44	Summation counter: Sent master frames, factor (MT_CNT_BASE)		High word, high byte
45			High word, low byte
46			Low word, high byte
47			Low word, low byte
48	Reserved		Bit 0 = MADDR
49	Reserved		
50 … 57	List of multiple addressing (see Table "Structure of bit fields")		
	Bit = 0	The AS-i address is assigned once or is not present.	
	Bit = 1	The AS-i address is assigned more than once.	
58 ... 220	Reserved		

The counters are integer values (2 bytes or 4 bytes).

Multiple addressing has been detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.

Structure of the bit fields

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	SLAVE 7/7A	SLAVE 6/6A	SLAVE 5/5A	SLAVE 4/4A	SLAVE 3/3A	SLAVE 2/2A	SLAVE 1/1A	Reserved

7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

9.4.34 No. CB: Read_and_Delete_AS-i-Master_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 97 Read and reset AS-i master error counters (FW V1.1 and higher) (Page 89)" for reading out the error counters. The Read_and_Reset_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command functions like the "Read_AS-i-Master_Error_Counter" command. In addition, the AS-i master then sets all error counters to 0.

Structure of the job data in the send buffer

Table 9- 65 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CB_H

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "No. CA: Read_Error_Counter (Page 152)" command.

9.4.35 No. CC: Read_AS-i_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)". The Read_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out AS-i slave-specific error counters. For the meaning of the error counters, refer to Section "Table 8-13 Meaning of error counter (Page 90)".

Structure of the job data in the send buffer

Table 9- 66 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CC_H
1	AS-i slave address

Structure of the responses in the receive buffer

Table 9- 67 Structure of the responses in the receive buffer

Byte	Meaning	
0	Counter: Slave failure	High byte
1		Low byte
2	Counter: Missing slave frame	High byte
3		Low byte
4	Counter: Faulty slave frame	High byte
5		Low byte
6	Counter: Peripheral fault	High byte
7		Low byte
8	Counter: Protocol error	High byte
9		Low byte
10	Counter: Faulty master frame	High byte
11		Low byte
12	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)	High word / high byte
13		High word / low byte
14		Low word / high byte
15		Low word / low byte

Byte	Meaning	
16	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)	High word / high byte
17		High word / low byte
18		Low word / high byte
19		Low word / low byte
20	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word / high byte
21		High word / low byte
22		Low word / high byte
23		Low word / low byte
24 … 31	Reserved	

9.4.36 No. CD: Read_and_delete_AS-i_Slave_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)" and "DS 154 Delete AS-i error counters (from FW V1.1) (Page 96)". The Read_and_Reset_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153. Data record DS 154 resets all AS-i slave error counters.

Structure of the job data in the send buffer

Table 9- 68 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CD_H
1	AS-i slave address

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "No. CC: Read_AS-i_error_counter (Page 156)" command.

9.4.37 No. 13: Activate_ground fault detection (reset EFD)

Meaning

The setting for enabling the integrated ground fault detection is always made when configuring the CM AS-i Master.
This command is used to enable or disable the ground fault detection via the user program so as to overwrite the configured setting.
After a startup or restart, the configured setting is applied again.

Structure of the job data in the send buffer

Table 9- 69 Structure of the job data in the send buffer

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Command number 13_H							
1	0							0 = Ground fault detection is enabled 1 = Ground fault detection is disabled

9.4.38 No. D0: Set_Configuration_Online

Meaning

The following configuration data for the addressed AS-i slave is configured with this command:

- IO code
- ID code
- ID1 code
- ID2 code
- Parameter value

The configuration data is stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses this configuration data as the specified expected configuration for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification". If the addressed AS-i slave does not support an ID1 code or ID2 code, ID1 code = F (hex) and ID2 code = F (hex) must be used as the preset values. When this command is executed, the AS-i master remains in the online phase. This means that the AS-i master is not restarted. The command can be executed in "Protected operation".

The command can be executed for any slaves including proxy slaves. Ensure that you have defined an adequate length for the I/O image when configuring the slave. If the the I/O image for the slave is not long enough, surplus input data are truncated and surplus output data are transmitted with substitute value 0. This applies to a digital I/O image and an analog I/O image.

If the value F (hex) is written to a proxy slave for all four codes (IO code, ID code, ID1 code and ID2 code), any slave type at this AS-i address is activated by the AS-i master.

Note

Configuration data are overwritten

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring using the "SET" button or configuring using HW Config.

Note

The configuration data for all proxy slaves can be reset to value F (hex) in the CM AS-i Master ST module by configuring the AS-i slaves using the "SET" button with no slaves connected (see Section "Configuration of the AS-i slaves using the "SET" button (Page 34)").

Structure of the job data in the send buffer

Table 9- 70 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D0_H$			
1	Slave address			
2	IO code		ID code	
3	ID1 code		ID2 code	
4	0		Parameter	

9.4.39 No. D1: AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address)

Meaning

This command writes the ID1 code of an AS-i slave with the specified address directly via the AS-i cable.

The AS-i master forwards the ID1 code to the AS-i slave without a plausibility check.

Requirements

- The AS-i slave at the target address must support writing of the ID1 code.
- There are no AS-i slaves on the AS-i bus with address "0".

Structure of the job data in the send buffer

Table 9- 71 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D1_H$			
1	AS-i slave address			
2	0		ID1 code

Data sets C

C.1 DS 100 Switch duplicate address detection on/off

Description

The duplicate address detection function can be activated/deactivated via the user program by means of write access to data record DS 100.

For the CM AS-i Master firmware V1.0 the status is stored in the AS-i Master volatile memory, i.e. if the AS-i voltage fails, duplicate address detection is deactivated.

For the CM AS-i Master firmware V1.0 and higher, duplicate address detection is adopted according to the setting in HW Config or GSD after failure of the AS-i voltage.

Note

From firmware V1.1 onwards use the setting option via HW Config or GSD to activate duplicate address detection. Data record DS 100 continues to exist for compatibility reasons.

Table C- 1 Structure of DS 100 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0							
1	0							
2	0							0 / 1
3	0							

Bit 0 = 0 Duplicate address detection is activated.
= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be changed in this case.

See also

Duplicate address detection (Page 76)

C.2 DS 100 Read setting for duplicate address detection

Description

Via read access to data record DS 100 the enable status of duplicate address detection can be read back.

Table C- 2 Structure of DS 100 read

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2	Reserved							0 / 1
3	Reserved							

Bit 0 = 0 Duplicate address detection is activated
= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be read out in this case.

USB	Universal Serial Bus
WRREC	Write record

Glossary

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. "Configured" means that the slave addresses and configuration data stored in the AS-i master agree with the values of existing AS-i slaves.

APF

AS-i Power Fail. Flag or LED display that indicates that the supply voltage on the AS-i cable is too low or has failed, e.g., failure of the AS-i power supply unit.

AS-i (AS-Interface)

Actuator-Sensor-Interface. A networking system for the plant-floor automation layer. It is suitable for networking sensors and actuators with controllers.

AS-i analog slave

AS-i analog slaves are special AS-i standard slaves that exchange analog values with the AS-i master; see also CTT.

AS-i master

The AS-i master monitors and controls simple digital or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are distinguished according to their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing type (AS-i slave with standard address in the range 0 ... 31 and AS-i slave with A/B address in the range 0, 1A ... 31A, 1B, 31B) or their functionality (standard slave for non-safety-related data transmission and ASIsafe slave for safety-related data).

AS-i slave with A/B address

AS-i slaves with A/B address use extended addressing. A (numerical) address can thus be used by two slaves with A/B address, e.g., 1A and 1B. Based on the address organization, up to 62 slaves with A/B address can be connected to the AS-Interface.

For cyclic data transmission, the master accesses each (numerical) address once per AS-i cycle (max. 5 ms). If two slaves use a (numerical) address on the bus both as an A address and a B address, two consecutive AS-i cycles are required for their data transmission (max. 10 ms rms). If a (numerical) address is used only as an A address or as a B address on the bus, the data transmission for these slaves occurs in every AS-i cycle.

AS-i slave with standard address

Each AS-i slave with standard address occupies one address on the AS-Interface; based on the address organization, up to 31 AS-i slaves with standard address can therefore be connected to the AS-Interface. If a slave with standard address occupies an address, this address is no longer available for slaves with A/B address.

For cyclic data transmission, the master accesses each address once per AS-i cycle (max. 5 ms).

CER

Configuration Error (Indication of configuration errors). The configuration error is indicated by an LED if the actual bus configuration does not match the specified configuration.

CM

Communication module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CTT

Combined Transaction Type. Special AS-i slave profile:

CTT slaves require several AS-i cycles or several AS-i addresses for updating process data between an AS-I slave and AS-i master.

The following CTT variants are defined:

CTT1: Slave profiles S-7.3, S-7.4

For cyclic data transmission of analog values or transparent data (up to 16 bits per channel).

Depending on the slave, the data transmission is in the direction of the input or output.

The S-7.1 and S-7.2 profiles are outdated profiles that are not managed automatically by the AS-i master (function blocks are required for decoding the process data).

CTT2: Slave profiles S-7.5.5, S-7.A.5, S-B.A.5

For transmission of data blocks similar to data record transmission in PROFIBUS/PROFINET.

The transmission can be initiated individually via the user program (acyclically, see "CTT2-Request_lesen_schreiben (Read_Write_CTT2_String)") or automatically by the master (cyclically, same as for analog values). Refer to the slave documentation.

The transmission process is managed automatically by the master and corresponds to a serial data transmission with approximately 12 bytes (or 6 bytes for A/B address with maximum configuration).

Depending on the slave, in parallel to the data block transmission, digital data of up to 2 DI / DO are also transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT3: Slave profiles S-7.A.7, S-7.A.A

For cyclic transmission of digital data.

Slave profile S-7.A.7 transmits 4 DI / 4 DO using a slave with A/B address. Like for standard slaves, the inputs are transmitted in each AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration). The outputs require double the transmission time.

Slave profile S-7.A.A transmits 8 DI / 8 DO using a slave with A/B address. The inputs and outputs are transmitted using four AS-i cycles.

CTT4: Slave profiles S-7.A.8, S-7.A.9

For cyclic transmission of analog values or transparent data (up to 16 bits per channel) in the input direction using a slave with A/B address.

Depending on the slave, in parallel to the data block transmission, digital data of up to 1 DO can also be transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT5: Slave profile S-6.0.x, where x = 2 … 7, A … C

For cyclic transmission of analog values or transparent data (up to 16 bits) in the input and output direction.

The CTT5 types each occupy 2, 3, or 4 slave addresses simultaneously, depending on the data record, so that consistent transmission of the full data width occurs in each AS-i cycle (5 ms).

DIAG

Diagnosis

EFD

Ground fault detection

GSD file

Generic station description file for PROFIBUS or PROFINET devices

GSDML file

GSD file for PROFINET devices. As a generic station description, this file contains all of the properties of a PROFINET device necessary for its configuration.

HSP

The Hardware Support Package supplements the hardware catalog of *STEP 7*.

ID code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

ID1 code

Also called: Extended ID1 code

Fixed or editable identification code saved in the AS-i slave.

See also: Slave profile

ID2 code

Also called: Extended ID2 code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

Inspector window

The inspector window of *STEP 7* / TIA Portal displays additional information about a selected object or executed actions. The indicated properties and parameters of the selected object can be edited within the inspector window.

IO code

Also called: I/O configuration

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

LAS

List of Activated Slaves

LDS

List of Detected Slaves

LED

A light-emitting diode that is used to display the signal status.

LPF

List of periphery faults This list in the AS-i master designates the status of the peripheral fault of the activated slaves.

LPS

List of Projected Slave (list of configured slaves)

Nibble

A nibble is a unit of information that comprises four bits.

Option handling

Option handling allows the user program to activate optional functions during normal operation without the need for reconfiguration.

PF

Peripheral fault: Error message of an active AS-i slave to the master, e.g., overload at output (depending on slave, see documentation of the AS-i slave).

Slave profile

The slave profile classifies the basic properties of an AS-i slave. The slave profile consists of the IO code, ID code, and ID2 code, which are stored as fixed, uneditable codes in each slave. In addition, a slave has an ID1 code, which is saved in the slave as a fixed code or a code that is editable by the user (e.g., with an addressing device). The value of the ID1 code usually has no effect on the operating characteristics of the slave. In this case, the user should not change the value, so that compatibility problems do not occur if the device is replaced. Note the documentation of the slave for the ID1 setting.

Each of the four identification codes consists of a 4-bit value that is usually written in hexadecimal notation with a value range of 0 to F. On power-up, the AS-i master reads the codes automatically from each slave and saves this ACTUAL configuration in the volatile memory of the AS-i master.

If the AS-i master is in “protected operation”, it compares the ACTUAL configuration with a CONFIGURED configuration, which is normally stored in non-volatile memory in the AS-i master. Slaves whose ACTUAL configuration matches the CONFIGURED configuration are activated and then participate in the cyclic data exchange. Slaves without a match are not activated and do not exchange cyclic data. A configuration error is also signaled.

ID2 and ID1 are optional codes. That is, some slaves do not have these two codes. In this case, the master enters the hexadecimal value “F” as a substitute value in the ACTUAL configuration.

Slaves with extended addressing, the so-called A/B slaves, use only the three less significant bits of the ID1 code as the slave identification. The most significant bit of the ID1 code is reserved and is used by the AS-i system to distinguish between an A address or B address. The effective value range of the ID1 code is thus 0 ... 7. For the read-out of the ID code, only the 3 less significant bits or all 4 bits are displayed, depending on the system, so that the displayed ID1 code can be within the value range 8 to F for slaves with B address. The user or programmer can ignore the most significant bit of the ID1 code for A/B slaves since it is managed automatically by the system.

The slave profile is usually shown in the documentation with the S prefix and a hyphen (in some cases), followed by the IO, ID, and ID2 codes, each separated by a dot.

Example: S-7.0.F

Since the ID1 code is usually editable, the value is often not documented or documented only as a default value.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://www.siemens.com/industrialsecurity)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://support.automation.siemens.com)

Table of contents

1 Documentation guide

1.1 Documentation guide for the F-DI 8x24VDC HF digital input module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital input module F-DI 8×24VDC HF

The table below lists additional documents that complement this description of the fail-safe digital input module F-DI 8×24VDC HF and are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital input module F-DI 8×24VDC HF

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

2 Product overview

2.1 Properties of the F-DI 8x24VDC HF

Order number

6ES7136-6BA00-0CA0

View of the module

Figure 2-1 View of the F-DI 8×24VDC HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 8 inputs (SIL3/Cat.4/PLe)
  - 8 outputs for sensor supply
  - Use of various interconnection types (1oo1, 1oo2) is possible
  - Supply voltage L+
  - Sink input (P-reading)
  - Suitable for connection of 3/4-wire sensors according to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Internal short circuit proof sensor supplies for each input
  - External sensor supply possible
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input (green LED)
  - Error display for each input (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 47).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

13	VS_4	14	VS_5			
15	VS_6	16	VS_7			
L+	DC24V	M	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

---

Note

The first BaseUnit must be a light BaseUnit.

Note

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

Parameters/address space 4

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for F-DI 8×24VDC HF

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
DI parameters:			
Sensor supply			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters			
Channel n, n+4			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non equivalent	no	Channel pair
Discrepancy behavior	• Supply 0 value • Supply last valid value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal not necessary • Test 0-signal necessary	no	Channel pair
Channel n			
Activated	• enable • disable	no	Channel
Sensor supply	• Sensor supply 0 to 7 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the sensor supply

4.2.2.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.2.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.2.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.3 Parameters of the channel pairs

4.2.3.1 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.3.2 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Evaluation of the sensors" parameter:

- 1oo1 evaluation
- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo1 evaluation

The sensor is available once for 1oo1 evaluation.

1oo2 evaluation, equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One two-channel sensor
- Two single-channel sensors
- One non-equivalent sensor

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

4.2.3.3 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.3.4 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.3.5 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4 Parameters of the channels

4.2.4.1 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 19)

4.2.4.2 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 53)

Response times (Page 57)

4.2.4.3 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.4 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

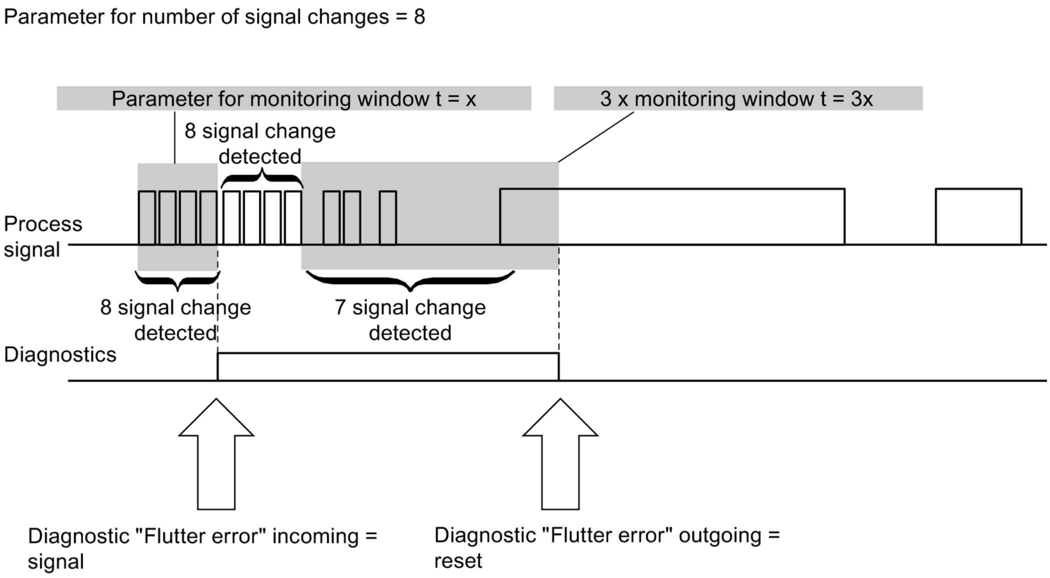

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.5 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.3 Address space

Address assignment of the digital input module F-DI 8×24VDC HF

The digital input module F-DI 8×24VDC HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 5	x + 0 to x + 3

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 4- 3 Address assignment through user data

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	Value status for DI_7	Value status for DI_6	Value status for DI_5	Value status for DI_4	Value status for DI_3	Value status for DI_2	Value status for DI_1	Value status for DI_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module 5

5.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

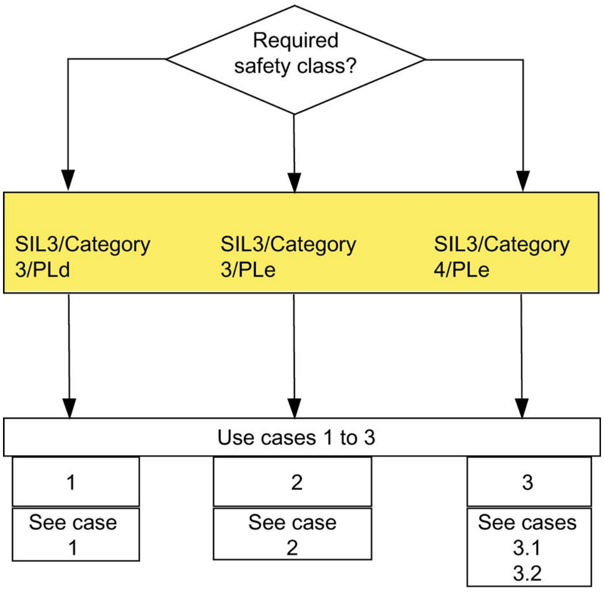

Figure 5-1 Selecting the application – digital input module F-DI 8×24VDC HF

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 1 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Note

You can operate the various inputs of an F-DI module simultaneously in SIL3/Cat.3/PLd **and** in SIL3/Cat.3 or Cat.4/PLe. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

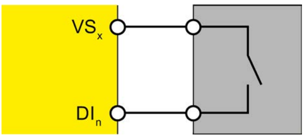

Figure 5-2 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

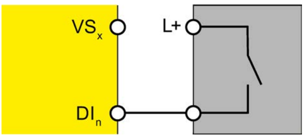

Figure 5-3 One sensor connected via one channel, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 2 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n • External sensor supply	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 3 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit of the input with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the cable must be routed short circuit proof.

5.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 and DI_4
- DI_1 and DI_5
- DI_2 and DI_6
- DI_3 and DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor equivalent

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

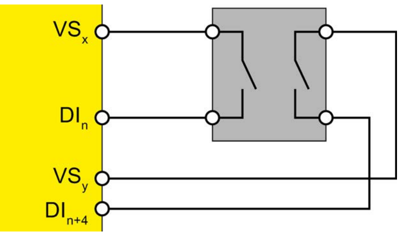

Figure 5-4 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

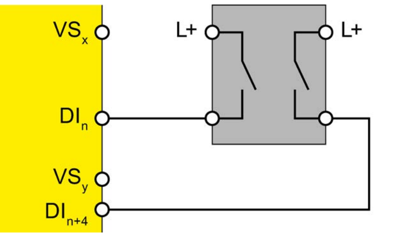

Figure 5-5 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

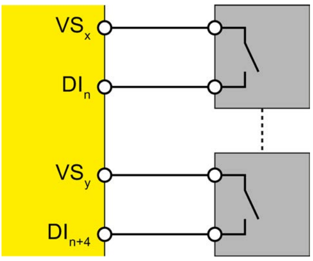

Figure 5-6 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

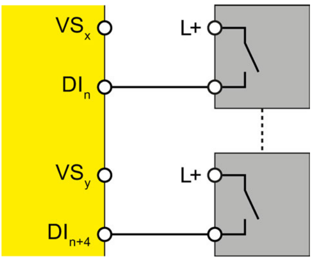

Figure 5-7 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 4 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 5 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair	no	no
Short circuit with other channels or other sensor supplies	yes*	yes
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 with DI_4
- DI_1 with DI_5
- DI_2 with DI_6
- DI_3 with DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied internally by at least one channel for application 3.1.

The sensor can be supplied internally or externally for application 3.2.

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- The actuators must be wired as seen in sections Use case 3.1 (SIL3/Cat.4/PLe) (Page 38) or Use case 3.2 (SIL3/Cat.4/PLe) (Page 40). You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.4.1 Use case 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

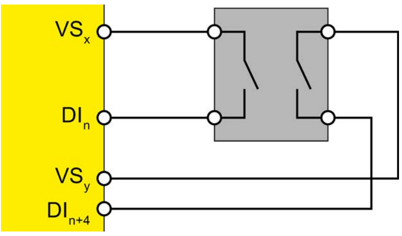

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

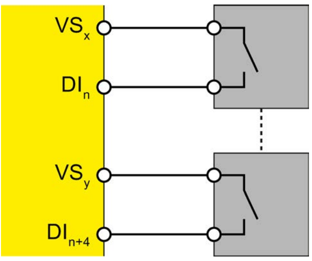

Figure 5-9 Two single-channel sensors connected via two channels, internal sensor supply

⚠ WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 6 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n (internally by at least one channel) • External

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 7 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4.2 Use case 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor

A nonequivalent sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation, non equivalent).

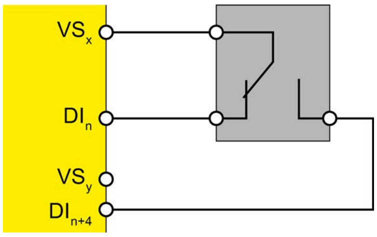

Figure 5-10 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

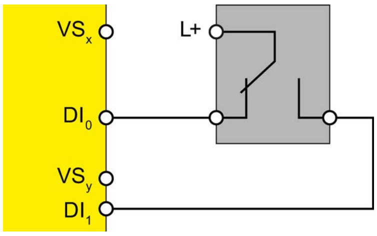

Figure 5-11 Nonequivalent sensor connected, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent

Two single-channel sensors are connected nonequivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

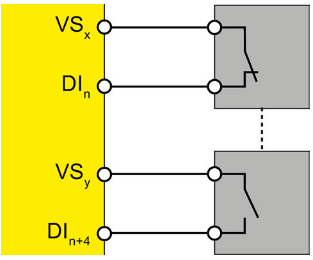

Figure 5-12 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

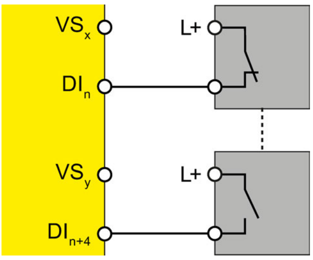

Figure 5-13 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 8 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 9 Fault detection

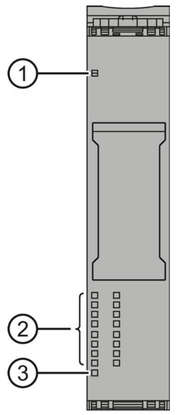
Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

6 Interrupts/diagnostic messages

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 47).

⚠ WARNING
The DIAG LED and the channel status and channel fault LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
/ Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DI 8×24VDC HF fail-safe digital input module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 47).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

Table 6- 5 Diagnostic interrupts of the F-DI 8×24VDC HF

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	1, 2, 3	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			
Discrepancy error, channel status 0/0	768_D	2, 3	Channel	
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D			No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D		Channel	
PROFIsafe communication error (timeout)	792_D		F-module	
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Supply voltage too high	803_D		F-module	No
Supply voltage too low	804_D			

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DI 8×24VDC HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	

Diagnostic message	Fault code	Meaning	Remedy
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		

Diagnostic message	Fault code	Meaning	Remedy
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.

Diagnostic message	Fault code	Meaning	Remedy
No pulse detected	778_D	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too high. • The "Minimum pulse time" parameter setting is too low. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784_D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor/switch is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 53))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53))
Fault in input circuit	787_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 53) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is deactivated, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. For this reason, tables on fault detection for the applications are presented under Applications of the F-I/O module (Page 29).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all F-modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of inputs and outputs for the value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the value status can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

7 Technical specifications

Technical specifications of F-DI 8×24VDC HF

	6ES7136-6BA00-0CA0
Product type designation	F-DI 8x24VDC HF
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFINET as of GSD version/GSD revision	V2.31
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Sensor supply	
Number of outputs	8
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 1.8 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	800 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	4 W

	6ES7136-6BA00-0CA0
Address space	
Address space per module	
Input	6 bytes
Output	4 bytes
Digital inputs	
Number of inputs	8
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m

Response times

A

Introduction

The next section shows the response times of the digital input module F-DI 8×24VDC HF. The response time of the digital input module F-DI 8×24VDC HF is included in the calculation of the F-system response time.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 20 ms

Maximum cycle time: T_{cycle} = 11.5 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, and discrepancy time are configured in STEP 7.

If you have configured "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Maximum response time with external short circuits

Maximum response time = input delay + (n × T_{cycle}) + sum ("Time for short circuit test" + "Startup time after short circuit test" for sensor with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that affect the system in general are described in the system manual.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the programming and operating manual SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

Conventions

CPU: When the term "CPU" is used hereafter, it refers to both the CPUs of the S7-1200/1500 automation system and CPUs of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software " (STEP 7 TIA Portal)".

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Standards

You can find a dated reference to the respective standards in the certificate (https://support.industry.siemens.com/cs/ww/en/view/57141281) or in the EC Declaration of Conformity (https://support.industry.siemens.com/cs/ww/en/view/71764057) for the F-module.

Certified versions

You can find the certified product and firmware versions in annex 1 of the report on the TÜV certificate (https://support.industry.siemens.com/cs/ww/en/view/57141289).

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Important note for maintaining the operational safety of your system

WARNING

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

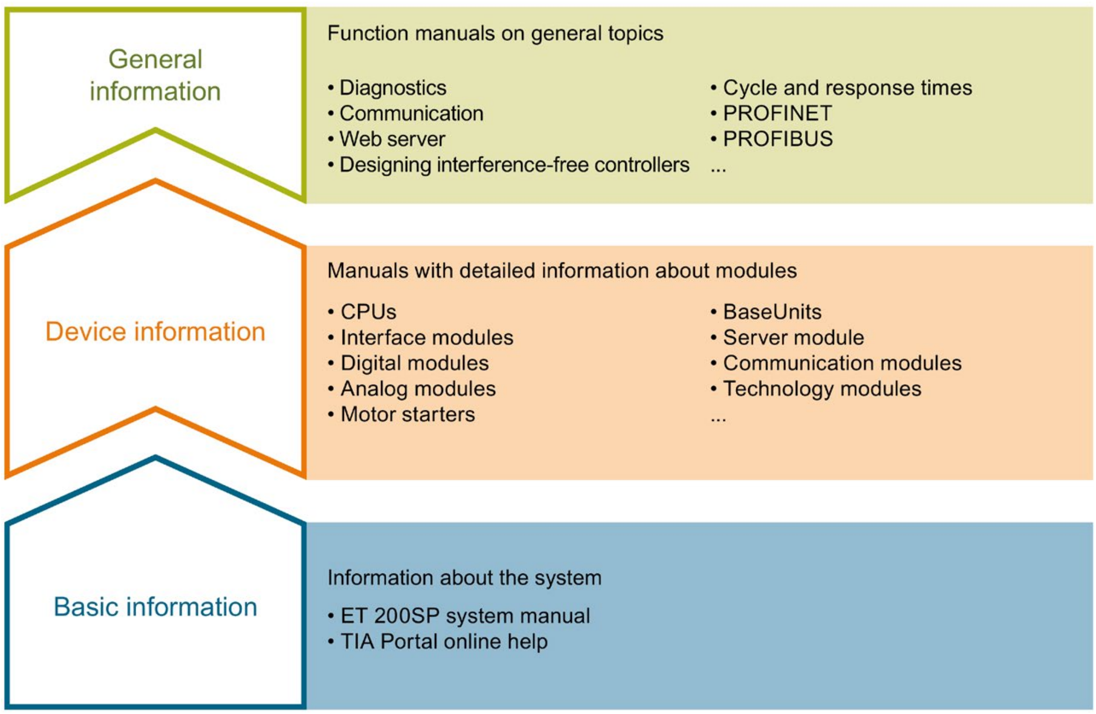
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

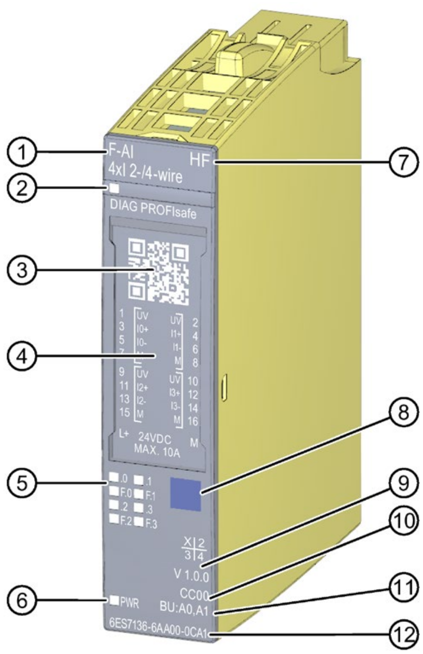
2.1 Properties

Article number

6ES7136-6AA00-0CA1

View of the module



① Module type and name	⑦ Function class
② LED for diagnostics	⑧ Color coding module type
③ 2D matrix code	⑨ Function and firmware version
④ Wiring diagram	⑩ Color code for selecting the color identification labels
⑤ LEDs for channel status	⑪ BU type
⑥ LED for supply voltage	⑫ Article number

Figure 2-1 View of the F-AI 4xI 0(4)..20mA 2-/4-wire HF module

Properties

The module has the following technical properties:

- Fail-safe module
- PROFIsafe

- Supports the "RIOforFA-Safety" profile on F-CPUs S7-1200/1500.
- PROFIsafe address type 2
- 4 analog inputs with electrical isolation between channels and the backplane bus (up to SIL3/Cat.4/PLd)
- Measuring ranges: 0..20 mA and 4..20 mA
- Resolution: 16 bits including sign
- Short circuit-proof power supply for 2-wire or 4-wire transmitter
- Supply voltage L+
- External sensor supply possible
- Assignable diagnostics
- Diagnostics display (DIAG, red/green LED)
- Status display for each input (green LED)
- Error display for each input (red LED)
- Diagnostics
  - e.g., short-circuit, channel-specific
  - e.g. supply voltage missing, module-specific
- Channel- and module-wide passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Value status

WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires.

The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 58).

Note

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Accessories

You can order the following accessories separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector
- Electronic coding element as spare part (article number 6ES7193-6EF00-1AA0)

You can find additional information about accessories in the Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293) System Manual.

Connecting 3

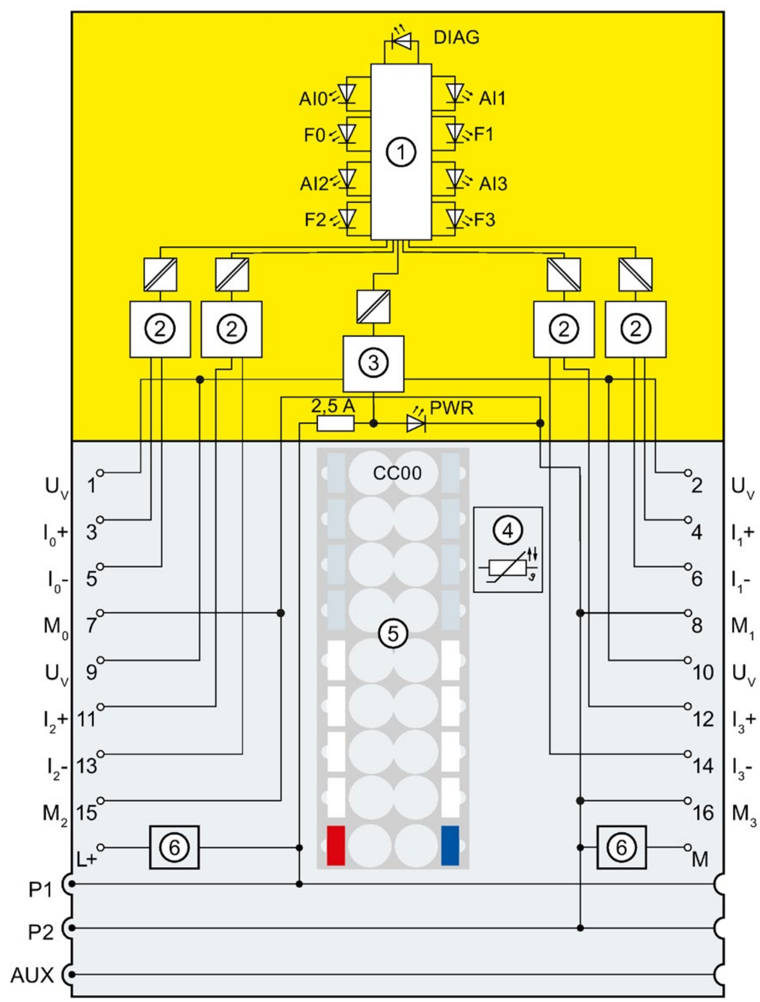
3.1 Wiring and block diagram

This section provides the block diagram of the F-AI 4xI 0(4)..20mA 2-/4-wire HF analog input module with the terminal assignment.

You can find additional information about wiring BaseUnits in the Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293) System Manual.

Block diagram

The following figure shows the block diagram of the F-AI 4xI 0(4)..20mA 2-/4-wire HF analog input module on the BaseUnit BU type A0/A1.



①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground to channel n
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	DIAG	Diagnostics LED (green, red)
I_n+	Current input positive, channel n	AI0, AI1, AI2, AI3	Channel status LED (green)
I_n-	Current input negative, channel n	F0, F1, F2, F3	Channel fault LED (red)
		PWR	Power LED (green)

Figure 3-1 Block diagram

Sensor supply

> **⚠ WARNING**
>
> Voltage dips and voltage fluctuations of the voltage supply are not buffered by the F-module and, thus, affect the sensor supply.
>
> This can cause the measured value to be false and must be taken into account when determining the safety function.
>
> To ensure that the sensor functions problem-free, we recommend one of the following options:
>
> - You can avoid voltage dips by using a voltage supply according to the NAMUR recommendation NE 21.
>
> or
>
> - Use a transducer with an appropriate battery backup or diagnostics.

Recommendation: Internal sensor supply

You are strongly advised to use the short circuit-proof internal sensor supply of the F-module. This internal sensor supply is monitored and its status is indicated by the Fn LED. The input is also protected in the event of short-circuits in the wiring or at the sensor.

Note

The internal sensor supply is switched off in case of a short circuit to ground or during power-up in the event of short circuit to L+.

The sensor supply is also switched off at input currents > 35 mA.

A check is made approximately 1 minute later to determine if the error has gone.

Note

Behavior of process values and diagnostics evaluation

Sensor startup during module startup:

After the internal sensor supply is activated, the evaluation of wire break and underflow diagnostics is suppressed for 3 seconds. During this time, the module makes the secure process data 0 available at all channels. This suppresses a possible wire break or underflow diagnostics caused by the sensor startup. If the sensor startup is not yet complete after the 3 seconds have elapsed, it is possible that the module might detect wire break or underflow and passivate the affected channel. In this case, the channel fault must be acknowledged during startup.

Sensor startup during operation:

If a sensor startup takes place during operation, e.g. the sensor supply is reactivated after a short-circuit, all analog values are invalid and wire break or underflow diagnostics can occur on the sensors connected to the internal sensor supply.

External/internal sensor supply

The figures in section "Applications of the F-I/O module (Page 40)" show how you can supply power to the sensors via an external sensor supply (for example, from another module).

WARNING

If there is a short-circuit from L+ to Mn+, the input resistors could be destroyed, depending on the selected interconnection type.

You can avoid this problem through proper wiring and use of the internal sensor supply. When an external sensor supply is used, other suitable measures are necessary to protect the input resistors (e.g. external fast 50 mA fuse in the input circuit of the F-module).

WARNING

External sensor supply

If you use an external sensor supply, you need to take into consideration the voltage dips and voltage fluctuations when determining the safety function.

To ensure that the sensor functions problem-free, we recommend one of the following options:

- Use a transducer with an appropriate battery backup or diagnostics.

  or
- Use a **redundant** external sensor supply

  or
- **Monitor** the external sensor supply for undervoltage/overvoltage, including shutdown of the sensor supply in the event of a fault (single channel for SIL2; two-channel for SIL3).

Parameters/address space 4

4.1 Measurement types and measuring ranges

The following table shows the measurement types and the respective measuring range.

Table 4- 1 Measurement types and measuring ranges

Measurement type	Measuring range	Resolution
Current	0 to 20 mA (2-wire and 4-wire transducer) 4 to 20 mA (2-wire and 4-wire transducer)	16 bits including sign 16 bits including sign

You can find the tables of the measuring ranges as well as overflow, overrange, etc. in the Appendix Representation of analog values (Page 71).

4.2 Parameters

Parameters for F-AI 4xI 0(4)..20mA 2-/4-wire HF

WARNING

Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 40).

The following parameters are possible:

Table 4- 2 Configurable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of the F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	depends on parameter assignment of F-CPU	No	Module
F-destination address	1 to 65534	suggested by F-system	No	Module
F-parameter signature (without address)	0 to 65535	calculated by F-system	No	Module

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Behavior after channel faults	• Passivate entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	suggested by F-system	No	Module
F-I/O DB name	—	suggested by F-system	No	Module
AI parameters				
Interference frequency suppression	• 50 Hz • 60 Hz	50 Hz	No	Module
Channel parameters:				
Channel n				
Sensor evaluation	• 1oo1 evaluation (max. SIL3/Cat.3/PLd) • 1oo2 evaluation (max. SIL3/Cat.4/PLe)	1oo1 evaluation (max. SIL3/Cat.3/PLd)	No	Channel
Standard value	• MIN • MAX	MIN	No	Channel
Discrepancy time *	100 to 30000 ms	100 ms	No	Channel
Tolerance window %, absolute	2.0 to 20.0%	5.0%	No	Channel
Tolerance window %, relative	2.0 to 20.0%	5.0%	No	Channel
Activated	• Disable • Enable	Enable	No	Channel
Channel fault acknowledgment	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel
Measuring range	• 0 to 20 mA • 4 to 20 mA	4 to 20 mA	No	Channel

Parameters	Value range	Default	Parameter reas-signment in RUN	Scope
Diagnostics: Wire break **	• Disable • Enable	Enable	No	Channel
Smoothing	• 1 • 2 • 4 • 8 • 16 • 32 • 64	1	No	Channel

* See formula under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 27)

* Can only be set with 4 to 20 mA measuring range

4.3 Explanation of parameters

4.3.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Base for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

4.3.2 Parameters of the channels

4.3.2.1 Interference frequency suppression

Here you set the interference frequency suppression for the line frequency:

- 50 Hz
- 60 Hz

You can find additional information on this in the Analog value processing function manual (https://support.industry.siemens.com/cs/ww/en/view/67989094).

4.3.2.2 Evaluation of the sensors

Overview

Here you select the type of sensor evaluation:

- "1oo1 evaluation (max. SIL3/Cat.3/PLd)"
- "1oo2 evaluation (max. SIL3/Cat.4/PLe)"

If you do not want to measure with a channel or channel pair, disable the channel or the channel pair.

1oo1 evaluation (max. SIL3/Cat.3/PLd)

With the 1oo1 evaluation, there is one sensor, and it is connected to the F-module via a single channel.

1oo2 evaluation (max. SIL3/Cat.4/PLe)

With the 1oo2 evaluation, two input channels are occupied by:

- Two single-channel sensors
- One two-channel sensor

Note that in 1oo2 evaluation, two channels are combined into a channel pair.

Achievable safety class

Depending on the selected sensor evaluation, you achieve the following safety classes with a sensor that is qualified accordingly:

- SIL3/Cat.3/PLd for "1oo1 evaluation" or
- SIL3/Cat.4/PLe for "1oo2 evaluation"

See also

Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 27)

4.3.2.3 Standard value

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can choose for each input channel pair which of the two F-CPU values is provided.

- "MIN": the lesser of the two values.
- "MAX": the greater of the two values.

During a discrepancy between the two input channels, the last valid standard value prior to the occurrence of the discrepancy is made available to the F-CPU.

4.3.2.4 Discrepancy time

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the discrepancy time for each channel pair here in milliseconds.

The discrepancy time does not start until the standard value is outside the assigned tolerance window (relative or absolute). If the two redundant input channels of the channel pair differ by more than the specified tolerance and for longer than the specified discrepancy time but no longer than the duration of the maximum response time, the F-module detects a discrepancy error and triggers a diagnostic interrupt. If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.

You can find additional information about configuring the discrepancy analysis under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 27).

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.3.2.5 Tolerance window %, absolute

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for the channel pair. You specify the tolerance window as a percentage of the full-scale value. The reference value is the full-scale value, i.e. 20 mA. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

For more information regarding setting the tolerance window, refer to Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 27).

Example

You have assigned the following:

- The "Tolerance window % absolute" 10%
- The measuring range 0..20 mA
- A discrepancy time of 100 ms

The input channels may differ from the configured discrepancy time (100 ms) up to the max. reaction time for a time window with a difference of more than 2 mA.

See also

Discrepancy time (Page 24)

4.3.2.6 Tolerance window %, relative

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for each channel pair. You specify the tolerance window as a percentage of the assigned standard value. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

The two parameters "Tolerance window % absolute" and "Tolerance window % relative" are combined. The "Tolerance window % absolute" parameter is decisive in case of low process values.

For more information regarding setting the tolerance window, refer to Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 27).

Example

You have assigned the following:

- The "tolerance window % relative" is set at 10%
- A measuring range of 0 to 20 mA
- A discrepancy time of 200 ms
- A unit value of 20 mA

The input channels may differ from the configured discrepancy time (200 ms) up to the max. reaction time for a time window with a difference of more than 2 mA.

Discrepancy time (Page 24)

4.3.2.7 Parameter assignment of discrepancy analysis for 1oo2 evaluation

Operating principle of discrepancy analysis

A discrepancy analysis is performed with a configured 1oo2 evaluation. **Smoothed** process values are used for the discrepancy analysis.

An assignable tolerance window is formed around the process value that represents the instantaneous standard value (value that is signaled to the F-CPU).

The tolerance window is formed relative to the process value or as an absolute value relative to the measuring range end value. Relative and absolute tolerance windows are combined.

If the process value does not represent the standard value at an instant and is within the tolerance window, **no** discrepancy exists.

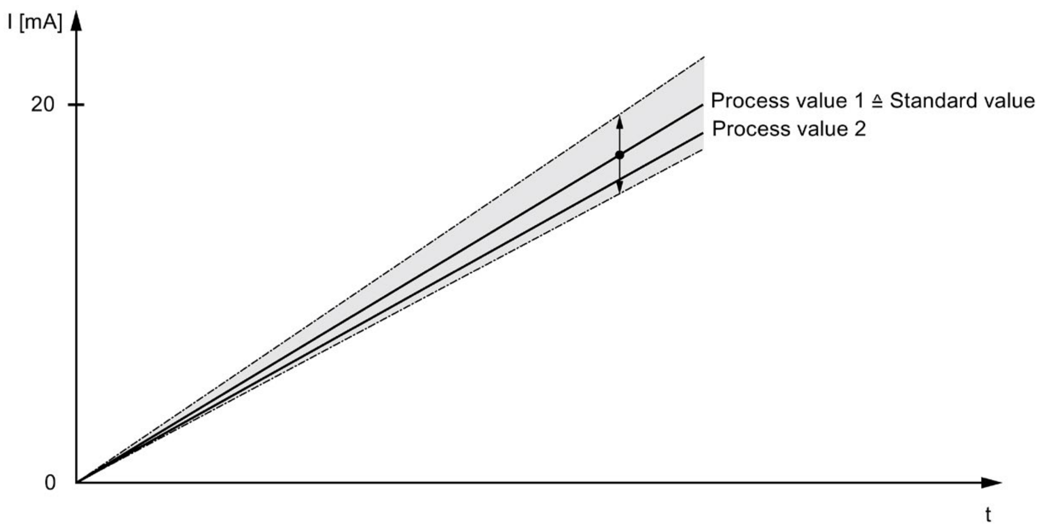

Figure 4-1 Example of a relative tolerance window *without* discrepancy (parameter assignment: standard value = MAX)

If the process value does not represent the standard value at an instant but is outside the tolerance window, a discrepancy exists.

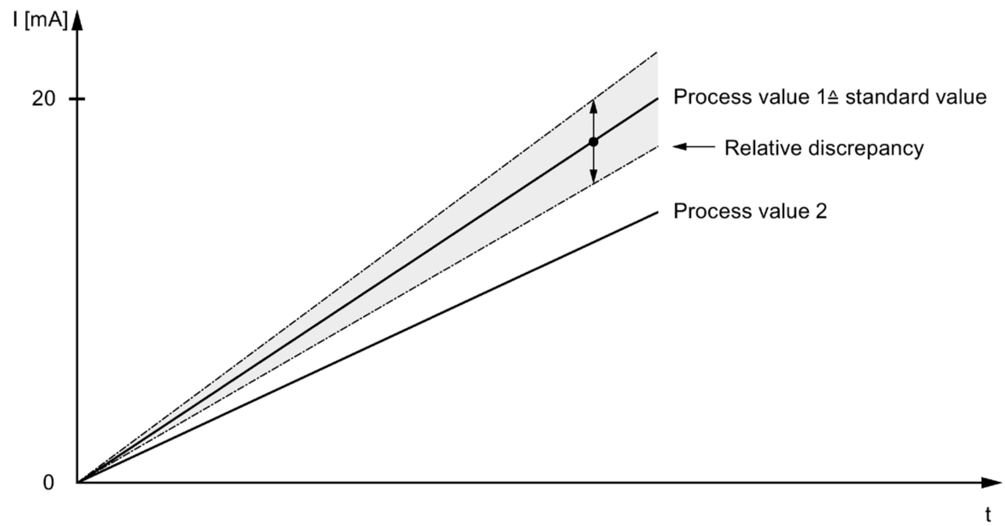

Figure 4-2 Example of a relative tolerance window *with* discrepancy (parameter assignment: standard value = MAX)

The assigned discrepancy time starts as soon as a discrepancy is detected. The discrepancy time runs as long as the discrepancy exists.

- During a discrepancy between the two input channels, the last valid standard value prior to occurrence of the discrepancy is signaled to the F-CPU.

  If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.

- There is no valid old value after startup. If the discrepancy is detected during this time, $7FFF_H$ is output for S7-300/400 F-CPUs or 0 is output for S7-1200/1500 F-CPUs and the discrepancy time is started.

  If there is no longer a discrepancy between the input channels when the discrepancy time expires, the standard value is output.

If the discrepancy time has expired, an error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the STEP 7 Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Configuring the discrepancy analysis parameters

The following four parameters for the discrepancy analysis are assigned for each channel pair:

- Discrepancy time
- Standard value
- Tolerance window %, absolute
- Tolerance window %, relative

"Discrepancy time" parameter

If the following is true, the F-module detects a discrepancy error:

- The process value that does not represent the standard value is outside the configured tolerance window.
- Lasts longer than the configured discrepancy time.
- Lasts at maximum the duration of the maximum response time.

In the case of a discrepancy error, the F-module triggers a diagnostic interrupt and sets the process value to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. The discrepancy time is reset if the standard value lies within the tolerance window again.

In the PII, the substitute value 0 is set for the safety program.

You calculate the maximum discrepancy time that is permitted in the respective application using the following formula:

Discrepancy time = Maximum response time (in case of discrepancy error) – 2 × Conversion cycle time × Smoothing – 2 × Conversion cycle time

---

Note

You calculate the discrepancy time by using the values from section Discrepancy time (Page 69) in the above equation.

You can assign the discrepancy time for each channel pair.

"Standard value" parameter

You can select which of the two values is to be signaled to the F-CPU for each input channel pair. During a discrepancy between the two input channels, the last valid standard value prior to occurrence of the discrepancy is signaled to the F-CPU.

- "MIN": The lower of the two values is signaled to the F-CPU as the standard value.
- "MAX": The higher of the two values is signaled to the F-CPU as the standard value.

"Tolerance window %, absolute" parameter

You can calculate the absolute tolerance window using the following formula:

$$T_{abs} = \frac{|\Delta I_{abs}|}{I_{ME} - I_{MA}} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta I_{abs} = \pm \frac{(I_{ME} - I_{MA}) \times T_{abs}}{100} \ [mA]$$

With

- I_{ME} = 20 mA (full-scale value)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA (start-of-scale value)
- I_{MA} = 4 mA for measuring range 4 ... 20 mA (start-of-scale value)
- T_{abs} = Tolerance in %
- ΔI_{abs} = Maximum deviation of current (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, absolute" parameter for each channel pair.

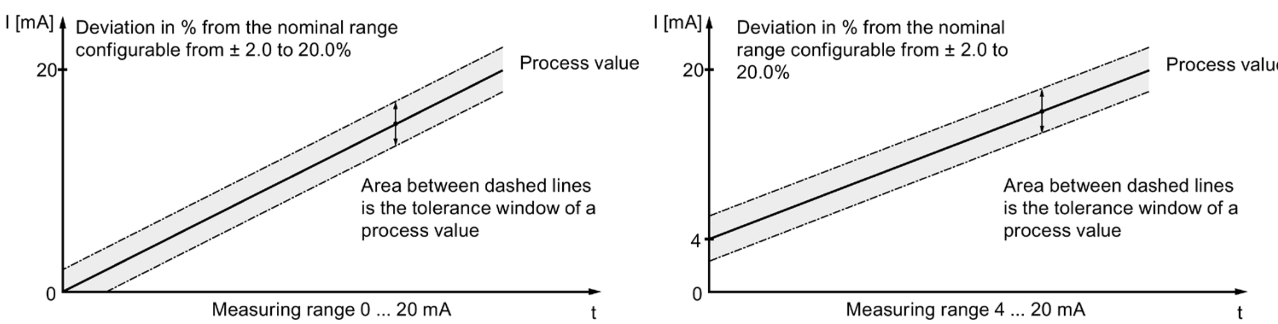

Figure 4-3 Absolute deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

"Tolerance window %, relative" parameter

The tolerance window is calculated as a percentage of the **smoothed** process value that represents the MIN or MAX value (depending on the parameter assignment of the standard value) in this instant.

You can calculate the relative tolerance window using the following formula:

$$T_{rel} = \frac{|\Delta I_{rel}|}{|I_{EW} - I_{MA}|} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta I_{rel} = \pm \frac{|I_{EW} - I_{MA}| \times T_{rel}}{100} \ [mA]$$

With

- I_{EW} = Process standard value (min./max.)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA
- I_{MA} = 4 mA for measuring range 4 ... 20 mA
- T_{rel} = Tolerance in %
- ΔI_{rel} = Maximum deviation of current (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, relative" parameter for each channel pair.

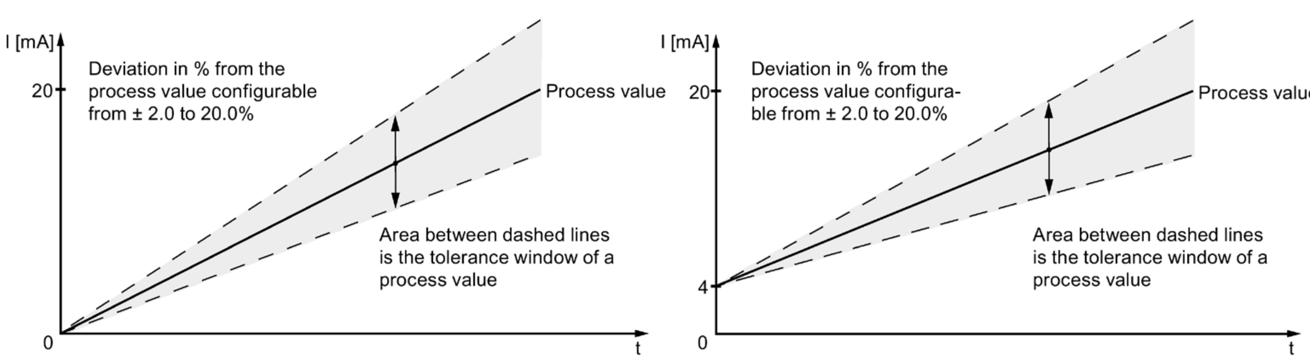

Figure 4-4 Relative deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

Combination of the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters

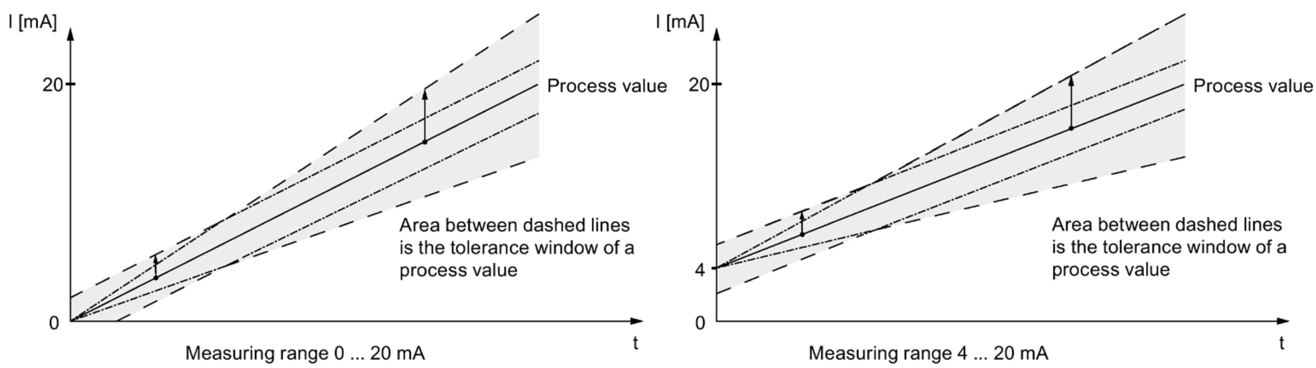
You can combine the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters as needed. The combined tolerance window (shown in gray in the figure below) is the maximum of T_{rel} and T_{abs}.

