2. If MTR_TM reaches 20% of TA, only a slight improvement can still be achieved.

Feedforward control

A disturbance variable can be added at the DISV input.

Manual value processing (LMNS_ON, LMNUP, LMNDN)

With LMNS_ON, you can change between manual and automatic mode. In manual mode, the actuator is halted and the integral action (INT) is set to 0 internally. Using LMNUP and LMNDN, the actuator can be adjusted to OPEN and CLOSED. Switching over to automatic mode therefore involves a bump. As a result of the GAIN, the existing control deviation leads to a step change in the internal manipulated variable. The integral component of the actuator, however, results in a ramp-shaped excitation of the process.

9.4.5.4 Input paramters TCONT_S

Table 9- 23 Input paramters TCONT_S

Parame-ters	Ad-dress	Data type	Default	Description
CYCLE	0.0	REAL	0.1 s	At this input, you enter the sampling time for the controller. CYCLE ≥ 0.001
SP_INT	4.0	REAL	0.0	The input "Internal setpoint" is used to specify a setpoint. The valid values depend on the sensors used.
PV_IN	8.0	REAL	0.0	At the "Process variable input" you can assign parameters to a commissioning value or you can interconnect an external process value in floating-point format. The valid values depend on the sensors used.
PV_PER	12.0	INT	0	The process value in I/O format is interconnected with the controller at the "Process value I/O" input.
DISV	14.0	REAL	0.0	For feedforward control, the disturbance variable is interconnected to the "Disturbance variable" input.
LMNR_HS	18.0	BOOL	FALSE	The signal "Control valve at high endstop" is interconnected on the input "High endstop signal of position feedback". • LMNR_HS=TRUE: The control valve is at high endstop.
LMNR_LS	18.1	BOOL	FALSE	The signal "Control valve at low endstop" is interconnected on the input "Low endstop signal of position feedback". • LMNR_LS=TRUE: The control valve is at low endstop.
LMNS_ON	18.2	BOOL	TRUE	Manipulated value signal processing is switched to manual mode at the "Enable manual mode of manipulated signal".
LMNUP	18.3	BOOL	FALSE	In manual mode of manipulated signals, the output parameter QLMNUP is operated at the input parameter "Manipulated signal up".
LMNDN	18.4	BOOL	FALSE	In manual mode of the manipulated signals, the output parameter QLMNDN is operated at the input parameter "Manipulated signal down".

9.4.5.7 Static variables TCONT_S

Table 9- 26 Static variables TCONT_S

Parameters	Ad-dress	Data type	Default	Description
PV_FAC	32.0	REAL	1.0	The "Process value factor" input is multiplied by the process value. The input is used to scale the process value range.
PV_OFFS	36.0	REAL	0.0	The input "Process value offset" is added to the process value. The input is used to scale the process value range. The valid values depend on the sensors used.
DEADB_W	40.0	REAL	0.0	A deadband is applied to the control deviation. The "Deadband width" input determines the size of the deadband. DEADB_W ≥ 0.0
PFAC_SP	44.4	REAL	1.0	PFAC_SP specifies the effective P-action when there is a setpoint change. • 1: P-action has full effect if the setpoint changes. • 0: P-action has no effect if the setpoint changes. Values from 0.0 to 1.0 are permitted.
GAIN	48.0	REAL	2.0	The "Proportional gain" input specifies controller amplification. The direction of control can be reversed by giving GAIN a negative sign. %/phys. unit
TI	52.0	REAL	40.0 s	The "Integration time" (integral-action time) input defines the integrator's time response.
MTR_TM	56.0	REAL	30 s	The runtime from endstop to endstop of the control valve is entered at the "Motor actuating time" parameter. MTR_TM ≥ CYCLE
PULSE_TM	60.0	REAL	0.0 s	A minimum pulse time can be configured at the "Minimum pulse time" parameter.
BREAK_TM	64.0	REAL	0.0 s	You can assign a minimum break time at the parameter "Minimum break time".
PER_MODE	68.0	INT	0	You can use this switch to enter the type of I/O module. The process value at input PV_PER is then scaled as follows at the PV output. • PER_MODE = 0: Thermoelements; PT100/NI100; standard PV_PER * 0.1 Unit: °C, °F • PER_MODE = 1: PT100/NI100; climate PV_PER * 0.01 Unit: °C, °F • PER_MODE = 2: Current/voltage PV_PER * 100/27648 Unit: %
PVPER_ON	70.0	BOOL	FALSE	If the process value is to be read in from the I/Os, the PV_PER input must be interconnected with the I/Os and the "Enable process value I/Os" input must be set.

9.5 Polyline

9.5.1 Compatibility with CPU and FW

The following table shows which version of Polyline can be used on which CPU:

CPU	FW	Polyline
S7-1200	V4.2 or higher	V1.0
S7-1500	V2.0 or higher	V1.0

9.5.2 Description Polyline

Description

The Polyline instruction maps input value Input onto output value Output using a characteristic curve. The characteristic curve is defined as a polyline with maximum 50 points. Linear interpolation is performed between the points. You can fit the polyline to the desired characteristic curve using the number and configuration of the points.

The Polyline instruction can be used, for example, to linearize non-linear characteristics of sensor or actuators.

Interpolation calculation

Polyline calculates the output value at the Output parameter for the input value at the Input parameter that lies between point values x_i and x_{i+1} with a linear interpolation. The linear interpolation is calculated according to the following formula:

$$Output = \frac{(Input - x_i)}{(x_{i+1} - x_i)} (y_{i+1} - y_i) + y_i$$

With parameter Reset = TRUE, an alternative output value can also be specified using the SubstituteOutput parameter.

Polyline data

The value pairs for the polyline are contained in the Static area of the instruction.

Note

- The minimum number of value pairs to be configured is 2.
- The maximum number of value pairs to be configured is 50.
- For a valid configuration, the x values must be specified in ascending order.

To allow the polyline data to be changed without the changes taking effect immediately, the value pairs of the polyline are duplicated and contained in the following structures:

- UserData

  The polyline data in this structure can be edited.

  Make use of this structure to specify or change the polyline data. Changes in this structure do not affect the interpolation calculation until the check and duplication of the data to the WorkingData structure is initiated. This happens by setting Validate = TRUE or automatically during the first processing of Polyline after the change of operating state of the CPU from STOP to RUN.

  The preassignment of values in this structure does not represent a valid configuration. To use the values for the interpolation calculation, change the tags to valid values.

- WorkingData

  The polyline data in this structure cannot be edited. This data is used for the interpolation calculation. Do not manually change the data in this structure.

Both structures have the same data type and thus the same content:

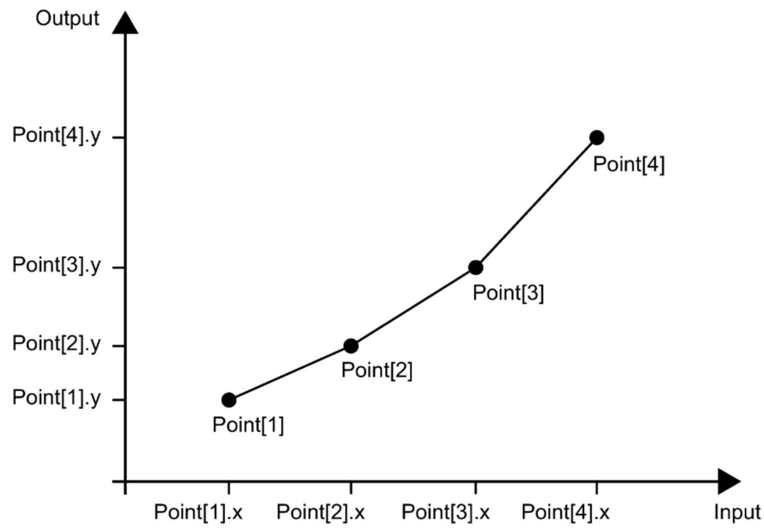
- NumberOfUsedPoints

  Number of points used for the interpolation calculation.

- Point

  The array with 50 elements contains value pairs of points Point[i].x and Point[i].y with index "i" from 1 to 50.

The following figure shows a polyline with four points.



Call

Polyline is called as a single-instance DB in an OB. In an FB, Polyline can be called as both a single-instance DB and a multi-instance DB and as a parameter-instance DB.

When the instruction is called, no technology object is created. No parameter assignment interface or commissioning interface is available. You assign the Polyline parameters directly in the instance DB and commission Polyline using a watch table of the user program in the CPU or HMI.

Startup

The tags in the UserData and WorkingData structures are not retentive. These tags are initialized with the start values after each change of operating state of the CPU from STOP to RUN.

If you change the actual values in the UserData structure in online mode and these values are to be retained after the change of operating state of the CPU from STOP to RUN, back up these values in the start values of the data block.

At the first call of the Polyline instruction after the change of operating state of the CPU from STOP to RUN, the data in the UserData structure is automatically checked for validity. If the check is successful, the data is transferred to the WorkingData structure.

Reaction to error

The Polyline instruction detects different errors that may occur during interpolation calculation. The result of the interpolation calculation can be output at the output despite a pending error. If an error prevents correct calculation of the interpolation result, a substitute output value is output at the output.

You specify the substitute output value that is output if an error occurs that prevents correct calculation of the interpolation result as follows at the ErrorMode tag:

- If the ErrorMode tag is set to 0, Polyline outputs the input value at the Input parameter.
- If the ErrorMode tag is set to 1, Polyline outputs the substitute output value. You assign the substitute output value at the SubstituteOutput parameter.
- If the ErrorMode tag is set to 2, Polyline outputs the last valid output value at the Output parameter.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error is set to FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is retentive and is reset only by a positive edge at the Reset or ErrorAck parameter.

9.5.3 Operating principle Polyline

Polyline data

To change the polyline, you edit the values in the UserData structure. The values are then checked for validity and transferred to the WorkingData structure. Only in the WorkingData structure are the values used for the interpolation calculation.

The values are checked and transferred when

- You set the Validate parameter to TRUE while the Reset parameter is set to FALSE.
- Polyline is called for the first time after the change of operating state of the CPU from STOP to RUN while the Reset parameter is set to FALSE.

  If Polyline has already been called, for example in OB100, another automatic check of the values is not performed at the subsequent calls.

If the polyline data in the UserData structure is invalid, the previous polyline data in the WorkingData structure remains unchanged and a corresponding error message is output. If the check was performed for the first time, no valid values are available in the WorkingData structure and a corresponding error message is output. In this case, the Output parameter is specified with the substitute output value that you configure with the ErrorMode tag.

The check and transfer of the values from the UserData structure requires more CPU processing time than the interpolation calculation. In time-critical applications, the first execution of Polyline can be in startup OB 100. In this way, the time-consuming one-time check and transfer of the polyline data can be completed before the cyclic application program sections.

Validity of the polyline data

When the values in the UserData structure are checked, they must meet the following conditions so that a valid polyline is available for the interpolation calculation:

- 2 ≤ UserData.NumberOfUsedPoints ≤ 50
- UserData.Point[j].x < UserData.Point[j+1].x with index j = 1..(UserData.NumberOfUsedPoints – 1)
- -3.402823e+38 ≤ UserData.Point[i].x ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints
- -3.402823e+38 ≤ UserData.Point[i].y ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints
- UserData.Point[i].x and UserData.Point[i].y are valid REAL values (≠ NaN) with index i = 1..UserData.NumberOfUsedPoints

If one or more conditions are not met during the check, the values in the UserData structure are not transferred to the WorkingData structure. A corresponding error message is output at the ErrorBits (Page 536) parameter.

The preassignment of values in the UserData structure does not represent a valid configuration. Change the tags to valid values so that the tags can be used for the interpolation calculation.

Note

If more than the maximum number of 50 points are needed for your application, use two or more instances of Polyline.

Calculating the output value

If the input value at the Input parameter is below the first x-value or above the last x-value of the utilized points, configure the preassignment of the Output parameter with the following settings at the OutOfRangeMode tag:

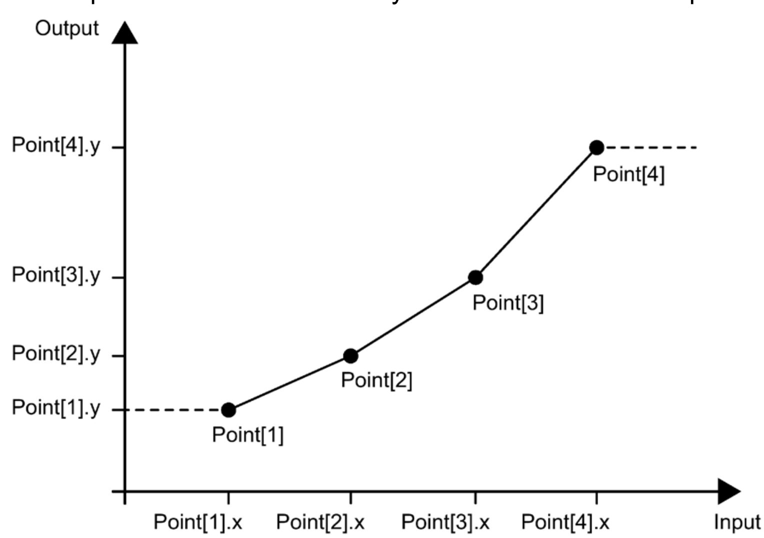
- OutOfRangeMode = 0

  The output value is extrapolated with the slope of the first or last two points.

  If the OutOfRangeMode tag lies outside the permissible value range of 0 to 1, the default preassignment 0 becomes effective.

- OutOfRangeMode = 1

  The output value is limited to the y-value of the first or last point.



The Output parameter has a permissible value range of a REAL data type of -3.402823e+38 to 3.402823e+38. The output value at the Output parameter is checked for validity each time the Polyline instruction is executed. If the interpolation calculation yields an invalid REAL value, the output value is replaced with the setting at the ErrorMode tag.

Enable behavior EN/ENO

If one of the following conditions is met, enable output ENO is set to FALSE.

- Enable input EN is set to TRUE and the Output parameter is specified by a substitute output value in case of error messages ErrorBits ≥ 16#0001_0000.
- Enable input EN is set to FALSE.

If enable input EN is set to TRUE and the Output parameter can be determined as follows, enable output ENO is set to TRUE:

- With valid interpolation calculation when Reset = FALSE.

or

- With valid SubstituteOutput parameter when Reset = TRUE.

Currently utilized points

The NextXIndex index outputs the index of the next higher x-value for the current input value. You can use this to determine the points that are being used for the current interpolation calculation.

WorkingData.Point[NextXIndex-1].x < Input ≤ WorkingData.Point[NextXIndex].x

Example:

- If the value of the Input parameter is between WorkingData.Point[3].x and WorkingData.Point[4].x, the NextXIndex tag has the value 4.
- If the value of the Input parameter is less than WorkingData.Point[1].x, the NextXIndex tag has the value 1.
- If the value of the Input parameter is greater than WorkingData.Point[WorkingData.NumberOfUsedPoints].x and is thus greater than the last x-value of the polyline, the NextXIndex tag has the value of the WorkingData.NumberOfUsedPoints + 1 tag. Consequently, maximum permissible value of the NextXIndex tag is 51.

9.5.4 Input parameters of Polyline

Parameter	Data type	Default	Description
Input	REAL	0.0	Input value
Substitute-Output	REAL	0.0	SubstituteOutput is used as the substitute output value when • Reset = TRUE or • An error with error message ErrorBits ≥ 16#0001_0000 prevents correct calculation of the interpolation result, and the configured value of Error-Mode is 1 .
Validate	BOOL	FALSE	If Validate is set to TRUE, the polyline data in UserData is checked for validity and transferred to WorkingData.
ErrorAck	BOOL	FALSE	Deletes the error messages • Edge FALSE -> TRUE ErrorBits is reset
Reset	BOOL	FALSE	Performs a restart of the instruction • Edge FALSE -> TRUE ErrorBits is reset. • As long as Reset is set to TRUE, the substitute output value Substitute-Output is output at the output. • As long as Reset is set to FALSE, the interpolation calculation is performed.

9.5.5 Output parameters of Polyline

Parameter	Data type	Default	Description
Output	REAL	0.0	Output value
Error	BOOL	FALSE	When Error is set to TRUE, at least one error is currently pending.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 536) shows which error messages are pending. ErrorBits is retentive and is reset at a positive edge at Reset or ErrorAck .

9.5.6 Static tags of Polyline

Tag	Data type	Default	Description
UserData	AuxFct _PointTable	-	Input are for polyline data The polyline data in the UserData structure can be edited. Changes in this structure do not affect the interpolation calculation until the check and duplication of the data to the WorkingData structure is initiated.
UserData.NumberOfUsedPoints	INT	0	Number of points used for the interpolation calculation Permissible value range: 2 to 50
UserData.Point	Array[1..50] of AuxFct_Point	-	Points for the interpolation calculation The array with 50 elements of data type AuxFct_Point contains the value pairs of the points.
UserData.Point[i]	AuxFct_Point	-	Point for the interpolation calculation An element with index "i" from the "Point" array.
UserData.Point[i].x	REAL	0.0	x-value of the point Permissible value range: Point[i].x < Point[i+1].x
UserData.Point[i].y	REAL	0.0	y-value of the point
WorkingData	AuxFct _PointTable	-	Display area of the currently active polyline data The polyline data in the WorkingData structure cannot be edited. It is used for the interpolation calculation.
WorkingData.NumberOfUsedPoints	INT	0	Number of points used for the interpolation calculation Permissible value range: 2 to 50
WorkingData.Point	Array[1..50] of AuxFct_Point	-	Points for the interpolation calculation The array with 50 elements of type AuxFct_Point contains the value pairs of the points.
WorkingData.Point[i]	AuxFct_Point	-	Point for the interpolation calculation An element with index "i" from the "Point" array.
WorkingData.Point[i].x	REAL	0.0	x-value of the point Permissible value range: Point[i].x < Point[i+1].x
WorkingData.Point[i].y	REAL	0.0	y-value of the point
ErrorMode	INT	0	Selection of the substitute output value following an error • 0 = Input • 1 = SubstituteOutput • 2 = Last valid output value Permissible value range: 0 to 2

Tag	Data type	Default	Description
OutOfRangeMode	INT	0	Selection of the output value if the input value lies outside the defined x-values • 0 = Maintain slope • 1 = y-value of the first/last point Permissible value range: 0 to 1
NextXIndex	INT	2	Index of the next x-value Used for monitoring the index of the points that are being used for the current interpolation calculation. The following condition applies: WorkingData.Point[NextXIndex-1].x < Input ≤ WorkingData.Point[NextXIndex].x Do not change this value manually.

9.5.7 ErrorBits parameter

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 16#0000_0003, for example, indicates that the errors 16#0000_0001 and 16#0000_0002 are pending simultaneously.

For Polyline the errors output at the ErrorBits parameter are divided into two categories:

- Errors with error messages ErrorBits < 16#0001_0000
- Errors with error messages ErrorBits ≥ 16#0001_0000

Errors with error messages ErrorBits < 16#0001_0000

If one or more errors with error messages ErrorBits < 16#0001_0000 are pending, enable output ENO is not changed. The output value can be determined as follows despite this error:

- Interpolation calculation when Reset = FALSE.

or

- Output of SubstituteOutput when Reset = TRUE.

ErrorBits (DW#16#...)	Description
0000_0000	No error is pending.
0000_0001	The Output parameter was limited to -3.402823e+38 or +3.402823e+38. If the interpolation value is output at the output (Reset = FALSE and ErrorBits < 16#0001_0000), check the following tags used in the interpolation calculation: • Input • WorkingData.Point[i].x • WorkingData.Point[i].y If a substitute output value is output at the Output parameter when Reset = FALSE and ErrorBits ≥ 16#0001_0000, check the Input or SubstituteOutput parameter, depending on the value set at the ErrorMode tag. If Reset = TRUE, check the SubstituteOutput parameter. If the Output parameter is no longer limited, the error that is stored at the Error parameter is cleared.

ErrorBits (DW#16#...)	Description
0000_0002	One or more tags in the UserData structure have invalid values but valid polyline data is available in the WorkingData structure. The polyline data in the UserData structure was checked because the Validate parameter is set to TRUE while the Reset parameter is simultaneously set to FALSE. The polyline data in the UserData structure is not transferred to the WorkingData structure so that the changes made in the UserData structure will not become effective. The FB Polyline continues the interpolation calculation with the unchanged values in the WorkingData structure. Ensure that the following conditions are met when the Validate parameter is set to TRUE: 1. 2 ≤ UserData.NumberOfUsedPoints ≤ 50 2. UserData.Point[j].x < UserData.Point[j+1].x with index j = 1..(UserData.NumberOfUsedPoints - 1) 3. -3.402823e+38 ≤ UserData.Point[i].x ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints 4. -3.402823e+38 ≤ UserData.Point[i].y ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints 5. UserData.Point[i].x and UserData.Point[i].y are valid REAL values (≠ NaN) with index i = 1..UserData.NumberOfUsedPoints The error bit at the Error parameter is deleted when • The Validate parameter is set to FALSE. or • The Reset parameter is set to TRUE or • The Validate parameter is set to TRUE while the Reset parameter is set to FALSE and the five conditions for UserData named above are met.

Errors with error messages ErrorBits ≥ 16#0001_0000

If one or more errors with error messages ErrorBits ≥ 16#0001_0000 are pending, the output value cannot be determined as expected. The substitute output value is output instead. Enable output ENO is set to FALSE.

ErrorBits (DW#16#...)	Description
0001_0000	The SubstituteOutput or Input parameter that is being used as the output value has no valid REAL value. The output is set to 0.0. Possible error scenarios: • The Reset parameter is set to FALSE and an error with ErrorBits ≥ 16#0002_0000 is pending that prevents the interpolation calculation, and – the Input parameter has no valid REAL value, then tag ErrorMode = 0. – the SubstituteOutput parameter has no valid REAL value, then tag ErrorMode = 1. • The Reset parameter is set to TRUE while the SubstituteOutput parameter has no valid REAL value. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The SubstituteOutput or Input parameter is changed to a valid REAL value. or • The SubstituteOutput or Input parameter is no longer being used as the output value. If the SubstituteOutput or Input parameter is changed to a valid REAL value, FB Polyline uses the SubstituteOutput or Input parameter again as the output value.
0002_0000	The Input parameter has no valid REAL value, while the interpolation calculation is to be performed (Reset = FALSE). The Output parameter is assigned the substitute output value that you configure at the ErrorMode tag. Note that the output value is set to 0.0 when tag ErrorMode = 0 is set because the value at the Input parameter is not being used as a substitute output value in this case. The NextXIndex tag is not updated as long as the Input parameter has an invalid REAL value The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The Input parameter is changed to a valid REAL value. or • The Reset parameter is set to TRUE. If the Input parameter is changed to a valid REAL value and the Reset parameter is set to FALSE, FB Polyline outputs the interpolation value again at the output.

ErrorBits (DW#16#...)	Description
0004_0000	The interpolation calculation yields an invalid REAL value for the Output parameter. Check the REAL values in the WorkingData structure for validity. The Output parameter is assigned the substitute output value that you configure at the ErrorMode tag. If you want to change the polyline data, first edit the UserData structure and then set parameter Validate = TRUE. Do not manually change the data in WorkingData structure. The NextXIndex tag can have an invalid value as long as this error is pending. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The interpolation calculation yields valid values for the Output parameter again. or • The Reset parameter is set to TRUE. If the interpolation calculation yields valid REAL values again and parameter Reset = FALSE is set, FB Polyline outputs the interpolation value again at the output.
0008_0000	One or more tags in the UserData structure have invalid values while no valid polyline data is available in the WorkingData structure. The polyline data in the UserData structure were checked because • The Validate parameter is set to TRUE while the Reset parameter is set to FALSE. or • When Polyline is executed for the first time after the change of operating state of the CPU from RUN to STOP , the Reset parameter is set to FALSE . The polyline data in the UserData structure is not transferred to the WorkingData structure so that the values in the UserData structure will not become effective. FB Polyline does not output the interpolation value at the Output parameter because no valid polyline data is contained in the WorkingData structure. The Output parameter is assigned the substitute output value that is configure at the ErrorMode tag. Ensure that the following conditions are met when the Validate parameter is set to TRUE or when the Reset parameter is set to FALSE while Polyline is being executed for the first time after the change of operating state of the CPU from STOP to RUN : 1. 2 ≤ UserData.NumberOfUsedPoints ≤ 50 2. UserData.Point[j].x < UserData.Point[j+1].x with index j = 1..(UserData.NumberOfUsedPoints – 1) 3. -3.402823e+38 ≤ UserData.Point[i].x ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints 4. -3.402823e+38 ≤ UserData.Point[i].y ≤ 3.402823e+38 with index i = 1..UserData.NumberOfUsedPoints 5. UserData.Point[i].x and UserData.Point[i].y are valid REAL values (≠ NaN) with index i = 1..UserData.NumberOfUsedPoints

ErrorBits (DW#16#...)	Description
0008_0000	Note that all tags in the UserData and WorkingData structures are not retentive. These tags are initialized with the start values after each change of operating state of the CPU from STOP to RUN. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The Validate parameter is set to TRUE while the Reset parameter is set to FALSE and the five conditions for UserData named above are met. or • When Polyline is executed for the first time after the change of operating state of the CPU from STOP to RUN, the Reset parameter is set to FALSE and the five conditions for UserData named above are met. or • The Reset parameter is set to TRUE. If the five conditions for UserData named above are met and the following conditions are met, FB Polyline outputs the interpolation value at the output again. • The Validate parameter is set to TRUE while the Reset parameter is set to FALSE. or • When Polyline is executed for the first time after the change of operating state of the CPU from RUN to STOP, the Reset parameter is set to FALSE.

9.6 SplitRange

9.6.1 Compatibility with CPU and FW

The following table shows which version of SplitRange can be used on which CPU:

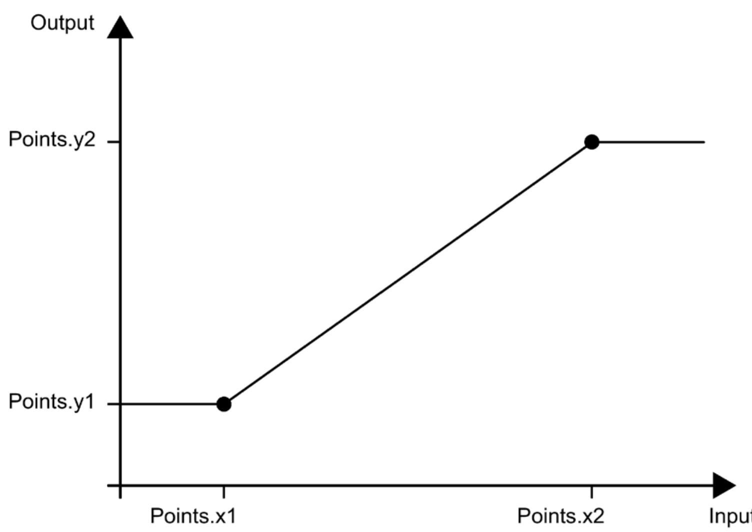
CPU	FW	SplitRange
S7-1200	V4.2 or higher	V1.0
S7-1500	V2.0 or higher	V1.0

9.6.2 SplitRange description

Description

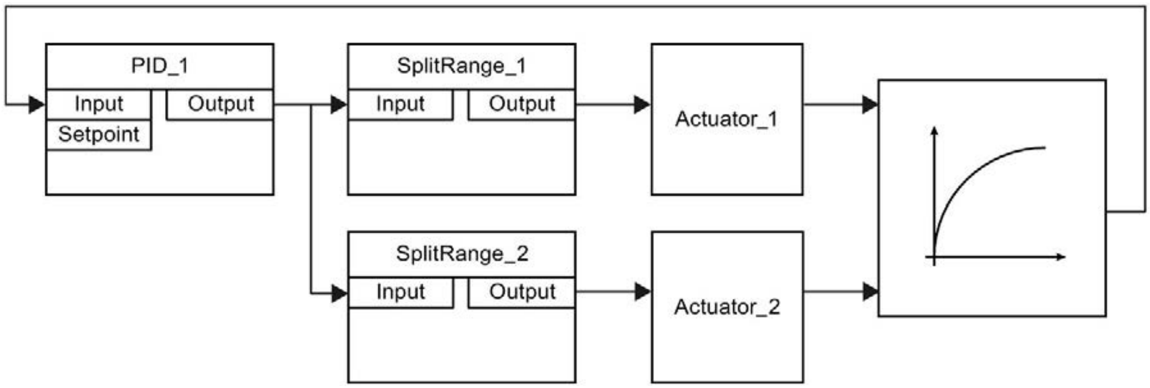
The SplitRange instruction converts the input value into an output value. The input value is located in the value range that is limited by Points.x1 and Points.x2. The output value is located in the value range that is limited by Points.y1 and Points.y2.

The following figure shows the relevant characteristic of an example configuration of the SplitRange instruction:



Use SplitRange when you need to control a process that is influenced by multiple actuators. SplitRange splits the output value range of the PID controller into multiple subranges. Assign a subrange to each actuator. The user program calls the block once per subrange. The input value of each SplitRange instance is connected to the output value of the PID controller.

The figure below shows an example of a control loop with two SplitRange instances and two actuators:



Validity of the SplitRange data

The value pairs in the Points structure define the input and output value range of SplitRange. The two value pairs are located in the static area of the block SplitRange.

SplitRange checks whether the following conditions are met for each call so that valid values are available for the calculation of the output value:

- Points.x1 < Points.x2
- Points.x1, Points.y1, Points.x2 and Points.y2 are within the permitted value range from -3.402823e+38 to 3.402823e+38
- Points.x1, Points.y1, Points.x2 and Points.y2 are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF)

If one or more of these conditions are not met, correct calculation of the output value is not possible. A corresponding error message is output at the ErrorBits parameter.

The preassignment of the x and y values with 0.0 does not represent a valid configuration. Change the tags to valid values so that the tags can be used for the calculation of the output value.

Enable behavior EN/ENO

If one of the following conditions is met, enable output ENO is set to FALSE.

- Enable input EN is set to TRUE and the Output parameter is specified by a substitute output value in case of error messages ErrorBits ≥ 16#0001_0000.
- Enable input EN is set to FALSE.

If enable input EN is set to TRUE and the Output parameter can be determined as follows, enable output ENO is set to TRUE:

- With the valid calculation of the output value with Reset = FALSE.

or

- With valid SubstituteOutput parameter when Reset = TRUE.

Call

SplitRange is called as a single-instance DB in an OB. In an FB, SplitRange can be called as both a single-instance DB and a multi-instance DB and as a parameter-instance DB.

When the instruction is called, no technology object is created. No parameter assignment interface or commissioning interface is available. You assign the SplitRange parameters directly in the instance DB and commission SplitRange using a watch table of the user program in the CPU or HMI.

Startup

The tags in the static area of SplitRange are not retentive. These tags are initialized with the start values after each operating state transition of the CPU from STOP to RUN.

If you change the actual values in the Points structure in online mode and these values are to be retained after the operating state transition of the CPU from STOP to RUN, back up these values in the start values of the data block.

Reaction to error

The SplitRange instruction detects different errors that may occur during calculation of the output value. The result of the calculation can be output at the output despite a pending error. If an error prevents correct calculation of the output value, a substitute output value is output at the output.

You specify the substitute output value that is output if an error occurs that prevents correct calculation of the output value as follows at the ErrorMode tag:

- If the ErrorMode tag is set to 0, SplitRange outputs the input value at the Input parameter.
- If the ErrorMode tag is set to 1, SplitRange outputs the substitute output value. You assign the substitute output value at the SubstituteOutput parameter.
- If the ErrorMode tag is set to 2, SplitRange outputs the last valid output value at the Output parameter.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error is set to FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is retentive and is reset only by a positive edge at the Reset or ErrorAck parameter.

9.6.3 SplitRange input parameters

Parameter	Data type	Default	Description
Input	REAL	0.0	Input value
Substitute-Output	REAL	0.0	SubstituteOutput is used as the substitute output value when • Reset = TRUE or • An error with error message ErrorBits ≥ 16#0001_0000 prevents correct calculation of the output value, and the configured value of ErrorMode is 1.
ErrorAck	BOOL	FALSE	Deletes the error messages • Edge FALSE -> TRUE ErrorBits is reset
Reset	BOOL	FALSE	Performs a restart of the instruction • Edge FALSE -> TRUE ErrorBits is reset. • As long as Reset is set to TRUE, the substitute output value Substitute-Output is output at the output. • As long as Reset is set to FALSE, the calculation of the output value is performed.

9.6.4 SplitRange output parameters

Parameter	Data type	Default	Description
Output	REAL	0.0	Output value
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 546) shows which error messages are pending. ErrorBits is retentive and is reset at a positive edge at Reset or ErrorAck .
Error	BOOL	FALSE	When Error is set to TRUE, at least one error is currently pending.

9.6.5 SplitRange static tags

Tag	Data type	Default	Description
Points	AuxFct_SplitRange_Points	-	Points data
Points.x1	REAL	0.0	x-value of point 1 Permissible value range: Points.x1 < Points.x2
Points.y1	REAL	0.0	y-value of point 1
Points.x2	REAL	0.0	x-value of point 2 Permissible value range: Points.x1 < Points.x2
Points.y2	REAL	0.0	y-value of point 2
ErrorMode	INT	0	Selection of the substitute output value following an error • 0 = Input • 1 = SubstituteOutput • 2 = Last valid output value Permissible value range: 0 to 2

9.6.6 ErrorBits parameter

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 16#0000_0003, for example, indicates that the errors 16#0000_0001 and 16#0000_0002 are pending simultaneously.

For SplitRange, the errors output at the ErrorBits parameter are divided into two categories:

- Errors with error messages ErrorBits < 16#0001_0000
- Errors with error messages ErrorBits ≥ 16#0001_0000

Errors with error messages ErrorBits < 16#0001_0000

If one or more errors with error messages ErrorBits < 16#0001_0000 are pending, enable output ENO is not changed. The output value can be determined as follows despite this error:

- Calculation of output value based on the input value and the value pairs in the Points structure when Reset = FALSE.

Or

- Output of SubstituteOutput when Reset = TRUE.

ErrorBits (DW#16#...)	Description
0000_0000	No error is pending.
0000_0001	The Output parameter was limited to -3.402823e+38 or +3.402823e+38. If a substitute output value is output at the Output parameter when Reset = FALSE and ErrorBits ≥ 16#0001_0000, check the Input or SubstituteOutput parameter, depending on the value set at the ErrorMode tag. If Reset = TRUE, check the SubstituteOutput parameter. If the Output parameter is no longer limited, the error that is stored at the Error parameter is cleared.

Errors with error messages ErrorBits ≥ 16#0001_0000

If one or more errors with error messages ErrorBits ≥ 16#0001_0000 are pending, the output value cannot be determined as expected. The substitute output value is output instead. Enable output ENO is set to FALSE.

ErrorBits (DW#16#...)	Description
0001_0000	The SubstituteOutput or Input parameter that is being used as the output value has no valid REAL value. The output is set to 0.0. Possible error scenarios: • The Reset parameter is set to FALSE and an error with ErrorBits ≥ 16#0002_0000 is pending that prevents the calculation of the output value, and – the Input parameter has no valid REAL value, then tag ErrorMode = 0. – the SubstituteOutput parameter has no valid REAL value, then tag ErrorMode = 1. • The Reset parameter is set to TRUE while the SubstituteOutput parameter has no valid REAL value. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The SubstituteOutput or Input parameter is changed to a valid REAL value. or • The SubstituteOutput or Input parameter is no longer being used as the output value. When the SubstituteOutput or Input parameter is changed to a valid REAL value, FB SplitRange uses the SubstituteOutput or Input parameter again as the output value.
0002_0000	The Input parameter has no valid REAL value while the calculation of the output value is being performed (Reset = FALSE). The Output parameter is assigned the substitute output value that you configure at the ErrorMode tag. Note that the output value is set to 0.0 when tag ErrorMode = 0 is set because the value at the Input parameter is not being used as a substitute output value in this case. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The Input parameter is changed to a valid REAL value. or • The Reset parameter is set to TRUE. When the Input parameter is changed to a valid REAL value and the Reset parameter is set to FALSE, FB SplitRange outputs the calculated output value again at the output.

ErrorBits (DW#16#...)	Description
0004_0000	One or more tags in the Points structure have invalid values. Or the calculation of the output value yields an invalid REAL value for the Output parameter. The Output parameter is assigned the substitute output value that you configure at the ErrorMode tag. Ensure that the following conditions are met: 1. Points.x1 < Points.x2 2. Points.x1, Points.y1, Points.x2 and Points.y2 are within the permitted value range from -3.402823e+38 to 3.402823e+38 3. Points.x1, Points.y1, Points.x2 and Points.y2 are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF) Note that all tags in the Points structure are not retentive. These tags are initialized with the start values after each operating state transition of the CPU from STOP to RUN. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The three conditions listed above are met for the values in the Points structure. or • The Reset parameter is set to TRUE. When the three conditions listed above are met for the values in the Points structure and the Reset = FALSE parameter is set, FB SplitRange outputs the calculated output value again at the output.

9.7 RampFunction

9.7.1 Compatibility with CPU and FW

The following table shows which version of RampFunction can be used on which CPU:

CPU	FW	RampFunction
S7-1200	V4.2 or higher	V1.0
S7-1500	V2.0 or higher	V1.0

9.7.2 RampFunction description

Description

The RampFunction instruction limits the slew rate of a signal. RampFunction outputs a signal jump at the input as ramp function of the output value.

Use the RampFunction to prevent signal jumps, for example, in the following cases:

- Between setpoint source and setpoint input of the controller to achieve a smoother response without influencing the disturbance reaction.
- Between the controller output and the actuator input to preserve the actuator, for example, a motor with gears or the process.

The following limits can be set for the slew rate:

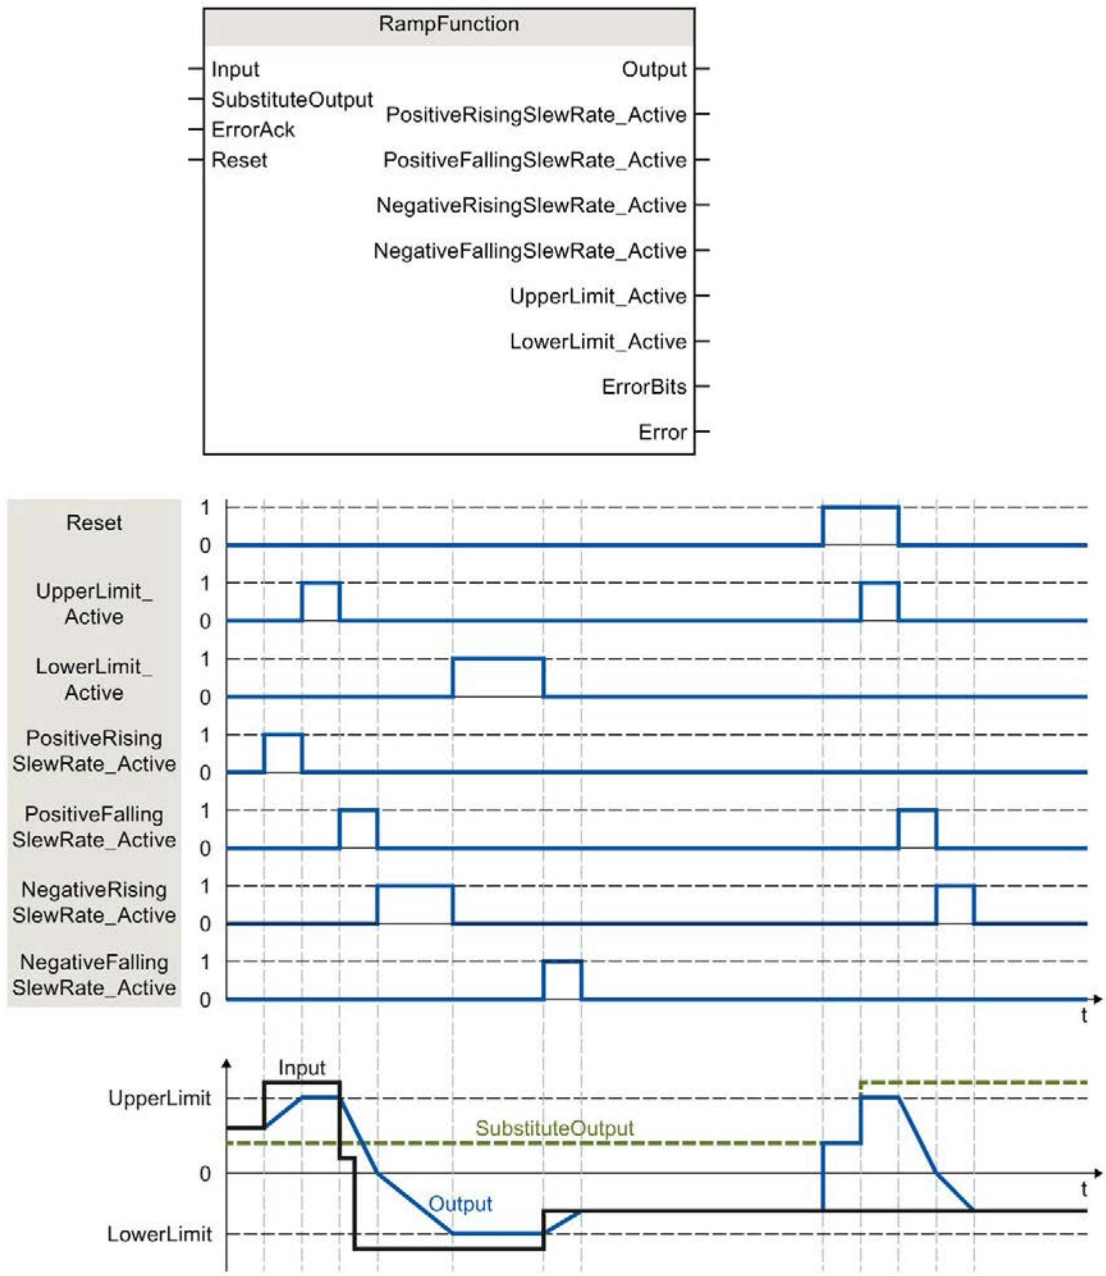
- Increasing slew rate in positive value range
- Decreasing slew rate in positive value range
- Increasing slew rate in negative value range
- Decreasing slew rate in negative value range

In addition, the RampFunction instruction limits the output value to the high and low limit.

When the slew rate limit or the low or high limit are reached, RampFunction sets the associated output bit to TRUE.

Function chart

The following figure shows the RampFunction instruction and a function chart as an example:



Call

RampFunction is called as a single-instance DB in an OB. In an FB, RampFunction can be called as both a single-instance DB and a multi-instance DB and as a parameter-instance DB.

When the instruction is called, no technology object is created. No parameter assignment interface or commissioning interface is available. You assign the RampFunction parameters directly in the instance DB and commission RampFunction using a watch table of the user program in the CPU or HMI.

Startup

The tags in the static area of RampFunction are not retentive. These tags are initialized with the start values after each operating state transition of the CPU from STOP to RUN.

If you change the actual values of the limits in online mode and these values are to be retained after the operating state transition of the CPU, back up these values in the start values of the data block.

You specify the initialization value for the Output parameter at the StartMode tag. The initialization value is output at the Output parameter during the first call of RampFunction after the operating state transition of the CPU. For subsequent calls, RampFunction calculates the output value, starting from this initialization value, based on the input value and the slew rate limits.

The following table shows the dependency between the StartMode tag and the Output parameter. The values in the Output column are output at the Output parameter after the operating state transition of the CPU.

StartMode	Output	Example
0	Value of the Input parameter	1	Value of the SubstituteOutput parame-ter	2	Remains unchanged. Output parame-ter is retentive.	
StartMode	Output	Example
3	0.0	4	Value of the LowerLimit tag	5	Value of the UpperLimit tag	
The following applies in addition for all values of the StartMode tag:

- When the values of the UpperLimit and LowerLimit tags are valid, the initialization value is limited to the value range of these tags. Only then is the initialization value output at the Output parameter.
- If the initialization value is invalid, the substitute output value is output at the Output parameter at the first call of the instruction after an operating state transition of the CPU. You configure the substitute output value at the ErrorMode tag. The substitute output value is limited by the value range of the tags UpperLimit and LowerLimit. For subsequent calls, the instruction calculates the output value starting from this substitute output value.
- The StartMode tag is only effective when the Reset = FALSE parameter is set at the first call of the instruction. If the Reset = TRUE parameter is set, the value of the SubstituteOutput parameter is output at the Output parameter.

Reaction to error

The RampFunction instruction detects different errors that may occur during calculation of the output value. The result of this calculation can be output at the output despite a pending error. If an error prevents correct calculation of the output value, a substitute output value is output at the output.

You specify the substitute output value that is output if an error occurs that prevents correct calculation of the output value at the ErrorMode tag.

The following table shows the dependency between the ErrorMode tag and the substitute output value that is output by the RampFunction at the Output parameter:

ErrorMode	Output
0	Value of the Input parameter
1	Value of the SubstituteOutput parameter
2	The last valid output value at the Output parameter
3	0.0
4	Value of the LowerLimit tag
5	Value of the UpperLimit tag

The following applies in addition for all values of the ErrorMode tag:

- If the substitute output value is not a valid REAL value, 0.0 is output as output value.
- When the values of the UpperLimit and LowerLimit tags are valid, the substitute output value is limited to the value range of these tags. Only then is the substitute output value output at the Output parameter.
- If an error is pending that prevents correct calculation of the output value, RampFunction changes at the Output parameter from the calculated output value to the substitute output value. A jump of the output value can occur, depending on the value of the ErrorMode tag.

The Error parameter indicates if an error is pending. When the error is no longer pending, Error is set to FALSE. The ErrorBits parameter shows which errors have occurred. ErrorBits is retentive and is reset only by a positive edge at the Reset or ErrorAck parameter.

9.7.3 RampFunction mode of operation

Limiting the slew rate

You can configure four limits for the slew rate of the input signal. The following factors determine which limit is currently in effect:

- Sign of the output value at the Output parameter
- Direction in which the amount of the output value changes at the Output parameter

The following table shows the effective tags for the slew rate limit depending on the Output parameter:

Output	Effective tag
Output ≥ 0 and |Output| rising	PositiveRisingSlewRate
Output ≥ 0 and |Output| falling	PositiveFallingSlewRate
Output < 0 and |Output| rising	NegativeRisingSlewRate
Output < 0 and |Output| falling	NegativeFallingSlewRate

The amount of the slew rate limits defines the maximum change of the output value per second.

Example:

The following scenario applies for the example:

- PositiveRisingSlewRate = 10.0
- Call time of RampFunction = 0.1 s
- Input > Output ≥ 0.0

Result:

The output value Output increases by 1.0 per call (10.0 per second) until the value at the Input parameter has been reached.

To disable the slew rate limit for one or more areas, set the corresponding tag to the value 3.402823e+38.

When the output value Output is currently limited by a slew rate limit, RampFunction sets the associated output bit to TRUE:

- PositiveRisingSlewRate_Active
- PositiveFallingSlewRate_Active
- NegativeRisingSlewRate_Active
- NegativeFallingSlewRate_Active

When the Reset parameter is set to TRUE, the slew rate limits are not in effect. This means jumps at the SubstituteOutput parameter result in jumps at the Output parameter.

RampFunction checks whether the following conditions for the tags PositiveRisingSlewRate, PositiveFallingSlewRate, NegativeRisingSlewRate and NegativeFallingSlewRate are met for each call:

- Values are within the permitted value range greater than 0.0 up to 3.402823e+38
- Values are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF)

If one or more conditions are not met, the substitute output value is output at the Output parameter. A corresponding error message is output at the ErrorBits parameter.

Limiting the output value

The output value Output is always limited to the value range of the tags UpperLimit and LowerLimit as long as these tags have valid values.

When the output value Output is currently limited by this value range, RampFunction sets the associated output bit to TRUE:

- UpperLimit_Active
- LowerLimit_Active

The limit of the output value has a higher priority than the limit of the slew rate. Changes of the tags UpperLimit and LowerLimit therefore result in jumps of the output value Output, if this is required to observe the limits of the tags UpperLimit and LowerLimit. The limiting of the slew rate is not taken into account in this case.

Example:

If the UpperLimit is reduced from 100.0 to 80.0 while the values of the parameters Input and Output are 90.0, the output value Output jumps to 80.0. The output value Output jumps to 80.0 regardless whether or not it violates the configured limit for the slew rate.

RampFunction checks whether the following conditions are met for each call:

- LowerLimit < UpperLimit
- LowerLimit and UpperLimit are within the permitted value range from -3.402823e+38 to 3.402823e+38
- LowerLimit and UpperLimit are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF)

If one or more conditions are not met, the substitute output value is output at the Output parameter. A corresponding error message is output at the ErrorBits parameter.

In addition, RampFunction checks for each call whether the output value Output has the permitted value range of a REAL data type from -3.402823e+38 to 3.402823e+38. If the calculation of the output value yields an invalid REAL value, the substitute output value is output at the Output parameter. You configure the substitute output value at the ErrorMode tag.

Enable behavior EN/ENO

If one of the following conditions is met, enable output ENO is set to FALSE.

- Enable input EN is set to TRUE and the Output parameter is specified by a substitute output value in case of error messages ErrorBits ≥ 16#0001_0000.
- Enable input EN is set to FALSE.

If enable input EN is set to TRUE and the Output parameter can be determined as follows, enable output ENO is set to TRUE:

- With the signal limiting the slew rate at Reset = FALSE.

or

- With valid SubstituteOutput parameter when Reset = TRUE.

Measuring the cycle time automatically

To calculate the slew rate of the output value RampFunction needs the time that has expired since the last call of RampFunction.

The cycle time by default is measured automatically and output as of the second call at the CycleTime.Value tag. RampFunction measures the cycle time for each call of the instruction and can therefore be used in non-equidistant call cycles, e.g. in OB1.

If measurement of the cycle time has an invalid result, RampFunction calculates the current output value with the last valid cycle time. In addition, RampFunction outputs an error message at the ErrorBits parameter.

When you disable automatic measurement of the cycle time by setting the tag CycleTime.EnableMeasurement = FALSE, you must enter the cycle time manually at the CycleTime.Value tag. RampFunction checks the CycleTime.Value tag for validity at each call.

Automatic measurement of the cycle time with breakpoints

When breakpoints are active between two calls of RampFunction, automatic measurement of the cycle time results in the actual time that has expired between two calls. When one breakpoint is active, the CPU is in HOLD operating state.

Note

The active breakpoints extend the time period between two calls of RampFunction.

The longer the time period between two calls, the greater the maximum permitted change of the output value at the Output parameter.

Example:

The following scenario applies for the example:

- PositiveRisingSlewRate = 10.0
- Call time of RampFunction = 0.1 s
- Input > Output ≥ 0.0

Result without breakpoints:

The output value Output increases by 1.0 per call until the value at the Input parameter has been reached.

Result with an active breakpoint of ten seconds:

With the next call, the output value Output increases by 100.0.

If you do not need the calculation of the output value based on the actual time with active breakpoints, follow these steps:

- Disable automatic measurement of the cycle times by setting the tag CycleTime.EnableMeasurement = FALSE.
- Enter the cycle time manually at the CycleTime.Value tag.

9.7.4 RampFunction input parameters

Parameter	Data type	Default	Description
Input	REAL	0.0	Input value
Substitute-Output	REAL	0.0	SubstituteOutput is used as the substitute output value when • Reset = TRUE or • An error with error message ErrorBits ≥ 16#0001_0000 prevents correct calculation of the output value, and the configured value of ErrorMode is 1.
ErrorAck	BOOL	FALSE	Deletes the error messages • Edge FALSE -> TRUE ErrorBits is reset
Reset	BOOL	FALSE	Performs a restart of the instruction • Edge FALSE -> TRUE ErrorBits is reset. • As long as Reset is set to TRUE, the substitute output value Substitute-Output is output at the output. • As long as Reset is set to FALSE, the calculation of the output value is performed.

9.7.5 RampFunction output parameters

Parameter	Data type	Default	Description
Output	REAL	0.0	Output value
PositiveRisingSle-wRate_Active	BOOL	FALSE	When PositiveRisingSlewRate_Active = TRUE, the output value is currently limited by PositiveRisingSlewRate .
PositiveFallingSle-wRate_Active	BOOL	FALSE	When PositiveFallingSlewRate_Active = TRUE, the output value is currently limited by PositiveFallingSlewRate.
NegativeRisingSle-wRate_Active	BOOL	FALSE	When NegativeRisingSlewRate_Active = TRUE, the output value is currently limited by NegativeRisingSlewRate.
NegativeFallingSle-wRate_Active	BOOL	FALSE	When NegativeFallingSlewRate_Active = TRUE, the output value is currently limited by NegativeFallingSlewRate.
UpperLimit_Active	BOOL	FALSE	When UpperLimit_Active = TRUE, the output value is currently limited by UpperLimit.
LowerLimit_Active	BOOL	FALSE	When LowerLimit_Active = TRUE, the output value is currently limited by LowerLimit.
ErrorBits	DWORD	DW#16#0	The ErrorBits parameter (Page 561) shows which error messages are pending. ErrorBits is retentive and is reset at a positive edge at Reset or ErrorAck .
Error	BOOL	FALSE	When Error = TRUE, at least one error is currently pending.

9.7.6 RampFunction static tags

Tag	Data type	Default	Description
PositiveRisingSlewRate	REAL	10.0	Limit for slew rate of the output value per second in positive range with rising amount With PositiveRisingSlewRate = 3.402823e+38, this slew rate limit is disabled. Permissible value range: > 0.0
PositiveFallingSlewRate	REAL	10.0	Limit for slew rate of the output value per second in positive range with falling amount With PositiveFallingSlewRate = 3.402823e+38, this slew rate limit is disabled. Permissible value range: > 0.0
NegativeRisingSlewRate	REAL	10.0	Limit for slew rate of the output value per second in negative range with rising amount With NegativeRisingSlewRate = 3.402823e+38, this slew rate limit is disabled. Permissible value range: > 0.0
NegativeFallingSlewRate	REAL	10.0	Limit for slew rate of the output value per second in negative range with falling amount With NegativeFallingSlewRate = 3.402823e+38, this slew rate limit is disabled. Permissible value range: > 0.0
UpperLimit	REAL	100.0	High limit of output value Permissible value range: > LowerLimit
LowerLimit	REAL	0.0	Low limit of output value Permissible value range: < UpperLimit
ErrorMode	INT	2	Selection of the substitute output value following an error • 0 = Input • 1 = SubstituteOutput • 2 = Last valid output value • 3 = 0.0 • 4 = LowerLimit • 5 = UpperLimit Permissible value range: 0 to 5
StartMode	INT	2	Selecting the output value for the first call of the instruction • 0 = Input • 1 = SubstituteOutput • 2 = Last output value • 3 = 0.0 • 4 = LowerLimit • 5 = UpperLimit Permissible value range: 0 to 5
CycleTime	AuxFct _CycleTime	-	Cycle time data

Tag	Data type	Default	Description
CycleTime.Value	REAL	0.1	Time interval between two calls of the instruction in seconds Permissible value range: > 0.0
CycleTime .EnableMeasurement	BOOL	TRUE	Enable automatic measurement of the cycle time

9.7.7 ErrorBits parameter

If several errors are pending simultaneously, the values of the ErrorBits are displayed with binary addition. The display of ErrorBits = 16#0000_0003, for example, indicates that the errors 16#0000_0001 and 16#0000_0002 are pending simultaneously.

The RampFunction instruction divides errors that are output at the ErrorBits parameter in two categories:

- Errors with error messages ErrorBits < 16#0001_0000
- Errors with error messages ErrorBits ≥ 16#0001_0000

Errors with error messages ErrorBits < 16#0001_0000

If one or more errors with error messages ErrorBits < 16#0001_0000 are pending, enable output ENO is not changed. The output value can be determined as follows despite this error:

- Calculation of output value based on the input value and the limits for the slew rate when Reset = FALSE.

or

- Output of SubstituteOutput when Reset = TRUE.

ErrorBits (DW#16#...)	Description
0000_0000	No error is pending.
0000_0002	The measurement of the cycle time yields in an invalid value while the output value is being calculated (Reset = FALSE). If a valid value of the cycle time has already been measured, RampFunction calculates the output value based on the last value of the CycleTime.Value tag. If no valid value of the cycle time was previously measured, RampFunction still outputs the output value at the Output parameter that is configured with the StartMode tag. The error bit at the Error parameter is deleted when • The measurement of the cycle time yields a valid value or • The Reset parameter is set to TRUE

Errors with error messages ErrorBits ≥ 16#0001_0000

If one or more errors with error messages ErrorBits ≥ 16#0001_0000 are pending, the output value cannot be calculated as expected. The substitute output value is output instead. Enable output ENO is set to FALSE.

The output value limit remains active as long as the tags LowerLimit and UpperLimit have valid values.

The slew rate limit is no longer active. Jumps at the output value can occur in one of the following scenarios:

- When the error is detected, RampFunction switches from the calculated output value to the replacement output value. Whether a jump occurs depends on the value of the tag ErrorMode.
- The substitute output value is changed while it is active.

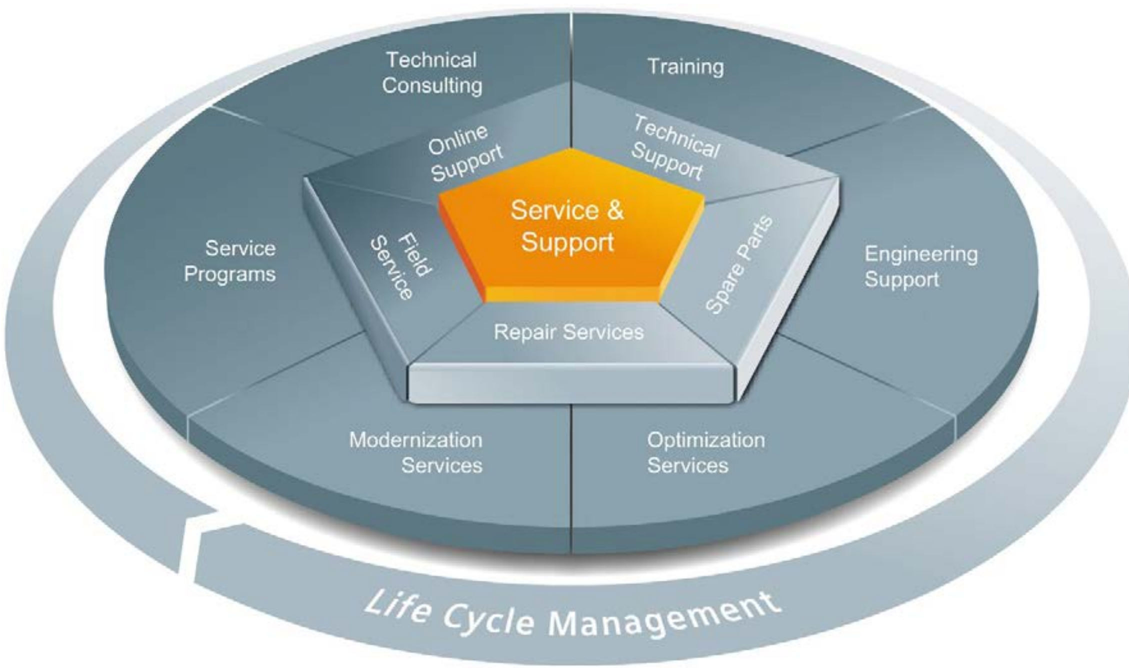
<table>
<tr><th>ErrorBits (DW#16#...)</th><th>Description</th></tr>
<tr><td>0001_0000</td><td>The SubstituteOutput or a different tag that is being used as output value has no valid REAL value.
The output value at the Output parameter is therefore set to 0.0 and limited by the tags LowerLimit and UpperLimit.
Possible error scenarios:
• The Reset parameter is set to FALSE and an error with ErrorBits ≥ 16#0002_0000 is pending that prevents the calculation of the output value, and
– the Input parameter has no valid REAL value, then tag ErrorMode = 0.
– the SubstituteOutput parameter has no valid REAL value, then tag ErrorMode = 1.
– the LowerLimit tag has no valid REAL value, then tag ErrorMode= 4.
– the UpperLimit tag has no valid REAL value, then tag ErrorMode= 5.
• The Reset parameter is set to TRUE while the SubstituteOutput parameter has no valid REAL value.
The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when
• The SubstituteOutput, Input, LowerLimit or UpperLimit parameter is changed to a valid REAL value.
or
• The SubstituteOutput, Input, LowerLimit or UpperLimit parameter is no longer being used as the output value.
When the SubstituteOutput, Input, LowerLimit or UpperLimit parameter is changed to a valid REAL value, RampFunction outputs the value of this parameter again as the output value.</td></tr>
<tr><td>0002_0000</td><td>The Input parameter has no valid REAL value while the calculation of the output value is being performed (Reset = FALSE).
The substitute output value is output at the Output parameter that is configured at the ErrorMode tag and is limited by the tags UpperLimit and LowerLimit.
Note that the output value is set to 0.0 when tag ErrorMode = 0 is set because the value at the Input parameter is not being used as a substitute output value in this case.
The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when
• The Input parameter is changed to a valid REAL value.
or
• The Reset parameter is set to TRUE.
When the Input parameter is changed to a valid REAL value and the Reset parameter is set to FALSE, RampFunction outputs the calculated output value again at the Output parameter.</td></tr>
</table>

ErrorBits (DW#16#...)	Description
0004_0000	The calculation of the output value yields an invalid REAL value at the Output parameter. The substitute output value is output at the Output parameter that is configured at the ErrorMode tag and is limited by the tags UpperLimit and LowerLimit. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The calculation of the output value outputs valid values at the Output parameter again. or • The Reset parameter is set to TRUE. When the calculation of the output value yields valid REAL values again and the Reset parameter is set to FALSE, RampFunction outputs the calculated output value again at the Output parameter.
0008_0000	The LowerLimit or UpperLimit tag has an invalid value. The following value is output at the Output parameter, depending on the Reset parameter: • Reset = FALSE The substitute output value that is configured with the ErrorMode tag is output at the Output parameter. • Reset = TRUE The value of the SubstituteOutput parameter is output at the Output parameter. In both cases, the Ouput parameter is limited to the value range of the REAL data type from -3.402823e+38 to 3.402823e+38. Ensure that the following conditions are met: 1. LowerLimit < UpperLimit 2. LowerLimit and UpperLimit are within the permitted value range from -3.402823e+38 to 3.402823e+38 3. LowerLimit and UpperLimit are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF) Note that the output value is set to 0.0 at the Output parameter when Reset = FALSE and • the LowerLimit tag has no valid REAL value, the tag ErrorMode = 4 or • the UpperLimit tag has no valid REAL value, then tag ErrorMode = 5. In this case, the values of the tags LowerLimit and UpperLimit are not output as substitute output values at the Output parameter because they are invalid. When the three conditions listed above for the LowerLimit and UpperLimit tags are met, the following applies: • The error bit at the Error parameter is cleared. • Enable output ENO is set to TRUE again. • RampFunction outputs the output value at the Output parameter again with – Reset = FALSE, by calculating and limiting the output value. – Reset = TRUE due to the limited value at the SubstituteOutput. parameter.

ErrorBits (DW#16#...)	Description
0010_0000	At least one of the following parameters has invalid values while the calculation of the output value is being performed (Reset = FALSE): 1. PositiveRisingSlewRate 2. PositiveFallingSlewRate 3. NegativeRisingSlewRate 4. NegativeFallingSlewRate The substitute output value is output at the Output parameter that is configured at the ErrorMode tag and is limited by the tags UpperLimit and LowerLimit. Ensure that the following conditions are met for all four parameters listed above: • The values are within the permitted value range greater than 0.0 up to 3.402823e+38 • The values are valid REAL values (≠ NaN e.g. 16#7FFF_FFFF) The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • The conditions listed above are met for the four parameters or • The Reset parameter is set to TRUE. When the conditions listed above are met for the four parameters and Reset is set to FALSE, Ramp-Function outputs the calculated output value at the Output parameter again.
0020_0000	The tag (configured with StartMode) for the initialization of the Output parameter at the first call of the instruction does not have a valid REAL value. The substitute output value is output with the first call of the instruction at the Output parameter that is configured at the ErrorMode tag and is limited by the tags LowerLimit and UpperLimit. For subsequent calls, RampFunction calculates the output value starting from this substitute output value. This error occurs at the first call of the instruction after the operating state transition of the CPU from STOP to RUN when Reset = FALSE and • The SubstituteOutput parameter has no valid REAL value with StartMode= 1. • The Output parameter has no valid REAL value with StartMode = 2. The following applies for the subsequent calls: • The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again. • RampFunction outputs the calculated output value at the Output parameter again.
0040_0000	The CycleTime.Value tag has an invalid value, while the calculation of the output value is being performed (Reset = FALSE). The substitute output value is output at the Output parameter that is configured at the ErrorMode tag and is limited by the tags UpperLimit and LowerLimit. Ensure that the following conditions are met: • 0.0 < CycleTime.Value < 3.402823e+38 • CycleTime.Value is a valid REAL value (≠ NaN e.g. 16#7FFF_FFFF) To automatically calculate the value of the CycleTime.Value tag, set the CycleTime.EnableMeasurement tag to TRUE. The error bit at the Error parameter is cleared and enable output ENO is set to TRUE again, when • the conditions listed above are met for the CycleTime.Value tag or • The Reset parameter is set to TRUE. When the conditions listed above are met for the CycleTime.Value tag and Reset is set to FALSE, RampFunction outputs the calculated output value at the Output parameter again.

Service & Support

A



Unmatched complete service for the entire life cycle

For machine manufacturers, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address on the Internet.

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet.

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses at the following address on the Internet.

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are select service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a service program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Benefits at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products from Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

This documentation supports you in configuring and programming modules for counting and measurement tasks of the S7-1500, ET 200MP and ET 200SP, as well as in position feedback and position input.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7

Validity of the documentation

This documentation applies to the use of the following modules:

- S7-1500 modules
  - TM Count 2x24V (as of firmware version V1.3)
  - TM PosInput 2 (as of firmware version V1.3)
  - TM Timer DIDQ 16x24V
  - CPU 1511C-1 PN
  - CPU 1512C-1 PN
  - DI 32x24VDC HF (as of firmware version V2.1.0)
  - DI 16x24VDC HF (as of firmware version V2.1.0)
- ET 200SP modules
  - TM Count 1x24V (as of firmware version V1.3)
  - TM PosInput 1 (as of firmware version V1.3)
  - TM Timer DIDQ 10x24V
  - DI 8x24VDC HS
- ET 200AL modules
  - DIQ 16x24VDC/0.5A 8xM12

TM Count, TM PosInput and compact CPU are suitable for complex counting and measuring tasks and for position detection. TM Timer DIDQ and digital modules are suitable for simple counting tasks.

Conventions

Please observe notes marked as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

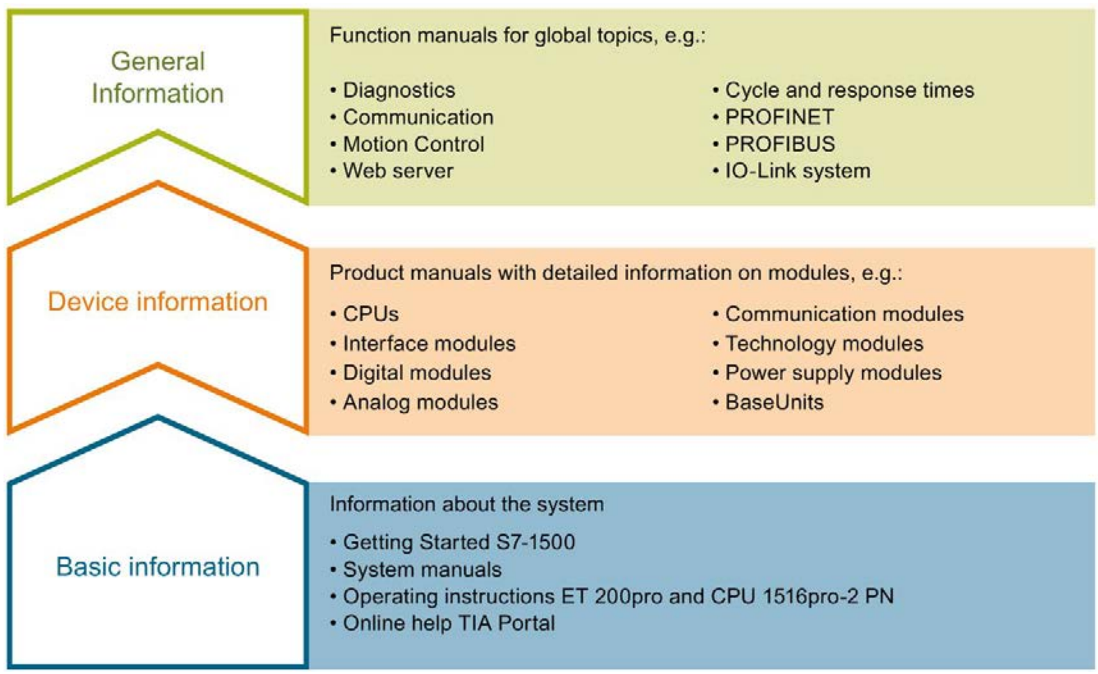
Additional assistance

- You can find information about the technical support offerings in the appendix Service & Support (Page 234).
- The range of technical documentation for the individual SIMATIC products and automation systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

The basics of counting, measurement and position input 2

2.1 Overview of modules and properties

Modules for the S7-1500 and ET 200MP systems

The table below summarizes the performance features of the modules for counting, measuring and position input for the S7-1500 and ET 200MP systems.

Property	S7-1500 / ET 200MP				
	Technology module			Digital input module	Compact CPU
	TM Count 2x24V	TM PosInput 2	TM Timer DIDQ 16x24V	DI 32x24VDC HF DI 16x24VDC HF	CPU 1511C-1 PN CPU 1512C-1 PN
Number of counters	2	2	4[1]	2	6
Use of counters can be activated/deactivated	—	—	X	X	X
Maximum signal frequency	200 kHz	1 MHz	50 kHz	1 kHz	100 kHz
Maximum count frequency for incremental encoders with quadruple evaluation (Page 76)	800 kHz	4 MHz	200 kHz	—	400 kHz
Maximum counting range	32 bits (Page 24)	32 bits (Page 24)	32 bits (Page 82)	32 bits (Page 87)	32 bits (Page 24)
Maximum position value range (Page 26)	—	32 bits	—	—	—
24 V incremental encoder connection	X (Page 71)	—	X (Page 84)	—	X (Page 71)
24 V pulse encoder connection	X (Page 71)	—	X (Page 84)	X (Page 95)	X (Page 71)
RS422/TTL incremental and pulse encoder (Page 73) connection	—	X	—	—	—
SSI absolute encoder (Page 75) connection	—	X	—	—	—
Position input for Motion Control (Page 70)	X	X	—	—	X

Property	S7-1500 / ET 200MP				
	Technology module			Digital input module	Compact CPU
	TM Count 2x24V	TM PosInput 2	TM Timer DIDQ 16x24V	DI 32x24VDC HF DI 16x24VDC HF	CPU 1511C-1 PN CPU 1512C-1 PN
5 V encoder supply	—	X	—	—	—
24 V encoder supply	X	X	X	—	X
Number of additional digital inputs per counter	3	2	—	—	2
Number of physical digital outputs per counter	2	2	—	—	1
Number of logical digital outputs per counter	2	2	—	1	2
Software gate	X (Page 30)	X (Page 30)	—	X (Page 90)	X (Page 30)
Hardware gate	X (Page 30)	X (Page 30)	—	—	X (Page 30)
Capture function (Latch) (Page 34)	X	X	—	—	X
Synchronization (Page 39)	X	X	—	—	X
Comparison functions	X (Page 47)	X (Page 47)	—	X (Page 92)	X (Page 47)
Hysteresis (Page 66)	X	X	—	—	X
Frequency, velocity and period duration measurement (Page 58)	X	X	—	—	X
Isochronous mode support	X (Page 79)	X (Page 79)	X (Page 85)	X (Page 96)	—
Support for diagnostic interrupts for sensor signals	X (Page 70)	X (Page 70)	—	—	X (Page 70)
Hardware interrupt support	X (Page 70)	X (Page 70)	—	X (Page 95)	X (Page 70)
Configurable filter for count signals and digital inputs	X	X	—	X	X

[1] The number of available counters is dependent on the channel configuration. In order to use four counters, you must choose the use of eight inputs in the channel configuration. If you choose the use of three inputs, you can use one counter. Other channel configurations do not allow any counter use.

Modules for the ET 200SP system

The following table provides an overview of the performance features of the modules for counting, measuring and position input for the ET 200SP system.

Property	ET 200SP			
	Technology module			Digital input module
	TM Count 1x24V	TM PosInput 1	TM Timer DIDQ 10x24V	DI 8x24VDC HS
Number of counters	1	1	3[1]	4
Use of counters can be activated/deactivated	—	—	X	X
Maximum signal frequency	200 kHz	1 MHz	50 kHz	10 kHz

2.2 Basics of counting, measuring and position input (TM Count, TM PosInput, Compact CPU)

2.2.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

2.2.2 Overview of applications

Introduction

The technology module is configured and assigned parameters using the configuration software.

The operation and control of the technology module functions is effected either via the technology object or through the application program via the control and feedback interface.

System environment for TM Count and TM PosInput

The technology modules can be used in the following system environments:

Application scenarios	Components required	Configuration software	In the user program
Central operation with an S7-1500 CPU or 151xSP CPU	• S7-1500 automation system or ET 200SP CPU • Technology module	STEP 7 (TIA Portal): Operating with "Counting and measurement" technology object • Device configuration with hardware configuration (Page 175) • Parameter setting with High_Speed_Counter (Page 97) or SSI_Absolute_Encoder (Page 142) technology object	For incremental / pulse encoders: High_Speed_Counter instruction for the technology object For SSI absolute encoder: SSI_Absolute_Encoder instruction for the technology object
		STEP 7 (TIA Portal): Position input for "Motion Control" technology object • Device configuration with hardware configuration (Page 175) • Parameter setting with axis and measuring input technology object (Page 183)	Instructions for "Motion Control" technology object
		STEP 7 (TIA Portal): Manual operation (without technology object) • Device configuration and parameter setting (Page 175) with hardware configuration	Direct access to control and feedback interface of the technology module in the I/O data

<table>
<tr><th>Application scenarios</th><th>Components required</th><th>Configuration software</th><th>In the user program</th></tr>
<tr><td rowspan="3">Distributed operation with a S7-1500 CPU</td><td rowspan="3">S7-1500 automation system

</table>

Application scenarios	Components required	Configuration software	In the user program
Distributed operation with an S7-1200 CPU	• S7-1200 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): Device configuration and parameter setting (Page 175) with hardware configuration	Direct access to control and feedback interface (Page 219) of the technology module in the IO data
Distributed operation with a S7-300/400 CPU	• S7-300/400 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): Device configuration and parameter setting (Page 175) with hardware configuration STEP 7: Device configuration and parameter setting with HSP (up to firmware version V1.2) or GSD file	Direct access to control and feedback interface (Page 219) of the technology module in the IO data
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Technology module	Third-party configuration software: Device configuration and parameter settings with GSD file	Direct access to control and feedback interface (Page 219) of the technology module in the IO data

System environment for a Compact CPU

The Compact CPUs can be used in the following system environments:

Application scenarios	Components required	Configuration software	In the user program
Central operation with a S7-1500 Compact CPU	• S7-1500 automation system • Compact CPU	STEP 7 (TIA Portal): Operating with "Counting and measurement" technology object • Device configuration with hardware configuration (Page 175) • Parameter setting with High_Speed_Counter (Page 97) technology object	High_Speed_Counter instruction for the technology object
		STEP 7 (TIA Portal): Position input for "Motion Control" technology object • Device configuration with hardware configuration (Page 175) • Parameter setting with axis and measuring input technology object (Page 183)	Instructions for "Motion Control" technology object
		STEP 7 (TIA Portal): Manual operation (without technology object) • Device configuration and parameter setting (Page 175) with hardware configuration	Direct access to control and feedback interface of the technology module in the I/O data

Parameter assignment options

In an S7-1500 system, you have two options for parameter assignment and control of technology module functions:

- Configuration using the technology object and control using the associated instruction
  Access to the control and feedback interface of the technology module takes place through the technology object.
- Parameter setting via hardware configuration
  The control and feedback interface of the technology module is accessed using direct access to the I/O data.

Configuration via technology object

For central and distributed use, we recommend the convenient, graphics-assisted configuration using a technology object. A detailed description of this configuration can be found in section High_Speed_Counter technology object (Page 97) or SSI_Absolute_Encodertechnology object (Page 142).

You specify the "Operation with technology object "Counting and measuring"" in the device configuration of the technology module: see section Operating mode (Page 181).

You can assign the technology module and counting channel in the basic parameters of the technology object: see section Basic parameters (Page 103).

Parameter setting via hardware configuration

You specify the "Manual operation (without technology object)" in the device configuration of the technology module: see section Operating mode (Page 181).

Additional support for parameter setting via hardware configuration is available in the context-sensitive help for the parameters in STEP 7 (TIA Portal). A description of the control and feedback interface is available in the following sections:

- Assignment of the control interface (Page 219)
- Assignment of the feedback interface (Page 222)

2.2.3 Recording of count signals

2.2.3.1 Counting with incremental or pulse encoder

Counting refers to the recording and adding up of events. The counters of the technology modules capture and evaluate pulse and incremental signals. The count direction can be specified using encoder or pulse signals or through the user program.

You can control counting processes using the digital inputs of the technology module. You can switch the digital outputs exactly at defined counter values, regardless of the user program.

You can configure the response of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program.

The highest counter limit that can be set is 2147483647 ($2^{31}–1$). The lowest counter limit that can be set is –2147483648 ($–2^{31}$).

You can configure the response of the counter at the counter limits:

- Continue or stop counting upon violation of a counter limit (automatic gate stop)
- Set counter value to start value or to opposite counter limit upon violation of a counter limit

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime by the user program.

The technology module can, as configured, set the current counter value to the start value upon synchronization, upon Capture function activation, upon violation of a counter limit or when the gate is opened.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are captured.

The hardware gate is controlled externally via a digital input of the technology module. The software gate is controlled via the user program. The hardware gate can be enabled through parameter assignment. The software gate (bit in the control interface of the cyclic I/O data) cannot be disabled.

Capture (Latch)

You can configure an external reference signal edge that triggers the saving of the current counter value or position value as a Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input
- Rising edge of the N signal at the encoder input

When using a digital input, you can specify whether counting is to continue from the current counter value or from the start value after the Capture function. When using the rising edge of the N signal at the encoder input, counting is to continue from the current counter value after the Capture function. The use of a digital input and the use of the N signal are not mutually exclusive for the Capture function.

The parameter "Frequency of the Capture function" determines if the function is executed for each configured edge or only once after each enable.

Measuring input

If you use the position input for Motion Control (Page 70), you can use the "Measuring input" technology object to execute a measuring input function with a hardware digital input.

Synchronization

You can configure an external reference signal edge to load the counter with the specified start value. The following external signals can load the counter with the start value:

- Rising or falling edge of a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input depending on the level of the assigned digital input

The parameter "Frequency of synchronization" determines whether the function is executed for each configured edge or only once after each enable.

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the counter value fluctuate around this position. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output will be switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

2.2.3.2 Position input with SSI absolute encoder

Description

You can use the TM PosInput technology modules with an SSI absolute encoder for position detection. The technology module reads the position value via a synchronous serial interface from the SSI absolute encoder and makes it available to the controller.

You can switch the digital outputs of the technology module exactly at defined position values, regardless of the user program. Position input with an SSI absolute encoder does not involve gate control. Due to system constraints, synchronization is not possible with an SSI absolute encoder.

Gray- and dual-code

Gray-code and dual-code SSI absolute encoders are supported.

Capture (Latch)

You can configure one or both edges of a digital input that triggers a saving of the current position value as Capture value.

The parameter "Frequency of the Capture function" determines if the function is executed for each configured edge or only once after each enable.

Measuring input

If you use the position input for Motion Control (Page 70), you can use the "Measuring input" technology object to execute a measuring input function with a hardware digital input.

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the position value fluctuate around this position. If a comparison value or a limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

Range for position value

You can specify a frame length of 10 bits to 40 bits for the SSI absolute encoder. The configurable bit numbers of the LSB and the MSB of the position value in the frame define the value range. The technology module can read a position value with a maximum length of 32 bits and communicate it to the controller.

If you use an encoder with a position value length of up to 31 bits, the position value is handled unsigned as a positive value and can assume values between 0 and $2^{(MSB-LSB+1)}-1$. If you use an encoder with a position value length of 32 bits, the MSB of the position value corresponds to the sign and the position value can assume values between –2147483648 and 2147483647. If you use a 32 bit position value for the comparison function, the position value is interpreted as DINT.

Complete SSI frame

Instead of having a measured variable returned, you can choose to have the least significant 32 bits of the current unprocessed SSI frame returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface.

2.2.4 Behavior at the counting limits

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another upward count pulse is received. The counter low limit is violated when the current counter value is equal to the counter low limit and another downward count pulse is received.

The appropriate status bit is set in the feedback interface in the event of limit violation:

Counting limit violated	Status bit
High counting limit	EVENT_OFLW is set
Low counting limit	EVENT_UFLW is set

You can reset the status bits with RES_EVENT .

You can configure whether or not and from which counter value counting is to continue following counting limit violation.

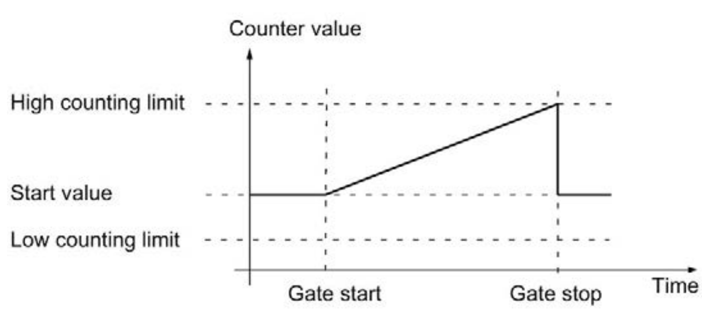
Note

The high counting limit and the start value define the value range of the counter:

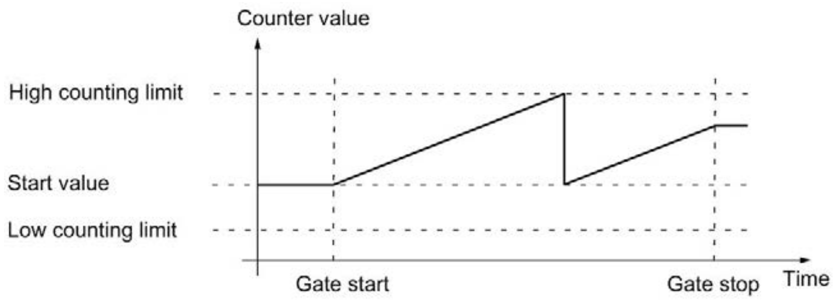
Value range of the counter = (high limit – start value) + 1

Examples

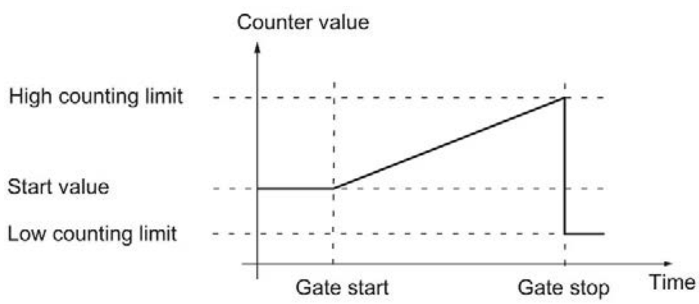
The figure below shows an example for terminating the counting process (automatic gate stop) after an overflow and setting the counter to the start value:



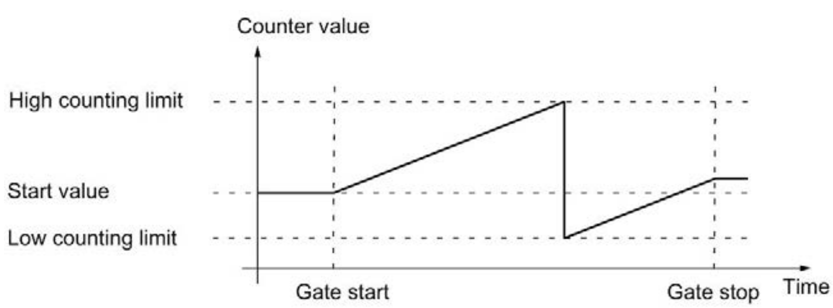
The figure below shows an example for continuing the counting process after an overflow and setting the counter to the start value:



The figure below shows an example for terminating counting after an overflow and setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.2.5 Gate control with incremental or pulse encoder

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The technology modules have two gates for each channel. These define the resulting internal gate:

- Software gate
- Hardware gate

2.2.5.1 Software gate

The software gate of the channel is opened and closed with the control bit (Page 219) SW_GATE. The status of the software gate is indicated by the feedback bit (Page 222) STS_SW_GATE .

2.2.5.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate by means of signals at the configured digital inputs of the channel.

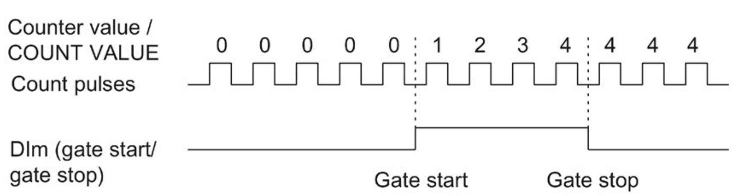
Note

The configured input filters delay the control signal of the digital input.

The status of a DIm digital input is indicated by the respective feedback bit (Page 222) STS_DIm .

Level-triggered opening and closing of the hardware gate with a digital input

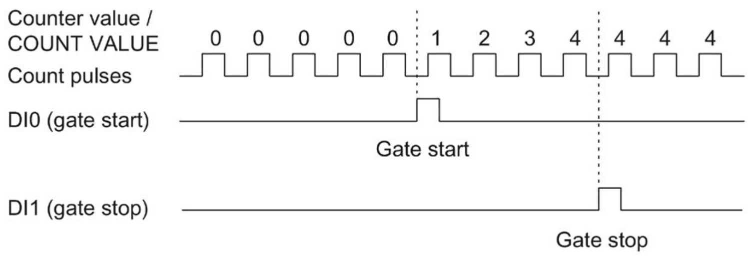
The figure below shows an example of level-triggered opening and closing with a digital input. The digital input is configured to be active with high level:



As long as the digital input is active, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input becomes inactive. The counter value stays constant and ignores any further count pulses.

Edge-triggered opening and closing of the hardware gate with two digital inputs

The figure below shows an example of opening and closing with two digital inputs. The two digital inputs are configured so that the rising edge is evaluated:



The hardware gate is opened with the configured edge at the digital input that is configured for opening. The hardware gate is closed with the configured edge at the digital input that is configured for closing.

2.2.5.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the feedback bit (Page 222) STS_GATE.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

When you configure the counter behavior, you can specify whether the counting process is to start from the start value or from the current counter value when the internal gate is opened.

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.2.5.4 Counter behavior at gate start

You have the following configuration options for counter behavior upon gate start:

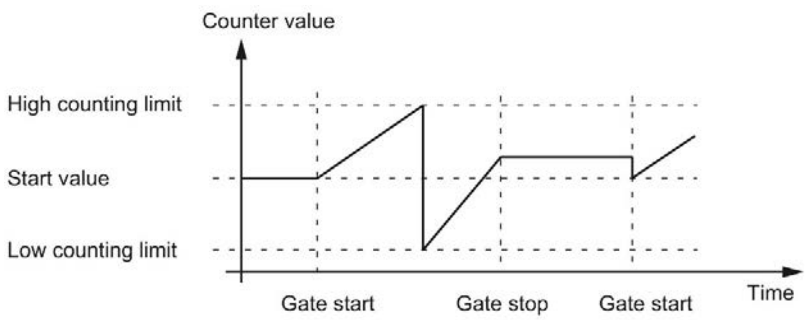
- Setting counter to start value
- Continuing with the current counter value

Setting counter to start value

Counter behavior is as follows for this configuration:

Each counting process starts with the start value when the internal gate is opened.

The figure below shows an example for continuing the counting process after counter is set to the start value:

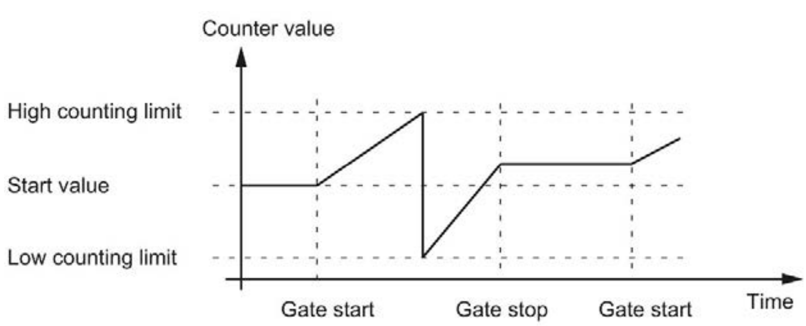


Continuing with the current counter value

Counter behavior is as follows for this configuration:

Each counting process starts from the current counter value after the internal gate is reopened.

The figure below shows an example for continuing the counting process with the current counter value:



2.2.6 Capture (Latch)

2.2.6.1 Capture with incremental or pulse encoder

Description

The "Capture" function is used to save the current counter value with an external reference signal. You can configure the Capture function for the following reference signals:

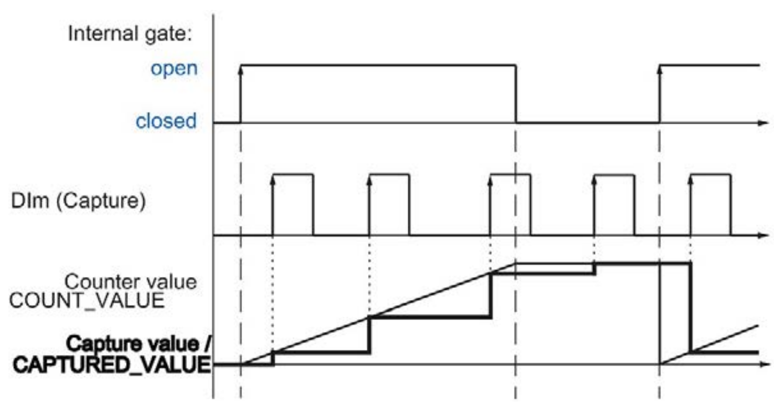
- Rising or falling edge at a digital input
- Rising and falling edge at a digital input
- Rising edge of signal N at the encoder input

Function principle

The Capture value is always the exact counter value at the time of the respective edge (delayed by the configured input filter time). The Capture function is effective regardless of the status of the internal gate. The unchanged counter value is saved when the gate is closed.

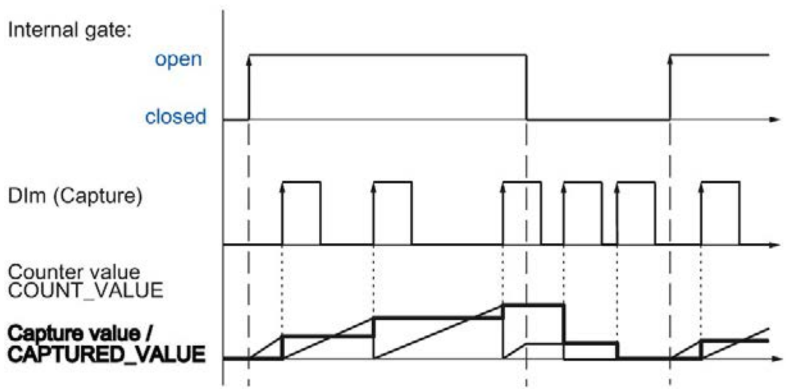
The figure below shows an example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Continue counting after Capture event



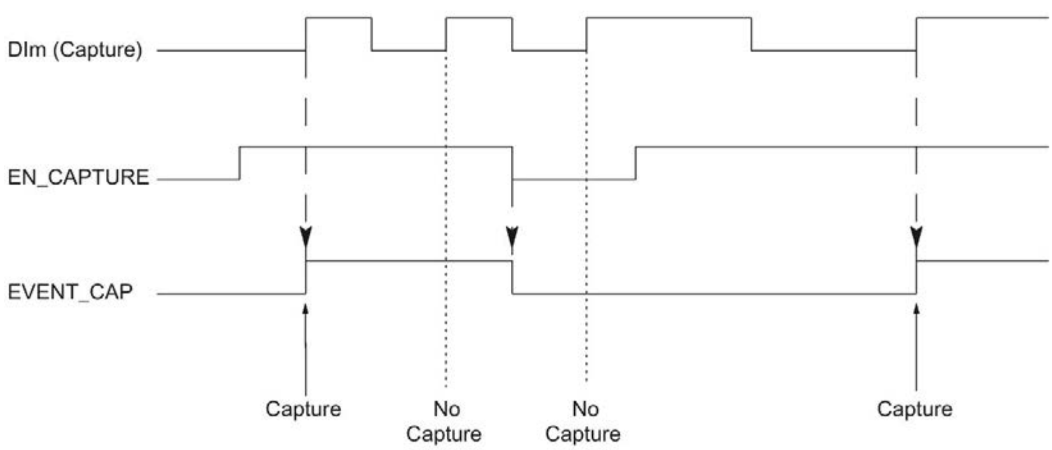
The figure below shows another example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Reset counter value to start value after Capture event and continue counting.

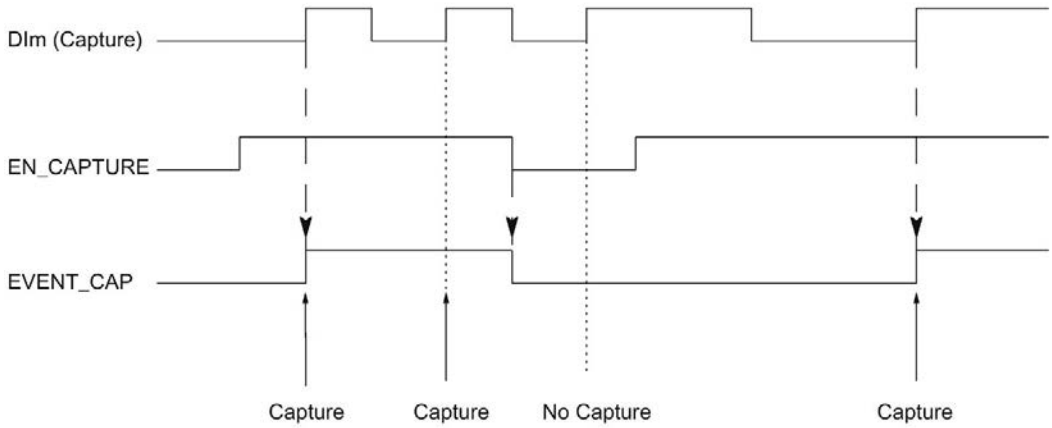


The control bit (Page 219) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 222) EVENT_CAP indicates that a counter value has been saved as a Capture in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 222) STS_DIm .

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the one-time Capture function by the rising edge at a digital input:



The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the periodic Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

The Capture function has no effect on the feedback bit STS_CNT and the LEDs UP and DN.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. If the hardware interrupts are triggered more quickly by the system than they can be acknowledged, hardware interrupts are lost and the "Hardware interrupt" diagnostics interrupt is signaled.

2.2.6.2 Capture with SSI absolute encoder

Description

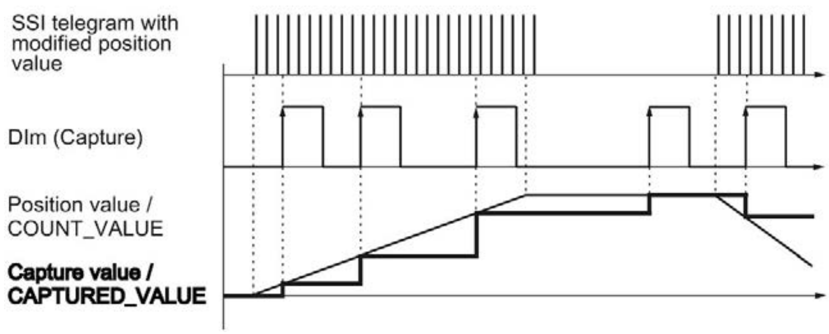
The "Capture" function is used to save the current position value using an external reference signal. You can configure the Capture function for the following reference signals:

- Rising **or** falling edge at a digital input
- Rising **and** falling edge at a digital input

Function principle

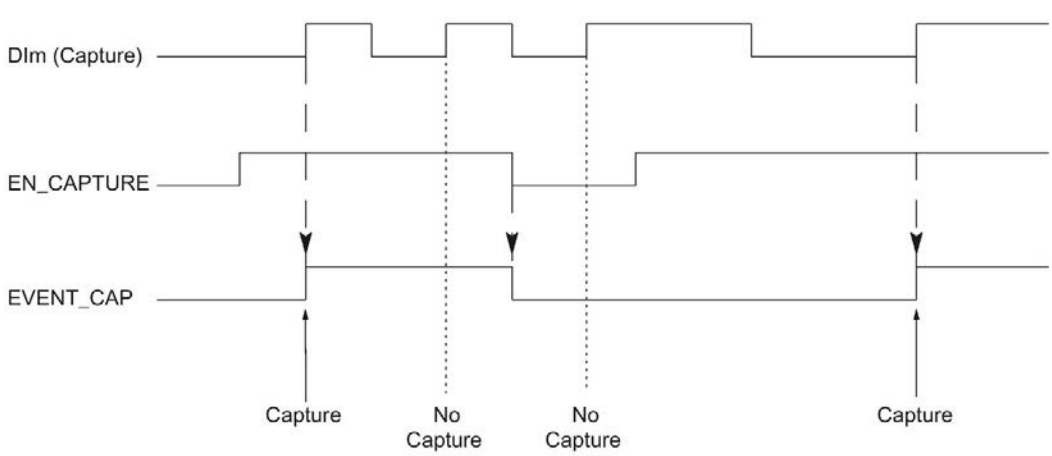
At the time of each edge, the position value of the last valid SSI frame is stored in the Capture value.

The figure below shows an example of the Capture event by a rising edge at the configured digital input:

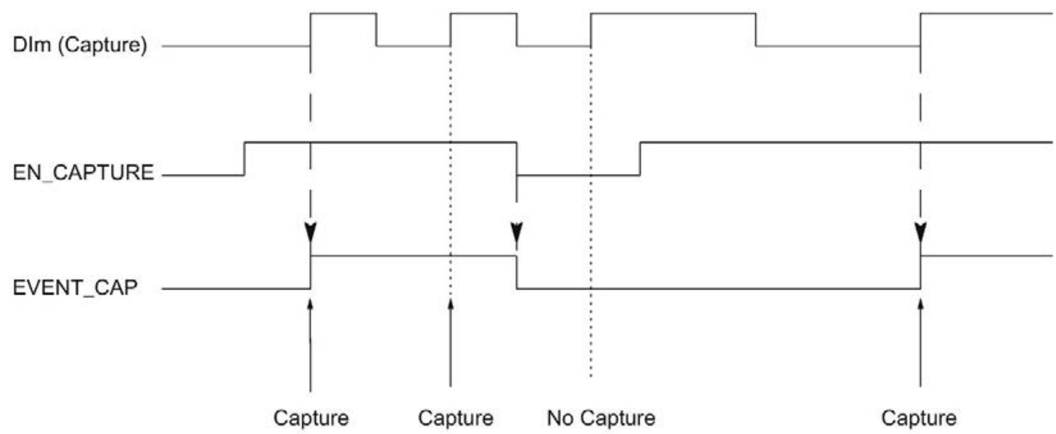


The control bit (Page 219) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 222) EVENT_CAP indicates that a position value has been saved as Capture value in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 222) STS_DIm .

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the one-time Capture function by the rising edge at a digital input:



The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the periodic Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. If the hardware interrupts are triggered more quickly by the system than they can be acknowledged, hardware interrupts are lost and the "Hardware interrupt" diagnostics interrupt is signaled.

2.2.7 Synchronization

Description

You use the "Synchronization" function to set the counter to the pre-defined start value with an external reference signal. You can configure synchronization for the following reference signals:

- Rising or falling edges at a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input defined by the level of a digital input

Function principle

Synchronization always takes place exactly at the time of the reference signal. Synchronization is effective regardless of the status of the internal gate.

You use the control bit (Page 219) EN_SYNC_UP to enable synchronization for counting in an upwards direction. Use the control bit (Page 219) EN_SYNC_DN to enable synchronization for counting down. The feedback bit (Page 222) EVENT_SYNC indicates that synchronization has been performed. Resetting EN_SYNC_UP or EN_SYNC_DN also resets EVENT_SYNC.

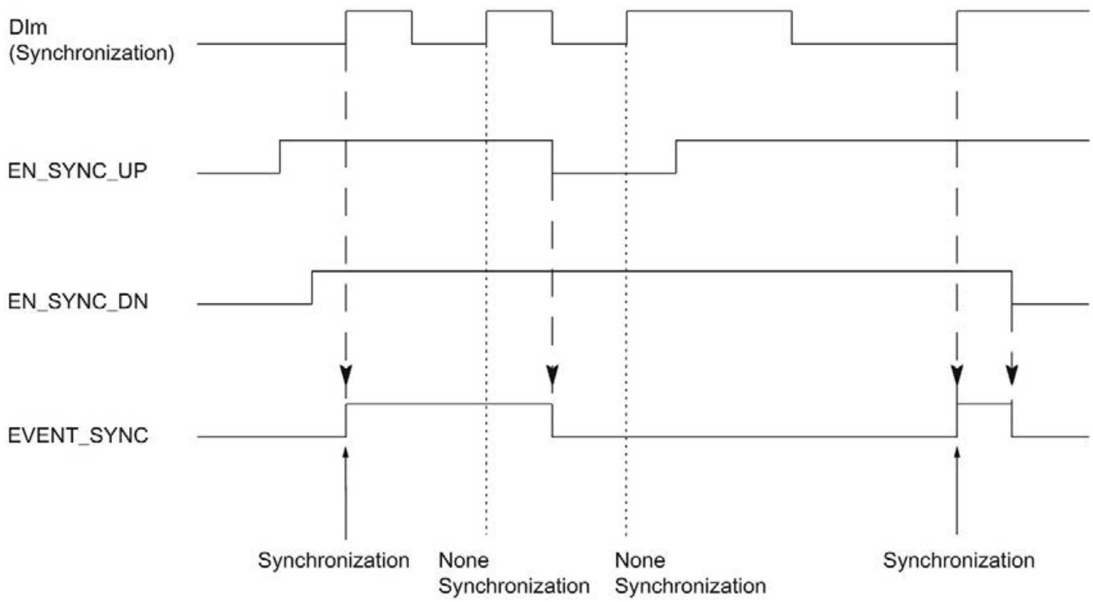
Note

The configured input filters delay the control signal of the corresponding digital input.

Synchronization has no effect on the feedback bit (Page 222) STS_CNT and the LEDs UP and DN.

Single synchronization

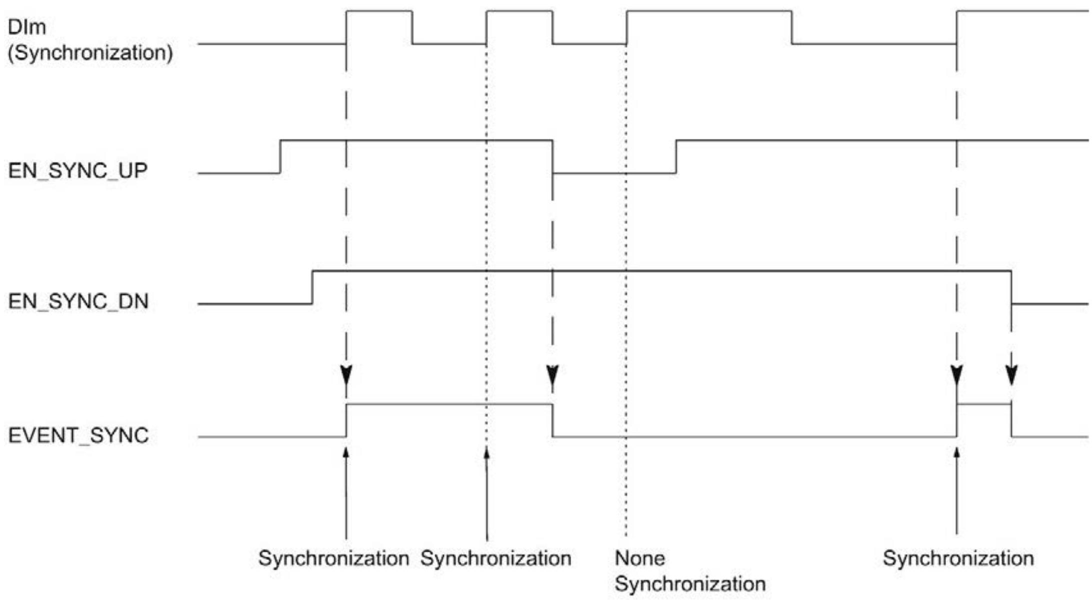
The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DNand EVENT_SYNC bits with single synchronization by an edge at a digital input for count pulses in an upwards direction:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. The counter can only be synchronized again once the control bit (Page 219) EN_SYNC_UP has been reset and set again.

Periodic synchronization

The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DN and EVENT_SYNC bits with periodic synchronization by an edge at a digital input for count pulses in an upwards direction:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

Hardware interrupt

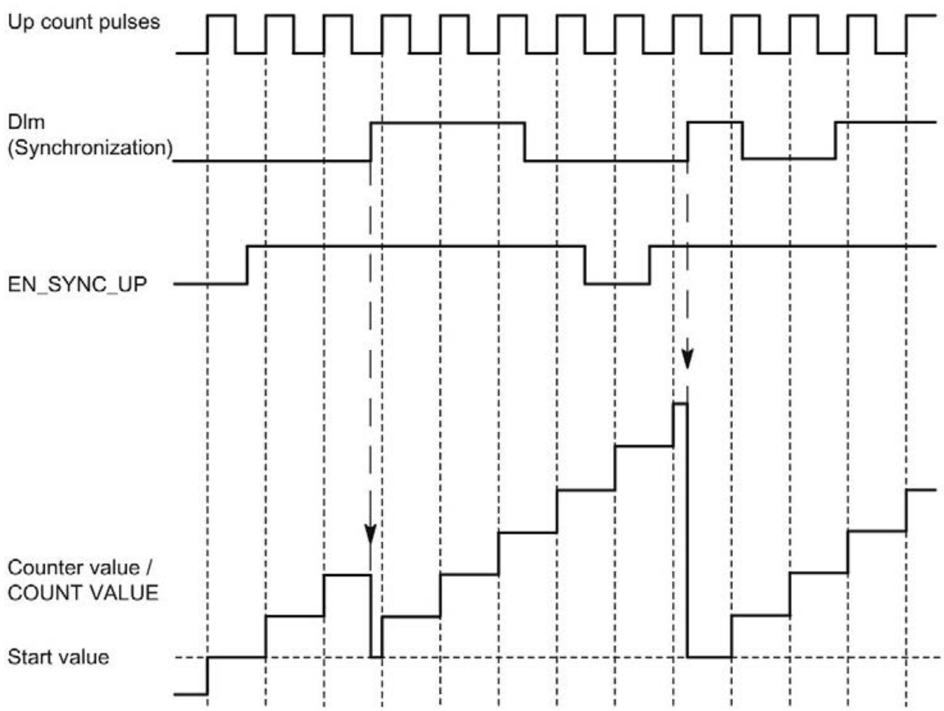
You can configure a hardware interrupt for the synchronization. If the hardware interrupts are triggered more quickly by the system than they can be acknowledged, hardware interrupts are lost and the "Hardware interrupt" diagnostics interrupt is signaled.

2.2.7.1 Synchronization by digital input

You can trigger synchronization by edges at a digital input.

Single synchronization

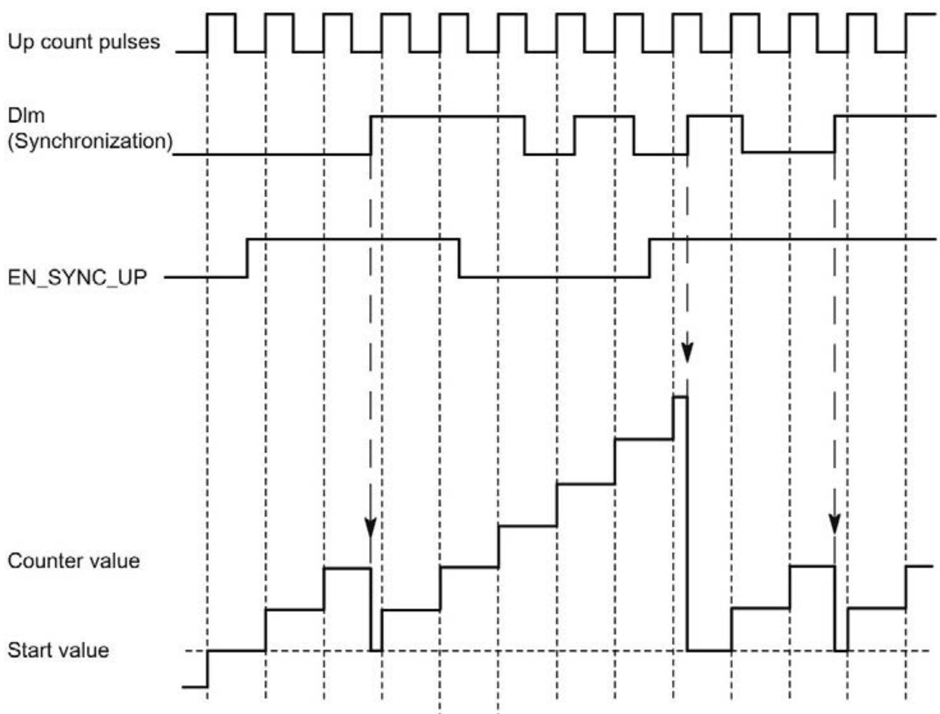
The figure below shows an example for single synchronization by an edge at a digital input:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. Until the control bit (Page 219) EN_SYNC_UP has been reset and set again, any additional rising edge at the digital output is ignored. The counter can then be synchronized again.

Periodic synchronization

The figure below shows an example for periodic synchronization by an edge at a digital input:



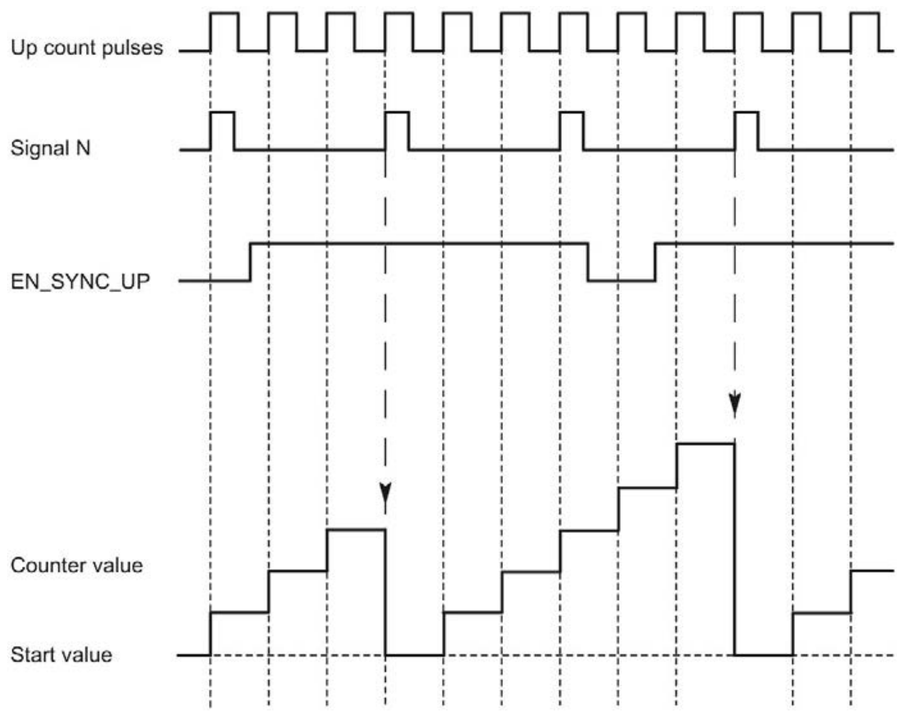
As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

2.2.7.2 Synchronization at signal N

You can trigger synchronization at signal N at the encoder input either directly or depending on the status of a digital input.

Single synchronization

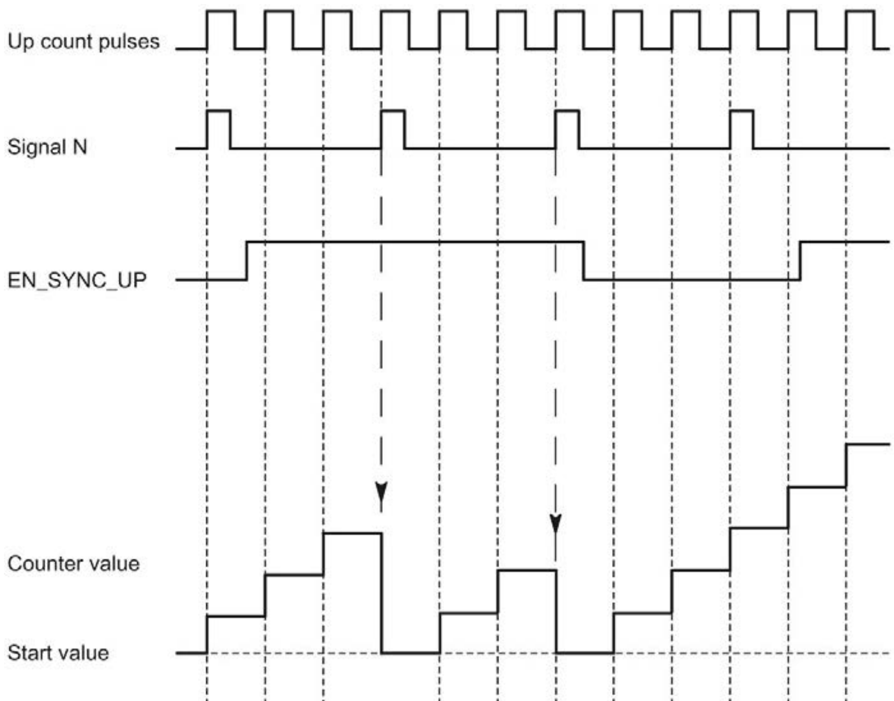
The figure below shows an example of single synchronization at signal N (not dependent on a digital input):



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first signal N. After resetting and setting the control bit (Page 219) EN_SYNC_UP once again, the counter can be synchronized again.

Periodic synchronization

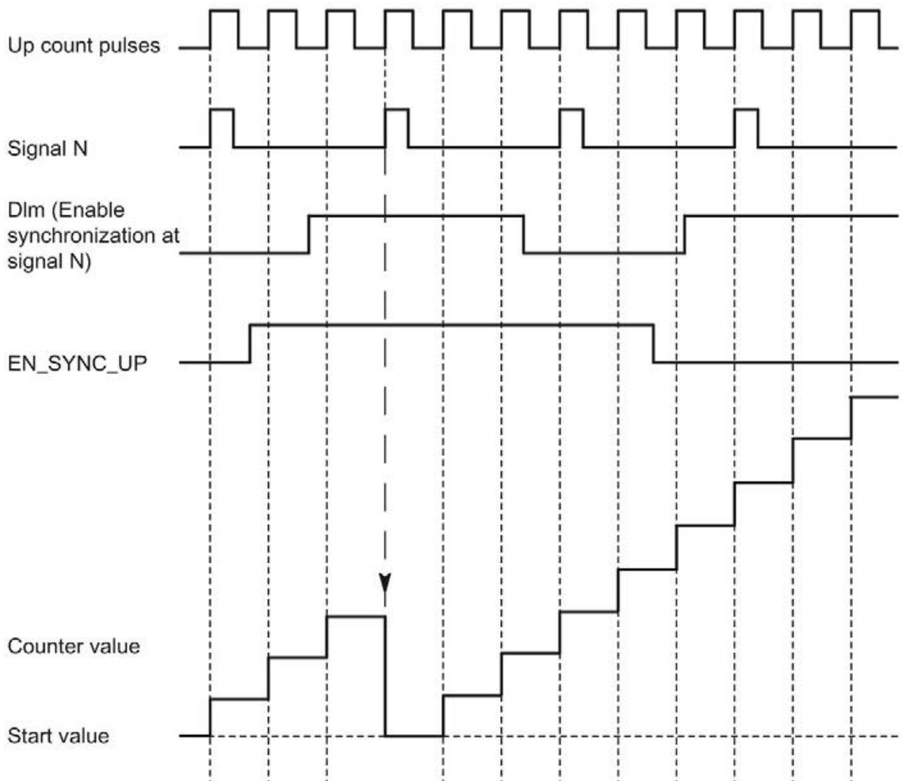
The figure below shows an example for periodic synchronization at signal N:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each signal N.

Enable by a digital input

The figure below shows an example for periodic synchronization at signal N depending on the status of a digital input:



As long as synchronization for counting up is enabled and the corresponding digital input is active, the counter is synchronized at each signal N. If one of the conditions is not met, the counter is not synchronized at the signal N.

2.2.8 Comparison values

2.2.8.1 Comparison values and outputs

Description

You can specify two comparison values to control both digital outputs of the channel independently of the user program:

- Comparison value 0 for digital output DQ0
- Comparison value 1 for digital output DQ1

Depending on the operating mode and the encoder used, define two position, counter or measured values as comparison value. The comparison values are configurable and can be modified during runtime using the user program.

Note

DQ0 of a counter of a Compact CPU

With a Compact CPU, the respective digital output DQ0 is available via the feedback interface, but not as a physical output.

Switching digital outputs from the user program

The control bits (Page 219) TM_CTRL_DQ0 and TM_CTRL_DQ1 are used to control use of the digital outputs.

If TM_CTRL_DQm is set to 0, you can control the relevant digital output from the user program with the control bit SET_DQm regardless of the configured technological function. If TM_CTRL_DQm is set to 1, the technological function of the controller of the respective digital output is enabled.

The status of a digital output is indicated by the respective STS_DQm feedback bit.

2.2.8.2 Switching at comparison values with counter value as reference

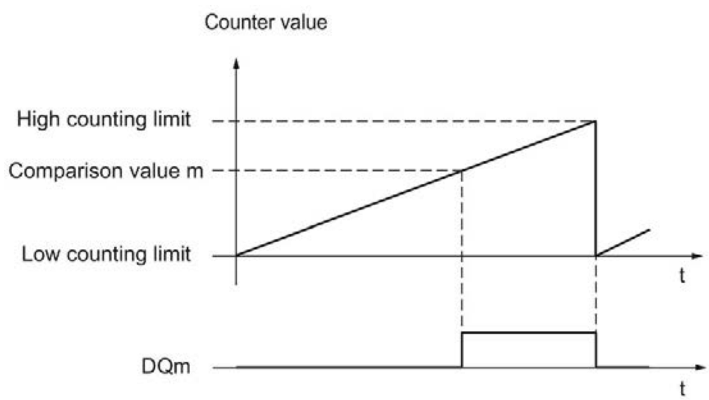
The comparison values are compared with the current counter value. If the counter value meets the assigned comparison condition and the technological function of the associated digital output is enabled, the digital output is set. If you assign "Between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high counting limit

The digital output is set to 1 if:

Comparison value <= counter value <= high counting limit

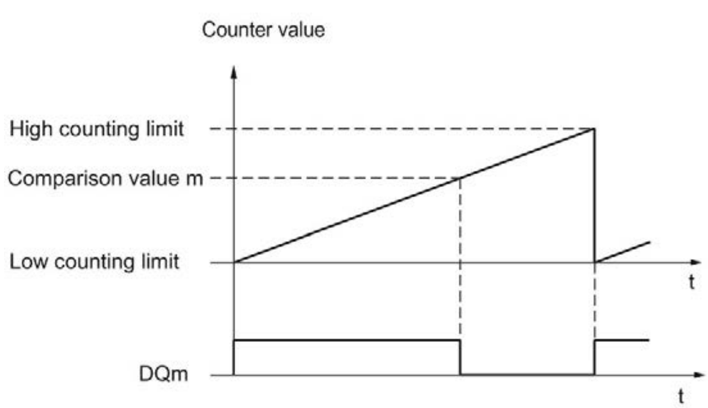


The comparison event is independent of the count direction.

Setting between comparison value and low limit

The digital output is set to 1 if:

Low counting limit <= counter value <= comparison value



The comparison event is independent of the count direction.

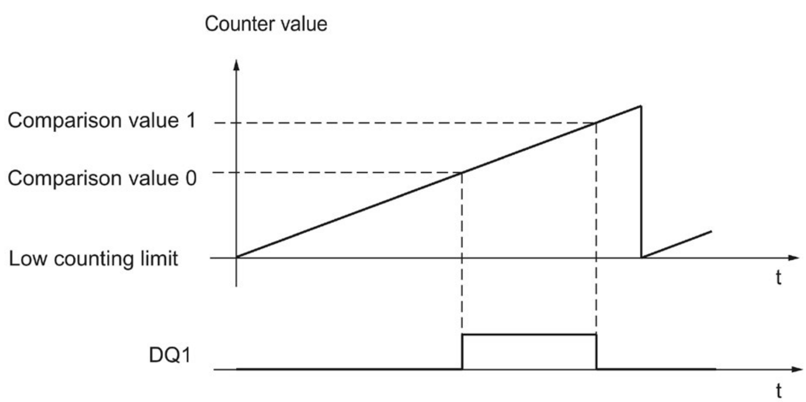
Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0. Comparison value 1 must be greater than Comparison value 0.

DQ1 is set to 1 if:

Comparison value 0 <= counter value <= comparison value 1

The figure below shows an example of the comparison event when counting in an upwards direction:

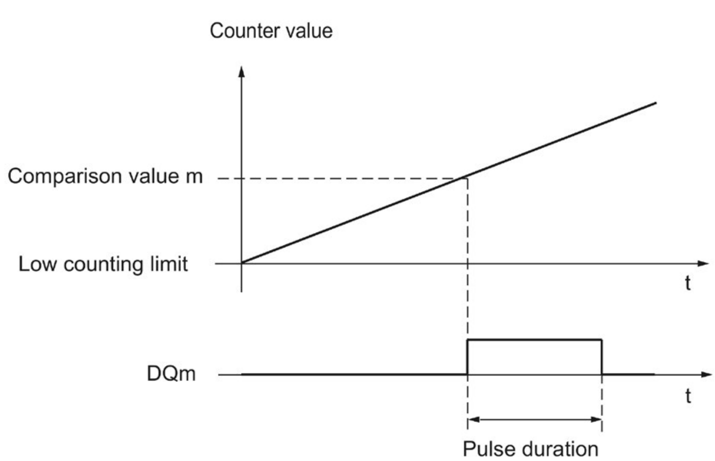


Setting at comparison value for one pulse duration

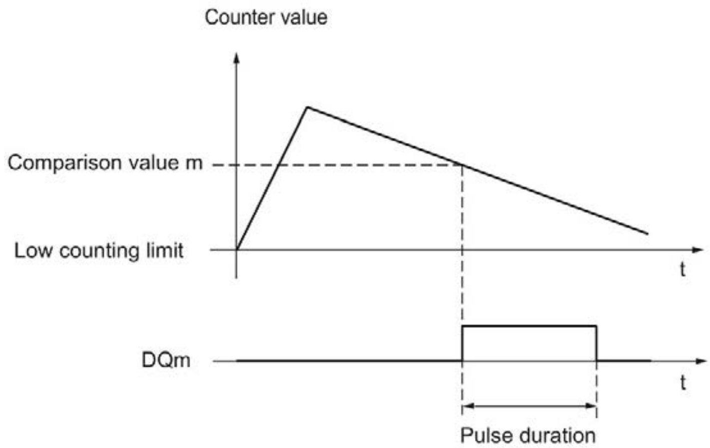
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Counter value = comparison value
- Current count direction = configured count direction for the comparison event

The figure below shows an example of the comparison event when counting in an upwards direction:

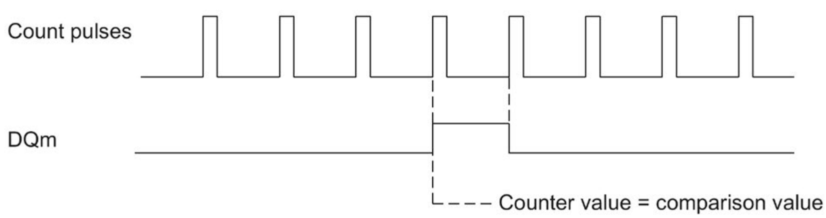


The figure below shows an example of the comparison event when counting in a downward direction:



To repeat the comparison event, the counter value must change and then correspond to the respective comparison value again.

If the pulse duration has been defined as "0" and the counter value is equal to the comparison value, the digital output is set to 1 until the next count pulse:



Note

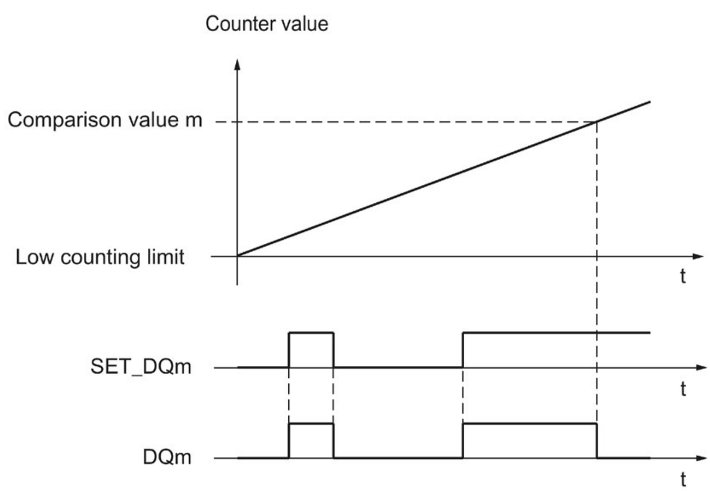
This comparison event switches the relevant digital output if a count pulse reaches the comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

Setting by the user program up to comparison value

You can set the respective digital output to 1 (edge) by setting the control bit (Page 219) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Match of the counter value and the comparison value in the configured direction of the comparison event
- Reset of the corresponding SET_DQm control bit.

The figure below shows an example of the comparison event when counting in an upwards direction:



You can disable the digital output before the counter value reaches the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached in the configured count direction, the feedback bit EVENT_CMPm is set independently of the state of the control bit SET_DQm.

The comparison event switches a digital output when a count pulse reaches the respective comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

2.2.8.3 Switching at comparison values with position value (SSI absolute value) as reference

The comparison values are compared with the current position value. If the position value meets the assigned comparison condition and the technological function of the associated digital output is enabled, the digital output is set. If you assign "Between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

If you use a 32 bit position value for the comparison function, the position value is interpreted as DINT.

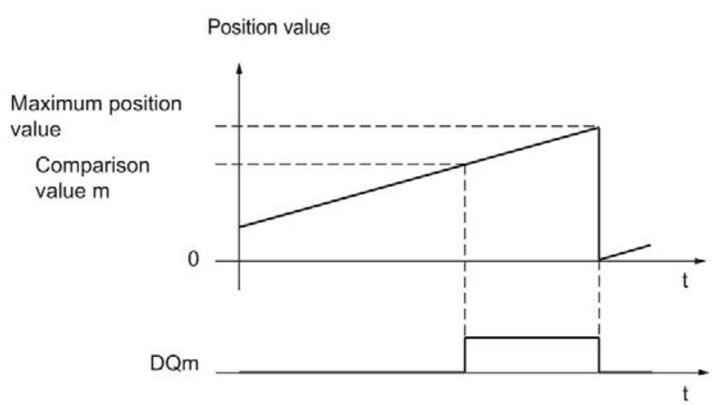
You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high limit

The high limit corresponds to the maximum position value.

The digital output is set to 1 if:

Comparison value <= position value <= maximum position value



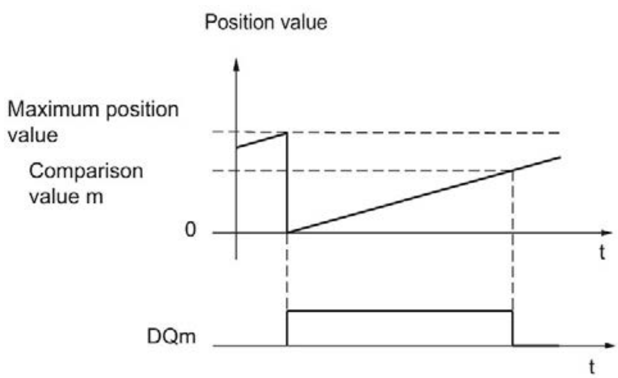
The comparison event is independent of the direction of the position value change. The maximum position value depends on the resolution of the SSI absolute encoder.

Setting between comparison value and low limit

The low limit corresponds to the position value "0".

The digital output is set to 1 if:

0 <= position value <= comparison value



The comparison event is independent of the direction of the position value change.

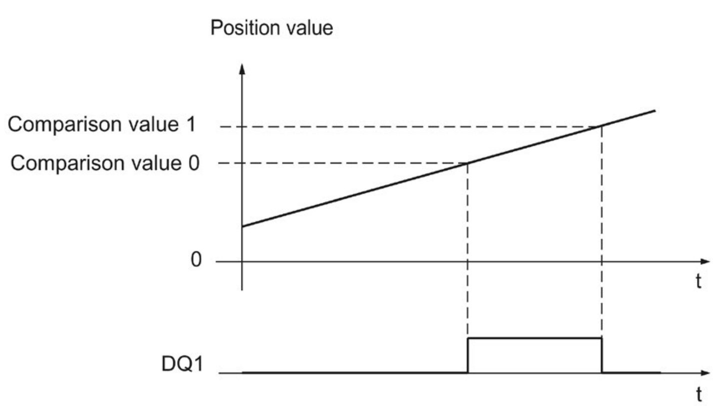
Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0. Comparison value 1 must be greater than Comparison value 0.

DQ1 is set to 1 if:

Comparison value 0 <= position value <= comparison value 1

The figure below shows an example of the comparison event when counting up:

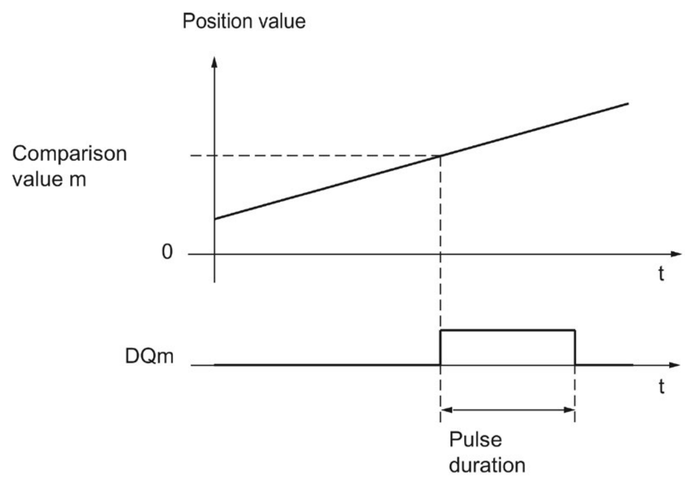


Setting at comparison value for one pulse duration

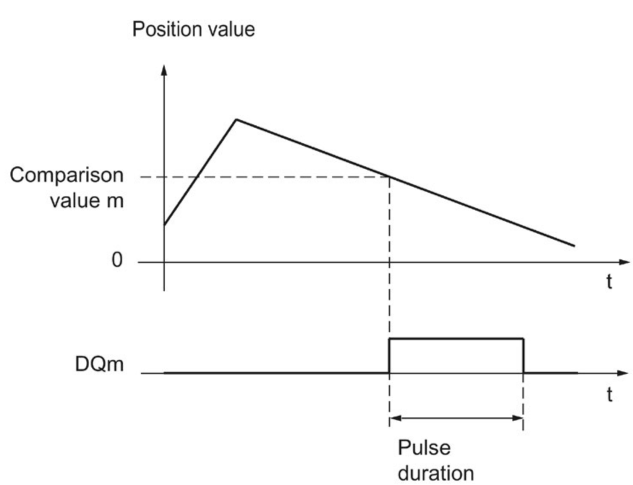
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Matching of the position value and comparison value or crossing of the comparison value
- Current direction of the position value change = assigned direction for the comparison event

The figure below shows an example of the comparison event when counting up:



The figure below shows an example of the comparison event when counting down:



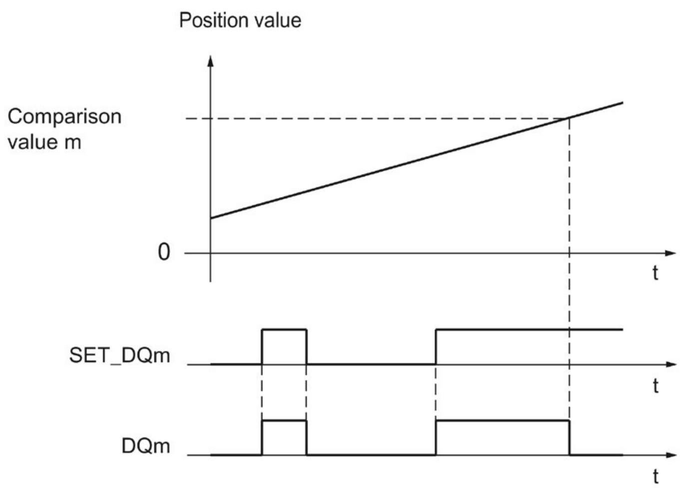
To repeat the comparison event, the position value must change and then correspond to or cross the respective comparison value again.

Setting by the user program up to comparison value

You can set each digital output to 1 (edge) by setting the control bit (Page 219) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Matching of the position value and the comparison value or crossing of the comparison value in the configured direction of the comparison event
- Resetting of the SET_DQm control bit.

The figure below shows an example of the comparison event when counting up:



You can disable the digital output before the position value corresponds to or exceeds the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached or exceeded in the assigned direction, feedback bit EVENT_CMPm is set independently of the status of control bit SET_DQm.

2.2.8.4 Switching at comparison values with measured value as reference

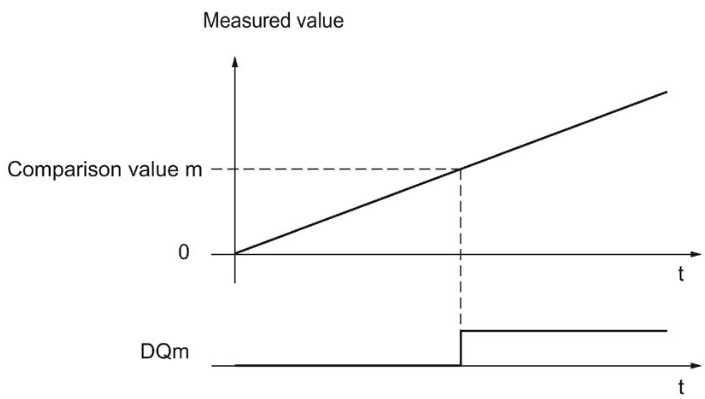
The comparison values are compared with the current measured value. If the measured value meets the configured comparison condition and the technological function of the corresponding digital output is enabled, the digital output is set. If you configure "Between comparison value 0 and 1" or "Not between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

You can make switching for a digital output dependent on one of the following comparison events:

Setting above the comparison value

The digital output is set to 1 if:

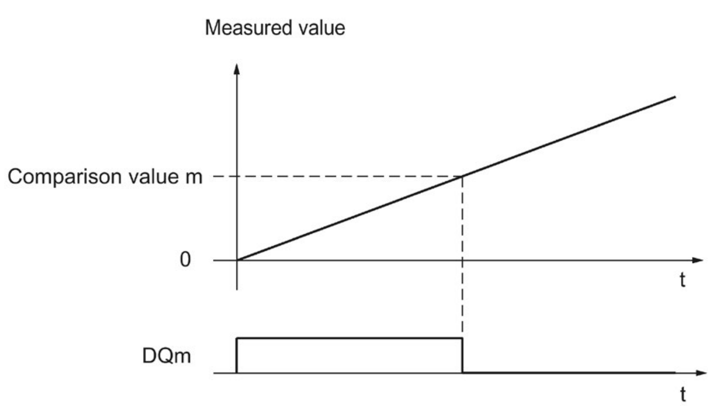
Measured value >= comparison value



Setting below the comparison value

The digital output is set to 1 if:

Measured value <= comparison value

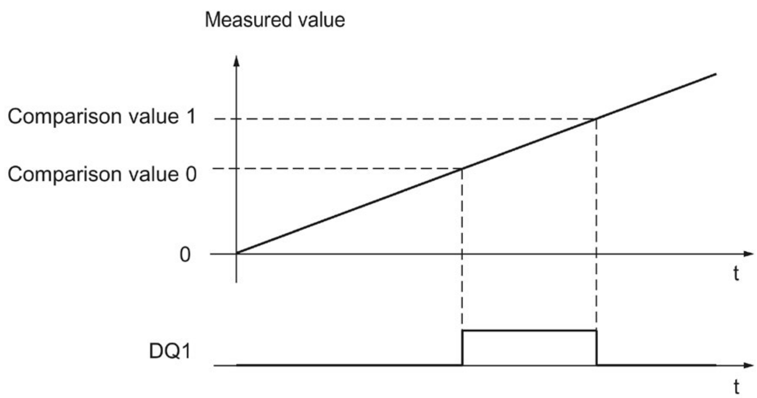


Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0. Comparison value 1 must be greater than Comparison value 0.

DQ1 is set to 1 if:

Comparison value 0 <= measured value <= comparison value 1

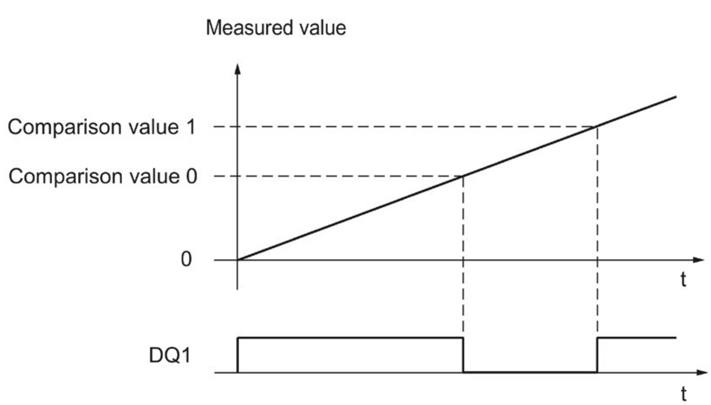


Not setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0. Comparison value 1 must be greater than Comparison value 0.

DQ1 is set to 1 if:

Comparison value 1 <= measured value <= comparison value 0



2.2.9 Measured value determination

2.2.9.1 Overview of measuring functions

The following highly accurate measuring functions are available (accuracy up to 100 ppm):

Measurement type (Page 59)	Description
Frequency measurement	The mean frequency is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in Hertz as floating point number.
Period measurement	The mean period duration is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in seconds as floating point number.
Velocity measurement	The mean velocity is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and other parameters, and returned in the configured unit of measurement.

Measured values and counter values are available concurrently in the feedback interface.

Update time

You can configure the interval at which the technology module updates the measured values cyclically as the update time. Setting longer update time intervals allows uneven measured variables to be smoothed and increases measuring accuracy.

Gate control for incremental and pulse encoders

Opening and closing the internal gate defines the period of time during which the count pulses are captured. The update time is asynchronous to the opening of the gate, which means that the update time is not started when the gate is opened. After the internal gate is closed, the last measured value captured is still returned.

2.2.9.2 Measured value determination with incremental or pulse encoder

Measuring range (TM Count and TM PosInput)

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0.04 Hz	800 kHz* / 4 MHz**
Period measurement	1.25 µs* / 0.25 µs**	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

* Applies to 24 V incremental encoders and "quadruple" signal evaluation.

** Applies to RS422 incremental encoders and "quadruple" signal evaluation.

All measured values are returned as signed values. The sign indicates whether the counter value increased or decreased during the relevant time period.

Measuring range (Compact CPU)

The measuring functions have the following measuring range limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0.04 Hz	400 kHz*
Period measurement	2.5 µs*	25 s
Velocity measurement	Depends on the configured number of "Increments per unit" and the "Time base for velocity measurement"	

* Applies to 24 V incremental encoders and "quadruple“ signal evaluation.

All measured values are returned as signed values. The sign indicates whether the counter value increased or decreased during the relevant time period.

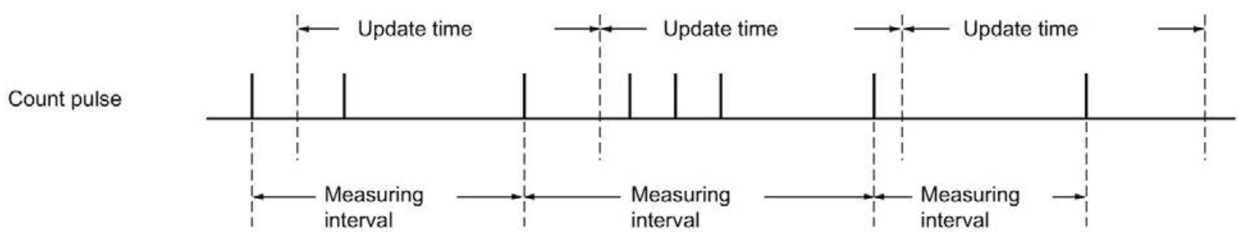
Measuring principle

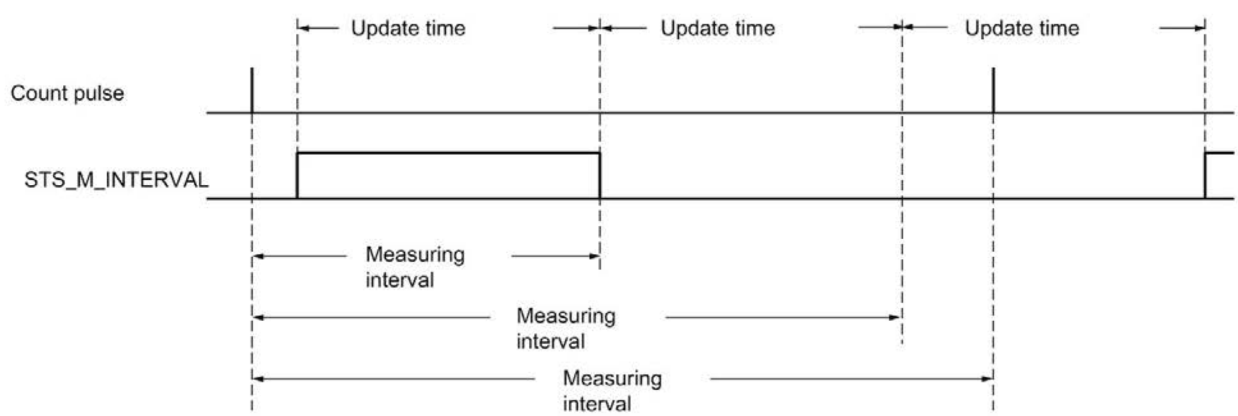
The technology module assigns a time value to each count pulse. The measuring interval is defined as the time between each last count pulse before and during the previous update time. The measuring interval and the number of pulses in the measuring interval are evaluated to calculate measured variables.

If there is no count pulse within an update time, the measuring interval is dynamically adjusted. In this case, a pulse is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last pulse which occurred. The number of pulses is then 1.

The feedback bit STS_M_INTERVAL indicates whether a count pulse occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual count pulse.

The following figures show the principle of measurement and the dynamic adjustment of the measuring interval:





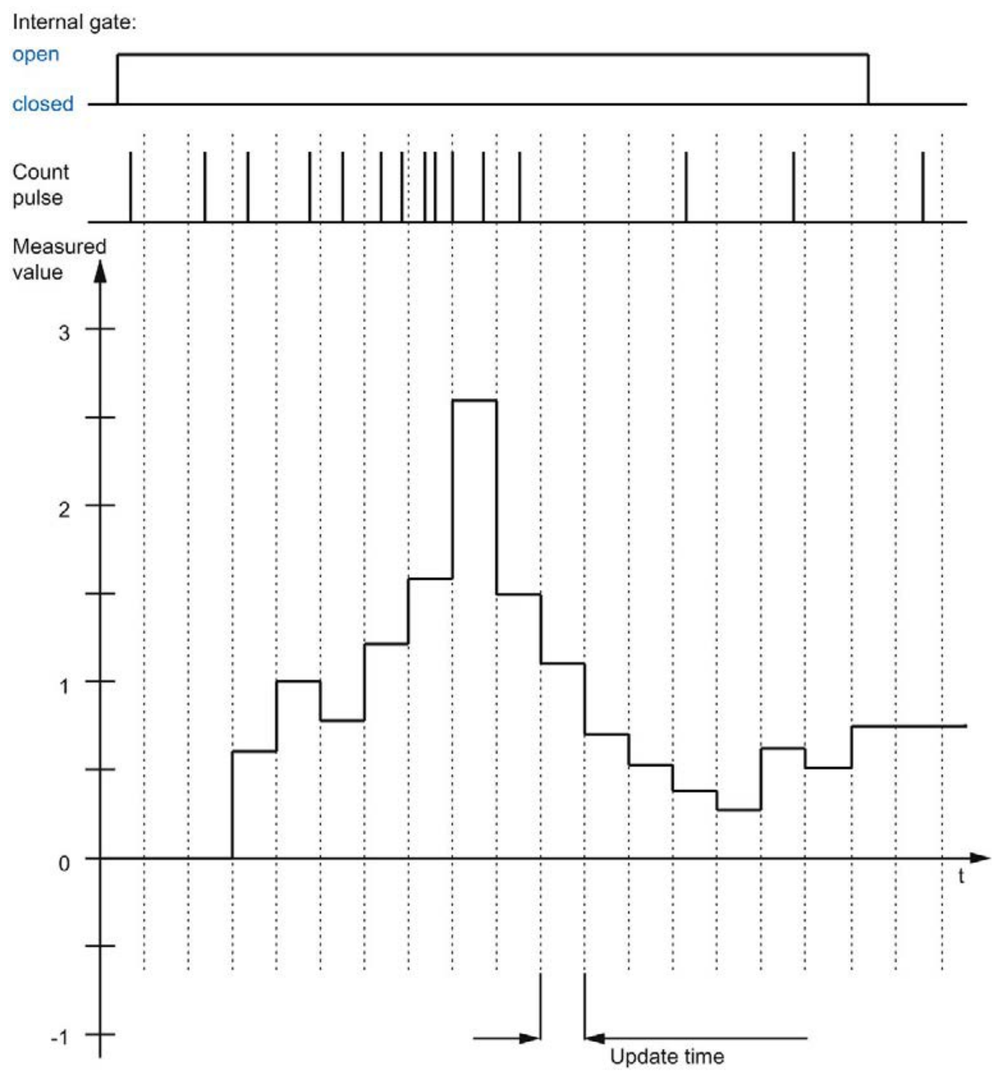
Frequency measurement

A value "0" is returned until the first measured value is available.

The measurement process begins with the first pulse detected once the internal gate has been opened. The first measured value can be calculated after the second pulse at the earliest.

The measured value is updated in the feedback interface (Page 222) upon completion of each update time. If the internal gate is closed, measuring stops and the measured value is no longer updated.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your encoder delivers 4000 increments per meter. The velocity is to be measured in meters per minute.

In this case, you need to configure 4000 Increments per unit and a time basis of one minute.

2.2.9.3 Measured value determination with SSI absolute encoder

Measuring range SSI absolute encoder

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0,04 Hz	4 MHz
Period measurement	0,25 µs	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

All measured values are returned as signed values. The sign indicates whether the position value increased or decreased during the relevant time period.

Measuring principle

The technology module assigns a time value to each SSI frame. The measuring interval is defined as the time between the last SSI frame with a change of position value before and during the previous update time. The measuring interval and the total change in position value in the measuring interval are evaluated to calculate a measured variable. The total change in position value in a measuring interval corresponds to the number of encoder increments in the same measuring interval.

If there is no change in position value within an update time, the measuring interval is dynamically adjusted. In this case, a change in position value is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last SSI frame with a change in position value. The change in position value is then 1.

The feedback bit STS_M_INTERVAL indicates whether a change in position value occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual change in position value. If the technology module cannot calculate measured values because the measuring range limit has been violated, the feedback bit STS_M_INTERVAL is not set.

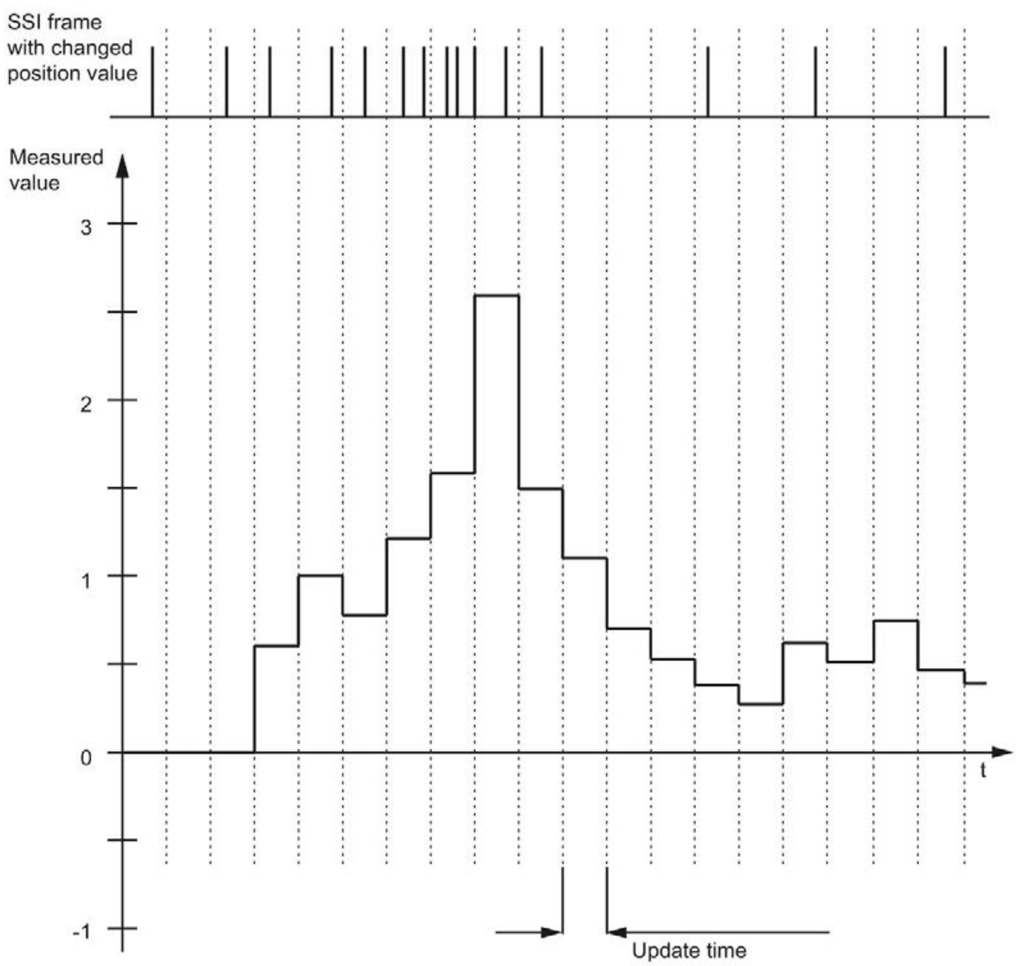
Frequency measurement

The value "0.0" is reported in the time up to the first available measured value.

The measuring process begins with the first detected change in position value. The first measured value can be calculated after the second detected change in position value at the earliest.

The measured value is updated in the feedback interface (Page 222) upon completion of each update time.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your SSI absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to configure 4096 Increments per unit and a time basis of one minute.

Note

Excessive encoder speed can provide wrong direction of rotation.

If an SSI absolute encoder rotates so quickly that more than half of the value range is covered within one module cycle[1], the velocity and direction of rotation can not be determined correctly anymore. This can result in an incorrect function at:

- DQ functions
- Feedback bits EVENT_OFLW, EVENT_UFLW, EVENT_ZERO, EVENT_CMP0, EVENT_CMP1 and STS_DIR

[1] Non isochronous mode: 500 µs; isochronous mode: PROFINET cycle time

---

Note

If you are using an SSI absolute encoder whose value range does not correspond to the power of 2, the calculated speed measured value may be incorrect at the moment of the overflow.

2.2.10 Hysteresis

2.2.10.1 Hysteresis with incremental or pulse encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the counter value has gone outside this range.

Slight movements by the encoder can result in the counter value fluctuating around a certain value. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a comparison event occurs.