$T = MAX \{ T_{rel}, T_{abs} \}$

$\Delta I = MAX \{ \Delta I_{rel}, \Delta I_{abs} \}$

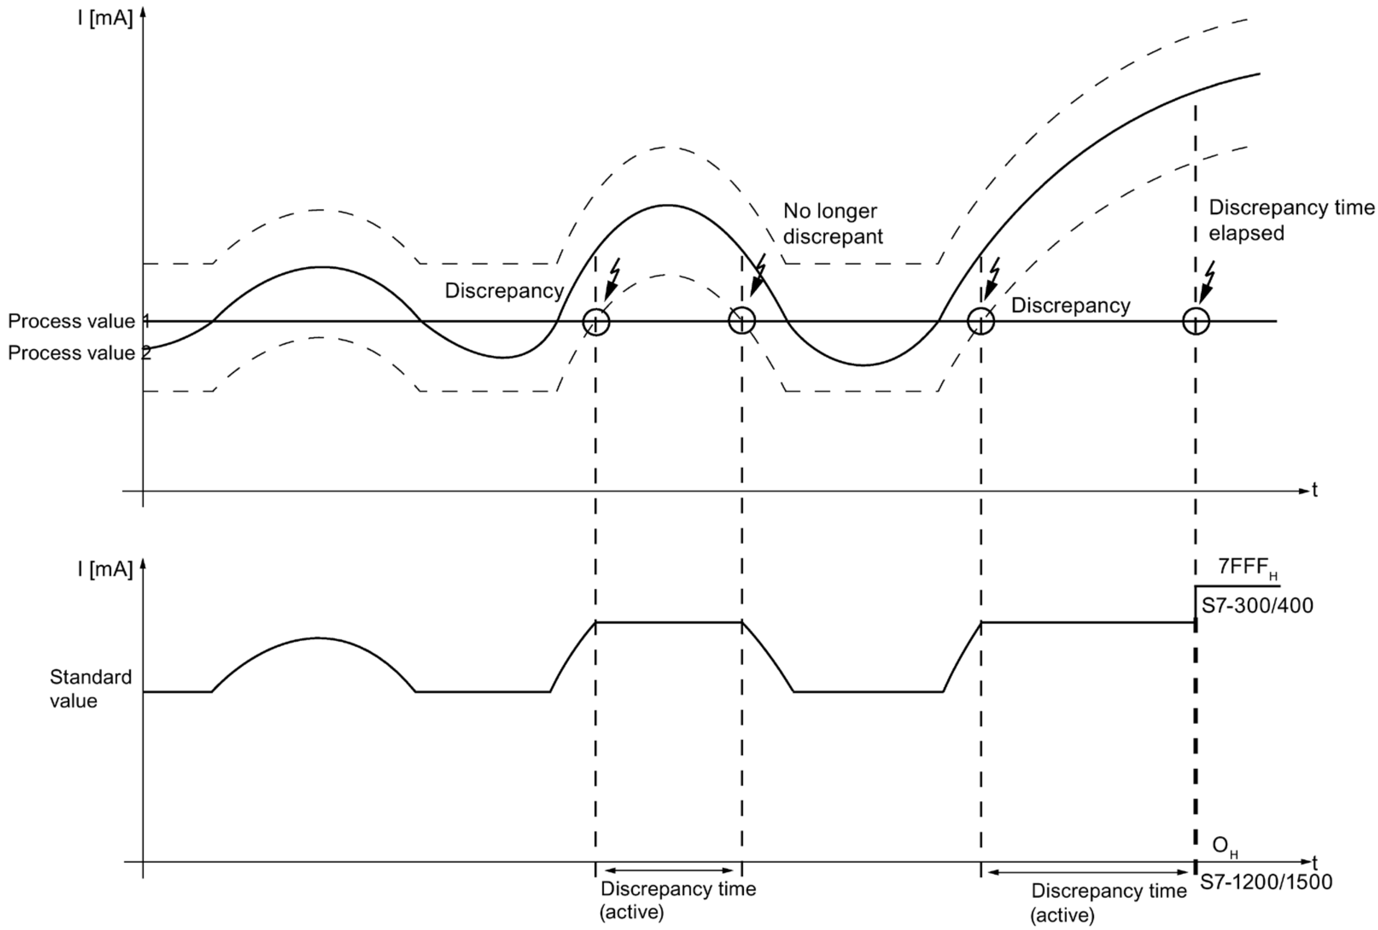
With

- T = Tolerance, in %
- ΔI = Maximum deviation of current (+/-)



Example

The following diagrams show you the behavior of the discrepancy evaluation when standard value = MAX.



The upper of the two diagrams shows you the characteristic curve of the two process values. The dashed line represents the absolute tolerance range configured in this example.

The lower of the two diagrams shows you the standard value signaled to the F-CPU.

In this example, on the first occurrence of a discrepancy, process value 1 is **within** the tolerance range again **before** expiration of the discrepancy time. This means the discrepancy error is not signaled.

In this example, on the second occurrence of a discrepancy, process value 1 is **outside** the tolerance range when the discrepancy time expires. As a result, a discrepancy error is signaled with 7FFF$_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs after expiration of the discrepancy time. In the PII, the substitute value 0 is set for the safety program.

Tolerance window %, absolute (Page 25)

Tolerance window %, relative (Page 26)

4.3.2.8 Activated

If you select this check box, the corresponding channel is enabled for signal processing.

You can deactivate an unused channel with this parameter.

If you deactivate unused channels, the response time of the F-module is reduced.

4.3.2.9 Channel failure acknowledge

Use on S7-1200/1500 F-CPUs

The parameter is only relevant if the F-module can be operated on an S7-1200/1500 F-CPU.

The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. For S7-300/400 F-CPUs you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.3.2.10 Measuring range

You select the measuring range for the channel with this parameter:

- 0 to 20 mA
- 4 to 20 mA

4.3.2.11 Diagnostics: Wire break

Function

Here you activate wire break detection for a configured measuring range of 4 to 20 mA.

With an assigned measuring range of 4 to 20 mA:

- With assigned wire break diagnostics and currents < 3.6 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.
- Without configured wire break and currents diagnostics < 0.4444 mA detects "underflow" and triggers a diagnostic interrupt in the F-CPU.

With an assigned measuring range of 0 to 20 mA, the wire break diagnostics is permanently set by default. With currents < 0.4442 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.

If you do not need a channel, deactivate the channel. Then, a wire break is not detected.

4.3.2.12 Smoothing

Using smoothing

Smoothing of analog values provides a stabilized analog signal for further processing. Smoothed values are always used for discrepancy analysis.

> **WARNING**
>
> The smoothing takes place as a result of averaging over the selected number of most recently converted analog values of a channel, e.g. 64.
>
> The mean value generation causes a discrepancy to be delayed with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)". You can find an example below.

Smoothing principle

The measured values are smoothed by a digital filter. Smoothing is achieved by the F-module forming the mean of a number of converted (digitized) analog values determined by the "Smoothing" parameter.

You assign smoothing in 7 levels (1, 2, 4, 8, 16, 32, 64 conversion cycles). The level determines the number of analog signals that are averaged. If smoothing = 1 is configured, the smoothing is deactivated.

A higher smoothing provides a more stable analog value, and prolongs the time it takes to apply a smoothed analog signal following a unit step. You can find an example below.

Note

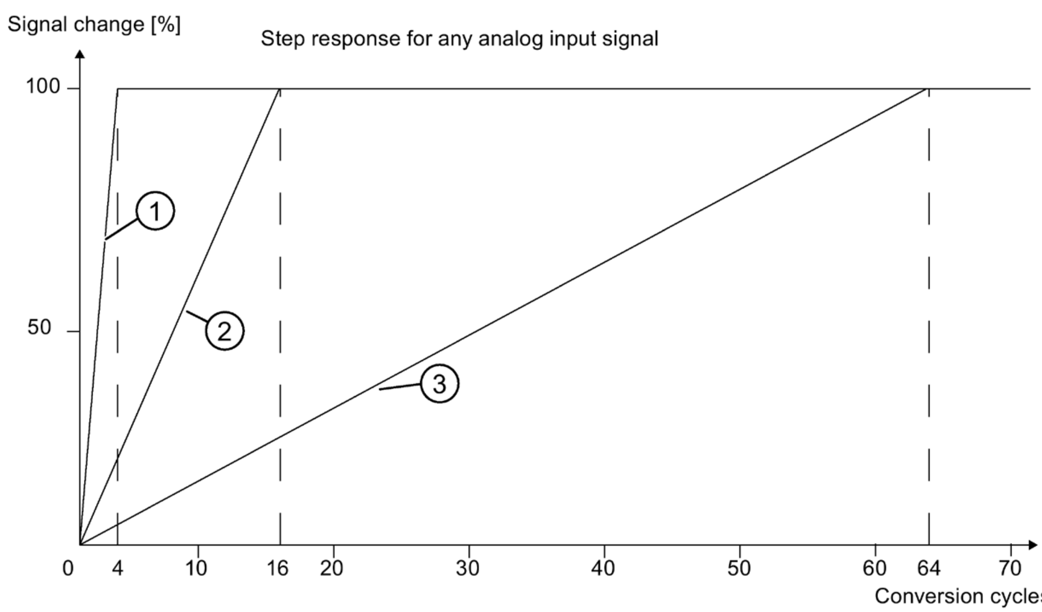
Smoothing is reset after startup, short circuit, wire break or another channel fault. If, for example, smoothing with 16 conversion cycles is assigned and all channels are active, it takes up to 2000 ms until the process value is signaled with a configured interference frequency suppression of 50 Hz.

Until the first valid process value, the F-module signals for the channel $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

If a discrepancy occurs, measuring and smoothing continues and is not restarted.

Example

The figure below shows the number of conversion cycles, depending on the smoothing setting, after which the analog value is completely smoothed and available in the case of a unit step. The figure applies to all signal changes at the analog input.



① Smoothing - 4 conversion cycles
② Smoothing - 16 conversion cycles
③ Smoothing - 64 conversion cycles

Example: Effect of smoothing on the maximum response time for a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)" in case of error

If an error (One Fault Delay Time, OFDT) occurred with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you calculate the maximum response time according to the following formula:

Maximum response time (in case of discrepancy error) = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time

Example: One channel pair connected and configured (activated), interference frequency 50 Hz, smoothing = 16 conversion cycles, discrepancy time = 2000 ms, conversion cycle time calculated with the formula from section Response times (Page 69):

Max. response time (in case of discrepancy error) = 2 × 70 ms × 16 + 2000 ms + 2 × 70 ms = 4380 ms

If a discrepancy exists between the two input channels, it can take 4380 ms until the F-module signals a discrepancy error to the F-CPU.

If the discrepancy time expires, an error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

4.4 Address space

Address assignment for the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF

The analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF occupies the following address areas in the F-CPU:

Table 4- 3 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 12	QB x + 0 to x + 3
S7-1200/1500 F-CPUs	IB x + 0 to x + 13	QB x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF

The user data occupy the following addresses in the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF out of all the assigned addresses in the F-CPU:

Table 4- 4 User data address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 0	Input value at channel 0							
IB x + 1	(Result of the 1oo2 evaluation channel 0/2)							
IB x + 2	Input value at channel 1							
IB x + 3	(Result of the 1oo2 evaluation channel 1/3)							
IB x + 4	Input value at channel 2							
IB x + 5								
IB x + 6	Input value at channel 3							
IB x + 7								
IB x + 8	—	—	—	—	Value status* for AI_3	Value status* for AI_2	Value status* for AI_1	Value status* for AI_0

* Only S7-1200/1500 F-CPUs

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module 5

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is performed on the suitable BaseUnit. Additional information is available in the Connecting section in the Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293) System Manual.

5.1 Application 1: Safety mode SIL3/Cat.3/PLd with 2-wire transducer

Introduction

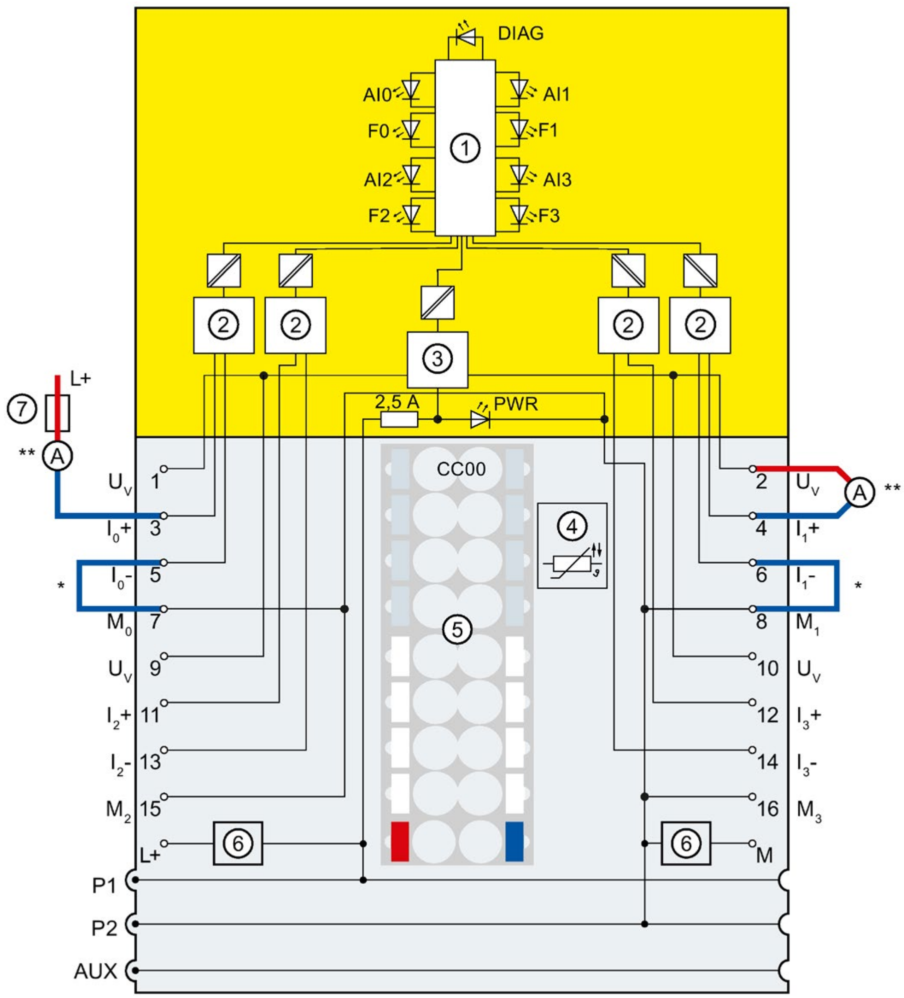
Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- Application 1: Safety mode SIL3/Cat.3/PLd, 1oo1 (1v1) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 58)".

Current measurement 0/4 to 20 mA, 2-wire transducer

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.



①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	DIAG	Diagnostics LED (green, red)
⑦	External fuse	AI0, AI1, AI2, AI3	Channel status LED (green)
I_n+	Current input positive, channel n	F0, F1, F2, F3	LED channel fault (red)
I_n-	Current input negative, channel n	PWR	Power LED (green)
*	Create the bridge directly at the terminal connection.	**	Measuring transducer

Figure 5-1 1oo1 evaluation

WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a suitably qualified sensor.

WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

Assignable parameters for application 1

Table 5- 1 Parameters for application 1 of F-AI 4xI 0(4)..20mA 2-/4-wire HF

Parameters	Range of values in safety mode
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo1 evaluation (max. SIL3/Cat.3/PLd)
Measuring range	• 0 ... 20 mA • 4 ... 20 mA
Diagnostics: Wire break	(in the measuring range 4 to 20 mA) • Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

5.2 Application 2: Safety mode SIL3/Cat.4/PLe with 2-wire transducer

Introduction

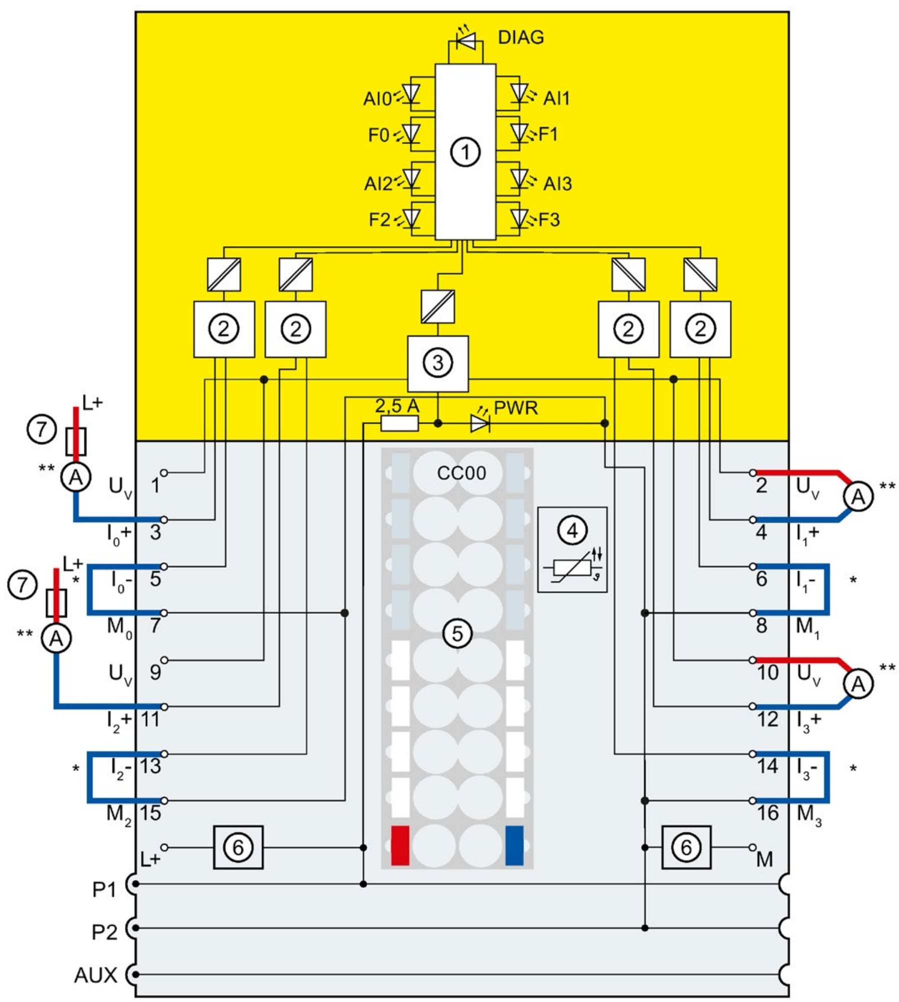
Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- application 2: Safety mode SIL3/Cat.4/PLe, 1oo2 (2v2) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 58)".

Current measurement 0/4 to 20 mA, 2-wire transducer

Two process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.



①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n

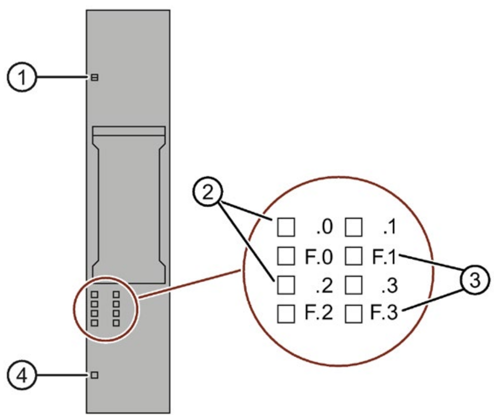
6.1 Status and error display

LED display

The following figure shows the LED display of the F-AI 4xI 0(4)..20mA 2-/4-wire HF.



①	DIAG (green/red)
②	Channel status (green)
③	Channel fault (red)
④	PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostic messages (Page 58).

> **⚠ WARNING**
>
> The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 6- 1 Error display of the LED DIAG

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for a user acknowledgment.
Flashing	• Operation in S7-1200/1500 F-CPUs: The F-module is waiting for a user acknowledgment after a module fault. • Operation in S7-300/400 F-CPUs: The F-module is waiting for a user acknowledgment.

Channel status/channel fault LED

Table 6- 2 Status display of the LEDs channel status / channel error

Channel status	Channel fault	Meaning
Off	Off	Channel deactivated or supply voltage L+ missing.
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
/ Alternately flashing		At least one channel is waiting for a user acknowledgment.

Channel status/DIAG/channel fault LED

Table 6- 3 Status display of the LEDs channel status / DIAG / channel error

Channel status	DIAG	Channel fault	Meaning
Off	Flash-ing	All On	The PROFIsafe address does not match the configured PROFIs-afe address.
Flashing	Flash-ing	Off	Identification of the F-module when assigning the PROFIsafe ad-dress.

PWR LED

Table 6- 4 Status display of LED PWR

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

6.2 Interrupts

Introduction

The fail-safe analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 58).

The list below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 58)

Scope of diagnostic interrupt: F-module

- Overtemperature
- Parameter error
- Supply voltage missing
- Channel/component temporarily not available
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog timer value is 0 ms (F_WD_Time)
- Parameter F_SIL exceeds SIL from specific device application
- Parameter F_CRC_Length does not match the generated values
- Version of F-parameter set incorrectly
- CRC1 fault
- Inconsistent iParameters (iParCRC error)
- F_Block_ID not supported
- Transmission error: Inconsistent data (CRC error)
- Transmission error: Timeout (monitoring time 1 or 2 expired)
- Module is defective
- Watchdog tripped
- Invalid/inconsistent firmware present

- Diagnostics memory overflow
- Channel failure acknowledgment
- F-address memory not accessible
- No valid F-address available
- Diagnostics memory overflow
- Undertemperature
- Supply voltage too high
- Supply voltage too low
- Channel/component not available

Scope of diagnostic interrupt: Channel

- Diagnostics: Wire break (can only be configured for measuring range 4..20mA)
- High limit exceeded
- Low limit violated
- Safety-related switch off
- Internal supply voltage of the module failed
- Common mode error
- Analog input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to M
- Discrepancy error
- Analog input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to M
- Read back failure
- ADC error
- Fault in test circuit

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 5 Diagnostic messages of the F-AI 4xI 0(4)..20mA 2-/4-wire HF

Diagnostic message	**Fault code**	**Meaning**	**Remedy**
Overtemperature	5_H	The F-module measured an excessively high temperature.	Operate the F-module within the specified temperature range (see Technical specifications (Page 64)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Wire break	6_H	Possible causes: • A cable to the sensor is broken. • Fault at the external circuit • Defective sensor • Wrong sensor type set in the parameters • Input channel not used • Measurement resistance too high	Check the possible causes and eliminate the fault.
High limit exceeded	7_H	The measured value exceeds the measuring range.	Check the interaction between the module and the sensor.
Low limit violated	8_H	The measured input value is below a measuring range.	Check the interaction between the module and the sensor.
Parameter error	10_H	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.

Diagnostic message	Fault code	Meaning	Remedy
Safety-related switch off	19_H	For safety purposes, channel was switched off due to an error on another channel. Possible causes: • Short circuit is present.	• Correct the process wiring.
Channel/component temporarily not available	$1F_H$	Possible causes: • Internal fault in the F-module • Firmware update error	• Replace the F-module. • Repeat the firmware update.
Mismatch of safety destination address (F_Dest_Add)	40_H	The F-module detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	41_H	The F-module detected an invalid F-destination address.	
Safety source address not valid (F_Source_Add)	42_H	The F-module detected a different F-source address.	
Safety watchdog timer value is 0 ms (F_WD_Time)	43_H	The F-module detected an invalid safety watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	44_H	The F-module detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The F-module detected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	46_H	The F-module detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	47_H	The F-module detected inconsistent F-parameters.	
Transmission error: Inconsistent data (CRC error)	$4D_H$	The F-module detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Electromagnetic interference has exceeded limits. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Inconsistent iParameters (iParCRC error)	51_H	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	52_H	The F-module detected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Timeout (monitoring time 1 or 2 expired)	54_H	The F-module detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.

Diagnostic message	Fault code	Meaning	Remedy
Module is defective	100_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Watchdog tripped	103_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Internal supply voltage of the module failed	104_H	Internal voltage is too low.	Replace the F-module.
Common mode error	118_H	Voltage between two input channels is too high.	Correct the input wiring.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for the F-module. Note any error messages. • Use only firmware versions released for this F-module.
Diagnostics memory overflow	$13E_H$	Overflow of the diagnostics memory. It was not possible to send all pending diagnostics. This error can lead to deactivation of the F-module and even to switch off/on of the supply voltage.	Remedy the cause of the diagnostics surge.
Analog input signal not recorded unique	304_H	Measured values from the sensor are not plausible. Possible causes: • Increased EMC • F-module defective	Check the interaction between the F-module and the sensor.
Internal sensor supply short-circuit to P	306_H	Possible causes: • Short-circuit of internal sensor supply to P	Check the process wiring.
Overload or internal sensor supply short-circuit to M	307_H	• The internal sensor supply is overloaded. • Missing or insufficient supply voltage L+.	• Eliminate the short-circuit in the process wiring. • Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.

Diagnostic message	Fault code	Meaning	Remedy
Channel failure acknowledgment	$30B_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
No valid F-address available	$30D_H$	The F-source address and F-destination address stored in the electronic coding element cannot be accessed.	Verify that the coding element is present. Replace the coding element, if necessary.
F-address memory not accessible	$30E_H$	No valid PROFIsafe address is saved in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between target and actual configuration of the plant.	• In the case of initial commissioning or deliberate parameter change, assign the PROFIsafe address. • Check the consistency of the target and actual configuration.
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 64))
Discrepancy error	314_H	The discrepancy time set for 1oo2 operation has exceeded. Possible causes of the discrepancy error: • Incorrect parameter assignment • Wire break in the sensor's supply cable	Check the discrepancy time, the sensors and the cabling.
Read back failure	$31E_H$	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Auxiliary voltage too high	321_H	The supply voltage is too high.	Check the supply voltage and then test the safety application.
Auxiliary voltage too low	322_H	The supply voltage is too low.	Check the supply voltage and then test the safety application.
ADC error	331_H	Internal error during analog-digital conversion. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Fault in test connection	332_H	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 64): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and fault display, the F-module provides information about the validity of each analog input signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is the binary additional information of an analog input signal. The value status is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the analog input signal.

The value status is affected by all faults.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors, you can only access the low order channel in the safety program, e.g. channel 0.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 38).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications 7

7.1 Technical specifications

Technical specifications of the F-AI 4xI 0(4)..20mA 2-/4-wire HF

Article number	6ES7136-6AA00-0CA1
General information	
Product type designation	F-AI 4xI 0(4) ... 20 mA 2/4-wire HF
Firmware version	
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 203
CiR – Configuration in RUN	
Reparameterization possible in RUN	No
Calibration possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	0.38 A
Current consumption, max.	0.4 A
24 V encoder supply	
• 24 V	Yes; min. L+ (-1.5 V)
• Short-circuit protection	Yes
• Output current, max.	300 mA; total current of all encoders/ channels
Power	
Power available from the backplane bus	70 mW
Power loss	
Power loss, typ.	2 W

Article number	6ES7136-6AA00-0CA1
Address area	
Address space per module	
• Inputs	14 byte; S7-300/400F CPU, 13 byte
• Outputs	5 byte; S7-300/400F CPU, 4 byte
Hardware configuration	
Automatic encoding	
• Electronic coding element type F	Yes
Analog inputs	
Number of analog inputs	4
• For current measurement	4
permissible input current for current input (destruction limit), max.	35 mA
Input ranges (rated values), currents	
• 0 to 20 mA	Yes
• Input resistance (0 to 20 mA)	125 Ω
• 4 mA to 20 mA	Yes
• Input resistance (4 mA to 20 mA)	125 Ω
Cable length	
• shielded, max.	1 000 m
Analog value generation for the inputs	
Measurement principle	Sigma Delta
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Integration time (ms)	20 / 16,667
• Interference voltage suppression for interference frequency f1 in Hz	50 / 60 Hz
Smoothing of measured values	
• Number of smoothing levels	7
• parameterizable	Yes
• Step: None	Yes; 1x conversion cycle time
• Step: low	Yes; 2x / 4x conversion cycle time
• Step: Medium	Yes; 8x / 16x conversion cycle time
• Step: High	Yes; 32x / 64x conversion cycle time

Article number	6ES7136-6AA00-0CA1
Encoder	
Connection of signal encoders	
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.1 %
Temperature error (relative to input range), (+/-)	0.023 %/K
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.1 %
Operational error limit in overall temperature range	
• Current, relative to input range, (+/-)	2 %
Basic error limit (operational limit at 25 °C)	
• Current, relative to input range, (+/-)	0.1 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	40 dB
• Common mode interference, min.	70 dB
Interrupts/diagnostics/status information	
Diagnostics function	Yes, "Alarms/diagnostic messages" section in the manual
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; Measuring range 4 to 20 mA only
• Short-circuit	Yes
Diagnostics indication LED	
• RUN LED	Yes; Green LED
• ERROR LED	Yes; Red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; Green/red LED

Article number	6ES7136-6AA00-0CA1
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	10 Vpp
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 5.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	48 g

Operational limit in complete temperature range

> **WARNING**
>
> When designing the safety function, you must take into account the information "Operational limit in complete temperature range" for the entire mission time.

Temperature characteristic values

Note

When the ambient temperature exceeds 55 °C, you must only apply a maximum total current of 3 A to an adjacent F-DQ 4x24VDC/2A PM HF.

Dimension drawing

Response times

A

Introduction

You will find the response times of the F-AI 4xI 0(4)..20mA 2-/4-wire HF below. The response times are included in the calculation of the F-system response time.

Definition of response time for fail-safe analog inputs

The response time results from the number of channels/channel pairs, the response time per channel/channel pair, the basic response time and the configured smoothing.

Times required for the calculation

- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 20 ms
- Basic response time: 20 ms
- Response time per channel
  - At 50 Hz: 25 ms
  - At 60 Hz: 22 ms

Conversion cycle time = basic response time + (N × response time per channel)

(N = number of active channels)

The conversion cycle time is the time in which all activated channels are processed/converted once.

Typical response time

You can calculate the typical response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF using the following formula:

Typical response time = Conversion cycle time × Smoothing

Max. response time (worst case delay time, WCDT)

You can calculate the maximum response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF (worst case delay time, WCDT) using the following formula:

Max. response time = 2 × Conversion cycle time × Smoothing

Response time in the case of a fault (one fault delay time, OFDT)

You can calculate the response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF (one fault delay time, OFDT) as follows:

- According to the following formula if a discrepancy error is present:

  Typical response time = Conversion cycle time × Smoothing + Discrepancy time + Conversion cycle time

  Maximum response time = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time

- According to the following formula if a channel fault is present:

  Typical response time = Conversion cycle time

  Max. response time = 2 × Conversion cycle time

This means that, for OFDT, the time on occurrence of a discrepancy error should be taken with parameter assignment "1oo2 evaluation (max. SIL3/Kat.4/PLe)" and the time on occurrence of a channel fault should be taken with parameter assignment "1oo1 evaluation (max. SIL3/Kat.3/PLd)".

Representation of analog values B

In this section we are presenting the analog values for all measuring ranges that you can use with the F-AI 4xI 0(4)..20mA 2-/4-wire HF analog input module.

Measured value resolution

The analog values are shown as fixed-point number in two's complement.

The resolutions shown here are 16 bits including sign.

Table B- 1 Resolution of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of analog values

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table B- 2 Current measuring range 0 to 20 mA

Values		Current measuring range	Range
Dec.	Hex.	0 to 20 mA	
32512	$7F00_H$	> 23.518 mA	Overflow[2]
32511 . . 27649	$7EFF_H$ . . $6C01_H$	23.518 mA . . 20.0007 mA	Overrange
27648 . . 614	$6C00_H$ . . 266_H	20 mA . . 0.4442 mA	Nominal range
613 . . 1 0	265_H . . 1_H 0_H	< 0.4442 mA . . 723.4 nA 0 mA	Wire break[1]

[1] The F-module signals a wire break, $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

[2] In *STEP 7 Safety*, the fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) in the PII for the safety program.

Table B- 3 Current measuring range 4 to 20 mA

Values		Current measuring range	Range	
Dec.	Hex.		Diagnostics wire break: No	Diagnostics wire break: Yes
32512	7F00$_H$	> 22.814 mA	Overflow[2]	Overflow[2]
32511 . . 27649	7EFF$_H$ . . 6C01$_H$	22.814 mA . . 20.0006 mA	Overrange	Overrange
27648 . . 1 0	6C00$_H$ . . 1$_H$ 0$_H$	20 mA . . 4 mA + 578.7 nA 4 mA	Nominal range	Nominal range
-1 . . -691	FFFF$_H$ . . FD4D$_H$	3.9994 mA . . 3.6 mA	Underrange	Underrange
-692 . . -6144	FD4C$_H$ . . E800$_H$	< 3.6 mA . . 0.4444 mA		Wire break[1]
-6145	E7FF$_H$	< 0.4444 mA	Underflow[2]	

[1] The F-module signals a wire break, 7FFF$_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

[2] In *STEP 7 Safety*, the substitute value 0 is provided in place of 7FFF$_H$ (for overflow) or 8000$_H$ (for underflow) in the PII for the safety program.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

Documentation guide 1

1.1 Documentation guide for F-DQ 4x24VDC/2A PM HF digital output module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital output module F-DQ 4×24VDC/2A PM HF

The table below lists additional documents that complement this description of the fail-safe digital output module DQ 4×24VDC/2A PM HF and are available on the Internet.

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview 2

2.1 Properties of the F-DQ 4x24VDC/2A PM HF

Order number

6ES7136-6DB00-0CA0

View of the module

Figure 2-1 View of the F-DQ 4×24VDC/2A PM HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 4 outputs, PM-switching (SIL3/Cat.4/PLe)
  - Supply voltage L+
  - Output current per output 2 A
  - Source output (PM-switching)
  - Suitable for solenoid valves, DC contactors and signal lamps
  - Diagnostic display (DIAG red/green LED)
  - Status display for each output (green LED)
  - Fault display for each output (red LED)
  - Diagnostics, e.g., short circuit/wire break/load voltage missing, channel-specific
  - Channel-specific or passivation throughout the module
  - Direct interconnection to F-DI possible (single channel: SIL1, two-channel: SIL3)
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 38).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Passivation of fail-safe outputs over a long period of time

WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting 3

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-DQ 4×24VDC/2A PM HF

Terminal assignment for F-DQ 4×24VDC/2A PM HF (6ES7136-6DB00-0CA0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit[1]**	**Color identification label (terminals 1 to 16)**
1	DQ-P$_0$	2	DQ-P$_1$	• DQ-P$_n$: Output signal, channel n, P-switching • DQ-M$_n$: Ground for output signal, channel n, M-switching	A0	 CC02 6ES7193-6CP02-2MA0
3	DQ-P$_2$	4	DQ-P$_3$			
5	DQ-P$_0$	6	DQ-P$_1$			
7	DQ-P$_2$	8	DQ-P$_3$			
9	DQ-M$_0$	10	DQ-M$_1$			
11	DQ-M$_2$	12	DQ-M$_3$			
13	DQ-M$_0$	14	DQ-M$_1$			
15	DQ-M$_2$	16	DQ-M$_3$			
L+	DC24V	M	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

The first BaseUnit must be a light BaseUnit.

Note

The fuse integrated in BaseUnit type A1 can trigger with the digital output module which renders the terminals useless.

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

Switching of grounded loads

The F-DQ 4×24VDC/2A PM HF can switch loads with a connection between chassis and ground of at least 100 kΩ. Otherwise a short circuit is detected.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection.

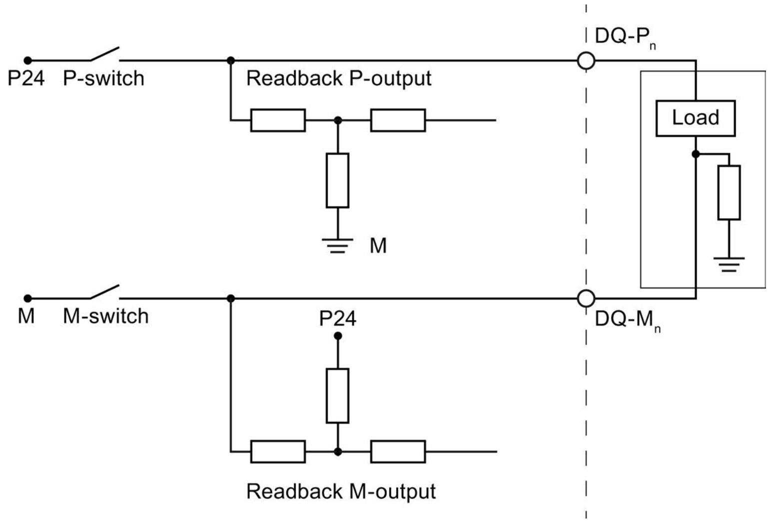

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

Alternatively, you can use F-PM-E 24VDC/8A PPM ST power module in which the output is configured as a PP-switching output.

Parameters/address space 4

4.1 Parameters

Parameters

WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for F-DQ 4×24VDC/2A PM HF

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
DQ parameters:			
Maximum test period	• 100 s • 1000 s	no	Module

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters:			
Channel n			
Activated	• disable • enable	no	Channel
Max. readback time dark test	0.6 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.6 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the channels

4.2.2.1 Maximal test period

With this parameter, you specify the time within which the light, dark and switch on tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test time is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

4.2.2.2 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

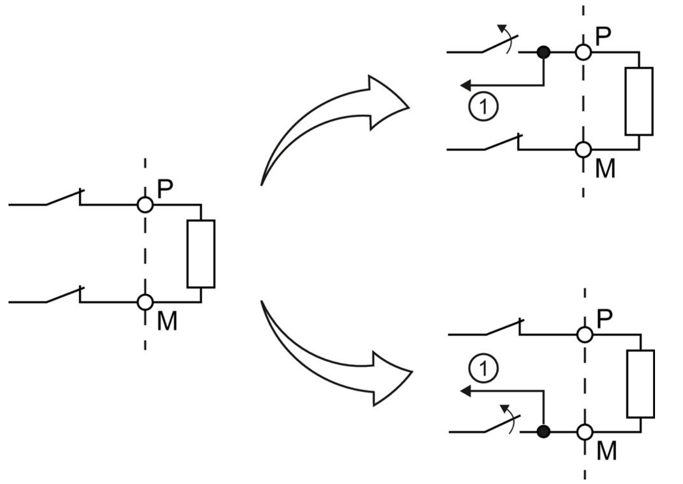
You can deactivate an unused channel with this parameter.

4.2.2.3 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-1 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads.

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

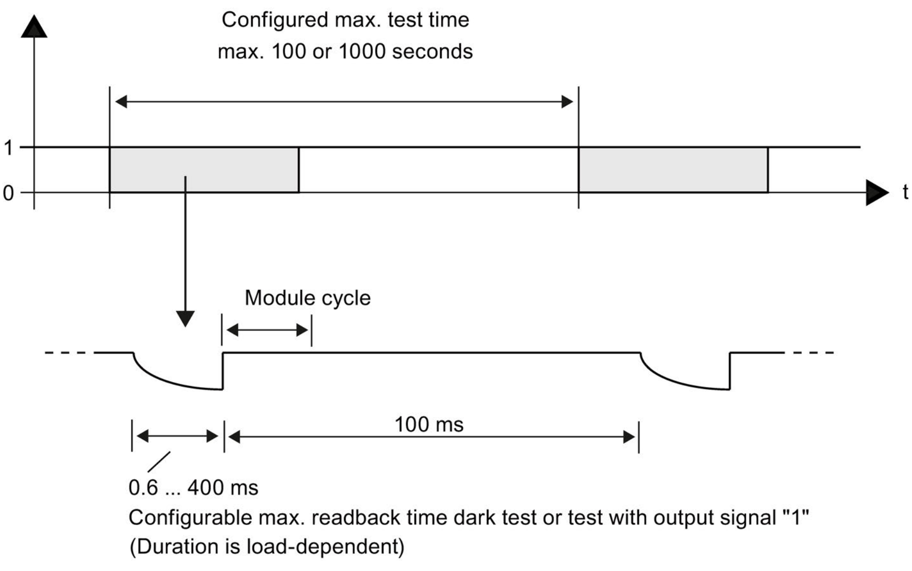


Figure 4-2 Test pulses of the dark test

The interval between two test pulses is 100 ms.

4.2.2.4 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, a single dark test pulse is directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. This also applies to the operating time if the operating time is < 48 hours. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

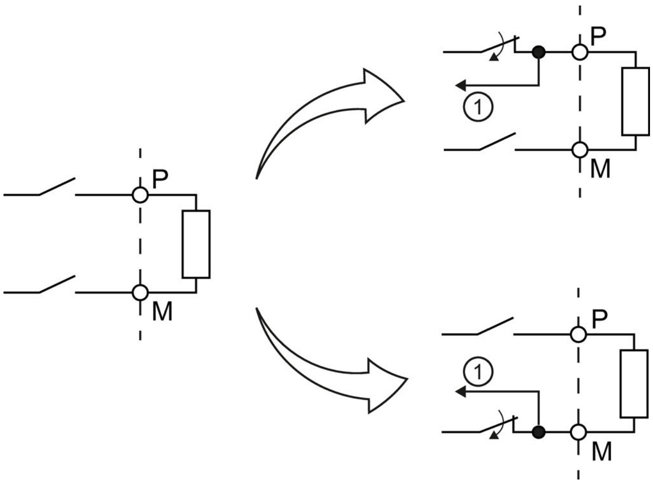
> **WARNING**
>
> If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated but all outputs are shut down and the module is passivated. This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.
>
> Consult the respective requirements of your product standards regarding error detection time.

4.2.2.5 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-3 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING
Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio). Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads.

If the capacitance of the actuator is not known, you may have to determine the required value for the readback time switch-on test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time is too small for a connected capacitive load. The charge of the capacitive load cannot take place during the configured readback time. Increase the readback time.

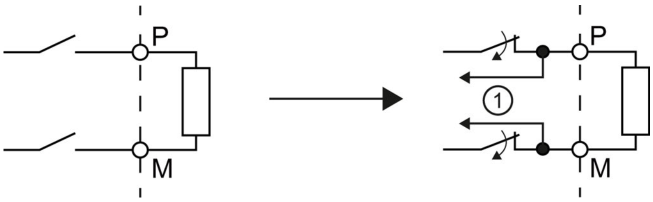
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.2.6 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, a test signal is switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-4 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

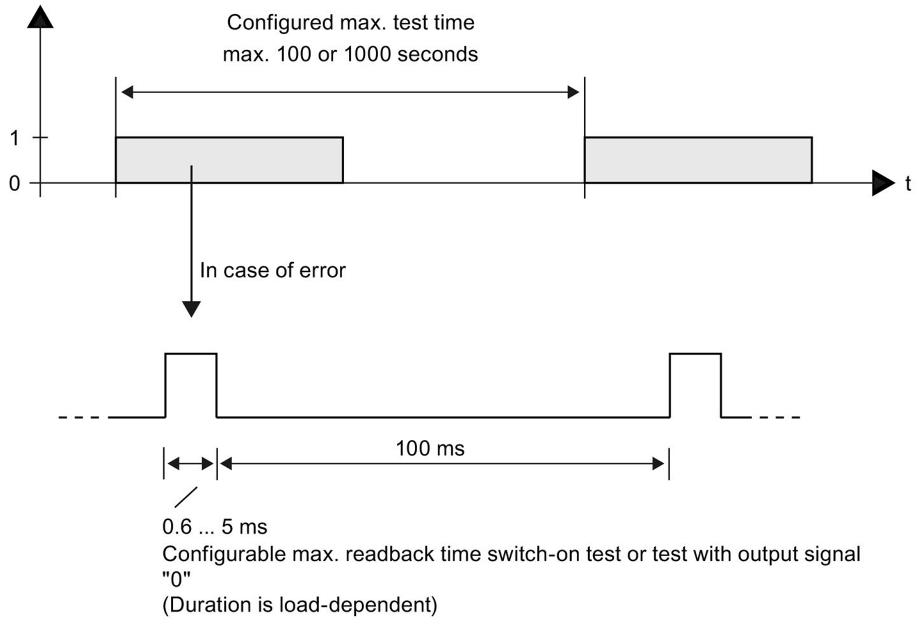


Figure 4-5 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test time per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 100 ms. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.2.7 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of the digital output module F-DQ 4×24VDC/2A PM HF

The digital output module F-DQ 4×24VDC/2A PM HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 4	x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 4×24VDC/2A PM HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 4×24VDC/2A PM HF:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Value status (Page 42)

Applications of the F-I/O module 5

5.1 Applications of the F-DQ 4x24VDC/2A PM HF

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is carried out on the matching BaseUnit (Page 13).

5.2 Application: Wiring a load to each digital output

Each of the four fail-safe digital output consists of a P-switch DQ-P_n and an M-switch DQ-M_n. You connect the load between the P-switch and the M-switch. The two switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

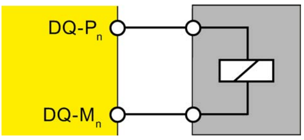

Figure 5-1 Wiring diagram for 1 relay each at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING
In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

5.3 Application: Connection of loads to L+ and M at each digital output

You can connect two relays using one fail-safe digital output. The following conditions should be kept in mind:

- Same reference potential
- The normally open contacts of the two relays must be connected in series.

This configuration achieves SIL3/Cat.4/PLe (process status readback required).

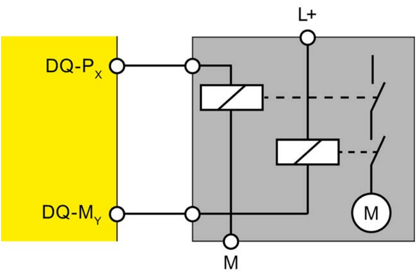

Figure 5-2 Wiring diagram for connecting 2 relays each to 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

When two relays are connected to one digital output, as shown in the figure above, the "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).

WARNING

With a cross circuit between P-switch and M-switch of the output, the module detects the fault and switches off the output. But the actuator is still supplied with power due to the external fault.

To avoid cross circuits between the P-switch and M-switch of a fail-safe digital output, you should always install the cables for the connection of the relays to the P-switch and M-switch separately to prevent any cross circuits (for example, as separately sheathed cables or in separate cable ducts).

Note

The digital output module F-DQ 4×24VDC/2A PM HF performs a bit pattern test depending on the parameter assignment. For this, the module outputs up to 5 ms pulses depending on the parameter assignment. This test (switch-on test) is run with a time offset between the P-switch and M-switch to prevent the actuator from being activated. This pulse may cause the corresponding relay to operated, which may reduce its service life.

We therefore recommend adhering to the wiring scheme described below.

5.4 Application: Wiring two loads in parallel to each digital output

To protect against cross-circuits between P-switch and M-switch in fail-safe digital outputs, we recommend the following wiring scheme. This circuit achieves SIL3/Cat.4/PLe.

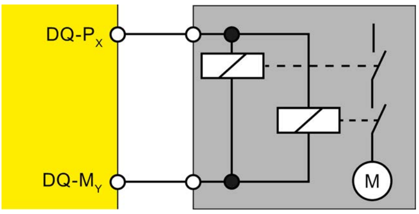

Figure 5-3 Wiring diagram for 2 relays each parallel at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

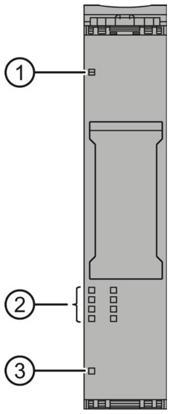
Note

With a parallel connection of two relays on one digital output (as shown above) the "wire break" fault is only detected if the wire break disconnects both relays from P or M. This diagnostics is not safety-related.

Interrupts/diagnostic messages 6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 38).

WARNING
The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DQ 4x24VDC/2A PM HF fail-safe digital output module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 38).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING
Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 38).

Table 6- 5 Diagnostic interrupts of the F-DQ 4x24VDC/2A PM HF

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	F-module	No
Parameter assignment error	16_D		
Load voltage missing	17_D		
Access to retentive storage of F-address not possible	30_D		
Different destination address (F_Dest_Add)	64_D		
Invalid destination address (F_Dest_Add)	65_D		
Invalid source address (F_Source_Add)	66_D		
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D		
"F_SIL" parameter exceeds the application-specific SIL	68_D		
"F_CRC_Length" parameter does not match the generated CRC	69_D		
Incorrect F-parameter version or F_Block_ID	70_D		
CRC1 error	71_D		
Inconsistent iParameters (iParCRC error)	75_D		
F_Block_ID not supported	76_D		

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Internal error	256_D		
Time monitoring activated	259_D		
Internal supply voltage of the module failed	260_D		
Output short-circuited to L+	261_D	Channel	Yes
Output short-circuited to ground	262_D		
Wire break	265_D		
Incorrect/inconsistent firmware present. Firmware update required	283_D	F-module	No
Switching frequency too high	785_D	Channel	
Undertemperature	786_D	F-module	
PROFIsafe communication error (timeout)	792_D	F-module	
PROFIsafe communication error (CRC)	793_D	F-module	
PROFIsafe address assignment error	794_D	F-module	
Output defective	797_D	Channel	No
Readback error	798_D	Channel	
Overload	800_D	Channel	
Supply voltage too high	802_D	F-module	
Supply voltage too low	803_D	F-module	

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Note

You can connect two actuators per output.

The diagnostics of the two actuators influenced each other in the case of duplicate wiring.

This means:

- a wire break is only signaled if both actuators are affected
- a single short circuit affects both actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DQ 4×24VDC/2A PM HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type

Diagnostic message	Fault code	Meaning	Remedy
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).

Diagnostic message	Fault code	Meaning	Remedy
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • There is a short circuit between two output channels. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 43))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43))
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • The capacitive load is too high. • Short circuit to L+ or M • The F-module is defective	• Increase the test times (dark, light, switch-on tests). • Check the wiring. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Readback error	798_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The capacitive load is too high. • The F-module is defective.	• Increase the test times (dark, light, switch-on tests). • If the error persists, replace the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 43) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications 7

Technical specifications of F-DQ 4×24VDC/2A PM HF

	6ES7136-6DB00-0CA0
Product type designation	F-DQ 4x24VDC HF
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFINET as of GSD version/GSD revision	V2.31
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	4 W
Address space	
Address space per module	
Input	5 bytes
Output	5 bytes

	6ES7136-6DB00-0CA0
Digital outputs	
Number of outputs	4
Digital outputs, configurable	Yes
Short circuit protection	Yes
• Response threshold, typ.	> 3.3 A
Wire break detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	2.9 A
Voltage induced on current interruption limited to	typ. 2*47V
Switching capacity of outputs	
With resistive load, max.	2 A
With lamp load, max.	10 W
Load resistance range	
Low limit	12 Ω
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	2 A
For "0" signal, residual current, max.	0.5 mA
Switching frequency	
With resistive load, max.	30 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	10 Hz; symmetrical
Total current of outputs	
Max. current per channel	2 A; (note derating data in the manual)
Max. current per module	6 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual

	6ES7136-6DB00-0CA0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C

	6ES7136-6DB00-0CA0
Dimensions	
Width	15 mm
Weights	
Weight, approx.	57 g

Temperature characteristic values

Mounting position	Maximum temperature	Total current across all channels
Horizontal	40 °C	6 A
	50 °C	5 A
	60 °C	4 A
Vertical	50 °C	4 A

Note

Because of the small size of the modules, pay attention to the development of heat between adjacent modules when output modules are exposed to elevated loads. If overtemperature occurs in an output module exposed to an elevated load, shutdown may result and reduce the plant availability. If you fully load an output module, the average total current of the modules directly adjacent to it should not exceed 75% of the values listed in the technical specifications. If you load directly adjacent modules with their maximum total current, reduce the maximum total current of the output module by 1 A (e.g., for horizontal installation up to 60 °C → total current of 3 A across all channels).

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times A

Introduction

The next section shows the response times of the digital output moduleF-DQ 4×24VDC HF. The response times of digital output module F-DQ 4×24VDC HF are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

Maximum cycle time: T_{cycle} = 15.5 ms

You assign the dark test time and switch-on time in STEP 7.

Maximum response time in the error-free case

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 4×24VDC HF digital output module is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load impedance and maximum switched load capacitance at a supply voltage of 24 V DC.

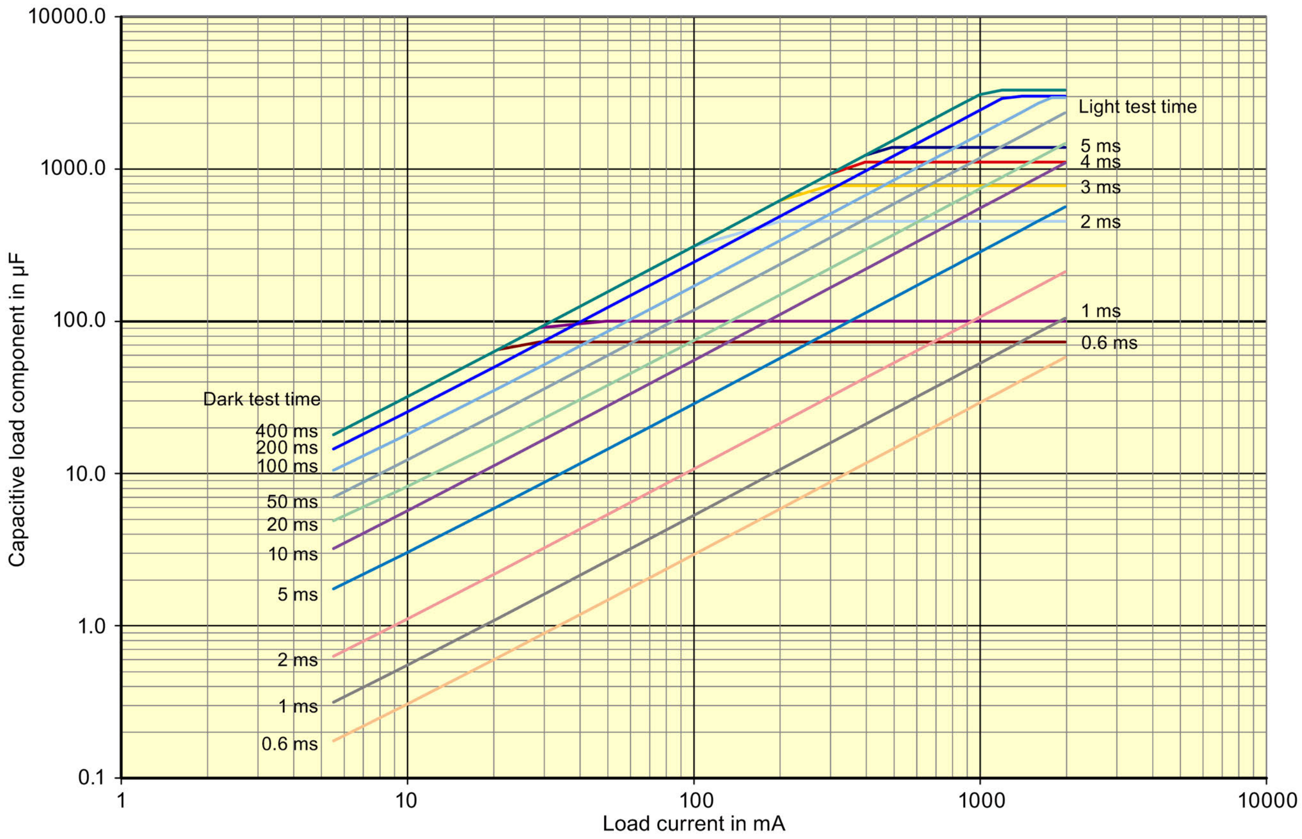


Figure B-1 Switching of capacitive loads for the F-DQ 4×24VDC HF digital output module depending on the configured dark and light test times

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

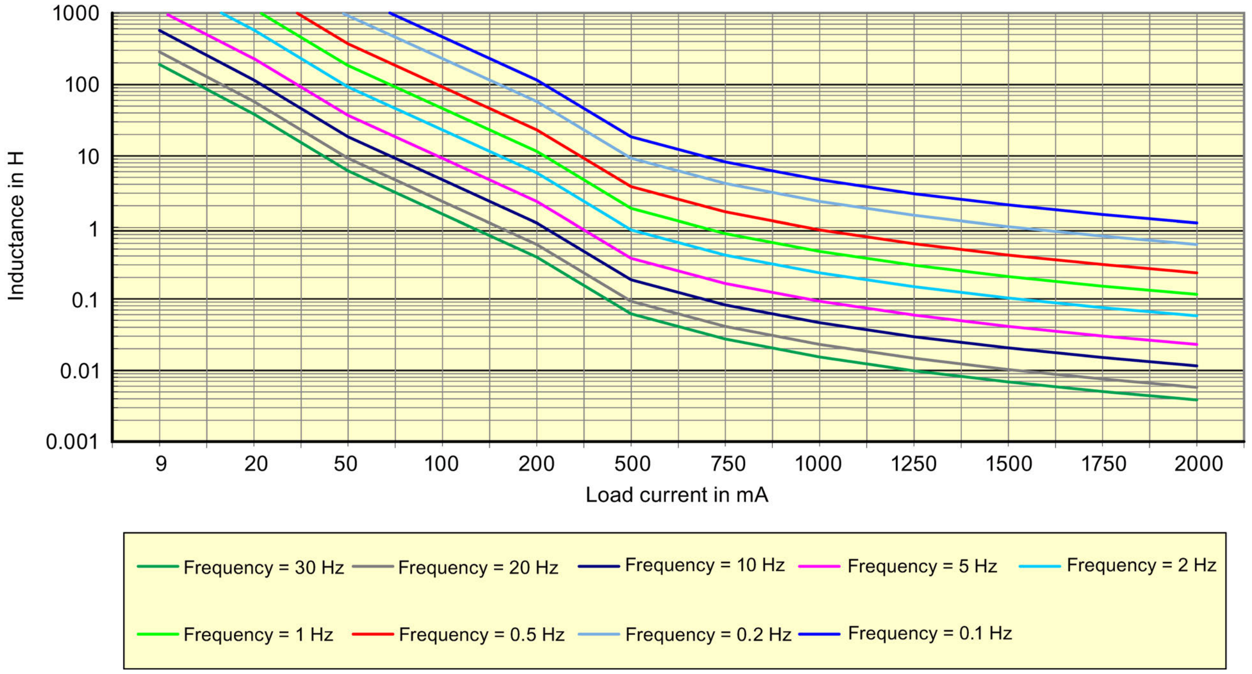

Figure B-2 Switching of inductive loads for the F-DQ 4x24VDC/2A PM HF digital output module depending on the load current and switching frequency

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that affect the system in general are described in this system manual.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the programming and operating manual SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

Conventions

CPU: When the term "CPU" is used in the following, it refers to both the CPUs of the S7-1500 automation system as well CPUs / interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software " (STEP 7 TIA Portal)".

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Standards

You can find a dated reference to the respective standards in the certificate (https://support.industry.siemens.com/cs/ww/en/view/57141281) or in the EC Declaration of Conformity (https://support.industry.siemens.com/cs/ww/en/view/71764057) for the F-module.

Important note for maintaining the operational safety of your system

Note

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

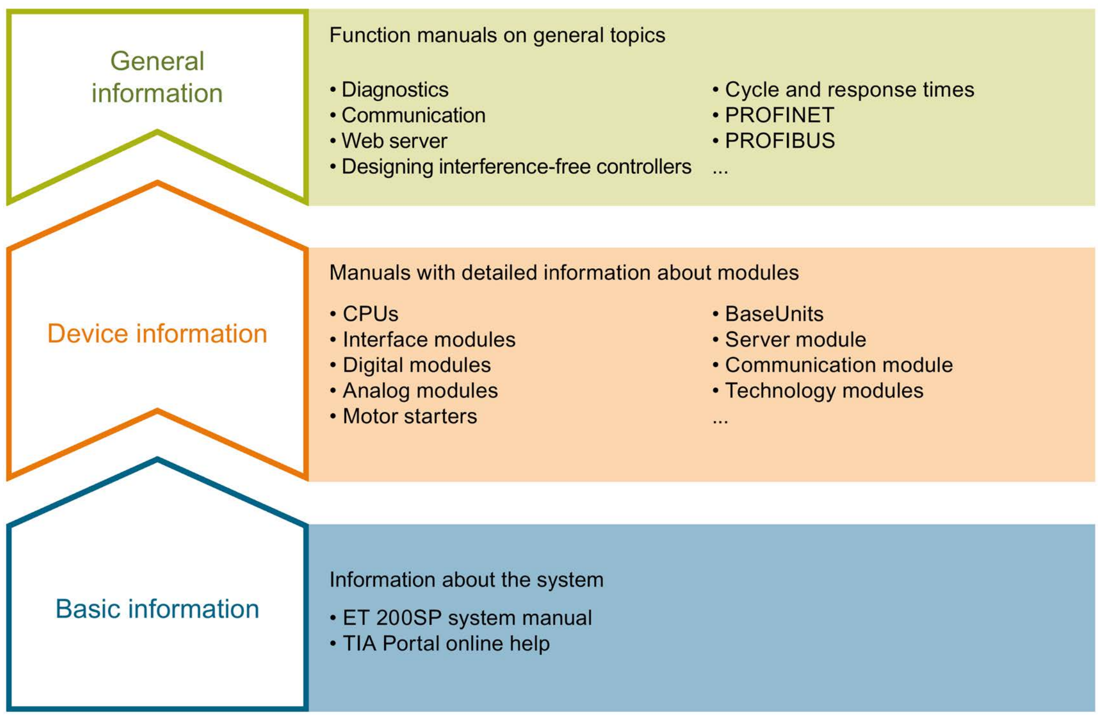
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide 1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

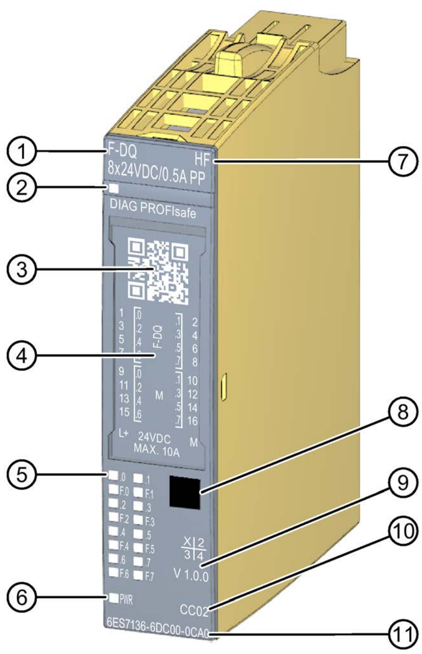
Article number

6ES7136-6DC00-0CA0

View of the module



①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color identification module type
③	2D matrix code	⑨	Function and firmware version
④	Connection diagram	⑩	Color code to select the color identification labels
⑤	LEDs for channel status	⑪	Article number
⑥	LED for supply voltage		

Figure 2-1 View of the module F-DQ 8x24VDC/0.5A PP HF

Properties

The module has the following technical characteristics:

- Fail-safe digital module
- PROFIsafe
- Supports the "RIOforFA-Safety“ profile on F-CPUs S7-1200/1500.
- PROFIsafe address type 2
- 8 outputs, PP-switching (SIL3/Cat.4/PLe)
- Supply voltage L+
- Output current 0.5 A per output
- Sourcing output (PP-switching)
- Suitable for solenoid valves, DC contactors and signal lamps
- Direct interconnection to inputs of an F-DI possible
- Diagnostics display (DIAG red/green LED)
- Status display for each output (green LED)
- Fault display for each output (red LED)
- Diagnostics
  - e.g., short-circuit, channel-specific
  - e.g. supply voltage missing, module-specific
- module-wide passivation

The module supports the following functions:

- Firmware update
- I&M identification data

WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostics alarms (Page 42).

Note

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Accessories

The following accessory must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection
- Electronic coding element as spare part

You can find additional information about accessories in the Distributed I/O System ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Passivation of fail-safe outputs over a long period of time

WARNING
Unintentional activation of F-I/O with fail-safe outputs
If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus put the F-system in a dangerous state. Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures. One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example. The required measures are standardized for plants with product standards. For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting 3

3.1 Wiring and block diagram

This section provides the block diagram of the F-DQ 8×24VDC/0.5A PP HF F-module with the terminal assignment.

You can find information about the various connection options and their configuration in the section Applications of the F-I/O module (Page 26) or Parameters/address space (Page 16).

You can find additional information about wiring BaseUnits in the Distributed I/O System ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Note

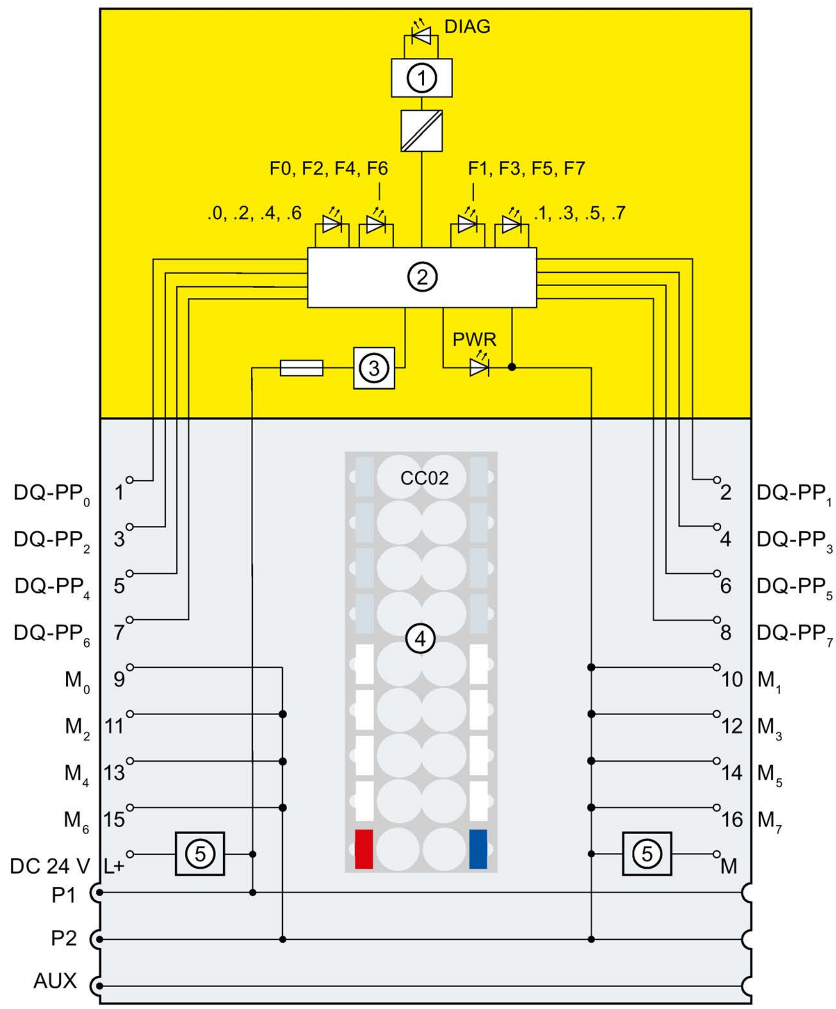
The load group of the F-module must begin with a light-colored BaseUnit. Keep this in mind as well during configuration.

Note

Make sure that you only use the digital output module with BaseUnit type A0 during commissioning.

Block diagram

The following figure shows the wiring of the F-DQ 8×24VDC/0.5A PP HF digital output module on BaseUnit BU type A0 without AUX terminals.



①	Backplane bus interface	M_n	Ground for connection of actuator of channel n.
②	Output electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to the left (dark-colored BaseUnit) Connection to the left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	$DQ\text{-}PP_n$	Output bit n, channel n, PP-switching (sourcing output)
④	Color-coded label with color code CC02 (optional)	DIAG	LED error of diagnostics (green, red)
⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)	.0 to .7	LED channel status (green)
24 VDC	Supply voltage L+ (feed for light-colored BaseUnit only)	F0 to F7	LED channel error (red)
M	Supply voltage ground	PWR	LED Power (green)

Figure 3-1 Block diagram

4 Parameters/address space

4.1 Parameters

Parameters for F-DQ 8x24VDC/0.5A PP HF

WARNING
Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 26).

The following parameters are possible:

Table 4- 1 Configurable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of F-monitoring time	• disable • enable	disabled	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	depends on parameter assignment of F-CPU	No	Module
F-destination address	1 to 65534	suggested by F-system	No	Module
F-parameter signature (without addresses)	0 to 65535	calculated by F-system	No	Module
Behavior after channel faults	• Passivate the entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module
F-I/O DB manual number assignment	• disable • enable	disabled	No	Module
F-I/O DB number	—	suggested by F-system	No	Module
F-I/O DB name	—	suggested by F-system	No	Module

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
DQ parameters:				
Maximum test period	• 100 s • 1000 s	1000 s	No	Module
Disable dark test for 48 hours	• disable • enable	disabled	No	Module
Channel parameters:				
Channel n				
Activated	• enable	enabled	No	Channel
Max. readback time light test / dark test	• 0.8 / 1.0 ms • 3.0 / 5.0 ms	0.8 / 1.0 ms	No	Channel
Activated light test	• enable	enabled	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reinte-gration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

4.2.1.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Base for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses assigned in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address) and the F I/O DB in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

4.2.1.2 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

4.2.1.3 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use in S7-300/400 F-CPUs

This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use in S7-1500 F-CPUs

When using the fail-safe module in S7-1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.2.2 Parameters of the channels

4.2.2.1 Maximum test period

With this parameter, you specify the time within which the light, dark tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test period is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

4.2.2.2 Disable dark test for 48 hours

This option allows you to suppress the dark test.

To suppress dark test pulses, you must ensure that all channels together carry the 0-signal once within the 48 hours. If this condition is not fulfilled, all dark test pulses will be applied anyway on all channels after expiration of this time.

With 0-signal channels, the test pulses of light test continue to occur.

> **WARNING**
>
> When you use the function "Disable dark test for 48 hours", cross-circuits between channels with 1-signal are not detected.
>
> If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated, but all outputs are shut down and the F-module is passivated.
>
> Also take into consideration the respective requirements of your product standards regarding error detection time.

When you activate the parameter "Disable dark test for 48 hours", all channels use the values set for channel 0 for the parameter "Max. readback time light test / dark test".

4.2.2.3 Activated

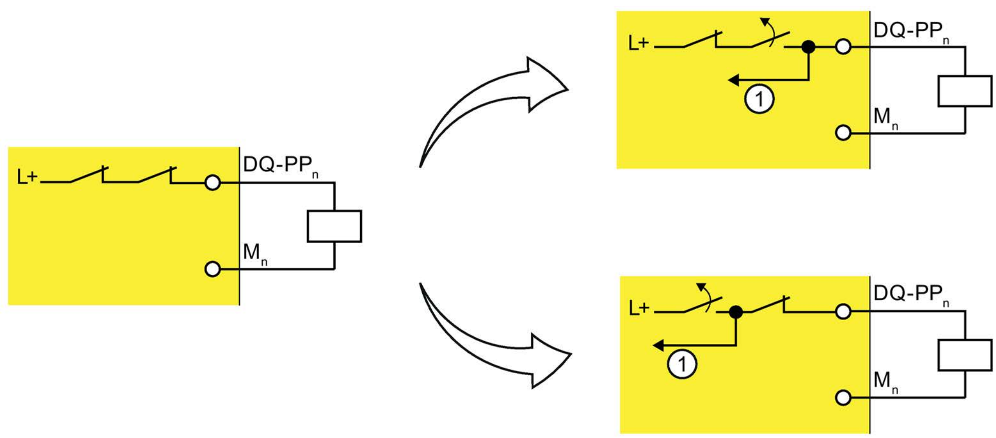
The channel is always activated for this F-module.

4.2.2.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel has the 1-signal. This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-1 Functional principle of the dark test (PP switching)

This parameter allows you to set the time for the readback.

If the expected signals could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the reaction time of the F-module.

> **WARNING**
>
> Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).
>
> Short-circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short-circuit detection (cross-circuit) with 1-signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test as low as possible, but high enough that the output channel is not passivated.

In case of the "Connecting a load per digital output" (Page 27) application, see the warnings and notes in the section describing the application.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads (Page 51).

Setting readback time dark test with unknown actuator capacity

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time dark test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

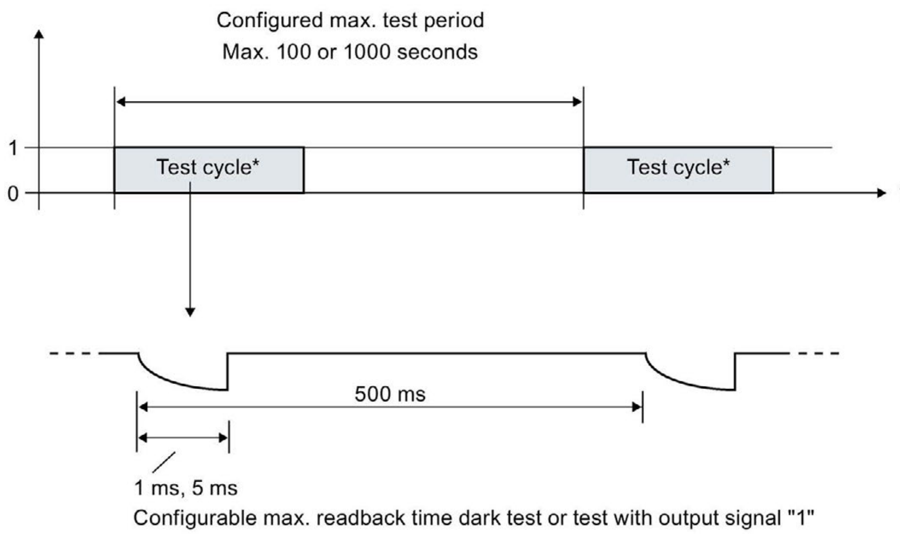
- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use a 1-signal with a minimum duration that corresponds to the "Maximum test period".
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

To increase availability, we recommend that you maintain an interval to the determined limit for the times.

Test pulses of the dark test

The interval between two test pulses is 500 ms.



* Output of test pulses only during test cycle.

Figure 4-2 Test pulses of the dark test

Note

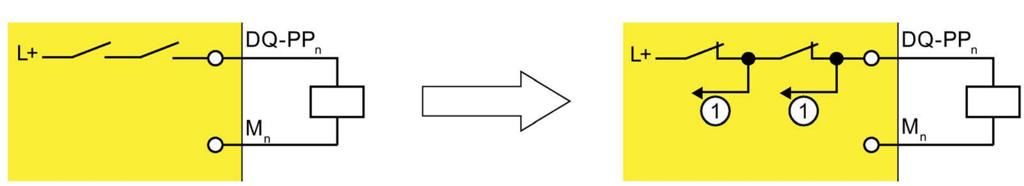
If the dark test detects an error, the affected channel is switched off with the error message "Short circuit to L+", all the other channels with the error message "Safety-related shutoff".

4.2.2.5 Max. readback time light test

Function

Short-circuit is detected with a 0-signal at the output.

For a light test, a test signal is switched to the output channel while the output channel has the 0-signal. The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



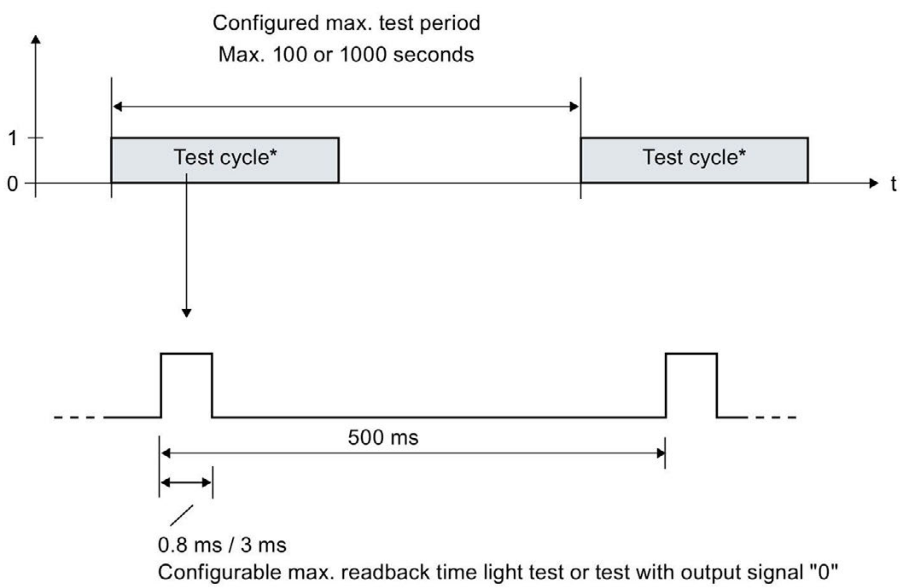
① Readback

Figure 4-3 Functional principle of the light test

If the signal was not read back correctly once the maximum readback time light test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time light test for the light test increases the reaction time of the F-module.

Test pulses of the light test



* Output of test pulses only during test cycle.

Figure 4-4 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test period per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 500 ms. If the fault is still present, the maximum test period is automatically reduced to 60 seconds and a diagnostics alarm is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.2.6 Activated light test

The light test is always enabled for this F-module.

4.2.2.7 Channel failure acknowledge

Use in S7-1500 F-CPUs

This parameter is only relevant if the fail-safe module is operated on an S7-1500 F-CPU, and can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel should react to a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. There you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.3 Address space

Address assignment of the digital output module F-DQ 8x24VDC/0.5A PP HF

The digital output module F-DQ 8x24VDC/0.5A PP HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 4	QB x + 0 to x + 4
S7-1500 F-CPUs	IB x + 0 to x + 5	QB x + 0 to x + 5

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 8x24VDC/0.5A PP HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 8x24VDC/0.5A PP HF:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 0	Value status DQ_7	Value status DQ_6	Value status DQ_5	Value status DQ_4	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
QB x + 0	DQ_7	DQ_6	DQ_5	DQ_4	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Value status (Page 46)

Applications of the F-I/O module 5

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is performed on the suitable BaseUnit. For more on this, see Connecting section in the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

5.1 Installation of the ground line between the power supply and the BaseUnit

Interconnection	Achievable fail-safe performance characteristics	
	Single ground line	Redundant ground line
Connection of the load to the M_n terminal of the BaseUnit	SIL3/Cat.4/PLe	Not required
Connection of the load to the ground of the BaseUnit	SIL3/Cat.3/PLd	SIL3/Cat.4/PLe

In case of redundant installation of the ground line between the power supply and the BaseUnits, the ground connection to the BaseUnits must be installed as follows:

- When the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF is installed on a dark-colored BaseUnit, terminal M of this dark-colored BaseUnit must be additionally connected to the ground of the power supply.
- When the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF is installed on a light-colored BaseUnit, terminal M of the dark-colored BaseUnit installed to the right of the light-colored BaseUnit must be additionally connected to the ground of the power supply.

WARNING

When connecting the load to the ground of the power supply, you must run two ground lines between the power supply and the BaseUnits for safety reasons to achieve SIL3/Cat.4/PLe. Otherwise, the maximum residual current at signal "0" (specified in the technical specifications) cannot be maintained if a single ground line is interrupted.

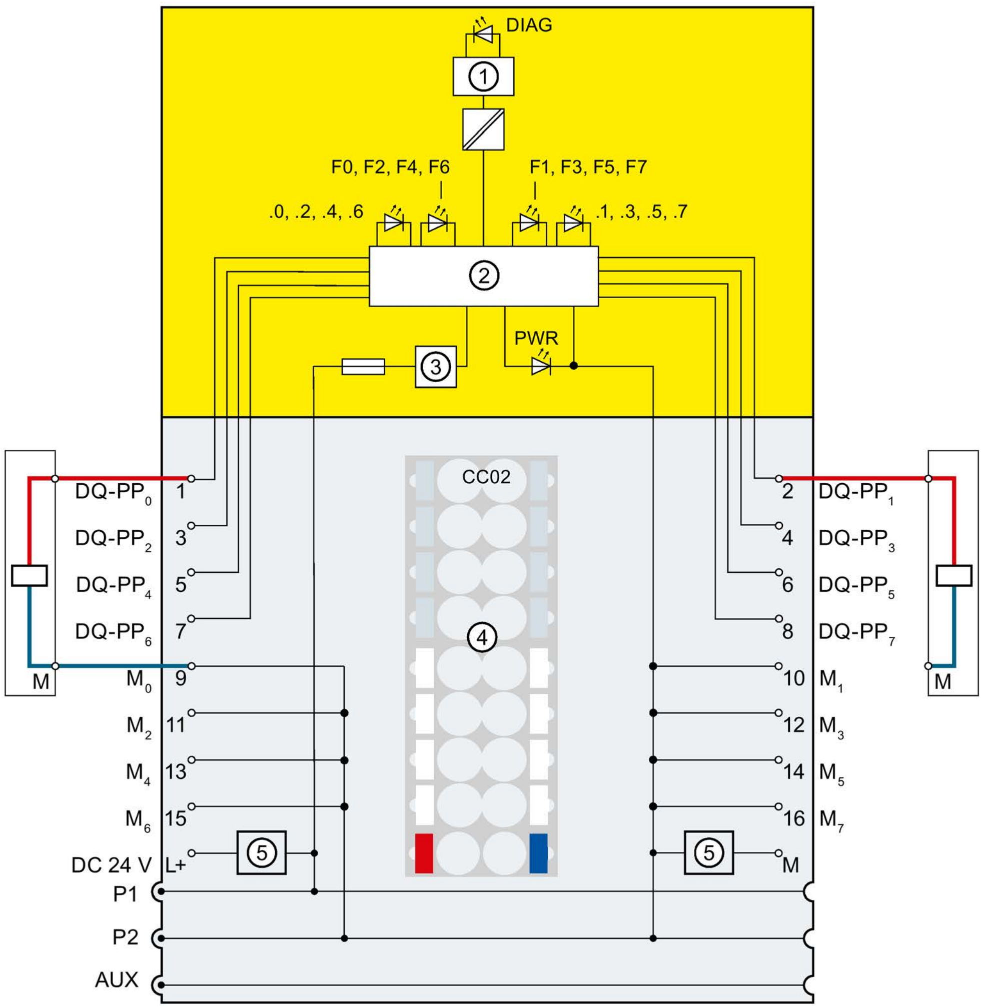
See also

Connecting (Page 14)

5.2 Application: Wiring a load to each digital output

Each of the 8 fail-safe digital outputs consists of two P-switches, which form a PP-switch DQ-PP$_n$. You connect the load between the sourcing output DQ-PP$_n$ and ground. The ground may be the internal ground M$_n$ or an external ground. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 26).



①	Backplane bus interface	④	Color-coded label with color code CC02 (optional)
②	Output electronics	⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)
③	Reverse polarity protection		

Figure 5-1 Wiring diagram for one relay each to a F-DQ of the digital output module F-DQ 8x24VDC/0.5A PP HF

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a suitably-qualified actuator, for example in accordance with IEC 60947.

WARNING

The actuator can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP$_n$. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP$_n$, you must route the lines used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).

WARNING

If there is cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).

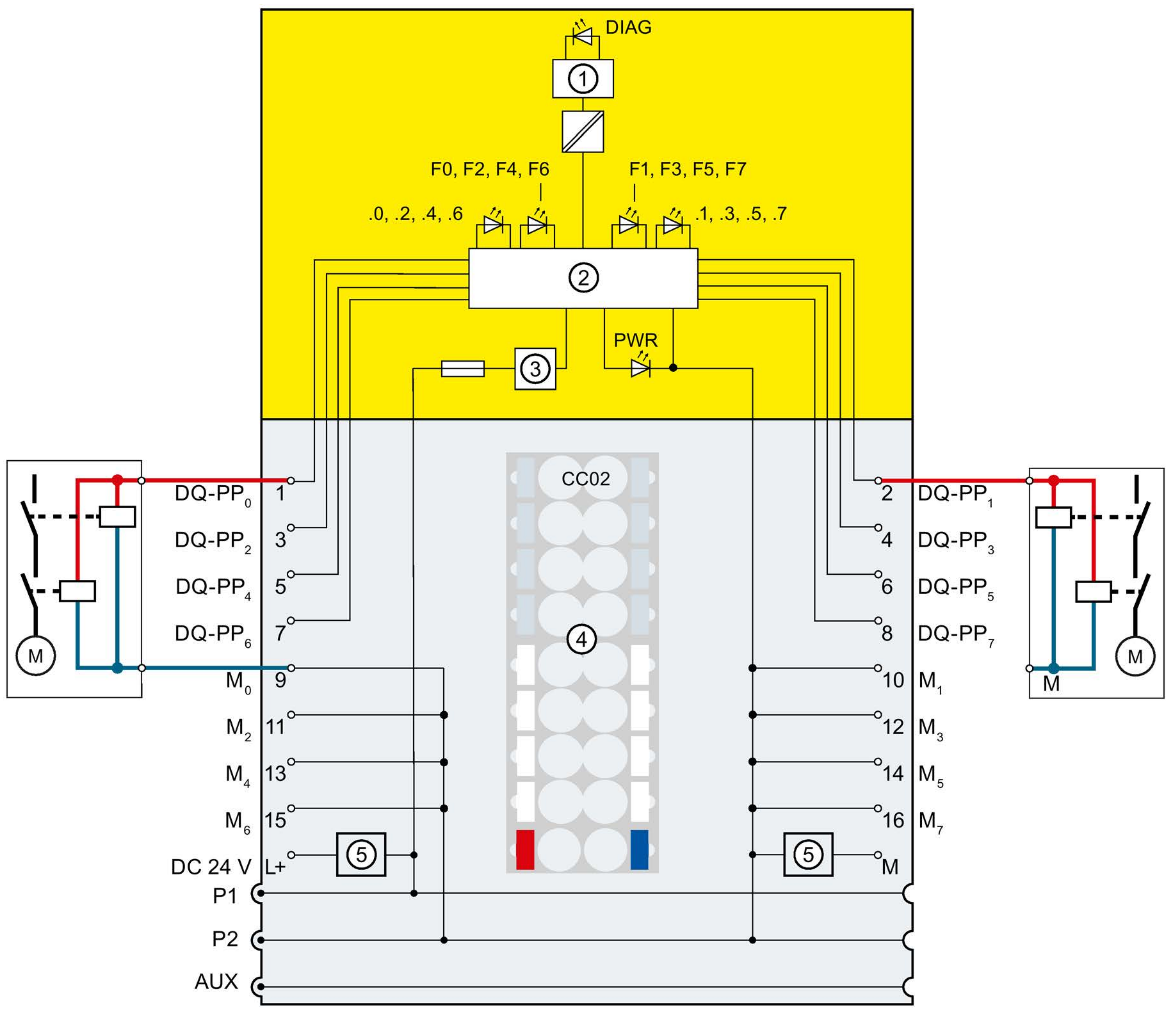
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".

If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.3 Application: Wiring two loads in parallel to each digital output

The ground may be the internal ground M_n or an external ground. This circuit achieves SIL3/Cat.4/PLe.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 26).



① Backplane bus interface

② Output electronics

③ Reverse polarity protection

④ Color-coded label with color code CC02 (optional)

⑤ Filter circuit supply voltage (available in light-colored BaseUnit only)

Figure 5-2 Wiring diagram for two relays in parallel to a F-DQ of the digital output module F-DQ 8x24VDC/0.5A PP HF

WARNING

The actuator can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP_n. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).

WARNING

If there is cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).

If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".

If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.4 Application: Connection of a fail-safe digital input to each digital output

Each of the 8 fail-safe digital outputs can be connected to a fail-safe digital input of the type 1, 2 or 3 in accordance with IEC61131-2.

In this application, the input delay of the fail-safe digital input must be set so that the light test and the dark test of the fail-safe digital output do not impair the fail-safe digital input.

You can achieve SIL3/Cat.4/PLe with this circuit.

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified fail-safe digital input, e.g. ET 200SP F-DI 8x24VDC HF.

Input without ground return

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 26).

If the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF and the fail-safe digital input module are supplied by different power supply units, the grounds of the two power supply units must be connected to each other.

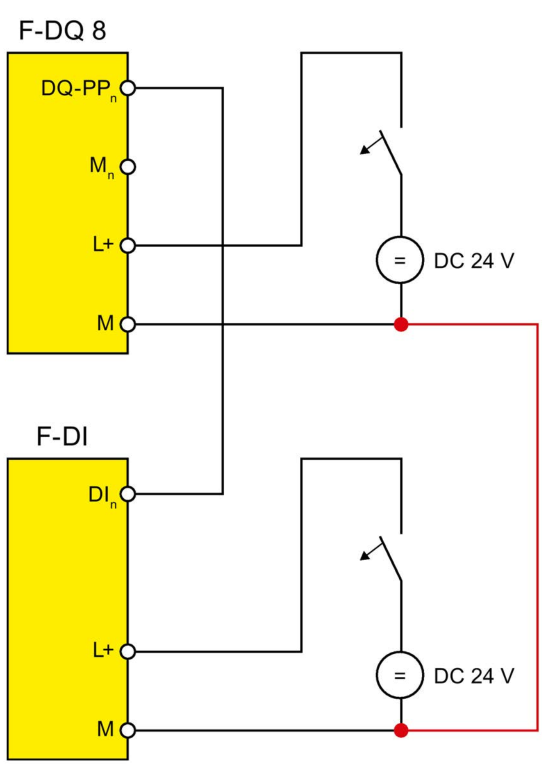


Figure 5-3 Wiring diagram of an output of the digital output module F-DQ 8x24VDC/0.5A PP HF with an input of a fail-safe digital input module (without ground return).

WARNING

To avoid an impermissible process value at the fail-safe digital input, the wiring must be installed so that an interruption of the connection between the ground of the fail-safe digital output module and the ground of the fail-safe digital input module can be excluded (e.g. redundant lines).

WARNING

In case of a cross-circuit between a positive potential (e.g. L+) and DQ-PP_n, a 1-signal is permanently present at the fail-safe digital input. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the fail-safe digital inputs in a cross-circuit-proof manner, for example, as separate, sheathed cables or in separate cable ducts.

WARNING

If there is cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).

If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".

If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

Input with ground return

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 26).

In this application for potential-free, fail-safe digital inputs, the connection DI_n- of the fail-safe digital input is returned to the internal ground M_n of the fail-safe digital output module.

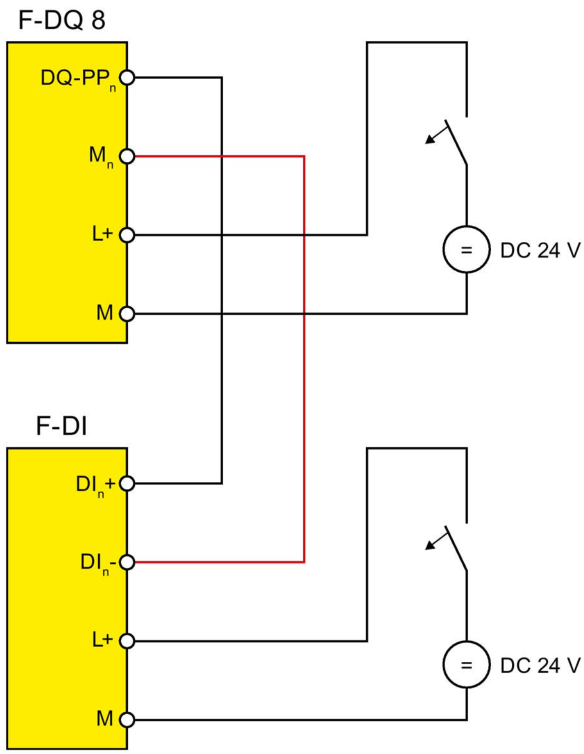

Figure 5-4 Wiring diagram of an output of the digital output module F-DQ 8x24VDC/0.5A PP HF with an input of a fail-safe digital input module (with ground return).

WARNING
In case of a cross-circuit between a positive potential (e.g. L+) and $DQ\text{-}PP_n$, a 1-signal is permanently present at the fail-safe digital input. To prevent cross-circuits between positive potential (e.g. L+) and $DQ\text{-}PP_n$, you must route the lines used to connect the fail-safe digital inputs in a cross-circuit-proof manner, for example, as separate, sheathed cables or in separate cable ducts.

WARNING

If there is cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).

If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".

If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.5 Application: Connection of the ET 200SP digital output module F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)

You can use any of the 8 fail-safe digital outputs to actuate one or more digital output modules F-RQ 1x24VDC/24..230VAC/5A.

Pay attention to the permitted current for the corresponding output channel and the total current over all outputs at the corresponding ambient temperature.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 26).

For the operation of the digital output module F-RQ 1x24VDC/24..230VAC/5A, the use of extended readback times is required (channel parameter Max. readback time light test / dark test with “3.0 / 5.0 ms").

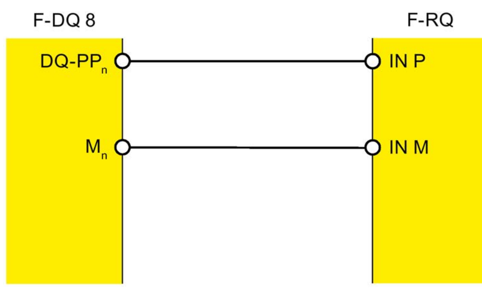

Figure 5-5 Wiring diagram

Note

The output signals "OUT P, OUT M" of the digital output module F-RQ 1x24VDC/24..230VAC/5A are looped through from "IN P, IN M” and should therefore be considered like the output signals of the F-DQ 8x24VDC/0.5A PP HF "DQ-PP$_n$, M$_n$". For this reason, please observe the wiring rules for the F-DQ 8x24VDC/0.5A PP HF.

WARNING

The digital output module F-RQ 1x24VDC/24..230VAC/5A can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP$_n$. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP$_n$, you must route the lines used to connect the digital output modules F-RQ 1x24VDC/24..230VAC/5A in a cross-circuit-proof manner, e.g. as separate, sheathed cables or in separate cable ducts.

WARNING

If there is cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).

If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".

If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

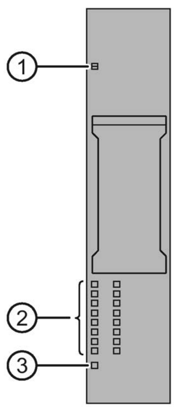
Interrupts/diagnostic messages

6

6.1 Status and error display

LED display

The following figure shows the LED display of the F-DQ 8x24VDC/0.5A PP HF.



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. You can find solutions for diagnostics alarms in section Diagnostics alarms (Page 42).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 6- 1 Error display of the LED DIAG

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for user acknowledgment.
Flashing	• Operation in S7-1200/1500 F-CPUs: The F-module expects user acknowledgment after a module error. • Operation in S7-300/400 F-CPUs: The F-module is waiting for user acknowledgment.

Channel status/channel fault LED

Table 6- 2 Status display of the LEDs channel status / channel error

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
/ Alternately flashing		• Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for user acknowledgment. • Operation in S7-300/400 F-CPUs: At least one channel is waiting for user acknowledgment.

Channel status/DIAG/channel fault LED

Table 6- 3 Status display of the LEDs channel status / DIAG / channel error

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

PWR LED

Table 6- 4 Status display of LED PWR

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

6.2 Interrupts

The fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF supports diagnostic interrupts.

Diagnostic interrupts

The F-module generates a diagnostic interrupt for each diagnostics alarm described in section Diagnostics alarms (Page 42).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING
Before acknowledging the short circuit diagnostics message, correct the respective fault and validate your safety function. In this case, follow the steps described in section Diagnostics alarms (Page 42).

Table 6- 5 Diagnostic interrupts of the F-DQ 8x24VDC/0.5A PP HF

Diagnostic interrupt	Fault code	Scope of diagnostics interrupt	Configurable
Overtemperature	5_D	F-module	No
Error	9_D		
Parameter error	16_D		
Supply voltage missing	17_D		
Safety-related shutoff	25_D		
Channel/component temporarily unavailable	31_D		
Mismatch of safety destination address (F_Dest_Add)	64_D		
Safety destination address not valid (F_Dest_Add)	65_D		
Safety source address not valid (F_Source_Add)	66_D		
Safety watchdog time value is 0 ms (F_WD_Time)	67_D		
Parameter F_SIL exceeds SIL from specific device application	68_D		
Parameter F_CRC_Length does not match the generated values	69_D		
Version of F-parameter set incorrectly	70_D		
CRC1 fault	71_D		
Save iParameter watchdog time exceeded	73_D		
Restore iParameter watchdog time exceeded	74_D		
Inconsistent iParameters (iParCRC error)	75_D		
F_Block_ID not supported	76_D		
Transmission error: Inconsistent data (CRC error)	77_D		
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D		
Module is defective	256_D		
Watchdog tripped	259_D		
Short-circuit to L+	261_D	Channel	
Short-circuit to ground	262_D		
Invalid/inconsistent firmware present	283_D	F-module	No
Channel failure acknowledgment	779_D	Channel	
F-address memory not accessible	781_D	F-module	
Frequency too high	785_D	Channel	
Undertemperature	786_D	F-module	
Supply voltage too high	801_D	F-module	No
Supply voltage too low	802_D	F-module	

6.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated for each diagnostics event and the F-module flashes the DIAG LED. You can read out the diagnostics alarm, for example, from the diagnostics buffer of the F-CPU. You can evaluate the error codes using the user program.

Note

You can connect several actuators per output.

If several actuators are connected to an output, the diagnostics of each actuator affects the other ones.

In other words, a single short-circuit affects multiple actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostics alarms, their meaning and possible remedies

Diagnostics alarm	Fault code	Meaning	Solution
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 47)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Error	9_D	The F-module has detected an internal error and does not start.	Replace the F-module.
Parameter error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	17_D	Missing or insufficient supply voltage L+	• Operate the F-module within the specified supply voltage range.

Diagnostics alarm	Fault code	Meaning	Solution
Safety-related shutoff	25_D	For safety purposes, channel was switched off due to an error on another channel. Possible causes: • A short-circuit exists. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light).
Channel/component tempo-rarily unavailable	31_D	The firmware version of the F-module is inconsistent.	Repeat the firmware update.
Mismatch of safety destina-tion address (F_Dest_Add)	64_D	The firmware of the F-module has de-tected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	65_D	The firmware of the F-module has de-tected an illegal different F-destination address.	Check the configuration/parameter assignment of the iPar server.
Safety source address not valid (F_Source_Add)	66_D	The firmware of the F-module has de-tected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	67_D	The firmware of the F-module has de-tected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	68_D	The firmware of the F-module has de-tected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generat-ed values	69_D	The firmware of the F-module has de-tected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	70_D	The firmware of the F-module has de-tected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	71_D	The firmware of the F-module has de-tected inconsistent F-parameters.	
Save iParameter watchdog time exceeded	73_D	iPar server does not respond to "save IPar" within 4.4 minutes.	
Restore iParameter watch-dog time exceeded	74_D	iPar server does not respond to "restore IPar" within 4.4 minutes.	Check the configuration/parameter assignment of the iPar server.
Inconsistent iParameters (iParCRC error)	75_D	The firmware of the F-module has de-tected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The firmware of the F-module has de-tected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.

Diagnostics alarm	Fault code	Meaning	Solution
Transmission error: Inconsistent data (CRC error)	77_D	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference. • Power switched OFF and ON for station • Assign the configuration and parameter assignment to the F-module (of the station).
Transmission error: Timeout (watchdog time 1 or 2 expired)	78_D	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Module is defective	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner. • wrong BaseUnit	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • If the F-module cannot be put back into operation, consider replacing it. • Use a BaseUnit of the type A0.
Watchdog tripped	259_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • If the F-module cannot be put back into operation, consider replacing it.
Short-circuit to L+	261_D	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load between the channels is too high (for example, due to cable length or load current being too low). • There is a short circuit between two output channels. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light). • Pay attention to the warnings in Applications of the F-I/O module (Page 26).

Diagnostics alarm	Fault code	Meaning	Solution
Short-circuit to ground	262_D	Short-circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • The capacitive load is too high. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light). • Check the actuator.
Invalid/inconsistent firmware present	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Channel failure acknowledgment	779_D	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
F-address memory not accessible	781_D	The F-source address and F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency (see Technical specifications (Page 47))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 47)) Once the temperature has increased and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Supply voltage too high	801_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	802_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 47) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875)

6.4 Value status

Properties

In addition to the diagnostics alarm and the status and error display, the F-module provides information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is affected by a short-circuit and the plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 24).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

7 Technical specifications

Technical specifications of the F-DQ 8x24VDC/0.5A PP HF

	6ES7136-6DC00-0CA0
General information	
Product type designation	F-DQ 8x24 V DC/0.5 A PP HF
Firmware version	
• FW update possible	Yes
Usable BaseUnits	BU type A0
Color code for module-specific color-coded label	CC02
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V14 SP1 with HSP 202
STEP 7 can be configured/integrated as of version	Check the entry (https://support.industry.siemens.com/cs/ww/en/view/15208817).
Supply voltage	
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	3 W
Address area	
Address space per module	
Inputs	6 bytes; 5 bytes non-RIO for FA; 6 bytes RIO for FA
Outputs	6 bytes; 5 bytes non-RIO for FA; 6 bytes RIO for FA
Hardware configuration	
Automatic coding	
• Electronic coding element type F	Yes

	6ES7136-6DC00-0CA0
Digital outputs	
Number of outputs	8
Short-circuit protection	Yes
• Response threshold, typ.	min. 0.7 A
Wire break detection	No
Voltage induced on current interruption limited to	Typ. -39 V
Control of a digital input	Yes
Switching capacity of outputs	
With resistive load, max.	0.5 A
With lamp load, max.	2 W
Load resistance range	
Low limit	48 Ω
High limit	12000 Ω
Output voltage	
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	0.5 A
For "0" signal, residual current, max.	0.5 mA
Switching frequency	
With resistive load, max.	30 Hz; symmetrical
With inductive load, max.	0.1 Hz; according to IEC 60947-5-1, DC-13, balanced
For capacitive load, max.	2 Hz; balanced
With lamp load, max.	10 Hz; symmetrical
Total current of outputs	
Max. current per channel	0.5 A; note derating information in the manual
Current per module, max.	3 A; note derating information in the manual
Total current of the outputs (per module)	
Horizontal mounting position	
• Up to 40 °C, max.	3 A
• Up to 50 °C, max.	2.5 A
• Up to 60 °C, max.	2 A
Vertical mounting position	
• Up to 50 °C, max.	2 A
Length of cable	
shielded, max.	100 m
unshielded, max.	100 m
Interrupts/diagnostics/status information	
Diagnostics function	Yes, see section "Interrupts/diagnostics alarms" in the manual
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes

	6ES7136-6DC00-0CA0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between channels and backplane bus	Yes
Between the channels and the voltage supply of the electronics	No
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
Maximum achievable safety class in safety mode	
Performance Level according to ISO 13849-1	PLe
Category according to ISO 13849-1	Cat. 4
SIL according to IEC 61508	SIL 3
Probability of failure (with a mission time of 20 years and time to repair of 100 hours)	
• Low demand mode: PFDavg according to SIL3	< 6.00E-05
• High demand/continuous mode: PFH according to SIL3	< 2.00E-09 1/h
Environmental conditions	
Ambient temperature in operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	48 g

Response times — A

Introduction

You can find the reaction times of the F-DQ 8x24 V DC/0.5 A PP HF digital output module below. The reaction times of the F-DQ 8x24 V DC/0.5 A PP HF digital output module are included in the calculation of the F-system reaction time.

Definition of reaction time for fail-safe digital outputs

The reaction time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

- Max. cycle time: T_{cycle} = 8 ms
- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 16 ms

The maximum reaction time in the case of fault (One Fault Delay Time, OFDT) is equivalent to the maximum reaction time with no faults (Worst Case Delay Time, WCDT).

Assign the parameters for maximum readback time dark test (Maximum Readback Time, T_{rb}) and maximum readback time light test (Maximum Readback Time Light Test, T_{rb_lt}) in STEP 7/in the TIA Portal.

Operating mode: Disable dark test for 48 hours – disabled

Maximum reaction time with no faults (Worst Case Delay Time, WCDT)

$t <= 4 * T_{cycle}$

Maximum reaction time with detection of a channel fault by readback

$t <= 6 * T_{cycle} + T_{rb}$

Maximum reaction time with detection of a channel fault by bit pattern test

$t <= 2 * T_{cycle}$ + maximum test period

Operating mode: Disable dark test for 48 hours – enabled

Maximum reaction time with no faults (Worst Case Delay Time, WCDT)

$t <= 5 * T_{cycle} + T_{rb} + T_{rb\_lt}$

Maximum reaction time with detection of a channel fault

A channel fault may not be detected until a 0-1 process value change takes place on the corresponding channel. Please note the restrictions detailed in section Disable dark test for 48 hours (Page 19)

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 8x24VDC/0.5A PP HF digital output module is interconnected with loads that have an excessive capacitance, this can lead to detection of a short-circuit. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load current and maximum switchable load capacitance at a supply voltage of 24 V DC.

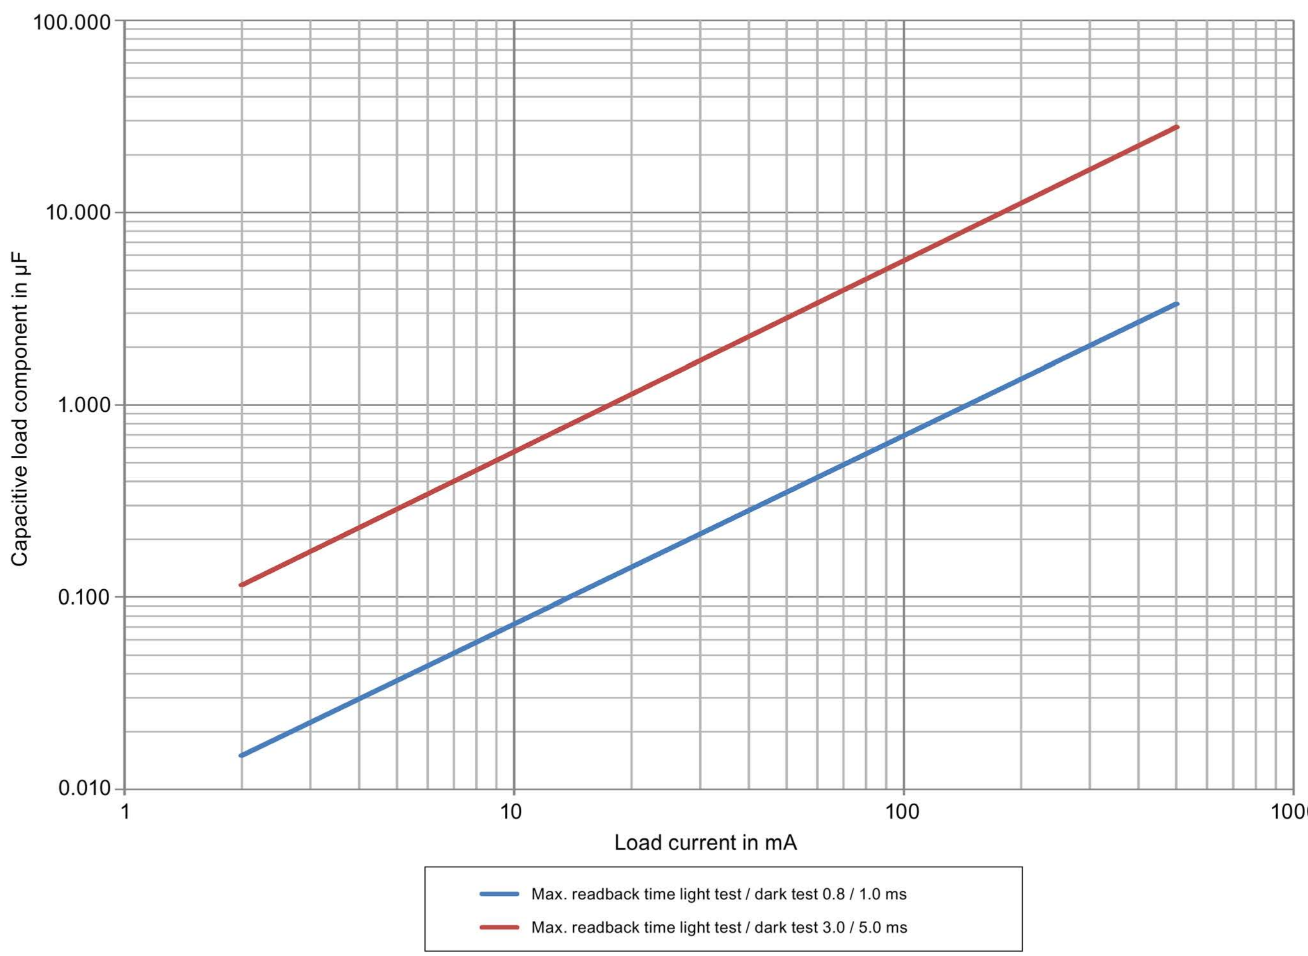

Figure B-1 Switching of capacitive loads for the F-DQ 8x24VDC/0.5A PP HF digital output module depending on the configured max. readback time light test / dark test.

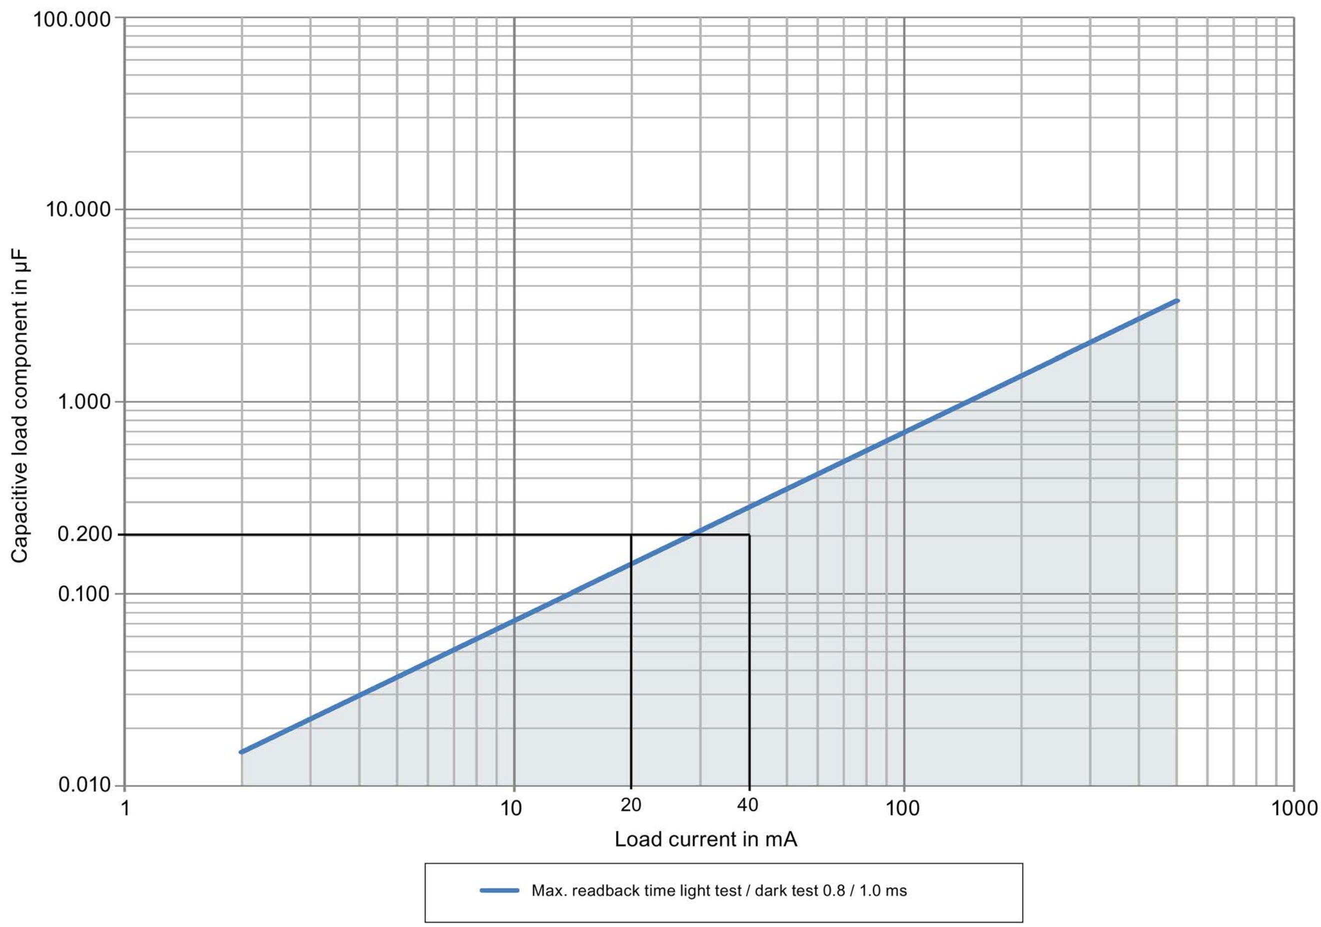
Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the trend, select an actuator with higher current consumption so that the new operating point is below the curve.

Example

You have configured a maximum readback time light test/dark test of "0.8 / 1.0 ms". You have set the load current to 20 mA and the capacity to 0.2 μF. The operating point is thus outside the range defined by the trend (gray background).

Solution: Select an actuator with higher current consumption. In this example, 40 mA. Alternatively, you can configure the parameter "Max. readback time light test / dark test" with "3.0 / 5.0 ms".