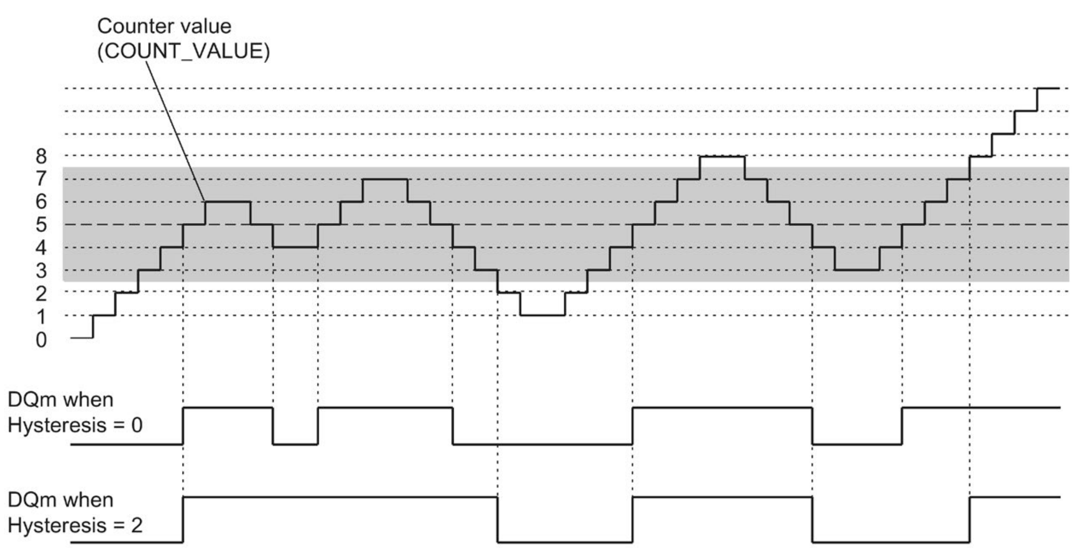
The hysteresis becomes active when the respective comparison value is reached by a count pulse. If the counter value is set to the start value during an active hysteresis, the hysteresis becomes inactive.

Regardless of the hysteresis value, the hysteresis range ends at the low/high counting limits.

Function principle

The figure below shows an example for the hysteresis with the following configuration:

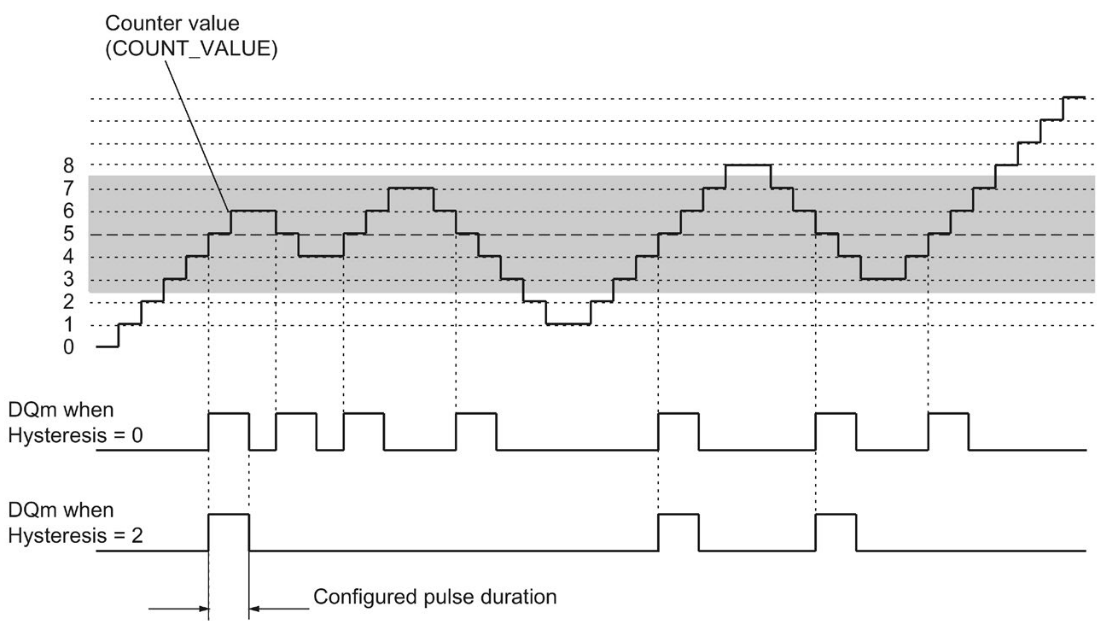
- Setting of a digital output between comparison value and high counting limit
- Comparison value = 5
- Hysteresis = 0 or 2 (gray background)



Hysteresis is enabled when the counter value 5 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the counter value 2 or 8 is reached.

The figure below shows an example for the hysteresis with the following configuration:

- Setting at comparison value for one pulse duration
- Comparison value = 5
- Comparison in both count directions
- Hysteresis = 0 or 2 (gray background)



2.2.10.2 Hysteresis with SSI absolute encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the position value has gone outside this range.

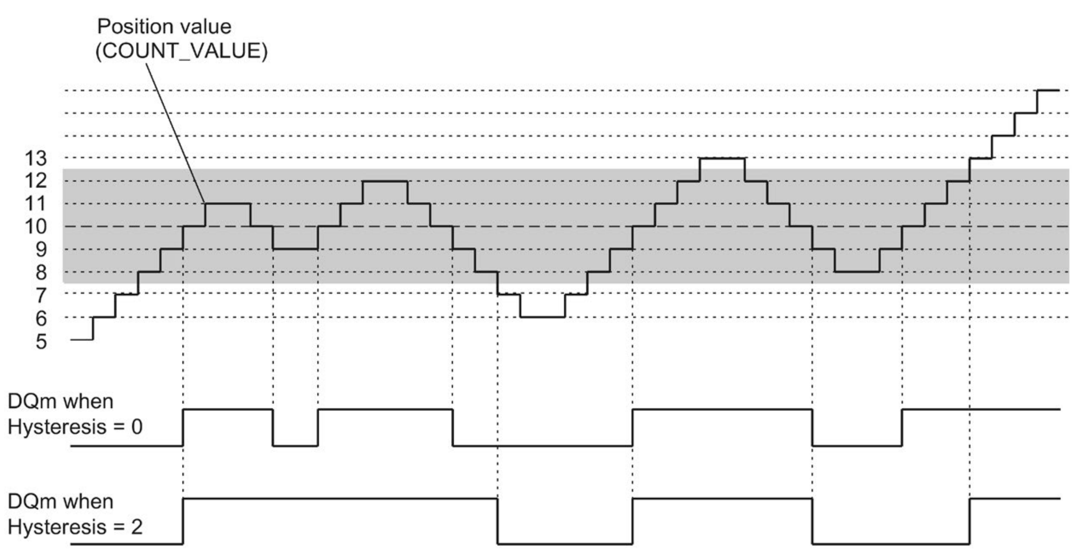
Slight movements by the encoder can result in the position value fluctuating around a certain value. If a comparison value, the minimum or maximum position value, lies within the fluctuation range, the associated digital output is switched on and off if a hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a compare event occurs.

Regardless of the hysteresis value, the hysteresis range ends at the respective minimum or maximum position value.

Function principle

The figure below shows an example for the hysteresis with the following parameter assignment:

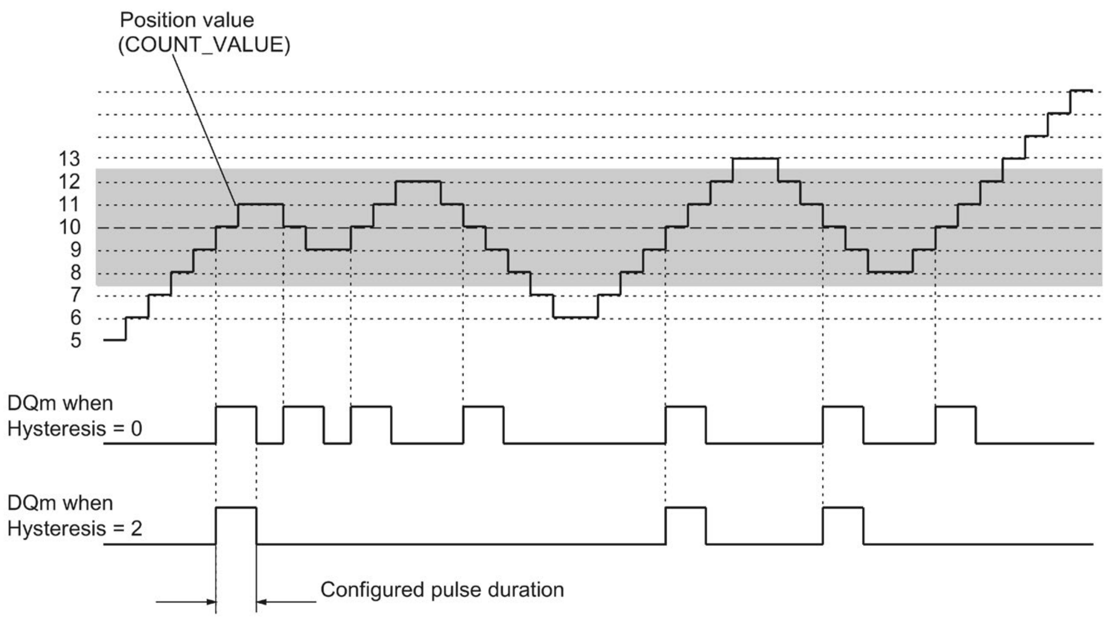
- Setting of a digital output between comparison value and high limit
- Comparison value = 10
- Hysteresis = 0 or 2 (gray background)



Hysteresis is enabled when the position value 10 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the position values 7 or 13 are reached.

The figure below shows an example for the hysteresis with the following parameter assignment:

- Setting at comparison value for one pulse duration
- Comparison value = 10
- Comparison in both directions of position value changes
- Hysteresis = 0 or 2 (gray background)



2.2.11 Interrupts

Hardware interrupt

The technology module can trigger a hardware interrupt in the CPU if, for example, a comparison event occurs; in the event of overflow or underflow; in the event of a zero crossing of the counter and/or of a change in count direction (direction reversal). You can specify which events are to trigger a hardware interrupt during operation.

Diagnostic interrupt

The technology module can trigger diagnostic interrupts in the event of errors. You enable the diagnostic interrupts for certain errors in the device configuration. Refer to the device manual for the technology module to learn about the events that can trigger a diagnostic interrupt during operation.

2.2.12 Position detection for Motion Control

Description

You can use the technology module for example with an incremental encoder for the following axis technology objects of S7-1500 Motion Control for position detection :

- TO_PositioningAxis
- TO_SynchronousAxis
- TO_ExternalEncoder

When using an incremental or pulse encoder, the position detection is based on the counting function of the technology module. With an SSI absolute encoder, the absolute value is read in via a synchronous, serial interface and prepared according to the parameter assignment and made available for S7-1500 Motion Control.

The range of functions of the technology module has the following limitations in this case:

- Counter behavior not configurable
- No functions for digital inputs available apart from measuring input function
- No comparison functions for digital outputs available
- No hardware interrupts available

In the device configuration of the technology module in STEP 7 (TIA Portal), select the "Position input for technology object "Motion Control"" operating mode and use the corresponding technology object in the program. This reduces the configuration options to the parameters that are essential. For TM Count or TM PosInput, the mode automatically applies to all channels of the technology module. For a Compact CPU, the mode automatically applies to the respective channel.

In this operating mode you can use the (TO_MeasuringInput) measuring input technology object to execute a measuring input function with a hardware digital input. To do this select the measuring input type "Measuring via PROFIdrive telegram" in the measuring input technology object and the value "1" as the number of the measuring input.

You can find information about further configuring in the help for the axis technology objects and the measuring input technology object of S7-1500 Motion Control.

2.2.13 Encoder signals

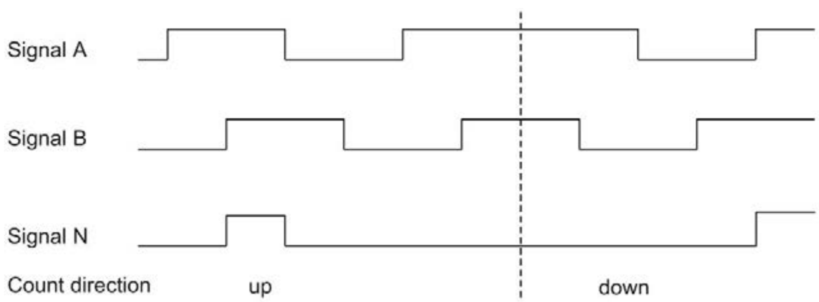
2.2.13.1 24 V and TTL count signals

24 V and TTL incremental encoder count signals

The 24 V incremental encoder returns the 24 V signals A, B, and N to the technology module. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

A 24 V incremental encoder uses the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value to the Capture value.

The figure below shows an example of the time profile of the signals of an 24 V incremental encoder:



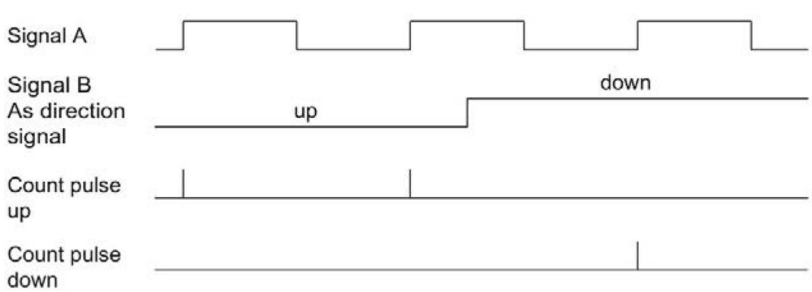
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

24 V and TTL pulse encoder count signals without/with direction signal

The encoder, for example an initiator (BERO) or a light barrier, returns only a count signal that is connected to terminal A of the counter.

In addition, you can connect a signal for direction detection to terminal B of the counter. In case of a high level the direction signal is counted backwards. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

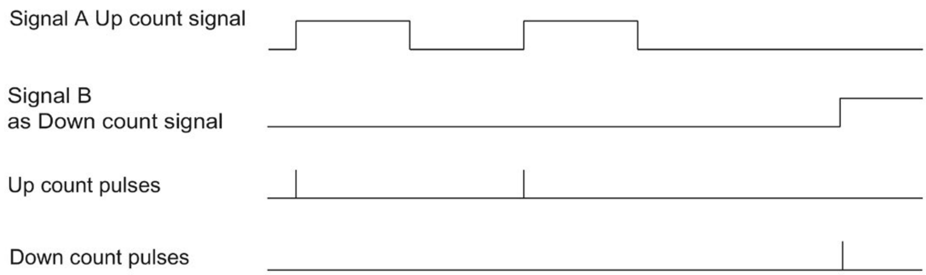
The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



24 V and TTL pulse encoder count signals with Up/Down count signal

The Up count signal is connected to terminal A. The Down count signal is connected to terminal B.

The figure below shows an example of the time profile of the signals of a pulse encoder with Up/Down count signal and the resulting count pulses:



Sourcing output/sinking output for 24 V counter signals (TM Count)

You can connect the following encoders/sensors to the counter inputs:

- Sourcing output:
  The A, B, and N inputs are wired to 24VDC .
- Sinking output:
  The A, B, and N inputs are wired to ground M .
- Push-pull (sourcing and sinking output):
  The A, B, and N inputs are wired alternately to 24VDC and ground M .

Sourcing output for 24 V counter signals (Compact CPU)

You can connect the sourcing output and push-pull encoders or sensors to the counter inputs.

Monitoring of the encoder signals (TM Count and TM PosInput)

The signals of push-pull 24 V encoders are monitored for wire breaks by the technology module. TTL signals are monitored by the technology module for faulty supply voltages.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.13.2 RS422 count signals

RS422 incremental encoder count signals

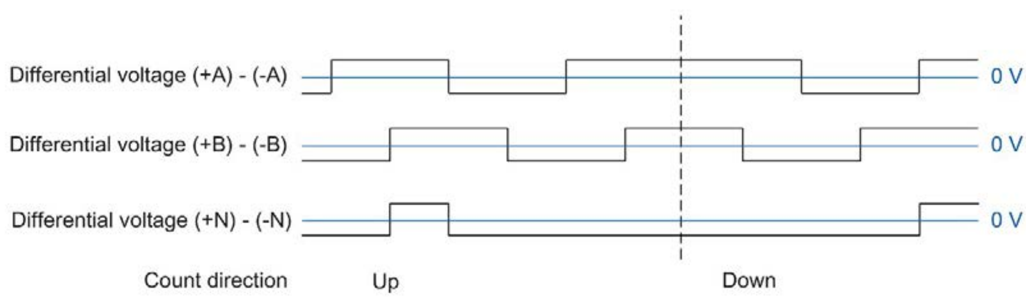
The RS422 incremental encoder sends the following differential signals to the technology module:

- +A and -A
- +B and -B
- +N and -N

The signal information for RS422 signals is encoded in the differential voltage between A and -A, B and -B, and +N and -N. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

RS422 incremental encoders use the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value as the Capture value.

The figure below shows an example of the time profile of the signals of an RS422 incremental encoder:



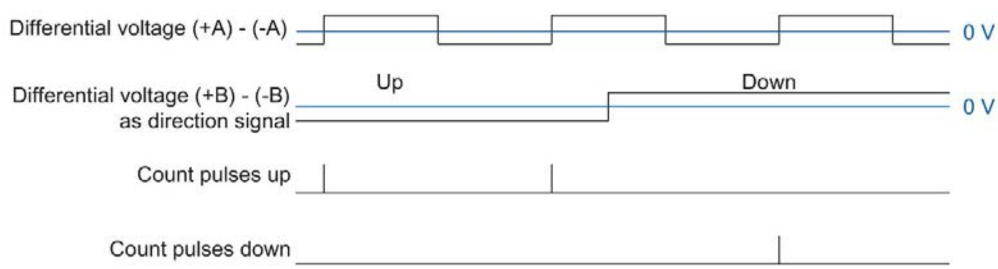
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

Count signals of RS422 pulse encoders without/with direction signal

The encoder, for example a light barrier, only returns a count signal that is connected to terminal A.

You can also connect a signal for direction detection to terminal B. In case of a high level the direction signal is counted backwards. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

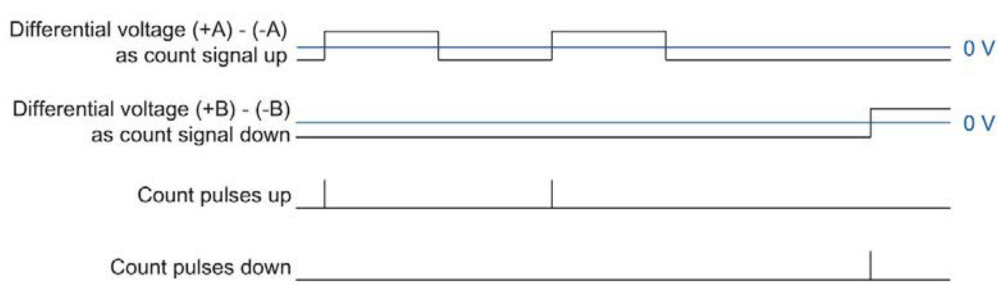
The figure below shows an example of the time profile of the signals of a RS422 pulse encoder with direction signal and the resulting count pulses:



Count signals of RS422 pulse encoders with Up/Down count signal

The Up count signal is connected to the A terminals. The Down count signal is connected to the B terminals.

The figure below shows an example of the time profile of the signals of an RS422 pulse encoder with Up/Down count signal and the resulting count pulses:



Monitoring of encoder signals

RS422 signals are monitored by the technology module for wire breaks, short-circuits, and incorrect supply voltage.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.13.3 SSI signals

Signals from SSI absolute encoders

The SSI absolute encoder and the technology module communicate by means of the SSI data signals +D and -D and the SSI clock signals +C and -C. SSI uses the RS422 signal standard. The signal information is coded in the respective differential voltage between +C and -C as well as +D and -D.

Monitoring of the encoder signals and the SSI frames

The signals of an SSI absolute encoder are monitored for wire breaks, short-circuits and incorrect supply voltage. The technology module also monitors the SSI frames for errors.

If you enable the diagnostic interrupts in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal or SSI frame errors.

2.2.14 Signal evaluation of incremental signals

2.2.14.1 Overview

The technology module counter counts the edges of encoder signals A and B. For incremental encoders with phase-shifted signals A and B, you can select either single or multiple evaluation to improve the resolution.

You can configure the following signal evaluations:

- Single evaluation (Page 76)
- Double evaluation (Page 77)
- Quadruple evaluation (Page 78)

Note

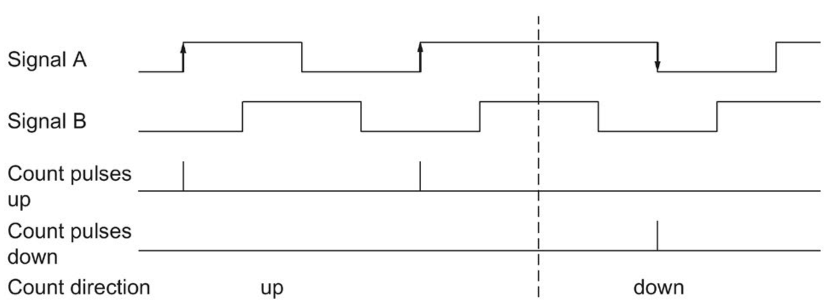
The phase offset between the edges of signals A and B is evaluated. If no phase shift is identifiable, an encoder error (invalid transition of A/B signals) is reported via the ENC_ERROR feedback bit.

2.2.14.2 Single evaluation

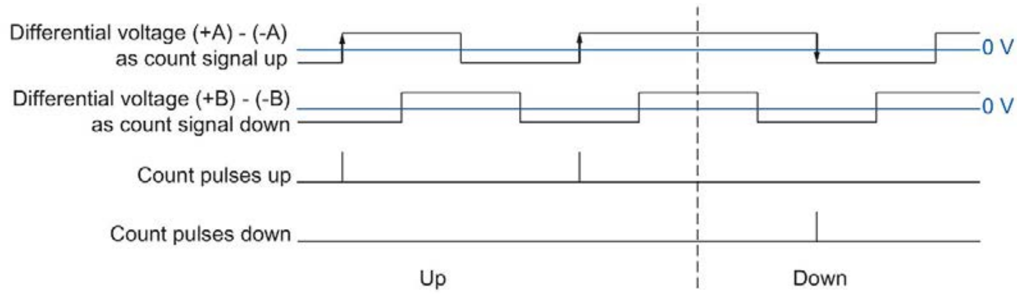
Single evaluation evaluates the rising and falling edge at signal A when signal B has a low level.

Count pulses in an upwards direction are generated with a rising edge at signal A during a low level at signal B. Count pulses in a downwards direction are generated with a falling edge at signal A during a low level of signal B.

The following figure shows an example for single evaluation of 24 V and TTL count signals:



The following figure shows an example for single evaluation of RS422 count signals:

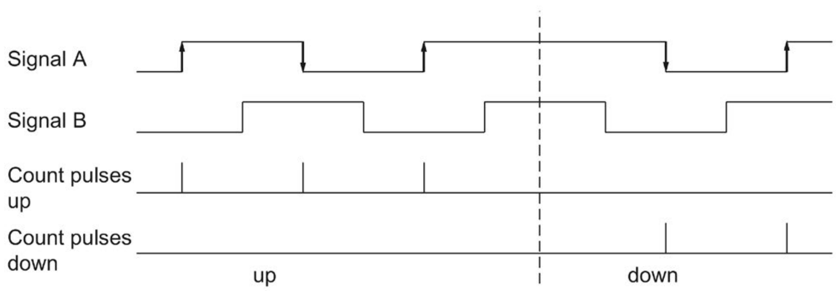


2.2.14.3 Double evaluation

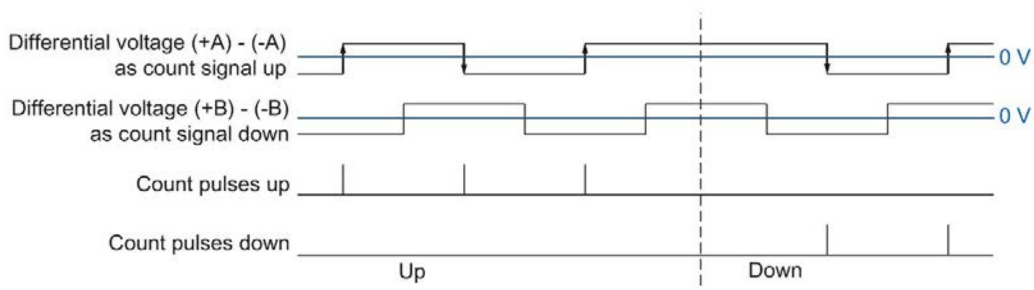
With double evaluation, the rising and falling edges of signal A are evaluated.

The edge direction of signal A and the level at signal B determines whether count pulses are generated in an upward or downward direction.

The following figure shows an example for double evaluation of 24 V and TTL count signals:



The following figure shows an example for double evaluation of RS422 count signals:

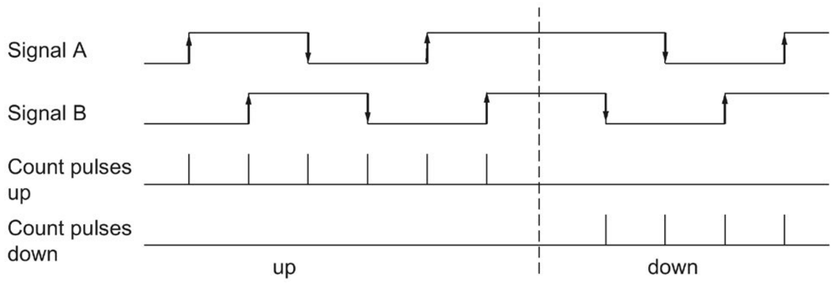


2.2.14.4 Quadruple evaluation

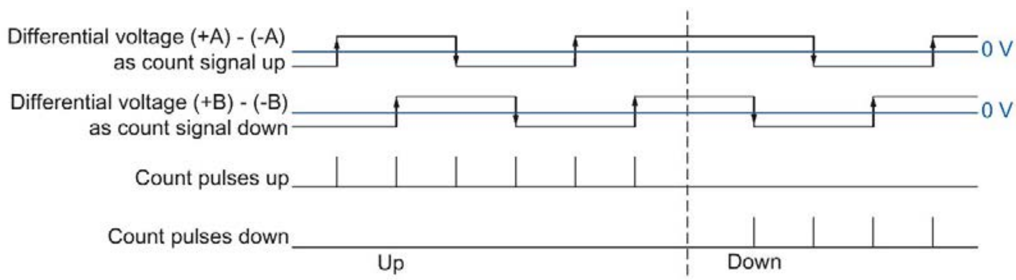
With quadruple evaluation, the rising and falling edges of signals A and B are evaluated.

The edge direction of one signal and the level of the other signal determines whether count pulses are generated in an upward or downward direction.

The figure below shows an example for quadruple evaluation of 24 V and TTL count signals:



The figure below shows an example for quadruple evaluation of RS422 count signals:



2.2.15 Clock synchronization (TM Count and TM PosInput)

The technology module supports the system function "Isochronous mode". This system function enables position, count and measured values to be recorded in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input and output data and the processing in the module are synchronized with each other. The output signals switch immediately if the relevant comparison condition is met. A change in the state of a digital input immediately affects the planned reaction of the technology module and changes the status bit of the digital input in the feedback interface.

In the case of operation with a "Counting and measurement" technology object use an OB of the type "Synchronous Cycle" (for example OB61). In the assigned OB the instruction High_Speed_Counter or SSI_Absolute_Encoder is called.

For position detection of a "Motion Control" technology object use the OB of the type "MC-Servo". When using the technology objects cam and cam track, isochronous mode is required. When using the measuring input technology object in connection with the hardware digital input DI1, no isochronous mode is required.

In case of manual operation use an OB of the "Synchronous Cycle" type (for example OB61). In the assigned OB the input and output data is processed.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the moment when the input data (T_i) are read, the position and counter value and, if appropriate, the measured value as well as status bits are detected and made available in the feedback interface for retrieval in the current bus cycle.

The update time for the measured value is synchronized in a suitable relationship to the system cycle and, if required, adapted in length. If you configure "0", the measured value is updated once per system cycle.

Isochronous mode parameter

In isochronous mode, the following parameters can have an effect on the isochronous parameters of the Sync domain.

- Filter frequency
- Frame length[1]
- Transmission rate[1]
- Monoflop time[1]
- Parity[1]

[1] Only when using an SSI absolute encoder

Because the isochronous parameters are not checked in RUN, overflows can occur when you change one or more of the named parameters in RUN: You prevent overflows by already selecting the option with the greatest time demand during the offline parameter assignment.

Additional information

For a detailed description of the isochronous mode refer to:

- The isochronous mode function manual available as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401).
- The PROFINET with STEP 7 function manual as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

2.3 Basics of counting (TM Timer DIDQ)

2.3.1 Overview of applications

Introduction

You configure the TM Timer DIDQ and assign its parameters with the configuration software.

The module's functions are controlled and monitored via the user program with the control and feedback interface.

System environment

The respective module can be used in the following system environments with its counter functions:

<table>
<tr><th>Applications</th><th>Components required</th><th>Configuration software</th><th>In the user program</th></tr>
<tr><td>Central operation with an S7-1500 CPU or 151xSP CPU</td><td>• S7-1500 automation system or ET 200SP CPU
• TM Timer DIDQ</td><td rowspan="2">STEP 7 (TIA Portal):
Device configuration and parameter setting with hardware configuration</td><td rowspan="3">Direct access to feedback interface of the technology module in the I/O data</td></tr>
<tr><td>Distributed operation with a S7-1500 CPU</td><td>• S7-1500 Automation System
• ET 200 Distributed I/O System
• TM Timer DIDQ</td></tr>
<tr><td>Distributed operation with a S7-300/400 CPU</td><td>• S7-300/400 automation system
• ET 200 distributed I/O system
• TM Timer DIDQ</td><td>STEP 7 (TIA Portal):
Device configuration and parameter setting with hardware configuration
STEP 7:
Device configuration and parameter setting with hardware configuration (only ET 200SP)</td></tr>
</table>

Note

A description of the control and feedback interface is available in the device manual for the TM Timer DIDQ.

2.3.2 Counting with incremental encoder

You can use a few channels of a TM Timer DIDQ for simple counting tasks with an incremental encoder. Counting refers to the recording and adding up of events. The channels configured as counters each acquire the two incremental signals and evaluate these accordingly.

Count direction

The technology module can count up and down with an incremental encoder. You can invert the counting direction to adapt it to the process.

Counting limits

The counting limits define the counter value range used.

The minimum counter value is -2147483648 (-2^{31}). The maximum counter value is 2147483647 ($2^{31}-1$). The respective counter counts continuously. At an overflow, the counter jumps to the other counting limit in each case and continues counting.

The counter value cannot be influenced by the user program.

Parameter assignment

For use of a counter for an incremental encoder, two digital inputs each of a channel group are combined. For this purpose, you choose the configuration "Incremental encoder (A, B phase-shifted)" in the channel parameters for the respective group.

Note

Counters of the TM Timer DIDQ 16x24V

The number of available counters of the TM Timer DIDQ 16x24V is dependent on the channel configuration. In order to use 4 counters, you must choose the use of 8 inputs in the channel configuration. If you choose the use of 3 inputs, you can use 1 counter. Other channel configurations do not allow any counter use.

Counter value feedback

The current counter value is indicated in the feedback interface in the TEC_IN value (DIm). DIm corresponds to the first of the two grouped digital inputs in each case. For the second digital input, "0" is returned in the value TEC_IN (DIm+1).

2.3.3 Counting with pulse encoder

You can use a few channels of a TM Timer DIDQ for simple counting tasks with a pulse encoder. Counting refers to the recording and adding up of events. The channels configured as counters each acquire one pulse signal and evaluate this accordingly.

Count direction

The technology module can count up and down with a pulse encoder.

Counting limits

The counting limits define the counter value range used.

The minimum counter value is -2147483648 (-2^{31}). The maximum counter value is 2147483647 ($2^{31}-1$). The respective counter counts continuously. At an overflow, the counter jumps to the other counting limit in each case and continues counting.

The counter value cannot be influenced by the user program.

Parameter assignment

For use of a counter for a pulse encoder, you choose the configuration "Use inputs individually" or "Use input/output individually" in the channel parameters for the respective group. You can configure the first digital input of a group as a counter.

Note

Counters of the TM Timer DIDQ 16x24V

The number of available counters of the TM Timer DIDQ 16x24V is dependent on the channel configuration. In order to use 4 counters, you must choose the use of 8 inputs in the channel configuration. If you choose the use of 3 inputs, you can use 1 counter. Other channel configurations do not allow any counter use.

Counter value feedback

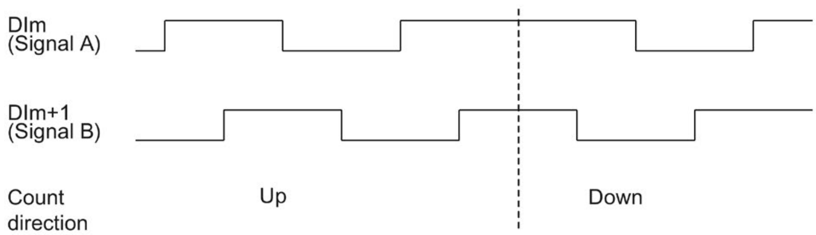
The current counter value is indicated in the feedback interface in the TEC_IN value (DIm). DIm corresponds to the respective digital input.

2.3.4 24 V count signals

Count signals of 24 V incremental encoders

The 24 V incremental encoder returns the 24 V signals A and B to the technology module. The A and B signals are phase-shifted by 90°.

The figure below shows an example of the time profile of the signals of an 24 V incremental encoder:



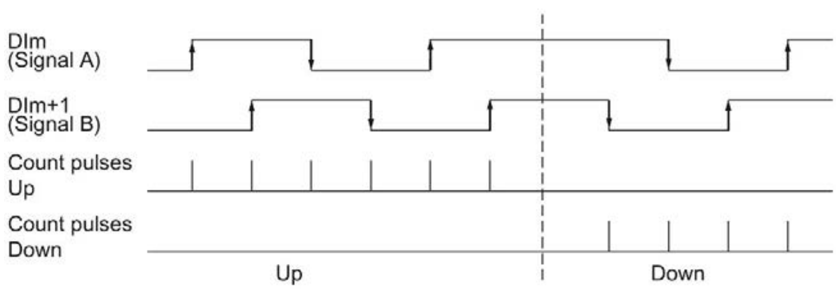
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

Signal evaluation

The two phase-shifted signals of an incremental encoder are evaluated four times. With quadruple evaluation, the positive and negative edges of signal A and signal B are evaluated.

Whether count pulses are generated in an upward or downward direction depends on the edge direction of the one signal and the level of the other signal in the meantime.

The figure below shows an example of the quadruple evaluation of 24 V count signals:



Count signals of 24 V pulse encoders

An encoder, for example, a proximity switch (BERO) or a light barrier, returns only one count signal that is connected to the digital input of a counter.

You can count the positive or the negative edges of the signal.

2.3.5 Isochronous mode

The TM Timer DIDQ supports the system function "Isochronous mode". This system function enables counter values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input and output data and the processing in the module are synchronized with each other.

Data processing

The data that was transmitted to the module in the current bus cycle via the control interface takes effect when it is processed in the module's internal cycle. The counter value and status bits are detected at time T_i and made available in the feedback interface for retrieval in the current bus cycle.

Additional information

You will find detailed description of the isochronous mode:

- In the Isochronous mode function manual as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401) .
- In the PROFINET with STEP 7 function manual as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

2.4 Basics of counting (digital modules)

2.4.1 Overview of applications

Introduction

You configure the digital module and assign its parameters using the configuration software.

The module's functions are controlled and monitored via the user program with the control and feedback interface.

System environment

The respective module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a S7-1500 CPU or ET 200SP CPU	• S7-1500 automation system or ET 200SP CPU • Digital module	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	Direct access to the control and feedback interface of the digital module in the I/O data
Distributed operation with a S7-1500 CPU	• S7-1500 Automation System • ET 200 Distributed I/O System • Digital module		
Distributed operation with a S7-300/400 CPU	• S7-300/400 automation system • ET 200 distributed I/O system • Digital module	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter setting with hardware configuration (ET 200SP) or GSD file (ET 200MP)	
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Digital module	Third-party configuration software: Device configuration and parameter settings with GSD file	

Note

A description of the control and feedback interface is available in the device manual for the digital module.

2.4.2 Counting with pulse encoders

Counting refers to the detection and summation of events. The modules' counters record and evaluate pulse signals. The counting direction can be specified using encoder or pulse signals or through the configuration.

You can use feedback bits to switch the digital outputs of digital output modules at defined counter values.

You can configure the characteristics of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program. See the module's device manual for the maximum and minimum configurable counter limits.

You can configure whether the counting processes are terminated or continue when a counter limit is violated (automatic gate stop).

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime with the user program.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are recordd.

The hardware gate is controlled externally via a digital input of the digital module. The hardware gate can be enabled through parameter assignment. The software gate is controlled via the user program. A description of the control and feedback interface is available in the device manual for the digital module.

2.4.3 Behavior at the counting limits

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another upward count pulse is received. The counter low limit is violated when the current counter value is equal to the counter low limit and another downward count pulse is received.

For digital modules of ET 200SP and ET 200AL, the corresponding event bit is set in the feedback interface when the limit is exceeded. You can reset an event bit with the respective control bit:

Counting limit violated	Event bit	Reset bit
High counting limit	EVENT_OFLW	RES_EVENT_OFLW
Low counting limit	EVENT_UFLW	RES_EVENT_UFLW

Note

A description of the control and feedback interface is available in the device manual for the digital module.

You can configure whether or not you want to continue counting to another counter limit after a counting limit violation.

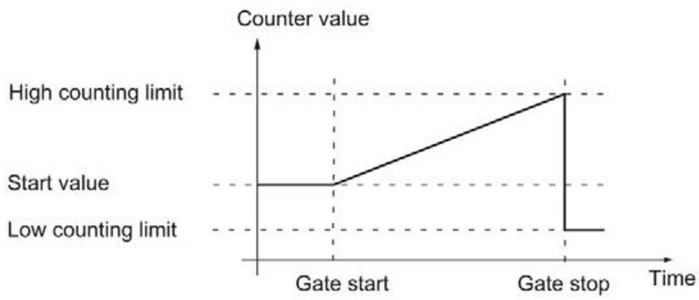
Note

The high counting limit and the start value define the value range of the counter:

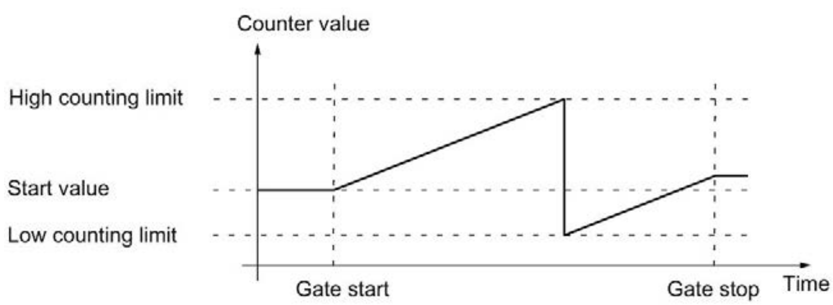
Value range of the counter = (high limit – start value) + 1

Examples

The figure below shows an example for terminating counting after overflow and setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.4.4 Gate control

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The digital modules have two gates for each counting channel. These define the resulting internal gate:

- Software gate
- Hardware gate

Note

The hardware gate is not available for all digital modules.

2.4.4.1 Software gate

The software gate of the channel is opened and closed with the SW_GATEcontrol bit.

Note

A description of the control and feedback interface is available in the device manual for the digital module.

2.4.4.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate using signals at the corresponding digital input.

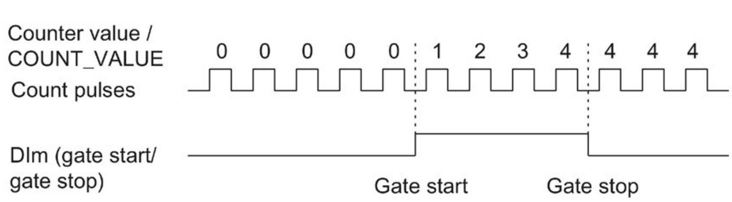
Note

A configurable input delay delays the control signal of the digital input.

The status of a DIm digital input is indicated by the respective STS_DIm feedback bit. A description of the control and feedback interface is available in the device manual for the digital module.

Opening and closing the hardware gate

The figure below shows an example of opening and closing with a digital input:



As long as the digital input is set, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input is reset. The counter value stays constant and ignores any further count pulses.

2.4.4.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the STS_GATE feedback bit. A description of the control and feedback interface is available in the device manual for the digital module.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.4.5 Comparison values

Depending on the module, you can define up to two comparison values that control a feedback bit for the channel, independent of the user program.

When there are two comparison values, comparison value 1 must be greater than comparison value 0. The comparison values are configurable and can be modified during runtime using the user program.

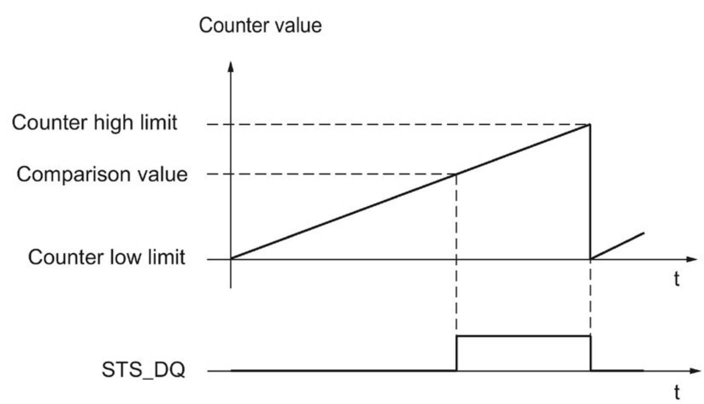
The comparison values are compared with the current counter value. If the counter value meets the configured comparison condition, the respective STS_DQ feedback bit is set.

You can use the respective feedback bit in order to switch a digital output module's digital output. You can make setting the respective STS_DQ feedback bit dependent on one of the following comparison events. See the device manual for the digital module to find out which comparison events can be configured.

Setting between comparison value and high counter limit

The respective STS_DQ feedback bit is set to 1 when:

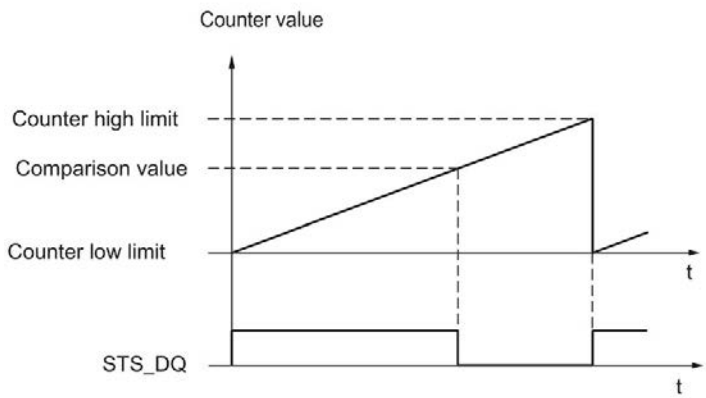
Comparison value <= counter value <= high counter limit



Setting between comparison value and low counter limit

The respective STS_DQ feedback bit is set to 1 when:

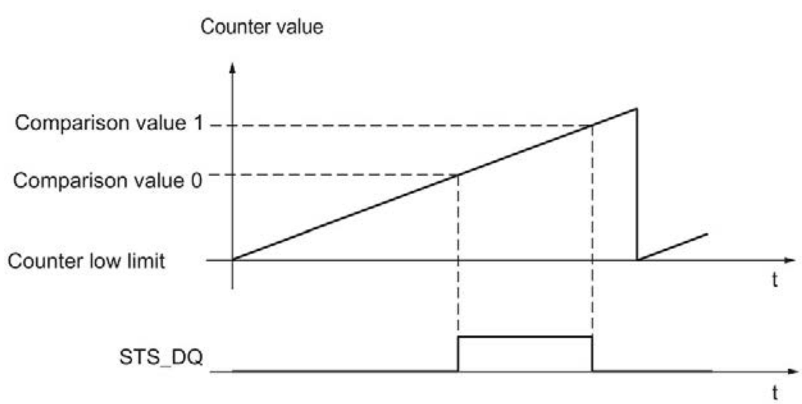
Low counter limit <= counter value <= comparison value



Setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

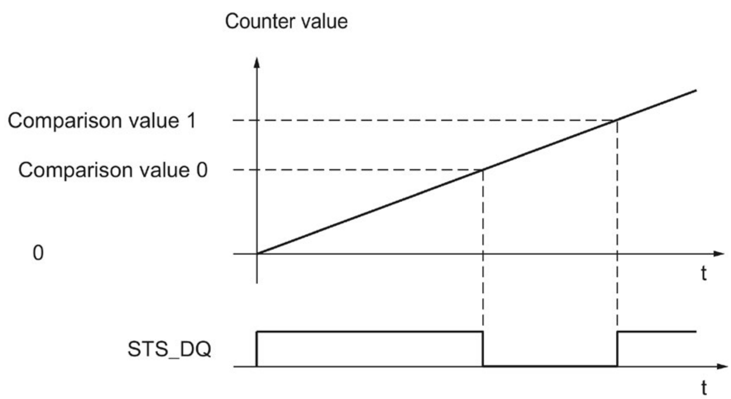
Comparison value 0 <= counter value <= comparison value 1



Not setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

Comparison value 0 <= counter value <= comparison value 1



2.4.6 Interrupts

Hardware interrupt

The modules can trigger a hardware interrupt in the CPU for certain events during operation. Process interrupts are enabled via the parameter assignment. Refer to the device manual for the module for information about the events that can trigger a hardware interrupt during operation.

Note

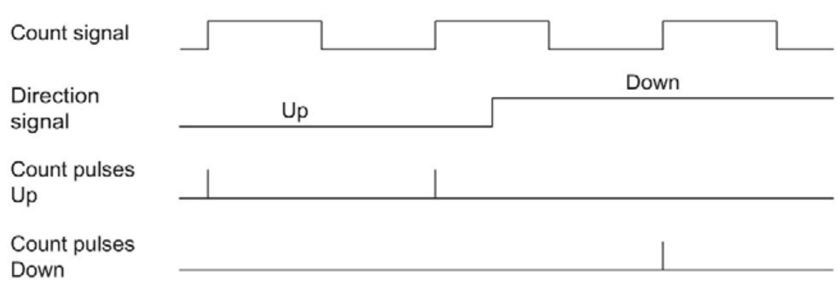
Hardware interrupts for counting are not available at all the modules.

2.4.7 24 V count signals

24 V pulse encoder count signals

An encoder, for example an initiator (BERO) or a light barrier, returns a count signal that is connected to the terminal of a counter. For some modules you change the count direction via the parameter assignment of the DI function.

The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



Note

A signal for direction detection is not connectable for all digital modules.

2.4.8 Isochronous mode

The digital module supports the system function "Isochronous mode". This system function enables counter values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input and output data and the processing in the module are synchronized with each other.

Data processing

The data that was transmitted to the module in the current bus cycle via the control interface takes effect when it is processed in the module's internal cycle. The counter value and status bits are detected at time T_i and made available in the feedback interface for retrieval in the current bus cycle.

Additional information

You will find detailed description of the isochronous mode:

- In the Isochronous mode function manual as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401) .
- In the PROFINET with STEP 7 function manual as a download from the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

3 Using the High_Speed_Counter technology object

3.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

3.2 High_Speed_Counter technology object

STEP 7 (TIA Portal) supports you in the configuration, commissioning and diagnostics of counting and measuring functions for the following technology modules with the "Technology objects" function:

- You configure the High_Speed_Counter technology object in STEP 7 (TIA Portal) with the settings for the counting and measuring functions.
- The corresponding High_Speed_Counter instruction is programmed in the user program. This instruction supplies the control and feedback interface of the technology module.

The High_Speed_Counter technology object corresponds to the instance DB of the High_Speed_Counter instruction. The configuration of the counting and measuring functions is saved in the technology object. The technology object is located in the folder "PLC > Technology objects".

The High_Speed_Counter technology object can be used for technology modules of both the S7-1500 and ET 200SP systems.

Operating mode

In order to assign the technology module parameters using the technology object, you specify the operating mode (Page 181) "Operating with "Counting and measurement" technology object" in the hardware configuration of the technology module. This selection is already preset.

3.3 Overview of the configuration steps

Introduction

The overview below shows the basic procedure for configuring the counting and measuring functions of the technology module with the High_Speed_Counter technology object.

Requirement (TM Count and TM PosInput)

Before you can use the High_Speed_Counter technology object, a project with an S7-1500 CPU or an ET 200SP CPU must be created in STEP 7 (TIA Portal) .

Requirement (Compact CPU)

Before you can use the High_Speed_Counter technology object, a project with a Compact CPU S7-1500 must be created in STEP 7 (TIA Portal).

Procedure

Proceed in the recommended sequence outlined below:

Step	Description
1	Configure a technology module (Page 175)
2	Add technology object (Page 99)
3	Configure a technology object according to your application (Page 101)
4	Call instruction in the user program (Page 124)
5	Load to CPU
6	Commissioning the technology object (Page 138)
7	Diagnostics of the technology object (Page 140)

3.4 Add technology object

Adding a technology object in the project navigation

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement (TM Count and TM PosInput)

A project with a CPU S7-1500 has been created.

Requirement (Compact CPU)

A project with a Compact CPU S7-1500 has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click on "Add new object".
   The "Add new object" dialog opens.
4. Select the "Counting and measurement" technology.
5. Select the "High_Speed_Counter" object.
6. Enter an individual name for the technology object in the "Name" text box.
7. Click "Additional information" if you want to add your own information to the technology object.
8. Confirm with "OK".

Result

The new technology object has now been created and stored in the project tree in the "Technology objects" folder.

	Object	Description
①	Configuration (Page 101)	In the configuration dialog: • Assignment of technology module and channel • Technology object parameter settings for counting and measurement functions When you change the configuration of the technology object, you must download the technology object **and** the hardware configuration to the CPU.
②	Commissioning (Page 138)	Commissioning and function test of the technology object: Simulating parameters of the High_Speed_Counter instruction and monitoring the effects
③	Diagnostics (Page 140)	Monitoring the counting and measuring functions

3.5 Configuring the High_Speed_Counter

3.5.1 Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click on the "Configuration" object.

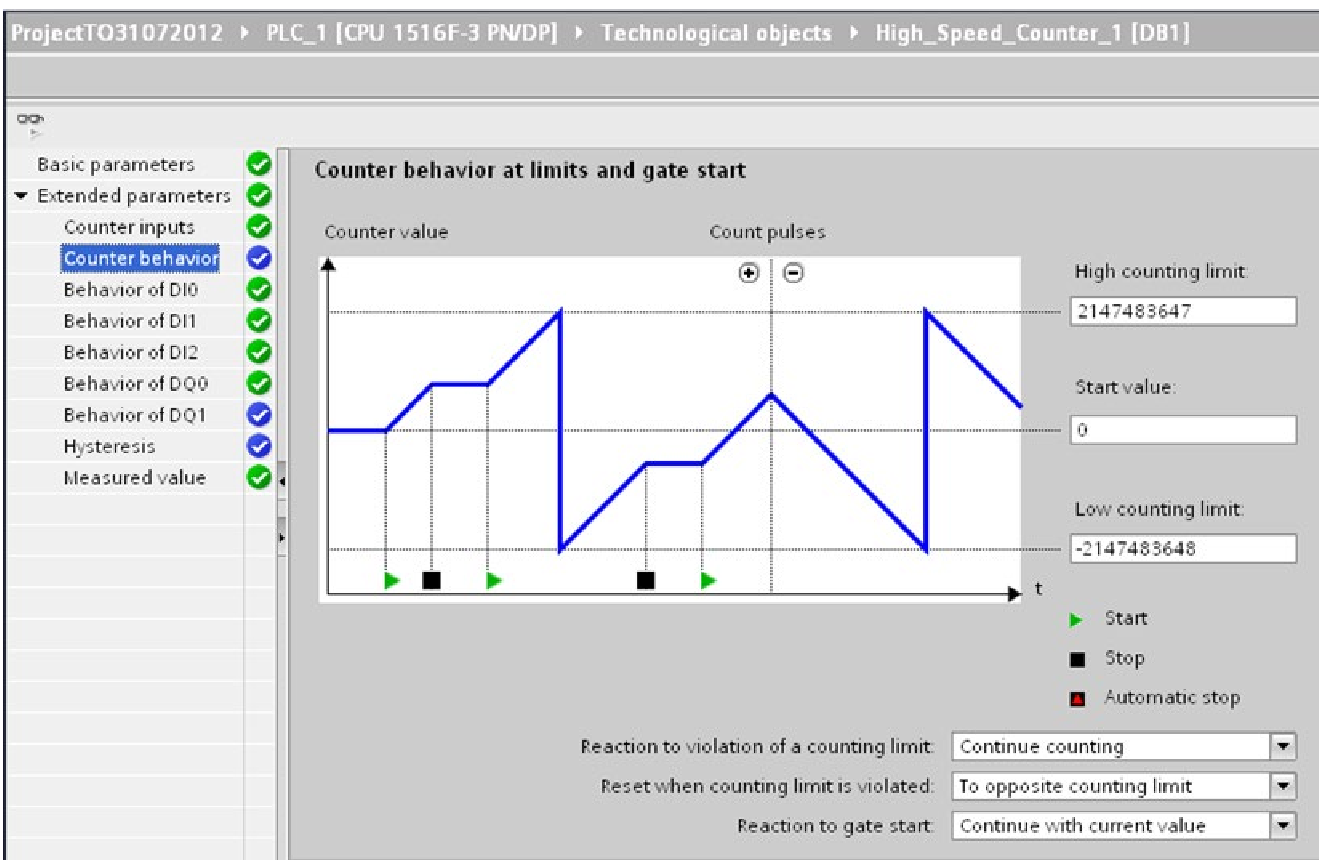
The configuration is divided into the following categories:

- **Basic parameters**

  The basic parameters include the selection of the technology module and the number of the counting channel for which the technology object is configured.

- **Extended parameters**

  The extended parameters include the parameters for adapting the counting and measuring functions and for setting the characteristics of the digital inputs and digital outputs.



Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	The configuration contains values set by the user or automatically adapted values and is complete All text boxes of the configuration contain valid values and at least one default value was changed.
	The configuration is incomplete or incorrect At least one text box or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.

3.5.2 Basic parameters

You can establish the connection between the High_Speed_Counter technology object and the technology module under "Basic parameters".

Module (TM Count and TM PosInput)

You select the technology module in a subsequent dialog box. All technology modules (central or distributed) that are configured for use with a "Counting and measurement" technology object under the S7-1500 CPU or ET 200SP CPU are available for selection.

After selecting the technology module, you can open the device configuration associated with the technology module by clicking the"Device configuration" button.

The technology module parameter settings required for the use of the technology object are made in the "Extended parameters" of the technology object.

Module (Compact CPU)

You can select a high-speed counter for the Compact CPU in a subsequent dialog. You can choose any of the high-speed counters which are enabled and configured for use with a technology object from "Counting and measuring".

After selecting the high-speed counter, you can open the device configuration associated with the Compact CPU by clicking the"Device configuration" button.

The parameter settings of the high-speed counter required for the use of the technology object are made in the "Extended parameters" of the technology object.

Channel

For a technology module with several counting channels, you can also select the number of the counting channel for which the High_Speed_Counter technology object is to be valid.

Note

A channel can be assigned to only *one* technology object. A channel that is already assigned to a technology object can no longer be selected.

Synchronization of the parameter values

If, after assignment of the channel to the technology object, there is an inconsistency between the parameter values in the property dialog and in the technology object, a button with a corresponding inquiry appears. When you click the button, the parameter values in the property dialog are overwritten by the parameter values in the property dialog within STEP 7 (TIA Portal). The current parameter values of the technology object are displayed in the property dialog.

3.5.3 Counter inputs (High_Speed_Counter)

Signal type

You can choose from the following signal types (Page 71):

Symbol	**Signal type**	**Meaning**	**Additional option-specific parameters**
	Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.	• Signal evaluation • Invert direction • Filter frequency • Sensor type or Interface standard
	Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.	• Signal evaluation • Invert direction • Filter frequency • Sensor type or Interface standard • Reaction to signal N • Frequency of synchronization • Frequency of the Capture function
	Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.	• Filter frequency • Sensor type or Interface standard
	Pulse (A)	A pulse encoder (signal A) without direction signal is connected. You can specify the count direction by means of the control interface (Page 219).	• Filter frequency • Sensor type or Interface standard
	Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.	• Filter frequency • Sensor type or Interface standard

Invert direction

You can invert the counting direction to adapt it to the process.

The inverting of the direction is configurable and active for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Signal evaluation

By configuring signal evaluation (Page 76), you can specify which edges of the signals are counted.

You can select from the following options:

Symbol	Signal evaluation	Meaning
	Single (Page 76) (default)	The edges of signal A are evaluated during a low level of signal B.
	Double (Page 77)	Each edge of signal A is evaluated.
	Quadruple (Page 78)	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counting inputs A, B and N.

The selected filter frequency is based on a pulse/break ratio of between around 40:60 and around 60:40. This results in a specific minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Filter frequency	Minimum pulse/break time
100 Hz	4.0ms
200 Hz	2.0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8.0 µs
100 kHz (preset for Compact CPU)	4.0 µs

Filter frequency	Minimum pulse/break time
200 kHz** (preset for TM Count)	2.0 µs
500 kHz*	0.8 µs
1 MHz* (default at TM PosInput)	0.4 µs

* Only available with TM PosInput

** * Only available with TM Count and TM PosInput

Sensor type (TM Count)

By configuring the sensor type, you specify how the counter inputs are switched for the TM Count.

You can select from the following options:

Sensor type	Meaning
Sourcing output (default)	The encoder/sensor switches the inputs A, B and N to 24VDC.
Sinking output	The encoder/sensor switches the inputs A, B and N to M.
Push-pull (sinking and sourcing output)	The encoder/sensor alternately switches the inputs A, B and N to M and 24VDC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull encoder and the sensor type "Push-pull (sinking and sourcing output)" is configured, you can monitor the encoder signals for wire break.

Sensor type (Compact CPU)

The "Sourcing output" sensor type is set for the Compact CPU and cannot be changed. The encoder or sensor switches the inputs A, B and N to 24V DC.

You can operate both sourcing output encoders as well as push-pull encoders on the Compact CPU. You can find additional information on the sensor type in the data sheet for the encoder.

Interface Standard (TM PosInput)

You use this parameter to specify whether the encoder outputs symmetric (RS422) or asymmetric (TTL) signals for the TM PosInput.

You can select from the following options:

Interface standard	Meaning
RS422, symmetrical (default)	The encoder outputs symmetric signals according to the RS422 standard (Page 73).
TTL (5 V), asymmetrical	The encoder outputs asymmetric 5 V signals according to the TTL standard (Page 71).

Note

The RS422 standard provides greater interference immunity than the TTL standard. If your incremental or pulse encoder supports the RS422 standard **and** the TTL standard, we recommend using the RS422 standard.

Reaction to signal N

You use this parameter to specify which reaction is triggered to signal N.

You can select from the following options:

Option	Meaning
No reaction to signal N (default)	The counter is not affected by signal N.
Synchronization at signal N (Page 44)	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.
Capture at signal N (Page 34)	The counter value is stored in the Capture value at signal N. The use of a digital input and the use of the N signal are not mutually exclusive for the Capture function. The technology object displays the Capture value at the output parameter CapturedValue.

Note

You can only select the reaction to signal N if you have selected the "Incremental encoder (A, B, N)" signal type.

Note

If "Synchronization at signal N" is selected, you can select the function "Enable synchronization at signal N" for a digital input (Page 111).

Note

For High_Speed_Counter as of V3.0, the following applies:

You can choose "Capture at signal N" only in operating mode "Use count value as reference":

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Frequency of the Capture function

This parameter is used to define the frequency of Capture events for the following functions:

- Capture at Signal N
- Capture as function of a digital input

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input or first rising edge of the N signal saves the current counter value as a Capture value.
Periodic (default)	Each configured edge at the respective digital input or each rising edge of the N signal saves the current counter value as a Capture value.

Note

This parameter is available for High_Speed_Counter as of V3.2.

3.5.4 Counter behavior

3.5.4.1 Counting limits and start value

High counting limit

You limit the counting range by setting the high counting limit. You can enter a value up to 2147483647 (2^{31}-1). You must enter a value that lies above the low counting limit.

The default setting is "2147483647".

Low counting limit

You limit the counting range by setting the low counting limit. You can enter a value up to -2147483648 (-2^{31}). You must enter a value below the high counting limit.

The default setting is "-2147483648".

Start value

By configuring the start value, you specify the value at which counting is to start and where it is to continue in the case of defined events. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Additional information

For more information, see Behavior at the counting limits (Page 28) and Counter behavior at gate start (Page 33).

3.5.4.2 Counter behavior at limits and gate start

Reaction to violation of a counting limit

You can configure the following characteristics for violation of a counting limit (Page 28):

Reaction	Meaning
Stop counting	If a counting limit is violated, counting is stopped and the internal gate is closed. To restart counting, you must also close and reopen the software/hardware gate.
Continue counting (default)	Counting continues either with the start value or at the opposite counting limit, depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter to the following values when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit (default)	The counter value is set to the opposite counting limit.

Reaction to gate start

You can set the following Reaction to gate start (Page 33):

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value (default)	When the gate is opened, counting is continued with the last counter value.

3.5.5 Behavior of a DI (High_Speed_Counter)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the hardware gate (Page 30).	• Input delay • Select level
Gate start (edge-triggered)	The configured edge at the respective digital input opens the hardware gate (Page 30).	• Input delay • Edge selection
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the hardware gate (Page 30).	• Input delay • Edge selection
Synchronization (Page 39)	The configured edge at the respective digital input sets the counter to the start value. The technology object indicates whether a synchronization has occurred at the output parameter SyncStatus.	• Input delay • Edge selection • Frequency of synchronization
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N (Page 44).	• Input delay • Select level
Capture	The configured edge at the respective digital input saves the current counter value (Page 34) as a Capture value. The use of a digital input and the use of the N signal are not mutually exclusive for the Capture function. The technology object displays the Capture value at the output parameter CapturedValue.	• Input delay • Edge selection • Frequency of the Capture function • Behavior of counter value after Capture
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective static variable of the technology object: • UserStatusFlags.StatusDI0 • UserStatusFlags.StatusDI1 • UserStatusFlags.StatusDI2	• Input delay

Note

With the exception of "Digital input without function", each function can only be used once for each counter, and if used for one digital input is not available to the others.

Note

For High_Speed_Counter as of V3.0, the following applies:

You can choose the "Capture" function only in operating mode "Use count value as reference".

Input delay (TM Count and TM PosInput)

You use this parameter to suppress signal interference at the digital inputs. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1" and for TM Count also under "Behavior of DI2".

Input delay (Compact CPU)

You use this parameter to suppress interference at the digital inputs of the DIn signals. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

You can configure the input delay for a digital input of a Compact CPU in the Inspector window of the device configuration under "Properties > DI 16/DQ 16 > Inputs > Channel n".

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms
- 0.4 ms
- 1.6 ms
- 3.2 ms (default)
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level (default)	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be set for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered.

The following options may be available depending on the function selected:

- At rising edge (default)
- At falling edge
- At rising and falling edge

The parameter can be set for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization
- Capture

Note

At rising and falling edge" can only be configured for the "Capture" function.

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as a function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Frequency of the Capture function

This parameter is used to define the frequency of Capture events for the following functions:

- Capture at Signal N
- Capture as function of a digital input

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input or first rising edge of the N signal saves the current counter value as a Capture value.
Periodic (default)	Each configured edge at the respective digital input or each rising edge of the N signal saves the current counter value as a Capture value.

Note

This parameter is available for High_Speed_Counter as of V3.2.

Behavior of counter value after Capture

You can configure the following characteristics for the counter after a capture event (Page 34):

Reaction	Meaning
Continue counting (default)	After saving the current counter value as Capture value, counting is continued unchanged.
Set to start value and continue counting	After saving the current counter value as Capture value, counting is continued with the start value.

3.5.6 Behavior of a DQ (High_Speed_Counter)

Operating mode (High_Speed_Counter V3.0 or higher)

The operating mode determines which value comparison functions work.

Operating mode	Meaning
Use count value as reference (default)	The comparison functions and hardware interrupts for compare events work with the counter value. This functionality corresponds to the functionality of the High_Speed_Counter in versions before V3.0.
Use measured value as reference	The comparison functions and hardware interrupts for compare events work with the measured value.

Note

You configure the operating mode under "Behavior of DQ0" for both digital outputs together. The operating mode is also displayed under "Behavior of DQ1".

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options:

Function of a digital output (Page 48) in operating mode "Use count value as reference"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= counter value <= high counting limit	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: Low counting limit <= counter value <= comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= counter value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the counter value reaches the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)

Function of a digital output (Page 48) in operating mode "Use count value as reference"	Meaning	Additional option-specific parameters
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active until the counter value is equal to the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

DQ0 of a counter of a Compact CPU

With a Compact CPU, the respective digital output DQ0 is available via the feedback interface, but not as a physical output.

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Note

The "At comparison value for a pulse duration" and "After set command from CPU until comparison value" functions only switch the digital output in question if a count pulse reaches the comparison value. When the counter value is set, e.g. by synchronization, the digital output does not switch.

Function of a digital output (Page 56) in operating mode "Use measured value as reference"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0(TM Count and TM PosInput)

Operating mode "Use count value as reference"

With the parameter assignment of the comparison value (Page 48), you specify the counter value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than or equal to the low counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 0(Compact CPU)

Operating mode "Use count value as reference"

With the parameter assignment of the Comparison value (Page 48), you specify the counter value at which the STS_DQ0 bit is set in the feedback interface of the selected comparison event. The digital output DQ0 is not available as a physical output in a Compact CPU.

You must enter an integer (DINT) that is greater than or equal to the low counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the Comparison value (Page 56), you specify the measured value at which the STS_DQ0 bit is set in the feedback interface of the selected comparison event. The digital output DQ0 is not available as a physical output in a Compact CPU.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Use count value as reference"

With the parameter assignment of the comparison value (Page 48), you specify the counter value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is smaller than or equal to the high counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "10".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The maximum value is 7.922816 x 10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the count direction for which the selected function is valid.

You can select from the following options:

Count direction	Meaning
In both directions (default)	The comparison and switching of the respective digital output take place regardless of the count direction.
Up	The comparison and switching of the respective digital output only takes place when the counter counts up.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

If you enter "0" and the counter value corresponds to the comparison value, the digital output remains active until the next count pulse.

You can enter a value between 0.0 and 6553.5.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 66), you can define a range around the comparison values. For the functions "Between comparison value and upper counter limit" and "Between comparison value and lower counter limit" the hysteresis also applies at the counter limits. Within the hysteresis range, the digital outputs cannot switch again until the counter value is outside the range.

Choose a small enough hysteresis. When the hysteresis range, starting from the configured comparison value, spans the entire counter value range, proper functioning of the comparison values cannot be guaranteed.

If a comparison value lies so close to the counter limit that the hysteresis range would extend beyond this counter limit, the hysteresis range ends at it.

If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

The following applies for High_Speed_Counter as of V3.0:

You configure the hysteresis under "Behavior of DQ0" for both digital outputs together. The hysteresis is also displayed under "Behavior of DQ1".

The hysteresis is only available in operating mode "Use count value as reference".

3.5.7 Specify measured value (High_Speed_Counter)

Measured variable

This parameter is used to specify the measured variable (Page 59) to be provided by the technology module. The technology object displays the measured value at the output parameter MeasuredValue.

You can select from the following options:

Measured variable	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second. The value is a floating point number (REAL). The unit is Hz. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Period	The measured variable is the average period between two increments. The value is an integer (DINT). The unit is s. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time • Time base for velocity measurement • Increments per unit

Update time

By configuring the update time (Page 59) in milliseconds, you can specify the time interval between two measured value updates.

The update time and the signal type effect the accuracy of the measurement. In the case of update times of at least 100 ms, the effect of the signal type is negligible.

In the case of update times of less than 100 ms, you achieve maximum measurement accuracy using the following signal types:

- Incremental encoder (A, B phase-shifted) with Signal evaluation "Single"
- Incremental encoder (A, B, N) with Signal evaluation "Single"
- Pulse (A) and direction (B)
- Pulse (A)

In the case of other signal types, measurement accuracy depends on the encoder and cable used.

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s

The default setting is "60 s".

Increments per unit

You can use this parameter to define the number of count pulses per relevant unit that the incremental or absolute encoder supplies for the velocity measurement.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example 1:

You encoder delivers 4000 count pulses for travel over one meter. The velocity is to be measured in meters per second. "Double" is configured as signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 8000
- Time base for velocity measurement: 1 s

Example 2:

Your encoder delivers 4096 count pulses per revolution. The velocity is to be measured in revolutions per minute. "Single" is configured as the signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s

3.6 Programming the High_Speed_Counter

3.6.1 High_Speed_Counter instruction

High_Speed_Counter

The High_Speed_Counter instruction is part of the High_Speed_Counter technology object. It supplies the control and feedback interface of the technology module.

The High_Speed_Counter instruction thereby forms the software interface between the user program and the technology module. It must be called cyclically from the user program in order to synchronize the input and output data.

The High_Speed_Counter instruction can be used for the technology modules of both S7-1500 and ET 200SP. The modules can be used centrally and decentrally. The instruction applies in each case to the channel of the technology module that was assigned to the associated technology object.

Additional information

Description High_Speed_Counter (Page 125)

High_Speed_Counter input parameters (Page 131)

High_Speed_Counter output parameters (Page 132)

Error codes of parameter ErrorID (Page 134)

High_Speed_Counter static variables (Page 136)

3.6.2 Call instruction in the user program

The High_Speed_Counter instruction can be called once for each counter in the cycle or, alternatively, in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the OB for cyclic program execution.
   The block is opened in the work area.
4. In the "Instructions" window, open the "Technology" group and the "Counting and measurement" folder.
   The folder contains the instruction.
5. Select the instruction and drag it to your OB.
   The "Call options" dialog opens.
6. Select a technology object from the "Name" list or enter the name for a new technology object.
7. Confirm with "OK".

Result

If the technology object does not exist yet, it is added. The instruction is added in the OB. The technology object is assigned to this call of the instruction.

Note

If you click one of the buttons "Configuration", "Commissioning" or "Diagnostics" in the user interface of the instruction, the respective editor opens.

3.6.3 Description High_Speed_Counter

Description

The High_Speed_Counter instruction is used to control the technology module counting and measuring functions via the user program.

Call

The instruction High_Speed_Counter must be called once per counter, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Operating principle

Counter value: The counter value is available at the output parameter CountValue. The counter value is updated at every call of the High_Speed_Counter instruction.

Measured value: The technology module updates the measured value asynchronously to the instruction call based on the configured update time. The measured value last determined by the technology module is updated at the output parameter MeasuredValue each time the instruction is called.

The measured value and the counter value are available in parallel in the feedback interface.

Capture: The output parameter CaptureStatus = TRUE indicates a valid Capture value at the output parameter CapturedValue.

- A Capture value is captured under the following conditions:
  - A digital input has the parameter assignment "Capture"
  - CaptureEnable = TRUE
  - Edge at digital input with the Capture function
- The output parameter CaptureStatus is reset by a negative edge at the input parameter CaptureEnable.

Synchronization: The output parameter SyncStatus = TRUE indicates that a synchronization has occurred.

- The counter value is synchronized under the following conditions:
  - A digital input has the parameter assignment "Synchronization" **or** the incremental encoder has the parameter assignment "Synchronization at signal N"
  - SyncEnable = TRUE
  - The static tag SyncUpDirection (or SyncDownDirection) = TRUE
  - Edge at the digital input with the synchronization function **or** positive edge of the signal N at the encoder input
- The output parameter SyncStatus is reset by a negative edge at
  - the input parameter SyncEnable or
  - the static tag SyncDownDirection or
  - the static tag SyncUpDirection

Parameter changes via the user program

Proceed as follows to modify parameters using the user program:

1. Check based on the respective Set tag to determine whether the technology object is ready for the parameter change (Set tag = FALSE) or whether a change job is still running (Set tag = TRUE).
   The following Set tags in UserCmdFlags are available for this in the static tags of the technology object instance DB:
   - SetReferenceValue0
   - SetReferenceValue1
   - SetUpperLimit
   - SetLowerLimit
   - SetCountValue
   - SetStartValue
   - SetNewDirection
2. If the technology object is ready for the parameter change, modify the relevant static tag. The following static tags of the technology object instance DB are available for this:
   - NewReferenceValue0 / NewReferenceValue0_M (for SetReferenceValue0)
   - NewReferenceValue1 / NewReferenceValue1_M (for SetReferenceValue1)
   - NewUpperLimit
   - NewLowerLimit
   - NewCountValue
   - NewStartValue
   - NewDirection

3. Set the relevant Set tag for execution of the change command.
4. Use the output parameter Error to check whether an error has occurred.
   If no errors have occurred and the Set tag has been automatically reset by the technology object, the parameter change was successful.

Note

Changed counting limit

If the new high counting limit is less than the current counter value, the counter value is set to the low counting limit or the start value according on the parameter assignment. If the new low counting limit is greater than the current counter value, the counter value is set to the high counting limit or the start value according to the parameter assignment.

Operating mode (High_Speed_Counter V3.0 or higher)

Configure the operating mode in the technology object under "Behavior of DQ0".

The operating mode is indicated by the output parameter CompareMeasuredValue:

State	Description
FALSE	Operating mode "Use count value as reference" The comparison functions work with the counter value. The following static variables are specifically used in this operating mode: • NewReferenceValue0 • NewReferenceValue1 • CurReferenceValue0 • CurReferenceValue1 The four specific static variables of operating mode "Use measured value as reference" are ignored.
TRUE	Operating mode "Use measured value as reference": The comparison functions work with the measured value. The following static variables are specifically used in this operating mode: • NewReferenceValue0_M • NewReferenceValue1_M • CurReferenceValue0_M • CurReferenceValue1_M The four specific static variables of operating mode "Use count value as reference" are ignored.

Acknowledgment of events

You acknowledge signaled events using the positive edge of the input parameter EventAck . EventAck must stay set until the technology object has reset the status bits of the following events of the count channel:

- CompResult0
- CompResult1
- ZeroStatus
- PosOverflow
- NegOverflow

Status of the digital inputs (TM Count and TM PosInput)

You can obtain the status of the digital inputs with the static tags StatusDI0, StatusDI1 or StatusDI2.

Status of the digital inputs (Compact CPU)

You can obtain the status of the digital inputs with the static tags StatusDI0 and StatusDI1. When a digital input of the Compact CPU is not used for a counter, you can use it via the user program.

Use of digital outputs by the user program (TM Count and TM PosInput)

You can set the digital outputs with the High_Speed_Counter instruction,

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- if you set the corresponding static tag ManualCtrlDQm (temporary overwrite).

The static tags SetDQ0 and SetDQ1 only have an effect in these cases. In the first and third case, DQm follows the value of SetDQm. In the second case, DQm is set with a positive edge of SetDQm. DQm is reset when the counter value corresponds to the comparison value or at a negative edge of SetDQm.

Use digital outputs by user program (Compact CPU)

You can set the DQ1 digital output with the High_Speed_Counter instruction.

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- if you set the corresponding static tag ManualCtrlDQ1 (temporary overwrite).

The static tag SetDQ1 only has an effect in these cases. In the first and third case, DQ1 follows the value of SetDQ1. In the second case, DQ1 is set and reset with a positive edge of SetDQ1 when the counter value corresponds to the comparison value or at a negative edge of SetDQ1.

Note

Before you can set a physical digital output of the Compact CPU with the High_Speed_Counter instruction, you have to assign the DQ1 signal to the desired digital output.

You can set the DQ0 signal using the High_Speed_Counter instruction with the static tag StatusDQ0.

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- If you set the static tag ManualCtrlDQ0 (temporary overwrite).

The static tag SetDQ0 only has an effect in these cases. In the first and third case, DQ0 follows the value of SetDQ0. In the second case, StatusDQ0 is set and reset with an edge (positive or negative) by SetDQ0 and is reset when the counter value corresponds to the comparison value.

Note

The digital output DQ0 is not available as a physical output.

Reaction to error

If an error has occurred during the call of the instruction or in the technology module, the output parameter Error is set. More detailed error information can be read at the output parameter ErrorID.

Eliminate the cause of the error and acknowledge the error message by setting the input parameter ErrorAck. When no more errors are pending, the technology object resets the output parameter Error . No new error is signaled until you acknowledge the previous error.

Changing the count direction

The count direction can only be changed by the user program if "Pulse (A)" is configured as the signal type. In all other cases, the count direction is determined by the input signals of the technology module. The count direction is controlled by the static tag NewDirection:

- +1: Upward count direction
- -1: Downward count direction

To execute the change command, you need to set the static tag SetNewDirection = TRUE.

3.6.4 High_Speed_Counter input parameters

Parameter	Declaration	Data type	Default	Description
SwGate	INPUT	BOOL	FALSE	Control software gate: • Positive edge: Software gate opens • Negative edge: Software gate closes Together with the hardware gate, the SwGate enables the internal gate.
Capture-Enable	INPUT	BOOL	FALSE	Enable Capture function After the enable, a Capture event occurs at the next configured edge at the relevant digital input. A negative edge at CaptureEnable resets the output parameter CaptureStatus. A negative edge at CaptureEnable resets the enable even if no Capture event has occurred. Irrespective of CaptureEnable the last value is retained at the output parameter CapturedValue until the next Capture event.
SyncEnable	INPUT	BOOL	FALSE	Enable synchronization The direction enabled for synchronization is indicated in the static tags SyncUpDirection and SyncDownDirection. A negative edge at SyncEnable resets the output parameter SyncStatus .
ErrorAck	INPUT	BOOL	FALSE	High_Speed_Counter up to V3.0: A positive edge acknowledges the status reported. High_Speed_Counter as of V3.1: A high level acknowledges the error status reported.
EventAck	INPUT	BOOL	FALSE	A positive edge resets the following output parameters: • CompResult0 • CompResult1 • ZeroStatus • PosOverflow • NegOverflow
SetCount-Value	INOUT	BOOL	FALSE	A positive edge starts the transfer of the new counter value in the static tag NewCountValue to the technology module. The counter value takes effect immediately after the transfer.

3.6.5 High_Speed_Counter output parameters

Parameter	Declaration	Data type	Default	Description
StatusHW	OUTPUT	BOOL	FALSE	Status bit technology module: The module is configured and ready for operation. The module data is valid.
StatusGate	OUTPUT	BOOL	FALSE	Status bit: Internal gate is released if parameter is set
StatusUp	OUTPUT	BOOL	FALSE	Status bit: The last count pulse incremented the counter and took place no more than 0.5 s ago
StatusDown	OUTPUT	BOOL	FALSE	Status bit: The last count pulse decremented the counter and took place no more than 0.5 s ago
CompResult0	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ0 occurred (status change) based on the selected comparison condition. If the counter value is set to the start value in operating mode "Use count value as reference", CompResult0 is not set. The positive edge of the input parameter EventAck is used to reset CompResult0 .
CompResult1	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ1 occurred (status change) based on the selected comparison condition. If the counter value is set to the start value in operating mode "Use count value as reference", CompResult1 is not set. The positive edge of the input parameter EventAck is used to reset CompResult1 .
SyncStatus	OUTPUT	BOOL	FALSE	Status bit: Synchronization event occurred If the input parameter SyncEnable is set, the configured edge sets the status bit SyncStatus at the respective digital input . SyncStatus is reset by a negative edge at • SyncEnable (input parameter) or • SyncUpDirection (static tag) or • SyncDownDirection (static tag)
CaptureStatus	OUTPUT	BOOL	FALSE	Status bit: Capture event occurred, the output parameter CapturedValue has a valid Capture value If the input parameter CaptureEnable is set, the configured edge sets the status bit CaptureStatus. at the respective digital input. You reset CaptureStatus using the negative edge of the input parameter CaptureEnable .
ZeroStatus	OUTPUT	BOOL	FALSE	Status bit: CountValue has reached the value "0" irrespective of the count direction You reset ZeroStatus using the positive edge of the input parameter EventAck.
PosOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated high counting limit in the positive direction You reset PosOverflow using the positive edge of the input parameter EventAck.
NegOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated low counting limit in the negative direction You reset NegOverflow using the positive edge of the input parameter EventAck.

Parameter	Declaration	Data type	Default	Description
Error	OUTPUT	BOOL	FALSE	An error has occurred. Refer to the output parameter ErrorID for the cause of the error.
ErrorID	OUTPUT	WORD	0	The ErrorID (Page 134) parameter displays the number of the error message. ErrorID = 0000_H: There is no error.
CountValue	OUTPUT	DINT	0	Current counter value
Captured-Value	OUTPUT	DINT	0	The last acquired Capture value The value is retained until the next Capture event, irrespective of the input parameter Cap-tureEnable. If a new Capture event has occurred, CaptureStatus is set and is reset by you using the negative edge of the input parameter CaptureEnable .
Measured-Value	OUTPUT	REAL	0.0	Current measured value for frequency, period duration or velocity (depending on configuration)
Compare-Measured-Value[1]	OUTPUT	BOOL	FALSE	Status bit: FALSE: Operating mode "Use count value as reference"; com-parison functions work with counter value TRUE: Operating mode "Use measured value as reference"; comparison functions work with measured value

[1] Available for High_Speed_Counter version V3.0 or higher

3.6.6 Error codes of parameter ErrorID

Error code (W#16#...)	Description
0000	No error
Error messages from technology module	
80A1	POWER_ERROR from feedback interface: Incorrect supply voltage L+
80A2	ENC_ERROR from feedback interface: Incorrect encoder signal
80A3	LD_ERROR from feedback interface: Error when loading via control interface
Error messages of the instruction High_Speed_Counter	
80B1	Invalid count direction
80B4	For operating mode "Use count value as reference", the following applies: New low counting limit does not meet the following conditions: • Low counting limit < high counting limit • Low counting limit <= comparison value/start value For operating mode "Use measured value as reference", the following applies: New low counting limit does not meet the following conditions: • Low counting limit < high counting limit • Low counting limit <= start value
80B5	For operating mode "Use count value as reference", the following applies: New high counting limit does not meet the following conditions: • Low counting limit < high counting limit • High counting limit >= comparison value/start value For operating mode "Use measured value as reference", the following applies: New high counting limit does not meet the following conditions: • Low counting limit < high counting limit • High counting limit >= start value
80B6	New start value does not meet the following condition: • Low counting limit <= start value <= high counting limit
80B7	New counter value does not meet the following condition: • Low counting limit <= counter value <= high counting limit
80B8	For operating mode "Use count value as reference", the following applies: New comparison value 0 does not meet the following conditions: • Low counting limit <= comparison value 0 <= high counting limit • Comparison value 0 < comparison value 1 For operating mode "Use measured value as reference", the following applies: New comparison value 0 does not meet the following conditions: • Comparison value 0 < comparison value 1

Error code (W#16#...)	Description
80B9	For operating mode "Use count value as reference", the following applies: New comparison value 1 does not meet the following conditions: • Low counting limit <= comparison value 1 <= high counting limit • Comparison value 0 < comparison value 1 For operating mode "Use measured value as reference", the following applies: New comparison value 1 does not meet the following conditions: • Comparison value 0 < comparison value 1
80C0	Instruction High_Speed_Counter was called multiple times with the same instance (DB)
80C1	Communication with technology module failed (read data records): Error information of internal instruction RDREC saved in static tag AdditionalErrorID
80C2	Communication with technology module failed (write data records): Error information of internal instruction WRREC saved in static tag AdditionalErrorID
80C3	Access to input data (feedback interface) failed: Error information of internal instruction GETIO_PART saved in static tag AdditionalErrorID
80C4	Access to output data (control interface) failed: Error information of internal instruction SETIO_PART saved in static tag AdditionalErrorID
80C5	Reading of the current start information of the OB failed: Error information of internal instruction RD_SINFO saved in static tag AdditionalErrorID
80C6	Failed to get I/O addresses of the technology module: Error information of internal instruction RD_ADDR saved in static tag AdditionalErrorID
80C7	Module not inserted or no supply voltage L+

3.6.7 High_Speed_Counter static variables

Tag	Data type	Default	Access	Description
NewCountValue	DINT	L#0	Write	New counter value
NewReferenceValue0	DINT	L#0	Write	New comparison value 0 in the operating mode "Use count value as reference"
NewReferenceValue1	DINT	L#10	Write	New comparison value 1 in the operating mode "Use count value as reference"
NewReferenceValue0_M[1]	REAL	L#0.0	Write	New comparison value 0 in operating mode "Use measured value as reference"
NewReferenceValue1_M[1]	REAL	L#10.0	Write	New comparison value 1 in operating mode "Use measured value as reference"
NewUpperLimit	DINT	L#2147483647	Write	New high counting limit
NewLowerLimit	DINT	L#-2147483648	Write	New low counting limit
NewStartValue	DINT	L#0	Write	New start value
NewDirection	INT	0	Write	New count direction: +1: Upward count direction -1: Downward count direction
CurReferenceValue0	DINT	L#0	Read	Current comparison value 0 in operating mode "Use count value as reference"
CurReferenceValue1	DINT	L#10	Read	Current comparison value 1 in operating mode "Use count value as reference"
CurReferenceValue0_M[1]	REAL	L#0.0	Read	Current comparison value 0 in operating mode "Use measured value as reference"
CurReferenceValue1_M[1]	REAL	L#10.0	Read	Current comparison value 1 in operating mode "Use measured value as reference"
CurUpperLimit	DINT	L#2147483647	Read	Current high counting limit
CurLowerLimit	DINT	L#-2147483648	Read	Current low counting limit
CurStartValue	DINT	L#0	Read	Current start value
AdditionalErrorID	DWORD	W#16#0000	Read	Error information of an internal instruction, e.g.,RDREC

Tag		Data type	Default	Access	Description
UserCmdFlags		STRUCT	-		
	SetNewDirection	BOOL	FALSE	Write	Set new count direction
	SetUpperLimit	BOOL	FALSE	Write	Set high counting limit
	SetLowerLimit	BOOL	FALSE	Write	Set low counting limit
	SetReferenceValue0	BOOL	FALSE	Write	Set comparison value 0
	SetReferenceValue1	BOOL	FALSE	Write	Set comparison value 1
	SetStartValue	BOOL	FALSE	Write	Set start value
	SyncDownDirection	BOOL	TRUE	Write	Enable synchronization in downward count direction
	SyncUpDirection	BOOL	TRUE	Write	Enable synchronization in upward count direction
	SetDQ0	BOOL	FALSE	Write	Set digital output DQ0
	SetDQ1	BOOL	FALSE	Write	Set digital output DQ1
	ManualCtrlDQ0	BOOL	FALSE	Write	Enable setting of digital output DQ0: TRUE: • SetDQ0 sets DQ0 • Control bit TM_CTRL_DQ0 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ0 = TRUE
	ManualCtrlDQ1	BOOL	FALSE	Write	Enable setting of digital output DQ1: TRUE: • SetDQ1 sets DQ1 • Control bit TM_CTRL_DQ1 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ1 = TRUE
UserStatusFlags		STRUCT	-		
	StatusDI0	BOOL	FALSE	Read	Current status of digital input DI0
	StatusDI1	BOOL	FALSE	Read	Current status of digital input DI1
	StatusDI2	BOOL	FALSE	Read	Current status of digital input DI2
	StatusDQ0	BOOL	FALSE	Read	Current status of digital output DQ0
	StatusDQ1	BOOL	FALSE	Read	Current status of digital output DQ1

1 Available for High_Speed_Counter version V3.0 or higher

3.7 Commissioning the High_Speed_Counter

3.7.1 Commissioning the technology object

A graphic display of the block in the commissioning editor helps you with commissioning and the function test for the technology object. You can change specific parameters of the High_Speed_Counter instruction in CPU/IM online mode and monitor their effects.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The corresponding High_Speed_Counter instruction is called cyclically from the user program.
- The parameters of the technology object are not overwritten by the user program.

Procedure

To open the commissioning editor of a technology object and to simulate a parameter value change, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Commissioning" object.
   The functions for commissioning the High_Speed_Counter technology object are displayed.
4. In the commissioning dialog, click on the "Monitor all" button.
   The parameters (online values) of the High_Speed_Counter technology object are loaded and displayed.
5. If the parameter you want to change has a text box, enter the new value there.
6. Select the check box of the parameter.
   The new parameter value becomes effective and the effects of the change are simulated.

Online mode

In online mode, you can modify the following parameters to test the technology object function:

- New counter value (NewCountValue)
- New high counting limit (NewUpperLimit)
- New low counting limit (NewLowerLimit)
- New comparison value 0 (NewReferenceValue0 or NewReferenceValue0_M)
- New comparison value 1 (NewReferenceValue1 or NewReferenceValue1_M)
- New start value (NewStartValue)
- Start and stop counter (SwGate)
- Enable Capture (CaptureEnable)
- Enable synchronization (SyncEnable)
- Acknowledgment of signaled error states (ErrorAck)
- Resetting the status flag (EventAck)

3.8 High_Speed_Counter diagnostics

3.8.1 Monitoring counter values, measured values, DIs and DQs

You use the diagnostic functions to monitor the counting and measuring functions.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the display editor for the diagnostic functions, follow these steps:

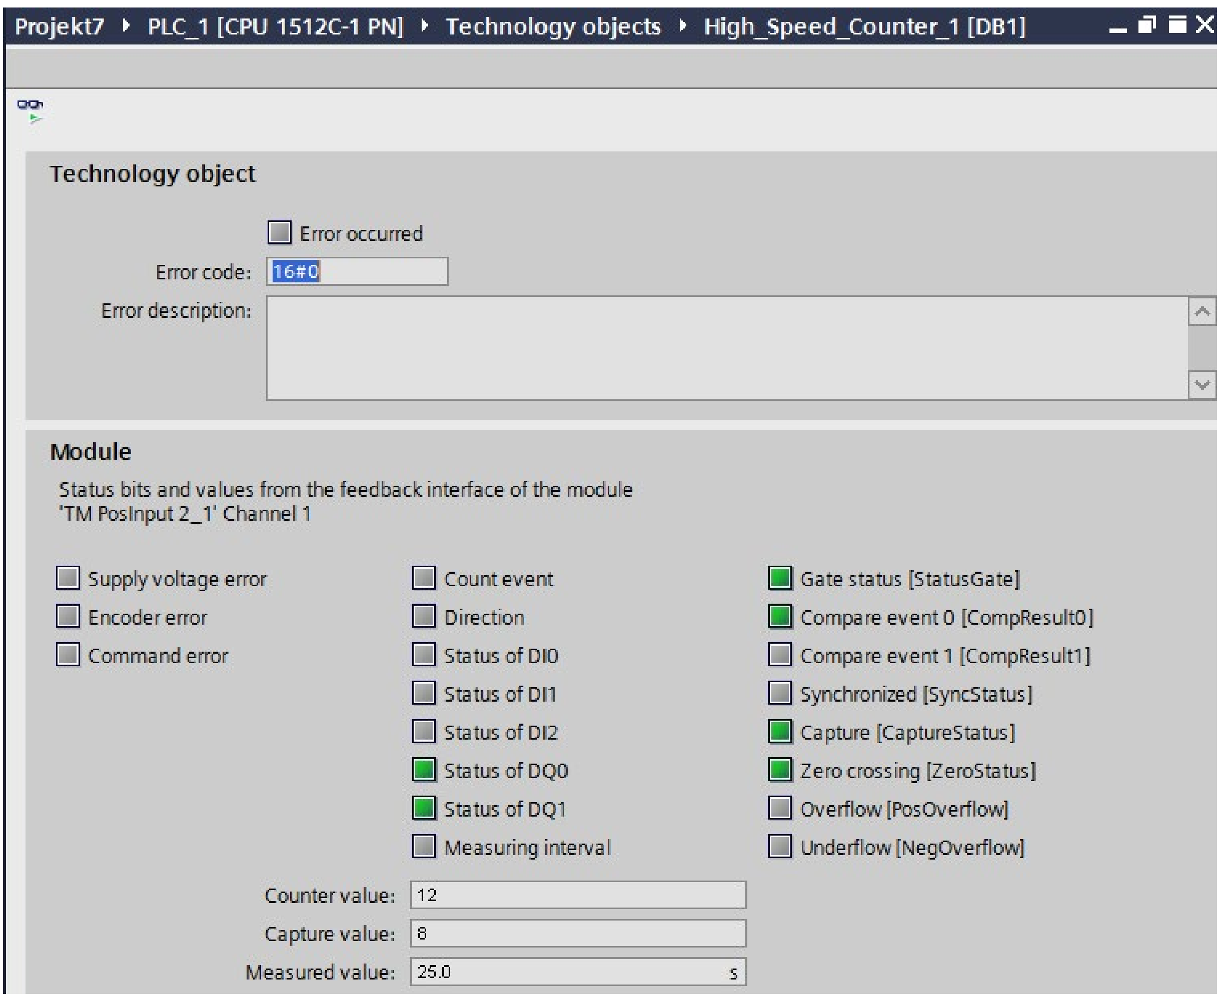
1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Diagnostics" object.
4. Click the "Monitor all" button.

Display

The following values are read by the technology object from the feedback interface and displayed:

- Event display/diagnostics information
- Signal states of the digital inputs and digital outputs
- Counter value
- Capture value
- Measured value

Additional information on status displays is available in the context-sensitive help for each event in STEP 7 (TIA Portal). When the CPU is in STOP, the status display is not updated.



4 Using the SSI_Absolute_Encoder technology object

4.1 Technology object SSI_Absolute_Encoder

STEP 7 (TIA Portal) supports you in the configuration, commissioning and diagnostics of counting and measuring functions for the TM PosInput technology module with the "Technology objects" function in combination with the SSI absolute encoders:

- In STEP 7 (TIA Portal) you configure the SSI_Absolute_Encoder technology object by entering the encoder parameters.
- The corresponding SSI_Absolute_Encoder instruction is programmed in the user program. This instruction supplies the control and feedback interface of the technology module.

The SSI_Absolute_Encoder technology object corresponds to the instance DB of the SSI_Absolute_Encoder instruction. The configuration of the position input and measuring functions is saved in the technology object. The technology object is located in the folder "PLC > Technology objects".

The SSI_Absolute_Encoder technology object can be used for the TM PosInput of both the S7-1500 and ET 200SP systems alike.

Operating mode

In order to assign the technology module parameters using a TM PosInput, you specify the operating mode (Page 181) "Operation with technology objects for "counting and measurement"" in the hardware configuration of the TM PosInput. This selection is already preset.

4.2 Overview of the configuration steps

Introduction

The overview below shows the basic procedure for configuring the position input and measuring functions of the technology module with the SSI_Absolute_Encoder technology object.

Requirement

Before you can use the technology object, a project with an S7-1500 CPU or an ET 200SP CPU must be created in STEP 7 (TIA Portal).

Procedure

Proceed in the recommended sequence outlined below:

Step	Description
1	Configure a technology module (Page 175)
2	Add technology object (Page 144)
3	Configure a technology object according to your application (Page 146)
4	Call instruction in the user program (Page 163)
5	Load to CPU
6	Commissioning the technology object (Page 172)
7	Diagnostics of the technology object (Page 173)

4.3 Add technology object

Adding a technology object in the project navigation

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement

A project with a CPU S7-1500 has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click on "Add new object".
   The "Add new object" dialog opens.
4. Select the "Counting and measurement" technology.
5. Select the "SSI_Absolute_Encoder" object.
6. Enter an individual name for the technology object in the "Name" text box.
7. Click "Additional information" if you want to add your own information to the technology object.
8. Confirm with "OK".

Result

The new technology object has now been created and stored in the project tree in the "Technology objects" folder.

	Object	Description
①	Configuration (Page 146)	In the configuration dialog: • Assignment of technology module and channel • Technology object parameter settings for position input and measurement functions When you change the configuration of the technology object, you must download the technology object **and** the hardware configuration to the CPU.
②	Commissioning (Page 172)	Commissioning and function test of the technology object: Simulating parameters of the SSI_Absolute_Encoder instruction and monitoring the effects
③	Diagnostics (Page 173)	Monitoring of the position input and measurement functions

4.4 Configuring SSI_Absolute_Encoder

4.4.1 Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click on the "Configuration" object.

The configuration is divided into the following categories:

- **Basic parameters**

  The basic parameters include the selection of the technology module and the number of the channel for which the technology object is configured.

- **Extended parameters**

  The extended parameters include the parameters for adapting the position input and measuring functions and for setting the characteristics of the digital inputs and digital outputs.

Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	The configuration contains values set by the user or automatically adapted values and is complete All text boxes of the configuration contain valid values and at least one default value was changed.
	The configuration is incomplete or incorrect At least one text box or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.

4.4.2 Basic parameters

Under "Basic parameters", you can establish the connection between the technology object and the TM PosInput technology module.

Module

You select the technology module in a subsequent dialog box. All TM PosInput technology modules (central or distributed) that are configured for use with a "Counting and measurement" technology object under the S7-1500 CPU or ET 200SP CPU are available for selection.

After selecting the technology module, you can open the device configuration associated with the technology module by clicking the"Device configuration" button.

The technology module parameter settings required for the use of the technology object are made in the "Extended parameters" of the technology object.

Channel

For a technology module with several channels, you select the number of the channel for which the technology object is valid.

Note

A channel can be assigned to only *one* technology object. A channel that is already assigned to a technology object can no longer be selected.

Synchronization of the parameter values

If, after assignment of the channel to the technology object, there is an inconsistency between the parameter values in the property dialog of the TM PosInput module and in the technology object, a button with a corresponding inquiry appears. When you click the button, the parameter values in the property dialog of the assigned module are overwritten by the parameter values of the technology object within STEP 7 (TIA Portal). The current parameter values of the technology object are displayed in the property dialog of the module (read-only).

4.4.3 SSI absolute encoder

Frame length

With the parameter assignment of the frame length, you specify the number of bits of an SSI frame of the SSI absolute encoder (Page 26) used. You can find the frame length of your SSI absolute encoder in the data sheet of the encoder. Special bits are also included in the frame length. A parity bit does not count in the frame length.

A frame length of between 10 bits and 40 bits is permitted. The default setting is "13 Bit".

You can find two examples of the SSI frame format at Examples of the frame format (Page 159).

Code type

You use the parameter assignment of the code type to specify whether the encoder supplies Dual code or Gray code.

You can select from the following options:

Code type	Meaning
Gray (default)	The gray-coded position value returned by the SSI absolute encoder is converted to dual code.
Dual	The value returned by the SSI absolute encoder is not converted.

Transmission rate

With the parameter assignment of the transmission rate, you specify the data transmission rate between the technology module and the SSI absolute encoder.

You can select from the following options:

- 125 kHz (preset)
- 250 kHz
- 500 kHz
- 1 MHz
- 1.5 MHz
- 2 MHz

The maximum transmission rate depends on the cable length and the technical specifications of the SSI absolute encoder. For additional information, refer to the product manual of the TM PosInput and the encoder description.

Monoflop time

With the parameter assignment of the monoflop time, you specify the idle time between two SSI frames.

The configured monoflop time must be at least equal to the monoflop time of the SSI absolute encoder used. You can find this value in the technical specifications of the SSI absolute encoder.

You can select from the following options:

- Automatically (default)
- 16 µs
- 32 µs
- 48 µs
- 64 µs

Note

If you select the "Automatic" option, the monoflop time automatically adapts to the encoder used.

In isochronous mode, the "Automatic" option corresponds to a monoflop time of 64 µs. If the monoflop time of the employed SSI absolute value encoder is less than 64 µs, you can select the value of the encoder to achieve faster isochronous times.

Parity

With the parameter assignment of the parity, you specify whether the SSI absolute encoder transfers a parity bit.

If, for example, a 25-bit encoder with parity is assigned, the technology module reads 26 bits. A parity error is indicated by the technology object at the ErrorID output parameter with the value 80A2.

Bit number LSB of the position value

This parameter is used to specify the bit number of the LSB (least significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the bit number of the MSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

The default setting is "0".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Bit number MSB of the position value

This parameter is used to specify the bit number of the MSB (most significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the frame length and higher than the bit number of the LSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

The default setting is "12".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Invert direction

You can use this parameter to invert the values supplied by the SSIabsolute encoder. This allows you to adapt the detected direction of the encoder to the motor's direction of rotation.

Note

This parameter acts only on the range from the LSB to the MSB of the position value in the frame.

SSI frame

You can also set the following parameters in the graphic with drag-and-drop:

- Frame length
- Bit number LSB of the position value
- Bit number MSB of the position value

Complete SSI frame

If "Complete SSI frame" has been selected as the measured variable, the module returns the least significant 32 bits of the unprocessed current SSI frame as the measured value. The graphic shows the corresponding meaning of a supplied bit. The following abbreviations are used:

V	Value: Position value as gray or dual code
S	Special: Special bit
P	Parity: Parity bit When you have configured a parity bit, the module returns the least significant 31 bits of the SSI frame *and* the parity bit.

4.4.4 Behavior of a DI (SSI_Absolute_Encoder)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Capture (Page 37)	The configured edge at the respective digital input saves the current position value as a Capture value. The technology object displays the Capture value at the output parameter CapturedValue. The function can only be used for one of the two digital inputs.	• Input delay • Edge selection • Frequency of the Capture function
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective static variable (Page 171) of the technology object: • UserStatusFlags.StatusDI0 • UserStatusFlags.StatusDI1	• Input delay

---

Note

You can choose the "Capture" function only in operating mode "Use position value (SSI absolute value) as reference".

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered for the "Capture" function.

You can select from the following options:

- At rising edge (default)
- At falling edge
- At rising and falling edge

Frequency of the Capture function

This parameter is used to define the frequency of Capture events (Page 37):

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input saves the current counter value as Capture value.
Periodic (default)	Each configured edge at the respective digital input saves the current counter value as a Capture value.

Note

This parameter is available for SSI_Absolute_Encoder as of V3.0.

4.4.5 Behavior of a DQ (SSI_Absolute_Encoder)

Operating mode

With the operating mode, you specify the reference value with which the comparison functions work.

Operating mode	Meaning
Use position value (SSI absolute value) as reference (default)	The comparison functions and hardware interrupts for compare events work with the position value.
Use measured value as reference	The comparison functions and hardware interrupts for compare events work with the measured value.

Note

You configure the operating mode under "Behavior of DQ0" for both digital outputs together. The operating mode is also displayed under "Behavior of DQ1".

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options depending on the operating mode:

Function of a digital output (Page 52) in operating mode "Use position value (SSI absolute value) as reference"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= position value <= maximum position value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: Minimum position value <= Position value <= Comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= position value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the assigned time and direction of the position value change when the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)

Function of a digital output (Page 52) in operating mode "Use position value (SSI absolute value) as reference"	Meaning	Additional option-specific parameters
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active for the assigned direction of the position value change until the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Function of a digital output (Page 56) in operating mode "Use measured value as reference"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0

Operating mode "Use position value (SSI absolute value) as reference"

With the parameter assignment of the comparison value (Page 52), you specify the position value at which the digital output DQ0 switches as a result of the selected comparison event.

If you use an SSI absolute encoder with a position value length of up to 31 bits, you must enter a positive integer (DINT) with a value between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, you must enter a signed integer (DINT) with a value between –2147483648 and 2147483647.

If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Use position value (SSI absolute value) as reference"

With the parameter assignment of the comparison value (Page 52), you specify the position value at which the digital output DQ1 switches as a result of the selected comparison event.

If you use an SSI absolute encoder with a position value length of up to 31 bits, you must enter a positive integer (DINT) with a value between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, you must enter a signed integer (DINT) with a value between –2147483648 and 2147483647.

If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "10".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The maximum value is 7.922816 x 10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the direction of position value change for which the selected function is valid.

You can select from the following options:

Direction of position value change	Meaning
In both directions (default)	The comparison and switching of the respective digital output is carried out regardless of whether the position value increases of decreases.
Up	The comparison and switching of the respective digital output only takes place when the position value increases.
Down	The comparison and switching of the respective digital output only takes place when the position value decreases.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

A value from 0.1 to 6553.5 ms is permissible.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 68), you can define a range around the comparison values. For the functions "Between comparison value and upper counter limit" and "Between comparison value and lower counter limit" the hysteresis also applies at the counter limits. Within the hysteresis range, the digital outputs cannot switch again until the position value has left this range once.

Choose a small enough hysteresis. When the hysteresis range, starting from the configured comparison value, spans the entire position value range, proper functioning of the comparison values cannot be guaranteed.

If a comparison value lies so close to the counter limit that the hysteresis range would extend beyond this counter limit, the hysteresis range ends there.

If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

You configure the hysteresis under "Behavior of DQ0" for both digital outputs together. The hysteresis is also displayed under "Behavior of DQ1".

Note

The hysteresis is only available in operating mode "Use position value (SSI absolute value) as reference".

4.4.6 Specify measured value (SSI_Absolute_Encoder)

Measured variable

With this parameter you specify whether the technology module is to provide a certain measured variable (Page 63) or the complete SSI frame.

You can select from the following options:

Option	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second, where each increment corresponds to one position value change. The value is a floating point number (REAL). The unit is Hz. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Period	The measured variable is the average period between two increments of the position value. The value is an integer (DINT). The unit is s. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time • Time base for velocity measurement • Increments per unit
Complete SSI frame	Instead of a measured variable, the first 32 bits of the SSI frame are returned (bit 0 to bit 31). In so doing, special bits that do not belong to the position information are also supplied. A configured inversion of the direction is ignored. The technology object displays the value at the output parameter CompleteSSIFrame. You can find examples under Examples of the frame format (Page 159). This option is only available in operating mode "Use position value (SSI absolute value) as reference".	—

Note

If the increment per revolution is required for calculation of the measured values, it is automatically calculated from the parameterized telegram length as the power of 2, e.g. 8192 increments per revolution with a telegram length of 13 bit. If you are using an SSI absolute encoder whose increment per revolution does not correspond to the power of 2, the calculated measured value may be incorrect for a short time.

Update time

By configuring the update time (Page 63) in milliseconds, you can specify the time interval between two measured value updates. Unsteady measured variables can be smoothed through longer update times

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s

The default setting is "60 s".

Increments per unit

With this parameter you define the number of increments per relevant unit that the SSI absolute encoder supplies for the velocity measurement.

You can enter a value between 1 and 65535.

Example 1:

Your absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s

Example 2:

You encoder delivers 10000 increments for travel over one meter. The velocity is to be measured in meters per second.

In this case, you need to assign the following parameters:

- Increments per unit: 10000
- Time base for velocity measurement: 1 s

4.4.7 Examples of the frame format

Example 1

In this example the SSI absolute encoder has the following specification:

- The encoder has a resolution of 13 bits per revolution and a value range of 12 bits of revolutions. The SSI frame has a length of 25 bits.
- The MSB of the position value is bit 24.
- The LSB of the position value is bit 0.
- The position value is Gray coded.
- A parity bit is not available.

The frame has the following format:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
Bit:	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG
	MSB																								LSB

Position value

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Complete SSI frame

If you configure "Complete SSI frame", the technology module returns the unprocessed SSI frame in the return interface right-justified:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Position value feedback value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD

MD Multiturn bit as binary code

SD Singleturn bit as binary code

Example 2

In this example the SSI absolute encoder has the following specification:

- The encoder has a resolution of 17 bits per revolution and a value range of 11 bits of revolutions. The SSI frame has a length of34 bits.
- The MSB of the position value is bit 33.
- The LSB of the position value is bit 6.
- The position value is Gray coded.
- The SSI frame has six special bits.
- A parity bit is available. A parity bit does not count in the frame length.

The frame has the following format:

Clock:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35
Bit:	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	*	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	S1	S2	P	S3	S4	S5	S6
	MSB																											LSB							

Position value

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Sn Special bit n

P Parity bit

Complete SSI frame

If you configure "Complete SSI frame", the technology module returns the least significant 32 bits of the SSI frame as an unprocessed bit string. The technology module returns the bit following the LSB as parity bit. In this example, the technology module therefore returns only the least significant 31 bits of the SSI frame. With the complete SSI frame, you can evaluate the additional special bits in your application.

The returned bit string is structured as follows:

Clock:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	P	S1	S2	S3	S4	S5	S6

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Sn Special bit n

P Parity bit

Position value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface: The special bits are ignored in this case. The parity bit is evaluated but is not returned with the position value:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Cycle:	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD

MD Multiturn bit as binary code

SD Singleturn bit as binary code

4.5 Programming the SSI_Absolute_Encoder

4.5.1 Instruction SSI_Absolute_Encoder

SSI_Absolute_Encoder

The SSI_Absolute_Encoder instruction is part of the SSI_Absolute_Encoder technology object. It supplies the control and feedback interface of the TM PosInput technology module.

The SSI_Absolute_Encoder instruction thereby forms the software interface between the user program and the technology module. It must be called cyclically from the user program in order to synchronize the input and output data.

The SSI_Absolute_Encoder instruction can be used for the TM PosInput of both the S7-1500 and ET 200SP systems alike. The TM PosInput modules can be used centrally and decentrally. The instruction applies in each case to the channel of the technology module that was assigned to the associated technology object.

Additional information

Description SSI_Absolute_Encoder (Page 164)

Input parameter SSI_Absolute_Encoder (Page 167)

Output parameter SSI_Absolute_Encoder (Page 168)

Error codes of parameter ErrorID (Page 170)

Static tags SSI_Absolute_Encoder (Page 171)

4.5.2 Call instruction in the user program

The SSI_Absolute_Encoder instruction can be called once per channel, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the OB for cyclic program execution.
   The block is opened in the work area.
4. In the "Instructions" window, open the "Technology" group and the "Counting and measurement" folder.
   The folder contains the instruction.
5. Select the instruction and drag it to your OB.
   The "Call options" dialog opens.
6. Select a technology object from the "Name" list or enter the name for a new technology object.
7. Confirm with "OK".

Result

If the technology object does not exist yet, it is added. The instruction is added in the OB. The technology object is assigned to this call of the instruction.

Note

If you click one of the buttons "Configuration", "Commissioning" or "Diagnostics" in the user interface of the instruction, the respective editor opens.

4.5.3 Description SSI_Absolute_Encoder

Description

The SSI_Absolute_Encoder instruction is used to control the position input and measuring functions of the technology module TM PosInput via the user program.

Call

The instruction must be called once per channel, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Operating principle

Position value: The position value is available at the output parameter PositionValue. The position value is updated every time the instruction is called.

Measured value: The technology module updates the measured value asynchronously to the instruction call based on the configured update time. The measured value last determined by the technology module is updated at the output parameter MeasuredValue each time the instruction is called.

Measured value and position value are available in parallel as output parameters.

Instead of a measured value, the complete SSI frame can be returned at the output parameter CompleteSSIFrame. Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment.

Capture: The output parameter CaptureStatus = TRUE indicates a valid Capture value at the output parameter CapturedValue.

- A Capture value is captured under the following conditions:
  - A digital input has the parameter assignment "Capture"
  - CaptureEnable = TRUE
  - Edge at digital input with the Capture function
- The output parameter CaptureStatus is reset by a negative edge at the input parameter CaptureEnable.

Parameter changes via the user program

Proceed as follows to modify parameters using the user program:

1. Check the relevant Set tag to establish whether the technology object is ready for the parameter change (Set tag = FALSE) or whether a change job is still running (Set tag = TRUE).
   The following Set tags in UserCmdFlags are available for this in the static tags of the technology object instance DB:
   - SetReferenceValue0
   - SetReferenceValue1
2. If the technology object is ready for the parameter change, modify the relevant static tag.
   The following static tags of the technology object instance DB are available for this:
   - NewReferenceValue0 / NewReferenceValue0_M (for SetReferenceValue0)
   - NewReferenceValue1 / NewReferenceValue1_M (for SetReferenceValue1)
3. Set the relevant Set tag for execution of the change job.
4. Use the output parameter Error to check whether an error has occurred.
   If no errors have occurred and the Set tag has been automatically reset by the technology object, the parameter change was successful.

Operating mode

Configure the operating mode in the technology object under "Behavior of DQ0".

The operating mode is indicated by the output parameters CompareMeasuredValue:

State	Description
FALSE	Operating mode "Use position value (SSI absolute value) as reference": The comparison functions work with the position value. The following static variables are specifically used in this operating mode: • NewReferenceValue0 • NewReferenceValue1 • CurReferenceValue0 • CurReferenceValue1 The four specific static variables of operating mode "Use measured value as reference" are ignored.
TRUE	Operating mode "Use measured value as reference": The comparison functions work with the measured value. The following static variables are specifically used in this operating mode: • NewReferenceValue0_M • NewReferenceValue1_M • CurReferenceValue0_M • CurReferenceValue1_M The four specific static tags of operating mode "Use position value (SSI absolute value) as reference" are ignored.

Acknowledgment of events

You acknowledge signaled events using the positive edge of the input parameter EventAck . EventAck must stay set until the technology object has reset the status bits of the following events of the count channel:

- CompResult0
- CompResult1
- ZeroStatus
- PosOverflow
- NegOverflow

Status of the digital inputs

You obtain the status of the digital inputs via the static tags StatusDI0 and StatusDI1.

Using digital outputs with user program

In the following cases you can set the digital outputs via the instruction:

Case	Description
The setting "Use by user program" is configured for "Set output".	The respective digital output DQM follows the value of SetDQm.
The setting "After set command from CPU until comp. value" is configured for "Set output".	The respective digital output DQm is set with a negative edge of SetDQm. DQm is reset when the position value corresponds to the comparison value or at a negative edge of SetDQm.
Set the respective static variable ManualCtrlDQm (temporary overwrite).	The respective digital output DQM follows the value of SetDQm.

Reaction to error

If an error has occurred during the call of the instruction or in the technology module, the output parameter Error is set. More detailed error information can be read at the output parameter ErrorID (Page 170).

Eliminate the cause of the error and acknowledge the error message by setting the input parameter ErrorAck. When no more errors are pending, the technology object resets the output parameter Error . No new error is signaled until you acknowledge the previous error.

4.5.4 Input parameter SSI_Absolute_Encoder

Parameter	Declaration	Data type	Default	Description
Capture-Enable	INPUT	BOOL	FALSE	Enable Capture function After the enable, a Capture event occurs at the next configured edge at the relevant digital input. A negative edge at CaptureEnable resets the output parameter CaptureStatus. A negative edge at CaptureEnable resets the enable even if no Capture event has occurred. Irrespective of CaptureEnable the last value is retained at the output parameter CapturedValue until the next Capture event.
ErrorAck	INPUT	BOOL	FALSE	SSI_Absolute_Encoder V1.0: A positive edge acknowledges the error status reported. SSI_Absolute_Encoder as of V2.0: A high level acknowledges the error status reported.
EventAck	INPUT	BOOL	FALSE	A positive edge resets the following output parameters: • CompResult0 • CompResult1 • ZeroStatus • PosOverflow • NegOverflow

4.5.5 Output parameter SSI_Absolute_Encoder

Parameter	Declaration	Data type	Default	Description
StatusHW	OUTPUT	BOOL	FALSE	Status bit technology module: The module is configured and ready for operation. The module data is valid.
StatusUp	OUTPUT	BOOL	FALSE	Status bit: Last position value has changed in the positive direction and took place no more than 0.5 s ago.
StatusDown	OUTPUT	BOOL	FALSE	Status bit: Last position value has changed in the negative direction and took place no more than 0.5 s ago.
CompResult0	OUTPUT	BOOL	FALSE	Status bit: Comparison event for DQ0 (change of state) occurs as a result of the selected comparison condition. The positive edge of the input parameter EventAck is used to reset CompResult0 .
CompResult1	OUTPUT	BOOL	FALSE	Status bit: Comparison event for DQ1 (change of state) occurs as a result of the selected comparison condition. The positive edge of the input parameter EventAck is used to reset CompResult1 .
CaptureStatus	OUTPUT	BOOL	FALSE	Status bit: Capture event occurred, the output parameter CapturedValue has a valid Capture value If the input parameter CaptureEnable is set, the configured edge sets the status bit CaptureStatus. at the respective digital input. You reset CaptureStatus using the negative edge of the input parameter CaptureEnable .
CapturedValue	OUTPUT	DINT	0	The last acquired Capture value The value is retained until the next Capture event, irrespective of the input parameter CaptureEnable. If a new Capture event has occurred, CaptureStatus is set and is reset by you using the negative edge of the input parameter CaptureEnable .
ZeroStatus	OUTPUT	BOOL	FALSE	Status bit: PositionValue has reached or exceeded the value "0" irrespective of the count direction. You reset ZeroStatus using the positive edge of the input parameter EventAck.
PosOverflow	OUTPUT	BOOL	FALSE	Status bit: PositionValue has exceeded the high limit of the position value range of the encoder in the positive direction. You reset PosOverflow using the positive edge of the input parameter EventAck.
NegOverflow	OUTPUT	BOOL	FALSE	Status bit: PositionValue has exceeded the low limit of the position value range of the encoder in the negative direction. You reset NegOverflow using the positive edge of the input parameter EventAck.
Error	OUTPUT	BOOL	FALSE	An error has occurred. Refer to the output parameter ErrorID for the cause of the error.
ErrorID	OUTPUT	WORD	0	The ErrorID (Page 170) parameter displays the number of the error message. ErrorID = 0000_H: There is no error.
PositionValue	OUTPUT	DINT	0	Current position value

Parameter	Declaration	Data type	Default	Description
Measured-Value	OUTPUT	REAL	0.0	Current measured value for frequency, period duration or velocity (depending on configuration) Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment in the technology object under "Measured value".
Complete-SSIFrame	OUTPUT	DWORD	0	Last received complete SSI frame (least significant 32 bits) Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment in the technology object under "Measured value".
Compare-Measured-Value	OUTPUT	BOOL	FALSE	Status bit: FALSE: Operating mode "Use position value (SSI absolute value) as reference"; position value is used as reference TRUE: Operating mode "Use measured value as reference"; measured value is used as reference

4.5.6 Error codes of parameter ErrorID

Error code (W#16#...)	Description
0000	No error
Error messages from technology module	
80A1	POWER_ERROR from feedback interface: Incorrect supply voltage L+
80A2	ENC_ERROR from feedback interface: Incorrect encoder signal
80A3	LD_ERROR from feedback interface: Error when loading via control interface
Error messages of the instruction SSI_Absolute_Encoder	
80B8	New comparison value 0 does not meet the following conditions: • Low counting limit <= comparison value 0 <= high counting limit • Comparison value 0 < comparison value 1
80B9	New comparison value 1 does not meet the following conditions: • Low counting limit <= comparison value 1 <= high counting limit • Comparison value 0 < comparison value 1
80C0	Instruction was called multiple times with the same instance (DB)
80C1	Communication with technology module failed (read data records): Error information of internal instruction RDREC saved in static tag AdditionalErrorID
80C2	Communication with technology module failed (write data records): Error information of internal instruction WRREC saved in static tag AdditionalErrorID
80C5	Reading of the current start information of the OB failed: Error information of internal instruction RD_SINFO saved in static tag AdditionalErrorID
80C6	Failed to get I/O addresses of the technology module: Error information of internal instruction RD_ADDR saved in static tag AdditionalErrorID
80C7	Module not inserted or no supply voltage L+

4.5.7 Static tags SSI_Absolute_Encoder

Tag	Data type	Default	Access	Description
NewReferenceValue0	DINT	L#0	Write	New comparison value 0 in operating mode "Use position value (SSI absolute value) as reference"
NewReferenceValue1	DINT	L#10	Write	New comparison value 1 in operating mode "Use position value (SSI absolute value) as reference"
NewReferenceValue0_M	REAL	L#0.0	Write	New comparison value 0 in operating mode "Use measured value as reference"
NewReferenceValue1_M	REAL	L#10.0	Write	New comparison value 1 in operating mode "Use measured value as reference"
CurReferenceValue0	DINT	L#0	Read	Current comparison value 0 in operating mode "Use position value (SSI absolute value) as reference"
CurReferenceValue1	DINT	L#10	Read	Current comparison value 1 in operating mode "Use position value (SSI absolute value) as reference"
CurReferenceValue0_M	REAL	L#0.0	Read	Current comparison value 0 in operating mode "Use measured value as reference"
CurReferenceValue1_M	REAL	L#10.0	Read	Current comparison value 1 in operating mode "Use measured value as reference"
AdditionalErrorID	DWORD	W#16#0000	Read	Error information of an internal instruction, e.g.,RDREC
UserCmdFlags	STRUCT	-		
SetReferenceValue0	BOOL	FALSE	Write	Set comparison value 0
SetReferenceValue1	BOOL	FALSE	Write	Set comparison value 1
SetDQ0	BOOL	FALSE	Write	Set digital output DQ0
SetDQ1	BOOL	FALSE	Write	Set digital output DQ1
ManualCtrlDQ0	BOOL	FALSE	Write	Enable setting of digital output DQ0. TRUE: SetDQ0 sets DQ0[1] FALSE: Setting not enabled
ManualCtrlDQ1	BOOL	FALSE	Write	Enable setting of digital output DQ1: TRUE: SetDQ1 sets DQ1[1] FALSE: Setting not enabled
UserStatusFlags	STRUCT	-		
StatusDI0	BOOL	FALSE	Read	Current status of digital input DI0
StatusDI1	BOOL	FALSE	Read	Current status of digital input DI1
StatusDQ0	BOOL	FALSE	Read	Current status of digital output DQ0
StatusDQ1	BOOL	FALSE	Read	Current status of digital output DQ1

[1] The instruction sets the TM_CTRL_DQm bit to FALSE. in the control interface of the module. The static tag SetDQm acts on the control bit SET_DQm.

4.6 Commissioning SSI_Absolute_Encoder

4.6.1 Commissioning the technology object

A graphic display of the block in the commissioning editor helps you with commissioning and the function test for the technology object. You can change specific parameters of the SSI_Absolute_Encoder instruction in CPU/IM online mode and monitor their effects.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The corresponding SSI_Absolute_Encoder instruction is called cyclically from the user program.
- The parameters of the technology object are not overwritten by the user program.

Procedure

To open the commissioning editor of a technology object and to simulate a parameter value change, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the SSI_Absolute_Encoder technology object in the project tree.
3. Double-click on the "Commissioning" object.
   The functions for commissioning the SSI_Absolute_Encoder technology object are displayed.
4. In the commissioning dialog, click on the "Monitor all" button.
   The parameters (online values) of the SSI_Absolute_Encoder technology object are loaded and displayed.
5. If the parameter you want to change has a text box, enter the new value there.
6. Select the check box of the parameter.
   The new parameter value becomes effective and the effects of the change are simulated.

Online mode

In online mode, you can modify the following parameters to test the technology object function:

- New comparison value 0 (NewReferenceValue0 or NewReferenceValue0_M)
- New comparison value 1 (NewReferenceValue1 or NewReferenceValue1_M)
- Enable Capture (CaptureEnable)
- Acknowledgment of signaled error states (ErrorAck)
- Resetting the status flag (EventAck)

4.7 SSI_Absolute_Encoder diagnostics

4.7.1 Monitoring counter values, measured values, DIs and DQs

The diagnostic functions are used to monitor the position input and measuring functions.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the display editor for the diagnostic functions, follow these steps:

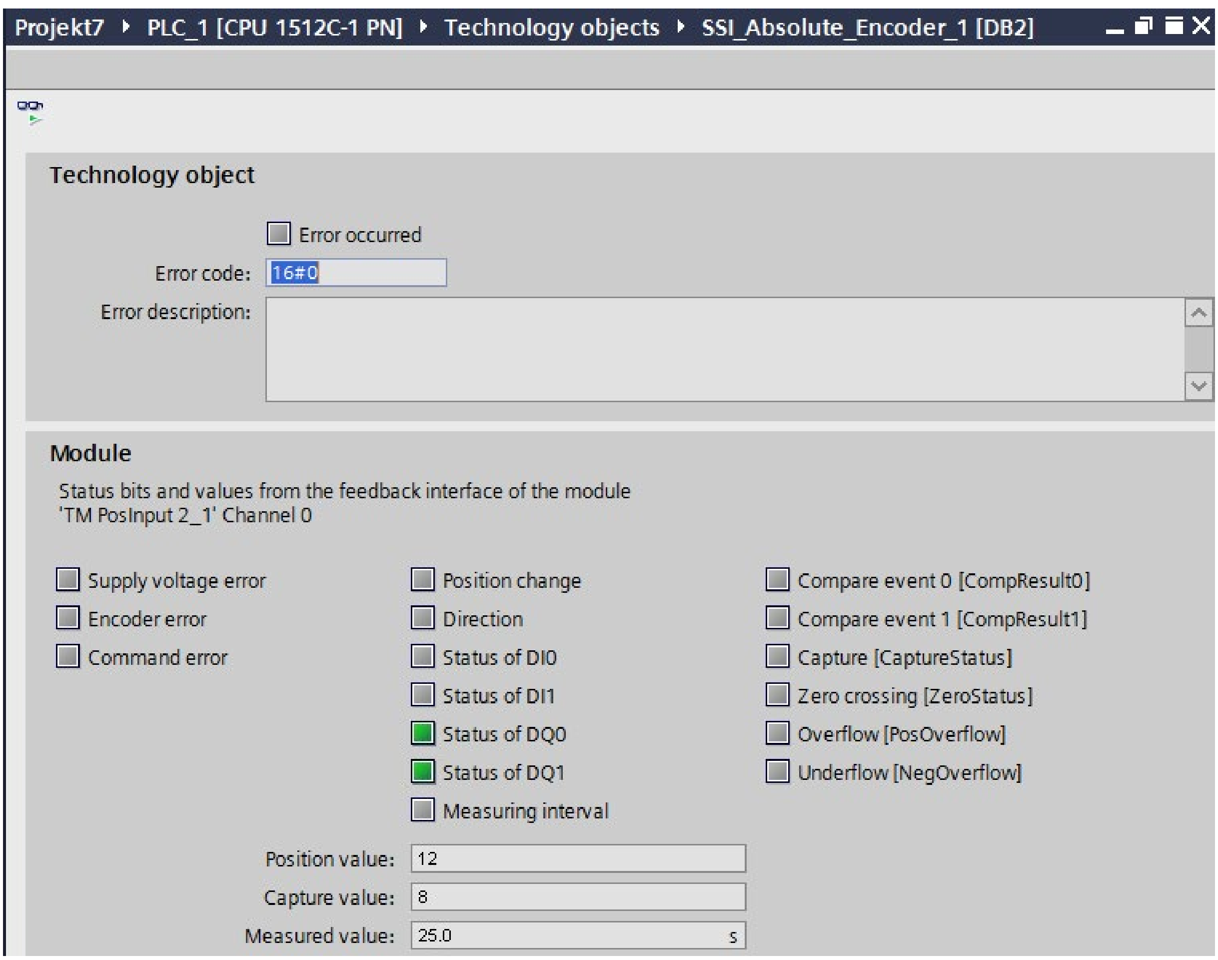
1. Open the "Technology objects" folder in the project tree.
2. Open the SSI_Absolute_Encoder technology object in the project tree.
3. Double-click on the "Diagnostics" object.
4. Click the "Monitor all" button.

Display

The following values are read by the technology object from the feedback interface and displayed:

- Event display/diagnostics information
- Signal states of the digital inputs and digital outputs
- Position value
- Capture value
- Measured value

Additional information on status displays is available in the context-sensitive help for each event in STEP 7 (TIA Portal). When the CPU is in STOP, the status display is not updated.



5 Using the module

5.1 Using the technology module

5.1.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

5.1.2 Configuring a module

5.1.2.1 Adding a technology module for hardware configuration (TM Count and TM PosInput)

Requirement

- The project has been created.
- The CPU S7-1500 has been created.
- At decentralized operation a distributed I/O ET 200 is created.

Procedure

To add a technology module to the hardware configuration, proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the technology module from the module catalog:
   "Technology module > Counting or Position input > Technology module > Article number"
4. Drag the technology module to the required slot in the module rack.

5.1.2.2 Adding a technology module to hardware configuration (Compact CPU)

Requirement

The project has been created.

Procedure

To add a Compact CPU to the project tree, follow these steps:

1. Double-click "Add new device".
   The "Add new object" dialog opens.
2. Select Controller".
3. Select the Compact CPU:
   "SIMATIC S7-1500 > CPU > Compact CPU > Article number"
4. Confirm with "OK".

Result

The new Compact CPU is displayed with the following objects in the project tree. Double-click to open the required editor.

	Object	Description
①	Device configuration (Page 179)	In the Inspector window (per channel): • Activation of the counter (Page 188) • Assign signals to inputs and outputs (Page 189) • Setting the reaction to CPU STOP (Page 179) • Enable diagnostic interrupts (Page 181) • Setting the operating mode (Page 181) • Enable hardware interrupts (Page 186) • Setting the module addresses
②	Online & Diagnostics (Page 218)	• Hardware diagnostics • Obtain information about the Compact CPU • Run firmware update

5.1.2.3 Open hardware configuration

Opening

To open the hardware configuration, follow these steps:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Click on the module.

5.1.2.4 Parameter assignment options

Counting, measuring and position input with SSI absolute encoder

For the counting and measuring function as well as the position input with an SSI absolute encoder, you have the following alternatives for parameter assignment and control of the technology module:

- Configuration of a technology object and control using the related instruction:

  When using an incremental or pulse encoder, we recommend the simple configuration with graphic support using thee High_Speed_Counter technology object. A detailed description of this configuration can be found in section Technology Object High_Speed_Counter (Page 97).

  When using an SSI absolute value encoder, we recommend the simple configuration with graphic support using the SSI_Absolute_Encoder technology object. A detailed description of this configuration can be found in section Technology Object High_Speed_Counter (Page 142).

  For configuration of a technology object, select the operating mode (Page 181) "Operating with "Counting and measurement" technology object".

- Parameter setting via hardware configuration and control via the control and feedback interface of the technology module:

  Select the operating mode (Page 181) "Manual operation (without technology object)" for this.

  A description of the control and feedback interface for TM Count and TM PosInput is available in the following sections:

  Assignment of the control interface (Page 219)

  Assignment of the feedback interface (Page 222)

- Parameter settings via GSD file and control via the control and feedback interface of the technology module.

  A description of the control and feedback interface for TM Count and TM PosInput is available in the following sections:

  Assignment of the control interface (Page 219)

  Assignment of the feedback interface (Page 222)

Position input for Motion Control

Alternatively, you have the option of using the technology module for position input for Motion Control.

Select the operating mode (Page 181) "Position input for "Motion Control" technology object" and assign the parameters of the encoder using the module parameters (Page 183) in the device configuration of the technology module. You perform the rest of the configuration of this application using an axis technology object of S7-1500 Motion Control .

5.1.2.5 Basic parameters

Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module for each channel to CPU STOP in the basic parameters of the device configuration.

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the actual position is read. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "In case of comparison value for a pulse duration" is set at CPU stop, the digital output is reset after expiry of pulse duration. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

Substitute value for DQ0 (TM Count und TM PosInput)

This parameter lets you specify which value the technology module is to output to the digital output DQ0 in the event of a CPU STOP under "Output substitute value".

Note

In operating mode "Operating with "Counting and measurement" technology object", you assign this parameter using the technology object.

Substitute value for DQ0 (Compact CPU)

You can use this parameter to specify the value to be output for a STOP of the Compact CPU in the feedback interface for DQ0 in the context of the "Substitute value for DQ0" behavior.

Note

In operating mode "Operating with "Counting and measurement" technology object", you assign this parameter using the technology object.

Substitute value for DQ1

This parameter lets you specify which value the technology module is to output to the digital output DQ1 in the event of a CPU STOP under "Output substitute value".

Note

In operating mode "Operating with "Counting and measurement" technology object", you assign this parameter using the technology object.

Diagnostic interrupts (TM Count and TM PosInput)

The technology module can trigger additional diagnostic interrupts when you enable the diagnostic interrupts in the basic parameters. These diagnostic interrupts are processed in an interrupt OB.

Detailed information on the error event is available in the error organization block with the instruction "RALRM" (read alarm supplementary information) and in the Diagnostics function manual (https://support.industry.siemens.com/cs/ww/en/view/59192926), section "System diagnostics by means of the user program".

Enable diagnostic interrupt on wire break

You use this parameter to specify whether a diagnostic interrupt is to be triggered in the event of wire breaks of the utilized signals for the following encoders:

- Push-pull 24 V encoder (Page 71)
- RS422 encoder (Page 73) (additionally monitored for short-circuits and incorrect supply voltage)
- SSI absolute encoder (Page 75) (additionally monitored for short-circuits and incorrect supply voltage)

Note

If you use an encoder with a different sensor type or interface standard, wire break cannot be detected.

Enable additional diagnostic interrupts

You use this parameter to specify whether diagnostic interrupts are to be triggered for additional errors.

See the device manual for the technology module to find out which errors during operation can trigger a diagnostic interrupt.

Diagnostics interrupts (Compact CPU)

Enable diagnostic interrupts

A Compact CPU can trigger diagnostic interrupts for certain faults if you have enabled diagnostic interrupts. These diagnostic interrupts are processed in an interrupt OB.

You use this parameter to determine if the Compact CPU should trigger diagnostic interrupts when a given error occurs.

See the device manual for the Compact CPU to find out which errors can trigger a diagnostic interrupt during operation. The diagnostic interrupts are not enabled in the default setting.

Operating mode

Selection of the operating mode for the channel

This setting defines how the channel counting and measuring functions are to be configured and controlled.

Operating mode	Description
Operating with "Counting and measurement" technology object	A technology object is used for the parameter assignment of the channel. The related instruction for the technology object in the user program provides the access to the control and feedback interfaces of the technology module. You specify the assignment between the technology module/channel and technology object in the basic parameters of the technology object.
Position input for "Motion Control" technology object	The technology module is used for position input for a higher-level Motion Control controller. This operating mode affects all channels of the technology module for TM Count and TM PosInput. Setting the operating mode only affects the given channel of the Compact CPU. Parameter assignment is implemented via the Device configuration of the technology module. Parameter assignment of the encoder signals is implemented by means of the Module parameters (Page 183).

Operating mode	Description
Manual operation (without technology object)	Parameter assignment of the channel is effected via the hardware configuration of the technology module: • Manual operation (incremental or pulse encoder) (Page 190) • Manual operation (SSI absolute encoder) (Page 207) You have direct access to the control and feedback interface of the channel through the user program.
Fast Mode	The technology module is used for very fast detection of the count or position value. No control interface is available. The parameter setting (hardware configuration) of the module is used for the parameter assignment of the channel. You have direct access to the feedback interface of the channel through the user program. This operating mode is not supported by every technology module.

Note

GSD file

When using a GSD file you determine the operating mode via the selection of the module name in the hardware catalog. You can select manual operation or Fast Mode in the process.

Selection of the operating mode for the channel

You use this parameter in "Manual operation" to specify the main task for which the channel of the technology module is used. This defines the setting options under "Parameters" (hardware configuration).

Operating mode	Description
Counting (Page 24) / Position input (Page 26)	The main function of the channel is counting or position input. The comparison functions and hardware interrupts work with the counter value or position value. The measured values are available concurrently.
Measuring (Page 58)	The main function of the channel is counting. The comparison functions (Page 56) and hardware interrupts for compare events work with the measured value. The counter value is available concurrently.

Note

GSD file

When using a GSD file you determine the operating type via the selection of the module name in the hardware catalog.

Module parameters (position input for Motion Control)

In operating mode "Position input for "Motion Control" technology object", the parameters for the encoder signals of the channel are assigned under "Module parameters". The parameters depend on the encoder used.

Note

You cannot use this operating mode with a GSD file.

Module parameters for incremental encoders and pulse encoders

If you use an incremental or pulse encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Signal evaluation
- Filter frequency
- Sensor type (for TM Count)
- Interface standard (for TM PosInput)
- Signal selection for reference mark 0
- Measuring input
- Increments per revolution
- Steps per revolution
- Reference speed

You can find a description of the first six parameters in section Counter inputs (Page 190).

Module parameters for SSI absolute encoders

If you use an TM PosInput with an SSI absolute encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Frame length
- Code type
- Transmission rate
- Monoflop time
- Parity
- Bit number LSB of the position value
- Bit number MSB of the position value

- Measuring input
- Steps per revolution
- Number of revolutions
- Reference speed

You can find additional information on the first new parameters in section Counter inputs (Page 207).

Signal selection for reference mark 0

You can use this parameter to specify the external reference signal upon which a new reference mark is saved for the encoder position.

You can select from the following options:

Option	Meaning
None[1]	No external reference signal is used.
DI0 (preset for TM Count and TM PosInput)	The current counter value is saved as the new encoder position reference mark upon a positive edge at digital input DI0.
Signal N of incremental encoder (default for Compact CPU[2])	The current counter value is saved as the new encoder position reference mark upon a positive edge of the signal N of incremental encoder.

1 Only available with Compact CPU

2 Exceptions: "DI0" is the default for HSC 3 and HSC 6 on the 1511C as well as on the 1512C in compatibility mode

Measuring input (TM Count and TM PosInput)

The parameter specifies that the hardware digital input DI1 serves as a measuring input. For rising, falling or both edges of the DI1, the current counter value or position value is saved as the current encoder position. The value of the parameter cannot be changed.

Measuring input (compact CPU)

This parameter is used to define the hardware input which is used as the external measuring input for saving the encoder position.

You can select from the following options:

Option	Meaning
None (default)	No external measuring input is used.
DI1	The hardware digital input DI1 serves as the measuring input. For rising, falling or both edges of the DI1, the current counter value is saved as current encoder position.

Increments per revolution

With this parameter you specify the line count of the incremental and pulse encoder. The line count can be found in the data sheet for the encoder.

Steps per revolution (incremental and pulse encoder)

The parameter specifies the number of count pulses per encode rotation.

The number of count pulses depends on the increment per rotation and the parameterized signal evaluation.

Example:

Your incremental or pulse encoder delivers 2048 increments per revolution. Depending on the signal evaluation the following value is displayed:

Signal evaluation	Steps per revolution
Single	2048
Double	4096
Quadruple	8192

Steps per revolution (SSI absolute encoder)

With this parameter you define the number of increments the SSI absolute encoder supplies per revolution.

Number of revolutions

The parameter specifies how many rotations the value range of the SSI absolute encoder encompasses.

The value is calculated from the parameterized values for the bit numbers LSB and MSB of the position value as well as the steps per revolution.

Reference speed

The encoder transmits the process value of the speed as a percentage of the reference speed. This parameter defines the speed in rpm which is to be correspond to the value 100 % . The reference speed must be identical to the setting in the controller.

You can enter a value between 6.00 and 210000.00. The default setting is "3000.00".

Further configuring

You can perform the further configuration by using an axis or measuring input technology object of S7-1500 Motion Control . See the S7-1500 Motion Control (https://support.industry.siemens.com/cs/ww/en/view/59381279) and S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326) function manuals for further details on configuring and commissioning position input and the measuring input technology object.

See also

Position detection for Motion Control (Page 70)

Hardware interrupts

You can set for each channel the events which are to trigger a hardware interrupt during operation when assigning the basic parameters of the technology module.

In an S7-1500 system, you enter a matching event name for each enabled hardware interrupt and assign a corresponding hardware interrupt OB to each hardware interrupt. If a hardware interrupt is triggered, the corresponding OB is started to evaluate the hardware interrupt data.

Note

In the following cases you can only release only *one* hardware interrupt per module.

- Distributed operation with an S7-300/400 CPU
- Use of a GSD file

A hardware interrupt is triggered if the condition for changing the respective status bit or event bit in the feedback interface is fulfilled.

Lost hardware interrupt

If the hardware interrupts are triggered more quickly by the system than they can be acknowledged, hardware interrupts are lost and the "Hardware interrupt" diagnostics interrupt is signaled.

Hardware interrupts that can be activated

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in operating mode Position input for "Motion Control" technology object	Description	Event Type number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
New Capture value available	Yes	Yes	No	No	No	Hardware interrupt when current counter value or position value is saved as Capture value	1000_B
Synchronization of the counter by an external signal	Yes	No	Yes	No	No	Hardware interrupt upon synchronization of the counter by signal N or DI edge	1001_B
Gate start	Yes	No	Yes	No	No	Hardware interrupt when internal gate opens	0001_B
Gate stop	Yes	No	Yes	No	No	Hardware interrupt when internal gate closes	0010_B
Overflow (high counting limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value exceeds high counting limit	0011_B

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in operating mode Position input for "Motion Control" technology object	Description	Event Type number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
Underflow (low counting limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value falls below low counting limit	0100_B
Change of direction[1]	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt when counter value or position value changes direction	1010_B
Zero crossing	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt with zero crossing of counter value or position value	0111_B
Comparison event for DQ0 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ0 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	0101_B
Comparison event for DQ1 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ1 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	0110_B

1 The STS_DIR feedback bit has a default of "0". A hardware interrupt is not triggered when the first change to the counter value or position value immediately after the technology module is switched on is in the down direction.

Default setting

No hardware interrupts are enabled in the default setting.

5.1.2.6 Additional parameters for Compact CPU

Introduction

When using a Compact CPU, the following parameters are additionally available for the signals of the high-speed counter.

Compatibility 1511C (high-speed counters of Compact CPU 1512C-1 PN)

Front connector assignment same as CPU 1511C

You can use this parameter to specify if the pin assignment for the front connector of the CPU 1511C-1 PN is to be used for the high-speed counter of the CPU 1512C-1 PN:

Option	Meaning
Disabled (default)	CPU 1512C-1 PN uses the pin assignment of the onboard front connector. 1512C-1 PN supports the use of the connections of both front connectors of the digital onboard I/Os for the high-speed counter. The assignment of hardware inputs and outputs for the HSC channels is described in the CPU 1512C-1 PN manual.
Enabled	CPU 1512C-1 PN uses the pin assignment of the front connector of the CPU 1511C-1 PN. 1511C-1 PN supports the use of the connections of the first front connector of the digital onboard I/Os for the high-speed counter. The assignment of hardware inputs and outputs for the HSC channels is described in the CPU 1511C-1 PN manual.

General

Activate this high-speed counter

You can use this parameter to specify whether the respective high speed counter is to be used:

Option	Meaning
Disabled (default)	The high-speed counter is not used. The counter uses no connections of the onboard front connector and can not trigger interrupts. Writing to its control interface is ignored and its feedback interface returns zero values.
Enabled	The high-speed counter is used. The assignment of HSC addresses to the connections of the onboard front connector is described in the device manual of the Compact CPU.

Hardware inputs/outputs

Clock generator input (A) / Pulse input (A) / Clock generator forward (A)

This parameter specifies which input is used for the encoder signal A for the respective counter. The value cannot be changed.

Clock generator input (B) / Pulse input (B) / Clock generator forward (B)

If you use an encoder with multiple signals for the respective counter, this parameter specifies which input is used for the encoder signal B. The value cannot be changed.

Reset input (N)

If you use an incremental encoder for the respective counter, this parameter specifies which input is used for the reset input (encoder signal N). The value cannot be changed.

HSC DI0 / HSC DI1

This parameter determines which digital input of the Compact CPU is to be used as the DIm of the counter.

Note

You can configure the input delay for a digital input in the Inspector window of the device configuration under "Properties > DI 16/DQ 16 > Inputs > Channel n".

HSC DQ0

You can read the status of the DQ0 via the feedback interface. You cannot assign DQ0 to a physical digital output of the Compact CPU.

HSC DQ1

This parameter determines which digital output of the Compact CPU is to be used as DQ1. You can select an output with an output delay of 5 μs or 500 μs.

You can find an overview of the output delay for all digital outputs in the device manual of the Compact CPU.

5.1.2.7 Manual operation (incremental or pulse encoder)

Counter inputs

Signal type

You can choose from the following signal types (Page 71):

Signal type	Meaning	Additional option-specific parameters
Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.	• Invert direction • Signal evaluation • Filter frequency • Sensor type or Interface standard
Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.	• Invert direction • Signal evaluation • Filter frequency • Sensor type or Interface standard • Reaction to signal N • Frequency of synchronization • Frequency of the Capture function
Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.	• Filter frequency • Sensor type or Interface standard
Pulse (A)	A pulse encoder (signal A) without direction signal is connected. You can specify the count direction by means of the control interface (Page 219).	• Filter frequency • Sensor type or Interface standard
Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.	• Filter frequency • Sensor type or Interface standard

Invert direction

You can invert the counting direction to adapt it to the process.

The inverting of the direction is configurable and active for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Signal evaluation

By configuring signal evaluation (Page 76), you can specify which edges of the signals are counted.

You can select from the following options:

Signal evaluation	Meaning
Single (default)	The edges of signal A are evaluated during a low level of signal B.
Double	Each edge of signal A is evaluated.
Quadruple	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counting inputs A, B and N.

The selected filter frequency is based on a pulse/break ratio of between around 40:60 and around 60:40. This results in a specific minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Filter frequency	Minimum pulse/break time
100 Hz	4.0ms
200 Hz	2.0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8.0 µs
100 kHz (preset for Compact CPU)	4.0 µs
200 kHz** (preset for TM Count)	2.0 µs
500 kHz*	0.8 µs
1 MHz* (default at TM PosInput)	0.4 µs

* Only available with TM PosInput

** * Only available with TM Count and TM PosInput

Sensor type (TM Count)

By configuring the sensor type, you specify how the counter inputs are switched for the TM Count.

You can select from the following options:

Sensor type	Meaning
Sourcing output (default)	The encoder/sensor switches the inputs A, B and N to 24VDC.
Sinking output	The encoder/sensor switches the inputs A, B and N to M.
Push-pull (sinking and sourcing output)	The encoder/sensor alternately switches the inputs A, B and N to M and 24VDC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull encoder and the sensor type "Push-pull (sinking and sourcing output)" is configured, you can monitor the encoder signals for wire break.

Sensor type (compact CPU)

The "Sourcing output" sensor type is set for the Compact CPU and cannot be changed. The encoder or sensor switches the inputs A, B and N to 24V DC.

You can operate both sourcing output encoders as well as push-pull encoders on the Compact CPU. You can find additional information on the sensor type in the data sheet for the encoder.

Interface standard (TM PosInput)

You use this parameter to specify whether the encoder outputs symmetric (RS422) or asymmetric (TTL) signals for the TM PosInput.

You can select from the following options:

Interface standard	Meaning
RS422, symmetrical (default)	The encoder outputs symmetric signals according to the RS422 standard (Page 73).
TTL (5 V), asymmetrical	The encoder outputs asymmetric 5 V signals according to the TTL standard (Page 71).

Note

The RS422 standard provides greater interference immunity than the TTL standard. If your incremental or pulse encoder supports the RS422 standard **and** the TTL standard, we recommend using the RS422 standard.

Reaction to signal N

You use this parameter to specify which reaction is triggered to signal N.

You can select from the following options:

Option	Meaning
No reaction to signal N (default)	The counter is not affected by signal N.
Synchronization at signal N (Page 44)	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.
Capture at signal N (Page 34)	The counter value is stored in the Capture value at signal N. The use of a digital input and the use of the N signal are not mutually exclusive for the Capture function. The technology object displays the Capture value at the output parameter CapturedValue.

Note

You can only select the reaction to signal N if you have selected the "Incremental encoder (A, B, N)" signal type.

Note

If "Synchronization at signal N" is selected, you can select the function "Enable synchronization at signal N" for a digital input (Page 196).

Note

For High_Speed_Counter as of V3.0, the following applies:

You can choose "Capture at signal N" only in operating mode "Use count value as reference":

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Frequency of the Capture function

This parameter is used to define the frequency of Capture events for the following functions:

- Capture at Signal N
- Capture as function of a digital input

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input or first rising edge of the N signal saves the current counter value as a Capture value.
Periodic (default)	Each configured edge at the respective digital input or each rising edge of the N signal saves the current counter value as a Capture value.

Counting limits and start value

High counting limit

You limit the counting range by setting the high counting limit. You can enter a value up to 2147483647 (2^{31}-1). You must enter a value that lies above the low counting limit.

The default setting is "2147483647".

Low counting limit

You limit the counting range by setting the low counting limit. You can enter a value up to -2147483648 (-2^{31}). You must enter a value below the high counting limit.

The default setting is "-2147483648".

Start value

By configuring the start value, you specify the value at which counting is to start and where it is to continue in the case of defined events. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Additional information

For more information, see Behavior at the counting limits (Page 28) and Counter behavior at gate start (Page 33).

Counter behavior at limits and gate start

Reaction to violation of a counting limit

You can configure the following characteristics for violation of a counting limit (Page 28):

Reaction	Meaning
Stop counting	If a counting limit is violated, counting is stopped and the internal gate is closed. To restart counting, you must also close and reopen the software/hardware gate.
Continue counting (default)	Counting continues either with the start value or at the opposite counting limit, depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter to the following values when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit (default)	The counter value is set to the opposite counting limit.

Reaction to gate start

You can set the following Reaction to gate start (Page 33):

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value (default)	When the gate is opened, counting is continued with the last counter value.

Behavior of a DI

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the hardware gate (Page 30).	• Input delay • Select level
Gate start (edge-triggered)	The configured edge at the respective digital input opens the hardware gate (Page 30).	• Input delay • Edge selection
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the hardware gate (Page 30).	• Input delay • Edge selection
Synchronization (Page 39)	The configured edge at the respective digital input sets the counter to the start value. The EVENT_SYNC feedback bit indicates whether a synchronization has occurred.	• Input delay • Edge selection • Frequency of synchronization
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N (Page 44).	• Input delay • Select level
Capture	The configured edge at the respective digital input saves the current counter value (Page 34) as a Capture value. The use of a digital input and the use of the N signal are not mutually exclusive for the Capture function. The CAPTURED_VALUE value in the feedback interface indicates the Capture value.	• Input delay • Edge selection • Frequency of the Capture function • Behavior of counter value after Capture
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective feedback bit: • STS_DI0 • STS_DI1 • STS_DI2	• Input delay

---

Note

With the exception of "Digital input without function", each function can only be used once for each counter, and if used for one digital input is not available to the others.

Input delay (TM Count and TM PosInput)

You use this parameter to suppress signal interference at the digital inputs. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1" and for TM Count also under "Behavior of DI2".

Input delay (compact CPU)

You use this parameter to suppress interference at the digital inputs of the DIn signals. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

You can configure the input delay for a digital input of a Compact CPU in the Inspector window of the device configuration under "Properties > DI 16/DQ 16 > Inputs > Channel n".

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms
- 0.4 ms
- 1.6 ms
- 3.2 ms (default)

- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level (default)	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be set for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered.

The following options may be available depending on the function selected:

- At rising edge (default)
- At falling edge
- At rising and falling edge

The parameter can be set for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization
- Capture

Note

At rising and falling edge" can only be configured for the "Capture" function.

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as a function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Frequency of the Capture function

This parameter is used to define the frequency of Capture events for the following functions:

- Capture at Signal N
- Capture as function of a digital input

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input or first rising edge of the N signal saves the current counter value as a Capture value.
Periodic (default)	Each configured edge at the respective digital input or each rising edge of the N signal saves the current counter value as a Capture value.

Behavior of counter value after Capture

You can configure the following characteristics for the counter after a capture event (Page 34):

Reaction	Meaning
Continue counting (default)	After saving the current counter value as Capture value, counting is continued unchanged.
Set to start value and continue counting	After saving the current counter value as Capture value, counting is continued with the start value.

Behavior of a DQ

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options:

Function of a digital output (Page 48) in the operating mode "Counting"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= counter value <= high counting limit	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: Low counting limit <= counter value <= comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= counter value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the counter value reaches the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active until the counter value is equal to the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

DQ0 of a counter of a Compact CPU

With a Compact CPU, the respective digital output DQ0 is available via the feedback interface, but not as a physical output.

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Note

The "At comparison value for a pulse duration" and "After set command from CPU until comparison value" functions only switch the digital output in question if a count pulse reaches the comparison value. When the counter value is set, e.g. by synchronization, the digital output does not switch.

Function of a digital output (Page 56) in the operating mode "Measuring"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0 (TM Count and TM PosInput)

Operating mode "Counting":

With the parameter assignment of the comparison value (Page 48), you specify the counter value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than or equal to the low counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Measurement":

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 0 (compact CPU)

Operating mode "Counting":

With the parameter assignment of the Comparison value (Page 48), you specify the counter value at which the STS_DQ0 bit is set in the feedback interface of the selected comparison event. The digital output DQ0 is not available as a physical output in a Compact CPU.

You must enter an integer (DINT) that is greater than or equal to the low counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Measurement":

With the parameter assignment of the Comparison value (Page 56), you specify the measured value at which the STS_DQ0 bit is set in the feedback interface of the selected comparison event. The digital output DQ0 is not available as a physical output in a Compact CPU.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Counting":

With the parameter assignment of the comparison value (Page 48), you specify the counter value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is smaller than or equal to the high counting limit. If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "10".

Operating mode "Measurement":

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The maximum value is 7.922816×10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the count direction for which the selected function is valid.

You can select from the following options:

Count direction	Meaning
In both directions (default)	The comparison and switching of the respective digital output take place regardless of the count direction.
Up	The comparison and switching of the respective digital output only takes place when the counter counts up.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down.

The parameter can be configured for the following functions:

- Between Comparison value 0 and 1 (Operating mode "Counting")
- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

If you enter "0" and the counter value corresponds to the comparison value, the digital output remains active until the next count pulse.

You can enter a value between 0.0 and 6553.5.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 66), you can define a range around the comparison values. For the functions "Between comparison value and upper counter limit" and "Between comparison value and lower counter limit" the hysteresis also applies at the counter limits. Within the hysteresis range, the digital outputs cannot switch again until the counter value is outside the range.

Choose a small enough hysteresis. When the hysteresis range, starting from the configured comparison value, spans the entire counter value range, proper functioning of the comparison values cannot be guaranteed.

If a comparison value lies so close to the counter limit that the hysteresis range would extend beyond this counter limit, the hysteresis range ends there.

If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

The hysteresis is only available in operating mode "Counting".

Specifying the measured value

Measured variable

This parameter is used to specify the measured variable (Page 59) to be provided by the technology module. The MEASURED_VALUE value in the feedback interface indicates the measured value.

You can select from the following options:

Measured variable	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second. The value is a floating point number (REAL). The unit is Hz.	• Update time
Period	The measured variable is the average period between two increments. The value is an integer (DINT). The unit is s.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter.	• Update time • Time base for velocity measurement • Increments per unit

Update time

By configuring the update time (Page 59) in milliseconds, you can specify the time interval between two measured value updates.