B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

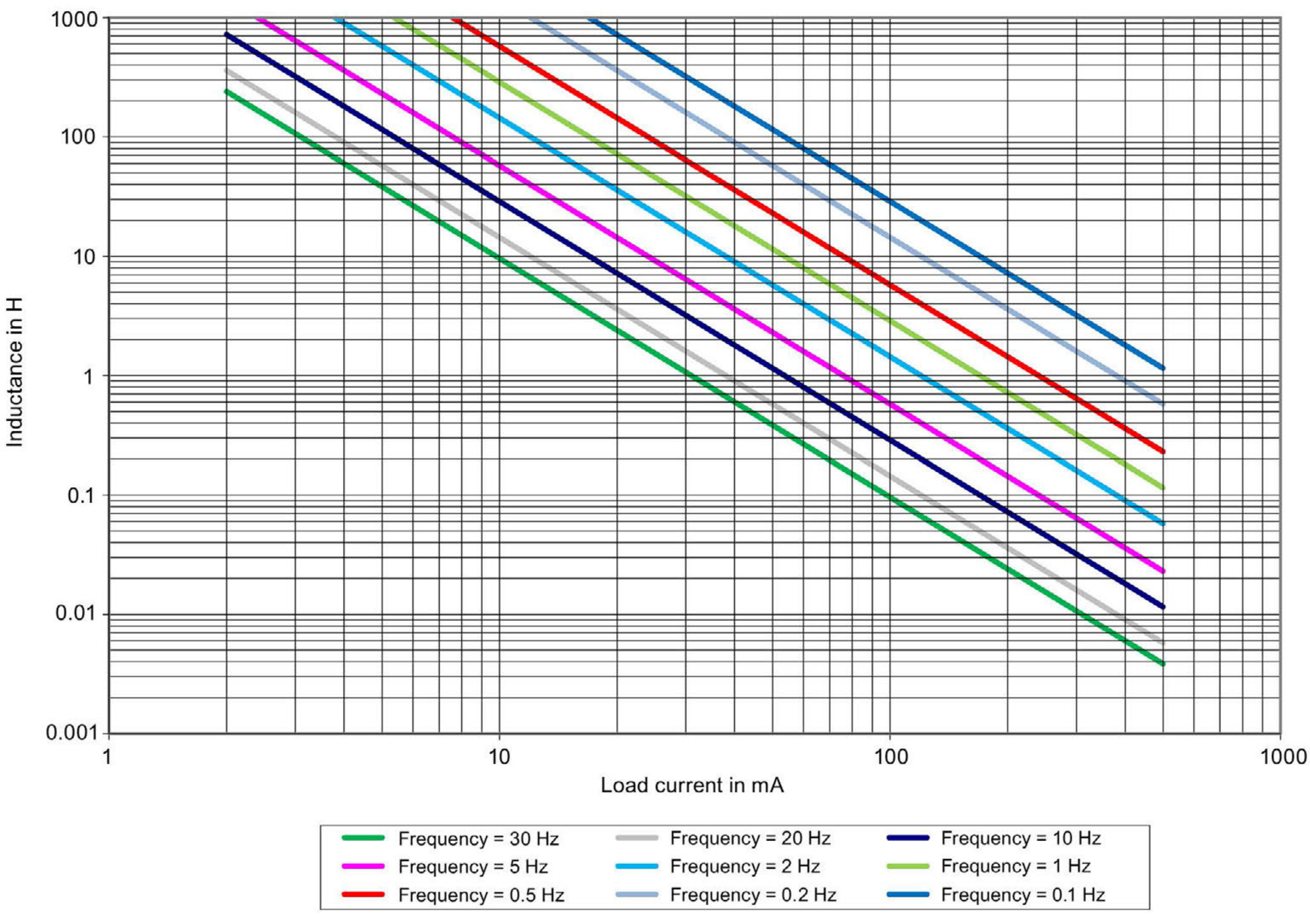


Figure B-2 Switching of inductive loads for the F-DQ 8x24VDC/0.5A PP HF digital output module depending on the load current and switching frequency

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of this documentation

This manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information in this manual and the system manual supports you when commissioning the ET 200SP system.

Conventions

Pay particular attention to notes highlighted as follows::

Note

A note contains important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Guide to the documentation

1.1 Guide to the documentation for the digital output module F-RQ 1x24VDC/24..230VAC/5A

Introduction

The documentation of the SIMATIC products has a modular structure and includes topics relating to your automation system.

The complete documentation of the ET 200SP system consists of different modules made up of system manuals, function manuals and device manuals.

The STEP 7 (online help) information system supports you when configuring and programming your automation system.

Overview of the documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

The table below lists additional documents that complement this description of the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A and that are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment and verification right through to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/automation/service&support).

Please e-mail any queries you may have e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-RQ 1x24VDC/24..230VAC/5A

Article number

6ES7136-6RA00-0BF0

View of the module

Figure 2-1 View of the F-RQ 1x24VDC/24..230VAC/5A module

Properties

- Technical properties
  - Digital module with 1 relay output (2 isolated NO contacts)
  - Safety class SIL3/category 4/PLecan be achieved if the F-RQ module is controlled by a fail-safe output (for example F-module F-DQ 4x24VDC/2A PM HF)
  - Control voltage 24 VDC
  - Total current for both NO contacts 5 A max.
  - Isolated from control voltage
  - Suitable for solenoid valves, DC contactors and signal lamps
- Supported system functions
  - I&M identification data
  - Firmware update

WARNING
The fail-safe performance characteristics in the technical specifications apply for a service life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the module in question from the BaseUnit or switch off its supply voltage before 100 hours are up.

Accessories

The following components can be used with the module:

- Labeling strips
- Color identification labels
- Reference identification labels

3 Connecting up

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A

Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)						
Terminal	**Assignment**	**Terminal**	**Assignment**	**Description**	**BaseUnit**	**Color identification label (terminals 1 to 16)**

Block diagram

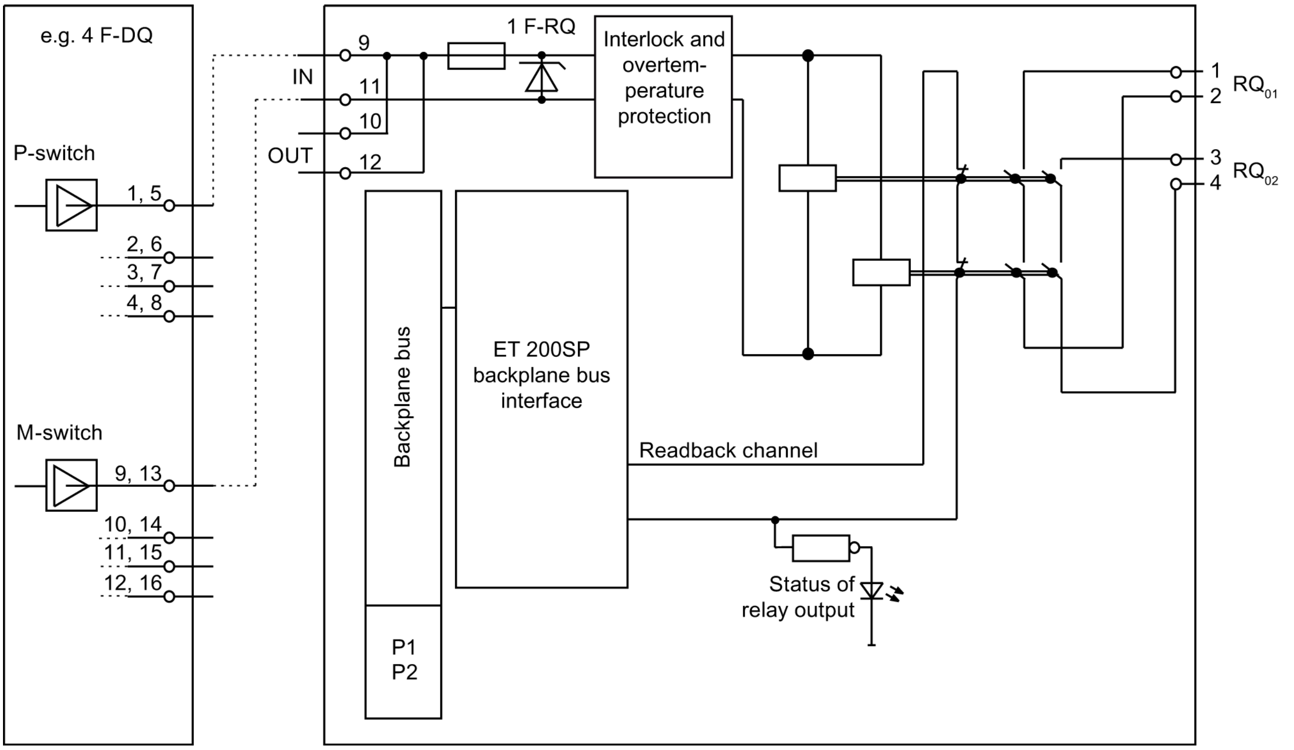

Figure 3-1 Block diagram F-RQ 1x24VDC/24..230VAC/5A

4 Addressing

4.1 Address space

Address assignment of the digital output module F-RQ 1x24VDC/24..230VAC/5A

The digital output module F-RQ 1x24VDC/24..230VAC/5A occupies the following address ranges in the F-CPU:

Table 4- 1 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
in input range	**in output range**
x.0 and x.1	—

x = Module start address

Address assignment of the user data of the digital output module F-RQ 1x24VDC/24..230VAC/5A

Of the occupied addresses of the digital output module F-RQ 1x24VDC/24..230VAC/5A, the user data occupies the following addresses in the F-CPU:

Table 4- 2 User data address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-RQ module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	RQ_1 Inverted readback channel (corresponds to process signal at IN)	RQ_0 Readback channel

x = Module start address

The user data is in the standard process image of the inputs and is not transferred to the F-CPU in safety-related communication. The readback channel in the user program is therefore displayed as a non-failsafe variable.

Note

With migration projects from the ET 200S product family, note the following:

The readback channel RQ_0 (bit 0) allows direct interconnection with the FDBACK instruction (F-block F_FDBACK) to its FEEDBACK input without additional inversion.

The readback channel RQ_1 (bit 1) is inverted.

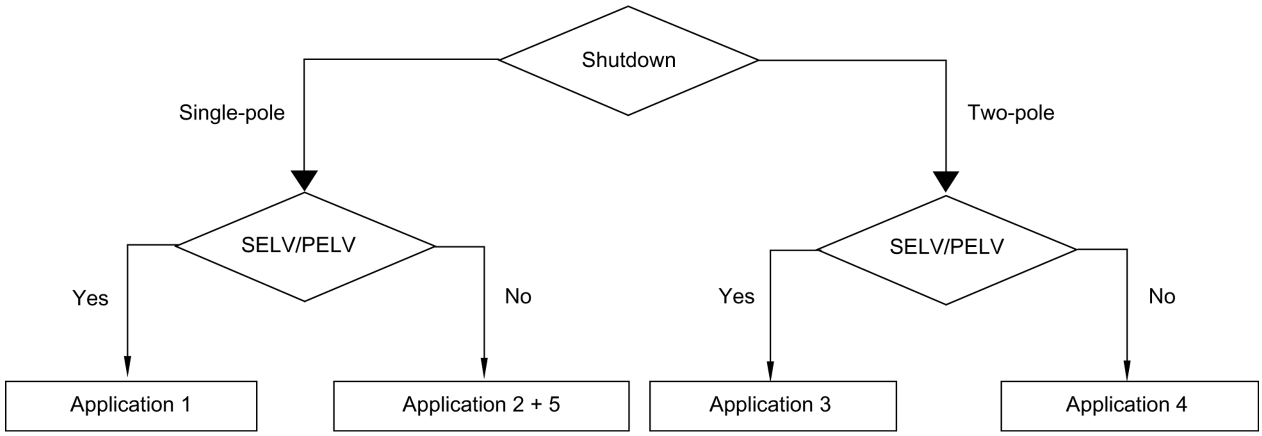
Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

5 Applications of the F-I/O module

5.1 Applications of the F-RQ 1x24VDC/24..230VAC/5A

You can achieve SIL3/category 4/PLe in the following applications if the activating F-module supports SIL3/category 4/PLe.



The wiring is carried out on the suitable BaseUnit (http://support.automation.siemens.com/WW/view/en/58532597/133300).

Wiring the 24 VDC power supply

Apply the 24 VDC control voltage to IN P (terminal 9) and IN M (terminal 11). The 24 VDC supply line is usually connected via a sourcing/sinking fail-safe output (e.g. digital output module F-DQ 4x24VDC/2A PM HF). Wire the P output (sourcing) of the F-DQ to the IN P of the F-RQ module and the M output (sinking)to the IN M of the F-RQ module.

As an alternative, you can also connect to a sourcing-sourcing fail-safe output. However, note that external short-circuits to P at the P input cannot be controlled. In this case, IN M would be connected directly to the control voltage ground.

NOTICE
Connecting the control voltage to the IN P and IN M inputs with the reverse polarity will destroy the F-module.

Wiring the load voltage and the load

The connectors of the relay output are electrically isolated NO contacts. This means that power must be supplied to these contacts from an external source. Connect the load supply (supply 1) and the load (load 1) in series to the RQ_{01} connectors (terminals 1;2). This ensures that the NO contacts of the relay interrupt the current flow of the power supply through the load. Due to the two relay contacts connected in series, the current flow can still be interrupted if one of the two relays has a fault..

The second circuit is independent of the first. They are logically interconnected by the common control. This means that the potential in the RQ_{02} (terminals 3;4), supply 2 and load 2 circuit may be different.

WARNING

If you connect a non-SELV/PELV power supply to one channel, you must not use the other channel.

Parameter assignment of the digital output module F-DQ 4x24VDC/2A PM HF

Assign the following parameters for the channel of the F-DQ 4x24VDC/2A PM HF digital output module to be activated:

Table 5- 1 Parameter assignment

Parameter	
Max. readback time dark test	1 ms
Max. readback time switch on test	1 ms

As the relays are highly inductive, you have the option of activating "Diagnostics: wire break" *or* "enable light test".

5.2 Application 1: 2 loads, single-pole switch-off

Wiring diagram

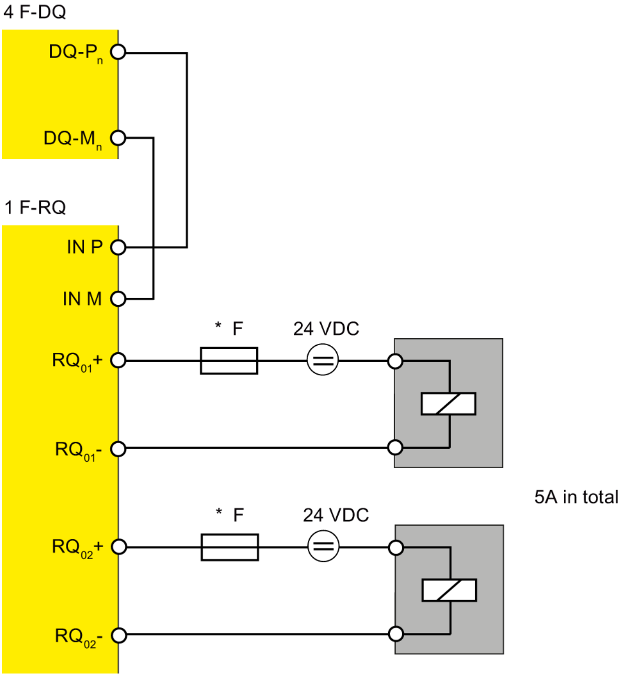


Figure 5-1 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

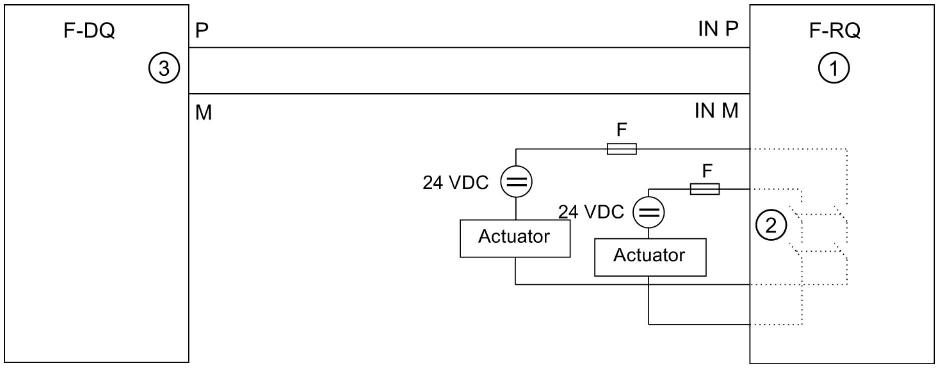
In this application, you can use one F-RQ module for single-pole switching of two loads with a total of 5A and one/two SELV/PELV power supplies.

> **WARNING**
>
> * Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
>
> Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-2 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.3 Application 2: 1 load, single-pole switch-off

Wiring diagram

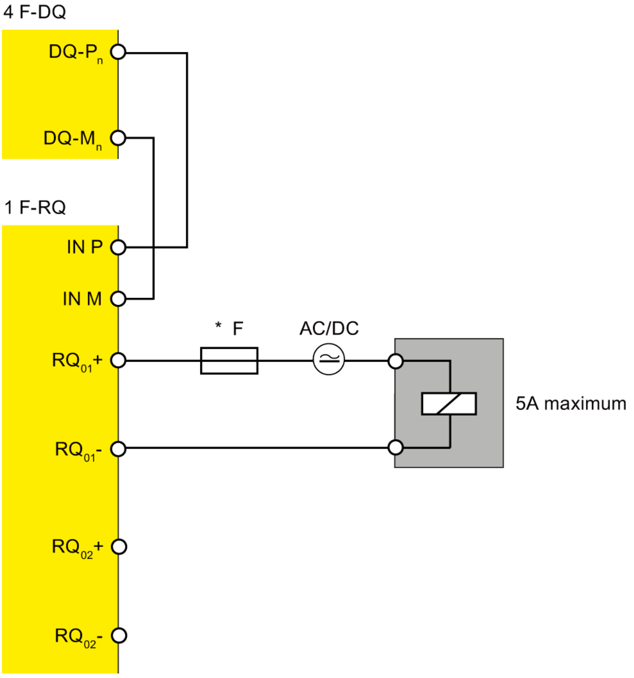


Figure 5-3 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

This application allows single-pole switching of one load with a total of 5A with one F-RQ module.

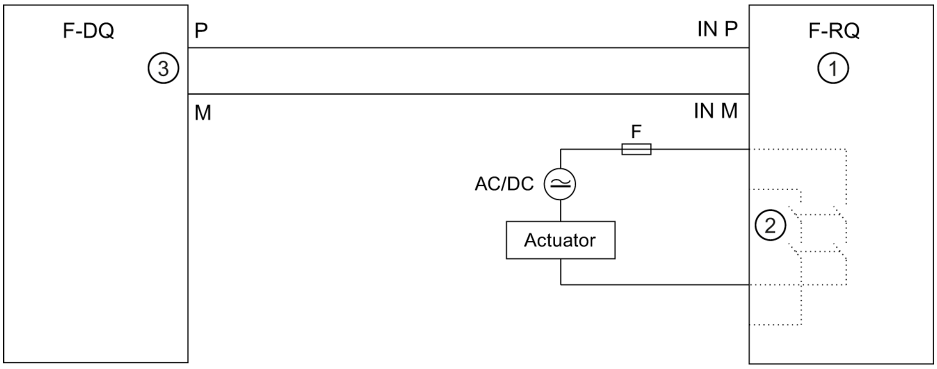
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Please note that for applications in accordance with EN 50156-1, the specified rated current of the overcurrent protective device must be multiplied by the safety factor 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-4 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.4 Application 3: 1 load, two-pole switch-off with 1 F-RQ module

Wiring diagram

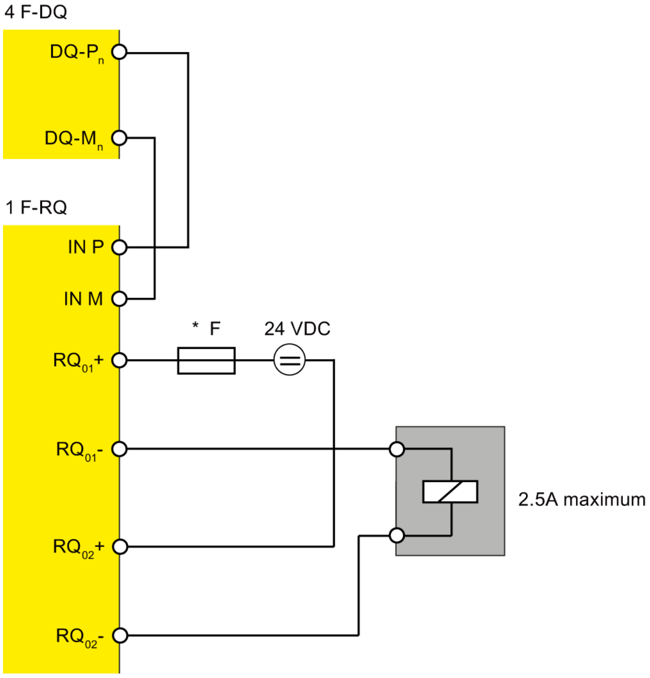


Figure 5-5 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

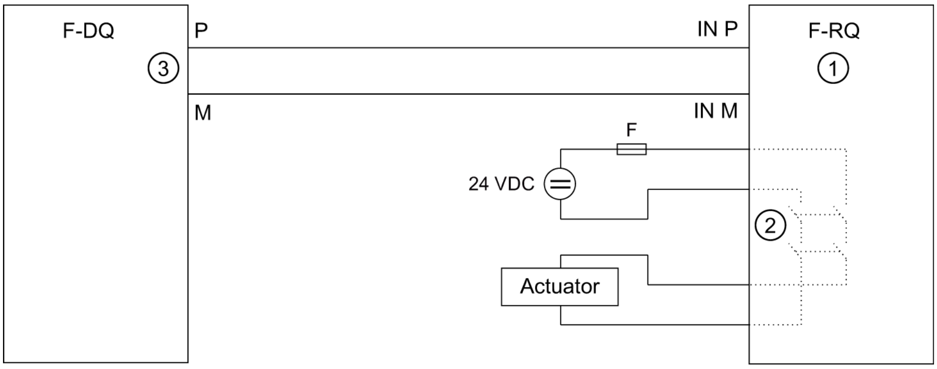
This application allows two-pole switching with one F-RQ module of one load with a maximum of 2.5A and an SELV/PELV power supply.

WARNING
* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A. Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-6 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.5 Application 4: 1 load, two-pole switch-off with 2 F-RQ modules

Wiring diagram

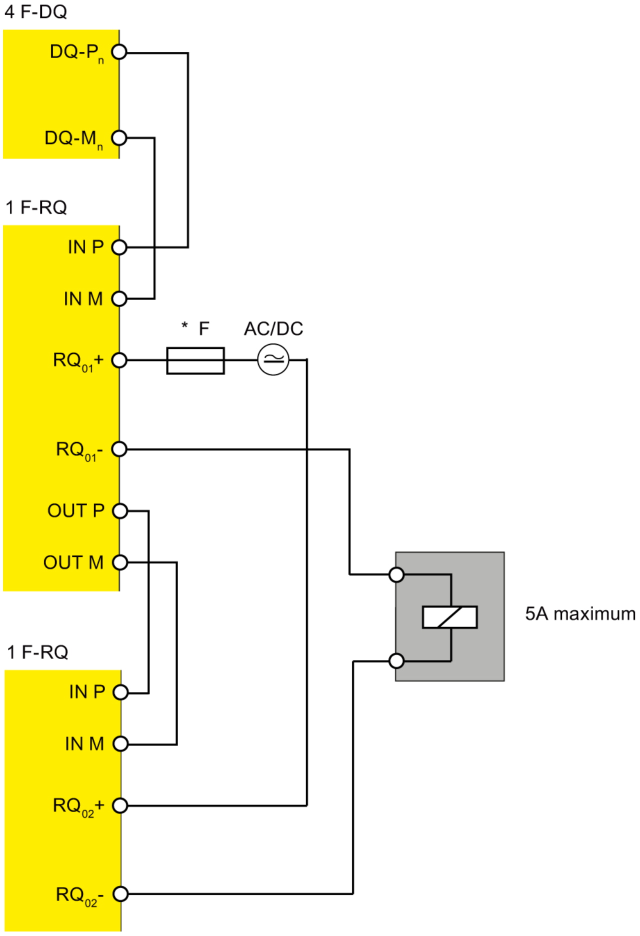


Figure 5-7 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows two-pole switching of one load with a max. of 5A with two F-RQ modules.

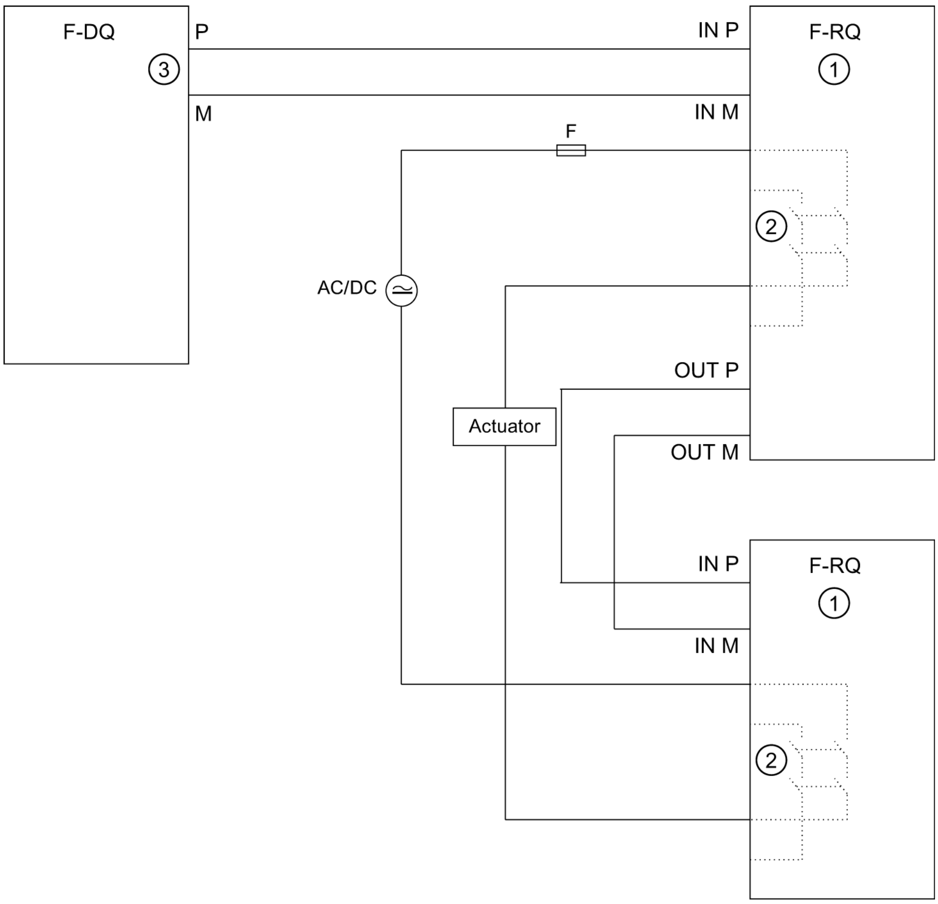
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-8 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

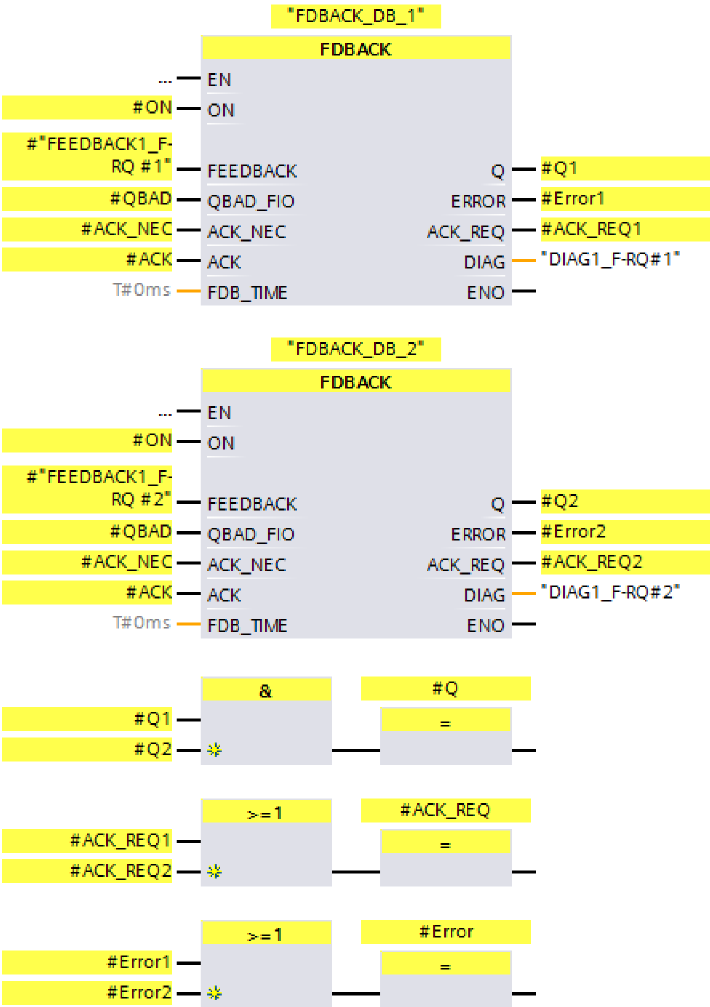
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:



5.6 Application 5: 2 loads, single-pole switch-off with 2 F-RQ modules

Wiring diagram

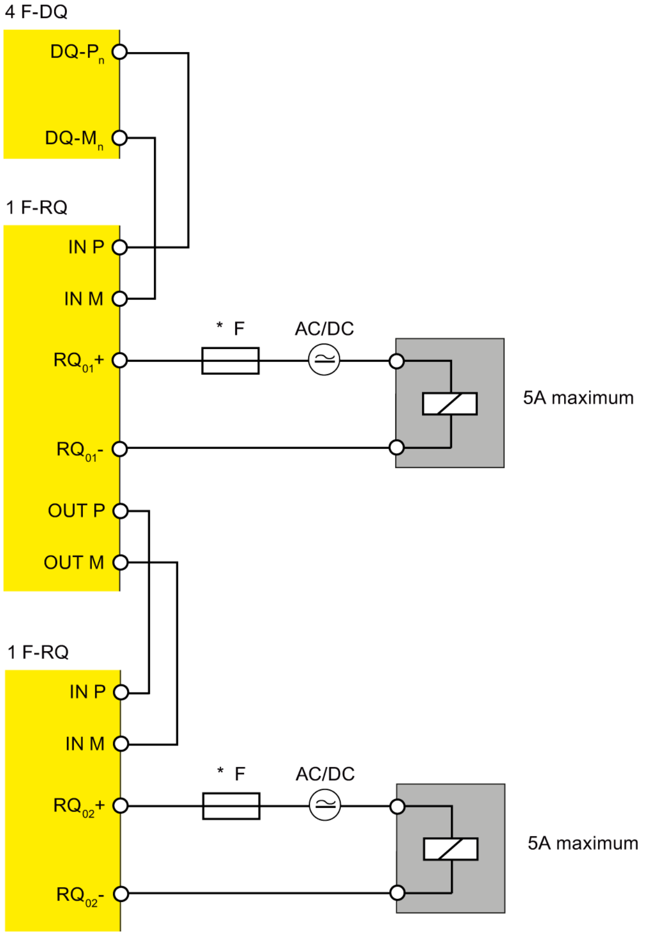


Figure 5-9 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

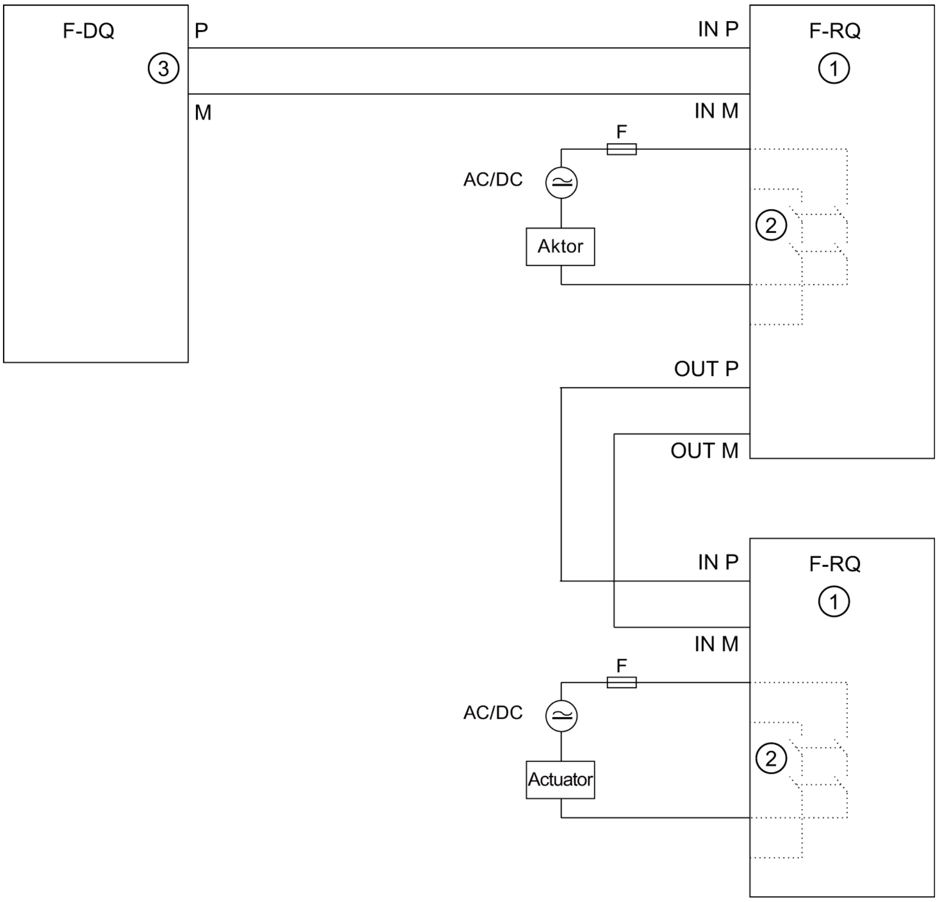
This application allows the single-pole switching of two loads with 5A each with two F-RQ modules. One power supply is not SELV/PELV.

WARNING
* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A. Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-10 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

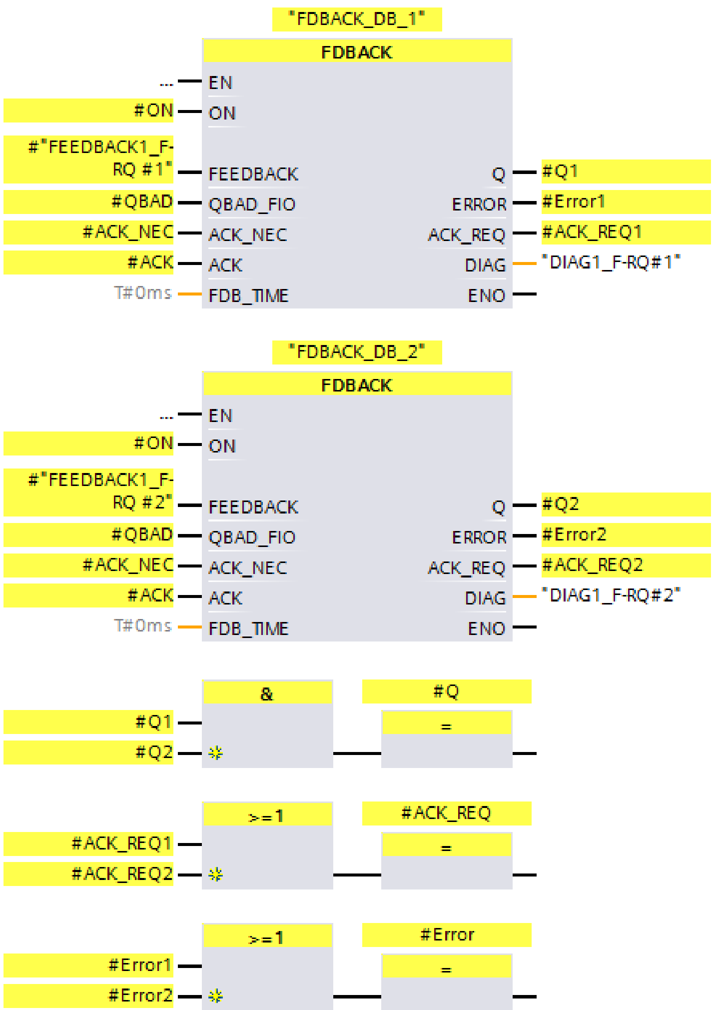
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

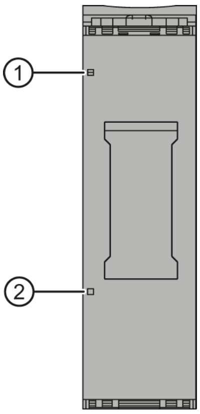
For this application, program an FDBACK instruction for each F-RQ module as follows:



Status and error display 6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays.

WARNING
The DIAG LED and the channel status LED of the output are not designed as safety-related LEDs and therefore must not be evaluated for safety-related activities.

DIAG LED

Table 6- 1 Meaning of the DIAG LED

DIAG	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module parameters not set
■ On	Module parameters set and no module diagnostics

Channel status LED

Table 6- 2 Meaning of the channel status LED

Status	Meaning
□ Off	Process signal = 0
■ On	Process signal = 1

Technical specifications 7

7.1 Technical specifications

Technical specifications of F-RQ 1×24VDC/24...230VAC/5A

	6ES7136-6RA00-0BF0
Product type designation	F-RQ 1x24VDC/24 ... 230VAC/5A
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
Installation type/mounting	
Rail mounting possible	Yes; standard mounting rail
Supply voltage	
Type of supply voltage	24 VDC
Rated value (DC)	24 V; coil voltage
Low limit of permitted range (DC)	20.4 V
High limit of permitted range (DC)	28.8 V
Power	
Power consumption from the backplane bus	100 mW
Power loss	
Power loss, typ.	1 W
Address range	
Address space per module	
Input	1 byte
Digital outputs	
Number of outputs	1
Voltage induced on current interruption limited to	No
Control of a digital input	Yes
Switching capacity of outputs	
With resistive load, max.	5 A
With lamp load, max.	25 W

	6ES7136-6RA00-0BF0
Switching frequency	
With resistive load, max.	2 Hz
With inductive load, max.	0.1 Hz; see information in the manual
With inductive load (to IEC 60947-5-1, DC13), max.	0.1 Hz
With inductive load (to IEC 60947-5-1, AC15), max.	2 Hz
Total current of the outputs (per module)	
Horizontal installation	
• Up to 40 °C, max.	5 A; note derating information in the manual
• Up to 50 °C, max.	4 A; note derating information in the manual
• Up to 60 °C, max.	3 A; note derating information in the manual
Vertical installation	
• Up to 50 °C, max.	3 A; note derating information in the manual
Relay outputs	
Number of relay outputs	1; 2 NO contacts
Rated input voltage of relay coil L+ (DC)	24 V
Current consumption of relays (coil current of all relays), max.	70 mA
External fuse for relay outputs	Yes, 6 A, see information in the manual
Relay approved acc. to UL 508	Yes; Pilot Duty B300 R300
Switching capacity of contacts	
• With inductive load, max.	See additional description in the manual
• With resistive load, max.	See additional description in the manual
• Thermal continuous current, max.	5 A
• Contact rating, min.	1 mA
• Contact rating after exceeding 300 mA, min.	10 mA
• Contact rating after exceeding 300 mA, max.	5 A
• Rated switching voltage (DC)	24 V
• Rated switching voltage (AC)	230 V
Length of cable	
Cable length, shielded, max.	500 m; for load contacts
Cable length unshielded, max.	300 m; for load contacts
Control cable (input), max.	10 m
Interrupts/diagnostics/status information	
Diagnostics messages	
Diagnostics	Yes, firmware update
Diagnostics display LED	
RUN LED	Yes; green/red DIAG LED
Channel status display	Yes; green LED

	6ES7136-6RA00-0BF0
Electrical isolation	
Electrical isolation, channels	
Between channels	Yes; only with SELV / PELV
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between channels and backplane bus/supply voltage	250 VAC (reinforced insulation)
Between backplane bus and supply voltage	60 VAC/75 VDC
Insulation	
Insulation test voltage	2545 VDC 2 s (routine test)
Overvoltage category	III
Tested with	
Between channels and backplane bus/supply voltage	2545 VDC 2s (routine test), surge voltage test 7200 VDC/5 positive and 5 negative pulses (type test)
Between backplane bus and supply voltage	707 VDC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
Category according to ISO 13849-1:2008	4
SIL according to IEC 61508:2010	SIL 3
Low demand (PFD) acc. to SIL2	<1.00E-04, proof test interval 1 year
Low demand (PFD) acc. to SIL3	<1.00E-05, proof test interval 1 month
High demand (PFH) acc. to SIL2	<1.00E-08 1/h, proof test interval 1 year
High demand (PFH) acc. to SIL3	<6.00E-09 1/h, proof test interval 1 month
Dimensions	
Width	20 mm
Weights	
Weight, approx.	56 g

Supplement to the technical specifications

Technical specifications	
Relay outputs	
Current consumption of relays (coil current of all relays), min.	20 mA
Permitted potential difference	
• Between NO contacts	75 VDC / 60 VAC
Insulation tested	
• Between the NO contacts	707 VDC (type test)

Derating

Note

As the modules are small, you need to monitor the heat build-up between adjacent modules if output modules are subject to high loads. A temperature rise in an output module exposed to a high load can result in shutdown and reduce plant availability. If the operating voltage > 25 VDC, the average total current of the modules directly adjacent should not exceed 50% of the levels listed in the technical specifications, and the ambient temperature should not exceed 50 °C.

If the ambient temperature exceeds 50 °C, supply voltage L+ must not exceed 25 VDC.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

7.2 Mechanical and climatic ambient conditions

In contrast to the specifications for mechanical environmental conditions and mechanical environmental conditions testing in the "Mechanical and climatic ambient conditions" section of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual, the following applies to this F-module:

Mechanical ambient conditions

The following table shows the mechanical ambient conditions in the form of sinusoidal vibrations.

Table 7- 1 Mechanical ambient conditions

Frequency band	ET 200SP with BusAdapter BA 2×FC	ET 200SP with BusAdapter BA 2×RJ45/ BA 2xSCRJ
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude	
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration	

Tests of mechanical ambient conditions

The following table provides important information about the type and scope of the tests for ambient mechanical conditions.

Table 7- 2 Tests of mechanical ambient conditions

Check for ...	Test standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sinus)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half sine Shock intensity: 150 m/s² peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

7.3 Switching capacity and service life of contacts

Switching capacity and service life of contacts

You can extend the service life beyond the value indicated in the tables below by installing an external protective circuit.

The tables below show the switching capacity and service life of the contacts.

Table 7- 3 Switching capacity and service life of contacts with resistive load

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	5.0 A	350000
	3.0 A	500000
	2.0 A	750000
	1.0 A	1800000
	0.5 A	4000000
230 VAC	5.0 A	100000
	3.0 A	150000
	2.0 A	200000
	1.0 A	400000
	0.5 A	800000

Table 7- 4 Switching capacity and service life of contacts **with inductive load according to IEC 947-5-1 DC 13/ AC15**

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	1.0 A	100000
	0.5 A	200000
230 VAC	1.0 A	200000
	0.5 A	350000

Table 7- 5 B10d values

AC	750000
DC	10000000

Response times

A

A.1 Response times

Introduction

The section below shows the response times of the digital output module F-RQ 1x24VDC/24..230VAC/5A. The response times of digital output module F-RQ 1x24VDC/24..230VAC/5A are included in the calculation of the F-system response time.

Definition of response time for fail-safe relay outputs

The response time defines the interval between controlling by means of a fail-safe digital output module until the signal change at the relay output.

Maximum response time without errors

The maximum response time for fail-safe relay outputs when there are no errors is equal to:

Max. response time = 16 ms

Readback response time

The readback response time for fail-safe relay outputs is equal to:

Readback response time = 30 ms

Maximum response time until error detection

Max. response time = cycle time of the safety program + max. readback time of the FDBACK instruction + max. response time of the F-DQ module + max. response time of the F-RQ module + 12.8 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

This manual complements the ET 200SP distributed I/O system system manual. General functions of the ET 200SP are listed in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Safety instructions 2

Important safety instructions

⚠ WARNING
Failure to observe this information may result in death, severe injury, and serious property damage.
For operation in Pollution Degree 2 environment.

⚠ WARNING
Failure to observe this information may result in death, severe injury, and serious property damage.
When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or an enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 according to EN 60529.

⚠ WARNING
Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Wires must not be connected to the device or disconnected from the device within a flammable or combustible environment.

⚠ WARNING
Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Do not disconnect live wires from the device if it cannot be ensured that an explosive atmosphere is not present in the environment.

⚠ WARNING
Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Replacement of components may impair suitability for Class I, Division 2 or Zone 2.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not open the device when the supply voltage is switched on.

WARNING

Connection only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in the Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

For this reason, you are only permitted to connect safety extra-low voltage (SELV) with limited power source (LPS) according to IEC 60950-1, EN 60950-1, VDE 0805-1 to the supply connections.

The supply of the device must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Take measures to prevent transient overvoltages of more than 40% of the rated voltage. You can ensure this by using only AS-i power supply units that meet the requirements indicated in Section Terminal assignment (Page 27) in "Power supply units for AS-Interface". Transient overvoltages are not permitted to exceed 119 V under any circumstances. This will ensure compliance with an ATEX requirement.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This device is only suitable for use in areas defined as Class I, Division 2, Groups A, B, C, and D and is not suitable for use in hazardous areas.

WARNING

To be operated by experienced users only

Improper operation may result in death, severe injury, and serious property damage. Users must be familiar with ASIsafe and the safety system used, e.g., SIMATIC, Distributed Safety, SIMATIC Safety Advanced.

Only an experienced user is permitted to teach the code sequences of safe AS-i slaves (organizational specification).

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is only suitable for use in areas defined as Class I, Zone 2, Group IIC and in non-hazardous areas.

NOTICE

Checking parameters

Check that all parameters are correctly set before final acceptance.

NOTICE

Reaction to faults in fail-safe modules

If you are using the module in safety-critical applications, the PROFIsafe mechanism of passivation and reintegration is enabled and must be used.

Observe the information concerning passivation and other fault reactions in the documentation for the ET 200SP Distributed I/O System, see Section Documentation guide (Page 7).

NOTICE

Single-channel use of safe AS-i input slaves

The values in the PROFIsafe process image input have Safety Integrity Level SIL 3.

If two-channel interconnection is not used for a safe AS-i input slave, the application has a maximum safety integrity level of SIL 2 or less. The configuration tool / STEP 7 cannot detect this.

You must ensure that the signals are correctly processed in the safety application.

NOTICE

Ensure that the plant is functioning correctly in productive operation

Carry out a function test before the system goes into productive operation.

Important note for maintaining the operational safety of the system

Note

Newsletter containing information on product development and product features

Owners of systems with safety-related characteristics must ensure compliance with special operational safety requirements. Suppliers are required to comply with special product monitoring measures. For this reason, Siemens publishes a special newsletter containing information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective. A newsletter keeps you constantly up to date in this regard. A subscription to the newsletter is necessary so that you can make any needed changes to your system. To sign up for the newsletter, go to:

Internet (https://www.industry.siemens.com/newsletter)

Product overview 3

3.1 Properties of the F-CM AS-i Safety ST

Item number

3RK7136-6SC00-0BC1

View of the module

Figure 3-1 View of the F-CM AS-i Safety ST module

Use of the module

The F-CM AS-i Safety ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The F-CM AS-i Safety ST module features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The F-CM AS-i Safety ST module can be plugged in to:

- BaseUnit Type C0
- BaseUnit Type C1

The F-CM AS-i Safety ST fail-safe communication module expands a standard AS-Interface network to include safety-related communication.

The F-CM AS-i Safety ST module reads the input states of safety-related AS-Interface input modules and provides these states to a fail-safe F-CPU for further evaluation.

In the opposite direction, the F-CM AS-i Safety ST module receives safe output states of an F-CPU and outputs them for control of safety-related outputs on AS-Interface.

The F-CM AS-i Safety ST fail-safe module supports safety-related applications up to SIL 3 according to EN 62061 or safety category up to PL e according to EN 13849-1. The input and output values of the safety-related AS-i slaves are addressed using the safe cyclic process image. You need an F-CPU for safe processing.

The F-CM AS-i Safety ST module has no AS-i master functionality. For operation of the AS-i network, you need a CM AS-i Master ST module (3RK7137-6SA00-0BC1) or another AS-i master conforming to AS-i Specification V3.0.

You can plug several F-CM AS-i Safety ST modules into one SIMATIC ET 200SP station. An F-CM AS-i Safety ST occupies 16 input bytes and 8 output bytes in the I/O address space. The number of F-CM AS-i Safety ST modules that can be plugged in depends on:

- The maximum address space of the utilized interface module (IM) of the ET 200SP
- The amount of address space occupied by other modules

Up to five module combinations of CM AS-i Master ST (32 input bytes/32 output bytes) and F-CM AS-i Safety ST (16 input bytes/8 output bytes) can be plugged in to one SIMATIC ET 200SP station with standard interface module IM 155-6 PN ST having a maximum address space of 256 input bytes/256 output bytes. If other modules are present in the ET 200SP station, the available address space and the maximum number of AS-i modules are reduced.

In a SIMATIC ET 200SP station with High Feature Interface Module IM 155-6 PN HF and a maximum address space of 1 440 input bytes/1 440 output bytes, a correspondingly greater number of modules can be plugged in.

You can find additional information in ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

Properties

- Technical properties
  - Gateway between PROFIsafe and ASIsafe, without master functionality
  - Expands a standard AS-i network to include safety-related communication (ASIsafe)
  - Transfer of safety-related digital I/O values in the cyclic process image
  - Monitoring of up to 31 safety-related input slaves
  - Control of up to 16 safety-related AS-i output slaves or switch-off groups
  - Power supplied from the AS-i voltage
  - Use of various interconnection types (1oo1 and 1oo2) is possible
  - Input delay of 0 ms to 150 ms can be assigned for each channel
  - Startup test can be activated for each channel
  - Discrepancy monitoring can be configured for each channel
  - Sequence monitoring can be set for each channel
  - Channel-wise passivation
  - Test for 0 signal before reintegration
  - 8 LED displays for status and error diagnostics
- Supported functions
  - I&M identification data
  - PROFIsafe V2.4
  - Firmware update

NOTICE
Max. proof test interval
When the proof test interval has expired, you must replace the device; see "Technical specifications (Page 93)".

- New properties as from FW V1.0.1
  As from product version 02, the module is shipped with FW V1.0.1 (or higher).
  - Extended functions (diagnostic texts)
  - New messages
  - New diagnostics data record 206

For more information, see Section "Parameterizing (Page 41)".

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

Ease of maintenance

The following features support maintenance:

- Code sequences are saved in the coding element. As a result, teaching of the code sequences does not have to be repeated after an F-CM AS-i Safety ST module is replaced.
- Use is automated to the greatest extent possible. This applies, in particular, to the teaching of the code sequences of safe AS-i slaves.
- An F-address that has already been assigned is stored in the coding element. This means that there is no need to repeat teaching-in after replacing the F-CM AS-i Safety ST module.
- The module/BaseUnit concept allows you to easily replace defective hardware. Remove the defective module from the rack and plug in the new module.

Further information can be found in the Section "Code sequences (Page 75)".

Certifications

More detailed information regarding certifications can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

3.2 Operating modes of the F-CM AS-i Safety ST

3.2.1 Standard mode

Self test during device startup

After the AS-i voltage is switched on (PWR LED shows steady green light), the F-CM AS-i Safety ST module performs a comprehensive self-test. During this test, all LEDs are lit for approximately 3 seconds. Exception: the "DIAG" LED is controlled directly by the ET 200SP backplane bus and indicates the communication status for the ET 200SP system.

Checking of the F-address

After the self-test, the module checks the F-address. If no valid F-address is available, the "DIAG" and "PROFIsafe" LEDs flash red (the status LED flashes green). You must then assign the F-address, see Section "F-parameters (Page 44).

Downloading of the module parameters

The F-CM AS-i Safety ST then begins to read in code sequences of the safe AS-i slaves on the connected AS-i bus. At the same time, the module downloads the module parameters that were stored in the PLC CPU. The module parameters can only be downloaded when the operating voltage is applied to the interface module of the ET 200SP and the parameters have been made available by the PLC CPU during startup of the ET 200SP station.

The "Status" LED flashes green until the module parameters are completely downloaded or the PLC CPU is in STOP state, or the PLC communication is interrupted.

Cyclic data exchange of safe input/output data

When a valid set of module parameters has been downloaded and the PLC CPU is in "RUN" state, the safe input/output data is evaluated according the parameter assignment and exchanged with the PLC CPU.

The PROFIsafe protocol is used for the data exchange.

The "Status" LED is lit green during cyclic data exchange.

If the F-CM AS-i Safety ST module starts cyclic data exchange directly after startup, but communication cannot yet be established on the AS-i bus, the F-CM AS-i Safety ST module supplies the substitute value "0" in the input image. Passivation is delayed by a maximum of 30 s in this case. As a result, communication can start on the AS-i bus within this time window without passivation. After this time window, the input/output channels are passivated if there is no AS-i communication.

3.2.2 Error statuses

Note

Statuses not considered to be errors

The F-CM AS-i Safety ST module does not consider the following statuses to be errors, i.e. no alarm and no passivation is triggered:

- Waiting for start-up test
- Input/output with value = 0 in the process image without error condition, e.g. normal opening of the input contacts by pressing an emergency stop button or opening a protective door.

Diagnostic information can be read out in the user program using data records. For information, please refer to Section "Data records for diagnostics (Page 57)".

3.2.2.1 Serious device fault

Description

Examples of conditions that trigger a serious device fault are:

- Fault in the electronics
- Repeated synchronization error

You can read the following pattern on the LEDs:

Table 3- 1 LED display for a serious device fault

LED	Display
"Status"	□ "Off"
"Error"	■ Red "On"
"CFG"	■ Red "On"
"PSF"	■ Red "On"

In the event of a serious device fault, communication with the F-CM AS-i Safety ST module, e.g., reading a data record, is not possible. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

1. Switch off the module.
2. Wait for the module to cool down, if necessary.
3. Switch on the device again.
4. If the error persists after the module is switched on, the module must be replaced.

3.2.2.2 Device fault

Description

Examples of conditions that trigger a device fault are:

- Device fault (e.g. sporadic synchronization error, see also DS92)
- Configuration error (e.g. problem with contact to backplane bus, coding plug missing, see also DS92)

You can read the following pattern on the LEDs:

Table 3- 2 LED display for device faults

LED	Display
"Status"	□ "Off"
"Error"	✲ Red "flashes"
"CFG"	□ "Off"
"PSF"	□ "Off"

In the event of a device fault of this type, communication with the F-CM AS-i Safety ST module is only possible. e.g., for reading out additional diagnostic information via data records. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

- Make sure that the station is properly grounded.
- Check whether the coding element is present or replace it if necessary.
- Plug the module into the BaseUnit in an untwisted position.

Switch off the module. If the error persists after the module is switched on and no external error cause can be found, the module must be replaced.

3.2.2.3 Process signal error

Description

Examples of conditions that trigger a process signal error are:

- Discrepancy error at the inputs of a safe AS-i input slave
- Sequence error at the inputs of a safe AS-i input slave
- Sporadic code sequence error (from FW V1.0.1), e.g. fault caused by EMC in the input circuit
- Code sequence error at a safe AS-i input slave, e.g. due to cross-circuit at the inputs
- Failure of a safe AS-i input slave

You can read the following pattern on the LEDs:

Table 3- 3 LED display for discrepancy error or sequence error

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	□ "Off"
"PSF"	✻ Red "flashes"

Table 3- 4 LED display for code sequence errors (e.g. due to cross-circuit) or for slave failure

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	✻ Red "flashes"
"PSF"	✻ Flashes red if the CPU is in RUN "off" if the CPU is in STOP.

In the event of a process signal error, the F-CM AS-i Safety ST module remains in cyclic data exchange. Only at the safe input slave involved in each case is the substitute value "0" processed and the channel passivated. After the cause of the error has been eliminated, the channel can be reintegrated via the safety program.

The "PSF" LED goes out only after all channels have been reintegrated.