The update time and the signal type (Page 190) effect the accuracy of the measurement. In the case of update times of at least 100 ms, the effect of the signal type is negligible.

In the case of update times of less than 100 ms, you achieve maximum measurement accuracy using the following signal types:

- Incremental encoder (A, B phase-shifted) with Signal evaluation "Single"
- Incremental encoder (A, B, N) with Signal evaluation "Single"
- Pulse (A) and direction (B)
- Pulse (A)

In the case of other signal types, measurement accuracy depends on the encoder and cable used.

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s

The default setting is "60 s".

Increments per unit

You can use this parameter to define the number of count pulses per relevant unit that the incremental or absolute encoder supplies for the velocity measurement.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example 1:

You encoder delivers 4000 count pulses for travel over one meter. The velocity is to be measured in meters per second. "Double" is configured as signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 8000
- Time base for velocity measurement: 1 s

Example 2:

Your encoder delivers 4096 count pulses per revolution. The velocity is to be measured in revolutions per minute. "Single" is configured as the signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s

5.1.2.8 Manual operation (SSI absolute encoder)

Counter inputs

Signal type

If an SSI absolute encoder with the data signal (Signal ID) and cycle signal (Signal C) is connected, select the signal type (Page 75) "Absolute encoder (SSI)".

Invert direction

You can use this parameter to invert the values supplied by the SSI absolute encoder. This allows you to adapt the detected direction of the encoder to the motor's direction of rotation.

Note

This parameter acts only on the range from the LSB to the MSB of the position value in the frame.

Frame length

With the parameter assignment of the frame length, you specify the number of bits of an SSI frame of the SSI absolute encoder (Page 26) used. You can find the frame length of your SSI absolute encoder in the data sheet of the encoder. Special bits are also included in the frame length. A parity bit does not count in the frame length.

A frame length of between 10 bits and 40 bits is permitted. The default setting is "13 Bit".

You can find two examples of the SSI frame format at Examples of the frame format (Page 159).

Code type

You use the parameter assignment of the code type to specify whether the encoder supplies Dual code or Gray code.

You can select from the following options:

Code type	Meaning
Gray (default)	The gray-coded position value returned by the SSI absolute encoder is converted to dual code.
Dual	The value returned by the SSI absolute encoder is not converted.

Transmission rate

With the parameter assignment of the transmission rate, you specify the data transmission rate between the technology module and the SSI absolute encoder.

You can select from the following options:

- 125 kHz (preset)
- 250 kHz
- 500 kHz
- 1 MHz
- 1.5 MHz
- 2 MHz

The maximum transmission rate depends on the cable length and the technical specifications of the SSI absolute encoder. For additional information, refer to the product manual of the TM PosInput and the encoder description.

Monoflop time

With the parameter assignment of the monoflop time, you specify the idle time between two SSI frames.

The configured monoflop time must be at least equal to the monoflop time of the SSI absolute encoder used. You can find this value in the technical specifications of the SSI absolute encoder.

You can select from the following options:

- Automatically (default)
- 16 μs
- 32 μs
- 48 μs
- 64 μs

Note

If you select the "Automatic" option, the monoflop time automatically adapts to the encoder used.

In isochronous mode, the "Automatic" option corresponds to a monoflop time of 64 μs. If the monoflop time of the employed SSI absolute value encoder is less than 64 μs, you can select the value of the encoder to achieve faster isochronous times.

Parity

With the parameter assignment of the parity, you specify whether the SSI absolute encoder transfers a parity bit.

If, for example, a 25-bit encoder with parity is assigned, the technology module reads 26 bits. A parity error is reported in the feedback interface by means of the ENC_ERROR bit.

Bit number LSB of the position value

This parameter is used to specify the bit number of the LSB (least significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the bit number of the MSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

The default setting is "0".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Bit number MSB of the position value

This parameter is used to specify the bit number of the MSB (most significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the frame length and higher than the bit number of the LSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

The default setting is "12".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Behavior of a DI

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Capture	The configured edge at the respective digital input saves the current position value as a Capture value. The CAPTURED_VALUE feedback bit indicates the capture value. The function can only be used for one of the two digital inputs.	• Input delay • Edge selection • Frequency of the Capture function
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective feedback bit: • STS_DI0 • STS_DI1	• Input delay

---

Note

You can choose the "Capture" function only in operating mode "Use position value (SSI absolute value) as reference".

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered for the "Capture" function.

You can select from the following options:

- At rising edge (default)
- At falling edge
- At rising and falling edge

Frequency of the Capture function

This parameter is used to define the frequency of Capture events:

You can select from the following options:

Option	Meaning
Once	The first configured edge at the respective digital input saves the current counter value as Capture value.
Periodic (default)	Each configured edge at the respective digital input saves the current counter value as a Capture value.

Behavior of a DQ

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options depending on the operating mode:

Function of a digital output (Page 52) in the operating mode "Position input"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= position value <= maximum position value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: Minimum position value <= Position value <= Comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= position value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the assigned time and direction of the position value change when the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active for the assigned direction of the position value change until the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Function of a digital output (Page 56) in the operating mode "Measuring"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 47).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0

Operating mode "Position input":

With the parameter assignment of the comparison value (Page 52), you specify the position value at which the digital output DQ0 switches as a result of the selected comparison event.

If you use an SSI absolute encoder with a position value length of up to 31 bits, you must enter a positive integer (DINT) with a value between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, you must enter a signed integer (DINT) with a value between –2147483648 and 2147483647.

If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "0".

Operating mode "Measurement":

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The minimum value is -7.922816×10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Position input"

With the parameter assignment of the comparison value (Page 52), you specify the position value at which the digital output DQ1 switches as a result of the selected comparison event.

If you use an SSI absolute encoder with a position value length of up to 31 bits, you must enter a positive integer (DINT) with a value between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, you must enter a signed integer (DINT) with a value between –2147483648 and 2147483647.

If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The default setting is "10".

Operating mode "Measurement"

With the parameter assignment of the comparison value (Page 56), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL). If you use the DQ function "Between comparison value 0 and 1", the comparison value 0 has to be smaller than comparison value 1. The maximum value is 7.922816 x 10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the direction of position value change for which the selected function is valid.

You can select from the following options:

Direction of position value change	Meaning
In both directions (default)	The comparison and switching of the respective digital output is carried out regardless of whether the position value increases of decreases.
Up	The comparison and switching of the respective digital output only takes place when the position value increases.
Down	The comparison and switching of the respective digital output only takes place when the position value decreases.

The parameter can be configured for the following functions:

- Between Comparison value 0 and 1 (operating mode "Position input")
- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

A value from 0.1 to 6553.5 ms is permissible.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 68), you can define a range around the comparison values. For the functions "Between comparison value and upper counter limit" and "Between comparison value and lower counter limit" the hysteresis also applies at the counter limits. Within the hysteresis range, the digital outputs cannot switch again until the position value has left this range once.

Choose a small enough hysteresis. When the hysteresis range, starting from the configured comparison value, spans the entire position value range, proper functioning of the comparison values cannot be guaranteed.

If a comparison value lies so close to the counter limit that the hysteresis range would extend beyond this counter limit, the hysteresis range ends there.

If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

The hysteresis is only available in "Position input" operating mode.

Specifying the measured value

Measured variable

With this parameter you specify whether the technology module is to provide a certain measured variable (Page 59) or the complete SSI frame.

You can select from the following options:

Option	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second, where each increment corresponds to one position value change. The value is a floating point number (REAL). The unit is Hz. The MEASURED_VALUE value in the feedback interface indicates the measured value.	• Update time
Period	The measured variable is the average period between two increments of the position value. The value is an integer (DINT). The unit is s. The MEASURED_VALUE value in the feedback interface indicates the measured value.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter. The MEASURED_VALUE value in the feedback interface indicates the measured value.	• Update time • Time base for velocity measurement • Increments per unit
Complete SSI frame	Instead of a measured variable, the first 32 bits of the SSI frame are returned (bit 0 to bit 31). In so doing, special bits that do not belong to the position information are also supplied. A configured inversion of the direction is ignored. The MEASURED_VALUE value in the feedback interface indicates the 32 bits. You can find examples under Examples of the frame format (Page 159). This option is only available in operating mode "Use position value (SSI absolute value) as reference".	—

Note

If the increment per revolution is required for calculation of the measured values, it is automatically calculated from the parameterized telegram length as the power of 2, e.g. 8192 increments per revolution with a telegram length of 13 bit. If you are using an SSI absolute encoder whose increment per revolution does not correspond to the power of 2, the calculated measured value may be incorrect for a short time.

Update time

By configuring the update time (Page 59) in milliseconds, you can specify the time interval between two measured value updates. Unsteady measured variables can be smoothed through longer update times

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s

The default setting is "60 s".

Increments per unit

With this parameter you define the number of increments per relevant unit that the SSI absolute encoder supplies for the velocity measurement.

You can enter a value between 1 and 65535.

Example 1:

Your absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s

Example 2:

You encoder delivers 10000 increments for travel over one meter. The velocity is to be measured in meters per second.

In this case, you need to assign the following parameters:

- Increments per unit: 10000
- Time base for velocity measurement: 1 s

5.1.3 Online & diagnostics module

5.1.3.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the technology module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure (TM Count and TM PosInput)

To open the display editor for the diagnostic functions, follow these steps:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click the module and select "Online & Diagnostics".
1. Select the required display in the diagnostics navigation.

Procedure (Compact CPU)

To open the display editor for the diagnostic functions, follow these steps:

1. Open the Compact CPU folder in the project tree.
2. Double-click on the "Online & diagnostics" object.
3. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the technology module device manual.

Note

Position input for Motion Control

In operating mode "Position input for "Motion Control" technology object", channel diagnostics is not available for the technology module.

5.1.4 Control and feedback interface (TM Count, TM PosInput)

Information on using the control and feedback interface can be found under Overview of application options (Page 18).

Note

The following description does not apply for the operating modes "Fast Mode" and "Position input for technology object "Motion Control"". You can find a description of the feedback interface in the respective device manual for those technology modules that support the "Fast Mode" operating mode.

5.1.4.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface per channel

The following table shows control interface assignment:

<table>
<tr><th colspan="2">Byte offset to start address Channel 0/1
↓ ↓</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>0
…
3</td><td>12
…
15</td><td colspan="8">SLOT_0:
DINT or REAL: Load value (significance of the value is specified in LD_SLOT_0)
Value range: –2147483648 to 2147483647_D or 80000000 to $7FFFFFFF_H$</td></tr>
<tr><td>4
…
7</td><td>16
…
19</td><td colspan="8">SLOT_1:
DINT or REAL: Load value (significance of the value is specified in LD_SLOT_1)
Value range: –2147483648 to 2147483647_D or 80000000 to $7FFFFFFF_H$</td></tr>
<tr><td>8</td><td>20</td><td colspan="4">LD_SLOT_1</td><td colspan="4">LD_SLOT_0</td></tr>
<tr><td>9</td><td>21</td><td>EN_ CAPTURE</td><td>EN_ SYNC_DN</td><td>EN_ SYNC_UP</td><td>SET_DQ1</td><td>SET_DQ0</td><td>TM_ CTRL_DQ1</td><td>TM_ CTRL_DQ0</td><td>SW_GATE</td></tr>
<tr><td>10</td><td>22</td><td>SET_DIR</td><td colspan="5">Reserved</td><td>RES _EVENT</td><td>RES _ERROR</td></tr>
<tr><td>11</td><td>23</td><td colspan="8">Reserved</td></tr>
</table>

Notes

Control bit/value	Notes
EN_CAPTURE	Use this bit to enable the Capture function. Resetting this bit resets a set EVENT_CAP in the feedback interface.
EN_SYNC_DN	Use this bit to enable the synchronization of the counter when counting in downward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
EN_SYNC_UP	Use this bit to enable the synchronization of the counter when counting in upward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
LD_SLOT_m	With this load request you specify the meaning of the value in SLOT_m: • 0000 means: No action, idle • 0001 means: Load count value (with incremental or pulse encoder) • 0010 not permitted • 0011 means: Load start value (with incremental or pulse encoder) • 0100 means: Load Comparison value 0 • 0101 means: Load comparison value 1 • 0110 means: Load low counting limit (with incremental or pulse encoder) • 0111 means: Load high counting limit (with incremental or pulse encoder) • 1000 to 1111 not permitted The technology module executes the respective action as soon as LD_SLOT_m changes. If values are loaded simultaneously via LD_SLOT_0 and LD_SLOT_1, the first value is applied internally from SLOT_0 and then the value from SLOT_1 is applied. This may lead to unexpected intermediate states.
RES_EVENT	Use this bit to trigger the reset of the saved events in the EVENT_ZERO, EVENT_OFLW, EVENT_UFLW, EVENT_CMP0, EVENT_CMP1 feedback bits.
Reserved	Reserved bits must be set to 0.
RES_ERROR	Use this bit to trigger the reset of the saved error states LD_ERROR and ENC_ERROR .
SET_DIR	Use this bit to specify the count direction for signal type "Pulse (A)". • 0 means: Up • 1 means: Down
SET_DQ0	Use this bit to set digital output DQ0 when TM_CTRL_DQ0 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ0 is effective regardless of TM_CTRL_DQ0 as long as the counter value is not equal to the comparison value.
SET_DQ1	Use this bit to set digital output DQ1 when TM_CTRL_DQ1 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ1 is effective regardless of TM_CTRL_DQ1 as long as the counter value is not equal to the comparison value.

Control bit/value	Notes
SW_GATE	Use this bit to open and close the software gate when using an incremental encoder or pulse encoder. Together, the software gate and the hardware gate form the internal gate. The technology module only counts when the internal gate is open. • 0 means: Software gate closed • 1 means: Software gate open The control of the hardware gate takes place externally via the digital inputs of the technology module. The hardware gate can be activated through parameter assignment. The software gate cannot be deactivated.
TM_CTRL_DQ0	Use this bit to enable the technological function of digital output DQ0. • 0 means: SET_DQ0 defines the state of DQ0 • 1 means: assigned function defines the state of DQ0
TM_CTRL_DQ1	Use this bit to enable the technological function of digital output DQ1. • 0 means: SET_DQ1 defines the state of DQ1 • 1 means: assigned function defines the state of DQ1

5.1.4.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module via the feedback interface.

Feedback interface per channel

The following table shows the assignment of the feedback interface:

<table>
<tr><th colspan="2">Byte offset to start address Channel 0/1
↓ ↓</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>0
…
3</td><td>16
…
19</td><td colspan="8">COUNT_VALUE:
DINT: Current counter value or position value</td></tr>
<tr><td>4
…
7</td><td>20
…
23</td><td colspan="8">CAPTURED_VALUE:
DINT: The last acquired Capture value</td></tr>
<tr><td>8
…
11</td><td>24
…
27</td><td colspan="8">MEASURED_VALUE:
REAL: Current measured value or DWORD: Full SSI frame</td></tr>
<tr><td>12</td><td>28</td><td colspan="5">Reserved</td><td>LD_ERROR</td><td>ENC_ ERROR</td><td>POWER_ ERROR</td></tr>
<tr><td>13</td><td>29</td><td colspan="2">Reserved</td><td>STS_SW_ GATE</td><td>STS_ READY</td><td>LD_STS_ SLOT_1</td><td>LD_STS_ SLOT_0</td><td>RES_EVEN T_ACK</td><td>Reserved</td></tr>
<tr><td>14</td><td>30</td><td>STS_DI2[1]</td><td>STS_DI1</td><td>STS_DI0</td><td>STS_DQ1</td><td>STS_DQ0</td><td>STS_GATE</td><td>STS_CNT</td><td>STS_DIR</td></tr>
<tr><td>15</td><td>31</td><td>STS_M_ INTERVAL</td><td>EVENT_ CAP</td><td>EVENT_ SYNC</td><td>EVENT_ CMP1</td><td>EVENT_ CMP0</td><td>EVENT_ OFLW</td><td>EVENT_ UFLW</td><td>EVENT_ ZERO</td></tr>
</table>

[1] For TM PosInput applies: Reserved

Note

Validity of the position value

The position value of an SSI absolute encoder is valid if STS_READY is set to 1 and ENC_ERROR is set to 0. In the module startup STS_READY is set to 0.

Notes

Feedback bit/value	Notes
CAPTURED_VALUE	This DINT value indicates the last detected Capture value. The following external signals can trigger the Capture function: • Rising or falling edge of a digital input • Both edges of a digital input The parameter "Frequency of the Capture function" determines if the function is executed for each configured edge or only once after each enable.
COUNT_VALUE	This DINT value shows the current counter value or position value. If you use an SSI absolute encoder with a position value length of up to 31 bits, the position value is treated unsigned as a positive value and can assume values between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, the MSB of the position value corresponds to the sign and the position value can assume values between –2147483648 and 2147483647. If you use a 32 bit position value for the comparison function, the position value is interpreted as DINT.
ENC_ERROR	This bit indicates that one of the following errors has occurred at the encoder signals (retentive) for the respective technology module: TM Count: • Wire break of digital input A, B, or N (with push-pull encoder) • Invalid transition of A/B signals (with incremental encoder) TM PosInput: • Invalid transition of A/B signals (with incremental encoder) • RS422/TTL error • SSI encoder error or SSI frame error (with SSI absolute encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the manual for the respective technology module. The bit is reset once you have acknowledged the error with RES_ERROR .
EVENT_CAP	This bit indicates that a Capture event has occurred and a counter value has been saved in CAPTURED_VALUE . You reset the status by resetting EN_CAPTURE .
EVENT_CMP0	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ0 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP0 is not set.
EVENT_CMP1	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ1 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP1 is not set.
EVENT_OFLW	This bit indicates the saved state which shows that there was a counter value overflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_SYNC	This bit indicates the saved status for which the counter was loaded with the start value by an external reference signal (synchronization) when using an incremental or pulse encoder. You reset the state by resetting EN_SYNC_UP or EN_SYNC_DN .
EVENT_UFLW	This bit indicates the saved state which shows that there was a counter value underflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_ZERO	This bit indicates the saved status with which the counter value or position value experienced a zero crossing. You reset the status by acknowledgment with RES_EVENT.

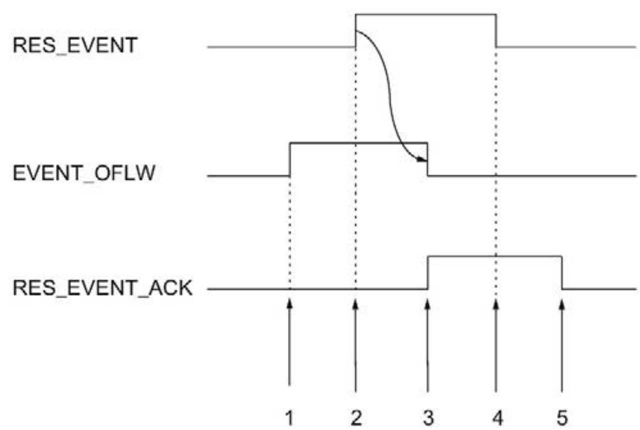
Feedback bit/value	Notes
LD_ERROR	This bit indicates that an error occurred (latching) during loading via the control interface. The loaded values were not applied. When using an incremental or pulse encoder, one of the following conditions is not fulfilled: • Low counting limit <= counter value <= high counting limit • Low counting limit <= start value <= high counting limit • Low counting limit <= comparison value 0/1 <= high counting limit When using an SSI absolute encoder, one of the following conditions is not fulfilled: • 0 <= position value <= maximum position value • 0 <= comparison value 0/1 <= maximum position value The bit is reset once you have acknowledged the error with RES_ERROR .
LD_STS_SLOT_0	This bit indicates by a status change (toggling) that the load request for Slot 0 (LD_SLOT_0) has been detected and executed.
LD_STS_SLOT_1	This bit indicates by a status change (toggling) that the load request for Slot 1 (LD_SLOT_1) has been detected and executed.
MEASURED_VALUE	This value shows the current measurement value with the REAL data type or the complete SSI frame with the DWORD data type: • Frequency: The mean frequency is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in Hertz as floating point number. • Period duration: The mean period duration is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in seconds as floating point number. • Velocity: The mean velocity is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and other parameters, and returned in the configured unit of measurement. • Complete SSI frame: Instead of a measured variable, the least significant 32 bits of the unprocessed current SSI frame are returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface. The measured values are returned as signed values. The sign indicates whether the counter value or position value increased or decreased during the relevant time period. The update time is asynchronous to the opening of the internal gate, which means that the update time is not started when the gate is opened. After the internal gate is closed, the last measured value captured is still returned.
POWER_ERROR	For an S7-1500 technology module, this bit indicates that the supply voltage L+ is not available or too low or that the front plug is not plugged in. For an ET 200SP technology module, this bit indicates that the supply voltage L+ is too low. If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of errors in the supply voltage. For details on the diagnostic interrupts and the corrective measures they require, refer to the device manual for the respective technology module. If the supply voltage L+ is available at a sufficient level once again, POWER_ERROR is automatically set to 0.
RES_EVENT_ACK	This bit indicates that the reset of event bit EVENT_SYNC, EVENT_CMP0, EVENT_CMP1, EVENT_OFLW, EVENT_UFLW, EVENT_ZERO is active.
Reserved	Reserve bits are set to 0.

Feedback bit/value	Notes
STS_CNT	This bit indicates that at least one count pulse or a position value change has occurred in the last ca. 0.5 s.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DI2	This bit indicates the status of digital input DI2 of the TM Count .
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. 0 means: Down 1 means: Up
STS_DQ0	This bit indicates the status of digital output DQ0.
STS_DQ1	This bit indicates the status of digital output DQ1.
STS_GATE	This bit indicates the status of the internal gate when using an incremental or pulse encoder. 0 means: Gate closed 1 means: Gate open Information for TM PosInput: In order for the counting logic including the gate control to function correctly, the startup of the technology module must complete correctly at least once with a connected incremental or pulse encoder (STS_READY at 1). If a connected encoder is not ready yet during startup, the function of the STS_GATE feedback bit is delayed until the encoder for the technology module is available. If the technology module starts up without a connected encoder, the startup does not complete correctly and STS_READY as well as STS_GATE remain at 0. As soon as an encoder is then connected, the startup completes and the STS_GATE functions correctly. An encoder error after a completed startup has no influence on STS_GATE.
STS_M_INTERVAL	This bit indicates that at least one count pulse or a position value change was detected in the previous measurement interval.
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.
STS_SW_GATE	This bit indicates the status of the software gate. 0 means: Gate closed 1 means: Gate open

Complete acknowledgment principle

Saving bits are acknowledged according to the complete acknowledgment principle.

The figure below shows an example of the sequence of the complete acknowledgment principle in the event of an overflow:



① The EVENT_OFLW feedback bit is set as a saving event upon overflow.
② You set the RES_EVENT control bit to trigger EVENT_OFLW reset.
③ The RES_EVENT_ACK feedback bit is set when reset of EVENT_OFLW is detected.
④ You then rest the control bit RES_EVENT .
⑤ The RES_EVENT_ACK feedback bit is reset.

5.2 Using the digital module

5.2.1 Configuring and assigning parameters to the module

5.2.1.1 Adding a module to the hardware configuration

Requirements

- The project has been created.
- The CPU has been created.
- The ET 200 distributed I/O has been created.

Procedure

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the digital input module from the module catalog:
   "DI > Digital input module > Article number" or
   "DIQ > Digital input module /Digital output module > Article number"
4. Drag the module to the required slot in the module rack.

5.2.1.2 Open hardware configuration

Opening

To open the hardware configuration, follow these steps:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Click on the module.

5.2.1.3 Counting operating mode

In counting operating mode or in the counter configuration you can set the following parameters for each channel.

Note

Some of the parameters and options are not available for all digital modules. See the module's device manual for the associated parameters and options.

Channel enabled

You use this parameter to specify whether the respective channel is enabled or disabled.

Each channel is enabled by default.

Input delay

By configuring the input delay, you suppress signal errors at the digital inputs. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Isochronous configuration is only possible if there is an input delay of 0.05 ms configured for at least one channel. In isochronous mode, the feedback interface is updated at the time T_i (time for reading the input data).

You can select from the following options:

- 0.05 ms
- 0.1 ms
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms (default)
- 12.8 ms
- 20 ms

Note

If you select the "0.05 ms" option for the input delay, you have to use shielded cables for connection of the digital inputs.

Reaction to violation of a counting limit

The following behavior can be configured for Violation of the counter high limit in the upward direction or the counter low limit in the downward direction (Page 88):

Reaction	Meaning
Stop counting (default at ET200SP and ET200AL)	After a counting limit is violated, the internal gate is closed (automatic gate stop). As a result, the counting process is stopped and the module ignores any further counting signals. The counter value is set to the opposite counting limit. To restart counting, you must close and reopen the software/hardware gate.
Continue counting (default at S7-1500)	After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

Edge selection

This parameter is used to specify which edge the respective counter counts:

Edge selection	Meaning
At rising edge (default)	The respective counter counts all rising edges at the digital input.
At falling edge	The respective counter counts all falling edges at the digital input.
At rising and falling edge	The respective counter counts all edges at the digital input.

Count direction

Use this parameter to specify the counting direction of the respective counter.

You can select from the following options:

- Up
- Down

Set output

Use this parameter to specify the Function (Page 92) that controls the STS_DQ feedback bit. You can use the STS_DQ reset bit in order to control a digital output module's digital output.

You can select from the following options:

Option	Meaning
Off (DQ = 0)	Regardless of the counter value, STS_DQ is permanently not set.
Off (DQ = 1)	Regardless of the counter value, STS_DQ is permanently set.
Between comparison value 0 and 1	STS_DQ is set if the counter value between comparison values 0 and 1.
Not between comparison value 0 and 1	STS_DQ is set if the counter value is outside the range between comparison values 0 and 1.
Between comparison value and counter high limit	STS_DQ is set if the counter value is between the comparison value and the counter high limit.
Between comparison value and counter low limit	STS_DQ is set if the counter value is between the comparison value and the counter low limit.

Setting function of the DI

Use this parameter to specify which function the respective digital input DI_{n+4} triggers.

You can select from the following options:

Option	Meaning
Digital input without function	No function is assigned to the respective digital input DI_{n+4}. The signal status of DI_{n+4} can be read by the CPU using the feedback interface.
Gate start/stop	Setting the respective digital input DI_{n+4} opens the hardware gate (Page 90) for DI_n. Resetting the respective digital input DI_{n+4} closes the hard-ware gate for DI_n.
Count direction	The respective DI_{n+4} digital input determines the counting direction at DI_n, in order to adjust it to the process. If DI_{n+4} is not set, DI_n counts up. If DI_{n+4} is set, DI_n counts down.

Note

If "Count direction" is selected and the counting direction in the process changes, the counting edge is automatically adjusted (opposite edges).

High counting limit

You limit the counting range by setting the counter high limit. The maximum value for the counter high limit depends on the module:

High counting limit	DI 8x24VDC HS, DIQ 16x24VDC/0.5A 8xM12	DI 32x24VDC HF, DI 16x24VDC HF
Maximum value	2147483647 (2^{31}–1)	4294967295 (2^{32}–1)
Default	2147483647	4294967295

You must enter a value that lies above the counter low limit.

Counter low limit

You limit the counting range by setting the counter low limit. The minimum value for the counter low limit depends on the module:

Counter low limit	DI 8x24VDC HS, DIQ 16x24VDC/0.5A 8xM12	DI 32x24VDC HF, DI 16x24VDC HF
Minimum value	–2147483648 (–2^{31})	0 (not configurable)
Default	0	0

You must enter a value below the counter high limit.

Start value

By configuring the start value, you specify the value at which counting is to start. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Comparison value

By configuring a comparison value (Page 92), you specify the counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You have to enter a value that is greater than or equal to the low counting limit as well as smaller than or equal to the high counting limit.

The default setting depends on the module:

Comparison value	DI 8x24VDC HS, DIQ 16x24VDC/0.5A 8xM12	DI 32x24VDC HF, DI 16x24VDC HF
Default	10	1

Comparison value 0

By configuring a comparison value (Page 92), you specify the counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than or equal to the counter low limit and less than comparison value 1.

The default setting is "0".

Comparison value 1

By configuring the second comparison value (Page 92), you specify the additional counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than comparison value 0 and less than or equal to the counter high limit.

The default setting is "10".

Hardware interrupt: Comparison event for DQ occurred

With this parameter, you specify for S7-1500 and ET200AL whether a process alarm is given off when a comparison event occurs based on the comparison function that was selected under "Set output".

The hardware interrupt is not enabled in the default setting.

5.2.2 Online & diagnostics module

5.2.2.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure

To open the display editor for the diagnostic functions, follow these steps:

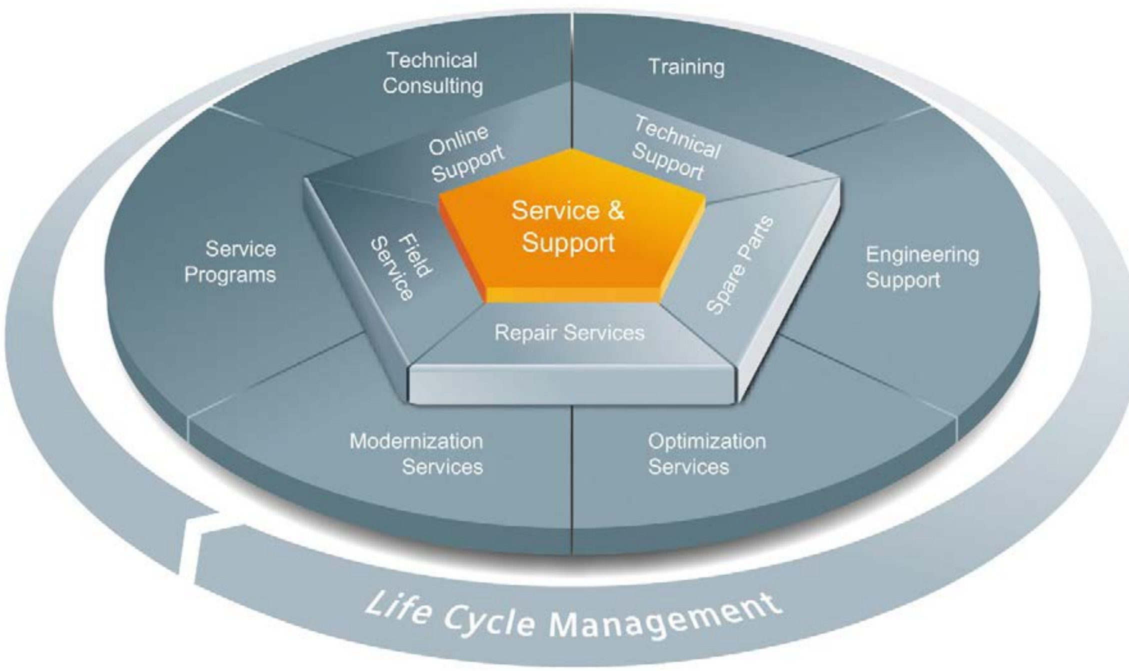
1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click on the module and select "Online & Diagnostics".
4. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the module's device manual.

Service & Support

A



Unmatched complete service for the entire life cycle

For machine manufacturers, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address on the Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses at the following address on the Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are select service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a service program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Benefits at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products from Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet (http://www.siemens.com/automation/partner).

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual will support you when you use "Time-based IO" technology with the S7-1500, ET 200MP, and ET 200SP systems.

The documentation deals with the following topics:

- Using "Time-based IO" technology
- Functions of the "Time-based IO" technology
- Hardware and software requirements for "Time-based IO"
- Configuring the "Time-based IO" function with STEP 7 (TIA Portal)
- Diagnostics of the "Time-based IO" function

Basic knowledge required

The following knowledge is required in order to understand the Function manual:

- General knowledge of automation engineering
- Knowledge of the industrial automation system SIMATIC
- Proficiency with STEP 7 (TIA Portal)

Scope of the documentation

The following documentation is valid for all components of the S7-1500, ET 200MP and ET 200SP systems that support the "Time-based IO" technology.

Conventions

The following terms are used as synonyms in this documentation:

- **TIA Portal:** This term is used as synonym for the "STEP 7" configuration and programming software (TIA Portal)".
- **TIO module**: This term is used as synonym for I/O modules of the type:
  - IO-Link Master CM 4xIO-Link
  - ET 200MP TM Timer DIDQ 16x24V
  - ET 200SP TM Timer DIDQ 10x24V
- **TIO_Time**: This term is used as synonym for the shared time basis (relative time) of the TIO modules.
- **Jitter**: This is a general term that includes various time influences affecting accuracy. This means that:
  - for input data: Deviation of the measured time from the actual event.
  - for output data: Deviation of the actual switching time from the specified time.

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

You should also pay particular attention to notes such as the one shown below:

Note

The notes contain important information on the product, handling the product or on part of the documentation to which particular attention should be paid.

Additional support

You will find information about the technical support available in the appendix.

The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).

The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

Introduction

The documentation of the SIMATIC products has a modular structure and covers a range of topics concerning your automation system.

The complete documentation for the S7-1500, ET 200MP, and ET 200SP systems consists of the respective system manuals, function manuals, and manuals for the specific device.

In addition, the TIA Portal (online help) information system supports you in configuring and programming your automation system.

Documentation for Time-based IO

The following table lists further documentation that you will need when using Time-based IO.

Table 1- 1 Documentation for Time-based IO

SIMATIC manuals

All current manuals for SIMATIC products are available for download free of charge from the Internet (http://www.siemens.com/automation/service&support).

Software download for IO-Link

The Port Configuration Tool (SIMATIC S7-PCT) is available on the Internet (http://support.automation.siemens.com/WW/view/en/32469496).

You will find software downloads for the IO-Link Device with time stamp function on the Internet:

- SICK (http://www.sick.com/group/EN/home/products/technologies/smart_sensor_solutions/Pages/product_track_and_trace.aspx)
- halstrup-walcher (http://www.halstrup-walcher.de/en/downloads/index.php)

Time-based IO basics 2

2.1 Using Time-based IO

Many processes in a plant require a relatively precise reproducibility as far as time is concerned. The reproducibility can be optimized to a limited extent by shorter CPU cycle times. The use of high-precision input/output with Time-based IO provides a more accurate reproducibility than the one that can be achieved by optimizing the CPU cycle time. An additional advantage of Time-based IO is the independence from the minimum time scale of the application cycle.

Below is a selection of typical areas of application that can benefit from this technology.

Defined response times

An output signal that responds with a precise delay time that is independent of the application cycle can be output by adding a specified time to the time stamp of an edge at the digital input.

Length measurement

The length of a product passing by can be determined by the difference between two input time stamps and an associated travel speed.

Cam controller

The ongoing movement can be extrapolated from a synchronous position information (for example, from a counter module or an axis). Based on this result, the time of a switching position (cam position) is calculated and transferred to the TIO module (output). This way the switch event takes place at the required position.

Dosing

By specifying a switch-on and a switch-off edge to a time-controlled digital output, a valve can be opened for a specific time and the amount of liquid can be dosed accordingly.

2.2 Time behavior of Time-based IO

2.2.1 Time behavior of standard technology

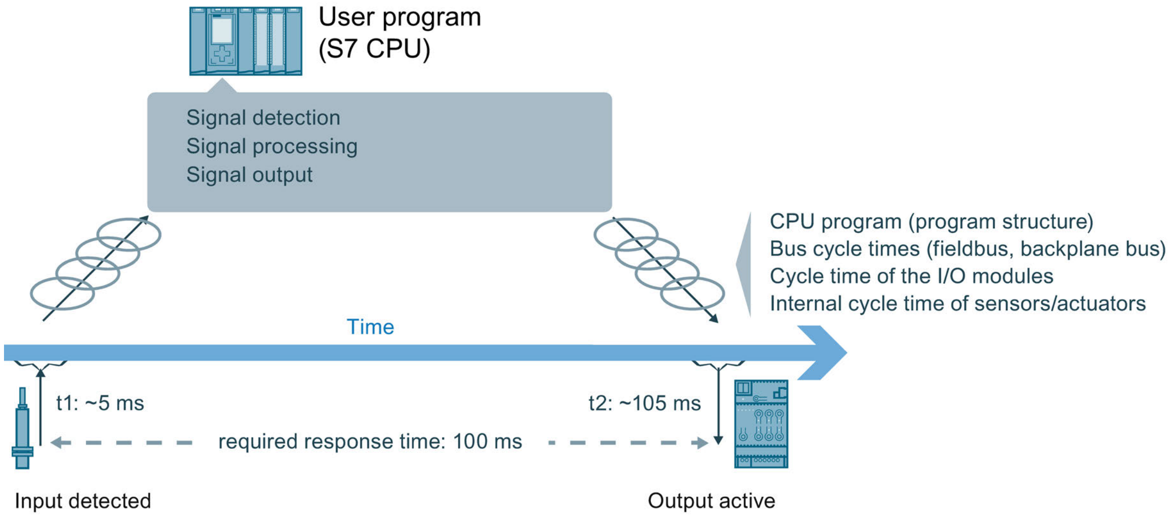
The time behavior of the inputs/outputs depends on the following factors for standard technology:

- CPU program (program structure)
- Bus cycle times (fieldbus, backplane bus)
- Cycle time of the I/O modules
- Internal cycle time of sensors/actuators

A deterministic statement as to

- when an input event (e.g., sensor signal) has taken place
- when the output event has an effect on the input event (e.g., output switches)

will become inaccurate due to the time factors listed above.

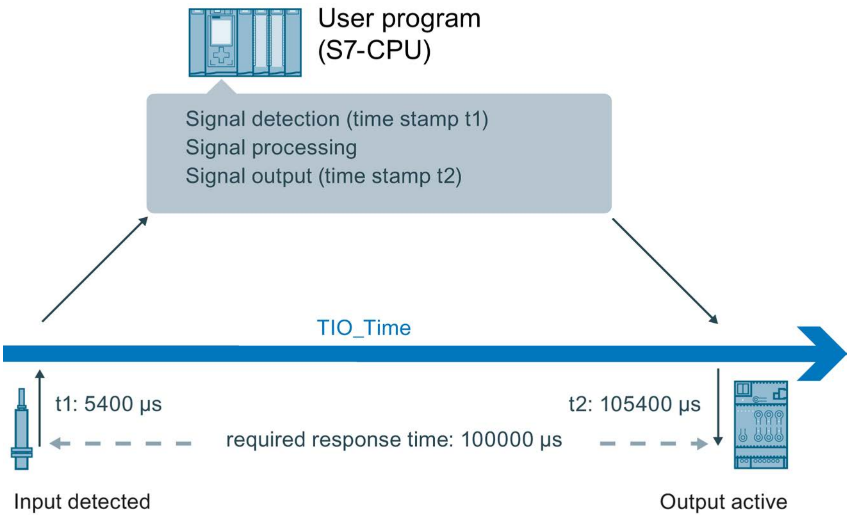


2.2.2 Time-based IO properties

Time-controlled I/O functionality

Time-based IO stands for time-based processing of I/O signals. All input signals are referred to one time (TIO_Time). The input signals receive the time stamp t1. After signal processing, the output event can also be linked with the TIO_Time and output at the required time. Output takes place at time t2.

Here an example for Time-based IO:



Independence and focus of Time-based IO

The shared time basis (TIO_Time) of all components involved is the basis for Time-based IO. By using TIO_Time, the accuracy of the output with Time-based IO does not depend on:

- CPU program (program structure)
- Bus cycle times (fieldbus, backplane bus)
- Cycle time of the I/O modules
- Internal cycle time of the IO-Link sensors/actuators

The focus of Time-based IO is not on the I/O response time but on the predictability (determinism) of I/O signals. With Time-based IO, it is possible to respond to an input signal with an output signal within a defined time. Keep in mind the system-dependent minimum response time when using Time-based IO.

Time-based IO stands for:

- I/O functionalities executed with high precision
- I/O processes with time stamp

Accuracy

Accuracy is crucial for the performance capability of Time-based IO.

Accuracy is a property of

- TIO module
- IO-Link sensor/ actuator

and indicates the deviation with which the required response is achieved. For Time-based IO, the accuracy and reproducibility of the response is in the millisecond range.

Response time

In addition to a very high accuracy, a minimum response time to an input event can result depending on the configuration.

The response time is the time between the input event and the required output event.

For the minimum response time:

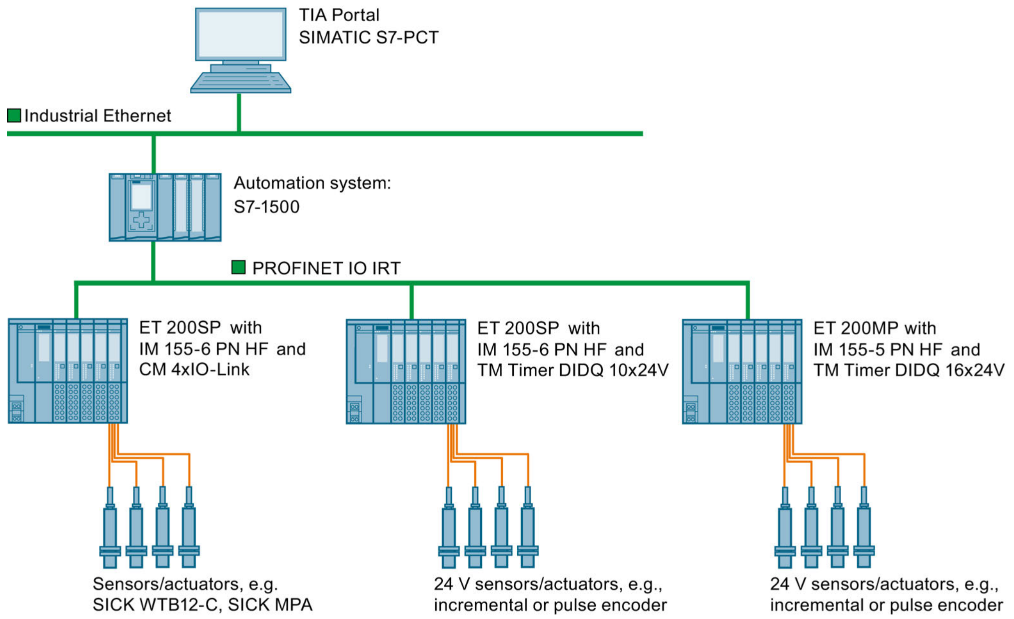
at least 3 * application cycle (T_{APP})

2.3 System environment

Introduction

Possible system configurations with PROFINET for the use of Time-based IO are shown below.

Use with TIA Portal



2.4 Hardware requirements

Introduction

The properties of the hardware components required for Time-based IO are listed below. You will also find specific modules as an example.

Requirements

Component	Properties	Examples
CPU	• Isochronous mode/ PROFINET IO IRT: provides defines response time and high-precision plant behavior.	• CPU 1511-1 PN
ET 200 interface module	• Supports isochronous mode	• ET 200SP with IM 155-6 PN HF (as of firmware V2.1) • ET 200MP with IM 155-5 PN HF
I/O module	• TIO module	• ET 200SP: CM 4xIO-Link (as of firmware V2.0) TM Timer DIDQ 10x24V • ET 200MP: TM Timer DIDQ 16x24V
IO-Link Device for CM 4xIO-Link	• supports IO-Link time stamp function	• SICK WTB12-C • halstrup-walcher PSE, PSS, PSW

2.5 Configuration software requirements

Introduction

Below please find a list of the software versions which support the "Time-based IO" function.

Requirements

Configuration software	Requirements	Supported hardware components	Additional information
STEP 7 (TIA Portal) as of V13	• PROFINET IO IRT • For CM 4xIO-Link: IO-Link technology	• S7-1500 automation system • ET 200SP and ET 200MP distributed I/O systems • CM 4xIO-Link • TM Timer DIDQ 16x24V (as of V13 Update 3) • TM Timer DIDQ 10x24V (as of V13 Update 3)	TIA Portal online help
S7-PCT as of V3.2	—	• CM 4xIO-Link	S7-PCT online help

TIO instructions

The TIO instructions are specific function blocks for use of Time-based IO. The following TIO instructions (Page 29) are available:

- TIO_SYNC
- TIO_IOLink_IN
- TIO_IOLink_OUT
- TIO_DI
- TIO_DQ

As of V13 Update 3, the TIO instructions are available as integrated instructions in TIA Portal.

2.6 Technical implementation

Introduction

The information below will help you better understand the core aspects of Time-based IO and find out which SIMATIC functions are used to implement the described aspects.

Synchronization of involved modules in PROFINET (shared time basis)

The Time-based IO technology uses isochronous mode for all involved PROFINET stations. Isochronous communication is made possible with PROFINET IRT (Isochronous Real-Time) and isochronous mode of the PROFINET stations.

Additional information on isochronous mode is available in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) and Isochronous Mode (http://support.automation.siemens.com/WW/view/en/15218045) manuals.

Several TIO modules can be synchronized to a shared time basis by using the isochronous PROFINET. The basis of the shared time basis for the TIO modules is the relative time TIO_Time.

TIO_Time

The TIO_Time is the central time basis to which all time stamps refer.

TIO_Time has the following properties:

- Shared time basis for all TIO modules which are synchronized with the TIO instruction TIO_SYNC.
- The time starts counting again with each CPU startup.
- TIO_Time has the data type LTime (e.g., LT#14s830ms652us315ns).
- All valid time stamps refer to TIO_Time:
  - Input time stamps of the TIO modules are converted to TIO_Time in TIO instructions TIO_IOLink_IN and TIO_DI.
  - Output time stamps are converted to output time stamps of the TIO modules in TIO instructions TIO_IOLink_OUT and TIO_DQ.

TIO instructions in the "Synchronous Cycle" OB

The TIO instructions must be called in a "Synchronous Cycle" OB.

You can find additional information in the chapter Programming (Page 29).

Modes for updating the process image

In isochronous mode, you can influence the order of the update of the process image partition of the input and output data. In doing so, you can select the following program execution models:

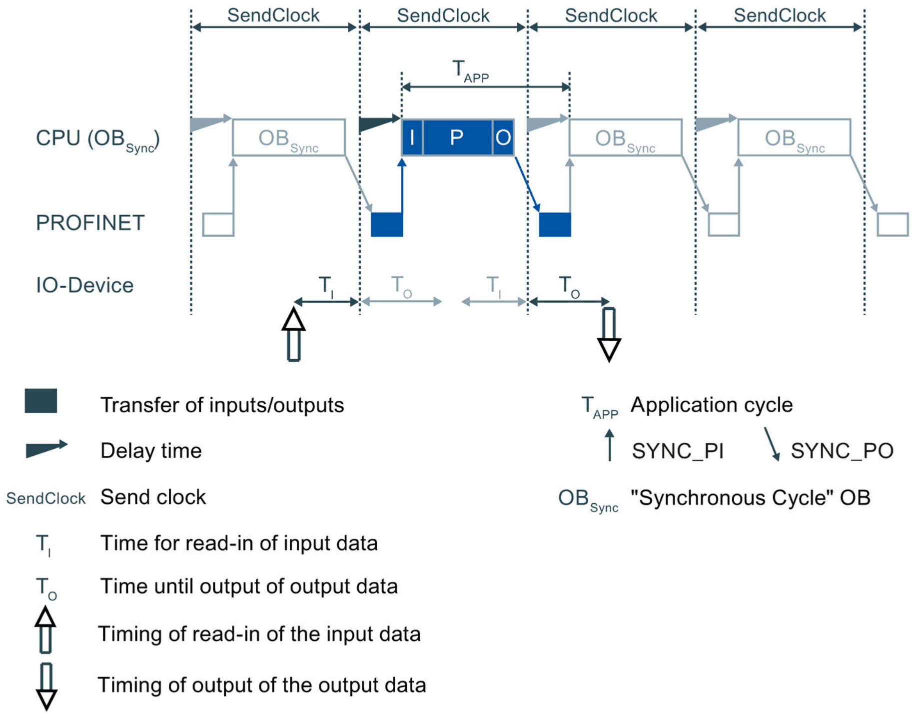
- IPO model (application cycle factor = 1)
- OIP model (application cycle factor >= 1)

The abbreviations I, P, O stand for the following processes: I = Input, P= Processing, O = Output.

Additional information on the application cycle factor is available in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) Manual.

IPO model (application cycle factor = 1)

The user program is started after the delay time. Start by updating the corresponding process image partition of the inputs in the user program by calling the SYNC_PI system instruction. Processing is started next (for example, calculation of the time stamps). The corresponding process image partition of the outputs is updated at the end of the user program in the CPU by SYNC_PO.



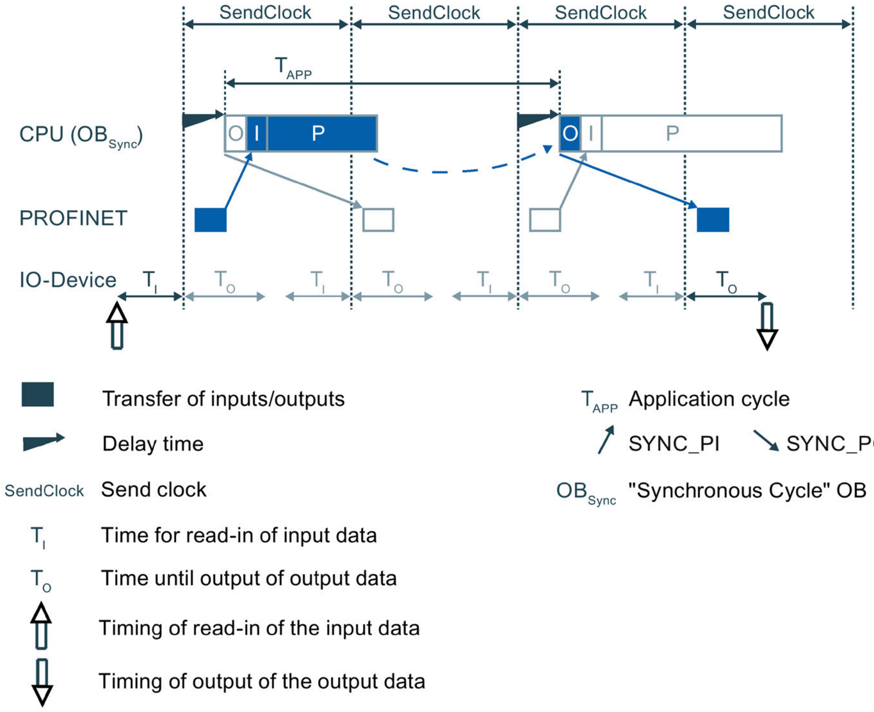
Properties of the IPO model:

- Supports shorter response times
- The application cycle may not be greater than the send clock.

  This gives the application less time than with the OIP model.

OIP model (application cycle factor >= 1)

The user program is started after the delay time. In PIP_Mode 0, the TIO_SYNC instruction updates the process image. In the other modes, you start by updating the corresponding process image partition of the outputs in the user program by calling the SYNC_PO system instruction. As a result, the output data that was calculated in the previous network cycle will become active during the next network cycle (T_O). Next the corresponding process image partition of the inputs is updated in the CPU by SYNC_PI. Processing starts after the data is transmitted (for example, calculation of the time stamps).



Properties of the OIP model:

- The response time is longer than with the IPO model.
- It is one application cycle longer than permitted by the send clock.

  This gives the application more time than with the IPO model.

Influence of accuracy

To estimate the accuracy you need the accuracy of

- TIO module
- Sensor/ actuator

Consult the data sheets of the respective module regarding the accuracy value.

You have to add the individual jitters of the TIO modules and the sensors/actuators. You can neglect any other influencing factors.

Configuring and parameter assignment 3

3.1 Requirements

Introduction

You need additional software components to use Time-based IO. You must also have created the standard configuration for your project.

Below you will learn more about the standard configuration for Time-based IO.

Requirements

In the TIA Portal:

- The project has been created.
- The CPU has been created and the parameters are assigned.
- ET 200 distributed I/O and modules have been created and the parameters are assigned.
- The connection has been created and the parameters are assigned via PROFINET.
- A "Synchronous Cycle" OB has been created.

In addition for IO-Link:

- S7-PCT is installed on the programming device/PC.
- IODD for IO-Link device (with time stamp function) are installed.

	Properties of the TIO module > I/O addresses	Assignment of I/O addresses to the process image partition (e.g., PIP1)	
	Properties of the TM Timer DIDQ > Basic parameters/Channel parameters	Parameter assignment for use of Timer DI and Timer DQ	
"Synchronous Cycle" OB	Properties of the "Synchronous Cycle" OB > Isochronous mode	Adjust application cycle, if necessary	
IO-Link Device (sensor/ actuator)	SIMATIC S7-PCT	Activate port of the IO-Link Device for Time-based IO	See chapter Configure IO-Link and activate Time-based IO (Page 27)

* Does not describe the exact location but the topic in the configuration software.

Setting for Time-based IO

If you have no special response time requirements, the following setting is suitable as a starting point:

- Send clock: 2 ms
- Application cycle: 4 ms
- Assignment to the process image partition: PIP1
- PIP_Mode: 0 (OIP model)

See also

Programming of Time-based IO (Page 30)

3.3 Configure IO-Link and activate Time-based IO

Introduction

For Time-based IO, the ports of the IO-Link Master must be set to the required operating mode and suitable sensors/actuators must be connected to the ports.

Requirements

- S7-PCT is installed on the programming device/PC.
- IODD for IO-Link Device (with time stamp function) are installed.

  You can find additional information on installation in the online help for S7-PCT.
- The project is open in network view in the TIA Portal.
- The hardware catalog is open.

Procedure

1. Right-click the IO-Link Master in the TIA Portal and select "Start Device Tool".

   The Port Configuration Tool (S7-PCT) opens.
2. Select the connected IO-Link Device (sensors/actuators with time stamp function) from the device catalog for the ports of the IO-Link Master in S7-PCT.

   Use drag-and-drop to insert the IO-Link Device to the matching Port of the IO-Link Master.
3. Adapt the settings of the ports to match their respective task in the application.

   Possible port settings:

   – IO-Link Time based IN: The input signals of the sensor are given a time stamp.

   – IO-Link Time based OUT: The signal is output at the specified time.
4. Save the settings.
5. Download the Port configuration to the IO-Link Master.
6. Close S7-PCT.

Result

The IO-Link Master is configured with the connected sensor and actuator information.

Programming 4

4.1 Overview of instructions

Introduction

Time-based IO is used with special instructions (TIO instructions). The TIO_SYNC TIO instruction is responsible for synchronizing all involved TIO modules and creates a unique time basis (TIO_Time) to which all actions are referenced.

Depending on the type of TIO module, additional instructions undertake the reading in of process input signals with associated time stamps and/or the time-controlled output of process output signals.

Note

The TIO instructions use the time stamp functions of the TIO modules. For the other functions of the respective TIO module, no use of instructions is necessary.

TIO instructions

Instruction	Can be used with TIO module	Short description
TIO_SYNC (Page 34)	• CM 4xIO-Link • TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Synchronizes the TIO modules and provides the time basis for Time-based IO
TIO_IOLink_IN (Page 38)	• CM 4xIO-Link	Reads the input signals with time stamp from the IO-Link Device (sensor)
TIO_DI (Page 42)	• TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Detects the edges at the digital input (Timer DI) and supplies the associated time stamp
TIO_IOLink_OUT (Page 47)	• CM 4xIO-Link	Outputs time-controlled output signals at the IO-Link Device
TIO_DQ (Page 52)	• TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Outputs time-controlled edges at the digital output (Timer DQ)

4.2 Programming of Time-based IO

Introduction

For use of Time-based IO, the TIO instructions must be called in a "Synchronous Cycle" OB. The application can also run in another OB. In this way, you can shorten the runtime of the "Synchronous Cycle" OB.

You need the following TIO instructions according to the required task:

<table>
<tr><th>TIO module</th><th colspan="2">TIO instructions</th></tr>
<tr><td>CM 4xIO-Link</td><td>• Per sensor, one TIO_IOLink_IN for read-in
• Per actuator, one TIO_IOLink_OUT for output</td><td rowspan="2">One TIO_SYNC (for up to eight TIO modules)</td></tr>
<tr><td>TM Timer DIDQ</td><td>• Per digital input, one TIO_DI for read-in
• Per digital output, one TIO_DQ for output</td></tr>
</table>

This section below describes the programming of the CPU for Time-based IO.

Requirements

Hardware configuration in the TIA Portal:

- The TIO modules are assigned to an isochronous network.
- The TIO modules are assigned to a shared process image partition.
- The process image partition is assigned to a "Synchronous Cycle" OB.

Additional information on configuration of Time-based IO is available in the section Settings for Time-based IO (Page 26).

Procedure

1. Create a TIO_SYNC TIO instruction in the "Synchronous Cycle" OB.
2. Connect all TIO modules to be synchronized at the TIO_SYNC TIO instruction using parameters HWID_1 to HWID_8.

   The HWID is located in HWCN under the module properties.
3. Configure the send clock at the TIO_SYNC TIO instruction.

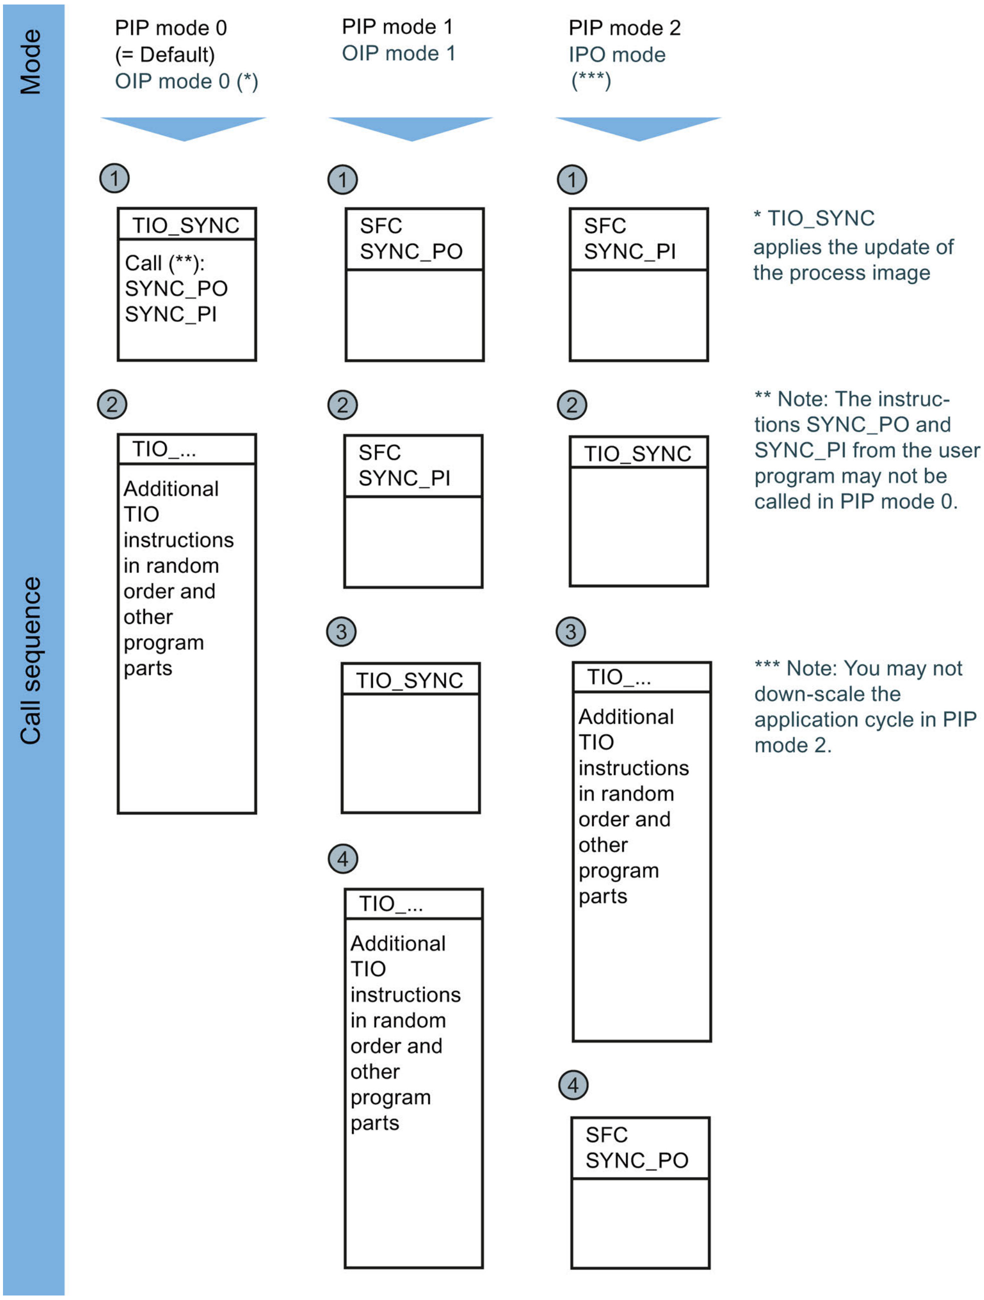
   The send clock is listed in the properties of the ET 200 station.

4. Set the data update mode at the TIO_SYNC instruction at the PIP_Mode input parameter.

   The description of the modes is available in the chapter Technical implementation (Page 20).

   The parameter assignment of the TIO_SYNC TIO instruction is complete.

5. For the following instructions, note the call sequence depending on the selected value for PIP_Mode:



6. Add the TIO instructions for data read-in/output required for your application in the "Synchronous Cycle" OB.

7. Connect the TIO_SYNC_Data input to the output of the same name at TIO_SYNC at each TIO instruction for read-in and output.
8. Assign the input parameters TO (see properties of the ET 200 station), HWID (see module properties in HWCN), and Port/Channel" for the TIO instructions for data read-in/output.

   Programming for the Time-based IO functionality is complete.
9. Connect the Time-based IO functionality with your application.
10. Compile and download the entire project to the CPU.

Result

You have completed programming the use of Time-based IO.

4.3 Time-based IO

4.3.1 TIO_SYNC: Synchronizing TIO modules

Description

You can use Time-based IO with the TIO_SYNC instruction. TIO_SYNC synchronizes TIO modules to a shared time basis TIO_Time.

You can synchronize up to 8 TIO modules with TIO_SYNC. All TIO modules must be assigned to the same process image partition (PIP). If you select "0" for the input parameter PIP_Mode, you assign the number of the process image partition at the PIP_PART input parameter.

Startup characteristics

At the startup of the CPU, the TIO_SYNC instruction receives and checks the input parameters once and initializes the TIO_Time. If startup takes place without errors, the instruction changes to normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction ensures synchronization of all TIO modules configured at the HWID input.

The calculated TIO_Time for the instructions of the TIO modules is provided at the TIO_SYNC_Data output.

Reaction to error

The Error output indicates whether the instruction parameters are assigned correctly and whether an error has occurred. If the instruction was not processed successfully, the reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_SYNC instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
HWID_1 ... HWID_8*	Input	HW_IO	-1	Hardware identifier for TIO module from HWCN
SendClock*	Input	LTime	LT#0ns	Send clock of the sync domain. Apply the send clock from the PROFINET configuration.
PIP_Mode*	Input	USInt	0	Mode for the data update**: • 0: OIP model with internal update of the process image by SYNC_PO and SYNC_PI. • 1: OIP model without internal update of the process image • 2: IPO model without internal update of the process image
PIP_PART*	Input	USInt	1	Only relevant if PIP_Mode = 0 Number of the process image partition which is to be updated isochronously.
TIO_SYNC_ Data	Output	"TIO_SYNC_ Data"		Calculated system time for the TIO instructions of the TIO modules and internal data used for synchronization. See UDT "TIO_SYNC_Data" (Page 57).
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

** The IPO model (PIP_Mode = 2) provides the shortest response times, but it also places the highest demands on system performance. Processing of all TIO instructions and other program sections must be completed within one send clock.

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
1001xxxx	An error has occurred with system function RD_SINFO. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10020000	The read cycle time of the isochronous OB is LT#0ms or has as negative value and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the value of the cycle time. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10030000	The TIO_SYNC instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB. Possible cause: The TIO_SYNC instruction was called in an "MC-Servo" or "MC-Interpolator" OB.	Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10040000	The assigned value at the PIP_Mode input parameter is outside the valid range of 0 to 2.	Correct the value at the PIP_Mode input parameter.
10050000	The assigned send clock is outside the permitted range of 0 < SendClock <= 4 ms and is therefore invalid.	Correct the value of the send clock.
0006xxxx	An error has occurred during execution of the SYNC_PI system function. The low word xxxx displays the error information of the RET_VAL return value from SYNC_PI.	Read the description of the SYNC_PI in the TIA Portal information system.
0007xxxx	An error has occurred during execution of the SYNC_PO system function. The low word xxxx displays the error information of the RET_VAL return value from SYNC_PO.	Read the description of the SYNC_PO in the TIA Portal information system.

Error code (DW#16#...)	Meaning	Remedy
10080000	Isochronous mode missing. Time-based IO cannot be used. Possible cause: Internal error during address calculation	Check the values of input parameters HWID_1 to HWID_8. Specify the hardware identifier of the TIO module from its module properties in HWCN.
10090000	TIO module HWID_1: Error during reading of HWID_1.	Check the value of the respective input parameter. Specify the hardware identifier of the TIO module in each case from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
100A0000	TIO module HWID_2: Error during reading of HWID_2.	
100B0000	TIO module HWID_3: Error during reading of HWID_3.	
100C0000	TIO module HWID_4: Error during reading of HWID_4.	
100D0000	TIO module HWID_5: Error during reading of HWID_5.	
100E0000	TIO module HWID_6: Error during reading of HWID_6.	
100F0000	TIO module HWID_7: Error during reading of HWID_7.	
10100000	TIO module HWID_8: Error during reading of HWID_8.	
10110000	The configured process image partition at input parameter PIP_PART is not within the valid range of 1 to 31.	Correct the value at the PIP_PART input parameter.
x0FF0000	General internal error.	—

4.3.2 TIO_IOLink_IN: Read process input signals with time stamps

Description

You can use the Time-based IO with the TIO_IOLink_IN instruction. TIO_IOLink_IN detects an event at the IO-Link Device and returns the process value including the associated time stamp.

The IO-Link Device must be equipped with the time stamp function and the Port must be in "IO-Link, Time based IN" mode.

Startup characteristics

During startup of the CPU, the instruction TIO_IOLink_IN applies the input parameters once and checks the following:

- Checking HWID
- Checking whether the Port number is in the range (1 to 4)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for a positive value
- Checking the setting to type IO-Link
- Checking Port mode regarding configuration for IO-Link Time based IN
- Checking whether the OB is a "Synchronous Cycle" OB
- Checking PortQualifier

If startup takes place without errors, the instruction changes to normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction detects the process data (SA_Data) of an IO-Link Device and the associated time stamp (time = TIO_Time) of the last valid change. Each valid change of the SA_Data with a correctly functioning port is accompanied by a valid time stamp.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_IOLink_IN instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN
Port*	Input	USInt	0	Port number (1 to 4) of the connected IO-Link Device
TIO_SYNC_ Data*	Input	"TIO_SYNC_ Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
SA_Bit0	Output	Bool	False	Display of a process data change (bit 0 of SA_Data). SA_Bit0 is event-oriented. As long as no valid time stamp has been acquired (EventCount = 0), the process data are invalid.
SA_Bit1	Output	Bool	False	Display of a process data change (bit 1 of SA_Data). SA_Bit1 is event-oriented. As long as no valid time stamp has been acquired (EventCount = 0), the process data are invalid.
SA_Data	Output	DWord	16#0	Process data SA_Data (Sensor Application Data)
TimeStamp	Output	LTime	LT#0ns	Time stamp: Time when a change of the process signal SA-Data took place at the IO-Link Device.
EventCount	Output	UInt	0	Counter: Is incremented with each new, valid time stamp. The counter is reset with each CPU startup.
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The system function is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number at the Port input parameter is outside the valid range of 1 to 4.	Correct the value at the Port input parameter.
10020000	The TIO_IOLink_IN instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
10060000	Unable to find IO-Link Device. Possible cause: The module configured using the hardware identifier is not an IO-Link Master for Time-based IO.	• Make sure that the configured module is an IO-Link Master for Time-based IO. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of 0 < T_{APP} <= 16 ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	The converted time stamp is invalid.	Check the connected sensor and the interaction between IO-Link Master and sensor (e.g., configuration).
000D0000	The value status PortQualifier of the IO-Link indicates that the process data is invalid.	Check the connected sensor and its configuration.
100E0000	The configured port mode of the IO-Link is incorrect.	Check the configuration of the connected sensor with S7-PCT.
x0FF0000	General internal error.	—

4.3.3 TIO_DI: Reading in edges at digital input and associated time stamps

Description

You can use the Time-based IO with the TIO_DI instruction. TIO_DI continuously detects the edges at a digital input of a TM Timer DIDQ and returns the associated time stamps.

Startup characteristics

During startup of the CPU, the instruction TIO_DI applies the input parameters once and checks the following:

- Checking HWID
- Checking to see if the number of the digital input (Channel) is in the permitted range (depending on addressed module and channel configuration)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for validity (0 ms to 4 ms)
- Checking whether the OB is a "Synchronous Cycle" OB

If startup takes place without errors, the instruction changes to normal operation. The input parameter EdgeSel can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction detects the edges at a digital input and the associated time stamps (time = TIO_Time) of the last valid, defined edge pair. Use the input parameter EdgeSel to determine the edges for which time stamps are detected.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_DI instruction.

Parameter	Declaration	Data type	Default	Description
		S7-1500		
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN
Channel*	Input	UInt	0	Number (0 ... m) of the digital input of the connected TM Timer DIDQ
TIO_SYNC_Data*	Input	"TIO_SYNC_Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
EdgeSel	Input	UInt	3	Specify the edges for which time stamps are detected: 0_D: Reserved 1_D: Only at positive edges 2_D: Only at negative edges 3_D: Positive and negative edges (order depending on occurrence) 4_D: First positive, then negative edge 5_D: First negative, then positive edge 6 bis 255_D: Reserved
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
DI	Output	Bool	False	Status of digital input. If an inversion of the digital input is configured, this parameter is inverted as well.
TimeStampRE	Output	LTime	LT#0ns	Time stamp: Time at which a positive edge was detected. Exception: EdgeSel = 2_D: Time at which a negative edge was detected.
TimeStampFE	Output	LTime	LT#0ns	Time stamp: Time at which a negative edge was detected. Exception: EdgeSel = 1_D: Time at which a positive edge was detected.
EventCountRE	Output	UInt	0	Counter: Is incremented with each new, valid time stamp at a positive edge. The counter is reset with each CPU startup.
EventCountFE	Output	UInt	0	Counter: Is incremented with each new, valid time stamp at a negative edge. The counter is reset with each CPU startup.
LEC	Output	UInt	0	Counter: Number of edges for which no time stamp could be saved. The module can count a maximum of seven edges per application cycle. The counter is reset with each new application cycle.

Parameter	Declaration	Data type S7-1500	Default	Description
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The system function is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number of the digital input at the Channel input parameter is outside the permitted range (depending on addressed module and channel configuration).	Correct the value at the Channel input parameter.
10020000	The TIO_DI instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
10060000	Unable to find TM Timer DIDQ. Possible cause: The module configured using the hardware identifier is not a TM Timer DIDQ.	• Make sure that the configured module is a TM Timer DIDQ. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of 0 < T_{APP} <= 16 ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.

Error code (DW#16#...)	Meaning	Remedy
000C0000	The converted time stamp is invalid. Possible cause: Communication error	Check the PROFINET communication with the TIO module.
000D0000	The Quality Information of the digital input indicates that an error has occurred at the digital input.	Check the wiring of the digital input.
000E0000	The assigned number at the Channel input parameter is not a digital input configured as Timer DI.	• Check the channel configuration (only for TM Timer DIDQ 16x24V). • Check the operating mode of the digital input.
000F0000	The assigned value at the EdgeSel input parameter is outside the valid range of 1 to 5.	Correct the value at the EdgeSel input parameter.
10100000	The send clock is outside the permitted range of 0 < SendClock <= 4 ms and is therefore invalid. The error code can also indicate that • The data in TIO_SYNC_Data is invalid or does not exist. • The TIO_DI instruction is not called in an isochronous OB.	Correct the send clock.
x0FF0000	General internal error.	—

4.3.4 TIO_IOLink_OUT: Output time-controlled process output signals

Description

You can use Time-based IO with the TIO_IOLink_OUT instruction. TIO_IOLink_OUT lets you activate the output data of an IO-Link Device at a specified time.

The IO-Link Device must be equipped with the time stamp function and the Port must be in "IO-Link, Time based OUT" mode.

Startup characteristics

During startup of the CPU, the instruction TIO_IOLink_OUT applies the input parameters once and checks the following:

- Checking HWID
- Checking whether the Port number is in the range (1 to 4)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for a positive value
- Checking the setting to type IO-Link
- Checking Port mode regarding configuration for IO-Link Time based OUT
- Checking whether the OB is a "Synchronous Cycle" OB
- Checking PortQualifier

If startup takes place without errors, the instruction changes to normal operation. The input parameters REQ , Out_Mode, TimeStamp and AA_Data can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction sends the process data (AA_Data) to an IO-Link Device. The output data AA_Data are activated at the time defined at the input parameter TimeStamp.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

You start an output job with a positive edge at the "REQ" parameter. You can only start a new job when there is no error pending and no job is active. When starting the output job, the AA_Data (bit 0, 1) are activated on the IO-Link Device at a time defined by TimeStamp. The job is done when the last application cycle is executed before the output time is reached (Done). Status and Error are constantly being updated during the job runtime.

Note

Once the job has been started with a positive edge, you can adapt the output time with the input of a new TimeStamp without having to restart the job.

Constraint:

If the adapted time stamp is less than 16 ms before the output time (TimeStamp - TIO_Time < 16), the last valid time stamp is used.

If you specify the value 0 as TimeStamp, the output is written directly with the data specified at the input AA_Data. This gives you the option to implement a direct control from the TIO module without time stamp in manual mode. You can use the direct control to interrupt an ongoing job.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_IOLink_OUT instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
REQ	Input	Bool	False	Starts the job at a positive edge.
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN.
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
Port*	Input	USInt	0	Port number (1 to 4) of the specified IO-Link Device
TIO_SYNC_ Data*	Input	"TIO_SYNC_ Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
TimeStamp	Input	LTime	LT#0ns	Time stamp: Time when the process data (AAE1, AAE2) are to be output.
AA_Data	Input	Word	16#0	Process output data: Date to be output (Word). Includes AAE1 and AAE2 on bit 0, 1.
Busy	Output	Bool	False	Busy = True: The job is not complete yet.
Done	Output	Bool	False	Done = True is displayed for one cycle: The job is signaled as "done, no errors".
Error	Output	Bool	False	If True, this output indicates that an error has occurred. In this case, BUSY and DONE are set to False. For detailed information see Status parameter. Error is reset as soon as the error is remedied.
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number at the Port input parameter is outside the valid range of 1 to 4.	Correct the value at the Port input parameter.
10020000	The TIO_IOLink_OUT instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
10060000	Unable to find IO-Link Device. Possible cause: The module configured using the hardware identifier is not an IO-Link Master for Time-based IO.	• Make sure that the configured module is an IO-Link Master for Time-based IO. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of 0 < T_{APP} <= 16 ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	The time stamp at the TimeStamp input parameter is invalid.	Check the TimeStamp input parameter.
000D0000	The value status PortQualifier of the IO-Link indicates that the process data is invalid.	Check the connected sensor and its configuration.
100E0000	The configured port mode of the IO-Link is incorrect.	Check the configuration of the connected sensor with S7-PCT.
100F0000	The read cycle time of the "Synchronous Cycle" OB is too long. T_{APP} > 16 ms.	Configure a smaller multiple of the send clock as the cycle time.
x0FF0000	General internal error.	—

4.3.5 TIO_DQ: Output edges time-controlled at the digital output

Description

You can use Time-based IO with the TIO_DQ instruction. TIO_DQ switches the digital output of a TM Timer DIDQ at a specified time.

Startup characteristics

During startup of the CPU, the instruction TIO_DQ applies the input parameters once and checks the following:

- Checking HWID
- Checking to see if the number of the digital input (Channel) is in the permitted range (depending on addressed module and channel configuration)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for validity (0 ms to 4 ms)
- Checking whether the OB is a "Synchronous Cycle" OB

If startup takes place without errors, the instruction changes to normal operation. The input parameters REQ , Out_Mode, TimeStampRE and TimeStampFE can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

The instruction outputs edges time-controlled at a digital output during normal operation.

- At the time defined at the TimeStampRE input parameter, a positive edge is output at the digital output.
- At the time defined at the TimeStampFE input parameter, a negative edge is output at the digital output.

Use the input parameter Out_Mode to determine if only one edge or both edges are output.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

You start an output job with a positive edge at the "REQ" parameter. You can only start a new job when there is no error pending and no job is active. When the output job is started, the digital output is switched at the times defined with TimeStampRE and TimeStampFE.

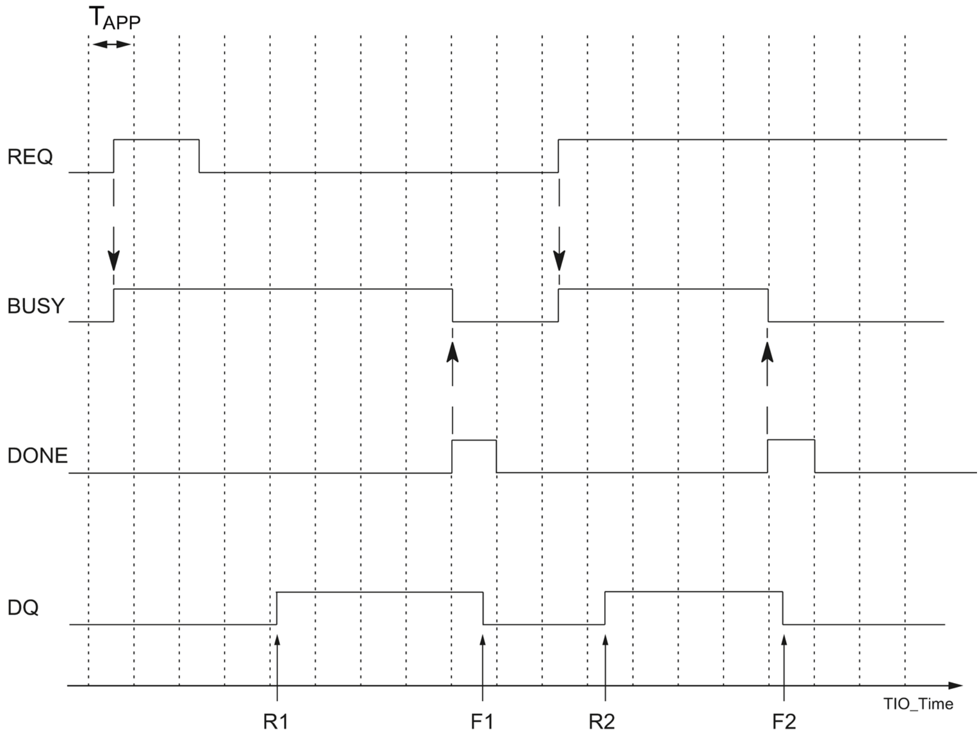
- If the digital output is already set at time TimeStampRE, the output job is not transferred to the module for the positive edge.
- If the digital output is not set at time TimeStampFE, the output job is not transferred to the module for the negative edge.

This means the digital output is not switched in both cases.

The job is done when the last application cycle is executed before the second output time is reached (DONE). Status and Error are constantly being updated during the job runtime.

The figure below shows an example for the reaction of the bits DONE and BUSY at the start of an output job under the following conditions:

- Out_Mode = 2
- The two time stamps are not adapted between the start of the job and the output.



T_{APP}	Application cycle
R1, R2	Specified times of a positive DQ edge
F1, F2	Specified times of a negative DQ edge

Note

Once the job has been started with a positive edge, you can adapt the output times with the input of TimeStampRE and TimeStampFE without having to restart the job.

Constraint:

If an adapted time stamp is less than two application cycles away from the output time (TimeStampRE - TIO_Time < 2*T_{APP} or TimeStampFE - TIO_Time < 2*T_{APP}), the last valid time stamp is used.

If you specify the value "0" as TimeStampRE or TimeStampFE, you can output the respective edge directly at the digital output with the input parameter Out_Mode = 3. This gives you the option to implement a direct control from the TIO module without time stamp in manual mode. You can use the direct control to interrupt an ongoing job.

Changes to the input parameters are not applied until the TIO_DQ instruction detects a startup of the CPU.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_DQ instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
REQ	Input	Bool	False	Starts the job at a positive edge.
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN.
Channel*	Input	UInt	0	Number (0 ... m) of the digital output of the connected TM Timer DIDQ
TIO_SYNC_Data*	Input	"TIO_SYNC_Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
Out_Mode	Input	UInt	2	Specify the output mode for the edges at the digital output: 0_D: Output only positive edge (TimeStampRE). 1_D: Output only negative edge (TimeStampFE). 2_D: Both edges are output (TimeStampRE and TimeStampFE). 3_D: Each edge is output directly when TimeStampRE = 0 or TimeStampFE = 0. If both time stamps have the value "0" or if no time stamp has the value "0", no edge is output. 4 bis 255_D: Reserved
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
TimeStampRE	Input	LTime	LT#0ns	Time stamp: Time when a positive edge is to be output.
TimeStampFE	Input	LTime	LT#0ns	Time stamp: Time when a negative edge is to be output.
StatusDQ	Output	Bool	False	Actual status of the digital output. If an inversion of the digital output is configured, StatusDQ is inverted as well.
BUSY	Output	Bool	False	BUSY = True: The job is not complete yet.
DONE	Output	Bool	False	DONE = True is displayed for one cycle: The job is signaled as "done, no errors".
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. In this case, BUSY and DONE are set to False. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number of the digital output at the Channel input parameter is outside the permitted range (depending on addressed module and channel configuration).	Correct the value at the Channel input parameter.
10020000	The TIO_DQ instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_DQ is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10060000	Unable to find TM Timer DIDQ. Possible cause: The module configured using the hardware identifier is not a TM Timer DIDQ.	• Make sure that the configured module is a TM Timer DIDQ. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0080000	TIO module is not synchronized using the TIO_SYNC instruction. The error code can also indicate that: • A job was already present before the first run of the instruction. • The assigned number at the Channel input parameter is not a digital output.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is LT#0ms or has as negative value and is therefore invalid. Correct the value. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_DQ is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	One or both time stamps at the TimeStampRE and TimeStampFE input parameters are invalid. The error is only signaled for the duration of one application cycle.	Check the TimeStampRE and TimeStampFE input parameters.
000D0000	The Quality Information of the digital output indicates that an error has occurred at the digital output.	• Check the parameter assignment of the digital output. • Check the wiring of the digital output for short-circuit, overload, and overtemperature.
000E0000	The assigned number at the Channel input parameter is not a digital output.	• Check the channel configuration (only for TM Timer DIDQ 16x24V). • Check the operating mode of the digital output.
100F0000	The read cycle time of the "Synchronous Cycle" OB is too long. T_{APP} > 16 ms.	Configure a smaller multiple of the send clock as the cycle time.
10100000	The send clock is outside the permitted range of 0 < SEND_CLOCK <= 4 ms and is therefore invalid. The error code can also indicate that • The data in TIO_SYNC_Data is invalid or does not exist. • The TIO_DQ instruction is not called in an isochronous OB.	Correct the send clock.

Error code (DW#16#...)	Meaning	Remedy
00110000	The assigned value at the Out_Mode input parameter is outside the valid range of 0 to 3.	Correct the value at the Out_Mode input parameter.
x0FF0000	General internal error.	—

4.3.6 UDT "TIO_SYNC_Data"

Description

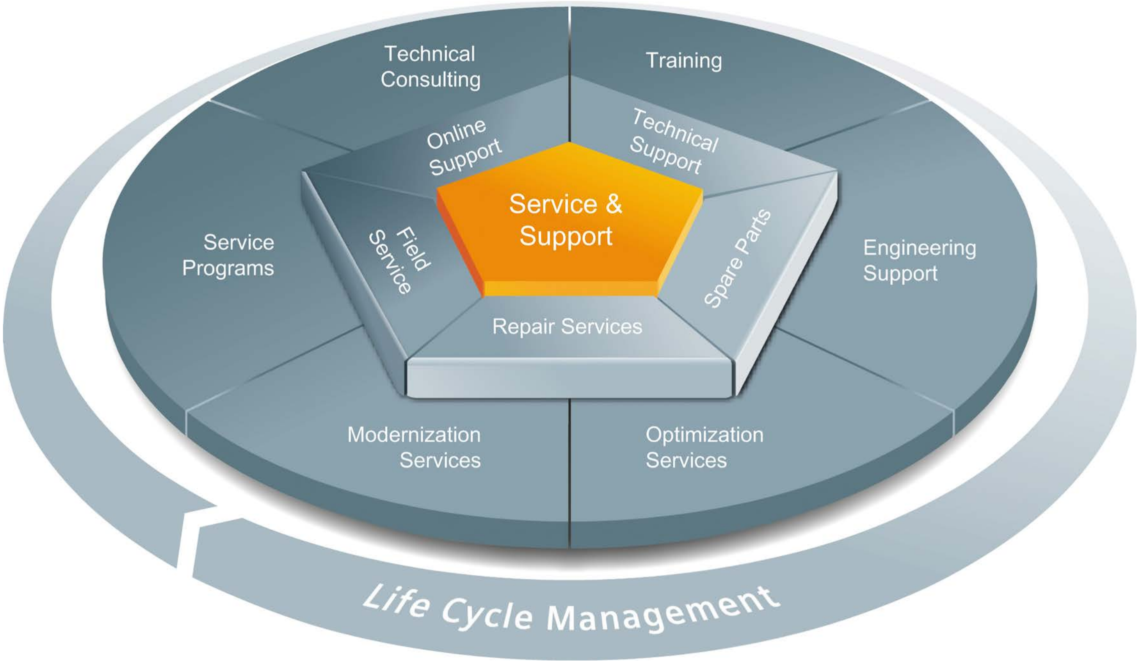
The data type UDT "TIO_SYNC_Data" contains the central structure and data for synchronization of the modules and passing of the TIO_Time.

Parameter

Parameter	Data type S7-1500	Description
TIO_TIME_BASE	LTime	Internal use
TIO_TIME	LTime	Shared time basis (relative time) of the TIO modules.
PIP_MODE	USInt	Mode for data update (is forwarded by the PIP_Mode input parameter of the TIO_SYNC instruction)
APP_CYC	LTime	Application cycle of the "Synchronous Cycle" OB
SEND_CLOCK	LTime	Send clock of sync domain (is forwarded by the SendClock input parameter of the TIO_SYNC instruction)
TBase	LTime	Internal use
ERROR	Bool	Internal use

Service & Support 5

5.1 Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Important notes

Purpose of this documentation

The information in this documentation enables you to configure (Page 43) and program (Page 111) SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance (Page 361) of a SIMATIC Safety F-system.

Note

The Programming and Operating Manual "SIMATIC Safety - Configuring and Programming" in its latest version (possibly including product information for the manual) is the relevant source of all information on functional safety regarding configuring and programming. This also applies in the event of discrepancies between this manual and other documentation on functional safety regarding configuring and programming

You must heed all warnings in the Programming and Operating manual "SIMATIC Safety - Configuring and Programming".

Basic knowledge requirements

General basic knowledge of automation engineering is needed to understand this documentation. Basic knowledge of the following is also necessary:

- Fail-safe automation systems
- Automation systems S7-300/400/1200/1500/1500 Software Controller/WinAC RTX F
- Distributed I/O systems on PROFIBUS DP/PROFINET IO
- Totally Integrated Automation Portal, including:
  - Hardware configuration with the *hardware and network editor*
  - Programming in the LAD and FBD programming languages using the *program editor*.
  - Communication between CPUs

Scope of this documentation

This documentation is valid for the optional packages *STEP 7 Safety Advanced V15.1* and *STEP 7 Safety Basic V15.1.*

The optional packages *STEP 7 Safety Advanced V15.1* and *STEP 7 Safety Basic V15.1* are used for configuration and programming of the fail-safe SIMATIC Safety system.

In this context, integration of the fail-safe I/O listed below in SIMATIC Safety is also addressed:

- S7-1500/ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200eco fail-safe I/O modules
- ET 200eco PN fail-safe I/O modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules
- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- Fail-safe GSD based DP slaves
- Fail-safe GSD based I/O devices

Approvals

The SIMATIC Safety F-system is certified for use in safety mode up to:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Incorporation in the information landscape

Depending on your application, you will need the following supplementary documentation when working with *STEP 7 Safety*.

This documentation includes references to the supplementary documentation where appropriate.

Documentation	Brief description of relevant content
For the SIMATIC Safety F-system	Depending on which F-CPU you are using, you will need the following documentation: • For the F-CPUs S7-1200/1500, a Product Information (http://support.automation.siemens.com/WW/view/en/109478599) describes all deviations from the respective standard CPUs. • Each F-CPU S7-300/400 that can be used has its own product information. The product information describes the deviations from the respective standard CPUs. • The Device manuals (http://support.automation.siemens.com/WW/view/en/67295862/133300) describe the S7-1500 CPUs. • The "S7-300, CPU 31xC and CPU 31x: Installation" (http://support.automation.siemens.com/WW/view/en/13008499) operating instructions describe the installation and wiring of S7-300 systems. • The "CPU 31xC and CPU 31x, Technical Data" (http://support.automation.siemens.com/WW/view/en/12996906) device manual describes the CPUs 315-2 DP and PN/DP, the CPU 317-2 DP and PN/DP, and the CPU 319-3 PN/DP. • The "S7-400 Automation System, Installation (http://support.automation.siemens.com/WW/view/en/1117849) installation manual describes the installation and wiring of S7-400 systems. • The "S7-400 Automation System, CPU Data" (http://support.automation.siemens.com/WW/view/en/23904550) reference manual describes the CPUs 414-3 PN/DP, the CPU 416-2, and the CPU 416-3 PN/DP. • The "ET 200S Interface Module IM 151-7 CPU" (http://support.automation.siemens.com/WW/view/en/12714722) manual describes the IM 151-7 CPU. • The "ET 200S, Interface Module IM 151-8 PN/DP CPU" (http://support.automation.siemens.com/WW/view/en/47409312) manual describes the IM 151-8 PN/DP CPU. • The "ET 200S, Interface Module IM 154-8 CPU" (http://support.automation.siemens.com/WW/view/de/24363739/0/en) manual describes the IM 154-8 CPU. • The Manual "Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176)" describes the WinAC RTX 2010 and the WinAC RTX F 2010. • The "S7-1500 Software Controller CPU 1505SP, CPU 1507S (http://support.automation.siemens.com/WW/view/en/109249299)" manual describes the SIMATIC S7-1500 Software Controller 1505SP and CPU 1507S.
"S7-1200 Functional Safety manual (http://support.automation.siemens.com/WW/view/en/104547552)" system manual	Describes the F-CPUs S7-1200 and the fail-safe modules S7-1200 (including installation, wiring, and technical specifications)

Documentation	Brief description of relevant content
"S7-1500/ET200MP system manual (http://support.automation.siemens.com/WW/view/en/59191792)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/14141/man) for the corresponding S7-1500/ET 200MP fail-safe modules	Describes the hardware of the S7-1500 systems and the S7-1500/ET 200MP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/14059/man) for the corresponding ET 200SP fail-safe modules	Describes the hardware of the ET 200SP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200eco Distributed I/O Station Fail-safe I/O Block (http://support.automation.siemens.com/WW/view/en/19033850)" manual	Describes the hardware of the ET 200eco fail-safe I/O module (including installation, wiring, and technical specifications)
Manual "ET 200eco PN F-DI 8 x 24 VDC, 4xM12 / F-DQ 3 x 24 VDC/2.0A PM, 3xM12 (https://support.industry.siemens.com/cs/ww/en/)"	Describes the hardware of the ET 200eco PN fail-safe I/O module (including installation, wiring, and technical specifications)
"Distributed I/O System ET 200S, Fail-Safe Modules (http://support.automation.siemens.com/WW/view/en/27235629)" operating instructions	Describes the hardware of the ET 200S fail-safe modules (including installation, wiring, and technical specifications)
"S7-300 Automation System, ET 200M Distributed I/O System, Fail-safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151)" manual	Describes the hardware of the S7-300 fail-safe signal modules (including installation, wiring, and technical specifications)
"Distributed I/O system ET 200pro, fail-safe I/O modules (http://support.automation.siemens.com/WW/view/en/22098524)" operating instructions	Describes the hardware of the ET 200pro fail-safe modules (including installation, wiring, and technical specifications)
"ET 200iSP distributed I/O device - Fail-safe modules (http://support.automation.siemens.com/WW/view/en/47357221)" operating instructions	Describes the hardware of the ET 200iSP fail-safe modules (including installation, wiring, and technical specifications)
Help on *STEP 7*	• Describes the operation of the standard tools in *STEP 7* • Contains information regarding configuration and parameter assignment of hardware • Contains a description of the FBD and LAD programming languages

The complete *SIMATIC S7* documentation is available on DVD. You can find more information on the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/manual-collection/Pages/Default.aspx).

Guide

This documentation describes how to work with the optional packages *STEP 7 Safety.* It includes instructions and reference sections (description of the instructions for the safety program).

The following topics are addressed:

- Configuration of SIMATIC Safety
- Access protection for SIMATIC Safety
- Programming of the safety program (safety-related user program)
- Safety-related communication
- Instructions for the safety program
- Support for the system acceptance
- Operation and maintenance of SIMATIC Safety
- Monitoring and response times

Conventions

In this documentation, the terms "safety engineering" and "fail-safe engineering" are used synonymously. The same applies to the terms "fail-safe" and "F-".

When *"STEP 7 Safety Advanced V15.1", "STEP 7 Safety Basic V15.1"* appears in italics, it refers to the optional package for the "SIMATIC Safety" F-system.

"STEP 7 Safety V15.1" stands for the optional package *"STEP 7 Safety Advanced V15.1"* and the optional package *"STEP 7 Safety Basic V15"*.

"(S7-300)" indicates that the section **only** applies to S7-300 F-CPUs. S7-300 F-CPUs also includes the F-CPUs ET 200S and ET 200pro (IM F-CPUs).

"(S7-400)" indicates that the section **only** applies to S7-400 as well as WinAC RTX F.

"(S7-1200)" indicates that the section **only** applies to S7-1200 F-CPUs.

"(S7-1500)" indicates that the section **only** applies to S7-1500 F-CPUs. S7-1500 F-CPUs also includes ET 200SP F-CPUs, the CPU 1516pro F-2 PN and the S7-1500 F Software Controller.

The scopes can be combined.

The term "Safety program" refers to the fail-safe portion of the user program and is used instead of "fail-safe user program," "F-program," etc. For purposes of contrast, the non-safety-related part of the user program is referred to as the "standard user program".

All fail-safe modules and instructions are highlighted in yellow to distinguish them from the modules and instructions of the standard user programs on the software interface (e.g., in the project tree). Similarly, the fail-safe parameters of F-CPUs and F-I/O are highlighted in yellow in the hardware configuration.

Each warning is marked with a unique number at the end of the text. This enables you to easily reference other documents, for example, to obtain an overview of the safety requirements for the system.

Additional support

If you have further questions about the use of products presented in this manual, contact your local Siemens representative.

You can find information on whom to contact on the Web (http://www.siemens.com/automation/partner).

A guide to the technical documentation for the various SIMATIC products and systems is available on the Web (http://www.siemens.com/simatic-tech-doku-portal).

You can find the online catalog and online ordering system on the Web (www.siemens.com/industrymall).

Training center

We offer courses to help you get started with the S7 automation system. Contact your regional training center or the central training center in Nuremberg (90327), Federal Republic of Germany.

You can find more information on the Internet (http://www.sitrain.com).

Technical Support

To contact Technical Support for all Industry Automation products, use the Support Request Web form (http://www.siemens.com/automation/support-request).

You can find additional information about our Technical Support on the Web (http://www.siemens.com/automation/service).

Important note for maintaining the operational safety of your system

Note

The operators of systems with safety-related characteristics must adhere to operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

Product Overview

1

1.1 Overview

SIMATIC Safety fail-safe system

The SIMATIC Safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency STOP devices for machining and processing equipment) and in the process industry (for example, for implementation of protection functions for safety devices of instrumentation and controls and of burners).

WARNING
The SIMATIC Safety F-system is used to control processes and to force the system into a safe state after shutdown. SIMATIC Safety can only be used for controlling processes in which an immediate shutdown does not pose a danger to persons or the environment. When realizing safety applications including the creation of the safety-relevant project data you have to take into consideration the standards, directives and guidelines relevant for your application. In particular include standards in which the software creation process is described (for example IEC 61508-3 or ISO 13849-1). *(S062)*

Achievable safety requirements

SIMATIC Safety F-systems can satisfy the following safety requirements:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Principles of safety functions in SIMATIC Safety

Functional safety is implemented principally through safety functions in the software. Safety functions are executed by the SIMATIC Safety system in order to bring the system to a safe state or maintain it in a safe state in case of a dangerous event. Safety functions are contained mainly in the following components:

- In the safety-related user program (safety program) in the F-CPU
- In the fail-safe inputs and outputs (F-I/O)

The F-I/O ensure the safe processing of field information (sensors: e.g. emergency STOP pushbutton, light barriers; actuators, e.g. for motor control). They have all of the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level. The user only has to program the user safety function. The safety function for the process can be provided through a user safety function or a fault reaction function. In the event of an error, if the F-system can no longer execute its actual user safety function, it executes the fault reaction function; for example, the associated outputs are shut down, and the F-CPU switches to STOP mode, if necessary.

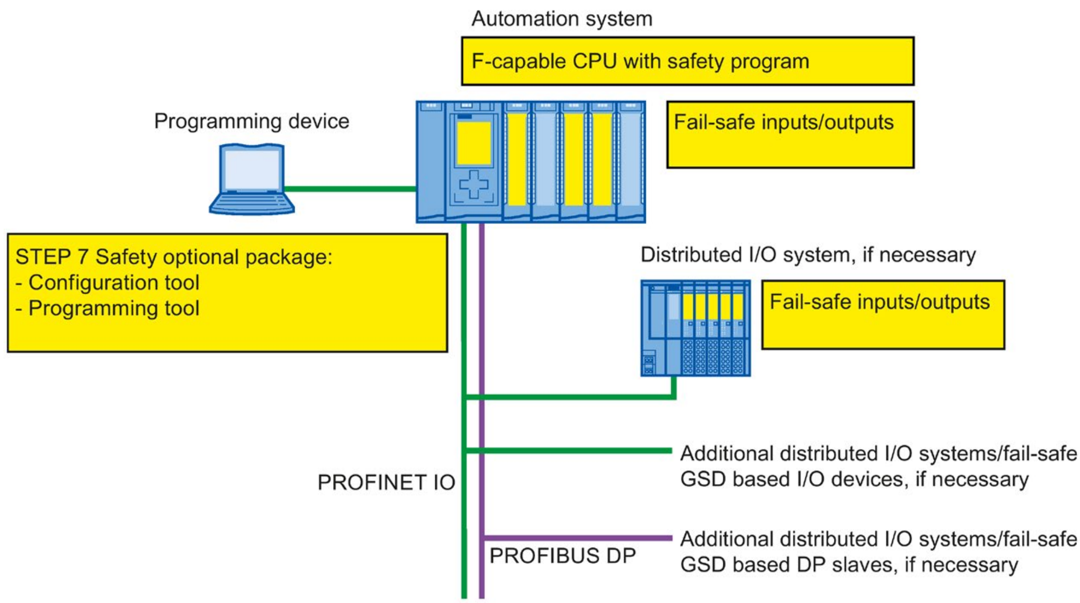
Example of user safety function and fault reaction function

In the event of overpressure, the F-system will open a valve (user safety function). In the event of a hazardous fault in the F-CPU, all outputs are deactivated (fault reaction function), whereby the valve is opened, and the other actuators also attain a safe state. For a non-faulty F-system, only the valve would be opened.

1.2 Hardware and Software Components

Hardware and software components of SIMATIC Safety

The following figure provides an overview of the hardware and software components required to configure and operate a SIMATIC Safety F-system.



Hardware components for PROFIBUS DP

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFIBUS DP:

- F-CPUs with DP interface, such as CPU 1516F-3 PN/DP
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe I/O modules ET 200eco (S7-300, S7-400)
  - Fail-safe GSD based DP slaves (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFIBUS DP for connection to distributed F-I/O:

- CP 443-5 Extended
- CM 1243-5
- CM 1542-5
- CP 1542-5
- SP CM DP

Hardware components for PROFINET IO

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFINET IO:

- F-CPUs with PN interface, e.g., CPU 1214FC DC/DC/DC
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200eco PN fail-safe I/O modules
  - Fail-safe GSD based I/O devices (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFINET IO for connection to distributed F-I/O:

- CP 443-1
- CP 443-1 Advanced-IT
- CM 1542-1
- CP 1545-1

Hardware components for central configuration

You can use the following fail-safe components in SIMATIC Safety F-systems centrally on an F-CPU:

- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- S7-1500 fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules (can also be used with CPU 1516proF-2)

You have the option to expand the configuration with standard I/O.

Required software components

You require the following software components:

- *SIMATIC STEP 7 Basic V15.1* with the *STEP 7 Safety Basic V15.1* optional package

  or

- *SIMATIC STEP 7 Professional V15.1* with the *STEP 7 Safety Basic V15.1* optional package

  or

- *SIMATIC STEP 7 Professional V15.1* with the *STEP 7 Safety Advanced V15.1* optional package

STEP 7 Safety optional packages

This documentation describes the optional packages *STEP 7 Safety Advanced V15.1* and *STEP 7 Safety Basic V15.1*. The *STEP 7 Safety* optional packages are the configuration and programming software for the SIMATIC Safety F-system. With *STEP 7 Safety*, you receive the following:

- Support for configuring the F-I/O in the *hardware and network editor* of the TIA Portal
- Support for creating the safety program using LAD and FBD and integrating error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your safety program in LAD and FBD with special safety functions

Moreover, *STEP 7 Safety* offers functions for comparing safety programs and for assisting you with the system acceptance.

> **WARNING**
>
> The configuration of F-CPUs and F-I/Os as well as the programming of F-blocks must be carried out in the TIA Portal as described in this documentation. You must observe all aspects described in the section System acceptance (Page 361) to ensure secure operation with the system SIMATIC SAFETY. Any other procedures are not permitted. *(S056)*

Additional optional packages

In addition to the *STEP 7 Safety* optional packages, you can use additional optional packages with F-I/O and F-CPUs and use instructions for programming your safety program with special safety functions within the SIMATIC Safety F-system. For example, SINUMERIK or Failsafe HMI Mobile Panels.

The installation, parameter assignment and programming as well as what is important to note during system acceptance, is described in the documentation for the specific optional packages.

Please also read the notes in Configurations supported by the SIMATIC Safety F-system (Page 66).

TIA Portal Cloud Connector

> **WARNING**
>
> Use of the TIA Portal Cloud Connector is only intended for engineering work with the TIA Portal. This means online access in productive operation (e.g. SCADA) is not permitted. This is particularly true for safety programs. *(S068)*

Openness

Openness as part of STEP 7 Safety is supported with the functions listed below. Requirement for this is that no password is created for the safety-related project data to prevent the use of Openness in productive operation.

As part of STEP 7 Safety the following is supported:

- Inserting / removing F-CPUs and F-I/Os
- Copying / deleting F-CPUs and F-I/Os from templates
- Compiling software (incl. safety program)
- Reading / configuring fail-safe parameters of the F-CPU
- Reading / configuring fail-safe parameters of F-I/O devices
- Reading / configuring fail-safe modules of ET 200SP
- Reading, declaring or deleting fail-safe variables in the PLC variable table
- Updating projects to the latest type versions of F-blocks
- Consistent station upload
- Export and import of F-blocks and F-compliant PLC data types (UDT)
- Comparison of hardware and software

The following are not supported.

- Downloading to device
- Compiling hardware

Note

If access protection is set up for the safety program, actions that require access authorization cannot be executed.

> **WARNING**
>
> When using Openness while handling safety-related project data their integrity must be ensured (for example in the context of saving or transferring of applications for "Source Code Management"). In case of a connection of external tools, observe the requirements for offline support tools according to IEC 61508-3. A violation of the integrity of the safety-related project data can not be determined during the import with STEP 7 Safety. A final verification of the correctness of the safety-related project data has to be carried out as described in the section System acceptance (Page 361). *(S070)*

Virtual environments

> **WARNING**
>
> **Use of virtual environments in the engineering system**
>
> Note that a HYPERVISOR or a client software of a HYPERVISOR is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior in the network with accessible systems.
>
> Make sure that this condition is met, for example, when using the following functions:
>
> - Reset of captured statuses (snapshots) of the virtual machines (VMs)
> - Suspending and resuming the virtual machines
> - Replay of recorded sequences in the virtual machines
> - Moving VMs between hosts in productive operation (e.g. Fault Tolerance (FT))
> - Digital twins of VMs in the virtual environment
>
> If in doubt, disable these functions in the settings (HYPERVISOR administration console). *(S067)*

Safety program

You can create a safety program using the *program editor*. You can program fail-safe FBs and FCs in the FBD or LAD programming languages using the instructions from the optional package and create fail-safe DBs.

Safety checks are automatically performed and additional fail-safe blocks for error detection and fault reaction are inserted when the safety program is compiled. This ensures that failures and errors are detected and appropriate reactions are triggered to maintain the F-system in the safe state or bring it to a safe state.

In addition to the safety program, a standard user program can be run on the F-CPU. A standard program can coexist with a safety program in an F-CPU because the safety-related data of the safety program are protected from being affected unintentionally by data of the standard user program.

Data can be exchanged between the safety program and the standard user program in the F-CPU by means of bit memory or data of a standard DB or by accessing the process image input and output.

Data Transfer from the Safety Program to the Standard User Program (Page 196)

1.3 Installing/uninstalling STEP 7 Safety Basic V15.1 optional package

Software requirements for *STEP 7 Safety Basic V15.1*

At a minimum, one of the following software packages must be installed on the programming device or PC:

- *SIMATIC STEP 7 Basic V15.1*
- *SIMATIC STEP 7 Professional V15.1*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Basic V15.1*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Basic V15.1"* or *"SIMATIC STEP 7 Professional V15.1*" software package has been installed, and make sure that *SIMATIC STEP 7 Basic V15.1* or *SIMATIC STEP 7 Professional V15.1* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Basic V15.1* is completely integrated into the information system of *SIMATIC STEP 7 Basic V15.1* or *SIMATIC STEP 7 Professional V15.1*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Advanced V15.1*

To uninstall *STEP 7 Safety Basic V15.1*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Basic V15.1* optional package, you can still open projects with F-CPUs whose F-capability is enabled but you can no longer edit the safety program. F-I/O is no longer supported.

1.4 Installing/uninstalling STEP 7 Safety Advanced V15.1 optional package

Software requirements for *STEP 7 Safety Advanced V15.1*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Professional V15 .1*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Advanced V15.1*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Professional V15.1"* software package has been installed, and make sure that *SIMATIC STEP 7 Professional V15.1* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Advanced V15.1* is completely integrated into the information system of *SIMATIC STEP 7 Professional V15.1*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Advanced V15.1*

To uninstall *STEP 7 Safety Advanced V15.1*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Advanced V15.1* optional package, you can still open projects with F-CPUs whose F-capability is enabled but you can no longer edit the safety program. F-I/O is no longer supported.

1.5 Installing/uninstalling STEP 7 Safety PowerPack

After the installation of the *STEP 7 Safety PowerPack* the functional scope of *STEP 7 Safety Advanced V15.1* is available to you.

Software requirements for *STEP 7 Safety PowerPack*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Safety Basic V15.1*
- *SIMATIC STEP 7 Professional V15.1*

Installing *STEP 7 Safety PowerPack*

1. Start the *Automation License Manager* on the programming device/PC on which the *"SIMATIC STEP 7 Professional V15.1"* software package is installed.
2. Install the license included in the *STEP 7 Safety PowerPack* as described in the *Automation License Manager help*.

Uninstalling *STEP 7 Safety PowerPack*

To uninstall the license included in the *STEP 7 Safety PowerPack*, proceed as described in the *Automation License Manager help*.

1.6 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced

Introduction

In *STEP 7 Safety Advanced*, you can continue to use projects with safety programs that you created with *S7 Distributed Safety V5.4 SP5*.

Requirement

STEP 7 Safety Advanced, *S7 Distributed Safety V5.4 SP5*, and the *F-Configuration Pack* used to create the project must all be installed on the computer you are using for migration. The *F-Configuration Pack V5.4 SP5* to *V5.5 SP13* is supported.

To that end, the projects must have been compiled in *S7 Distributed Safety V5.4 SP5* and with the *F-Configuration Pack*.

Prior to migration

Delete all F-blocks not required by the safety program in your *S7 Distributed Safety V5.4 SP5* project prior to migration.

Procedure as in *STEP 7 Professional*

Proceed just as you would for standard projects to migrate projects from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced*. Once the migration is complete, you should verify using the collective F-signature whether the project was migrated unchanged.

Note

If you use the safety program to migrate F-blocks with know-how protection, remove the know-how protection prior to migration.

You can assign the F-blocks know-how protection again once the migration is completed.

This migration approach is described in the "Migration" section of the *STEP 7 Professional* Help. Special considerations about *STEP 7 Safety Advanced* are described below.

Note

We recommend that you enable the "Include hardware configuration" option in the "Migrating project" window.

Older hardware versions

Older versions of F-hardware may not be supported by *STEP 7 Safety Advanced* .

If you have used and configured versions of F-CPUs and F-I/O in S7 Distributed Safety projects that are not approved for *STEP 7 Safety Advanced*, you will need to upgrade this hardware to the new version in *S7 Distributed Safety V5.4 SP5* and the corresponding *F-Configuration Pack*. Once the upgrade is completed, migration to *STEP 7 Safety Advanced* is feasible. A Product Information with a list of approved hardware is available on the Internet (https://support.industry.siemens.com/cs/ww/de/view/109481784):

Particularities for safety-related CPU-CPU communication via S7 connections

You can find information about the special considerations for migrated projects with safety-related CPU-CPU communication via S7 connections in Safety-related communication via S7 connections (Page 248). Please also note Communication with S7 Distributed Safety via S7 connections (Page 258).

Particularities for ESTOP1 or FDBACK instructions

Information on the special considerations when using the ESTOP1 and FDBACK instructions can be found in the "Instruction versions" section in ESTOP1: Emergency STOP/OFF up to stop category 1 (STEP 7 Safety V15.1) (Page 430) and FDBACK: Feedback monitoring (STEP 7 Safety V15.1) (Page 475).

Post-migration procedures

Once migration is complete, you have a complete project with a safety program which has retained the program structure of *S7 Distributed Safety* and the collective F-signature. F-blocks from the S7 Distributed Safety F-library (V1) are converted into instructions that are provided by *STEP 7 Safety Advanced*.

The migrated project therefore does not need to be re-accepted; it can be loaded as is to the F-CPU as long as it has not been modified or compiled since migration.

Note

Safety summary

You cannot create a safety summary in *STEP 7 Safety Advanced* for a migrated project. The printout of the project created with *S7 Distributed Safety V5.4 SP5* and the corresponding acceptance documents are still valid, because the collective F-signature has been retained.

Compiling of the migrated hardware configuration

If you receive an error message after migration and subsequent compilation of the hardware configuration stating that the F-source address does not match the "Central F-source address" parameter of the F-CPU, change the "Central F-source address" parameter.
The F-source addresses of all F-I/Os assigned to the F-CPU are reassigned in the process.

If after migration of an SM 326; DI 24 x DC 24V (6ES7 326-1BK01-0AB0 and 6ES7 326-1BK02-0AB0) and subsequent compilation of the hardware configuration, the error message "F_IParam_ID_1: Value outside the permitted range" is displayed, delete the F-SM and reinsert it.

In both cases, subsequent compilation of the safety program is required.

Compiling the migrated safety programs

As a result of compilation of the migrated project with *STEP 7 Safety Advanced*, the existing program structure (with F-CALL) is converted to the new program structure of *STEP 7 Safety Advanced* (with main safety block). This changes the F-collective signature and the safety program has to be validated or acceptance may have to be carried out again.

(S7-300, S7-400) You must call up the main safety block according to the F-CALL from an arbitrary block of the standard user program. We recommend a call from an OB 3x.

Note

During the first-time compiling of the migrated safety program the call of the F-CALL is replaced automatically by a call of the main safety block, if the calling block of the F-CALL was created using the programming language LAD, FBD or STL.

Note

Changing the Safety system version

Before compiling with *STEP 7 Safety Advanced* for the first time, you must change the safety system version to a version which is not equal to 1.0 in the "Settings" area of the *Safety Administration Editor*. We recommend that you use the highest available version.

Note

Using the latest version of instructions

If you want to expand the migrated safety program, we recommend that you update to the latest version of the instructions used before compiling with *STEP 7 Safety Advanced* for the first time. Read the information on instruction versions for each instruction.

Note

Note that compiling the migrated safety program extends the runtime of the F-runtime group(s) and increases the memory requirements of the safety program (see also Excel file for calculating response time (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

See also

Application example "Migration of a safety program to TIA Portal" (https://support.industry.siemens.com/cs/ww/en/view/109475826)

1.7 Migšrating PLC programs to a n F-CPU S7-1500

To migrate an F-CPU S7-300/400 onto an F-CPU S7-1500, proceed as with the migration of a standard CPU S7-300/400 onto a CPU S7-1500.

Points to note after migration:

- Non-automatable actions
  - Creating an F-runtime group and assigning it to the main safety block.
  - The hardware configuration including the I/O of the initial F-CPU is not automatically transferred to an S7-1500 F-CPU. Implement the hardware configuration of the new CPU manually after migration.

    Please also read the sections "Specify F-destination address for F-I/O of PROFIsafe address type 1" and "Specify F-destination address for F-I/O of PROFIsafe address type 2“ in chapter "Configuring an F-CPU (Page 48)“. Otherwise, this can lead to a reassignment of the F-destination addresses in the configuration.
  - When using F-I/Os with PROFIsafe Protocol Version = Expanded Protocol (XP) (for example S7-1500/ET 200MP F-modules) keep in mind that you need one byte more in the address area of S7-1200/1500 F-CPUs than in S7-300/400 F-CPUs.
  - Replacement of the OV instruction by the connection of the ENO output for Math functions (Page 520).
  - Replacement of the RD_FDB instruction by the instructions RD_ARRAY_I (Page 539) and RD_ARRAY_DI (Page 542).
  - Replacement of the F-runtime group communication through Communication via Flexible F-Link (Page 145).
- Instructions not supported:
  - MUTING
  - TWO_HAND
  - WR_FDB
  - OPN
  - SENDS7
  - RCVS7
- Data types not supported
  - DWORD
- Changes to safety program programming
  - F_GLOBDB.VKE0/1 replaced by FALSE/TRUE (Page 119).
  - Readable values from the F_GLOBDB replaced by the F-runtime group information DB. Additional information is available under F-shared DB (S7-300, S7-400) (Page 148) and F-runtime group information DB (S7-1200, S7-1500) (Page 148).
  - Replacement of the QBAD_I_xx or QBAD_O_xx tag by the value status. Additional information is available under Value status (S7-1200, S7-1500) (Page 159) and F-I/O DB (Page 165).

- New naming convention when naming the F-I/O DBs
- Modified behavior of QBAD and PASS_OUT (Page 171) tags for F-I/O with "RIOforFA safety" profile.

Compile the safety program and eliminate any compilation errors displayed.

Note

A new acceptance must be carried out following F-CPU migration.

1.8 Upgrading projects to STEP 7 Safety V15.1

1.8.1 Upgrading projects from STEP 7 Safety V15 to V15.1

If you want to continue to work with a project from *STEP 7 Safety V15*, you must first upgrade the project to *STEP 7 Safety V15.1*.

Perform the upgrade following the usual procedure for *STEP 7*. After upgrading to V15.1, you have to compile your safety program.

1.8.2 Upgrading projects from STEP 7 Safety V14 SP1 to V15.1

If you want to continue to work with a project from *STEP 7 Safety V14 SP1*, you must first upgrade the project to *STEP 7 Safety V15.1*.

Perform the upgrade following the usual procedure for *STEP 7*. After upgrading to V15.1, you have to compile your safety program.

1.8.3 Upgrading projects from STEP 7 Safety V13 SP1 to V15.1

If you want to continue to work with a project from *STEP 7 Safety V13 SP1*, you must first upgrade the project to *STEP 7 Safety V15.1*.

Perform the upgrade following the usual procedure for *STEP 7*. After upgrading to V15.1, you have to compile your safety program.

(S7-300/400): After compilation, the safety program is consistent and the collective F-signature of the upgraded safety program corresponds to the collective F-signature of the safety program from V13 SP1. Acceptance of changes is not required

(S7-1200/1500): After compiling, your safety program is consistent and the collective F-signature of the upgraded safety program has changed for system reasons. The new collective F-signature of the safety program with *STEP 7 Safety V15.1* replaces the former collective F-signature of the safety program with *STEP 7 Safety V13 SP1*.

You can find an overview of all system-related changes under "Common data/Protocols/F-Convert Log+CPU name+time stamp". One of the system-related changes is that *STEP 7 Safety V15.1* automatically replaces versions of instructions no longer supported with new, functionally identical versions. The overview contains a comparison of the previous signatures with *STEP 7 Safety V13 SP1* to the new signatures with *STEP 7 Safety V15.1* and displays the automatically changed instruction versions. Print out the overview and store this printout with your acceptance documents or your machine documentation. Change acceptance is not required, since the "Collective F-signature with *STEP 7 Safety V13 SP1*" contained in the overview matches the collective F-signature in your current acceptance documents.

Keep in mind that existing change histories are not upgraded. All previous entries are deleted after the upgrade. If necessary, print out the change log before you upgrade.

Special features for user acknowledgment and reintegration of F-I/O after F-I/O or channel faults and PASS_ON = 1 (S7-1200, S7-1500)

The following applies to F-I/Os:

- S7-300 fail-safe signal modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules

Keep in mind the changed behavior for user acknowledgment and reintegration when configuring "Behavior after channel fault" = "Passivation of the channel" and tag ACK_NEC (F-I/O DB) = 1. The behavior was adapted to the behavior when configuring "Behavior after channel fault" = "Passivate the entire module":

As of *STEP 7 Safety V14* or higher, user acknowledgment of a corrected F-I/O or channel fault is **possible** even when the tag PASS_ON (F-I/O DB) = 1. A reintegration (provision of process values) takes place **as soon as the tag PASS_ON = 0**.

Until *STEP 7 Safety V13 SP1*, user acknowledgment of a corrected F-I/O or channel fault was **not possible** as long as the tag PASS_ON (F-I/O DB) = 1. A user acknowledgment was only possible once the tag PASS_ON = 0. The reintegration (provision of process values) took place immediately after the user acknowledgment.

Special features when using instruction profiles

If you want to use an instruction profile in your project from *STEP 7 Safety V13 SP1*, delete the instruction profile before you upgrade to *STEP 7 Safety V15.1.* Before deleting, make a note of your settings. After upgrading create a new instruction profile, if required, and enter the noted settings there, if applicable. Please note that some instruction versions are no longer supported under *STEP 7 Safety V15.1*. You will find additional information about the supported instruction versions in the description of the respective instruction.

1.8.4 Upgrading projects from STEP 7 Safety prior to V13 SP1

If you want to upgrade from a project **prior to** *STEP 7 Safety V13 SP1* to *STEP 7 Safety V15.1*, you must upgrade the project as in Standard to *STEP 7 Safety V13 SP1* via an intermediate step.

The safety program signature does not change after upgrading the safety program to *STEP 7 Safety V13 SP1*. Acceptance of changes is therefore not required.

Perform the upgrade following the usual procedure for *STEP 7 Professional*.

When upgrading a project that was created with *STEP 7 Safety Advanced V11* . please note the following information:

Note

Adjustments are required before you can continue working on a project upgraded from *STEP 7 Safety Advanced V11*:

There was a product warning for *STEP 7 Safety Advanced V11* regarding setting the parameters "Discrepancy behavior" and "Reintegration after discrepancy error" for the fail-safe digital input and output modules 4F-DI/3F-DO DC24V/2A (6ES7138-4FC01-0AB0, 6ES7138-4FC00-0AB0). These parameters could be displayed incorrectly in certain combinations.

Based on the handling instructions in this product warning, you used a conversion table to set the affected parameters so that they were displayed incorrectly in the safety summary and hardware configuration in order for them to have the correct effect in the F-module. You also corrected the safety summary by hand to document the actual behavior of F-modules.

To reverse these changes, follow these steps:

1. Compile the upgraded project with *STEP 7 Safety Advanced V13 SP1*. An error message is displayed for each F-module in *STEP 7 Safety Advanced V11* the parameters of which you have corrected: "The CRC (F_Par_CRC) of the module (xxx) does not match the calculated value (yyy)."
2. Adapt the parameter assignment of each F-module for which this error message is displayed to match your handwritten corrections in the safety summary.
3. Do this for each F-CPU and then compile the safety program.
4. If the collective F-signature following compiling corresponds to the collective F-signature on the safety summary, you have made all the necessary corrections.

Use of CPs

F-I/Os operated downstream from a CP443-5 Extended, CP443-1 or CP 443-1 Advanced-IT were not automatically assigned a unique F-destination address.

As soon as you compile the hardware in a project with such F-I/Os in *STEP 7 Safety V13 SP1*, you are notified for the affected F-I/Os. You have to assign new, unique F-destination addresses for the reported F-I/Os. Additional information is available under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 68), PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 70) and Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 77).

This changes the collective F-signature of the safety program. Because the F-SW collective signature is unchanged, it is documented that the safety program has remained unchanged. The changed F-HW collective signature indicates that the safety-related hardware configuration has changed. You can now verify that solely the changed F-destination addresses have caused this change:

- The F-parameter signature (without address) for each changed F-I/O remains the same.
- Only the affected F-I/O DBs are listed in the comparison editor of the safety program with the filter set to "Compare only F-blocks relevant for certification".

Changed names of F-I/O DBs

Prior to *STEP 7 Safety V13 SP1* it was possible to change the name of an F-I/O DB. This change results in a changed collective F-signature during upgrading.

If a changed collective F-signature is unwanted during upgrading, follow these steps:

1. Under *STEP 7 Safety V13*, rename the changed names of the F-I/O DBs back to the original names.
2. Compile the safety program.

   The collective F-signature does not change as a result.
3. Print a comparison printout (Page 339).

   Use the comparison printout to ensure that you have only changed the names of the F-F-I/O DBs.
4. Upgrading the safety program to *STEP 7 Safety V13 SP1*. After upgrading, the safety program has the F-collective signature from step 2.

1.9 First steps

Getting Started in SIMATIC Safety

Three Getting Started documents are available to help you begin using SIMATIC Safety.

The Getting Started documentation is an instruction manual that provides a step-by-step description of how to create a project with SIMATIC Safety. It gives you the opportunity to quickly become familiar with the scope of features of SIMATIC Safety.

Contents

The Getting Started documentation describes the creation of a single, continuous project that is extended with each section. Based on the configuration, you program a fail-safe shutdown, make changes to the programming, and accept the system.

In addition to the step-by-step instructions, the Getting Started documentation also gives you background information for every new topic, which explains the functions used in more detail and how they interrelate.

Target audience

The Getting Started documentation is intended for beginners but is also suitable for users who are switching from *S7 Distributed Safety*.

Download

Three Getting Started documents are available as PDF files for free download in the Industry Online Support:

- STEP 7 Safety Advanced V11 with S7-300/400 F-CPUs (http://support.automation.siemens.com/WW/view/en/49972838)
- STEP 7 Safety Basic V13 SP1 with S7-1200 F-CPUs (http://support.automation.siemens.com/WW/view/en/34612486/133300) (part of the manual "S7-1200 Functional Safety manual")
- STEP 7 Safety Advanced V13 with S7-1500 F-CPUs (http://support.automation.siemens.com/WW/view/en/101177693)

Configuring 2

2.1 Overview of Configuration

Introduction

You basically configure a SIMATIC Safety F-system in the same way as a standard S7-300, S7-400, S7-1200, S7-1500 or ET 200MP, ET 200SP, ET 200S, ET 200iSP, ET 200eco, ET 200eco PN or ET 200pro automation system in *STEP 7.*

This section presents only the essential differences compared to standard configuration you encounter when configuring a SIMATIC Safety F-system.

This documentation distinguishes between two groups of F-I/O:

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, S7-1500/ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

Which F-components can you configure with the *STEP 7 Safety* optional package?

The table below shows you which F-CPUs you can configure with *STEP 7 Safety Basic* and which with *STEP 7 Safety Advanced*:

F-CPUs	*STEP 7 Safety Basic*	*STEP 7 Safety Advanced*
S7-300	—	x
S7-400	—	x
S7-1200	x	x
S7-1500	—	x
WinAC RTX F	—	x
S7-1500 F Software Controller	—	x

The table below shows you which F-I/Os you can configure with *STEP 7 Safety Basic* and which with *STEP 7 Safety Advanced* as well as which PROFIsafe address type they support:

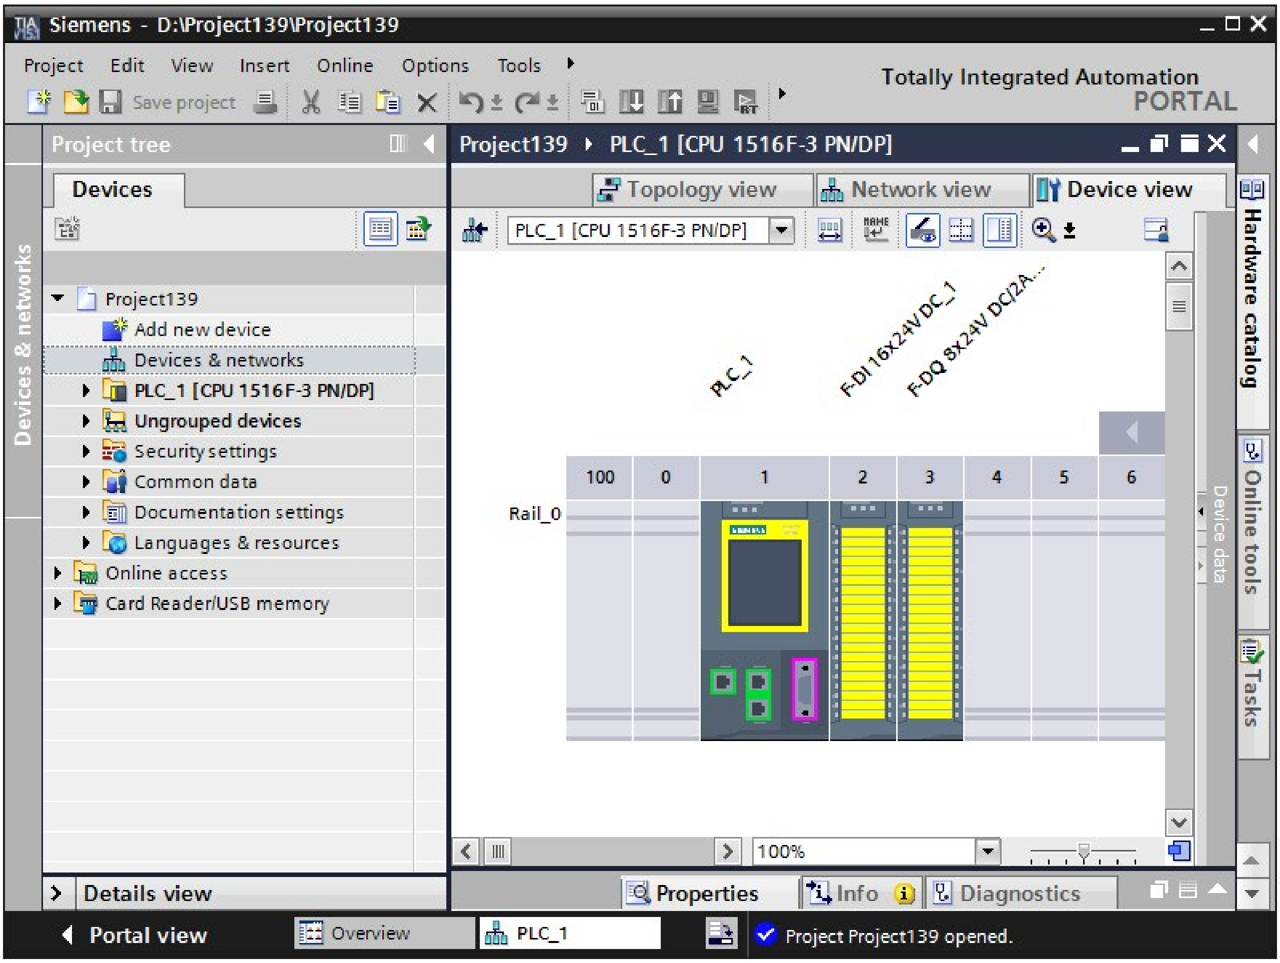
F-I/O	*STEP 7 Safety Basic*	*STEP 7 Safety Advanced*	*PROFIsafe address type*
S7-300 F-SMs	x**	x**	1
ET 200S F-modules	x	x	1
ET 200pro F-modules	x	x	1
ET 200iSP F-modules	x	x	1
ET 200eco DP F-I/Os	—	With S7-300/400 F-CPUs (only PROFIsafe V1 mode)	1
ET 200eco PN F-I/Os	x	x	2
S7-1200 F-modules (centrally on S7-1200 F-CPUs)	x	x	2
ET 200SP F-modules	x	x	2
S7-1500/ET 200MP F-modules	x	x	2
fail-safe GSD based DP slaves	x	x	*
fail-safe GSD based I/O devices	x	x	*

* Consult the respective documentation to determine the PROFIsafe address type of a GSD based DP slave/GSD based I/O device. If in doubt, assume that the PROFIsafe address is type 1.

*** F-SMs that only support PROFIsafe V1 mode can only be used on F-CPUs S7-300/400.

Example: Configured F-system in *STEP 7 Professional*

The following figure presents a configured F-system. You choose the fail-safe components in the "Hardware catalog" task card as you would do with standard components and place them in the work area of the network or device view. F-components are shown in yellow.



Additional information

For detailed information on F-I/O, refer to the *manuals for the relevant F-I/O*.

Which safety-related communication options can you configure?

You need to use the *hardware and network editor* to configure the following safety-related communication options (see Configuring and programming communication (S7-300, S7-400) (Page 201) or Configuring and programming communication (S7-1200, S7-1500) (Page 270)):

- Communication with Flexible F-Link (Page 262)
- Safety-related master-master communication
- Safety-related master-master communication for *S7 Distributed Safety*
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related I-slave-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for *S7 Distributed Safety*
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication
- Safety-related communication via S7 connections
- Safety-related communication via S7 connections for *S7 Distributed Safety* or *S7 F Systems*

2.2 Particularities for configuring the F-System

Configuring is the same as for standard components

You configure a SIMATIC Safety F-system in the same way as a standard S7 system. This means that you configure and assign parameters for the hardware in the *hardware and network editor* as a centralized system (F-CPU and F-IO if required e.g. CPU 1516F-3 PN/DP and F-modules S7-1500/ET 200MP) and/or as a distributed system (F-CPU, F-SMs in ET 200M, F-modules ET 200MP, F-modules ET 200SP, ET 200S, ET 200pro, ET 200iSP, ET 200eco, ET 200eco PN, fail-safe GSD based DP slaves and fail-safe fail-safe GSD based I/O devices).

Special F-parameters

For the F-functionality there are special F-parameters that you can review and set in the "Properties" of the fail-safe components (F-CPU and F-I/O). F-parameters are marked in yellow.

F-parameters are explained in "Configuring an F-CPU (Page 48)" and "Configuring F-I/O (Page 53)".

Compiling the hardware configuration

You must compile the hardware configuration of the SIMATIC Safety F-system (shortcut menu "Compile > Hardware configuration"). A configured F-CPU with enabled F-capability is the only prerequisite for programming the safety program.

Note

Inconsistencies are possible when configuring the hardware and can also be saved. A full consistency check of the hardware configuration and possible connection data is performed only during compilation. Therefore, perform "Edit > Compile" regularly.

Changing safety-related parameters

Note

If you change a safety-related parameter (marked in yellow) for an F-I/O or an F-CPU, you must then compile the modified hardware configuration and the Compiling the safety program (Page 311) (shortcut menu "Compile > Hardware and software (only changes)") and download. This also applies for changes to the F-I/O which are not used in the safety program. F-I/O in standard operation is not affected by this.

2.3 Configuring an F-CPU

Introduction

You configure the F-CPU basically in the same way as a standard automation system.

F-CPUs are always configurable in *STEP 7*, regardless of whether or not the *STEP 7 Safety* optional package is installed. Without an installed optional package, however, the F-CPU can only be used as a standard CPU.

If the *STEP 7 Safety* optional package is installed, you can enable or disable the F-capability for the F-CPU.

If you want to use the F-I/O in safety mode or in safety-related communication, the F-capability of the F-CPU must be enabled.

F-capability is enabled by default after the *STEP 7 Safety* optional package is installed.

Enabling/disabling F-capability

If you want to modify the F-capability setting, proceed as follows:

1. Select the F-CPU in the device or network view, and select the "Properties" tab in the inspector window.
2. Select "Fail-safe" in the area navigation.
3. Use the appropriate button to enable/disable the F-capability.
4. If you want to disable F-capability, confirm the "Disable F-activation" dialog with "Yes".

Disabling F-capability for an existing safety program

If you want to disable the F-capability for an F-CPU because you intend to use the F-CPU as a standard CPU although a safety program is installed, you must note the following:

- You need the password for the safety program, if assigned.
- The Safety Administration Editor (Page 81) is deleted from the project tree.
- The F-OBs are deleted. (S7-1200, S7-1500)
- All F-blocks are deleted.
- From now on you cannot use F-I/O in safety mode with this F-CPU.

Configuring the F-parameters of the F-CPU

In the "Properties" tab of the F-CPU, you can change or apply the default settings for the following parameters:

- The F-destination address range
  - Low limit for F-destination addresses
  - High limit for F-destination addresses
- The default F-monitoring time for central or distributed F-I/O at the F-CPU

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

Specify F-destination address for F-I/O of PROFIsafe address type 1

With the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" you specify a range for this F-CPU in which the F-destination address of newly inserted F-I/Os of PROFIsafe address type 1 (Page 68) is assigned automatically. An F-destination address that is not within the F-destination address range yet, is also reassigned when you reassign a DP slave/IO device with the F-CPU or switch on the F-activation of the F-CPU or change the logical address of this F-module.

The F-destination address is assigned in ascending order starting at the "Low limit for F-destination addresses". When no free F-destination address is available in the F-destination address range, the next available free F-destination address outside the F-destination address range is assigned and a warning is output during compilation.

The maximum possible F-destination address for ET 200S, ET 200eco, ET 200pro, ET 200iSP F-modules and S7-300 F-SMs is 1022.

The F-destination addresses for F-I/O of PROFIsafe address type 1 must be unique network-wide and CPU-wide.

By selecting different F-destination address ranges for different F-CPUs, you can define different ranges for the automatic assignment of the F-destination address. This is useful when you are operating multiple F-CPUs in one network. Subsequent manual address changes are possible. (see also Recommendation for PROFIsafe address assignment (Page 65))

Example:

You have configured the F-destination address range as follows:

- Low limit for F-destination addresses = 100
- High limit for F-destination addresses = 199

When inserting the first F-I/O of PROFIsafe address type 1, the F-destination address 100 is assigned. When inserting an additional F-I/O of PROFIsafe address type 1, the F-destination address 101 is assigned.

Note

The parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" have no effect on the following F-I/Os:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 bit (article number 6ES7336-1HE00-0AB0)

Specify F-destination address for F-I/O of PROFIsafe address type 2

The F-destination address of F-I/O of PROFIsafe address type 2 (Page 70) is assigned automatically for each F-CPU in descending order starting with 65534. The low limit is the value configured with the parameter "Low limit for F-destination addresses" (for F-I/O of PROFIsafe address type 1) + 1.

When the value configured with the "High limit for F-destination addresses" parameter is reached, a warning is output during compilation. (See also Recommendation for PROFIsafe address assignment (Page 65))

Specify F-source address for F-I/O of PROFIsafe address type 2

You specify the F-source address for F-I/O of PROFIsafe address type 2 (Page 70) assigned to this F-CPU with the "Central F-source address" parameter. The F-source address must be unique throughout the network. (see also Recommendation for PROFIsafe address assignment (Page 65))

Note

A change to the "Central F-source address" parameter results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required because the F-source addresses of all F-I/Os of address type 2 are changed centrally by this step.

"Default F-monitoring time" parameter

Configure the "Default F-monitoring time" for monitoring the communication between the F-CPU and F-I/O.

You can adjust the F-monitoring time via the following parameters:

- "Default F-monitoring time for central F-I/O"
- "Default F-monitoring time for F-I/O of this interface"

The **default F-monitoring time for the central F-I/O** acts on the F-I/O that is arranged centrally, i.e. near the F-CPU. You set this parameter in the properties of the F-CPU (select F-CPU, then select "Properties > Fail-safe > F-parameters").

The **default F-monitoring time for the F-I/O of this interface** acts on the F-I/O that is assigned to this interface of the F-CPU (PROFIBUS or PROFINET). You change this parameter in the properties of the relevant interface (selection of the interface in the "Device view" tab, then "F-parameters").

The various settings available allow you to flexibly adapt the F-monitoring time to the conditions of your F-system, for example to take account of different bus cycles.

You can also change the F-monitoring time individually for each F-I/O in the F-I/O properties (see Configuring F-I/O (Page 53) or Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 77)).

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

⚠ WARNING
It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 607).

Automatic generation of the safety program

The safety program of an F-CPU consists of one or two F-runtime groups that contain the F-blocks (see also Defining F-Runtime Groups (Page 132)). When the F-CPU (with activated F-capability) is inserted into the work area of the device view or network view, a safety program with an F-runtime group is generated automatically.

You can define in *STEP 7 Safety* that no F-runtime group is generated while inserting the F-CPU (with activated F-capability).

Proceed as follows:

1. Select the "Options > Settings" menu command.
2. Select the "STEP 7 Safety" area.
3. If it is not already disabled, disable automatic generation of an F-runtime group by deselecting the "Generate default fail-safe program" option.

This change has no influence on any existing safety programs; it only defines whether an F-runtime group is automatically generated for each one of the subsequently inserted F-CPUs.

Configuring the protection level of the F-CPU

WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. For this purpose, configure at least the protection level "Full access (no protection)" and assign a password under "Full access incl. fail-safe (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".

Assign different passwords for the individual protection levels. *(S041)*

You configure the protection level following the same procedure as for standard CPUs.

For information on the password for the F-CPU, refer to Access protection (Page 101). Pay special attention to the warnings in Access protection for the F-CPU (Page 106).

2.4 Configuring F-I/O

Introduction

You configure the S7-1500/ET 200MP, ET 200SP, ET 200S, ET 200eco (S7-300, S7-400), ET 200eco PN, ET 200pro and ET 200iSP F-modules, the S7-300 F-SMs and the S7-1200 F-modules as usual in *STEP 7*:

After you have inserted the F-I/O in the work area of the *device or network view*, you access the configuration dialogs by selecting the relevant F-I/O and the "Properties" tab.

Note

Changes to the parameter assignment result in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

The use of ET 200SP F-modules is possible with IM155-6PN ST as of Firmware V1.1, IM 155-6 PN HF and IM 155-6 DP HF.

The distributed use of S7-1500/ET 200MP F-modules is possible with IM 155-5 PN ST as of firmware V3.0, IM 155-5 PN HF as of firmware V2.0 and IM 155-5 DP ST as of firmware V3.0.

The central use of S7-1500/ET 200MP F-modules is possible with S7-1500 F-CPUs as of firmware V1.7, distributed use as of firmware V1.5.

(S7-1200) We recommend you limit the total number of F-I/Os that are used centrally or distributed in an S7-1200 F-CPU to 12. Depending on the volume of project data, the maximum number of F-I/Os can be smaller.

WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test.

Examples for such changes are:

- Adding F-I/O
- Changing the start address of F-I/O
- Changing the slot position of F-I/O
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Channel-granular passivation after channel faults

You can configure how the F-I/O will respond to channel faults, such as a short-circuit, overload, discrepancy error, or wire break, provided the F-I/O supports this parameter (e.g. for ET 200S or ET 200pro F-modules). You configure this response in the properties for the relevant F-I/O ("Behavior after channel fault" parameter). This parameter is used to specify whether the entire F-I/O or just the faulty channel(s) are passivated in the event of channel faults.

Note

(S7-300, S7-400) Note that channel-granular passivation increases the runtime of the F-runtime group(s) compared to passivation of the entire F-I/O (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

"Channel failure acknowledge" parameter (S7-1200, S7-1500)

In the case of F-I/Os that support the "Channel failure acknowledge" channel parameter (for example S7-1500/ET 200MP F-modules and S7-1200 F-modules), this replaces the ACK_NEC tag of the F-IO data block.

If an F-I/O fault is detected by the F-I/O, passivation of all channels of the relevant F-I/O occurs. If channel faults are detected, the relevant channels are passivated if "Passivate channel" is configured. If "Passivate the entire module" is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, reintegration of the relevant F-I/O occurs in line with the "Channel failure acknowledge" parameter.

- Automatically
- Manually
- Adjustable (when channel-granular passivation is configured.)

WARNING
The parameter assignment "Channel failure acknowledge = Automatic" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint.*(S045)*

Note

The default assignment for the "Channel failure acknowledge" parameter when the F-module is created is "Manually".

Organization block/Process image (S7-1200, S7-1500)

If you use F-I/O in standard mode, you can select the organization block/process image as you do for standard I/O.

If you use F-I/O in safety mode, no selection is possible. The process image is updated at the beginning or end of the F-OB (see section Program structure of the safety program (S7-1200, S7-1500) (Page 114)).

Contrary to F-I/O operated in non-isochronous mode, you need to selected a process image partition, such as PIP 1 for F-I/O that is operated in isochronous mode (see "Configuring isochronous mode (S7-1500) (Page 63)").

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB (Page 165) are assigned automatically when the F-I/O is configured. The name of the F-I/O DB by default contains the start address and the name of the F-I/O. You can disable adding the prefix of the start address. The naming scheme depends on the setting in Safety Administration Editor.

You can find information on the assignment of number ranges and disabling the prefix of the start address in *Safety Administration Editor*, "Settings" area (Page 90).

Change the number of the F-I/O DB:

Change the number in the properties of the F-I/O.

Change the name of the F-I/O DB:

The name of the F-I/O DB is derived by the system from the name of the F-I/O depending on the type of F-I/O.

- For F-I/O with an F-module with a single F-submodule, the module name is used.
- For F-I/O with multiple F-submodules, the submodule name is used.

You change the name of the F-I/O DB indirectly by changing the name of the F-I/O.

Customizing the F-monitoring time for F-I/O

You can customize the F-monitoring time in the properties of the F-I/O under "F-parameters". This may be necessary to prevent a timeout being triggered when no error occurs and the F-I/O requires a longer F-monitoring time or assignment with a default F-monitoring time is not possible. For this purpose, activate the corresponding check box and assign an F-monitoring time.

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 607).

Group diagnostics for fail-safe S7-300 signal modules

By disabling a channel of the fail-safe signal module in the module properties, you also disable the group diagnostics for this channel.

Exception for S7-300/400 F-CPUs:

For the following S7-300 fail-safe signal modules

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0) and
- SM 336; AI 6 x 13Bit (article number 6ES7336-1HE00-0AB0)

the "Group diagnostics" parameter enables and disables the monitoring of channel-specific diagnostic messages of F-SMs (such as wire break and short-circuit) to the F-CPU. You should disable group diagnostics for **unused** input or output channels.

WARNING

(S7-300, S7-400) For the following S7-300 fail-safe signal modules (F-SMs) with activated safety mode, "Group diagnostics" must be enabled for all connected channels:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

Check to verify that you have only disabled group diagnostics for these F-SMs for input and output channels that are actually unused. *(S003)*

Diagnostic interrupts can be enabled optionally.

Additional information

For detailed description of the **parameters**, refer to the help on the properties of the respective F-I/O and in the respective *manual for the F-I/O*.

2.5 Configuration control (option handling) for F-I/Os

For configuration control (option handling) with F-I/Os proceed as with the standard I/O devices. Detailed information can be obtained by searching for "Configuration control (option handling)" in the help of *STEP 7*.

The following section describes what you have to observe additionally for F-I/Os.

Requirement

- The requirements that are specified under "Configuration control (option handling)" in the help of *STEP 7* are fulfilled.
- The requirements that are specified under "Configuration control (option handling)" in the help of *STEP 7* are fulfilled. Handle the F-I/O as standard I/O.
- V2.1. is set as a safety system version.
- The F-I/Os for which you use the configuration control (option handling) are located
  - Distributed at an F-CPU S7-300/400/1200/1500
  - Centrally at an F-CPU S7-1500
- The PROFIsafe address of the F-I/Os are set or assigned.

Note

The assignment of the PROFIsafe addresses (Page 72) is only possible if the maximum configuration actually exists.

Procedure

(F-CPU S7-1200/1500) Deactivate the F-I/Os not existing in the respective variant (option) by setting the DISABLE (Page 170) variable in the associated F-I/O DB (Page 165) to "1". This prevents the flashing of the error LED of the F-CPU and diagnostic entries of the safety program that reference these F-I/Os. With the DISABLED (Page 171) variable of the associated F-IO data block, you can evaluate whether an F-module is deactivated.

(F-CPU S7-300/400) In order to prevent the flashing of the error LEDs of the F-CPUs you do have to observe anything further. You cannot suppress diagnostics entries.

WARNING

If configuration control is used, your actual configuration deviates from the configured maximum configuration. You identify F-I/Os that do not exist in the current variant (station option) via control record as "not available".

If an F-I/O marked as "not available" is possibly nevertheless in the real structure, it has to be ensured that substitute values (0) are provided for these F-I/Os in the safety program or output at the outputs. This is achieved by setting the DISABLE variable (S7-1200/1500) or respectively PASS_ON variable (S7-300/400) in the associated F-I/O DB to "1". *(S077)*

2.5.1 Example

Introduction

The following example shows how you to

- Select/detect a station option
- Disable F-I/Os that are not present in a station option (S7-1200/1500)
- Provide your safety program for various station options

Safe selection/detection of the station option

You carry out a safe selection/detection of a station option with inputs of an F-I/O wired fixed to M/L+.

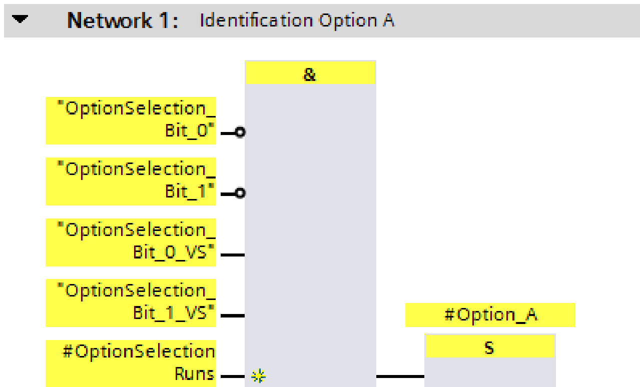
For example, you can select up to 4 station options with 2 inputs of an F-I/O.

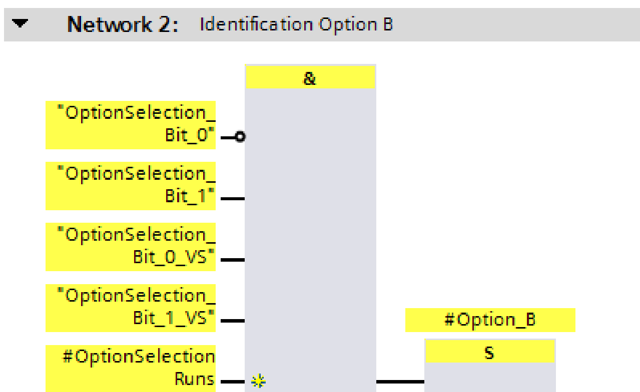
Option	OptionSelection_Bit_0	OptionSelection_Bit_1
Q	0	0
B	0	1
C	1	0
D	1	1

Note when detecting the station option that substitute values (0) are used for the inputs of the F-I/O in certain situations, e.g. during startup of the F-system or when F-I/O channel errors occur.

In these situations, the present station option cannot be detected. You should therefore also evaluate the value status of inputs and only apply the station option one-time after startup of the F-system.

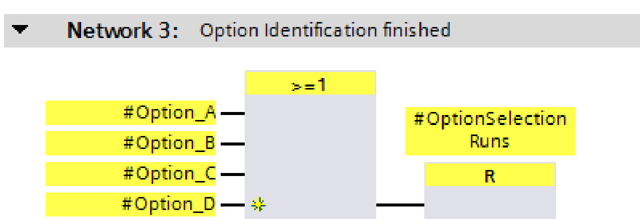
For one-time recognition of the station option, define a static local datum, for example, OptionSelectionRuns with default value "TRUE".





Correspondingly for options C and D.

As soon as a station option is detected, reset the static local datum for one-time detection of the station option:



Note

When you make the selection/detection of a station option only in the standard user program, only the "Station option" is available to you as a standard datum that is not secured.

Make sure that no dangerous states arise from this.

Read the section "Data exchange between standard user program and safety program (Page 195)".

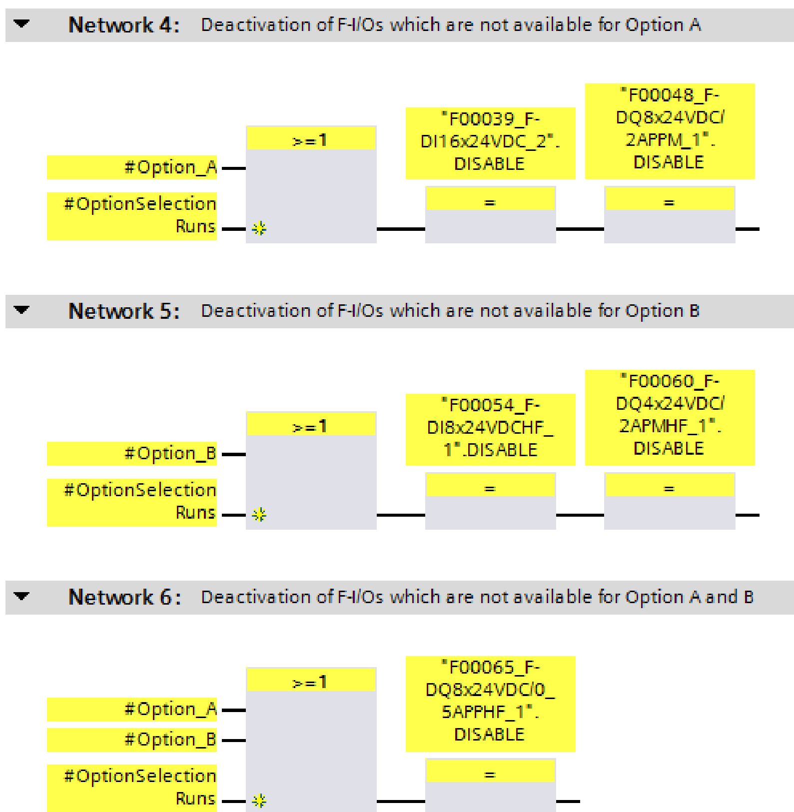
Disabling F-I/Os that are not present in a station option

If one or more F-I/Os are not present in a station option, you can prevent the blinking of the error LED of the F-CPU by disabling these F-I/Os.

In addition, diagnostic messages of the safety program that refer to these F-I/Os are suppressed.

Note

As long as the detection of the station option (during startup of the F-system) is not yet complete (OptionSelectionRuns = TRUE), you should disable all "optional" F-I/O devices.



Providing the safety program for various station options

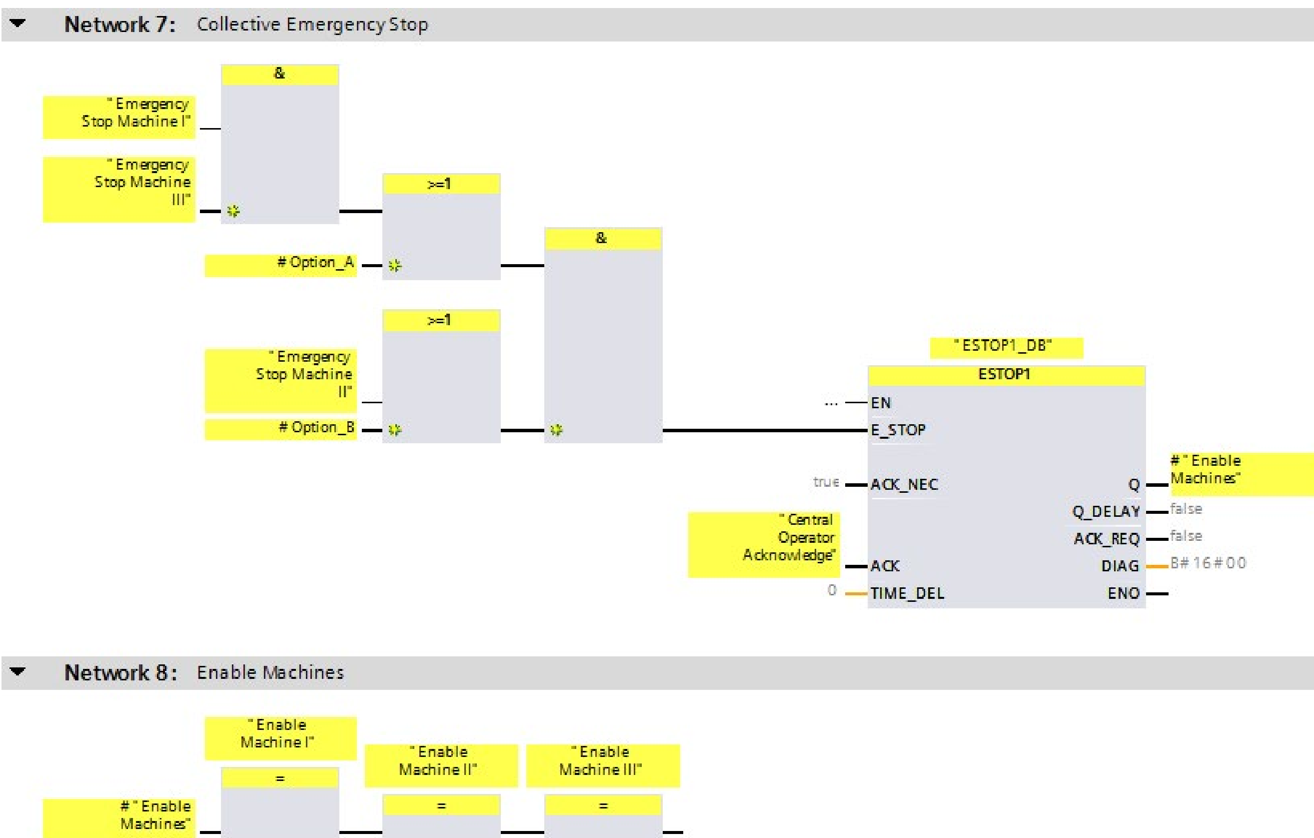
In the following example, the EMERGENCY STOP signals of different plant units or machines are combined into a collective EMERGENCY STOP signal.

Machines I and III and the corresponding F-I/O with the EMERGENCY STOP signal for machines I and III are not present with station option A.

Machine II and the corresponding F-I/O with the EMERGENCY STOP signal for machine II is not present with station option B.

The substitute values (0) are therefore used in the safety program for the EMERGENCY STOP signals from the respective unavailable machines.

In order to prevent the collective EMERGENCY STOP from being triggered because machines / EMERGENCY STOP signals are not present with certain station options, you can suppress the evaluation of the EMERGENCY STOP signal for unavailable machines by taking into account the present station option.



2.6 Configuring shared device

To configure shared devices follow the procedure as in the standard. The configuration is described in the *STEP 7* help under "Configuring shared devices".

F-destination addresses

Please also read the chapter "Recommendation for PROFIsafe address assignment (Page 65)" for assigning the F-destination address.

See also

Assign PROFIsafe address to an F-module (Page 75)

2.7 Configuring isochronous mode (S7-1500)

To configure isochronous mode for F-I/Os that support this mode, e.g. "Profisafe Telgr 902" submodule of the SINAMICS S120 CU310-2 PN V5.1 drive, proceed as in the standard. The configuration is described in the *STEP 7* help under "Configuring isochronous mode".

Note the following:

- Contrary to F-I/O operated in non-isochronous mode, you need to selected a process image partition, such as PIP 1 for F-I/O that is operated in isochronous mode.
  This process image partition must contain only F-I/O operated in isochronous mode and no standard I/O.
- The assigned isochronous mode interrupt OB must first be generated as F-OB by specifying a F-runtime group (see Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 137)). It is not possible to add an F-OB with event class "Synchronous Cycle" directly during the configuration of the isochronous mode.

Requirement

F-CPUs S7-1500 as of firmware version 2.0, with IRT support.

Connection of F-I/O operated in isochronous mode to the isochronous mode interrupt OB

You access F-I/O operated in isochronous mode in the same way as you do standard I/O operated in isochronous mode, via the select process image partition.

Contrary to standard I/O that is operated in isochronous mode, the process image partition is updated by the F-system at the beginning or end of the F-OB (see Program structure of the safety program (S7-1200, S7-1500) (Page 114)).

No calling of the instructions SYNC_PI and SYNC_PO is required in the F-OB.

Note

With isochronously operated F-I/O, it is not ensured (fail-safe) that all input data of the F-I/Os assigned to the process image partition are consistently available at the beginning of the main safety block or all output data is transferred consistently to the F-I/Os, in other words, logically and temporally together. The consistency is only ensured within an F-I/O.

The consistency of all isochronous F-I/Os of the process image partition usually depends on the number of isochronous F-I/Os and the scope of the safety program in the isochronous mode interrupt OB.

If there are corresponding consistency requirements, you must check the consistency of the input and output data yourself. You can do this, for example, by additionally transferring and evaluating time stamps in the input and output data of the isochronous F-I/Os.

2.8 Recommendation for PROFIsafe address assignment

Before inserting the F-I/O, specify an address range for each F-CPU for the F-destination addresses of the F-I/O of PROFIsafe address type 1 (Page 68) that does not overlap with the address range of any other F-CPU network-wide or CPU-wide (system-wide). You define the range for F-I/Os of PROFIsafe address type 1 with the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" (see also section Configuring an F-CPU (Page 48)).

The F-destination addresses of F-I/O of PROFIsafe address type 2 (Page 70) must not overlap with any address range of the F-I/O of PROFIsafe address type 1. The ranges of the F-destination addresses of the F-I/O of PROFIsafe address type 2 may overlap if the F-source addresses are different. This is the case for supported configurations (Page 66) if the "Central F-source address" parameter has been set differently for each F-CPU.

Assign relatively low F-destination addresses for F-I/O of PROFIsafe address type 1 and relatively high F-destination addresses for F-I/O of PROFIsafe address type 2.

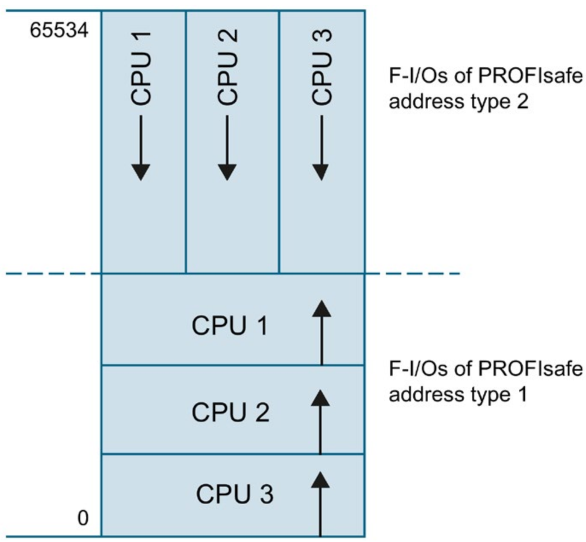


Figure 2-1 Address assignment for F-I/O of PROFIsafe address types 1 and 2

The safety summary (Page 364) lists the following information for each F-CPU:

- "Central F-source address" parameter (F-source address for F-I/O of PROFIsafe address type 2)
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 1
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 2

Any F-I/O configured using I-slave-slave communication is taken into consideration in the safety summary as part of the F-destination address range of the I-slave.

Any F-I/O configured in a shared device is taken is specified in the safety summary as part of the F-destination address range of the F-CPU to which this F-I/O is assigned.

2.9 Configurations supported by the SIMATIC Safety F-system

Supported configurations

F-I/Os (see Overview of Configuration (Page 43)) are supported in the following configurations:

central configuration (also I-slave):

- The F-I/O is in the same rack as the associated F-CPU.
- The F-I/O is located in a subrack of the rack of the associated F-CPU.

distributed configuration (at integrated DP-/PN interface of the CPU or at CP/CM):

- PROFIBUS (also after IE/PB link)
  - The F-I/O is located on a DP Slave.
  - The F-I/O is located on a DP Slave and is addressed via I-slave-slave communication. The assigned DP master (of the assigned IO controller of the IE/PB link) can be a standard CPU or an F-CPU.
- PROFINET IO
  - The F-I/O is located on an IO Device.
  - The F-I/O is located in a shared device.

For F-I/O not listed in "Overview of Configuration (Page 43)", please check the relevant documentation to see whether it is supported by the SIMATIC Safety F-system. If in doubt, treat these F-I/Os as part of a configuration that is not supported.

Checks performed by the SIMATIC Safety F-system

For supported configuration, the F-system checks:

- Whether the PROFIsafe operating mode parameter (F_Par_Version) is set to V2 mode in the PROFINET IO environment**.
- Whether the F-destination addresses have been assigned uniquely CPU-wide.
  You yourself must ensure the network-wide uniqueness of the PROFIsafe address.
- Whether the F-source address for the F-I/O of PROFIsafe address type 2 corresponds to the "Central F-source address" parameter of the F-CPU.

WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Check the correctness of the PROFIsafe addresses with the help of the safety summary.
  - Use the safety summary to check that the F-source address corresponds to the "Central F-source address" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1 or if you cannot set the F-source address in accordance with the "Central F-source address" parameter of the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported. (see Completeness and correctness of the hardware configuration (Page 368)) *(S050)*

* "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

2.10 PROFIsafe addresses for F-I/O of PROFIsafe address type 1

F-destination address

The uniqueness of the PROFIsafe address is ensured solely with the F-destination address. The F-source address is not displayed and has no effect on whether or not the PROFIsafe address is unique.

Therefore, the F-destination address must be unique network-wide and CPU-wide (see the following rules for address assignment).

To prevent incorrect parameter assignment, an F-destination address which is unique CPU-wide is automatically assigned during placement of the F-I/O in the work area of the device or network view as long as you only configure supported configurations (Page 66).

To ensure a network-wide unique F-destination address assignment when multiple DP master systems and PROFINET IO systems are operated on one network, you must set the "Low limit for F-destination addresses" and "High limit for F-destination addresses" in the properties of the F-CPU in SIMATIC Safety F-systems appropriately, before placing the F-I/O (see section "Recommendations for address assignment") so that the F-destination address ranges do not overlap.

When you change the F-destination address of an F-I/O, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations. You yourself must ensure the network-wide uniqueness of the F-destination address.

For ET 200S, ET 200eco (PROFIBUS), ET 200pro, ET 200iSP F-modules and S7-300 F-SMs:
You must set the F-destination address at the F-I/O with the DIP switch before you install the F-I/O. You can assign up to 1022 different F-destination addresses.

Note

(S7-300, S7-400) For the following fail-safe S7-300 signal modules, the F-destination address is the start address of the F-SM divided by 8:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

WARNING
F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch). The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 65).

See also

Completeness of the safety summary (Page 364)

2.11 PROFIsafe addresses for F-I/O of PROFIsafe address type 2

F-source address and F-destination address

The uniqueness of the PROFIsafe address is ensured by the combination of F-source address and F-destination address.

The PROFIsafe address must be unique network-wide and CPU-wide. This is the case if the following two conditions are met:

- The F-source address ("Central F-source address" parameter) of the F-CPU is unique network-wide. Keep this in mind for changes.
- The F-destination address of the F-module is unique CPU-wide.

You define the F-source address using the "Central F-source address" parameter in the F-CPU. Provided you only configure supported configurations (Page 66), this parameter is automatically applied as the F-source address and a CPU-wide unique F-destination address is assigned (usually in descending order starting with 65534).

When you change the F-destination address, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations.

You must assign the F-source address and F-destination address to the F-I/O before you commission the F-I/O. You can find additional information in Assigning a PROFIsafe address of the F-I/Os with SIMATIC Safety (Page 72).

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-source and F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

WARNING

FI/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

To ensure that addresses are unique across F-CPUs for supported configurations (Page 66), you need to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Central F-source address" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 65).

Completeness of the safety summary (Page 364)

2.12 Setting the F-destination address for F-I/O with DIP switches

Information on how to set the F-destination address for F-I/O with DIP switches is available in the documentation of the respective F-I/O.

2.13 Assigning a PROFIsafe address of the F-I/Os with SIMATIC Safety

Introduction

Fail-safe ET 200SP modules, fail-safe S7-1500/ET 200MP modules, fail-safe ET 200eco PN I/O modules and fail-safe S7-1200 modules do not have a DIP switch with which you set the unique F-destination address for each module. Instead, you assign the PROFIsafe address (Page 66) consisting of F-source address and F-destination address directly from *STEP 7 Safety* for fail-safe ET 200SP modules, fail-safe ET 200eco PN I/O modules and fail-safe S7-1500/ET 200MP modules. The PROFIsafe addresses for S7-1200 F-modules are automatically assigned during download of the hardware configuration.

In the following cases it is necessary to reassign the addresses of the fail-safe ET 200SP, fail-safe ET 200eco PN I/O modules and fail-safe S7-1500/ET 200MP modules:

- Later placement of a fail-safe module during initial commissioning (not for ET 200eco PN)
- Intentional modification of the F-destination address
- Modification of the "Central F-source address" parameter for the associated F-CPU (changes the F-source address).
- Replacement of the coding element
- Commissioning of a mass-produced machine

In the following cases it is not necessary to reassign the addresses of the fail-safe ET 200SP and fail-safe S7-1500/ET 200MP modules:

- Power On/Off
- Replacement of an F-module (repair) without PG/PC
- Replacement of the BaseUnit (transferring the coding element with assigned F-source address and F-destination address to the new BaseUnit)
- Replacement of a BaseUnit without coding element
- Changes in the design in case a new BaseUnit is inserted in front of a fail-safe module
- Repair/replacement of the interface module

Reassignment is not required for fail-safe ET 200eco PN I/O modules in the following cases:

- Power On/Off
- Replacement of the compact device (transferring the coding element with assigned F-source address and F-destination address to the new compact device)

Basic procedure

Note

Assigning the PROFIsafe address for S7-1200 fail-safe modules

The procedure described below for identifying and assigning the PROFIsafe addresses is not required for S7-1200 fail-safe modules.

Note that an S7-1200 F-CPU must not include an additional unconfigured F-module.

1. Configure the F-destination address (Page 70) and F-source address (Page 70) in the hardware configuration in *STEP 7 Safety*.
2. Identify the ET 200SP, S7-1500/ET 200MP or the ET 200eco PN fail-safe I/O modules to which you want to assign the configured PROFIsafe addresses.
3. Assign the PROFIsafe address to the F-modules.

2.13.1 Identifying F-modules

Requirement

The following requirements must be met:

- The F-CPU and fail-safe modules are configured.
- The hardware configuration has been downloaded.
- When using an ET 200SP Open Controller, the hardware configuration of the ET 200SP Open Controller **and** of the fail-safe software controller must be downloaded.
- The F-CPU and fail-safe modules can be reached online.

WARNING

Make sure that the latest hardware configuration has been downloaded to the F-CPU before identification.

Clicking "Identification" confirms the fail-safe correctness of the PROFIsafe addresses for the fail-safe modules.

Therefore, proceed carefully when confirming the F-modules by LED flashing or the serial number of the F-CPU with central fail-safe modules or the serial number of the interface module with fail-safe modules.

An assignment of the PROFIsafe addresses with the serial number of the interface module is only permitted when the assignment is made for all F-I/Os of a station. When selecting individual F-I/Os, the flashing of each individual F-I/O must be checked and confirmed. *(S046)*

Procedure

Proceed as follows to identify the F-modules:

1. Establish an online connection to the F-CPU with which the fail-safe modules are operated.
2. In the network view, select the F-CPU with fail-safe modules or the interface module with the fail-safe modules to which you want to assign the PROFIsafe address.
3. Select "Assign PROFIsafe address" from the shortcut menu.
4. Under "Assign PROFIsafe address by", select the method to be used for identifying the F-modules.
   – "Identification by LED flashing"

     This is the default setting. The DIAG and STATUS LEDs of the F-modules to be identified flash upon identification.

   – "Identification by serial number"

     If you cannot see the fail-safe modules directly, you can identify the fail-safe modules by the serial number of the F-CPU or interface module.

   Note

   The displayed serial number may be amended with a year number compared to the serial number printed on the interface module. The serial numbers are nevertheless identical.

   Note

   Determining the serial number of an ET 200SP Open Controller

   When you use the ET 200SP F-modules centrally on an ET 200SP Open Controller and identify them by the serial number, then read the serial number in the display of the fail-safe S7-1500 software controller in the menu "Overview > CPU".

   ---

5. In the "Assign" column, select all the F-modules to which you want to assign the PROFIsafe address.

   If you select the F-CPU or the interface module in the "Assign" column, all F-modules of the station are selected.
6. Click the "Identification" button. Check whether the DIAG and STATUS LEDs for the F-modules whose PROFIsafe address you want to assign are flashing green. If you identify using the serial number, compare the displayed serial number to the serial number of the F-CPU with central fail-safe modules or the interface module with fail-safe modules.
7. If you have configured more S7-1500/ET 200MP fail-safe modules than exist online, a dialog is displayed. Enter the number of S7-1500/ET 200MP fail-safe modules actually existing in this dialog and confirm the dialog.

   If you have configured fewer S7-1500/ET 200MP fail-safe modules than exist online, the online-offline difference is shown and the assignment of the PROFIsafe address is not possible.

2.13.2 Assign PROFIsafe address

Requirement

The F-modules have been successfully identified.

Procedure

To assign a PROFIsafe address, proceed as follows:

1. In the "Confirm" column, select all the fail-safe modules to which you want to assign the F-source address and F-destination address.
2. Use the "Assign PROFIsafe address" button to assign the PROFIsafe address to the fail-safe modules. You may have to enter the password of the F-CPU.

   You must acknowledge the "Acknowledge assignment" dialog within 60 seconds to assign the PROFIsafe address.

2.13.3 Assign PROFIsafe address to an F-module

Introduction

In the "Assign PROFIsafe address" dialog only the F-modules which are assigned to an F-CPU of this project are offered, as the PROFIsafe address of an F-module in a shared device can only be assigned from a project in which the F-CPU to which the F-modules are assigned is located.

Requirement

Requirement for assignment of the PROFIsafe address is that you have downloaded the hardware configuration completely to the F-CPU. When you have assigned the F-modules in a shared device to multiple F-CPUs, you must first download the hardware configuration of all F-CPUs involved before you assign the PROFIsafe addresses.

Note the following for the assignment:

If the corresponding interface module is not assigned to the corresponding CPU, the programming device and shared device must be located in the same subnet. Otherwise, follow the procedure as described in the sections Identifying F-modules (Page 73) and Assign PROFIsafe address (Page 75).

See also

Configuring shared device (Page 63)

2.13.4 Changing the PROFIsafe address

Changing the PROFIsafe address

Note

Keep in mind that after changing the PROFIsafe address of an F-I/O you must also conduct an acceptance (Page 368) including check of your change (Page 378) per safety summary (Page 341).

1. You change the PROFIsafe address (F-destination address, F-source address) in the hardware configuration.
2. Compile the hardware configuration.
3. Download the hardware configuration to the F-CPU.
4. Select "Assign PROFIsafe address" from the shortcut menu.
5. Proceed as described under Identifying F-modules (Page 73) and Assign PROFIsafe address (Page 75).

2.14 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices

Requirement

In order to use fail-safe GSD based DP slaves for SIMATIC Safety, these GSD based slaves must be operated on PROFIBUS DP and support the PROFIsafe bus profile. When used in an S7-1200/1500 F-CPU, they must support the PROFIsafe bus profile in V2 mode.

Fail-safe GSD based DP slaves used in hybrid configurations on PROFIBUS DP and PROFINET IO downstream from a IE/PB link must support the PROFIsafe bus profile in V2 mode.

In order to use fail-safe GSD based I/O devices for SIMATIC Safety, the GSD based devices must be operated on PROFINET IO and support the PROFIsafe bus profile in V2 mode.

Configuration with GSD files

As is the case in a standard system, the basis for configuring fail-safe GSD based DP slaves/IO devices is the device specification in the GSD file (device master file).

A GSD file contains all of the properties of a GSD based DP slave or GSD based I/O device. For fail-safe GSD based DP slaves/GSD based I/O devices, certain parts are protected by a CRC.

The GSD files are supplied by the device manufacturers.

Protection of the data structure of the device in GSD files

The only GSD files supported are those that satisfy the requirements for protection defined as of *PROFIsafe Specification* V2.0 using a CRC stored in this file ("desired value" for F_IO_StructureDescCRC).

The data structure described in the GSD file is checked when the F-I/O is added to the hardware configuration and when the hardware configuration is compiled. When an error is detected, you should clarify whether the GSD file provided by the device manufacturer contains the desired value for F_IO_StructureDescCRC.

Assignment and setting of the PROFIsafe address

WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 68) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 70).

Set the F-source address for fail-safe DP standard slaves / fail-safe I/O standard devices according to the manufacturer's specifications. If the F-source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Central F-source address" parameter matches the value of the F-source address of the fail-safe GSD based DP slave / fail-safe GSD based I/O device. *(S053)*

Configuration procedure with GSD files

You import the GSD files to your project (see *Help on STEP 7 "GSD files"*).

1. Select the fail-safe GSD based DP slave / GSD based I/O device in the "Hardware catalog" task card and connect it to the relevant subnet in the network view.
2. Select the fail-safe GSD based DP slave/GSD based I/O device and insert the necessary F-modules, if this does not occur automatically.
3. Select the relevant F-module and open the "Properties" tab in the inspector window.

For fail-safe GSD based DP slaves/GSD based I/O devices (contrary to other F-I/O), the "Manual assignment of the F-monitoring time" parameter is enabled. The result is that the value specified in the GSD file for the F-monitoring time is used as default value when the slaves/devices are plugged. You can change both values (time and type of assignment) later manually.

F-parameter "F_CRC_Seed" and "F_Passivation" for fail-safe GSD based I/O devices

The F-parameters "F_CRC_Seed" and "F_Passivation" influence the behavior of a fail-safe GSD based I/O device. The combination of the F-parameters cannot be set but is specified by selecting a corresponding F-module. Up to three F-module variants can be used, depending on the S7-300/400 or S7-1200/1500 F-CPU used.

F-module variant	F_CRC_Seed	F_Passivation	Behavior of the fail-safe GSD based I/O device	Can be used with F-CPU
1	Parameter does not exist	Parameter does not exist	The GSD based I/O device works with the Basic Protocol (BP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-300/400/1200/1500*
2	CRC-Seed24/32	Device/module	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-1200/1500
3	CRC-Seed24/32	Channel	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is supported.	S7-1200/1500

* Only use the F-module variant 1 with S7-1200/1500 F-CPUs if neither F-module variant 2 nor 3 exists.

Additional information

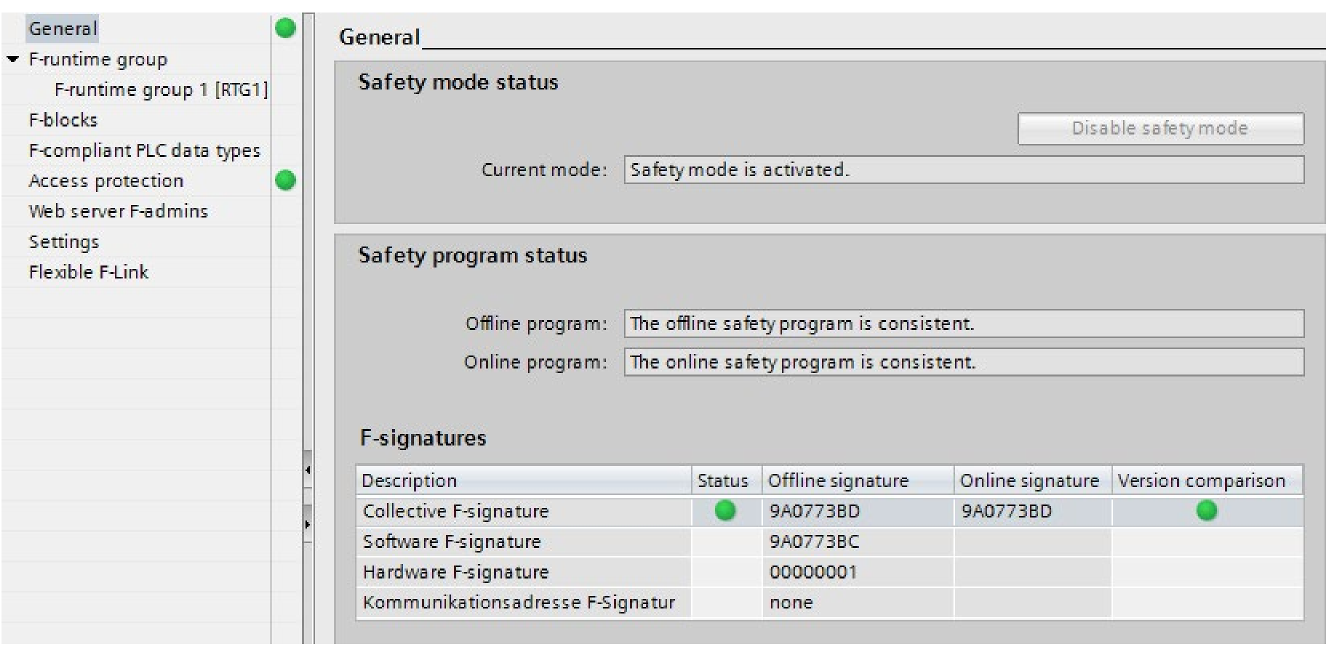
You can find the description of the parameters in the Help on fail-safe GSD based DP slaves and GSD based I/O devices.

3 Safety Administration Editor

Overview

The *Safety Administration Editor* supports you as follows:

- Displaying of status of the safety program
- Displaying of collective F-signature
- (S7-1200, S7-1500) F-SW collective signature
- (S7-1200, S7-1500) F-HW collective signature
- Displaying of status of safety mode
- Creating and organizing of F-runtime groups
- Displaying information on the F-blocks
- Displaying information about F-compliant PLC data types (UDT)
- Information for users with F-Admin permission
- Specifying/changing access protection
- Set/modify settings for the safety program, e.g. Enable F-change history
- (S7-1200, S7-1500) Create/display/delete F-communications via flexible F-Link



The *Safety Administration Editor* is divided into the following areas:

- General

  Under "General", the status of the safety mode, the safety program, the F-collective signature and for F-CPUs S7-1200/1500 the F-SW collective signature and the F-HW collective signature are displayed. Additional information on the "General" area can be obtained in ""General" area (Page 83)".

- F-runtime group

  You define the blocks and properties of an F-runtime under "F-runtime group".

  You can find information on F-runtime groups at ""F-runtime group" area (Page 86)".

- F-blocks

  Under "F-blocks", you can find information on the F-blocks used in your safety program and their properties . Additional information on the "F-blocks" area can be obtained in ""F-blocks" area (Page 88)".

- F-compliant PLC data types

  Under "F-compliant PLC data types", you obtain information on the created F-compliant PLC data types (UDT). There you also obtain information whether or not an F-compliant PLC data type (UDT) is used in the safety program. Additional information on "F-compliant PLC data types" can be found in ""F-compliant PLC data types" area (S7-1200, S7-1500) (Page 89)".

- Access protection

  Under "Access protection", you can set up, change, or revoke the password for the safety program. Access protection is mandatory for productive operation. Additional information on access protection can be found in "Access protection for the safety program (Page 103)".

- Web server F-Admins

  Under "Web server F-admins", you obtain information on users with the F-Admin attribute for the Web server of the F-CPU. Additional information on the "Web server F-Admins" area can be obtained in "“Web server F-Admins” area (S7-1200, S7-1500) (Page 90)".

- Settings

  Under "Settings", you set the parameters for the safety program. Information on the settings for your safety program can be found in ""Settings" area (Page 90)".

- Flexible F-Link

  In the "Flexible F-Link" area, you receive information about the configured F-communications via Flexible F-Links in tabular form. You can obtain information at ""Flexible F-Link" area (S7-1200, S7-1500) (Page 96)".

See also

Program structure of the safety program (S7-1200, S7-1500) (Page 114)

Program structure of the safety program (S7-300, S7-400) (Page 111)

Defining F-Runtime Groups (Page 132)

3.1 Opening the Safety Administration Editor

Requirement

The *Safety Administration Editor* is visible as an element in the project tree, if you have configured a CPU as an F-CPU in the project, which means the "F-capability activated" option must be selected (in the properties of the F-CPU).

Procedure

To open the *Safety Administration Editor*, follow these steps:

1. Open the folder for your F-CPU in the project tree.
2. Double-click on "Safety administration" or right-click and select the corresponding shortcut menu for the *Safety Administration Editor*.

Result

The *Safety Administration Editor* for your F-CPU opens in the work area.

3.2 "General" area

"Safety mode status"

The "Safety mode status" shows the current status of safety mode. The prerequisite is an existing online connection to the selected F-CPU.

The following statuses are possible:

- "Safety mode is activated"
- "The safety mode is not activated"
- "F-CPU is in STOP"
- "No active F-CPU available"
- "F-runtime group was not called"
- "The safety program is not called"
- "(No online connection)"

"Disable safety mode"

For existing online connection and active safety mode operation, you have the option of using the "Disable safety mode" button to disable safety mode for the selected F-CPU. Safety mode can be deactivated only for the entire safety program and not for individual F-runtime groups.

Requirement: "Safety mode can be disabled" is selected in the "Settings" area.

Proceed as follows:

1. Click the "Disable safety mode" button.
2. Enter the password for the safety program in the dialog window and confirm with "OK".
3. A corresponding dialog will display the collective F-signature.
4. Using the displayed collective F-signature, verify that you have selected the desired F-CPU.
5. If you have selected the correct F-CPU, confirm the dialog with "Yes".

Result: Safety mode for the F-CPU is disabled.

"Safety program status"

"Safety program status" displays the current status of your online and offline program.

The following statuses are possible:

- Consistent (with information if no password has been assigned.)
- Inconsistent
- Modified

If no connection to the online program could been established, the message "(no online connection) " will be shown.

"F-signatures"

For a non-existing online connection

Under "F-signatures" multiple signatures are displayed. Each signature is formed from different parts of the fail-safe project data.

- F-collective signature: This signature changes with each change of the fail-safe project data. It contains the signatures described below.
- F-SW collective signature (S7-1200/1500): This signature changes with each change of the safety program.
- F-HW collective signature (S7-1200/1500): This signature changes with each change of the fail-safe HW configuration.
- F-communication address signature (S7-1200/1500): This signature changes with each change of the name or the F-communication UUID of communication connections with flexible F-link.

The time of the last compilation process is displayed for the F-collective signature in the "Time stamp" column.

For an existing online connection

For an existing online connection, the following is displayed under the "Program signature":

- The status of safety program

Status	Meaning
	The online and offline collective F-signatures match, and a password was assigned for the online and offline safety programs.
	The online and offline collective F-signatures do *not* match or no password was assigned for one of the safety programs.
—	The safety program status could not be determined.

- The online and offline collective F-signatures
- When the collective F-signatures match: Information on whether the F-block versions are consistent online and offline.

Status	Version comparison	Statement
	Not relevant	The online and offline collective F-signatures *do not* match one another.
		The online and offline collective F-signatures match, but the online versions of F-blocks differ from the offline versions.
		The online and offline F-collective signatures match, identical versions of F-blocks are being used online and offline.
Not relevant	—	The safety system versions could not be determined.

You can find additional information on the consistency of the online safety program at under Identity of online and offline program (Page 375).

See also

Disabling safety mode (Page 344)

Program identification (Page 337)

3.3 "F-runtime group" area

3.3.1 "F-runtime group" area

A safety program consists of one or two F-runtime groups.

General information on F-runtime groups can be found in "Program structure of the safety program (S7-300, S7-400) (Page 111)" and "Program structure of the safety program (S7-1200, S7-1500) (Page 114)".

You can find information on creating F-runtime groups at Defining F-Runtime Groups (Page 132)

(S7-1200, S7-1500) "Creating a global F-I/O status block"

You can create a standard block (FB) with the name "RTGx_GLOB_FIO_STATUS", which evaluates whether substitute values are output instead of process values for at least one F-I/O or at least one channel of an F-I/O of an F-runtime group x. The result of the evaluation is available at the "QSTATUS" output. The F-O that you have disabled with the DISABLE variable in the F-I/O DB are then ignored.

The "RIOforFA_VALUE_STATUS" output corresponds to the "QSTATUS" output, but only takes F-I/Os into account with the "RIOforFA-Safety" profile.

To generate this standard FB, you use the "Create global F-I/O status block" button. You can only create the standard FB when your safety program has been compiled. You can call the standard FB anywhere in your standard user program.

Note

When adding or deleting an F-I/O, you have to generate "RTGx_GLOB_FIO_STATUS" again.

See also

Process Data or Fail-Safe Values (Page 162)

3.3.2 Pre-/postprocessing (S7-1200, S7-1500)

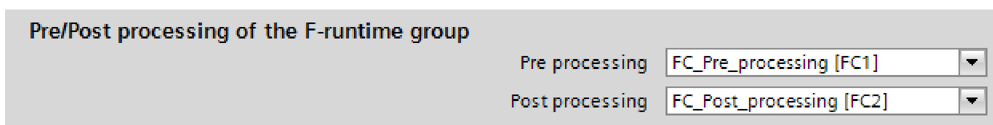
With preprocessing and postprocessing you have the option of calling standard blocks (FCs) directly before or after an F-runtime group, for example for data transfer with fail-safe communication via Flexible F-Link (Page 262).

Requirement

- Only standard-FCs usable.
- Only temporary local data and constants are permitted in the block interface of a standard-FC.

Procedure

1. Create the standard-FCs for the preprocessing and the postprocessing.
2. Assign the standard-FCs in the Safety Administration Editor under "Pre-/postprocessing of the F-runtime group".



Note

When you delete an assigned FC or overwrite it by copying, its selection as a pre-processing / post-processing block is automatically reset.

Effect on the safety program

- The runtime of the F-runtime group is extended by the runtime of the standard FCs for pre-/postprocessing (influence on TRTG_CURR and TRTG_LONG in the F-runtime group information DB).
- Because the preprocessing / postprocessing does not change the functionality of the safety program, the F-collective signature remains unchanged after compilation.

Load behavior

The calls of the selected standard FCs are placed during compiling or after the call of the main safety block in the F-OB.

This means that the STOP operating state is required during a subsequent download. Changes in the contents at the selected standard FCs can take place in RUN.

Exceptions are changes of the block name and block numbers which also include the compilation of the safety program.

When a preprocessing/postprocessing block is uploaded individually by the F-CPU, it does not automatically connect to the F-runtime group in the Safety Administration Editor.

If consistent loading of the F-CPU is performed instead, the settings for preprocessing and postprocessing are updated according to the online CPU.

3.4 "F-blocks" area

Overview

The "F-Blocks" area helps you in the following tasks:

- Displaying the F-blocks used in your safety programs.
- Displaying the F-blocks used in the F-runtime groups.
- Displaying additional information about the F-blocks.

A description of the F-blocks is available in "Creating F-blocks in FBD / LAD (Page 151)".

Displayed information

The following information is displayed for F-blocks in offline mode:

- Has the F-block been compiled and used?
- Function of F-block in the safety program
- Block signature
- Time stamp of the last change

The following information is displayed for F-blocks in online mode:

- Status (whether block has the same time stamp online and offline)
- Function of F-block in the safety program
- Block signature of the block offline
- Block signature of the block online

The F-blocks are hierarchically displayed as in the "Program blocks" folder.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 339)".

Note

During the offline-online comparison, the comparison statuses may occasionally differ between the *comparison editor* and status display in the *Safety Administration Editor*. The decisive status is the result of the comparison in the *comparison editor*, since this is the only comparison that takes into account the contents of the F-blocks.

Filter function

Using the filter function, you can select whether you want to view all F-blocks of a certain F-runtime group or the entire safety program.

- Select "All F-blocks " from the drop-down list to view all F-blocks.
- Select an F-runtime group from the drop-down list to see all F-blocks of this F-runtime group.

3.5 "F-compliant PLC data types" area (S7-1200, S7-1500)

Overview

Under "F-compliant PLC Data Types" you obtain information on the F-compliant PLC data types (UDT) you have defined.

You can delete F-compliant PLC data types (UDT) from the shortcut menu.

A description of F-compliant PLC data types (UDT) is available in "F-compliant PLC data types (UDT) (S7-1200, S7-1500) (Page 126)".

Displayed information

The following information is displayed for F-compliant PLC data types (UDT) in offline mode:

- Is the F-compliant PLC data type used in the safety program?
- Time stamp of the last change.

The following information is displayed for F-compliant PLC data types (UDT) in online mode:

- Status (whether the F-compliant PLC data types (UDT) have the same time stamp online and offline)

The F-compliant PLC data types (UDT) are displayed hierarchically as in the folder "PLC Data Types".

Double-click the F-compliant PLC data type (UDT) to open it for editing.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 339)".

Note

During offline-online comparison, the comparison statuses between the *comparison editor* and status display in the *Safety Administration Editor* can be different under certain circumstances. The comparison result in the *comparison editor* is decisive, since this is the only comparison that takes into account the contents of the F-compliant PLC data types (UDT).

3.6 “Web server F-Admins” area (S7-1200, S7-1500)

You require the "F-admin" right in order to carry out restoration of a backup (Page 328) via the Web server of your F-CPU. You assign the "F-admin" right in the hardware configuration of the F-CPU under the user management of the Web server.

In this section, you obtain information on which users have the "F-admin" right online or offline for F-CPUs that support this right. You can see from this whether a change to the "F-admin" right is active on the F-CPU. In order to make a change to the "F-admin" right effective, you have to load the configuration to the F-CPU.

See also

Completeness and correctness of the hardware configuration (Page 368)

3.7 "Settings" area

"Number ranges of the generated F-system blocks"

The number ranges assigned here are used by the F-System for new, automatically generated F-blocks.

At this point, you can select whether the number ranges are managed by the F-system or if a fixed range specified by you is used.

- "F-system managed"

  The number ranges are managed automatically by the F-system, depending on the F-CPU used. The F-system selects an available number range. The start and end ranges of the number ranges are displayed.

- "Fixed range"

  You can select the start and end ranges of the number ranges from the available range. The available range depends on the F-CPU used.

  An invalid number range selection is indicated by an error message.

  The only check performed during configuration is whether the configured low limit is less than or equal to the high limit and within the available range of the F-CPU. The check as to whether the configured range is sufficient is first made during compiling. You need to ensure a sufficiently large range. Where the available range is insufficient, a compiling error occurs. Not all blocks are generated and the safety program is not executable.

Changes will become valid only during the next compilation. The automatically created F-blocks may be moved into the new area during compilation. The F-I/O DBs are an exception. They always retain their original number that you may change in the properties of the F-I/O.

"Safety system version"

This parameter is used to specify the safety system version (including version of the F-system blocks and automatically generated F-blocks, see Overview of Programming (Page 111)).

A number of versions are available:

Version[3]	S7-300/400	S7-1200	S7-1500	Function
1.6	—	x	x	These versions have identical functions.
2.0	x	x[1]	x[2]	Depending on the set version, the result may be different runtimes of the F-runtime group(s) (see Excel file for response time calculation on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
2.1	—	x[1]	x[2]	Additionally supports the variables "DISABLE" and "DISABLED" in the F-I/O DB
2.2	—	x[1]	x[2]	Supports the safety-related CPU-CPU communication and F-runtime group communication with Flexible F-Link.

1 supported for Firmware version V4.2 or higher

2 supported for Firmware version V2.0 or higher

3 After the migration of projects that were created with *S7 Distributed Safety V5.4 SP5*, version 1.0 is set automatically in order to identify migrated projects which have not yet been compiled with *STEP 7 Safety Advanced*.

Usually, you do not need to make any settings for this parameters.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

"Local data used in safety program" (S7-300, S7-400)

You use this parameter to specify the amount of temporary local data (in bytes) that is available for the call hierarchy below the main safety block.

The setting applies to each F-runtime group of a safety program. Additional information on F-runtime groups can be found in "Program structure of the safety program (S7-1200, S7-1500) (Page 114)" and "Program structure of the safety program (S7-300, S7-400) (Page 111)".

The **minimum possible amount** is determined by the local data requirement of the F-blocks generated automatically when the safety program is compiled.

For this reason, you must provide at least 440 bytes. However, the local data requirement for the automatically added F-blocks may be higher depending on the local data requirement of the F-blocks you created with FBD or LAD.

Therefore, provide as much local data as possible. If there is not enough local data available for the automatically added F-blocks (440 bytes or more), the safety program will be compiled nevertheless.

Data in automatically added F-DBs are then used instead of local data. However, this increases the runtime of the F-runtime group(s). You will receive a notice when the automatically added F-blocks require more local data than configured.

WARNING

The calculated maximum runtime of the F-runtime group using the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is no longer correct in this case because the calculation assumes sufficient availability of F-local data.

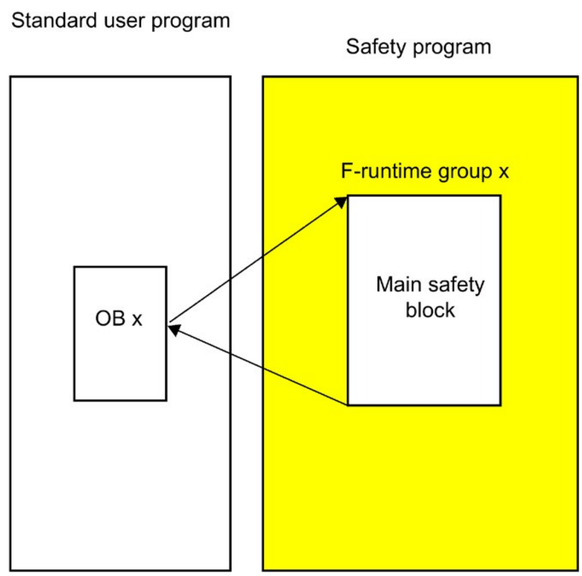
In this case, use the value you configured for the maximum cycle time of the F-runtime group (F-monitoring time) as the maximum runtime of the F-runtime group when calculating the maximum response times in the event of an error and for any runtimes of the standard system using the above-mentioned Excel file. *(S004)*

The maximum possible amount depends on:

- Local data requirement of the main safety block and the higher-level standard user program. For this reason, you should call the main safety blocks directly in OBs (cyclic interrupt OBs, whenever possible), and additional local data should not be declared in these cyclic interrupt OBs.
- Maximum volume of local data of the utilized F-CPU (see Technical Specifications in the product information for the utilized F-CPU). For S7-400 F-CPUs, you can configure the local data for each priority class. Therefore, assign the largest possible local data volume for the priority classes in which the safety program (the main safety blocks) is called (e.g., OB 35).

Maximum possible amount of local data as a function of local data requirement of main safety block and higher-level standard user program (S7-300, S7-400):

Case 1: Main safety block called directly from OBs

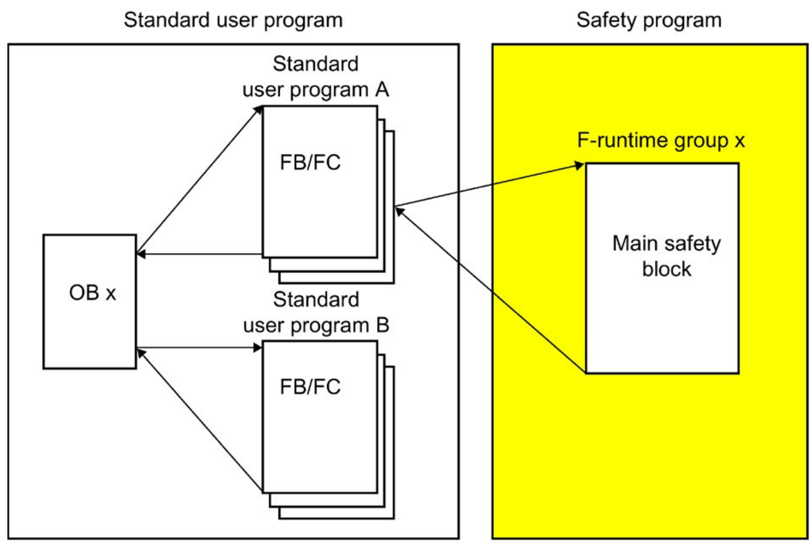


Set the "Local data used in safety program" parameter to the maximum amount of local data of the utilized F-CPU minus the local data requirement of the main safety block (if the main safety block has 2 F-runtime groups, use the largest local data requirement) and minus the local data requirement of the calling OBx (if there are 2 F-runtime groups, use the OB with the largest local data requirement).

Note: If you have not declared any temporary local data in the main safety blocks and calling OBx, the local data requirement of the main safety blocks is 6 bytes and the local data requirement of the calling OBx is 26 bytes. You can derive the local data requirement of the main safety blocks and calling OBx from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

Case 2: Main safety block not called directly from OBs



Set the "Local data settings" parameter to the value calculated for Case 1, minus the local data requirement of standard user program A (if standard user program A has 2 F-runtime groups, use the largest local data requirement).

Note: You can derive the local data requirement of the standard user program A from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

"Advanced settings"

"Safety mode can be disabled"

If you deselect the "Safety mode can be disabled" option, you can prevent the disabling of safety mode for a safety program.

When you change the setting for this option, you need to recompile the safety program and download it to the F-CPU for the change to become effective. This changes the F-collective signature and the F-SW collective signature of your safety program.

We recommend that you disable this option before you start production and before acceptance of the safety program to prevent an unintentional disabling of the safety mode.

"Enable F-change history"

Enable the logging of changes to the safety program by using the "Enable F-change history" option. For more information, refer to the section "F-change history (Page 359)".

"Enable consistent upload from the F-CPU" (S7-1500)

This option allows you to load the loaded project data (including safety-related project data) consistently from the F-CPU.

The option can only be activated if the F-CPU and the firmware of the F-CPU supports the loading of the project data (including safety-related project data).

F-CPUs S7-1500 as of firmware V2.1 are supported. S7-1500 F Software Controllers are not supported.

At every change to this option you have to load the project data to the F-CPU.

Note that the activation of this option extends the loading of the safety-related project data into the F-CPU.

"Activate variable F-communication- IDs" (S7-1200, S7-1500)

If you activate this option, you can supply the DP_DP_ID input of the SENDP or RCVSP instructions with the variable values from a global F-DB.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS a network includes all the nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all the nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and, if applicable, RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must ensure that the value at the DP_DP_ID input is "0" during this phase.

"System-generated objects" (S7-1200, S7-1500)

"Creates driver I-DBs without prefix"

When you select this option, the I-DBs of the F-I/O DBs are created without prefix.

Naming scheme:

- Default: F{logical address(5-digit)}_{module_name}
- With activated option: {module_name}

Uniqueness:

- The driver I-DB names assigned by the system must not be used for other blocks any longer. A compilation error is output in case of identical block names.
- If the option is selected, all module names must be unique in their first 124 characters. This is the maximum length of a block name. All additional characters of the module name are cut off.

"Debug"

The "Debug" button is provided for service and support purposes.

3.8 "Flexible F-Link" area (S7-1200, S7-1500)

In the "Flexible F-Link" area, you create new F-communications, obtain information on existing F-communications and delete F-communications.

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 F-CPUs as of firmware V4.2
- Safety system version as of V2.2

Information on created F-communications

In the "Flexible F-Link" area, you receive information on configured F-communications in tabular form:

- CPU-wide unique name of F-communication
- F-compliant PLC data type (UDT) for send/receive data
- Direction of F-communication: Transmitting/receiving
- F-monitoring time of F-communication
- F-Communication UUID
- Tag for send data
- Tag for receive data

Creating F-communication

1. In an empty row of the table click "<Add new>"
2. Assign a name to the communication connection.
3. Select an F-compliant PLC data type (UUID) for the communication connection.

   If you have not yet created an F-compliant PLC data type (UDT) for the communication connection or wish to create a new one, create a new F-compliant PLC data type (UDT) (Page 126) with any structure. Note that the size can be a up to 100 bytes.
4. Select the direction of the communication connection ("Send" or "Receive").
5. Select the F-monitoring time of the communication connection (Page 608).

The UUID of the F-communication is displayed via Flexible F-Link in the "F communication UUID" column. The F-communication UUID ensures sufficient uniqueness of the safety-related communication ID even across network limits.

The "Tag for send data" column shows you the newly created tag for send data of the F-communication DB.

The "Tag for receive data" column shows you the newly created tag for receive data of the F-communication DB.

You can find the newly created F-communication DB for this F-communication under "Program blocks\System blocks\STEP 7 Safety\F-communication DBs".

Deleting F-communication

1. Select the entire row and confirm "Delete" in the shortcut menu. You can also delete multiple F-communications at the same time.

Copying F-communication

1. Select the entire row and confirm "Copy" in the shortcut menu. You can also copy multiple F-communications at the same time.
2. With the "Paste" menu command, you can paste the copied F-communications into the table as often as needed. The UUID for the respective F-communication is retained during copying. If necessary, re-generate the UUID.

Generating a new F-communication-UUID

1. Select the entire row and confirm "Generate UUID" in the shortcut menu. You can also generate multiple UUIDs at the same time.

Interface of the F-communication DB for sending

The following table shows you the interface of the F-communication DB for the communication connection with the direction "Send":

Section	Name	Data type	Initial value	Description
Input	SEND_DATA	F-compliant PLC data type (UDT)	As in the F-compliant PLC data type (UDT).	User data to be sent:
	ACK_RCV_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the received raw data.
Output	ERROR	BOOL	False	Signals currently pending communication errors or communication errors not acknowledged yet at the receiver (not in the initial start). 1=Communication error
	ACTIVATE_FV	BOOL	True	Communication passivated, in the initial start (for example receiver not started), or HOST sends ACTIVATE_FV. DEVICE sends status bit: FV_ACTVATED, but no 0-values. 1=The communication uses fail-safe values
	DIAG	Byte	16#0	Error bits (Timeout or CRC error currently still pending, or communication after error not depassivated yet) Bit 3: Acknowledgement request active at the receiver Bit 4: Timeout detected Bit 6: CRC error detected
	SEND_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the received raw data
	ACK_RCV_LENGTH	UInt	0	Length information to ACK_RCV_ARRAY in bytes
	SEND_LENGTH	UInt	0	Length information to SEND_ARRAY in bytes
InOut	—	—	—	—
Static	—	—	—	—

Interface of the F-communication DB for receiving

The following table shows you the interface of the F-communication DB for the communication connection with the direction "Receive":

Section	Name	Data type	Initial value	Description
Input	PASS_ON	BOOL	False	This way you can passivate the output data (output of the pas- sivation values) 1=Enable passivation
	ACK_REI	BOOL	False	Reintegration (in case of reinte- gration request) by means of positive edge 1=Acknowledgment for reintegra- tion
	RCV_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the received raw data
Output	RCV_DATA	F-compliant PLC data type (UDT)	As in the F-compliant PLC data type (UDT).	Output data (PASS_VALUES or data received).
	ERROR	BOOL	False	Signals currently pending com- munication errors or communica- tion errors not acknowledged yet (not in the initial start). 1=Communication error
	PASS_OUT	BOOL	True	At PASS_OUT=1 the PASS_VALUES are output Could be: ERROR, PASS_ON, in the initial start (e.g. sender not started), or ACK_REQ is pending (error not acknowledged)
	ACK_REQ	BOOL	False	Reintegration requirement (com- munication stable again after error, substitute values are still output) 1=Acknowledgment request for reintegration
	SENDMODE	BOOL	False	MOD_MODE is active or commu- nication with PLCSIM Advanced on the sending F-CPU 1=F-CPU with a sender in the deactivated safety operation or on a simulated CPU

Section	Name	Data type	Initial value	Description
	DIAG	Byte	16#0	Error bits (Timeout or CRC error) Bit 0: Timeout detected by the sender Bit 1: Communication error currently pending in the sender Bit 2: CRC error detected by the sender Bit 4: Timeout detected by the receiver Bit 6: CRC error detected by the receiver
	ACK_SEND_ARRAY	Array[0..n] of Byte	Each element with 16#0	Array with the raw data to be sent.
	RCV_LENGTH	UInt	0	Length information of RCV_ARRAY in bytes
	ACK_SEND_LENGTH	UInt	0	Length information of ACK_SEND_ARRAY in bytes
InOut	—	—	—	—
Static	PASS_VALUES	F-compliant PLC data type (UDT)	Same as the F-compliant PLC data type (UDT) or in the I/O DB	Passivation or substitute values

4 Access protection

Access protection is necessary for productive operation

Access protection to the SIMATIC Safety F-system is mandatory for productive operation.

No access protection is initially necessary for test purposes, commissioning, etc. This means you can execute all offline and online actions without access protection, i.e., without password prompt.

WARNING
Access to the SIMATIC Safety F-system without access protection is intended for test purposes, commissioning, etc., when the system is not in productive operation. You must guarantee the safety of the system through other organizational measures, for example, restricted access to certain areas. **Before you transition into productive operation, you must have set up and activated access protection.** *(S005)*

4.1 Overview of access protection

Introduction

You can protect access to the SIMATIC Safety F-system by two password prompts: one for the safety program and another for the F-CPU.

Password for the safety program

The password for the safety program is available in two forms:

- The offline password is part of the safety program in the offline project on the programming device or PC.
- The online password is part of the safety program in the F-CPU.

Password for the F-CPU

The access protection is set at the F-CPU level. This password is also used to identify the F-CPU and must therefore be unique network-wide.

Overview of password assignment and prompt

The following table provides an overview of the access permissions for the F-CPU and the safety program.

The sections below show you how to assign the passwords and how to set up, change, and cancel access permissions for the F-CPU and the safety program.

	Password for F-CPU	Password for safety program
Assignment	In the *hardware and network editor*, during configuration of the F-CPU, inspector window, in "Settings" tab under "Protection", corresponding safety level, e.g., "Write protection for fail-safe blocks" (S7-300, S7-400). Select at least the access level "Full access (no protection)" for S7-1200/1500 F-CPUs and assign a password for "Full access incl. fail-safe (no protection)". If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".	In the *Safety Administration Editor* under "Access Protection".
Prompt	If you do not have access permission for the safety program (Page 103): For example • When uploading the complete safety program to the F-CPU • (S7-300, S7-400) when uploading the hardware configuration to the F-CPU • (S7-1200, S7-1500) when uploading a hardware configuration to the F-CPU that contains safety-related changes • When PROFIsafe address is assigned • When F-blocks that are used in the safety program are downloaded and deleted • When disabling safety mode • When restoring a backup of the F-CPU. Exception with S7-1200/1500 F-CPUs: If neither the safety program nor the F-CPU password is changed by the restore process, you are not prompted for the F-CPU password.	If you have assigned a password and this has not yet been entered since the project was opened, or you do not have access permission for the safety program (Page 103): **Offline password** e.g.: • When the password is changed • When modifying the safety program • When changing and deleting F-runtime groups • When changing safety-related parameters of F-I/O **Online password** e.g., when disabling safety mode (the password must always be entered, even if access permission for the safety program is still valid)

Safety program recompilation is required after changes to standard DBs to which the safety program has read or write access (Page 195). These standard DBs are not governed by the safety program access protection.

Please note that you also require the online password to download the safety-relevant changes to the hardware configuration. This is also true for changes to F-I/O not used in the safety program.
You have to also recompile and download the safety program for the download to be consistent.

4.2 Access protection for the safety program

Setting up access protection for the safety program

To set up access protection for the safety program, assign a password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Access protection" in the area navigation.
3. Under "Offline safety program protection", click "Setup" and enter the password (max. 30 characters) for the safety program in the following dialog in the "New password" and "Confirm password" fields.
4. Confirm the assigned password with "OK".

You have set up access protection for the safety program and have gained access permission for the safety program.

Note

You cannot define the online password separately; the offline password assigned during the next download is applied. After a change to the offline password, the online and offline passwords may differ until the next time the offline safety program is downloaded to the F-CPU.

During loading from the device the offline password is replaced by the online password or deleted.

Note

Use different passwords for the F-CPU and the safety program to optimize access protection.

WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the password protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

Changing the password for the safety program

You may change the safety program password as long as you have the necessary access permissions. It takes place likewise in the "Access protection" area (via "Change" button) and is carried out as usual under Windows through entry of the old and double entry of the new password.

Deleting access protection for the safety program

To delete access protection for the safety program, delete the password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Access protection" in the area navigation.
4. Click the "Change" button.
5. Under "Old password", enter the password for the safety program.
6. Click "Revoke" and then on "OK".

Gaining access permission through login to the safety program

Log in to the safety program as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Access protection" in the area navigation.
4. Enter the password for the safety program in the "Password" input field.
5. Select the "Login" button.

Validity of access permission for a safety program

If access permission for a safety program was obtained through the entry of the password, this remains until the project is closed. If *STEP 7* is closed, any project that is still open is automatically closed and any access permission granted is canceled.

Canceling access permission through logoff

The access permission for the safety program can be canceled as follows:

- By clicking the "Log off" button in the "Access protection" area in the "*Safety Administration Editor*".
- In the shortcut menu for the *Safety Administration Editor* shortcut menu (access by right-clicking).
- By using the lock symbol in the line of the *Safety Administration Editor*.

The user will then be prompted to enter the password for the safety program again the next time an action requiring a password is performed. A Stop-Run transition is required to "revoke" access permission for control.

Access permission for the safety program is canceled automatically, if the project or *STEP 7* has been closed.

Displaying the validity of access permission

The validity of the access permission is displayed in the project tree as follows:

- The access permission is valid, if the lock symbol in the line of the *Safety Administration Editor* is shown unlocked.
- The access permission is not available, if the lock symbol shows a closed lock.
- If no lock symbol is shown, no password was assigned.

4.3 Access protection for the F-CPU

Setting up access protection for the F-CPU

To set up access protection for the F-CPU, assign a password for the F-CPU in the F-CPU configuration.

You arrive there directly, if you click the link "Go to the "Protection" area of the F-CPU" in the "Access protection" area in the *Safety Administration Editor*. Proceed as described in the *STEP 7* help under "Configuring access levels".

WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. For this purpose, configure at least the protection level "Full access (no protection)" and assign a password under "Full access incl. fail-safe (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".

Assign different passwords for the individual protection levels. *(S041)*

You enable access protection by downloading (Page 313) the hardware configuration to the F-CPU.

WARNING

If **multiple F-CPUs** can be reached over a network (e.g. Industrial Ethernet) by **one programming device or PC**, you must take the following actions to ensure that the project data is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.

Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- The last download of the safety program prior to switching to productive operation must be made with enabled access protection. *(S021)*

WARNING

When using tools for the automation or operation (of TIA Portal or Web server) which allow access protection for the F-CPU to be bypassed (e.g. saving or automatic entry of a CPU password for the protection level "Full access incl. fail-safe (no protection)" or Web server password), the safety relevant project data may not be protected against unintentional changes anymore. *(S078)*

Changing the password for the F-CPU

For the new password to become valid after a password change for the F-CPU, you must download the changed configuration into the F-CPU. If necessary, you must enter the "old" password for the F-CPU for this load operation. The F-CPU must be in STOP mode.

Deleting access protection for the F-CPU

To delete access protection for the F-CPU, delete the password for the F-CPU. To do this, proceed as in the standard.

Obtaining access permission for the F-CPU

You obtain access permission for the F-CPU - depending on the configured protection level - by entering the password for the F-CPU prior to performing an action requiring a password.

Obtaining access permission for the F-CPU

Access permission for the F-CPU remains valid until the project is closed in *STEP 7* or access permission is canceled.

Canceling access permission for the F-CPU

You cancel the access permission with the menu command "Online > Delete access rights" auf.

WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the access protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

4.4 Access protection through organizational measures

To prevent that a safety program is swapped without authorization by exchanging removable media (e.g. flash card, SIMATIC Micro Memory Card or hard disk with WinAC RTX F), you must observe the following warning:

⚠ WARNING
You must limit access to the F-CPU to persons who are entitled for plugging removable media through access protection. *(S079)*

To prevent that a WinAC RTX F or an S7-1500 F Software Controller is accidentally uninstalled or installed, you must observe the following warning:

⚠ WARNING
You must limit access to a WinAC RTX F or an S7-1500 F Software Controller through access protection to persons who are authorized to uninstall and install or repair a WinAC RTX F or an S7-1500 F Software Controller (e.g. by using Windows administrator rights (ADMIN)). *(S075)*

The "Delete Configuration" function is only offered in the panel of the PC station with an S7-1500 F Software Controller when no access protection is set up on the F-CPU. We therefore recommend that you do not set up F-access protection until after commissioning.

To prevent unauthorized restoration of the safety program, formatting of the F-CPU and deleting program folders using the display of an S7-1500 F-CPU, you must observe the following warning:

⚠ WARNING
The display password may only be given to persons who are authorized to restore safety programs, format the F-CPU and delete program folders. If a password is not set up for the display, you must protect the display through organizational measures against unauthorized operation. For example by setting up access protection for specific rooms. *(S063)*

To prevent unauthorized restoration of the safety program with the Web server in an S7-1200/1500 F-CPU, you must observe the following warning:

WARNING

The "F-admin" authorization for Web server without password protection (user "Everybody" or "Anyone") is only intended for test purposes, maintenance, etc. This means only when the system is not in productive operation. In this case you must ensure the safety of the system through other organizational measures. For example by setting up access protection for specific rooms.

Before you transition into productive operation, you must remove the "F-admin" right for the user "Everybody".

Only authorized personnel may have access to the password of the Web server user with the "F-admin" right. After downloading the hardware configuration, check whether only permitted users of the Web server have the "F-admin" right on the F-CPU. To do so, use the online view of the *Safety Administration Editor* (see also Safety Administration Editor (Page 81)).

Saving the login file and the password of the Web server in the browser is only permitted when use by unauthorized persons is prevented through other organizational measures (e.g. access protection to the PG/PC). *(S064)*

5 Programming

5.1 Overview of Programming

Introduction

A safety program consists of F-blocks that you create using the FBD or LAD programming language and F-blocks that are automatically added. Fault detection and reaction measures are automatically added to the safety program you create, and additional safety-related tests are performed. Moreover, you have the option to incorporate special ready-made safety functions in the form of instructions into your safety program.

An overview of the following is given below:

- The structure of the safety program
- The fail-safe blocks
- Differences in the programming of the safety program with FBD/LAD compared to programming of standard user programs

5.1.1 Program structure of the safety program (S7-300, S7-400)

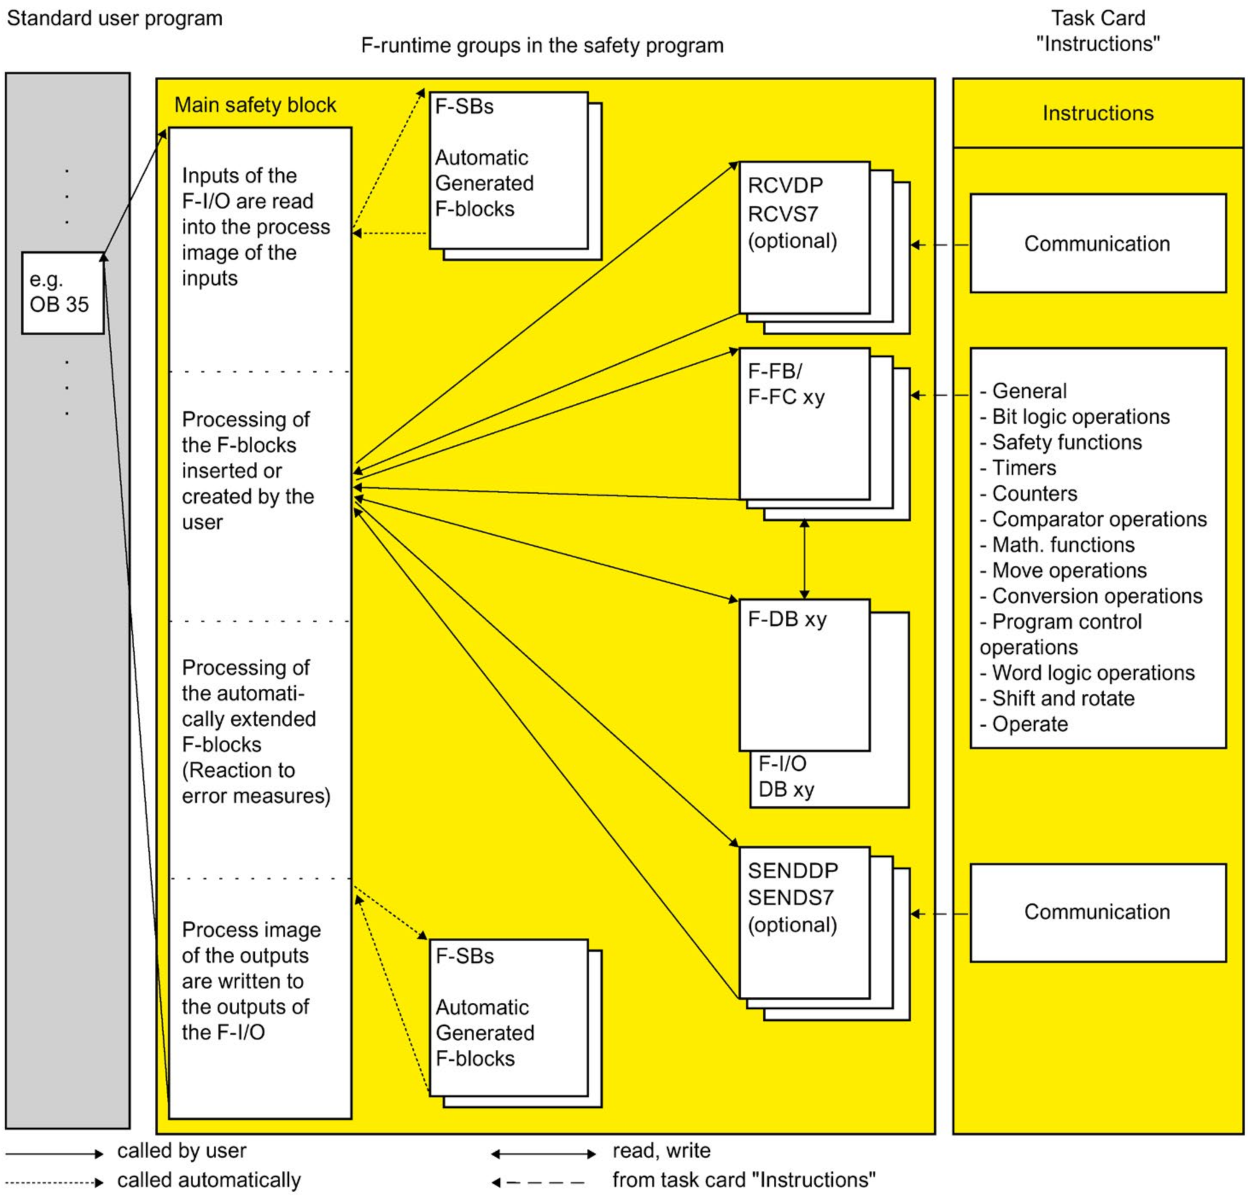
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks, automatically generated F-blocks, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-300/400 F-CPU.

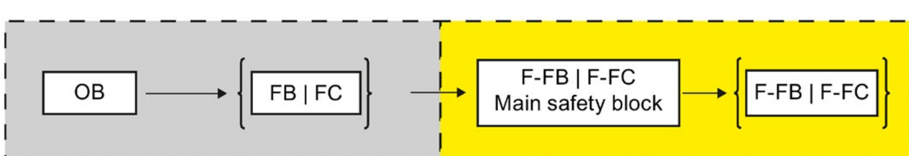


Main safety block

The main safety block is the first F-block of the safety program that you program yourself. During compiling, it is supplemented by additional invisible calls of F-system blocks.

You must assign the main safety block to an F-runtime group (Page 132).

The main safety block in an S7-300/400 F-CPU is called from any block in the standard user program. We recommend a call from an OB 3x.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- A main safety block (an F-FB/F-FC that you assign to the calling OB (FB/FC) as needed)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

5.1.2 Program structure of the safety program (S7-1200, S7-1500)

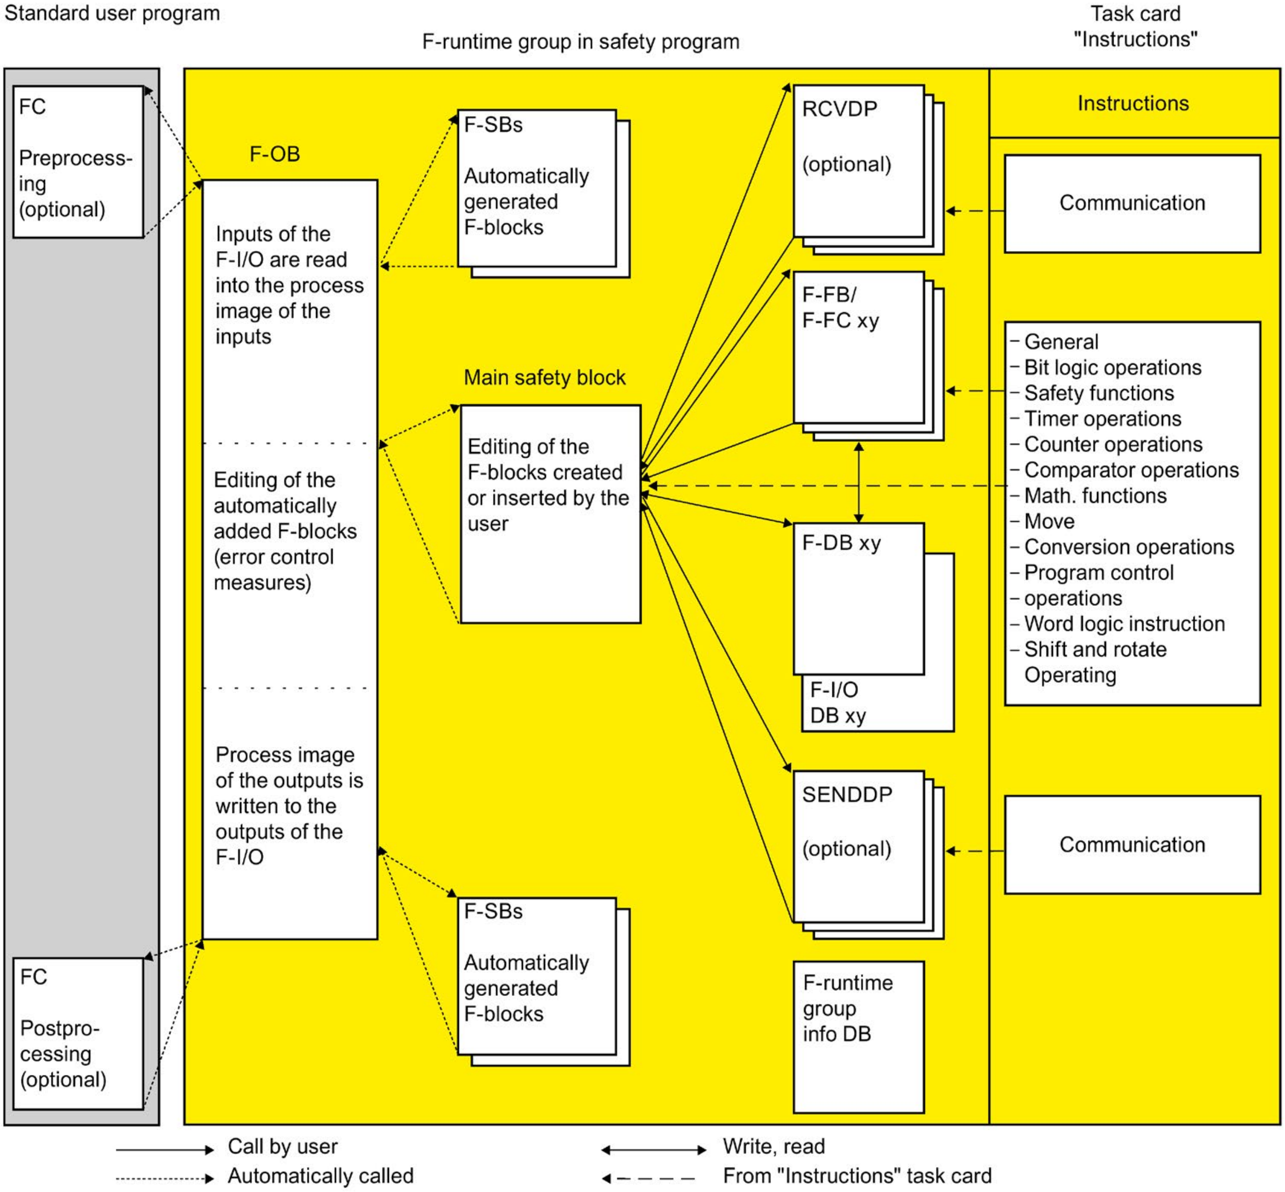
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks F-SBs, automatically generated F-blocks, F-runtime DB, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-1200/1500 F-CPU.

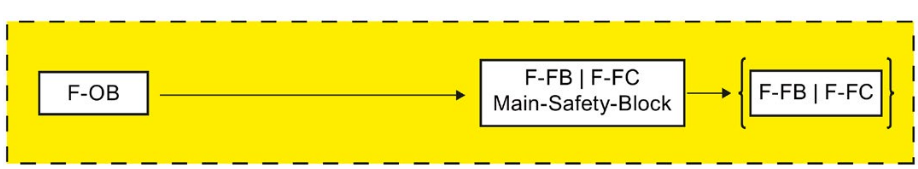


Main safety block

The main safety block is the first F-block of the safety program that you program yourself.

You must assign the main safety block to an F-runtime group (Page 132).

The main safety block in an S7-1200/1500 F-CPU is called by the F-OB assigned to the F-runtime group.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- An F-OB which calls the main safety block
- A main safety block (an F-FB/F-FC that you assign to the F-OB)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-runtime group information DB
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks
- A preprocessing and/or postprocessing block, as needed (see Pre-/postprocessing (S7-1200, S7-1500) (Page 87))

Pre-/postprocessing of an F-runtime group

You have the option of calling blocks of the standard application groups (FCs) directly before or after an F-runtime group, for example for data transfer of fail-safe communication via Flexible F-Link. (see Pre-/postprocessing (S7-1200, S7-1500) (Page 87))

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

See also

F-runtime group information DB (S7-1200, S7-1500) (Page 148)

5.1.3 Fail-Safe Blocks

F-blocks of an F-runtime group

The following table shows the F-blocks that you use in an F-runtime group:

F-block	Function	S7-300/400 F-CPUs	S7-1200/1500 F-CPUs
Main safety block	The first step in programming of the safety program is the main safety block. The main safety block in S7-300/400 F-CPUs is an F-FC or F-FB (with instance DB), which is called by a standard block (recommendation: OB 35) from the standard user program. The main safety block in S7-1200/1500 F-CPUs is an F-FC or F-FB (with instance DB), which is called by the F-OB.	X	X
F-FB/F-FC	Both in the main safety block as well as additional F-FBs and F-FCs, you can perform the following: • Program the safety program with the instructions available for F-blocks in FBD or LAD • Call other created F-FBs/F-FCs for structuring the safety program • Insert F-blocks from the project library or global libraries	X	X
F-DB	Optional fail-safe data blocks that can be read- and write-accessed within the entire safety program.	X	X
F-I/O DB	An F-I/O DB is automatically generated for each F-I/O when it is configured. You can or you must access the tags of the F-I/O DB in conjunction with F-I/O accesses.	X	X
F-shared DB	The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system.	X	—
F-runtime group information DB	An F-runtime group information DB is created when you create an F-runtime group. The F-runtime group information DB provides information on the F-runtime group and on the safety program as a whole.	—	X

Note

You are not permitted to insert F-system blocks from the "System blocks" folder in a main safety block/F-FB/F-FC.

Instructions for the safety program

In the "Instructions" task card, you can find instructions for the F-CPU used and which you can to use program the safety program.

You can find instructions that you know from the standard user program, such as bit logic operations, mathematical functions, functions for program control, and word logic operations.

Moreover, there are instructions with safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, feedback monitoring and instructions for safety-related communication between F-CPUs.

Additional information

For a detailed description of the instructions for the safety program, refer to Overview of instructions (Page 391).

Using instruction versions

As with the instructions for the standard user program, there may also be different versions of the instructions for the safety program.

Additional information on instruction versions can be found in the help on STEP 7 in "Basics for instruction versions".

Further information on the differences of the individual versions of the instructions for the safety program can be found in the relevant chapter of the instructions.

Note

Note the following:

- If you change the version of an instruction used in the safety program in the task card “Instructions” to a version which does not have identical functions, the functioning of your safety program may change after recompiling the safety program. In addition to the signature of the F-block that uses the instruction, the F-collective signature and the F-SW collective signature of your safety program also change. You may have to perform an acceptance test (Page 378).
- (S7-300/400) If you use a know-how protected F-block in your safety program which uses an instruction which is not the same version as that set in the task card "Instructions", when the program is compiled without entering the password for the know-how protected F-block, it is adjusted to the version set in the task card "Instructions", providing the interfaces of the instruction versions are identical. If the instruction versions do not have identical functions, the functioning of the know-how protected F-block may change and always its signature.

5.1.4 Restrictions in the programming languages FBD/LAD

LAD and FBD programming languages

The user program in the F-CPU typically consists of a standard user program and a safety program.

The standard user program is created using standard programming languages such as SCL, STL, LAD, or FBD.

For the safety program, LAD or FBD may be used with certain restrictions in the instructions and the applicable data types and operand areas. Please also note the restrictions for the individual instructions.

Supported instructions

The instructions available depend on the F-CPU used. You can find the supported instructions in the description of the instructions (starting from (Page 391)).

Note

Enable input EN and enable output ENO cannot be connected.

Exception:

(S7-1200, S7-1500) With the following instructions you can program overflow detection by connecting the enable output ENO:

- ADD: Add (STEP 7 Safety V15.1) (Page 520)
- SUB: Subtract (STEP 7 Safety V15.1) (Page 523)
- MUL: Multiply (STEP 7 Safety V15.1) (Page 526)
- DIV: Divide (STEP 7 Safety V15.1) (Page 529)
- NEG: Create twos complement (STEP 7 Safety V15.1) (Page 533)
- ABS: Form absolute value (STEP 7 Safety V15.1) (S7-1200, S7-1500) (Page 536)
- CONVERT: Convert value (STEP 7 Safety V15.1) (Page 548)

Supported data types and parameter types

Only the following data types are supported:

- BOOL
- INT
- WORD
- DINT
- DWORD (S7-300, S7-400)
- TIME
- ARRAY, ARRAY[*] when using the instructions RD_ARRAY_I: Read value from INT F-array (STEP 7 Safety V15.1) (S7-1500) (Page 539) and RD_ARRAY_DI: Read value from DINT F-array (STEP 7 Safety V15.1) (S7-1500) (Page 542).

  Restrictions:
  - ARRAY only in F-global DBs
  - ARRAY limits: 0 up to max. 10000
  - ARRAY[*] only as in-out parameter (InOut) in F-FCs and F-FBs
  - ARRAY of UDT
  - ARRAY of Bool
  - ARRAY of Word
  - ARRAY of Time
- F-compliant PLC data type (UDT) (S7-1200, S7-1500)

Note

If the result of an instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
You must therefore ensure that the permitted range for the data type is observed when creating the program, or select a matching data type or use the ENO output.

Note the description of the individual instructions.

Non-permitted data and parameter types

The following types are **not** permitted:

- All types not listed in the section "Supported data types and parameters types" (e.g. BYTE, REAL)
- Complex data types (for example, STRING, ARRAY (S7-300, S7-400, S7-1200), STRUCT, PLC data type (UDT) (S7-300, S7-400))
- Parameter types (e.g. BLOCK_FB, BLOCK_DB, ANY)

Supported operand areas

The system memory of an F-CPU is divided into the same operand areas as the system memory of a standard CPU. You can access the operand areas listed in the table below from within the safety program.

Table 5- 1 Supported operand areas

Operand area	Description
Process image of the inputs	
• Of F-I/O	Only read-only access to input channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. The process image of the inputs of F-I/O is updated prior to the start of the main safety block.
• Of standard I/O	Input channels of standard I/O can only be accessed read-only. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In addition, a process-specific validity check is required. See the *STEP 7 help* for the update times of the process image of the inputs of standard I/O.
Process image of the outputs	
• Of F-I/O	Only write-only access to output channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the F-I/O are calculated and stored in the process image of the outputs. The process image of the outputs for F-I/O is updated after the end of the main safety block.
• Of standard I/O	Output channels of standard I/O are write-only channels. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the standard I/O are also calculated and stored in the process image of the outputs, if needed. See the *STEP 7 help* for the update times of the process image of the outputs of standard I/O.

Operand area	Description
Bit memory	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. A particular element of the bit memory can be either read- or write-accessed in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Note that it is only permitted to use bit memory for connecting the standard user program and the safety program; it must not be used as a buffer for F-data.
Data blocks	
• F-DB	Data blocks store information for the program. They can either be defined as global data blocks such that all F-FBs, F-FCs, or main safety blocks can access them or assigned to a particular F-FB or main safety block (instance DB). A tag of a shared DB can only be accessed from one F-runtime group, and an instance DB only from the F-runtime group in which the corresponding F-FB/instruction is called.
• DB	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. For a tag of a DB, either read access or write access is possible in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Please note that the tags of a DB can only be used for transferring data between the standard user program and the safety program; DBs must not be used as a buffer for F-data.
Temporary local data	This memory area holds the temporary tags of a block (or F-block) while the (F-) block is being executed. The local data stack also provides memory for transferring block parameters and for saving intermediate results.

File type conversion

Just as with the standard user program, there are two possibilities for file type conversion in the safety program.

- Implicit conversion

  The implicit conversion is executed as in the standard user program with the following restrictions: The bit length of the source data type has to match the bit length of the destination data type.

- Explicit conversion

  You use an explicit conversion instruction (Page 548) before the actual instruction is executed.

Slice access

Slice access is not possible in the safety program.

Non-permitted operand areas

Access via units other than those listed in the table above is **not** permitted. The same applies to access to operand areas not listed, in particular:

- Data blocks that were automatically added

  Exception: Certain tags in the F-I/O DB (Page 165) and in the F-shared DB (S7-300, S7-400) (Page 148) or F-runtime group information DB (S7-1200, S7-1500) (Page 148)
- I/O area: Inputs
- I/O area: Outputs

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-300, S7-400)

The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-300/400 F-CPUs as "Tags" "RLO0" and "RLO1" in the F-global DB. You access them through a fully qualified DB access ("F_GLOBDB".RLO0 or "F_GLOBDB".RLO1).

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-1200, S7-1500)

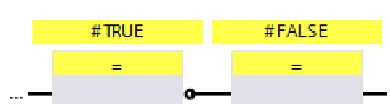
The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-1200/1500 F-CPUs to assign parameters during block calls.

You can also create "1" or "TRUE" in a tag with the help of the "Assignment (Page 402)" instruction.

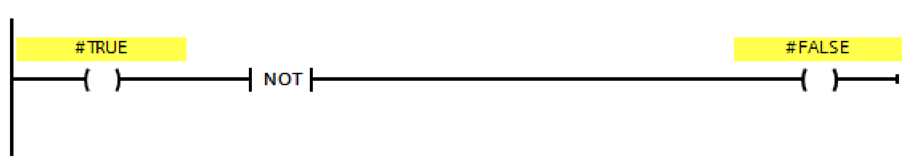
To do so, do not interconnect the box input of the "Assignment" instruction in FBD. In LAD, you interconnect the input directly with the supply rail.

You obtain a tag with "0" or "FALSE" by subsequent inversion with the instruction "Invert RLO (Page 399)".

Example FBD:



Example LAD:



Operand area of temporary local data: Particularities

Note

Note when using the operand area of temporary local data that the first access of a local data element in a main safety block/F-FB/F-FC must always be a write access. This initializes the local data element.

Make sure that a temporary local data element is initialized prior to the first JMP, JMPN, or RET instruction.

The "local data bit" should be initialized with the Assign ("=") (FBD) or ("--( )") (LAD) instruction. Assign the local data bit a signal state of "0" or "1" as a Boolean constant.

Local data bits cannot be initialized with the Flip Flop (SR, RS), Set Output (S) or Reset Output (R) instructions.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

"Fully qualified DB access"

Access to tags of a data block in an F-FB/F-FC is "fully qualified DB access". This also applies to initial access to tags of a data block after a jump label.

For S7-300/400 F-CPUs, only initial access needs to be "fully qualified DB access". Alternatively, you can use the instruction "OPN".

Example of "fully qualified DB access":

Assign a name for the F-DB, e.g. "F_Data_1". Use the names assigned in the declaration of the F-DB instead of the absolute addresses.

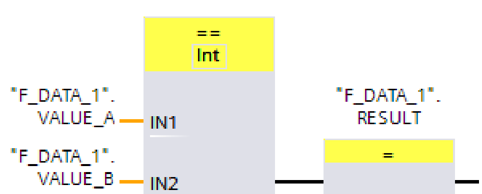


Figure 5-1 Example with fully-qualified access

Example of "non-fully qualified DB access" (S7-300, S7-400):

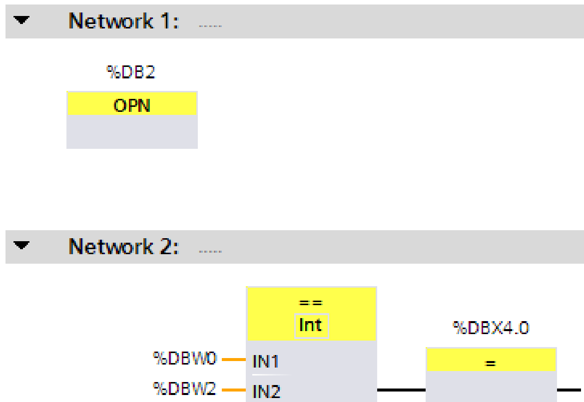

Figure 5-2 Example without fully-qualified access

Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

5.1.5 F-compliant PLC data types (UDT) (S7-1200, S7-1500)

Introduction

You declare and use F-compliant PLC data types (UDT) as you would standard PLC data types (UDT). You can use F-compliant PLC data types (UDT) in the safety program as well as in the standard user program.

Differences to standard PLC data types (UDT) are described in this chapter.

Information on the use and declaration of standard PLC data types (UDT) is available in the *STEP 7 help* under "Declaring PLC data types".

Declaring F-compliant PLC data types (UDT)

You declare F-compliant PLC data types (UDT) as you would PLC data types (UDT).

In F-compliant PLC data types (UDT), you can use all data types (Page 119) that you can also use in safety programs. Exception: ARRAY.

Nesting of F-compliant PLC data types (UDT) within F-compliant PLC data types (UDT) is not supported.

Proceed as follows for declaration:

1. Click on "Add new PLC data type" in the "PLC Data Types" folder in the project tree.
2. To create an F-compliant PLC data type (UDT), enable the option "Create F-compliant PLC data type" in the "Add new PLC data type" dialog.
3. Proceed as described in the *STEP 7 help* under "Programming structure of PLC data types".

You specify default values for F-compliant PLC data types (UDT) during the declaration.

Using F-compliant PLC data types (UDT)

You use F-compliant PLC data types as you would standard PLC data types (UDT).

Changes to F-compliant PLC data types (UDT)

You need the password for the safety program to change F-compliant PLC data types (UDT). Regardless if you are using the F-compliant PLC data type (UDT) in an F-block, in a standard block or not at all.

See also

"F-compliant PLC data types" area (S7-1200, S7-1500) (Page 89)

5.1.5.1 Grouping PLC tags for inputs and outputs of F-I/O in structures (S7-1200, S7-1500)

You group PLC tags for inputs and outputs of F-I/O in structures (structured PLC tag) as you would for inputs and outputs of standard I/O.

Use F-compliant PLC data types (UDT).

Rules

When creating structured PLC tags for inputs and outputs of F-I/O, you must also observe the following rules in addition to the rules in the standard:

- You must not group inputs/outputs of standard I/O and F-I/O at the same time in a structured PLC tag.
- You may only group inputs/outputs of actually existing channels (channel value and value status) in a structured PLC tag.

  See also Addressing F-I/O (Page 157)
- You may only group inputs/outputs of channels (channel value and value status) that are enabled in the hardware configuration in a structured PLC tag.

  See also Addressing F-I/O (Page 157)
- You may only group inputs of channels (channel value and value status) that provide the result of the "1oo2 sensor evaluation" with set "1oo2 sensor evaluation".

  See also Addressing F-I/O (Page 157)
- In a structured PLC tag for an F-I/O with outputs, you must either group all outputs of this F-I/O or an output range with multiples of 16 bits.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
- A structured PLC tag that groups outputs of an F-I/O must not overlap with other PLC tags.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

To observe these rules, you must declare the F-compliant PLC data type that is used for the structured PLC tag accordingly.

You can find the addresses allocated to a structured PLC tag in the "IO tags" tab of an F-I/O configuration.

5.1.5.2 Example of structured PLC tags for inputs and outputs of F-I/O (S7-1200, S7-1500)

Introduction

This example uses the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation to demonstrate how you use structured PLC tags for access to F-I/O.

Channel structure of the 4 F-DI/3 F-DO DC24V/2A F-module

The table below sets out the channel structure and address assignment of the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation. You may only access existing and enabled channels (addresses I15.0 to I15.3 and I16.0 to I16.3). These channels provide the result of 1oo2 evaluation generated internally in the F-module.

Table 5- 2 Channel structure and addresses of the channel values of inputs with 1oo2 evaluation

Channel	Address
DI channel 0 channel value	I15.0
DI channel 1 channel value	I15.1
DI channel 2 channel value	I15.2
DI channel 3 channel value	I15.3
—	I15.4
—	I15.5
—	I15.6
—	I15.7

Table 5- 3 Channel structure and addresses of the value status of the inputs with 1oo2 evaluation

Channel	Address
DI channel 0 value status	I16.0
DI channel 1 value status	I16.1
DI channel 2 value status	I16.2
DI channel 3 value status	I16.3
—	I16.4
—	I16.5
—	I16.6
—	I16.7

Table 5- 4 Channel structure and addresses of the value status of outputs

Channel	Address
DO channel 0 value status	I17.0
DO channel 1 value status	I17.1
DO channel 2 value status	I17.2
DO channel 3 value status	I17.3

Table 5- 5 Channel structure and addresses of the channel values of outputs

Channel	Address
DO channel 0 channel value	Q15.0
DO channel 1 channel value	Q15.1
DO channel 2 channel value	Q15.2
DO channel 3 channel value	Q15.3

Creating F-compliant PLC data types (UDT)

Create two F-compliant PLC data types (UDT), for example, for access to all channels.

The figure below shows an F-compliant PLC data type (UDT) for access to the channel values and value status of the inputs with 1oo2 evaluation:

4 F-DI/3 F-DO DC24V/2A_DI

	Name	Data type	Comment
1	CH_DI_0	Bool	Channel 0 (DI)
2	CH_DI_1	Bool	Channel 1 (DI)
3	CH_DI_2	Bool	Channel 2 (DI)
4	CH_DI_3	Bool	Channel 3 (DI)

The figure below shows the F-compliant PLC data type (UDT) for access to the channel values and value status of the outputs:

4 F-DI/3 F-DO DC24V/2A_DO

	Name	Data type	Comment
1	CH_DO_0	Bool	Channel 0 (DO)
2	CH_DO_1	Bool	Channel 1 (DO)
3	CH_DO_2	Bool	Channel 2 (DO)

Using F-compliant PLC data types (UDT)

As demonstrated in the figure below, you can use the two F-compliant PLC data types (UDT) that you have created in an F-FC (e.g. "Motor"):

Motor

	Name	Data type	Comment
1	Input		
2	Motor SS DI	"4 F-DI/3 F-DO DC24V/2A_DI"	Motor interface channel values DI
3	CH_DI_0	Bool	Kanal 0 (DI)
4	CH_DI_1	Bool	Kanal 1 (DI)
5	CH_DI_2	Bool	Kanal 2 (DI)
6	CH_DI_3	Bool	Kanal 3 (DI)
7	Motor SS DI VS	"4 F-DI/3 F-DO DC24V/2A_DI"	Motor interface value status DI
8	CH_DI_0	Bool	Kanal 0 (DI)
9	CH_DI_1	Bool	Kanal 1 (DI)
10	CH_DI_2	Bool	Kanal 2 (DI)
11	CH_DI_3	Bool	Kanal 3 (DI)
12	Motor SS DO VS	"4 F-DI/3 F-DO DC24V/2A_DO"	Motor interface value status DI
13	CH_DO_0	Bool	Kanal 0 (DO)
14	CH_DO_1	Bool	Kanal 1 (DO)
15	CH_DO_2	Bool	Kanal 2 (DO)
16	Output		
17	Motor SS DO	"4 F-DI/3 F-DO DC24V/2A_DO"	Motor interface channel values DO
18	CH_DO_0	Bool	Kanal 0 (DO)
19	CH_DO_1	Bool	Kanal 1 (DO)
20	CH_DO_2	Bool	Kanal 2 (DO)

Creating structured PLC tag for the F-module 4 F-DI/3 F-DO DC24V/2A

Create structured PLC tags for the F-module 4 F-DI/3 F-DO DC24V/2A:

Tag table_1

	Name	Data type	Address	Comment
1	TagDI_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DI"	%I15.0	Motor 1 DI
2	TagDI_VS_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DI"	%I16.0	Motor 1 DI VS
3	TagDO_VS_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DO"	%I17.0	Motor 1 DO VS
4	TagDO_4 F-DI/3 F-DO	"4 F-DI/3 F-DO DC24V/2A_DO"	%Q15.0	Motor 1 DO

Accessing the F-FC

Transfer the structured PLC tags you have created when you call the F-FC (e.g. "Motor"):

Addressing F-I/O (Page 157)

Value status (S7-1200, S7-1500) (Page 159)

5.1.6 Editing PLC tags with external editors

To edit PLC tags with external editors follow the procedure as in the standard. Additional information can be found in the *STEP 7* help in "Editing PLC tags with external editors".

Note the following:

Note

After importing a tag table which contains tags used in the safety program, the collective F-signature of the safety program is reset.

To form the collective F-signature again you have to recompile the project data. For this, with access protection set up for the safety program, you need a valid access authorization for the safety program.

If you would like to edit PLC tags with external editors, we therefore recommend that you store PLC tags to be used in the safety program in a separate tag table.

5.1.7 Using Multiuser engineering

If you want to use Multiuser engineering, proceed as described in the STEP 7 help under "Using Multiuser engineering".

5.2 Defining F-Runtime Groups

5.2.1 Rules for F-Runtime Groups of the Safety Program

Rules

Note the following:

- The channels (channel values and value status) of an F-I/O can only be accessed from a single F-runtime group.
- Tags of the F-I/O DB of an F-I/O can only be accessed from one F-runtime group and only from that F-runtime group from which the channels or value status of this F-I/O are also accessed (if access is made).
- F-FBs can be used in more than one F-runtime group but they must be called with different instance DBs.
- Instance DBs of F-FB can only be accessed from the F-runtime group in which the associated F-FB is called.
- A tag of a global F-DB (except the F-global DB) can only be accessed from one F-runtime group (however, a global F-DB can be used in more than one F-runtime group).
- (S7-300, S7-400) A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", but only read-accessed by the "receiver" F-runtime group.
- (S7-300, S7-400) An F-communication DB can only be accessed from one F-runtime group.
- (S7-1200, S7-1500) You must not call the main safety block yourself. It is automatically called by the assigned F-OB.

Note

F-OBs are protected by F-system know-how. The OB start information of F-OBs therefore cannot be evaluated.

- (S7-1200, S7-1500). The F-OB should be created with the highest priority of all OBs.

Note

The cycle time of the F-OB can be prolonged by, among other things, communication load, the processing of higher-priority interrupts, as well as by test and commissioning functions.

- (S7-300, S7-400) The main safety block may only be called once from a standard block. Multiple calls can cause the F-CPU to go to STOP mode.

- (S7-300, S7-400) For optimal use of temporary local data, you must call the F-runtime group (the main safety block) directly in an OB (cyclic interrupt OB, if possible); you should not declare any additional temporary local data in this cyclic interrupt OB.
- (S7-300, S7-400) Within a cyclic interrupt OB, the F-runtime group should be executed **before** the standard user program; i.e. it should be called at the very beginning of the OB, so that the F-runtime group is always called at fixed time intervals, regardless of how long it takes to process the standard user program.

  For this reason, the cyclic interrupt OB should also not be interrupted by higher priority interrupts.
- The process image of the inputs and outputs of standard I/O, bit memory, and tags of DBs in the standard user program may be accessed either as read-only or read/write from more than one F-runtime group. (see also Data exchange between standard user program and safety program (Page 195))
- F-FCs can generally be called in more than one F-runtime group.

Note

You can improve performance by writing sections of the program that are not required for the safety function in the standard user program.

When determining which elements to include in the standard user program and which to include in the safety program, you should keep in mind that the standard user program can be modified and downloaded to the F-CPU more easily. In general, changes in the standard user program do not require an acceptance.

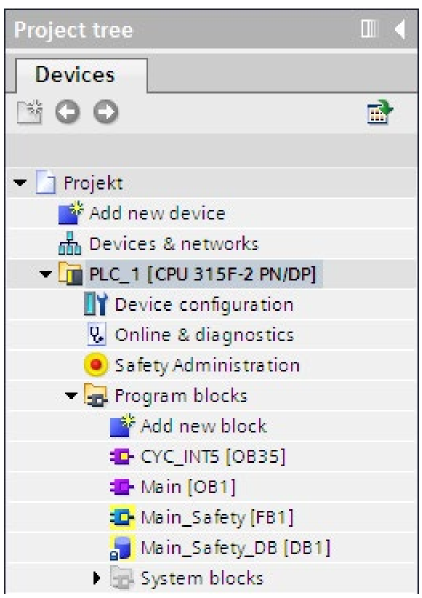
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400)

Requirements

- You have inserted an S7-300/400 F-CPU in your project.
- In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default after an F-CPU has been added. When you open the "Program blocks" folder, you see the (F-)blocks of the F-runtime group (CYC_INT5 [OB 35], Main_Safety [FB 1], and Main_Safety_DB [DB1]) in the project tree.



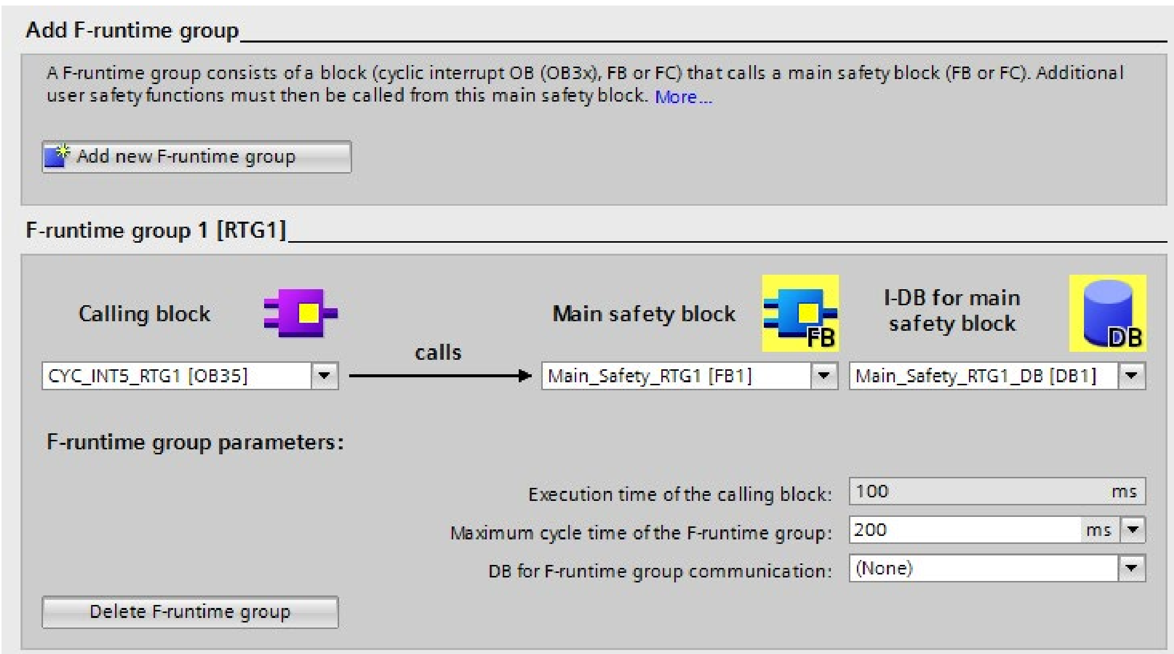
The following section describes how you modify the settings / parameters of the F-runtime group created by default or add and additional F-runtime group.

Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Specify the block in which the main safety block is to be called.

   Cyclic interrupt OB 35 is suggested here by default. The advantage of using cyclic interrupt OBs is that they interrupt the cyclic program execution in OB 1 of the standard user program at fixed time intervals; that is, the safety program is called and executed at fixed time intervals in a cyclic interrupt OB.

   In this input field, you can select only those blocks that were created in the LAD, FBD, or STL programming language. If you select a block here, the call is inserted automatically into the selected block and, if necessary, removed from a previously selected block.

   If you want to call the main safety block in a block that was created in another programming language, you must program this call itself. The input field is then not editable (grayed out), and you can change the call only in the calling block and not the *Safety Administration Editor*.
4. Assign the desired main safety block to the F-runtime group. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety [FB1] and Main_Safety_DB [DB1] are suggested by default.

5. The F-CPU monitors the F-cycle time of the F-runtime group. For "Maximum cycle time of F-runtime group", enter the maximum permitted time between two calls of the F-runtime group.

> **WARNING**
>
> The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often or, for example, isochronous. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 489) from the "Instructions" task card and not using counters (OB calls). *(S007)*

> **WARNING**
>
> The response time of their safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.
>
> Therefore, the configuration/parameter assignment of the standard system influences the response time of its safety function.
>
> Examples:
>
> - The increase in priority of a standard OB compared to an F-OB can extend the runtime of the F-runtime group due to the interruption by higher-priority interrupts.
> - The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".
>
> Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety program and does not lead to a modification of the collective F-signature.
>
> If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always set the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 608)).
>
> The monitoring times are protected against change with the access protection of the safety program and are recorded by the F-collective signature as well as the F-SW collective signature.
>
> When calculating with Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

6. If one F-runtime group is to provide tags for evaluation to another F-runtime group of the safety program, assign a DB for F-runtime group communication. Select an F-DB for "DB for F-runtime group communication". (See also F-runtime group communication (S7-300, S7-400) (Page 141))
7. If you want to create a **second F-runtime group**, click the "Add new F-runtime group" button.
8. Assign an F-FB or F-FC as the main safety block to a calling block. This F-FB or F-FC is automatically generated in the project tree, if not already present.

9. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
10. Follow steps 3 to 5 above to complete generation of the second F-runtime group.

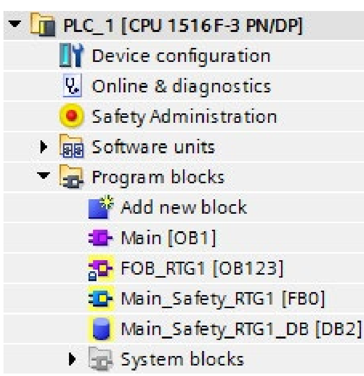
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500)

Requirements

- You have inserted an S7-1200/1500 F-CPU in your project.
- In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default after an F-CPU has been added. When you open the "Program blocks", you see the (F-)blocks of the F-runtime group (FOB_RTG1 [OB123], Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1]) in the project tree.



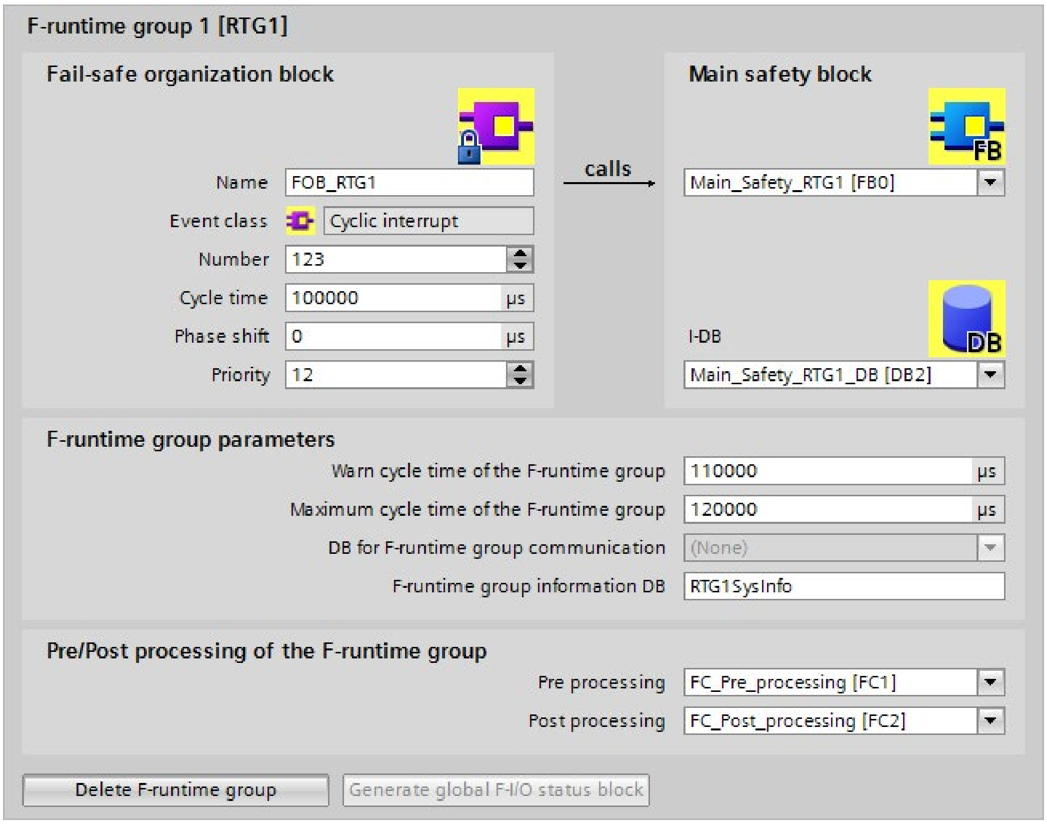
The following section describes how you modify the settings / parameters of the F-runtime group created by default or add and additional F-runtime group.

Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Assign a name for the F-OB under "F-OB".
4. Specify the event class of the F-OB when you create a new F-runtime group.

   For an F-OB you can select between the event classes "Program cycle", "Cyclic interrupt" or "Synchronous cycle".

   In the case of the F-runtime group created by default, the F-OB has the event class "Cyclic interrupt". To change the event class of the F-OB of an already created F-runtime group, you need to delete and F-runtime group and create a new one.

Note

We recommend creating the F-OB with the event class "Cyclic interrupt" as "cyclic interrupt OB". The safety program will then be called and run at fixed time intervals.

F-OBs with the event class "Synchronous cycle" are only recommended in conjunction with F-I/O devices that support isochronous mode, for example submodule "Profisafe Telgr 902" of drive SINAMICS S120 CU310-2 PN V5.1.

F-OBs with the event class "Program cycle" are not recommended, as these have the lowest priority "1" (see below).

Note

Note the maximum permissible number of OBs (incl. F-OBs) with event class "Synchronous cycle" (see technical specifications in the product manuals of the S7-1500 CPUs).

5. If required, you can manually change the number of the F-OB proposed by the system. To do so, note the number ranges valid for the relevant event class.
6. Assign cycle time, phase shift and priority parameters for F-OBs with event class "Cyclic interrupt".

   Assign the priority parameter for F-OBs with event class "Synchronous cycle".

   – Select a cycle time which is less than the "Maximum cycle time of F-runtime group" and less than the "Cycle time warning limit of F-runtime group".
   – Select a phase shift which is less than the cycle time.
   – If possible, select a priority that is higher than the priority of all other OBs.

Note

Through a high priority of the F-OB you ensure that the runtime of the safety program and the response time of your safety functions (Page 608) are influenced as little as possibly by the standard user program.

Note

For F-OBs with event class "Synchronous cycle" you need to also assign parameters for application cycle (ms) and possibly delay time (ms) after defining the F-runtime group and the connection of the isochronous F-I/O to the isochronous mode interrupt OB. You can find these parameters in the "Properties" dialog box of the isochronous mode interrupt OB in the "Isochronous mode" group. Proceed as described in the STEP 7 help under "Configuring isochronous mode interrupt OBs".

7. Assign the calling main safety block to the F-OB. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1] are suggested by default.

8. The F-CPU monitors the F-cycle time of the F-runtime group. Two parameters are available:
   – If the "Cycle time warning limit of F-runtime group" is exceeded, an entry is written to the diagnostics buffer of the F-CPU. This parameter can, for example, be used to determine whether the cycle time exceeds a required value without the F-CPU switching to STOP mode.
   – If the "Maximum cycle time of F-runtime group" is exceeded, the F-CPU will go to STOP. For "Maximum cycle time of F-runtime group", select the maximum permitted time between two calls of this F-runtime group (maximum of 20000000 µs).

WARNING

The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often or, for example, isochronous. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 489) from the "Instructions" task card and not using counters (OB calls). *(S007)*

WARNING

The response time of their safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.

Therefore, the configuration/parameter assignment of the standard system influences the response time of its safety function.

Examples:

- The increase in priority of a standard OB compared to an F-OB can extend the runtime of the F-runtime group due to the interruption by higher-priority interrupts.
- The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".

Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety program and does not lead to a modification of the collective F-signature.

If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always set the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 608)).

The monitoring times are protected against change with the access protection of the safety program and are recorded by the F-collective signature as well as the F-SW collective signature.

When calculating with Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

The "Cycle time warning limit of F-runtime group" must be configured as less than or equal to the "Maximum cycle time of F-runtime group".

9. Assign a name for the F-runtime group information DB (Page 148) under "F-runtime group DB".
10. If required, you can select blocks of the standard program (FCs) with regard to preprocessing or postprocessing of an F-runtime group (see Pre-/postprocessing (S7-1200, S7-1500) (Page 87))
11. If you want to create a **second F-runtime group**, click the "Add new F-runtime group" button. Follow steps 3 to 10 above.

5.2.4 F-runtime group communication (S7-300, S7-400)

Safety-related communication between F-runtime groups

Safety-related communication can take place between the two F-runtime groups of a safety program. This means fail-safe tags can be provided by one F-runtime group in an F-DB and read in another F-runtime group.

Note

A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", while it can only be read-accessed by the "receiver" F-runtime group.

Tip: You can improve performance by structuring your safety program in such a way that as few tags as possible are exchanged between the F-runtime groups.

Procedure for defining a DB for F-runtime group communication

You define the DB for F-runtime group communication in the work area "F-runtime groups". Proceed as follows:

1. Click "F-runtime groups" in "*Safety Administration Editor*".
2. Select an existing F-DB in the "DB for F-runtime group communication" field or assign a new one.
3. Assign a name to the F-DB.

Up-to-dateness of tags read from another F-runtime group

Note

Tags read are up-to-date as at the time of the last completed processing cycle of the F-runtime group providing the tags prior to start-up of the F-runtime group reading the tags.

If the tags supplied undergo multiple changes during runtime of the F-runtime group supplying the tags, the F-runtime group reading the tags only receives the last change (see figure below).

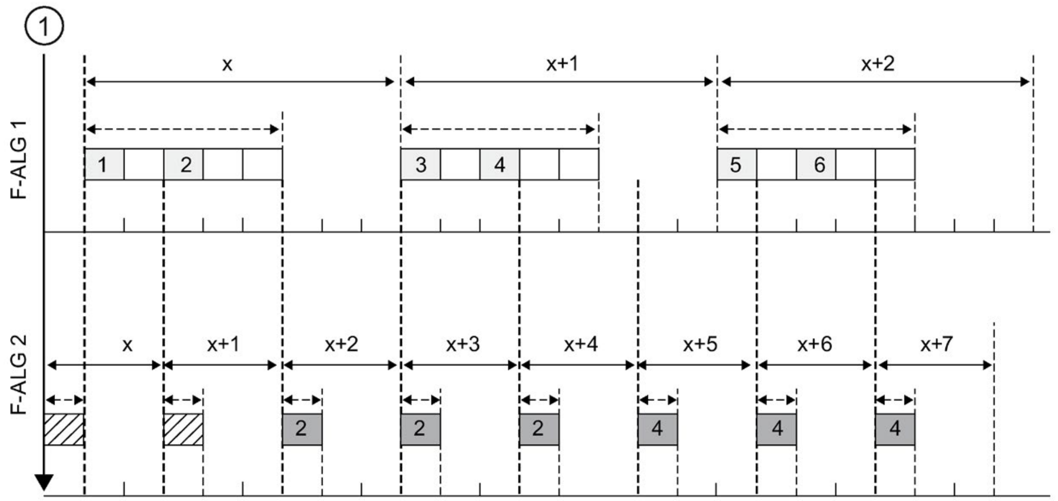
Assignment of fail-safe values

After F-system start-up, fail-safe values are supplied to the F-runtime group which has read access to tags in the DB for F-runtime group communication of another F-runtime group (for example, F-runtime group 2). These are the values you specified as initial values in the DB for F-runtime group communication of F-runtime group 1.

F-runtime group 2 reads the fail-safe values the first time it is called. The second time the F-runtime group 2 is called, it reads the latest tags if F-runtime group 1 has been processed completely between the two calls of F-runtime group 2. If F-runtime group 1 has not been processed completely, F-runtime group 2 continues to read the fail-safe values until F-runtime group 1 is completely processed.

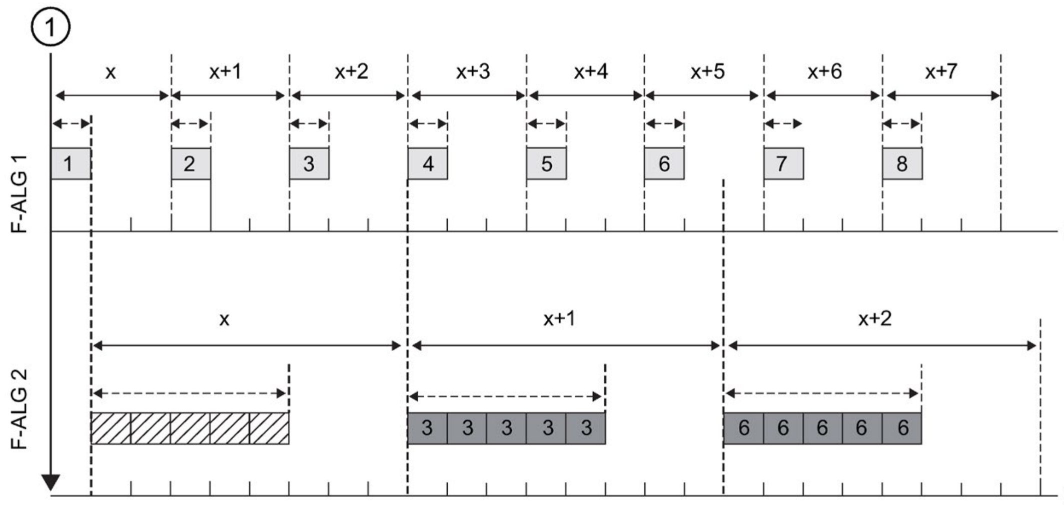
The behavior is illustrated in the two figures below.

Reading tags from F-runtime group 1, which has a longer OB cycle and lower priority than F-runtime group 2



①	Startup of F-system
⟷	Cycle time of the (F-)OB in which the F-runtime group is called.
⇠⇢	Runtime of the F-runtime group
1	... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1
2	...Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1
▨	Initial value in the DB for F-runtime group communication

Reading tags from F-runtime group 1, which has a shorter OB cycle and higher priority than F-runtime group 2



①	Startup of F-system
	Cycle time of the (F-)OB in which the F-runtime group is called.
	Runtime of the F-runtime group
1	... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1
2	... Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1
	Initial value in the DB for F-runtime group communication

F-runtime group supplying tags is not processed

Note

If the F-runtime group whose DB for F-runtime group communication is to supply the tags is not processed (the main safety block of the F-runtime group is not called), the F-CPU goes to STOP mode. One of the following diagnostics events is then entered in the diagnostics buffer of the F-CPU:

- Error in safety program: cycle time exceeded
- Number of the relevant main safety block (of F-runtime group that is not processed)
- Current cycle time in ms: "0"

5.2.5 F-runtime group communication (S7-1200, S7-1500)

Introduction

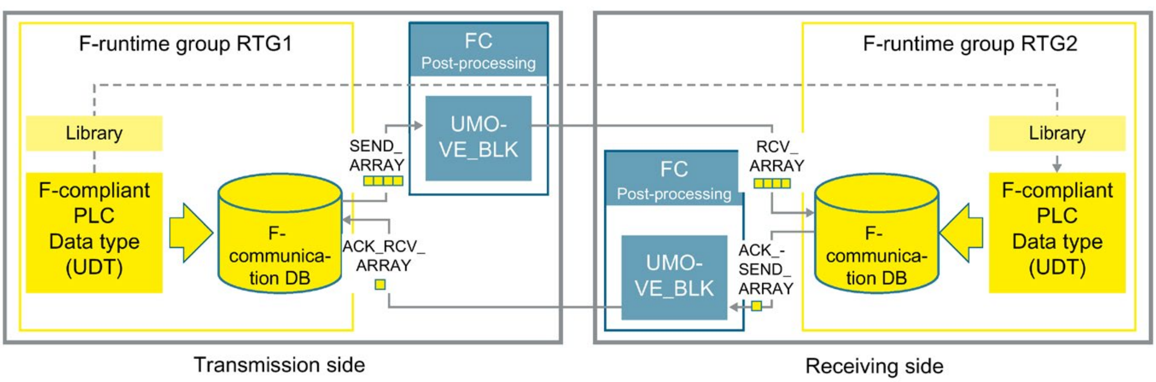
With the help of Flexible F-Link you realize a F-runtime group communication.

With Flexible F-Link a coded F-array is made available for the send data of the F-runtime group. The coded F-array is transferred to the other F-runtime group with standard instructions such as UNMOVE_BLK.

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 F-CPUs as of firmware V4.2
- Safety system version as of V2.2

F-runtime group communication



If you want to send a data fail-safe from one F-runtime group to another F-runtime group, follow these steps:

1. Create an F-compliant PLC data type (UUID) for the F-runtime group communication. The size is up to 100 bytes.
2. Create two F-communications for an F-runtime group communication in the Safety Administration Editor in the "Flexible F-Link" area. One F-communication each for the send and receive side.
3. Configure the same F-monitoring time and F-communication UUID for each F-runtime group communication relationship.

   Information on calculating the F-monitoring times can be found in Monitoring and response times (Page 607).

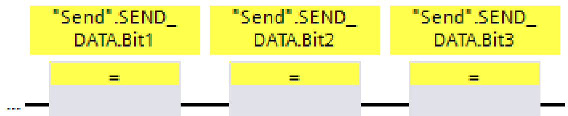
   For example:

   Flexible F-Link settings

	Name	PLC Data Type	Direction	F-monitoring time: (ms)	F-communication UUID
1	Send	Data	Send	500	5d61f443-ede6-4e4e-9db6-e79af634f9ad
2	Receive	Data	Receive	500	2c85b9e5-da34-422d-98eb-f7136309a3a2

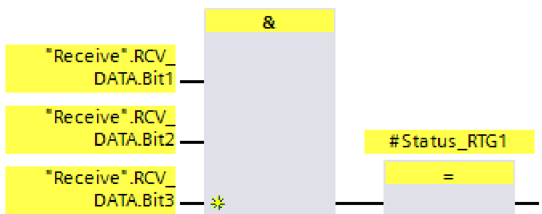
4. On the send side (e.g. RTG1) supply the data of the transmission DBs with the data to be sent.

   For example:



5. Read the receiving data from the receiving DB on the receive side (e.g. RTG2).

   For example:



6. Call the instruction "UMOVE_BLK" in the F-runtime group for the send data (e.g. RTG1) in the FC for post processing (Page 87).
7. Interconnect the "UMOVE_BLK" instruction for the data to be sent as follows:

   "Send" is the F-communication DB (Page 96) of the F-runtime group that sends the data.

   "Receive" is the F-communication DB (Page 96) of the F-runtime group that receives the data.

8. Call the instruction "UMOVE_BLK" in the F-runtime group for acknowledgment (e.g. RTG2) in the FC for post processing (Page 96).
9. Interconnect the "UMOVE_BLK" instruction for the acknowledgment connection as follows:

   "Receive" is the F-communication DB (Page 96) of the F-runtime group that sends the acknowledgment telegram.

   "Send" is the F-communication DB (Page 96) of the F-runtime group that receives the acknowledgment telegram.

10. Compile the user program.
11. Download the user program to the F-CPU.

WARNING

During the acceptance use the safety summary to verify that the offsets of the elements of the F-compliant PLC data types (UDT) match for the sending and receiving data within the safety message frame. For this purpose all members and addresses are listed in the safety summary per UDT. Also keep in mind that the size can be a up to 100 bytes. *(S088)*

WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, the F-communication UUID for the communication is explicitly provided by the system. By copying communications in Safety Administration Editor within the parameterization table or when copying into another F-CPU, the F-communication UUIDs are not generated new and are therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself need to ensure the uniqueness. To do this select the affected UUIDs and regenerate via the "Generate UUID" shortcut menu. The uniqueness must be ensured in the safety summary during acceptance of the safety program. *(S087)*

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Up-to-dateness of tags read from another F-runtime group

The same statements as those in the section "F-runtime group communication (S7-300, S7-400) (Page 141)" apply (except for the storage locations written or read or initial values).

5.2.6 F-shared DB (S7-300, S7-400)

Function

The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system. The F-shared DB is automatically inserted when the hardware configuration is compiled.

Using its name F_GLOBDB, you can evaluate certain data elements of the safety program in the standard user program.

Reading an F-shared DB in the standard user program

You can read out the following information in the F-shared DB in the standard user program or on an operator control and monitoring system:

- Operating mode: safety mode or disabled safety mode ("MODE" tag)
- Error information "Error occurred when executing safety program" ("ERROR" tag)
- Collective F-signature ("F_PROG_SIG" tag)
- Compilation date of the safety program ("F_PROG_DAT" tag, DATE_AND_TIME data type)

You use fully qualified access to access these tags (e.g. ""F_GLOBDB".MODE").

5.2.7 F-runtime group information DB (S7-1200, S7-1500)

Introduction

The F-runtime group information DB provides key information on the corresponding F-runtime group and on the safety program as a whole.

The F-runtime group information DB is generated automatically when an F-runtime group is created. A symbol, for example, "RTG1SysInfo", is assigned for the F-runtime group information DB. You can change the name in the *Safety Administration Editor*.

Information in the F-runtime group information DB

The F-runtime group information DB provides the following information:

Name		Data type	For processing in the safety program	For processing in the standard user program	Description
MODE		BOOL	x	x	1 = Disabled safety mode
F_SYSINFO					
	MODE	BOOL	—	x	1 = Disabled safety mode
	TCYC_CURR	DINT	—	x	Current cycle time of the F-runtime group, in ms
	TCYC_LONG	DINT	—	x	Longest cycle time of the F-runtime group, in ms
	TRTG_CURR	DINT	—	x	Current runtime of the F-runtime group, in ms
	TRTG_LONG	DINT	—	x	Longest runtime of the F-runtime group, in ms
	T1RTG_CURR	DINT	—	x	Not supported by *STEP 7 Safety V15.1*.
	T1RTG_LONG	DINT	—	x	Not supported by *STEP 7 Safety V15.1*.
	F_PROG_SIG	DWORD	—	x	Collective F-signature of the safety program
	F_PROG_DAT	DTL	—	x	Compilation date of the safety program
	F_RTG_SIG	DWORD	—	x	F-runtime groups signature
	F_RTG_DAT	DTL	—	x	Compilation date of the F-runtime group
	VERS_S7SAF	DWORD	—	x	Version identifier for *STEP 7 Safety*

You access the content of the F-runtime group information DB with fully qualified addressing. Either collectively with the F_SYSINFO PLC data type (UDT), for example, "RTG1SysInfo.F_SYSINFO", provided by the F-system or individual information, for example, "RTG1SysInfo.F_SYSINFO.MODE".

Program identification (Page 337)

"Flexible F-Link" area (S7-1200, S7-1500) (Page 96)

5.2.8 Deleting an F-runtime group

Deleting an F-runtime group

To delete an F-runtime group, proceed as follows:

1. In the area navigation of the *Safety Administration Editor*, click on the F-runtime group to be deleted.
2. Select the "Delete F-runtime group" button in the work area.
3. Confirm the dialog with "Yes".
4. Compile the safety program (Page 311) (menu command "Edit > Compile") to put your changes into effect.

The assignment of the F-blocks to an F-runtime group (to the calling block of the main safety block) is deleted. However, the F-blocks continue to exist.

Note

If you want to delete your safety program, delete all F-blocks outside the System blocks folder in the project tree.

F-blocks that do not allow deletion are deleted by recompiling the safety program or deactivating F-capability for the F-CPU (see Configuring an F-CPU (Page 48)).

5.2.9 Changing the F-runtime group (S7-300, S7-400)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Specify another block as the calling block of the main safety block.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time of the F-runtime group
- Specify another DB as a data block for F-runtime group communication.

5.2.10 Changing the F-runtime group (S7-1200, S7-1500)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Change the name, number, cycle time, phase shift and priority of the F-OB.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time and the cycle time warning limit of the F-runtime group.
- Assign another name for the F-runtime group information DB.
- Specify an FC for the preprocessing and postprocessing.

5.3 Creating F-blocks in FBD / LAD

5.3.1 Creating F-blocks

Introduction

In order to create F-FBs, F-FCs, and F-DBs for the safety program, you should follow the same basic procedure as for standard blocks. In the following, only the deviations from the procedure for standard blocks are presented.

Creating F-FBs, F-FCs, and F-DBs

You create F-blocks in the same way as for standard blocks. Proceed as follows:

1. Double-click on "Add new block" under "Program blocks" in the project tree.
2. In the dialog that appears, specify the type, name, and language and select the "Create F-block" check box. (If you do not select the check box, a standard block is created.)
3. After the dialog is confirmed, the F-block is opened in the *Program editor*.

Note the following

Note the following important instructions:

Note

You may not declare block parameters in the block interface of the main safety block because they cannot be supplied.

Note

You can edit start values in instance DBs. The function "Apply actual values" is not supported.

Note

You may not access static local data in single instances or multi-instances of other F-FBs.

Note

You must always initialize outputs of F-FCs.

The F-CPU can go to STOP mode if the information above is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If you wish to assign an address from the data area (data block) to a formal parameter of an F-FC as an actual parameter, you have to use fully qualified DB access. (S7-300, S7-400)

Note

Access to the inputs in an F-FB/F-FC is read-only, while access to the outputs is write-only.

Use an in/out if you wish to have both read and write access.

Note

For greater clarity, assign meaningful names to the F-blocks you have created.

Copying/pasting F-blocks

You can copy F-FBs, F-FCs, and F-DBs in exactly the same was as blocks of the standard user program.

(S7-1200, S7-1500) You may not copy an F-OB.

Exception:

You cannot copy blocks from the folder "Program blocks > System blocks".

See also

Changing the F-runtime group (S7-1200, S7-1500) (Page 151)

5.3.2 Know-how protection

For know-how protection of F-blocks, proceed as described in the *STEP 7* help under "Protecting blocks".

Requirements

Note the following with regard to know-how protection of F-blocks:

- An F-block to which you wish to assign know-how protection must be called in the safety program.
- Before you can set up the know-how protection for an F-block, the safety program must be consistent. For this purpose, compile (Page 311) the safety program.

Note

No source code is output for know-how protected F-blocks in the safety summary. Therefore, create the safety summary (for example to carry out a code review or accept the F-block) before you set up the know-how protection.

Note

If you want to edit the program code and/or the block interface of a know-how protected F-block, we recommend that you do not open the F-block by entering a password, but rather remove the know-how protection completely and set it up again after compiling.

Note

(S7-1200, S7-1500) When a know-how protected F-block or F-blocks called by it are renamed, the signature of the know-how protected F-block is not changed until the password is entered when opening or removing the know-how protection.

Note

When know-how protected F-blocks are used, warnings and error messages whose cause can lie in the know-how protected F-blocks can be displayed during compilation of the safety program. The warnings and error messages contain corresponding information. Example: In a know-how protected F-block, you perform read access to a tag of the standard user program to which write access is taking place in a different (know-how protected) F-block.

For S7-1200/1500 F-CPUs, you can obtain additional information from the safety summary in the section "Know-how protected F-blocks in the safety program".

See also

Reuse of F-blocks (Page 154)

5.3.3 Reuse of F-blocks

Introduction

You can reuse F-blocks that you have already tested and, if applicable, approved, in other safety programs – without having to test and approve them again.

You can protect the content of the F-block by setting up the know-how protection.

Like standard blocks, you can store F-blocks as master copies or types in global libraries or in the project library.

Additional information can be found in the *STEP 7 help* under "Using libraries".

Creating safety documentation for the F-block to be reused

Create safety documentation with the following information for F-blocks that you want to reuse.

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-blocks

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version when setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-blocks

The safety documentation should also contain a description of the functionality of the F-block, in particular if it is know-how protected.

The required information is obtained by creating a safety summary of the safety program in which you originally created, tested and approved the F-block to be reused.

This safety summary can also serve directly as the safety documentation for the F-block to be reused.

Checks when using the F-block to be reused

When reusing the F-block, ensure the following:

- The signature and initial value signature (S7-300/400) of the F-block are unchanged.
- (SIMATIC S7-1200, S7-1500) The documented safety system version is set.
- The documented (or functionally identical) versions of the versioned LAD/FBD instructions are set. You can find information about the instruction versions in the description of the instructions.
- The called F-blocks with the documented signatures and initial value signatures (S7-300/400) are used.

If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

Compliance of the know-how protected F-blocks used in the safety program with their safety documentation. (Page 366)

5.4 Programming startup protection

Introduction

> **⚠ WARNING**
>
> **STOP, for example, via programming device/PC, mode switch, communication function or "STP" instruction**
>
> Initiating STOP, for example by means of programming device/PC operation, mode switch, communication function or "STP" instruction as well as maintaining the STOP state are not safety-oriented. This STOP state can be easily (and unintentionally) be revoked, for example, by programming device/PC operation.
>
> When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost. The F-system automatically reintegrates the F-I/O.
>
> If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S031)*

Example of restart/startup prevention

In order to implement a restart/startup prevention, it must be possible to detect a startup. To detect a startup, you declare a tag of data type BOOL with initial value "TRUE" in an F-DB.

Block the output of process data when this tag has the value "1," for example, by passivating F-I/O using the PASS_ON tag in the F-I/O DB.

To manually enable the output of process data, you reset this tag by means of a user acknowledgment.

Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 187)

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 192)

F-I/O DB (Page 165)

F-I/O access 6

6.1 Addressing F-I/O

Overview

Below you will find a description of how to address the F-I/O in the safety program and which rules must be observed in the process.

Addressing via the process image

As with standard I/O, you access F-I/O (e.g., S7-1500/ET 200MP fail-safe modules) via the **process image** (PII and PIQ).

Direct reading (with I/O identification ":P") of inputs or writing of outputs is not possible in the safety program.

Updating the process image

The process image of the inputs of F-I/O is updated at the start of the F-runtime group. The process image of the outputs of F-I/O is updated at the end of the F-runtime group (see Program structure of the safety program (S7-300, S7-400) (Page 111) or Program structure of the safety program (S7-1200, S7-1500) (Page 114)). For additional information on updating the process image, refer to the note in Data Transfer from the Safety Program to the Standard User Program (Page 196).

The communication required between the F-CPU (process image) and the F-I/O to update the process image uses a special safety protocol in accordance with PROFIsafe.

Rules

- You may only address a channel (channel value and value status) of an F-I/O in **one** F-runtime group. The first programmed addressing defines the assignment for the F-runtime group.
- You may only address a channel (channel value and value status) of an F-I/O with a unit that matches the data type of the channel.
  Example: To access input channels of data type BOOL, you must use the "input (bit)" (I x.y) unit. Access to the 16 consecutive input channels of the data type BOOL via the unit "input word" (IW x) is not possible.
- Address only inputs and outputs that reference an actually existing channel (channel value and value status) (e.g. for an F-DO 10xDC24V with start address 10 only the outputs Q10.0 to Q11.1 for the channel values and the inputs I10.0 to I11.1 for the value status). Keep in mind that due to the special safety protocol, the F-I/O occupies a larger area of the process image than is required for the existing and enabled channels on the F-I/O (channel values and value status). To find the area of the process image where the channels (channel values and value status) are stored (channel structure), refer to the relevant manuals for the F-I/O.
- Channels can be disabled for certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules). Address only channels (channel value and value status) that are enabled in the hardware configuration. When you address channels that are disabled in the hardware configuration, a warning may be output when compiling the safety program.
- For certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules), a "1oo2 (2v2) sensor evaluation" can be specified. Two channels are grouped into one channel pair in this case, and the result of the "1oo2 sensor evaluation" is usually provided under the address of the channel with the lower channel number (see relevant manuals of the F-I/O). Address only this channel (channel value and value status) of the channel pair. When you address a different channel, a warning may be output when compiling the safety program.

WARNING

If you use an additional component between the F-CPU (S7-300/400) and the F-I/O that copies the safety message frame in accordance with PROFIsafe between the F-CPU (S7-300/400) and F-I/O per user program, you must test all safety functions affected by the copy function whenever you change the user-programmed copy function. *(S049)*

Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 246)

Value status (S7-1200, S7-1500) (Page 159)

6.2 Value status (S7-1200, S7-1500)

Properties

The value status is additional binary information for the channel value of an F-I/O. The value status is entered in the process image input (PII).

The value status is supported by S7-1500/ET 200MP, ET 200SP, ET 200eco PN, ET 200S, ET 200iSP, ET 200pro, S7-1200 fail-safe modules or S7-300 F-SMs, fail-safe I/O standard devices as well as fail-safe DP standard slaves that support the "RIOforFA-Safety" profile. Information about the value status can be found in the documentation of the respective F-I/O.

We recommend you amend the name of the channel value with "_VS" for the value status, for example, "TagIn_1_VS".

The value status provides information on the validity of the corresponding channel value:

- 1: A valid process value is output for the channel.
- 0: A fail-safe value is output for the channel.

The channel value and value status of an F-I/O can only be accessed from the same F-runtime group.

Location of value status bits in the PII for F-I/O with digital inputs

The value status bits come straight after the channel values in the PII.

Table 6- 1 Example: Address assignment in PII for F-I/O with 16 digital input channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	DI_{15}	DI_{14}	DI_{13}	DI_{12}	DI_{11}	DI_{10}	DI_9	DI_8
x + 2	Value status DI_7	Value status DI_6	Value status DI_5	Value status DI_4	Value status DI_3	Value status DI_2	Value status DI_1	Value status DI_0
x + 3	Value status DI_{15}	Value status DI_{14}	Value status DI_{13}	Value status DI_{12}	Value status DI_{11}	Value status DI_{10}	Value status DI_9	Value status DI_8

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs

The value status bits in the PII are mapped with the same structure as the channel values in the PIQ.

Table 6- 2 Example: Address assignment in PIQ for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Table 6- 3 Example: Address assignment in PII for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs and digital inputs

The value status bits come directly after the channel values in the PII in the following order:

- Value status bits for the digital inputs
- Value status bits for the digital outputs

Table 6- 4 Example: Address assignment in PIQ for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bit in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Table 6- 5 Example: Address assignment in PII for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status DI_1	Value status DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

The location of the channel values in the PII and PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog inputs

The value status bits come directly after the channel values in the PII.

Table 6- 6 Example: Address assignment in PII for F-I/O with 6 analog input channels (data type INT)

Byte in the F-CPU	Assigned bytes/bits in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AI_0							
...	...							
x + 10	Channel value AI_5							
x + 12	—	—	Value status AI_5	Value status AI_4	Value status AI_3	Value status AI_2	Value status AI_1	Value status AI_0

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog outputs

The value status bits are mapped in the PII.

Table 6- 7 Example: Address assignment in PIQ for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bytes in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AO_0							
...	...							
x + 10	Channel value AO_5							

x = Module start address

Table 6- 8 Example: Address assignment in PII for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	Value status AO_5	Value status AO_4	Value status AO_3	Value status AO_2	Value status AO_1	Value status AO_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

6.3 Process Data or Fail-Safe Values

When are fail-safe values used?

The safety function requires that fail-safe values (0) be used instead of process data for passivation of the entire F-I/O or individual channels of an F-I/O in the following cases. This applies both to digital channels (data type BOOL) as well as for analog channels (data type INT or DINT):

- When the F-system starts up
- When errors occur during safety-related communication (communication errors) between the F-CPU and F-I/O using the safety protocol in accordance with PROFIsafe
- When F-I/O faults and channel faults occur (such as wire break, short circuit, and discrepancy errors)
- As long as you enable passivation of the F-I/O with PASS_ON = 1 in the F-I/O DB (see below)
- As long as you disable the F-I/O with DISABLE = 1 in the F-I/O DB (see below)

Fail-safe value output for F-I/O/channels of an F-I/O

When **passivation** occurs for an **F-I/O with inputs**, the F-system provides the safety program with fail-safe values (0) in the PII instead of the process data pending at the fail-safe inputs of the F-I/O.

The overflow or underflow of a channel of the **SM 336; AI 6 x 13Bit** or **SM 336; F-AI 6 x 0/4 ... 20 mA HART** is recognized by the F-system as an F-I/O/channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If you want to process fail-safe values other than "0" in the safety program for an F-I/O with inputs **for analog channels of data type INT or DINT**, you can assign individual fail-safe values for QBAD = 1 and value status = 0 or QBAD_I_xx/QBAD_O_xx = 1 (instructions JMP/JMPN, LABEL and MOVE). For details about the characteristics go to QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status (Page 171).

WARNING
For an F-I/O with digital input channels (data type BOOL), the value provided in the PII must always be processed in the safety program, regardless of the value status or QBAD/QBAD_I_xx. *(S009)*

When **passivation** occurs in an **F-I/O with outputs**, the F-system outputs fail-safe values (0) at the fail-safe outputs instead of the output values provided by the safety program in the PIQ.

<table>
<tr><th>State of associated PAA/PIQ by ...</th><th>F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs</th><th>F-I/O without "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs</th><th>F-I/O with S7-300/400 F-CPUs</th></tr>
<tr><td>Startup of F-system</td><td colspan="3" rowspan="2">The F-system overwrites the PII/PIQ with fail-safe values (0).</td></tr>

</table>

Reintegration of F-I/O/channels of an F-I/O

The switchover from fail-safe values (0) to process data (**reintegration of an F-I/O**) takes place **automatically** or following **user acknowledgment** in the F-I/O DB. The reintegration method depends on the following:

- The reason for passivation of the F-I/O or channels of the F-I/O
- At F-I/Os without the "Channel failure acknowledge" channel parameter on the value of the ACK_NEC variable of the associated F-IO data blocks (Page 165).
- At F-I/Os with the "Channel failure acknowledge" channel parameter (for example F-modules S7-1500 / ET 200 MP / F-modules SIMATIC S7-1200) on the value of the channel parameter.

For fail-safe GSD based DP slaves / GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation.

Note

Note that for channel faults in the F-I/O, channel-granular passivation takes place if configured accordingly in the *hardware and network editor*. For the concerned channels, fail-safe values (0) are output.

Reintegration after channel faults reintegrates all channels whose faults were eliminated; faulty channels remain passivated.

Configuring F-I/O (Page 53)

6.4 F-I/O DB

Introduction

An F-I/O DB is automatically generated for each F-I/O (in safety mode) when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that you can evaluate or can/must write to in the safety program. It is not permitted to change the initial values of the tags directly in the F-I/O DB. When an F-I/O is deleted, the associated F-I/O DB is also deleted.

Access to an F-I/O DB

You access tags of the F-I/O DB for the following reasons:

- For reintegration of F-I/O after communication errors, F-I/O faults, or channel faults
- If you want to passivate the F-I/O depending on particular states of your safety program (for example, group passivation)
- If you want to deactivate the F-I/O (for example, configuration control)
- For changing parameters for fail-safe GSD based DP slaves/GSD based I/O devices
- If you want to evaluate whether fail-safe values or process data are output

6.4.1 Tags of the F-I/O DB

The following table presents the variables of an F-I/O DB:

	Tag	Data type	Function	Initial value
Tags that you can or must write	PASS_ON	BOOL	1=enable passivation	0
	ACK_NEC	BOOL	1=acknowledgment for reintegration required in the event of F-I/O or channel faults	1
	ACK_REI	BOOL	1=acknowledgment for reintegration	0
	IPAR_EN	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DISABLE*	BOOL	1=Deactivate F-I/O	0
Tags that you can evaluate	PASS_OUT	BOOL	Passivation output	1
	QBAD	BOOL	1=Fail-safe values are output	1
	ACK_REQ	BOOL	1=Acknowledgment request for reintegration	0
	IPAR_OK	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DIAG	BYTE	Non-fail safe service information	0
	DISABLED*	BOOL	1=F-I/O is deactivated	0
	QBAD_I_xx	BOOL	1=fail-safe values are output to input channel xx (S7-300/400)	1
	QBAD_O_xx	BOOL	1=fail-safe values are output to output channel xx (S7-300/400)	1

* As of Safety-System Version 2.1 for S7-1200/1500

Differences in evaluation in S7-1200/1500 F-CPUs and S7-300/400

The following table describes the differences in the evaluation of tags of the F-I/O DB and the value status depending on the F-I/O and F-CPU used.

Tag in the F-I/O DB or value status	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	F-I/O with S7-300/400 F-CPU
ACK_NEC	—[2]	x	x
QBAD[3]	x	x	x
PASS_OUT[3]	x	x	x
QBAD_I_xx[1]	—	—	x
QBAD_O_xx[1]	—	—	x
Wertstatus[1]	x	x	—

[1] QBAD_I_xx and QBAD_O_xx display the validity of the channel value channel-granular and thus correspond to the inverted value status with S7-1200/1500. Value status or QBAD_I_xx and QBAD_O_xx are not available with fail-safe DP GSD based slaves or fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

[2] In the case of F-I/Os that support the "Channel failure acknowledge" channel parameter (for example S7-1500/ET 200MP F-modules or S7-1200 F-modules), this replaces the ACK_NEC variable of the F-IO data block.

[3] For details about the characteristics, see "QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status"

6.4.1.1 PASS_ON

The PASS_ON tag allows you to enable passivation of an F-I/O, for example, depending on particular states in your safety program.

Using the PASS_ON tag in the F-I/O DB, you can passivate F-I/O; channel-granular passivation is not possible.

As long as PASS_ON = 1, **passivation** of the associated F-I/O occurs.

6.4.1.2 ACK_NEC

If an F-I/O fault is detected by the F-I/O, **passivation** of the relevant F-I/O occurs. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, **reintegration** of the relevant F-I/O occurs, depending on ACK_NEC:

- With ACK_NEC = 0, you can assign an **automatic reintegration**.
- With ACK_NEC = 1, you can assign a **reintegration** by **user acknowledgment**.

WARNING

The parameter assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

Note

The initial value for ACK_NEC is 1 after creation of the F-I/O DB. If you do not require automatic reintegration, you do not have to write ACK_NEC.

See also

After F-I/O or channel faults (Page 180)

6.4.1.3 ACK_REI

When the F-system detects a communication error or an F-I/O fault for an F-I/O, the relevant F-I/O is passivated. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. **Reintegration** of the F-I/O/channels of the F-I/O after the fault has been eliminated requires a **user acknowledgment** with a positive edge at variable ACK_REI of the F-I/O DB:

- After every communication error
- After F-I/O or channel faults only with parameter assignment "Channel failure acknowledgement = manual" or ACK_NEC = 1

Reintegration after channel faults reintegrates all channels whose faults were eliminated.

Acknowledgment is not possible until tag ACK_REQ = 1.

In your safety program, you must provide a user acknowledgment by means of the ACK_REI tag for each F-I/O.

WARNING
For the user acknowledgement, you must interconnect the ACK_REI tag of the F--I/O DB with a signal generated by an operator input. An interconnection with an automatically generated signal is not permitted. *(S011)*

Note

Alternatively, you can use the "ACK_GL" instruction to carry out reintegration of the F-I/O following communication errors or F-I/O/channel faults (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V15.1) (Page 487)).

6.4.1.4 IPAR_EN

The IPAR_EN tag corresponds to the iPar_EN_C tag in the PROFIsafe bus profile as of PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out when this tag must be set or reset when parameters of fail-safe GSD based DP slaves/GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Note that IPAR_EN = 1 does not trigger passivation of the relevant F-I/O.

If passivation is to occur when IPAR_EN = 1, you must also set tag PASS_ON = 1.

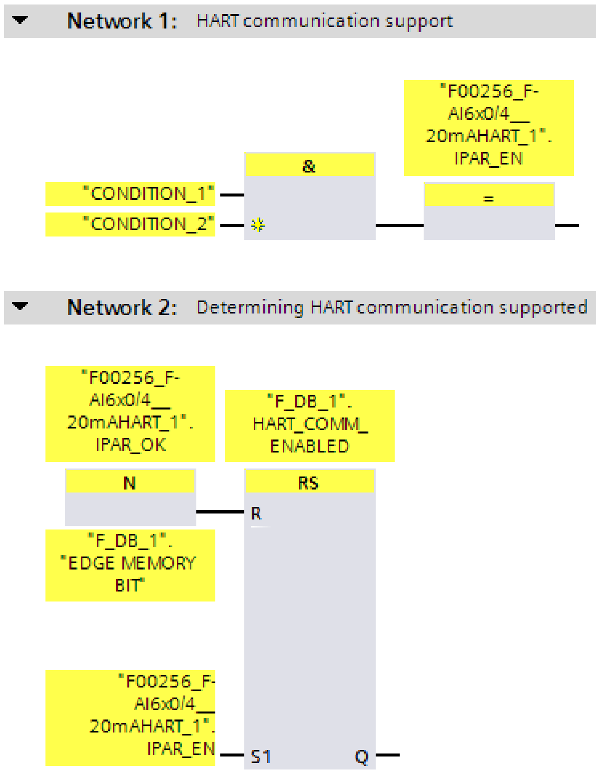
HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART

If you set the IPAR_EN tag to "1" while parameter "HART_Tor" = "switchable" is assigned, the HART communication for the SM 336; F-AI 6 x 0/4 ... 20 mA HART is enabled. Setting this tag to "0" disables the HART communication. The F-SM acknowledges the enabled or disabled HART communication with tag IPAR_OK = 1 or 0.

Enable HART communication only when your system is in a status, in which any reassignment of parameters for an associated HART device can be done without any risk.

If you want to evaluate the "HART communication enabled" status in your safety program, e.g., for the purpose of programming interlocks, you must build up the information as shown in the following example. This is necessary to ensure that the information is properly available even if communication errors occur while the HART communication is enabled with IPAR_EN = 1. Only change the status of the IPAR_EN tag during this evaluation if there is no passivation due to a communication error or F-I/O or channel fault.

Example of enabling HART communication



Additional information on HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART can be found in the Automation System S7-300, ET 200M Distributed I/O System manual, Fail-Safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151) manual and in the help on the F-module.

6.4.1.5 DISABLE

The DISABLE variable allows you to deactivate an F-I/O.

As long as DISABLI = 1, the associated F-I/Os are **passivated**.

Diagnostics entries of the safety program may no longer be entered in the diagnostics buffer of the F-CPU for this F-I/O (for example, due to communication error).

Existing diagnostics entries are marked as outgoing.

6.4.1.6 QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status

The following table set outs differences in the reaction of the channel values and QBAD, PASS_OUT, DISABLED, QBAD_I_xx/QBAD_O_xx variables and of the value status depending on the F-I/O and F-CPU used.

<table>
<tr><th>Fail-safe value output after...</th><th>F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU</th><th>F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPUs</th><th>F-I/O with S7-300/400 F-CPU</th></tr>
<tr><td>Startup of F-system</td><td colspan="2" rowspan="4">QBAD and PASS_OUT = 1
DISABLED unchanged
For all channels:
Channel value = fail-safe value (0)
Value status = 0*</td><td rowspan="4">QBAD and PASS_OUT = 1
For all channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1*</td></tr>
<tr><td>Communication errors</td></tr>
<tr><td>F-I/O faults</td></tr>
<tr><td>Channel faults
in configuration of passivation for complete F-I/O</td></tr>
<tr><td>Channel faults during configu-ration of channel-granular passivation</td><td>QBAD, PASS_OUT and DISABLED unchanged
For the affected channels:
Channel value = fail-safe value (0)
Value status = 0</td><td>QBAD and PASS_OUT = 1
DISABLED unchanged
For the affected chan-nels:
Channel value = fail-safe value (0)
Value status = 0*</td><td>QBAD and PASS_OUT = 1
For the affected channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1*</td></tr>
<tr><td>As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1</td><td colspan="2">QBAD = 1, PASS_OUT and DISABLED unchanged
For all channels:
Channel value = fail-safe value (0)
Value status = 0*</td><td>QBAD = 1, PASS_OUT un-changed
For all channels:
Channel value = fail-safe value (0)
QBAD_I_xx and QBAD_O_xx = 1*</td></tr>
<tr><td>As long as the F-I/O is deac-tivated in the F-I/O DB with DISABLE = 1</td><td colspan="2">QBAD, PASS_OUT and DISABLED = 1
For all channels:
Channel value = fail-safe value (0)
Value status = 0*</td><td>-</td></tr>
</table>

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

6.4.1.7 ACK_REQ

When the F-system detects a communication error or an F-I/O fault or channel fault for an F-I/O, the relevant F-I/O or individual channels of the F-I/O are passivated. ACK_REQ = 1 signals that **user acknowledgment** is required for reintegration of the relevant F-I/O or channels of the F-I/O.

The F-system sets ACK_REQ = 1 as soon as the fault has been eliminated and user acknowledgment is possible. For channel-granular passivation, the F-system sets ACK_REQ = 1 as soon as the channel fault is corrected. User acknowledgment is possible for this fault. Once acknowledgment has occurred, the F-system resets ACK_REQ to 0.

Note

For F-I/O with outputs, acknowledgment after F-I/O or channel faults may only be possible some minutes after the fault has been eliminated, until the necessary test signal is applied (see *F-I/O manuals*).

6.4.1.8 IPAR_OK

The IPAR_OK tag corresponds to the iPar_OK_S tag in the PROFIsafe bus profile, PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out how to evaluate this tag when parameters of fail-safe GSD based DP slaves or GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

For HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART see Chapter IPAR_EN (Page 169).

6.4.1.9 DIAG

The DIAG tag provides non-fail-safe information (1 byte) about errors or faults that have occurred for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you perform an acknowledgment with the ACK_REI tag or until automatic reintegration takes place.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Timeout detected by F-I/O	The PROFIBUS/PROFINET connection between F-CPU and F-I/O is faulty. The value of the F-monitoring time for the F-I/O is set too low. The F-I/O are receiving invalid parameter assignment data or	• Check the PROFIBUS/PROFINET connection and ensure that there are no external sources of interference. • Check the parameter assignment of the F-I/O. If necessary, set a higher value for the monitoring time. Recompile the hardware configuration, and download it to the F-CPU. Recompile the safety program. • Check the diagnostics buffer of the F-I/O. • Turn the power of the F-I/O off and back on.

1 Not for F-I/O that support the "RIOforFA-Safety" profile.

2 For S7-300/400 F-CPUs only

3 For S7-1200/1500 F-CPUs only

6.4.2 Accessing tags of the F-I/O DB

Name of the F-I/O DB

An F-I/O DB is automatically generated for each F-I/O when the F-I/O is configured in the *hardware and network editor* and a name is generated at the same time.

The name is formed by combining the fixed prefix "F", the start address of the F-I/O, and the names entered in the properties for the F-I/O in the *hardware and network editor* (example: F00004_F-DI24xDC24V_1).

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB are assigned automatically when the F-I/O are configured. The naming scheme depends on the setting in the Safety Administration Editor ("Specifies driver I-DBs without prefix (Page 90)"). You change the number in the "Properties" tab of the associated F-I/O. You change the name by renaming the F-I/O.

Rule for accessing tags of the F-I/O DB

Tags of the F-I/O DB of an F-I/O can only be accessed from the F-runtime group from which the channels of this F-I/O are accessed (if access is made).

"Fully qualified DB access"

You can access the tags of the F-I/O DB via a "fully qualified DB access" (that is, by specifying the name of the F-I/O DB and by specifying the name of the tag).

Example of evaluating the QBAD tag

F-I/O DB (Page 165)

6.5 Passivation and reintegration of F-I/O

Overview

In the following you can find information on passivation and reintegration of F-I/O.

Signal sequence charts

The signal sequences presented below represent typical signal sequences for the indicated behavior.

Actual signal sequences and, in particular, the relative position of the status change of individual signals can deviate from the given signal sequences within the scope of known "fuzzy" cyclic program execution factors, depending on the following:

- The F-I/O used
- The F-CPU used
- The cycle time of the (F-)OB in which the associated F-runtime group is called
- The target rotation time of the PROFIBUS DP or the update time of the PROFINET IO

Note

The signal sequences shown refer to the status of signals in the user's safety program.

6.5.1 After startup of F-system

Behavior after a startup

Fail-safe value output after startup of the F-system	**F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU**	**F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU**	**Every F-I/O with S7-300/400 F-CPU**
Passivation of the entire F-I/O occurs during startup.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the F-I/O, i.e. the provision of process values in the PII or the output of process values provided in the PIQ at the fail-safe outputs, takes place **automatically**, regardless of the setting at the ACK_NEC tag or the configuration "Channel failure acknowledge", no sooner than the second cycle of the F-runtime group after startup of the F-system.

You can find additional information on pending F-communication, F-I/O or channel errors during startup of the F-system in the sections After communication errors (Page 178) and After F-I/O or channel faults (Page 180).