The "DIAG" LED switches from flashing red to green as soon as all errors that led to a passivation of the individual channels have been cleared.

Communication with the F-CM AS-i Safety ST module is possible, for example, for reading out additional diagnostic information via data records.

Response to code sequence errors

- **Sporadic code sequence error**
  Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
  Behavior as from firmware V1.0.1:
  - Sporadic code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The resetting to the substitute value 0 takes place without any delay.
  - Diagnostic alarm is triggered (after a short delay, in order to distinguish between sporadic code sequence errors and general code sequence errors).
  - **Response to FW V1.0.0**
  - No message as diagnostic alarm in FW V1.0.0 and no passivation of the channel.
  - Safety input bit of the channel is reset to substitute value 0 without a delay and automatically switches to the process value 0 or 1 if there is no interference to the code sequence.
- **Code sequence error (general)**
  Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the fail-safe input module.
  Behavior (identical for firmware V1.0.0 and V1.0.1 or higher):
  - Code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The reset to the substitute value 0 takes place without a delay, while the diagnostic alarm is triggered after a short delay (delay necessary in order to distinguish between sporadic code sequence errors and general code sequence errors).

3.2.2.4 Parameter assignment error

Description

In the event of invalid configuration data, the cyclic data exchange will not start.

You can read the following pattern on the LEDs:

Table 3- 5 LED display for parameter assignment errors

LED	Display
"Status"	✻ Green "flashing"
"Error"	□ "Off"
"CFG"	□ "Off"
"PSF"	✻ Red "flashes"

1. Check the hardware configuration in *STEP 7*.
2. Perform a compilation.
3. Download the configuration data to the PLC CPU.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Noting the firmware version

After a firmware update, mark the current firmware version on the housing of the F-CM AS-i Safety ST.

Note

Requirement for the firmware update

Always perform the firmware update of the F-CM AS-i Safety ST in a separate ET 200SP rack. Ensure that no other modules besides the interface module (IM), the F-CM AS-i Safety ST, and the terminating server module are located in the ET 200SP rack.

During the firmware update of the F-CM AS-i Safety ST module, the associated CPU must be in the STOP operating state. To do this, switch the CPU to the STOP state before starting the firmware update.

Note

If the FW V1.0.0 is replaced by another FW version, then an intermediate step is necessary. If you would like to replace a higher FW version with FW version V1.0.0, then this intermediate step is also necessary.

As an intermediate step, the Bootloader Version (B1.0.0) of the firmware must be loaded before the actual firmware V1.x.x.

NOTICE

Observe references to the download page for executing the firmware change
Failure to do so can result in the destruction of the device.

The firmware versions are made available in the Online Support:
Online Support (https://support.industry.siemens.com/cs/ww/en/view/109743655)

NOTICE

Checking the firmware version for F-permission

Before using a new firmware version, check whether it is permitted for use in the respective module.

The permissible firmware version is specified in the appendices of the F-CM AS-i Safety ST Safety certificate.

See also:

Certificate for failsafe module F-CM AS-i Safety ST (3RK7136-6SC00-0BC1) (https://support.industry.siemens.com/cs/ww/en/view/90477145)

Certificate for ET 200SP modules (http://support.automation.siemens.com/WW/view/en/49368678/134200)

Handling of the F-address and the code sequences

Note

Saving of the F-address in the coding element

During a firmware update, the F-address that is saved in the coding element is retained. Observe the information in the description of the firmware version.

Note

Saving of the code sequences in the coding element

During a firmware update, the ASIsafe code sequences that are saved in the coding element are retained. Observe the information in the description of the firmware version.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- "DIAG" LED flashes red.
- "ADDR" LED flashes green.
- "PWR" LED lights up green.
- The rest of the LEDs are Off.

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

On successful completion of a firmware update, the module performs a hot restart. It is not necessary to switch off the voltage.

After the restart, the LEDs indicate the status of the F-CM AS-i Safety ST same as after a device startup.

If the firmware update cannot be completed, switch the AS-i voltage off and back on again and repeat the firmware update.

See also

Error statuses (Page 17)

Connection 4

4.1 Terminal assignment

Requirement

For connecting, you require a BaseUnit:

- Type C1 (dark BaseUnit, e.g., item number 6ES7193-6BP20-0BC1)
- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

WARNING
Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition
Connect the BaseUnit only to AS-i power supply units that meet the requirements given in Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

Variants

Use with light BaseUnit Type C0

If the F-CM AS-i Safety ST module is connected to an AS-i network whose AS-i master is located outside the ET 200SP station, use the light BaseUnit Type C0.

If the AS-i master is located within the ET 200SP station, you can also use the light BaseUnit. However, you must wire the AS-i network explicitly using the connecting terminals.

The light BaseUnit Type C0 has no internal connection to the module plugged in on the left.

Use with dark BaseUnit Type C1

If you are using a combination of CM AS-i Master ST and F-CM AS-i Safety ST on the same AS-i network, use the dark BaseUnit. In this case, plug the CM AS-i Master ST module into a light BaseUnit Type C0. Next to it on the right, plug the F-CM AS-i Safety ST module into a dark BaseUnit Type C1.

In this case, connect the AS-i network to the light BaseUnit. The dark BaseUnit does not have to be connected to the AS-i network because the connection is made automatically via the BaseUnit group.

In contrast to other BaseUnit types, for the BaseUnits Type C0 and Type C1, the P1 and P2 busbars of the BaseUnit are electrically isolated from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-). An electrical connection is made in each case via the plugged-in CM AS-i Master ST module or F-CM AS-i Safety ST module.

The AS-i voltage connected to the light BaseUnit Type C0 is applied through the plugged CM AS-i Master ST module to the busbars. The busbars of the BaseUnit group are connected-through. The F-CM AS-i Safety ST module is supplied with AS-i voltage via the busbars of the dark BaseUnit Type C1. It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload in the modules.

If you want to maintain the voltage supply of the F-CM AS-i Safety ST module when the CM AS-i Master ST module is unplugged from the light BaseUnit, you can wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and the dark BaseUnit Type C1.

Grouping of a light BaseUnit Type C0 with several dark BaseUnits Type C1

The use of a single F-CM AS-i Safety ST module on an AS-i network is generally sufficient. If several F-CM AS-i Safety ST modules are being used on an AS-i network by means of series connected dark BaseUnits Type C1, you must wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and a dark BaseUnit Type C1. This will prevent an overload of the modules. A current draw from the dark BaseUnit is not allowed. Additional information about this can be found in "Use with dark BaseUnit Type C1".

General terminal assignment

Table 4- 1 Terminal assignment of the F-CM AS-i Safety ST

Terminal	Assignment	Description
1	TEACH1	Connection of the "TEACH" button (optional)
2	TEACH2	See Section Code sequences (Page 75).
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L 1)	ASI+	Dark BaseUnit Type C1: optional connection of the AS-i cable, positive polarity Light BaseUnit Type C0: connection of the AS-i cable, positive polarity
1N, 2N 1)	ASI-	Dark BaseUnit Type C1: optional connection of the AS-i cable, negative polarity Light BaseUnit Type C0: connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "TEACH" button

You can connect a "TEACH" button to the "TEACH1" and "TEACH2" terminals of the F-CM AS-i Safety ST module. The "TEACH" button enables the transfer of code sequences of the connected safe AS-i input slaves. This function is activated by closing the button contact on the TEACH1 and TEACH2 terminals.

The maximum cable length between the terminal and "TEACH" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

Additional rules and instructions for operating the ET 200SP with fail-safe modules

Observe generally the information in Section "Connecting" in the following documentation:

- Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)
- Product Information ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/78361093/0/en)

The conditions for connecting sensors and actuators to the modules of the ET 200SP also apply generally to the connecting of sensors and actuators to the slaves and modules of the AS-i network.

In addition, the information in the documentation of the AS-i component applies.

Ensure that all components of the AS-i network are connected in such a way that the voltage applied to the safety-related AS-i modules is limited to a maximum of 40 V.

The ET 200SP modules CM AS-i Master ST and F-CM AS-i Safety ST have internal safe electrical isolation from the backplane bus of the ET 200SP.

Power supply units for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to a maximum of 40 V in the event of a fault, including a second fault.

The Siemens power supply units for AS-Interface meet these requirements. For additional information, refer to the operating instructions of the power supply unit.

Use an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit that meets the above-indicated requirements and an AS-i data decoupling unit.

In the following text, the expression "AS-i power supply unit" stands, unless described otherwise, for an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit and an AS-i data decoupling unit.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

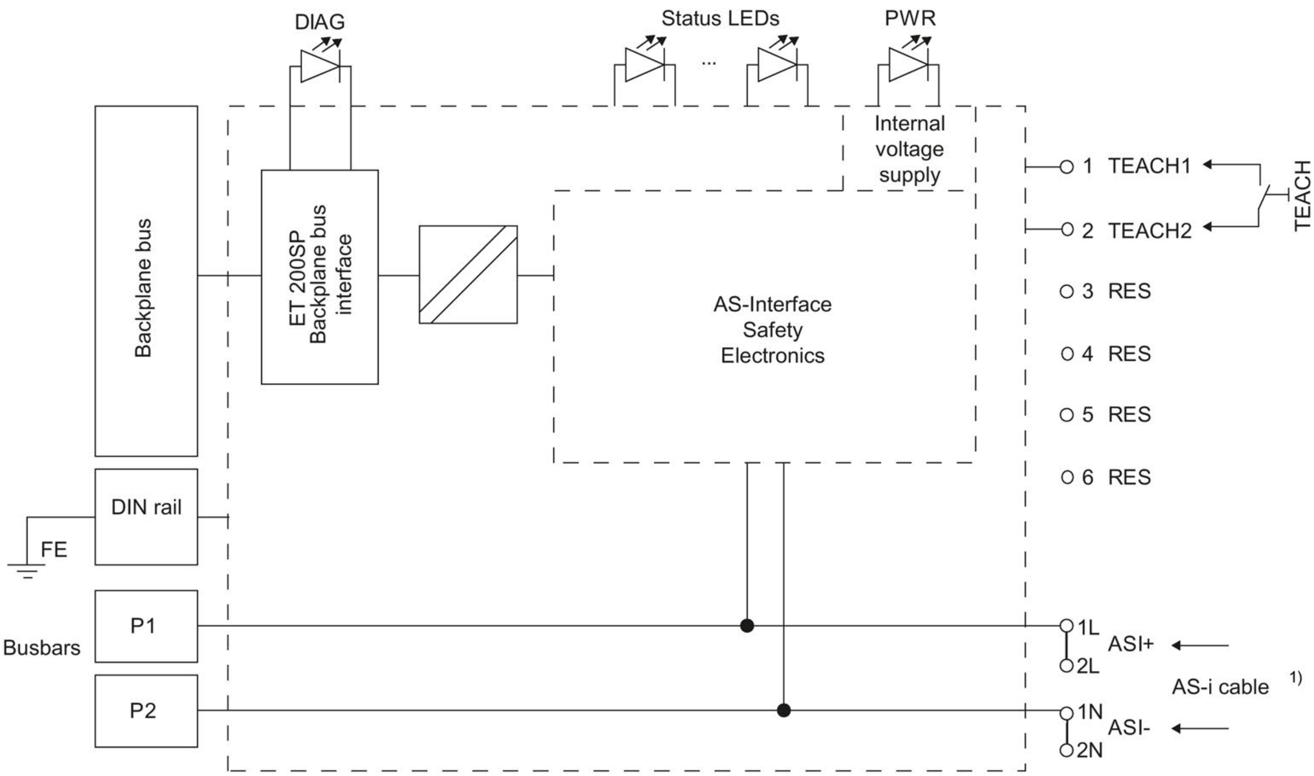
Use a PELV / SELV power supply when operating the F-CM AS-i Safety ST module on PROFIsafe.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/20025980/133000)

4.2 Schematic circuit diagram

Schematic circuit diagram



1) AS-i cable: Connection not applicable for dark BaseUnit

Figure 4-1 Schematic diagram of F-CM AS-i Safety ST

Connection to busbars

Requirement:

- An AS-i power supply unit is connected to the light BaseUnit Type C0 of the BaseUnit group.
- A CM AS-i Master ST module is plugged into the light BaseUnit.

If you plug an F-CM AS-i Safety ST module into a dark BaseUnit Type C1, the F-CM AS-i Safety ST module will be automatically supplied with AS-i voltage via the busbars.

It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload of the modules.

Note the additional explanations in Section Terminal assignment (Page 27).

Configuring 5

5.1 Configuring the F-CM AS-i Safety ST

Notes on configuration

You configure the ET 200SP station and its F-CM AS-i Safety ST module and assign their parameters with *STEP 7*.

There is currently no provision for configuration via a GSD file, because the GSD configuration procedure does not permit safety-related parameter assignment (according to PROFIsafe Specification V2.4).

Note

F-CM AS-i Safety ST in the hardware catalog of *STEP 7*

If the F-CM AS-i Safety ST module is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". This HSP can be obtained from the Internet using the corresponding function in *STEP 7*.

Note

Operation under S7 F systems is not approved.

Note

The data exchange with "F-DX-MOD" is not supported.

Software for configuration of the F-CM AS-i Safety ST

Configuration software	Requirements	Installation information
STEP 7 (classic) V5.5 SP3 HF4 or higher with Distributed Safety	Hardware Support Package HSP 2093[1)] Internet	Online Help for *STEP 7*
STEP 7 (classic) V5.5 SP4 or higher with Distributed Safety		
STEP 7 (TIA Portal) V13 or higher with Safety Advanced	Hardware Support Package HSP 70[1)] Internet (http://support.automation.siemens.com/WW/view/en/29156492/133100)	
STEP 7 (TIA Portal) V14 or higher with Safety Advanced / Basic		

1) Download optional, if not already contained in the hardware catalog

Note

Observe the online help on *STEP 7*.

The "S7 F-Configuration Pack" can be found on the Internet (http://support.automation.siemens.com/WW/view/en/15208817).

Procedure

1. Assign the parameters of the F-CM AS-i Safety ST module according to your safety application.
2. Configure the AS-i Master in such a way that it includes all AS-i slaves in the communication – including the control addresses for safe AS-i outputs that are activated in the F-CM AS-i Safety ST module.
3. Download the hardware configuration to the PLC-CPU.
4. Assign the associated F-address to the F-CM AS-i Safety ST module.
5. Start the teaching and transferring of the code sequences of the safe AS-i input slaves.
6. Create the safety program in the F-CPU.
7. Test your application.

Information concerning these steps can be found in the following sections and in the manuals of the utilized devices.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage
Observe instructions in the programming and operating manuals

Observe the instructions in the manuals.

5.2 Safety-related communication with AS-Interface

5.2.1 Operating principle of code sequences of safe AS-i slaves

For realization of safety-related communication, each safe AS-i input slave sends a code sequence over the AS-i bus. To prevent a mix-up of the AS-i input slaves on an AS-i bus, each AS-i input slave sends a different code sequence. The code sequences are permanently stored in the AS-i input slave.

The F-CM AS-i Safety ST module checks every code sequence for correct data content. Depending on the result of the evaluation, the module sets the the safe input image.

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

You will find more information about teaching code sequences, and the LED behavior, in Section "Code sequences (Page 75)".

You can find a description of the individual parameters in the Section "Process signal errors (Page 20)".

5.2.2 Operating principle of the safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe AS-i input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

For the function of a safe AS-i output, you need the following components:

- A control unit
- An evaluation unit

Control unit

The control unit outputs safety-related IN or OUT control commands to the AS-i bus. The control unit is integrated in the F-CM AS-i Safety ST module. The control unit assumes an active position in the communication. It acts like an AS-i slave and has an AS-i address that must be called by the AS-i master. The values in the output data of the AS-i master are not relevant in this case. The F-CM AS-i Safety ST module inserts the safety-related control data into the communication data.

Besides controlling the OFF state according to specification, a control unit can control up to four different output switching states: F-OUT 1, F-OUT 2, F-OUT 3, and F-OUT 4. The F-CM AS-i Safety ST module, however, makes available only the output switching state F-OUT 1, i.e., The OFF and ON states are controlled.

In addition to the switching states, a control unit can send out two different auxiliary signals: AUX1 and AUX2. You can use these auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, the AUX1 and AUX2 signals are mapped in the safe process image output. The auxiliary signals are not safety-related signals, however. During control by the safety program, the F-CM AS-i Safety ST module sends a sequence from each auxiliary signal one after the other on the AS-i bus. Up to 16 different control units can be activated in the F-CM AS-i Safety ST module. The control units are managed in the F-CM AS-i Safety ST module as switching group 0 to switching group 15.

If you want to use more than 16 different control units, you can plug two F-CM AS-i Safety ST modules into the ET 200SP station.

Observe the information on the bus configuration in Section AS-i bus configuration with multiple F-CM AS-i Safety ST modules (Page 38).

NOTICE
Uniqueness of the AS-i address on the AS-i bus
Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Evaluation unit

The evaluation unit reads the safety-related control commands ON or OFF on the AS-i bus and passes corresponding switching commands, e.g., to switching contacts. In case of error, e.g., communication error on the AS-i bus, the evaluation unit switches off. The evaluation unit is integrated in the safe AS-i output module to which, for example, drive contactor coils are connected. The evaluation unit behaves as a passive unit in the AS-i communication. The master does not detect the evaluation unit and does not call it. The evaluation unit monitors the communication of the AS-i address of the control unit and reacts to its safety-related control signals.

You set the AS-i address (see Section "Control unit") the evaluation unit is to monitor.

You can set multiple evaluation units to the same address so that a control unit can control multiple safe output modules simultaneously.

NOTICE
Bus cycle time for safe AS-i outputs
An evaluation unit requires a minimum AS-i bus cycle time. Ensure that at least 5 AS-i addresses are present on the AS-i bus. Otherwise, the control unit goes to error state. When A/B slaves are used, at least 5 different numerical AS-i addresses must be present. That is, a combination of slave addresses 1A and 1B count as 1 numerical address.
The F-CM AS-i Safety ST module does not have a monitoring function for this configuration rule.

5.3 AS-i bus configuration with multiple F-CM AS-i Safety ST modules

The F-CM AS-i Safety ST module generates an additional physical bus load on the AS-i cable.

To avoid faults due to too low levels of the communication signals on the AS-i cable, the entire bus load on the AS-i cable must not exceed a maximum value.

The following rules apply to the determination of the physical bus load on the AS-i cable:

Device type	Bus load value
Slave with A/B address	0.5
Slave with standard address	1.0
F-CM AS-i Safety ST module	2.5

Maximum value as sum of all devices	35.0

Determine the total bus load by adding the bus load values of the components connected to the AS-i cable. You do not have to include the standard AS-i master and AS-i power supply unit system components when calculating the bus load.

To avoid disturbances, the maximum bus load must not exceed the value 35.

The bus load value of the F-CM AS-i Safety ST module remains unchanged if switching groups are activated in the F-CM AS-i Safety ST module for control of safe outputs. In other words, the internally generated AS-i addresses do not influence the bus load value.

If you connect additional components, e.g., an MSS 3RK3 modular safety system, to the AS-i cable, you must take into consideration the bus load values of these components. For more detailed information, refer to the relevant manual.

When a repeater is used, this yields multiple cable segments for which the bus load can be determined separately.

The following configuration examples result from the table:

- In a fully expanded AS-Interface network configuration (with 31 slaves with standard address), you can install 1 F-CM AS-i Safety ST module.
- In an AS-Interface network configuration with 30 slaves with standard address, you can install 2 F-CM AS-i Safety ST modules.

5.4 Configuring with STEP 7 (classic)

With *STEP 7* (classic) the F-CM AS-i Safety ST module is configured independently of the configuration of further ET 200SP modules, e.g. CM AS-i Master ST.

If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM AS-i Safety ST module, then this configuration error is not recognized when compiling the configuration. The F-CM module does not report that the slave cannot be detected until operation is in progress or code sequences are being read.

5.5 Configuring with the TIA Portal

TIA Portal V13 SP1

With TIA Portal V13 SP1, an F-CM AS-i Safety module can only be configured in combination with an AS-i master, necessitating the configuration of the AS-i slaves in STEP 7.

The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.

The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.

TIA Portal V14 or higher

From TIA Portal V14 onwards, an F-CM AS-i Safety module can be configured:

- In combination with an AS-i Master, necessitating the configuration of the AS-i slaves in STEP 7. The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.
  The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.
- Regardless of an AS-i master, i.e. no configuration of the AS-i slaves in STEP 7 is required. In this case, the parameters of the AS-i input slaves are set in the properties window of the F-CM AS-i Safety ST module.

In the case of safe inputs/outputs, the "Configuration status" output field in the properties of the F-CM reports whether the configuration of the F-CM is compatible with the configuration of the connected AS-i subnet. If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM module, then the compilation of the configuration is nevertheless still possible. During operation or when reading the code sequences, however, the F-CM module reports that the slave cannot be detected.

The affected input address is passivated.

Configuration of safe AS-i outputs

The F-CM module contains a control unit for the safe AS-i outputs, see Section "Functional principle of the safe AS-i outputs (Page 36)".

TIA Portal V13 SP1

When configuring with TIA Portal V13 SP1, this control unit is not visible in the network view on the AS-Interface subnet of the AS-i master. The configuration of the F-CM module, however, is always combined with the AS-i master.

TIA Portal V14 or higher

In TIA Portal V14 or higher, the control unit must additionally be configured as a virtual slave on the AS-i subnet of the master, in the event that the AS-i slaves are configured in STEP 7.

A virtual slave is inserted automatically if a safe AS-i output is activated in the properties of the F-CM module and the F-CM module is already linked with the AS-i subnet. If necessary, by using the "Add AS-i Slave to AS-i network" button, the virtual slave can be inserted in the properties of the F-CM module under "Safe outputs". If no AS-i subnet is connected to the F-CM when the "Add AS-i slave to AS-i network" button is actuated, a subnet is automatically inserted.
The virtual slave can be managed like any other slave on the subnet, which means that all AS-i slave addresses existing in the AS-i subnet are visible. The virtual slave can be deleted if the control of the safe AS-i output is no longer required.

If necessary, the virtual slave can also be inserted straight from the hardware catalog (3RK7136-6SC00-0BC1F-DQ) into the subnet of the master.

Note

The virtual slave 3RK7136-6SC00-0BC1F-DQ is not a hardware module that is connected to the AS-i cable, but only a tool for the configuration of the AS-i master. The AS-i address assigned to the virtual slave 3RK7136-6SC00-0BC1F-DQ is emulated in the F-CM AS-i Safety module as soon as the corresponding safe output is activated in the properties of the F-CM.

If the AS-i master is engineered without configuring the AS-i slaves in STEP 7, i.e. either configuration of the AS-i slaves via the "SET" button or via the control panel in the TIA Portal, then the secure outputs in the F-CM must be configured and must have been loaded into the station before the configuration of the AS-i slaves is read into the master by means of the "SET" button or via the control panel in the TIA Portal.

Assigning parameters / Setting the address space 6

6.1 Parameters

List of parameters

Table 6- 1 F-parameters

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
F-monitoring time (ms)	1 … 65534 ms	150 ms	No	F-CM AS-i Safety ST
F-source address	1 … 65534	Assigned by the F-system	No	F-CM AS-i Safety ST
F-destination address	1 … 65534	Is suggested by the F-system	No	F-CM AS-i Safety ST

For information on the F-parameters and the assignment of the F-address, refer to the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

Table 6- 2 Potential group / AS-i network

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
BaseUnit with AS-i voltage supply	Potential group: The AS-i network of the left module (dark BaseUnit) is used New potential group: New AS-i network (light BaseUnit)	The AS-i network of the left module (dark BaseUnit) is used	No	F-CM AS-i Safety ST

6.2 Explanation of the parameters

6.2.1 F-parameters

Specify F-destination address for F-I/O of the PROFIsafe address type 2

The F-destination address of F-I/O of the PROFIsafe address type 2 is automatically assigned for every F-CPU.

F-source address

With the parameter "Central F-source address" you specify the F-source address for the F-I/O of the PROFIsafe address type 2 assigned to this F-CPU. The F-source address must be unique throughout the network.

Note

A change to the parameter "Central F-source address" results in a modification to the safety program when it is recompiled. A new acceptance may therefore be required, as this centrally modifies the F-source address of all F-I/O devices of address type 2 retrospectively.

SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)

6.2.2 Potential group / AS-i network

Here, you set:

- The BaseUnit you are using.
- How the F-CM AS-i Safety ST I/O module is connected to the AS-i network.

The module can be connected to the AS-i cable by external wiring or automatically via the module plugged in on the left.

- Enable new AS-i network (light BaseUnit)
- Use AS-i network of the left module (dark BaseUnit)

BaseUnit with voltage supply

Enable new AS-i network (light BaseUnit)

Select this option if the module is plugged into a light BaseUnit.

Connect the module to the AS-i cable (ASI+ / ASI-) via the BaseUnit. The module is supplied with voltage from the AS-i cable. Connect the AS-i cable to an AS-i power supply unit or to a combination of a data decoupling unit and a suitable power supply unit.

There is no module-internal connection of the AS-i cable to the module plugged in on the left.

With TIA Portal or with STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (normally: CM AS-i Master ST).

> **WARNING**
>
> **Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition**
>
> Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

Use AS-i network of the left module (dark BaseUnit)

Select this option if the module is plugged into the dark BaseUnit.

The module inserted on the left must be a CM AS-i Master ST module (normal situation) or another F-CM AS-i Safety ST module (special case).

The module is connected to the AS-i cable of the module plugged in on the left and supplied with voltage via the module-internal connection.

The module-internal connection is designed only for supplying power to the F-CM AS-i Safety ST I/O module. If several dark BaseUnits are connected in series, a direct connection of the dark BaseUnits to the AS-i cable using external wiring is additionally recommended.

Supplying power to AS-i modules, e.g., AS-i slaves, via the terminals of the dark BaseUnit is not permitted.

With TIA Portal, the F-CM AS-i Safety ST module uses the same AS-Interface subnet as the module inserted on the left (normally: CM AS-i Master ST).

With STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (as a rule: CM AS-i Master ST).

> **WARNING**
>
> **Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition**
>
> Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

6.2.3 Module parameters - General

Behavior after channel faults

This parameter is permanently set to "Passivate the channel".

After channel faults have occurred, only the faulty PROFIsafe channels are passivated. The PROFIsafe channel corresponds to the safe input and output address in the process image.

6.2.4 Module parameters - Safe inputs

Configuration status

A valid evaluation is only possible if a compatible safe AS-i slave is actively operating on the network.
Input monitoring where there is a missing safe input or a missing AS-i slave causes a passivation of the input address. If no configuration of the slaves is saved in the STEP 7 project, the settings of the AS-i master must ensure that the connected compatible safe AS-i slave is actively operating, for example, using the "SET" button of the master.

Input monitoring activated

With activation of the input monitoring, you activate the corresponding AS-i slave as an input channel for signal processing in the safety program. The AS-i address must be assigned to a safe AS-i input slave.

When the input monitoring is activated, the value of the input channel is calculated based on the input states of the assigned safe AS-i input slave and the evaluation conditions specified by the parameter assignment. If a fault occurs, the substitute value "0" is transferred and the channel is passivated.

If input monitoring is deactivated, the substitute value "0" is transferred. The channel is not passivated.

If required, the AS-i slave can be monitored by another evaluation module, e.g., by another F-CM AS-i Safety ST module, the 3RK3 Modular Safety System. This applies both when input monitoring is deactivated and when it is activated.

Note

Call of the AS-i slave

The AS-i slave must be called by the AS-i master. Set up the configuration of the AS-i master in such a way that the communication of the AS-i master with the AS-i address functions properly.

Note

Slave profile

A safe AS-i input slave has the slave profile (IO.ID) = 0.B or 7.B.

I address

The input bit address of the input channel for the signal processing in the safety program is indicated here. It is calculated automatically from the start of the inputs entered on the "Addresses" tab.

Input delay

To suppress coupled-in interference or brief switching pulses, you can set an input delay for each AS-i slave. This will suppress interference pulses whose pulse time is less than the set input delay, in ms. The input delay applies to both channels of the channel pair of the AS-i slave.

Note

Time of fault suppression shortened by up to 75 ms

It can take 15 AS-i cycles until the valid code sequence is detected. As a result, the time of the fault suppression is shortened by up to 75 ms compared to the set value.

A long input delay suppresses longer interference pulses but results in a longer response time.

Range of values:	0 to 150 ms
Default	0 ms

The values 0, 50 to 150 ms can be selected in 10 ms increments.

The input delay time acts in addition to the system response time. Suppressed interference pulses are not visible in the safety program.

Evaluation of the sensors

This parameter specifies how the connected sensors are to be evaluated.

1oo1 evaluation

In 1oo1 evaluation, the sensor exists once and is connected to the first input of the safe AS-i slave via a single channel. You jumper the second input of the AS-i slave. Instead of the jumper, you can also connect another single-channel sensor to the second input. Only when both inputs supply an ON signal does the F-CM AS-i Safety ST module transfer the "1" value to the safety program (the two inputs are ANDed).

The individual states of the two inputs of the AS-i slave are not visible in the safety program.

A discrepancy analysis is not performed in 1oo1 evaluation.

1oo2 evaluation, equivalent

In 1oo2 (2v2) evaluation, equivalent, both inputs of the safe AS-i slave are occupied by one two-channel sensor or by two single-channel sensors. The two single-channel sensors then belong together functionally as a pair.

The input signals are compared internally for equivalence. The two inputs of the AS-i slave are combined to form a channel pair.

A discrepancy analysis is possible in 1oo2 evaluation, equivalent.

Discrepancy analysis

If you are using a two-channel sensor or two single-channel sensors that acquire the same physical process variable, the sensors will, for example, respond with a delay due to the limited accuracy of their arrangement to each other. For fail-safe inputs, the discrepancy analysis for equivalence is used to infer errors from the time characteristic of two signals of the same functionality. For two associated input signals, if different levels are detected after the input delay time has expired, the discrepancy analysis is started. A check is made to determine if the difference has disappeared after expiration of an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error.

Startup test

If the "Startup test" parameter is activated, after startup of the channel or after a cross-circuit error (code sequence error), the value transferred to the safety program is kept at the substitute value "0" until the connected sensor has been correctly actuated at least once. Afterwards, the value of the input channel is calculated according to the set functionality.

The actuation of the sensor is defined to mean that both inputs of the safe AS-i slave must supply an ON signal, e.g., both switching contacts of the sensor are closed. Then, they must supply an OFF signal, e.g., switching contacts open. Finally, an ON signal must be supplied again, e.g., switching contacts closed. During the sensor actuation phase, none of the following errors may occur:

- Discrepancy error
- Sequence error
- Cross-circuit error (code sequence error)

After reintegration is complete, you must perform a startup test. For this purpose, you actuate the sensor to be monitored once.

A discrepancy error or a sequence monitoring error does not trigger a new startup test.

Discrepancy monitoring

If the discrepancy monitoring is activated, a discrepancy analysis is performed. This is the normal setting for 1oo2 evaluation, equivalent, in order to achieve high error uncovering.

You can deactivate the discrepancy monitoring for special situations. This corresponds in principle to 1oo1 evaluation of sensors. Check whether the lower error uncovering is sufficient for the required safety level. You may possibly use a sensor with integrated error uncovering. If required, you can activate the sequence monitoring.

When 1oo2 evaluation of the sensors is set, discrepancies in signal states between input 1 and input 2 are monitored.

When discrepancy monitoring is activated, the discrepancy time starts to elapse as soon as a difference is detected between the signal on input 1 and the signal on input 2. If the set discrepancy time is exceeded and the difference continues to exist, a discrepancy error is triggered.

Before switch-on, the signal value 0 must be present at both inputs, even when a discrepancy error has not occurred or the discrepancy time has not been set to "infinite".

If the "Evaluation of the sensors" parameter has been assigned with 1oo1, discrepancy monitoring is not performed.

Discrepancy behavior

This parameter is permanently set to "Supply 0 value".

The discrepancy behavior determines the value that is made available to the safety program in the F-CPU during the discrepancy, i.e., while the discrepancy time is running.

After expiration of the set input delay time, once an "OFF" signal is detected at one of the two input channels of the channel pair involved, this parameter setting causes the value "0" to be provided to the safety program in the F-CPU. This setting does not affect the sensor-actuator response time as a result of the discrepancy time.

Discrepancy time infinite

If you activate "Discrepancy time infinite", the time period for the discrepancy analysis never expires. As a result, a time-related discrepancy error will not be detected.

Nevertheless, the following switch-on condition applies: After a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again.

If this condition is not satisfied, especially in the event of a single-channel switch-off (i.e., signal OFF at only one of the two input channels of the relevant channel pair) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) even though the time for the discrepancy analysis has not expired. In data record 202, the bit 0.2 "= 1" is set in the status of the input monitoring of AS-i address n.

A discrepancy error is only detected if both input channels of the affected channel pair have not received the "0" signal simultaneously.

If "Discrepancy time infinite" is deactivated, the discrepancy analysis uses the value set for the "Discrepancy time" parameter.

Discrepancy time

You can specify the discrepancy time in the range of 0 to 60 000 ms for each channel pair.

The following settings are required:

- "Sensor evaluation": 1oo2 evaluation, equivalent
- "Discrepancy monitoring": Active
- "Discrepancy time infinite": Deactivated

In most cases, the discrepancy time is started but does not completely elapse, because the signal differences are evened out again after a short time.

Select a large enough discrepancy time so that in error-free cases, the difference between the two signals always disappears before the discrepancy time expires.

If the input signals do not match after expiration of the assigned discrepancy time, e.g., due to a mechanical defect of the sensor or sensor wire break, a discrepancy error is detected.

When discrepancy time is running, the switch-on condition also applies that after a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again. If this condition is not satisfied, especially in the event of brief switch-off of a channel (due to signal OFF at only one of the two input channels) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) if the time for the discrepancy analysis has not expired.

A detected discrepancy error indicates to the user that the switch-on condition is not satisfied.

Assign a discrepancy time that is greater than the input delay time.

Sequence monitoring

Overview

The sequence monitoring monitors the sequence of the signals of the channel pair when there is a signal change OFF >>> ON at the inputs of the safe AS-i slave.

The following settings are possible:

- Deactivated: The sequence is not a condition that has to be satisfied for switching on the function output.
- Ascending order: Input 1 before input 2 at "HIGH" state
- Descending order: Input 2 before input 1 at "HIGH" state

If the sequence is violated, the "Sequence condition violated" error is detected. The value transferred to the safety program is kept at "0" until the "OFF" signal is read in at both input channels. Switch-on condition is, for example, both switching contacts of the sensor open. The inputs must be switched on one after the other in the assigned sequence and must not switch on simultaneously.

You can activate the sequence monitoring if 1oo2 evaluation, equivalent, is set for the sensor evaluation. In this case, the discrepancy monitoring can be activated or deactivated.

Deactivated

The sequence of the inputs is not monitored.

Ascending order: Input 1 before input 2 at "HIGH" state

For switch-on of the channel, input channel 1 must first read in and hold an "ON" signal followed by input channel 2.

When the channel is switched off, the sequence of the input channels is not monitored.

Descending order: Input 2 before input 1 at "HIGH" state

For switch-on of the channel, input channel 2 must first read in and hold an "ON" signal followed by input channel 1.

When the channel is switched off, the sequence of the input channels is not monitored.

Reintegration after discrepancy error

This parameter is permanently set to: "Test 0-signal necessary on both channels".

A discrepancy error is not considered to be rectified until an "OFF" signal is present again at both input channels. Reintegration of the PROFIsafe channel is then possible.

6.2.5 Module parameters - Safe outputs

Configuration status

For operation of the switching group the AS-i master must activate communication with the associated AS-i address of the control unit in the F-CM. For this reason the configuration of the AS-i network must include a virtual AS-i slave with the profile IO.ID.ID2 = 6.B.D and ID1 = 0. If the slaves are not configured, the AS-i master must be set such that the AS-i address of the control unit in the F-CM is actively operating, for example, using the "SET" button of the master while the F-CM module is being configured and connected to the AS-i master.

Activate output control

With this parameter, you activate the corresponding switching group and the associated AS-i address of the control unit in the F-CM AS-i Safety ST module.

You will find additional information in Section Operating principle of the safe AS-i outputs (Page 36), "Operating principle of the safe AS-i outputs."

When output control is activated, the control unit in the F-CM AS-i Safety ST module is switched on so that the F-CM AS-i Safety ST module generates an additional AS-i address on the AS-i Bus. The associated value is output from the safe process image via this AS-i address.

When output control is deactivated, the corresponding control unit in the F-CM AS-i Safety ST module is switched off, and an AS-i slave is not emulated on the AS-i bus.

AS-i address

Here, you set the AS-i address within the range of 1 to 31 that the F-CM AS-i Safety ST module is to use for control of a safe AS-i output.

WARNING
Uniqueness of the AS-i address on the AS-i bus
Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Note

Communication of the AS-i master with the AS-i address

The AS-i address of the control unit must be called by the AS-i master. Set up the communication of the AS-i master in such a way that communication with the AS-i address of the control unit functions properly.

Note

Slave profile of the control unit in the F-CM AS-i Safety ST module (control of a safe AS-i output)

The AS-i address of the control unit corresponds to a slave with slave profile (IO.ID.ID2) = 6.B.D and ID1 = 0.

Q address switching output

The output bit address is displayed here. It determines the switching state of the safe output (control signal F-OUT 1). Interconnect the "Q address switching output" in your safety program according to the required safety logic.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

Q address error acknowledgment

The output bit address that sends an acknowledgment signal to the safe output is displayed here.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

A positive edge (0 >>> 1) triggers the F-CM AS-i Safety ST module to first send the AUX1 auxiliary signal to the safe output followed by the AUX2 auxiliary signal. Another positive edge is necessary for sending another sequence of auxiliary signals.

The auxiliary signals are used, in general, for acknowledging an error state at the safe output. Refer to the AS-Interface (http://support.automation.siemens.com/WW/view/en/26250840/0/en) System Manual and the Operating Instructions of the safe output module (http://support.automation.siemens.com/WW/view/en/43666143/0/en) used to find out which functions the auxiliary signals are used for.

Note

"Q address error acknowledgment"

The "Q address error acknowledgment" does not trigger an error acknowledgment in the F-CM AS-i Safety ST module. Rather, as described above, it sends an acknowledgement signal to the safe output module on the AS-i bus.

6.3 Address space

6.3.1 Address assignment for user data and value status of the F-CM AS-i Safety ST module

Input and output address assignment

Of the assigned addresses of the F-CM AS-i Safety ST module, the user data occupy the following addresses in the F-CPU:

Table 6- 6 Input address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
x + 0	DI0.7 AS-i address 7	DI0.6 AS-i address 6	DI0.5 AS-i address 5	DI0.4 AS-i address 4	DI0.3 AS-i address 3	DI0.2 AS-i address 2	DI0.1 AS-i address 1	DI0.0 Reserved
x + 1	DI1.7 AS-i address 15	DI1.6 AS-i address 14	DI1.5 AS-i address 13	DI1.4 AS-i address 12	DI1.3 AS-i address 11	DI1.2 AS-i address 10	DI1.1 AS-i address 9	DI1.0 AS-i address 8
x + 2	DI2.7 AS-i address 23	DI2.6 AS-i address 22	DI2.5 AS-i address 21	DI2.4 AS-i address 20	DI2.3 AS-i address 19	DI2.2 AS-i address 18	DI2.1 AS-i address 17	DI2.0 AS-i address 16
x + 3	DI3.7 AS-i address 31	DI3.6 AS-i address 30	DI3.5 AS-i address 29	DI3.4 AS-i address 28	DI3.3 AS-i address 27	DI3.2 AS-i address 26	DI3.1 AS-i address 25	DI3.0 AS-i address 24
x + 4	Value status for DI0.7	Value status for DI0.6	Value status for DI0.5	Value status for DI0.4	Value status for DI0.3	Value status for DI0.2	Value status for DI0.1	Reserved

x + 8	Value status for DQ0.7	Value status for DQ0.6	Value status for DQ0.5	Value status for DQ0.4	Value status for DQ0.3	Value status for DQ0.2	Value status for DQ0.1	Value status for DQ0.0
x + 9	Value status for DQ1.7	Value status for DQ1.6	Value status for DQ1.5	Value status for DQ1.4	Value status for DQ1.3	Value status for DQ1.2	Value status for DQ1.1	Value status for DQ1.0
x + 10	Reserved							
...								
x + 15	Reserved							

X = Module start address

NOTICE
Process value "0" is transmitted as a non-safety related value
Based on the transfer principle of the code sequences, the process value "1" is transferred via AS-Interface as a safe value, so that the enable for switching on a machine can be issued in a safety-related manner. If an error occurs during transfer of the value "1", this error is detected and substitute value "0" is used. The process value "0" is transferred via AS-interface as an unsafe value. That is, a faulty transmission of the "0" value cannot be detected. The "0" value must therefore not be used as safety-related information that initiates a dangerous action (e.g. feedback "0" of a switch position).

Table 6- 7 Output address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
x + 0	DQ0.7 Switching group 7	DQ0.6 Switching group 6	DQ0.5 Switching group 5	DQ0.4 Switching group 4	DQ0.3 Switching group 3	DQ0.2 Switching group 2	DQ0.1 Switching group 1	DQ0.0 Switching group 0

x + 2	Error acknowledgment for DQ0.7	Error acknowledgment for DQ0.6	Error acknowledgment for DQ0.5	Error acknowledgment for DQ0.4	Error acknowledgment for DQ0.3	Error acknowledgment for DQ0.2	Error acknowledgment for DQ0.1	Error acknowledgment for DQ0.0
x + 3	Error acknowledgment for DQ1.7	Error acknowledgment for DQ1.6	Error acknowledgment for D1.5	Error acknowledgment for DQ1.4	Error acknowledgment for DQ1.3	Error acknowledgment for DQ1.2	Error acknowledgment for DQ1.1	Error acknowledgment for DQ1.0
x + 4	Reserved							
...								
x + 7	Reserved							

X = Module start address

The error acknowledgment bit initiates the AUX1 and AUX2 signals one after the other.

Note

Use of the error acknowledgment bit of a safe AS-i output

The values in the PROFIsafe process output image have Safety Integrity Level SIL 3. In addition to the switching states, a control unit can send out two different auxiliary signals to a safe AS-i output: AUX1 and AUX2. These auxiliary signals are not safety-related signals. You can use the auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, these error acknowledgment bits are mapped in the safe process output image. If error acknowledgment bits are sent to a safe AS-i output, the *STEP 7* or SIMATIC Manager configuration tool is unable to detect that the error acknowledgment bits are not safe. This means: No warnings or faults will be output for it when the safety application is generated. The user is responsible for the correct processing of these signals in the safety application.

6.3.2 Value status

Properties

For each input signal and output signal, the F-CM AS-i Safety ST module provides information about the signal's validity, i.e., the "value status". Like the input signal, the value status is stored in the process image.

Value status for the digital input and output modules

The value status is binary supplementary information of a digital input or output signal. It is entered in the process input image simultaneously with the process signal. The value status provides information regarding the validity of the input or output signal.

The value status is influenced by the following:

- Code sequence errors, e.g, caused by a permanent fault on the AS-i bus, wiring error, etc.
- Missing safe AS-i input slaves
- Channel faults
- Replacement of a safe AS-i slave by a non-safe AS-i slave
- Discrepancy error
- Sequence error

Value status = 1: A valid process value is output for the channel.

Value status = 0: A substitute value is output for the channel or the channel is deactivated.

Assignment of the inputs and outputs to the value status in the process image

A value status is assigned to each channel of the F-CM AS-i Safety ST module in the process input image.

Additional information

A detailed description of the evaluation and processing of the value status can be found in the Programming and Operating Manual SIMATIC Safety - Programming and Configuring (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

6.4 Data records for diagnostics

For diagnostic purposes, you can read out the following data records via your user program. In firmware V1.0.1 or higher the diagnostics data record 206 is available. This data record contains a summary of the information that is relevant for a comprehensive diagnosis via your user program.

Note

Use of the DS 206 for diagnostic purposes is recommended (firmware V1.0.1 or higher).

The data records 92, 202 and 204 are required for the diagnosis via the user program for a module with firmware V1.0.0. For reasons of compatibility, these data records also remain available in firmware V1.0.1 or higher.

Firmware update (Page 24)

6.4.1 DS 92 Device-specific diagnostics

Meaning

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 92 contains device-specific messages and information on the device function states of the F-CM AS-i Safety ST module.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.0:

- The "Error code" column in the table below indicates which events are relevant here. If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- The text inside parentheses after the error code corresponds to the error text that is specified for the given error code according to the PROFIBUS Standard. Several error codes can be output. If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms in firmware V1.0.1 or higher are described in Section "DS 206 Diagnostic Data Record (Page 69)".

Table 6- 8 DS 92 device-specific diagnostics

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
0.0 … 0.7	Reserved	-	-

15 … 17	Reserved	-	-
18.0	Group error code sequence_Logic	24 ("Switch-off")	A code sequence error or logic error is present for at least one safe input. Bytes 90 … 91 contain the AS-i address of the first safe input for which the error is present.
18.1	Reserved	-	-
18.2	Group_Message_Input_Triggered	-	At least one monitored safe input has value status "0". Possible cause: • Startup test necessary • Safety sensor triggered Bytes 94 … 95 contain the AS-i address of the first safe input for which the value status "0" is present.
18.3 … 18.7	Reserved	-	-

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
19 … 21	Reserved	-	-
22.0 … 22.1	Reserved	-	-
22.2	Timeout	24 ("Switch-off") 8 ("Lower limit undershot")	An internal data processing error has occurred. The F-CM AS-i Safety ST module signals a device fault. Bit 13.2 is additionally set.
22.3 … 22.6	Reserved	-	-
22.7	AS-i slave failure	26 ("External error")	No communication is detected in the case of at least one monitored safe input slave or control unit for a safe AS-i output.
23.0 … 23.7	Reserved	-	-
24 … 25	Reserved	-	-
26.0 … 26.3	Reserved	-	-
26.4	Coding element error	24 ("Switch-off") 27 ("Unclear error")	A data error occurred or coding element is missing when a coding element is accessed. The F-CM AS-i Safety ST module signals a device fault.
26.5 … 26.7	Reserved	-	-
27 … 28	Reserved	-	-
29.0 … 29.7	Reserved	-	-
30 … 33	Reserved	-	-
34 … 35	Parameter assignment error object	-	Object number for which a parameter assignment error was detected. 0 = No error 1 … 31 = The number corresponds to the AS-i address of a safe input. 32 … 47 = A number 32 … 47 corresponds to the number of the switching group 0 … 15
36 … 37	Reserved	-	-
38.0	AS-i bus error	26 ("External error")	The AS-i data communication is interrupted, substitute values in the interconnection logic

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
38.1	AS-i parameter assignment error	26 ("External error")	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 55. If an AS-i address of an output switching group is not included by the AS-i master in the data communication, this bit is set. A substitute value will be used instead.
38.2	AS-i configuration error	-	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 39. This bit is set when SET ≠ ACTUAL on the AS-i bus, when, for example, an AS-i slave is missing. A substitute value will be used instead.
38.3	AS-i voltage too low	-	If the AS-i voltage is too low during operation, a serious device fault results.
38.4	Reserved	-	-
38.5	AS-i communication okay	-	-
38.6 … 38.7	Reserved	-	-
39	Incorrect AS-i address	-	AS-i address of the AS-i slave that the device has identified as faulty: 0 = No error 1 … 31 = AS-i slave address
40 … 47	Reserved	-	-
48.0	ASIsafe safe input active	-	As soon as safe AS-i slaves become monitored, this bit is set.
48.1	ASIsafe safe output active	-	If safe AS-i outputs are controlled, this bit is set.
48.2 … 48.7	Reserved	-	-
49.0	ASIsafe code sequences missing	26 ("External error")	Safe input In addition, the AS-i address is entered in byte 50.
49.1	ASIsafe code sequences duplicated	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.2	ASIsafe code sequences new	-	New code sequences are available for transfer. In addition, the AS-i address is entered in byte 50.
49.3	ASIsafe code sequences known	-	The code sequences are taught and saved in the coding element.
49.4	ASIsafe code sequence error	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
49.5	ASIsafe code sequence teaching active	-	The code sequences are being collected. When the code sequences for all safe AS-i input slaves detected on the bus are taught, this bit is reset.
49.6 … 49.7	Reserved	-	-
50	Code sequence error object	-	This bit contains the lowest AS-i address for which a code sequence problem has occurred. Code sequence problems are: • 49.0 ASIsafe code sequences missing (Prio 3) • 49.1 ASIsafe code sequences duplicated (Prio 1) • 49.2 ASIsafe code sequences new (Prio 4) • 49.4 ASIsafe code sequence error (Prio 2)
51 … 54	Reserved	-	-
55	Switching group error object	-	This byte contains the lowest AS-i address that is configured for an output switching group but is not addressed by the master. Correct the slave configuration of the master.
56 … 61	Reserved	-	-
62.0	F_Dest_Adr does not match	24 ("Switch-off") 19 ("Communication error") 64 ("Different destination address")	-
62.1	F_Dest_Adr invalid	24 ("Switch-off") 19 ("Communication error") 65 ("Invalid destination address")	The coding element does not contain an F-address.
62.2	F_Source_Adr invalid	24 ("Switch-off") 19 ("Communication error") 66 ("Invalid source address")	-
62.3	F_WD-Time_0	24 ("Switch-off") 19 ("Communication error") 67 ("Watchdog time is 0 ms")	F_WD-Time value is 0 ms.
62.4	F_SIL value	24 ("Switch-off") 19 ("Communication error") 68 ("Parameter 'F_SIL' exceeds the appl. SIL")	F_SIL value exceeds SIL value of the specified device application

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
62.5	F_CRC_Length	24 ("Switch-off") 19 ("Communication error") 69 ("Parameter 'F_CRC_Length' does not match …")	F_CRC_Length value does not match the actual CRC length.
62.6	F_Par_Version	24 ("Switch-off") 19 ("Communication error") 70 ("Incorrect F-parameter version or F_Block_ID")	F_Par_Version does not match the F-parameter set or F-Block_ID is invalid Block_ID
62.7	CRC1 error	24 ("Switch-off") 19 ("Communication error") 71 ("CRC1 error")	-
63.0 … 63.2	Reserved	-	-
63.3	iPAR_CRC error	24 ("Switch-off") 19 ("Communication error") 75 ("Inconsistent I-parameters [iParCRC error]")	-
63.4	Operator acknowledge requested	-	Channel is ready for reintegration
63.5 … 63.7	Reserved	-	-
64 … 65	Reserved	-	-
70 … 89	Reserved	-	-
90 … 91	Object_Code_Sequence_Logic	-	AS-i address of the first safe AS-i slave for which a code sequence error or logic error i present. See also bit 18.0. 0 = No error 0 = No error 1 … 31 = AS-i slave address ≥32 = Internal error numbers
92 … 93	Reserved	-	-
94 … 95	Object_input_triggered	-	AS-i address of the first safe AS-i slave for which the input_triggered message is present. See also bit 18.2. 0 = No error 1 … 31 = AS-i slave address ≥32 = Internal error numbers
96 … 199	Reserved	-	-

6.4.2 DS 202 Status safe inputs/outputs

Description

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

DS 202 contains non-safety-related status information for the safe input slaves and for the control of the safe output slaves.

The status information for the control of the safe output slaves relates either to the control units activated in the F-CM AS-i Safety ST module or to data of external control units for safe output slaves that is also read on the AS-i bus.

Table 6- 9 DS 202 Status safe inputs/safe outputs

Byte	Description
0 … 1	Reserved
2 … 5	Status input monitoring AS-i address 1
6 … 9	Status input monitoring AS-i address 2
10 … 13	Status input monitoring AS-i address 3

190 … 199	Reserved

Table 6- 10 Input monitoring: Structure of the status information in DS 202

Byte.Bit	Message bit		Remark
0.0	Value = 1:	Startup test necessary	-
0.1	Value = 1:	Sequence condition violated	-
0.2	Value = 1:	Discrepancy condition violated	-
0.3	Value = 1:	Safety sensor triggered	-
0.4 … 0.7	Reserved		-
1.0	Value = 1:	Code sequence error	Cross-circuit at input
1.1 … 1.7	Reserved		-
2.0	Reserved		-
2.1	Value = 1:	Switch-on condition not met	-
2.2 … 2.7	Reserved		-
3.0 … 3.7	Reserved		

Table 6- 11 Output control: Structure of the status information in DS 202

Byte.Bit	Message bit	Remark
0.0	Output active	The control unit of the switching group sends the "F-OUT 1" control signal.
0.1 … 0.7	Reserved	-
1.0 … 1.3	Reserved	-
1.4	Auxiliary signal AUX1 sent	Auxiliary control signal AUX1 was transferred with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.5	Auxiliary signal AUX2 sent	Auxiliary control signal AUX2 was transmitted with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.6 … 1.7	Reserved	-
2.0 … 2.7	Reserved	-
3.0 … 3.7	Reserved	-

6.4.3 DS 204 Status code sequences

Description

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

The DS 204 contains the statuses of all AS-i slaves that are known to the F-CM AS-i Safety ST module.

Table 6- 12 DS 204: Status code sequence for an AS-i address in DS 204

Byte	Description
0 … 13	Reserved
14 … 17	Status code sequence for AS-i address 1
18 … 21	Status code sequence for AS-i address 2
22 … 25	Status code sequence for AS-i address 3
26 … 29	Status code sequence for AS-i address 4
30 … 33	Status code sequence for AS-i address 5
34 … 37	Status code sequence for AS-i address 6
38 … 41	Status code sequence for AS-i address 7

Table 6- 13 Assignment of the bits of an AS-i address in the "Status code sequence" data structure

Byte	Bit	Description	Setting	Meaning of the setting
0	0 … 2	Status of the slave	= 0	No slave present
			= 1	Standard slave (not safety-related)
			= 2	Safe slave, but the code sequence type safe input/safe output is not yet decoded.
			= 3	Code sequence type safe output
			= 4	Code sequence type safe input
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 6	Status of parameter assignment	= 0	No safe AS-i output slave or AS-i input slave is configured.
			= 1	Reserved
			= 2	Safe AS-i slave is configured The detected slave corresponds to the activation.
			= 3	Safe AS-i slave is configured The detected slave does not correspond to the activation.
			= 4 … 7	Reserved
	7	-	Reserved	-
1	0 … 2	Status of the code sequence	= 0	Code sequence irrelevant: No activation or no slave is present.
			= 1	Code sequence missing: No code sequence is taught or transferred.
			= 2	Code sequence duplicated: At least one other slave has the same code sequence.
			= 3	Code sequence new: The taught code sequence does not correspond to the transferred code sequence.
			= 4	Code sequence known: The taught code sequence does not correspond to the transferred code sequence.
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 5	Status of the safe input 1	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.
	6 … 7	Status of the safe input 2	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.

Byte	Bit	Description	Setting	Meaning of the setting
2	0 … 1	Status of the "F-OUT 1" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	2 … 3	Status of the "F-OUT 2" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	4 … 5	Status of the "F-OUT 3" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	6 … 7	Status of the "F-OUT 4" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
3	0 … 1	Status of the auxiliary signal 1	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	2 … 3	Status of the auxiliary signal 2	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	4 … 7	-	Reserved = 0	-

6.4.4 DS 206 Diagnostic data record

Meaning

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 206 contains a summary of the information that is relevant for a comprehensive diagnosis of the F-CM AS-i Safety ST module via your user program.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.1 or higher:

- The "Error code" column in the table below indicates which events are relevant here.
- If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms for firmware V1.0.0 are described in Section "DS 92 Device-specific diagnosis (Page 57)".