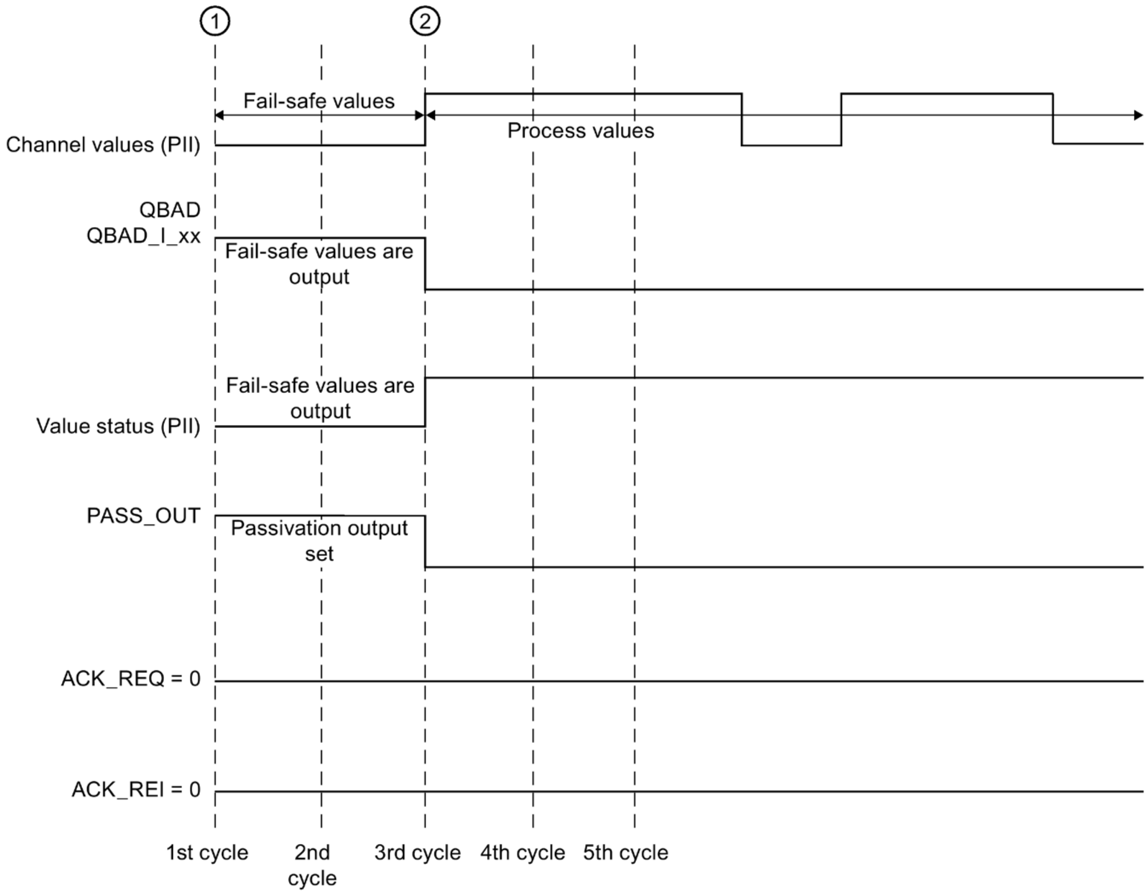
For fail-safe GSD based DP slaves/GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Depending on the F-I/O you are using and the cycle time of the F-runtime group and PROFIBUS DP/PROFINET IO, several cycles of the F-runtime group can elapse before reintegration occurs.

If communication between the F-CPU and F-I/O takes longer to establish than the F-monitoring time set in the properties for the F-I/O, automatic reintegration does not take place.

Signal sequence for passivation and reintegration of F-I/O after F-system startup

Example for an F-I/O with inputs:



① Startup of F-system/passivation

② Automatic reintegration (e.g. third cycle)

WARNING

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The F-system automatically reintegrates the F-I/O, as described above.

An operating error or an internal error can also trigger a startup of the safety program with the values from the load memory. If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S008)*

6.5.2 After communication errors

Behavior after communication errors

Fail-safe value output after communication errors	**F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU**	**F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU**	**Every F-I/O with S7-300/400 F-CPU**
If a communication error between the F-CPU and the F-I/O is detected, all channels of the entire F-I/O are passivated.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

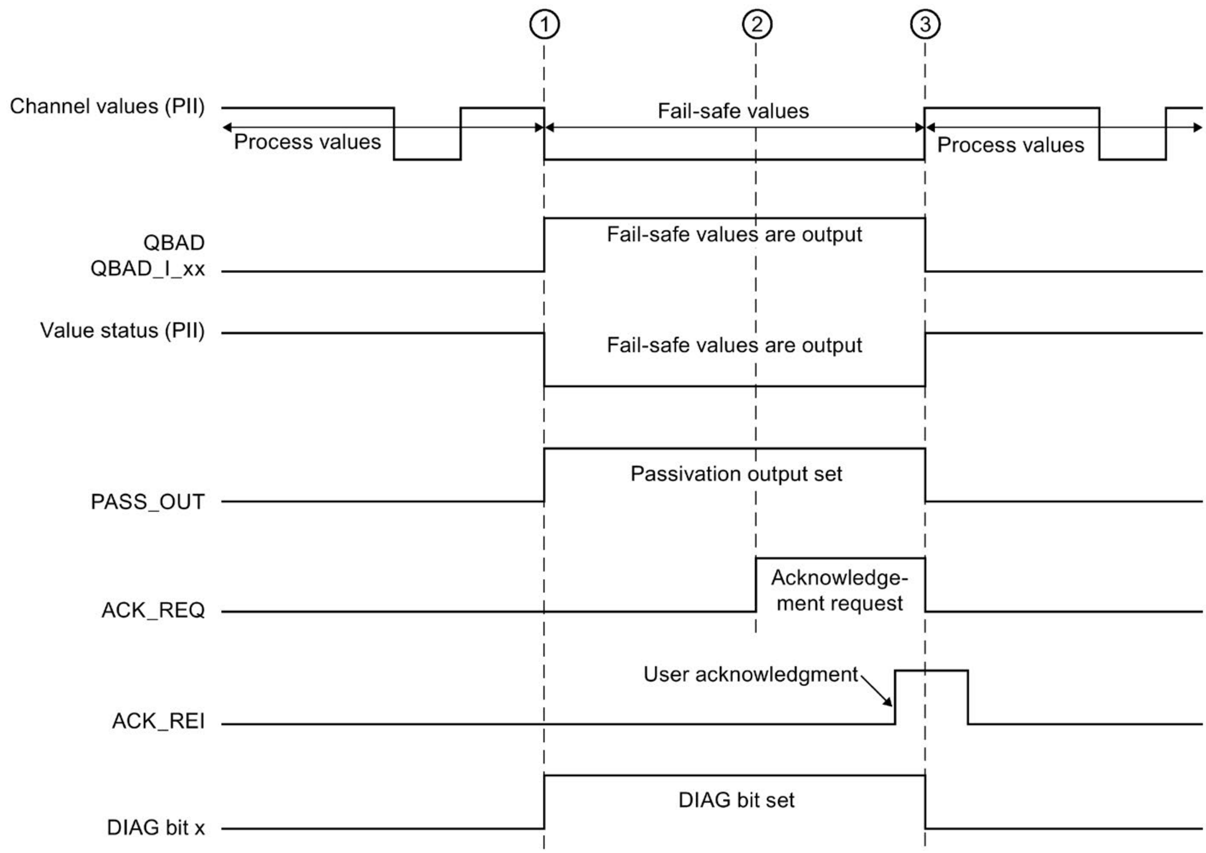
Reintegration of F-I/O

Reintegration of the relevant F-I/O, that is, provision of process data in the PII or output of process data provided in the PIQ at the failsafe outputs, takes place only when the following occurs:

- All communication errors have been eliminated and the F-system has set tag ACK_REQ = 1
- A **user acknowledgment** with a positive edge has occurred:
  - At the ACK_REI tag of the F-I/O DB (Page 168) or
  - At the ACK_REI_GLOB input of the "ACK_GL" instruction (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V15.1) (Page 487))

Signal sequence for passivation and reintegration of F-I/O after communication errors

Example for an F-I/O with inputs:



①	Communication error/passivation
②	All communication errors have been eliminated
③	Reintegration

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 192)

6.5.3 After F-I/O or channel faults

Behavior after F-I/O faults

Fail-safe value output after F-I/O faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If an F-I/O fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Behavior after channel fault

Fail-safe value output after channel faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
When passivation for **complete** F-I/O is configured: If a channel fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
With configuration of **channel-granular** passivation: If a channel fault is detected by the F-system, passivation of all the affected channels of the entire F-I/O occurs.	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the relevant F-I/O or the relevant channels of the F-I/O, that is, provision of process data in the PII or output of process data provided in the PIQ at the failsafe outputs, takes place only when the following occurs:

- All F-I/O or channel faults have been eliminated.

If you have configured channel-granular passivation for the F-I/O, the relevant channels are reintegrated once the fault is corrected; any faulty channels remain passivated.

Reintegration is performed depending on your setting for the ACK_NEC tag or the "Channel failure acknowledge" parameter (configuration of the S7-1500/ET 200MP F-module and S7-1200 F-module)

- With ACK_NEC = 0 or the configuration "Channel failure acknowledge = automatic", **automatic reintegration** is performed as soon as the F-system detects that the fault has been corrected. For F-I/O with inputs, reintegration takes place right away. For F-I/O with outputs or F-I/O with inputs and outputs, depending on the F-I/O you are using, reintegration can take several minutes, first after the necessary test signals have been applied, which are used by the F-I/O to determine that the fault has been eliminated.
- With ACK_NEC = 1 or the configuration "Channel failure acknowledge = manual", reintegration is performed only as a result of user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB or at the ACK_REI_GLOB input of the "ACK_GL" instruction. Acknowledgment can be made as soon as the F-system detects that the fault has been eliminated and tag ACK_REQ = 1 has been set.

  For fail-safe GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based I/O device .

WARNING

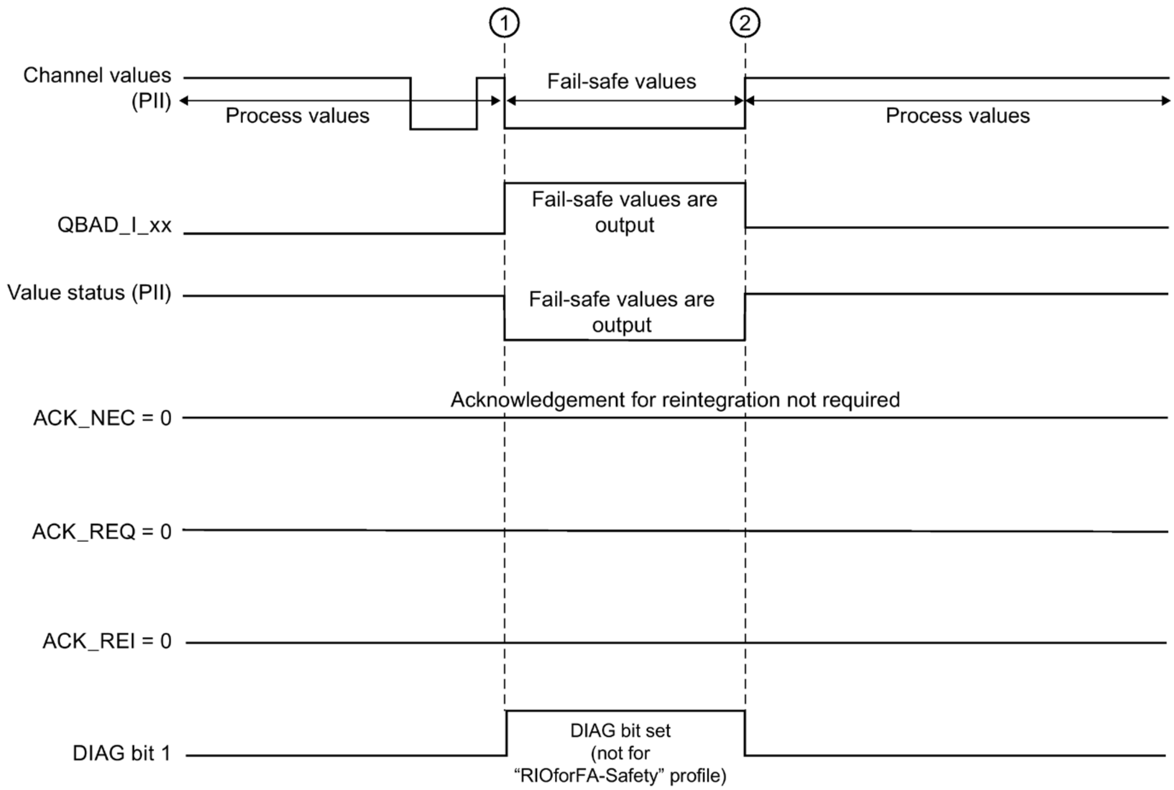
Following a power failure of the F-I/O lasting less than the assigned F-monitoring time for the F-I/O, automatic reintegration can occur regardless of your setting for the ACK_NEC tag, as described for the case when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic".

If automatic reintegration is not permitted for the relevant process in this case, you must program startup protection by evaluating tags QBAD or QBAD_I_xx and QBAD_O_xx or value status or PASS_OUT.

In the event of a power failure of the F-I/O lasting longer than the specified F-monitoring time for the F-I/O, the F-system detects a communication error. *(S012)*

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic" (for passivation of entire F-I/O after channel faults)

Example for an F-I/O with inputs:



① F-I/O or channel faults
Passivation

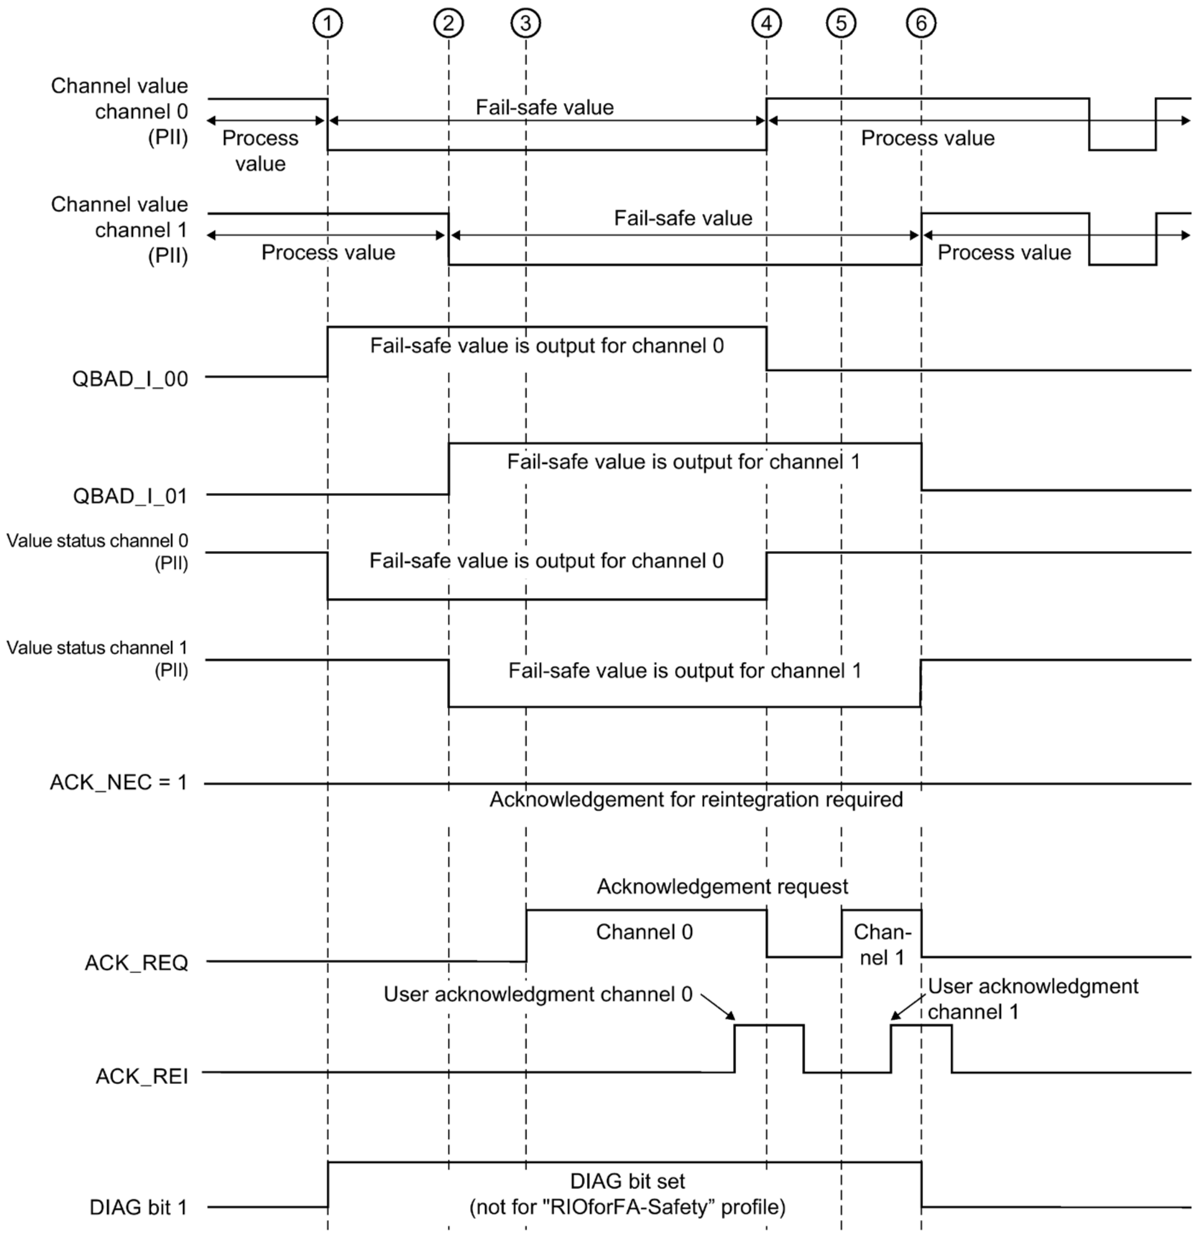
② F-I/O or channel faults corrected
Automatic reintegration

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for passivation of entire F-I/O after channel faults)

For the signal sequence for passivation and reintegration of F-I/O after F-I/O or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (initial value), see After communication errors (Page 178).

Signal sequence for passivation and reintegration of F-I/O after channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for channel-granular passivation)

Example for an F-I/O with inputs:



① Channel fault for channel 0/passivation of channel 0
② Channel fault for channel 1/passivation of channel 1
③ Channel fault eliminated for channel 0
④ Reintegration of channel 0
⑤ Channel fault eliminated for channel 1
⑥ Reintegration of channel 1

6.5.4 Group passivation

Programming a group passivation

If you want to enable passivation of additional F-I/O when an F-I/O or a channel of an F-I/O is passivated by the F-system, you can use the PASS_OUT/PASS_ON tags to perform **group passivation** of the associated F-I/O.

Group passivation by means of PASS_OUT/PASS_ON can, for example, be used to force simultaneous reintegration of all F-I/O after startup of the F-system.

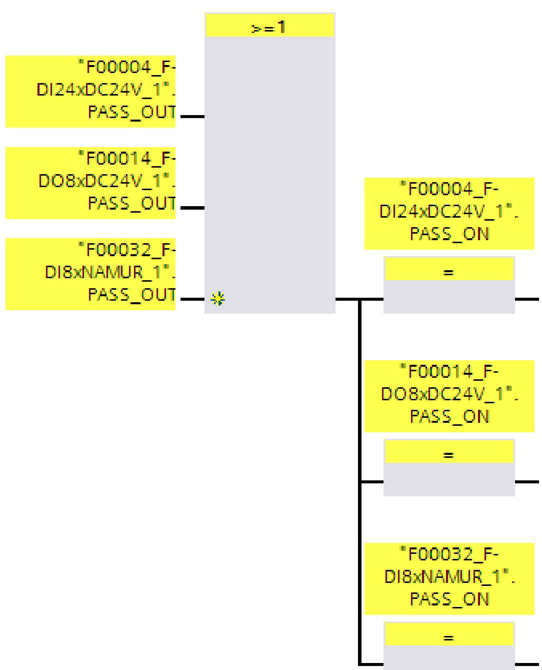
For group passivation, you must OR all PASS_OUT tags of the F-I/O in the group and assign the result to all PASS_ON tags of the F-I/O in the group.

During use of fail-safe values (0) due to group passivation by means of PASS_ON = 1, the QBAD tag of the F-I/O of this group = 1.

Note

Note the different behavior of PASS_OUT for F-I/O with/without "RIOforFA-Safety" profile (see table in section QBAD/PASS_OUT/DISABLED/QBAD_I_xx/QBAD_O_xx and value status (Page 171)).

Example of group passivation

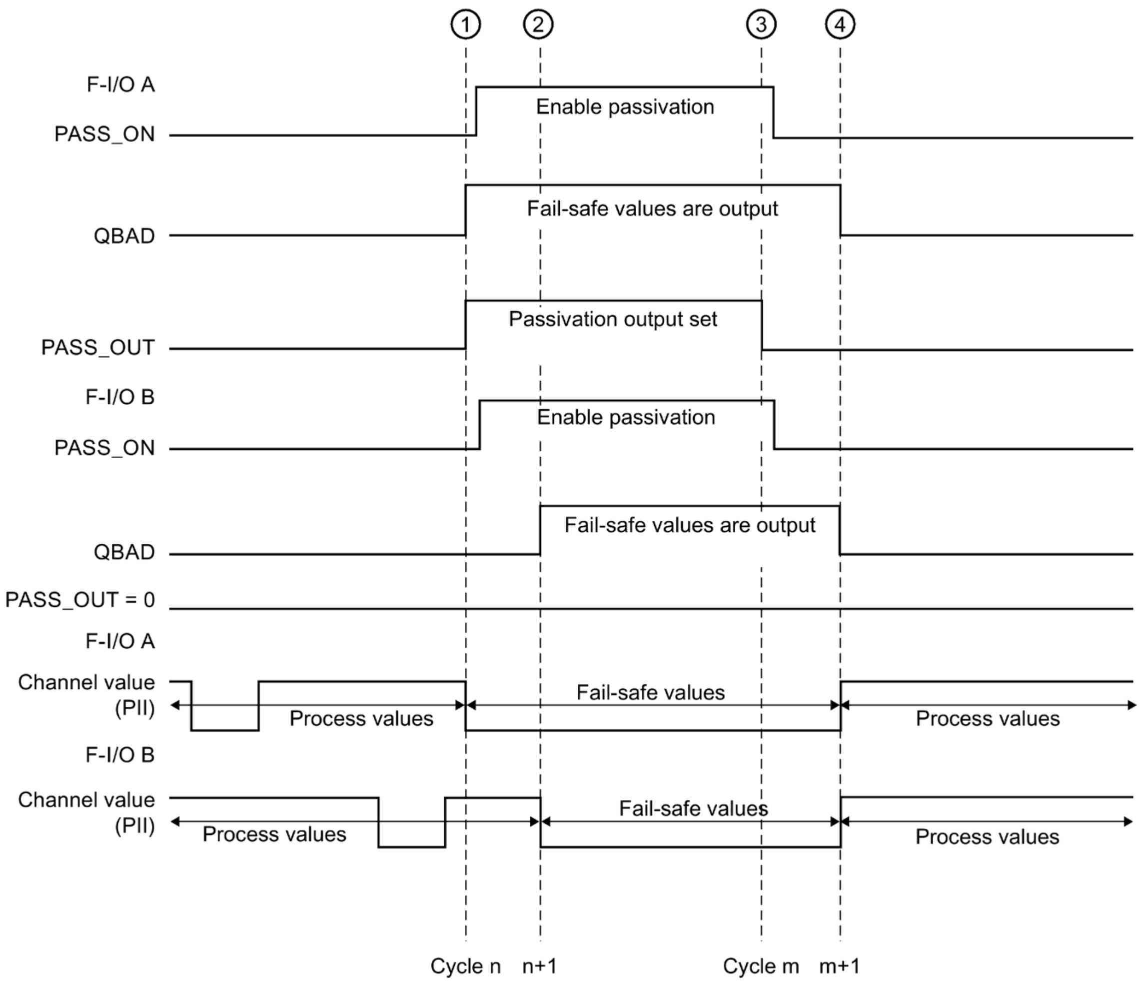


Reintegration of F-I/O

Reintegration of F-I/O passivated by group passivation occurs **automatically**, if a reintegration (**automatic** or **through user acknowledgment**) occurs for the F-I/O that triggered the group passivation (PASS_OUT = 0).

Signal sequence for group passivation following communication error

Example for two F-I/O with inputs:



① Communication error in F-I/O A
Passivation of F-I/O A

② Passivation of F-I/O B

③ Communication error in F-I/O A corrected and acknowledged

④ Reintegration F-I/O A and B

Implementation of user acknowledgment 7

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller

Options for user acknowledgment

Depending on the result of the risk analysis, you have the following options for implementing a user acknowledgment:

- An acknowledgment key that you connect to an F-I/O with inputs
- An acknowledgment key that you connect to an standard I/O with inputs
- An HMI system

User acknowledgment by means of acknowledgment key

Note

When you implement user acknowledgment by means of acknowledgment key, and a communication error, an F-I/O fault, or a channel fault occurs in the F-I/O to which the acknowledgment key is connected, then it will not be possible to acknowledge the reintegration of this F-I/O.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected.

A user acknowledgment may be issued using an acknowledgment key connected to a standard I/O with inputs if this risk analysis allows this.

User acknowledgment by means of an HMI system

For implementation of a user acknowledgment by means of an HMI system, the ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V15.1) (Page 577) instruction is required.

Procedure for programming user acknowledgment by means of an HMI system (S7-300, S7-400)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and an "acknowledgment value" of "9" (2nd step in acknowledgment).

   or

   Assign function key 1 to transfer an "acknowledgment value" of "6" (1st step in acknowledgment) once, and function key 2 to transfer an "acknowledgment value" of "9" (2nd step in acknowledgment) once. You need to assign the in/out IN (in the data area of the ACK_OP instruction) to the field or the function keys.
3. Optional: In your HMI system, evaluate output Q in the instance DB of ACK_OP to show the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

If you want to perform a user acknowledgment exclusively from a programming device or PC using the watch table (monitor/modify tag) without having to disable safety mode, then you must transfer an operand (memory word or DBW of a DB of the standard user program) at in/out IN when calling ACK_OP. You can then transfer "acknowledgment values" "6" and "9" on the programming device or PC by modifying the memory word or DBW of a DB once. The memory word or DBW of a DB must not be written by the program.

Note

If you connect the in/out IN to a memory word or DBW of a DB, you have use a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction at the in/out IN.

WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

The configuration of your operator control and monitoring system does not have any effect on the collective F-signature.

Procedure for programming user acknowledgment by means of an HMI system (S7-1200, S7-1500)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. Assign the ACK_ID input an identifier between 9 and 30000 for the acknowledgment.
3. Assign the in/out IN a memory word or DBW of a DB of the standard user program.

   Note

   You need to provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction.

4. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and the "Identifier" configured at the ACK_ID input (2nd step in acknowledgment).

   or

   Allocate a function key 1 for a one-time transfer of the "acknowledgment value" of "6" (1st step in acknowledgment) and a function key 2 for a one-time transfer of the "Identifier" set at the ACK_ID input (2nd step in acknowledgment).
   You need to assign memory word or the DBW of the DB of the standard user program assigned to the in/out IN to the field or the function keys.
5. Optional: In your HMI system, evaluate output Q in the instance DB of ACK_OP to show the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

The supply of the IN input/output of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the F-collective signature, the F-SW collective signature or the signature of the block that calls the ACK_OP instruction.

Changes to the supply of the IN input/output or to the configuration of your operator control and monitoring system therefore do not result in a changed F-collective signature/F-SW collective signature/signature of the calling block.

Example of procedure for programming a user acknowledgment for reintegrating an F-I/O

1. Optional: set the ACK_NEC tag in the respective F-I/O DB (Page 168) to "0" if automatic reintegration (without user acknowledgment) is to take place after an F-I/O fault or a channel fault.

⚠ WARNING
The parameter assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

2. Optional: Evaluate the QBAD or QBAD_I_xx/QBAD_O_xx (S7-300/400) tags or value status (S7-1200, S7-1500) or DIAG in the respective F-I/O DB to trigger an indicator light in the event of an error, and/or generate error messages on the HMI system in your standard user program by evaluating the above tags or the value status. These messages can be evaluated before performing the acknowledgment operation. Alternatively, you can evaluate the diagnostic buffer of the F-CPU.
3. Optional: Evaluate the ACK_REQ tag in the respective F-I/O DB, for example, in the standard user program or on the HMI system, to query or to indicate whether user acknowledgment is required.
4. Assign the input of the acknowledgment key or the OUT output of the ACK_OP instruction to the ACK_REI tag in the respective F-I/O DB or the ACK_REI_GLOB input of the ACK_GL instruction (see above).

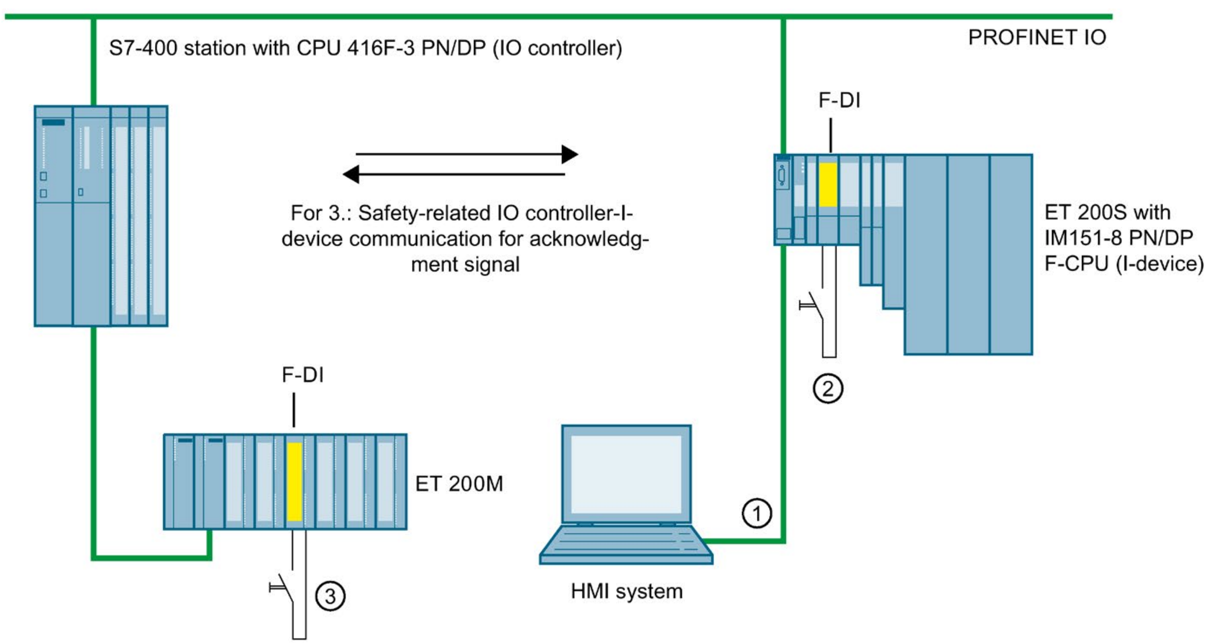
7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device

Options for user acknowledgment

You can implement a user acknowledgment by means of:

- An HMI system that you can use to access the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the DP master/IO controller

These three options are illustrated in the figure below.



1. User acknowledgment by means of an HMI system with which you can access the F-CPU of the I-slave/I-device

The ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V15.1) (Page 577) instruction is required to implement user acknowledgment with an HMI system that you can use to access the F-CPU of the I-slave/I-device.

Programming procedure

Follow the procedure described in "Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 187)" under "Programming procedure ...".

From your HMI system, you can then directly access the instance DB of ACK_OP in the I-slave/I-Device.

2. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the I-slave/I-device

Note

In the event of a communication error, F-I/O fault, or channel fault in the F-I/O to which the acknowledgment key is connected, an acknowledgment for reintegration of this F-I/O is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected (see 1).

3. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the DP master/IO controller

If you want to use the acknowledgment key that is assigned to the F-CPU at the DP master/IO controller to perform user acknowledgment in the safety program of the F-CPU of an I-slave/I-device as well, you must transmit the acknowledgment signal from the safety program in the F-CPU of the DP master/IO controller to the safety program in the F-CPU of the I-slave/I-device using safety-related master-I-slave/IO controller-I-device communication.

Programming procedure

1. Place the SENDDP (Page 588) instruction in the safety program in the F-CPU of the DP master/IO controller.
2. Place the RCVDP (Page 588) instruction in the safety program in the F-CPU of the I-slave/I-Device.
3. Supply an input SD_BO_xx of SENDDP with the input of the acknowledgment key.
4. The acknowledgment signal for evaluating user acknowledgments is now available at the corresponding RD_BO_xx output of RCVDP.

   The acknowledgment signal can now be read in the program sections in which further processing is to take place with fully qualified access directly in the associated instance DB (for example, "RCVDP_DB".RD_BO_02).

5. Supply the corresponding input SUBBO_xx of RCVDP with FALSE (fail-safe value 0) to ensure that user acknowledgment is not accidentally triggered before communication is established for the first time after startup of the sending and receiving F-systems, or in the event of a safety-related communication error.

Note

If a communication error, an F-I/O error, or a channel fault occurs at the F-I/O to which the acknowledgment key is connected, then an acknowledgment for reintegration of this F-I/O will no longer be possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the DP master/IO controller.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the DP master/IO controller, in order to acknowledge reintegration of the F-I/O to which an acknowledgment key is connected.

If a safety-related master-I-slave/IO controller-I-Device communication error occurs, the acknowledgment signal cannot be transmitted, and an acknowledgment for reintegration of safety-related communication is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of the safety-related communication for transmission of the acknowledgment signal (see 1).

---

8 Data exchange between standard user program and safety program

You have the option of transferring data between the safety program and the standard user program. Tags can be transferred using DBs, F-DBs and bit memory:

	From the standard user program		From the safety program	
	Read access	**Write access**	**Read access**	**Write access**
Tag from DB	Permitted	Permitted	A tag from the DB can be read-accessed *or* write-accessed	
Tag from F-DB	Permitted	**Not permitted**	Permitted	Permitted
Bit memory	Permitted	Permitted	Bit memory can be read-accessed *or* write-accessed	

You can also access the process image of the standard I/O and F-I/O:

		From the standard user program		From the safety program	
		Read access	**Write access**	**Read access**	**Write access**
Process image of standard I/O	PII	Permitted	Permitted	Permitted	**Not permitted**
	PIQ	Permitted	Permitted	**Not permitted**	Permitted
Process image of F-I/O	PII	Permitted	**Not permitted**	Permitted	**Not permitted**
	PIQ	Permitted	**Not permitted**	**Not permitted**	Permitted

Decoupling of the safety program from the standard program

For data exchange between standard user program and safety program, we recommend that you define special data blocks (transfer data blocks) in which the data to be exchanged is stored. This action allows you to decouple the blocks of the standard and the safety program. The changes in the standard program do not affect the safety program (and vice versa) provided these data blocks are not modified.

8.1 Data Transfer from the Safety Program to the Standard User Program

Data transfer from the safety program to the standard user program

The standard user program can read all data of the safety program, for example using symbolic (fully qualified) accesses to the following:

- The instance DBs of the F-FBs ("Name of instance DB".Signal_x)
- F-DBs (for example "Name of F_DB".Signal_1)
- The process image input and output of F-I/O (for example "Emergency_Stop_Button_1" (I 5.0))

Note

For S7-300/400 F-CPUs

The process image input of F-I/O is updated not only at the start of the main safety block, but also by the standard operating system.

To find the standard operating system update times, refer to the *Help on STEP 7* under "Process image input and output". For F-CPUs that support process image partitions, also bear in mind the update times when process image partitions are used. For this reason, when the process image input of F-I/O is accessed in the standard user program, it is possible to obtain different values than in the safety program. The differing values can occur due to:

- Different update times
- Use of fail-safe values in the safety program

To obtain the same values in the standard user program as in the safety program, you must not access the process image input in the standard program until after execution of an F-runtime group. In this case, you can also evaluate the QBAD or QBAD_I_xx tag in the associated F-I/O DB in the standard user program, in order to find out whether the process image input is receiving fail-safe values (0) or process data. When using process image partitions, also make sure that the process image is not updated by the standard operating system or by the UPDAT_PI instruction between execution of an F-runtime group and evaluation of the process image input in the standard user program.

Note

For S7-1200/1500 F-CPUs

The process image input of F-I/O is updated prior to processing the main safety block.

You can also write safety program data directly to the standard user program (see also the table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 119)):

Data block/bit memory

In order to write safety program data directly to the standard user program (e.g., DIAG output of the SENDDP instruction), you can write to data blocks of the standard user program from the safety program. However, a written tag must not be read in the safety program itself.

You can also write to bit memory in the safety program. However, written bit memory must not be read in the safety program itself.

Process image output

You can write to the process image output (PIQ) of standard I/O in the safety program, for example for display purposes. The PIQ must not be read in the safety program.

8.2 Data Transfer from Standard User Program to Safety Program

Data transfer from standard user program to safety program

As a basic principle, only fail-safe data or fail-safe signals from F-I/O and other safety programs (in other F-CPUs) can be processed in the safety program, as standard tags are unsafe.

If you have to process tags from the standard user program in the safety program, however, you can evaluate either bit memory from the standard user program, tags from a standard DB, or the process image input (PII) of standard I/O in the safety program (see table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 119)).

Note that structural changes to standard data blocks which are used in the safety program lead to inconsistencies of the safety program and possibly to the password being requested. In this case the collective F-signature is the same as the original again after compilation. To prevent this effect, use "interprocess communication blocks" between the standard user program and the safety program.

⚠ WARNING
Because these tags are not generated safely, you must carry out additional process-specific validity checks in the safety program to ensure that no dangerous states can arise. If bit memory, a tag of a standard DB, or an input of standard I/O is used in both F-runtime groups, you must perform the validity check separately in each F-runtime group. *(S015)*

To facilitate checks, all PLC tags from the standard user program that are evaluated in the safety program are included in the safety summary (Page 341).

Bit memory

In order to process tags of the standard user program in the safety program, you can also read bit memory in the safety program. However, read bit memory must not be written in the safety program itself.

Data block

In order to process tags of the standard user program in the safety program, you can read tags from data blocks of the standard user program in the safety program. However, a read tag must not be written in the safety program itself.

Process image of the inputs

You can read the process image input (PII) of standard I/O in the safety program. The PII must not be written in the safety program.

Examples: Programming validity checks

- Use Comparison (Page 511) instructions to check whether tags from the standard user program exceed or fall below permitted high and low limits. You can then influence your safety function with the result of the comparison.
- Use the ---(S)---: Set output (STEP 7 Safety V15.1) (Page 404), ---(R)---: Reset output (STEP 7 Safety V15.1) (Page 403) or SR: Set/reset flip-flop (STEP 7 Safety V15.1) (Page 406) instructions, for example, with tags from the standard user program to allow a motor to be switched off, but not switched on.
- For switch-on sequences, use the AND logic operation instruction, for example, to logically combine tags from the standard user program with switch-on conditions that you derive from fail-safe tags.

If you want to process tags from the standard user program in the safety program, please bear in mind that there is not a sufficiently simple method of checking validity for all tags.

Reading tags from the standard user program that can change during the runtime of an F-runtime group

If you want to read tags from the standard user program (bit memory, tags of a standard DB, or PII of standard I/O) in the safety program, and these tags can be changed - either by the standard user program or an operator control and monitoring system - during runtime of the F-runtime group in which they are read (for example because your standard user program is being processed by a higher-priority cyclic interrupt), you must use bit memory or tags of a standard DB for this purpose.

(S7-1200/1500) You must create the standard OB with the same priority as the F-OB. The standard OB must be called phase-shifted to the F-OB and describe the variables in this.

We recommend that you select the phase shift so that the standard OB is executed immediately before the F-OB.

(S7-300/400) You must write the bit memory or tags of a standard DB with the tags from the standard user program immediately before calling the F-runtime group.

You are then permitted to access only this bit memory or these tags of a standard DB in the safety program.

Also note that **clock memory** that you defined when configuring your F-CPU in the "Properties" tab can change during runtime of the F-runtime group, since clock memory runs asynchronously to the F-CPU cycle.

Note

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Safety-related communication 9

9.1 Configuring and programming communication (S7-300, S7-400)

9.1.1 Overview of communication

Introduction

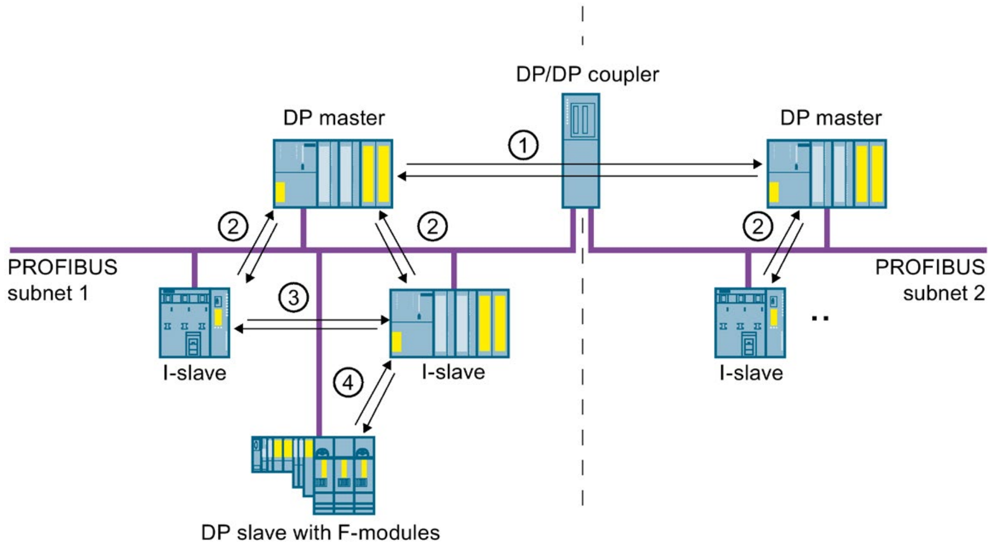
This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	On subnet	Additional hardware required
I-slave-slave communication	PROFIBUS DP	—
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
I-slave-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
Safety-related communication via S7 connections	Industrial Ethernet	—
IO controller-IO controller communication for S7 Distributed Safety	PROFINET IO	PN/PN coupler
Master-master communication for S7 Distributed Safety	PROFIBUS DP	DP/DP coupler
Safety-related communication to S7 Distributed Safety or S7 F Systems via S7 connections	Industrial Ethernet	—

Overview of safety-related communication via PROFIBUS DP

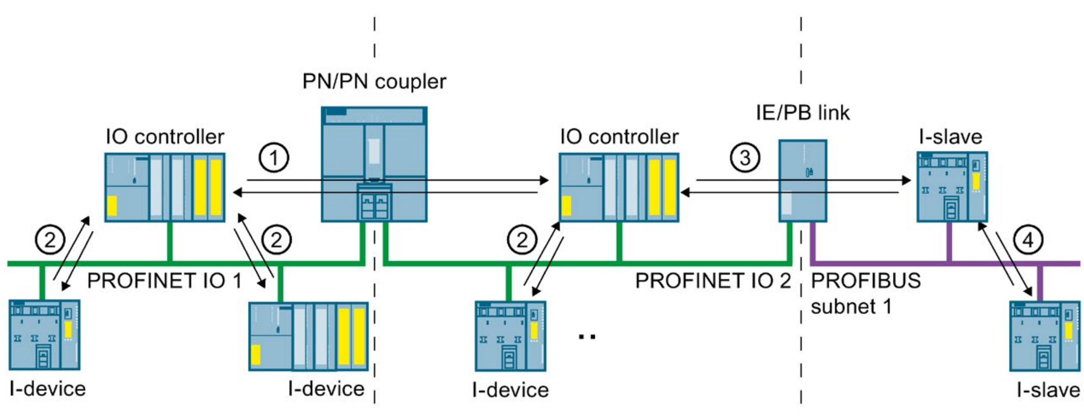
The figure below presents an overview of the 4 options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-300/400 F-CPUs.



① Safety-related master-master communication
② Safety-related master-I-slave communication
③ Safety-related I-slave-I-slave communication
④ Safety-related I-slave-slave communication

Overview of safety-related communication via PROFINET IO

The figure below presents an overview of the four options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-300/400 F-CPUs. If an IE/PB-link is used, safety-related communication is possible between assigned I-slaves.



① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication
④ Safety-related I-slave-I-slave communication integrating an IO controller

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of fail-safe data of the data type INT or BOOL is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. Each transfer area consists of one input and one output address area.

Safety-related I-slave-slave communication via PROFIBUS DP

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware version > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware version > V4.0.0.

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O of a DP slave takes place using direct data exchange, as in the standard program. The process image is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave.

Safety-related CPU-CPU communication via Industrial Ethernet

Safety-related CPU-CPU communication via Industrial Ethernet is possible using S7 connections, both from and to the following:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

In safety-related communication via S7 connections, a specified amount of fail-safe data of data type BOOL, INT, WORD, DINT, DWORD, or TIME is transferred fail-safe between the safety programs of the F-CPUs linked by the S7 connection.

The data transfer makes use of the SENDS7 instruction for sending and the RCVS7 instruction for receiving. Data are exchanged using one F-DB ("F-communication DB") each at the sender and receiver ends.

Safety-related CPU-CPU communication to *S7 Distributed Safety* or *F-systems*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety* or *S7 F-systems*.

9.1.2 Safety-related IO controller-IO controller communication

9.1.2.1 Configure safety-related IO controller-IO controller communication

Introduction

Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

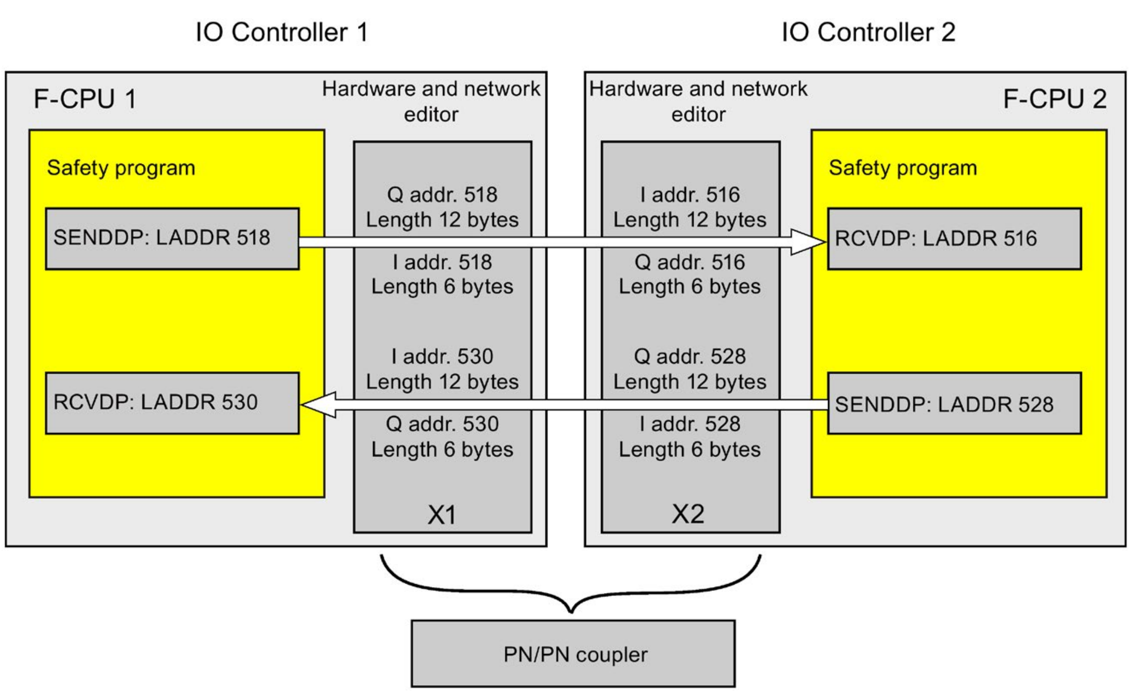
For 416F-2 DP CPUs without an integrated PROFINET interface, use a CP 443-1 or CP 443-1 Advanced-IT.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the PN/PN coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for output data and the transfer area for input data for the **data to be sent** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

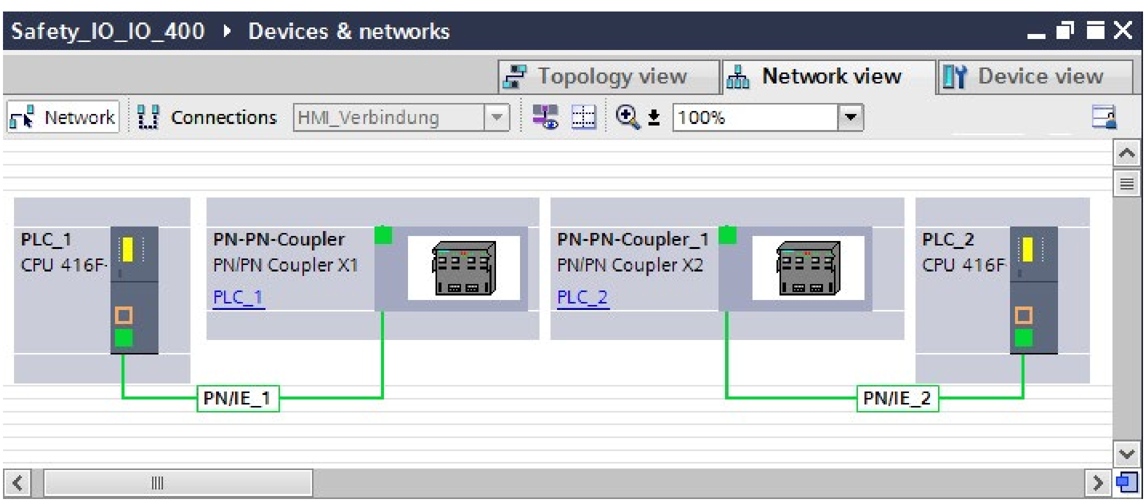
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   – One "IN/OUT 6 bytes / 12 bytes" module and
   – One "IN/OUT 12 bytes / 6 bytes" module

6. In the properties of the modules, assign the addresses outside the process image as follows:

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:

   – Input addresses: Start address 518

   – Output addresses: Start address 518

   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:

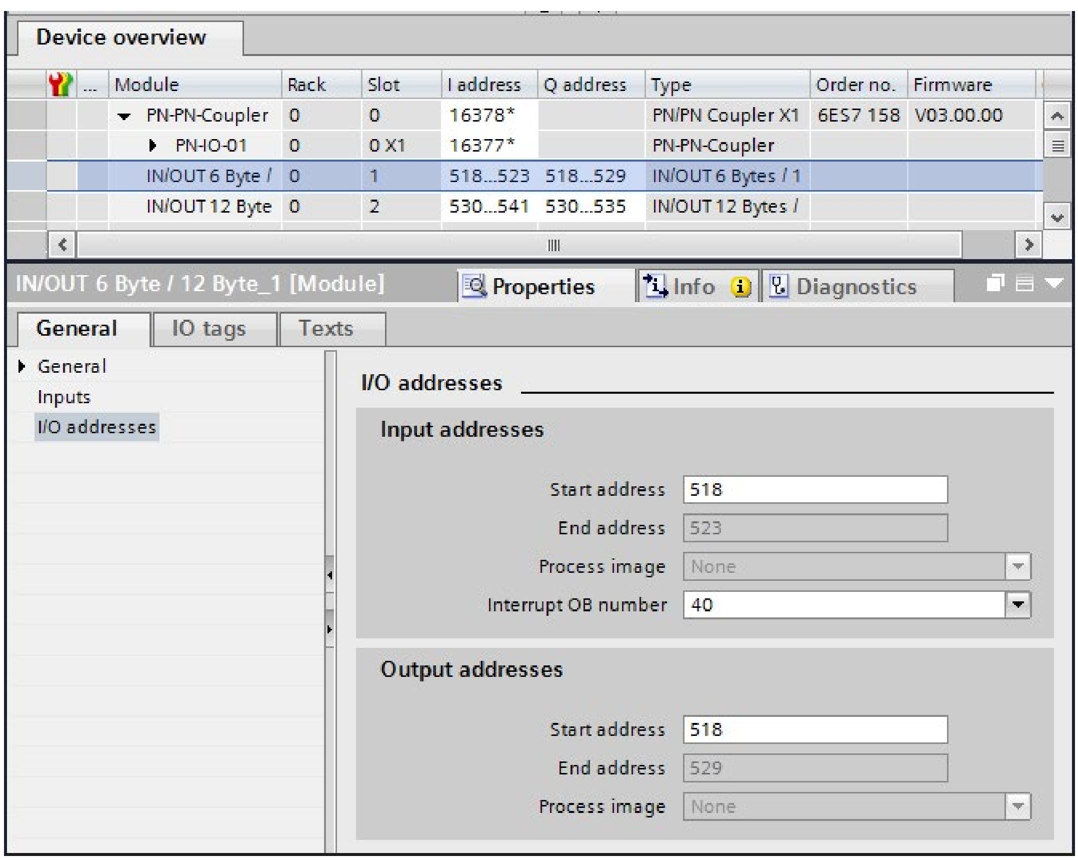
   – Input addresses: Start address 530

   – Output addresses: Start address 530

Note

Make sure that you assign identical start addresses for the address areas of the output and input data.

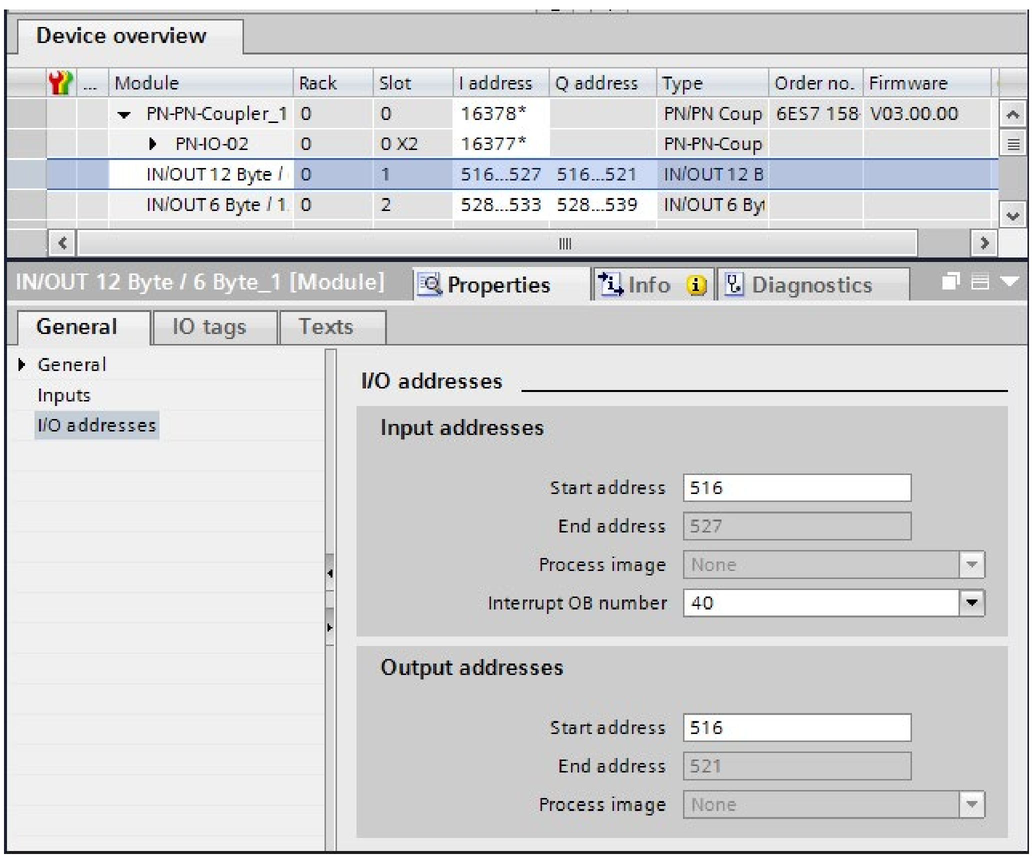
Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



7. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   – One "IN/OUT 12 bytes / 6 bytes" module and
   – One "IN/OUT 6 bytes / 12 bytes" module
8. In the properties of the modules, assign the addresses outside the process image as follows:

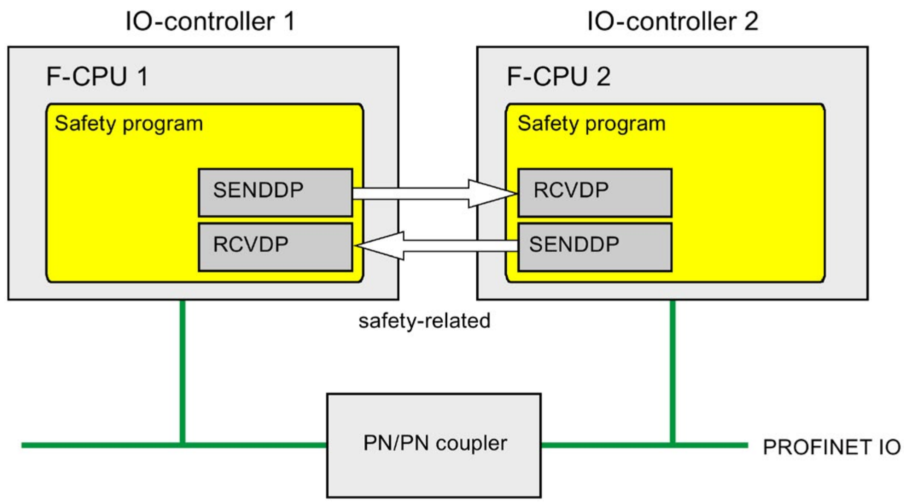
   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:
   – Input addresses: Start address 516
   – Output addresses: Start address 516

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:
   – Input addresses: Start address 528
   – Output addresses: Start address 528



9.1.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.1.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

Programming procedure

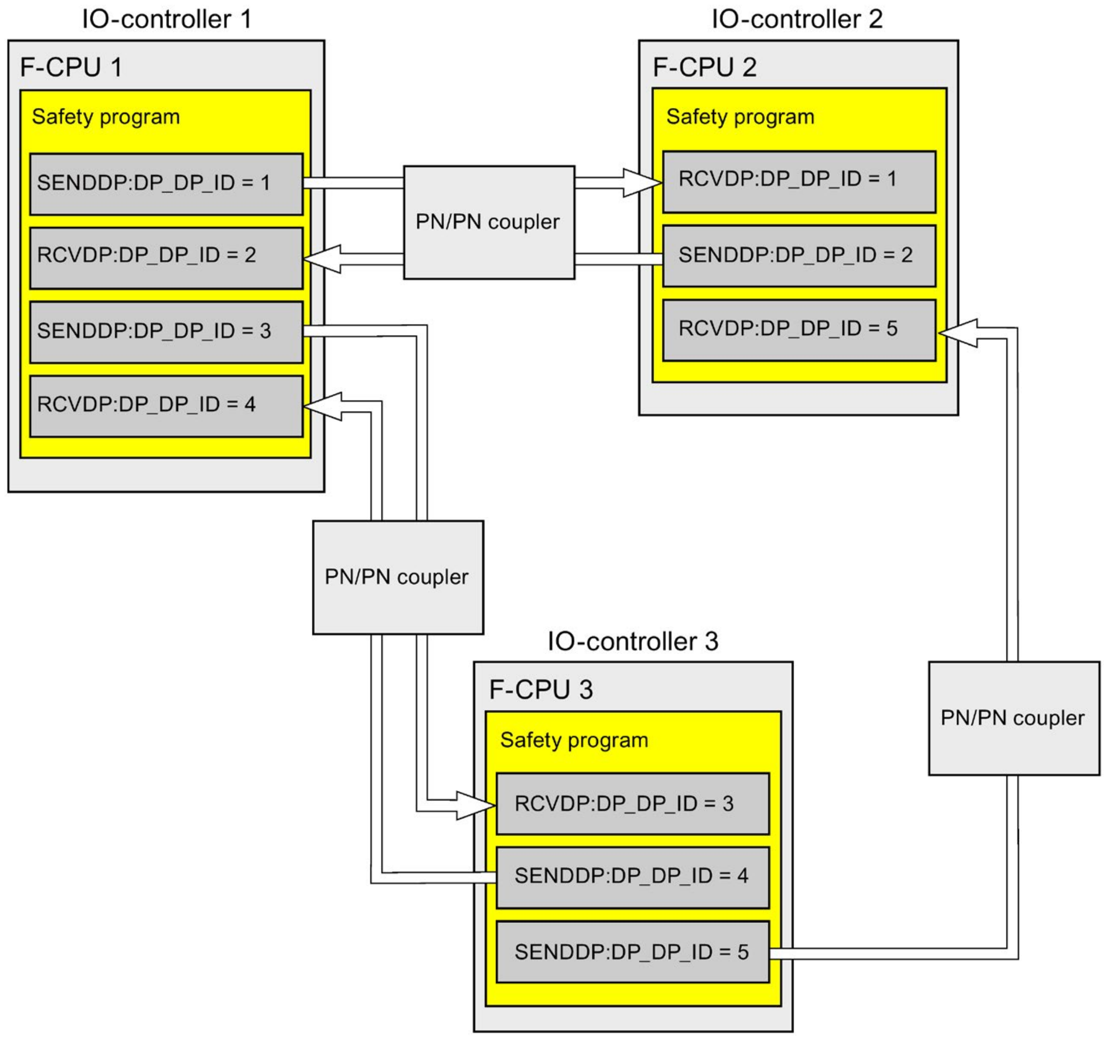
You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 588) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 588) for receiving at the start of the main safety block.
3. Assign the start addresses of the output and input data transfer areas of the PN/PN coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related IO controller-IO controller communication relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).

7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   – Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, provide the tag "F_GOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   – Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).
9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.

12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 344).

9.1.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

---

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.1.3 Safety-related master-master communication

9.1.3.1 Configure safety-related master-master communication

Introduction

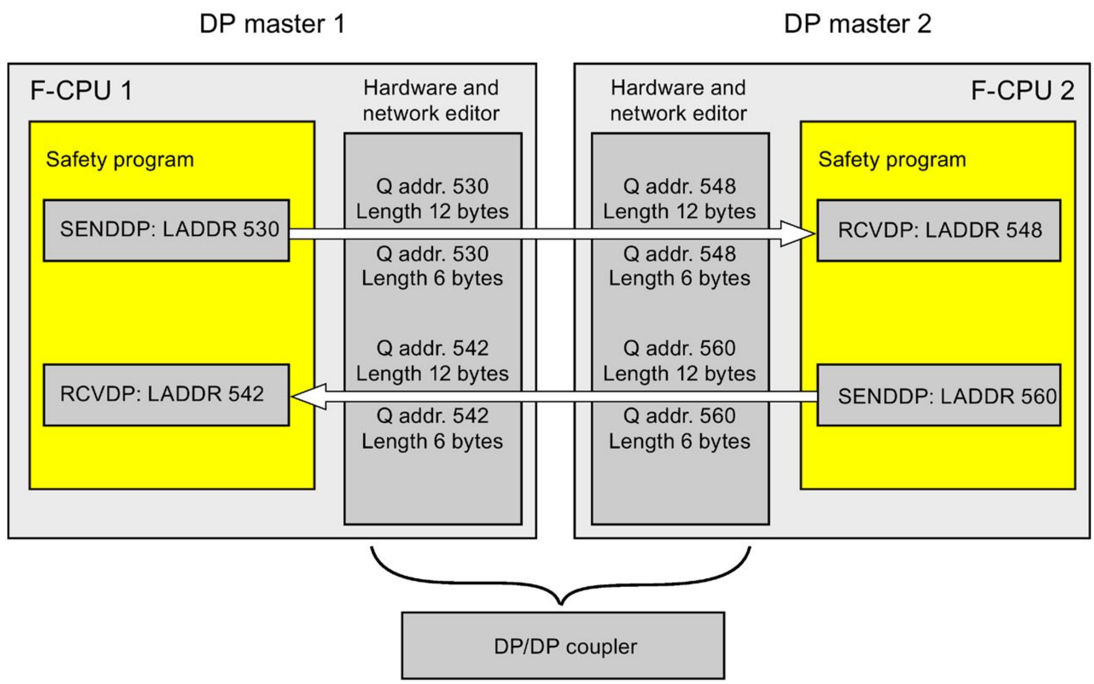
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the DP/DP coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for input data and the transfer area for output data for the **data to be sent** must begin with the same start address. A total of 6 bytes (consistent) is required for the transfer area for input data; 12 bytes (consistent) are required for the transfer area for output data.

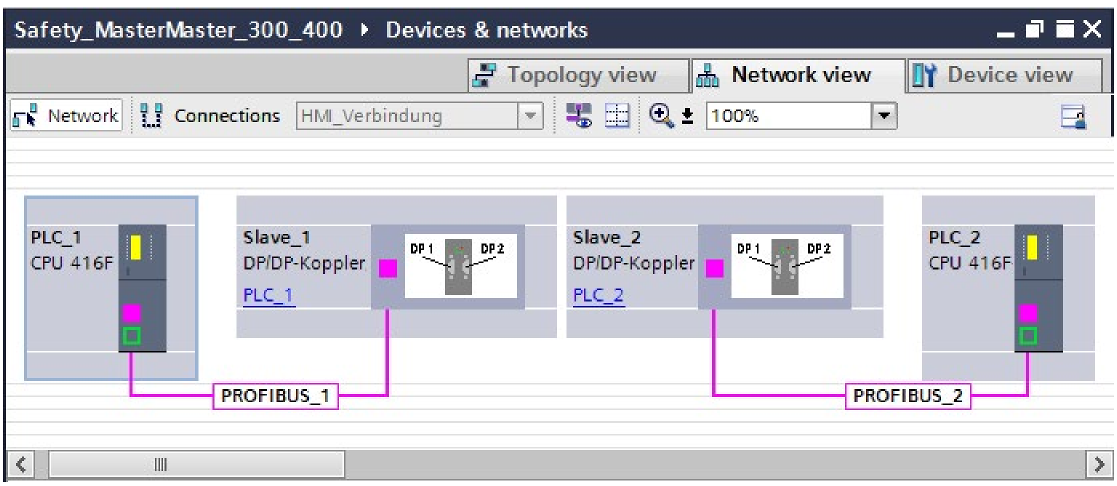
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.



6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler of PLC 1, either using the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).
7. Switch to the device view of the DP/DP coupler for PLC1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   – One "6 bytes I/12 bytes Q consistent" module, and
   – One "12 bytes I/6 bytes Q consistent" module

8. In the properties of the modules, assign the addresses outside the process image as follows:

   For "6 bytes I/12 bytes Q consistent" module for sending data for example:

   – Input addresses: Start address 530

   – Output addresses: Start address 530

   For "12 bytes I/6 bytes Q consistent" module for receiving data for example:

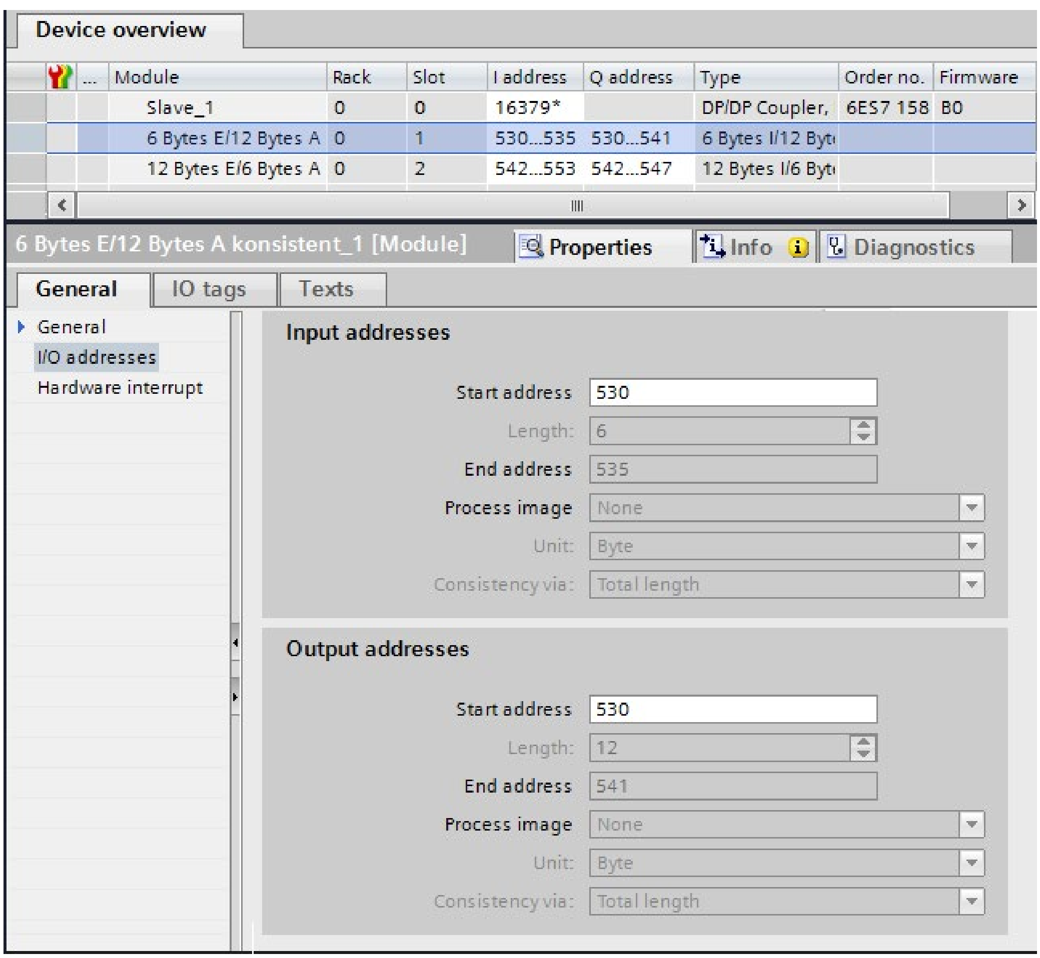
   – Input addresses: Start address 542

   – Output addresses: Start address 542

Note

Make sure that you assign identical start addresses for the address areas of the output and input data.

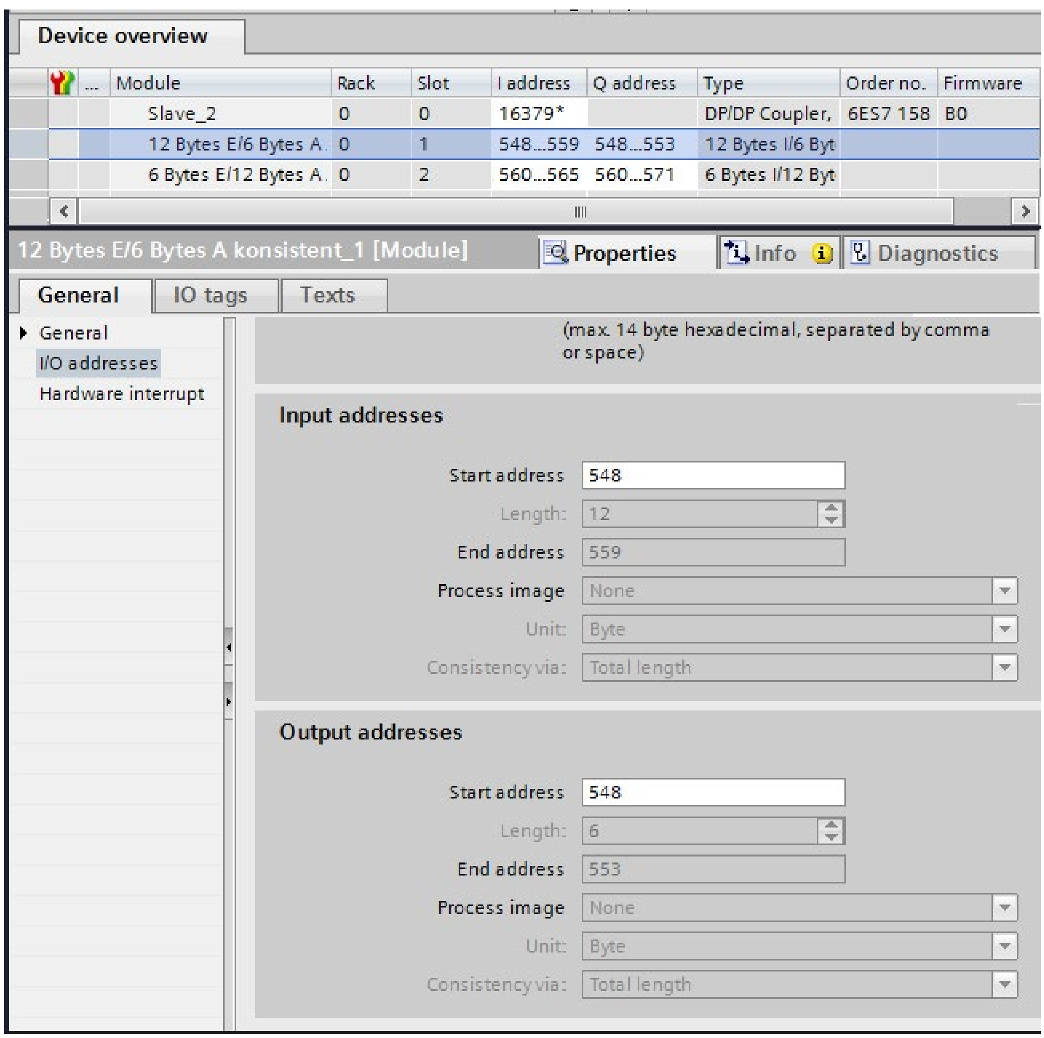
Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



9. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   – One "12 bytes I/6 bytes Q consistent" module, and
   – One "6 bytes I/12 bytes Q consistent" module
10. In the properties of the modules, assign the addresses outside the process image as follows:

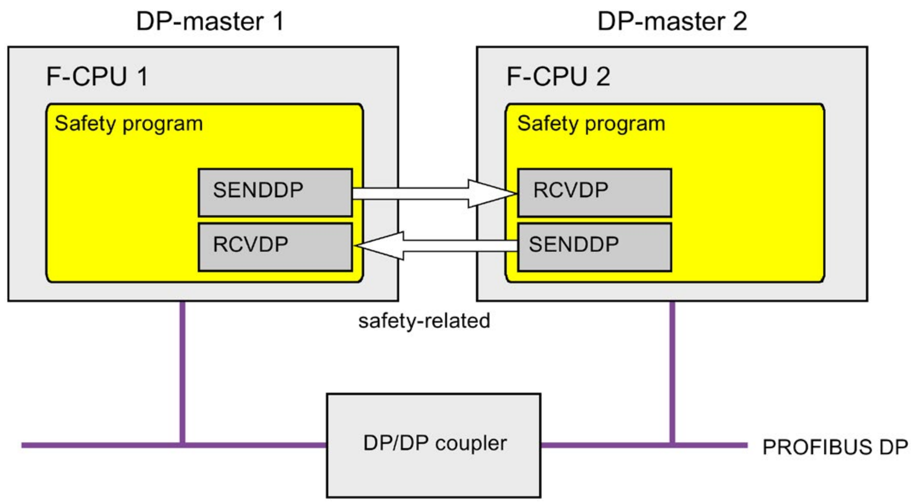
    For "12 bytes I/6 bytes Q consistent" module for receiving data for example:
    – Input addresses: Start address 548
    – Output addresses: Start address 548

    For "6 bytes I/12 bytes Q consistent" module for sending data for example:
    – Input addresses: Start address 560
    – Output addresses: Start address 560



9.1.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.1.3.3 Program safety-related master-master communication

Requirement for programming

The transfer areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

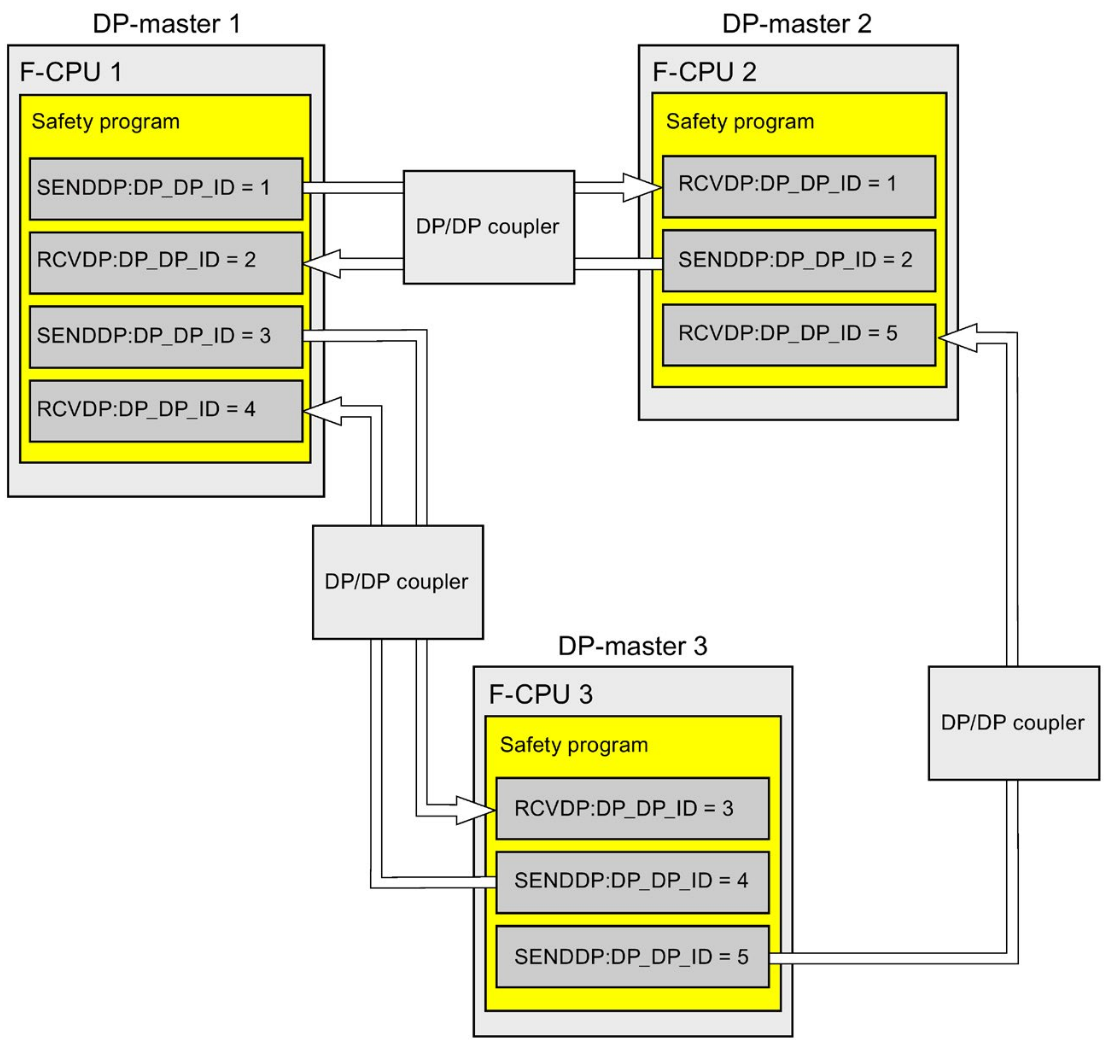
You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 588) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 588) for receiving at the start of the main safety block.
3. Assign the start addresses of the transfer areas for output and input data of the DP/DP coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related master-master communications relationships.



> **WARNING**
>
> The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).
>
> You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g. "Name RCVDP_1".RD_BO_02).

7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   – Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value for data of the data type BOOL, provide the tag "F_GLOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   – Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).
9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.

12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 344).

9.1.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.1.4 Safety-related IO controller-I-device communication

9.1.4.1 Configuring safety-related communication between IO controller and I-device

Introduction

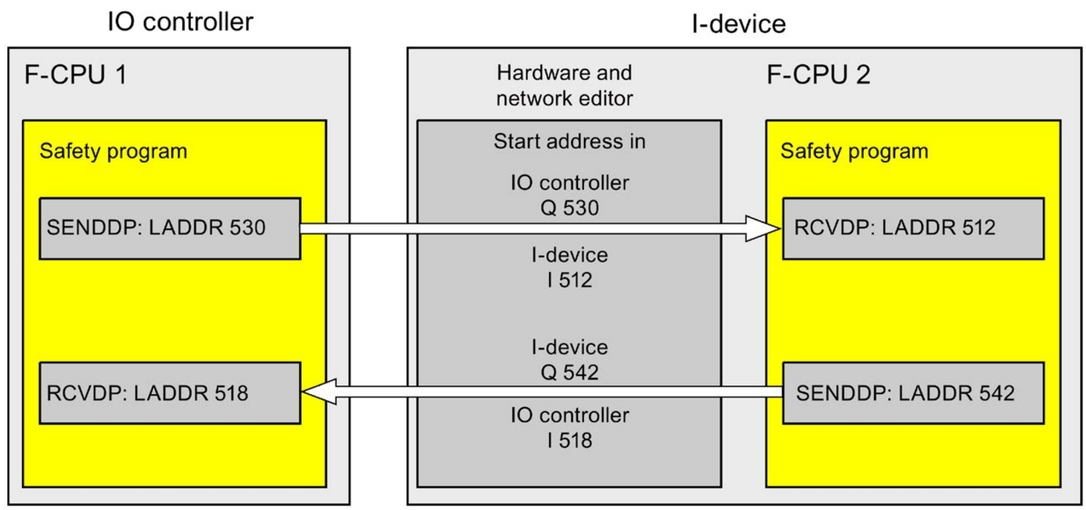
Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (**F**-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

The F-CPU to be used as an I-device must support the "IO-device" operating mode.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

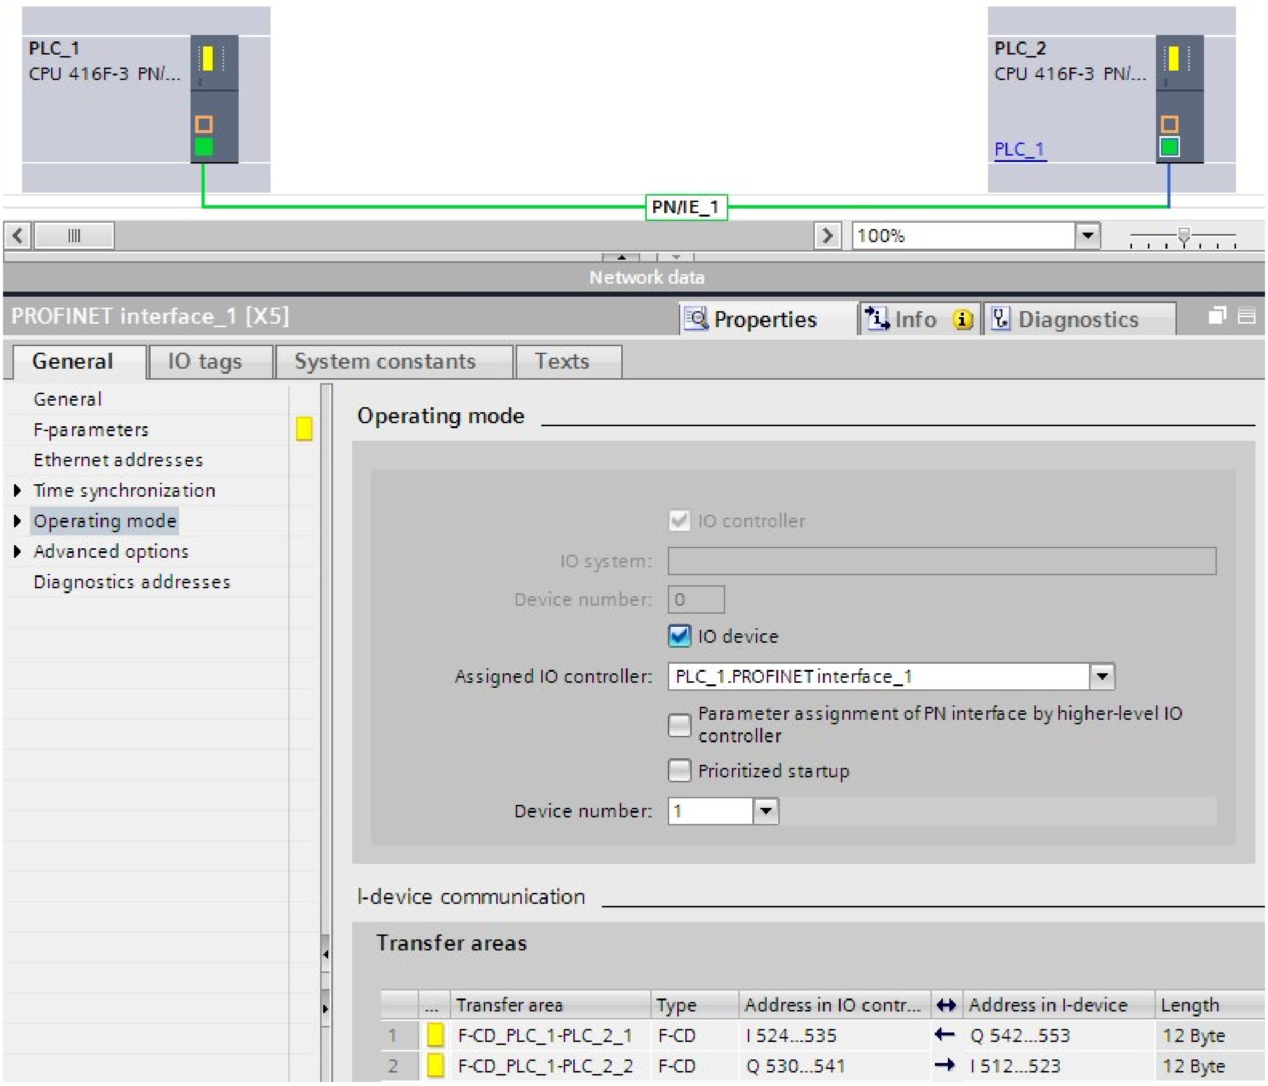
The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for sending to the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned outside of the process image are displayed.

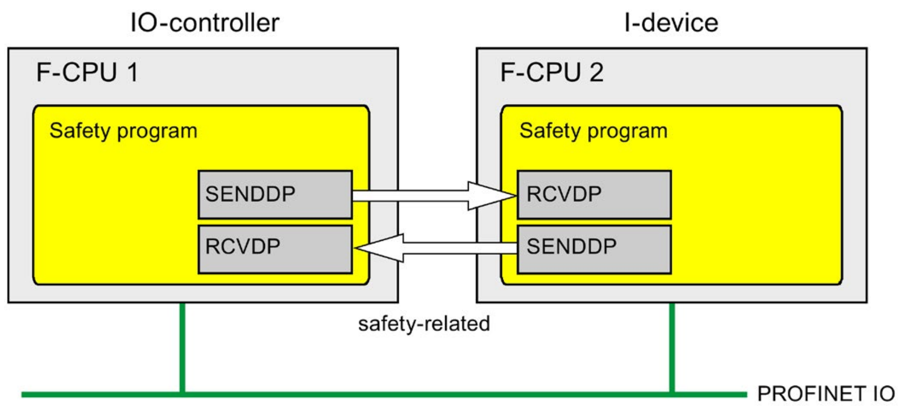
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").

4. Create an additional F-CD connection for receiving from the IO controller.
5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from IO controller (→).



9.1.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.1.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

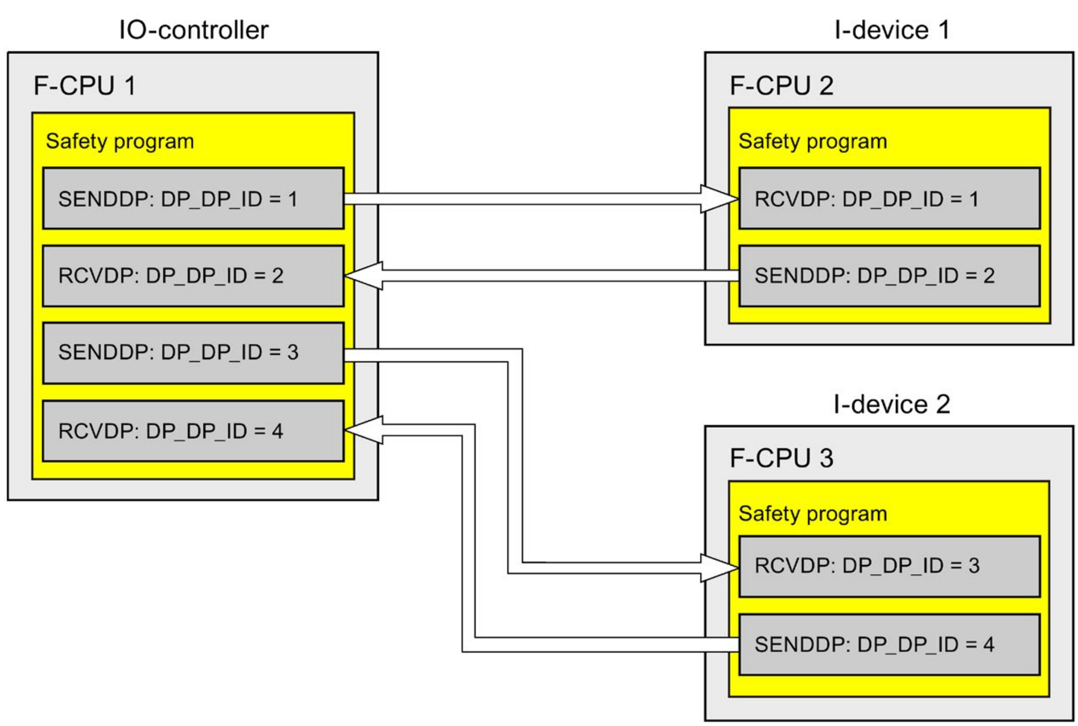
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 209)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the IO controller	→	Address in the IO controller
RCVDP in the IO controller	←	Address in the IO controller
SENDDP in the I-device	←	Address in the IO device
RCVDP in the I-device	→	Address in the IO device

The figure below contains an example of how to specify the F-communication IDs for the inputs of the SENDDP and RCVDP instructions for 4 safety-related IO controller-I-device communication relationships.



WARNING
The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374). You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

WARNING
It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

9.1.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller- I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.1.5 Safety-related master-I-slave communication

9.1.5.1 Configuring safety-related master-I-slave communication

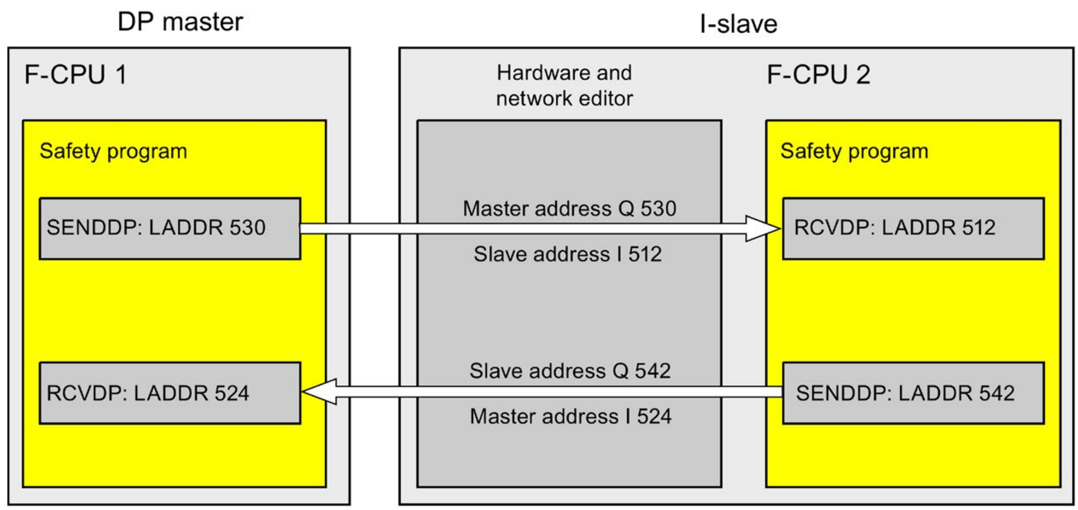
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

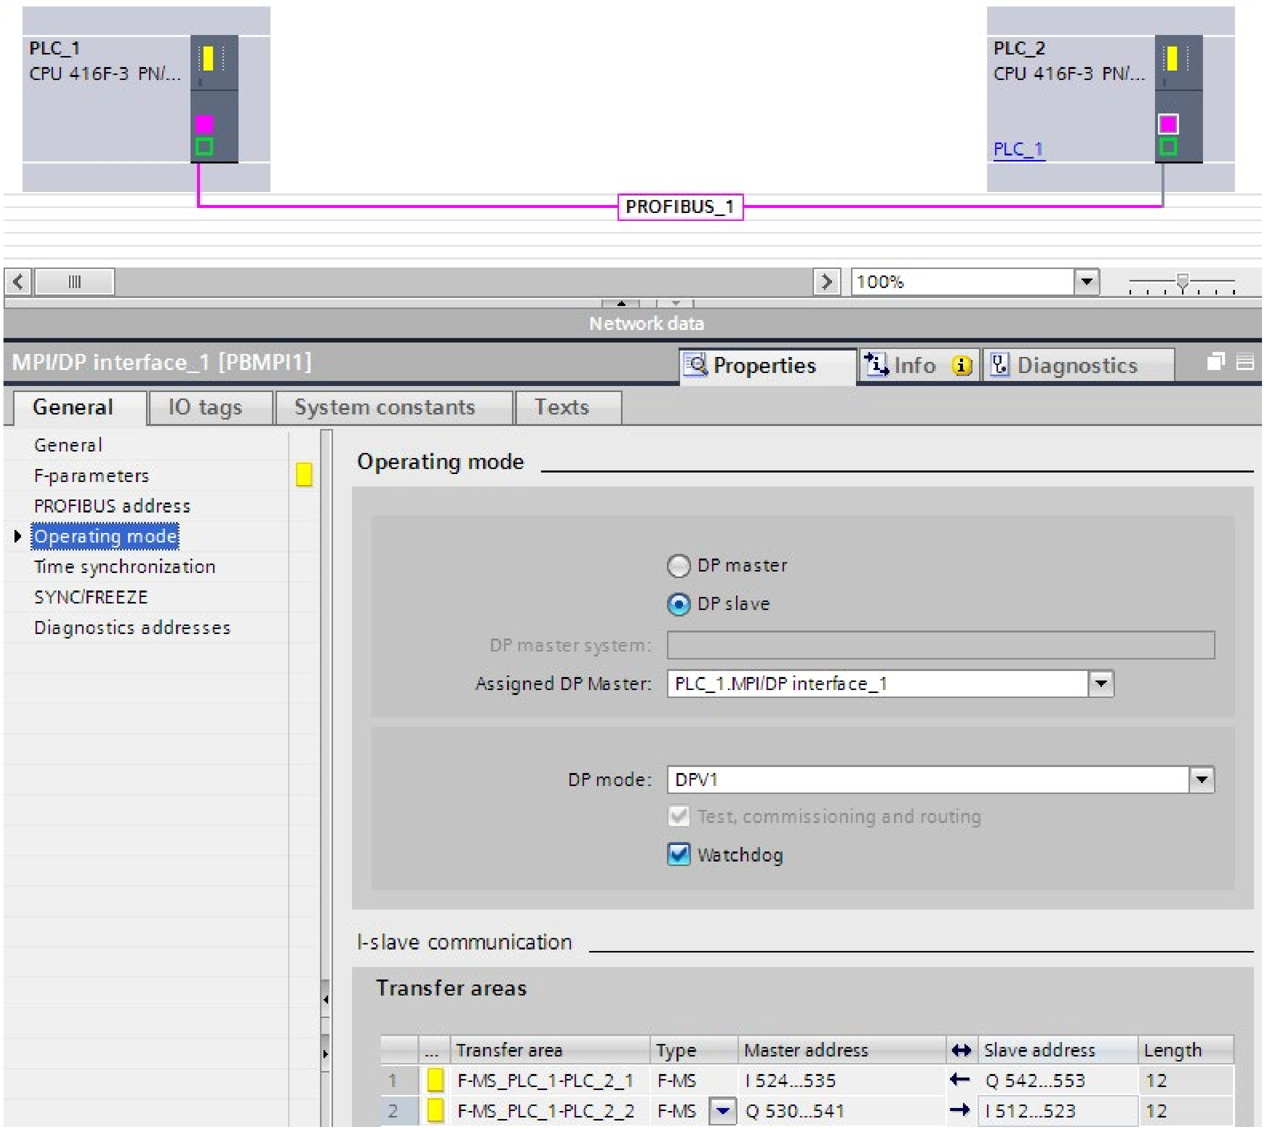
The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Activate the "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this DP interface to a DP interface of F-CPU 1.
3. Select the PROFIBUS interface of F-CPU 2. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the transfer areas in the I-slave and DP master assigned outside of the process image are displayed.

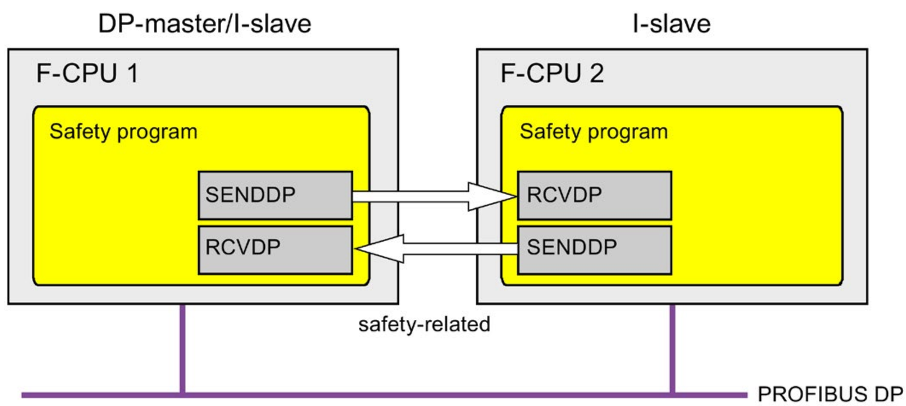
   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").

4. Create an additional F-MS connection for receiving from the DP master.
5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.1.5.2 Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave or between the F-CPUs of multiple I-slaves makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.1.5.3 Program the safety-related master-I-slave or I-slave-I-slave communication

Requirements

The transfer areas must be configured.

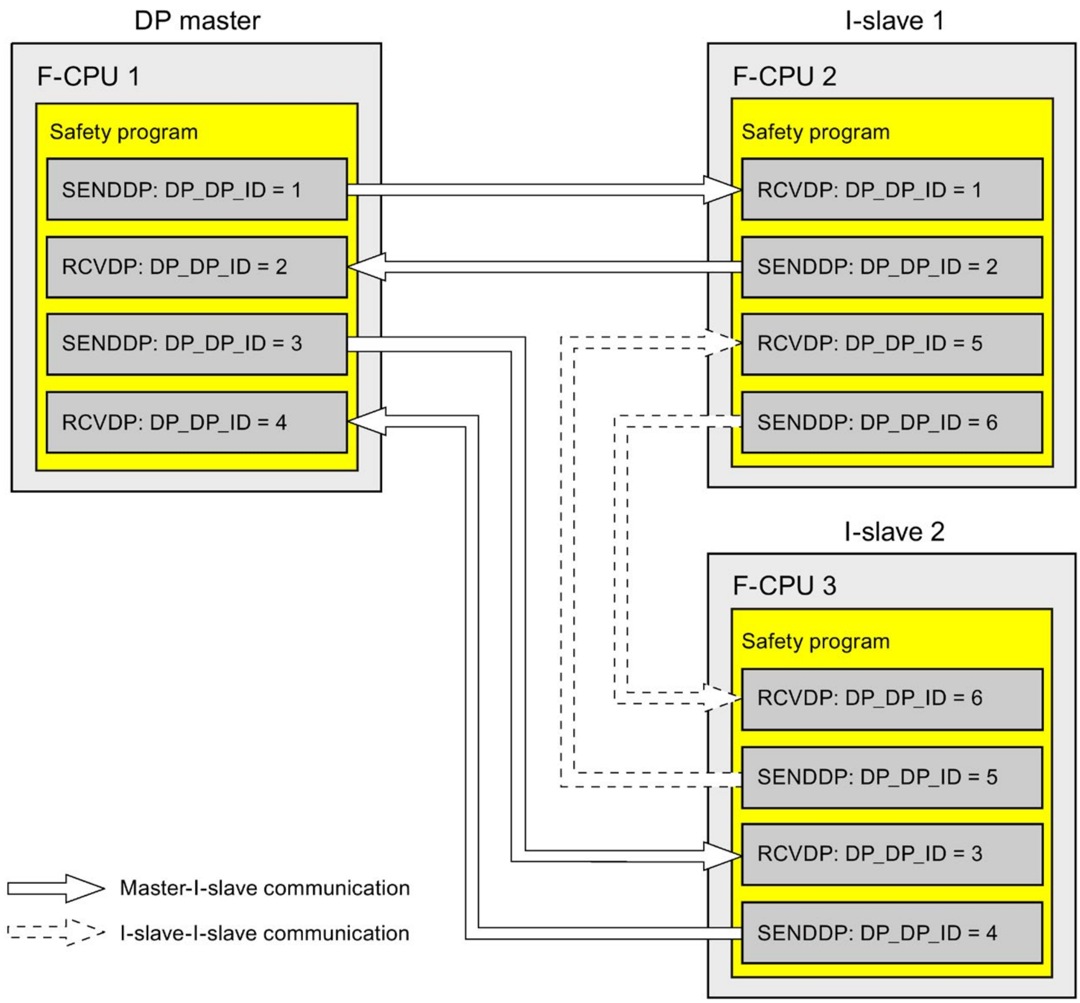
Programming procedure

The procedure for programming safety-related master-I-slave communication or I-slave-I-slave communication is the same as that for programming safety-related master-master communication (see Program safety-related master-master communication (Page 218)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the DP master	→	Master address
RCVDP in the DP master	←	Master address
SENDDP in the I-slave	←	Slave address
RCVDP in the I-slave	→	Slave address

The figure below contains an example of how to specify the F-communication IDs at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave and two I-slave-I-slave communications relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In

PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

> **WARNING**
>
> It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

9.1.5.4 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data					
		DP master		I-slave 1		I-slave 2	
		Output data	Input data	Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes	—	—
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes	—	—
I-slave-I-slave	**Sending:** I-slave 1 to I-slave 2	—	18 bytes	12 bytes	6 bytes	6 bytes	12 bytes
	Receiving: I-slave 1 from I-slave 2	—	18 bytes	6 bytes	12 bytes	12 bytes	6 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS, F-DX, F-DX-Mod., MS, DX). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.6 Safety-related I-slave-I-slave communication

9.1.6.1 Configure safety-related I-slave-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPUs of I-slaves takes place using direct data exchange (**F-**DX) – same as in standard programs.

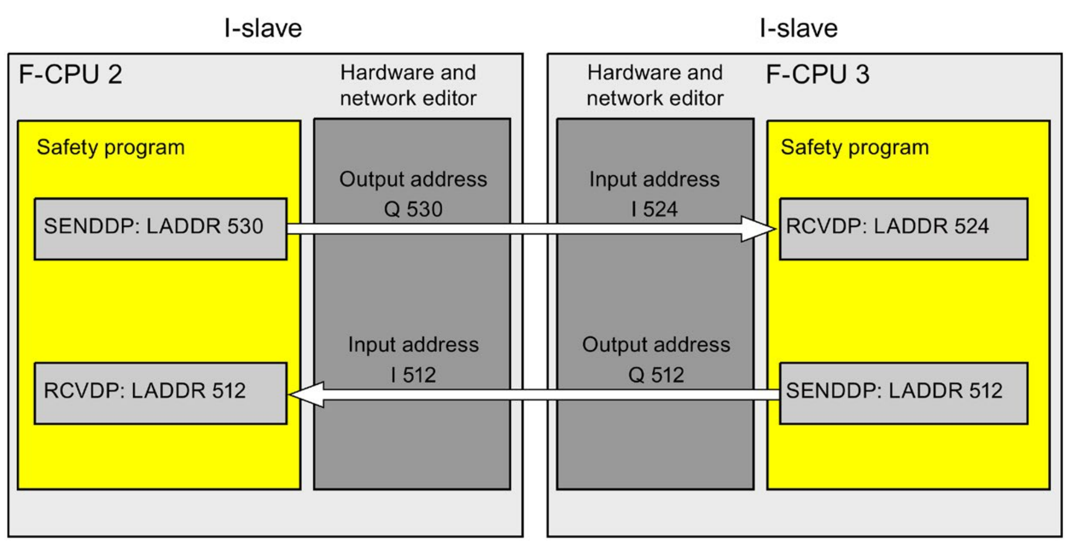
You do not need any additional hardware for I-slave-I-slave communication.

I-slave-I-slave communication is also possible:

- If the assigned DP master is a standard CPU that supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

Configuring transfer areas

For every safety-related communication connection between two I-slaves, you must configure transfer areas in the *hardware and network editor*. In the figure below, both of the I-slaves are to be able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX_PLC_2-PLC_1_1" for the first F-DX connection between F-CPU 1 and F-CPU 2.

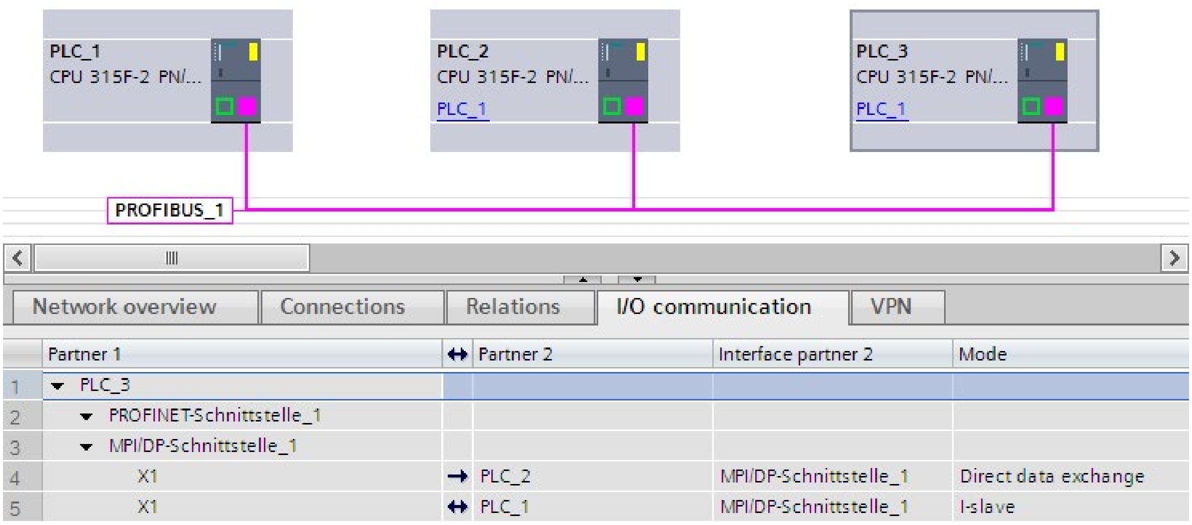
You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

The procedure for configuring safety-related I-slave-I-slave communication is identical to that in the standard system. Proceed as follows:

1. Insert three F-CPUS from the "Hardware catalog" task card in the project.
2. Activate "DP slaves" mode (I-slave) for F-CPU 2 and F-CPU 3 in the properties of their DP interfaces and assign these DP interfaces to a DP interface of F-CPU 1.
3. Select the DP interface of F-CPU 3 in the network view.
4. Select the "I/O communication" tab.
5. Use a drag-and-drop operation in the network view to move F-CPU 2 to the "Partner 2" column on the "I/O-communication" tab.

   This creates a line with "Direct data exchange" mode for sending to the I-slave (F-CPU 2) (→).



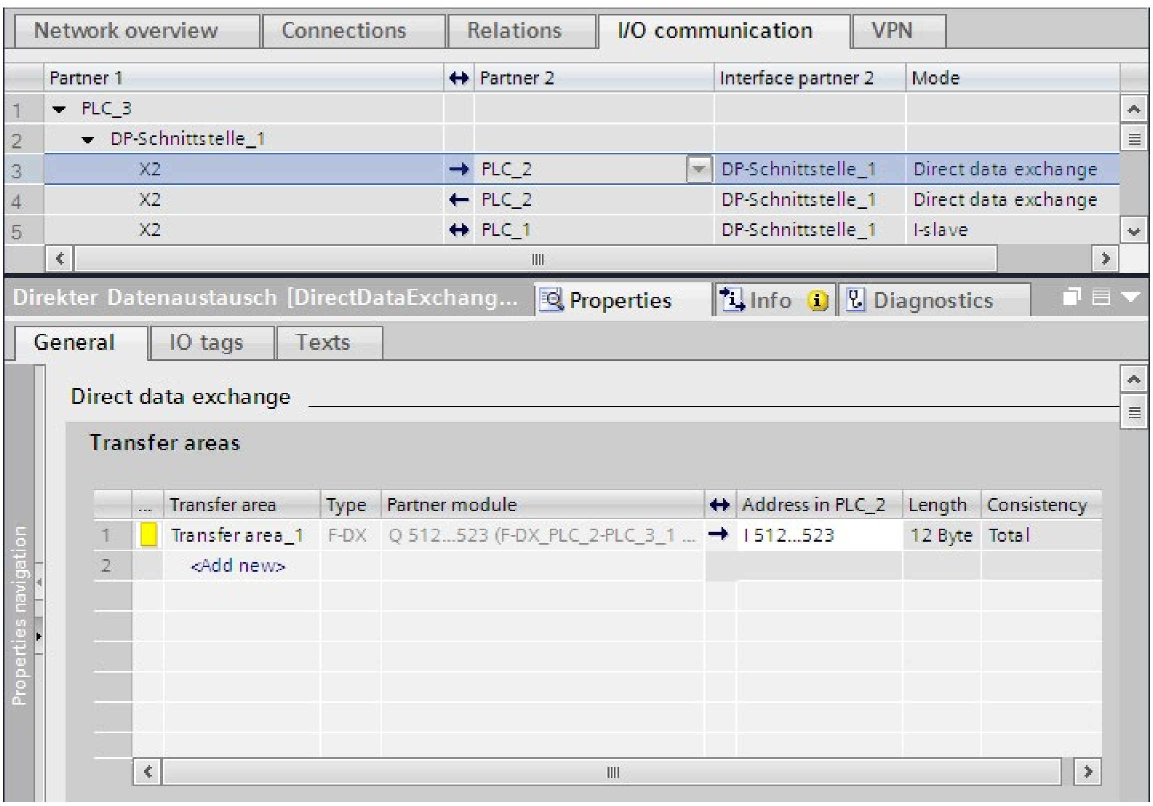
6. Click in the newly created line (→).

7. In "Transfer areas" ("Direct data exchange" table), create an F-DX connection (type "F-DX") for sending to the I-slave (F-CPU 2) (→). The F-DX connection is shown in yellow in the table and the transfer areas in the I-slaves assigned outside of the process image (PLC_2 and PLC_3) are displayed.

   In addition, a line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 2) (→) is created automatically in the "I/O communication" tab, and an acknowledgment connection (←, transfer area x_Ack) is created automatically in the associated "Direct data exchange" table.

   One transfer area (type F-MS) for the master CPU (disabled in display) is created for in the "I-slave communication table" of each I-slave.

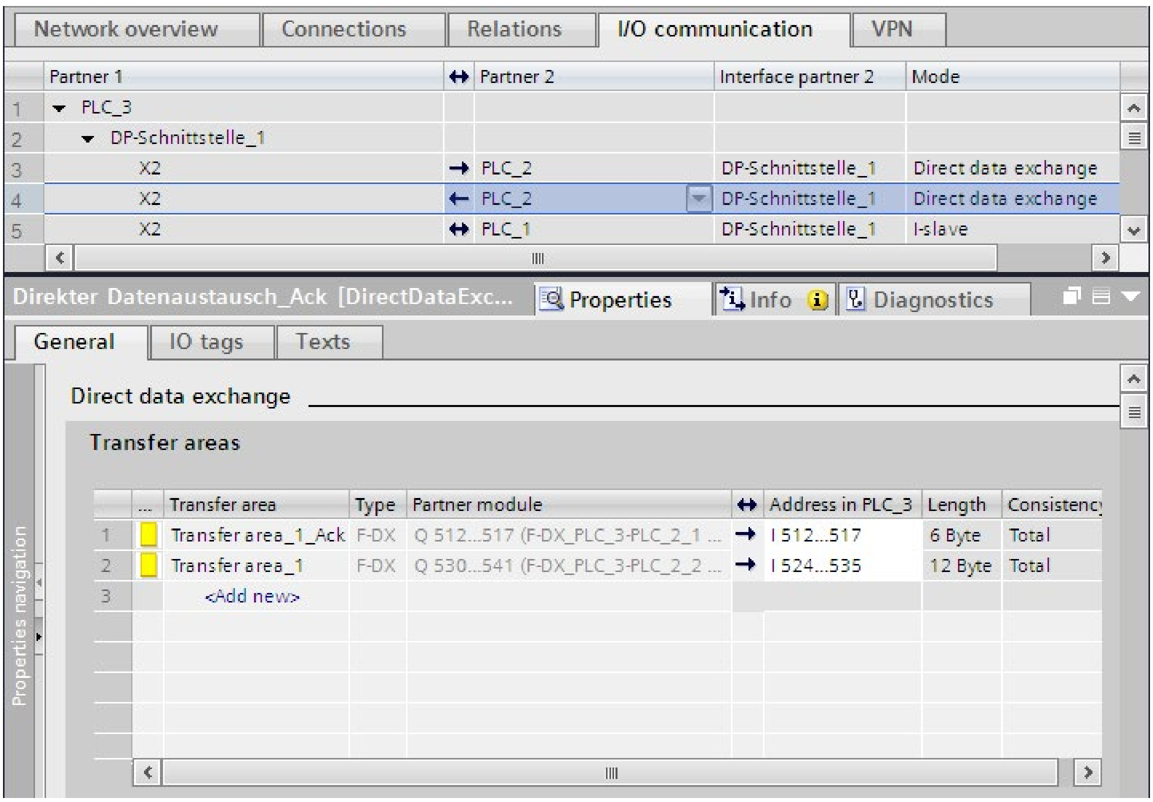
   This completes the configuration for sending to F-CPU 2.



8. In the "I/O communication" tab, select the automatically created line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 3) (←).
9. In "Transfer areas" ("Direct data exchange" table), create another F-DX connection for receiving from the I-slave (F-CPU 3).

   In this case, as well, an acknowledgment connection (←, transfer area x_Ack) is created automatically in the "Direct data exchange table" and two transfer areas (type F-MS) for the master CPU (disabled in display) are created in the "I-slave communication" table of both I-slaves.

   This completes the configuration for receiving from F-CPU 2.



Changing disabled local address areas of the transfer areas

In order to change the disabled local address area of "Transfer area x", you must change the address area of the corresponding acknowledgment connection "Transfer area x_Ack".

1. In "I/O communication", select the line with the arrow pointing in the same direction as the arrow of "Transfer area x" in the "Direct data exchange" table.
2. Then select the line with "Transfer area x_Ack" in the "Direct data exchange" table.
3. Change the address area there.

9.1.6.2 Safety-related I-slave-I-slave communication via SENDDP and RCVDP

Reference

The description of the communication via SENDDP and RCVDP for safety-related I-slave-I-slave communication can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.1.6.3 Programming safety-related I-slave-I-slave communication

Reference

The description of the programming of safety-related I-slave-I-slave communication can be found in Program the safety-related master-I-slave or I-slave-I-slave communication (Page 233).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the 1st I-slave	→	Address in the <1st I-slave> (in example column "Address in PLC_2")
RCVDP in the 1st I-slave	←	Address in the <1st I-slave> (in example column "Address in PLC_2")
SENDDP in the 2nd I-slave	←	Address in the <2nd I-slave> (in example column "Address in PLC_3")
RCVDP in the 2nd I-slave	→	Address in the <2nd I-slave> (in example column "Address in PLC_3")

9.1.6.4 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

The description of the limits for the data transfer of safety-related I-slave-I-slave communication can be found in Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication (Page 235).

9.1.7 Safety-Related I-Slave-Slave Communication

9.1.7.1 Configuring Safety-Related I-Slave-Slave Communication

Introduction

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O in a DP slave takes place using direct data exchange (**F-**DX-Mod), same as in standard programs.

You do not need any additional hardware for I-slave-slave communication.

I-slave-slave communication is also possible:

- when the assigned DP master is a standard CPU, if the standard CPU supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

An F-I/O DB is automatically generated for each F-I/O when it is configured in the *hardware and network editor*, this is required for the F-I/O access via safety-related I-slave-slave communication. The F-I/O DB is initially created in the safety program of the DP master, provided it is an F-CPU with F-activation. Only with the setup of the F-DX-Mod connection is the F-I/O DB created in the safety program of the I-slave and deleted in the safety program of the DP master.

The process image input is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave (see description in Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 246)).

Restrictions

Note

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware version > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware version > V4.0.0.

Note

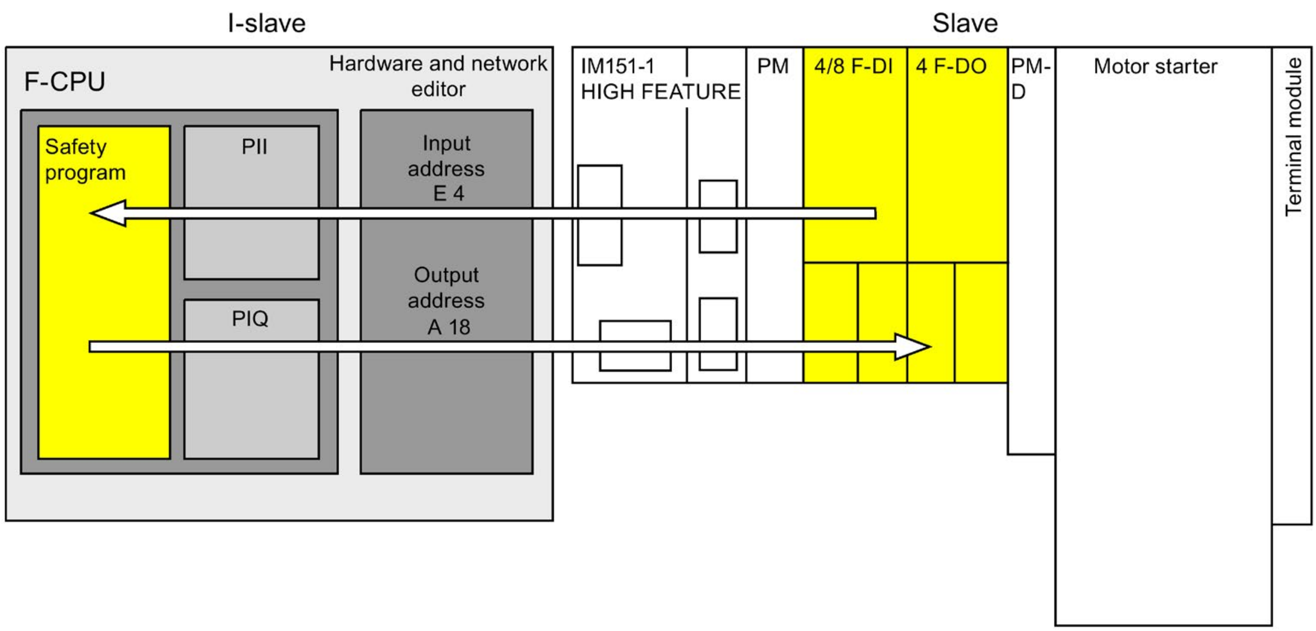
With safety-related I-slave-slave communication, make sure that the CPU of the DP master is powered up before the F-CPU of the I-slave.

Otherwise, depending on the F-monitoring time specified for the F-I/O, the F-system can detect an error in safety-related communication (communication error) between the F-CPU and the F-I/O assigned to the I-slave. This means that the F-I/O are not reintegrated automatically after F-system startup. They are instead only reintegrated after a user acknowledgment with a positive edge in the ACK_REI tag of the F-I/O DB (see also After communication errors (Page 178) and After startup of F-system (Page 175)).

Configuring transfer areas

For every safety-related communication connection between an I-slave and slave, you must configure transfer areas in the *hardware and network editor*.

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX-Mod_PLC_2-PLC_1_1" for the first F-DX-Mod connection between F-CPU 1 and F-CPU 2.

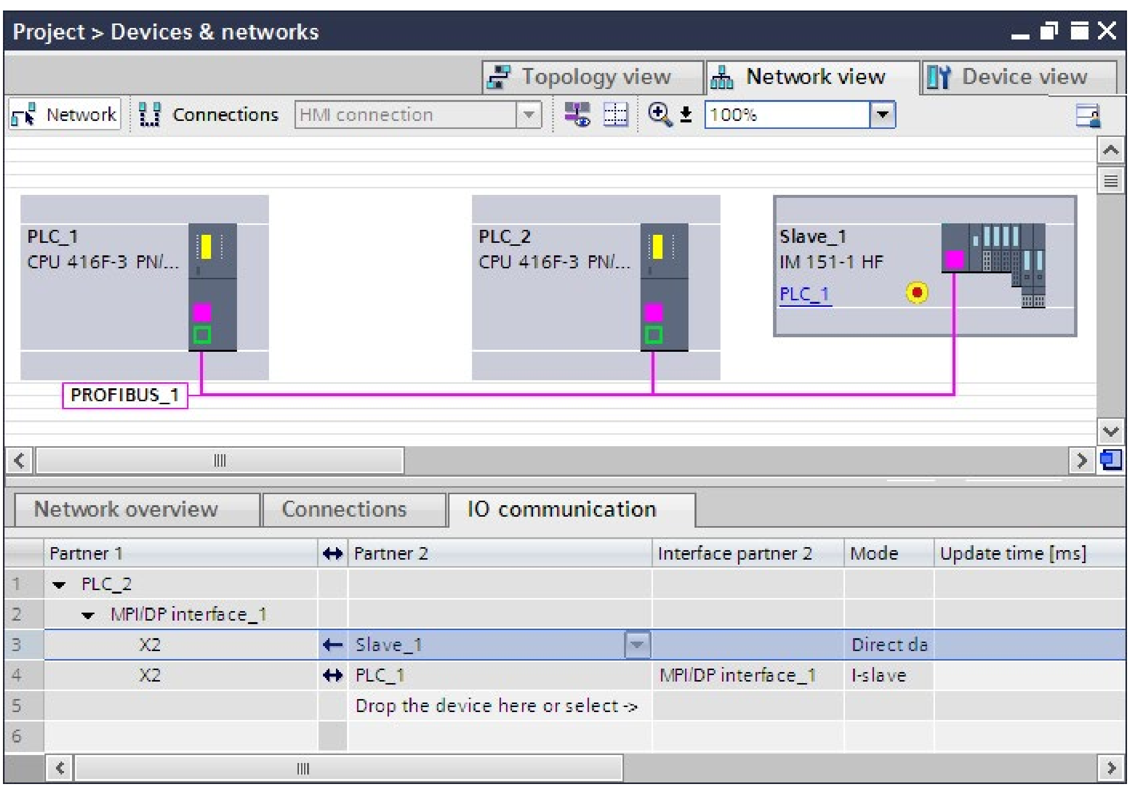


Configuration procedure using the example of an ET 200S with F-modules in the slave

The procedure for configuring safety-related I-slave-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Insert a suitable DP slave, e.g. IM 151-1 HF, article no. 6ES7151-1BA0... from the "Hardware catalog" task card into the network view of the *hardware and network editor*.
3. Insert a power module, a 4/8 F-DI module and a 4 F-DQ module in the device view of the ET 200S.
4. Activate "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this to F-CPU 1.
5. Assign the DP interface of the IM 151-1 HF to the DP master (F-CPU 1).
6. Select the DP interface of F-CPU 2 (I-slave) in the network view.
7. Select the "I/O communication" tab.
8. Use a drag-and-drop operation in the network view to move the ET 200S to the "Partner 2" column in the "I/O-communication" tab.



9. Click in the newly created line (←).

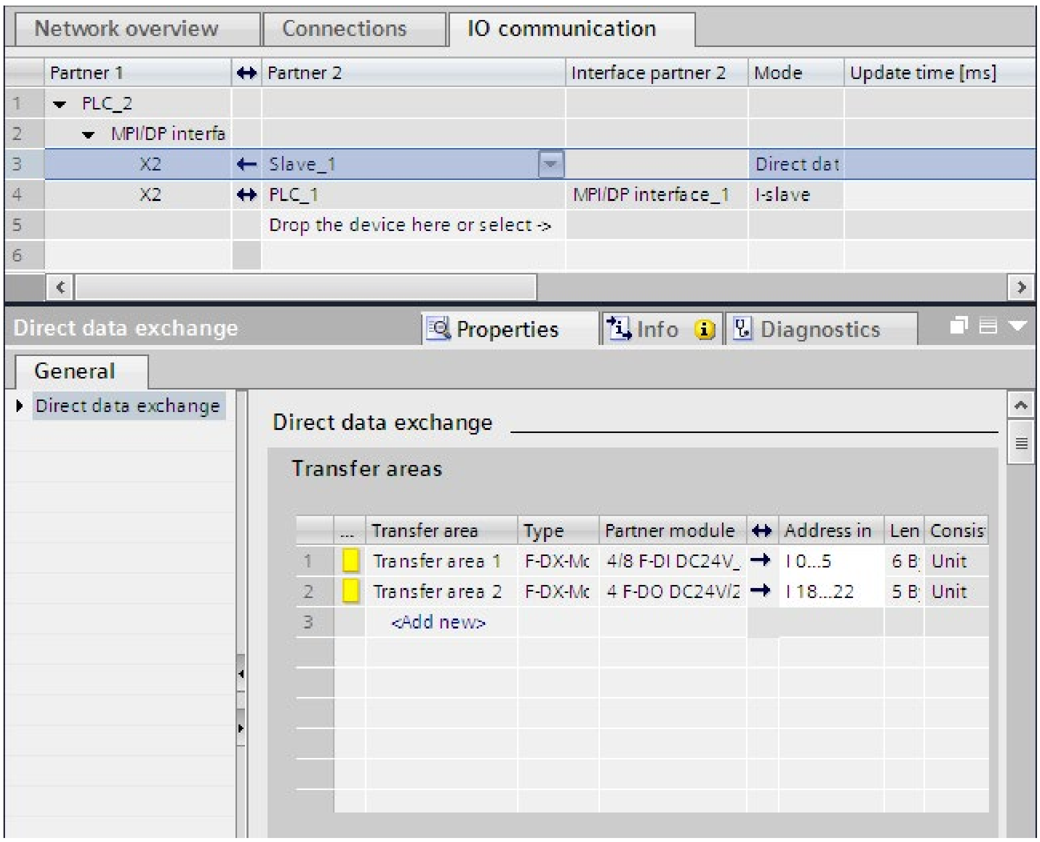
10. In "Transfer areas", create an F-DX-Mod connection (type "F-DX-Mod"). The F-DX-Mod connection is marked in yellow in the table. The addresses for the "partner module" 4/8 F-DI in the I-Slave (PLC_2) are displayed. You can change the addresses directly in the table, if required.

    This completes the configuration for the 4/8 F-DI module.

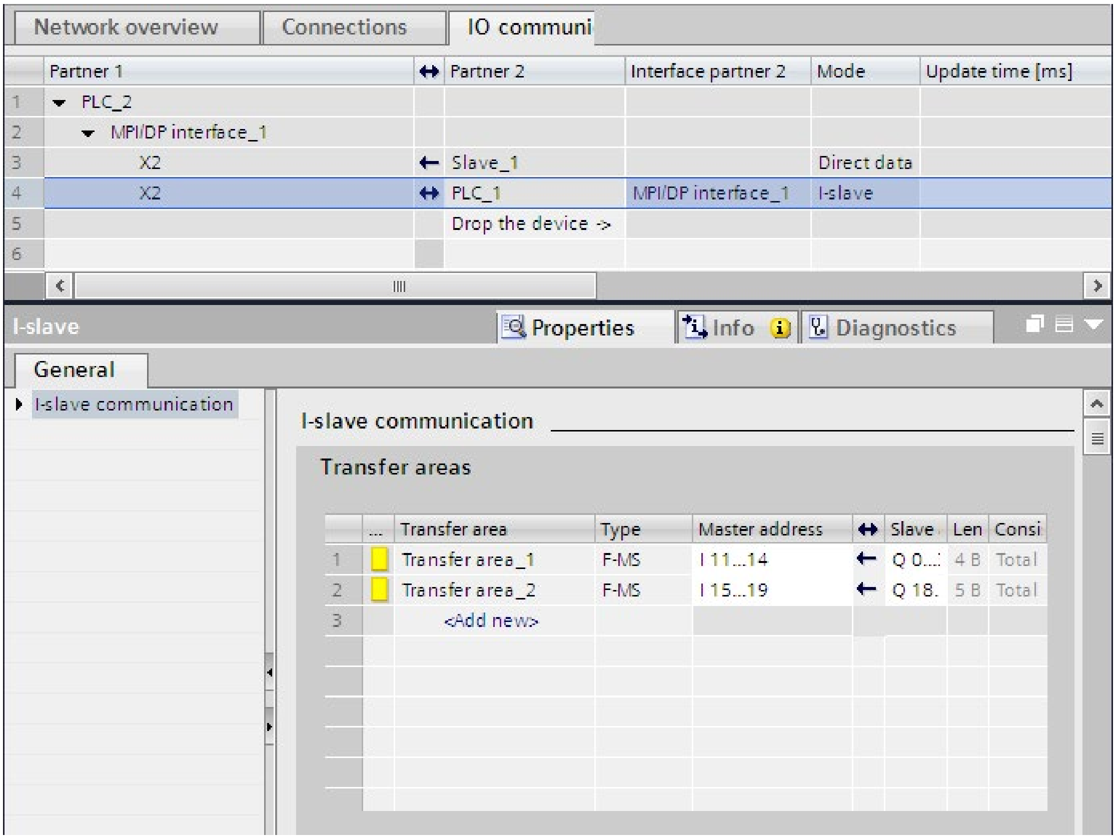
11. In "Transfer areas", create another F-DX-Mod connection.

12. Change the partner module to the 4 F-DO module, either directly in the "Transfer areas" table or in the details of transfer area 2, if the 4 F-DO module was not already selected.

    This completes the configuration for the 4 F-DO module.



In the "I-slave communication table" of the I-slave, a transfer area (type F-MS) for the master CPU (disabled in display) is created for each F-DX-Mod connection:



Change in configuration of I-slave-slave communication

> **WARNING**
>
> If you have reconfigured I-slave-slave communication for an F-I/O or have deleted an existing I-slave-slave communication, you must compile the hardware configuration of the DP master as well as the hardware configuration of the I-slave and download them to the DP master and I-slave, respectively.
>
> The collective F-signature in the F-CPU of the I-slave and the collective F-signature in the F-CPU of the DP master (if a safety program exists there, too) are set to "0". You must then recompile the safety program(s). *(S019)*

9.1.7.2 Safety-Related I-Slave-Slave Communication - F-I/O Access

Access via the process image

In safety-related I-slave-slave communication, you use the process image (PII or PIQ) to access the F-I/O in the safety program of the F-CPU of the I-slave. This is the same as F-I/O access to F-I/O that are directly assigned to an I-slave or DP master. In the I-slave you access the F-I/O with the addresses that were assigned for the F-DX-Mod connection in "Transfer areas" ("Direct data exchange" table).

In this case, ignore the displayed operand area. Access F-I/O with inputs using the PII and F-I/O with outputs using PIQ.

Information on I/O access can be found in F-I/O access (Page 157).

9.1.7.3 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

An example of the amount of output data and input data that are assigned for safety-related communication is shown in the table below for an ET 200S 4/8 F-DI and an ET 200S 4 F-DO:

Safety-related communication	Communication connection	Assigned input and output data*	
		Between I-slave and DP master	
		Output Data in the I-slave	Input data in the I-slave
I-slave-slave	I-slave-slave communication with 4/8 F-DI	4 bytes	6 bytes
	I-slave-slave communication with 4 F-DO	5 bytes	5 bytes

* Example for 4/8 F-DI and 4 F-DO of ET 200S

Consider all additional configured safety-related and standard communication connections (F-MS, F-DX, F-DX-Mod., MS and DX connections) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master. If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.8 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master -I-slave connections (**F**-MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 607)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 229) also applies.

9.1.9 Safety-related communication via S7 connections

9.1.9.1 Configuring safety-related communication via S7 connections

Introduction

Safety-related communication between the safety programs of F-CPUs via S7 connections takes place by means of established S7 connections that you create in the network view of the *hardware and network editor* - same as in standard programs.

Restrictions

Note

In SIMATIC Safety, S7 connections are generally permitted only via Industrial Ethernet.

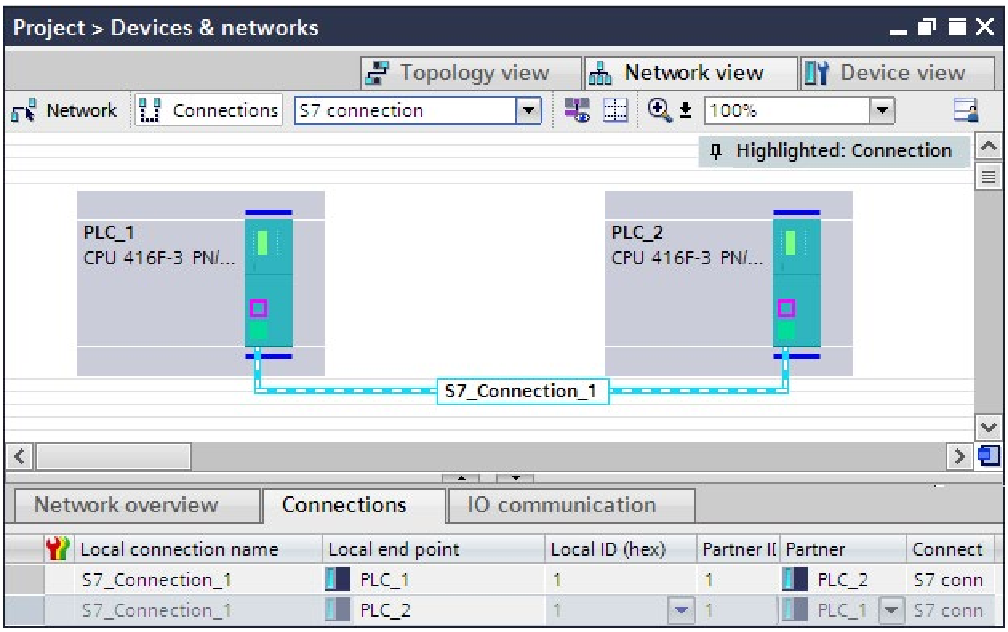
Safety-related communication via S7 connections is possible from and to the following CPUs:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

Creating S7 connections

For each connection between two F-CPUs, you must create an S7 connection in the network view of the *hardware and network editor*.

For every end-point of a connection, a local and a partner ID is automatically assigned from the perspective of the end-point (the F-CPU). If necessary, you can change both IDs in the "Connections" tab. You assign the local ID to the "ID" input of the SENDS7 and RCVS7 instructions in the safety programs.

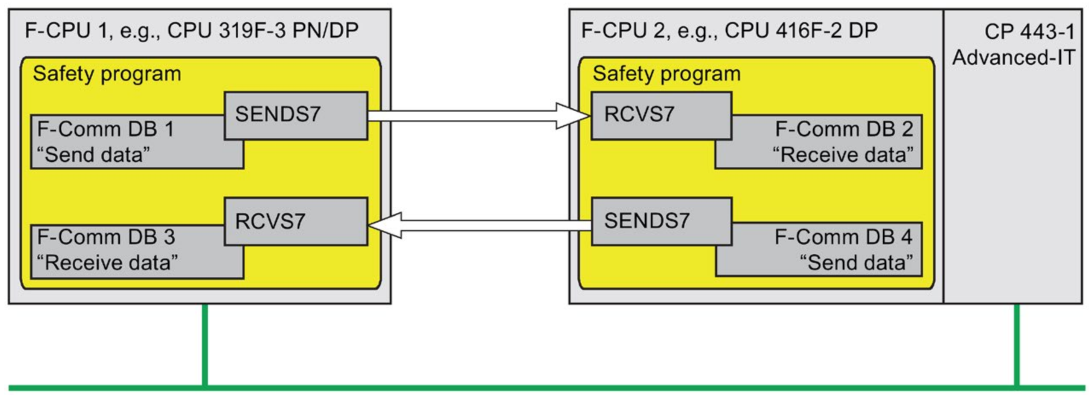


Procedure for configuring S7 connections

You configure the S7 connections for safety-related CPU-to-CPU communication in the same way as in *STEP 7 Professional* (see *Help on STEP 7 Professional* "S7 connections").

9.1.9.2 Communication via SENDS7, RCVS7, and F-Communication DB

Communication via the SENDS7 and RCVS7 instructions



You use the **SENDS7 and RCVS7** instructions for fail-safe sending and receiving of data via S7 connections.

These instructions can be used to transmit a specified amount of fail-safe data of data types BOOL, INT, WORD, DINT, DWORD, and TIME in a fail-safe manner. The fail-safe data are stored in F-DBs (F-communication DBs) that you have created.

You can find these instructions in the "Instructions" task card under "Communication". The RCVS7 instruction **must** be called at the start of the main safety block. The SENDS7 instruction **must** be called at the end of the main safety block.

Note that the send signals are sent only after calling the SENDS7 instruction at the end of the relevant F-runtime group execution.

A detailed description of the SENDS7 and RCVS7 instructions is found in SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V15.1) (S7-300, S7-400) (Page 599).

F-communication DB

For each connection, send data are stored in an F-DB (F-communication DBx) and receive data are stored in an F-DB (F-communication DBy).

You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

9.1.9.3 Programming safety-related communication via S7 connections

Introduction

The programming of safety-related CPU-CPU communication via S7 connections is described below. You must set up the following in the safety programs of the relevant F-CPUs:

- Create F-DBs (F-Communication-DBs) in which send/receive data for communication are stored.
- Call and assign parameters for instructions for communication from the "Instructions" Task Card in the safety program.

Requirement for programming

The S7 connections between the relevant F-CPUs must be configured in the network view in the "Connections" tab of the *hardware and network editor*.

Creating and Editing an F-Communication DB

F-communication DBs are F-DBs that you create and edit in the same way as other F-DBs in the project tree. You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

Note

The length and structure of the F-communication DB on the receiver side must match the length and structure of the associated F-communication DB on the sender side.

If the F-communication DBs do not match, the F-CPU can go to STOP mode. A diagnostics event is entered in the diagnostics buffer of the F-CPU.

For this reason, we recommend that you use the following procedure:

1. Create an F-communication DB in the project tree in or below the "Program blocks" folder of the F-CPU at the sender end.
2. Specify the appropriate structure of the F-communication DB, taking into account the data to be transferred.
3. Copy this F-communication DB to the project tree in or below the "Program blocks" folder of the F-CPU at the receiver end, and change the name, if necessary.

Other requirements for F-communication DBs

F-communication DBs must also conform to the following properties:

- They are not permitted to be instance DBs.
- Their length is not permitted to exceed 100 bytes.
- In F-communication DBs, only the following data types may be declared: BOOL, INT, WORD, DINT, DWORD, and TIME.
- The data types must be arranged block-wise and in the following order: BOOL, data types with bit length of 16 bits (INT, WORD), and data types with bit length of 32 bits (DINT, DWORD, and TIME). Within the data blocks with lengths of 16 bits and 32 bits, the data types can be arranged in any order.
- No more than 128 data elements of data type BOOL are permitted to be declared.
- The amount of data of data type BOOL must always be an integer multiple of 16 (word limit). Reserve data must be added, if necessary.

If these criteria are not fulfilled, *STEP 7 Safety Advanced* outputs an error message during compilation.

Assignment of fail-safe values

Fail-safe values are made available at the receiver end:

- While the connection between the communication partners is being established the first time after startup of the F-systems
- Whenever a communication error occurs

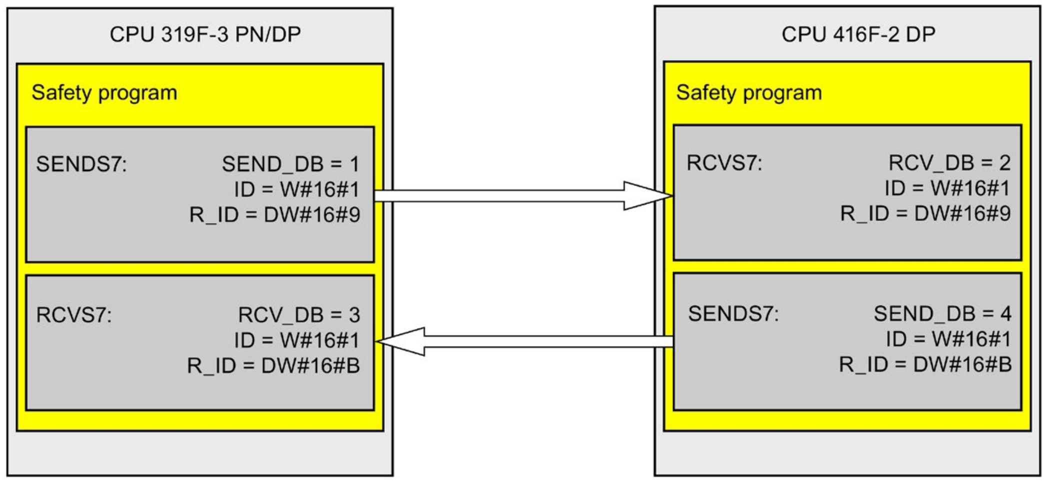
The values you specified as initial values in the F-communication DB at the receiver end are made available as initial values.

Programming procedure

You program safety-related communication via S7 connections as follows:

1. Supply the tags in the F-communication DB at the sender end with send signals using fully qualified access (e.g., "Name of F-communication DB".tag name).
2. Read the tags in the F-communication DB at the receiver end (receive signals) that you want to process further in other sections of the program using fully qualified access (e.g., "Name of F-communication DB".tag name).
3. In the safety program from which data are to be sent, call the SENDS7 instruction for sending at the end of the main safety block.
4. In the safety program in which data are to be received, call the instruction RCVS7 for receiving at the start of the main safety block.
5. Assign F-communication DB numbers to the SEND_DB input of SENDS7 and the RCV_DB input of RCVS7.
6. Assign the local ID of the S7 connection (data type: WORD) from the perspective of the F-CPU that was configured in the "Connections" tab of the network view to the ID input of SENDS7.

7. Assign the local ID of the S7 connection (data type: WORD) that was configured in the "Connections" tab of the network view to the ID input of RCVS7.
8. Assign an odd number (data type: DWORD) to the R_ID inputs of SENDS7 and RCVS7. This serves to specify that a SENDS7 instruction belongs to an RCVS7 instruction. The associated instructions receive the same value for R_ID.



WARNING

The value for the respective F-communication ID (input R_ID; data type: DWORD) can be freely selected; however, it must be odd for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

9. Assign the TIMEOUT inputs of the SENDS7 and RCVS7 instructions with the required monitoring time.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

10. To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND (initial value = "TRUE") with 0. In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction and the receiver RCVS7 provides fail-safe values for this period (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.
11. Optional: Evaluate the ACK_REQ output of RCVS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
12. Supply the ACK_REI input of RCVS7 with the signal for the acknowledgment for reintegration.
13. Optional: evaluate the SUBS_ON output of RCVS7 or SENDS7 in order to query whether the RCVS7 instruction is outputting the fail-safe values you specified as initial values in the F-communication DB.
14. Optional: Evaluate the ERROR output of RCVS7 or SENDS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
15. Optional: evaluate the SENDMODE output of RCVS7 in order to query whether the F-CPU with the associated SENDS7 instruction is in disabled safety mode (Page 344).

Particularities for migrated projects

If you have migrated a project from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced* in which safety-related communication via S7 connections is programmed, you must note the following:

- Do not delete migrated instance DBs for the SENDS7 and RCVS7 instructions in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks".

Otherwise, communication errors may occur in the relevant communication connections.

A migrated instance DB for the SENDS7 and RCVS7 instructions has been deleted if, after compiling the safety program, the "User-defined ID" in the newly generated is not identical to "FRCVS7CL" or "FSNDS7CL".

You can find the "User-defined ID" of a block in its properties in the "Information" area.

9.1.9.4 Safety-related communication via S7 connections - Limits of data transfer

---

Note

If the amount of data to be transmitted exceeds the permitted length for the F-communication DB (100 bytes), you can create another F-communication DB that you transfer to additional SENDS7/RCVS7 instructions with modified R_ID.

Note that USEND and URCV instructions are called internally at each SENDS7 or RCVS7 call and use connection resources in the F-CPU. This affects the maximum number of communication connections available (*see manuals for F-CPUs*).

Additional information on the data transfer limits for S7 connections of individual F-CPUs is available on the Internet (http://support.automation.siemens.com/WW/view/en/38549114).

9.1.10 Safety-related communication with other S7 F-systems

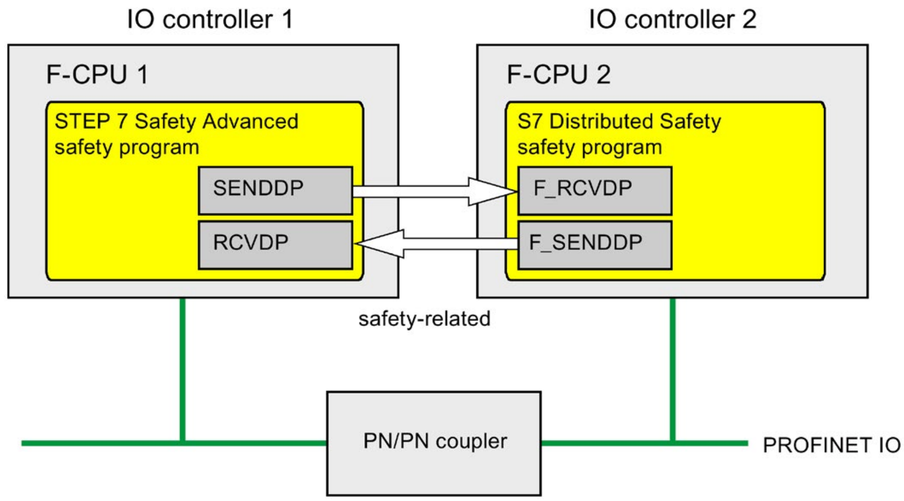
9.1.10.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs as IO controller-IO controller communication, master-master communication or communication via established S7 connections.

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 F/FH Systems F-systems is possible via established S7 connections.

9.1.10.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

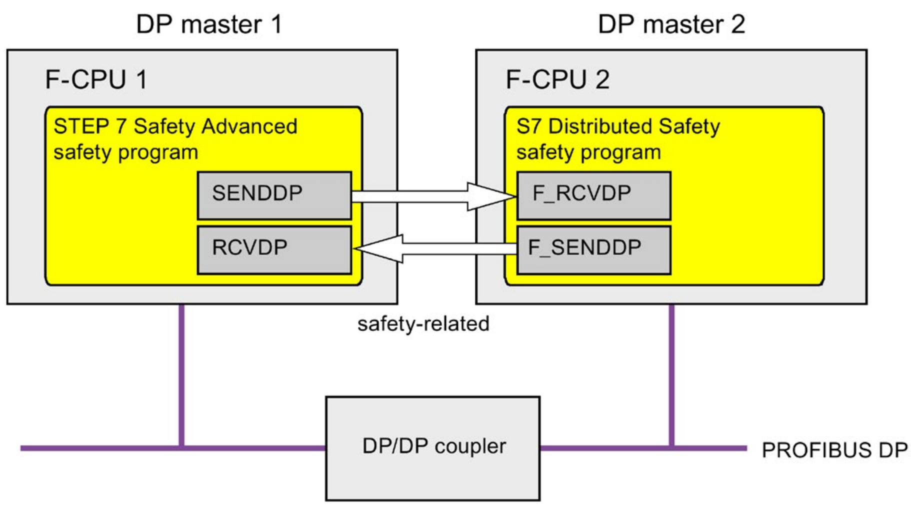
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related IO controller-IO controller communication (Page 204).

9.1.10.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

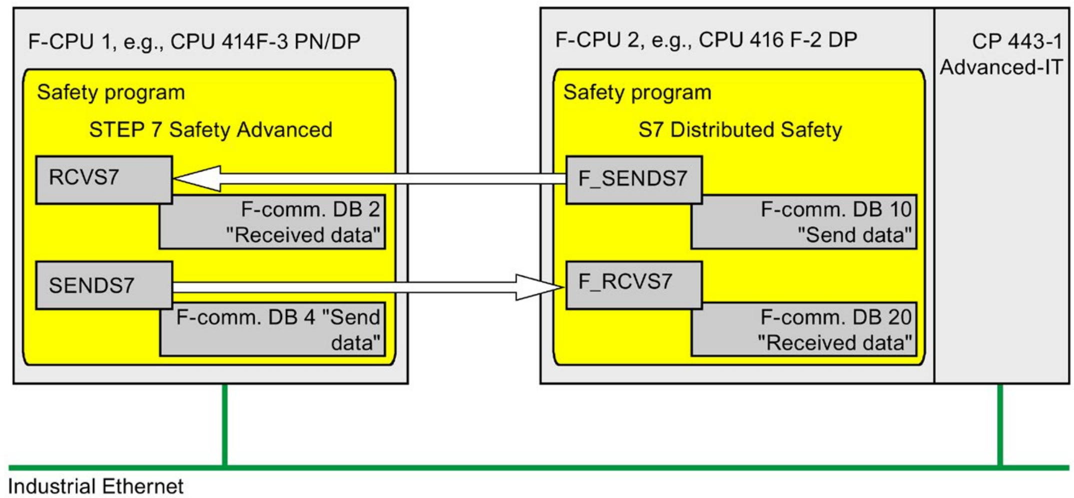
At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related master-master communication (Page 213).

9.1.10.4 Communication with S7 Distributed Safety via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SENDS7/F_RCVS7 F-application blocks at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in section "Safety-related communication via S7 communications" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

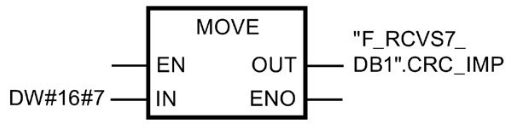
Because safety-related communication via S7 connections is not possible with unspecified partners in S7 Distributed Safety, you must first create a "virtual" SIMATIC station in *S7 Distributed Safety* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Professional*.

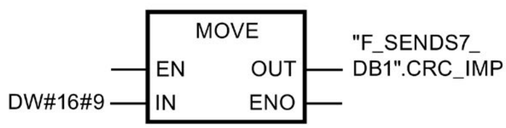
In addition, for all communication connections to this F-CPU, you must transfer the F-communication ID that you assigned in the R_ID input of the associated calls of the F_SENDS7 and F_RCVS7 F-application blocks additionally to the CRC_IMP tag in the instance DB of F_SENDS7 and F_RCVS7, respectively, in the standard user program immediately before calling the F-CALL.

Program example:

Network 1: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP



Network 2: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP



Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related communication via S7 connections (Page 248).

For the F-CPU in *S7 Distributed Safety*, you must create and specify an unspecified S7 connection. You can find information on this in the *STEP 7* help, under "Creating an unspecified connection" or "Specifying and unspecified connection".

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 Distributed Safety*.

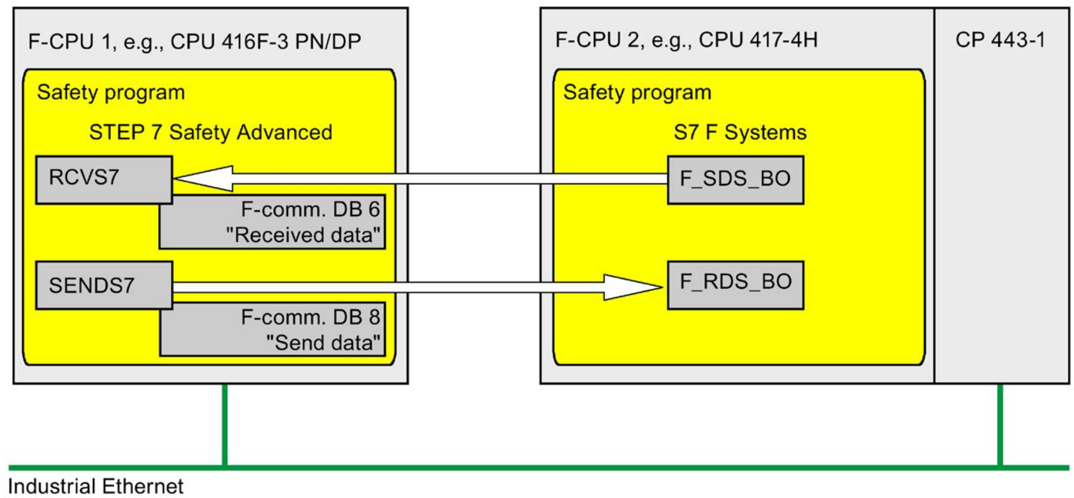
If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

If the instance DBs of the SENDS7 and RCVS7, instructions that you want to use for communication with *S7 Distributed Safety* were migrated from *S7 Distributed Safety*, you must delete them in the project tree in the "STEP 7 Safety" folder, under "Program blocks > System blocks" (contrary to the information in Programming safety-related communication via S7 connections (Page 251), section "Particularities for migrated projects").

9.1.10.5 Communication with S7 F/FH Systems via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SDS_BO/F_RDS_BO F-blocks at the *S7 F Systems* end.

A maximum of 32 data elements of data type BOOL can be exchanged.



Procedure at the *S7 F Systems* end

At the *S7 F-systems* end, proceed as described in section "Safety-related communication between F-CPUs" in the S7 F/FH Systems - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/16537972) manual.