Table 6- 14 DS 206 Diagnosis

Byte.Bit	**Description** In the case of binary values, the description declares the status "1"	**FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm**	**Remark**
0	Version High	-	-
1	Version Low	-	-
2.0	Overtemperature	1048	Maximum operating temperature exceeded
2.1	Undertemperature	786	Ambient temperature too low
2.2	Incorrect parameter value	16	Configuration data contains errors
2.3	Incorrect or inconsistent firmware	283	Firmware is faulty Firmware update necessary
2.4	Supply voltage too high	1038	AS-i voltage too high
2.5	Supply voltage too low	1039	AS-i voltage too low
2.6	Program cycle time exceeded	259	Internal cycle time exceeded
2.7	Device fault	1059	Self-test has determined a device fault. For details, see further error messages.
3.0	Serious device fault	9	Serious device fault. No communication possible
3.1	Teaching necessary	1055	New code tables are available for transfer.
3.2	Normal operation	-	Cyclic I/O data exchange active
3.3	Startup	-	Parameters are loaded No cyclic I/O data exchange
3.4	Serious device fault	-	Serious device fault. No communication possible
3.5	I/O device signal error	-	One or more channels are passivated
3.6	Code sequence cannot be read correctly	-	A code sequence is non-existent or incomplete
3.7	Reintegration necessary	-	Error is cleared, but at least one channel is still passivated
4.0	Access to device settings	-	Assignment of the F-address Acceptance of the code sequences Firmware update

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
4.1	ASIsafe code table teaching active	-	Teach LED flashes yellow; code sequences are collected. Is reset when the code tables for all safe AS-i input slaves detected on the bus have been taught.
4.2	Diagnostic memory overflow	33	Too many simultaneous error messages
4.3	Change of parameters not permissible	-	Modification of parameter data is rejected in normal mode
4.4 ... 4.7	Reserved	-	-
5.0	Status LED flashes green	-	-
5.1	Status LED lit green	-	-

Table 6- 15 Status AS-i addresses: Structure of the status information

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0.0	Reserved	-	-
0.1	Discrepancy error, channel status 0/1	1041	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".
0.2	Discrepancy error, channel status 1/0	1042	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.3 ... 0.4	Reserved	-	-
0.5	Sequence error, channel status 0/1	1045	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0.6	Sequence error, channel status 1/0	1046	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.7	Sequence error, channel status 1/1	1047	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "1".
1.0	Input slave missing or of the incorrect type	1050	-
1.1	Control unit of the output switching group not in cyclic data exchange	1051	The AS-i master does not address the configured AS-i address of the output switching group.
1.2	Code sequence error (systematic fault)	1054	Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the safe input module.
1.3	Code sequence missing in the memory of the F-CM	1056	-
1.4	ASIsafe code sequences duplicated	1057	Identical code sequence occurs several times
1.5	Sporadic code sequence error	1058	Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
1.6 ... 1.7	Reserved	-	-
2.0	Safety sensor triggered	-	-
2.1	Switch-on condition not met		The safe input value has been reset to the status "0"
2.2	Startup test necessary	-	Test of the input is necessary: Both inputs of the channel pair must assume the status "0".
2.3	Status of process image (user data)	-	-
2.4	Value status	-	Value status = 1: A valid process value is output for the channel. Value status = 0: A substitute value is output for the channel (error on channel or the channel is deactivated).
2.5... 2.7	Reserved	-	-
3.0	Safe AS-i input slave configured	-	-
3.1	Safe AS-i output slave configured	-	-
3.2	Unsafe slave detected	-	-
3.3	Safe slave detected, type unknown	-	-
3.4	Safe slave detected, type input slave	-	-
3.5	Safe slave detected, type output slave	-	-
3.6	Slave is located in cyclic data exchange	-	-
3.7	Reserved	-	-

7 Code sequences

The principle of the ASIsafe code sequences is briefly explained in Section Safety-related communication with AS-Interface (Page 35).

The F-CM AS-i Safety ST module manages the code sequences of the safe AS-i slaves in two steps. First, the F-CM AS-i Safety ST module reads all code sequences on the AS-i bus and checks whether the respective code sequence is plausible. This operation is referred to as "teaching the code sequences". The code sequences taught in this way are in volatile memory. The taught code sequences are transferred to the non-volatile memory after a request by the user.

Initial commissioning

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

Replacement of a safe AS-i input slave

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

For the transfer of the code sequences to the non-volatile memory, you can open the "Teach ASIsafe" dialog by pressing the "Teach ..." button.

Alternatively, the transfer is also possible by pressing the optional "TEACH" button (at least 3 s).

Replacement of the F-CM AS-i Safety ST module

The non-volatile memory is located in the BaseUnit. The transferred code sequences are retained in this memory after replacement of the F-CM AS-i Safety ST module.

Below is a description of the options offered by the F-CM AS-i Safety ST module for transferring code sequences.

See also

Connection (Page 27)

7.1 Transferring code sequences via STEP 7 online access

When code sequence are managed via *STEP 7* online access, you have the option of monitoring the status of the existing code sequences in a graphic overview. In particular, the graphic overview offers advantages for initial commissioning. In addition, you can use the graphic overview for transferring the code sequences of replaced slaves during operation. You can open the graphic overview for diagnostic purposes without changing the saved code sequences. The transfer of taught code sequences is possible but not mandatory.

In order to open this dialog, there must be an online connection to the controller or to the F-CM AS-i Safety ST module. Load the hardware configuration into the modules of the controller before teaching the code sequences so that the online configuration of the F-CM AS-i Safety ST module matches the offline configuration.

7.1.1 "Teach ASIsafe code sequences" dialog

The "Teach ASIsafe code sequences" dialog contains an overview of the code sequences of the existing safety-related AS-i slaves. In this dialog, you start the transfer of the code sequences read in on the AS-i bus into the memory of the F-CM AS-i Safety ST module.

The "Teach ASIsafe code sequences" dialog does not make any changes to the module configuration. You can open the dialog for information purposes during operation. The information displayed in the dialog are obtained online from the F-CM AS-i Safety ST module. There is no comparison with the offline configuration in this case.

Within the "AS-i addresses 0…15" and "AS-i adresses 16…31", you see the following information for each AS-i address:

- Slave status
- Code sequence
- F-IN 1 … 2
- F-OUT 1 ... 4

For the AS-i address 0, only information about the slave status can be displayed because a slave with the address 0 does not exchange cyclic input/output data.

Below this information you see:

- The "Transfer taught code sequences" button
- The "Progress of teaching operation" display

By double-clicking the "Close" button, you can exit the dialog at any time. If the button is actuated, the data will not be changed. If the code sequences have not been transferred or have only been partially transferred, a corresponding notice appears.

"Slave Status" column

The "Slave status" column shows the following information about the AS-i address via a color code:

Gray	The address does not exist on the AS-i bus. It is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated)
Green (without check mark)	The address belongs to a slave that exists on the AS-i bus. However, the slave is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated). The slave on the AS-i bus is a safe slave or a standard slave. It is available for use by the AS-i master or another module.
Green (with check mark)	The address is present on the AS-i bus and corresponds to the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated).
Yellow	An error has been detected: The address is present on the AS-i bus but does not correspond to the configuration of the F-CM AS-i Safety ST module (input monitoring control or output monitoring control is activated). Check the slave. Replace the slave with the required slave or change the configuration.
Red	An error has been detected: The address is not present on the AS-i bus but is needed in the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated). • Check whether the slave exists on the AS-i bus and has been included in the communication by the AS-i master. • Check whether the slave is contained in the configuration of the AS-i master. Correct the configuration of the AS-i bus, if required.

"Code sequence" column

The "Code sequence" column shows the following information about the AS-i address via a color code:

Gray	No code sequence is needed for the address.
Green (without check mark)	A code sequence was taught but not transferred to the memory. Start the transfer of the code sequence by double-clicking the "Transfer taught code sequences" button.
Green (with check mark)	The code sequence was transferred to the non-volatile memory. Note: This status is also displayed when the output control is activated for this address. The code sequences for safe outputs are automatically predefined in the F-CM AS-i Safety ST module. They are not transferred to the non-volatile memory of the code sequences.
Yellow	An error has been detected: A code sequence was taught that is already being used by another slave. The code sequence cannot be used. Replace the slave with a different slave.
Red	Warning or error: The address is sending an incomplete or invalid code sequence. Check whether both inputs of the safe input slave are assigned with the "ON" signal. If required, actuate the associated safety contacts. The contacts must be closed. • Check whether a cross-circuit exists at the inputs. If necessary, correct the wiring of the inputs.

"F-IN 1 ... 2" column

The "F-IN 1 ... 2" column shows the following information about the AS-i address via a color code:

The numbers 1 to 2 designate the number of the input channel.

Gray	The input channel is not present. A safe input slave was not detected at the address.
Green	The input channel shows the value 1 ("ON" status).
White	The input channel shows the value 0 ("OFF" status).
Yellow	The input channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the input channel cannot be read in. Substitute value 0 is used.

"F-OUT 1 ... 4" column

The "F-OUT 1 ... 4" column shows the following information about the AS-i address via a color code:

The numbers 1 to 4 designate the number of the output channel.

Gray	The output channel is not present. A safe output channel was not detected at the address.
Green	The output channel shows the value 1 ("ON" status).
White	The output channel shows the value 0 ("OFF" status).
Yellow	The output channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the output channel cannot be read in.

If the output control is activated for the address, the F-CM AS-i Safety ST module can control the status for F-OUT 1. The F-CM AS-i Safety ST module cannot control F-OUT 2 … 4. The value 0 is output here.

If an external control unit uses the output address, the dialog shows the statuses for F-OUT 1 … 4 read in on the AS-i bus.

7.1.2 Transferring taught code sequences

In order for the input data of a safe AS-i input slave to be evaluated and made available to the safety program, the taught code sequences must be transferred to the non-volatile memory.

To do so, click the "Transfer taught code sequences..." button.

A dialog opens prompting you whether the code sequences are to be transferred. With "Yes" you confirm that you are addressing the correct module. For checking purposes, the "ADDR" LED flashes green on the front of the F-CM AS-i Safety ST module The code sequences are transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

With "No" you cancel the prompt without transferring the code sequence.

> **WARNING**
>
> **The switching on of plant components may result in death, severe injury, and serious property damage.**
>
> Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

The "Transfer taught code sequences" button is deactivated when all taught code sequences have already been transferred to the non-volatile memory.

7.1.3 "Progress of teaching operation" display

You can track the progress of the teaching operation.

Progress bar "Teaching in progress":

If at least one safe slave is detected on the AS-i bus whose code sequence has not yet been taught an active progress bar and the text "Teaching in progress" is displayed. Check the displays in the "Code sequences" column and ensure that the safe slaves send their code sequences.

For further information, refer to the "'Code sequence' column".

Taught slaves:

The "Taught slaves" output field shows the number of already transferred code sequences in relation to the number of code sequences that must still be transferred. You will additionally see the numerical ratio as a percentage. When 100% is indicated, all code sequences have been transferred to the non-volatile memory.

You will find additional information in the section "Accept taught code sequences".

7.2 Transferring code sequences with the "TEACH" button.

The use of the "TEACH" button provides an easy way of transferring taught code sequences.

The "TEACH" button can be used, for example, to transfer code sequences of replaced modules during operation. However, it is also suitable for initial commissioning.

To learn how to connect the button to the BaseUnit, refer to Section "Connecting". You can track the progress of the code sequence transfer via the LEDs.

Press the "TEACH" button for at least 3 s. This action causes all currently taught code sequences that are unique and consistent to be transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

WARNING
The switching on of plant components may result in death, severe injury, and serious property damage.
Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

When the transfer of the code sequences has been ended successfully, the "TEACH" LED goes out and you can release the "TEACH" button.

If you press the "TEACH" button before all code sequences are taught, the code sequences received up to then will be transferred.

7.3 Final steps

7.3.1 Reintegrating passivated input channels

The input channels of the F-CM AS-i Safety ST module for which no valid code sequences are saved supply the substitute value "0" and are passivated.

After the transfer of the code sequences, the passivated channels must be reintegrated so that the application can work with the real process values.

The procedure for this can be found in the following Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

After transferring the code sequences, check the safety equipment for proper functioning.

Alarm, fault, and system events 8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the F-CM AS-i Safety ST module:

- LEDs on the module
- Diagnostics in *STEP 7*:
  – Diagnostic buffer
- Alarm messages in user program

See also

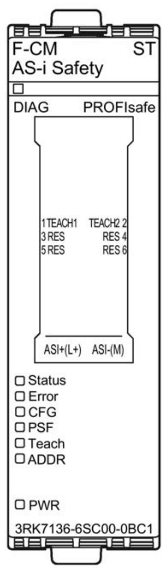
Meaning of the LEDs (Page 85)

8.2 LED statuses

8.2.1 Arrangement of the LEDs on the F-CM AS-i Safety ST

Introduction

LEDs on the front plate of the respective module display module-internal and module-external faults. The LEDs and their evaluation are described in the manuals for the relevant modules of the SIMATIC devices.



DIAG	Diagnosis
STATUS	Operating state of the module
Error	Operating state of the module
CFG	Fault on the AS-i bus
PSF	Process signal error, e.g.,channel fault on AS-i-F input slave
Teach	Teaching: Teaching of code sequences
ADDR	Addressing of the F-CM AS-i Safety ST module. F-addressing and teaching. The LED indicates whether the module is conducting safety-relevant communication with the software tool.
PWR	Supply voltage

Figure 8-1 LEDs of F-CM AS-i Safety ST

8.2.2 Meaning of the LEDs

The "F-CM AS-i Safety ST" module has 8 LEDs on the front:

LED "DIAG"

The "DIAG" LED displays the general status of the ET 200SP module

Table 8- 1 Meaning of the "DIAG" LED

"DIAG"	Meaning
☐ Off	The voltage is not OK.
✻ Green flashes	The F-CM AS-i Safety ST module is not ready for operation. The module parameters are not assigned.
■ Green ON	The F-CM AS-i Safety ST module is parameterized and error-free. No diagnostic alarms of the F-CM AS-i Safety ST are active.
✻ Red flashes	The F-CM AS-i Safety ST module is parameterized and indicates a diagnostic fault, or a firmware update is in progress.
✻✻ The two-color LED alternately flashes red/green	The position (ping) is displayed for 3 seconds.

LED "Status"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 2 Meaning of the "Status" LED

"Status"	Meaning
■ Green ON	• The F-CM AS-i Safety ST module is OK. • Cyclic I/O data exchange active
✻ Green flashes	• The system is powering up. • No cyclic I/O data exchange

LED "Error"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 3 Meaning of the "Error" LED

"Error"	Meaning
■ Red ON	**Serious device fault, e.g.,** • Fault in the electronics • Overtemperature
✻ Red flashes	**Device fault, e.g.,** • Intermittent data processing error (EMC problem) • Contact problem with the backplane bus • Missing coding element in the BaseUnit • Missing firmware update
□ Off	No error

LED "CFG"

The "CFG" LED indicates errors on the AS-i bus.

Table 8- 4 Meaning of the "CFG" LED

"CFG"	Meaning
■ Red ON	The AS-i bus is OK, but a code sequence error exists.
✻ Red flashes	Fault on the AS-i bus: • A code sequence does not exist or it is incomplete.
☐ "Off"	All code sequences are completely transferred.

LED "PSF"

The "PSF" LED indicates process signal errors at one or more channels of the module.

Table 8- 5 Meaning of the "PSF" LED

LED "PSF"	Meaning
■ Red ON	PROFIsafe channel fault for the complete F-CM AS-i Safety ST module, e.g. fault on F-CM AS-i input slave
✻ Red "flashes"	• Discrepancy error at the inputs of a safe AS-i input slave • Sequence error at the inputs of a safe AS-i input slave • Code sequence error at a safe AS-i input slave, e.g., due to cross-circuit at inputs or an EMC problem • Failure of a safe AS-i input slave The channel involved is passivated. The "PSF" LED goes out only after all channels have been reintegrated.
☐ "Off"	No process signal error

LED "TEACH"

This LED indicates teaching of safe AS-i slaves. The "TEACH" LED indicates the progress of the teaching operation.

Table 8- 6 Meaning of the "TEACH" LED

LED "TEACH"	Meaning
■ Yellow ON	The code sequences have been successfully taught, but have not yet been accepted. Transfer the code sequences either via the STEP 7 online dialog or by pressing the optional "TEACH" button (for at least 3 s). For more information, see the Section "Code sequences (Page 75)".
✻ Yellow flashes	Teaching of code sequences in progress.
□ "Off"	The code sequences are completely transferred.

LED "ADDR"

The "ADDR" LED indicates that the device is conducting safety-relevant communication with a software tool.

Table 8- 7 Meaning of the "ADDR" LED

LED "ADDR"	Meaning
✻ Green flashes	Feedback that the module is addressed: • For assignment of the F-address • For transfer of the code sequences • Firmware update in progress
☐ Off	Not relevant

LED "PWR"

The "PWR" LED indicates the status of the voltage supply.

Table 8- 8 Meaning of the "PWR" LED

LED "PWR"	Meaning
■ Green ON	AS-i voltage is applied.
☐ "Off"	Insufficient AS-i voltage is applied.

8.3 Diagnostic messages

The F-CM AS-i Safety ST module generates one or more alarms when various events occur.

Note

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the following must be observed:

With firmware V1.0.1 or higher, the F-CM AS-i Safety ST module generates a modified range of alarm messages compared with V1.0.0.

If the user program evaluates the error numbers of the generated alarms directly, the user program may have to be adapted if the firmware version is changed (e.g. when changing a device). If necessary, the firmware version of a replacement device can be modified to the previously used firmware version (see Section "Firmware update (Page 24)").

It is expected that the upgrading of the firmware version from V1.0.0 to V1.0.1 will not usually have any influence on the user program. The safety functionality of the F-CM AS-i Safety ST module does not change when the firmware is replaced.

If, after the replacement of a device, an alarm message of the F-CM AS-i Safety module appears in the message system (e.g. on an HMI panel), which contains an error code instead of a message text, then the assigned message texts are not known to the message system. In order to update the message texts, the project must be re-compiled with a current version of the TIA Portal / STEP 7 and loaded into the controller or into the message system. The function of the message system can be checked by generating an alarm (e.g. by removing an assigned AS-i safety slave).

Diagnostic messages for firmware V1.0.0

The following applies for firmware V1.0.0: Which events lead to which alarm messages is indicated in the description of data record DS 92 "Device-specific diagnostics" (Page 57).

The alarms use the diagnostic codes 0 to 31 according to the PROFIBUS Standard.

Diagnostic messages as from firmware V1.0.1

The following applies as from firmware V1.0.1: Which events lead to which alarm messages is indicated in the description of data record DS 206 "Data record diagnostics" (Page 69).

The alarms use diagnostic codes in the extended range of values according to the PROFINET Standard. The alarms allow a meaningful system diagnosis to be made, specifying the type of error and the AS-i address affected.

8.4 Replacement of defective devices

8.4.1 Replacing a safe AS-i input slave

Replace a failed safe AS-i input slave with a new device of the same type and assign the correct AS-i address to the slave. This address assignment can be performed automatically by the AS-i master (see manual of the AS-i master) or manually, e.g., with the AS-i addressing device (1904-2AB02).

Close the contacts on the inputs of the safe AS-i input slave so that the slave sends the code sequences.

The F-CM AS-i Safety ST module detects a new code sequence automatically and teaches it. For reintegration, the taught code sequence must be transferred.

The transfer can be started from the STEP 7 online dialog or by pressing the optional "TEACH" button (at least 3 s). For more information, see Section Code sequences (Page 75).

Observe the "CFG" and "TEACH" LEDs, see Section Meaning of the LEDs (Page 85).

To exclude impermissible duplicate code sequences for two safe input slaves, code sequences from all safe input slaves present on the AS-i bus must be transferred, regardless of whether the monitoring is activated or deactivated.

8.4.2 Replacing the safe AS-i output module (evaluation unit)

After replacement of a safe AS-i output module (evaluation unit), no setting is necessary on the F-CM AS-i Safety ST module.

Observe the operating instructions of the AS-i output module, and set the correct F-address for the AS-i output module and the AS-i address of any integrated standard slave.

An error acknowledgment for the affected output switching group must be performed, if necessary. See Section 6.3 Address space.

Non-safety related AS-i slaves (standard slaves) are not evaluated by the F-CM AS-i Safety ST module. Observe the replacement instructions in the operating instructions of the AS-i master or the slave.

8.4.3 Replacing the F-CM AS-i Safety ST module

When the F-CM AS-i Safety ST module is replaced, the new device automatically receives all necessary settings from the head module (IM) of the ET 200SP and the coding element in the BaseUnit.

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the instructions in Section "DS 206 Diagnostic data record (Page 69)" must be observed.

For more information, see Manual "ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293/0/en)

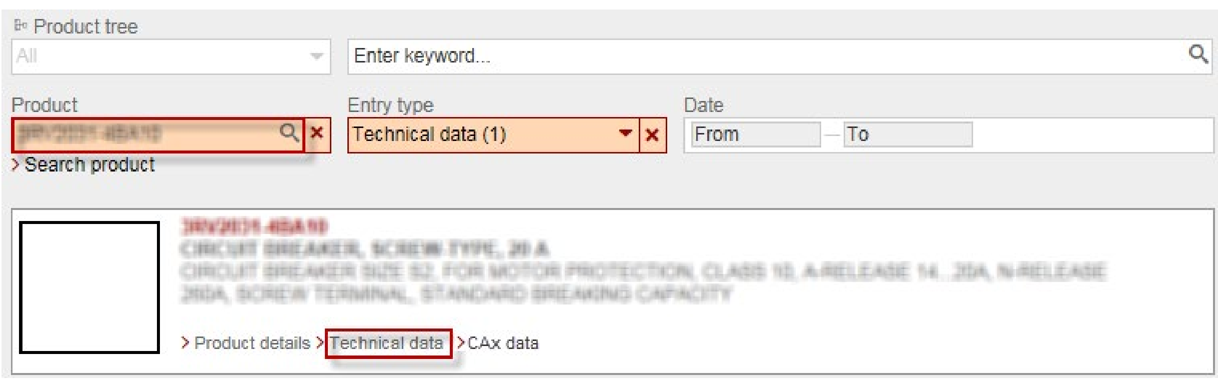
Technical specifications 9

9.1 Technical data in Siemens Industry Online Support

Technical data sheet

You can also find the technical data of the product at Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/15757/td).

1. Enter the full article number of the desired device in the "Product" field, and confirm with the Enter key.
2. Click the "Technical data link.



9.2 Configuration software

Information on the configuration software that you can use can be found in the Table "Software for configuration of the F-CM AS-i Safety ST" in Section Configuring the F-CM AS-i Safety ST (Page 33).

9.3 Safe technical specifications

Safety characteristics

Table 9- 1 Maximum achievable safety class in safety mode

Standard	Designation	Value
SIL according to IEC 61508	SIL	3
EN ISO 13849-1[1)]	PL	e
	Category	4

1) Performance Level

Table 9- 2 **Safety characteristics**

Characteristic	Designation	Value
High Demand according to SIL 3[1)] Total value for AS-i system with the F-CM AS-i Safety ST module[2)]	PFH_D	$1.00 \times 10^{-9} \times 1 / h$ $1.89 \times 10^{-9} \times 1 / h$
Individual value for F-CM AS-i Safety ST	PFH_D	$0.89 \times 10^{-9} \times 1 / h$
Individual value for AS-Interface transfer procedure	PFH_D	$1.00 \times 10^{-9} \times 1 / h$
Individual value for AS-Interface slave[2)]	PFH_D	0
Proof test interval	T1	20 years
Low Demand according to SIL 3[3)] Total value for AS-i system with the F-CM AS-i Safety ST module[2)]	PFD	2.00×10^{-5} 1.55×10^{-5}
Individual value for F-CM AS-i Safety ST	PFD	0.55×10^{-5}
Individual value for AS-Interface transfer procedure	PFD	1.00×10^{-5}
Individual value for AS-Interface slave[2)]	PFD	0
Mean Time To dangerous Failure	$MTTF_d$	≥100 years (37 000 years) High (according to EN ISO 13849-1)
Diagnostic Coverage level	DC	>99 %
Common Cause Failure	CCF	75 points (requirements met according to EN ISO 13849-1)

1) Probability of a dangerous failure in the case of an operating mode with high or continuous demand rate

2) Value "0" as an approximation for the individual value for AS-Interface slave applies only under the assumption that the PFH_D or PFD value of the AS-i slave is comparatively low and, thus, the PFH_D or PFD value of the AS-i slave does not contributed significantly to the PFH_D or PFD value of the total system. For this, observe the technical specifications of the safe AS-i slaves and use the specific values of the manufacturer.

3) Probability of a dangerous failure in the case of an operating mode with lower demand rate

9.4 Response times

The response times specified below represent worst case specifications. The response times relate to the switch-off operation (status change "1" → "0").

The response times for the switch-on operation (status change "0" → "1") can be longer but are not relevant for the given safety-related examination.

Maximum response time in the input direction

The maximum response time in the input direction results from the calculation of the response time from the safe AS-i input slave up to the head module (IM) of the ET 200SP:

max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	20 ms	Module-internal processing
max.	2 ms	Transfer ET 200SP backplane bus
max.	32 ms	Total response time in input direction (with 0 ms input delay)

WARNING

Increased response time

If an input delay time > 0 is assigned for a safe input, this input delay time must be added to the total response time.

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the sensor
- Additional response time in the safe AS-i input slave (see operating instructions)
- Bus response time between the head module (IM) of the ET 200SP and the controller
- Response time of the controller
- Timeout time (F-monitoring time) of the controller in case of PROFIsafe failure

These influencing variables must be taken into consideration when calculating the system response time of the total system.

In the above-indicated total response time, it is taken into consideration that a maximum of 4 AS-i bus cycle times elapse between a safe input slave failure and detection of an error.

Maximum response time in the output direction

The maximum response time in the output direction results from the calculation of the response time from the head module (IM) of the ET 200SP to the safe AS-i input slave (evaluation unit).

max.	2 ms	Transfer ET 200SP backplane bus
max.	20 ms	Module-internal processing
max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration

----

max.	32 ms	Total response time in output direction (for disturbance-free PROFIsafe transmission)

> **WARNING**
>
> **Increased response time**
>
> In case of PROFIsafe failure, the total response time in the output direction increases by the set timeout time of the F-CM AS-i Safety ST module (see F-parameters, F-monitoring time).
>
> In the total response time indicated above, external influencing variables are **not** included:
>
> - Response time of the controller
> - Bus response time between the controller and the head module (IM) of the ET 200SP
> - Response time in the safe AS-i output module (evaluation unit), see operating instructions
> - For response time of the safe AS-i output module (evaluation unit) in case of AS-i failure, see operating instructions
> - Response time of the actuator (e.g., contactor)
>
> These influencing variables must be taken into consideration when calculating the system response time of the total system.

Additional information

Further information is provided in

System Manual SIMATIC Industrial Software Safety Engineering in SIMATIC S7 (http://support.automation.siemens.com/WW/view/en/12490443/0/en)

For calculation of response times, the following aid is available on the Internet:

- For S7 Distributed Safety, the Excel file S7fcotia.xls (http://support.automation.siemens.com/WW/view/en/25412441)

9.5 Calculation of monitoring times and response times

The Excel file S7fcotia.xls for S7 Distributed Safety is available on the Internet to aid the approximate calculation of the runtime of the F-runtime group, the minimum F-monitoring time, and the maximum response time of the safety program:

S7fcotia (http://support.automation.siemens.com/WW/view/en/25412441)

Additional information is available in Manual "Safety Engineering in SIMATIC S7".

You can download this free of charge on the Internet at:

Safety Engineering in SIMATIC S7
(http://support.automation.siemens.com/WW/view/en/12490443/0/en)

Notes on completing the Excel file S7fcotia.xls (when used without IE/PB Link)

Tab "max. runtime F-run-time group"

Enter the number of modules (in the relevant F-runtime group) in the "F-CM AS-i Safety ST" row under "ET 200SP fail-safe modules".

Tab "min. F-Monitoring times"

In the "Configuring the PROFIsafe monitoring time" section, select one of the following variants depending on which head module (IM) of the ET 200SP is being used.

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 3 Values for calculating the minimum F-monitoring times

Description	Designation	Value
Max. acknowledgment time of the F-CM AS-i Safety ST	T_DAT	20 ms
F-I/O with inputs and outputs	-	Yes

Tab "max. response times"

In the "Input" section, select one of the following variants for the relevant signal flow of the safety function depending on which head module (IM) of the ET 200SP is being used:

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 4 Values for calculating the max. response times

Description	Designation	Value
Max. discrepancy time (Note: The safe value 0 is supplied while the discrepancy time is running)	T_DIS	0
Maximum response time in error-free operation	T_WCDT	20 ms
Maximum response time when an error is present	T_OFDT	20 ms
Max. acknowledgment time of the F-I/O	T_DAT	20 ms
Configured PROFIsafe monitoring time	T_PSTO, conf.	F_WD_TIME (see the setting on the PROFISAFE tab of the properties dialog)
Max. response time of sensor Note: For T_Sensor_DLY, the part of the system starting from the F-CM AS-i Safety ST module up to the sensor, including the AS-i bus, is considered.	T_Sensor_DLY	10 ms (signal flow of AS-i Bus) + Assigned input delay + Response time of the sensor + Additional response time in the safe AS-i input slave

Glossary

1oo1 evaluation

Type of sensor evaluation. With 1oo1 evaluation, the sensor exists once. The sensor is connected to the F-module over a single channel.

1oo2 evaluation, equivalent

Type of sensor evaluation. With 1oo2 evaluation, two input channels are occupied by one two-channel sensor or by two single-channel sensors. The input signals are compared internally for equivalence.

AS-i (AS-Interface)

Actuator-sensor interface. A networking system for the lowest field level of the automation level. The networking system is suitable for networking sensors and actuators with control devices (previous designation: SINEC S1).

AS-i A/B slave

AS-i A/B slaves use the extended address range. You can assign two A/B slaves as a pair to an address on AS-Interface. Because of the address organization, you can therefore connect up to 62 AS-i A/B slaves to AS-Interface.

AS-i analog slave

AS-i analog slaves are AS-i slaves that exchange analog values with the AS-i master.

AS-i master

The AS-i master monitors and controls binary or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are distinguished according to their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing mode (AS-i standard slave and AS-i A/B slave with extended addressing mode).

AS-i standard slave

The AS-i standard slave occupies one address on AS-Interface; because of to the address organization, up to 31 AS-i standard slaves can therefore be connected to AS-Interface.

ASIsafe®

The AS-Interface Safety at Work concept allows the integration of safety-related components in an AS-Interface network, e.g.:

- EMERGENCY STOP switch
- Protective door switch
- Safety light grid

These safety-related components are fully compatible, according to EN 50 295, with the well-known AS-Interface components, e.g., master, slaves, power supply unit, etc. They can be operated together on the yellow AS-Interface cable. Siemens supplies all components for configuring a safe AS-Interface network.

CM

Communication Module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CRC

Cyclic Redundancy Check is a test procedure for checking the integrity of data. A generator polynomial is used to calculate a checksum over the data to be monitored. This checksum is, in the signature sense, characteristic of the data concerned. The generator polynomial can be calculated according to various algorithms.

DIAG

Diagnosis

Distributed Safety

Siemens-specific addition to PROFIsafe. The Distributed Safety fail-safe system with F-Configuration Pack supports implementation of safety concepts for machine and personal protection.

With Distributed Safety, passivation of selective channels has possible since PROFIsafe V2.0. The quality bits transferred in the process image are used to enter a substitute value in the process image for the channel concerned. The quality bits for the inputs and outputs are subsequently transferred in the process image to the actual process data. The same mechanism that PROFIsafe uses for reintegration of the module is used for reintegration of passivated channels.

F-address

Each fail-safe module has an F-address. For the F-CM AS-i Safety ST module, the F-address must initially be assigned online using *Step 7*. You specify the F-address in the configuration.

Fail-safe systems

Fail-safe systems are characterized in that, when certain failures occur, the system remains in a safe state or changes over directly to another safe state.

F-parameters

The fail-safe parameters are safety-relevant parameters. They are needed for communication via PROFIsafe.

I-parameters

Individual parameters for revising the AS-i functionality. The I-parameters are safety-relevant.

LED

A light-emitting diode that is used to display the signal status.

Nibble

A nibble is a unit of information that comprises four bits.

Passivation

When a fail-safe I/O device detects an error, it switches the affected channel, or all channels, to the safe state. That is, the channels of these fail-safe I/O devices are passivated. The fail-safe I/O device signals the detected fault to the F-CPU.

In the case of passivation of a fail-safe I/O device with inputs, the fail-safe system provides the safety program with substitute value "0" instead of the process values that are present at the fail-safe inputs.

In the case of passivation of a fail-safe I/O device with outputs, the fail-safe system transfers substitute value "0" to the fail-safe outputs instead of the output values supplied by the safety program.

PROFIsafe

Safety-related bus profile of PROFINET IO for communication between the safety program and the fail-safe I/Os in a fail-safe system.

Proof test interval

Time interval after which a component must be put into error-free state. The component is replaced or proof is furnished that it is entirely free of errors.

Safe state

The basis of the safety concept in fail-safe systems is that a safe state exists for all process variables.

Safety class

Safety Integrated Level (SIL) acc. to IEC 61508. The higher the safety integrity level, the stronger the measures for avoiding systematic failures as well as for overcoming intermittent failures and hardware failures.

Fail-safe modules used in safety mode can achieve up to safety class SIL 3.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

1.1 Documentation Guide for Power Module F-PM-E 24VDC/8A PPM ST

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

The table below lists additional documents that complement this description of the F-PM-E 24VDC/8A PPM ST fail-safe power module and are available on the Internet.

Table 1- 1 Documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate

Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview 2

2.1 Properties of the F-PM-E 24VDC/8A PPM ST

Order number

6ES7136-6PA00-0BC0

View of the module

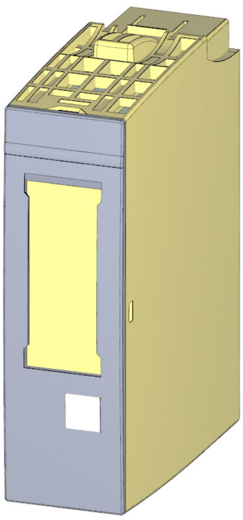

Figure 2-1 View of the F-PM-E 24VDC/8A PPM ST module

Properties

- Technical properties
  - Fail-safe digital module
  - 2 inputs (SIL3/Cat.4/PLe)
  - 1 output PM-switching or PP-switching, output current 8 A (SIL3/Cat.4/PLe)
  - 2 outputs for sensor supply
  - Sink input (P-reading)
  - Source output (PM/PP-switching)
  - Supply voltage L+
  - Suitable for connection of 2-wire sensors to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input or output (green LED)
  - Fault display for each input or output (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 69).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Safety-related shutdown of standard DQ modules by the F-PM-E 24VDC/8A PPM ST

This cost-effective solution allows for full and simultaneous shutdown of all affected outputs of the standard DQ modules when a fault is detected in the process or on the F-PM-E 24VDC/8A PPM ST power module.

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

You can use the F-PM-E 24VDC/8A PPM ST power module with all standard DQ modules within a potential group. Additional information is available in Applications for safety-related shutdown of standard modules (Page 59).

Passivation of fail-safe outputs over a long period of time

WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Connecting 3

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-PM-E 24VDC/8A PPM ST

Terminal assignment for F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit[1]**	**Color identification label (terminals 1 to 16)**
1	DI$_0$	2	DI$_1$	• DI$_n$: Input signal, channel n • VS$_n$: Internal sensor supply, channel n • DQ-P$_0$: Output signal, channel 0, P-switching • DQ-M$_0$: Ground for output signal, channel 0, M-switching • AUX: Protective conductor connection or voltage bus for SELV/PELV circuits	C0	 CC52 6ES7193-6CP52-2MC0
3	VS$_0$	4	VS$_1$

L+	DC24V	N	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

---

Note

Make sure that you only use the power module with BaseUnit type C0 during commissioning.

Digital output

The digital output switches the voltage L+ and M using two electronic switches (see Block diagram (Page 16)). The switched voltage and chassis are conducted to the internal voltage buses P1 and P2. The switched voltage and chassis is also available at the BaseUnit at DQ-P_0 and DQ-M_0.

This results in two connection options that can be used at the same time, if desired:

- One load can be wired directly to the BaseUnit (see Applications for the output DQ/P1 and P2 (Page 39)).
- The standard modules can be supplied and switched off safety-related by means of the internal voltage buses P1 and P2. You can, in turn, connect loads to the standard modules (see Applications for safety-related shutdown of standard modules (Page 59)).

⚠ WARNING
It is no longer possible to shut down an actuator if a cross circuit has developed between L+ and DQ. To prevent cross circuits between L+ and DQ, you must route the cables used to connect the actuators in a cross-circuit proof manner (for example, as separate, sheathed cables or in separate cable ducts).

Redundant ground conductor required

⚠ WARNING
The ground conductor to the BaseUnit for F-PM-E 24VDC/8A PPM ST must be installed twice for safety reasons. Any interruption of a single ground conductor would prevent the safety-related shutdown of voltage bus P2.

Property of the individual shutdown of F-modules with fail-safe outputs

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Switching of loads with ground if the F-module is configured PM-switching

If the following two conditions are met, F-PM-E 24VDC/8A PPM ST detects a short circuit:

- If loads that have a connection between chassis and ground are switched by the F-PM-E 24VDC/8A PPM ST , for example, to improve the EMC properties.
- If chassis and ground are connected at the power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection (refer to the diagram below as an example for an F-PM-E 24VDC/8A PPM ST).

Remedy:

- Use the F-PM-E 24VDC/8A PPM ST configured as a PP-switching module.
- Increase the value of the resistance between chassis and ground at the load end to more than 100 kΩ.
- Reduce the capacitance value between chassis and ground at the load end to less than 2 µF.

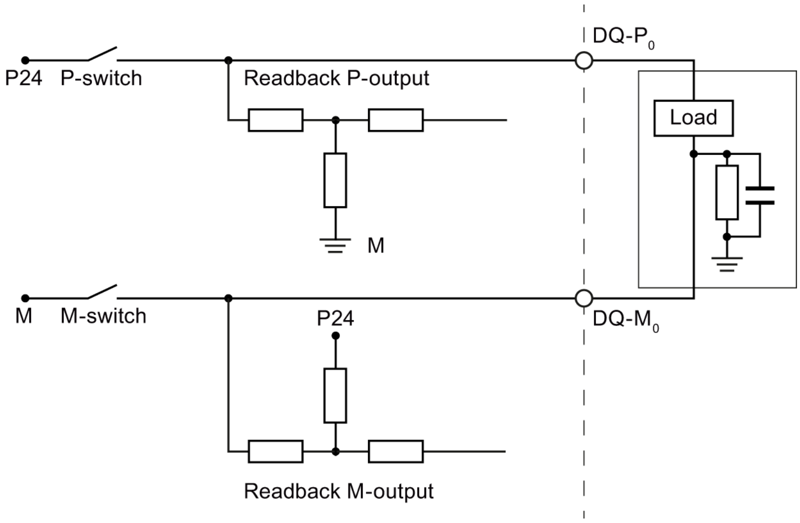

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

WARNING
During startup, the F-PM-E 24VDC/8A PPM ST carries out a switch-on test of approximately 3 ms. The capacitance between chassis and ground at the load end is charged by way of the load resistance. This low charging current may briefly trigger sensitive load circuits.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for power module

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
PM-parameters:			
Maximum test period	• 100 s • 1000 s	no	Module
Sensor supply:			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Inputs:			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent	no	Channel pair
Discrepancy behavior	• Supply last valid value • Supply 0 value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal necessary • Test 0-signal not necessary	no	Channel pair
Activated	• disable • enable	no	Channel
Sensor supply	• Sensor supply 0 • Sensor supply 1 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Output:			
Activated	• disable • enable	no	Channel
Control of the output	• F-CPU • F-CPU and onboard F-DI	no	Module
Output type	• PM switching • PP switching	no	Channel
Max. readback time dark test	0.8 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.8 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 PM-parameters

4.2.2.1 Maximum test period

Here you specify the time within which the light and dark tests (in all combinations) should be performed throughout the module. When this time expires, the tests are repeated.

The "Maximum test period" parameter is a module parameter, which means the test cycle for the entire fail-safe output module is performed within the configured maximum test time. If the bit pattern test is not performed within the configured time (or the shortened test time of 60 seconds in case of an error), the module goes into the error state.

4.2.3 Parameters of the sensor supply

4.2.3.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.3.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.3.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.4 Parameters of the inputs

4.2.4.1 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Sensor evaluation" parameter:

- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo2 evaluation equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One single-channel sensor
- One non-equivalent sensor
- One two-channel sensor
- Two single-channel sensors

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

Achievable safety class

The following safety class can be achieved depending on the selected sensor evaluation:

- SIL3/Cat.4/PLe with "1oo2 evaluation equivalent/non-equivalent"

4.2.4.2 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.4.3 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.4.4 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4.5 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.4.6 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 20)

4.2.4.7 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 77)

4.2.4.8 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.9 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

Parameter for number of signal changes = 8

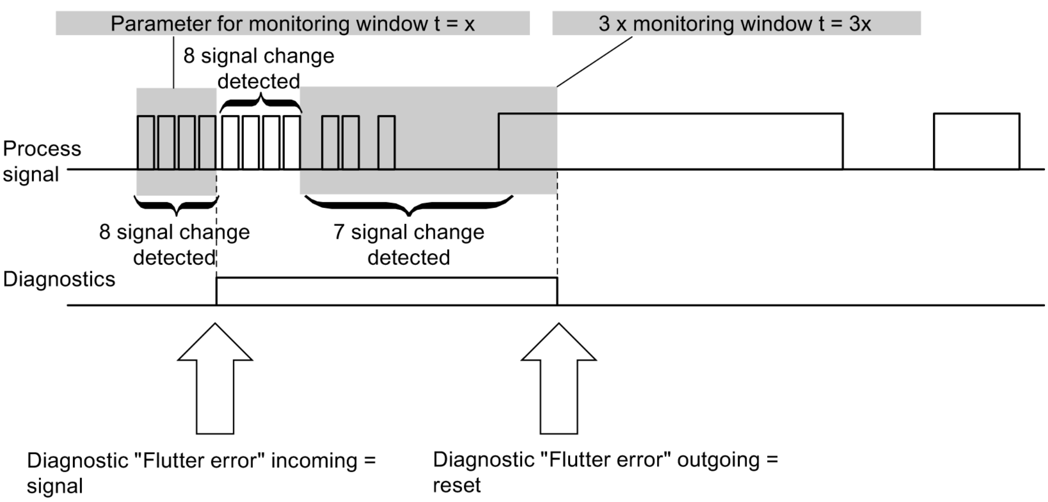

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.10 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.2.5 Parameters of the output

4.2.5.1 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

You can deactivate an unused channel with this parameter.

4.2.5.2 Controlling the output

Activates the internal evaluation.

Additional information on internal evaluation is available in the chapter "Application for internal evaluation" (Page 57).

4.2.5.3 Output type

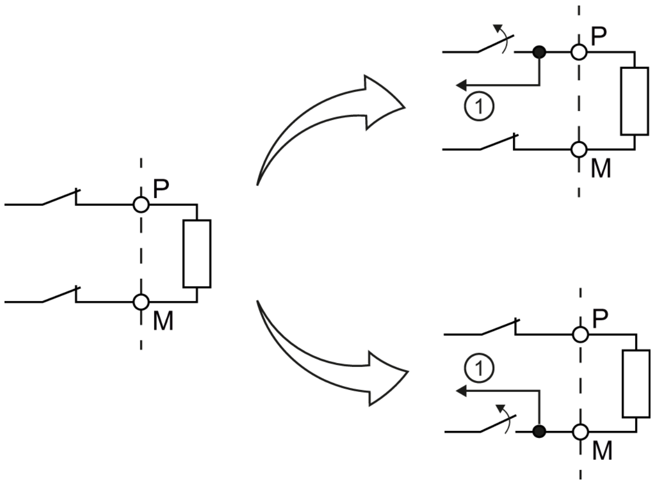
The parameter specifies if the output switches PM or PP.

4.2.5.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-2 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING
Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio). Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

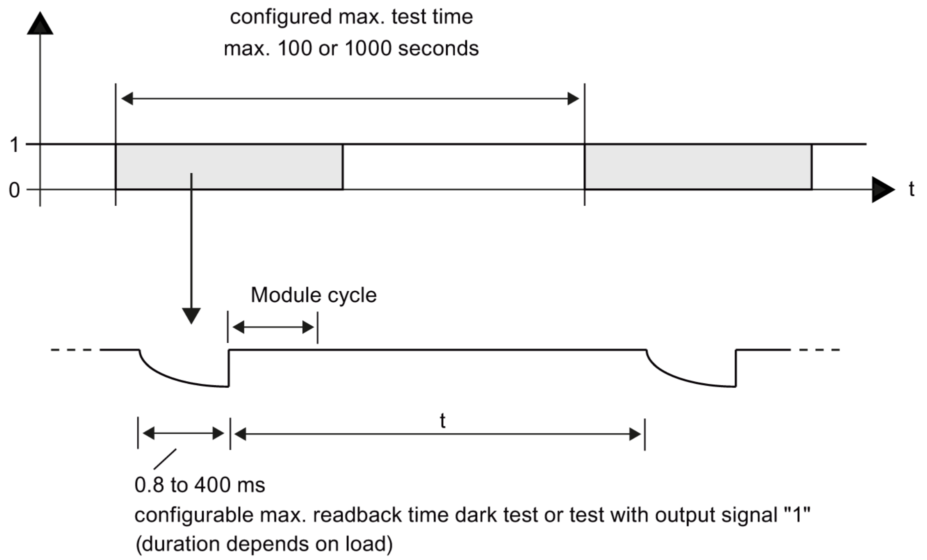


Figure 4-3 Test pulses of the dark test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

4.2.5.5 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, 2 dark test pulses (PP switching) or 3 dark test pulses (PM switching) are directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

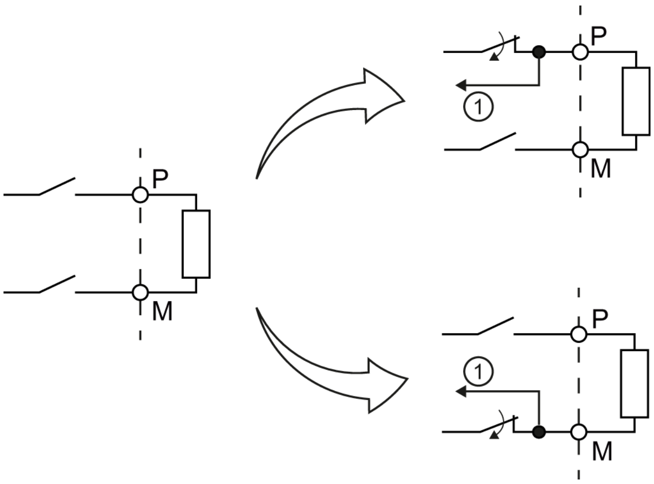
⚠ WARNING
The output is passivated if an error caused by a short-circuit is recognized when the safety-function is executed (output turned off). This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out. If the channel can retain signal 0 for 48 hours and longer, the function "Disable dark test for 48 hours" must not be used. Consult the respective requirements of your product standards regarding error detection time.

4.2.5.6 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-4 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

WARNING
Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio). Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the required value for the readback time by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time switch on test is too small for a connected capacitive load. The charge of the capacitive load cannot take place within the configured readback time switch on test. Increase the readback time.

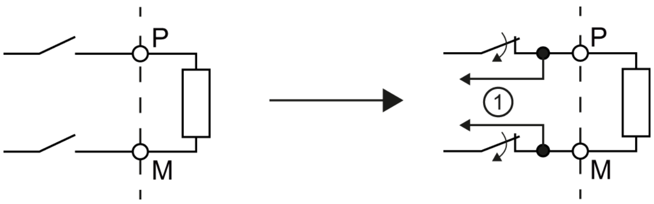
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.5.7 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, several test signals are switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-5 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

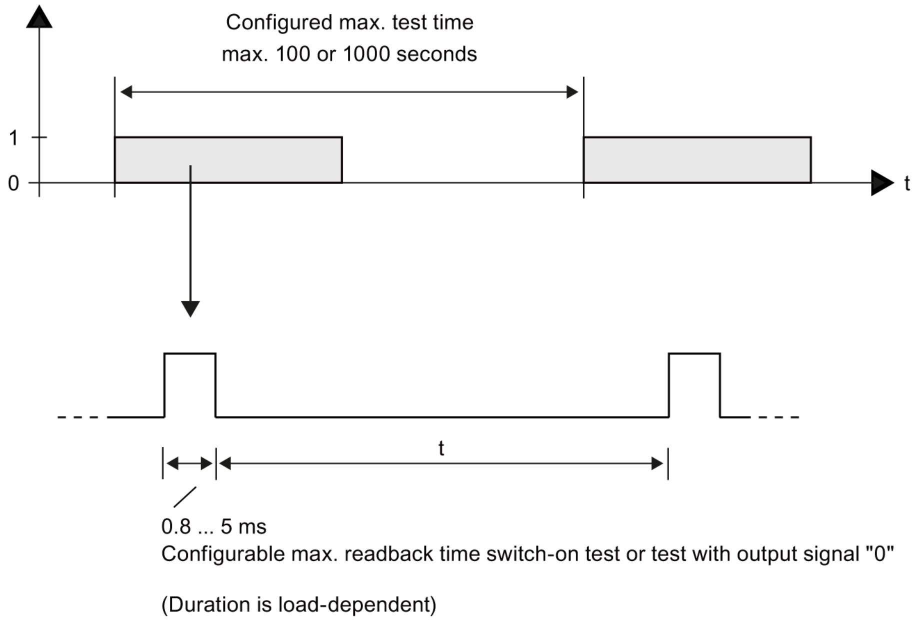


Figure 4-6 Test pulses of the light test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after t. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.5.8 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

Wire break is signaled when the following conditions are met:

- Wiring to the actuator is interrupted.
- A module that is disabled in fail-safe mode by the F-PM module has been removed.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of power module F-PM-E 24VDC/8A PPM ST

The F-PM-E 24VDC/8A PPM ST power module occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 6	x + 0 to x + 4

x = Module start address

Address assignment of the user data and value status of power module F-PM-E 24VDC/8A PPM ST

Of the assigned addresses of power module F-PM E 24VDC/8A PPM ST, the user data occupy the following addresses in the F-CPU:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status for DI_1	Value status for DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module 5

5.1 Applications for the output DQ/P1 and P2

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving the various safety categories.

Table 5- 1 Conditions for achieving SIL/Cat./PL

F-PM-E 24VDC/8A PPM ST		Achievable safety class
Digital output DQ	Without standard DQ modules	SIL3/Cat.4/PLe
	With standard DQ modules	SIL2/Cat.3/PLd

5.1.1 Applications: Safety mode up to SIL3/Cat.4/PLe

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

5.1.1.1 Application: Wiring a load to the digital output, PM switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. They connect the load between the P-switches DQ-P_0 and the M-switch DQ-M_0. The two P-switches and the M-switch are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

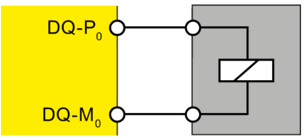

Figure 5-1 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

WARNING
In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 2 Parameters

Parameter	
Output type	PM switching

5.1.1.2 Application: Wiring a load to the digital output, PP switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. You connect the load between the P-switch DQ-P_0 and chassis in this case. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

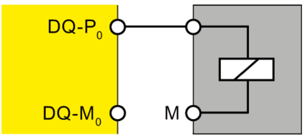

Figure 5-2 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

> **WARNING**
>
> In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 3 Parameters

Parameter	
Output type	PP switching

5.1.1.3 Application: Wiring two loads in parallel to the digital output, PM switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

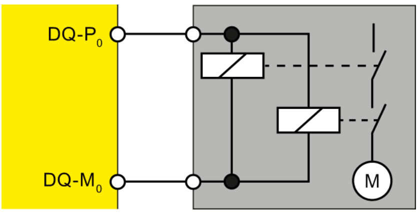

Figure 5-3 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 4 Parameters

Parameter	
Output type	PM switching

5.1.1.4 Application: Wiring two loads in parallel to the digital output, PP switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 5 Parameters

Parameter	
Output type	PP switching

5.2 Applications for inputs

5.2.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

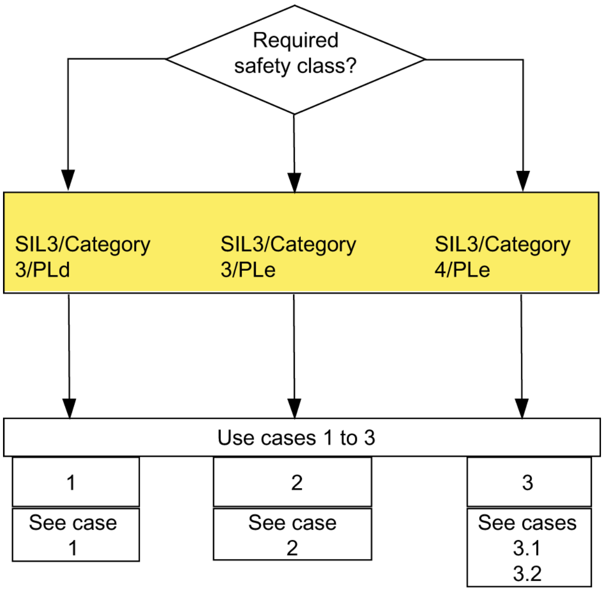

Figure 5-5 Selecting the application – digital inputs of the F-PM-E 24VDC/8A PPM ST

WARNING
The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 6 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

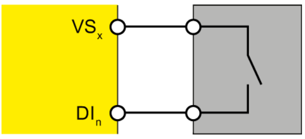

Figure 5-6 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

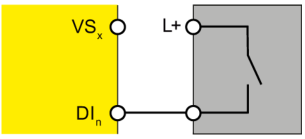

Figure 5-7 One sensor connected via one channel, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 7 Parameter assignment

Parameters	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 8 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	**Internal sensor supply and short circuit test deactivated**	**External sensor supply**
Short circuit with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the wiring between the sensor and the input channel must be short circuit proof.

5.2.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

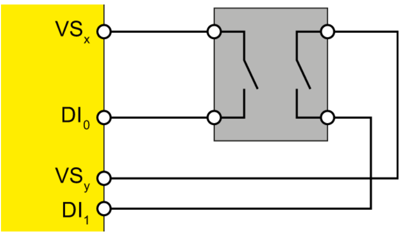

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

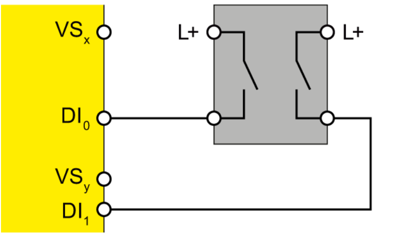

Figure 5-9 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

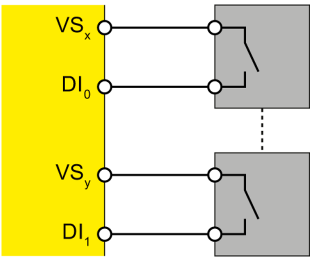

Figure 5-10 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

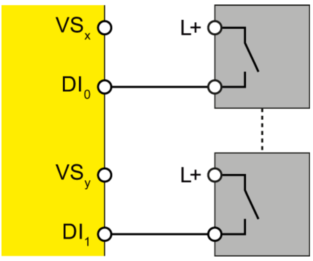

Figure 5-11 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 9 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 10 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair, with other channels or other sensor supplies	no	no
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied **internally** for application 3.1 (Page 52).

The sensor can be supplied internally or externally for application 3.2 (Page 54).

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- All short circuits listed in Table 5-12 Fault detection (Page 53) and Table 5-14 Fault detection (Page 56) must be detected. You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.2.4.1 Application 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to both inputs of the power module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

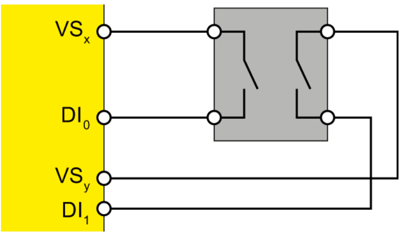

Figure 5-12 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

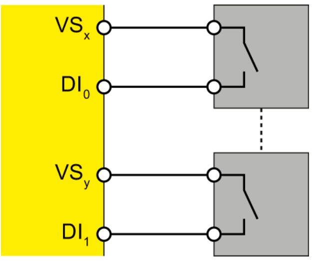

Figure 5-13 Two single-channel sensors connected via two channels, internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 11 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 12 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4.2 Application 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor nonequivalent via two channels

A nonequivalent sensor is connected nonequivalent via 2 channels to both inputs of the power module for each process signal (1oo2 evaluation, nonequivalent).

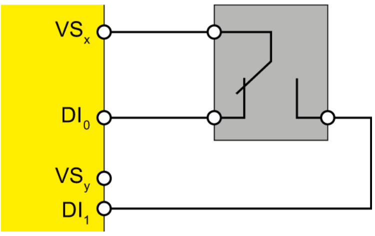

Figure 5-14 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

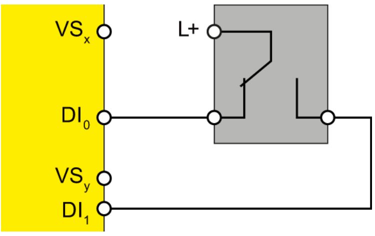

Figure 5-15 Nonequivalent sensor connected, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent via two channels

Two single-channel sensors are connected nonequivalent to both inputs of the power module for each process signal (1oo2 evaluation).

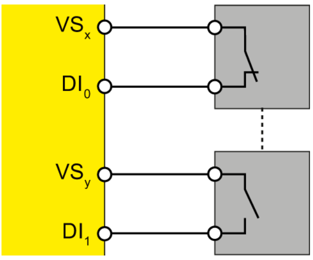

Figure 5-16 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

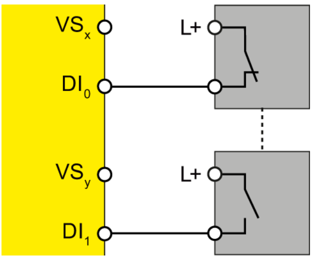

Figure 5-17 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 13 Parameter assignment

Parameters	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 14 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

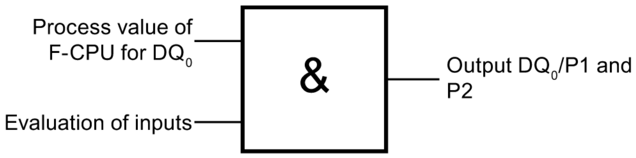
5.3 Application for internal evaluation

Function

The evaluation of the safety function takes place internally in the F-module.

You can choose between 1oo1 evaluation or nonequivalent/equivalent 1oo2 evaluation of the sensors.

- With 1oo1 evaluation, the activated inputs are logically ANDed with the process image of output DQ_0.
- With 1oo2 evaluation, the result of the inputs is logically ANDed with the process image of output DQ_0.



The acknowledgment in case of an error takes place by the safety program in the F-CPU.

Use the wiring diagrams Applications for the output DQ/P1 and P2 (Page 39) and Applications for inputs (Page 43).

You achieve SIL3/Cat.4/PLe.

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator and sensor, for example, in accordance with IEC 60947.

Note

If an error occurs at the inputs in this application, the F-module also outputs the error message "Safety-related shutdown" or "Safety event" for the output. Following elimination of the error at the inputs, a reintegration of the output is only possible after the bit pattern test (within the test time shortened to 60 s) has been performed.

Interconnection example

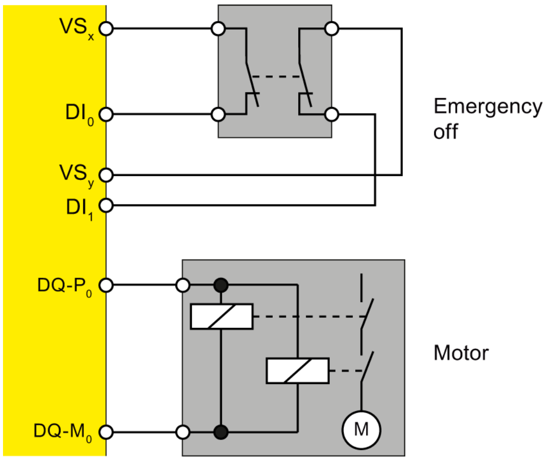


Figure 5-18 Emergency Off shutdown of a motor with equivalent 1oo2 evaluation

Parameter assignment

Assign the following parameters for the F-module:

Parameter	
Control of the output	F-CPU and onboard F-DI
Type of sensor interconnection	• 1-channel • 2-channel equivalent • 2-channel, non equivalent
Sensor supply	Sensor supply 0, Sensor supply 1, or External sensor supply

5.4 Applications for safety-related shutdown of standard modules

5.4.1 Safety-related shutdown of standard output modules, PM-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage buses P1 and P2.

Configure the power module parameters as described in section Terminal assignment (Page 13).

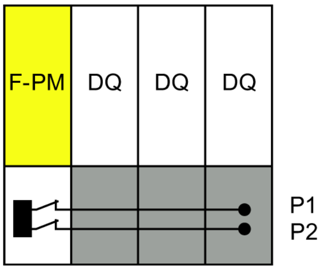

Figure 5-19 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

> **WARNING**
>
> Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:
>
> In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.
>
> Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.
>
> It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.
>
> Safety-related process values must be
>
> - safely
> - read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
> - the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
> - output by the fail-safe output module for shutdown of the corresponding safety relay or
> - output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.
>
> If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.
>
> The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.
>
> The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

> **WARNING**
>
> Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

WARNING

Note the following for the "Safety-related shutdown of standard modules" application:

If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

5.4.2 Safety-related shutdown of standard output modules, PP-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage bus P1.

Configure the power module parameters as described in section Terminal assignment (Page 13).

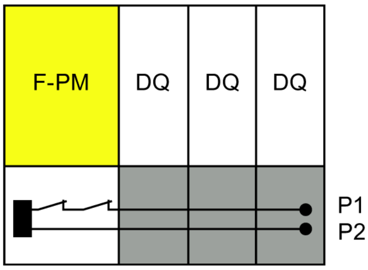

Figure 5-20 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:

In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.

Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.

It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.

Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.

The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.

The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

WARNING

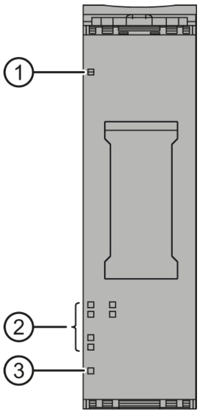
Note the following for the "Safety-related shutdown of standard modules" application:

If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

Interrupts/diagnostic messages 6

6.1 Status and error display

LED display



①	DIAG (green/red)
②	Channel status (green), channel fault (red)
③	PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 69).

⚠ WARNING
The DIAG LED and the channel status and channel fault LEDs of the inputs and outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
/ Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-PM-E 24VDC/8A PPM ST fail-safe power module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 69).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 69).

Table 6- 5 Diagnostic interrupts of the F-PM-E 24VDC/8A PPM ST

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	—	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Output short-circuited to L+	261_D		Channel	Yes
Output short-circuited to ground	262_D			
Wire break	265_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			No
Discrepancy error, channel status 0/0	768_D	2, 3		
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D	1,2,3		No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D			
PROFIsafe communication error (timeout)	792_D			
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Output defective	797_D	—		No
Readback error	798_D			
Overload	800_D			
Supply voltage too high	802_D	1, 2, 3	F-module	
Supply voltage too low	803_D			

6.3 Diagnostic messages

Digital module error types

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-PM-E 24VDC/8A PPM ST

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	

Diagnostic message	Fault code	Meaning	Remedy
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The sensor cable is short-circuited to L+. • The output cable is short-circuited to L+.	Correct the process wiring.
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The sensor cable is short-circuited to ground. • The output cable is short-circuited to ground. • The output signal is short-circuited to ground.	Correct the process wiring.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.

Diagnostic message	Fault code	Meaning	Remedy
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.

Diagnostic message	Fault code	Meaning	Remedy
Overload or short circuit of internal sensor supply to ground	775D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.
No pulse detected	778D	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too low. • The "Minimum pulse time" parameter setting is too high. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 77))
Undertemperature	786D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77))
Fault in input circuit	787D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • Short circuit to L+ or M • The F-module is defective.	• Check the wiring. • Replace the F-module.
Readback error	798_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	If the error persists, replace the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

In the case of a voltage dip in the supply voltage L+, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 77): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is disabled, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. The corresponding tables for fault detection for the applications are available under Applications of the F-I/O module (Page 39).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 36).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications 7

Technical specifications of F-PM-E 24VDC/8A PPM ST

	6ES7136-6PA00-0BC0
Product type designation	F-PM-E PPM 24VDC
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	V2.3
PROFINET as of GSD version/GSD revision	V2.31
Operating mode	
Multi-output	No
Installation type/mounting	
Rack mounting possible	No
Front installation possible	No
Rail mounting possible	Yes; standard DIN rail
Wall mounting/direct mounting possible	No
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V

	6ES7136-6PA00-0BC0
Sensor supply	
Number of outputs	2
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 2.1 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	600 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	5 W
Address space	
Address space per module	
Input	7 bytes
Output	5 bytes
Digital inputs	
Number of inputs	2
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m

	6ES7136-6PA00-0BC0
Digital outputs	
Number of outputs	1
Digital outputs, configurable	Yes
Short circuit protection	Yes
• Response threshold, typ.	> 14.8 A
Wire break detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	8.8 A
Voltage induced on current interruption limited to	max 1.5 V
Switching capacity of outputs	
With resistive load, max.	8 A
With lamp load, max.	100 W
Load resistance range	
Low limit	3 Ω
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	8 A
For "0" signal, residual current, max.	1.5 mA; PP-switching: Max. 1.5 mA; PM-switching: Max. 1 mA
Switching frequency	
With resistive load, max.	10 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	4 Hz; symmetrical
Total current of outputs	
Max. current per channel	8 A; (note derating data in the manual)
Max. current per module	8 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual

	6ES7136-6PA00-0BC0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	60 V DC / 75 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C
Dimensions	
Width	20 mm
Height	72 mm
Depth	55 mm
Weights	
Weight, approx.	70 g

Temperature characteristic values (derating)

Mounting position	Maximum temperature	Maximum output current
Horizontal	40 °C	8 A
	50 °C	6 A
	60 °C	4 A
Vertical	50 °C	4 A

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times

A

A.1 Response times

Introduction

The next section shows the response times of power module F-PM-E 24VDC/8A PPM ST. The response times of the fail-safe modules are included in the calculation of the F-system response time.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 29 ms

Maximum cycle time: T_{cycle} = 14 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, dark test time, switch-on time, discrepancy time, and test time are configured in STEP 7.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Definition of response time for internal evaluation: Cycle time + Input delay + Short circuit test time + Maximum(readback time, switch-on time, light test time)

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel n1)

Maximum response time with external short circuits

Maximum response time = Input delay + (n × T_{cycle}) + Sum(all short circuit test times + all startup times of sensors with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel 1)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Maximum response time for fail-safe digital outputs

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

The maximum response time for fail-safe digital outputs in the presence of an error is equal to:

Maximum response time = T_{cycle} + 2 × Maximum(dark test time, switch-on time) + interval between test pulses

A.2 Minimum distance of test pulses

The minimum interval between two test pulses depends on the activation of the light test, the configured maximum test time, and whether the output has been specified as a PM-switching or PP-switching output.

You can find the dependencies in the table below:

Assigned maximum test time	PM switching, light test not active	PM switching, light test active	PP switching, light test not active	PP switching, light test active
1000 s	62.080 s	45.147 s	82.913 s	38.137 s
100 s	5.830 s	4.238 s	7.913 s	3.521 s

Switching of loads

B

B.1 Connecting capacitive loads

If the output of power module F-PM-E 24VDC/8A PPM ST is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The figure below shows typical curves for the assignable readback times representing the correlation between load resistance and switchable load capacitance at a supply voltage of 24 V DC.

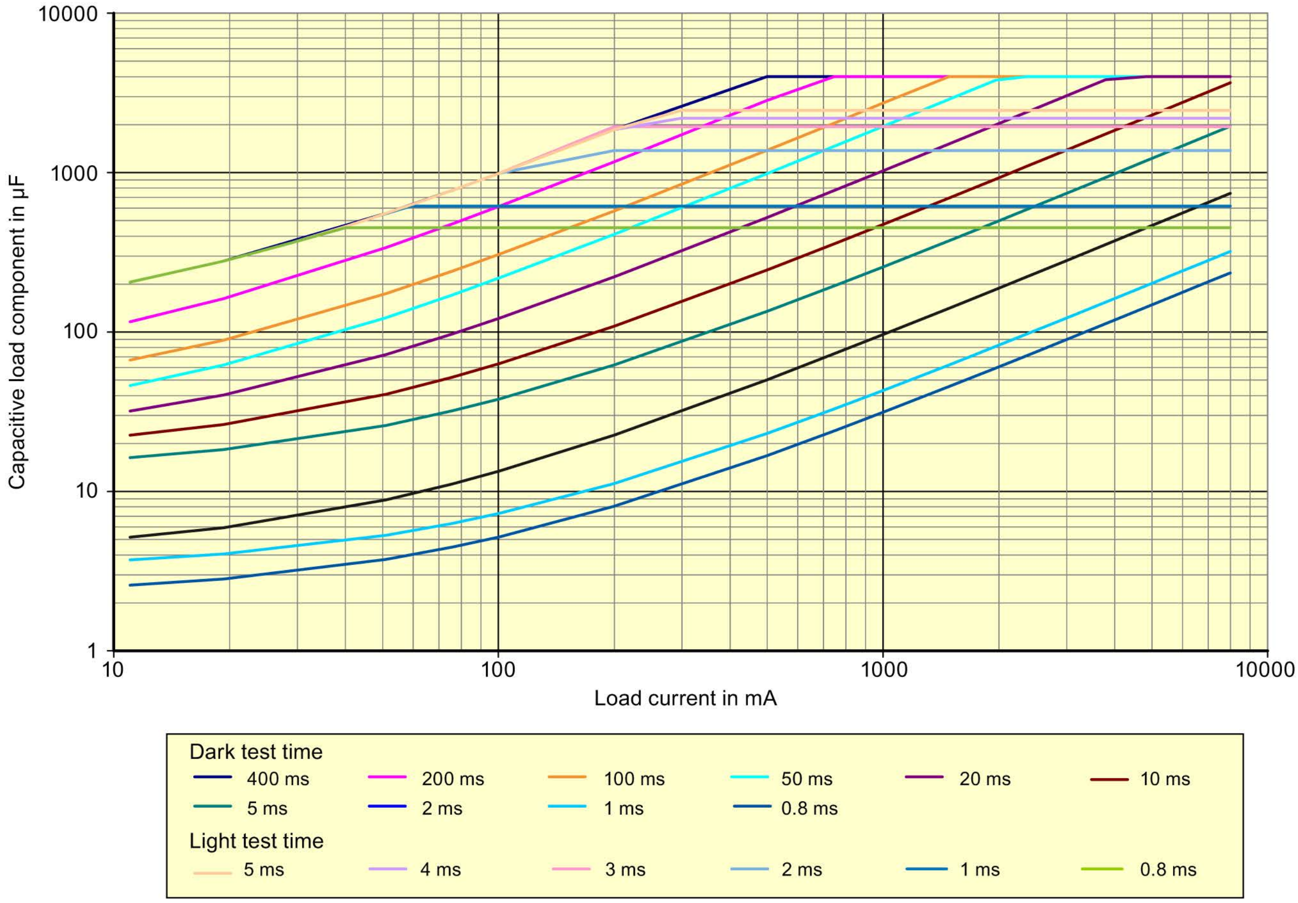


Figure B-1 Switching of capacitive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the configured dark and light test times

The curves shown were plotted using a SIMATIC PS 307 10A power supply unit with a cable length of 25 m (cable cross-section of 1.5 mm²) between the output of the F-PM-E 24VDC/8A PPM ST power module and the load.

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

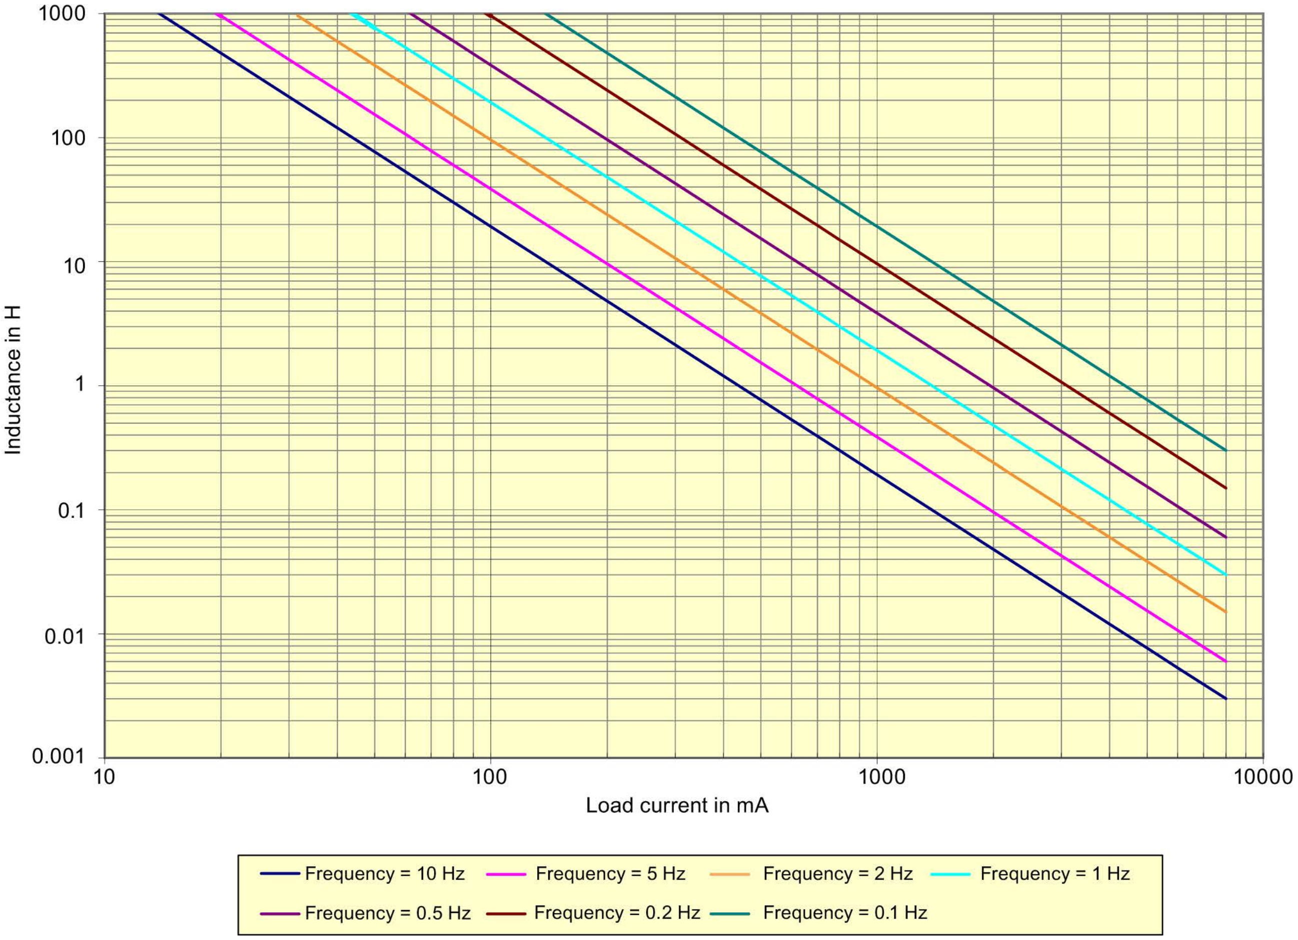

Figure B-2 Switching of inductive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the load current and switching frequency

SIEMENS

Produktinformation

Security-Hinweise

Siemens bietet Produkte und Lösungen mit Industrial Security-Funktionen an, die den sicheren Betrieb von Anlagen, Lösungen, Maschinen, Geräten und/oder Netzwerken unterstützen. Sie sind wichtige Komponenten in einem ganzheitlichen Industrial Security-Konzept. Die Produkte und Lösungen von Siemens werden unter diesem Gesichtspunkt ständig weiterentwickelt. Siemens empfiehlt, sich unbedingt regelmäßig über Produkt-Updates zu informieren.

Für den sicheren Betrieb von Produkten und Lösungen von Siemens ist es erforderlich, geeignete Schutzmaßnahmen (z. B. Zellenschutzkonzept) zu ergreifen und jede Komponente in ein ganzheitliches Industrial Security-Konzept zu integrieren, das dem aktuellen Stand der Technik entspricht. Dabei sind auch eingesetzte Produkte von anderen Herstellern zu berücksichtigen. Weitergehende Informationen über Industrial Security finden Sie unter (http://www.siemens.com/industrialsecurity).

Um stets über Produkt-Updates informiert zu sein, melden Sie sich für unseren produktspezifischen Newsletter an. Weitere Informationen hierzu finden Sie unter (http://support.automation.siemens.com).

Allgemeine Ergänzungen zur Dokumentation

Inhalt

Diese Produktinformation enthält Ergänzungen und Korrekturen zur Dokumentation der F-Module ET 200SP.

Ergänzung der Kapitel 5.1.1.2 "*Anwendungsfall: Anschluss von einer Last am Digitalausgang, PP schaltend*", 5.1.1.4 "*Anwendungsfall: Anschluss von 2 Lasten parallel liegend am Digitalausgang, PP schaltend*" und 5.4.2 "*Sicherheitsgerichtete Abschaltung von Standard-Ausgabemodulen, PP schaltend*" des Gerätehandbuchs "Powermodul F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNUNG
Wenn der Ausgangskanal 100 Stunden, und länger, dauerhaft „0"-Signal führen kann, muss der Helltest aktiviert werden. Beachten Sie die jeweiligen Anforderungen Ihrer Produktnormen hinsichtlich der Fehleraufdeckungszeit.

Nicht unterstützte Parameter

Die Parameter "Impulsverlängerung" und "Dunkeltest für 48 Stunden deaktivieren" werden nicht unterstützt.

Abhängigkeiten zwischen den Parametern "Diskrepanzzeit" und "Eingangsverzögerung"

Die Diskrepanzzeit muss größer als die Eingangsverzögerung parametriert werden.

Abhängigkeiten zwischen den Parametern "Hochlaufzeit des Gebers nach Kurzschlusstest" und "Zeit für Kurzschlusstest"

Die Hochlaufzeit des Gebers nach Kurzschlusstest muss mindestens 1% der Zeit für den Kurzschlusstest betragen.

Einschalten der Versorgungsspannung L+ für F-Module ET 200SP und IM

Stellen Sie sicher, dass vor dem Einschalten der Versorgungsspannung L+ eines F-Moduls sowohl das F-Modul als auch die IM gleichzeitig spannungslos waren. Eine Einschaltreihenfolge müssen Sie dabei nicht beachten.

A5E32586870-AF, 02/2014

Zyklisches Lesen von I&M-Daten

Zyklisches Lesen von I&M-Daten kann das Timing der F-Module belasten. Vermeiden Sie deshalb schnelle Lesezyklen von unter 500 ms.

Drahtbrucherkennung F-Modul F-DQ 4x24VDC/2A PM HF

Die Ansprechschwelle der Drahtbrucherkennung beträgt < 15 mA.

Einsatz von nicht-fehlersicheren Modulen

Fehlersichere Module ET 200SP dürfen Sie in einem Dezentralen Peripheriesystem ET 200SP nur zusammen mit nicht-fehlersicheren Modulen einsetzen, die mit SELV/PELV betrieben werden. Außerdem darf das Digitalausgabemodul RQ 4x120VDC-230VAC/5A NO ST nicht mit der gleichen Spannung wie die fehlersicheren Module ET 200SP versorgt werden.

Quittierungzeit T_{DAT}

Product Information for the documentation on Power Module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

General amendments to the documentation

Content

This Product Information contains additional information and corrections relating to the documentation on Power Module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0) up to and including hardware version (FS) 04.

The Product Information is part of the product supplied. The information in it should be considered more up-to-date if uncertainties arise.

Technical specifications of the F-PM-E 24VDC/8A PPM ST up to and including hardware version (FS) 04.

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

General amendments to the documentation

Content

This product information contains amendments and corrections to the documentation of the ET 200SP fail-safe modules.

Amendment to chapter 5.1.1.2 "*Use case: Wiring a load to the digital output, PP switching*", 5.1.1.4 "*Use case: Wiring of two parallel loads to the digital output, PP switching*" and 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING
The light test must be activated if the output channel can permanently carry the "0" signal for 100 hours or more. Consult the respective requirements of your product standards regarding error detection time.

Unsupported parameters

The "Pulse stretching" and "Disable dark test for 48 hours" parameters are not supported.

Dependencies between the "Discrepancy time" and "Input delay" parameters

The configured discrepancy time must be greater than the configured input delay.

Dependencies between the "Startup time of the sensors after short circuit test" and "Time for short circuit test" parameters

The startup time of the sensor after a short circuit test must amount to at least 1% of the time for the short circuit test.

Switching on the supply voltage L+ for the ET 200SP F-modules and IM

Make sure that the F-module as well as the IM were de-energized at the same time before you switch on the supply voltage L+ for an F-module. You do not have to observe a switch-on sequence.

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Open-circuit detection for F-DQ 4x24VDC/2A PM HF fail-safe module

The response threshold of the open-circuit detection is < 15 mA.

Using non-fail-safe modules

In an ET 200SP distributed I/O system, you can only use ET 200SP fail-safe modules together with non-fail-safe modules that are operated with SELV/PELV. In addition, the digital output module RQ 4x120VDC-230VAC/5A NO ST cannot be supplied with the same voltage as the ET 200SP fail-safe modules.

T_{DAT} acknowledgment time

F-Module	T_{DAT} acknowledgment time
Digital input module F-DI 8x24VDC HF	23 ms
Digital output module F-DQ 4x24VDC/2A PM HF	31 ms
Power module F-PM-E 24VDC/8A PPM ST	30 ms

Notes relatives à la sécurité

Siemens commercialise des produits et solutions comprenant des fonctions de sécurité industrielle qui contribuent à une exploitation sûre des installations, solutions, machines, équipements et/ou réseaux. Ces fonctions jouent un rôle important dans un système global de sécurité industrielle. Dans cette optique, les produits et solutions Siemens font l'objet de développements continus. Siemens vous recommande donc vivement de vous tenir régulièrement informé des mises à jour des produits.

Pour garantir une exploitation fiable des produits et solutions Siemens, il est nécessaire de prendre des mesures de protection adéquates (par ex. concept de protection des cellules) et d'intégrer chaque composant dans un système de sécurité industrielle global et moderne. Veuillez également tenir compte des produits que vous utilisez et qui proviennent d'autres fabricants. Pour plus d'informations sur la sécurité industrielle, rendez-vous sur (http://www.siemens.com/industrialsecurity).

Veuillez vous abonner à la newsletter d'un produit particulier afin d'être informé des mises à jour dès qu'elles surviennent. Pour plus d'informations, rendez-vous sur (http://support.automation.siemens.com).

Addenda généraux à la documentation

Contenu

Cette information produit contient des addenda et des correctifs à la documentation des modules de sécurité ET 200SP.

Addendum au chapitre 5.1.1.2 "*Cas d'application : Connexion d'une charge à la sortie TOR, commutation PP*", 5.1.1.4 "*Cas d'application : Connexion de 2 charges parallèles à la sortie TOR, commutation PP*" et 5.4.2 "*Désactivation de sécurité de modules de sorties standard, commutation PP*" du manuel "Module de puissance F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ ATTENTION
Si la voie de sortie peut fournir un signal "0" en continu pendant 100 heures et plus, le test avec activation doit être activé. Tenez compte des exigences spécifiques aux normes de votre produit en ce qui concerne le temps de détection des erreurs.

Paramètres non pris en charge

Les paramètres "Impulsion prolongée" et "Désactivation du test avec désactivation pour 48 heures" ne sont pas pris en charge.

Dépendances entre les paramètres "Temps de discordance" et "Retard à l'entrée"

Le temps de discordance doit être supérieur au retard à l'entrée.

Dépendances entre les paramètres "Temps de démarrage du capteur après le test de court-circuit" et "Temps de test de court-circuit"

Le temps de démarrage du capteur après le test de court-circuit doit être égal au moins égal à 1% au temps de test de court-circuit.

Mise en route de la tension d'alimentation L+ des modules F ET 200SP et IM

Assurez-vous que le module F et l'IM sont tous deux hors tension avant de mettre en route la tension d'alimentation L+ d'un module F. Pour ce faire, il n'est pas nécessaire de suivre un ordre d'activation.

Lecture cyclique des données I&M

La lecture cyclique des données I&M peut surcharger la synchronisation des modules F. Il convient donc d'éviter les cycles rapides de lecture inférieurs à 500 ms.

Détection de rupture de fil du module de sécurité F-DQ 4x24 V CC/2A PM HF

Le seuil de déclenchement de la détection de rupture de fil est < 15 mA.

Utilisation de modules non de sécurité

Les modules de sécurité ET 200SP ne doivent être utilisés dans un système de périphérie décentralisée ET 200SP qu'avec des modules non de sécurité fonctionnant avec une TBTS/TBTP. En outre, le module de sorties TOR RQ 4x120VDC-230VAC/5A NO ST ne doit pas être alimenté avec la même tension que les modules de sécurité ET 200SP.

Temps d'acquittement T_{DAT}

Module F	Temps d'acquittement T_{DAT}
Module d'entrées TOR F-DI 8x24 V CC HF	23 ms
Module de sorties TOR F-DQ 4x24 V CC/2A PM HF	31 ms
Module d'alimentation F-PM-E 24 V CC/8A PPM ST	30 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Scope of the product information

This product information amends the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293) to include ET 200SP fail-safe modules.

Table of contents

Product overview 1

1.1 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher-level safety requirements. F-systems serve to control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard ET 200SP modules is that they have an internal two-channel design. The two integrated processors monitor each other, automatically test the input and output circuits, and switch the F-I/O module to a safe state in the event of a fault.

The F-CPU communicates with the fail-safe modules via the fail-safe PROFIsafe bus profile.

Fail-safe power modules, together with the respective BaseUnit, serve the load voltage supply of the potential group and the safety-oriented tripping of the load voltage for standard output modules.

Fail-safe digital input modules detect the signal states of safety-oriented sensors and send the relevant safety message frames to the F-CPU.

Fail-safe digital output modules are suitable for safety-related shutdown procedures with short circuit and cross-circuit protection up to the actuator.

Possible uses of ET 200SP with fail-safe modules

The use of ET 200SP with fail-safe modules allows conventional configurations in safety engineering to be replaced with PROFNET IO components. This includes the replacement of switching devices for emergency STOP, protective door monitors, two-hand operation, etc.

ET 200SP fail-safe modules are supported with the STEP 7 Safety Advanced optional package V12 including HSP 54 or higher.

ET 200SP fail-safe modules are supported with IM155-6PN ST as of firmware V1.1.

Achievable safety classes

Fail-safe modules are equipped with integrated safety functions for safety mode.

The following safety classes can be achieved through appropriate parameter assignment of the safety functions in STEP 7 Professional V12 SP1 or higher with STEP 7 Safety Advanced optional package V12 or higher, through a specific combination of fail-safe and standard modules, and through a specific arrangement and wiring of sensors and actuators:

Safety class in safety mode		
According to IEC 61508	**According to ISO 13849-1:2006**	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

Use in SIMATIC Safety F-systems

ET 200SP fail-safe modules can be used with the STEP 7 Safety Advanced optional package, V12 or higher under PROFINET IO, together with an F-CPU.

SIMATIC Safety F-system with ET 200SP

The following figure shows a sample configuration for a SIMATIC Safety F-system with, among other things, an ET 200SP on a PROFINET IO. The PROFINET IO lines can be set up with copper cable, with fiber-optic cable or WLAN.

You will find further information on the Internet at Application planning (Page 13).

Tasks of the fail-safe IO controller (F-CPU) include the exchange of safety-related and non-safety-related data with fail-safe and standard ET 200SP modules.

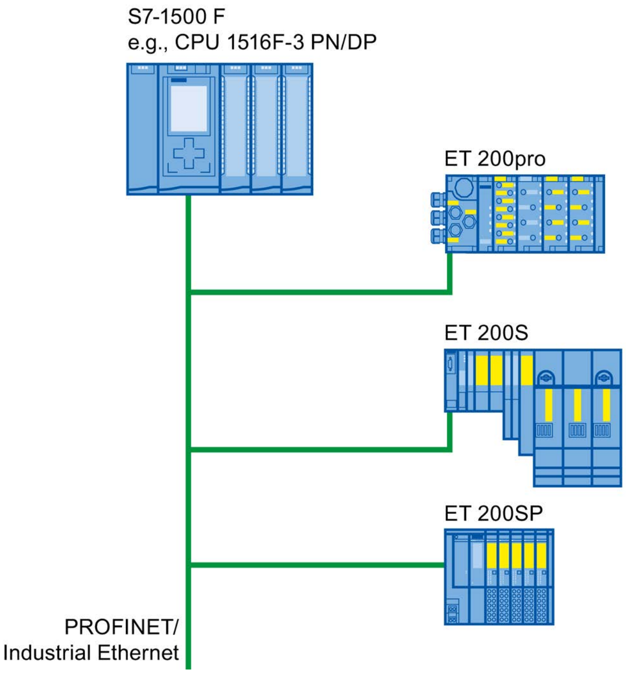

Figure 1-1 Fail-safe SIMATIC Safety automation system (sample configuration)

Use in safety mode only

Fail-safe modules can only be used in fail-safe mode. They cannot be used in non-fail-safe mode In this context, fail-safe mode/non-fail-safe mode refers to the operating mode of the F-I/O module, which either does or doesn't support safety-related communication via safety message frames.

Fail-safe modules and non-fail-safe modules can be combined within an ET 200SP.

1.2 Fault reactions with fail-safe modules

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

Note

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators.

Fault reactions and startup of the F-system

The safety function requires that fail-safe values (safe state) be applied to the fail-safe module instead of process values (**passivation of the fail-safe module**) in the following situations:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If F-I/O faults or channel faults are detected (e.g., wire break, discrepancy error)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. When the system is powered down and then restarted, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

WARNING

For channels that you set to "deactivated" in *STEP 7*, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnostic and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Fail-safe value output for F-modules

In the case of F-modules with inputs, the F-system provides fail-safe values (0) for the safety program instead of the process data pending at the fail-safe inputs in case of passivation.

In the case of F-modules with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program in case of passivation. The output channels are de-energized. This also applies when the F-CPU goes into STOP mode. The parameter assignment of fail-safe values is not possible.

Depending on which F-system you are using and the type of fault that occurred (F-I/O fault, channel fault or communication error), fail-safe values are used either for the relevant channel only or for all channels of the relevant fail-safe module.

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs are provided to the safety program
- In the case of an F-module with outputs, the output values provided in the safety program are again transferred to the fail-safe outputs

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Reaction of the F-module with inputs to communication errors

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

Application planning

2

2.1 Forming potential groups with fail-safe modules

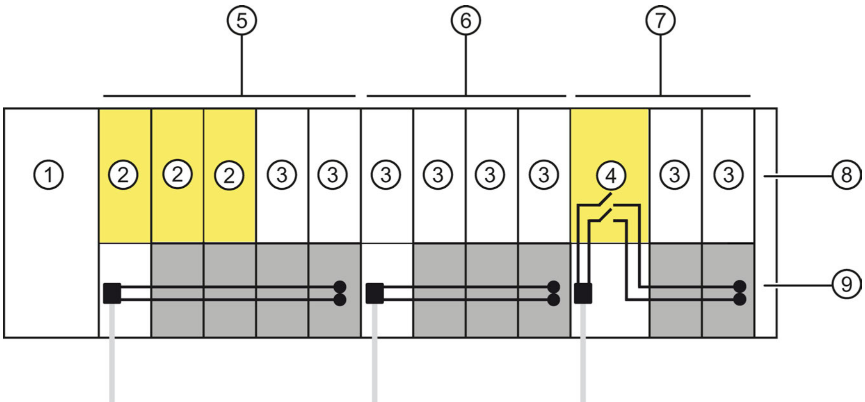
Introduction

ET 200SP distributed I/O systems can be configured using fail-safe and non-fail-safe modules. This chapter provides an example of a mixed configuration comprising fail-safe and non-fails-safe modules.

Assembly example for ET 200SP with fail-safe and non-fail-safe modules

Generally speaking, it is not necessary to operate fail-safe and non-fail-safe modules in separate potential groups. You can divide the modules into fail-safe and non-fail-safe potential groups and mount them.

The following diagram shows an assembly example with fail-safe and non-fail-safe modules within a single ET 200SP.



①	Interface module IM 155-6 PN HF
②	F-module
③	Non-fail-safe module
④	Power module F-PM-E 24VDC/8A PPM ST
⑤	Mixed fail-safe and non-fail-safe potential group with BaseUnits BU15..D and BU15..B. You achieve SIL3/Cat.4/PLe for the fail-safe modules.
⑥	Non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
⑦	Fail-safe potential group with BaseUnits BU20..D and BU15..B. Through disconnection of the power bus, and thus of the non-fail-safe modules, up to SIL2/Cat.3/PLd is possible.
⑧	Server module
⑨	P1/P2 power buses

Figure 2-1 ET 200SP assembly example with fail-safe modules

Installation 3

3.1 Basics

The following applies to ET 200SP fail-safe modules:

⚠ WARNING
Protection from conductive contaminants In consideration of the environmental conditions, the devices must be protected from conductive contaminants. One way to accomplish this is by installing the devices in a control cabinet with an appropriate degree of protection.

4 Connecting

4.1 Additional rules and provisions for operation of the ET 200SP with fail-safe modules

4.1.1 Safe functional extra-low voltage (SELV) for fail-safe modules

> **WARNING**
>
> The fail-safe modules must be operated with safe functional extra low voltage (SELV, PELV).
>
> You can find more information on safe functional extra-low voltage in the data sheets, for example, of the applicable power supplies.
>
> The fail-safe modules work with a rated voltage of 24 V DC. The tolerance range is 20.4 V DC to 28.8 V DC.
>
> Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.
>
> Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g., use of an overvoltage protector.
>
> All system components that can supply electrical energy in any form whatsoever must fulfill this condition.
>
> Each additional circuit (24 V DC) used in the system must have a safe functional extra low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.
>
> Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safe functional extra-low voltage as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.

> **WARNING**
>
> Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.
>
> An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the fault voltage U_m to be exceeded.

Power supply requirements for compliance with NAMUR recommendations

---

Note

To ensure adherence to the NAMUR recommendation NE 21, IEC 61131-2 and EN 298, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least **20 ms**. The latest up-to-date information on PS components is available on the Internet (http://mall.automation.siemens.com).

It goes without saying that these requirements also apply to power packs/power supply units not constructed using ET 200SP / S7-300/-400/-1500 technology.

4.1.2 Requirements of sensors and actuators for fail-safe modules

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety.

The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".

To achieve the respective safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat.3/PLe, a single-channel sensor is all you need. However, to achieve SIL3/Cat.3/PLe with a single-channel sensor, the sensor itself must be SIL3/Cat.3/PLe-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat.4/PLe, sensors must be connected by two channels.

WARNING

In the case of fail-safe input modules, a "0" value is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.

Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the respective actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Duration requirements for sensor signals

WARNING

Observe the following requirements for sensor signals:

- In order to ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- In order for pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in section "Response times" of the respective F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

High-speed actuators may briefly drop out or be activated during this test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g., 230 V DC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (according to IEC 60664-1).

This is generally the case for relays and contactors. Particular attention must be paid to this issue for semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

4.1.3 Capacitive crosstalk of digital input/output signals

When fail-safe digital output and input signals are in a single cable, F-DQ modules and F-PM-E modules may experience readback errors.

Cause: Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short circuit and performs a safety-related shutdown.

Remedy:

- Separate cables for F-DI modules, F-DQ modules, and F-PM-E modules or non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels for the F-PM-E module
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce capacitive coupling of a strong magnetic field.

Remedy:

- Spatially disconnect the inductive loads or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

Configuring

5

5.1 Assigning the F-destination address for fail-safe modules

5.1.1 Assigning the F-destination address

The F-destination address is saved permanently on the coding element of the ET 200SP fail-safe modules.

Note

During assignment of the F-destination address, the F-modules must be supplied with supply voltage L+.

Note

Note the following in conjunction with configuration control:

Before you can use configuration control together with F-modules, you must assign the F-destination address to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the F-destination address, refer to the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) programming and operating manual.

Maintenance 6

6.1 Firmware update

Introduction

It may be necessary to update the firmware during operation (e.g. function expansions).

Update the firmware of the interface module and I/O modules using firmware files.

Options for the firmware update

Online via PROFINET IO/PROFIBUS DP (with STEP 7)

Requirements

The ET 200SP is accessible online via PROFINET IO/PROFIBUS DP.

Additional requirement for fail-safe modules

> **WARNING**
>
> **Check of the firmware version for F-validity**
>
> When using a new firmware version, you must check whether the employed firmware version is approved for use in the respective module.
>
> The approved firmware version is specified in the appendices of the Certificate for SIMATIC Safety.

Procedure

Connect the programming device or PC to the PROFINET IO or PROFIBUS DP interface of the ET 200SP.

Note

Firmware update of analog I/O modules

For analog I/O modules, L+ supply voltage must be present on the module at the start of and during the firmware update.

You can find additional information on the procedure in the online help for STEP 7.

7 Technical specifications

7.1 Electromagnetic compatibility of fail-safe modules

Protecting ET 200SP with fail-safe modules against overvoltages

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the BaseUnits to ensure surge immunity for the ET 200SP with fail-safe modules.

Note

Lightning protection measures always require a case-by-case examination of the entire system. An almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.

For detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure shows an example configuration with fail-safe modules. Voltage is supplied by 1 power supply unit. Note, however, that the total current of the modules fed by the power supply unit must not exceed the permissible limits. You can also use multiple power supply units.

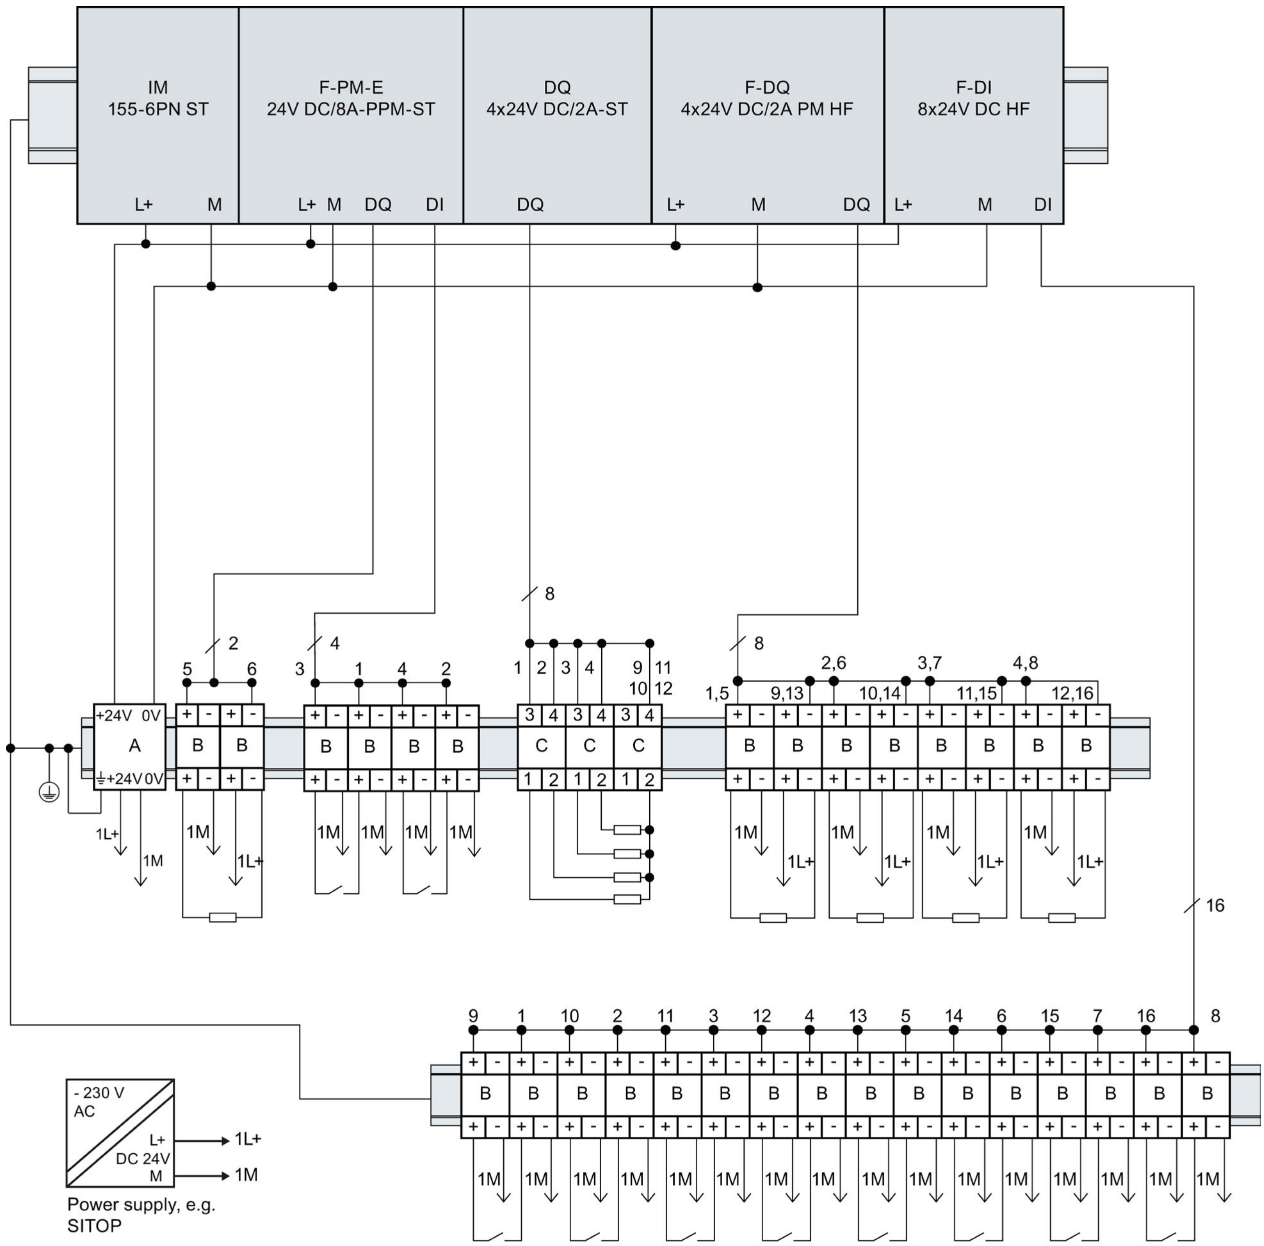

Figure 7-1 External protective circuit (surge filter) for ET 200SP with fail-safe modules

Name	Order number of Dehn Co.
A = BVT AD 24	918 402
B = DCO RK D 5 24	919 986
C = DEHNconnect DCO RK E 60	919 990

7.2 Standards and approvals

CE mark

The ET 200SP F distributed I/O system meets the requirements and safety objectives of the following EC directives and satisfies the harmonized European Standards (EN) for programmable logic controllers published in the official journals of the European Community:

- 2006/42/EC "Directive on Machinery" (Machinery Directive)
- 2006/95/EC "Electrical Equipment Designed for Use within Certain Voltage Limits" (Low-Voltage Directive)
- 2004/108/EC "Electromagnetic Compatibility" (EMC Directive)
- 94/9/EC "Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres" (Explosion Protection Directive)

The EC declarations of conformity are kept available for the relevant authorities at:

Siemens Aktiengesellschaft
Industry Sector
I IA AS FA DH AMB
PO Box 1963
D-92209 Amberg, Germany

These are also available for download on the Customer Support web page, keyword "Declaration of Conformity".

Accessories/spare parts 8

8.1 Lightning protection and overvoltage protection for fail-safe modules

Overvoltage suppressors for fail-safe electronic modules

Note

This section lists only those overvoltage suppressors that may be used for the protection of fail-safe modules.

Be sure to observe the detailed information on lightning protection and overvoltage protection of the ET 200SP distributed I/O device in ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Components for overvoltage protection of fail-safe modules (lightning protection zone transition 0_B to 1)

The table below lists overvoltage arresters you can use for fail-safe modules:

Table 8- 1 Components for the overvoltage protection (only for unshielded lines)

Fail-safe modules	Connecting of the lines to interface 0_B to 1 with:	Article number
Supply voltage 1L+, L+ (24 V DC)	BLITZDUCTOR BVT AD 24	918 402
Inputs/outputs of the F-modules (24 V DC)	DEHNconnect RK DCO RK D 5 24	919 986

Glossary

1oo1 evaluation

Type of → sensor evaluation – in the case of the 1oo1 evaluation, there → is one sensor with a 1-channel connection to the F module.

1oo2 evaluation

Type of → sensor evaluation – in the case of 1oo2 evaluation , two input channels are assigned one two-channel sensor or two one-channel sensors. The input signals are compared internally for equivalence or nonequivalence.

Acknowledgment time

During the acknowledgment time, the → F-I/O acknowledge the sign of life specified by the → F-CPU. The acknowledgment time is included in the calculation of the → monitoring time and → response time of the overall fail-safe system.

Actuator

Actuators can be power relays or contactors for switching on loads, or they can be loads themselves (e.g., directly controlled solenoid valves).

Availability

Availability is the probability that a system is functional at a specific point in time. Availability can be increased by redundancy, e.g., by using multiple -> sensors at thesame measuring point.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

In channel-specific passivation, the affected channel is either automatically reintegrated or the fail-safe module must be removed and reinserted after the fault has been eliminated.

Channel group

The channels of a module are grouped together in a channel group. Certain parameters in STEP 7 can only be assigned to channel groups, rather than to individual channels.

Channel number

Channel numbers are used to uniquely identify the inputs and outputs of a module and to assign channel-specific diagnostic messages.

Channel-specific passivation

With this type of passivation, only the affected channel is passivated in the event of a → channel fault. In the event of a → module fault, all channels of the → fail-safe module are passivated.

CRC

Cyclic Redundancy Check

CRC signature

The validity of the process values in the safety message frame, the accuracy of the assigned address references, and the safety-related parameters are validated by means of the CRC signature in the safety message frame.

Dark period

Dark periods occur during shutdown tests and complete bit pattern tests. The fail-safe output module switches test-related zero signals to the active output. This output is then briefly disabled (= dark period). An adequate carrier → actuator will not respond to this and will remain activated.

Derating

See temperature characteristics

Discrepancy analysis

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is performed to determine whether the difference (for nonequivalence testing: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

The discrepancy analysis compares the two input signals of the 1oo2 sensor evaluation in the fail-safe input module.

Discrepancy time

Configurable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are extended unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily since a discrepancy error is detected when, in reality, no error exists.

Fail-safe modules

ET 200SP modules with integrated safety functions that can be used for safety-related operation (safety mode).

Fail-safe systems

Fail-safe systems (F-systems) remain in a safe state or immediately assume another safe state as soon as particular failures occur.

Fault response time

The maximum fault response time of an F-system defines the interval between the occurrence of any fault and a safe reaction at all affected fail-safe outputs.

For → F-systems overall: The maximum fault response time defines the interval between the occurrence of any fault at any → F-I/O and the safe reaction at the corresponding fail-safe output.

For digital inputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the backplane bus.

For digital outputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the digital output.

Fault tolerance time

The fault tolerance time of a process is the time a process can be left unattended without risk to life and limb of the operating personnel, or damage to the environment.

Any type of F-system control is tolerated within this fault tolerance time, i.e. the → F-system can control its processes incorrectly or even not at all. The fault tolerance time depends on the type of process and must be determined on a case-by-case basis.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is permitted for use in SIMATIC Safety. A standard user program can also be run on the F-CPU.

F-I/O

Collective name for fail-safe inputs and outputs available in SIMATIC S7 for integration into the SIMATIC Safety F-system. Available F-I/O modules:

- Fail-safe I/O module for ET 200eco
- Fail-safe signal modules S7-300 (F-SMs)
- Fail-safe modules for ET 200S
- Fail-safe modules for ET 200SP
- Fail-safe DP standard slaves
- Fail-safe PA field devices
- Fail-safe IO devices

F-monitoring time

→ PROFIsafe monitoring time

F-Systems

→ fail-safe systems

Module fault

Module faults can be external faults (e.g. missing load voltage) or internal faults (e.g. processor failure). Internal faults always require module replacement.

Monitoring time

→ PROFIsafe monitoring time

M-switch

Each fail-safe digital output of ET 200SP F-modules consists of a P-switch DO-P_x (current sourcing) and an M-switch DO-M_x (current sinking). The load is connected between the P-switch and M-switch. The two switches are always activated so that voltage is applied to the load.

Nonequivalent sensor

A nonequivalent → sensor is a two-way switch that is connected to two inputs of an → F-I/O (via 2 channels) in → fail-safe systems (for → 1oo2 evaluation of sensor signals).

Passivation

If an → F-I/O module detects a fault it switches either the affected channel or all channels to a → safe state, i.e. the channels of this F-I/O module are passivated. The F-I/O module signals the detected faults to the → F-CPU.

When passivating channels at F-I/O with inputs, the → F-System provides fail-safe values for the → safety program instead of the process values pending at the fail-safe inputs.

When passivating channels at F-I/O with outputs, the F-system returns fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program.

Performance Level

Performance Level (PL) according to ISO 13849-1:2006 or EN ISO 13849-1:2008

PROFIsafe

Safety-oriented PROFINET I/O bus profile for communication between the → safety program and the → F-I/O module in a → fail-safe system.

PROFIsafe address

Every → fail-safe module has a PROFIsafe address. You have to configure the PROFIsafe address.

PROFIsafe monitoring time

Monitoring time for safety-related communication between the F-CPU and F-I/O

Proof-test interval

Period after which a component must be forced to fail-safe state, that is, it is either replaced with an unused component, or is proven faultless.

P-switch

→ M-switch

Redundancy, availability-enhancing

Multiple instances of components with the objective of maintaining component functionality in the event of hardware faults.

Redundancy, safety-enhancing

Multiple availability of components with the aim of exposing hardware faults based on comparison; such as → 1oo2 evaluation in → fail-safe modules.

Reintegration

After the elimination of a fault, it is necessary to ensure the reintegration (depassivation) of the → F-I/O. Reintegration (switchover from fail-safe values to process values) occurs either automatically or only after a user acknowledgment in the safety program.

In the case of a fail-safe input module, the process values pending at the fail-safe inputs are made available to thesafety program again after reintegration. In the case of a fail-safe output module, the → fail-safe system transfers the output values in the safety program to the fail-safe outputs again.

Safe state

The basic principle of the safety concept in F-systems is the existence of a safe state for all process variables. For the digital F-I/O, for example, the safe state is the value "0".

Safety class

Safety level (Safety Integrity Level) SIL according to IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and hardware failures.

The fail-safe modules support operation in safety mode up to safety class SIL3.

Safety function

A mechanism integrated in the → F-CPU and → F-I/O that enables their use in → the fail-safe system SIMATIC Safety.

According to IEC 61508:2010 A safety function is implemented by a safety system in order to maintain or force a system safe state in the event of a specific fault.

Safety message frame

In safety mode, data are transferred between the → F-CPU and → F-I/O in a safety message frame.

Safety mode

Operating mode of → F-I/O that enables → safety-related communication via → safety message frames.

→ ET 200SP fail-safe modules can only used in safety mode.

Safety program

Safety-related user program

Safety-related communication

Communication used to exchange fail-safe data.

Sensor evaluation

There are two types of sensor evaluation:

→ 1oo1 evaluation – sensor signal is read once

→ 1oo2 evaluation – sensor signal is read in twice by the same F-module and compared internally

Sensors

Sensors are used for accurate detection of digital and analog signals as well as routes, positions, velocities, rotational speeds, masses, etc.

SIL

Safety Integrated Level → safety class

Standard mode

Operating mode of F-I/O in which standard communication is possible by means of → safety message frames, but not → safety-related communication.

Fail-safe ET 200SP modules can only be operated in safety mode.

Value status

The value status is the binary additional information of a digital signal. The value status is entered in the process image of the input and provides information on the validity of the signal.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions affecting the system in general are described there.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Changes compared to the previous version

In contrast to the previous version, the chapters "BaseUnits for motor starters" and "Dimension drawings for motor starters" have been added to this manual.