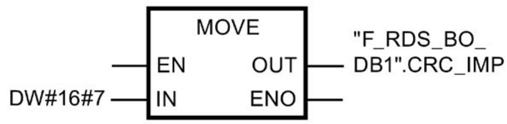
Because safety-related communication via S7 connections is not possible with unspecified partners in *S7 F/FH Systems*, you must first create a "virtual" SIMATIC station in *S7 F/FH Systems* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Safety Advanced*.

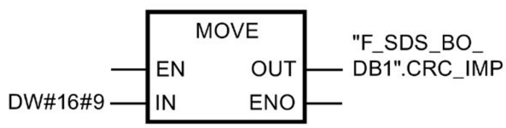
In addition, you must insert a function in your S7 program (in the area reserved in CFC for other applications), in which, for all communication connections for this F-CPU, you transfer the F-communication ID that you assigned in the R_ID input of the associated calls of the F_SDS_BO and F_RDS_BO F-blocks additionally to the CRC_IMP tag in the instance DB of the F_SDS_BO and F_RDS_BO, respectively. You obtain the number of the instance DB from the object properties of the block in CFC. Assign descriptive names for these instance DBs. If you perform a compress operation in CFC, you must check whether the numbers of these instance DBs have changed.

Program example:

Network 1: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP



Network 2: Communication to STEP 7 Safety Advanced: R_ID -> CRC_IMP



You must then import the function in CFC as block type and insert your standard user program in a chart. In the run sequence, make sure that the associated standard runtime group is processed before the F-runtime group.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in "Safety-related communication via S7 connections" (Page 248).

Particularity: In *STEP 7 Safety Advanced*, you must create the F-communication DB with exactly 32 data elements of data type BOOL.

For the F-CPU in *S7 F/FH Systems*, you must create and specify an unspecified S7 connection. You can find information on this in the

STEP 7 help under "Creating an unspecified connection" or "Specifying and unspecified connection".

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 F Systems*.

If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

9.2 Configuring and programming communication with Flexible F-Link (S7-1200, S7-1500)

9.2.1 Flexible F-Link

Introduction

As of *STEP 7 Safety V15.1* a new fail-safe CPU-CPU communication "Flexible F-Link" is available for the F-CPUs S7-1200 and S7-1500. This means fail-safe data can be easily exchanged as fail-safe arrays with standard communication mechanisms between F-CPUs.

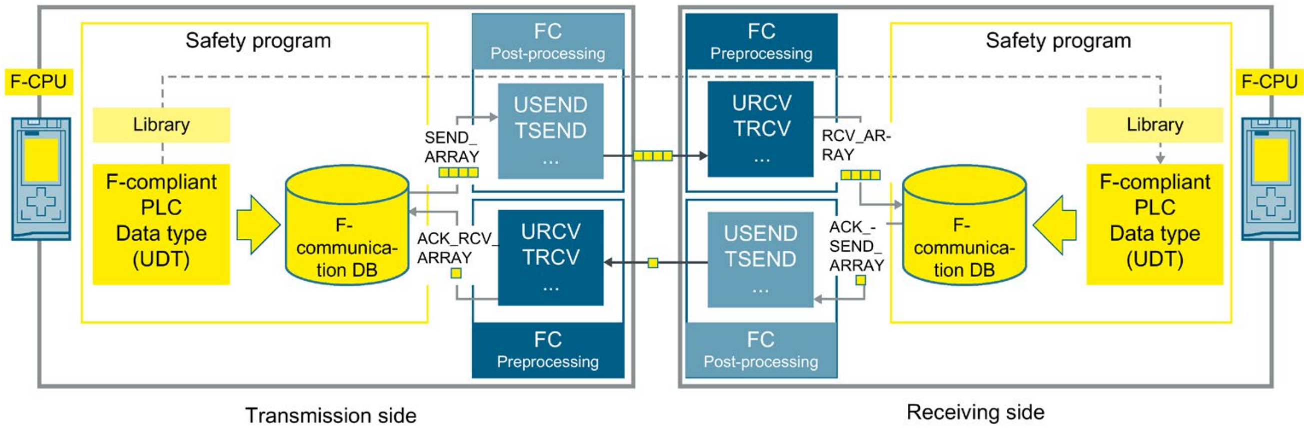
Flexible F-Link offers a series of advantages for exchanging fail-safe data:

- Collection of fail-safe data to be transmitted in F-compliant PLC data types (UDTs)
- Up to 100 bytes of fail-safe data per UDT
- Support of fail-safe data types
- Easy parameter assignment and automatic generation of fail-safe communication DBs
- Transmission of fail-safe data with standard communication blocks also across network limits
- F-runtime group communication (Page 96) for F-CPUs 1200/1500
- System-integrated and globally sufficiently unique F-communication UUID
- Separate F-communication address signature for easy detection of changes to the F-communication UUID

Requirement

- S7-1500 F-CPUs as of firmware V2.0
- S7-1200 F-CPUs as of firmware V4.2
- As of safety system version V2.2

Principles of communication via Flexible F-Link



Proceed as follows on the **send side**:

1. Create an F-compliant PLC data type (UDT) for the data to be sent. The size is up to 100 bytes.
2. Create an F-communication with direction "Sending" in the Safety Administration Editor.

   A new F-communication DB is created for the F-communication under "Program blocks\system blocks\STEP 7 Safety\F-communication DBs".
3. Set the F-monitoring time (Page 613) for the F-communication.
4. In the safety program, interconnect the tag for the send data (SEND_DATA) at the F-communication DB (Page 96) of the F-communication.
5. To transmit the coded, fail-safe arrays, create suitable communication blocks for sending and receiving (acknowledgment) in the standard program. For processing the process values in the correct chronological order, you can make use of the F-OB Pre-/post-processing (Page 87). Note when using standard communication blocks that the fail-safe arrays are available consistently at the time of evaluation and that the F-monitoring time (Page 613) is observed.
   – Use a standard instruction for consistent transfer of SEND_ARRAY (for example TSEND_C, TSEND or USEND).
   – Use a standard instruction for consistent receiving of ACK_RCV_ARRAY (for example TRCV_C, TRCV or URCV).

Proceed as follows on the **receive side**:

1. Create an F-compliant PLC data type (UDT) with the same structure as on the send side.

   To do so, copy the F-compliant PLC data type (UDT) from the send side or use the project library or global library.
2. Create an F-communication with the direction "Receiving" in the Safety Administration Editor.

   A new F-communication DB is created for the F-communication under "Program blocks\system blocks\STEP 7 Safety\F-communication DBs"
3. Copy the F-communication UUID of the F-communication from the send side.
4. Set the same F-monitoring time as for the send side.
5. In the safety program, interconnect the tags for the receive data (RCV_DATA) at the F-communication DB (Page 96).
6. To transmit the coded, fail-safe arrays, create suitable communication blocks for sending and receiving (acknowledgment) in the standard program. For processing the process values in the correct chronological order, you can make use of the F-OB Pre-/post-processing (Page 96). Note when using standard communication blocks that the fail-safe arrays are available consistently at the time of evaluation and that the F-monitoring time (Page 613) is observed.
   - Use a standard instruction for consistent receiving of RCV_ARRAY (for example TRCV_C, TSEND or USEND).
   - Use a standard instruction for consistent transfer of ACK_SEND_ARRAY (for example TSEND_C, TRCV or URCV).
7. In the safety program, interconnect the tags for the receive data (RCV_DATA) at the F-communication DB (Page 96) of the F-communication.

WARNING

During the acceptance use the safety summary to verify that the offsets of the elements of the F-compliant PLC data types (UDT) match for the sending and receiving data within the safety message frame. For this purpose all members and addresses are listed in the safety summary per UDT. Also keep in mind that the size can be a up to 100 bytes. *(S088)*

WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, the F-communication UUID for the communication is explicitly provided by the system. By copying communications in Safety Administration Editor within the parameterization table or when copying into another F-CPU, the F-communication UUIDs are not generated new and are therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself need to ensure the uniqueness. To do this select the affected UUIDs and regenerate via the "Generate UUID" shortcut menu. The uniqueness must be ensured in the safety summary during acceptance of the safety program. *(S087)*

WARNING

You must take the following into account for safety-related CPU-CPU communication with the communication type Flexible F-Link:

If the F-CPU that sends the data is on a simulated F-CPU with S7 PLCSIM, you can no longer assume that the data sent by this F-CPU are generated safely. You must then implement organizational measures such as operation monitoring and manual safety shutdown to ensure safety in those portions of the system that are affected by the sent data. Alternatively, you must output fail-safe substitute values instead of the received data in the F-CPU that receives the data by evaluating SENDMODE*.

* SENDMODE is available to you as a tag in the F-communication DB.

(S086)

Example of a safety-related communication between two F-CPUs (Page 266)

F-runtime group communication (S7-1200, S7-1500) (Page 145)

9.2.2 Example of a safety-related communication between two F-CPUs

Safety-related communication between two F-CPUs

If you want to send a data fail-safe from one F-CPU to another F-CPU, follow these steps on the send side (e.g. F-CPU1):

1. Create an F-compliant PLC data type (UDT) for the data to be sent for F-CPU1. The size is up to 100 bytes.
2. Create an F-communication with the direction "sending" in the Safety Administration Editor in the "Flexible F-Link" range.
3. Configure the F-monitoring time and the F-communication UUID.

   Information on calculating the F-monitoring times can be found in Monitoring and response times (Page 607).

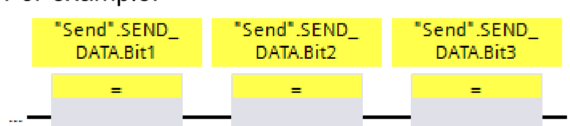
   For example:

   Flexible F-Link settings

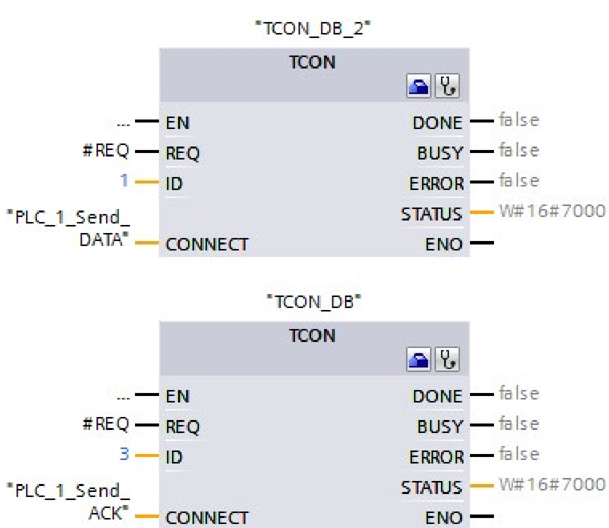
	Name	PLC Data Type	Direction	F-monitoring time: (ms)	F-communication UUID
1	Send	Data	Send	500	5d61f443-ede6-4e4e-9db6-e79af634f9ad
2	<Add new>				

4. On the send side supply the data of the transmission DBs with the data to be sent.

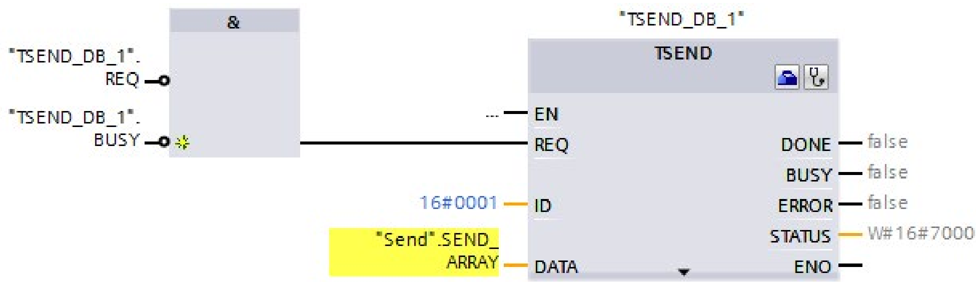
   For example:

5. Call a "Connection setup" FB in OB1 of the F-CPU1 and program the connection setup in this function block.
6. Interconnect a "TCON" instruction twice to set up the communication connection as follows:

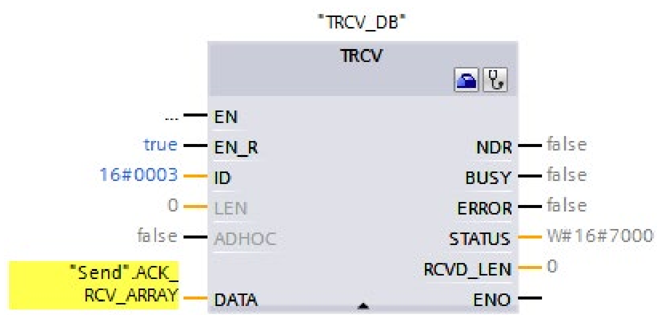
   


7. Call the "TSEND" instruction for the data to be sent in the FC for the post processing (Page 87) of the F-CPU1.
8. Interconnect a "TSEND" instruction for the data to be sent as follows:



"Sending" is the F-communication DB (Page 96) that sends the data to the F-CPU1.

9. Call the "TRCV" instruction for the acknowledgment in the FC for the pre-processing (Page 87) of the F-CPU1.
10. Interconnect a "TRCV" instruction for the acknowledgment connection as follows:



"Sending" is the F-communication DB (Page 96) that sends the data to the F-CPU1.

11. Compile the user program.
12. Download the user program to the F-CPU1.

Proceed as follows on the **receive side** (for example F-CPU2):

1. For F-CPU2 create an F-compliant PLC data type (UDT) with the same structure as F-CPU1 for the data to be received. The size is up to 100 bytes.

   To do so, copy the F-compliant PLC data type (UDT) from the send side or use the project library or global library.
2. Create an F-communication with the direction "receiving" in the Safety Administration Editor in the "Flexible F-Link" range.
3. Configure the same F-monitoring time and F-communication UUID as for F-CPU1.

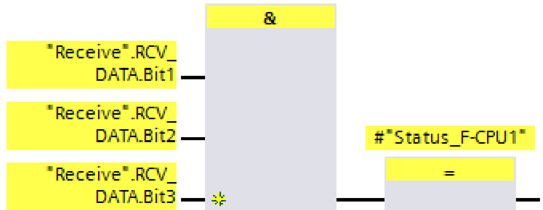
   For example:

Flexible F-Link settings

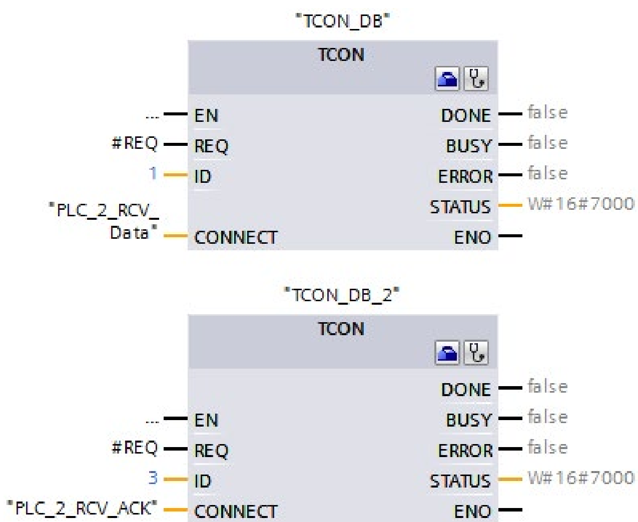
	Name	PLC Data Type	Direction	F-monitoring time: (ms)	F-communication UUID
1	Receive	Data	Receive	500	5d61f443-ede6-4e4e-9db6-e79af634f9ad
2	<Add new>				

4. Read the receiving data from the receiving DB on the receive side.

   For example:



5. Call a "Connection setup" FB in OB1 of the F-CPU2 and program the connection setup in this function block.
6. Interconnect a "TCON" instruction twice to set up the communication connection as follows:

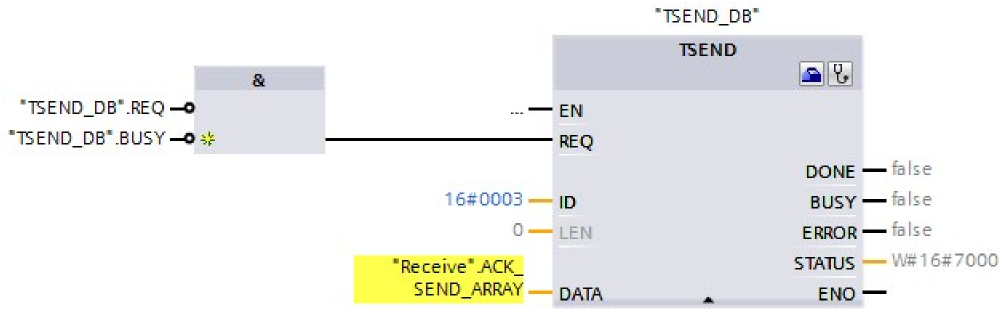


7. Call the "TRCV" instruction for the data to be received in the FC for the pre-processing (Page 87) of the F-CPU2.
8. Interconnect a "TRCV" instruction for the data to be received as follows:

   "Receiving" is the F-communication DB (Page 96) that sends the data to the F-CPU2.

9. Call the "TSEND" instruction for the acknowledgment in the FC for the post processing (Page 87) of the F-CPU2.

10.Interconnect a "TSEND" instruction for the acknowledgment connection as follows:



"Receiving" is the F-communication DB (Page 96) that sends the acknowledgment telegram to the F-CPU2.

11.Compile the user program.

12.Download the user program to the F-CPU2.

WARNING

During the acceptance use the safety summary to verify that the offsets of the elements of the F-compliant PLC data types (UDT) match for the sending and receiving data within the safety message frame. For this purpose all members and addresses are listed in the safety summary per UDT. Also keep in mind that the size can be a up to 100 bytes. *(S088)*

WARNING

When a new Flexible F-Link communication is created in the Safety Administration Editor, the F-communication UUID for the communication is explicitly provided by the system. By copying communications in Safety Administration Editor within the parameterization table or when copying into another F-CPU, the F-communication UUIDs are not generated new and are therefore not unique anymore. If the copy is used to configure a new communication relationship, you yourself need to ensure the uniqueness. To do this select the affected UUIDs and regenerate via the "Generate UUID" shortcut menu. The uniqueness must be ensured in the safety summary during acceptance of the safety program. *(S087)*

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

FAQ: "How do you program the TCON communication instruction to set up a connection for Open User Communication between two S7-1500 CPUs?" (https://support.industry.siemens.com/cs/ww/en/view/58875807)

9.3 Configuring and programming communication (S7-1200, S7-1500)

9.3.1 Overview of communication

Introduction

This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

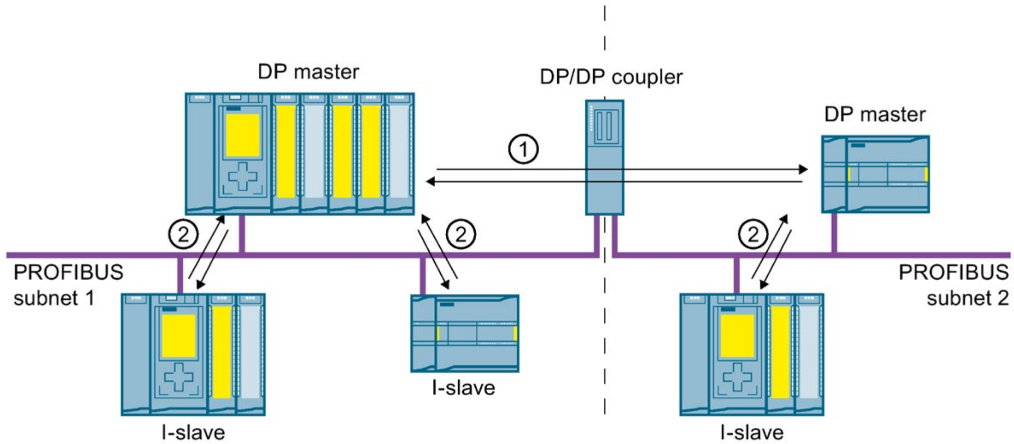
Safety-related communication	**On subnet**	**Additional hardware required**
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
IO controller-IO controller communication for *S7 Distributed Safety*	PROFINET IO	PN/PN coupler
Master-master communication for *S7 Distributed Safety*	PROFIBUS DP	DP/DP coupler

Note

Safety-related communication with S7-1200 F-CPUs is only permitted as of firmware version V4.1.2.

Overview of safety-related communication via PROFIBUS DP

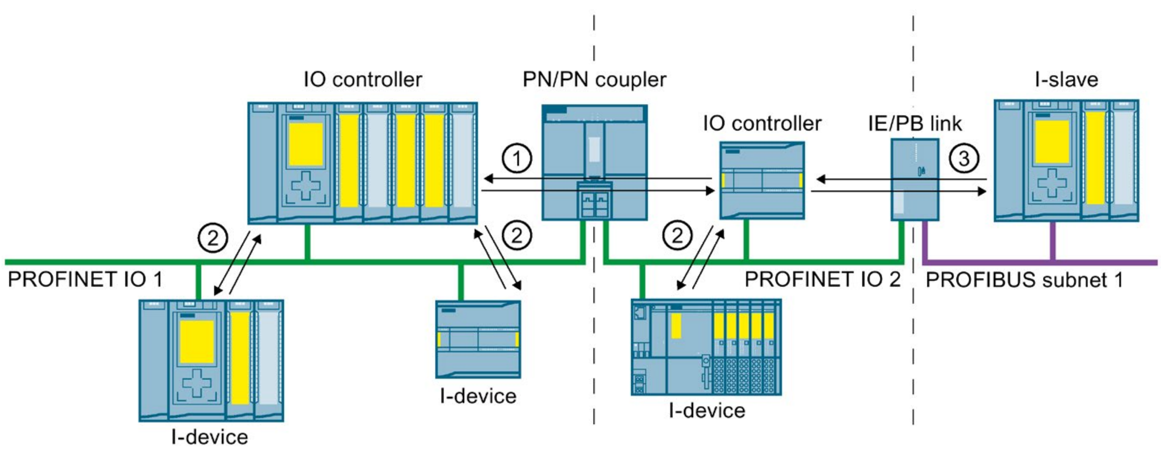
The figure below provides an overview of the options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.



① Safety-related master-master communication
② Safety-related master-I-slave communication

Overview of safety-related communication via PROFINET IO

The figure below provides an overview of the options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.



① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of data of the data type BOOL or INT (DINT as alternative) is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. The hardware identifier (HW identifier) defines the transfer areas configured.

Safety-related CPU-CPU communication for *S7 Distributed Safety*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety*.

9.3.2 Safety-related IO controller-IO controller communication

9.3.2.1 Configure safety-related IO controller-IO controller communication

Introduction

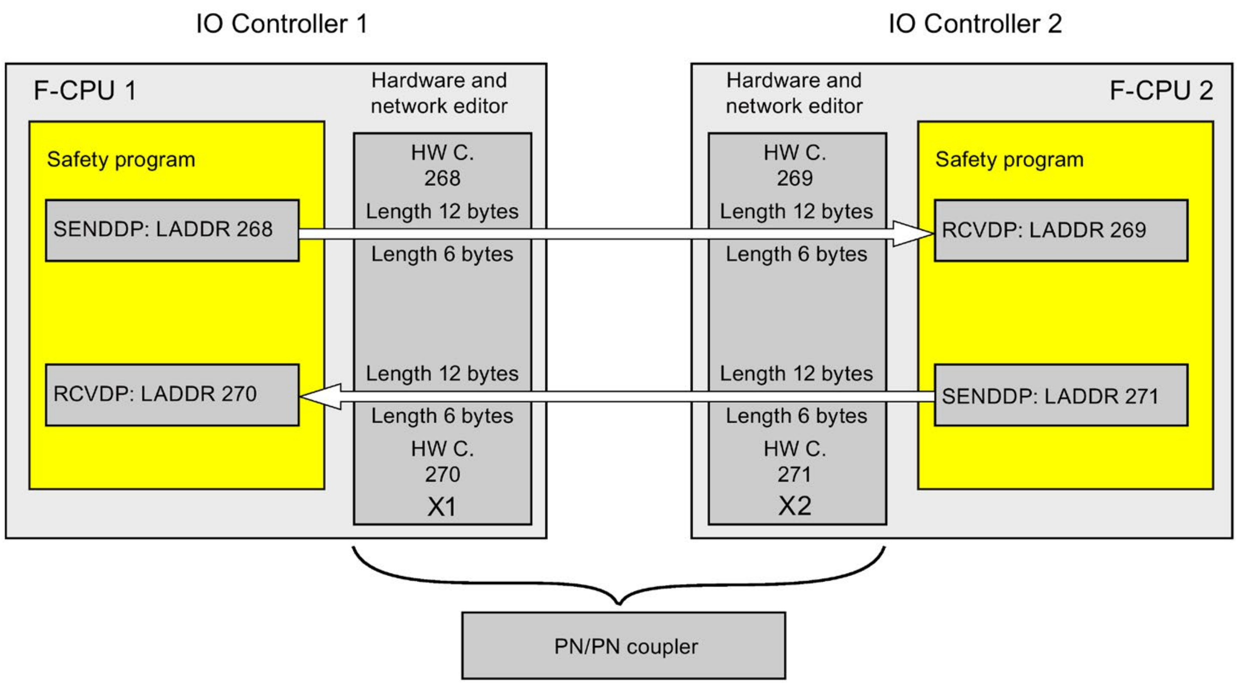
Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Note

PN/PN Coupler article number 6ES7158-3AD10-0XA0

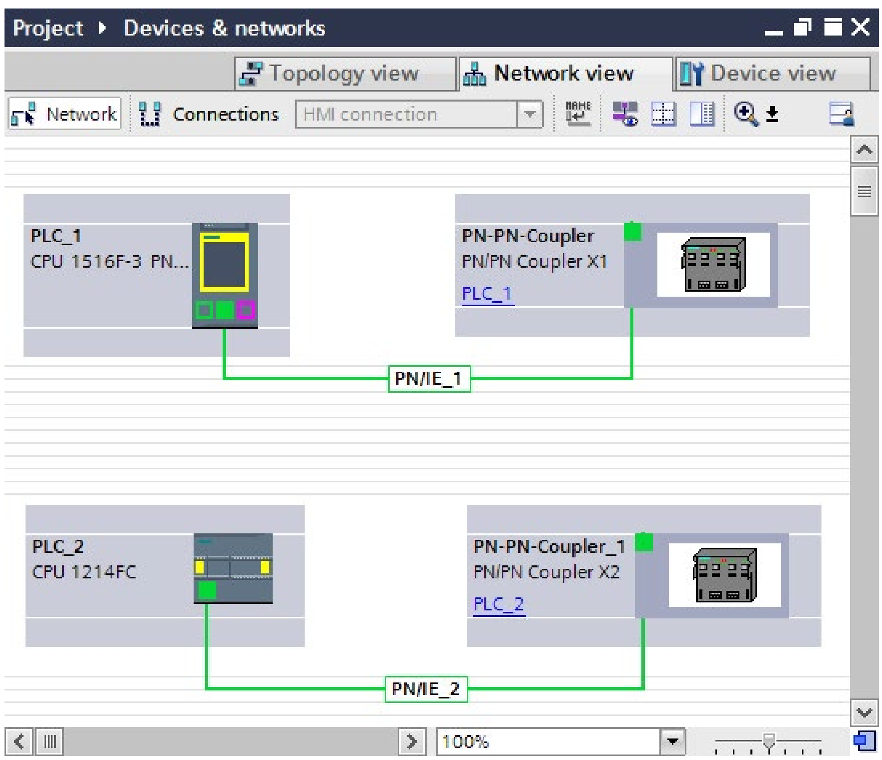
When configuring the transfer areas for the output and input data, proceed as described in the "SIMATIC bus links PN/PN coupler (https://support.industry.siemens.com/cs/ww/en/view/44319532)" manual, section "Configuring the PN/PN Coupler with STEP 7 TIA Portal".

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   – One "IN/OUT 6 bytes / 12 bytes" module and
   – One "IN/OUT 12 bytes / 6 bytes" module

Note

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

Device overview

Module	...	Rack	Slot	I address	Q address	Type	Article n...	Firmware
PN-PN-Coupler		0	0	8186*		PN/PN Coupler X1	6ES7 158...	V03.00.00
PN-IO-01		0	0 X1	8185*		PN-PN-Coupler		
IN/OUT 6 Byte / 12 Byte_1		0	1	0...5	0...11	IN/OUT 6 Bytes ...		
IN/OUT 12 Byte / 6 Byte_1		0	2	6...17	12...17	IN/OUT 12 Byte...		

6. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   – One "IN/OUT 12 bytes / 6 bytes" module and
   – One "IN/OUT 6 bytes / 12 bytes" module

Device overview

Module	...	Rack	Slot	I address	Q address	Type	Article n...	Firmware

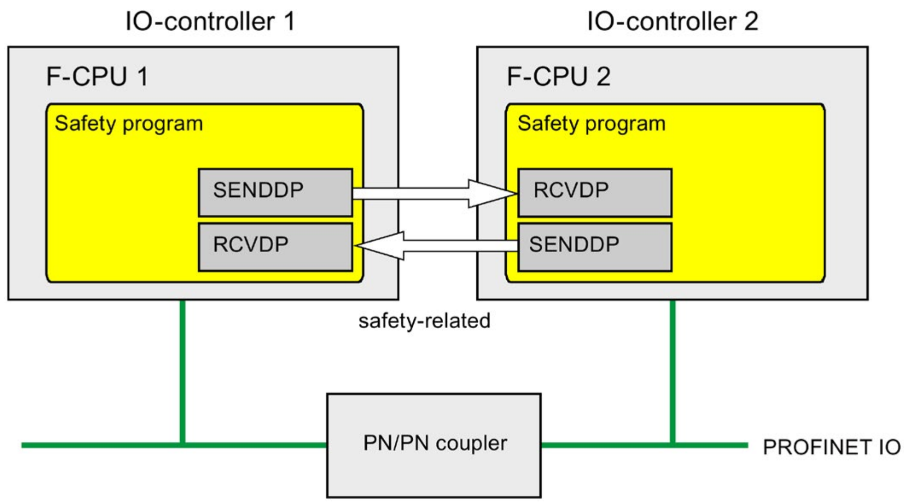
PN-IO-02		0	0 X2	8185*		PN-PN-Coupler		
IN/OUT 12 Byte / 6 Byte_1		0	1	0...11	0...5	IN/OUT 12 Byte...		
IN/OUT 6 Byte / 12 Byte_1		0	2	12...17	6...17	IN/OUT 6 Bytes ...		

9.3.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call up the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call at the start or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.3.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

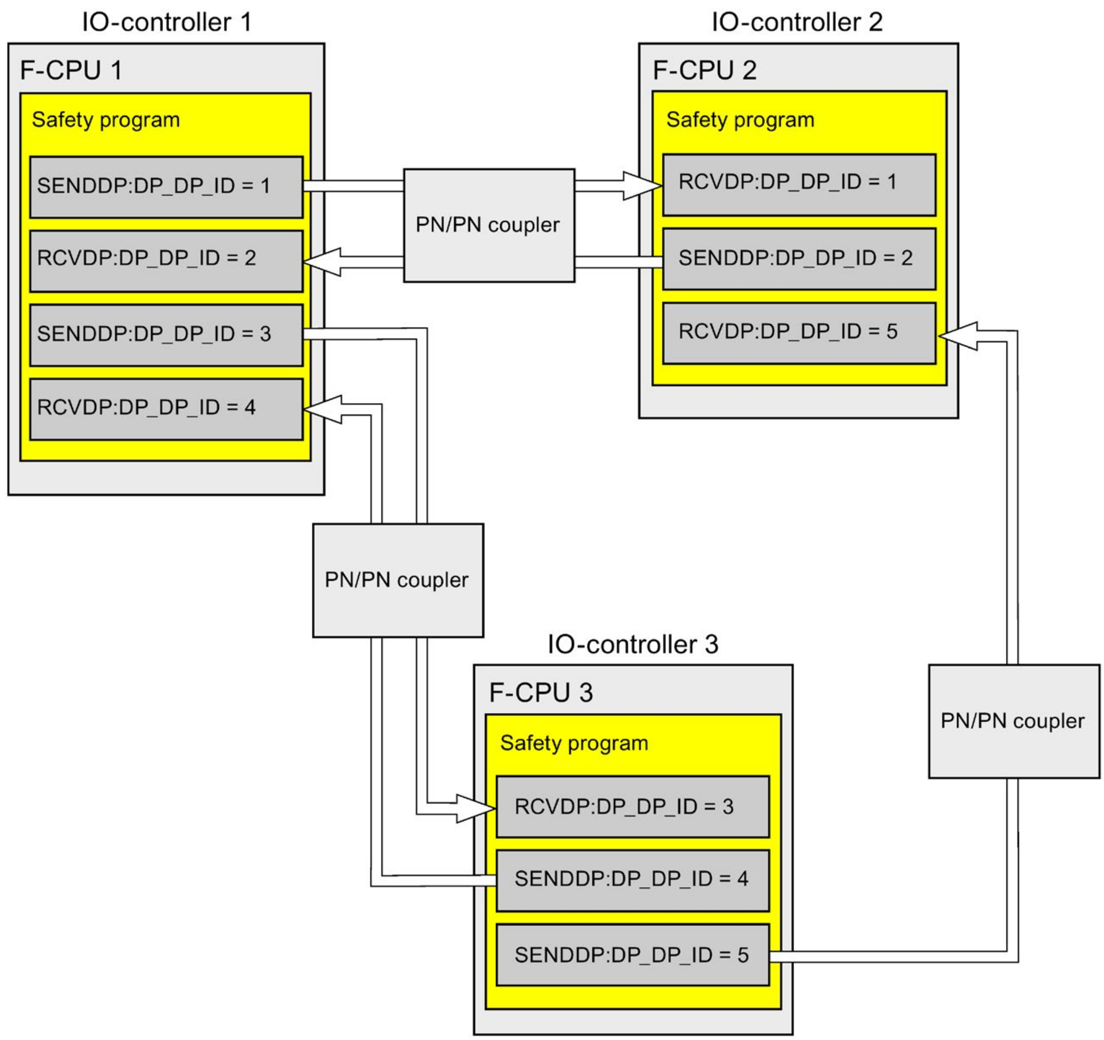
Programming procedure

You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 588) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 588) for receiving at the start of the main safety block.
3. Assign the respective LADDR inputs HW identifiers (system constants in the default tag table) for the transfer areas for output and input data of the PN/PN coupler that are configured in the hardware and network editor.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.
4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related IO controller-IO controller communication relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

WARNING
Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

WARNING
It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.
13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 344).

9.3.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.3.3 Safety-related master-master communication

9.3.3.1 Configure safety-related master-master communication

Introduction

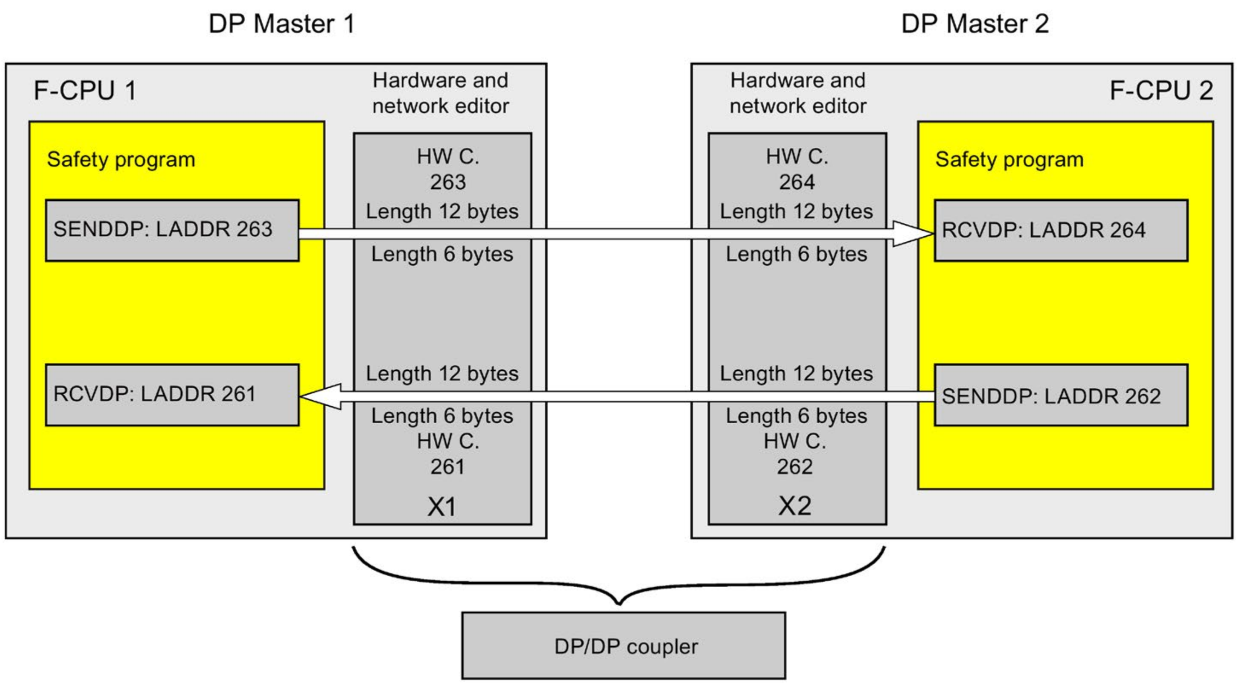
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

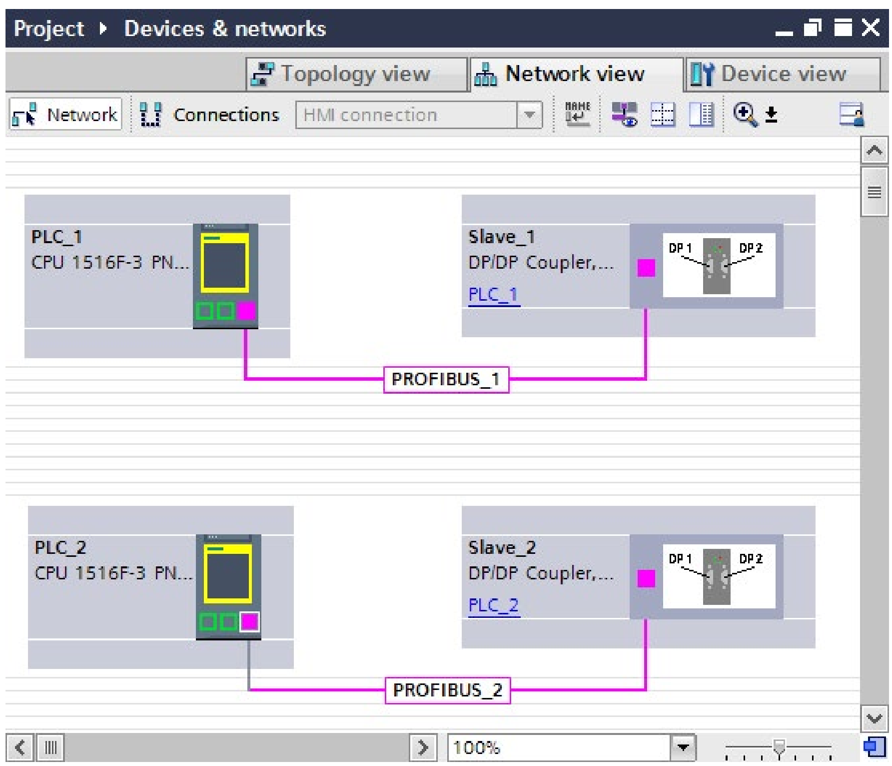
A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.



6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler, either via the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).

7. Switch to the device view of the DP/DP coupler PLC1 for bidirectional communication connections i.e. where each F-CPU should both send and receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab of the DP/DP coupler:
   – One "6 bytes I/12 bytes Q consistent" module, and
   – One "12 bytes I/6 bytes Q consistent" module

   Note

   The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

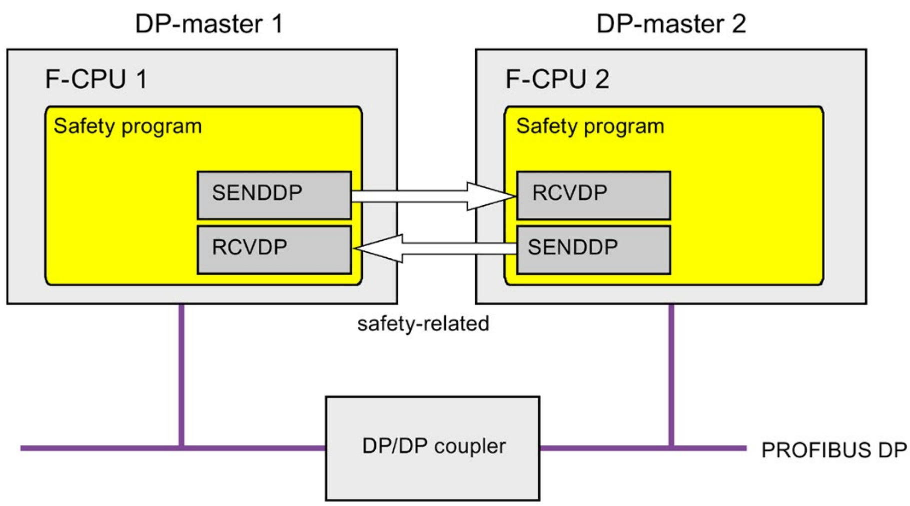
9.3.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call up the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the start or the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.3.3.3 Program safety-related master-master communication

Requirement for programming

The address areas for input and output data for the DP/DP coupler must be configured.

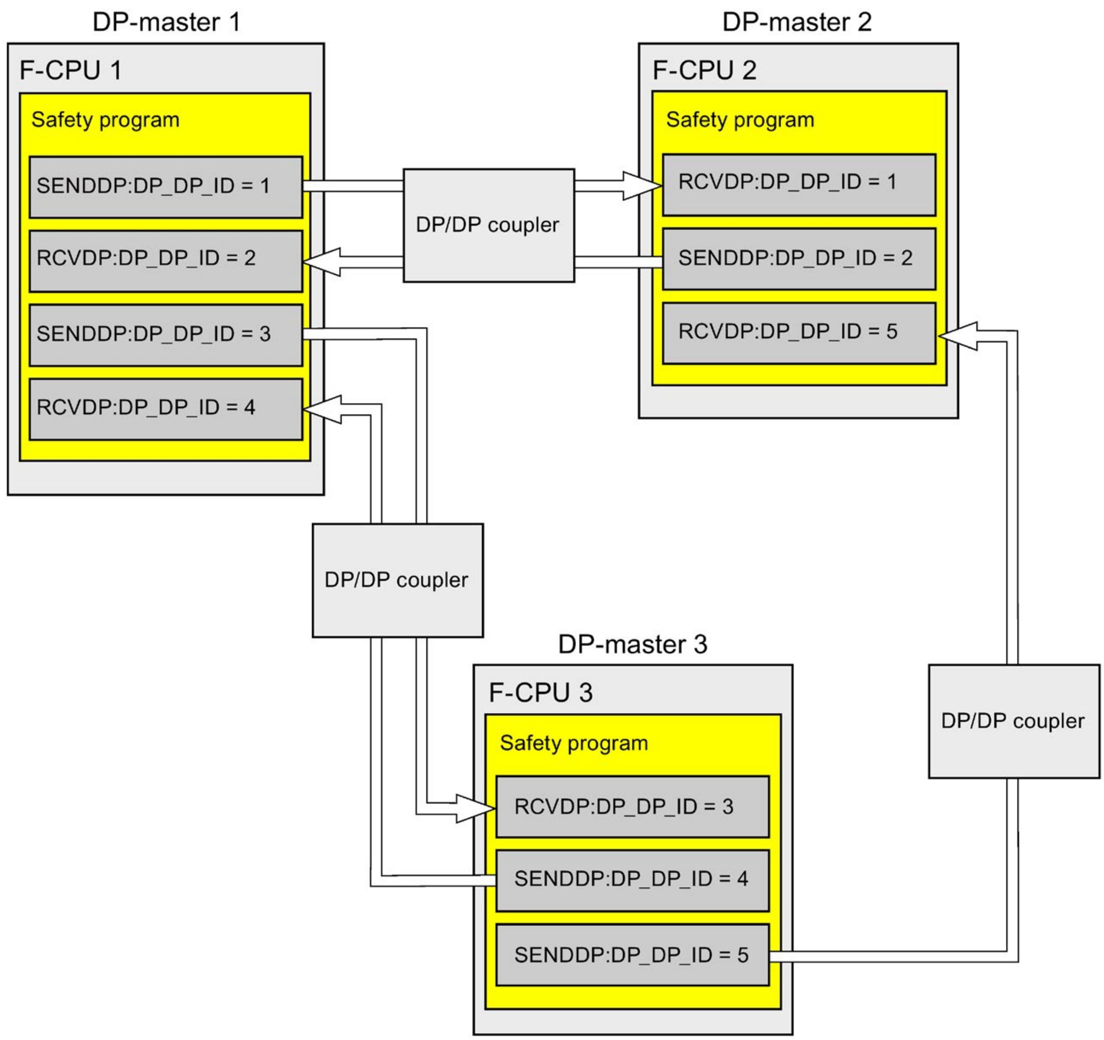
Programming procedure

You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 588) for sending at the end of the main safety block or a separate F-FC/F-FB.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 588) for receiving at the start of the main safety block or a separate F-FC/F-FB.
3. Assign the HW identifiers for the output and input data of the DP/DP coupler configured in the *hardware and network editor* (constant in the tag table) to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.
4. Assign the value for the respective F-communication ID to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for 5 safety-related master-master communications relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   – Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").

– Specification of dynamic fail-safe values:

  If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

WARNING
Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

WARNING
It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.

11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.

12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.

13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.

14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 344).

9.3.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.3.4 Safety-related IO controller-I-device communication

9.3.4.1 Configuring safety-related communication between IO controller and I-device

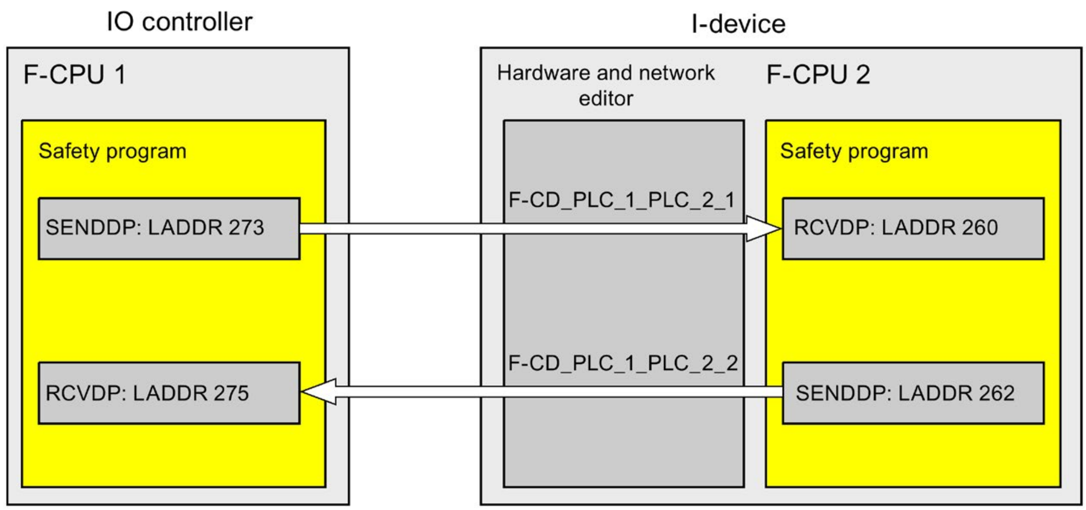
Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (F-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the IO controller and in the F-CPU of the I-device. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

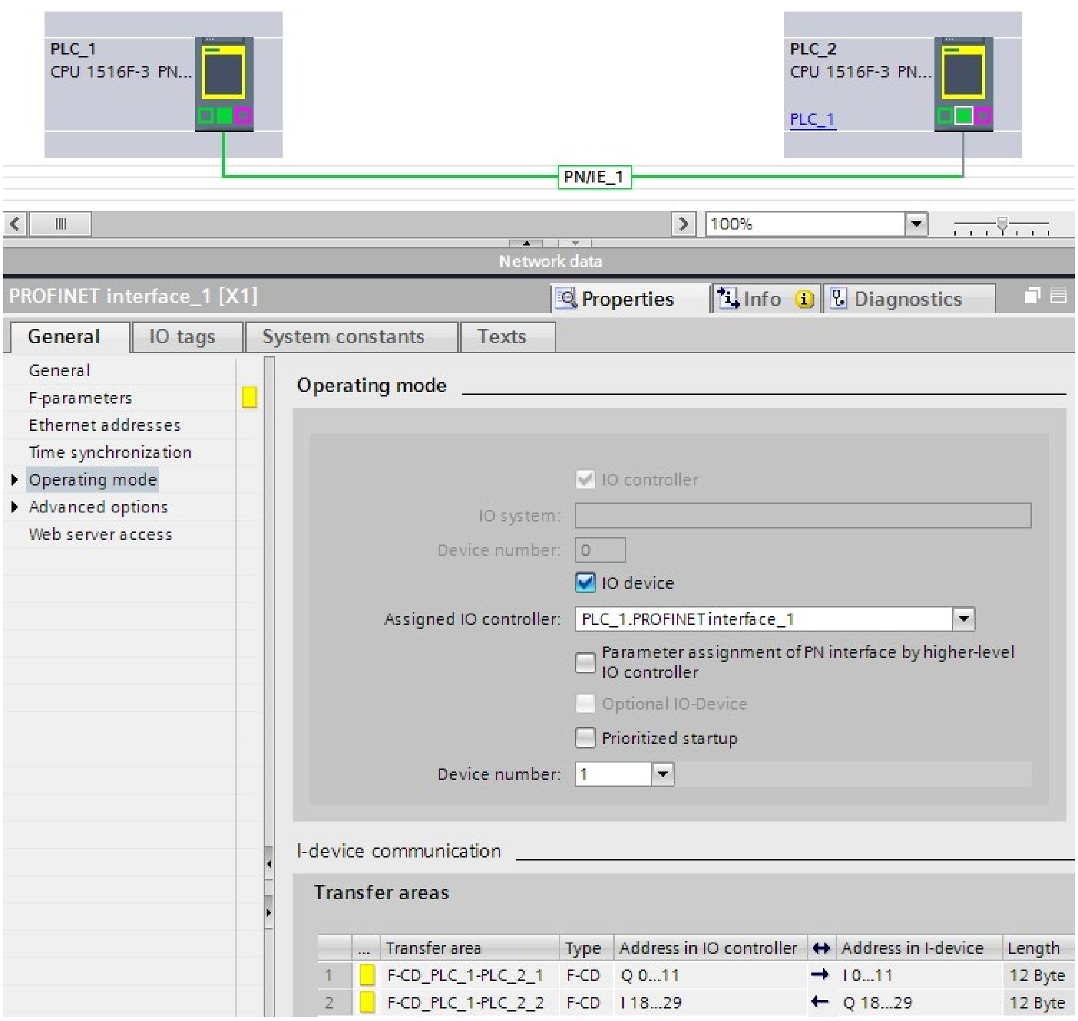
Procedure for configuration

The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

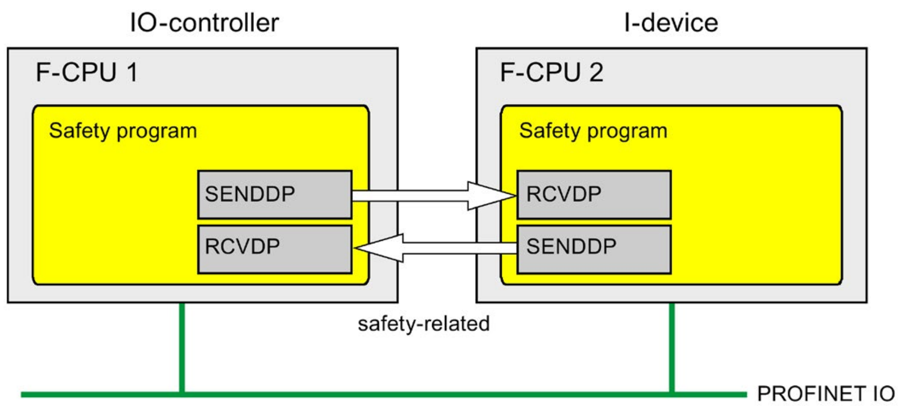
1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for receiving from the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned are displayed.

   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").
4. Create an additional F-CD connection for sending to the IO controller.
5. In the transfer area you just created, click on the arrow to change the transfer direction to sending to the IO controller (←).



9.3.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call up the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call at the start or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.3.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

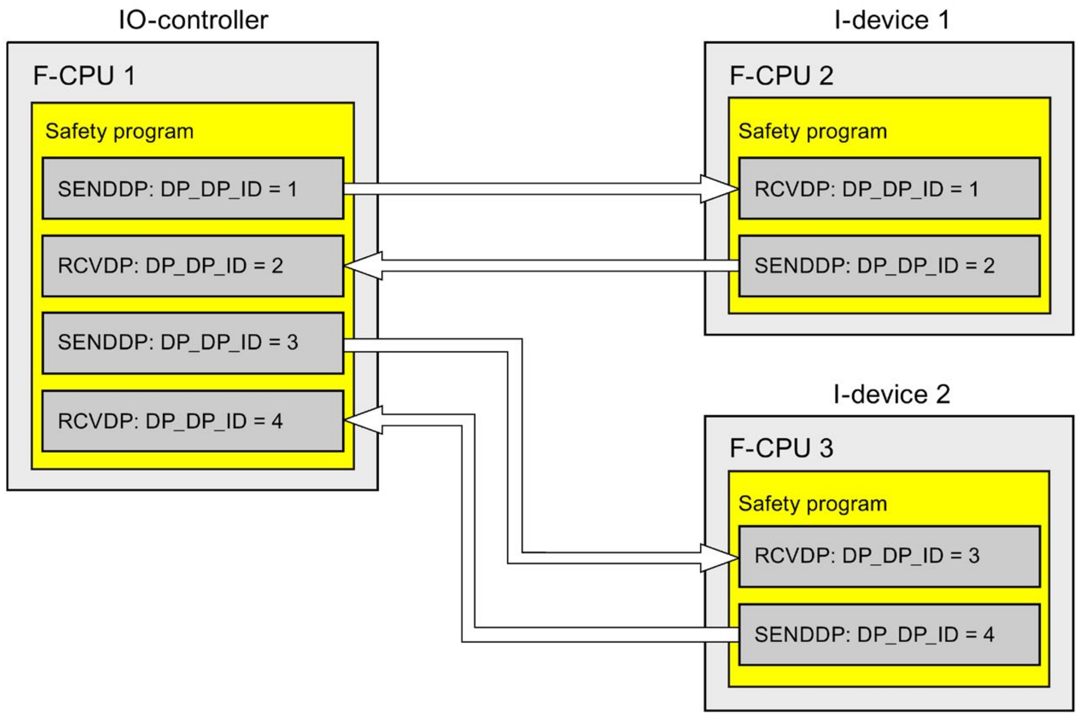
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 277)).

The assignment of the HW identifiers (system constants in the standard tag table) of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table:

Instruction	HW identifier
SENDDP in the IO controller	Hardware identifier of the transfer area in the IO controller
RCVDP in the IO controller	Hardware identifier of the transfer area in the IO controller
SENDDP in the I-device	Hardware identifier of the transfer area in the I-device
RCVDP in the I-device	Hardware identifier of the transfer area in the I-device

The figure below contains an example of how to specify the F-communication IDs for the inputs of the SENDDP and RCVDP instructions for 4 safety-related IO controller-I-device communication relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

9.3.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

<table>
<tr><th rowspan="3">Safety-related communication</th><th rowspan="3">Communication connection</th><th colspan="4">Assigned input and output data</th></tr>
<tr><th colspan="2">In the IO controller</th><th colspan="2">In the I-device</th></tr>
<tr><th>Output data</th><th>Input data</th><th>Output data</th><th>Input data</th></tr>
<tr><td rowspan="2">IO controller-
I-Device</td><td>Sending:
I-Device 1 to IO controller</td><td>6 bytes</td><td>12 bytes</td><td>12 bytes</td><td>6 bytes</td></tr>
<tr><td>Receiving:
I-Device 1 from IO controller</td><td>12 bytes</td><td>6 bytes</td><td>6 bytes</td><td>12 bytes</td></tr>
</table>

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.3.5 Safety-related master-I-slave communication

9.3.5.1 Configuring safety-related master-I-slave communication

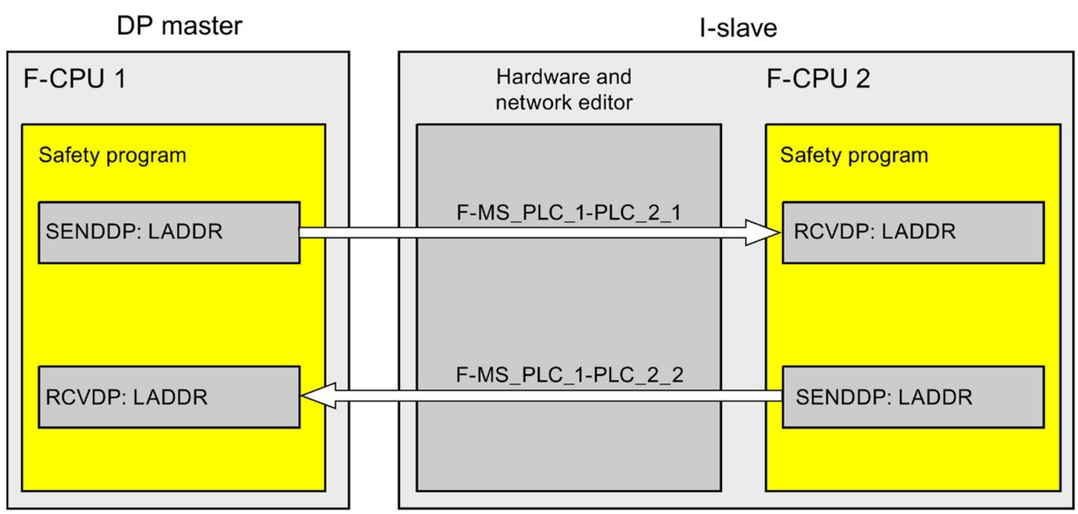
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the DP master and in the F-CPU of the I-slave. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

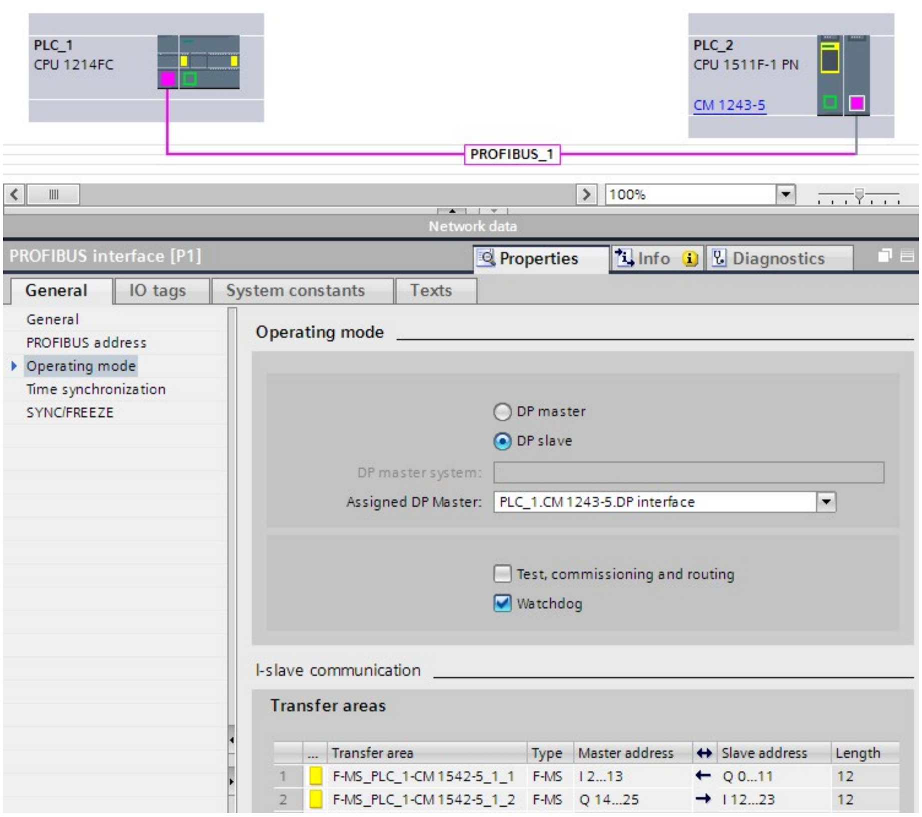
Procedure for configuration

The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

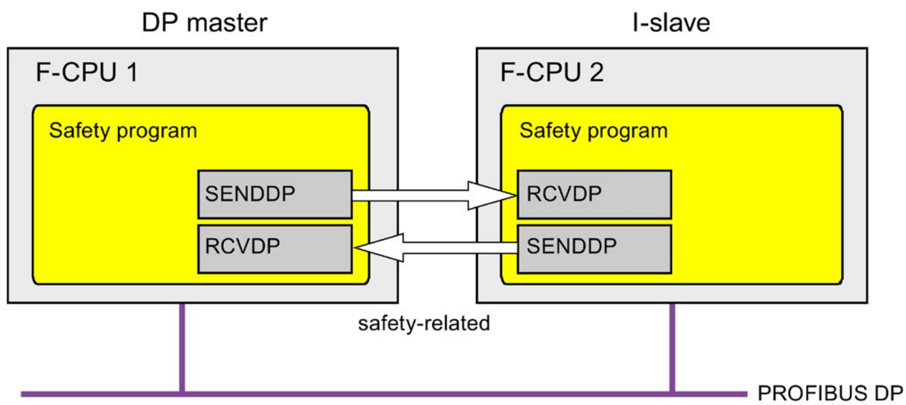
1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. If the F-CPU which is to be operated as DP master (F-CPU 1) does not have an integrated PROFIBUS DP interface, insert an PROFIBUS-CM, for example.
3. From the device view of the F-CPUs which are to be operated as I-slaves (F-CPU 2), insert a suitable CM DP module or CP DP module.
4. If necessary, enable "DP-slave" (I-slave) mode in the properties for the CM/CP DP module.
5. Assign the DP interface of the CM/CP to a DP interface of F-CPU 1.
6. Select the PROFIBUS interface of F-CPU 2 or of the CM. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the assigned transfer areas in the I-slave and DP master are displayed.

   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").
7. Create an additional F-MS connection for receiving from the DP master.
8. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.3.5.2 Safety-related master-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

You can also call the RCVDP and SENDDP instructions in separate F-FBs/F-FCs which you have to call up at the beginning or end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1) (Page 588).

9.3.5.3 Programming safety-related master-I-slave communication

Requirements

The transfer areas must be configured.

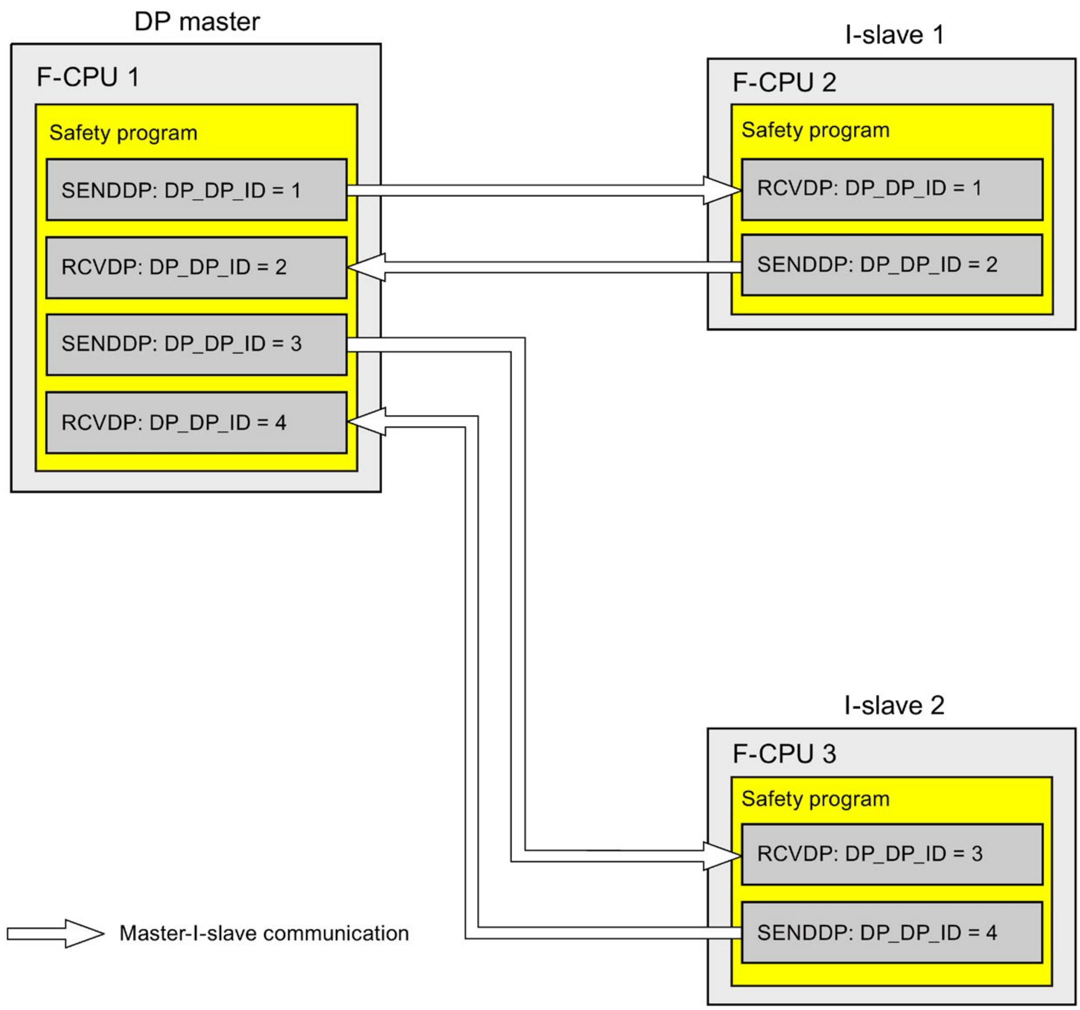
Programming procedure

The procedure for programming safety-related master-I-slave communication is the same as that for programming safety-related master-master communication (see Safety-related master-master communication (Page 281)).

The assignment of the HW identifiers of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	HW identifier
SENDDP in the DP master	Hardware identifier of the respective transfer area in the DP master
RCVDP in the DP master	Hardware identifier of the respective transfer area in the DP master
SENDDP in the I-slave	Hardware identifier of the transfer area in the I-slave
RCVDP in the I-slave	Hardware identifier of the transfer area in the I-slave

The figure below contains an example of how to specify the F-communication IDs at the inputs of the SENDDP and RCVDP instructions for four safety-related master-I-slave communication relationships.



WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 607).

9.3.5.4 Limits for data transfer of safety-related master-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		DP master		I-slave	
		Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS and MS). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.3.6 Safety-related IO controller-I-slave communication

9.3.6.1 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F**-MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 607)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 297) also applies.

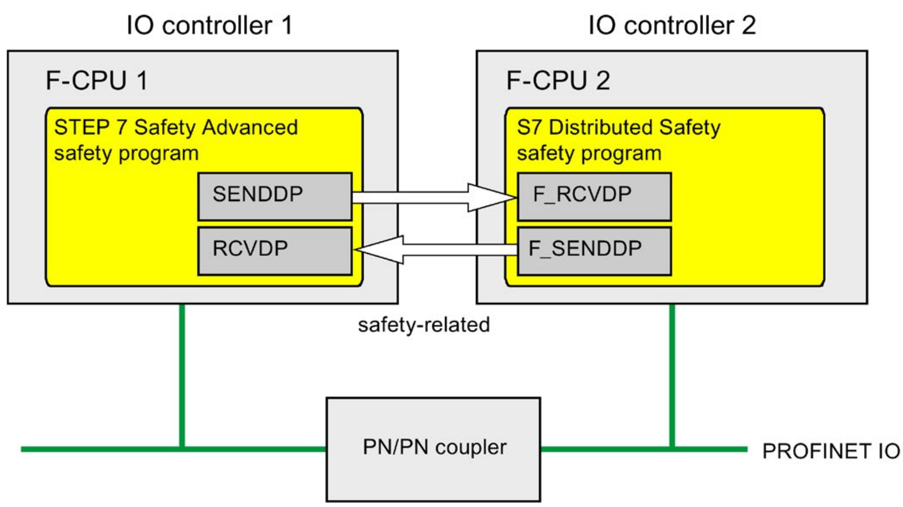
9.3.7 Safety-related communication to S7 F-System S7 Distributed Safety

9.3.7.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible, via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs, as IO controller-IO controller communication or master-master communication.

9.3.7.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

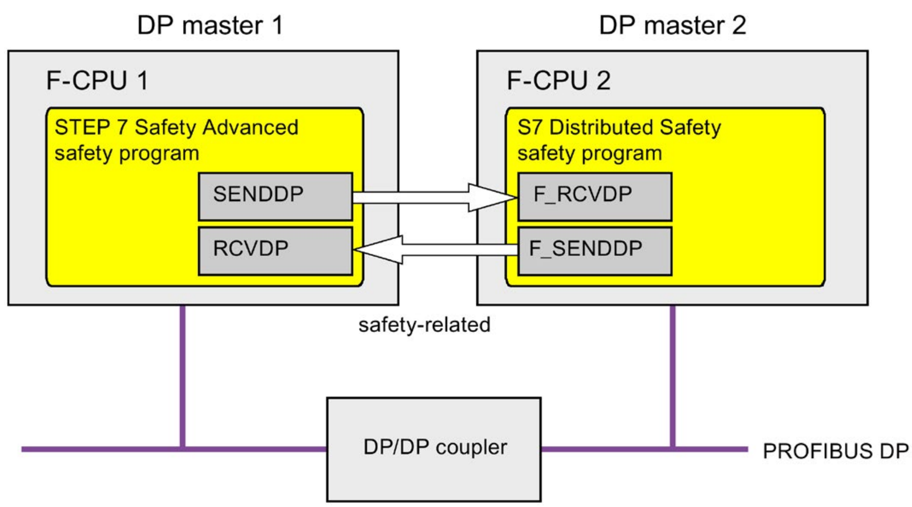
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related IO controller-IO controller communication (Page 272).

9.3.7.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related master-master communication (Page 281).

9.4 Configuring and programming communication between S7-300/400 and S7-1200/1500 F-CPUs

9.4.1 Overview of communication

Introduction

This section provides an overview of the options for safety-related communication between S7-300/400 and S7-1200/1500 F-CPUs in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	On subnet	Additional hardware required
Safety-related CPU-CPU communication:		
Master-master communication	PROFIBUS DP	DP/DP coupler
Master-I-slave communication	PROFIBUS DP	—
IO controller-IO controller communica-tion	PROFINET IO	PN/PN coupler
IO controller-I-device communication	PROFINET IO	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link

Basic procedure for configuring and programming

Configure and program safety-related communication between S7-300/400 F-CPUs and S7-1200/1500 F-CPUs as described in Configuring and programming communication (S7-300, S7-400) (Page 201) and Configuring and programming communication (S7-1200, S7-1500) (Page 270) for your application.

To program an S7-300/400 F-CPU, use the start addresses of the transfer areas. To program an S7-1200/1500 F-CPU, use the HW identifiers of the transfer areas.

9.5 Configuring and programming communication in several projects

9.5.1 Safety-oriented IO Controller I device communication in several projects

9.5.1.1 Configuring safety-related communication between IO controller and I-device

Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (F-CD) in PROFINET IO, in the same way as in standard systems.

The following section describes particular aspects when the IO Controller and the I-device are located in different projects.

Requirement

- The IO Controller is an S7-1200/1500 F-CPU that supports the IO Controller functionality.
- The I-device is an S7-300/400/1200/1500 F-CPU that supports the I-device functionality.
- The project in which the I-device is located, must have been created with *S7 Distributed Safety V5.4*, *STEP 7 Safety V13* or later.

Configuring

1. Configure the safety-related communication in the project with the I-device as described under "Configuring safety-related communication between IO controller and I-device (Page 223)" (S7-300/S7-400) or "Configuring safety-related communication between IO controller and I-device (Page 290)" (S7-1200/S7-1500) respectively. In this case the F-CPU 1 (IO Controller) is only a placeholder for the F-CPU in the project of the IO Controller.

   Note

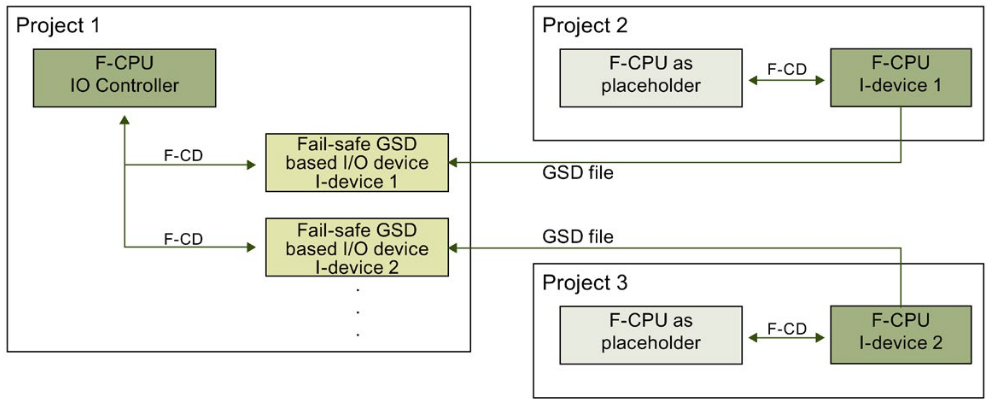
   When creating with *STEP 7 Safety* < V14 SP1 avoid a subsequent change from the transfer areas from CD to F-CD.

   When creating with *S7 Distributed Safety V5.4* create the application transfer areas of the address type "Output" and "Input" directly after each other.

   ---

2. Export the I-device as a GSD file. Proceed as described in the *STEP 7* help under "Configuring an I-device".
3. Import the GSD file in the project with the IO Controller. Proceed as described in the *STEP 7* help under "Installing a GSD file".

4. Insert the I-device from the "Hardware catalog" task card into the project with the IO Controller.
5. Assign the F-CPU of the IO Controller to the I-device.



9.5.1.2 Programming safety-related IO Controller I-device communication

Programming procedure

To program the safety-related communication between the IO controller and I-device for an F-CPU S7-300/400, analogously follow the procedure described under "Safety-related IO controller-I-device communication via SENDDP and RCVDP (Page 226)" and "Programming safety-related IO controller I-device communication (Page 227)". To program an S7-300/400 F-CPU, use the start addresses of the transfer areas.

To program the safety-related communication between the IO controller and I-device for an F-CPU S7-1200/1500, analogously follow the procedure described under "Safety-related IO controller-I-device communication via SENDDP and RCVDP (Page 293)" and "Programming safety-related IO controller I-device communication (Page 294)". To program an S7-1200/1500 F-CPU, use the HW identifiers of the transfer areas.

Compiling and commissioning a safety program 10

10.1 Compiling the safety program

To compile a safety program, follow the same basic procedure as for compiling a standard user program. You can start at various points to accomplish this in *STEP 7*. The basics for compiling user programs can be found in the *Help on STEP 7*.

Note

Please note that following a safety-related change to the hardware configuration that not only this, but also the safety program has to be recompiled and downloaded. This also applies for changes to the F-I/O which are not used in the safety program.

Note

The safety program is not compiled consistently with the menu command "Edit > Compile" or the "Compile" icon under the following conditions:

- When you select a user-created folder in the project tree.
- When you select one or more (F-)blocks in the "Program blocks" folder in the project tree.

Use this procedure to test if modified F-blocks can be compiled.

Note

The following applies for S7-300/400 F-CPUs:

If you want to compile a know-how-protected F-block after a change, you must remove the know-how protection for this F-block before compiling.

Reporting compiling errors

You can recognize whether or not the compilation was successful based on the message in the inspector window under "Info > Compile", error messages and warnings are output.

For information on the procedure you must follow to eliminate compiling errors, see "Eliminating compiling errors" in the *Help on STEP 7*.

See also

Safety Administration Editor (Page 81)

10.2 Safety program work memory requirements (S7-300, S7-400)

Estimation

You can estimate the work memory requirement for the safety program as follows:

Work memory required for the safety program

32 KB for F-system blocks

+ 4.4 KB for safety-related communication between F-runtime groups
+ 4.5 x work memory requirement for all F-FB/F-FCs/main safety blocks
+ 4.5 x work memory requirement of all utilized instructions, which are shown in the "Instructions" task card with the block icon.
  (except SENDDP, RCVDP, SENDS7, and RCVS7)
+ Work memory requirement of the utilized SENDDP and RCVDP instructions
  (4.3 KB each)
+ Work memory requirement of the utilized SENDS7 and RCVS7 instructions
  (8.5 KB each)

Work memory required for data

5 x work memory requirement for all F-DBs (including F-communication DB, but excluding DB for F-runtime group communication) and I-DBs for main safety block/F-FB

+ 24 x work memory requirement for all DBs for F-runtime group communication
+ 2.3 x work memory requirement for all I-DBs of instructions (except SENDDP, RCVDP, SENDS7 and RCVS7)
+ Work memory requirement of all I-DBs of instructions SENDDP (0.2 KB), RCVDP (0.3 KB), SENDS7 (0.6 KB), and RCVS7 (1.0 KB)
+ 0.7 KB per F-FC
+ 0.7 KB per F-I/O (for F-I/O DBs, etc.)
+ 4.5 KB

Block size of automatically generated F-blocks

Do not utilize the entire maximum size of an F-block, because the automatically generated F-blocks are larger and as a result, the maximum possible size may be exceeded in the F-CPU. If the block size is exceeded, this triggers a corresponding error message with information on which F-blocks are too large. These must be divided up, if necessary.

10.3 Downloading project data

10.3.1 Downloading project data to an F-CPU

Introduction

Once you have successfully compiled your safety program, you can download it to the F-CPU. To download a safety program, you follow essentially the same approach as for downloading a standard user program, via different starting points in *STEP 7*.

- In the "Load preview" dialog, enter data (e.g. password for the F-CPU) and set the requirements for downloading (e.g. that the F-CPU is switched to STOP mode before downloading).
- The "Load results" dialog shows the results after downloading.

We will show you the options for downloading the safety program later. For basic information on downloading, refer to the *Help on STEP 7*.

Rules for downloading the safety program to an F-CPU

WARNING

If **multiple F-CPUs** can be reached over a network (e.g. Industrial Ethernet) by **one programming device or PC**, you must take the following actions to ensure that the project data is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.

Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- The last download of the safety program prior to switching to productive operation must be made with enabled access protection. *(S021)*

Note

You can perform the downloading of a consistent safety program only in STOP mode.

Note

If *STEP 7 Safety* detects an inconsistent safety program during startup of the F-CPU, the F-CPU cannot be started, provided the F-CPU supports this detection function (see product information for the particular S7-300/400 F-CPU). This is always supported with S7-1200/1500 F-CPUs). A corresponding diagnostics event is entered in the diagnostics buffer of the F-CPU.

If the F-CPU does not support this detection function, the F-CPU can go to STOP mode if an inconsistent safety program is executed in activated safety mode.

The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

When downloading the safety program, ensure that the "Consistent download" action is set for the "Safety program" selection in the "Load preview" dialog.

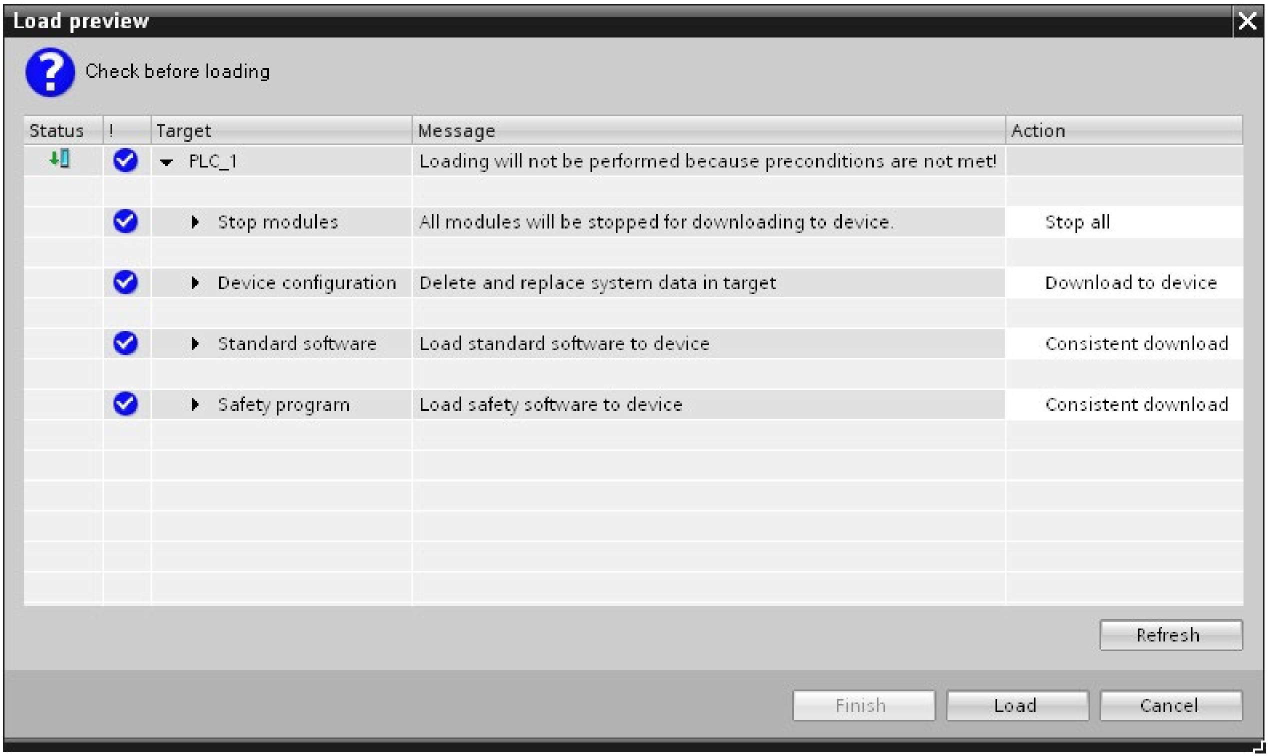
Inconsistent downloading is only possible in disabled safety mode.

Password prompt before downloading to an F-CPU

If you have assigned a protection level for the F-CPU (Page 106) (in the properties of the F-CPU in the "Protection" tab), the corresponding password is prompted in "Load preview" dialog. Without entry of password, only actions that are allowed without password are possible. As soon as the conditions for downloading are met, the "Load" button becomes active.

"Load preview" dialog

For an F-CPU, the "Load preview" dialog also contains the section "Safety program".



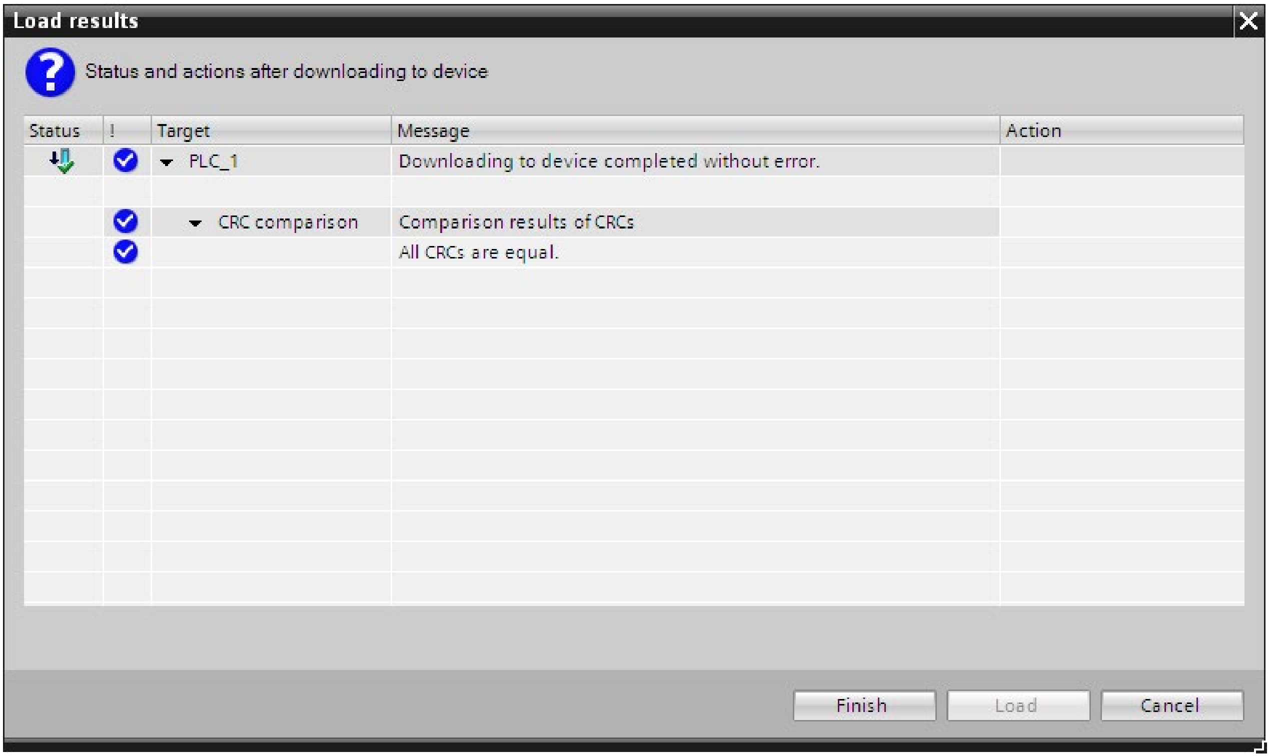
Make the following selection:

- In order to download a consistent safety program, select the "Consistent download" action under target "Safety program".
- (S7-300, S7-400) To download individual F-blocks selectively (Page 318), select the "Download selection" action under the target "Safety program", and then select the required F-blocks. If necessary, you will be prompted to disable safety mode under "Disable safety mode". This setting is only suitable for the online test of individual F-blocks.
- (S7-300, S7-400) In order to download the safety program only, select the "Consistent download" action under target "Safety program" and the "Download selection" action under target" Standard software", and then select only the standard blocks that call the main safety block.
- (S7-300, S7-400) To download no safety program, for example, because you do not know the password of the F-CPU, select the "No action" action under target "Safety program".

For S7-1200/1500 F-CPUs, only the "Consistent download" value is possible as an action in the "Load preview" dialog. It is not possible to select separate loading of standard program or safety program. The complete user program is automatically consistently downloaded as soon as changes have been made in both the standard program and in the safety program. Refer also to the section entitled Data exchange between standard user program and safety program (Page 195).

"Load results" Dialog

After downloading into the F-CPU, the dialog "Load results" is opened. This dialog shows you the status and the necessary actions after downloading.



Verify that the "Downloading of safety program completed without errors." message appears in the "Load results" dialog. If not, repeat the download operation.

10.3.1.1 Downloading project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card or flash card)

When you download project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card for S7-300 or flash card for S7-400), you must observe the following warning:

WARNING
If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program: • Download the safety program to the F-CPU. • Perform a program identification (i.e. check whether the collective F-signatures match online and offline). • Perform a memory reset of the F-CPU using the mode switch or via the programming device/PC. Once the work memory has been deleted, the safety program is again transferred from the load memory (memory card, SIMATIC Micro memory card for S7-300 F-CPUs,flash card for S7-400 F-CPUs) to the work memory. *(S022)*

10.3.1.2 Downloading project data to an S7-400 F-CPU without flash card inserted

When you download project data to an S7-400 F-CPU without flash card inserted, you must observe the following warning:

WARNING
If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program: • Perform a memory reset of the F-CPU using the **mode switch** or via the **programming device/PC**. • Download the configuration and the safety program to the F-CPU. • Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S023)*

10.3.1.3 Downloading project data to a WinAC RTX F

When you download project data to a WinAC RTX F, you must observe the following warning:

> **WARNING**
>
> You must adhere to the following procedure when downloading the safety program to the WinAC RTX F with a programming device/PC to ensure that the WinAC RTX F does not contain an "old" safety program:
>
> 1. Perform a memory reset of the WinAC RTX F (see Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176) manual).
> 2. Download the project data (Page 313) to the WinAC RTX F.
>
>   **If the function test of the safety program does not take place in the destination WinAC RTX F, you must also follow points 3. and 4:**
> 3. Perform a program identification. This means you check whether the collective F-signatures match online and offline.
> 4. Perform the F-system startup.
>
> Between the online program identification and the startup of the F-system, the WinAC RTX F must not be closed (for example, as a result of POWER OFF/POWER ON or booting). *(S024)*

10.3.1.4 Downloading individual F-blocks to an S7-300/400 F-CPU

Download F-blocks in disabled safety mode.

You can download F-blocks and standard blocks simultaneously to the F-CPU via the project tree. However, as soon as F-blocks are to be downloaded, a check is carried out to determine whether or not the F-CPU is in STOP mode or disabled safety mode. If not, you have the option of switching to disabled safety mode or placing the F-CPU in STOP mode.

If you want to download individual F-blocks to the F-CPU, for example, to test changes, make sure that you have not selected the folder "Program blocks" or the F-CPU in the project tree but only the blocks you want to download.

Only then will you be prompted in the "Load preview" dialog to disable safety mode once you have changed the option from "Consistent download" to "Download selection" and have changed the option “Stop modules” to “No action”.

If you fail to observe this prompt, the blocks are downloaded without deactivation of the safety mode which will STOP the F-CPU.

You can also deactivate the safety mode explicitly in the *Safety Administration Editor* before you start the download.

Be aware that the consistency of the safety program in the F-CPU cannot be guaranteed when individual F-blocks are downloaded. For a consistent safety program, always download the entire safety program to the F-CPU.

Rules for downloading individual F-blocks

The following rules apply to downloading of individual F-blocks:

- Downloading is only possible in disabled safety mode or when the F-CPU is in STOP mode.
- F-blocks can only be downloaded to an F-CPU to which a safety program has already been downloaded.
- Only an offline safety program is permitted to be used as a source program.

Consequently, you have to download the entire safety program when initially downloading the safety program and after changing the password for the safety program.

Note

If you are downloading F-blocks only, the blocks in which the main safety blocks are called (e.g., cyclic interrupt OB 35) are not downloaded. To do so, select the "Selection" option under "Standard software" in the preview dialog, and select the necessary blocks.

Note

Downloading of individual F-blocks is only suitable for testing F-blocks. Prior to the transition to productive mode, you must download the safety program consistently to the F-CPU.

10.3.1.5 Downloading project data to an S7-1200 F-CPU without program card inserted

When you download project data to an S7-1200 F-CPU without program card inserted, you must observe the following warning:

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.6 Downloading project data to an S7-1200 F-CPU with program card inserted

When you download project data to an S7-1200 F-CPU with program card inserted, you must observe the following warning:

WARNING

You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory of the F-CPU when you insert a program card into an S7-1200 F-CPU:

1. Check to see whether **the STOP/RUN LED (orange) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**.
   If this is the case, the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as external load memory) and you can skip step 3.
2. Insert the program card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program card is being evaluated or that the internal load memory must be deleted.
3. Use one of the following methods to delete the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program.
4. Use one of the following methods to evaluate the program card:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S061)*

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Orange/Green	ERROR Red	MAINT Orange
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (orange) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

WARNING

If you use a programming device/PC to download F-blocks to an S7-1200 F-CPU with inserted program card (external load memory), you must ensure that the transfer takes place to the external load memory. This can be accomplished by the following measures:

- Check to see if the program card is inserted correctly.
- Insert a program card whose memory size is different than the size of the internal load memory. Check in the project tree under "Online & Diagnostics > Diagnostics > Memory" if the memory size displayed for the load memory matches the memory size of the program card. *(S058)*

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.7 Downloading project data to an S7-1500 F-CPU

When you download project data to an S7-1500 F-CPU, you must observe the following warning:

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.8 Downloading project data to an S7-1500 F Software Controller

When you download project data to an S7-1500 F Software Controller, you must observe the following warnings:

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

WARNING

For security reasons, the password of an S7-1500 F Software Controller is also stored in a separate memory in addition to the load memory.

Unlike the load memory, this separate memory is not deleted. This means the previous passwords are once again active after deleting the S7-1500 F Software Controller followed by a run-up.

For this reason, note the following:

- The S7-1500 F Software Controller is deleted in case of the following download scenarios of the PC station:
  - Downloading a PC station with revised interface assignment.
  - Downloading a PC station with revised storage location for retentive data.
- We recommend that you do not set up F-access protection until after commissioning. If you still have to change the interface assignment of the PC station or the storage location for retentive data, you do not have to enter the F-password during the subsequent mandatory download of the S7-1500 F Software Controller.
- We recommend that you remove the F-access protection from an S7-1500 F Software Controller that is no longer in use. If you forget the F-password when you want to operate the S7-1500 F Software Controller later, you can remove it by uninstalling/installing or loading a new image. *(S076)*

Downloading project data to an F-CPU (Page 313)

Software Controller (http://support.automation.siemens.com/WW/view/en/109249299)

10.3.2 Downloading project data to a memory card and inserting a memory card

Proceed as you would with standard blocks to download project data from an F-CPU to a memory card (flash card for S7-400, SIMATIC Micro Memory Card for S7-300 or SIMATIC Memory Card for S7-1200/1500). You must also observe the following warning:

WARNING
If the function test of the project data is not performed in the destination F-CPU, you must ensure that the correct project data are on the memory card after downloading the project data to the memory card. Follow these steps: 1. Make sure that you are using an empty memory card. 2. Download the project data to the memory card. 3. If necessary, clearly label the memory card (e.g. with the collective F-signature). The procedure outlined must be ensured through organizational measures. *(S043)*

When inserting a memory card (flash card for S7-400, SIMATIC Micro Memory Card for S7-300 or SIMATIC Memory Card for S7-1200/1500) with project data from an F-CPU, you observe the following warning:

WARNING
If the function test of the safety program is not performed in the destination F-CPU, you must ensure through online program identification or other suitable measures (e.g. by checking the labeling of the memory card) that the memory card inserted has the correct safety program. *(S025)*

10.3.2.1 Inserting a SIMATIC Micro Memory Card or flash card into an S7-300/400 F-CPU

When you insert a memory card (flash card for S7-400 or SIMATIC Micro memory card for S7-300) into an S7-300/400 F-CPU , you must observe the following warning:

> **WARNING**
>
> If the function test of the safety program is not performed in the destination F-CPU, you must adhere to the following procedure when inserting the memory card to ensure that the F-CPU does not contain an "old" safety program:
>
> - Switch off the power to the F-CPU. For F-CPUs with battery backup (e.g. CPU 416F-2), remove any battery. (To ensure that the F-CPU is de-energized, wait for the buffer time of the power supply you are using or, if this is not known, remove the F-CPU.)
> - Remove the memory card with the old safety program from the F-CPU.
> - Insert the memory card with the new safety program into the F-CPU.
> - Switch on the F-CPU again. For F-CPUs with battery backup (e.g. CPU 416F-2), reinsert the battery, if one was removed.
>
> *(S026)*

10.3.2.2 Inserting a transfer card into an S7-1200 F-CPU

When you insert a transfer card into an S7-1200 F-CPU, you must observe the following warning:

WARNING
You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory when you copy the project data to an S7-1200 F-CPU using a transfer card: 1. Check to see whether **the STOP/RUN LED (orange) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**. If this is the case, the internal load memory of the F-CPU has already been deleted and you can skip step 3. 2. Insert the transfer card into the F-CPU. If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the transfer card is being evaluated or that the internal load memory must be deleted. 3. Use one of the following methods to delete the internal load memory: – Turn the F-CPU off and back on. – Switch the F-CPU from STOP to RUN. – Execute the "Memory reset" (MRES) function. After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing.** The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program. 4. Use one of the following methods to evaluate the transfer card (transfer from the transfer card to the internal load memory): – Turn the F-CPU off and back on. – Switch the F-CPU from STOP to RUN. – Execute the "Memory reset" (MRES) function. After restart and evaluation of the SIMATIC Memory Card, the F-CPU copies the project data to the internal load memory of the F-CPU. Once the copy process is complete, the maintenance LED on the F-CPU is flashing to indicate that you can remove the transfer card. 5. Remove the transfer card from the F-CPU. 6. Use one of the following methods to evaluate the internal load memory: – Turn the F-CPU off and back on. – Switch the F-CPU from STOP to RUN. – Execute the "Memory reset" (MRES) function. The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S059)*

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Orange/Green	ERROR Red	MAINT Orange
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (orange) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

10.3.3 Downloading project data of an S7-1200 F-CPU from the internal load memory to an empty SIMATIC Memory Card

When you download project data from the internal load memory of an S7-1200 F-CPU to an empty SIMATIC Memory Card, you must observe the following warning:

WARNING

To ensure that the safety program is downloaded from the internal load memory of the F-CPU to the SIMATIC Memory Card when plugging an empty SIMATIC Memory Card into an S7-1200 F-CPU and that the internal load memory of the F-CPU is deleted afterward, you must observe the following procedure:

1. Make sure that you are using an empty SIMATIC Memory Card, for example, by checking in the Windows Explorer that the "SIMATIC.S7S" folder and the "S7_JOB.S7S" file are deleted.
2. Insert the empty SIMATIC Memory Card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program can be copied from the internal load memory to the SIMATIC Memory Card and that the internal load memory is deleted afterward.
3. Use one of these methods to trigger copying from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart and copying of the program from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store the safety program. The SIMATIC Memory Card is now a program card.
4. Use one of the following methods to evaluate the program card:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S057)*

Note

Also observe the setting "Disable copying from internal load memory to external load memory" in the hardware configuration of your F-CPU.

10.3.4 Updating project data on an S7-1200 F-CPU using a transfer card

When you want to update the project data on an S7-1200 F-CPU using a transfer card, you must observe the following warning:

WARNING

If you run an update of the safety program on an S7-1200 F-CPU with the help of a transfer card, you must ensure that the transfer to the internal load memory took place correctly by means of a subsequent program identification. *(S060)*

10.3.5 Restoring a backup of the safety program to an S7-300/1200/1500 F-CPU

You have the option of backing up an F-CPU in the same way as a standard CPU and then restoring it. You can find information on backing up a CPU in the *help on STEP 7* under "Creating a backup of an S7-CPU".

Note the following warnings when restoring the software and hardware configuration of an F-CPU:

WARNING

Once you have restored a backup of an F-CPU, you must perform a program identification. *(S055)*

Note

We recommend that you use the collective F-signature that is included in the name of the backup file for program identification. You must not change the collective F-signature in the name in this case.

WARNING

(S7-1200/1500) If multiple F-CPUs with Web server can be reached by a programming device or PC, you must take additional actions to ensure that the safety program is downloaded to the correct F-CPU by restoring it.

Use CPU-specific passwords for the "F-Admin" right on the Web server. For example, select a uniform password with attached IP address (e.g. Password_192.168.0.8) for each F-CPU. *(S065)*

10.3.6 Special features when creating and importing images of an S7-1500 F Software Controller

Creating an image

⚠ WARNING
You must comply with the following points when creating an image with a safety program: • You must limit access to an S7-1500 F Software Controller through access protection to persons who are authorized to create images. • Before creating the image, you must use program identification to ensure that the correct safety program is installed on the S7-1500 F Software Controller. • Images with safety programs must be created on an empty data carrier (deleted or formatted) or an existing image must be explicitly deleted. • After creating the image, remove the data carrier containing the image. • Clearly label the data storage medium (e.g. with the collective F-signature). *(S073)*

NOTICE
If the safety program in the image and the old safety program on the S7-1500 F Software Controller are not identical, the imported safety program would not start. In this case, you must download the safety program to the F-CPU once again. For example, with the TIA Portal. Therefore, you should always keep your image backups up-to-date.

Import image

> **WARNING**
>
> You must comply with the following points when importing an image with a safety program:
>
> - You must limit access to an S7-1500 F Software Controller through access protection to persons who are authorized to import images.
> - When importing an image via LAN, remote access or comparable accesses, you have to ensure access protection (e.g. via Windows administrator permission (ADMIN)). Note, however, that only authorized persons are set up as users.
> - To ensure that the images are written to the correct S7-1500 F software controller, when importing an image via LAN you must ensure that only one S7-1500 F software controller can be accessed. For example, by removing the physical connections and routing options to other S7-1500 F software controllers.
> - You must ensure that the correct safety program is on the image, for example, through unique identification of the data storage medium.
> - After importing the image, remove the image and copies thereof.
> - After importing the image, you must use program identification to ensure, for example with the Panel, that the correct safety program is installed on the S7-1500 F software controller.*(S074)*

10.3.7 Loading project data from an F-CPU to a programming device / PC

Loading the user program (including safety program) to a programming device / PC (S7-300, S7-400)

To upload a user program (including safety program) to a programming device / PC, proceed as with a standard program, "Online > Upload from device (software)" or "Online > Upload device as new station (hardware and software)"

You can only upload the hardware configuration if F-capability is not enabled for the F-CPU. You can only upload F-I/Os if these are operated in standard mode.

Note

In principle, it is possible to upload a safety program from the F-CPU to a programming device or PC. Note, however, that any symbols used in the safety program are deleted and cannot be recreated, since no symbol information is saved in the F-CPU. Symbols are available only if you are using an offline project.

A safety program uploaded from the F-CPU to a programming device / PC may not be loaded again into the F-CPU.

Loading the project data (including safety-related project data) into a programming device / PC (S7-1500)

The "Upload from device (software)" or "Upload device as new station (hardware and software)" function is only possible for S7-1500 F-CPUs if the "Enable consistent upload from the F-CPU" option is activated for the F-CPU in the *Safety Administration Editor* and the project data are loaded to the F-CPU afterwards.

To load the project data (including safety-related project data) to a programming device or PC, proceed as for standard blocks.

If multiple F-CPUs can be reached over a network (e.g. Industrial Ethernet) by the programming device / PC, you have to ensure that the project data are downloaded from the correct F-CPU. For example with "Online & diagnostics" > "Online accesses " > "Flash LED".

After successful loading from the device you can continue working as with a project that was created offline.

WARNING

If you want to carry out an acceptance with the project data upload to the programming device / PC or want to carry out changes to the safety-related project data and the F-CPU is in STOP mode, you have set to programming device / PC to RUN before uploading. This way, you can ensure that the safety program is executable. If the F-CPU remains in STOP, you are not allowed to perform acceptance or changes with the safety-related project data. *(S080)*

You can load individual F-blocks into a programming device / PC irrespective of the "Enable consistent upload from the F-CPU" option.

You cannot upload individual know-how protected F-blocks to a programming device / PC.

Note

The offline password is replaced or deleted by the online password of the safety program.

See also

"Settings" area (Page 90)

10.3.8 Loading PC station via the configuration file

You have the option to save the system configuration of the PC system in a configuration file, transport it and load it to a target system. The entire configuration of your PC station is saved in a configuration file with the ending *.psc from the TIA Portal.

Saving and loading of the configuration file is supported as of:

- *STEP 7 Safety V15*
- S7-1500 F Software Controller V2.5

Example

You can find a detailed example on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109759142).

Identification parameters

The identification parameters include:

- File name
- Information in the project and the station that was stored from the TIA Portal in the PSC file in the metadata.

  For example:

  – Project version
  – Plant designation
  – Station comment

Save the identification parameters in a file, if necessary, that you store on the target system.

For evaluating and testing these identification parameters via script, you must store this information directly in the script or save the identification parameters in a separate file, if necessary, that you store on the target system.

10.3.8.1 Creating a configuration file

1. In the TIA Portal create a new configuration file with "Project > Memory Card file > New > PC system configuration file (.psc)".

   The configuration file is created in the project tree under "Card Reader/USB memory".
2. Use the collective F-signature to check in the SAE that you have selected the correct project/station.
3. Use your mouse to drag the selected PC station to the configuration file.

   This loads the PC station to the configuration file.

> **WARNING**
>
> Instead of online program identification, you can use a unique name for the configuration file *.psc (**P**C **S**tation **C**onfiguration) to ensure that the correct security program is located in the configuration file.
>
> In addition, you have to observe the following when creating a configuration file:
>
> On creation of a configuration file with the security program, an existing file may not be used. You have to create a new file.
>
> You should also remove configuration files with a faulty security program from data storage.
>
> You must limit access to the configuration file (*.psc) through access protection to persons who are authorized to import and modify the configuration file. *(S081)*

10.3.8.2 Importing the configuration file

You have the following options for importing the configuration file:

- Via the PC Station Panel menu (import configuration file)
- By means of a script

Import via the PC Station Panel menu

Requirement

If you want to start the import of the configuration file via the menu in the PC Station Panel of an S7-150xS(P) F, the executing user must be in the Windows user group "Failsafe Operators".

Procedure

WARNING

If the import operation was successful, you will receive a positive feedback. If you do not receive a positive message, you must assume that the import operation was not successful and that the old security program is still present.

When importing a configuration file of a PC station via the menu of the panel with a security program, you must observe the following:

- Use the unique name of the configuration file to check that you have selected the required configuration file.
- To ensure that the import is performed on the correct S7-1500 F software controller, when importing a configuration file via LAN you must ensure that you address the correct S7-1500 F software controller. To do this, perform one of the following actions:
  - Remove the physical connections and routing options to other S7-1500 F software controllers.
  - Use unique computer names and unique user logins or use other identification options. *(S084)*

Import by means of a script

WARNING

You must check in the script based on the specified identification parameters whether the import of the configuration file is permitted for the respective target system (e.g. by evaluating the F-CPU name, project name or using the plant designation).

In addition, checking the respective instance of the target system, which means a diversified check of your addressing and/or checking the version of the configuration file, for example, only higher versions or the exclusion of specific versions (black list), can also be necessary or useful. You must store this information on the target system beforehand.

Example of checking the respective version for reliability:

- The script evaluates the information about the version and only allows configuration files of a higher version, for example.

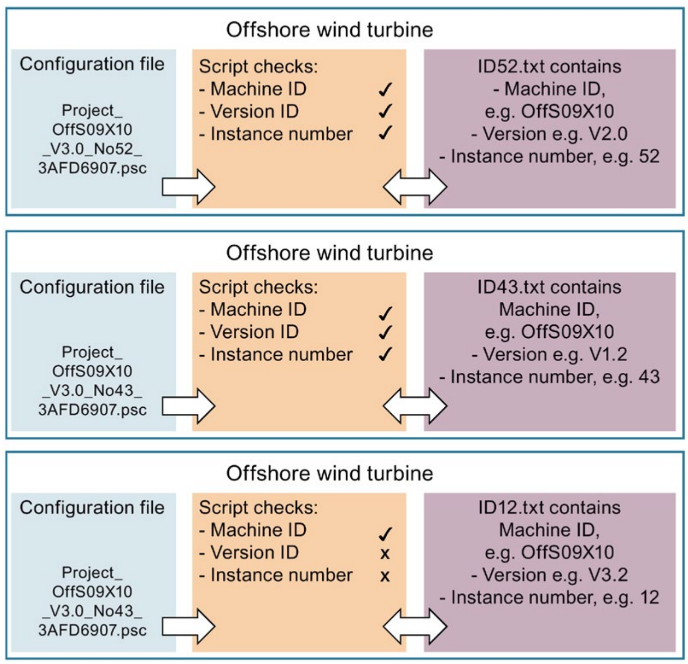
As a machine manufacturer, you must ensure that the script is protected against unauthorized manipulation (change to contents or name).

If as a machine manufacturer you only make available the configuration files, you have to ensure that an incorrect configuration file is not imported during import through technical measures (extended checks in the script) and training of the machine operators. *(S082)*

The script checks for:

- Matching machine ID
- Version ID greater than current one. If so, the new version is written to the txt file.
- Instance number

The figure below contains a systematic overview of checking the configuration file in the script with the help of an identification parameter stored in a separate file (shown in violet in the figure below):



WARNING

You determine the successful import of a security program via the script by evaluating the corresponding return value (0x51A3). If the corresponding return value is not returned by the script command PCSystem_Control, the import has failed and the old safety program may still be present.

To ensure that the return value is not from the previous import, you need to reset the return value to 0x3FF ("PCSystem_Control /ImportConfig" without entering a data name) before the import and then check that the return value has been reset to 0x3FF (Enter "PCSystem_Control /GetStatus /ImportConfig" and then enter "echo %errorlevel%". This instruction must deliver the return value 0x3FF.)

If the import operation is triggered by a server, feedback about the positive return value must be given.

For traceability we recommend that you document the import operation in a log file.

If the the configuration file is imported manually via the Windows command line (via script command), you need to do one of the following:

- Reset the return value to 0x3FF and check it before the import (see above).
  - Carry out the import.
  - Evaluate return value (enter "PCSystem_Control /GetStatus /ImportConfig" and then enter "echo %errorlevel%". This instruction must deliver the return value 0x51A3).
- Carry out the import.
  - Manual program identification performed, e.g. via the panel of the F-CPU.

(S083)

Note

The positive return value when importing a configuration file via script is "0x51A3” for an S7-1500 F software controller, in contrast to the S7-1500 software controller, in which case it is "0x0000".

When the file is imported via script, the authorization should be moved to the script. This means that the executing user does not need a higher authorization as the script which was made available by the machine manufacturer contains the necessary authorizations (user group "Failsafe Operators").

The rights are assigned via script by assignment of the Windows service to the corresponding user group. This initial installation must be performed beforehand by the Windows administrator on every computer with S7-150xS(P) F. The Windows service can be called by the executing user and the Windows service executes the script.

10.4 Program identification

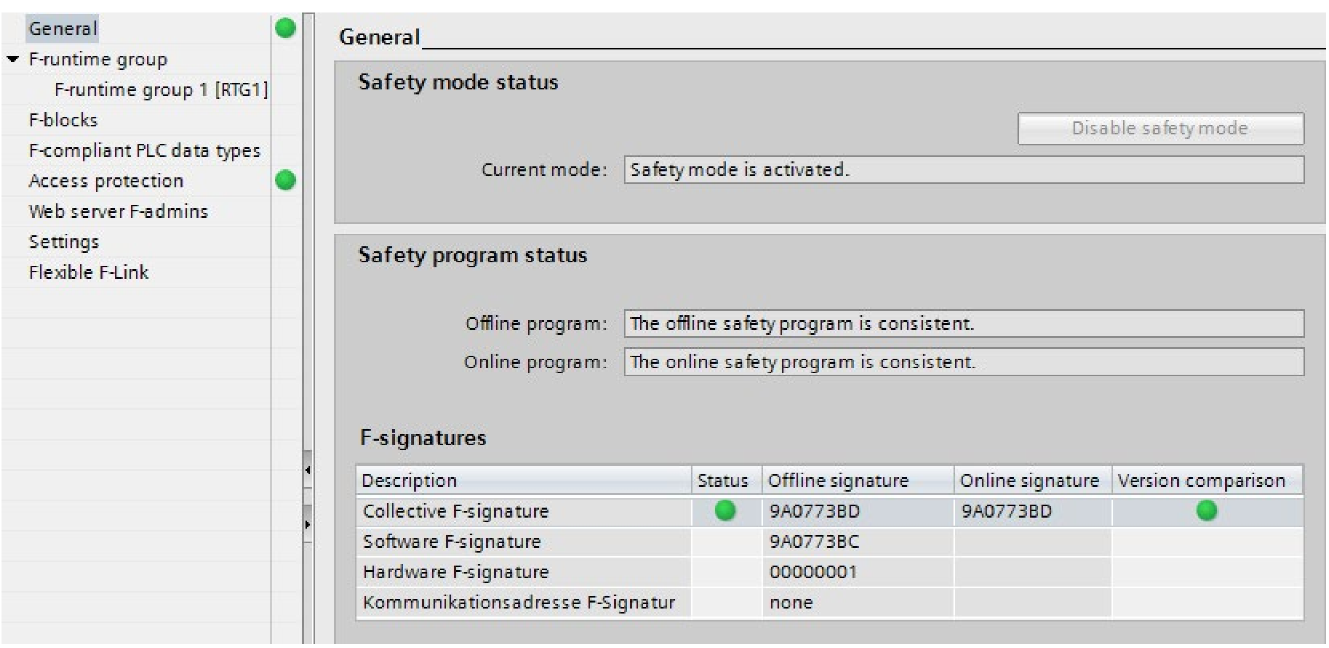
You use the program identification to determine that the correct safety program was downloaded to the F-CPU To do so, you compare the collective F-signatures of the safety program and the assignment of the "F-admin" rights online with the expected value. The expected value can be, for example, the collective F-signature of the safety program offline from the *Safety Administration Editor* or from the safety summary. Check the assignment of the "F-admin" right in the *Safety Administration Editor*.

Use organizational measures to ensure that the safety program is not downloaded by any other TIA Portal (on a separate programming device or PC) while you perform the program identification.

With the *Safety Administration Editor*

For a program identification using the *Safety Administration Editor*, follow these steps:

1. Open the *Safety Administration Editor* of the F-CPU you want to check.
2. Connect online with the F-CPU you want to check.
3. Compare the collective F-signature displayed online with the expected value in the "General" section.
4. Check whether the offline and online program are consistent (Page 375).
5. Check whether the green symbol is displayed in the column "status" and "Version comparison".



6. Check in the "Web server F-admins" section whether only authorized users have the "F-admin" right offline and online.

With HMI

For a program identification using the HMI, follow these steps:

1. Read the collective F-signature of the safety program from the F_PROG_SIG tag of the F-global DB (Page 148) (S7-300, S7-400) or the tag F_SYSINFO.F_PROG_SIG of the F-runtime group information DB (Page 148) (S7-1200, S7-1500).
2. Compare the value of the F_PROG_SIG tag with the expected value.

With the display of an S7-1500 F-CPU

For a program identification using the display of an F-CPU, follow these steps:

1. In the display menu, go to "Overview > Fail-safe".
2. Compare the displayed collective F-signature with the expected value.

With the Web server of an S7-1200/1500 F-CPU

For a program identification using the Web server of an S7-1200/1500 F-CPU, follow these steps:

1. Read the collective F-signature on the homepage of the Web server.
2. Compare the displayed collective F-signature with the expected value.

Safety Administration Editor (Page 81)

10.5 Comparing Safety Programs

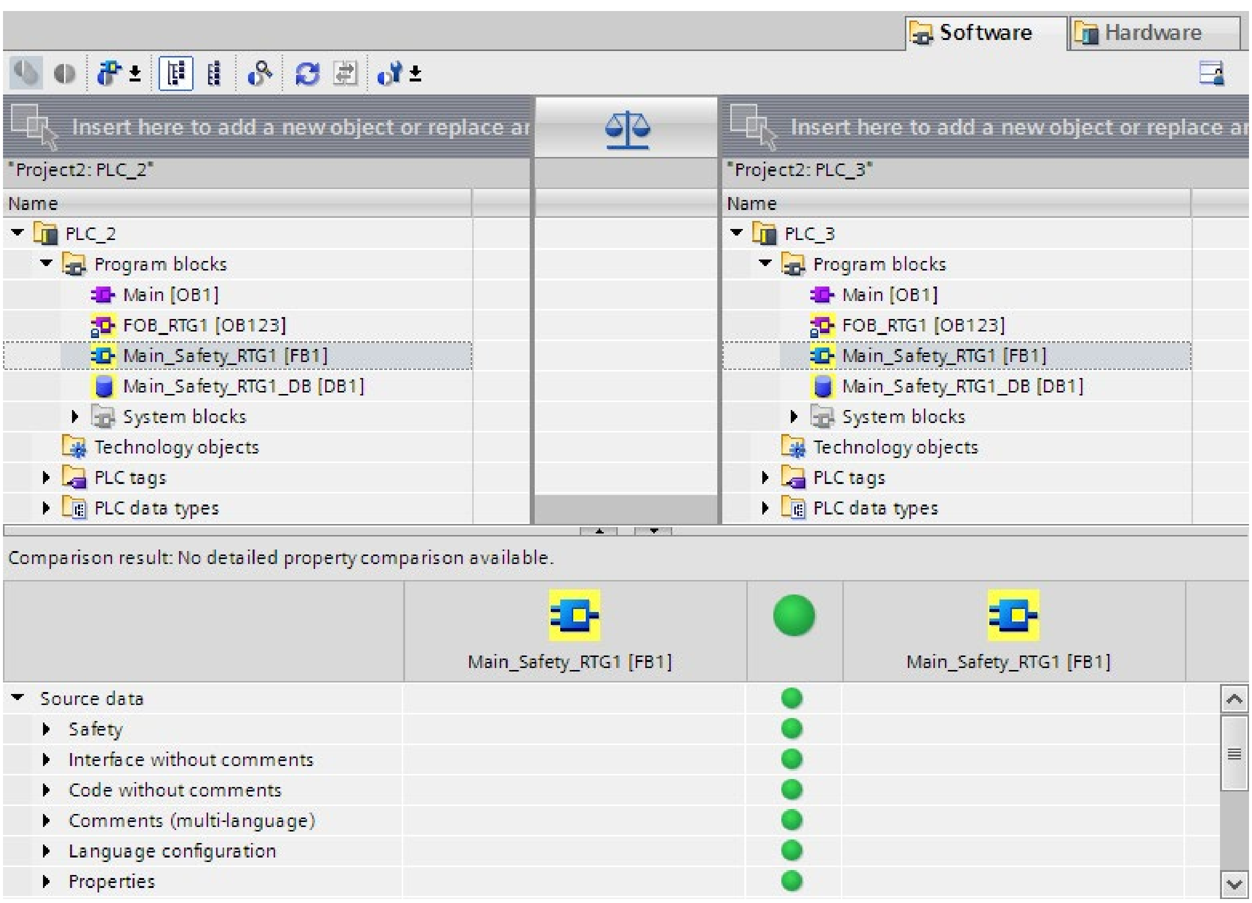
Compare safety programs as in standard

You can use the *comparison editor* in *STEP 7* for offline-online or offline-offline comparison of safety programs. The procedure is the same as for standard user programs. The contents of F-blocks are also compared for the comparison of safety programs. As a result, an offline-offline comparison can also be used for an acceptance of changes (Page 378). You enable this comparison by selecting the "Safety" comparison criterion and disabling all other comparison criteria.

Comparison result for safety programs

The representation of the comparison result corresponds to the representation of *STEP 7*.

If you click the "Program blocks" folder on the left of the comparison editor, you can see the collective F-signature of the safety program displayed under "Comparison result". You also receive information about whether the safety program is consistent.



If you click on an F-block, you can see the respective signatures and interface signatures in addition to the standard information.

Note

If you interrupt the connection to the F-CPU during the online/offline comparison, the comparison result will be incorrect.

Comparison filter options

You can use filters in the *comparison editor* to limit the comparison result to the following block groups:

- Compare only F-blocks
- Compare only F-blocks relevant for certification
- Compare only standard blocks

You also have the *STEP 7* filter options "Show only objects with differences" and "Show identical and different objects".

For comparison of safety programs, F-blocks in the "System blocks" folder are also relevant.

Comparison criteria

Make sure that under only the comparison criterion "Safety" is enabled.

Classification of displayed changes

Regardless of whether you carried out an offline/online or offline/offline-comparison, the following changes could account for the indicated changes to the automatically generated F-blocks:

- Change in the maximum cycle time of F-runtime group and warn cycle time of F-runtime group
- Change in F-parameters of the F-CPU
- changed safety system version or change to the hardware configuration (S7-1200/1500: Displayed as change of the "F_SystemInfo_DB" block).
- (S7-300/400) Change in the F-runtime group communication, for example, change in the number of a DB for F-runtime group communication
- Change in main safety block, F-FB, F-FC, F-DB
- Change of the hardware configuration for the F-I/O addressed in the safety program

It is possible that a block is displayed as changed, but no changes are displayed in the detailed comparison of the block content. This is not a display problem but means that changes of addresses in the tag table, for example, have an effect on this block. Test this block in case of doubt.

Printing result of comparison

The comparison result can be printed via "Project > Print" in the menu bar or the print button in the toolbar. Select "Print objects/area" "All" and "Properties" "All".

Make sure that all pages were printed completely. Incomplete printouts (e.g. due to low on toner) must not be used for the acceptance of changes.

10.6 Printing project data

Printing

You can print all important project data (hardware configuration of the F-CPU and F-I/O, safety program). You obtain a "safety summary" that, alongside the documentation, serves as a basis for testing the correctness of the individual components of the system. Correctness is a prerequisite for system acceptance.

The collective F-signature specifications in the footer of the printout ensure that the printout is explicitly associated with a safety program.

Safety summary

The safety summary provides documentation of the safety-related project data which supports you during acceptance of the system.

Procedure for creating a safety summary

To create a safety summary, follow these steps:

1. In the project tree, select the *Safety Administration Editor* of the F-CPU whose safety summary you want to create.
2. Select "Print" in the shortcut menu or "Project > Print" in the menu bar or the print button in the toolbar.

   In the displayed dialog, you can make layout settings for the printout and specify the scope of the printout (all/subset), among other things.
3. Under "Document information", select one of the ISO formats, e.g. "DocuInfo_ISO_A4_Portait".
4. Select the "All" option, if the F-blocks and F-compliant PLC data types are to be shown in the printout. This is necessary, for example, to document the program code for the acceptance(see Acceptance of system (Page 361)). Select the "Compact" option to exclude the source code from the printout.
5. Click the "Print" button.

As a result, you receive the safety summary for the F-CPU.

Make sure that all pages were printed completely. Incomplete printouts (e.g. due to low on toner) must not be used for the acceptance of changes.

Contents of the summary in overview

The topics that are considered in the summary are summarized in the following:

- General information on program identification, signatures, software versions, access protection, settings of the safety program (from the "Settings" work area of the *Safety Administration Editor*), for example safety system version.
- System library elements used in safety program (from the "Instructions" task card) along with their versions
- Information about the F-runtime groups (e.g. cycle time warning limit of the F-runtime group, maximum cycle time of the F-runtime group)
- List of the F-blocks within the "Program blocks" folder (e.g. name, function, associated F-runtime group, signature)
- (S7-1200, S7-1500) List of the know-how protected F-blocks used in the safety program (e.g., name, signature, used safety system version, used versioned instructions or called F-blocks).
- (S7-1200, S7-1500) List of F-compliant PLC data types (UDT), if these exist in the safety program.
- Data from the standard user program that are evaluated in the safety program
- Block parameters of the safety-related CPU-CPU communication
- (S7-300, S7-400) Absolute addresses and names of the F-shared DB tags that can be accessed from the standard user program
- Information on hardware (used F-I/O, CPU version, addresses)
- Information on the printout (print date, number of pages)

Content of the footer of the printouts

On the basis of the footer of the printout, you can find out:

- Whether the printed safety-related project data is consistent and whether all pages of the printout belong to the same safety program and the same version (the same F-collective signature in the footer of every page means that the printout belongs to the safety program with this F-collective signature).

The footer is added to the source code of the F-blocks only if the "All" option was selected for the safety summary.

If F-blocks are printed by other means, the footer is omitted, and you can no longer easily identify whether the block printout belongs to the current safety program version.

Printing a migrated project

You can only print a safety summary for a project migrated from *S7 Distributed Safety V5.4 SP5* if the project was compiled with *STEP 7 Safety Advanced* and the new program structure for safety programs (main safety block) has therefore been applied. Otherwise, the printout is not possible and you will receive a corresponding error message.

We recommend that you print out your project in *S7 Distributed Safety V5.4 SP5* before the migration.

10.7 Testing the safety program

10.7.1 Overview of Testing the Safety Program

Complete function test or test of changes

After creating a safety program, you must carry out a complete function test in accordance with your automation task.

For changes made to a safety program that has already undergone a complete function test, only the changes and that there is no effect on the parts of the safety program that were not changed need be tested.

Monitoring

Read-only test functions (such as monitoring tags of the safety program) are available for safety programs as in the standard.

Modifying

Read and write test functions (such as controlling tags of the safety program) are only available to a limited extent for safety programs and only in disabled safety mode.

Simulation via *S7-PLCSIM*

You can test the safety program using *S7-PLCSIM*. You use *S7-PLCSIM* in the same way as for standard user programs.

You start the simulation with *S7-PLCSIM* using menu item "Online > Simulation > Start".

Rules for testing

- Forcing of F-I/O inputs and F-I/O outputs is not possible.
- Controlling F-I/O outputs in connection with the function “Enabling F-I/O outputs" is not possible.
- Setting breakpoints in the standard user program will cause errors in the safety program (see also Testing the safety program (Page 347)).
- Changes in the configuration of F-I/O or safety-related CPU-CPU communication can only be tested after the hardware configuration has been saved and downloaded, and after the safety program has been compiled and downloaded to the F-CPU.

Disabling safety mode (Page 344)

10.7.2 Disabling safety mode

Introduction

The safety program generally runs in the F-CPU in safety mode. This means that all fault control measures are activated. The safety program cannot be modified during operation (in RUN mode) in safety mode. You must disable safety mode of the safety program to, for example, modify tags in the safety program in RUN mode. Safety mode remains disabled until the F-CPU is next switched from STOP to RUN mode.

Rules for disabling safety mode

WARNING

Because changes to the safety program can be made in RUN mode when safety mode is deactivated, you must take the following into account:

- Disabling safety mode is intended for test purposes, commissioning, etc. Whenever safety mode is disabled, the safety of the system must be ensured by other organizational measures, such as monitored operation, manual safety shutdown, and access restrictions to certain areas.
- Disabling of safety mode must be displayed.

  Use the MODE tag in the F-global DB ("F_GLOBDB".MODE) for S7-300/400 F-CPUs or in the F-runtime group information DB (e.g. RTG1SysInfo.F_SYSINFO.MODE) for S7-1200/1500 F-CPUs, which you can evaluate to read the operating mode (1 = Disabled safety mode). This means not only is the disabled safety mode displayed on the programming device or PC in the dialog box for disabling safety mode, but it can also be indicated by means of an indicator light controlled by the standard user program or a message to an HMI system generated by evaluating the above-mentioned "Disabled safety mode" variable in the F-shared DB.
- It must be possible to verify that safety mode has been disabled. A log is required, if possible by recording and, if applicable. archiving alarms to the operator control and monitoring system or, if need be, through organizational measures. In addition, it is recommended that disabling of safety mode be indicated on the HMI system.
- Safety mode is disabled F-CPU-wide. You must, however, take the following into account for safety-related CPU-CPU communication: If the F-CPU that sends the data is in disabled safety mode, you can no longer assume that the data sent by this F-CPU are generated safely. You must then ensure safety in those units that are affected by the sent data through organizational measures or output safe substitute values in the F-CPU that receives the data by evaluating SENDMODE* instead of the received data.

* SENDMODE is available to you as output of the RCVDP or RCVS7 instructions or in case of communication via Flexible F-Link as a tag in the F-communication DB.

(S027)

Procedure for disabling safety mode

To disable safety mode, follow these steps:

1. Open the *Safety Administration Editor* of the corresponding F-CPU.
2. Open the work area "General (Page 83)" in the area navigation.
3. Check to see whether the safety mode status is displayed as activated.

   If so, continue with the next step; if not, stop the process, because safety mode is already disabled or cannot be disabled.
4. Click the "Disable safety mode" button.
5. Enter the password for the online safety program.

   If you enter the correct password, another prompt will appear, which also contains the collective F-signature in the F-CPU. Check to see whether this is the collective F-signature you expected. If there is a match, acknowledge the dialog.
6. Enter the password for the F-CPU.

   After correctly entering the password for the F-CPU, safety mode is disabled.

   If the password is not valid, safety mode is not deactivated and remains active.

   (S7-300, S7-400) When individual F-blocks are downloaded, the condition "Disable safety mode" is listed automatically in the "Load preview" dialog. For this reason, it is not necessary to explicitly disable safety mode before every F-block download.

Note

If the collective F-signature or the passwords do not agree for the safety program online and offline, this means:

- The offline safety program was modified after the last downloading, or
- An incorrect F-CPU was addressed. Check the latter based on the online collective F-signature.

Enabling safety mode

Note

To enable safety mode, the F-CPU must be switched from STOP to RUN mode.

Switching the F-CPU from STOP to RUN mode always enables safety mode, even if the safety program has been modified or is not consistent. The MODE tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB is set to "0" for S7-1200/1500 F-CPUs.

If you have changed your safety program, but have not recompiled and downloaded it, the F-CPU can revert to STOP mode.

Evaluating safety mode/disabled safety mode

If you wish to evaluate safety mode/disabled safety mode in the safety program, you can evaluate the "MODE" tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB for S7-1200/1500 F-CPUs (1 = Disabled safety mode). You use fully qualified access to access this tag (e.g. "F_GLOBDB".MODE or RTG1SysInfo.MODE).

You can use this evaluation, for example, to passivate F-I/O when the safety program is in disabled safety mode. To do so, assign the "MODE" tag in the F-shared DB or F-runtime group information DB to all "PASS_ON" tags in the F-I/O DBs of the F-I/O that you wish to passivate.

WARNING

When the safety program is in disabled safety mode, the "MODE" tag in the F-shared DB or F-runtime group information DB is also evaluated in disabled safety mode.

Even if the F-I/O are passivated in disabled safety mode as a result of evaluation of the "MODE" tag, system safety must be ensured in disabled safety mode through other organizational measures, such as operation monitoring and manual safety shutdown. *(S028)*

Communication (Page 588)

10.7.3 Testing the safety program

Introduction

Tags of he safety program can be monitored at any time.

Controlling tags of the safety program is only possible in deactivated safety mode as some fault control measures of the safety program have to be disabled for this.

You can control the following tags of the safety program:

- Inputs and outputs of the F-I/O (channel values and value status (S7-1200, S7-1500))
- Tags in F-global DB (except DB for F-runtime group communication)
- Tags in instance DBs of F-FBs
- Tags in F-I/O DBs (for permitted tags see F-I/O DB (Page 165))

Note

A modify function controlled by the F-system is only possible if the *STEP 7 Safety* optional package is installed. Modification of tags by means of an HMI system as well as modification without an installed *STEP 7 Safety* optional package can cause the F-CPU to go into STOP.

Procedure for monitoring tags of the safety program

Monitor the required tags of the safety program from an open watch table or from the *program editor* (program status).

1. Proceed as in the standard. Additional information can be found in the *STEP 7 help* in “Testing user programs".

Procedure for controlling tags of the safety program

Control the required tags of the safety program from an open watch table:

1. For modifying, deactivate the safety mode (Page 344) in the automatically shown dialog.
2. Terminate existing modify requests after testing is complete before activating safety mode.

Values in F-DBs can only be modified online in the F-CPU. If the value is also to be changed offline, you must do this by editing the start value offline and compiling the safety program.

Proceed as follows to control tags of F-I/O:

1. Create a separate row for each channel value and value status (S7-1200, S7-1500) to be modified. The control value must correspond to the channel value or value status.
2. Set “start of scan cycle" or “end of scan cycle" and "permanent" or “once".

   Regardless of the trigger point setting, requests to modify inputs (PII) of F-I/O always become effective before the main safety block is executed and requests to modify outputs (PIQ) always become effective after execution of the main safety block.
3. (S7-300, S7-400) Create an additional watch table if you want to control more than 5 inputs/outputs.

Note

F-I/O can only be modified in RUN mode of the F-CPU.

You cannot modify a configured F-I/O from which neither a channel value or a value status (S7-1200, S7-1500), nor any tag from the associated F-I/O DB has been used in the safety program. In your safety program, you should therefore always use at least one tag from the associated F-I/O DB or at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be modified.

For inputs (PII), modify requests take priority over fail-safe value output, while for outputs (PIQ), fail-safe value output takes priority over modify requests. For outputs (channels) that are not activated in the properties for the F-I/O, modify requests affect the PIQ only, and not the F-I/O.

Note

The following applies for S7-1200/1500 F-CPUs:

To avoid invalid combinations of channel value and status value:

- The value status is set by the F-system automatically to 1 when setting a channel value to a value <> fail-safe value 0
- The fail-safe value 0 is automatically output when setting the value status to 0 for the associated channel value

---

WARNING

You need to specifically reset constant modify requests in the watch table in disabled safety mode.

Please note that constant modify requests that are not correctly reset can remain active in the background even after a STOP/RUN transition on the F-CPU.

Because the F-CPU is in safety mode again after a STOP/RUN transition, the constant modify requests are no longer effective and are not shown in the watch table.

The requests become active again as soon as you disable safety mode again.

With a memory reset of the F-CPU, you can make sure that no constant modify requests are active in the background on the F-CPU. *(S029)*

Wiring test using watch table

You can carry out a wiring test for an input by changing an input signal and verifying whether or not the new value arrives in the PII.

You can carry out a wiring test for an output by changing the output with the Modify function and verifying whether the required actuator responds.

For the wiring test, note that a safety program must be running on the F-CPU, in which at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be monitored or modified or one tag from the associated F-I/O DB has been used.

For F-I/O that can also be operated as standard I/O (e.g., S7-300 fail-safe signal modules), you can also carry out the wiring test for outputs using the Modify function in STOP mode by operating the F-I/O as standard I/O rather than in safety mode.

Additional rules for testing (S7-300/400/1500)

Setting breakpoints in the standard user program will cause the following errors in the safety program:

- F-cycle time monitoring has expired
- Error during communication with the F-I/O

  (S7-1500) Fail-safe modules switch to safe mode after the configured F-monitoring time has expired.
- Error during safety-related CPU-CPU communication
- Internal CPU faults

If you nevertheless want to use breakpoints for testing, you must first disable safety mode. This will result in the following errors:

- Error during communication with the F-I/O
- Error during safety-related CPU-CPU communication

Difference between S7-1500 F-CPUs and S7-300/400 F-CPUs:

- If a breakpoint is activated and reached, the F-CPU goes directly to STOP after HOLD.
- If you want to switch to RUN again after HOLD to test your standard user program further, you can simulate this with S7-PLCSIM.

No access protection is initially necessary for test purposes, commissioning, etc. This means you can execute all offline and online actions without access protection, that is, without password prompt.

See also

Changing the safety program in RUN mode (S7-300, S7-400) (Page 355)

Downloading project data to an F-CPU (Page 313)

10.7.4 Testing the safety program with S7-PLCSIM

You can test your safety program together with your standard program on a simulated CPU with *S7-PLCSIM* and without the need for hardware. Also observe warning S030 in the section "Notes on Safety Mode of the Safety Program (Page 383)".

You use *S7-PLCSIM* for SIMATIC Safety F-systems as you would for S7 standard systems. Note the following special features:

Safety mode/disabled safety mode

We recommend that you test your safety program in safety mode to detect whether the F-CPU goes into STOP as early as in the test phase of your safety program in *S7-PLCSIM* as a result of, for example, that the results of instructions were outside the permitted range for the data type.

The following simulations can be run in *S7-PLCSIM*, just as on an actual F-CPU, in disabled safety mode only.

- Modifying tags in F-DBs and F-I/O DBs.

The F-CPU can go to STOP mode in *S7-PLCSIM* if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

(S7-1200, S7-1500) To prevent unintentional modification of tags in F-DBs and F-I/O DBs in safety mode, we recommend that you do not select the "Activate/deactivate modification of non-inputs" button in *S7-PLCSIM*

During the simulation with *S7-PLCSIM* , monitoring of the maximum cycle time of the F-runtime group and the cycle time warning limit of the F-runtime group (S7-1200, S7-1500) are disabled.

Input simulation of F-I/O

Modification of inputs (channel values) in *S7-PLCSIM:*

You modify inputs (channel values) of F-I/O as you would inputs (channel values) of standard I/O in *S7-PLCSIM*.

Modification of inputs (value status) in *S7-PLCSIM:*

(S7-1200, S7-1500) By modifying inputs (value status) of F-I/O you can simulate the incoming and outgoing F-I/O/channel faults. Keep in mind the following notes/restrictions:

- To realistically simulate the behavior of the F-I/O, you must note the connection between channel value and value status on the real F-I/O. The combination value status = 0 and channel value <> fail-safe value (0) is invalid and can result in the simulation deviating from the behavior of the real F-CPU.
- During the transition from "STOP" to "RUN" of the CPU in *S7-PLCSIM*, all F-I/O inputs (value status) are initialized with 1. This means you can start with the modification of inputs (channel values) without simulation of the inputs (value status).

- The modification of inputs (value status) in *S7-PLCSIM* does not have an effect on the tags QBAD and PASS_OUT in the F-I/O DB. Note that with real F-I/O QBAD and PASS_OUT can be 1 as soon as the value status is 0 for at least one channel of the F-I/O. (see tags of the F-I/O DB: PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 171)).
- For F-I/O configured with "Behavior after channel fault" = "Passivation of the complete F-I/O", use the tag PASS_ON in the F-I/O DB for simulation of the passivation of the complete F-I/O for F-I/O / channel faults. If you only passivate individual inputs (channel value including value status) for the simulation, the behavior of the simulation will deviate from the real F-CPU.
- You can also use the PASS_ON tag in the F-I/O DB for F-I/O without value status to simulate the passivation of the entire F-I/O in case of F-I/O or channel faults.
- You must modify the inputs (channel values) to $7FFF_H$ (for overflow) or 8000_H (for underflow) to simulate an F-I/O/channel fault of the SM 336; AI 6 x 13Bit or the SM 336; F-AI 6 x 0/4...20 mA HART with configuration "Behavior after channel fault" = "Passivate channel".
- For F-I/O which does not support the "RIOforFA-Safety" profile, you must run a user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB as with a real F-I/O for reintegration after the value status has changed from 0 to 1 or when the channel value has changed from $7FFF_H$/8000_H to unequal $7FFF_H$/8000_H (see above) when ACK_NEC = 1 of the F-I/O DB. Reintegration takes place automatically in all other cases possibly deviating from the real F-I/O.

Update times

Keep in mind that the status of the inputs (channel values or value status (S7-1200/1500)) that you are monitoring in the SIM table in *S7-PLCSIM* is only identical to the status being processed in the safety program if there is no passivation of the associated F-I/O.

With passivation of the F-I/O, the safety program operates with fail-safe values (channel value and value status (S7-1200/1500) =0).

Instructions for communication between F-CPUs

The following applies for SENDDP/RCVDP (S7-300/400) instructions and SENDDP/RCVDP instructions with Version < 3.0 (S7-1200/1500):

You cannot simulate communication between F-CPUs with the SENDDP and RCVDP instructions in *S7-PLCSIM*. You can, however, use the SENDDP and RCVDP instructions together with *S7-PLCSIM*. During simulation in *S7-PLCSIM*, the RCVDP instruction outputs the fail-safe values pending at its inputs SUBBO_xx and SUBI_xx ((S7-1200/1500) or alternatively SUBDI_00). The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON.

For SENDDP/RCVDP instructions with Version >= 3.0 the following applies:

During the simulation with *S7-PLCSIM* it is possible to simulate the received data and the information "Deactivated Safety Mode" (RCVDP) or respectively the information "Substitute value output" (SENDDP) in the corresponding transfer area for inputs. Note the following notes:

- The simulated values do not become active until you set the SIMULATION bit for the first time in the respective simulation control word (see the following table) after the F-system has started up. Before setting the SIMULATION bit, the RCVDP instruction outputs the fail-safe values that are pending at its inputs SUBBO_xx and SUBI_yy ((S7-1200/1500) or alternatively SUBDI_00).
- The setting of the SEND_MODE bit in the simulation control word causes a setting of the SENDMORE output for the RCVDP instruction.
- The setting of the STATUS_SUBS bit in the simulation control word causes a setting of the SUBS_ON output for the SENDDP instruction.
- Reserved bits in the simulation control word always have to be 0.
- During a STOP/RUN transition from *S7-PLCSIM* the most recently simulated values in the transfer area for inputs are kept.

The start address(es) of the configured transfer area for the input and output data can be found in the respective configuration (see also "Configuring and programming communication (S7-1200, S7-1500) (Page 270)“).

Table 10- 1 Structure of the relevant transfer area for inputs of the simulation control word (instruction RCVDP)

> **WARNING**
>
> You must take the following into account for safety-related CPU-CPU communication with the communication type Flexible F-Link:
>
> If the F-CPU that sends the data is on a simulated F-CPU with S7-PLCSIM, you can no longer assume that the data sent by this F-CPU are generated safely. You must then implement organizational measures such as operation monitoring and manual safety shutdown to ensure safety in those portions of the system that are affected by the sent data. Alternatively, you must output fail-safe substitute values instead of the received data in the F-CPU that receives the data by evaluating SENDMODE*.
>
> * SENDMODE is available to you as a tag in the F-communication DB.
>
> *(S086)*

(S7-300, S7-400) You cannot simulate communication between F-CPUs with the SENDS7 and RCVS7 instructions in *S7-PLCSIM*. You can, however, use the SENDS7 and RCVS7 instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVS7 instruction outputs the initial values specified in the communication DB as fail-safe values. The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON.

Inconsistent safety program (S7-1200, S7-1500)

If the CPU goes into STOP in *S7-PLCSIM* with the diagnostic entry "Safety program: inconsistent", the F-CPU is not initialized correctly in *S7-PLCSIM* yet. Perform a memory reset of the F-CPU in *S7-PLCSIM* and download the program once again to the CPU in *S7-PLCSIM*.

10.7.5 Changing the safety program in RUN mode (S7-300, S7-400)

Introduction

Changes to the safety program during operation (in RUN mode) can only be made in disabled safety mode (Page 344). You make changes to F-blocks offline in the *program editor* in the same way as for a standard program. F-blocks cannot be changed online.

Note

If you do **not** want to make changes to the safety program during operation, see Creating F-blocks in FBD/LAD (Page 151).

Procedure for changing the safety program in RUN mode

To change the safety program, follow these steps:

1. Change the main safety block or F-FB and its associated instance DB, F-FC, or F-DB in the *Program editor*.
2. Download the changed F-block(s) to the F-CPU (for procedure, see Downloading project data to an F-CPU (Page 313)). The entire program is then automatically compiled.
3. If safety mode is active, the "Load preview" dialog will prompt you to deactivate it and to enter the password for the safety program.

   Note

   When downloading in disabled safety mode, you can only download the fail-safe blocks created by you (main safety blocks, F-FB, F-FC, or F-DB), F-application blocks, or standard blocks and their associated instance DBs. If you download automatically added F-blocks (F-SBs or automatically generated F-blocks and associated instance DBs, F-shared DB), the F-CPU can go to STOP mode or safety mode can be activated.

   Therefore, always select individual blocks only when downloading in disabled safety mode.

Sequence for downloading changes

Changes in the safety program in RUN mode when safety mode is disabled can, for example, cause the status of an actuator to change as a result of program changes.

After changes, start by downloading the safety program and then the function of the standard user program monitored by the safety program.

Restrictions on safety-related CPU-CPU communication

During operation (in RUN mode), you cannot establish new safety-related CPU-CPU communication by means of new SENDDP/RCVDP or SENDS7/RCVS7 instructions.

To establish new safety-related CPU-CPU communication you must always download the relevant safety program consistently to the F-CPU while in STOP mode after inserting a new SENDDP, SENDS7, RCVDP, or RCVS7 instruction.

Restrictions on F-runtime group communication

You cannot make any changes to the safety-related communication between F-runtime groups in RUN mode. This means that you cannot assign, delete, or change any DBs for F-runtime group communication of an F-runtime group.

Following changes in the F-runtime group communication, you must always download the safety program consistently to the F-CPU while in STOP mode.

Restrictions on F-I/O access

If during operation (in RUN mode), you insert an F-I/O access to an F-I/O of which no single channel value or tag from the associated F-I/O DB has yet been used in the safety program, the F-I/O access only becomes effective when the safety program is downloaded consistently to the F-CPU.

Changing the standard user program

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

Procedure for applying changes to the safety program

If you download individual F-blocks to the F-CPU during operation (in RUN mode), the F-system blocks (F-SBs) and the automatically generated F-blocks are neither updated nor downloaded, resulting in an inconsistent safety program in the F-CPU. Use the following procedure to apply changes to the safety program:

1. Download the safety program consistently to the F-CPU, and activate safety mode by switching the F-CPU from STOP to RUN mode (for procedure, see Downloading project data to an F-CPU (Page 313)).
2. Follow the steps described in Acceptance of Changes (Page 378).

10.7.6 Changing the standard user program in RUN mode (S7-1200, S7-1500)

Changing the standard user program

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

10.7.7 Deleting the safety program

Deleting individual F-blocks

To delete an F-block, follow the same procedure as in *STEP 7*.

Deleting an F-runtime group

See Deleting an F-runtime group (Page 150)

(S7-300, S7-400) Remove all calls that you have used to call the safety program (Main_Safety).

Deleting the entire safety program for S7-300/400 F-CPUs *with* inserted memory card (SIMATIC Micro memory card or flash card)

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
4. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.
5. To delete a safety program on the Memory Card (SIMATIC Micro Memory Card or Flash Card), insert the Memory Card (SIMATIC Micro Memory Card or Flash Card) in the programming device or PC or in a SIMATIC USB prommer.
6. Select the menu command "Project > Card Reader/USB memory > Show Card Reader/USB memory" in the menu bar.
7. Open the "SIMATIC Card Reader" folder and delete the Memory Card.
8. Insert the Memory Card into the F-CPU.

You can then download the offline standard user program to the F-CPU.

Deleting the entire safety program for S7-400 F-CPUs *without* inserted flash card

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
4. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.
5. Perform a memory reset on the F-CPU (in the "Online tools" task card of the F-CPU).

You can then download the offline standard user program to the F-CPU.

Delete the entire safety program for SIMATIC S7-1200/1500 F-CPUs

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.

You can then download the offline standard user program to the F-CPU.

10.8 F-change history

Enable the logging of changes to the safety program by using the option "Enable F-change history" in the *Safety Administration Editor*. The F-change history behaves like the standard change history.

An F-change history is created for each F-CPU in the project navigation under "Common data/logs".

The following is logged in the F-change history:

- Collective F-signature
- User name
- Compile time stamp
- Download of the safety program with time stamp
- Compiled F-blocks with signature and time stamp

The F-change history can contain a maximum of 5000 entries per F-CPU. When the 5000 entries are exceeded, a new F-change history is created using the naming scheme "F-change history <CPU name> YYYY-MM-DD hh:mm:ss".

After a project upgrade, the "Go to" function is not supported anymore for the F-change history of the project for the entries which were created before *STEP 7 Safety* V15.1.

NOTICE
The connection between the F-CPU and the associated F-change history is made through the name of the F-change history. Therefore, do not rename the F-CPU and the F-change history. If you rename the F-CPU or the F-change history, a new F-change history with the current name of the F-CPU is started.

Note

You may not use the F-change history to recognize changes in the safety program/in the configuration of the F-I/Os during the acceptance of changes.

To accept changes, proceed as described under Acceptance of Changes (Page 378).

Note

We recommend activating the F-change history before changing over to productive operation.

System acceptance 11

11.1 Overview of System Acceptance

Introduction

During a system acceptance test, all the standards and guidelines (for example PROFINET Installation Guidelines) relevant to the specific application must be complied with. This also applies to systems that are not "subject to acceptance". For the acceptance, you must consider the requirements in the Certification Report (http://support.automation.siemens.com/WW/view/en/49368678/134200).

As a general rule, the acceptance of an F-System is performed by an independent expert. The independence required of the expert must be defined in the safety plan and depends on the required PL/SIL.

Observe all warnings in this manual.

WARNING
The configuration of F-CPUs and F-I/Os as well as the programming of F-blocks must be carried out as described in this documentation. You must observe all aspects described in the section System acceptance (Page 361) to ensure secure operation with the system SIMATIC SAFETY. Any other procedures are not permitted. *(S056)*

Proof of the correct implementation of the safety-related project data

In order for a system acceptance to be granted, you must recognize and document the correctness of the individual components. For documentation of the component properties, you must create a safety summary.

The following characteristics must be covered:

- Correctness of the safety program including hardware configuration (including testing) (Page 363)
- Completeness of the safety summary (Page 364)
- Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate (Page 365)
- Compliance of the know-how protected F-blocks used in the safety program with their safety documentation. (Page 366)
- Completeness and correctness of the hardware configuration (Page 368)
- Correctness and completeness of the communication configuration (Page 374)
- Identity of online and offline program (Page 375)
- Other characteristics (Page 376) such as software version, use of data from the standard user program

After the acceptance, you should archive all relevant documents and also the project data so as to make the accepted project available as a reference for a subsequent acceptance.

Safety summary

The safety summary (Page 341) is the project documentation required for acceptance of the system.

11.2 Correctness of the safety program including hardware configuration (including testing)

The correctness of software cannot only be ensure through tests and verifications during commissioning, but rather already requires the observance of a wide variety of measures during creation. Also see warning S062 on this in chapter "Overview (Page 23)".

Verification/function test

Already during the creation, you will test (Page 343) your safety program and the associated hardware configuration. You must carry out tests with regard to the specification of your safety functions and document them before you seek acceptance for the system.

To allow you to perform a code review of your safety program and document the accepted program code, the source code of all F-blocks is printed as a part of the safety summary (Page 341), provided you have selected the "All" property for the printout.

If you want to carry out a function test after loading, you have to carry out program identification after loading. Additional information is available in "Downloading project data (Page 313)".

The correct function of the safety program must be guaranteed by complying with all steps from the "Overview of System Acceptance (Page 361)" chapter before it may be used productively. When using configuration control (option handling), you must ensure correct operation of the safety program for all possible station options by performing appropriate functional tests. You should archive the test reports along with the safety summary and the acceptance documents.

Times, for example monitoring times (Page 607) and delay times, can only be verified to a limited extent with functional tests (Page 313). You should check these times selectively to determine whether they are dimensioned correctly, for example, on the basis of the safety summary.

Some of these times are itemized specially in the safety summary, for example, the F-monitoring time (for communication between F-CPU and F-I/O) and the monitoring time of the safety-related CPU-CPU communication (TIMEOUT input). For the monitoring times derived under normative conditions, the Excel file for response time calculation is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100). These have to be considered together with the practically determined conditions of the application. Note that these monitoring times have an impact on the response times of your safety functions.

Consistency of the safety program

Check in the "General information" section of the safety summary to determine whether the safety program was recognized as "consistent".

This is the case for S7-300/400 F-CPUs only if the following signatures are also identical:

- Collective F-signature ("General information" section, "Collective F-signature")
- "Signature of F-blocks with F-attribute" ("General information" section, "Current compilation")

Consistency of the safety program is required for the acceptance. If the signatures are not identical, you have the possibility to establish the consistency through recompiling of the safety program and new creation of the safety summary.

11.3 Completeness of the safety summary

Introduction

If your safety program status including hardware configuration is ready for acceptance, you must carry out and document additional checks on the basis of the safety summary to prove that the safety summary is complete and is part of the safety program to be accepted.

Procedure for creation of safety summary

To generate the safety summary, follow the procedure described in Printing project data (Page 341).

In so doing, use the "All" property in order to include the source code of your F-blocks in the printout.

Checking the safety summary for completeness

If you want to use an existing summary, whose completeness is not exactly known, you must check to determine whether the same collective F-signature is contained in the footer on all pages of the printout. This allows you to prove that all printed sheets belong to the same project.

In section "Supplementary information", you can find the number of pages in the safety summary, among other things. With this, you can prove that all pages of the safety summary are printed. Incomplete printouts (for example due to low on toner) must not be used for an acceptance.

If you created the safety summary with the "All" option, the source code of all F-blocks will also be printed. The printout of this source code also contains the footer to enable you to easily assign the source code to a particular safety summary.

Association with the safety program

In the "General information" section of the safety summary, check whether the collective F-signature corresponds to the collective F-signature of the safety program to be accepted in the work area of the *Safety Administration Editor* under "General". If they are not the same, then the summary and safety program do not match.

11.4 Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate

Introduction

The *STEP 7 Safety* optional package contains LAD/FBD instructions for programming of your safety program as well as F-system blocks that have been created and tested by SIEMENS and certified by TÜV for creating an executable safety program. In the process, the F-system blocks used are automatically defined by the F-system based on the set safety system version (see section "Settings" area (Page 90)).

To allow you to check whether the used versioned LAD/FBD instructions and F-system blocks correspond to Annex 1 of the Report for the TÜV certificate and to the versions you intend to use, these are listed in the safety summary.

Procedure

To check, download the current Annex 1 of the report for the TÜV certificate "SIMATIC Safety" from the Internet (http://support.automation.siemens.com/WW/view/en/49368678/134200).

Proceed as follows for the check:

> **WARNING**
>
> - (S7-1200, S7-1500) The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions in Annex 1 of the Report for the TÜV Certificate.
> - (S7-300, S7-400) The versions, signatures and initial value signatures of the versioned LAD/FBD instructions and F-system blocks listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions, signatures and initial value signatures in Annex 1 of the Report for the TÜV Certificate.
> - The versions of the versioned LAD/FBD instructions listed in the safety summary must meet the safety requirements of your application.
>
>   Keep in mind possible differences in functionality of different versions specified in the section for the respective instruction.
> - The safety system version listed in the safety summary under "Safety program settings" must match the versions in Annex 1 of the Report for the TÜV Certificate. *(S054)*

In case of discrepancies, recheck whether you have the correct versions.

(S7-300 / 400) Differences may also arise when there are F-blocks / instructions in your safety program that are not used.

11.5 Compliance of the know-how protected F-blocks used in the safety program with their safety documentation.

If you use know-how protected F-blocks for the programming of your safety program (e.g. from libraries), the source code for these is not printed in the safety summary.

Therefore, the author of the know-how protected F-block must already carry out acceptance of the F-block and provide the following information:

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-blocks

During a system acceptance test, you have to carry out the following checks using the safety summary:

- The signature and initial value signature of each know-how protected F-block listed in the safety summary in the section "F-blocks in the safety program" must agree with the signature and initial value signature documented by the author.
- The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions of each know-how protected F-block documented by the author or must be functionally identical with these.
- The signatures and initial value signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "F-blocks in the safety program" must correspond to the signatures and initial value signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures and initial value signatures. If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version when setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-blocks

During a system acceptance test, you have to carry out the following checks using the safety summary:

- The signature of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must agree with the signature documented by the author.
- The safety system version of each know-how protected F-block listed in the safety summary under "Know-how protected F-blocks in the safety program" must match the versions in Annex 1 of the Report for the TÜV Certificate.
- The versions of the versioned LAD/FBD instructions of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must correspond to the versions documented by the author or must be functionally identical with these.
- The signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must correspond to the signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures. If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

11.6 Completeness and correctness of the hardware configuration

Introduction

The hardware configuration is an essential component of the project to be accepted. With the configuration of the hardware, you have set properties that can influence the safety of signals. You must document these settings with the safety summary to prove that you fulfill the safety requirements for your application.

The section "Hardware configuration of F-I/O" is available in the safety summary for this. This section consists of several tables:

- A table with information about the F-CPU and the ranges of F-destination addresses used and of the Central F-source address of the F-CPU.
- An overview table with the F-I/O used.
- A table for each F-I/O with information about the F-I/O and all parameters of the F-I/O with the configured values.

Check whether only authorized users have the "F-admin" right in the *Safety Administration Editor* or in the standard printout of the project data.

Note

Note that you will find F-I/O that you address via safety-related I-slave-slave communication in the safety summary of the I-slave F-CPU and not in the F-CPU of the assigned DP master.

The safety summary of the F-CPU of the DP master includes a note for this F-I/O in the overview table indicating that the F-I/O is not assigned to this F-CPU.

Note

When using shared devices:

Note that you will find F-I/O that you address in a shared device in the safety summary of the F-CPU of the IO controller to which it is assigned.

The safety summary of the F-CPUs of the other IO controllers between which the shared device is divided, includes a note in the overview table for this F-I/O that it is not assigned to this F-CPU.

Procedure for checking that the hardware configuration is complete

Ensure that all configured F-I/O are included in the safety summary. Also make sure that there is no F-I/O that you have not configured as belonging to this F-CPU.

Note

If configuration control (option handling) is used, the safety summary must contain all the F-I/O devices of the maximum configuration. The following checks are to be carried out for al the F-I/Os of the maximum configuration.

Procedure for checking the correctness of the hardware configuration using the safety summary

To check the hardware configuration for correctness, proceed as follows:

1. Check in the “F-hardware configuration“ section to verify the uniqueness of the PROFIsafe addresses.

   Please see sections PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 68) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 70), Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 77) and Recommendation for PROFIsafe address assignment (Page 65).

   – Check if the "Central F-source address" parameter of the individual F-CPUs differs network-wide. F-CPUs to which solely F-IOs of the PROFIsafe address type 1 are assigned do not have to be considered during the check.

   – For F-I/Os of PROFIsafe address type 1 check whether the F-destination addresses comply with the following warning:

   > **WARNING**
   >
   > F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).
   >
   > The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

   * A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

   ** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

   – For F-I/Os of PROFIsafe address type 2 check whether the F-destination addresses comply with the following warning:

WARNING

FI/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

To ensure that addresses are unique across F-CPUs for supported configurations (Page 66), you need to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Central F-source address" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

– fail-safe GSD based DP slaves / GSD based I/O devices check whether the PROFIsafe addresses comply with the following warning:

WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 68) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 70).

Set the F-source address according to the manufacturer specifications for fail-safe DP standard slaves / fail-safe IO standard devices. If the F-source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Central F-source address" parameter matches the value of the F-source address of the fail-safe GSD based DP slave / fail-safe GSD based I/O device. *(S053)*

2. Check the safety-related parameters (including F-monitoring time or F_WD_Time) of all configured F-I/O.

   You can find these parameters in the "Hardware configuration of F-I/O" section in the detailed tables for the F-I/O.

   The table consists of two parts:

   – The left part contains the parameters which refer to the F-I/O itself ("Module data").

   – The right part contains the parameters of the individual channels ("Channel parameters")

   These parameters must be set as prescribed by the safety requirements of your application.

   When using fail-safe GSD based DP slaves/GSD based I/O devices, note the relevant documents for the possible additional safety-related (technical) parameters.

   Note

   F-I/O that are to be assigned the same safety-related parameters (except for PROFIsafe addresses) can be copied during configuration. Except for the PROFIsafe addresses, you no longer have to check the safety-related parameters individually. It is sufficient to compare the "Signature of F-parameters (without addresses)" in the "Hardware configuration of the F-I/O" section in the overview table. This also applies to fail-safe GSD based DP slaves/GSD based I/O devices without i-parameters. For GSD based DP slaves / GSD based I/O devices with i-parameters, it may be that "F-parameter signature (w/o addresses)" does not match, even though all safety-related parameters, except for the PROFIsafe addresses, do match. In this case, you need to compare all safety-related parameters.

   Exception:

   For F-I/Os that do not support the "RIOforFA-Safety" profile, you also need to compare the "Behavior after channel fault" parameter, if any, for "F-parameter signature (w/o addresses)".

3. Check whether the article numbers of the F-I/O in the safety summary correspond to the article numbers of the actual F-I/O in the system. If the article numbers are different, the existing F-I/O must be spare-part-compatible to the F-I/O listed in the safety summary.

4. For non-supported configuration, please see Configurations supported by the SIMATIC Safety F-system (Page 66).

WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Check the correctness of the PROFIsafe addresses with the help of the safety summary.
  - Use the safety summary to check that the F-source address corresponds to the "Central F-source address" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1 or if you cannot set the F-source address in accordance with the "Central F-source address" parameter of the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported.

  (S050)

* "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Check that only authorized persons have the "F-admin" right.

WARNING
The "F-admin" authorization for Web server without password protection (user "Everybody" or "Everyone") is only intended for test purposes, maintenance, etc. This means only when the system is not in productive operation. In this case, you must ensure the safety of the system through other organizational measures, for example through protected access to certain areas. Before you transition into productive operation, you must remove the "F-admin" right for the user "Everyone". Only authorized personnel may have access to the password of the Web server user with the "F-admin" right. After downloading the hardware configuration, check whether only permitted users of the Web server have the "F-admin" right on the F-CPU. To do so, use the online view of the *Safety Administration Editor* (see also Safety Administration Editor (Page 81)). Saving the login file and the password of the Web server in the browser is only permitted when use by unauthorized persons is prevented through other organizational measures (e.g. access protection to the PG/PC). *(S064)*

11.7 Correctness and completeness of the communication configuration

Introduction

Safety-related communication is based on the mechanisms of the standard communication of *STEP 7*.

To ensure that errors which standard communication does not discover are detected, safety-related communication connections between F-CPUs are secured. Further parameters are required for this, which you have to document and check on acceptance.

For this purpose, the "Block parameters for safety-related CPU-CPU-communication" and "Overview of communication via Flexible F-Link" sections are available in the safety summary. The section "Block parameters for safety-related CPU-CPU-communication" contains up to two tables (for communication via PROFIBUS DP or PROFINET IO and for communication via S7 connections). The section "Overview of communication via Flexible F-Link" contains a table with an overview of the connection configurations and a "Communication via Flexible F-Link for UDT" table for each used F-compliant PLC data type (UDT).

Procedure for testing for correctness of the communication via Flexible F-Link

To check the communication via Flexible F-Link for correctness, follow these steps:

- Check your connection parameter assignment in the table "Overview of communications via Flexible F-Link". If you have copied communication relationships, ensure the uniqueness of the UUID.
- Check the table(s) "Overview of communications via Flexible F-Link" for each F-communication relationship to ensure that the offsets of the elements of the F-compliant PLC data types (UDT) match regarding send and receive data within the safety message frame.

Procedure for testing for correctness of the communication configuration

To check the communication configuration for correctness, proceed as follows:

- In the "Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO" table, check to determine whether you have assigned a unique DP_DP_ID input network-wide* for all safety-related communication connections (e.g., master-master, master-I-slave and IO controller-IO controller communication).
- In the "Safety-related CPU-CPU communication via S7 connections" table, check to determine whether you have assigned a unique R_ID input network-wide* for all safety-related communication via S7 connections.

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

11.8 Identity of online and offline program

Once you have checked all properties of the offline safety program you must ensure that the safety program is identical on the F-CPU on which it is supposed to be run.

1. Connect online with the F-CPU. If multiple F-CPUs can be reached over a network (e.g. Industrial Ethernet) by the programming device / PC, you have to ensure that you are connected with the correct F-CPU. For example with "Online & diagnostics" > "Online accesses " > "Flash LED".
2. Open the *Safety Administration Editor*.
3. Check whether the online and offline F-collective signatures match the F-collective signatures from the safety summary.
4. In the "General" area, check the information for
   – F-collective signature online
   – F-collective signature offline
   – Information on whether safety programs are consistent online and offline.
   – Version check view

   Use the output information to check which situation you are dealing with and, if necessary, execute the recommended measure:

collective F-signatures online/offline	**Consistency online to offline**	**Statement**	**Measure**
	not relevant	The safety programs are different.	• Ensure that you are connected with the desired F-CPU. • Download the safety program to the F-CPU.
		The safety programs are identical but different versions of F-blocks are used.	The safety program must be downloaded to the F-CPU for the latest versions to become effective.
		The safety programs are identical.	None

Keep in mind that only a change comparison will provide reliable information as to whether the safety programs are identical. The display of signatures is used for quick identification of changes.

11.9 Other characteristics

Introduction

In addition, you must check a few more characteristics that are also relevant for the acceptance of the project.

Validity check for data transfer from the standard program to the safety program

Check to determine whether a validity check was programmed for all data transferred from the standard user program to the safety program. For this purpose, the "Data from the standard user program" section lists all tags of the standard user program that you are reading in the safety program. Tags of the safety program that you are writing in the safety program are not listed here because a plausibility check is not required for them. For more information, refer to the S015 warning in section "Data Transfer from Standard User Program to Safety Program (Page 197)".

Checking the program version

Check whether the version of *STEP 7 Safety* used to create the summary (in the footer of the printout) is as least as high as the version used to compile the safety program. The latter version can be found in the "General information" section of the safety summary under "Used Versions". Both versions must be listed in Annex 1 of the Report for the TÜV certificate.

Ability to disable safety mode

Make sure that safety mode cannot be disabled. For information about this, refer to section "General information" under "Safety program settings". This setting ensures that the safety mode of the safety program cannot be disabled inadvertently. For more information, refer to the S027 warning in section "Disabling safety mode (Page 344)".

Access protection

Check in the "General information" section under "Access protection" to determine whether the setting for access protection is permitted. Note the following warning.

Otherwise, the project must not be accepted, because the safety program in the F-CPU is not protected against unauthorized accesses.

WARNING
(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

WARNING
(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. For this purpose, configure at least the protection level "Full access (no protection)" and assign a password under "Full access incl. fail-safe (no protection)". This protection level only allows full access to the standard user program, not to F-blocks. If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)". Assign different passwords for the individual protection levels. *(S041)*

11.10 Acceptance of Changes

Introduction

In general, you can adopt the same approach for the acceptance of changes as the initial acceptance (see Overview of System Acceptance (Page 361)).

You must check the complete safety program including the safety-related HW configuration for changes.

WARNING
In the case of acceptance of changes, you must check whether the intended changes were made correctly and completely. You must also check whether unintentional changes may have been made at another location (for example, I/O or instructions that were added).*(S072)*

To avoid the acceptance of the entire system in case of negligible changes, *STEP 7 Safety* helps you to identify those parts of your safety program that have changed.

For an acceptance of changes, it is sufficient to check the following:

- Checking the changed or newly added F-blocks.
- Checking the changed or newly added instructions and F-system blocks.
- Checking the safety-related parameters of the changed or newly added F-I/O.
- Checking the structure of the safety-related HW configuration (e.g. slot positions or start addresses of the F-I/Os).
- Checking the changed communication connection with Flexible F-Link.

You then perform a function test of the F-blocks/F-I/Os affected by the changes.

Check that the changes have no impact on the unchanged parts of safety-related project data, in particular for deleted F-blocks or deleted F-I/O.

Note

Acceptance of changes is not possible after CPU migration.

WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test (Page 347).

Examples for such changes are:

- Adding F-I/O
- Changing the start address of F-I/O
- Changing the slot position of F-I/O
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Detection of changes in the safety-related project data

You need two TIA projects to identify relevant changes:

- Reference project: Contains the initially accepted project data. They are the starting point for the upcoming comparison.
- Project to be accepted: Contains the current safety-related project data. It is the result of the reference project and the changes made in it.

To detect changes you have to compare the safety-related project data from the reference project with the data of the project to be accepted.

The F-collective signature is a quick first step to determine whether relevant changes have been made. If the signature has changed, relevant changes are present in the safety-related project data.

You can now use the F-SW collective signature, the F-HW collective signature and the F-communication address signature to narrow down whether these changes are contained in the safety program (F-SW collective signature changed) and/or in the safety-related project data (F-HW collective signature) and/or in the communication data (with Flexible F-Link, F-communication address signature).

Detection of changes in the safety program

A quick possibility to detect changes in the safety program is the comparison of the F-SW collective signature of the safety-related project data in the reference project with the F-SW collective signature in the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the safety program which need to be validated and, if necessary, accepted.

To localize changes in the safety program, perform an offline-offline comparison between the changed safety program and the accepted safety program (see Comparing Safety Programs (Page 339)). Use filter setting "Compare only F-blocks relevant for certification". This limits the output of the comparison to exactly those F-blocks that must be considered for the acceptance of changes.

WARNING
Make sure that the comparison criterion "Safety" is enabled so that the criteria relevant for an acceptance of changes are taken into consideration in the comparison. *(S069)*

By disabling the remaining comparison criteria, you can deselect those differences that are irrelevant for the acceptance of changes (e.g. time stamp).

The status of the comparison helps you to identify which F-blocks were changed.

Detection of changes in the safety-related hardware configuration

A quick possibility to detect changes in the safety-related hardware configuration is the comparison of the F-HW collective signature of the safety-related project data in the reference project with the F-HW collective signature of the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the safety-related hardware configuration which need to be validated and, if necessary, accepted.

If the F-HW collective signature has changed and all F-I/O devices are unchanged, this indicates that safety-related parameters of the F-CPU have changed, or that the structure of the safety-related hardware configuration has changed, for example, slot positions.

There are two possible ways for localizing safety-related changes in the safety-related hardware configuration:

- Comparison in the comparison editor
- Comparison based on two safety summaries

Comparison in the comparison editor

If you have access to the reference project, you can also detect the changes in the safety-related hardware configuration through an offline-offline comparison of the changed F-CPU with the accepted F-CPU (see Comparing Safety Programs (Page 339)). Both projects must be consistent and compiled.

1. Navigate in the comparison result to the "System blocks > STEP 7 Safety > F-I/O DBs" folder. All data blocks listed in this folder are F-I/O-DBs and are each assigned to an F-I/O.
   - If the F-I/O-DBs in the comparison result are identical, this means that the safety-related configuration of the assigned F-I/O was also not changed. Standard-parameters may have changed.
   - If the F-I/O-DBs in the comparison result are not identical, this means that the safety-related configuration of the assigned F-I/O was also changed.
   - If the F-I/O DBs in the comparison result are marked as "not existing", associated F-I/O devices may have been deleted or added or the name or start addresses of the F-I/O devices have been changed. In this case you can find the assignment of an F-I/O DB to a specific F-I/O in the safety summary under "Hardware configuration of F-I/O".
2. If you have found changed F-I/O, you can check the changed parameters in the safety summary as described below.

Comparison based on two safety summaries

Carry out a comparison based on two safety summaries as follows:

1. In the section "Hardware configuration of the F-I/O" compare the start addresses (I/O addresses), the parameter "Behavior after channel fault" and the slot of the F-I/O.
2. In the overview table of the utilized F-I/O in the "Hardware configuration of F-I/O" section, compare the parameter CRCs of the F-I/O with those in the safety summary of the accepted F-CPU.
   - If the "Parameter signature (without addresses)" is different for an F-I/O, this indicates the existence of a safety-related change of safety-related parameters of the F-I/O. In addition, the PROFIsafe addresses may also be changed.

     In this case, in the “F-I/O hardware configuration“ section check the safety-related parameters of the F-I/O and verify the uniqueness of the PROFIsafe addresses.
   - If the "Parameter signature (w/o addresses) is identical, it is possible that only the PROFIsafe addresses were changed.

     In this case it is sufficient to verify the uniqueness of the PROFIsafe addresses.

Check as described in section “Completeness and correctness of the hardware configuration (Page 368)“.

Detecting changes in the communication with Flexible F-Link

A quick possibility to detect changes in the configuration of the communication with Flexible F-Link, the comparison of the F-communication address signature of the safety-related project data in the reference project with the F-communication address signature of the safety-related project data in the project to be accepted. If they differ from each other, this means that there are changes in the configuration of the communication with Flexible F-Link, which need to be validated and, if necessary, accepted.

To localize changes in the configuration of the communication with Flexible F-Link, compare the table "Overview of communications via Flexible F-Link" of the reference project in the respective safety summary with the one of the project to be accepted.

Operation and Maintenance

12

12.1 Notes on Safety Mode of the Safety Program

Introduction

Pay attention to the following important notes on safety mode of the safety program.

Use of simulation devices/simulation programs

WARNING

Use of simulation devices/simulation programs in plants

If you operate simulation devices or simulation programs that generate safety message frames, for example, based on PROFIsafe, and make them available to the SIMATIC Safety F-system via the bus system (such as PROFIBUS DP or PROFINET IO), you must ensure the safety of the F-system using organizational measures, such as operational monitoring and manual safety shutdown.
Note, for example, that a protocol analyzer is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior.

***S7-PLCSIM* version < 15.1 or *S7-PLCSIM Advanced version* < 2.0 SP1 and safety system version < 2.2**

If you use the *S7-PLCSIM* (Page 343) to simulate safety programs, the measures mentioned above are not necessary because S7-PLCSIM cannot establish an online connection to a real component.

***S7-PLCSIM* version ≥ 15.1 or *S7-PLCSIM Advanced* version ≥ 2.0 SP1 or safety system version ≥ 2.2**

You must ensure the safety of the F-system with organizational measures, for example, through operation monitoring and manual safety shutdown.

In addition, the loading of a safety program with Safety System version 2.2 and higher onto an *S7-PLCSIM* is only permissible as of *S7-PLCSIM* V15.1 or *S7-PLCSIM Advanced* V2.0 SP1. *(S030)*

Note

For an *S7-PLCSIM* before V15.1 or *S7-PLCSIM Advanced* before V2.0 SP1 and a Safety System version 2.2 and higher, the safety program changes to STOP and a corresponding diagnostics event is issued.

Switching F-CPU to STOP mode

WARNING

STOP via programming device/PC, mode switch, communication function or "STP" instruction

Initiating STOP by means of programming device/PC operation, mode switch, communication function or "STP" instruction as well as maintaining the STOP state is not safety-oriented. This STOP state can be easily (and unintentionally) be revoked by programming device/PC operation.

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost. The F-system automatically reintegrates the F-I/O.

If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected (see Programming startup protection (Page 155)). *(S031)*

CRC error in safety-related communication

Note

CRC error in safety-related communication

If you observe that an F-CPU requests manual acknowledgement of a CRC error more than once within the space of 100 hours, and this occurs repeatedly, check whether the PROFINET or PROFIBUS installation guidelines have been followed.

There is a CRC error if:

- The ACK_REQ tag of the F-I/O DB is set and the DIAG tag of the F-I/O DB (bit 2 or bit 6) indicates CRC errors
  or
- A CRC error is entered in the diagnostic buffer of the F-CPU

In this case, the failure probability values (https://support.industry.siemens.com/cs/ww/en/view/109481784) (PFD_{avg}/PFH) for safety-related communication no longer apply.

Information on installation guidelines for PROFINET and PROFIBUS can be found in:

- PROFIBUS Installation Guidelines (www.profibus.com/PBInstallationGuide)
- PROFIBUS Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profibus-interconnection-technology/display/)
- PROFINET Installation Guidelines (www.profibus.com/PNInstallationGuide)
- PROFINET Cabling and Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profinet-cabling-and-interconnection-technology/display/)
- PROFIsafe Environment Requirements (www.profibus.com/PROFIsafeRequirements)

When your review indicates that the configuration guidelines for PROFIBUS and PROFINET have been met, contact Customer Support.

12.2 Replacing Software and Hardware Components

Replacement of software components

When replacing software components on your programming device or PC, e.g. with a new version of *STEP 7*, you must adhere to the information regarding upward and downward compatibility in the documentation and readme files for these products (e.g. *STEP 7 Safety*).

When replacing *STEP 7 Safety*, check whether the version of *STEP 7 Safety* is listed in Annex 1 of the Report for the TÜV certificate.

Replacement of hardware components

Hardware components for SIMATIC Safety (F-CPU, F-I/O, batteries, etc.) are replaced in the same way as in standard automation systems.

Replacement of S7-1500 F software Controllers

WARNING

After replacing a CPU module (e.g. new PC with data storage medium of old PC) or replacement of the data storage medium (e.g. data storage medium with safety program 1 is replaced with data storage medium with safety program 2), you must use the Panel to check if the correct collective F-signature is displayed or whether a program identification is carried out. *(S066)*

Removing and inserting F-I/O during operation

If removing and inserting is possible for standard I/O during operation, it is also possible for the respective F-I/O. However, be aware that replacing an F-I/O module during operation can cause a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 165) or, alternatively, by using the "ACK_GL (Page 487)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

CPU firmware update

Check of the CPU operating system for F-approval: When using a new CPU operating system (firmware update), you must check to see if the CPU operating system you are using is approved for use in an F-system.

The minimum CPU operating system versions with guaranteed F-capability are specified in the appendix of the Certificate. This information and any notes on the new CPU operating system must be taken into account.

Firmware update for interface module

When using a new operating system for an interface module, e.g. IM 151-1 HIGH FEATURE ET 200S (firmware update), you must observe the following:

If you have selected the "Activate firmware after update" option for the firmware update (see *Help on STEP 7*, "Online & Diagnostics"), the IM will be automatically reset following a successful download operation and will then run on the new operating system. Note that the firmware update for interface modules during operation generates a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 165) or, alternatively, by using the "ACK_GL (Page 487)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

Preventive maintenance (proof test)

Proof test for complex electronic components generally means replacement with new, unused components.

PFD_{avg} and PFH values for S7-300/400 F-CPUs and F-I/O

You will find a list of the failure probability values (PFD_{avg}, PFH values) for components that can be used in SIMATIC Safety on the Internet.

PFD_{avg} and PFH values for S7-1200/1500 F-CPUs

Below are the probability of failure values (PFD_{avg}, PFH values) for S7-1200/1500 F-CPUs with a service life of 20 years and an MTTR of 100 hours:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

PFD_{avg} and PFH values for safety-related communication

Below you will find the failure probability values (PFD_{avg}, PFH values) for safety-related communication:

Operation in low demand mode	Operation in high demand or continuous mode
low demand mode	high demand/continuous mode
According to IEC 61508:2010:	**According to IEC 61508:2010:**
PFD_{avg} = Average probability of a dangerous failure on demand	**PFH = Average frequency of a dangerous failure [h^{-1}]**
< 1E-05*	< 1E-09*

*** Note on S7-300/400 F-CPUs:**
The PFH value is valid under the assumption that a maximum of 100 F-I/Os are involved in a safety function. If you use more than 100 F-I/Os, you have to also add 4E-12 per F-I/O for the safety function.
The PFD_{avg} value is valid for a service life of 20 years and under the assumption, that a maximum of 25 F-I/Os are involved in a safety function. If more than 25 F-I/OS are used, you need to add 3.5E-7 per F-I/O for this safety function.

12.3 Guide to diagnostics (S7-300, S7-400)

Introduction

Here you find a compilation of diagnostic capabilities that can be evaluated for your system when an error occurs. Most of the diagnostic capabilities are the same as those in standard automation systems. The sequence of steps represents a recommendation.

Steps for evaluating diagnostic capabilities

The following table shows the steps you take to evaluate diagnostic capabilities.

Step	Procedure	Reference
1	**Evaluate LEDs on the hardware (F-CPU, F-I/O):** • BUSF LED on the F-CPU: Flashes when a communication error occurs on PROFIBUS DP/PROFINET IO; On if a programming error occurs when OB 85 and OB 121 are programmed (e.g. instance DB is not loaded) • STOP LED on the F-CPU: illuminates when the F-CPU is in STOP mode • Fault LEDs on the F-I/O: e.g. SF-LED (group error LED) on if any fault occurs in the individual F-I/O	*Manuals for F-CPU and F-I/O*
2	**Evaluate diagnostic buffer of the modules:** You read the diagnostic buffer of a module (F-CPU, F-I/O, CP) in its online and diagnostic view in the "Diagnostic buffer" group under the "Online & Diagnostics" folder.	*Help on STEP 7 and manuals for the F-CPU and F-I/O*
3	**Evaluate stacks of the F-CPU:** when the F-CPU is in STOP mode, read the following successively: • Block stack: Check whether STOP mode of the F-CPU was triggered by an F-block of the safety program • Interruption stack • Local data stack	*Help on STEP 7*

Step	Procedure	Reference
4	**Evaluate diagnostic tag of the F-I/O DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** Evaluate the DIAG tag in the F-I/O DB	F-I/O access (Page 157)
5	**Evaluate diagnostic outputs of the instance DBs of instructions using testing and commissioning functions, using an operator control and monitoring system, or in the standard user program:** • Evaluate the following for MUTING, EV1oo2DI, TWO_H_EN, MUT_P, ESTOP1, FDBACK, SFDOOR in the assigned instance DB: – Output DIAG • Evaluate the following for SENDDP or RCVDP in the assigned instance DB: – Output RET_DPRD/RET_DPWR – Output DIAG • Evaluate the following for SENDS7 or RCVS7 in the assigned instance DB: – Output STAT_RCV – Output STAT_SND – Output DIAG	Instructions

Tip on RET_DPRD/RET_DPWR

The diagnostic information of the RET_DPRD/RET_DPWR outputs of the SENDDP or RCVDP instructions corresponds to the diagnostic information of the RETVAL return value of the "DPRD_DAT" and "DPWR_DAT" instructions. You can find the description in the help on *STEP 7* for the "DPRD_DAT" and "DPWR_DAT" instructions.

Tip: STAT_RCV and STAT_SND

The diagnostic information of the STAT_RCV output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "URCV" instruction. The diagnostic information of the STAT_SND output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "USEND" instruction. You can find the description in the help on *STEP 7* for the instruction "UCRV" or "USEND" .

12.4 Guide to diagnostics (S7-1500)

Detailed information on diagnostics for an S7-1500 F-CPU can be found in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

12.5 Guide to diagnostics (S7-1200)

Detailed information on diagnostics for an S7-1200 F-CPU can be found in the S7-1200 Functional Safety manual (http://support.automation.siemens.com/WW/view/en/104547552).

13 Overview of instructions for the safety program

Overview of instructions for the safety program

When programming an F-block, you can find all instructions available for programming an F-block in LAD or FBD with the configured F-CPU in the "Instructions" task card.

In addition to the instructions that are familiar to you from programming a standard block, there are also special safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, and feedback monitoring and instructions for safety-related CPU-CPU communication.

Note the following

Note

Enable input EN and enable output ENO cannot be connected.

Exception:

(S7-1200, S7-1500) With the following instructions you can program overflow detection by connecting the enable output ENO:

- ADD: Add (STEP 7 Safety V15.1) (Page 520)
- SUB: Subtract (STEP 7 Safety V15.1) (Page 523)
- MUL: Multiply (STEP 7 Safety V15.1) (Page 526)
- DIV: Divide (STEP 7 Safety V15.1) (Page 529)
- NEG: Create twos complement (STEP 7 Safety V15.1) (Page 533)
- ABS: Form absolute value (STEP 7 Safety V15.1) (S7-1200, S7-1500) (Page 536)
- CONVERT: Convert value (STEP 7 Safety V15.1) (Page 548)

13.1 General

13.1.1 LAD

13.1.1.1 New network (STEP 7 Safety V15.1)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an LAD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.1.1.2 Empty box (STEP 7 Safety V15.1)

Requirement

A network is available.

Procedure

To insert an LAD instruction into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the required instruction from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.1.1.3 Open branch (STEP 7 Safety V15.1)

Description

Use branches to program parallel connections with the Ladder Logic (LAD) programming language. Branches are inserted into the main current path. You can insert several contacts into the branch, thereby creating a parallel connection from series connections. You can program complex ladder diagrams in this way.

Requirement

- A network is available.
- The network contains elements.

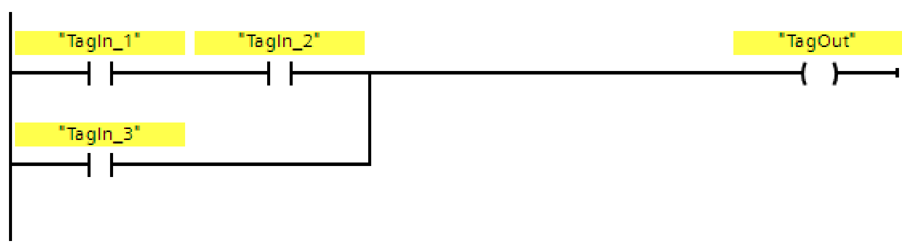
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Open branch".
3. Use a drag-and-drop operation to move the element to the desired place in the network.
4. If you want to connect the new branch directly to the power rail, drag the element to the power rail.

Example

The following figure provides an example of how to use branches:



13.1.1.4 Close branching (STEP 7 Safety V15.1)

Description

Branches must be closed again at suitable places. If necessary, branches will be arranged so that they do not cross each other.

Requirement

A branch is available.

Procedure

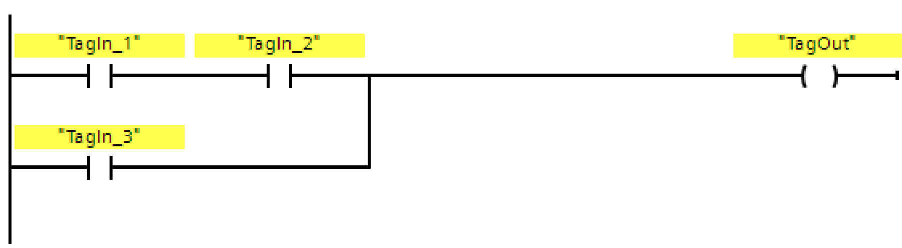
To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.

   A dashed line will appear as soon as the cursor is moved.
3. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
4. Release the left mouse button.

Example

The figure below provides an example of how to use branches:



13.1.2 FBD

13.1.2.1 New network (STEP 7 Safety V15.1)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an FBD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.1.2.2 Empty box (STEP 7 Safety V15.1)

Requirement

A network is available.

Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.1.2.3 Open branch (STEP 7 Safety V15.1)

Description

You use branches, which you insert between the boxes, to program parallel connections with the Function Block Diagram (FBD) programming language You can insert additional boxes in the branch, thereby programming complex function block diagrams.

Requirement

A network is available.

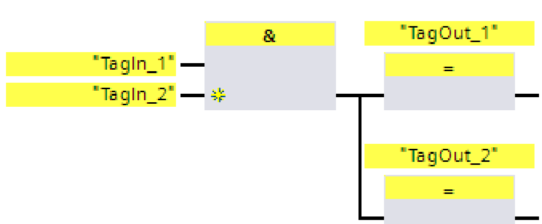
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate in the pane to "Basic instructions > General > Branch".
3. Use a drag-and-drop operation to move the element to the desired place to a connecting line between two boxes.

Example

The following figure provides an example of how to use branches:



13.1.2.4 Insert binary input (STEP 7 Safety V15.1)

Description

Use the "Insert binary input" instruction to expand the box of one of the following instructions by a binary input:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by expanding the instruction box.

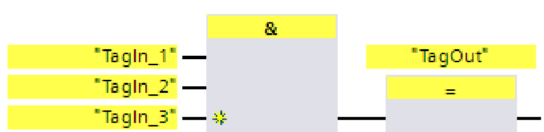
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



The box of instruction "AND logic operation" has been expanded by an additional binary input at which the signal state of operand "TagIn_3" is queried. Output "TagOut" is set when the signal state of operands "TagIn_1", "TagIn_2", and "TagIn_3" is "1".

See also

AND logic operation (STEP 7 Safety V15.1) (Page 414)

OR logic operation (STEP 7 Safety V15.1) (Page 416)

X: EXCLUSIVE OR logic operation (STEP 7 Safety V15.1) (Page 417)

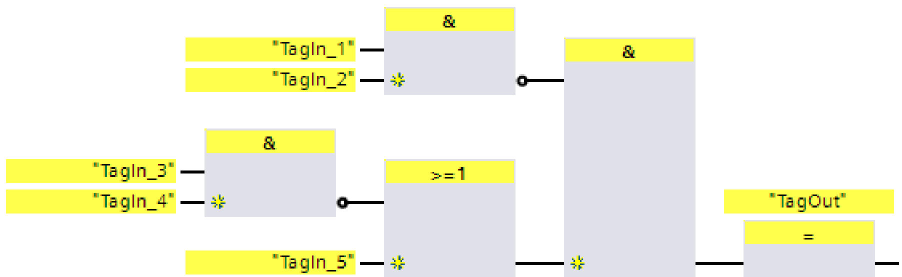
13.1.2.5 Invert RLO (STEP 7 Safety V15.1)

Description

You can use the "Invert RLO" instruction to invert the result of logic operation (RLO).

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- The "TagIn_1" and/or "TagIn_2" input has the signal state "0".
- The "TagIn_3" or "TagIn_4" input has the signal state "0" or the "TagIn_5" input has the signal state "1".

13.2 Bit logic operations

13.2.1 LAD

13.2.1.1 ---| |---: NO contact (STEP 7 Safety V15.1)

Description

The activation of the normally open contact depends on the signal state of the associated operand. If the operand has signal state "1," the normally open contact is closed. Power flows from the left power rail through the normally open contact into the right power rail and the signal state at the output of the instruction is set to "1".

If the operand has signal state "0," the normally open contact is not activated. The power flow to the right power rail is interrupted and the signal state at the output of the instruction is reset to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

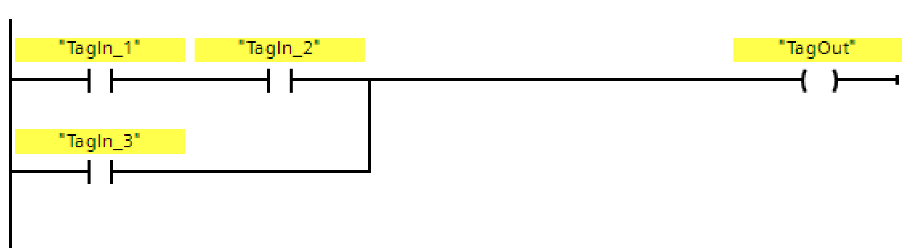
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "1".

13.2.1.2 ---| / |---: NC contact (STEP 7 Safety V15.1)

Description

The activation of the normally closed contact depends on the signal state of the associated operand. If the operand has signal state "1", the normally closed contact is opened and the signal state at the output of the instruction is reset to "0".

If the operand has signal state "0", the normally closed contact is not activated and the signal state at the output of the instruction is set to "1".

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

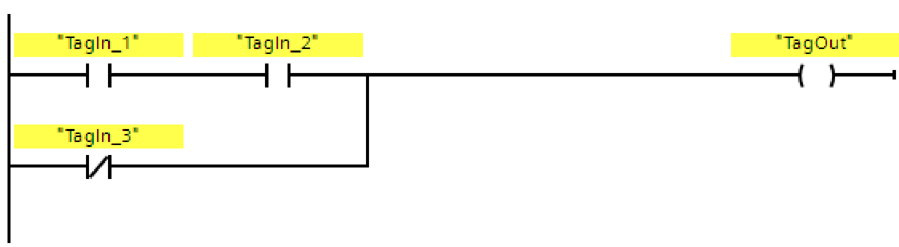
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

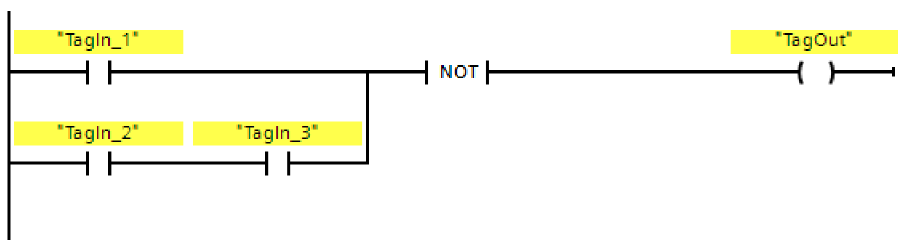
13.2.1.3 --|NOT|--: Invert RLO (STEP 7 Safety V15.1)

Description

You can use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). When the signal state is "1" at the input of the instruction, the output of the instruction has the signal state "0". When the signal state is "0" at the input of the instruction, the output has the signal state "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operands "TagIn_2" and "TagIn_3" have signal state "1".

13.2.1.4 ---( )---: Assignment (STEP 7 Safety V15.1)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. When the result of logic operation (RLO) at the input of the coil is "1," the specified operand is set to signal state "1". When the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent immediately to the output.

The "Assignment" instruction can be placed at any position in the network.

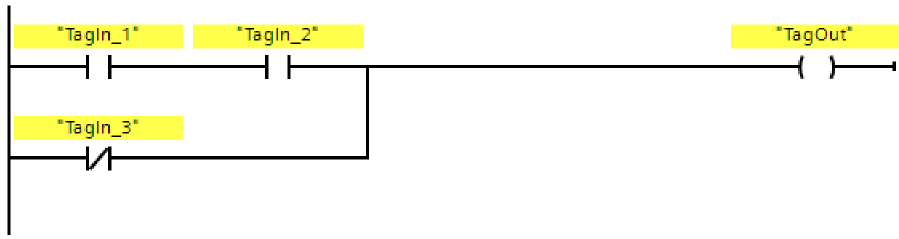
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

13.2.1.5 ---(R)---: Reset output (STEP 7 Safety V15.1)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If power flows to the coil (RLO is "1"), the specified operand is set to "0". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

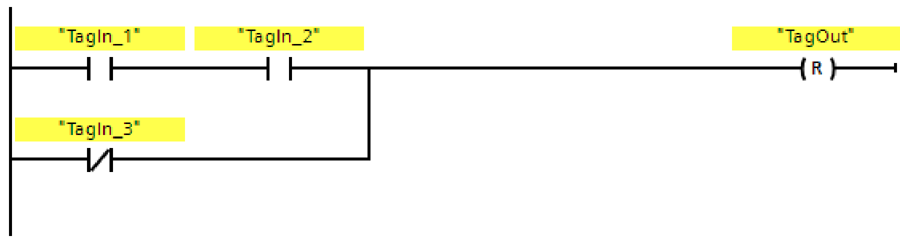
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.1.6 ---(S)---: Set output (STEP 7 Safety V15.1)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If power flows to the coil (RLO is "1"), the specified operand is set to "1". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

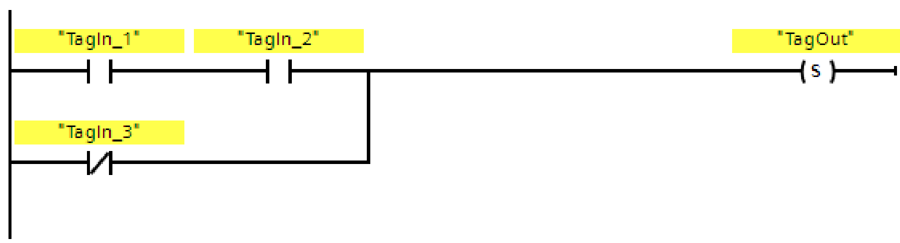
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.1.7 SR: Set/reset flip-flop (STEP 7 Safety V15.1)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

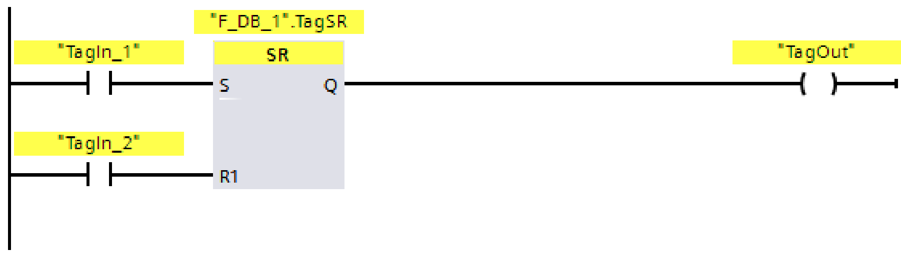
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands ""F_DB_1".TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.1.8 RS: Reset/set flip-flop (STEP 7 Safety V15.1)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

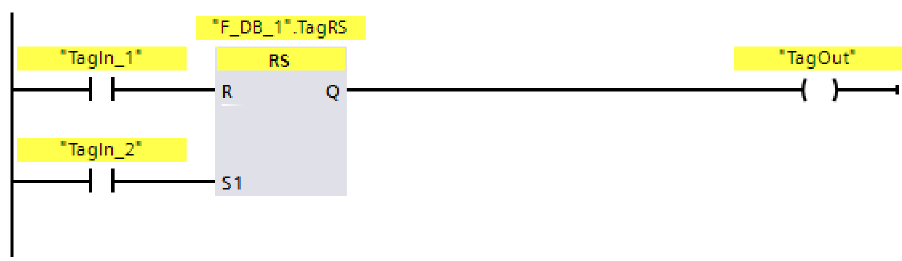
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands ""F_DB_1".TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.1.9 --|P|--: Scan operand for positive signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1". The signal state of the previous query is saved at edge memory bit ""F_DB_1".Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.2.1.10 --|N|--: Scan operand for negative signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:

Operand "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at operand "TagIn_1". The signal state of the previous query is saved at edge memory bit ""F_DB_1".Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.2.1.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation (RLO) with the signal state of the previous query, which is saved in the edge bit memory (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

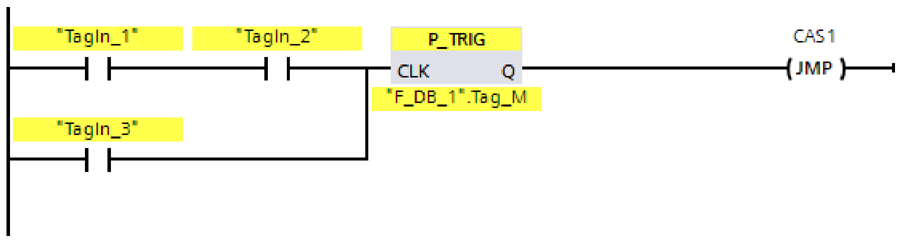
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit ""F_DB_1".Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.2.1.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

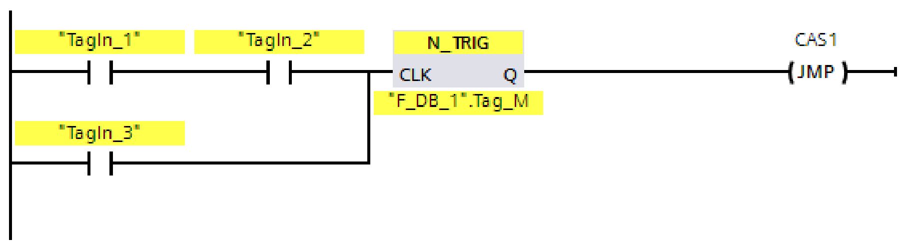
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory ""F_DB_1".Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.2.2 FBD

13.2.2.1 AND logic operation (STEP 7 Safety V15.1)

Description

You can use the "AND logic operation" instruction to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "AND logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "AND logic operation" instruction that is not the first instruction in the logic string logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the AND truth table.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:

Output "TagOut" is set when the signal state of operands "TagIn_1" and "TagIn_2" is "1".

AND truth table

The following table shows the results when linking two operands by an AND logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	1	1
0	1	0
1	0	0
0	0	0

See also

Insert binary input (STEP 7 Safety V15.1) (Page 398)

13.2.2.2 OR logic operation (STEP 7 Safety V15.1)

Description

You can use the "OR logic operation" instruction to get the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of at least one of the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of all of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "OR logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "OR logic operation" instruction that is not the first instruction in the logic string, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the OR truth table.

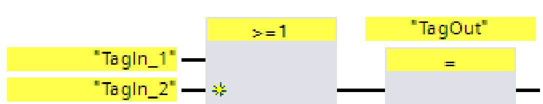
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of operand "TagIn_1" or "TagIn_2" is "1".

OR truth table

The following table shows the results when linking two operands by an OR logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	1
0	0	0

See also

Insert binary input (STEP 7 Safety V15.1) (Page 398)

13.2.2.3 X: EXCLUSIVE OR logic operation (STEP 7 Safety V15.1)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to get the result of a signal state query according to the the EXCLUSIVE OR truth table.

With an "EXCLUSIVE OR logic operation" instruction, the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the overall result of logic operation is "1" if an odd-numbered quantity of queried operands returns the result "1".

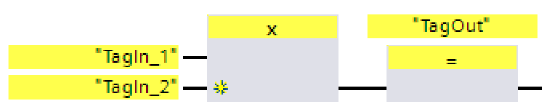
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of one of the two operands "TagIn_1" and "TagIn_2" is "1". When both operands have signal state "1" or "0" then output "TagOut" is reset.

EXCLUSIVE OR truth table

The following table shows the results when two operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	0
0	0	0

The following table shows the results when three operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Signal state of the third operand	Result of logic operation
1	0	0	1
0	1	1	0
0	1	0	1
1	0	1	0
0	0	1	1
1	1	0	0
1	1	1	1
0	0	0	0

See also

Insert binary input (STEP 7 Safety V15.1) (Page 398)

13.2.2.4 =: Assignment (STEP 7 Safety V15.1)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand located above the Assign box.

The "Assignment" instruction can be placed at any position in the logic operation sequence.

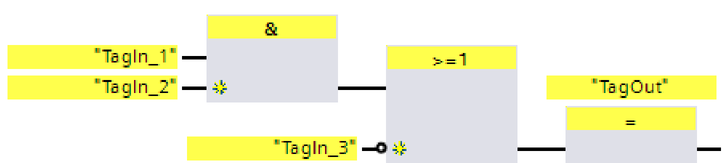
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut" at the output of the "Assignment" instruction is set when one of the following conditions is fulfilled:

- Inputs "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at input "TagIn_3" is "0".

13.2.2.5 R: Reset output (STEP 7 Safety V15.1)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is reset to "0". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

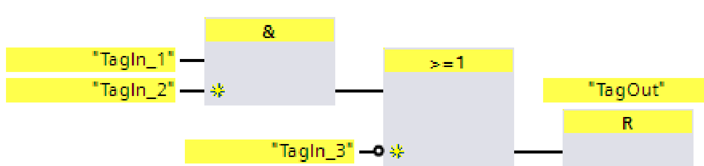
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.6 S: Set output (STEP 7 Safety V15.1)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to "1". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

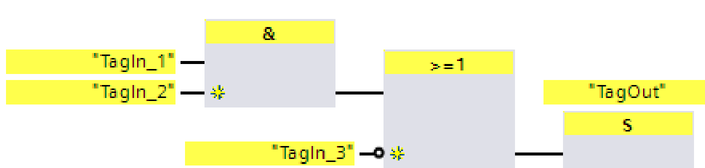
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.7 SR: Set/reset flip-flop (STEP 7 Safety V15.1)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

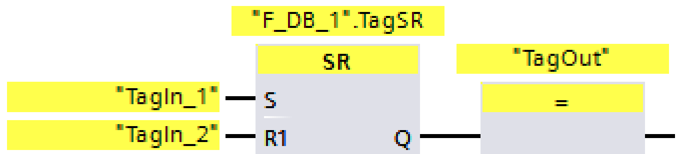
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands ""F_DB_1".TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.8 RS: Reset/set flip-flop (STEP 7 Safety V15.1)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FC for the operand of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

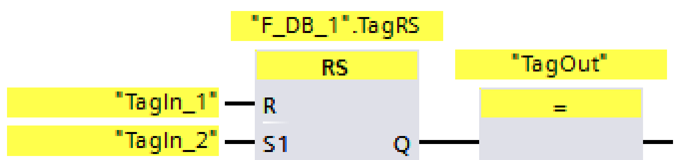
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands ""F_DB_1".TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands ""F_DB_1".TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.9 P: Scan operand for positive signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

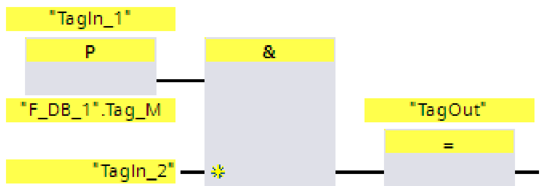
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



"TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.2.2.10 N: Scan operand for negative signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

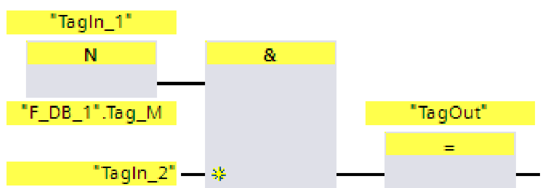
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.2.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

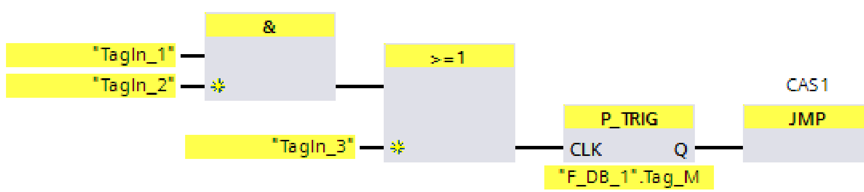
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit ""F_DB_1".Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.2.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V15.1)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

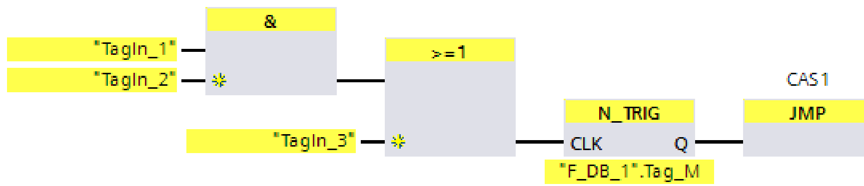
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory ""F_DB_1".Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.3 Safety functions

13.3.1 ESTOP1: Emergency STOP/OFF up to stop category 1 (STEP 7 Safety V15.1)

Description

This instruction implements an emergency STOP/emergency OFF shutdown with acknowledgment for Stop Categories 0 and 1.

Enable signal Q is reset to 0, as soon as input E_STOP takes a signal state of 0 (Stop category 0). Enable signal Q_DELAY is reset to 0 after the time delay set at input TIME_DEL (Stop Category 1).

Enable signal Q is reset to 1 not before input E_STOP takes a signal state of 1 and an acknowledgment occurs. The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets output ACK_REQ to 1, as soon as input E_STOP = 1.

Following an acknowledgment, the instruction resets ACK_REQ to 0.

Every call of the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ESTOP1_DB_1) or a multi-instance (e.g., ESTOP1_Instance_1) for the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note: In case of two channels according to category 3,4 of ISO 13849-1:2015 or EN ISO 13849-1:2015, the discrepancy monitoring of the two NC contacts of the EMERGENCY STOP/EMERGENCY OFF must already take place in the F-I/O. The F-I/O has to be configured accordingly (sensor evaluation: two-channel, equivalent), and the result of the evaluation interconnected with the E_STOP input. In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
E_STOP	Input	BOOL	EMERGENCY STOP/EMERGENCY OFF
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	1=Acknowledgment
TIME_DEL	Input	TIME	Time delay
Q	Output	BOOL	1=Enable
Q_DELAY	Output	BOOL	Enable is OFF delayed
ACK_REQ	Output	BOOL	1=Acknowledgment necessary
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	o	o	
1.5	x	x	x	
1.6	x	x	x	The reaction of the delay time TIME_DEL for F-CPUs S7-1200/1500 was adapted to the reaction of F-CPUs S7-300/400: If the input ESTOP (0 -> 1 (including acknowledgment) -> 0) is changed while the delay time is running, the delay time is restarted.

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After an F-system startup, when ACK_NEC = 1, you must acknowledge the instruction using a rising edge at input ACK.

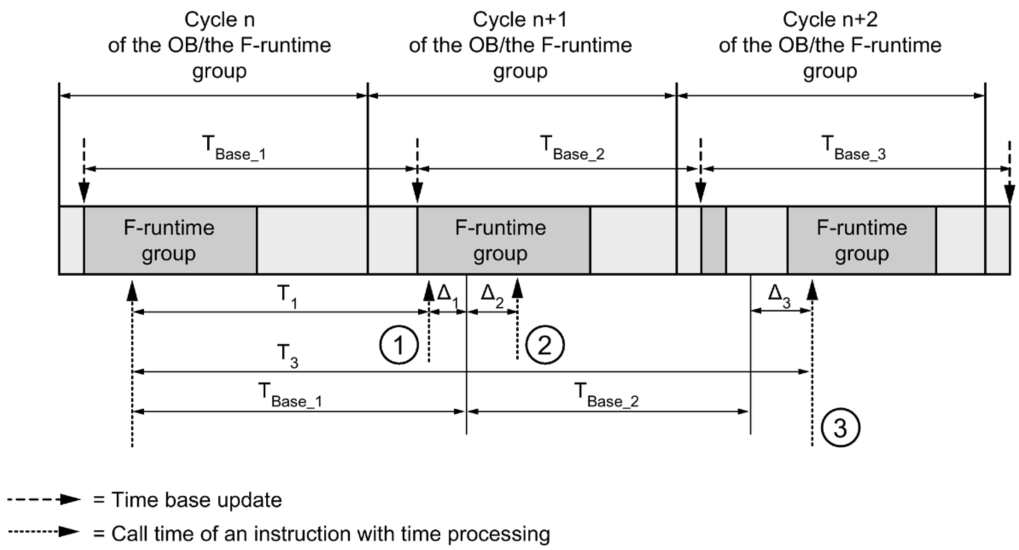
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 4 and 5 are saved until you acknowledge at the ACK input.

Structure of DIAG

<table>
<tr><th>Bit no.</th><th>Assignment</th><th>Possible error causes</th><th>Remedies</th></tr>
<tr><td>Bit 0</td><td>Incorrect TIM_DEL setting</td><td>Time delay setting < 0</td><td>Set time delay > 0</td></tr>
<tr><td>Bit 1</td><td>Reserved</td><td>—</td><td>—</td></tr>
<tr><td>Bit 2</td><td>Reserved</td><td>—</td><td>—</td></tr>
<tr><td>Bit 3</td><td>Reserved</td><td>—</td><td>—</td></tr>
<tr><td rowspan="4">Bit 4</td><td rowspan="4">Acknowledgment not possible because emergency STOP/emergency OFF is still active</td><td>Emergency STOP/Emergency OFF pushbutton is locked</td><td>Release Emergency STOP/Emergency OFF pushbutton</td></tr>
<tr><td>F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of emergency STOP/emergency OFF pushbutton</td><td>For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)</td></tr>
<tr><td>Emergency STOP/Emergency OFF pushbutton is defective</td><td>Check emergency STOP/emergency OFF pushbutton</td></tr>
<tr><td>Wiring fault</td><td>Check wiring of the emergency STOP/emergency OFF pushbutton</td></tr>
<tr><td rowspan="2">Bit 5</td><td rowspan="2">If enable is missing: input ACK has a permanent signal state of 1</td><td>Acknowledgment button defective</td><td>Check acknowledgment button</td></tr>
<tr><td>Wiring fault</td><td>Check wiring of acknowledgment button</td></tr>
<tr><td>Bit 6</td><td>Acknowledgment required
(= state of ACK_REQ)</td><td>—</td><td>—</td></tr>
<tr><td>Bit 7</td><td>State of output Q</td><td>—</td><td>—</td></tr>
</table>

Timing imprecision resulting from the update time of the time base used in the instruction:



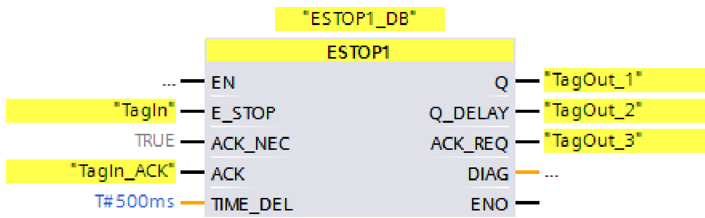
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

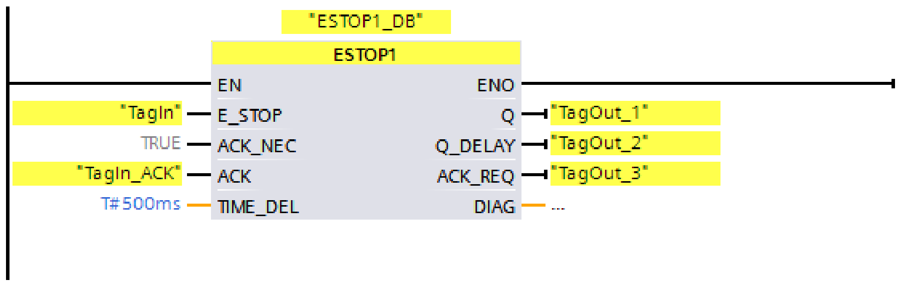
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

This instruction implements two-hand monitoring.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Two-hand monitoring with enable". The application "Two-hand monitoring with enable" replaces the instruction "Two-hand monitoring" with compatible functions.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN2 = 0). Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time. Enable signal Q can never be set to 1 if the discrepancy time is set to values less than 0 or greater than 500 ms.

Every call of the "Two-hand monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_HAND_DB_1) or a multi-instance (e.g., TWO_HAND_Instance_1) for the "Two-hand monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration. If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 is set in the relevant F-I/O DB. (See also F-I/O access (Page 157))

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

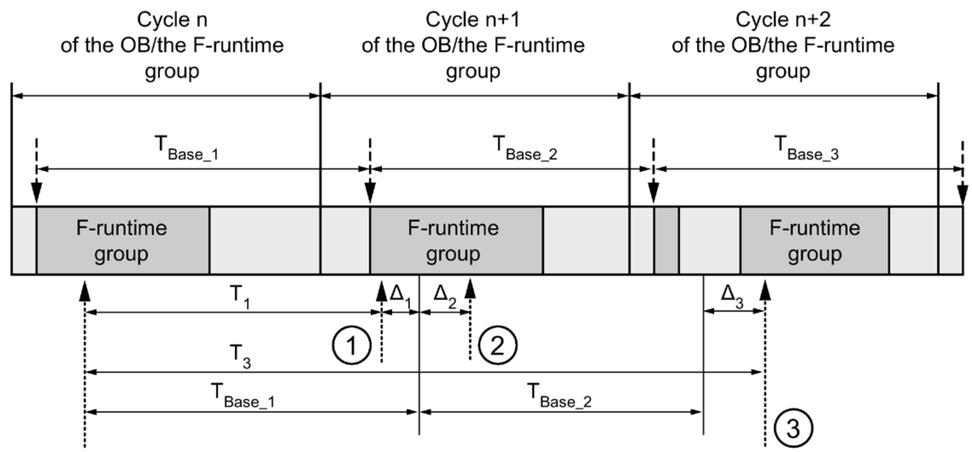
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·········► = Call time of an instruction with time processing

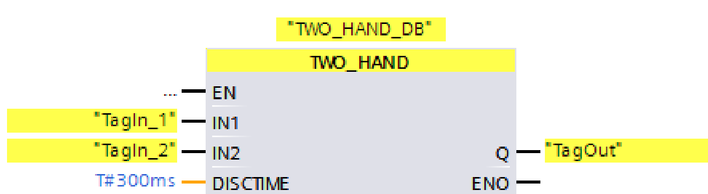
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

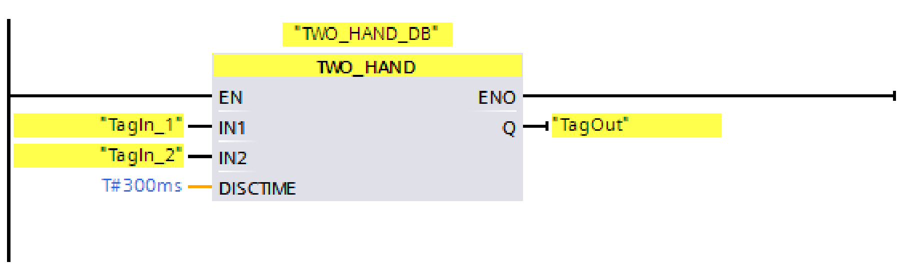
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V15.1)

Description

This instruction implements two-hand monitoring with enable.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1 when existing ENABLE = 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN 2 = 0) or ENABLE = 0. Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time when existing ENABLE = 1.

Every call of the "Two-hand monitoring with enable" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_H_EN_DB_1) or a multi-instance (e.g., TWO_H_EN_Instance_1) for the "Two-hand monitoring with enable" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 or respectively value status = 0 is set in the relevant F-I/O DB.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  – For time values up to 200 ms, a maximum of 4 ms
  – For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
ENABLE	Input	BOOL	Enable input
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

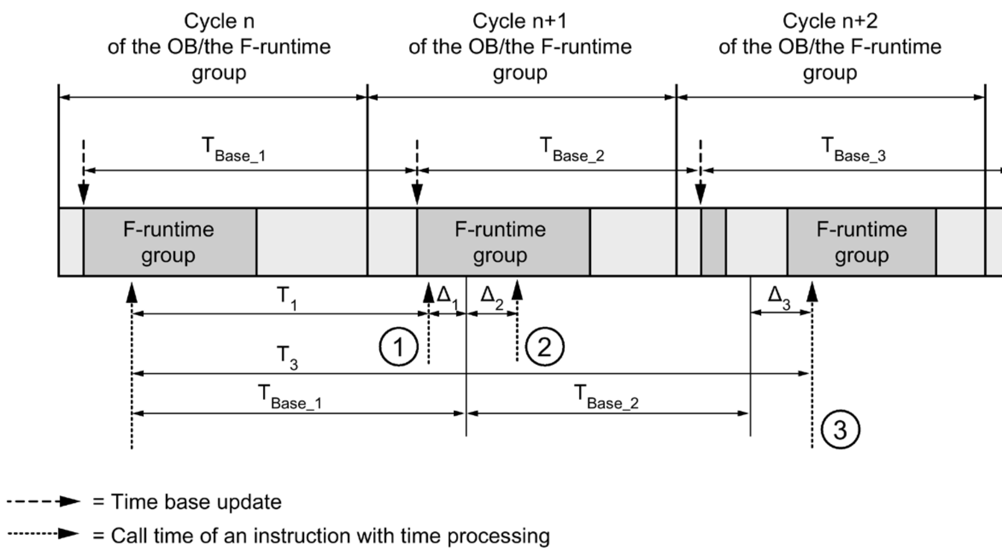
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 5 are saved until the cause of the error has been eliminated.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect discrepancy time DISCTIME setting	Discrepancy time setting is <0 or > 500 ms	Set discrepancy time in range of 0 to 500 ms
Bit 1	Discrepancy time elapsed	Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Pushbuttons were not activated within the discrepancy time	Release pushbuttons and activate them within the discrepancy time
		Wiring fault	Check wiring of pushbuttons
		Pushbuttons defective	Check pushbuttons
		Pushbuttons are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Incorrect activation sequence	One pushbutton was not released	Release pushbuttons and activate them within the discrepancy time
		Pushbuttons defective	Check pushbuttons
Bit 5	ENABLE does not exist	ENABLE = 0	Set ENABLE = 1, release pushbutton and activate it within the discrepancy time
Bit 6	Reserved	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



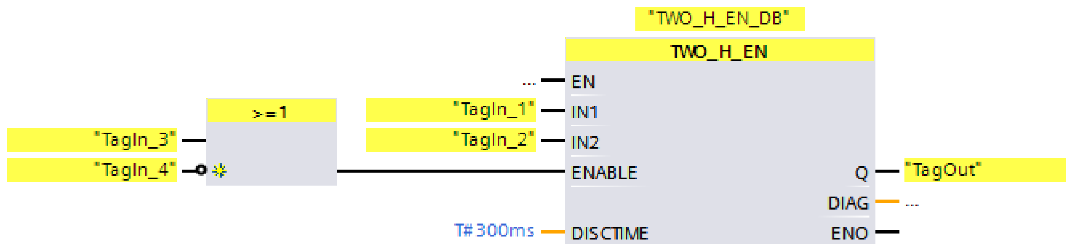
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

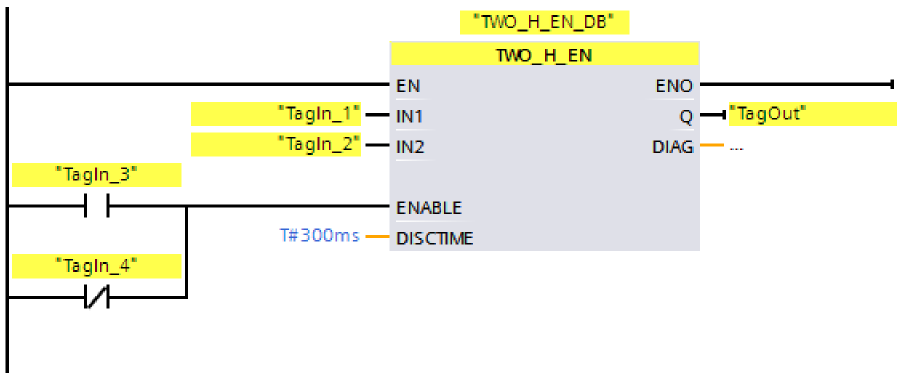
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.4 MUTING: Muting (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

This instruction performs parallel muting with two or four muting sensors.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Parallel muting (Page 456)". The instruction "Parallel muting" replaces the instruction "Muting" with compatible functions.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUTING_DB_1) or a multi-instance (e.g., MUTING_Instance_1) for the "Muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

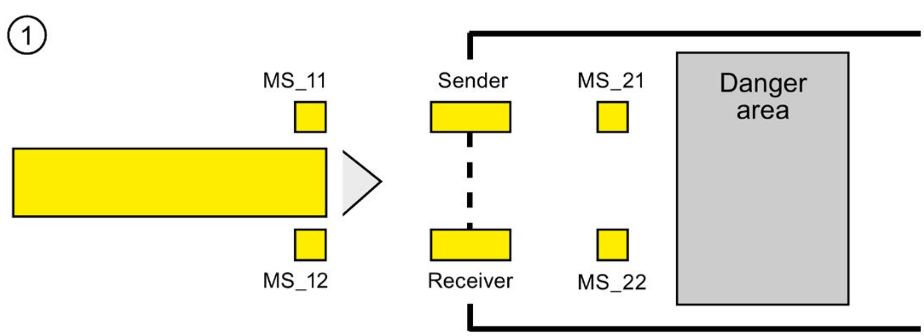
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 1 of sensor pair 1
MS_12	Input	BOOL	Muting sensor 2 of sensor pair 1
MS_21	Input	BOOL	Muting sensor 1 of sensor pair 2
MS_22	Input	BOOL	Muting sensor 2 of sensor pair 2
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal of the muting lamp channel
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
ACK	Input	BOOL	Acknowledgment of restart inhibit
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	BYTE	Non-fail safe service information

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

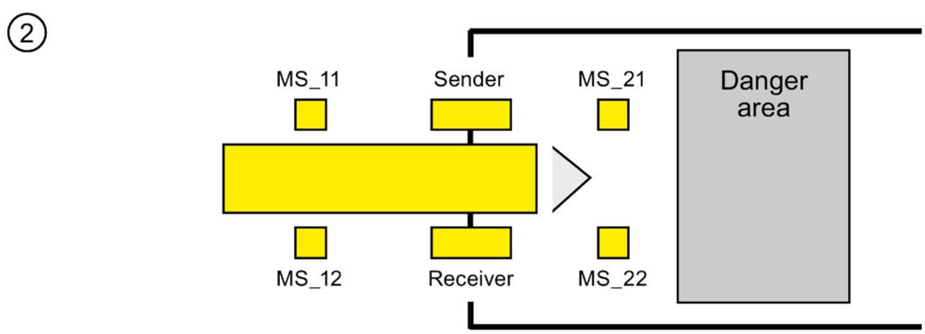


- If both muting sensors MS_11 and MS_12 are activated by the product within DISCTIM1 (apply signal state = 1), the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

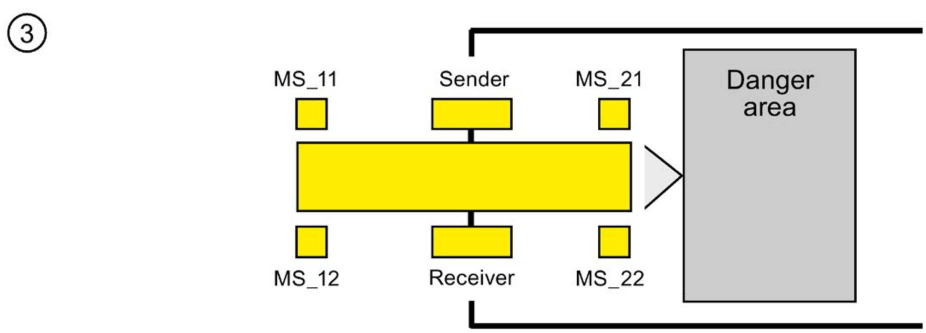
Note

The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

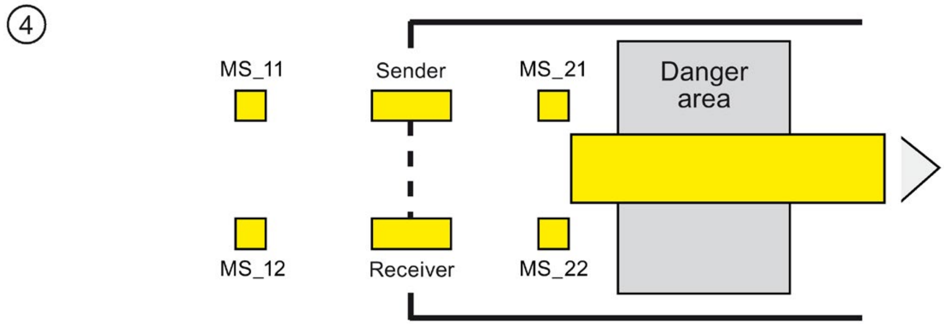
F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop).



- The two muting sensors MS_21 and MS_22 must be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

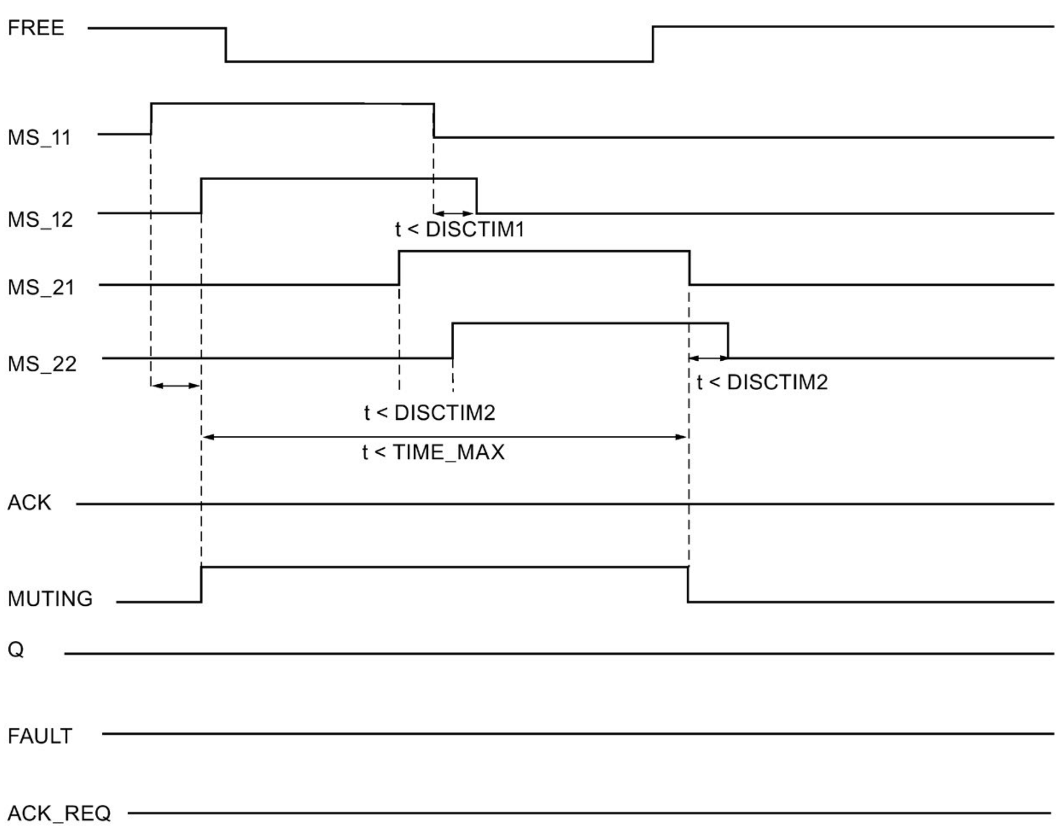


- Only if one of the two muting sensors MS_21 and MS_22 is switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

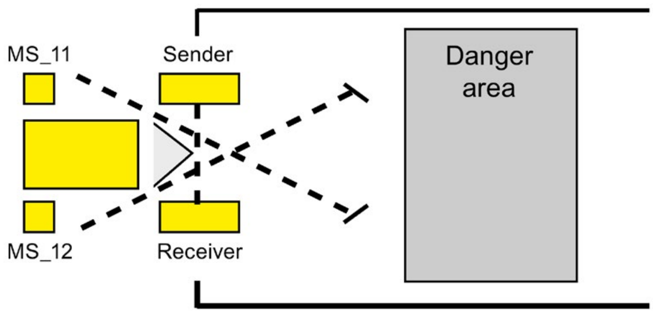


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (if MUTING is not active), when errors occur, and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- The muting lamp monitoring function responds at input QBAD_MUT
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

WARNING
When a valid combination of muting sensors is immediately detected at startup of the F-system (for example, because the muting sensors are interconnected to inputs of a standard I/O that immediately provide process values during the F-system startup), the MUTING function is immediately started and the MUTING output and enable signal Q are set to 1. The FAULT output (group error) is not set to 1 (no restart inhibit!). *(S035)*

Acknowledgment of restart inhibit

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)

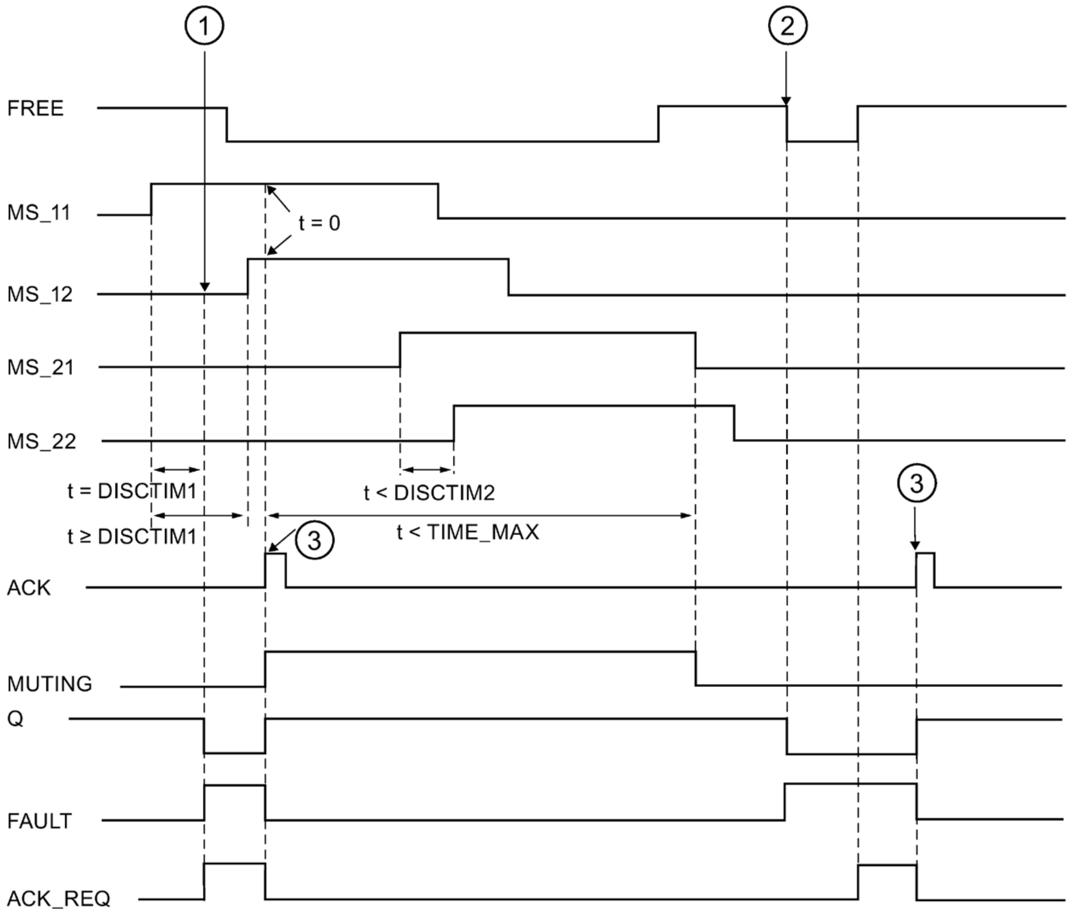
  and
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 187)).

The FAULT output is set to 0. Output ACK_REQ = 1 signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK-REQ = 1 as soon as the light curtain is no longer interrupted or errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

Note

Following discrepancy errors and once the maximum muting time has been exceeded, ACK_REQ is immediately set to 1. As soon as a user acknowledgment has taken place at input ACK, discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (if MUTING is not active)



①	Sensor pair 1 (MS_11 and MS_12) is not activated within discrepancy time DISCTIM1.
②	The light curtain is interrupted even though the MUTING function is not active.
③	Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

you must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

WARNING
When STOP = 1, the discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the error is not detected and the MUTING function can be started unintentionally. *(S036)*

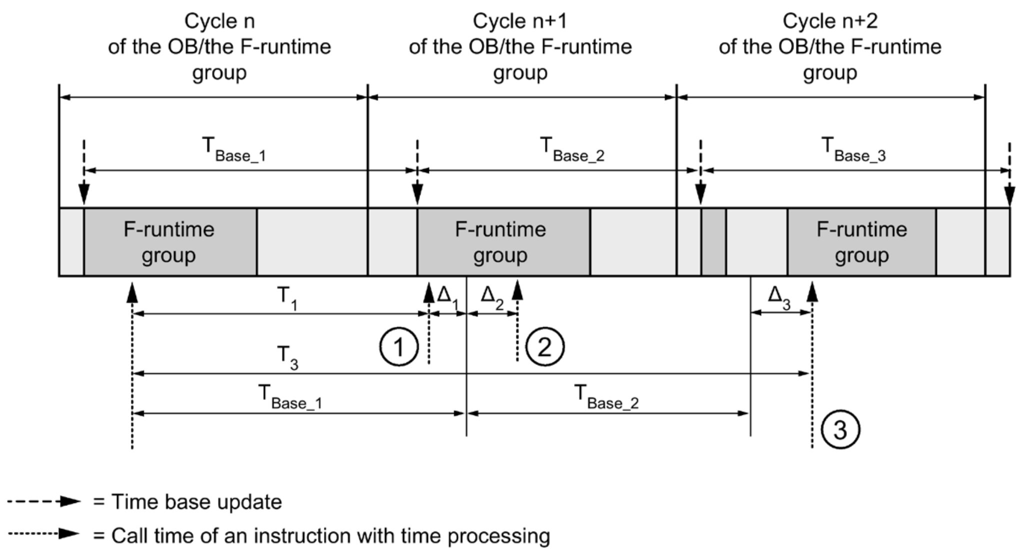
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
Bit 5	Reserved	—	—
Bit 6	Reserved	—	—
Bit 7	Reserved	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



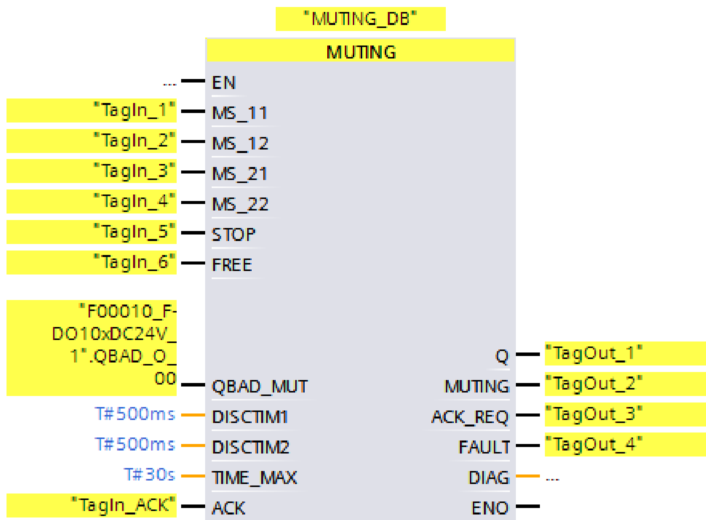
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

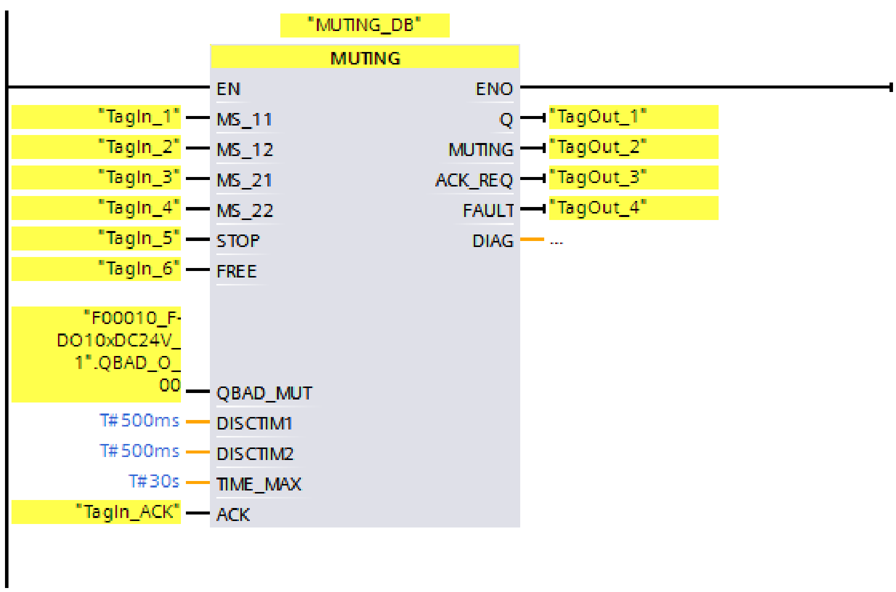
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.5 MUT_P: Parallel muting (STEP 7 Safety V15.1)

Description

This instruction performs parallel muting with two or four muting sensors.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Parallel muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUT_P_DB_1) or a multi-instance (e.g., MUT_P_Instance_1) for the "Parallel muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

> **WARNING**
>
> When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:
>
> - Known timing imprecision (based on standard systems) resulting from cyclic processing
> - Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
> - Tolerance of internal time monitoring in the F-CPU
>   - For time values up to 200 ms, a maximum of 4 ms
>   - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value
>
> You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 11
MS_12	Input	BOOL	Muting sensor 12
MS_21	Input	BOOL	Muting sensor 21
MS_22	Input	BOOL	Muting sensor 22
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
ENABLE	Input	BOOL	1=Enable MUTING
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the muting lamp channel
ACK	Input	BOOL	Acknowledgment of restart inhibit
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	WORD	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x*	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x*	—	—	These versions have identical functions to version V1.0. The output DIAG can now be correctly interconnected with the operand of data type WORD.
1.2	x*	—	o	
1.3	x*	o	o	
1.4	x	x	x	

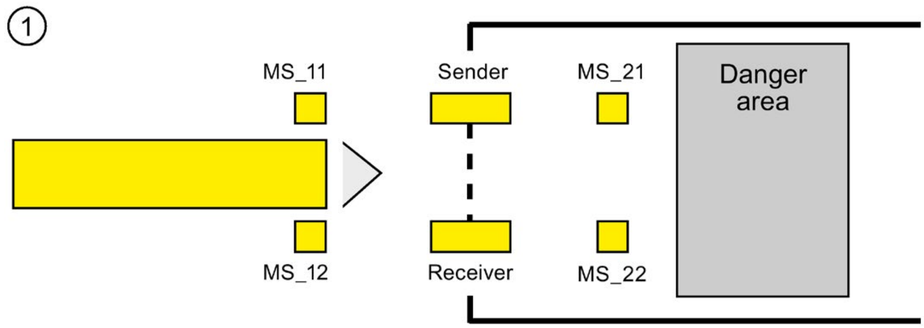
o This version is no longer supported.

* S7-300/400: When a restart inhibit (output FAULT = 1) and ENABLE = 1 is present, output ACK_REQ is set to 1 even if not at least one muting sensor is activated. Use the DIAG bits 5 and 6 for additional information.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

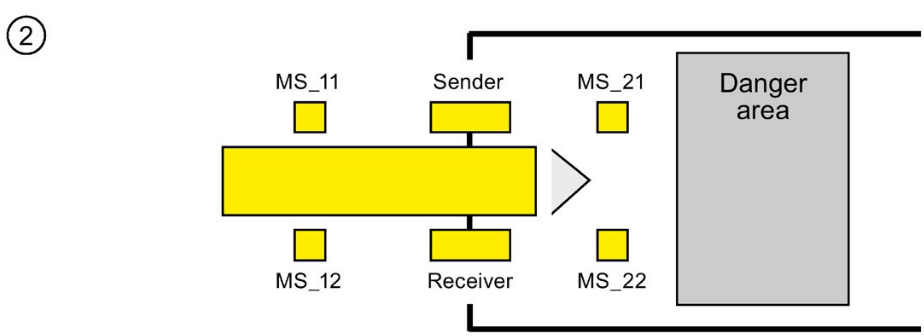


- If muting sensors MS_11 and MS_12 are both activated by the product within DISCTIM1 (apply signal state = 1) and MUTING is enabled by setting the ENABLE input to 1, the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

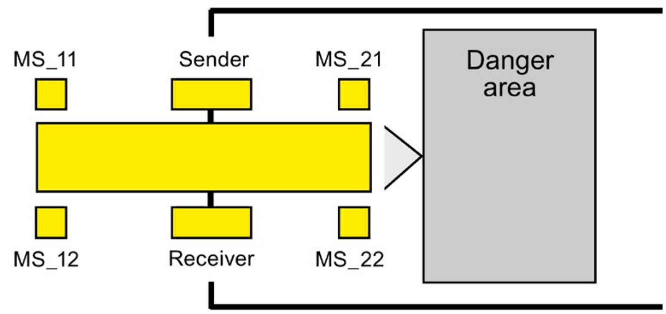
The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / with inverted value statues of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



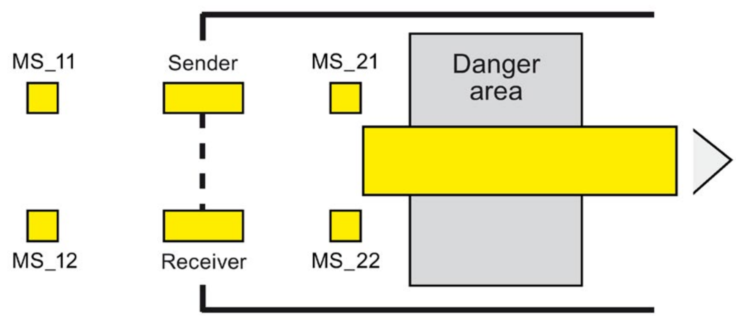
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop). Each of the two muting sensors MS_11 and MS_12 may be switched to inactive (t < DISCTIM1) for a short time (apply signal state 0).

3



- Muting sensors MS_21 and MS_22 must both be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

4

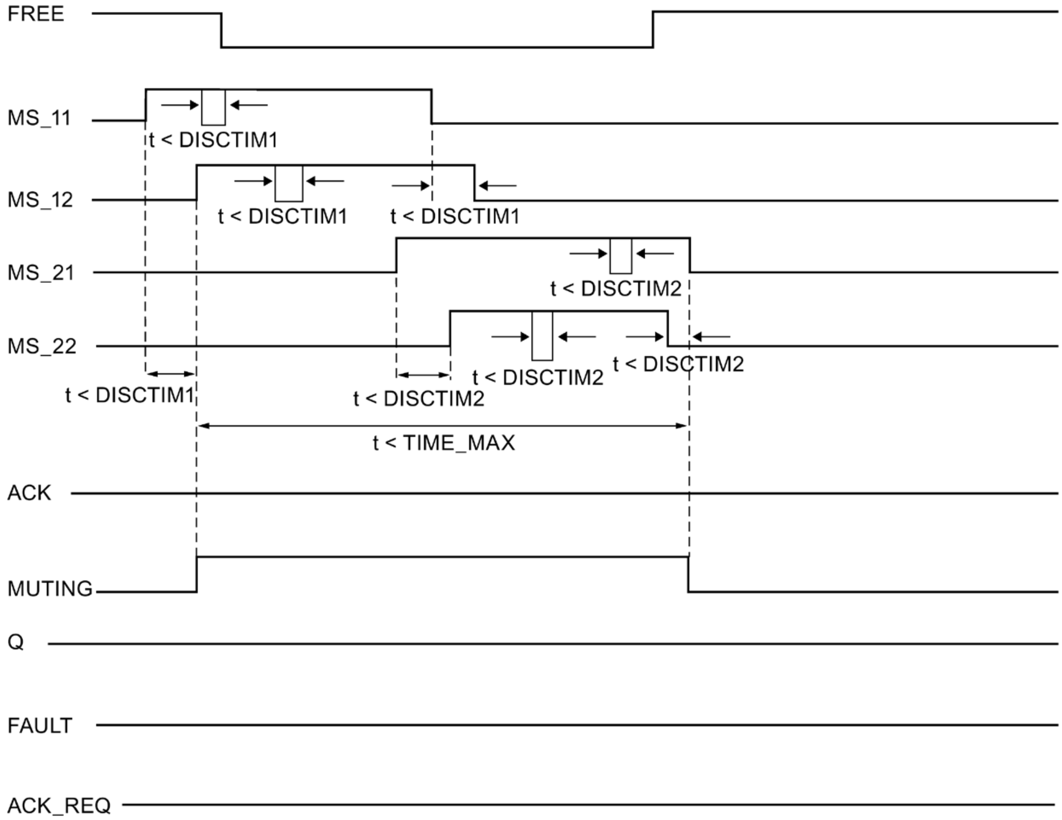


Only if muting sensors MS_21 and MS_22 are both switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

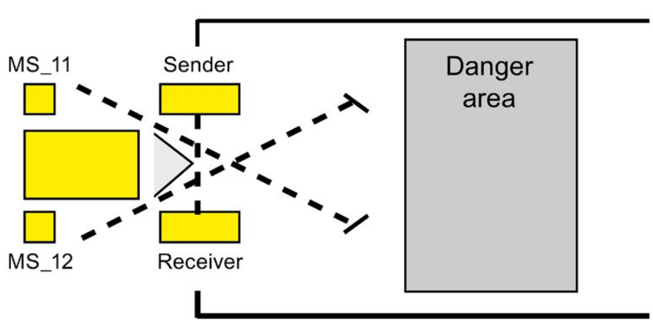


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (MUTING is not active), as well as when errors occur and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- Light curtain is (being) interrupted and the muting lamp monitoring at input QBAD_MUT is set to 1
- Light curtain is (being) interrupted and the MUTING function is not enabled by setting input ENABLE to 1
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min
- The F-system starts up (regardless of whether or not the light curtain is interrupted, because the F-I/O is passivated after F-system startup and, thus, the FREE input is initially supplied with 0)

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

User acknowledgment of restart inhibit (no muting sensor is activated or ENABLE = 0)

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)

  and

- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 187)).

The FAULT output is set to 0. Output ACK_REQ = 1 (and DIAG bit 6) signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

User Acknowledgment of restart inhibit (at least one muting sensor is activated and ENABLE = 1)

Enable signal Q becomes 1 again, when:

- If present, errors are eliminated (see output DIAG)
- FREE occurs until a valid combination of muting sensors is detected

The FAULT output is set to 0. The MUTING function is restarted, if necessary, and the MUTING output becomes 1 if a valid combination of muting sensors is detected. When ENABLE = 1, output ACK_REQ = 1 (and DIAG bit 5) signals that FREE is necessary for error elimination and for removal of the restart inhibit.*After successful FREE, ACK_REQ is reset to 0 by the instruction.

Note

Once the maximum muting time is exceeded, TIME_MAX is reset as soon as the MUTING function is restarted.

FREE function

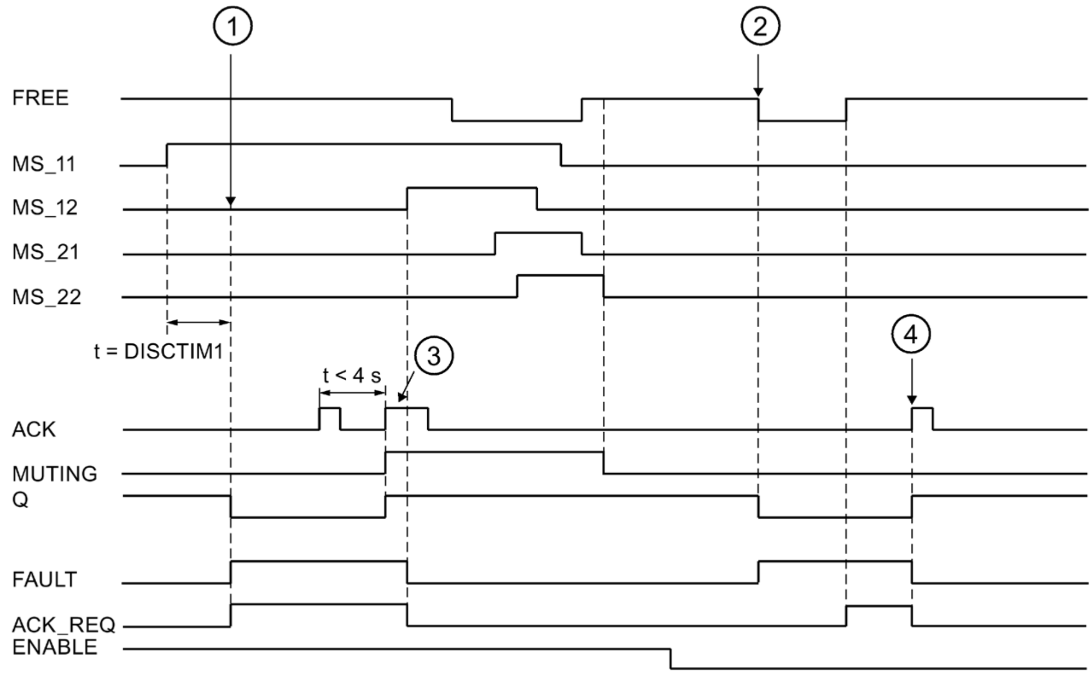
If an error cannot be corrected immediately, the FREE function can be used to free the muting range. Enable signal Q and output MUTING =1 temporarily. The FREE function can be used if:

- ENABLE = 1
- At least one muting sensor is activated
- A user acknowledgment with rising edge at input ACK occurs twice within 4 s, and the second user acknowledgment at input ACK remains at a signal state of 1 (acknowledgment button remains activated)

WARNING

When using the FREE function, the action must be observed. A dangerous situation must be able to be interrupted at any time by releasing the acknowledgment button. The acknowledgment button must be mounted in such a way the entire danger area can be observed. *(S037)*

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (MUTING is not active)



① Sensor pair 1 (MS_11 and MS_22) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though there is no enable (ENABLE=0)

③ FREE function

④ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

WARNING

When STOP = 1 or ENABLE = 0, discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the fault is not detected and the MUTING function can be started unintentionally (when ENABLE =1). *(S038)*

Output DIAG

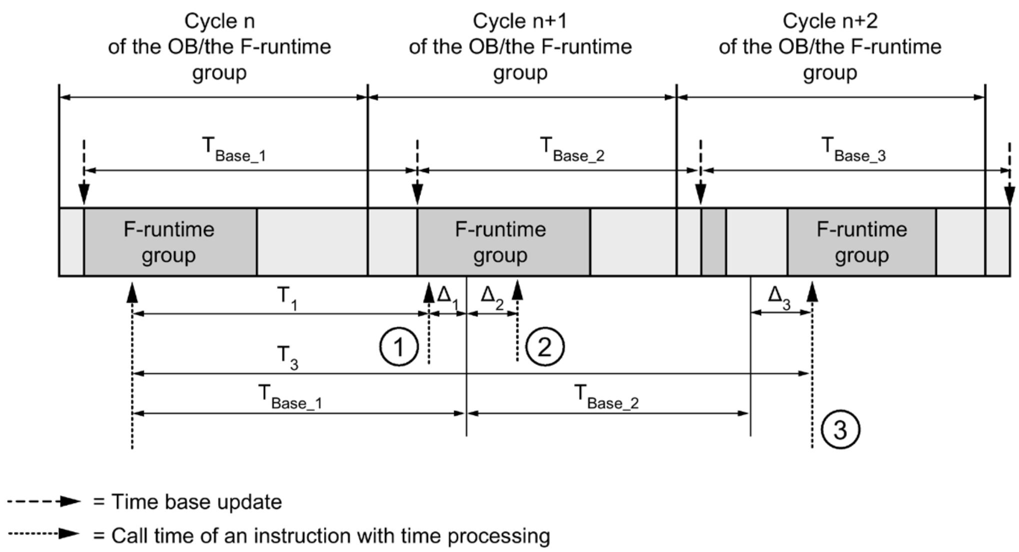
The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 6 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	ENABLE = 0	Set ENABLE = 1
		Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
		Startup of F-system	For FREE, see DIAG Bit 5
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)

Bit no.	Assignment	Possible error causes	Remedies
Bit 5	FREE is necessary	See other DIAG bits	Two rising edges at ACK within 4 s, and activate acknowledgment button until ACK_REQ = 0
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—
Bit 8	State of output MUTING	—	—
Bit 9	FREE active	—	—
Bit 10	Reserved	—	—
...			
Bit 15	Reserved	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



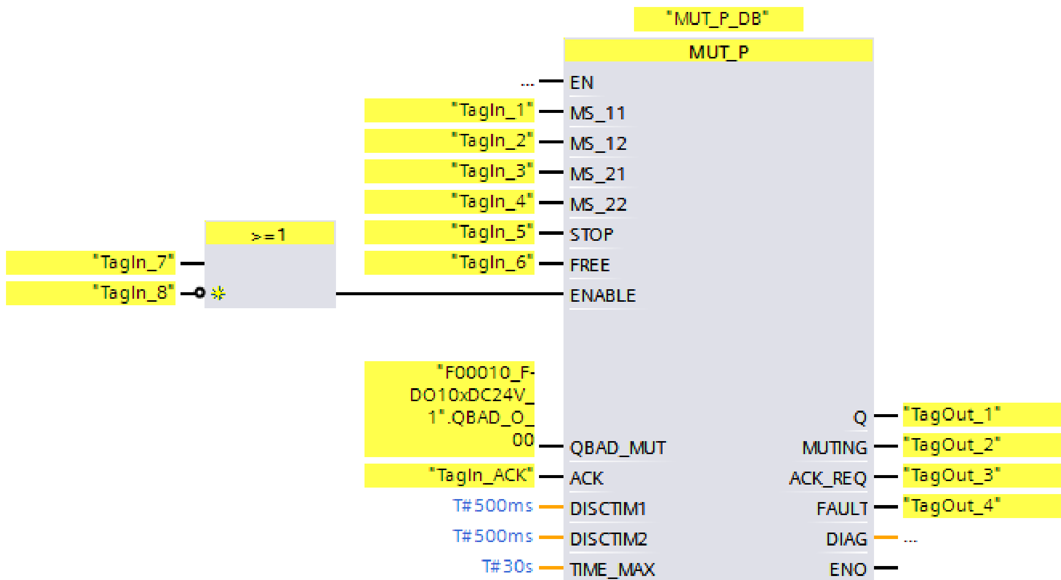
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

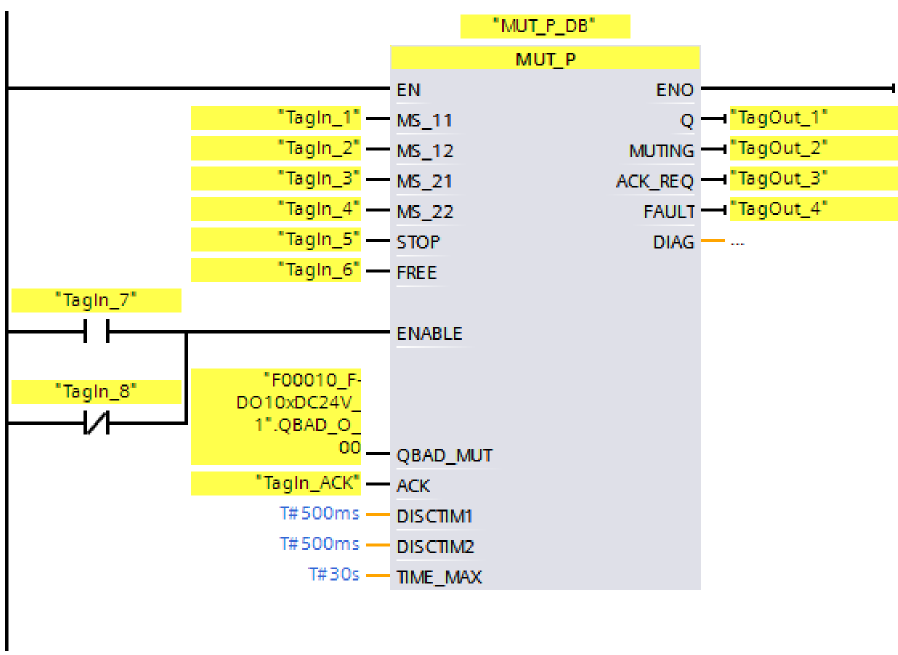
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V15.1)

Description

This instruction implements a 1oo2 evaluation of two single-channel sensors combined with a discrepancy analysis.

Output Q is set to 1, if the signal states of inputs IN1 and IN2 both equal 1 and no discrepancy error DISC_FLT is stored. if the signal state of one or both inputs is 0, output Q is set to 0.

As soon as the signal states of inputs IN1 and IN2 are different, the discrepancy time DISCTIME is started. If the signal states of the two inputs are still different once the discrepancy time expires, a discrepancy error is detected and DISC_FLT is set to 1 (restart inhibit).

If the discrepancy between inputs IN1 and IN2 is no longer detected, the discrepancy error is acknowledged according to the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK to acknowledge the discrepancy error.

The output ACK_REQ = 1 signals that a user acknowledgment at input ACK is necessary to acknowledge the discrepancy error (cancel the restart inhibit). The instruction sets ACK_REQ = 1 as soon as discrepancy is no longer detected. After acknowledgment or if, prior to acknowledgment, there is once again a discrepancy between inputs IN1 and IN2, the instruction resets ACK_REQ to 0.

Output Q can never be set to 1 if the discrepancy time setting is < 0 or > 60 s. In this case, output DISC_FLT is also set to 1 (restart inhibit). The call interval of the safety program (e.g., OB 35) must be less than the discrepancy time setting.

Every call of the "1oo2 evaluation with discrepancy analysis" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., EV1oo2DI_DB_1) or a multi-instance (e.g., EV1oo2DI_Instance_1) for the "1oo2 evaluation with discrepancy analysis" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

> **WARNING**
>
> When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:
>
> - Known timing imprecision (based on standard systems) resulting from cyclic processing
> - Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
> - Tolerance of internal time monitoring in the F-CPU
>   - For time values up to 200 ms, a maximum of 4 ms
>   - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value
>
> You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Sensor 1
IN2	Input	BOOL	Sensor 2
DISCTIME	Input	TIME	Discrepancy time (0 to 60 s)
ACK_NEC	Input	BOOL	1 = acknowledgment necessary for discrepancy error
ACK	Input	BOOL	Acknowledgment of discrepancy error
Q	Output	BOOL	Output
ACK_REQ	Output	BOOL	1 = acknowledgment required
DISC_FLT	Output	BOOL	1 = discrepancy error
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

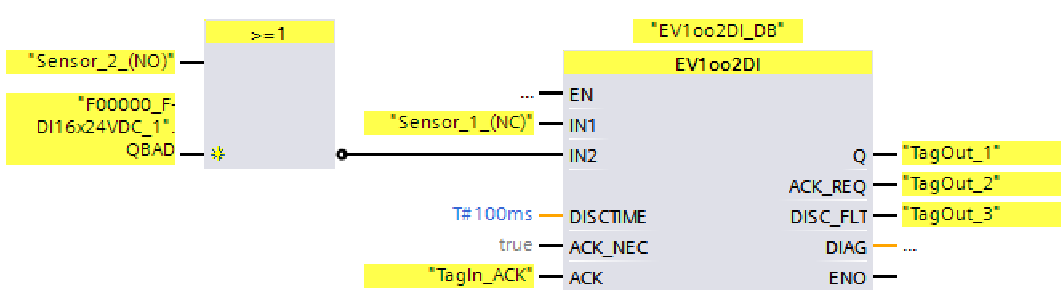
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

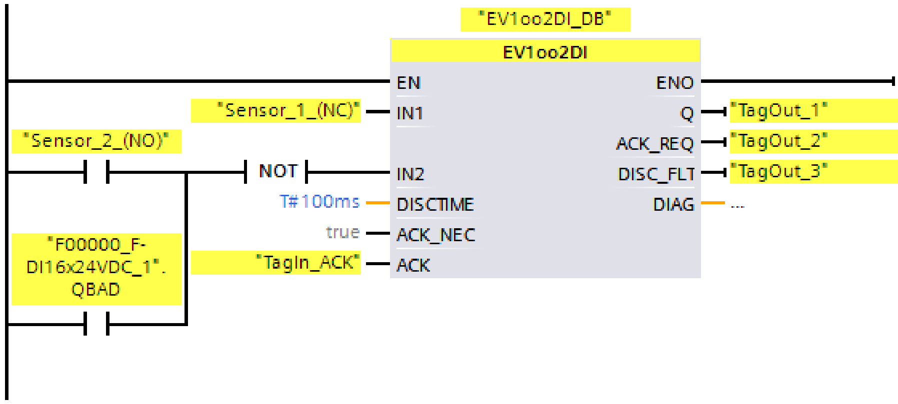
Activating inputs IN1 and IN2

Inputs IN1 and IN2 must both be activated in such a way that their safe state is 0.

Example with QBAD or QBAD_I_xx signal

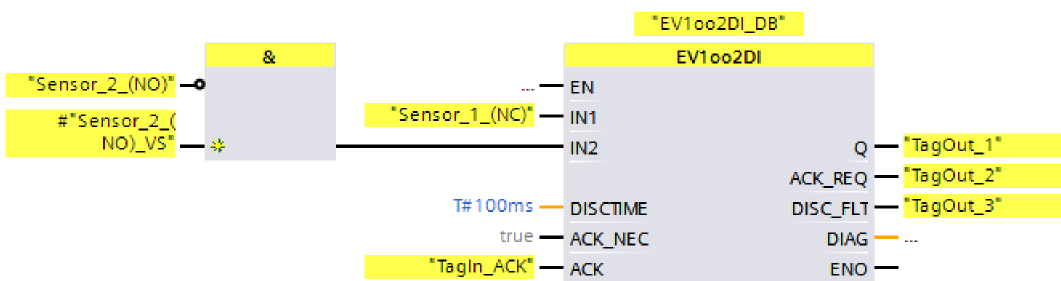
For non-equivalent signals you need to OR the input (IN1 and IN2) with which you assign the encoder signal to the safe state 1, with the QBAD signal of the associated F-I/O or the QBAD_I_xx signal of the associated channel (with S7-300/400 F-CPUs) and negate the result. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

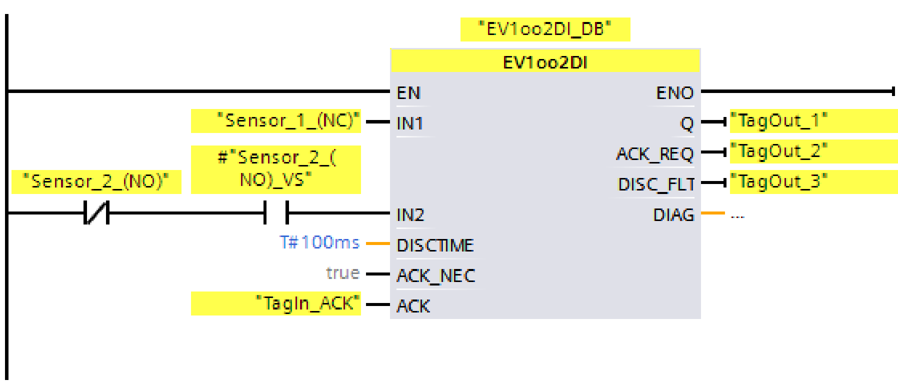




Example with value status

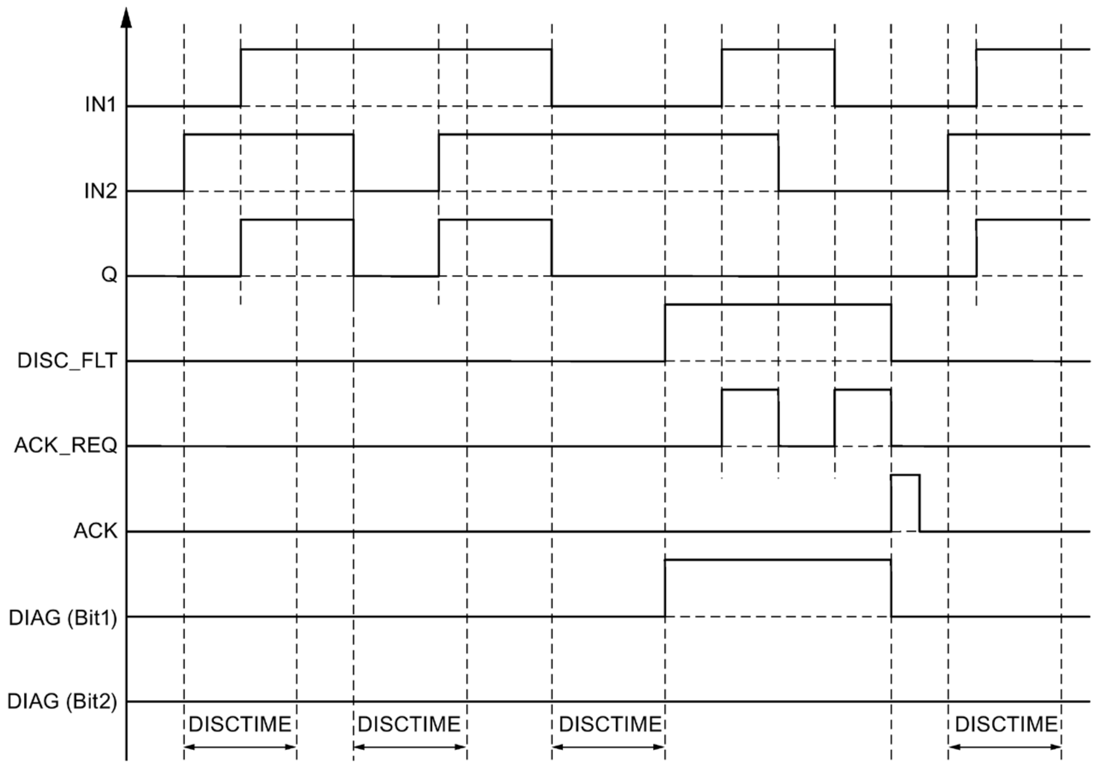
For nonequivalent signals, you have to negate the input (IN1 or IN2) with which you have assigned the encoder signal to a safe state of 1 and AND it with the value status of the associated channel. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.





Timing diagrams EV1oo2DI

If ACK_NEC = 1:



Startup characteristics

Note

If the sensors at inputs IN1 and IN2 are assigned to different F-I/O, it is possible that the fail-safe values are output for different lengths of time following startup of the F-system due to different startup characteristics of the F-I/O. If the signal states of inputs IN1 and IN2 remain different after the discrepancy time DISCTIME has expired, a discrepancy error is detected after the F-system starts up.

If ACK_NEC = 1 you must acknowledge the discrepancy error with a rising edge at input ACK.

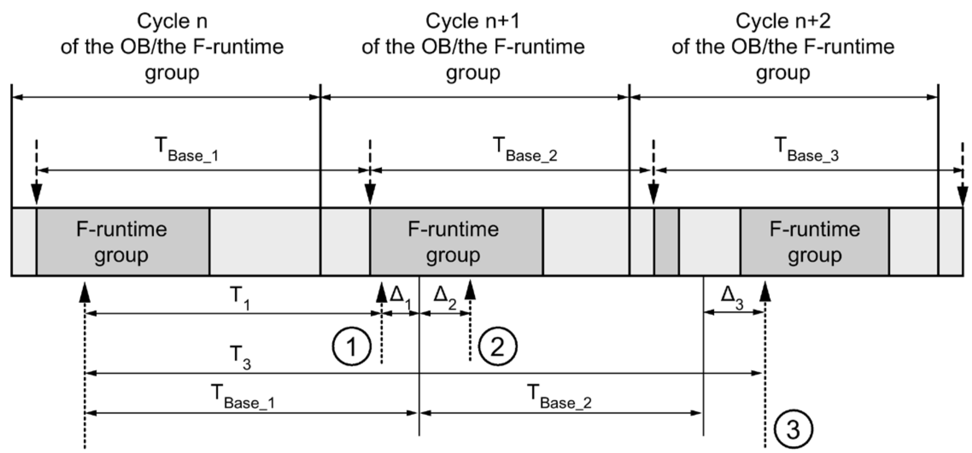
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time setting (= status of DISC_FLT)	Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 60 s	Set discrepancy time in range between 0 s and 60 s
Bit 1	For discrepancy errors: last signal state change was at input IN1	—	—
Bit 2	For discrepancy errors: last signal state change was at input IN2	—	—
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For discrepancy errors: input ACK has a permanent signal state of 1	Acknowledgment button defective	Replace acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



---► = Time base update

·········► = Call time of an instruction with time processing

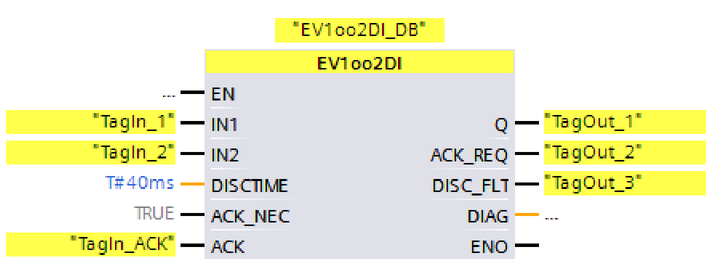
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

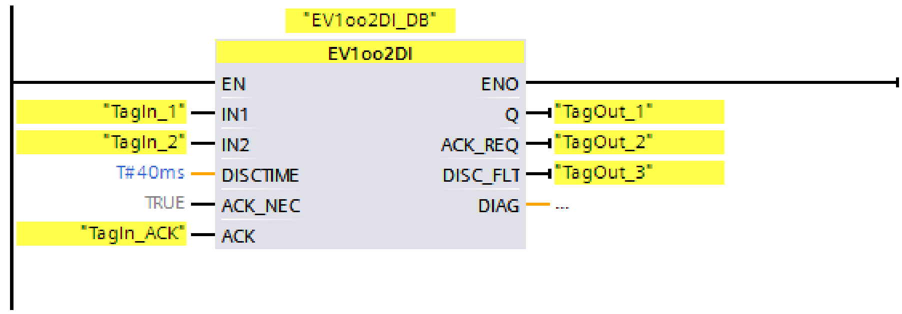
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.7 FDBACK: Feedback monitoring (STEP 7 Safety V15.1)

Description

This instruction implements feedback monitoring.

The signal state of output Q is checked to see whether it corresponds to the inverse signal state of the feedback input FEEDBACK.

Output Q is set to 1 as soon as input ON = 1. Requirement for this is that the feedback input FEEDBACK = 1 and no feedback error is saved.

Output Q is reset to 0, as soon as input ON = 0 or if a feedback error is detected.

A feedback error ERROR = 1 is detected if the inverse signal state of the feedback input FEEDBACK (to input Q) does not follow the signal state of output Q within the maximum tolerable feedback time. The feedback error is saved.

If a discrepancy is detected between the feedback input FEEDBACK and the output Q after a feedback error, the feedback error is acknowledged in accordance with the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must acknowledge the feedback error with a rising edge at input ACK.

The ACK_REQ = 1 output then signals that a user acknowledgment is necessary at input ACK to acknowledge the feedback error. Following an acknowledgment, the instruction resets ACK_REQ to 0.

To avoid a feedback errors from being detected and acknowledgment from being required when the F-I/O controlled by the Q output are passivated, you need to supply input QBAD_FIO with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / inverted value status of the associated channel.

Every call of the "Feedback monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., FDBACK_DB_1) or a multi-instance (e.g., FDBACK_Instance_1) for the "Feedback monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision *(S034)*.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ON	Input	BOOL	1= Enable output
FEEDBACK	Input	BOOL	Feedback input
QBAD_FIO	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the Q output
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
FDB_TIME	Input	TIME	Feedback time
Q	Output	BOOL	Output
ERROR	Output	BOOL	Feedback error
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

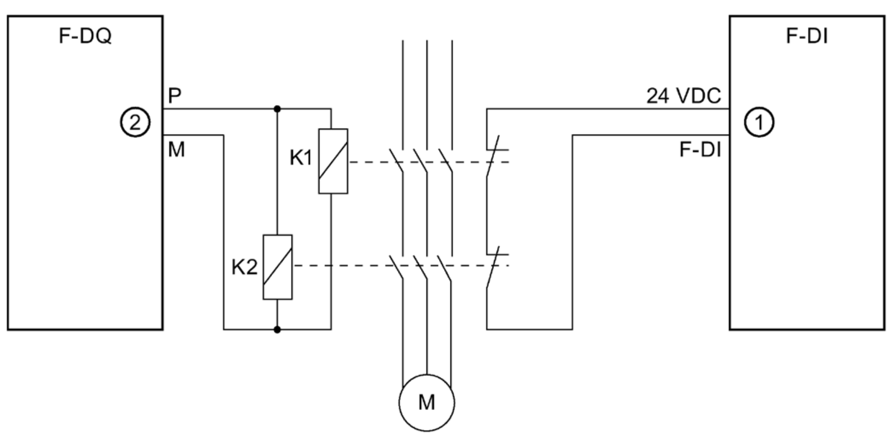
Ver-sion	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	o	o	
1.5	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Interconnection example



① Sent to the FEEDBACK input of the instruction

② from output Q of the instruction

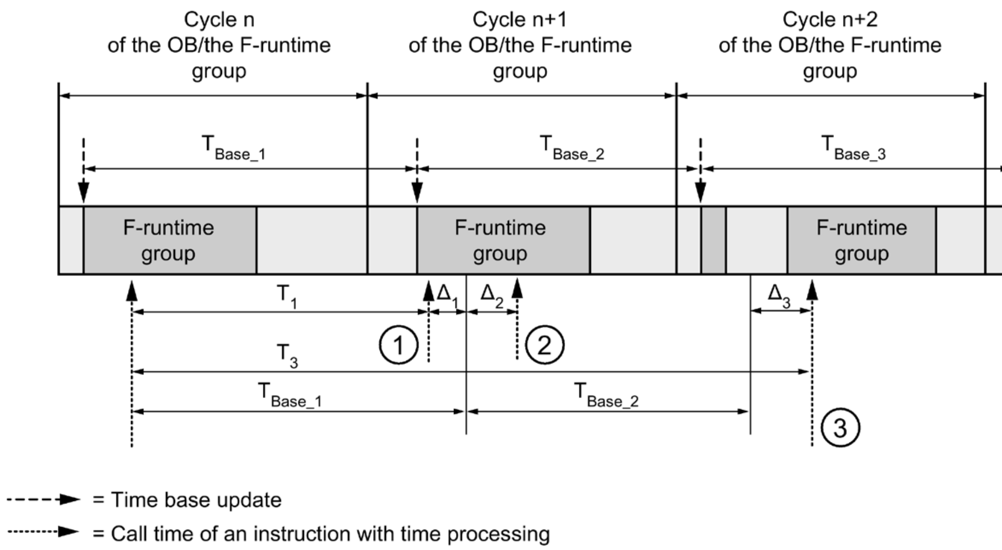
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0, 2, and 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Feedback error or incorrect feed-back time setting (= state of ERROR)	Feedback time setting < 0	Set feedback time > 0
		Feedback time setting is too low	If necessary, set a higher feedback time
		Wiring fault	Check wiring of actuator and feed-back contact
		Actuator or feedback contact is defective	Check actuator and feedback con-tact
		I/O fault or channel fault of feedback input	Check I/O
Bit 1	Passivation of F-I/O/channel controlled by output Q (= state of QBAD_FIO)	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
Bit 2	After feedback error: feedback input has permanent signal state of 0	F-I/O fault or channel fault of feedback input	Check I/O
		Feedback contact is defective	Check feedback contact
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of feedback input	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For feedback error: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



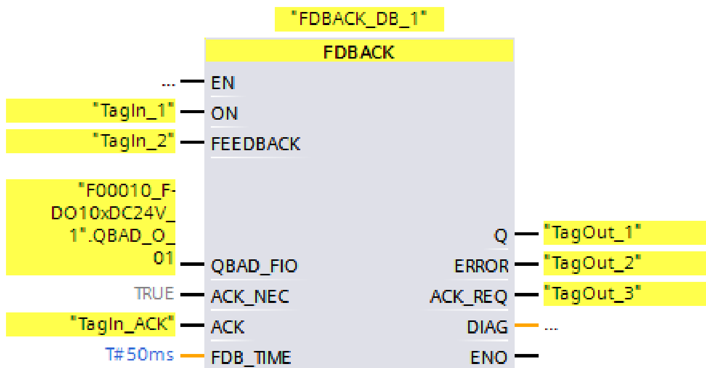
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

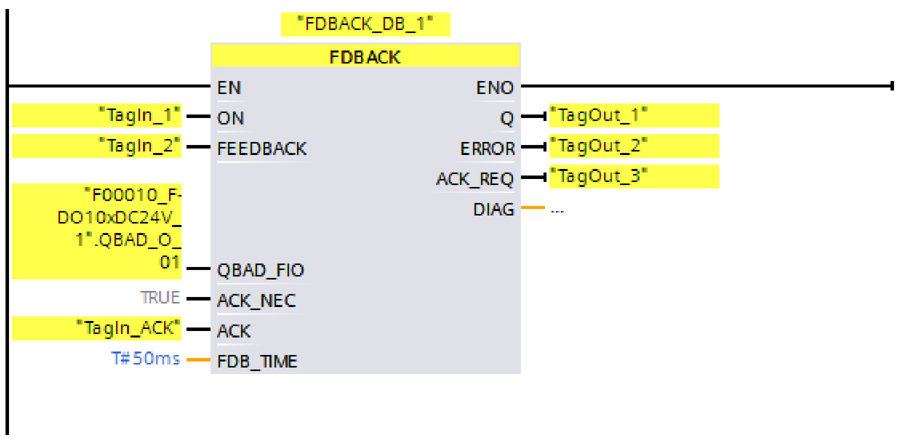
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

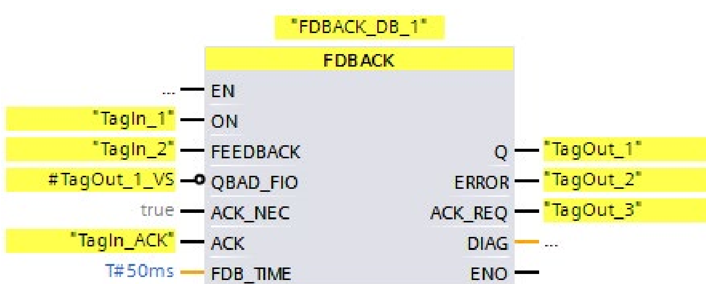
Example

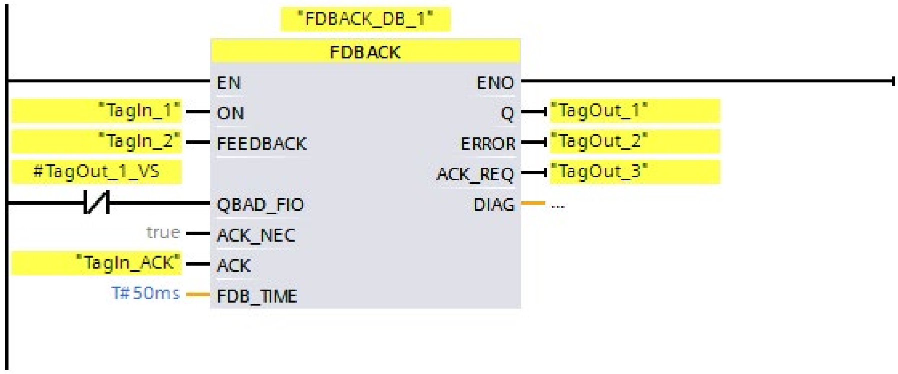
The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.3.8 SFDOOR: Safety door monitoring (STEP 7 Safety V15.1)

Description

This instruction implements safety door monitoring.

Enable signal Q is reset to 0 as soon as one of the inputs IN1 or IN2 take a signal state of 0 (safety door is opened). The enable signal can be reset to 1, only if:

- Inputs IN1 and IN2 both take a signal state of 0 prior to opening the door (safety door has been completely opened)
- Inputs IN1 and IN2 then both take a signal state of 1 (safety door is closed)
- An acknowledgment occurs

The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ = 1 is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets ACK_REQ = 1 as soon as the door is closed. Following an acknowledgment, the instruction resets ACK_REQ to 0.

In order for the instruction to recognize whether inputs IN1 and IN2 are 0 merely due to passivation of the associated F-I/O, you need to supply inputs QBAD_IN1 or QBAD_IN2 with the QBAD signal of the associated F-I/O or QBAD_I_xx signal / inverted value status of the associated channel. Among other things, this will prevent you from having to open the safety door completely prior to an acknowledgment in the event the F-I/O are passivated.

Every call of the "Safety door monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SFDOOR_DB_1) or a multi-instance (e.g., SFDOOR_Instance_1) for the "Safety door monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Input 1
IN2	Input	BOOL	Input 2
QBAD_IN1	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN1
QBAD_IN2	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN2
OPEN_NEC	Input	BOOL	1= Open necessary at startup
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
Q	Output	BOOL	1= Enable, safety door closed
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

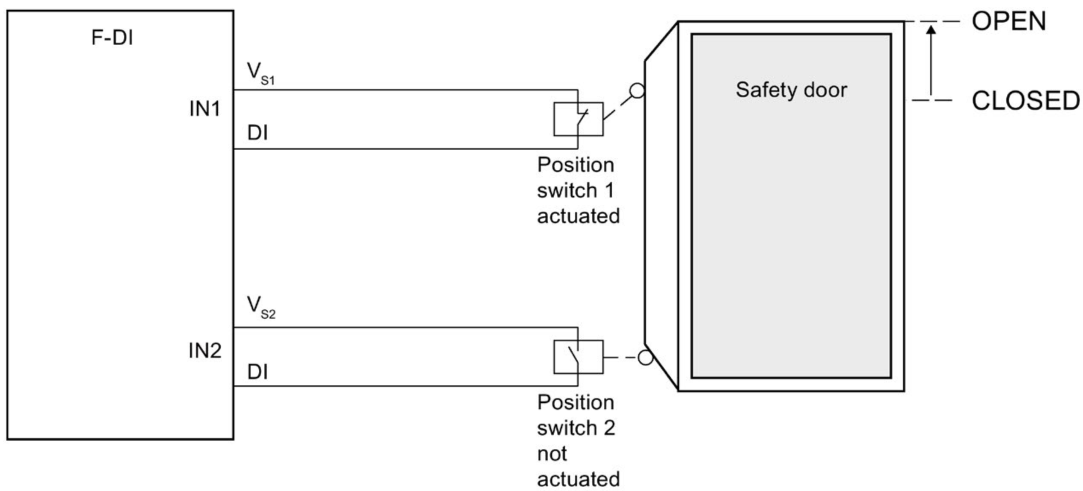
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

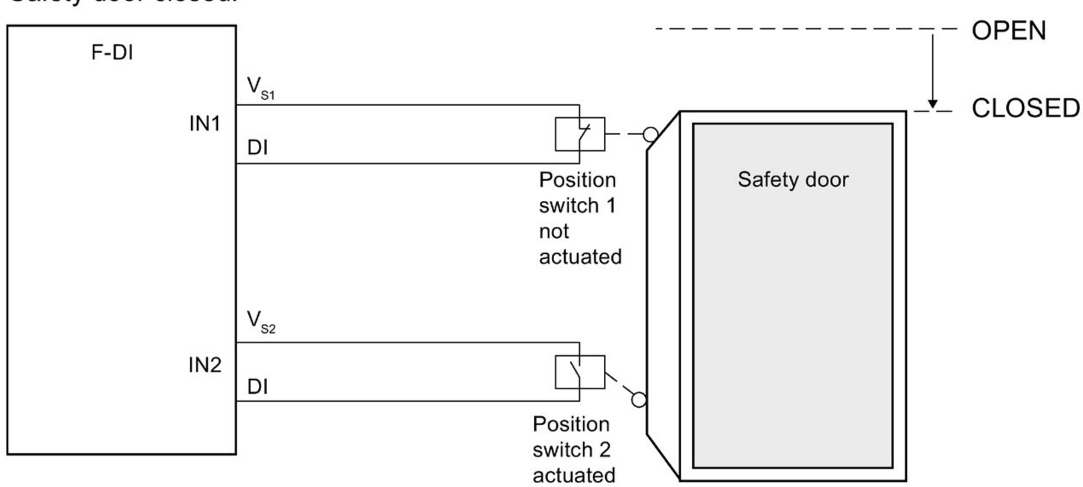
Interconnection example

You must interconnect the NC contact of position switch 1 of the safety door at input IN1 and the NO contact of position switch 2 at input IN2. Position switch 1 must be mounted in such a way that it is positively operated when the safety door is open. Position switch 2 must be mounted in such a way that it is operated when the safety door is closed.

Safety door open:



Safety door closed:



Startup characteristics

After an F-system startup, enable signal Q is reset to 0. The acknowledgment for the enable takes place according to the parameter assignment at inputs OPEN_NEC and ACK_NEC:

- When OPEN_NEC = 0, an automatic acknowledgment occurs **independently** of ACK_NEC, as soon as the two inputs IN1 and IN2 take signal state 1 for the first time following reintegration of the associated F-I/O (safety door is closed).
- When OPEN_NEC = 1 **or** if at least one of the IN1 and IN2 inputs still has a signal state of 0 after reintegration of the associated F-I/O, an automatic acknowledgment occurs **according** to ACK_NEC or you have to use a rising edge at input ACK for the enable. Prior to acknowledgment, inputs IN1 and IN2 both have to take a signal state of 0 (safety door has been completely opened) followed by a signal state of 1 (safety door is closed).

WARNING

The OPEN_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S039)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.

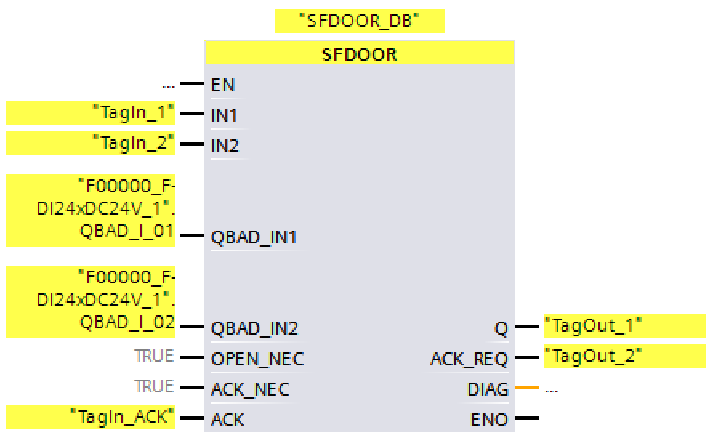
Structure of DIAG

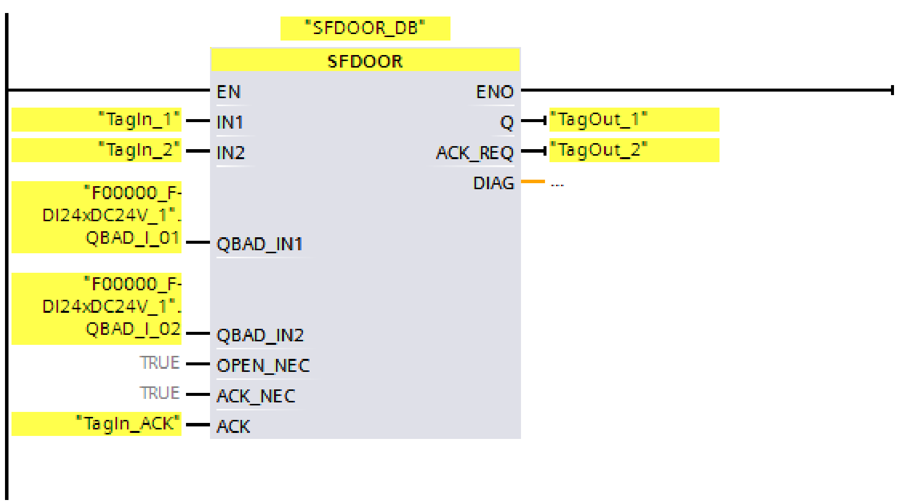
Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Signal state 0 is missing at both IN1 and IN2 inputs	Safety door was not completely opened when OPEN_NEC = 1 after F-system startup	Open safety door completely
		Open safety door was not completely opened	Open safety door completely
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 2	Signal state 1 is missing at both IN1 and IN2 inputs	Safety door was not closed	Close safety door
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 3	QBAD_IN1 and/or QBAD_IN2 = 1	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O or channel of IN1 and/or IN2	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 172)

Bit no.	Assignment	Possible error causes	Remedies
Bit 4	Reserved	—	—
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

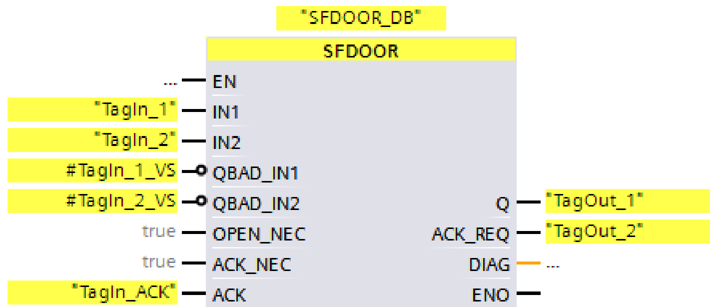
Example

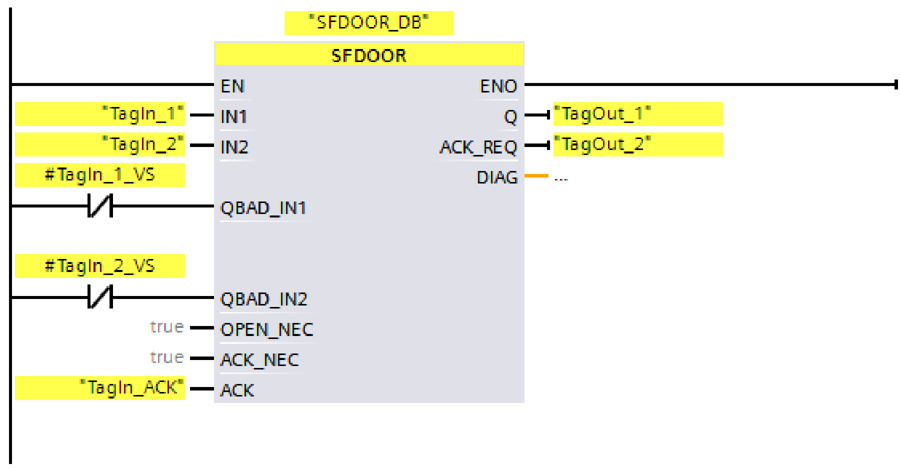
The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.3.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V15.1)

Description

This instruction creates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F-I/O of an F-runtime group after communication errors, F-I/O errors, or channel faults.

A user acknowledgment (Page 187) with a positive edge at input ACK_GLOB is required for reintegration. The acknowledgment occurs analogously to the user acknowledgment via the ACK_REI tag of the F-I/O DB (Page 168), but it acts simultaneously on all F-I/O of the F-runtime group in which the instruction is called.

If you use the instruction ACK_GL, you do not have to provide a user acknowledgment for each F-I/O of the F-runtime group via the ACK_REI tag of the F-I/O DB.

Every call of the "Global acknowledgment of all F-I/O of a runtime group" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_GL_DB_1) or a multi-instance (e.g., ACK_GL_Instance_1) for the "Global acknowledgment of all F-I/O of a runtime group" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

An acknowledgment via the ACK_GL instruction is only possible if the tag ACK_REI of the F-I/O DB = 0. Accordingly, an acknowledgment via the tag ACK_REI of the F-I/O DB is only possible if the input ACK_GLOB of the instruction = 0.

The instruction is only allowed to be called once per F-runtime group.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_GLOB	Input	BOOL	1=acknowledgment for reintegration

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

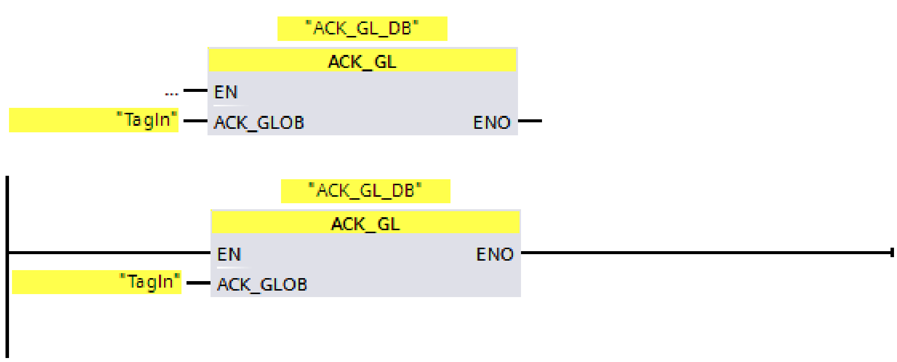
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



13.4 Timer operations

13.4.1 TP: Generate pulse (STEP 7 Safety V15.1)

Description

You can use the "Generate pulse" instruction to set output Q for a programmed period. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. Output Q is set for period PT, regardless of the subsequent sequence of the input signal. Also the detection of a new positive signal edge does not influence the signal state at output Q as long as period PT runs.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. If period PT is reached and the signal state at input IN is "0", output ET is reset.

Every call of the "Generate pulse" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate pulse" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction").
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate pulse" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TP instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of pulse; must be positive.
Q	Output	BOOL	Pulse output
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

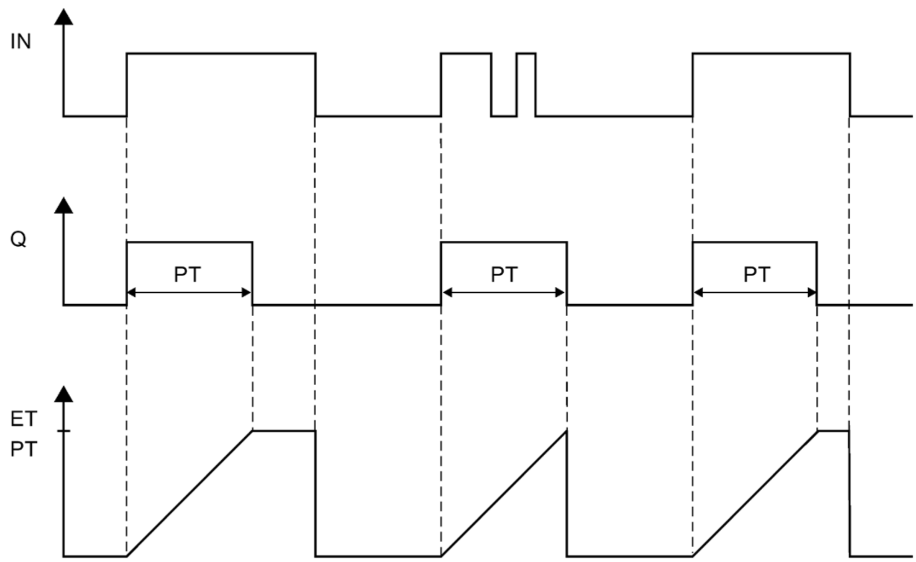
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

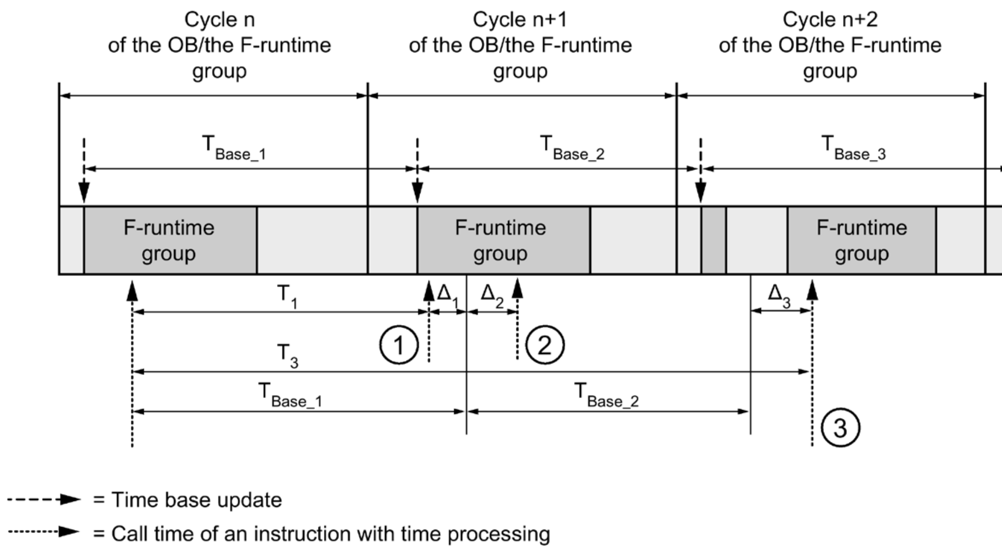
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate pulse":



Timing imprecision resulting from the update time of the time base used in the instruction:



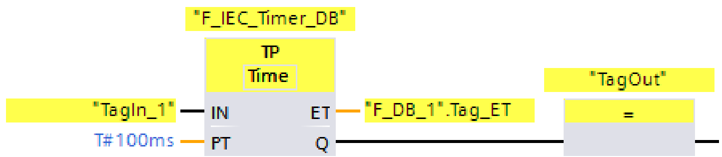
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of $Δ_1$, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

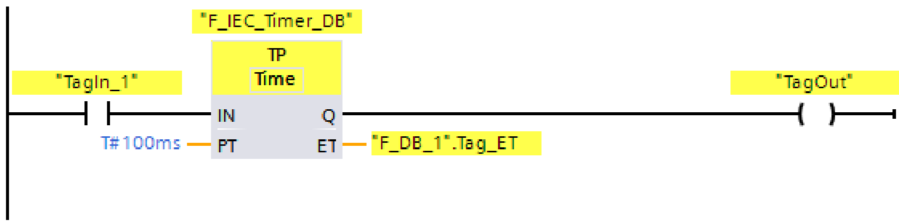
② The instruction is called a second time in cycle n+1. This does not involve another time update (by $Δ_2$).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of $Δ_3$, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





If the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate pulse" instruction is started and the period assigned at input PT (100 ms) runs, regardless of the further course of operand "TagIn_1".

Operand "TagOut" at output Q has signal state "1" as long as the period is running. Operand ""F_DB_1".Tag_ET" contains the current time value.

13.4.2 TON: Generate on-delay (STEP 7 Safety V15.1)

Description

You use the "Generate on-delay" instruction to delay the setting of output Q by the assigned period PT. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. When period PT has expired, output Q is set to signal state "1". Output Q remains set as long as the start input is set to "1". When the signal state at the start input changes from "1" to "0", output Q is reset. The time function is restarted when a new positive signal edge is detected at the start input.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. Output ET is reset, as soon as the signal state at input IN changes to "0".

Every call of the "Generate on-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate on-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate on-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TON instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the output ET is reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of on-delay; must be positive.
Q	Output	BOOL	Output that is set after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Ver-sion	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

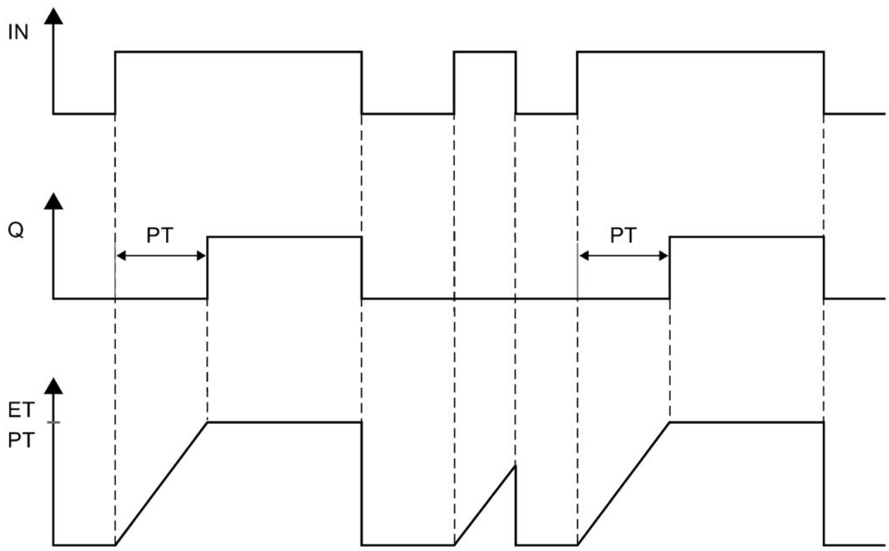
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

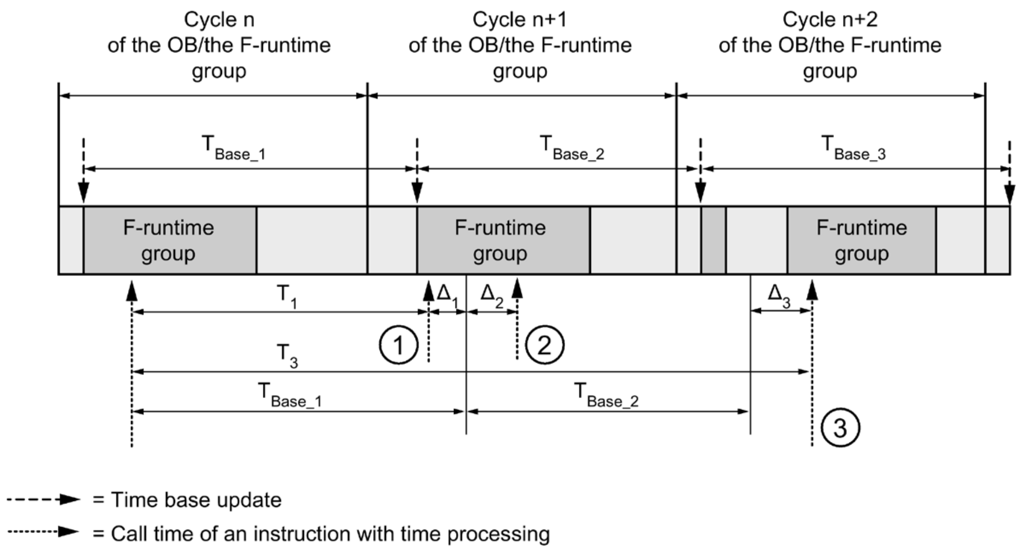
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate on-delay":



Timing imprecision resulting from the update time of the time base used in the instruction:



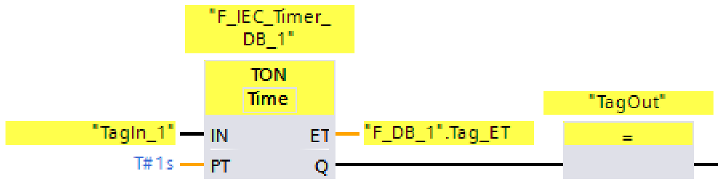
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

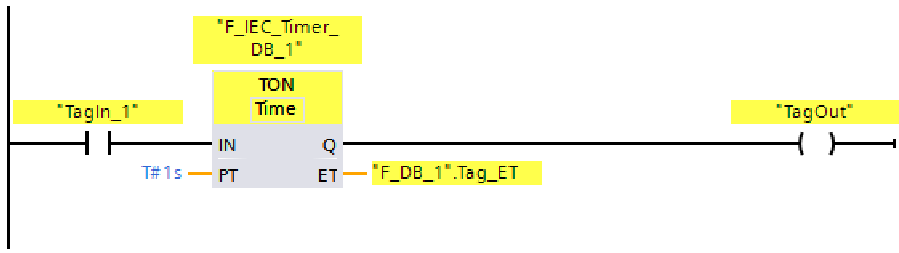
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





When the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate on-delay" instruction is started and the period assigned at input PT (1 s) runs.

Operand "TagOut" at output Q feeds signal state "1" when the period has elapsed and remains set as long as operand "TagIn_1" still feeds signal state "1". Operand ""F_DB_1".Tag_ET" contains the current time value.

13.4.3 TOF: Generate off-delay (STEP 7 Safety V15.1)

Description

You use the "Generate off-delay" instruction to delay the resetting of output Q by the assigned period PT. Output Q is set if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. When the signal state at input IN changes back to "0", the programmed period PT starts. Output Q remains set as long as period PT runs. After period PT expires, output Q is reset. If the signal state at input IN changes to "1" before period PT has expired, then the time is reset. The signal state at output Q remains at "1".

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. After time PT has elapsed, output ET remains at its current value until input IN changes back to "1". If input IN changes to "1" before time PT has expired, the output ET is reset to value T#0.

Every call of the "Generate off-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is in inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate off-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate off-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TOF instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of off delay; must be positive.
Q	Output	BOOL	Output that is reset after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

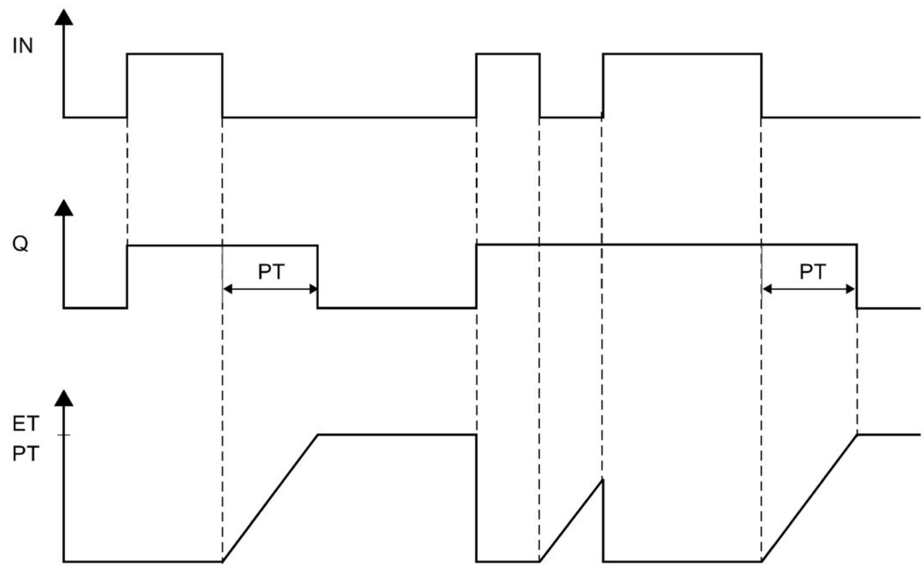
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

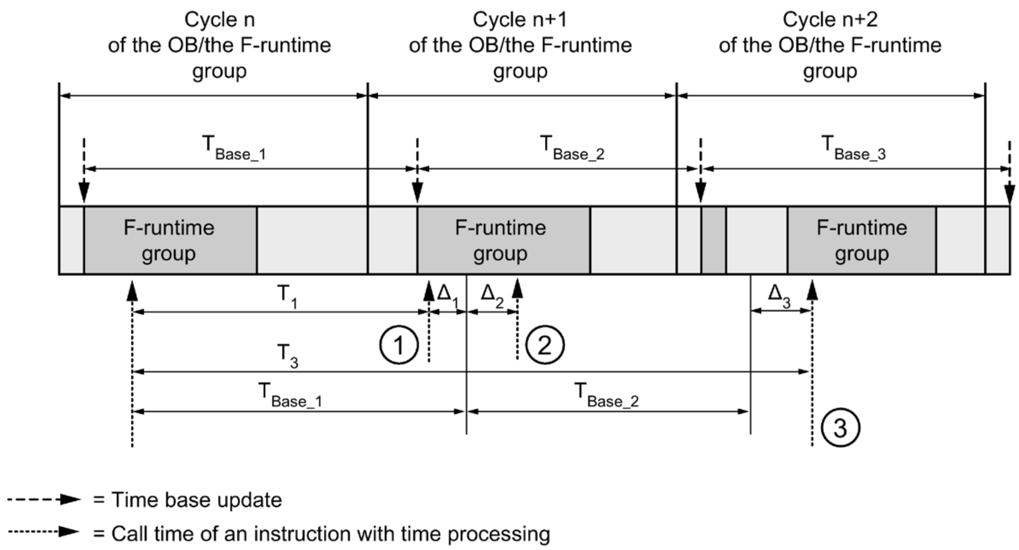
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate off-delay":



Timing imprecision resulting from the update time of the time base used in the instruction:



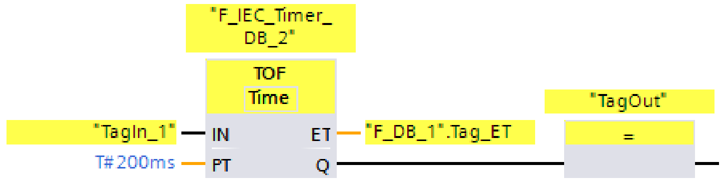
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

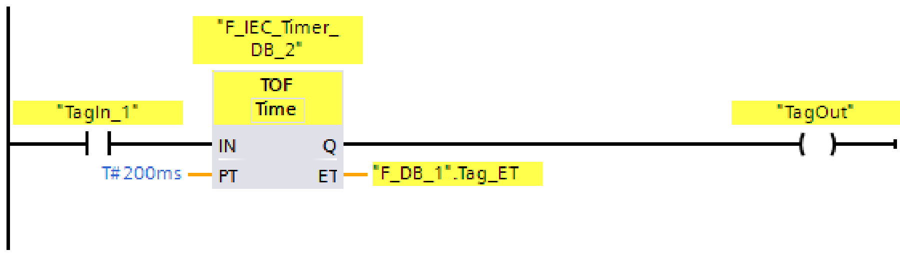
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base\_1} + T_{Base\_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





If the signal state of operand "TagIn_1" changes from "0" to "1", the signal state of operand"TagOut" at output Q is set to "1".