Recycling and disposal

For ecologically sustainable recycling and disposal of your old device, contact a certificated disposal service for electronic scrap and dispose of the device in accordance with the regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

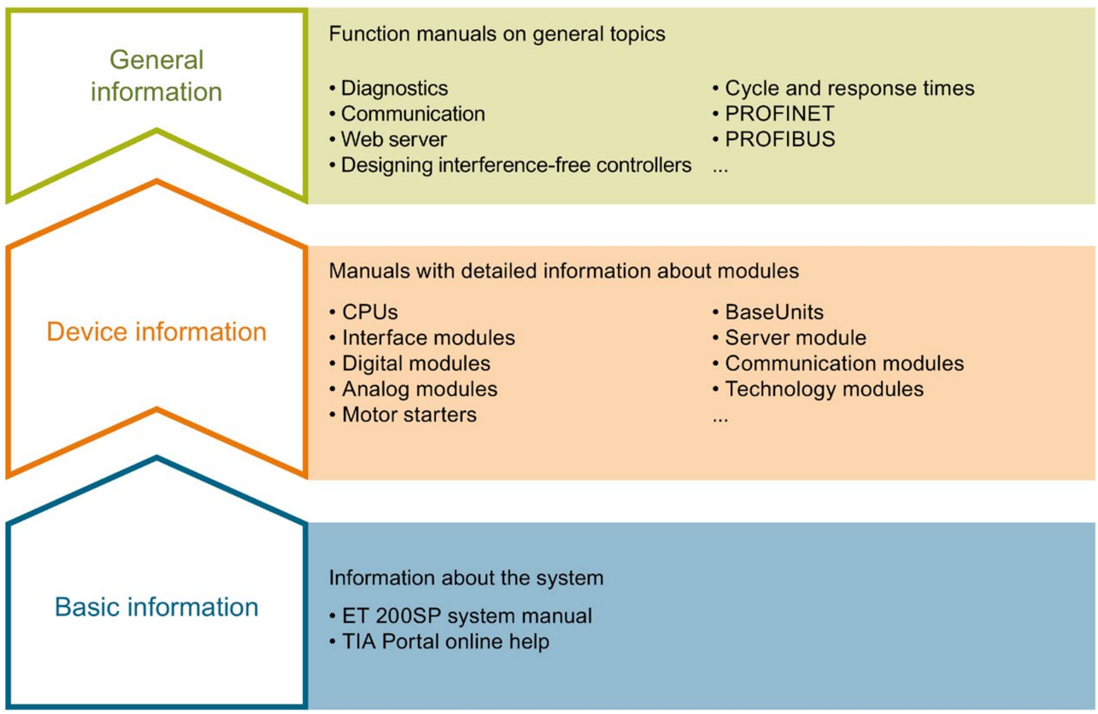
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

1 Guide to the documentation

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 New properties

What's new in the BaseUnits manual, edition 02/2018, compared to edition 12/2016?

What's new?		What are the customer benefits?	Where can I find information?
New contents	Potential distributor modules	A system-integrated potential distribution can be implemented via the PotDis modules. One application is, for example, the design of digital input modules with 16 channels and three-wire connection. You use the potential distributor modules to reserve the unused signal cables of antivalent sensors. Another application is the supply of potentials for supply of external components.	Section Potential distributor modules (Page 111)
	BaseUnit type U0 Can be used for all I/O modules whose article number ends in U0	Light-colored version: BU20-P16+A0+2D Per slot, up to 16 process terminals can be supplied to the module with max. 230 V/5 A per terminal. • 2 supply terminals on integrated self-assembling voltage buses P1/P2, max. 230 V AC/10 A • Separation of voltage buses P1/P2 and AUX from the adjacent module on the left	Section BU20-P16+A0+2D (Page 78)
		Dark-colored version: BU20-P16+A0+2B Per slot, up to 16 process terminals can be supplied to the module with max. 230 V/5 A per terminal. • 2 terminals for external supply/forwarding from integrated self-assembling voltage buses P1/P2 • Bridging voltage buses P1/P2 and AUX to the adjacent module on the left	Section BU20-P16+A0+2B (Page 82)

3 Product overview

General properties of the BaseUnits

The ET 200SP distributed I/O system includes various BaseUnits. You use the BaseUnit to specify the following, for example:

- Process connection
- Plug-in I/O module/motor starter
- Infeed of supply voltage specified

You can recognize the properties of the BaseUnits from their short description:

Table 3- 1 Properties of the BaseUnits

Short description BU15-P16+A10+2D/T (example)			**BaseUnit properties**
Name/module width	BU	15	BaseUnit with width of 15 mm
		20	BaseUnit with width of 20 mm
		30	BaseUnit with width of 30 mm
Process connection	P	4	• Connection method: Push-in terminal • Number of terminals to the I/O module: 4
		8	• Connection method: Push-in terminal • Number of terminals to the I/O module: 8
		16	• Connection method: Push-in terminal • Number of terminals to the I/O module: 16
Connection to the AUX busbar	A	0	No connection to the AUX busbar
		10	n = number of AUX terminals, e.g. 10
Self-assembling voltage buses	2		2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B)
	12		• 2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B) • 2×5 push-in additional terminals (1 B to 5 B, 1 C to 5 C). For connecting further potential up to a maximum supply current of 24 V DC/10 A
	0		No terminals with access to the self-assembling voltage buses P1, P2
		B	• Looping through the potential group • Tapping of the supply voltage for external components or looping through with a maximum total current of 10 A per potential group
		D	• Opening a new potential group • Feeding in of supply voltage up to a maximum supply current of 10 A
Additional functions	T		Integrated temperature sensor to compensate the reference junction temperature for thermocouples

Properties of the BaseUnits for motor starters

The following table lists the properties of the individual BaseUnits for motor starters:

BaseUnit	Properties
BU30-MS1	• Push-in terminals for opening a new potential group (24 V DC). • Feeding in of supply voltage up to a maximum supply current of 7 A DC. • Opening a new supply voltage potential group (500 V AC) • Feeding in of supply voltage up to a maximum supply current of 32 A AC.
BU30-MS2	• Further conduction of the potential group (24 V DC) • Push-in terminals for opening a new supply voltage potential group (500 V AC) • Infeed of supply voltage up to a maximum supply current up to 32 A AC.
BU30-MS3	• Push-in terminals for opening a new potential group (24 V DC). • Infeed of the supply voltage L+ up to an infeed current of 7 A DC • Further conduction of the supply voltage potential group (500 V AC)
BU30-MS4	• Further conduction of the supply voltage potential group (500 V AC) • Further conduction of the potential group (24 V DC)
BU30-MS5	• Further conduction of the potential group (24 V DC) • Push-in terminals for opening a new supply voltage potential group (500 V AC) • Infeed of supply voltage up to a maximum supply current of 32 A AC • A fail-safe digital input
BU30-MS6	• Further conduction of the potential group (24 V DC) • Further conduction of the supply voltage potential group (500 V AC) • Push-In terminals • A fail-safe digital input

Properties of the potential distributor modules

The following table shows the properties of the individual potential distributor modules:

Table 3- 2 PotDis-BaseUnits properties

Short description PotDis-BU-P1/D-R (example)			**PotDis-BaseUnit properties**
Designation	PotDis-BU		PotDis-BaseUnit
Process connection (24 V DC / 10 A)	P1		Terminals for supplying or tapping the supply voltage with connection to the voltage bus P1 (see D, B)
	P2		Terminals for supplying or tapping the supply voltage with connection to the voltage bus P2 (see D, B)
Self-assembling voltage buses		D	• Opening a new PotDis potential group • Feeding in of supply voltage up to a maximum supply current up to 10 A • Tapping the supply voltage for external components or looping with a maximum total current of 10 A per potential group
		B	• Further conduction of the potential group • Tapping the supply voltage for external components or looping with a maximum total current of 10 A per potential group
Color coding of the spring releases	R		Connection to the internal voltage bus P1 Red spring release
	B		Connection to the internal voltage bus P2 Blue spring release

Properties of the terminal blocks PotDis-TB

The following table shows the properties of the individual terminal blocks:

Table 3- 3 Properties of the PotDis-Terminalblocks

Short description PotDis-TB-P1-R (example)		**PotDis-Terminalblock properties**
Designation	PotDis-TB	PotDis terminal block
Process connection (24 V DC / 10 A)	P1	• Connection to the voltage bus P1 • Terminals for picking off the rated supply voltage 24 V DC with max. 10 A of the same voltage level
	P2	• Connection to the voltage bus P2 • Terminals for picking off the rated supply voltage 24 V DC with max. 10 A of the same voltage level
	n.c.	• No connection to the P1, P2 or AUX bus • Terminals can be used freely up to 230 V AC with max. 10 A
	BR	• No connection to the P1, P2 or AUX bus • Terminals for protective conductor connection or voltage bus (internal connected) freely usable up to 230 V AC with max. 10 A

	G	Gray spring release

Selecting, installing and connecting BaseUnits

You can find additional information in the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

WARNING
Personal injury or damage to equipment is possible. Connecting a rated supply voltage to the BaseUnit higher than the one given in the technical specifications may lead to dangerous situations in your plant or cause defects in ET 200SP components. Therefore, only connect the rated supply voltage given in the technical specifications to the BaseUnit. The connected rated supply voltage must correspond to the rated supply voltage of the I/O modules in the potential group. When mains voltage is connected to the BaseUnit, ensure that all other supply voltages on this BaseUnit use the same phase as the mains.

The Totally Integrated Automation Selection Tool (TIA Selection Tool) (http://w3.siemens.com/mcms/topics/de/simatic/tia-selection-tool) supports you in selecting, configuring and ordering the ET 200SP modules. The free TIA Selection Tool is available on the Internet (http://support.automation.siemens.com/WW/view/en/58649293).

WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Proper use of hardware products

This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.

Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.

EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Machinery Directive 2006/42/EC.

WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Please take note of our latest information.

Systems with safety-related characteristics are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we publish a special newsletter containing information on product developments and features that are (or could be) relevant to operation of safety-related systems. You need to subscribe to the corresponding newsletter to ensure that you always remain up-to-date and are able to make any necessary changes to your plant regarding operational safety should the need arise.

4 BaseUnits for I/O modules

4.1 Product description

4.1.1 Introduction

Properties of the BaseUnits

The ET 200SP distributed I/O system offers you a rugged and service-friendly design with permanent wiring over the BaseUnits (BU).

The BaseUnits provide the electrical and mechanical connection of the ET 200SP modules. A wide range of BaseUnits is available to suit individual requirements.

You can place BaseUnits at any location with the ET 200SP distributed I/O system. Thanks to the push-in connection system, you can wire the terminals without tools.

Note the following restrictions:

- The potential group based on SELV/PELV supply or the PotDis version is light-colored.
- The infeed of protective conductor via BU is not permitted.

You can find additional information on using the BaseUnit in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Note

All BaseUnits placed in a load group must match the infeed potential of the corresponding light-colored BaseUnits.

4.2 BU type A0, light-colored version with AUX terminals

Short designation

Short designation: BU15-P16+A10+2D

4.2.1 Product overview

Delivery options (packing unit VPE)

6ES7193-6BP20-0DA0 (VPE: 1 unit)

6ES7193-6BP20-2DA0 (VPE: 10 units)

View

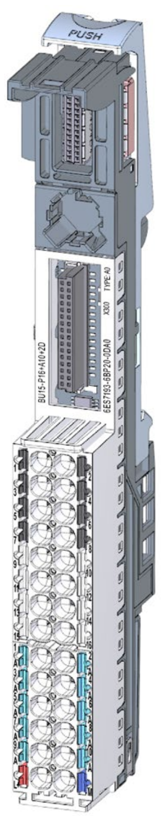

Figure 4-1 BU type A0, light-colored version with AUX terminals

Properties

- BaseUnit suitable for all I/O modules of the BaseUnit type "A0/A1". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.
  - Supply voltage (L+ terminal, ground): Max. 24 V DC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 10 AUX terminals for connecting a protective conductor or potential. The AUX busbar is not connected to the I/O module. Max. 24 V DC/10 A
- Connection system in the form of push-in terminals Connection cross-sections are available in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 10 A.

4.2.2 Connecting up

Pin assignment

Pin assignment for BaseUnit BU type A0, light-colored version with AUX terminals	
Terminal	**Descriptions**
1 to 16	Assignment is determined by the I/O module. You can find additional information in the I/O Module (http://support.automation.siemens.com/WW/view/en/55679691/133300) manual.
1 A, 2 A, 3 A, 4 A, 5 A, 6 A, 7 A, 8 A, 9 A, 10 A	Protective conductor connection or voltage bus freely usable up to 24 V DC with max. 10 A
L+/ M	L+: Rated supply voltage 24 V DC with max. 10 A M: Ground

4.2.3 Technical specifications

Technical specifications of the BU-Typ A0, Variante hell mit AUX-Klemmen

Article number	6ES7193-6BP20-2DA0
General information	
Product type designation	Type A0
Supply voltage	
Rated value (DC)	24 V
external protection for power supply lines	Yes; 24 V DC/10 A miniature circuit breaker with type B or C tripping characteristic
Current carrying capacity	
For P1 and P2 bus, max.	10 A
For AUX bus, max.	10 A
For process terminals, max.	2 A
Hardware configuration	
Formation of potential groups	
• New potential group	Yes
• Potential group continued from the left	No
Potential separation	
between the potential groups	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Accessories	
Color coding labels	
• for process terminals	CC00 to CC09
• for AUX terminals	CC71 to CC73
• for add-on terminals	does not exist
Connection method	
Terminals	
• Terminal type	Push-in terminal
• Conductor cross-section, min.	0.14 mm²; AWG 26
• Conductor cross-section, max.	2.5 mm²; AWG 14
• Number of process terminals to I/O module	16
• Number of terminals to AUX bus	0
• Number of add-on terminals	0
• Number of terminals with connection to P1 and P2 bus	2
Dimensions	
Width	15 mm
Height	141 mm
Depth	35 mm
Weights	
Weight, approx.	50 g

4.3 BU type A0, light-colored version without AUX terminals

Short designation

Short designation: BU15-P16+A0+2D

4.3.1 Product overview

Properties

- BaseUnit suitable for all I/O modules of the BaseUnit type "A0/A1". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit conducts the potential group further. The self-assembling voltage buses P1 and P2, and the AUX busbar are connected to the left-hand neighboring module (BaseUnit).
- Access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 10 AUX terminals for connecting a protective conductor or potential. The AUX busbar is not connected to the I/O module. Max. 24 V DC/10 A
- Connection system in the form of push-in terminals Connection cross-sections are available in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Delivery options (packing unit VPE)

6ES7193-6BP40-0DA1 (VPE: 1 unit)

View

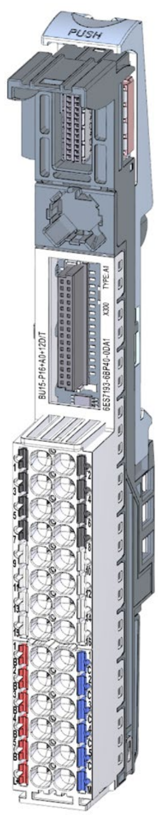

Figure 4-9 BU type A1, light-colored version, with additional terminals

Properties

- BaseUnit suitable for all I/O modules of BaseUnit type "A1". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.

  Note

  Using another I/O module can trigger an internal, non-exchangeable fuse and you must exchange the terminal box.

  – Supply voltage (L+ terminal, ground): Max. 24 V DC/10 A

  – Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- No access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 2x5 additional terminals for supplying a supply voltage up to 24 V DC/ 10 A. The additional terminals are not connected to the I/O module.
- Recording of the terminal temperature for internal temperature compensation at connected thermocouples
- Connection system in the form of push-in terminals Connection cross-sections are available in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 10 A.

4.6.2 Connection

Delivery options (packing unit VPE)

6ES7193-6BP40-0BA1 (VPE: 1 unit)

View

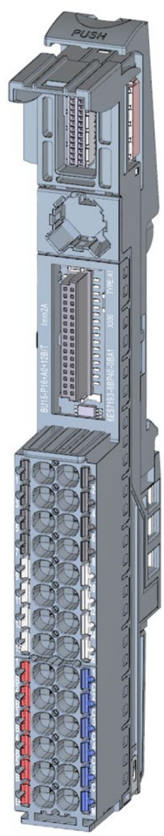

Figure 4-13 BU type A1, dark-colored version, with additional terminals

Properties

- BaseUnit suitable for all I/O modules of BaseUnit type "A1". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.

  Note

  Using another I/O module can trigger an internal, non-exchangeable fuse and you must exchange the terminal box.

  – Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit conducts the potential group further. The self-assembling voltage buses P1 and P2, and the AUX busbar are connected to the left-hand neighboring module (BaseUnit).
- No access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 2x5 additional terminals for supplying a supply voltage up to 24 V DC/ 10 A. The additional terminals are not connected to the I/O module.
- Recording of the terminal temperature for internal temperature compensation at connected thermocouples
- Connection system in the form of push-in terminals Connection cross-sections are available in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

4.8.2 Connection

Pin assignment

Pin assignment for BU type A1, dark-colored version, with additional terminals	
Terminal	**Descriptions**
1 to 16	Assignment is determined by the I/O module. You can find additional information in the I/O Module (http://support.automation.siemens.com/WW/view/en/55679691/133300) manual.
1 B, 2 B, 3 B, 4 B, 5 B / 1 C, 2 C, 3 C, 4 C, 5 C	2 x 5 add-on terminals for the infeed of a supply voltage up to 24 V DC with max. 10 A
(AUX)	No access to the AUX busbar via terminals
L+, P1 / M, P2	L+: Rated supply voltage 24 V DC with max. 10 A M: Ground

Technical specifications of the BU type A1, dark-colored version, with additional terminals

Article number	6ES7193-6BP40-0BA1
General information	
Product type designation	Type A1
Supply voltage	
Rated value (DC)	24 V
external protection for power supply lines	Yes; 24 V DC/10 A miniature circuit breaker with type B or C tripping characteristic
Current carrying capacity	
For P1 and P2 bus, max.	10 A
For process terminals, max.	2 A
Hardware configuration	
Additional terminals	Yes
Temperature sensor	Yes
Formation of potential groups	
• New potential group	No
• Potential group continued from the left	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Accessories	
Color coding labels	
• for process terminals	CC00 to CC09
• for AUX terminals	does not exist
• for add-on terminals	CC74
Connection method	
Terminals	
• Terminal type	Push-in terminal
• Conductor cross-section, min.	0.14 mm²; AWG 26
• Conductor cross-section, max.	2.5 mm²; AWG 14
• Number of process terminals to I/O module	16
• Number of terminals to AUX bus	0
• Number of add-on terminals	0
• Number of terminals with connection to P1 and P2 bus	2
Dimensions	
Width	15 mm
Height	141 mm
Depth	35 mm

Delivery options (packing unit VPE)

6ES7193-6BP20-0DC0 (VPE: 1 unit)

View

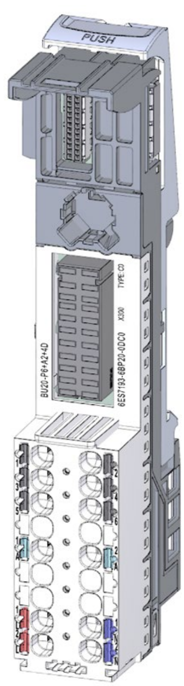

Figure 4-21 BU type C0, light-colored version, with AUX terminals, supply over supply terminals

Properties

- BaseUnit suitable for all I/O modules of BaseUnit type "C0/C1". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.
  - Supply voltage (terminal 1 L, 2 / 1 N, 2 N): Max. 230 V AC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 4): Max. 5 A
  - Current carrying capacity per process terminal (terminal 5 and 6): Max. 10 A
- The BaseUnit opens up a new potential group by means of the inserted I/O module. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 6 terminals to the process (assignment with the I/O module)
- Two AUX terminals for connecting a PE terminal or potential. The AUX busbar is not connected to the I/O module. Max. 24 V DC/10 A
- Connection system in the form of push-in terminals You can find more information in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 10 A.

4.12.2 Connecting

Pin assignment

Pin assignment for BU type C0, light-colored version, with AUX terminals, supply over supply terminals

4.15 BU type F0, dark-colored version, with AUX terminals, supply over supply terminals

Short designation

Short designation: BU20-P8+A4+0B

4.15.1 Product overview

When you use the AUX terminals as a PE busbar:

NOTICE
When AUX is used as PE, AUX must be identified as green-yellow (e.g., gn/ye color-coded labels). These identifications must be removed if the terminals are no longer used as PE.

- BaseUnit suitable for all I/O modules of the BaseUnit type "U0". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 10 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1, P2 and the AUX busbar are disconnected from the adjacent module on the left (BaseUnit, interface module, CPU).
- No access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- Connection system in the form of push-in terminals Connection cross-sections are available in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 10 A.

Note

A potential group opened with light-colored BaseUnit of type U0 must contain no dark-colored BaseUnit of type A0 or A1.

4.16.2 Connection

Pin assignment

Pin assignment for BU type U0, light-colored version, without AUX terminals	
Terminal	**Descriptions**
1 to 16	Assignment is determined by the I/O module. You can find additional information in the I/O Module (http://support.automation.siemens.com/WW/view/de/55679691/133300) manual.
(AUX)	No access to the AUX busbar via terminals
P1 / P2	P1: Rated supply voltage up to 230 V AC with max. 10 A P2: Neutral/Ground

Article number	6ES7193-6BP00-0DU0
General information	
Product type designation	BU type U0, BU20-P16+A0+2D, PU 1
Supply voltage	
Rated value (DC)	120 V
• For P1 and P2 bus	120 V
• For AUX bus	120 V
Rated value (AC)	240 V; 400 V (L1 - L2 - L3); 240 V (L1, N)
• For P1 and P2 bus	240 V
• For AUX bus	240 V
• for process terminals	240 V
external protection for power supply lines	Yes
Mains filter	
• integrated	Yes
Current carrying capacity	
up to 60 °C, max.	10 A
For P1 and P2 bus, max.	10 A
For AUX bus, max.	10 A
For process terminals, max.	10 A
Hardware configuration	
Automatic encoding	Yes
Formation of potential groups	
• New potential group	No
• Potential group continued from the left	Yes
Potential separation	
between backplane bus and supply voltage	Yes
between the potential groups	Yes
Isolation	
Isolation tested with	3 100 V DC for 2 s
Connection method	
Terminals	
• Terminal type	Push-in terminal
• Conductor cross-section, min.	0.14 mm²; 0.2 mm² without wire end ferrule
• Conductor cross-section, max.	2.5 mm²; 1.5 mm² with wire end ferrule
• Number of process terminals to I/O module	16
• Number of terminals to AUX bus	0
• Number of add-on terminals	0
• Number of terminals with connection to P1 and P2 bus	2
Dimensions	
Width	20 mm
Height	117 mm

BaseUnits for motor starters 5

5.1 Introduction

Properties of the infeed bus

- The infeed bus is set up by connecting the BaseUnits, and wiring takes place automatically
- The infeed bus distributes the energy to the SIMATIC ET 200SP motor starter within one load group
- The max. current carrying capacity is up to 32 A (3-phase)
  - With infeed (for one load group) and motor connection
  - Infeed bus: 3-pole + PE
  - The voltage range for power infeed is 48 … 500 V AC

You must observe the deratings depending on the configuration.

Properties of the self-assembling voltage bus (power bus)

- Maximum current: 7 A
- Rated voltage: 24 V DC

You must observe the deratings depending on the configuration.

AUX1 bus

The AUX1 bus is not supported in the BaseUnits of the SIMATIC ET 200SP motor starters.

You can find assembly rules of the BaseUnits for the SIMATIC ET 200SP motor starter in the System Manual SIMATIC ET 200SP motor starters.

5.2 BU30-MS1 - BaseUnit with 24 V DC and 500 V AC infeed

5.2.1 Product overview

Article number

3RK1908-0AP00-0AP0

View

Figure 5-1 BaseUnit with 24 V DC and 500 V AC infeed

Properties

- BaseUnit suitable for all fail-safe and non-fail-safe SIMATIC ET 200SP High Feature motor starters
- The BaseUnit opens a new potential group (24 V DC). The power buses P1 and P2 are interrupted to the left-hand neighboring module (BaseUnit, interface module/CPU).
- The BaseUnit opens a new potential group (500 V DC). The infeed bus L1 (L), L2 (N), L3, PE is interrupted to the left-hand BaseUnit of the ET 200SP motor starter.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus (3RK1908-1DA00-2BP0) is included in the scope of delivery.
- The fail-safe input F-DI of the fail-safe motor starter is connected to the power bus.

Maximum configuration per voltage group (24 V DC)

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 7 A.

Maximum configuration of the infeed bus (500 V AC)

The number of motor starters that can be used per infeed group depends on the following factors:

1. Total current requirement of all motor starters operated on this infeed group.
2. Ambient temperature and installation type in which the motor starters are operated. You can find further information in the derating table in the Manual SIMATIC ET 200SP motor starters (https://support.industry.siemens.com/cs/ww/en/view/109479973).

5.2.2 Connection

Pin assignment

5.6.1 Product overview

Article number

3RK1908-0AP00-0EP0

View

Figure 5-9 BaseUnit with 500 V AC and F-DI

Properties

- BaseUnit suitable for all fail-safe SIMATIC ET 200SP High Feature motor starters
- The BaseUnit takes over the potential group (P1, P2) from the adjacent module on the left.
- The BaseUnit opens a new supply group 500 V AC. The potential group (24 V DC) is further continued
- The BaseUnit has an F-DI input terminal for fail-safe control signals of the motor starter. This signal is not forwarded to neighboring motor starters.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus is included in the scope of delivery.

Maximum configuration of the supply bus

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated according to item 1. and item 2. must not exceed 7 A.

Properties of the F-DI input

The fail-safe digital input "F-DI" has the following properties:

- Use of interconnection type 1oo1 possible
- Sink input
- Input delay 10 ms
- Status display of the input F-DI at the motor starter module (green LED)

View

Figure 5-11 BaseUnit without 500 V AC infeed, with F-DI

Properties

- BaseUnit suitable for all fail-safe SIMATIC ET 200SP High Feature motor starters
- The BaseUnit takes over the potential group (P1, P2) from the adjacent module on the left.
- This BaseUnit handles the potential group/infeed bus (500 V AC) of the left-hand BaseUnit and loops this through.
- The BaseUnit has an F-DI input terminal for fail-safe control signals of the motor starter. This signal is not forwarded to neighboring motor starters.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus is not included in the scope of delivery.

Properties of the F-DI input

The fail-safe digital input "F-DI" has the following properties:

- Use of interconnection type 1oo1 possible
- Sink input
- Input delay 10 ms
- Status display of the input F-DI at the motor starter module (green LED)

6 Potential distributor modules

6.1 Introduction

Properties of potential distributor modules

A potential distributor module (PotDis module) consists of a potential distributor BaseUnit (PotDis-BU) and a potential distributor terminal block (PotDis-TB) installed on top of it.

A system-integrated potential distribution is possible with the various PotDis-BUs and PotDis-TBs.

You can place potential distributor modules at any location with the ET 200SP distributed I/O system. In doing so, you must observe the same design rules that apply to the design of a potential group from the BaseUnits for I/O modules. The following information is particularly important:

- The potential groups opened with a light-colored PotDis-BU must contain no I/O modules. You can integrate any dark-colored PotDis-BUs into I/O module potential groups provided these are based on SELV/PELV supply.
- If you do not need the additional terminals of the PotDis-TB in a potential distributor module, replace the PotDis-TB with a BU-Cover.
- You may only connect one potential group within a combination of PotDis-BU and PotDis-TB.
- Only SELV/PELV potentials are permitted on PotDis-BUs. Separate different SELV/PELV potential groups using light-colored PotDis-BUs.
- With potential distributor modules you may only connect to the PotDis-TB versions BR-W and n.c.-G potential, which exceed the voltage level of SELV/PELV.
- PotDis terminals are not directly configurable as PotDis via GSD/GSDML. When configuring with GSD, always use an empty module; with GSDML, integrate a free space.

Potential distributor modules are configurable with STEP 7/STEP 7 TIA Portal. Individual versions are listed in the following table:

Engineering with	**version/HSP**
STEP 7 TIA Portal	
• Configurable as of version • Configurable as of version • Configurable as of version • Configurable as of version	HSP0241 up to V13 SP1 Update 8 HSP0241 up to V14 HSP0241 up to V14 SP1 Update 5 HSP0241 up to V15 Update 1
STEP 7	
• Configurable as of version	HSP0293 up to V5.5 SP4

You can find additional information on the use of the potential distributor modules in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

6.2 PotDis-BU type P1, light-colored version

6.2.1 Short designation

Short designation

Light-colored version with 16 terminals to P1 + 2 supply terminals P1/P2.

Short designation: PotDis-BU-P1/D-R.

D stands for a new potential group, which means P1, P2, AUX separated to the left, R stands for red spring release.

6.2.2 Product overview

Delivery options (packing unit VPE)

6ES7193-6UP00-0DP1 (VPE: 1 unit)

View

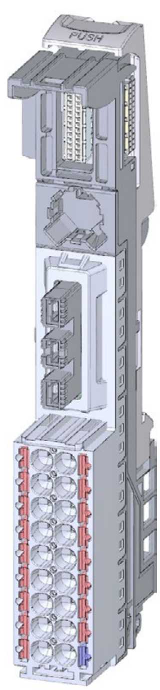

Figure 6-1 PotDis-BU type P1, light-colored version

Properties

- BaseUnit suitable for all PotDis terminal blocks of the type "P1/P2/N0/P0". Can be recognized by the laser inscription on the front and/or the last two digits of the article number.
  - Supply voltage (terminal P1, P2) up to DC 48 V/10 A
  - Current carrying capacity per terminal: Max. 10 A
- BaseUnit opens up a new PotDis potential group. The self-assembling voltage buses P1, P2 and the AUX busbar are disconnected from the adjacent module on the left (BaseUnit, CPU, interface module).

NOTICE
Opening a potential group for I/O modules is not permitted with the BaseUnit PotDis-BU-P1/D-R.
The BaseUnit PotDis-BU-P1/D-R opens a new potential group only for the potential distributor modules. Opening a potential group for I/O modules is not permitted with the BaseUnit PotDis-BU-P1/D-R.

- 18 terminals
  - 17 red terminals (P1)
  - 1 blue terminal (P2)
- 36 terminals (with PotDis-TB)
- Connection system in the form of push-in terminals

6.2.4 Technical specifications

Technical specifications of the BaseUnit PotDis-BU type P1, light-colored version

Article number	6ES7193-6UP00-0DP1
General information	
Product type designation	PotDis BU type P1, light version, PU 1
Supply voltage	
Rated value (DC)	
• For P1 and P2 bus	48 V; max.
• for process terminals	48 V; max.
external protection for power supply lines	Yes; 10 A miniature circuit breaker with type B or C tripping characteristic for the respective rated supply voltage
Current carrying capacity	
For P1 and P2 bus, max.	10 A
For process terminals, max.	10 A
Hardware configuration	
Formation of potential groups	
• New potential group	Yes
• Potential group continued from the left	No
Potential separation	
between backplane bus and supply voltage	Yes
Isolation	
Isolation tested with	3 250 V DC
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C; No condensation
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; No condensation
• vertical installation, max.	50 °C
• Vertical installation, min.	0 °C; No condensation
• Vertical installation, max.	50 °C
• Horizontal installation, min.	0 °C; No condensation
• Horizontal installation, max.	50 °C
Altitude during operation relating to sea level	
• Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Accessories	
Color coding labels	
• for process terminals	CC62

Article number	6ES7193-6UP00-0DP1
Connection method	
Terminals	
• Terminal type	Push-in terminal
• Conductor cross-section, min.	0.14 mm²
• Conductor cross-section, max.	2.5 mm²
• Number of terminals with connection to P1 and P2 bus	17 terminals to P1, 1 terminal to P2
Dimensions	
Width	15 mm
Height	117 mm
Depth	35 mm
Weights	
Weight, approx.	40 g

6.3 PotDis-BU type P1, dark-colored version

Short designation

Dark-colored version with 16 terminals to P1 + 2 supply terminals P1/P2.

Short designation: PotDis-BU-P1/B-R.

B stands for bridged potential group, which means P1, P2, AUX bridged to the left, R stands for red spring release.

6.3.1 Product overview

② PotDis-TB-P2-B
③ PotDis-TB-n.c.-G
④ PotDis-TB-BR-W

Figure 6-9 PotDis terminal blocks

Properties

- Terminal blocks matching all BaseUnits PotDis-BU
  - Current carrying capacity per terminal: Max. 10 A
- 18 terminals
  - PotDis-TB-P1-R terminal block: Red terminals with connection to the supply voltage P1 of the BaseUnit PotDis-BU
  - PotDis-TB-P2-B terminal block: Blue terminals with connection to ground P2 of the BaseUnit PotDis-BU
  - PotDis-TB-n.c.-G terminal block: Gray (internal not connected) terminals without connection to the BaseUnit PotDis-BU

NOTICE
Mixed connection of direct current or alternating current (DC/AC) is not permitted on the PotDis-TB-n.c-G Connect direct currents up to 48 V or alternating currents up to 230 V to the terminals of the PotDis-TB-n.c.-G. A mixed connection of both types of voltages (DC/AC) is not permitted at the terminals of the PotDis-TB-n.c.-G.

  - PotDis-TB-BR-W terminal block: White (internal not connected) terminals without connection to the BaseUnit-BU

NOTICE
Only PotDis-TB-BR may be used for protective conductors. Check all protective conductors. Check the required conductor cross-section for the respective plant unit before commissioning of the plant (especially for motor starters).

- Connection system in the form of push-in terminals
- You can find the assignment of color-coded labels in the ET 200SP System Manual under Accessories.

NOTICE
Use of color-coded labels
Before commissioning the system, check that the color-coded labels attached correspond to the wired potential.

NOTICE
Voltages greater than SELV/PELV
Voltages greater than SELV/PELV are only permitted for the PO PotDis-TBs BR (bridged) and NC (not connected). This applies equally to protective conductors. No voltages greater than SELV/PELV are present on the terminals of the PotDis module with connection to the P1/P2 rails.

6.6.2 Connecting

Pin assignment

Pin assignment for PotDis-TB terminal block		
Terminal block	**Terminal**	**Explanation**
PotDis-TB-P1-R	P1	Rated supply voltage up to 48 V DC with max. 10 A (18 red terminals)
PotDis-TB-P2-B	P2	Ground (18 blue terminals)
PotDis-TB-n.c.-G	n c. (not connected)	Terminals can be used freely up to 230 V AC with max. 10 A (18 gray terminals). If you connect voltage, it must belong to the same potential group.
PotDis-TB-BR-W	BR (bridged)	Terminals for protective conductor connection or voltage bus freely usable up to 230 V AC with max. 10 A (18 white terminals)

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Table of contents

1 Preface

Purpose of the manual

This manual provides all the necessary information for configuring, installing, connecting and commissioning the BusAdapter.

Basic knowledge required

The following knowledge is required in order to understand the manual:

- General knowledge in the field of automation technology
- Knowledge of the use of computers or PC -like tools (e.g. programming devices) under the Windows operating system.
- Knowledge of working with STEP 7. You can find information on this topic in the STEP 7 online help.

Range of validity of this manual

The manual describes the components based on the data valid at the time of its release. We reserve the right to include up-to-date Product Information with new components and new versions of components.

Recycling and disposal

The BusAdapter can be recycled due to their low pollutant content. For environmentally sustainable recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal work area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support on the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

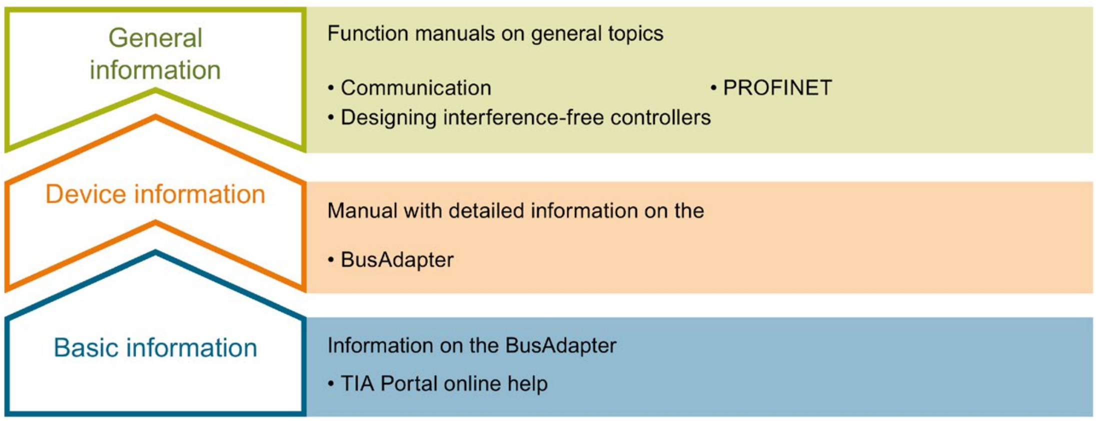
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Guide

2

2.1 BusAdapter guide



Device information

The BusAdapter manual contains information, for example, on properties, assembling, connecting, configuring and parameter assignment, alarms and diagnostics and technical specifications of the BusAdapter.

General information

The function manuals contain detailed descriptions on general topics such as PROFINET and communication.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/de/view/109742709).

"mySupport"

With "mySupport", your personal work area, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/de/).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

Your documentation is available in My Documentation Manager (http://support.industry.siemens.com/My/ww/de/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/de/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

Additional information can be found on the Internet under Application examples (https://support.industry.siemens.com/sc/ww/de/sc/2054).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/de/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- PRONETA also scans: configuration of the station name, IP subnet mask and identification and maintenance data (I&M1..3)

For more information, refer to SIEMENS PRONETA (https://support.industry.siemens.com/cs/ww/de/view/67460624).

Product overview

3

Introduction

The SIMATIC BusAdapters connect PROFINET IO to their ET 200SP system. You select the required connection technology and connection method for your process from the different versions of SIMATIC BusAdapter.

Supported PROFINET devices

The SIMATIC BusAdapters are used for:

- ET 200SP interface module and central processing unit (CPU and Open Controller)
- PN/PN Coupler
- Switches

Overview

The SIMATIC BusAdapters can be ordered in the following versions:

BusAdapter	Article number	Property	Figure
BA 2xRJ45	6ES7193-6AR00-0AA0	PROFINET BusAdapter with standard Ethernet socket for standard RJ45 connector	
BA 2xFC	6ES7193-6AF00-0AA0	PROFINET BusAdapter with FastConnect Ethernet connection for direct connection of the bus cable for applications with increased EMC and vibration/shock load	
BusAdapter	Article number	Property	Figure
BA 2xSCRJ	6ES7193-6AP00-0AA0	PROFINET BusAdapter with fiber-optic cable connection POF/PCF for SCRJ connector for applications with increased EMC and vibration/shock load as well as electrical potential differences between two stations	
BA SCRJ/RJ45	6ES7193-6AP20-0AA0	Media converter, PROFINET BusAdapter with POF/PCF fiber-optic cable ⇔ standard RJ45 connector	
BA SCRJ/FC	6ES7 193-6AP40-0AA0	Media converter, PROFINET BusAdapter with POF/PCF fiber-optic cable ⇔ direct connection of bus cable	
BA 2xLC	6ES7193-6AG00-0AA0	PROFINET BusAdapter with glass fiber-optic cable connection for LC connector for applications with increased EMC and vibration/shock load as well as electrical potential differences between two stations

4.1 Product overview

Article number

6ES7193-6AR00-0AA0

View

Figure 4-1 BusAdapter BA 2×RJ45

Properties

- You connect PROFINET IO cable with RJ45 connector to the PROFINET device via the BusAdapter BA 2×RJ45. To do this, screw the BusAdapter BA 2×RJ45 to the PROFINET device and insert the PROFINET connecting cable.
- You loop through the PROFINET via the integrated 2-port switch.

4.2 Connecting

Installing the bus connector

Install the PROFINET connector according to the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Tools required

3 to 3.5 mm screwdriver, alternatively TX10 (torx).

Accessories required

- Connector:
  - IE FC RJ45 plug 180 2X2 (6GK1901-1BB10-2A)
  - IE FC RJ45 plug 180 4X2 (6GK1901-1BB12-2A)
- Cables:
  - IE FC TP standard cable (6XV1840-2A)
  - IE FC TP trailing cable (6XV1840-3AH10)
  - IE FC TP marine cable (6XV1840-4AH10)
  - IE FC TP robust cable (6XV1841-2)
  - IE TP torsion cable (6XV1870-2F)
- Please observe the specifications in the PROFINET Installation Guide (http://www.profibus.com/).

Pin assignment

The following table shows the signal name and description of the pin assignment of BusAdapter BA 2×RJ45.

Table 4- 1 PROFINET IO pin assignment with BusAdapter BA 2×RJ45

View	Signal name		Description
	1	TD	Transmit Data +
	2	TD_N	Transmit Data –
	3	RD	Receive Data +
	4	TERM1	Termination Network 1
	5	TERM1	Termination Network 1
	6	RD_N	Receive Data –
	7	TERM2	Termination Network 2
	8	TERM2	Termination Network 1

Procedure

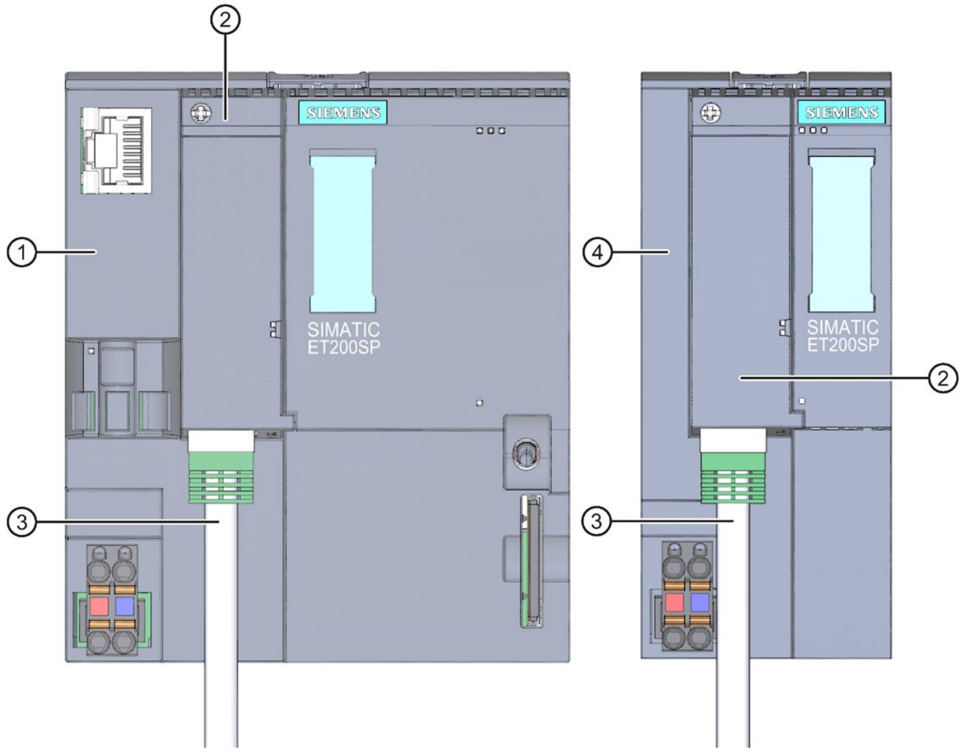
Watch video sequence "Connect BusAdapter BA 2xRJ45 to the ET 200SP interface module" (https://support.industry.siemens.com/cs/ww/de/view/95886218)

To connect PROFINET IO to the PROFINET device via the BusAdapter BA 2xRJ45, follow these steps:

1. Plug the BusAdapter BA 2×RJ45 into the PROFINET device.
2. Screw the BusAdapter BA 2×RJ45 to the PROFINET device (1 screw with 0.2 Nm tightening torque).
3. Plug the RJ45 bus connector into the PROFINET port on the BusAdapter BA 2×RJ45.

You can also swap steps 2 and 3.

BusAdapter BA 2×RJ45 installed



① CPU
② BusAdapter BA 2×RJ45
③ PROFINET connecting cable
④ Interface module

Figure 4-2 BusAdapter BA 2×RJ45 installed (using an ET 200SP CPU/interface module as an example)

Note

Installation guidelines for modules with PROFINET IO interfaces

Ensure that all devices are connected to the SELV/PELV power supply (or equivalent). Only then are you permitted to operate the modules with PROFINET IO interfaces in LAN networks (Local Area Networks).

A data transfer point that guarantees this degree of safety is prescribed for connection to the WAN (Wide Area Network).

4.3 Diagnostics

LEDs

The figure below shows the LEDs on the BusAdapter BA 2xRJ45:

5.1 Product overview

Article number

6ES7193-6AF00-0AA0

View

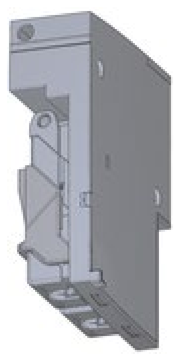

Figure 5-1 BusAdapter BA 2xFC

Properties

- You connect PROFINET IO cable with FastConnect connection method to the PROFINET device via the BusAdapter BA 2xFC. To do this, screw the BusAdapter BA 2xFC with the connected PROFINET connection cable in place on the PROFINET device.
- You loop through the PROFINET via the integrated 2-port switch.

5.2 Connecting

Installing the bus connector

Install the PROFINET connector according to the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Tools required

3 to 3.5 mm screwdriver, alternatively TX10 (torx).

Accessories required

- If you use Fast Connect Cable, we recommend the Industrial Ethernet Fast Connect Stripping Tool (6GK1901-1GA00) with green knife cassette (6GK1901-1B). This guarantees fast and safe stripping.
- Fast Connect Cable (recommended types):
  - IE FC TP Standard Cable GP 2x2 (6XV1840-2AH10)
  - IE FC TP Trailing Cable 2x2 (6XV1840-3AH10)
  - IE FC TP Marine Cable (6XV1840-4AH10)
  - IE FC TP Flexible Cable GP 2x2 (6XV1870-2B)
  - IE FC TP Trailing Cable 2x2 (6XV1870-2D)
  - IE TP Torsion Cable 2x2 (6XV1870-2F)
  - FC TP FRNC Cable GP (6XV1871-2F)
  - IE FC TP Food Cable GP 2x2 (6XV1871-2L)
  - IE FC TP Festoon Cable 2x2 (6XV1871-2S)
- Please observe the specifications in the PROFINET Installation Guide (http://www.profibus.com/).

Pin assignment

The following table shows the signal name and description of the pin assignment of BusAdapter BA 2×FC:.

Table 5- 1 PROFINET IO pin assignment with BusAdapter BA 2×FC

View	Signal name		Description
Port 1  Port 2	1	RD_N	Receive Data -
	2	TD_N	Transmit Data -
	3	RD	Receive Data +
	4	TD	Transmit Data +

Procedure

Watch the video sequence "Connecting the BusAdapter BA 2xFC to the interface module" (https://support.industry.siemens.com/cs/ww/de/view/95886218)

To connect PROFINET IO to the PROFINET device via the BusAdapter BA 2xFC, follow these steps:

1. Strip insulation from the sheath of the PROFINET connecting cable as follows:

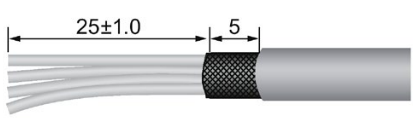

Figure 5-2 PROFINET connecting cable

2. Pull back the locking slide and fold up the cover of the connection element.
3. Pull up the wire guide as far as it will go.
4. Insert the unstripped single cores of the PROFINET connecting cable into the cable routing as far as it will go. **Firmly** press down the wire guide as far as it will go. Please refer to the color coding.

5. Close the cover of the connection element. Then push the locking slide forwards as far as it will go.
6. Screw the BusAdapter BA 2×FC to the PROFINET device (1 screw with 0.2 Nm tightening torque). To do this, use a screwdriver with a 3 to 3.5 mm blade, alternatively TX10.

6 BusAdapter BA 2xSCRJ

6.1 Product overview

Article number

6ES7193-6AP00-0AA0

View

Figure 6-1 BusAdapter BA 2xSCRJ

Properties

- Using BusAdapter BA 2×SCRJ , you connect PROFINET IO to the PROFINET device optically with fiber-optic cables via an SCRJ connector. To do this, screw the BusAdapter BA 2×SCRJ to the PROFINET device and plug in the SCRJ connector.
- You loop through the PROFINET via the integrated 2-port switch.
- SCRJ connector is suitable for POF and PCF.

6.2 Connecting

Installing the bus connector

Install the PROFINET connector according to the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Tools required

3 to 3.5 mm screwdriver, alternatively TX10 (torx).

Accessories required

- Connector for PROFINET connection: IE SCRJ POF Plug
- Fiber-optic cable:
  - IE POF standard cable (6XV1874-2A)
  - IE POF trailing cable (6XV1874-2B)
  - IE PCF standard cable (6XV1861-2A)
  - IE PCF trailing cable (6XV1861-2C)
  - IE PCF trailing cable, GI (6XV1861-2D)

Requirements

- Prepare the IE POF cables with the connectors IE SCRJ POF Plug or IE SC RJ PCF Plug.

  You will find more Instructions in the installation instructions:

  – POF fiber-optic cables with IE SCRJ POF plugs (A5E00351141).

  – PCF fiber-optic cables with IE SCRJ PCF plugs (A5E00835119).
- When installing the fiber-optic cable, make sure the bending radius is not less than permitted:
  – IE POF/PCF standard cable: 150 mm
  – IE POF/PCF trailing cable: 60 mm
- The maximum lengths of the fiber-optic cables are as follows:
  – IE POF standard cable: 50 m
  – IE POF trailing cable: 50 m
  – IE POF standard cable: 100 m
  – IE PCF trailing cable: 100 m
  – IE PCF trailing cable, GI: 250 m
- When the PROFINET device is the last device of the fiber-optic cable network, the unoccupied fiber-optic cable interface must be closed with a blanking plug. When the modules ship, the blanking plugs are inserted in the PROFINET sockets of the BusAdapter.

Pin assignment

The following table shows the signal name and description of the pin assignment of BusAdapter BA 2×SCRJ.

Table 6- 1 PROFINET IO pin assignment with BusAdapter BA 2×SCRJ

View	Signal name	Description
	①	Receive Data
	②	Transmit Data

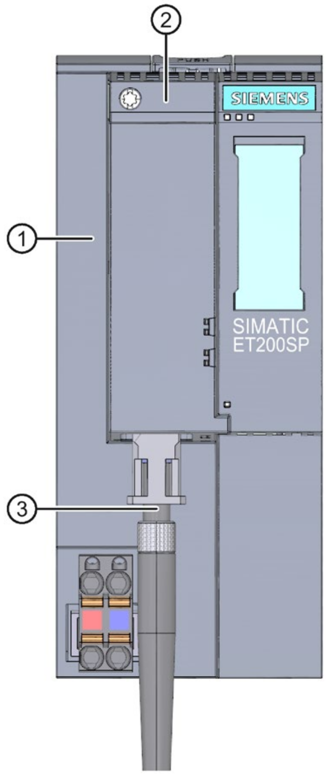
Procedure

1. Plug the BusAdapter BA 2×SCRJ into the PROFINET device.
2. Screw the BusAdapter BA 2×SCRJ to the PROFINET device (1 screw with 0.2 Nm tightening torque). To do this, use a screwdriver with a 3 to 3.5 mm blade, alternatively TX10.
3. Remove the blanking plugs from the PROFINET sockets.
4. Hold the prepared connector by the housing. Insert it into the PROFINET socket on the BusAdapter BA 2xLC until you hear it click into place. The coding of the connectors ensures a safe connection.

> **CAUTION**
>
> **Risk of damage to eyes**
>
> Do not look directly into the opening of the optical transmitter diodes. The emitted light beam damages your eyes.

You can swap steps 3 and 4.

BusAdapter BA 2×SCRJ installed



① Interface module
② BusAdapter BA 2xSCRJ
③ PROFINET connecting cable (fiber-optic cable)

Figure 6-2 BusAdapter BA 2×SCRJ connected to interface module (using ET 200SP interface module as an example)

Reusing used fiber-optic cables

Note

Shorten both fiber-optic cores by the amount of the curved lengths and reassemble the connectors. This will prevent any attenuation losses caused by re-bent, heavily stressed portions of the fiber-optic cores.

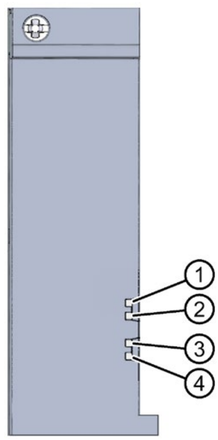
Reference

For more information on the installation guidelines for fiber-optic cables, refer to the SIMATIC NET PROFIBUS Network Manual (https://support.industry.siemens.com/cs/de/de/view/1172302).

6.3 Diagnostics

LEDs

The figure below shows the LED display on the BusAdapter BA 2xSCRJ:



① LK1 (green)
② MT1 (yellow)
③ LK2 (green)
④ MT2 (yellow)

Figure 6-3 LEDs on the BusAdapter BA 2xSCRJ

LK1/LK2 and MT1/MT2 LEDs on the BusAdapter

Table 6- 2 Status and error displays

LED		Meaning	Remedy
LK1/LK2	MT1/MT2		
□ off	Not relevant	There is no Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner, e.g. IO controller.	Check whether the bus cable to the switch or IO controller is disconnected.
■ on	Not relevant	There is an Ethernet connection between the PROFINET IO interface of your PROFINET device and a communication partner, e.g. IO controller.	-
flashes	Not relevant	The "Node flash test" is running. The RN/ER/MT LEDs are also flashing.	-
Not relevant	□ off	No error	-
Not relevant	■ on	• Fiber-optic error • Maintenance demanded: attenuation through the fiber-optic cable is already so high that operation will soon no longer be possible.	Causes and measures for the transmission route: • Replace the fiber-optic cable if damaged or aged. • Ensure correct installation of the PROFINET plugs or PROFINET connectors. • Adhere to maximum length of 50 m for POF cable or 100 m for PCF cable. • Ensure that the FOC connectors fit securely.

6.4 Technical specifications

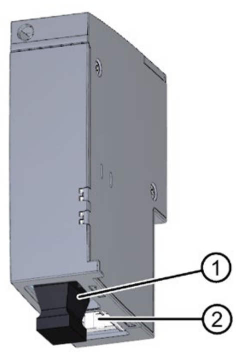
BusAdapter BA SCRJ/RJ45 7

7.1 Product overview

Article number

6ES7193-6AP20-0AA0

View



① Fiber-optic cable SCRJ
② RJ45

Figure 7-1 BusAdapter BA SCRJ/RJ45

Properties

You connect PROFINET IO connection cables to the PROFINET device via the BusAdapter BA SCRJ/RJ45:

- Optically with fiber-optic cables (FOC) with an SCRJ connector to port 1
- Electrically with a standard RJ45 connector to port 2

To do this, screw the BusAdapter BA SCRJ/RJ45 to the PROFINET device and plug in the SCRJ connector or the RJ45 connector.

You can loop through PROFINET IO via the integrated 2-port switch. You can use any port of the BusAdapter for feeding or for looping through. The integrated media converter converts the signals automatically.

7.2 Connecting

Installing the bus connector

Install the PROFINET connector in accordance with the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Connecting the SCRJ connector

You can find more information about the required tools, accessories, requirements and procedures in the section Connecting BusAdapter BA 2×SCRJ (Page 28).

Connecting the RJ45 connector

You can find more information about the required tools, accessories and procedures in the section Connecting BusAdapter BA 2×RJ45 (Page 15).

Pin assignment

The following table shows the signal names and description of the pin assignment for the BusAdapter BA SCRJ/RJ45:

Table 7- 1 PROFINET IO pin assignment with BusAdapter BA SCRJ/RJ45

View	Signal name		Description

Note

Installation guidelines for modules with PROFINET IO interfaces

Ensure that all devices are connected to the SELV/PELV power supply (or equivalent). Only then are you permitted to operate the modules with PROFINET IO interfaces in LAN networks (Local Area Networks).

A data transfer point that guarantees this degree of safety is prescribed for connection to the WAN (Wide Area Network).

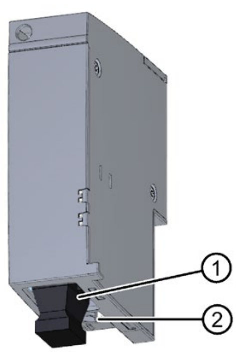
6ES7193-6AP40-0AA0

View



① SCRJ fiber-optic cable

② FastConnect FC

Figure 8-1 BusAdapter BA SCRJ/FC

Properties

- You connect PROFINET IO to the PROFINET device via the BusAdapter BA SCRJ/FC .
- The BusAdapter BA SCRJ/FC has one port for connection of a copper cable and one port for connection of a fiber-optic cable.

Screw the BusAdapter BA SCRJ/FC with the attached Fast Connect bus cable onto the interface module and plug in the SCRJ connector.

You loop through the PROFINET IO via the integrated 2-port switch. You can use any port of the BusAdapter for feeding or for looping through. The integrated media converter converts the signals automatically.

8.2 Connecting

Installing the bus connector

Install the PROFINET connector according to the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Connecting the SCRJ connector

You can find more information about the required tools, accessories, requirements and procedures in the section Connecting BusAdapter BA 2×SCRJ (Page 28).

Connecting the RJ45 connector

You can find more information about the required tools, accessories and procedures