If the signal state of operand "TagIn_1" changes back to "0", the period assigned at input PT (200 ms) runs.

The "TagOut" operand at output Q is set back to "0" when the period expires. Operand ""F_DB_1".Tag_ET" contains the current time value.

13.5 Counter operations

13.5.1 CTU: Count up (STEP 7 Safety V15.1)

Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at the CU input changes from "0" to "1" (positive signal edge), the instruction is executed and the current count at the CV output increases by one. The count value is increased on each detection of a positive signal edge until it reaches the high limit of the data type specified at the CV output. When the high limit is reached, the signal state at the CU input no longer affects the instruction.

The counter status can be queried at output Q. The signal state at output Q is determined by parameter PV. When the current count value is greater than or equal to the value of parameter PV, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is reset to zero when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at input CU has no effect on the instruction.

Every call of the "Count up" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Counter input
R	Input	BOOL	Reset input
PV	Input	INT	Value for which output Q is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Ver-sion	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

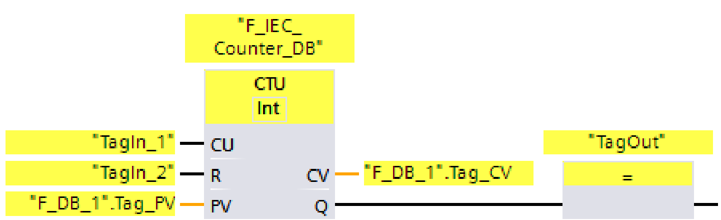
o This version is no longer supported.

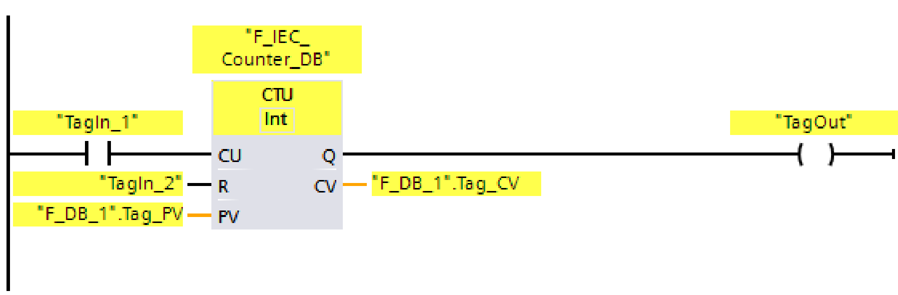
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





When the signal state of the "CU" input changes from "0" to "1", the "Count up" instruction is executed and the current count of the "CV" output increases by one. The count value is increased on every additional positive signal edge until the high limit of the specified data type (32767) is reached.

The value at the PV parameter is applied as the limit for determining the "TagOut" operands at the Q output. Output "Q" returns the signal state "1" as long as the current count is greater than or equal to the value of operand "PV". In all other cases, the "Q" output has the signal state "0".

13.5.2 CTD: Count down (STEP 7 Safety V15.1)

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at input CD changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is decreased by one. The count value is decreased on each detection of a positive signal edge until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at input CD no longer affects the instruction.

The counter status can be queried at output Q. When the current count value is less than or equal to zero, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is set to the value of parameter "PV" when the signal state at input LD changes to "1". As long as signal state "1" exists at input LD, the signal state at input CD has no effect on the instruction.

Every call of the "Count down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count down" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Counter input
LD	Input	BOOL	Load input
PV	Input	INT	Value at the output CV when LD = 1 is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

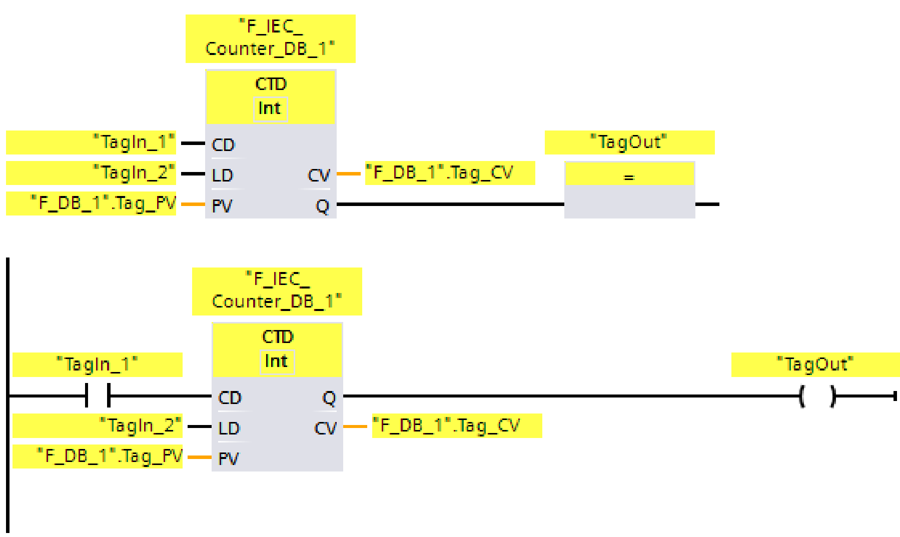
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state of the "CD" input changes from "0" to "1", the "Count down" instruction is executed and the current count at "CV" output decreases by one. The count value is decreased on each additional positive signal edge until the low limit of the specified data type (-32768) is reached.

Output "Q" returns the signal state "1" as long as the current count is less than or equal to zero. In all other cases, output "Q" has signal state "0".

13.5.3 CTUD: Count up and down (STEP 7 Safety V15.1)

Description

You can use the "Count up and down" instruction to increment and decrement the count value at output CV. If the signal state at the CU input changes from "0" to "1" (positive signal edge), the current count at the CV output increases by one. If the signal state at input CD changes from "0" to "1" (positive signal edge), the count value at output CV is decreased by one. If a positive signal edge is present at inputs CU and CD in one program cycle, the current count value at output CV remains unchanged.

The count value can be increased until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is no longer decreased.

When the signal state at input LD changes to "1", the count value at output CV is set to the value of parameter PV. As long as signal state "1" exists at input LD, the signal state at inputs CU and CD has no effect on the instruction.

The count value is set to zero, when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at inputs CU, CD, and LD has no effect on the "Count up and down" instruction.

The status of the up counter can be queried at output QU. When the current count value is greater than or equal to the value of parameter PV, output QU delivers signal state "1". In all other cases, the signal state at output QU is "0".

The status of the down counter can be queried at output QD. When the current count value is lesser than or equal to zero, output QD delivers signal state "1". In all other cases, the signal state at output QD is "0".

Every call of the "Count up and down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up and down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up and down" instruction when the F-system is started up.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input

Parameter	Declaration	Data type	Description
PV	Input	INT	Value set at the output QU/ at which the output CV is set at LD = 1.
QU	Output	BOOL	Status of up counter
QD	Output	BOOL	Status of down counter
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

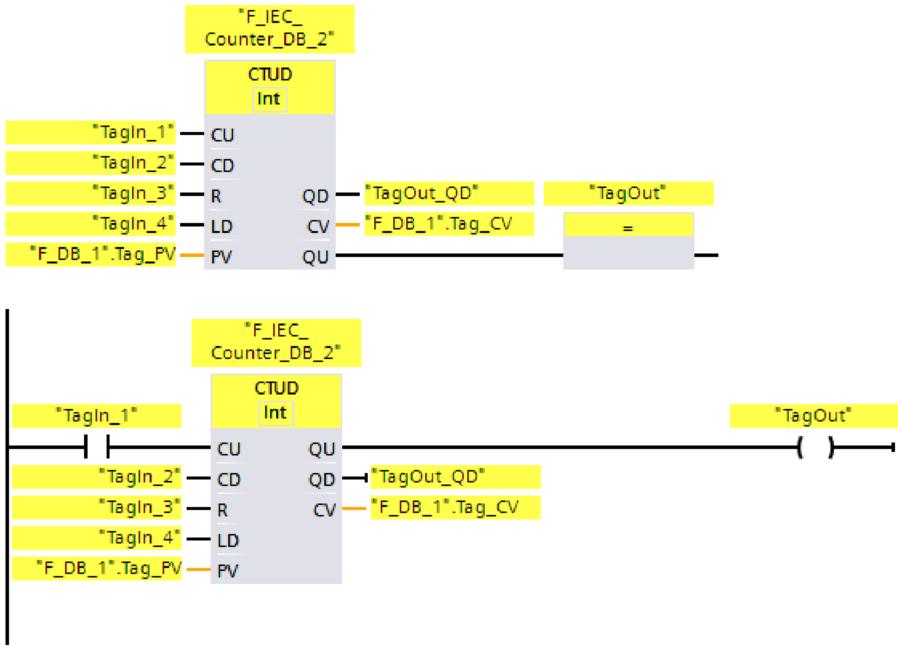
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state at the "CU" input or at the "CD" input changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When a positive signal edge is present at the "CU" input, the current count of the "CV" output increases by one. When a positive signal edge is present at the "CD" input, the current count at the "CV" output decreases by one. The count value is increased on each positive signal edge at the CU input until it reaches the high limit of 32767. The count value is decreased on each positive signal edge at the CD input until it reaches the low limit of -32768.

Output "QU" returns the signal state "1" as long as the current count is greater than or equal to the value at the "PV" input. In all other cases, output "QU" has signal state "0".

Output "QD" returns the signal state "1" as long as the current count is less than or equal to zero. In all other cases, output "QD" has signal state "0".

13.6 Comparator operations

13.6.1 CMP ==: Equal (STEP 7 Safety V15.1)

Description

You can use the "Equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

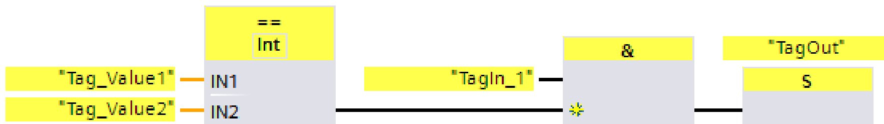
The following table shows the parameters of the instruction:

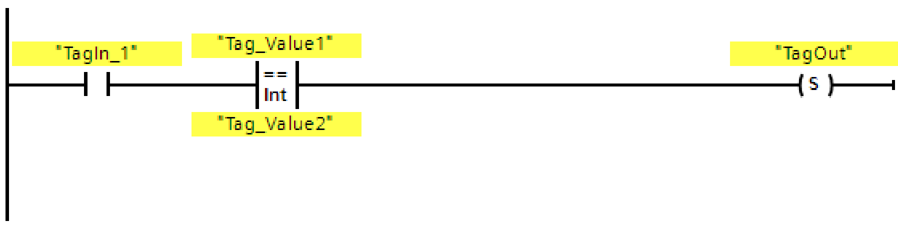
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" = "Tag_Value2").

13.6.2 CMP <>: Not equal (STEP 7 Safety V15.1)

Description

You can use the "Not equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is not equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

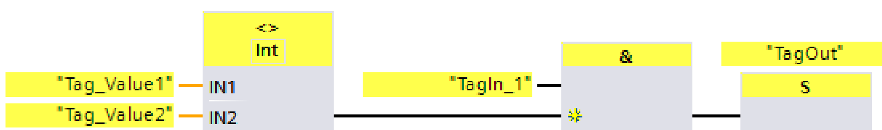
The following table shows the parameters of the instruction:

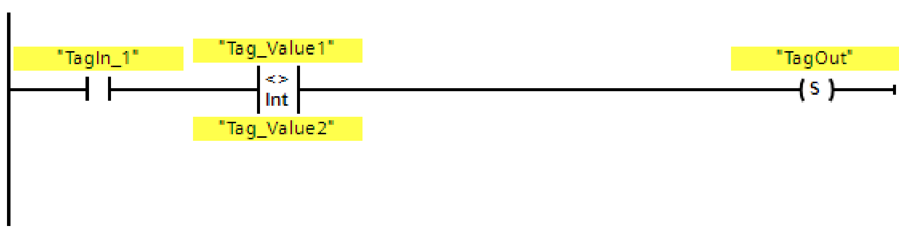
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <> "Tag_Value2").

13.6.3 CMP >=: Greater or equal (STEP 7 Safety V15.1)

Description

You can use the "Greater or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

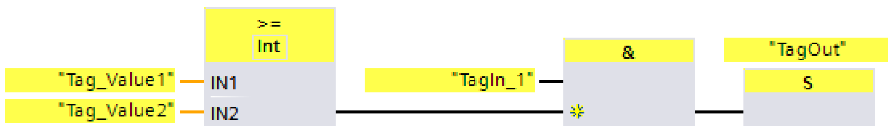
The following table shows the parameters of the instruction:

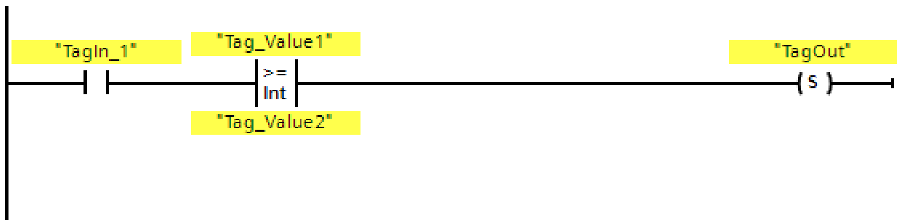
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" >= "Tag_Value2").

13.6.4 CMP <=: Less or equal (STEP 7 Safety V15.1)

Description

You can use the "Less or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

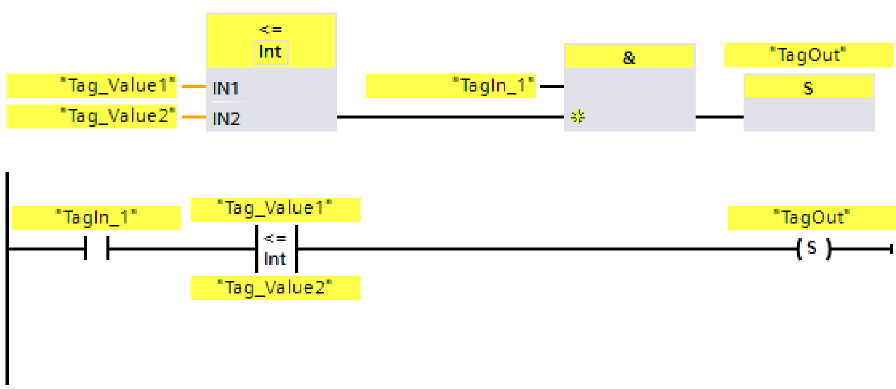
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <= "Tag_Value2").

13.6.5 CMP >: Greater than (STEP 7 Safety V15.1)

Description

You can use the "Greater than" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

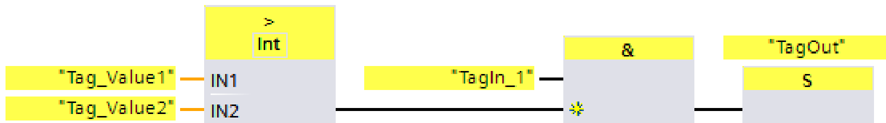
The following table shows the parameters of the instruction:

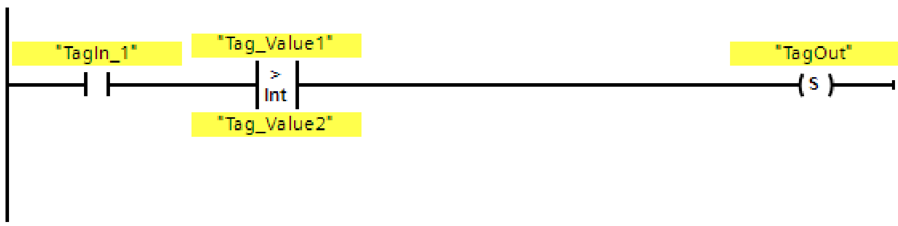
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" > "Tag_Value2").

13.6.6 CMP <: Less than (STEP 7 Safety V15.1)

Description

You can use the "Less than" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

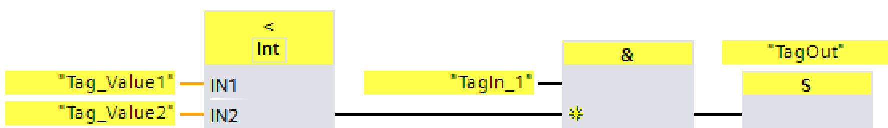
The following table shows the parameters of the instruction:

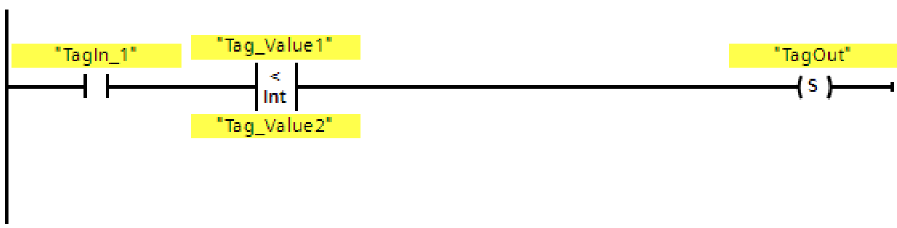
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" < "Tag_Value2").

13.7 Math functions

13.7.1 ADD: Add (STEP 7 Safety V15.1)

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at the OUT output (OUT = IN1 + IN2).

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters

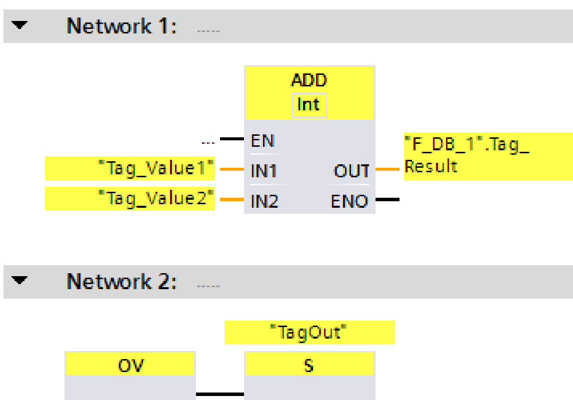
The following table shows the parameters of the instruction:

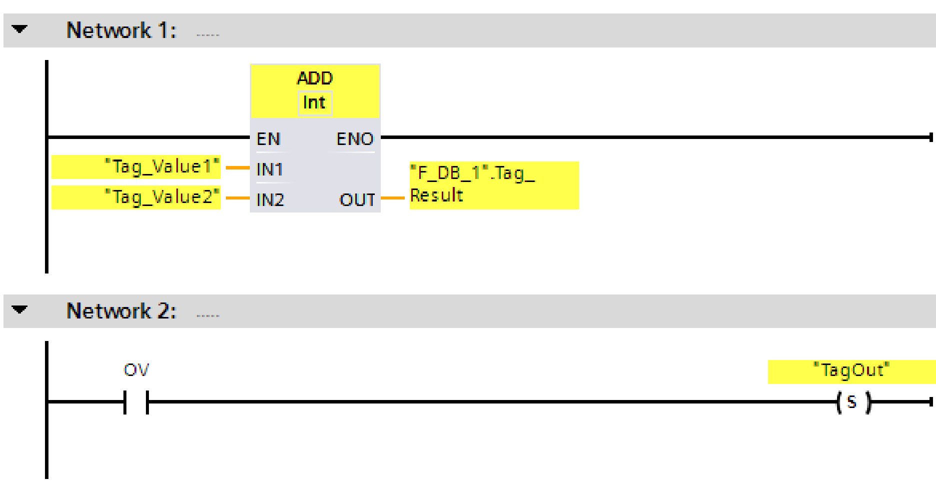
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	First addend
IN2	Input	INT, DINT	Second addend
OUT	Output	INT, DINT	Total

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





The "Add" instruction is always executed regardless of the signal state at enable input EN.

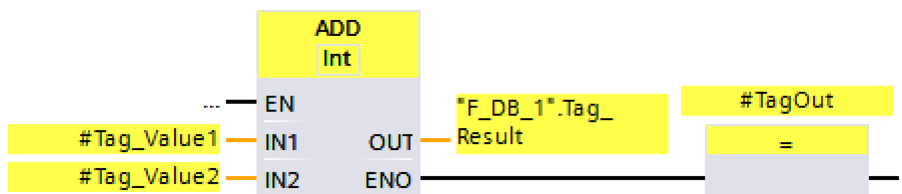
The value of the "Tag_Value1" operand is added to value of the "Tag_Value2" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

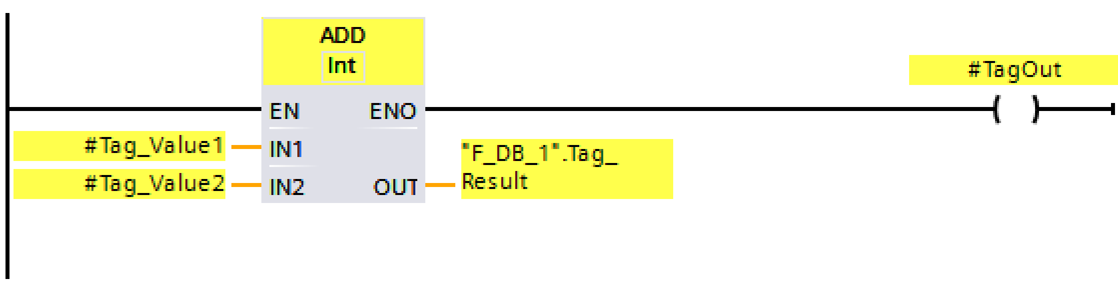
If needed, you can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

When an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:





The "Add" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is added to value of the "#Tag_Value2" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Add" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

If needed, you can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

13.7.2 SUB: Subtract (STEP 7 Safety V15.1)

Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at the OUT output (OUT = IN1 – IN2).

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters

The following table shows the parameters of the instruction:

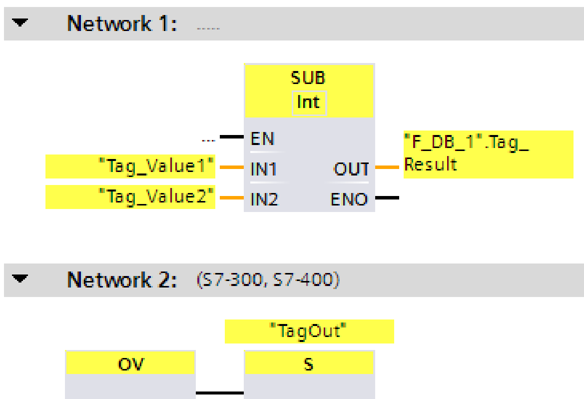
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Minuend

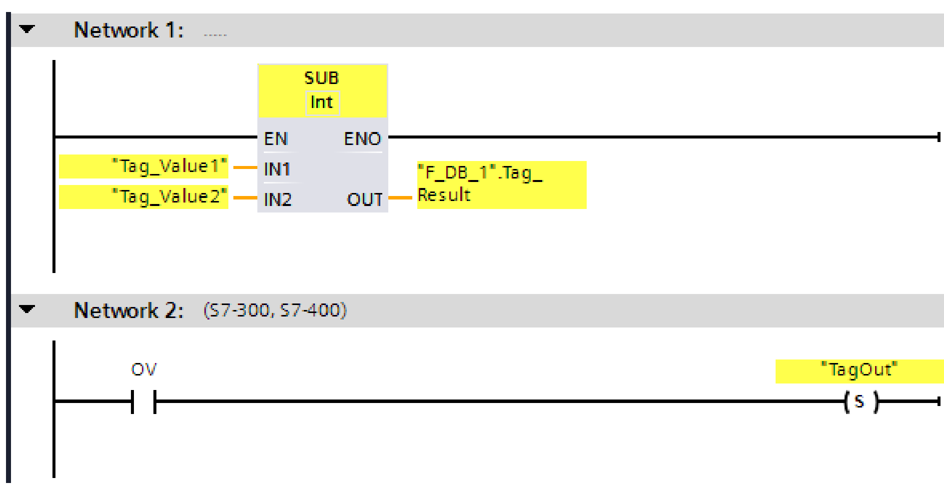
Parameter	Declaration	Data type	Description
IN2	Input	INT, DINT	Subtrahend
OUT	Output	INT, DINT	Difference

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





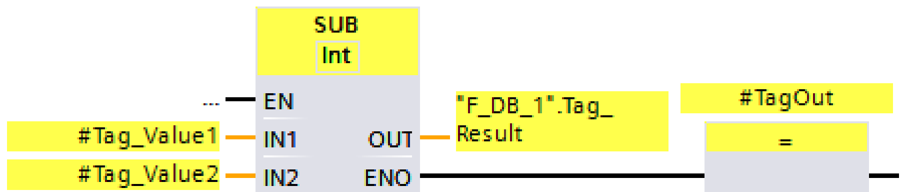
The "Subtract" instruction is always executed regardless of the signal state at enable input EN.

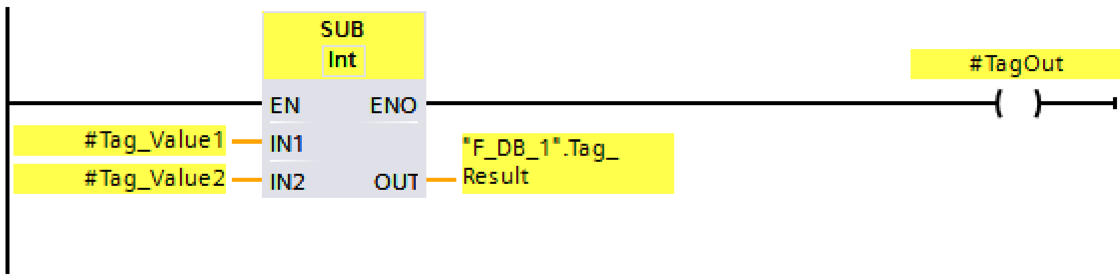
The value of the "Tag_Value2" operand is subtracted from the value of the "Tag_Value1" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Subtract" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:





The "Subtract" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value2" operand is subtracted from the value of the "#Tag_Value1" operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Subtract" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.7.3 MUL: Multiply (STEP 7 Safety V15.1)

Description

You can use the "Multiply" instruction to multiply the value at input IN1 by the value at input IN2 and query the product at output OUT (OUT = IN1 × IN2).

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters

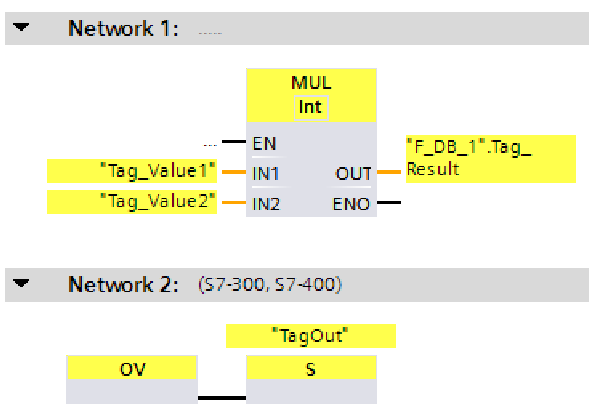
The following table shows the parameters of the instruction:

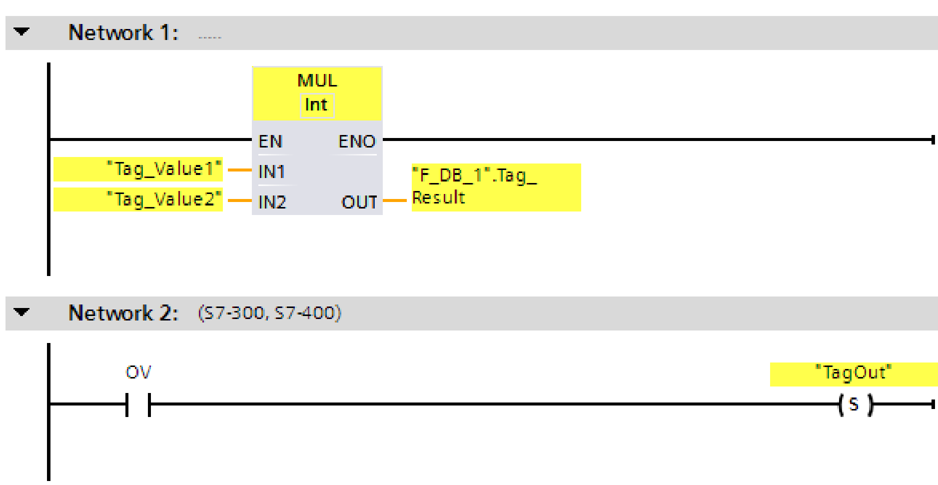
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Multiplier
IN2	Input	INT, DINT	Multiplicand
OUT	Output	INT, DINT	Product

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





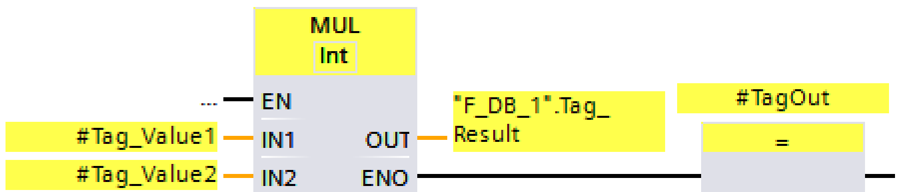
The "Multiply" instruction is always executed regardless of the signal state at enable input EN.

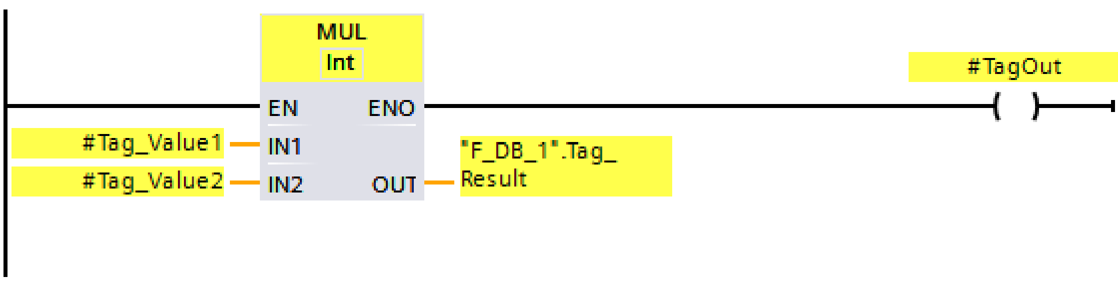
The value of the "Tag_Value1" operand is multiplied by the value of the "Tag_Value2" operand. The result of the multiplication is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Multiply" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:





The "Multiply" instruction is always executed regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is multiplied by the value of the "#Tag_Value2" operand. The result of the multiplication is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Multiply" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.7.4 DIV: Divide (STEP 7 Safety V15.1)

Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at the OUT output (OUT = IN1 / IN2).

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Note

S7-300/400, S7-1200/1500 (enable output ENO connected):

If the divisor (input IN2) of a DIV instruction = 0, the quotient of the division (result of division at output OUT) = 0. The result reacts like the corresponding instruction in a standard block. The F-CPU does *not* go to STOP mode.

S7-1200/1500 (enable output ENO not connected):

If the divisor (input IN2) of a DIV instruction = 0, the F-CPU goes to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU. We recommend that you rule out a divisor (input IN2) = 0 when creating the program.

Parameters

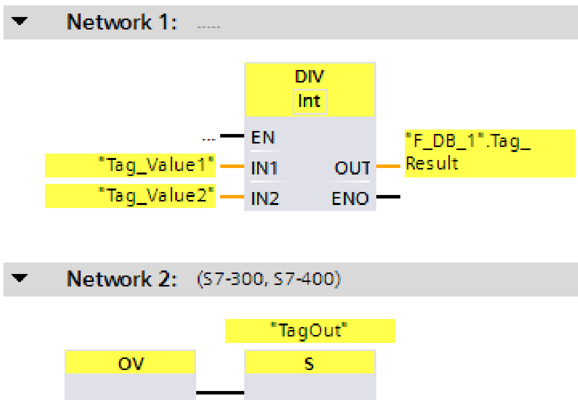
The following table shows the parameters of the instruction:

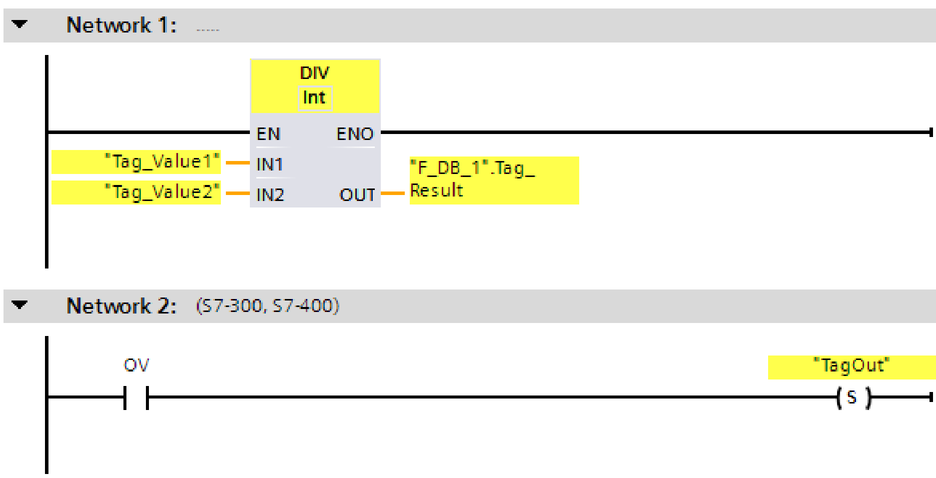
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN1	Input	INT, DINT	Dividend
IN2	Input	INT, DINT	Divisor
OUT	Output	INT, DINT	Quotient

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





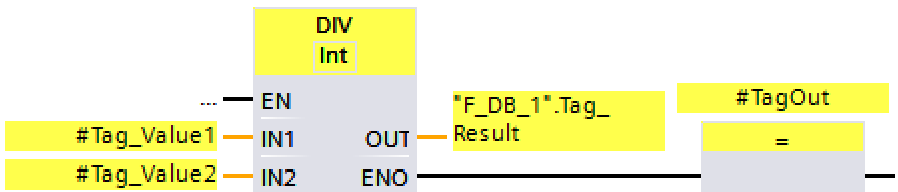
The "Divide" instruction is always execute regardless of the signal state at enable input EN.

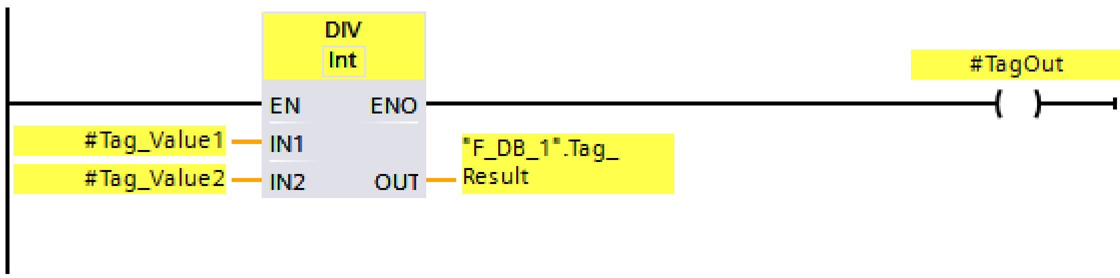
The value of the "Tag_Value1" operand is divided by the value of the "Tag_Value2" operand. The result of the division is stored in the ""F_DB_1".Tag_Result" operand.

When an overflow occurs during execution of the "Divide" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:





The "Divide" instruction is always execute regardless of the signal state at enable input EN.

The value of the "#Tag_Value1" operand is divided by the value of the "#Tag_Value2" operand. The result of the division is stored in the ""F_DB_1".Tag_Result" operand.

When no overflow occurs during execution of the "Divide" instruction, the ENO enable output has the signal state "1" and the "#TagOut" operand is set.

13.7.5 NEG: Create twos complement (STEP 7 Safety V15.1)

Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN input and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-1200, S7-1500) You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.
- Work memory requirement of safety program is increased.

Parameters

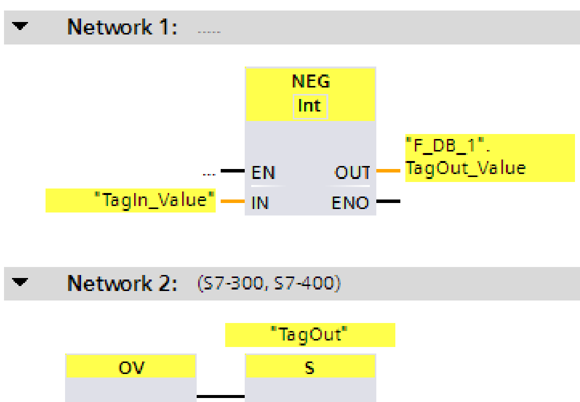
The following table shows the parameters of the instruction:

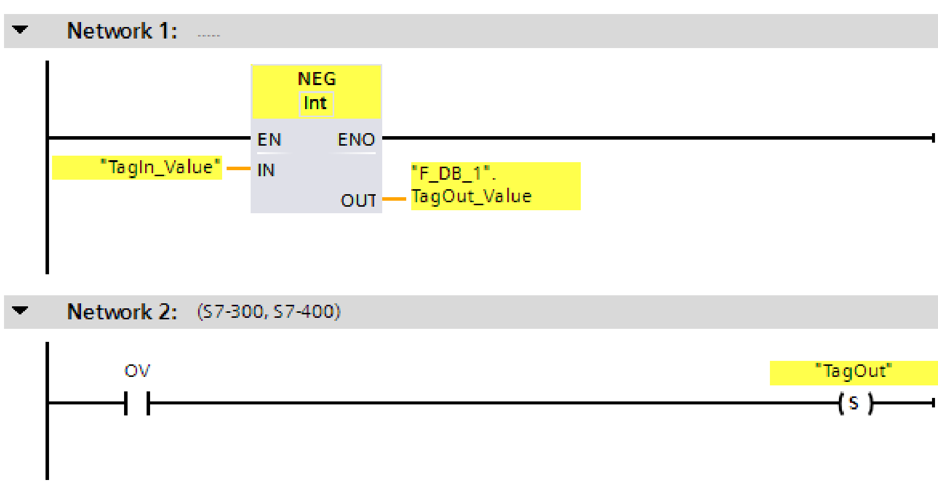
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Twos complement of the input value

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example for S7-300/400 F-CPUs

The following example shows how the instruction works:





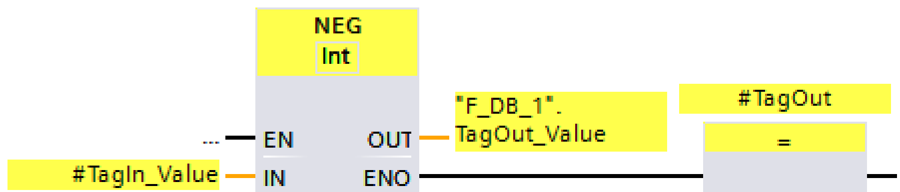
The "Create two's complement" instruction is always executed regardless of the signal state at enable input EN.

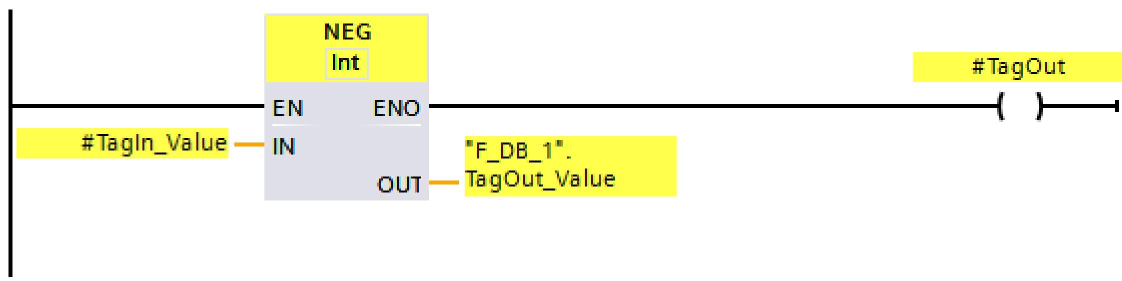
The sign of the "TagIn_Value" operand is changed and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When an overflow occurs during execution of the "Create two's complement" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

Example for S7-1200/1500 F-CPUs

The following example shows how the instruction works:





The "Create two's complement" instruction is always executed regardless of the signal state at enable input EN.

The sign of the "#TagIn_Value" operand is changed and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Create two's complement" instruction, the ENO enable output has the signal state "1" and the "TagOut" operand is set.

13.7.6 ABS: Form absolute value (STEP 7 Safety V15.1) (S7-1200, S7-1500)

Description

You use the "Form absolute value" instruction to calculate the absolute amount of the value which is specified at the input "IN". The result of the instruction is output at the OUT output and can be queried there.

Enable input "EN" or (S7-300, S7-400) of the "ENO" enable output cannot be connected. The instruction is therefore always executed regardless of the signal state at enable input "EN".

Note

When the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

You can avoid a STOP of the F-CPU by connecting the ENO enable output, thereby programming overflow detection.

Note the following:

- If the result of the instruction is located outside the permitted range for this data type, the enable output ENO returns the signal state "0".
- The result of the instruction reacts like the analogous instruction in a standard block.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- Work memory requirement of safety program is increased.

Parameters

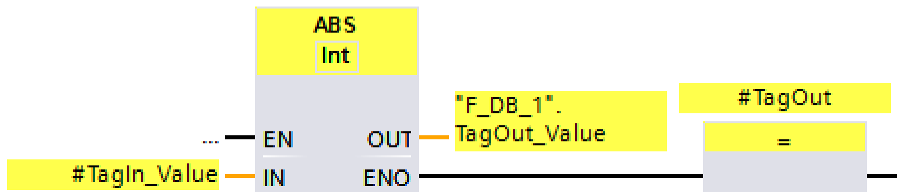
The following table shows the parameters of the instruction:

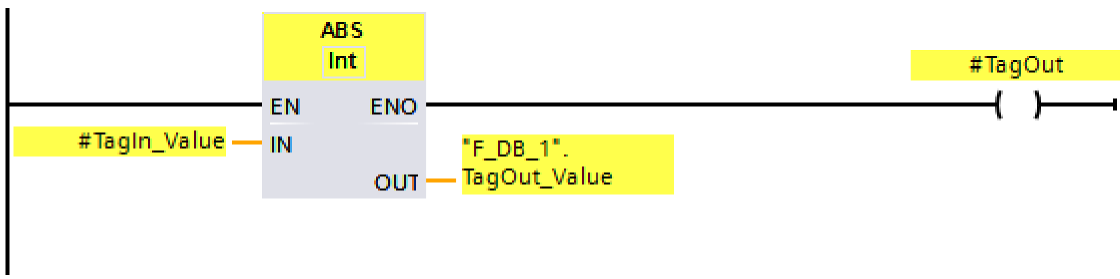
Parameter	Declaration	Data type	Description
ENO	Output	BOOL	(S7-1200, S7-1500) Enable output
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Absolute value of the input value

You select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





The instruction "Form absolute value"is always executed regardless of the signal state at enable input "EN".

The absolute amount of the value at the "TagIn_Value" operand is calculated and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Form absolute value" instruction, the enable output ENO has the signal state "1" and the "#TagOut" operand is set.

13.8 Move operations

13.8.1 MOVE: Move value (STEP 7 Safety V15.1)

Description

You can use the "Move value" instruction to transfer the content of the operand at input IN to the operand at output OUT1.

Only operands with identical operand width and identical data structure can be specified for input IN and output OUT1.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

(S7-1200, S7-1500) In the basic state, the instruction box contains an output (OUT1). The number of outputs can be expanded. The inserted outputs are numbered in ascending order on the box. During execution, the content of the operand at the IN input is transferred to all available outputs. The instruction box cannot be expanded if operands with F-compliant PLC data types (UDT) are transferred.

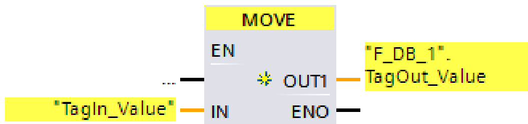
Parameters

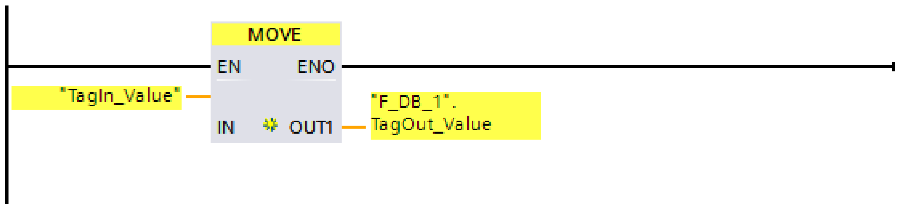
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT, WORD, (S7-300/400) DWORD, TIME, F-compliant PLC data type (UDT)	Source value
OUT1	Output	INT, DINT, WORD, (S7-300/400) DWORD, TIME, F-compliant PLC data type (UDT)	Destination address

Example

The following example shows how the instruction works:





The instruction is always executed regardless of the signal state at enable input "EN". The instruction copies the content of operand "TagIn_Value" to operand ""F_DB_1".TagOut_Value".

13.8.2 RD_ARRAY_I: Read value from INT F-array (STEP 7 Safety V15.1) (S7-1500)

Description

You use the "Read value from INT F-array" instruction to read an element from the array at the ARRAY input, which refers to the index at the INDEX input, and write its value at the OUT output. If an error occurs while accessing the array during runtime, this is displayed at the output ERROR.

The array must be created in an F-global DB and can contain only one dimension. The elements of the ARRAY must be data type INT. The following applies for the array limits in contrast:

- The low limit must be 0.
- The high limit can be 10000 maximum.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at the "EN" enable input).

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ARRAY	Input	VARIANT	Array from which is read
INDEX	Input	DINT	Element in the array which is read. The specification may be a constant or a tag.
OUT	Output	INT	Value which is read and output.
ERROR	Output	BOOL	Error information The parameter ERROR is set if an error occurs during the processing of the instruction.

ARRAY parameter

In addition to the direct connection with an array within a fail-safe global DB, this input can also be interconnected with an INOUT of data type ARRAY[*] of INT. This enables the decoupling of data and program logic in order, for example, to create a library function without any connection existing to a dedicated data block.

ERROR parameter

The table below shows the meaning of the value of the ERROR parameter:

Value	Description
FALSE	No error
TRUE	Value at the INDEX parameter is outside the limit value of the ARRAY.

Instruction versions

One version is available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	—	—	x[1]	

[1] supported as of firmware version V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

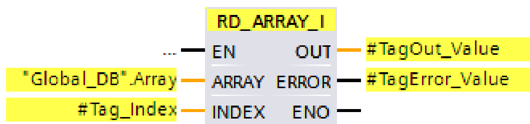
Reaction to errors

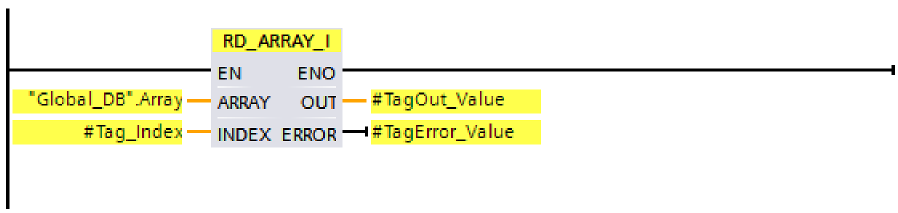
If the value at the INDEX input is outside the array limits, the output ERROR = 1 is set, and the array value of the element with index = 0 is output at OUT output, regardless of the value passed at the INDEX input.

Therefore, set the value of the element with index = 0 as a fail-safe substitute value.

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
ARRAY	"Global_DB".Array	The "Global_DB".Array operand is an ARRAY of data type Array[0..10] of INT
INDEX	#Tag_Index	2
OUT	#TagOut_Value	Value of the element at the location array[2]
ERROR	#TagError_Value	False

The instruction "Read value from INT F-array" is always executed regardless of the signal state at enable input "EN".

The content of the 2nd element of the operand "Global_DB.Array" is output at the "#TagOut_Value" output.

13.8.3 RD_ARRAY_DI: Read value from DINT F-array (STEP 7 Safety V15.1) (S7-1500)

Description

You use the "Read value from DINT F-array" instruction to read an element from the array at the ARRAY input, which refers to the index at the INDEX input, and write its value at the OUT output. If an error occurs while accessing the array during runtime, this is displayed at the output ERROR.

The array must be created in an F-global DB and can contain only one dimension. The elements of the array must be of the DINT data type. The following applies for the array limits in contrast:

- The low limit must be 0.
- The high limit can be 10000 maximum.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at the "EN" enable input).

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ARRAY	Input	VARIANT	Array from which is read
INDEX	Input	DINT	Element in the array which is read. The specification may be a constant or a tag.
OUT	Output	DINT	Value which is read and output.
ERROR	Output	BOOL	Error information The parameter ERROR is set if an error occurs during the processing of the instruction.

ARRAY parameter

In addition to the direct connection with an array within a fail-safe global DB, this input can also be interconnected with an INOUT of data type ARRAY[*] of DINT. This enables the decoupling of data and program logic in order, for example, to create a library function without any connection existing to a dedicated data block.

ERROR parameter

The table below shows the meaning of the value of the ERROR parameter:

Value	Description
FALSE	No error
TRUE	Value at the INDEX parameter is outside the limit value of the ARRAY.

Instruction versions

One version is available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	—	—	x[1]	

[1] supported as of firmware version V2.0

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

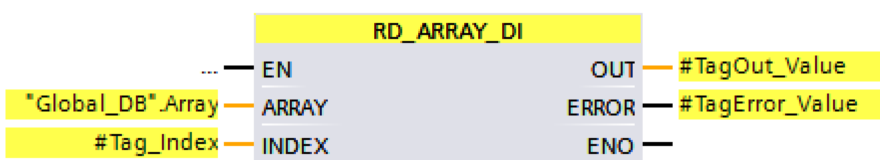
Reaction to errors

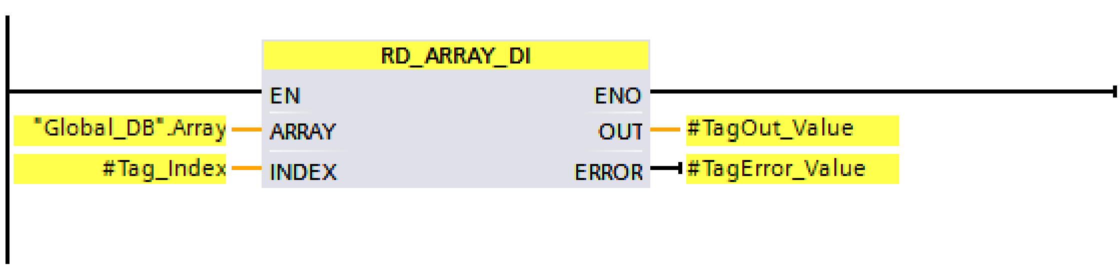
If the value at the INDEX input is outside the array limits, the output ERROR = 1 is set, and the array value of the element with index = 0 is output at OUT output, regardless of the value passed at the INDEX input.

Therefore, set the value of the element with index = 0 as a fail-safe substitute value.

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
ARRAY	"Global_DB".Array	The operand "Global_DB".Array is an ARRAY of data type Array[0..10] of DINT
INDEX	#Tag_Index	2
OUT	#TagOut_Value	Value of the element at the location array[2]
ERROR	#TagError_Value	False

The instruction "Read value from DINT F-array" is always executed regardless of the signal state at enable input "EN".

The content of the 2nd element of the operand "Global_DB.Array" is output at the "#TagOut_Value" output.

13.8.4 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety V15.1) (S7-300, S7-400)

Description

This instruction writes the value specified in input IN to the tag addressed by INI_ADDR and OFFSET in an F-DB.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB to which the value at input IN is to be written is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

As shown in the following example, the INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Value to be written to the F-DB
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset

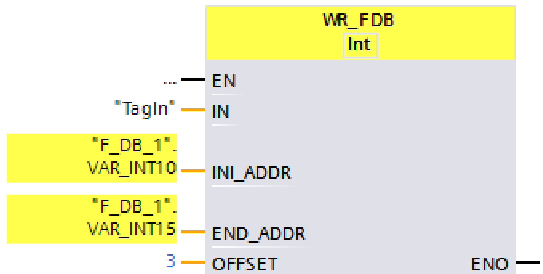
You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

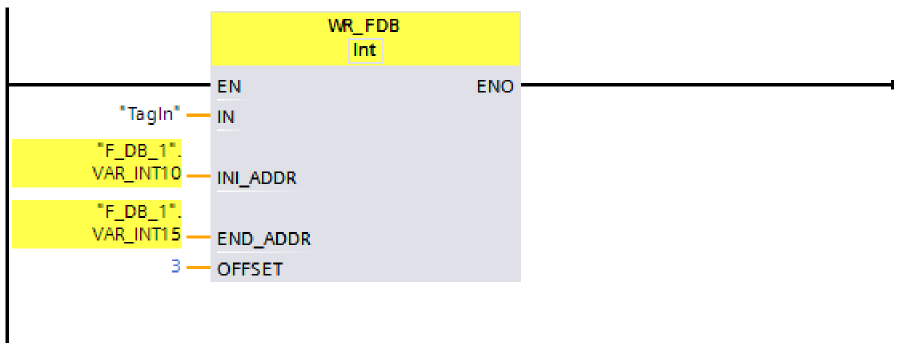
Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFS

Name	Data type	Initial value	Comment
Static			
VAR_BOOL10	BOOL	false	
VAR_BOOL11	BOOL	false	
VAR_BOOL12	BOOL	false	
VAR_BOOL13	BOOL	false	
VAR_TIME10	TIME	T#0MS	
VAR_TIME11	TIME	T#0MS	
VAR_INT10	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT10 Example 1
VAR_INT11	INT	0	
VAR_INT12	INT	0	
VAR_INT13	INT	0	<- OFFSET = 3
VAR_INT14	INT	0	
VAR_INT15	INT	0	<- END_ADDR = "F-DB_1".VAR_INT15
VAR_BOOL20	BOOL	false	
VAR_BOOL21	BOOL	false	
VAR_BOOL22	BOOL	false	
VAR_BOOL23	BOOL	false	
VAR_INT20	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT20 Example 2
VAR_INT21	INT	0	
VAR_INT22	INT	0	
VAR_INT23	INT	0	<- END_ADDR = "F-DB_1".VAR_INT23
VAR_INT30	INT	0	<- INI_ADDR = "F-DB_1".VAR_INT30 Example 3
VAR_INT31	INT	0	<- OFFSET = 1
VAR_INT32	INT	0	
VAR_INT33	INT	0	
VAR_INT34	INT	0	<- END_ADDR = "F-DB".VAR_INT34
VAR_TIME20	TIME	T#0MS	
VAR_DINT10	DINT	0	<- INI_ADDR = "F-DB_1".VAR_DINT10 Example 4
VAR_DINT11	DINT	0	
VAR_DINT12	DINT	0	<- OFFSET = 2
VAR_DINT13	DINT	0	<- END_ADDR = "F-DB_1".VAR_DINT13

Example

The following example shows how the instruction works:





13.8.5 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

This instruction reads the tag addressed via INI_ADDR and OFFSET in an F-DB and provides it at output OUT.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB from which the tag is to be read is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

The INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted. Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFSET are contained in WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety V15.1) (S7-300, S7-400) (Page 544).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

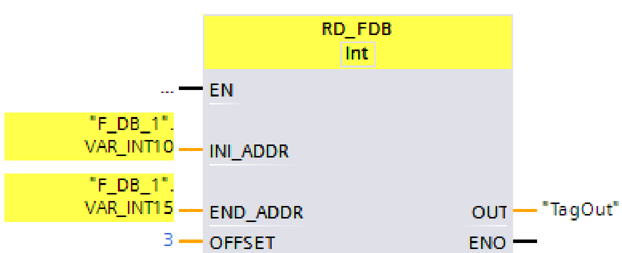
The following table shows the parameters of the instruction:

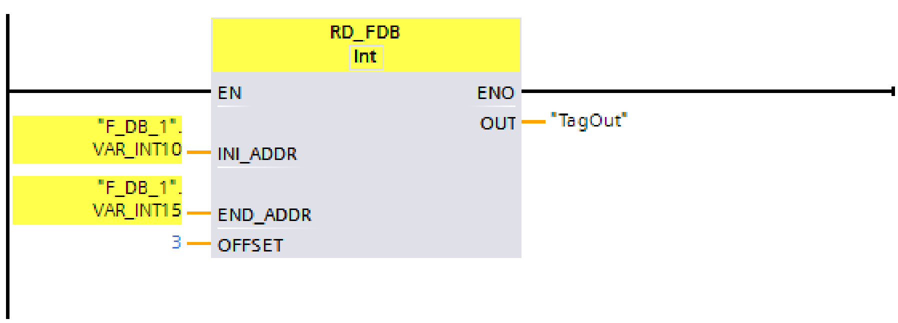
Parameter	Declaration	Data type	Description
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset
OUT	Output	INT, DINT	Value to be read from the F-DB

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





13.9 Conversion operations

13.9.1 CONVERT: Convert value (STEP 7 Safety V15.1)

Description

The "Convert value" instruction reads the content of parameter IN and converts it according to the data types selected in the instruction box. The converted value is output at the OUT output .

Enable input "EN" cannot be connected. The instruction is therefore always executed (regardless of the signal state at the "EN" enable input). The connection of the "ENO" enable output is only possible and required when converting from the "DINT" to the "INT" data type.

Note

When converting from "DINT" to the "INT" data type, you need to connect the ENO enable output and thereby programming overflow detection.

Note the following:

- If the value at the input is outside the INT range, ENO returns 0.
- The result of the instruction reacts like the analogous instruction in a standard block.

Parameters

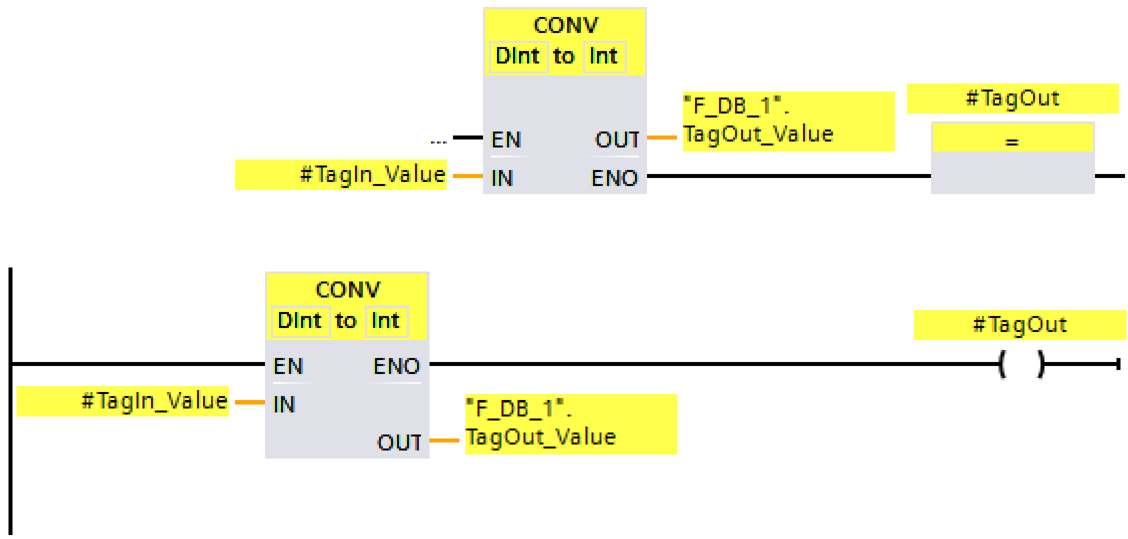
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ENO	Output	BOOL	Enable output
IN	Input	INT, DINT	Value to be converted.
OUT	Output	INT, DINT	Result of the conversion

You can select the data types of the instruction in the "<???>" drop-down lists of the instruction box. The supported conversions are from "INT to DINT" and "DINT to INT".

Example

The following example shows how the "Convert value "DINT to INT"" instruction for S7-1200/1500 F-CPUs works:



The instruction is always executed regardless of the signal state at enable input EN.

The value of the "TagIn_Value" operand is converted to an integer (16-bit) and the result is stored in the ""F_DB_1".TagOut_Value" operand.

When no overflow occurs during execution of the "Convert value "DINT to INT"" instruction, the ENO enable output has the signal state "1" and the "TagOut" operand is set.

You can also store the signal status of the ENO enable output in an (F-)DB, and centrally evaluate whether overflows have occurred for all or one group of instructions with overflow detection.

13.9.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V15.1)

Description

This instruction converts the 16 values of data type BOOL at inputs IN0 to IN15 to a value of data type WORD, which is made available at output OUT. The conversion takes place as follows: The i-th bit of the WORD value is set to 0 (or 1), if the value at input INi = 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN0	Input	BOOL	Bit 0 of WORD value
IN1	Input	BOOL	Bit 1 of WORD value
...			...
IN15	Input	BOOL	Bit 15 of WORD value
OUT	Output	WORD	WORD value consisting of IN0 to IN15

Instruction versions

A number of versions are available for this instruction:

Ver-sion	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

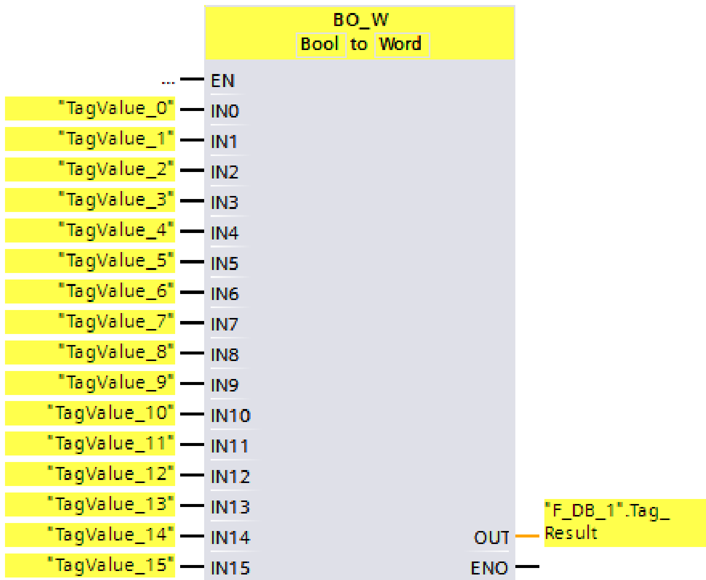
[2] supported for Firmware version V2.0 or higher

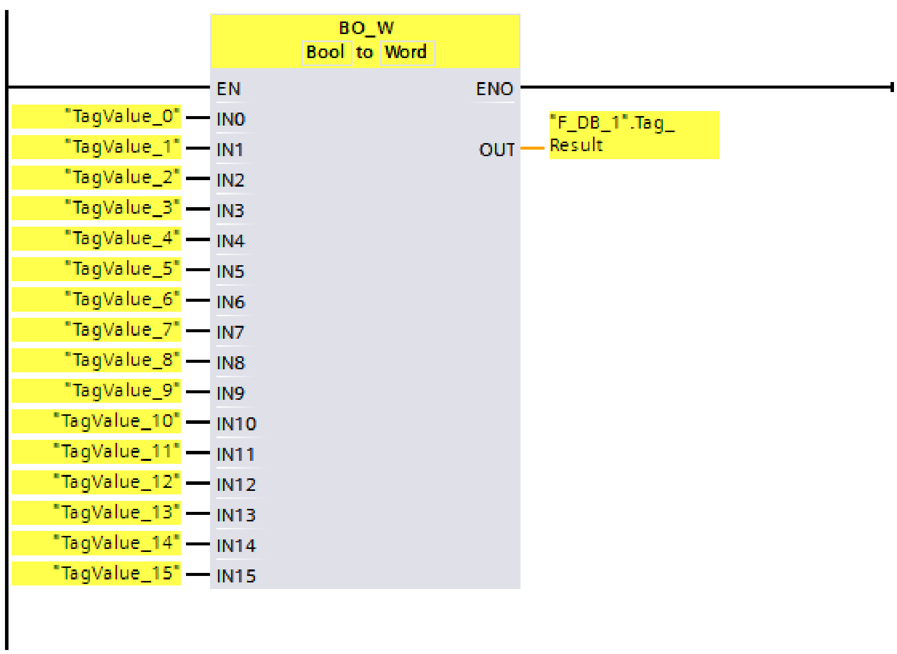
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN0	TagValue_0	FALSE
IN1	TagValue_1	FALSE
...		...
IN13	TagValue_13	FALSE
IN14	TagValue_14	TRUE
IN15	TagValue_15	TRUE
OUT	"F_DB_1".Result	W#16#C000

The values of operands "TagValue_0" to "TagValue_15" are combined into a value of the data type WORD and assigned to operand ""F_DB_1".TagResult".

13.9.3 W_BO: Convert a data element of data type WORD to 16 data elements of data type BOOL (STEP 7 Safety V15.1)

Description

This instruction converts the value of data type WORD at input IN to 16 values of data type BOOL, which are provided at outputs OUT0 to OUT15. The conversion takes place as follows: Output OUTi is set to 0 (or 1), if the i-th bit of the WORD value is 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	WORD value
OUT0	Output	BOOL	Bit 0 of WORD value
OUT1	Output	BOOL	Bit 1 of WORD value
...			...
OUT15	Output	BOOL	Bit 15 of WORD value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

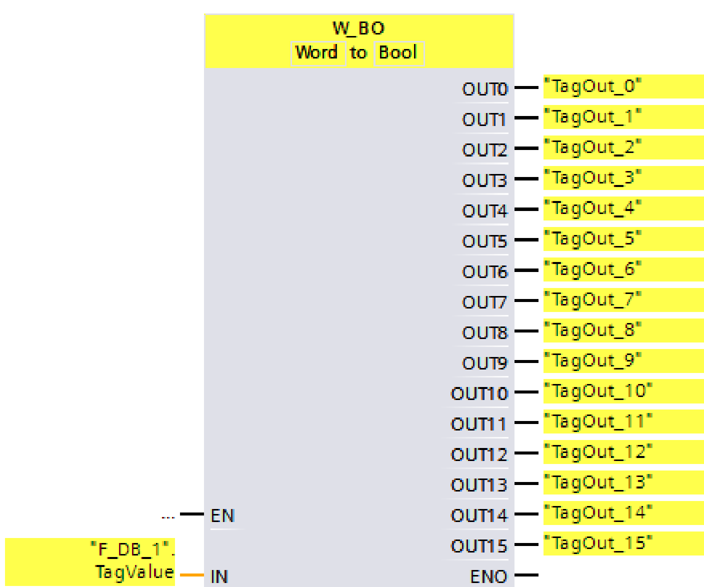
[2] supported for Firmware version V2.0 or higher

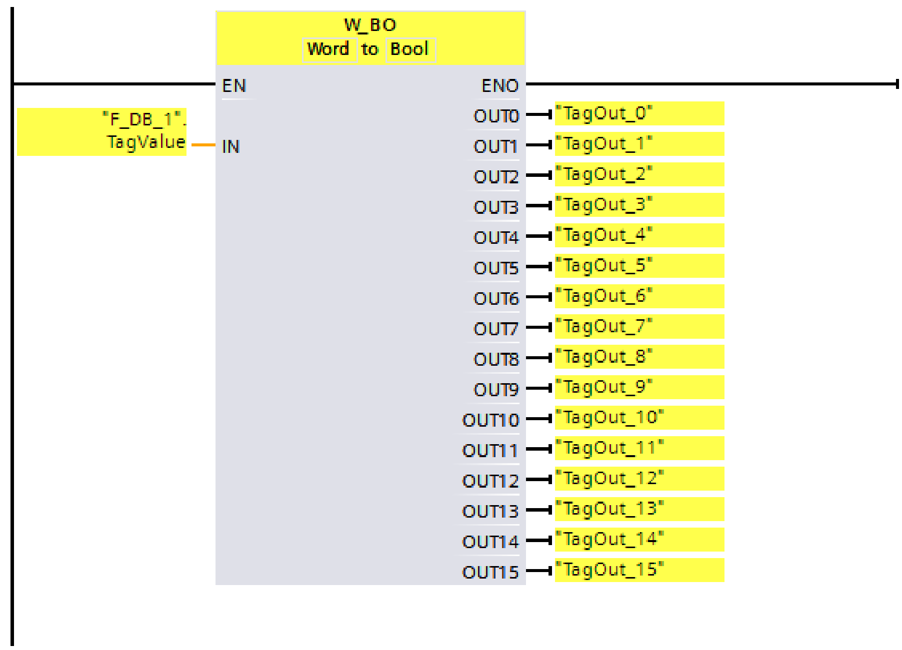
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagValue	W#16#C000
OUT0	TagOUT_0	FALSE
OUT1	TagOUT_1	FALSE
...		...
OUT13	TagOUT_13	FALSE
OUT14	TagOUT_14	TRUE
OUT15	TagOUT_15	TRUE

The value of operand ""F_DB_1".TagValue" of data type WORD is converted to the 16 values "TagOUT_0" to "TagOUT_15" of data type BOOL.

13.9.4 SCALE: Scale values (STEP 7 Safety Advanced V15.1)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale values" instruction must be assigned a data area in which the instruction data are stored. In addition, when the instruction is inserted in the program, the "Call options" dialog is automatically opened, where you can create a data block (single instance) (e.g., SCALE_DB_1) or a multi-instance (e.g., SCALE_Instance_1) for the "Scale values" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	INT	High limit value of value range of OUT
LO_LIM	Input	INT	Low limit value of value range of OUT
OUT	Output	INT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

---

Note

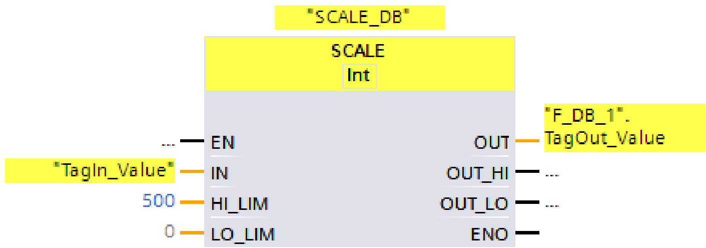
If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

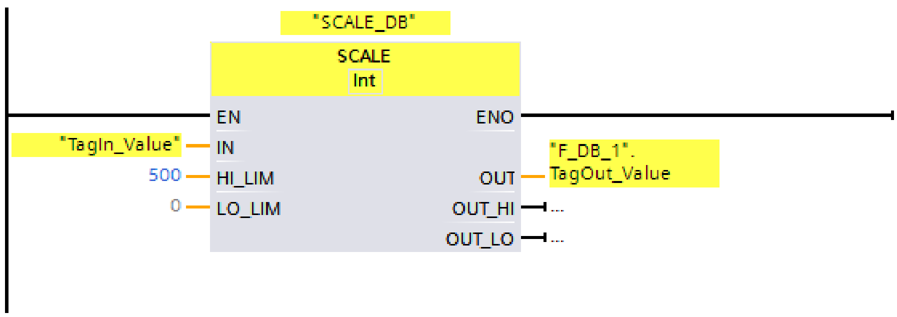
If other fail-safe values should be output in this case, you need to evaluate the QBAD signal of the associated F-I/O or QBAD_I_xx signal / value status of the corresponding channel.

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:





When operand "TagIn_Value" = 20000, the result for ""F_DB_1".TagOut_Value" is 361.

13.10 Program control operations

13.10.1 JMP: Jump if RLO = 1 (STEP 7 Safety V15.1)

Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (Page 562) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1" or the input is not connected, the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "0", the program continues executing in the next network.

Note

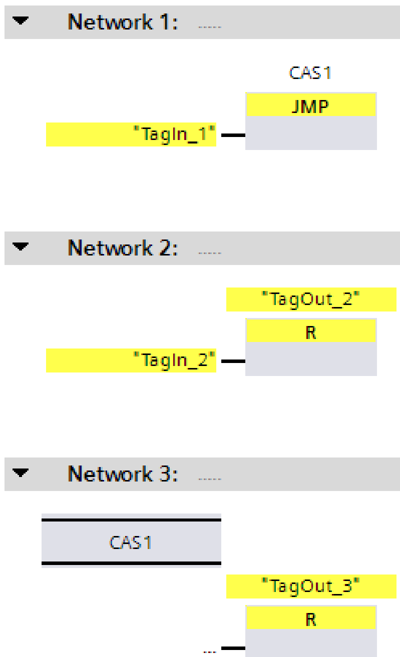
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

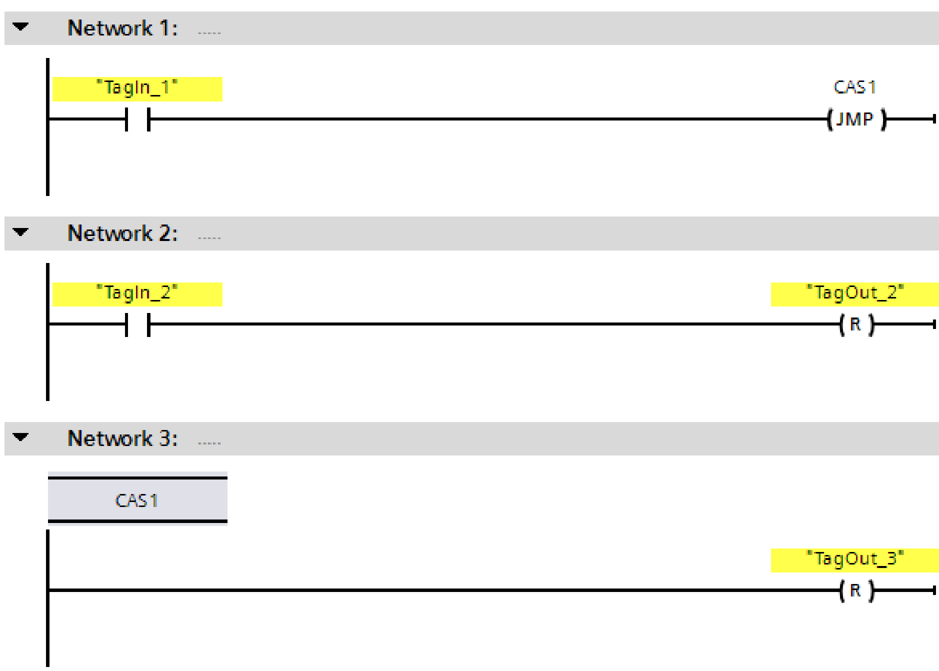
Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:





When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.10.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V15.1)

Description

You can use the "Jump if RLO = 0" instruction to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (Page 562) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "1", the program continues executing in the next network.

Note

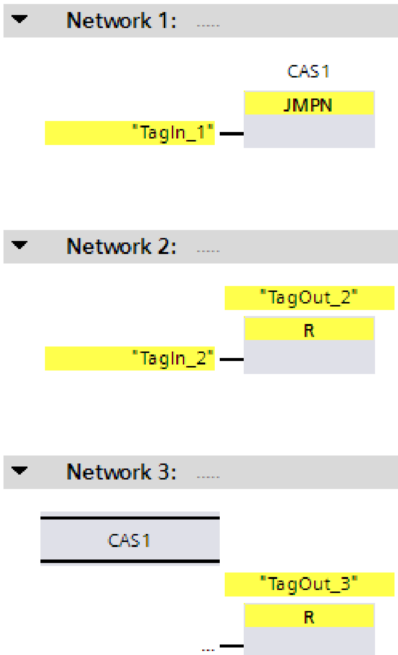
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

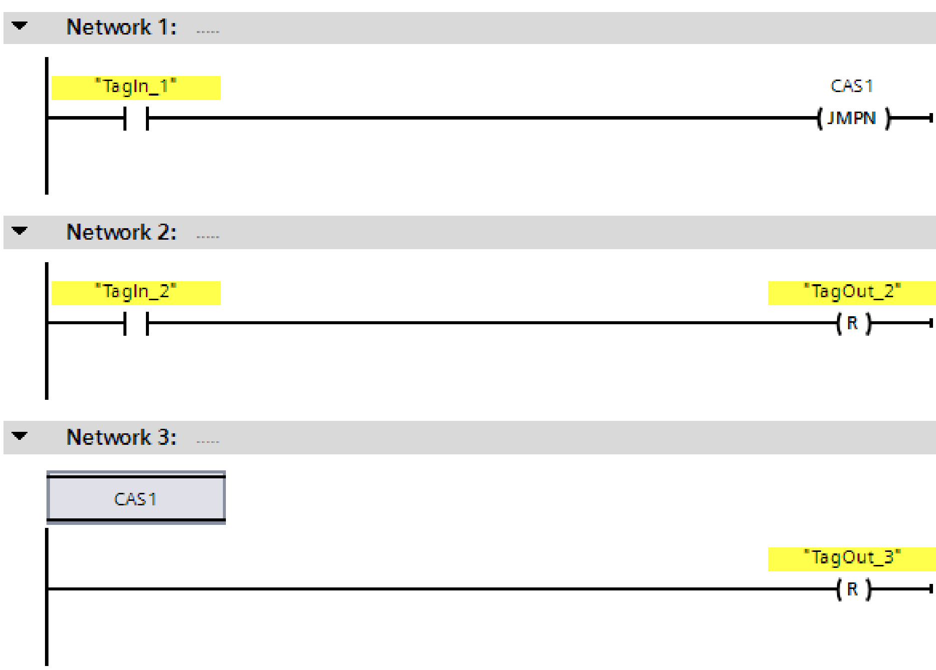
Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:





When operand "TagIn_1" has signal state "0", the "Jump if RLO = 0" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.10.3 LABEL: Jump label (STEP 7 Safety V15.1)

Description

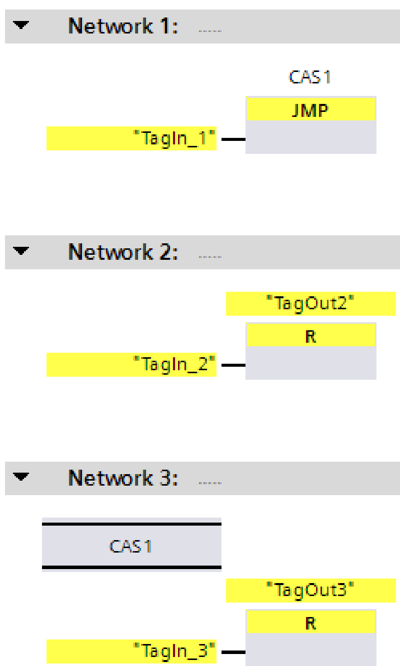
You can use a jump label to specify a destination network, in which the program execution should resume after a jump.

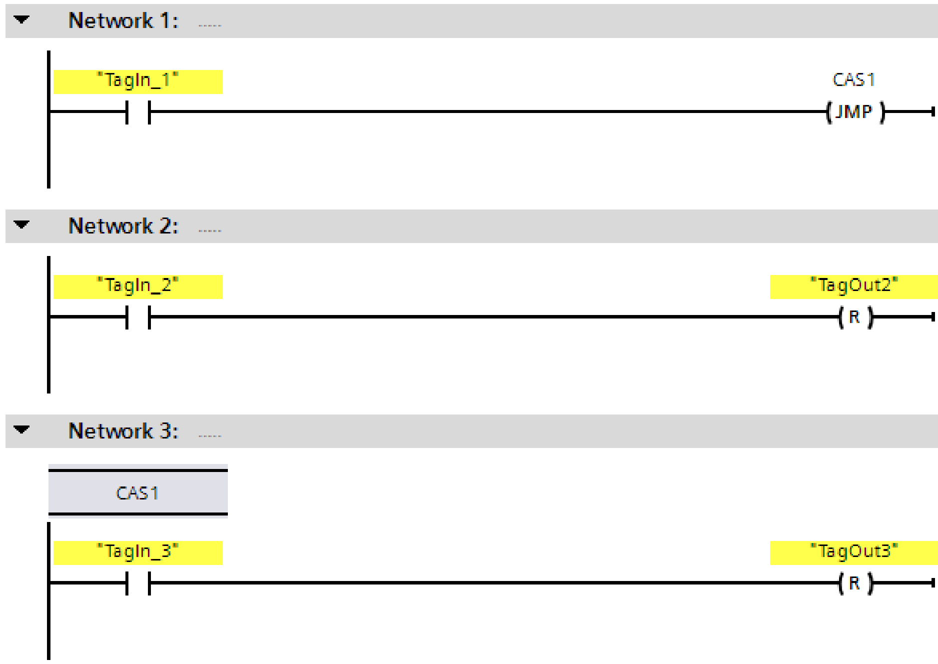
The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. To each jump label can be jumped from several locations.

Example

The following example shows how the instruction works:





When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

See also

JMP: Jump if RLO = 1 (STEP 7 Safety V15.1) (Page 558)

JMPN: Jump if RLO = 0 (STEP 7 Safety V15.1) (Page 560)

RET: Return (STEP 7 Safety V15.1) (Page 564)

13.10.4 RET: Return (STEP 7 Safety V15.1)

Description

You can use the "Return" instruction to stop the processing of a block.

If the result of logic operation (RLO) at the input of the "Return" instruction is "1" or the box input of the S7-1200/1500 F-CPUs is not connected in FBD, program execution is terminated in the currently called block and continued in the calling block (for example, in the main safety block) after the call function. If the RLO at the input of the "Return" instruction is "0", the instruction is not executed. Program execution continues in the next network of the called block.

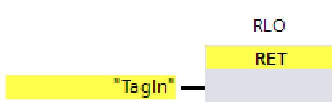
Influencing the status of the call function (ENO) is irrelevant, because the enable output "ENO" cannot be connected.

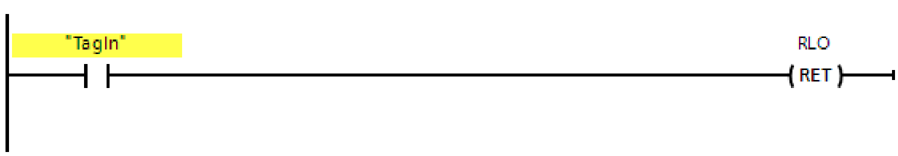
Note

(S7-300, S7-400) You may not program a RET instruction in the main safety block.

Example

The following example shows how the instruction works:





When the "TagIn" operand delivers signal state "1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block.

13.10.5 OPN: Open global data block (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

You can use the "Open global data block" instruction to open a data block. The number of the data block is transferred to the DB register. Subsequent DB commands access the relevant blocks depending on the register contents.

Note

Note when using the "Open global data block" instruction that the content of the DB register can be changed after calls of F-FB/F-FC and "fully qualified DB accesses", such that there is no guarantee that the last data block you opened with "Open global data block" is still open.

You should therefore use the following method for addressing data to avoid errors when accessing data of the DB register:

- Use symbolic addressing.
- Use only fully qualified DB accesses.

If you still want to use the "Open global data block" operation, you must ensure that the DB register is restored by repeating the "Open global data block" instruction following calls of F-FB/F-FC and "fully qualified DB accesses." Otherwise, a malfunction could result.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Data block>	Input	BLOCK_DB	Data block that is opened

"Fully qualified DB access"

The initial access to data of a data block in an F-FB/F-FC must always be a "fully qualified DB access," or it must be preceded by the "Open global data block" instruction. This also applies to the initial access to data of a data block after a jump label.

An example of "fully qualified DB access" and "non-fully qualified DB access" is provided in Restrictions in the programming languages FBD/LAD (Page 119).

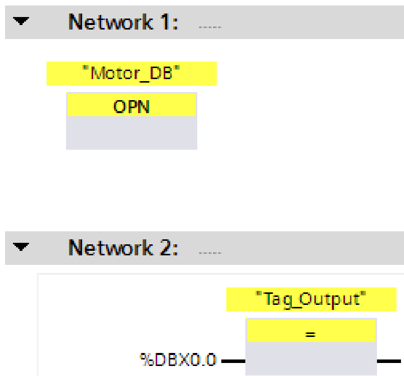
Access to instance DBs

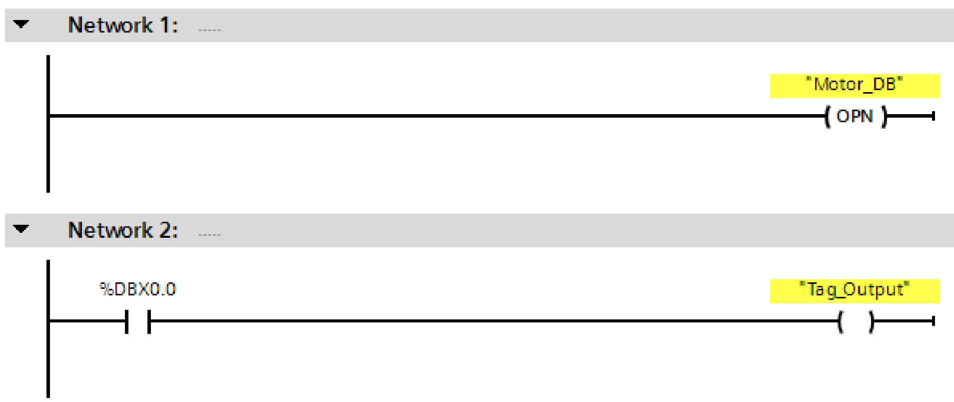
You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

Example

The following example shows how the instruction works:





The "Motor_DB" data block is called in network 1. The number of the data block is transferred to the DB register. The "DBX0.0" operand is queried in network 2. The signal state of the "DBX0.0" operand is assigned to the "Tag_Output" operand.

13.11 Word logic operations

13.11.1 AND: AND logic operation (STEP 7 Safety V15.1)

Description

You can use the "AND logic operation" instruction to combine the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

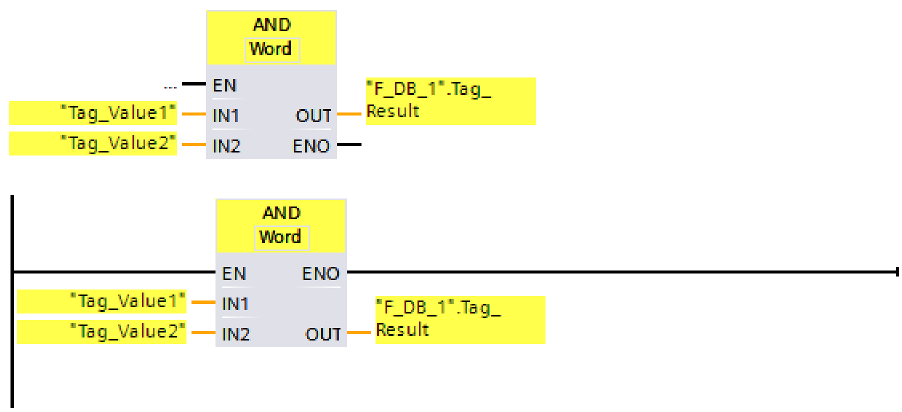
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"F_DB_1"."Tag_Result" = 00000000 00000101

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ANDed. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.11.2 OR: OR logic operation (STEP 7 Safety V15.1)

Description

You can use the "OR logic operation" instruction to connect the value at input IN1 input to the value at input IN2 bit-by-bit by OR logic and query the result at output OR.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ORed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The result bit has signal state "1" when at least one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

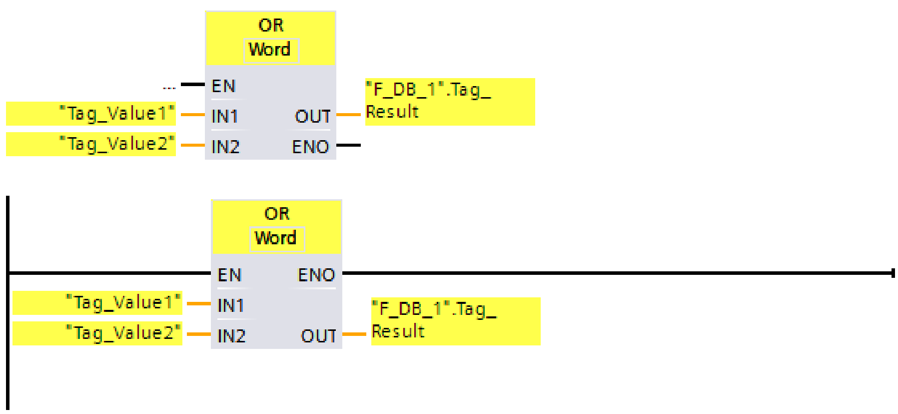
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"F_DB_1"."Tag_Result" = 01010101 01011111

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ORed. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.11.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V15.1)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at input IN1 and the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 input and bit 0 of the value at input IN2 are logically combined by EXCLUSIVE OR. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The result bit has signal state "1" when one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

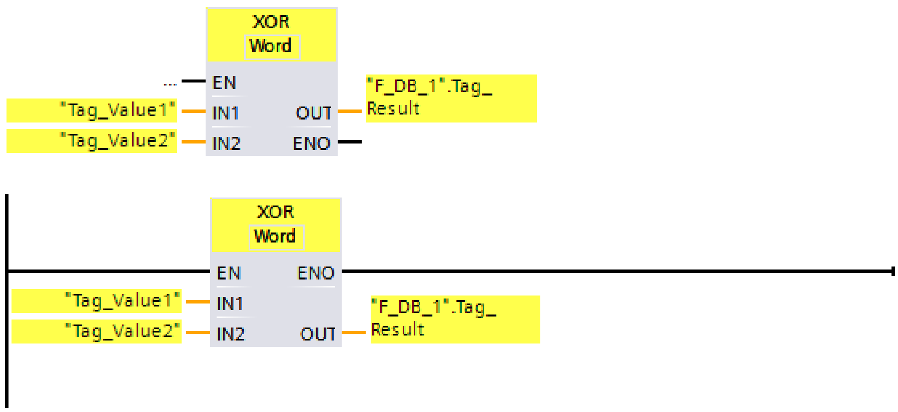
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	`"Tag_Value1" = 01010101 01010101`
IN2	`"Tag_Value2" = 00000000 00001111`
OUT	`"F_DB_1"."Tag_Result" = 01010101 01011010`

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are logically combined by EXCLUSIVE OR. The result is mapped bit-by-bit and output in the ""F_DB_1".Tag_Result" operand.

13.12 Shift and rotate

13.12.1 SHR: Shift right (STEP 7 Safety V15.1)

Description

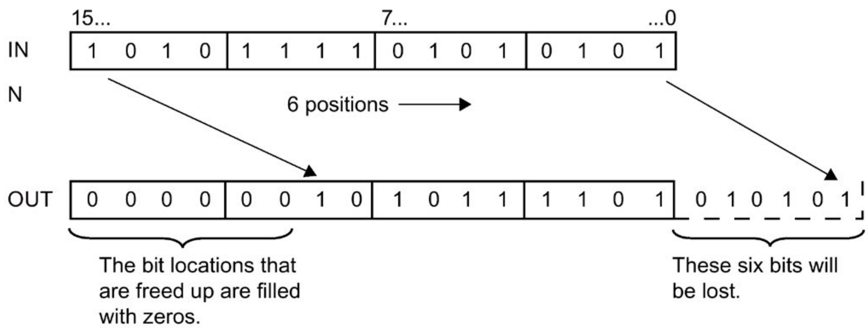
Use the "Shift right" instruction to shift the content of the operand at input IN bit-by-bit to the right and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The bit locations that are freed up in the left area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the right:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

Ver-sion	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

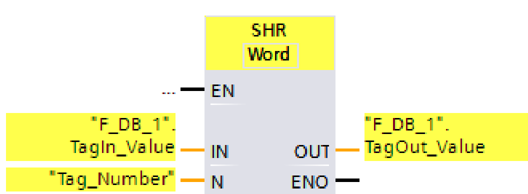
[2] supported for Firmware version V2.0 or higher

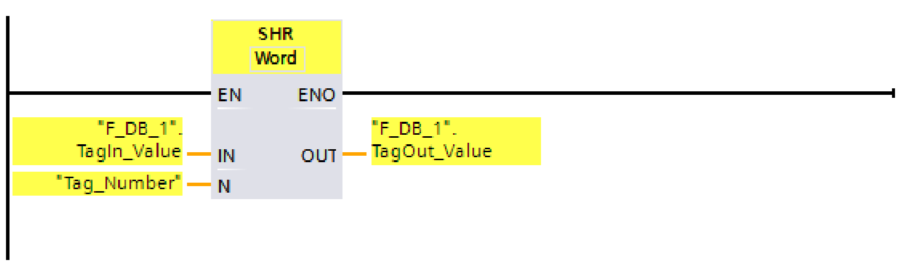
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	"F_DB_1".TagOut_Value	0000 0111 1111 0101

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand ""F_DB_1".TagIn_Value" is moved three bit positions to the right. The result is output at output ""F_DB_1".TagOut_Value".

13.12.2 SHL: Shift left (STEP 7 Safety V15.1)

Description

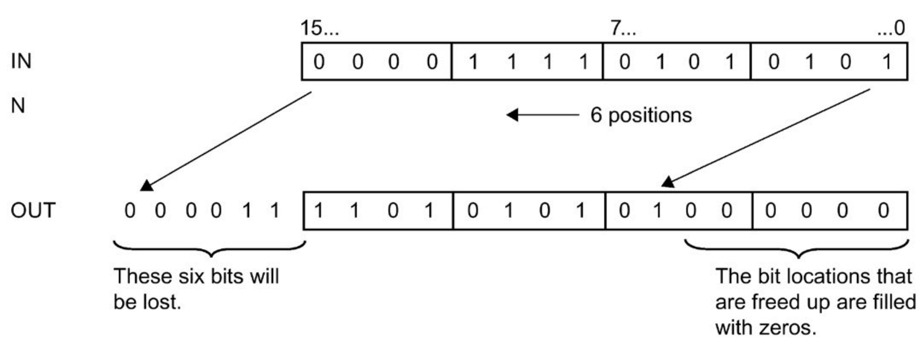
Use the "Shift left" instruction to shift the content of the operand at input IN bit-by-bit to the left and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions that are freed up in the right area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the left:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

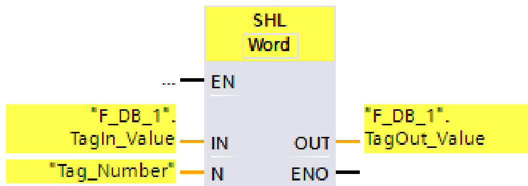
[2] supported for Firmware version V2.0 or higher

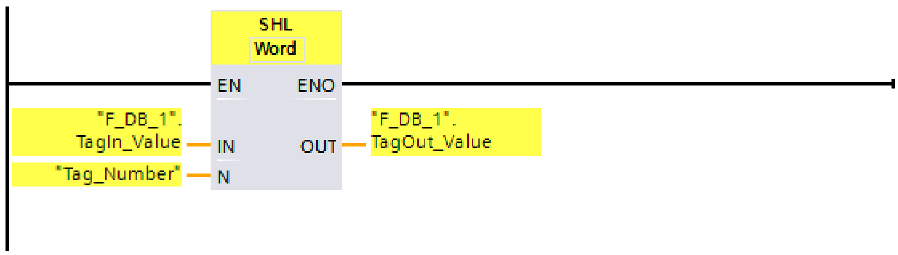
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	"F_DB_1".TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	"F_DB_1".TagOut_Value	1111 1010 1111 0000

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand ""F_DB_1".TagIn_Value" is moved four bit positions to the left. The result is output at output ""F_DB_1".TagOut_Value".

13.13 Operating

13.13.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V15.1)

Description (S7-300, S7-400)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to a value of 9 within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value of 9 after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value 9 within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value 9, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name.*(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.

You can provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Note

The configuration of your operator control and monitoring system does not have any effect on the collective F-signature.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Description (S7-1200, S7-1500)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to the value at the ACK_ID input within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value at the ACK_ID input after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value at the ACK_ID input within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value at the ACK_ID input, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING
The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them. Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.

You need to provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction.

Note

The supply of the IN input/output of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the F-collective signature, the F-SW collective signature or the signature of the block that calls the ACK_OP instruction.

Changes to the supply of the IN input/output or to the configuration of your operator control and monitoring system therefore do not result in a changed F-collective signature/F-SW collective signature/signature of the calling block.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters (S7-300, S7-400)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Parameters (S7-1200, S7-1500)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_ID	Input	INT	Identifier of the acknowledgment (9 to 30000)
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Instruction versions

A number of versions are available for this instruction:

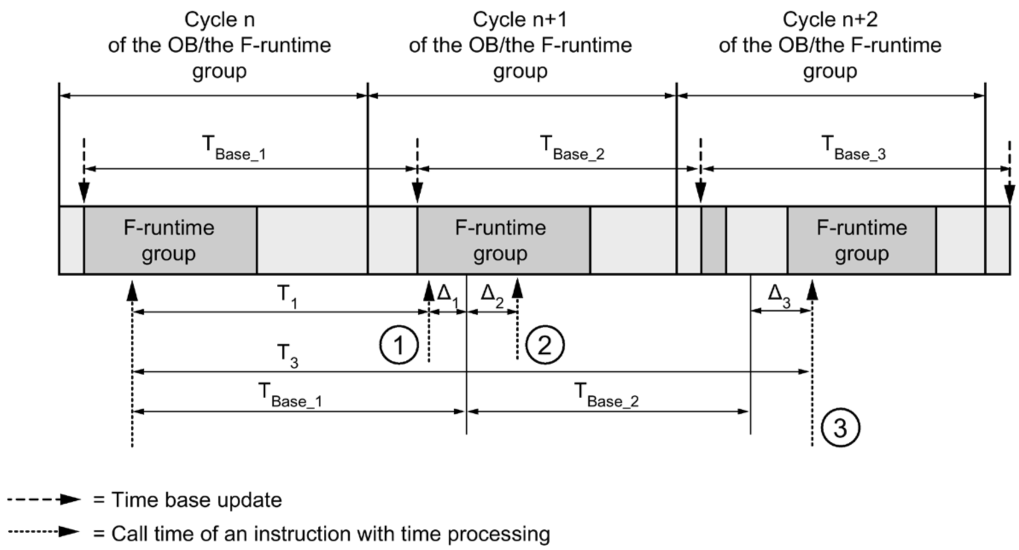
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions are identical in function to version V1.0 for S7-300/400 F-CPUs. The input ACK_ID must also be taken into consideration for S7-1200/1500 F-CPUs.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing imprecision resulting from the update time of the time base used in the instruction:



① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

An example how the instruction is used is available under Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 187).

See also

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 192)

13.14 Additional instructions

13.14.1 LAD

13.14.1.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" instruction functions like a normally open contact. If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".

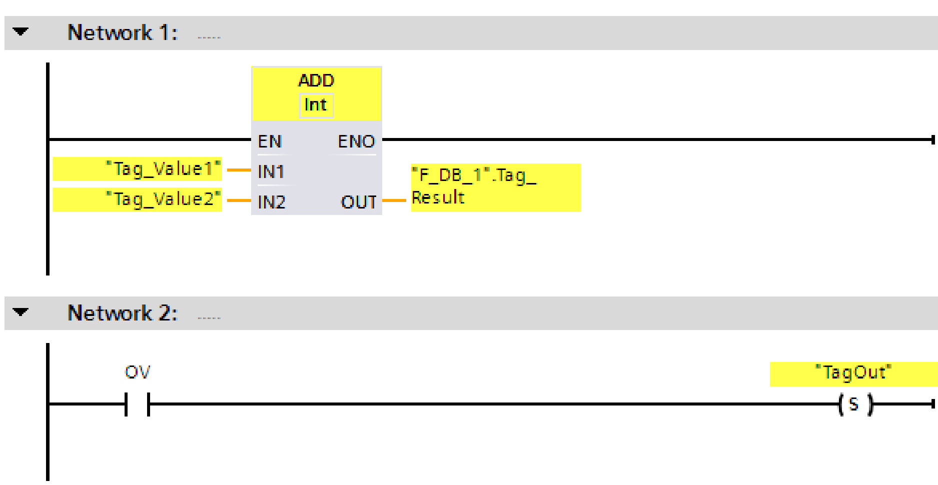
The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

Example

The following example shows how the instruction works:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.14.1.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

You can use the "Get negated status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed. This instruction is only available in LAD.

The "Get negated status bit OV" instruction functions like a normally closed contact. If the query is satisfied, the instruction has signal state "0". If the query is not satisfied, the instruction has signal state "1".

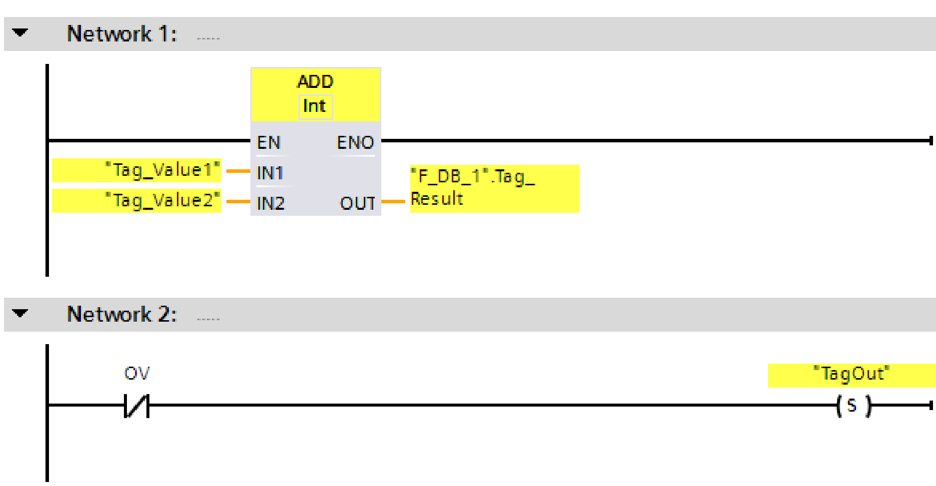
The "Get negated status bit OV" evaluation must be inserted in the network following the instruction that influences the OV. This network must not contain any jump labels.

Note

The execution time of the OV-affecting instruction is extended when the "Get negated status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

Example

The following example shows how the instruction works:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If an overflow does *not* occur during execution of the "Add" instruction, the status bit OV is reset to "0". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.14.2 FBD

13.14.2.1 OV: Get status bit OV (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".

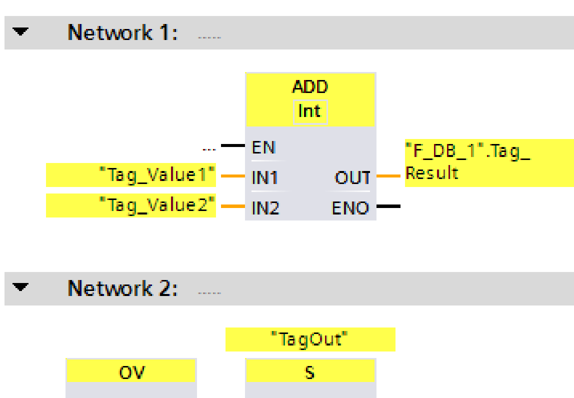
You can program a query of status bit OV for "0" with the "Invert RLO" instruction.

Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

Example

The following example shows how the instruction works:



The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the ""F_DB_1".Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.15 Communication

13.15.1 PROFIBUS/PROFINET

13.15.1.1 SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V15.1)

Introduction

You use the SENDDP and RCVDP instructions for fail-safe sending and receiving of data using:

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication

Description

The SENDDP instruction sends 16 data elements of data type BOOL and 2 data elements of data type INT or one data element of the data type DINT (S7-1200, S7-1500) in a fail-safe manner to another F-CPU via PROFIBUS DP/PROFINET IO. The data can be received there by the related RCVDP instruction.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g. RCVDP_DB_1) for these instructions. Once it is created, the new data block can be found in the "STEP 7 Safety" folder in the project tree under "Program blocks > System blocks". For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

With the SENDDP instruction, the data to be sent (for example, outputs of other F-blocks/instructions) are available at input SD_BO_xx or SD_I_xx or SD_DI_00 as alternative.

With the RCVDP instruction, the data received are available at outputs RD_BO_xx and RD_I_xx or RD_DI_00 as alternative for additional processing by other F-blocks/instructions.

(S7-1200, S7-1500) At the DINTMODE input of the SENDDP instruction you specify if the data at the inputs SD_I_00 and SD_I_01 or the data at the input SD_DI_00 is sent.

The operating mode of the F-CPU with the SENDDP instruction is provided at output SENDMODE. If the F-CPU with the SENDDP instruction is in disabled safety mode, output SENDMODE = 1.

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define the communication relationship between a SENDDP instruction in one F-CPU and a RCVDP instruction in the other F-CPU by specifying an F-communication ID at the DP_DP_ID inputs of the SENDDP and RCVDP instructions. Associated SENDDP and RCVDP instructions are assigned the same value for DP_DP_ID.

WARNING

The value for the respective F-communication ID (input DP_DP_ID; data type: INT) can be freely selected**; however, it must be unique for all safety-related communication connections network-wide* and CPU-wide at all times. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness and completeness of the communication configuration (Page 374).

You must supply constant values*** to the inputs DP_DP_ID and LADDR when calling the instruction. Direct write accesses in the associated instance DB to DP_DP_ID and LADDR are not permitted in the safety program! *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, no connection is established at the DP_DP_ID input for a F-communication ID "0".

*** S7-1200/1500: As of version V3.0 of the SENDDP and RCVDP instructions, the DP_DP_ID input can also be supplied with variable values from a global F-DB. In this case as well you have to check during the acceptance of the safety program that the uniqueness is ensured *at every moment*, by checking the algorithm for the creation of the variable value accordingly. If you cannot ensure a unique F-communication ID during startup of the safety program, because it is only specified after startup of the safety program, you must make sure that the value at the DP_DP_ID input is "0" during this phase.

Note

Within a safety program, you must assign a different start address (S7-300/400) or HW identifier (S7-1200/1500) for every call of the SENDDP and RCVDP instructions at input LADDR.

A separate instance DB must be used for each call of the SENDDP and RCVDP instructions. You must not declare and call these instructions as multi-instances.

(S7-300/400) The inputs of the RCVDP and RCVS7 instructions may not have preceding logic operations (for example "AND logic operation").

The inputs of the RCVDP instruction cannot be initialized using fully qualified DB accesses with outputs of a RCVDP or RCVS7 instruction called in an upstream network.

(S7-1200/1500) The RD_D_00 output must not be evaluated for DINTMODE = 0; the RD_I_xx outputs of the RCVDP instruction must not be evaluated for DINTMODE = 1.

(S7-1200/1500) The outputs of the SENDDP and RCVDP instructions must not be supplied with tags from the standard user program. Exception: RET_DPRD, RET_DPWR and DIAG outputs.

Fully qualified access to DP_DP_ID and LADDR is not possible in the safety program.

You cannot use an actual parameter for an output of an RCVDP instruction, if it is already being used for an input of the same or another RCVDP or RCVS7 instruction.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You are not permitted to insert any SENDDP/RCVDP instructions between a JMP or JMPN instruction and the associated jump destination (jump label).

You cannot insert a RET instruction prior to a SENDDP instruction.

SENDDP parameter

The following table shows the parameters of the SENDDP instruction:

Parameter	Declaration	Data type	Description
SD_BO_00	Input	BOOL	Send data BOOL 00
...			...
SD_BO_15	Input	BOOL	Send data BOOL 15
SD_I_00	Input	INT	Send data INT 00
SD_I_01	Input	INT	Send data INT 01
SD_DI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Send data DINT 00
DINTMODE	Input	DINT	(S7-1200, S7-1500) (hidden) 0=SD_I_00 u. SD_I_01 are sent 1=SD_DI_00 is sent
DP_DP_ID	Input	INT	F-communication ID between SENDDP and RCVDP
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 607))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=RCVDP outputs fail-safe values
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other")).
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other")).
DIAG	Output	BYTE	Non-fail safe service information

RCVDP parameter:

The following table shows the parameters of the RCVDP instruction:

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	1=Acknowledgment for reintegration of send data following communication error
SUBBO_00	Input	BOOL	Fail-safe value for receive data BOOL 00
...			...
SUBBO_15	Input	BOOL	Fail-safe value for receive data BOOL 15
SUBI_00	Input	INT	Fail-safe value for receive data INT 00
SUBI_01	Input	INT	Fail-safe value for receive data INT 01
SUBDI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Fail-safe value for receive data DINT 00
DP_DP_ID	Input	INT	F-communication ID between SENDDP and RCVDP
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 607))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with SENDDP instruction in disabled safety mode
RD_BO_00	Output	BOOL	Receive data BOOL 00
...			...
RD_BO_15	Output	BOOL	Receive data BOOL 15
RD_I_00	Output	INT	Receive data INT 00
RD_I_01	Output	INT	Receive data INT 01
RD_DI_00	Output	DINT	(S7-1200, S7-1500) (hidden) Receive data DINT 00
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other")).

Parameter	Declaration	Data type	Description
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other")).
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.4	x	—	x	
1.3	x	—	o	S7-300/400: These versions have identical functions to version V1.0. S7-1200/1500: Instead of 2 data of data type INT, one data of data type DINT can be sent/received as alternative. Otherwise identical function as version V1.0.
1.5	x	x	x	
2.0	x	x[1]	x[2]	
3.0	x	x[1]	x[2]	S7-300/400: This version has identical functions to version V2.0. S7-1200/1500: • The DP_DP_ID input can also be supplied with tags of a global F-DB. In case of DP_DP_ID = 0 no connection is established. • Supports the data status byte of the PN/PN coupler as of V4.0 • Supports the simulation of the communication in S7-PLCISM operation Otherwise functionally identical to version V2.0

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

[2] supported for Firmware version V2.0 or higher

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

You need to insert the RCVDP instruction *either* at the start of the main safety block *or* (with S7-1200/1500 F-CPUs) in an F-FB/F-FC called directly at the start of the main safety block. No other instructions can be located before in the main safety block and no other instructions can be located before or afterwards in the F-FB/F-FC.

You need to insert the SENDDP instruction *either* at the end of the main safety block *or* (with S7-1200/1500 F-CPUs) in an F-FB/F-FC called directly at the end of the main safety block. No other instructions can be located afterwards in the main safety block and no other instructions can be located before or afterwards in the F-FB/F-FC.

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDDP and RCVDP instructions). During this time, the receiver (RCVDP instruction) outputs the fail-safe values present at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00.

The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON. The SENDMODE output has default setting "0" and is not updated as long as output SUBS_ON = 1.

As of version V3.0 of the SENDDP and RCVDP instructions, communication is only established when DP_DP_ID <> 0.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires or for F-CPUs S7-1200/1500 as of V3.0 due to a change of the DP_DP_ID to 0 after establishment of communication, the outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVDP instruction) then outputs the fail-safe values assigned at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs. Output SENDMODE is not updated while output SUBS_ON = 1.

The send data of the SENDDP instruction present at inputs SD_BO_xx and SD_I_xx, SD_DI_00 as alternative, are only output again when communication errors are no longer detected (ACK_REQ = 1) and you acknowledge (Page 187) the RCVDP instruction with a positive edge at input ACK_REI.

Communication errors also occur if the values of the DP_DP_IDs between associated SENDDP and RCVDP are temporarily different on a change of the values of variable DP_DP_IDs after communication establishment.

WARNING

For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

An interconnection with an automatically generated signal is not permitted.* *(S040)*

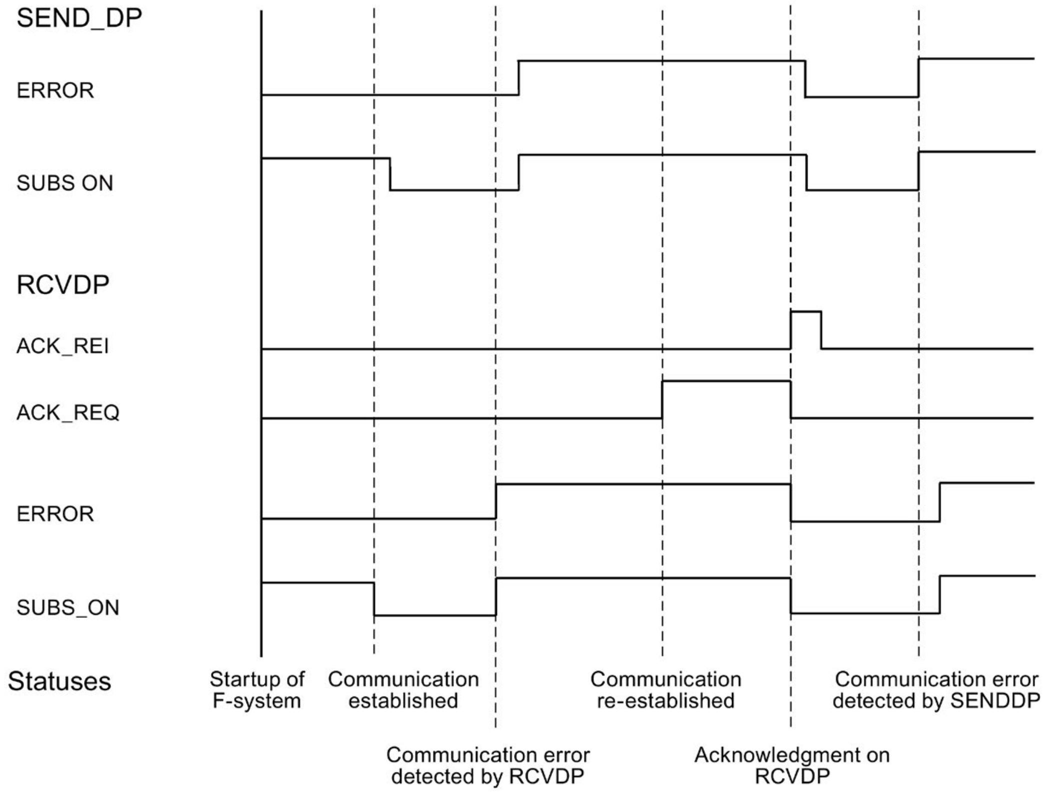
* If variable F-communication IDs are used, the communication partner of the SENDDP or RCVDP instructions can be changed during running operation. The resultant communication errors may only be acknowledged with an automatically generated signal at the ACK_REI input under the following conditions:

- The F-program reliably forms a signal "Communication partner change is in progress" with the RCVDP instruction on the basis of the process state.
- The signal "Communication partner change is in progress" is only formed if there is no communication error.
- While the signal "Communication partner change is in progress" is active, no evaluation of the received process values is carried out at the RCVDP instruction.
- The automatic acknowledgement is only carried out if the "Communication partner change is in progress" signal is available.
- From a safety standpoint automatic reintegration is permitted for the relevant process.

Note that output ERROR (1=communication error) for a communication error will not be set unless communication between the connection partners (SENDDP and RCVDP instructions) has been previously established. If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDDP and the RCVDP instructions, and the bus connection. You also obtain information on possible error causes by evaluating outputs DIAG, RET_DPRD and RETDP_WR.

In general, always evaluate RET_DPRD and RETDP_WR, since it is possible that only one of the two outputs will contain error information.

Timing diagrams SENDDP/RCVDP



Output DIAG

In addition, non-fail-safe information about the type of communication errors that occurred is provided at output DIAG of the SENDDP and RCVDP instructions for service purposes.

You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge the errors at input ACK_REI of the RCVDP instruction.

Structure of DIAG of the SENDDP/RCVDP instruction

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Invalid DP_DP_ID	The DP_DP_ID is 0.	Check the DP_DP_ID of SENDDP or RCVDP.
Bit 4	Timeout of SENDDP/RCVDP detected	The standard program overwrites transfer areas of SENDDP and RCVDP.	Check the standard program for writing accesses into the transfer areas of SENDDP and RCVDP. Please also take indirect accesses into account.
		DP_DP_ID of SENDDP and RCVDP different.	Check the DP_DP_ID of SENDDP and RCVDP.
		For variable F-communication IDs the values are changed at the DP_DP_ID input.	When the DP_DP_ID of SENDDP and RCVD is consistent again, perform an acknowledgment at the ACK_REI input.
		Interference in bus connection to partner F-CPU.	Check the bus connection and ensure that there are no external sources of interference.
		Monitoring time setting for F-CPU and partner F-CPU is too low.	Check the parameterized monitoring time TIMEOUT at SENDDP and RCVDP of both CPUs. Set a higher value if necessary. Recompile the safety program.
		Configuration of the DP/DP coupler or PN/PN coupler is invalid.	Check the configuration of the DP/DP coupler or of the PN/PN coupler.
		Data validity indicator "DIA" of the DP/DP coupler is "ON".	Set the data validity indicator "DIA" at the DIL switch of the DP/DP coupler to "OFF".
		Parameter "Data validity indicator DIA" of the PN/PN coupler is activated.	Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler.
		Parameter "Activate data status" of the PN/PN coupler (as of V4.0) is activated.	Deactivate the "Activate data status" parameter in the properties for the PN/PN coupler (as of V4.0) or S7-1200/1500: Use Version V3.0 of the SENDDP and RCVDP instructions.
		Internal fault of DP/DP coupler or PN/PN coupler	Replace the DP/DP coupler or PN/PN coupler
		CP in STOP mode, or internal fault in CP	Switch the CP to RUN. Check the diagnostics buffer of the CP. If necessary, replace the CP.
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	Switch the F-CPUs to RUN. Check the diagnostics buffer of the F-CPUs. If necessary, replace the F-CPUs.
Bit 5	Sequence number error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4

Bit no.	Assignment	Possible error causes	Remedies
Bit 6	CRC-error of SENDDP/RCVDP detect-ed	See description for bit 4	See description for bit 4
		DP_DP_ID of SENDDP and RCVDP different	Check DP_DP_ID of SENDDP and RCVDP
Bit 7	Reserved	—	—

13.15.2 S7 communication

13.15.2.1 SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V15.1) (S7-300, S7-400)

Introduction

You use the SENDS7 and RCVS7 instructions for fail-safe sending and receiving of data using S7 connections.

Note

In *STEP 7 Safety Advanced*, S7 connections are generally permitted over Industrial Ethernet only.

Safety-related communication via S7 connections is possible from and to F-CPUs with PROFINET interface or S7-400 F-CPUs with PROFINET-capable CPs. See also Safety-related communication via S7 connections (Page 248).

Description

The SENDS7 instruction sends the send data contained in an F-communication DB to the F-communication DB of the associated RCVS7 instruction of another F-CPU in a fail-safe manner using an S7 connection.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SENDS7_DB_1) or a multi-instance (e.g., SENDS7_Instance_1) for this instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Information on the F-communication DB is contained in "Programming safety-related communication via S7 connections (Page 251)".

An F-communication DB is an F-DB for safety-related CPU-CPU communication with special properties. You must specify the numbers of the F-communication DBs at inputs SEND_DB and RCV_DB of instructions SENDS7 and RCVS7.

The operating mode of the F-CPU with the SENDS7 instruction is provided at output SENDMODE of the RCVS7 instruction. If the F-CPU with the SENDS7 instruction is in disabled safety mode, then output SENDMODE = 1.

To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND with "0" (default = "1"). In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction, and the receiver provides fail-safe values for this period of time (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.

You must specify the local ID - from the perspective of the F-CPU - of the S7 connection (from the connection table in the network view) at input ID of the SENDS7 instruction (see also Configuring (Page 43)).

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define a communication relationship between an SENDS7 instruction in one F-CPU and a communication relationship between an RCVS7 instruction and the other F-CPU by assigning an odd number at input R_ID (of the SENDS7 and RCVS7 instructions). Associated SENDS7 and RCVS7 instructions receive the same value for R_ID.

WARNING

The value for the respective F-communication ID (input R_ID; data type: DWORD) can be freely selected; however, it must be odd for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Note

A separate instance DB must be used for each call of the SENDS7 and RCVS7 instructions within a safety program. You must not declare and call these instructions as multi-instances.

The inputs of the RCVS7 instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVS7 or RCVDP instruction called in an upstream network.

You cannot use an actual parameter for an output of an RCVS7 instruction, if it is already being used for an input of the same or another RCVS7 or RCVDP instruction.

The F-CPU can go to STOP if this is not observed. A diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You must not program any SENDS7/RCVS7 instruction between a JMP or JMPN instruction and the associated destination network of the JMP or JMPN instruction.

You cannot program a RET instruction prior to a SENDS7 instruction.

SENDS7 parameter

The following table shows the parameters of the SENDS7 instruction:

Parameter	Declaration	Data type	Description
SEND_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 607))
EN_SEND	Input	BOOL	1= Send enable
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for a F-communication ID between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Receiving block outputs fail-safe values
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail safe service information

RCVS7 parameter

The following table shows the parameters of the RCVS7 instruction.

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	Acknowledgment for reintegration of send data after communication error
RCV_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 607))
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for a F-communication ID between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with the SENDS7 instruction in disabled safety mode
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1500	Function
1.0	x	—	
1.1	x	—	This version has identical functions to version V1.0. It also supports later versions of internally called instructions. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.1 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.2	x	—	This version has identical functions to version V1.0/1.1. It also supports later versions of internally called instructions.

When a new F-CPU is created with *STEP 7 Safety Advanced*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

You must insert the RCVS7 instruction at the start of the main safety block. No other instructions may be located before it in the main safety block.

You must insert the the SENDS7 instruction at the end of the main safety block. No other instructions may be located after it in the main safety block.

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDS7 and RCVS7 instructions). The receiver (RCVS7 instruction) provides fail-safe values for this time period (initial values in its F-communication DB).

The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON. The SENDMODE output (RCVS7 instruction) has default setting "0" and is not updated as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVS7 instruction) then provides fail-safe values (initial values in its F-communication DB). Output SENDMODE is not updated while output SUBS_ON = 1.

The send data present in the F-communication DB (SENDS7 instruction) are not output before the communication error is no longer detected (ACK_REQ = 1) and you acknowledge (Page 187) with a positive edge at input ACK_REI of the RCVS7 instruction.

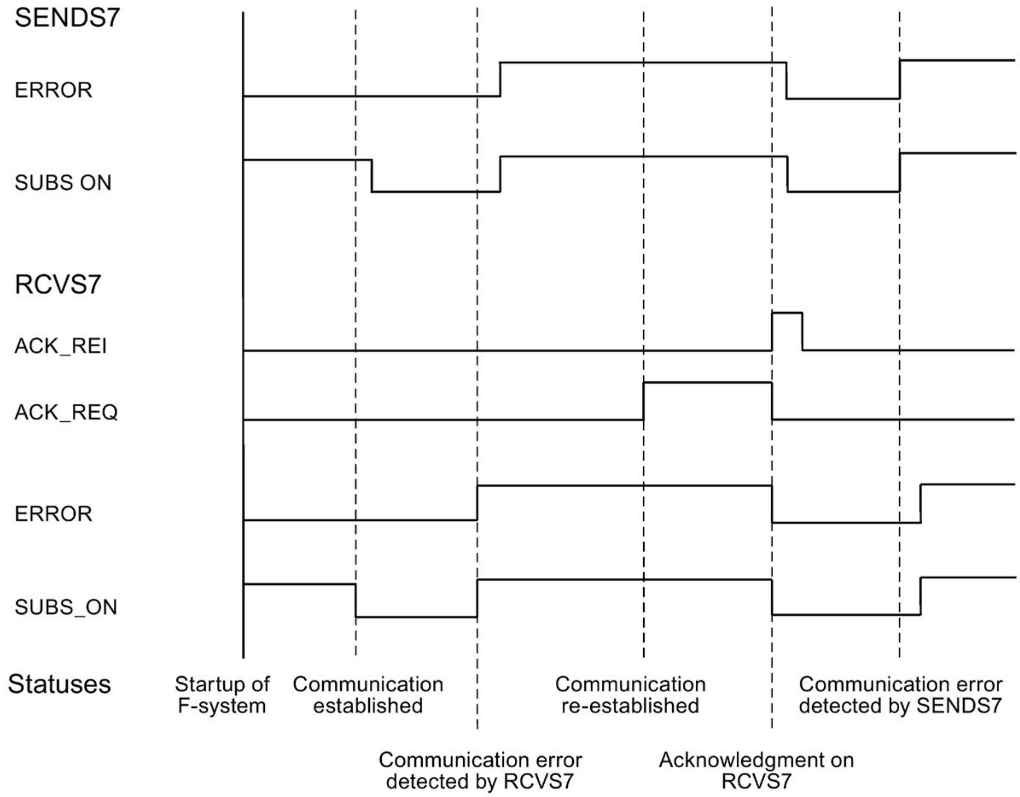
WARNING
For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input. An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) will be set for the first time on a communication error if communication has already been established between the connection partners (SENDS7 and RCVS7 instructions). If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions, and the bus connection. You can also receive information on possible error causes by evaluating the STAT_RCV and STAT_SND outputs.

In general, always evaluate STAT_RCV and STAT_SND, since it is possible that only one of the two outputs will contain error information.

If one of the DIAG bits is set at output DIAG, also check whether the length and structure of the associated F-communication DB on both the sending and receiving ends match.

Timing diagrams SENDS7 and RCVS7



Output DIAG

Non-fail-safe information on the type of communication errors that have occurred is made available at output DIAG for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge them at input ACK_REI of the associated RCVS7 instruction.

Structure of DIAG

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout detected by SENDS7 and RCVS7	Fault in bus connection to partner F-CPU	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low	Check assigned monitoring time TIMEOUT for SENDS7 and RCVS7 of both F-CPUs. If possible, set a higher value. Recompile safety program
		CPs in STOP mode, or internal fault in CPs	• Switch CPs to RUN mode • Check diagnostic buffer of CPs • Replace CPs, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	• Switch F-CPUs to RUN mode • Check diagnostic buffer of F-CPUs • Replace F-CPUs, if necessary
		Communication was shut down with EN_SEND = 0.	Enable communication again at the associated SENDS7 with EN_SEND = 1
		S7 connection has changed, the IP address of the CP has changed, for example	Recompile the safety programs and download them to the F-CPUs
Bit 5	Sequence number error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 6	CRC-error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 7	RCVS7: Communication cannot be established	Configuration of the safety-related CPU-CPU communication is incorrect, parameter assignment of the SENDS7 and RCVS7 instructions is incorrect See also description for Bit 4	Check configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions is incorrect See also description for Bit 4
	SENDS7: Reserved	—	—

Monitoring and response times

A

Introduction

In the following, you will learn:

- Which F-specific monitoring times you must configure
- Which rules must be followed when specifying monitoring times
- Where you enter the F-specific monitoring times
- Which rules must be followed with regard to the maximum response time of a safety function

Support for calculations

An Excel file is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100) to assist you in calculating approximately the runtimes of the F-runtime groups, the minimum F-specific monitoring times, and the maximum response times of your F-System.

Additional information

The monitoring and response times for the standard part are calculated in SIMATIC Safety in exactly the same way as for standard S7-300, S7-400, S7-1200 and S7-1500 automation systems and are not addressed here. For a description of this calculation, refer to the *hardware manuals for the CPUs*.

A.1 Configuring monitoring times

Monitoring times to be configured

You must configure the following monitoring times:

Monitoring...	Setting...	Parameters	See
F-cycle time or cycle time warning limit of the F-runtime groups that contain the safety program	in *Safety Administration Editor*: • Dialog for definition of an F-runtime group	Maximum cycle time of the F-runtime group	• Procedure for defining an F-runtime group (S7-300, S7-400) (Page 134) • Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 137)
of the safety-related communication between F-CPU and F-I/O via PROFIsafe (PROFIsafe monitoring time)	In the *hardware and network editor*: • Centrally when configuring the F-CPU; properties of the F-CPU; or • when configuring the F-I/O; properties of the F-I/O	F-monitoring time F_WD_TIME	• Configuring an F-CPU (Page 48) • Configuring F-I/O (Page 53) • Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 77)
of the safety-related CPU-CPU communication	At the TIMEOUT input of the instructions: • SENDDP; RCVDP; SENDS7; RCVS7	TIMEOUT	• Communication (Page 588)
(S7-1200, S7-1500) Communication with Flexible F-Link	in Safety Administration Editor: • "Flexible F-Link" area	F-monitoring time of F-communication	• "Flexible F-Link" area (S7-1200, S7-1500) (Page 96) • F-runtime group communication (S7-1200, S7-1500) (Page 145) • Configuring and programming communication with Flexible F-Link (S7-1200, S7-1500) (Page 262)

(S7-300, S7-400) You do not have to configure the monitoring time for safety-related communication between F-runtime groups.

Rules for configuring monitoring times

When configuring monitoring times, you must take into account the availability as well as the safety of the F-system as follows:

- Availability: To ensure that the time monitoring is not triggered when there is no error, the monitoring times selected must be sufficiently long.
- Safety: To ensure that the process safety time is not exceeded for the process, the monitoring times selected must be sufficiently short.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned F-monitoring time. *(S018)*

General procedure for configuring monitoring times

Use the following procedure for configuring monitoring times:

1. Configure the standard system.

   Refer to the applicable *hardware manuals* and *Help on STEP 7* for the necessary information.
2. Configure the specific monitoring times of the F-System with respect to availability. You use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to calculate the approximate minimum monitoring time.
3. Use the Excel file for response time calculation to calculate the maximum response time and then verify that the process safety time of the process is not exceeded. If necessary, you must reduce the specific monitoring times of the F-System.

A.1.1 Minimum monitoring time for the F-runtime group cycle time

Parameter "Maximum cycle time of the F-runtime group"

You configure the monitoring time for the F-runtime group cycle time in the *Safety Administration Editor* in the work area for definition of the F-runtime group (Page 132).

To prevent F-runtime group cycle time monitoring from being triggered when there are no pending faults and causing the F-CPU to go to STOP, you must set the maximum cycle time of the F-runtime group high enough.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to determine the minimum monitoring time for the F-runtime group cycle time. Note also the comments in the Excel file.

For S7-1200/1500 F-CPUs, you can also use the "Cycle time warning limit of F-runtime group (Page 137)", "Maximum cycle time of F-runtime group (Page 137)" and the tags TCYC_CURR (Page 148) and TCYC_LONG (Page 148) for dimensioning.

A.1.2 Minimum monitoring time for safety-related communication between F-CPU and F-I/O

Parameter "F-monitoring time"

You have two options for configuring the monitoring time of safety-related communication between the F-CPU and F-I/O:

- Centrally in the *hardware and network editor* during parameter assignment of the F-CPU (Page 48); in the properties of the F-CPU, or
- During parameter assignment of the F-I/O (Page 53) in the *hardware and network editor*, in the properties of the F-I/O

"F-monitoring time" = PROFIsafe monitoring time T_{PSTO}

The specified PROFIsafe monitoring time T_{PSTO} must be high enough to prevent tripping the F-cycle time monitoring when no faults are present.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) available for SIMATIC Safety to calculate the minimum monitoring time for safety-related communication between the F-CPU and F-I/O.

Note also the comments in the Excel file.

Check to determine whether configured PROFIsafe monitoring time is too short

Note

During commissioning of the F-system, you can perform a check while safety mode is active to determine whether the configured PROFIsafe monitoring time is too short.

This check of the PROFIsafe monitoring time is useful if you want to ensure that the configured monitoring time exceeds the minimum monitoring time by a sufficient amount. In this way, you can avoid the possible occurrence of sporadic monitoring time errors.

Procedure:

1. Insert an F-I/O (one that will not be needed later for system operation).
2. Assign a shorter monitoring time for this F-I/O than for the F-I/O of the system.
3. If the additional F-I/O fails and the "Monitoring time for safety message frame exceeded" diagnostic is signaled, you have fallen below the minimum possible PROFIsafe monitoring time.
4. Increase the monitoring time for the added F-I/O just to the point where it no longer fails. This monitoring time corresponds approximately to the minimum possible monitoring time.

Conditions:

The F-I/O to be inserted additionally and the F-I/O whose PROFIsafe monitoring time is to be checked must have the following properties in common:

- They must be inserted in the same rack
- They must be nodes in the same subnet

Tip:

It may be useful to leave the additional F-I/O in place for systems that will be modified or expanded during operation after commissioning. This F-I/O will then provide an early warning in the event of changes in the time behavior, enabling you to avoid a process shutdown triggered by the F-I/O in the process.

A.1.3 Minimum monitoring time of safety-related CPU-CPU communication

Input TIMEOUT at SENDDP and RCVDP or SENDS7 and RCVS7/F-monitoring time for communication via Flexible F-Link

The time monitoring is performed in the SENDDP and RCVDP (Page 588) or SENDS7 and RCVS7 (Page 599) instructions of the communication partner. You must assign the time monitoring with identical monitoring time for both instructions at the TIMEOUT input.

You must specify a monitoring time TIMEOUT that is large enough so that monitoring is not initiated when no faults are present.

For communication via Flexible F-Link you specify the F-monitoring time for the F-communication when creating an F-communication (Page 96).

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) that is available for SIMATIC Safety to determine the minimum value for TIMEOUT or the F-monitoring time.

Note also the comments in the Excel file.

A.1.4 Monitoring Time for Safety-Related Communication between F-Runtime Groups

Monitoring time for safety-related communication between F-runtime groups (S7-300, S7-400)

The monitoring time for safety-related communication between F-runtime groups is determined automatically from the values for the "Maximum cycle time of F-runtime group" (work area for Definition of the F-runtime group (Page 132) in the *Safety Administration Editor*).

Monitoring time = (maximum cycle time of the 1st F-runtime group) + (maximum cycle time of the 2nd F-runtime group)

Monitoring time for safety-related communication between F-runtime groups (S7-1200, S7-1500)

You can calculate the monitoring time for safety-related communication between F-runtime groups from the values for the "Maximum cycle time of F-runtime group" (area for Definition of the F-runtime group (Page 132) in the *Safety Administration Editor*), if you place the default user program for the F-runtime group communication into pre-/postprocessing (Page 87).

Monitoring time = (Maximum cycle time of the 1st F-runtime group) + (Maximum cycle time of the 2nd F-runtime group).

A.2 Response Times of Safety Functions

Definition of response time

The response time is the time from detection of an input signal until the linked output signal changes.

Fluctuation range

The actual response time lies between a minimum response time and maximum response time. You must always take the maximum response time into account in your system configuration.

Rules for maximum response time of a safety function

The maximum response time of a safety function must be shorter than the process safety time of the process.

Definition for process safety time of a process

The process safety time of a process is the time interval between the occurrence of an error, within which the process can be left on its own without causing injury to operating personnel or damage to the environment, and the point in time the response is completed.

The controlling F-system can perform any control during the process safety time, this includes incorrectly or not at all. The process safety time of a process depends on the process type and must be determined on a case-by-case basis.

Procedure for response time calculation

The Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is available for calculating the maximum response time of a safety function.

Use the Excel file to calculate the approximate maximum response time of the safety function and then check that the process safety time of the process is not exceeded.

If necessary, you must reduce the specific monitoring times of the F-system (see Minimum monitoring time for safety-related communication between F-CPU and F-I/O (Page 610)).

WARNING

You may only use the Excel file for response time calculation or for timeout calculation when using Flexible F-Link communication, if you have observed the following regulations with regard to the standard instructions for consistent transfer of data:

CPU-CPU communication (Page 262)

You must call the standard instruction for consistent sending of data and acknowledgments in the postprocessing (Page 87) and the standard instruction for consistent receiving of data and acknowledgments in the preprocessing (Page 87).

F-runtime group communication (Page 145)

You have to call up the standard instruction UMOVE_BLK for transferring the data to be sent in the postprocessing of the sending F-runtime group. You have to call the standard instruction UMOVE_BLK for transferring the acknowledgment to be sent in the postprocessing of the receiving F-runtime group. *(S089)*

WARNING

The response time of their safety function depends, among other things, on the cycle time of the F-OB, the runtime of the F-runtime group and, when distributed F-I/O is used, the parameter assignment of PROFINET/PROFIBUS.

Therefore, the configuration/parameter assignment of the standard system influences the response time of its safety function.

Examples:

- The increase in priority of a standard OB compared to an F-OB can extend the cycle time of the F-OB or the runtime of the F-runtime group due to the higher-priority processing of the standard OB. Please note that during creation of technology objects, OBs with very high priority may be created automatically.
- The change of the send clock cycle of PROFINET changes the cycle time of an F-OB with event class "Synchronous cycle".

Note that the configuration / parameter assignment of the standard system is not subject to access protection for the safety program and does not lead to a modification of the collective F-signature.

If you do not take organizational measures to prevent changes in the configuration / parameter assignment of the standard system with influence on the response time, you must always set the monitoring times for the calculation of the maximum response time of a safety function (see Configuring monitoring times (Page 608)).

The monitoring times are protected against change with the access protection of the safety program and are recorded by the F-collective signature as well as the F-SW collective signature.

When calculating with Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) you need to consider the value that is specified for "Any standard system runtimes" as value for the maximum response time. *(S085)*

Checklist

B

Life cycle of fail-safe automation systems

The following table contains a checklist summarizing all activities in the life cycle of a fail-safe SIMATIC Safety system, including requirements and rules that must be observed for each activity.

Checklist

Glossary

Access protection

→ Fail-safe systems must be protected against dangerous, unauthorized access. Access protection for F-systems is implemented by assigning two passwords (one for the → F-CPU, and one for the → safety program).

Automatically generated F-blocks

→ F-blocks that are automatically generated and, if necessary, called when the → safety program is compiled, in order to generate an executable safety program from the safety program programmed by the user.

Category

Category in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

With SIMATIC Safety, use in → safety mode up to category 4 is possible.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

CPU-wide

In the context of F-I/Os, "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

In the context of safety-related CPU-CPU communication, "CPU-wide" encompasses all the safety-related communication connections that are configured in an F-CPU.

CRC

Cyclic Redundancy Check → CRC signature

CRC signature

The validity of the process data in the → safety message frame, the correctness of the assigned address relationships, and the safety-related parameters are validated by means of a CRC signature contained in the safety message frame.

DB for F-runtime group communication

-> F-DB for safety-related communication between F-runtime groups of a safety program.

Depassivation

→ Reintegration

Disabled safety mode

Temporary deactivation of → safety mode for test purposes, commissioning, etc.

The following actions are possible only in disabled safety mode:

- Downloading changes of the → safety program to the -> F-CPU during ongoing operation (in RUN mode)
- Test functions such as "Modify" or other write access to data of the → safety program (with limitations)

Whenever safety mode is deactivated, the safety of the system must be ensured by other organizational measures, such as operation monitoring and manual safety shutdown.

Discrepancy analysis

Discrepancy analysis for equivalence or non-equivalence is used for fail-safe inputs to detect errors caused by the time characteristic of two signals with the same functionality. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same level). On expiration of an assignable period (→ discrepancy time), a check is made to determine whether the difference in levels (for non-equivalence testing, the same level) has disappeared after an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error. The discrepancy analysis is performed between the two input signals of the 1oo2 evaluation of the sensors (→ sensor evaluation) in the fail-safe input.

Discrepancy time

Assignable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are prolonged unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily because a discrepancy error is detected when, in reality, no error exists.

DP/DP coupler

Device for coupling two PROFIBUS DP subnets required for master-master communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

Expert

The acceptance of a system, i.e., the safety-related acceptance test of the system, is usually carried out by an independent expert (for example, from TÜV).

Fail-safe GSD based DP slaves

Fail-safe GSD based DP slaves are standard slaves that are operated on PROFIBUS with the DP protocol. They must operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile. A GSD file is used for their configuration.

Fail-safe GSD based I/O devices

Fail-safe GSD based I/O devices are standard devices that are operated on PROFINET with the I/O protocol. They must operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile in V2-MODE. A GSD file is used for their configuration.

Fail-safe I/O modules

ET 200eco modules and ET 200eco PN modules that can be used for safety-related operation (→ safety mode). These modules are equipped with integrated → safety functions. They operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile.

Fail-safe modules

Fail-safe modules ET 200SP, ET 200S, ET 200pro, ET 200iSP that can be used in the ET 200SP, ET 200S, ET 200pro or ET 200iSP distributed I/O systems.

Fail-safe modules S7-1500/ET 200MP, which can be used centrally in an S7-1500 or in a distributed I/O ET 200MP system.

Fail-safe module S7-1200 which can be used centrally in an S7-1200 system.

These modules are equipped with integrated safety functions (→ Safety mode) for fail-safe operation (→ Fail-safe operation). They operate in accordance with the → PROFIsafe bus profile.

Fail-safe systems

Fail-safe systems (F-systems) are systems that remain in a safe state or immediately switch to another safe state as soon as particular failures occur.

Fault reaction function

→ User safety function

Fault reaction time

The maximum fault reaction time for an F-system specifies the time between the occurrence of any error and a safe reaction at all affected fail-safe outputs.

F-blocks

The following fail-safe blocks are designated as F-blocks:

- those created by the user in LAD or FBD
- those created by the user as → F-DBs
- those selected by the user from a global library
- those added automatically in the → safety program (→ F-SBs, → automatically generated F-blocks, → F-shared DB, → F-I/O DBs; instance DBs of F-FBs)

All F-blocks are shown in yellow in the project tree.

F-CALL

"F-call blocks" for the → safety program in *S7 Distributed Safety*.

F-collective signature

The F-collective signature uniquely identifies a particular state of safety-related project data. It is important for the program identification as well as the on-site acceptance of the safety program, for example by → experts.

F-communication address signature

The F-communication address signature is formed from the names and the F-communication UUIDs of communication connections with Flexible F-Link that are used in the safety program.

F-communication DBs

Fail-safe data blocks for the

- safety-related CPU-CPU communication via S7 connections
- Communication with Flexible F-Link

F-compliant PLC data type (UDT)

An F-compliant PLC data type (UDT) is a PLC data type (UDT) in which you can use all data types that can be used in safety programs.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is approved for use in SIMATIC Safety and in which a → safety program can run in addition to the → standard user program.

F-DBs

Optional fail-safe data blocks that can be read-/write-accessed from anywhere within the safety program (exception: DBs for F-runtime group communication).

F-destination address

→ PROFIsafe address

F-FBs

Fail-safe function blocks (with instance DBs), in which the user programs the → safety program in FBD or LAD.

F-FCs

Fail-safe FCs, in which the user programs the → safety program in → FBD or → LAD.

F-HW collective signature

The F-HW collective signature uniquely identifies a particular state of safety-related hardware configuration. The F-HW collective signature is important to document the change/non-change of the safety-related hardware configuration, for example in the context of an acceptance of changes.

F-I/O

Collective name for fail-safe inputs and outputs available in *SIMATIC S7* for integration in SIMATIC Safety, among others. The following are available:

- → ET 200eco fail-safe I/O module
- → ET 200eco PN fail-safe I/O module
- → S7-300 fail-safe signal modules
- → Fail-safe modules for S7-1200
- → Fail-safe modules for ET 200MP
- → Fail-safe modules for ET 200SP
- → Fail-safe modules for ET 200S
- → Fail-safe modules for ET 200pro
- → Fail-safe modules for ET 200iSP
- → Fail-safe GSD based DP slaves
- → Fail-safe GSD based I/O devices

F-I/O DB

Fail-safe data block for F-CPUs to an → F-I/O in *STEP 7 Safety*. An F-I/O DB is automatically created for each F-I/O when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that the user can or must evaluate or write in the safety program as follows:

- For reintegration of the F-I/O after communication errors
- For reintegration of F-I/O after F-I/O or channel faults
- If the F-I/O must be passivated as a result of particular states of the safety program (for example, group passivation)
- For reassignment of parameters for fail-safe GSD based DP slaves/GSD based I/O devices or enabling HART communication for the F-I/O with the corresponding functionality
- In order to evaluate whether fail-safe values or process data are output

F-I/O faults

Module-related F-I/O fault, such as a communication error or parameter assignment error

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, S7-1500/ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

F-modules

→ Fail-safe modules

F-OB

The F-OB calls the main safety block of an F-runtime group in S7-1200/1500 F-CPUs.

F-runtime group

The → safety program consists of one or two F-runtime groups. An F-runtime group is a logical construct of several associated → F-blocks. It is generated internally by the F-system. An F-runtime group consists of the following F-blocks:

→ Main safety block, F-OB (S7-1200, S7-1500), if applicable → F-FBs/ → F-FCs, if applicable → F-DBs, → F-I/O DBs, F-blocks of global libraries, instance DBs, → F-SBs, and → automatically generated F-blocks.

F-runtime group information DB

The F-runtime group information DB provides key information on the corresponding → F-runtime group and on the → safety program as a whole.

F-shared DB

(S7-300, S7-400) Fail-safe data block that contains all of the shared data of the → safety program and additional information needed by the F-system. The F-shared DB is automatically inserted and expanded when the hardware configuration is compiled. Using its name F_GLOBDB, the user can evaluate certain data of the → safety program.

F-SMs

→ S7-300 fail-safe signal modules

F-source address

→ PROFIsafe address

F-SW collective signature

The F-SW collective signature uniquely identifies a particular state of the safety program. The F-SW collective signature is important to document the change/non-change of the safety program, for example in the context of an acceptance of changes.

F-system blocks

Fail-safe system blocks that are automatically inserted and called when the → safety program is compiled in order to generate an executable safety program from the user's safety program.

F-systems

→ Fail-safe systems

Hardware configuration

The hardware configuration encompasses the configuration of the standard parameters of the CPUs and standard I/Os as well as the configuration of the safety-related parameters of the F-CPUs and the I/Os.

I-device

The functionality of the "I-device" (intelligent I/O-device) of a CPU allows data exchange with an I/O-controller and thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-device is connected as an I/O-device to a "parent" I/O-controller.

IE/PB link

Device for coupling PROFINET IO and PROFIBUS DP-systems required, among other things, for IO-controller-I-slave communication between -> safety programs in different → F-CPUs in SIMATIC Safety.

i-parameter

Individual parameters of → fail-safe GSD based DP slaves and → fail-safe GSD based I/O devices

I-slave

The functionality of the "I-slave" (intelligent DP slave) of a CPU allows data exchange with a DP master and, thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-slave is connected as a DP slave to a "parent" DP master.

Main safety block

"Introductory F-block" for fail-safe programming of the → safety program in *STEP 7 Safety*. The main safety block is an → F-FB or → F-FC that the user assigns to the calling F-OB (S7-1200, S7-1500) or block (OB, FC, FB) (S7-300, S7-400) of an → F-runtime group.

The main safety block contains the safety program and any calls of other → F-FBs/F-FCs for program structuring.

Network-wide

A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/32 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Passivation

When passivation occurs in an → F-I/O with inputs, the → F-system provides the safety program with fail-safe values (0) instead of the process data pending at the fail-safe inputs in the PII.

When passivation occurs in an F-I/O with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values in the PIQ provided by the safety program.

PL

Performance Level (PL) in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

With SIMATIC Safety, use up to Performance Level (PL) e is possible in → safety mode.

PN/PN coupler

Device for coupling two PROFINET IO systems required for IO controller-IO controller communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

PROFIsafe

Safety-related bus profile of PROFIBUS DP and PROFINET IO for communication between the → safety program and the → F-I/O in an → F-system. See IEC 61784-3-3:2010 or PROFIsafe – Profile for Safety Technology on PROFIBUS DP and PROFINET IO; Order No: 3.192 (V2.6.1).

PROFIsafe address

The PROFIsafe address (code name according to IEC 61784-3-3:2010) is used for protection of standard addressing mechanisms, such as IP addresses. The PROFIsafe address consists of an F-source address and an F-destination address. Each → F-I/O therefore has two address parts, an F-source address and an F-destination address.

The F-source address is automatically assigned and is displayed for fail-safe GDS based DP slaves/fail-safe GSD based I/O devices and F-modules ET 200SP, F-modules ET 200MP, ET 200eco PN and F-modules S7-1200. The F-source address for F-modules ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 is always 1. For F-modules ET 200SP/ET 200MP, the F-source address corresponds to the "Central F-source address" parameter of the assigned F-CPU.

You need to configure the F-destination address in the *hardware and network editor*. You assign the F-destination address for the ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 F-modules with a switch. For F-modules ET 200SP and F-modules ET 200MP, ET 200eco PN assign the PROFIsafe address in the *hardware and network editor*. For S7-1200 F-modules, the F-destination address is automatically assigned by the F-system.

Program signature

→ collective F-signature

Project data

The project data includes the → hardware configuration and the → user program.

Reintegration

The switchover from fail-safe values (0) to process data (reintegration of an → F-I/O) takes place automatically or following user acknowledgment in the F-I/O DB. The reintegration method depends on the following:

- The reason for → passivation of the F-I/O/channels of the F-I/O
- The parameter assignment in the → F-I/O DB or in the configuration itself (for example, ET 200MP fail-safe modules on an S7-1500 F-CPU and S7-1200 fail-safe modules on an S7-1200 F-CPU)

Following reintegration for an → F-I/O module with inputs, the process data pending at the inputs in the PII are provided again for the safety program. For an F-I/O with outputs, the F-system again transfers the output values provided in the PIQ in the safety program to the fail-safe outputs.

RIOforFA Safety

Remote IO for Factory Automation with PROFIsafe; profile for F-I/O

S7-300 fail-safe signal modules

Fail-safe signal modules of the S7-300 module series that can be used for safety-related operation (→ Safety mode) as centralized modules in an S7-300 or as distributed modules in the ET 200M distributed I/O system. The fail-safe signal modules are equipped with integrated → safety functions. They operate in accordance with the → PROFIsafe bus profile.

S7-PLCSIM

The *S7-PLCSIM* application enables you to execute and test your program on a simulated automation system on your programming device or PC. Because the simulation takes place completely in your programming device or PC, you do not need any hardware (CPU, I/O).

Safe state

The basic principle of the safety concept in → fail-safe systems is the existence of a safe state for all process variables. For digital → F-I/O that conform to IEC 61508:2010, this is always the value "0".

Safety Administration Editor

The *Safety Administration Editor* provides support for the main tasks of your safety program.

Safety function

Mechanism integrated in the → F-CPU and → F-I/O that allows them to be used in -> fail-safe systems.

According to IEC 61508:2010, a function that is implemented by a safety device in order to maintain the system in the safe state or bring the system to a safe state in the event of a specific fault. (fault reaction function -> user safety function)

Safety message frame

In → safety mode, data are transferred in a safety message frame between the → F-CPU and → F-I/O, or between the F-CPUs in safety-related CPU-CPU communication.

Safety mode

1. Operating mode of → F-I/O in which → safety-related communication can take place using → safety message frames.
2. Operating mode of the safety program. In safety mode of the safety program, all safety mechanisms for error detection and fault reaction are enabled. In safety mode, the safety program cannot be modified during operation. Safety mode can be disabled by the user (→ disabled safety mode).

Safety program

Safety-related user program

Safety protocol

→ Safety message frame

Safety summary

The safety summary provides documentation of the safety-related project data which supports you during acceptance of the system.

Safety-related communication

Safety-related communication is used to exchange fail-safe data.

Safety-related hardware configuration

The safety-related hardware configuration includes the configuration of the safety-related parameters of the F-CPU as well as the configuration of the F-I/O devices.

Safety-related project data

The safety-related project data includes the safety-related hardware configuration as well as the → safety program.

Sensor evaluation

There are two types of sensor evaluation:

- 1oo1 evaluation – sensor signal is read once
- 1oo2 evaluation - sensor signal is read twice by the same → F-I/O and compared internally

Shared device

The "Shared Device" functionality enables distribution of the submodules of an IO-device between different IO-controllers.

Signature

→ collective F-signatures

SIL

Safety integrity level SIL in accordance with IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and random hardware failures.

With SIMATIC Safety, up to Safety Integrity Level SIL3 is possible in safety mode.

Standard communication

Communication used to exchange non-safety-related data

Standard mode

Operating mode of → F-I/O in which → safety-related communication between the F-CPU and the F-I/O by means of → safety message frames is not possible; only → standard communication is possible in this operating mode.

Standard user program

Non-safety-related user program

Startup of F-system

With an → F-CPU, the standard user program starts up in the normal way. When the → safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The → F-system performs an automation → reintegration of the → F-I/O.

User program

The user program comprises the → standard user program and the → safety program.

User safety function

The → safety function for the process can be provided through a user safety function or a fault reaction function. The user only has to program the user safety function. In the event of an error, if the → F-system can no longer execute its actual user safety function, it executes the fault reaction function: for example, the associated outputs are disabled, and the → F-CPU switches to STOP mode, if necessary.

Value status

The value status is additional binary information for a channel value. The value status is entered in the process image input and provides information on the validity of the channel value.

1: A valid process data is output for the channel value.

0: A fail-safe value is output for the channel value.

Versioned instruction

Instruction for which a version is displayed in the "Version" column of the "Instructions" task card:
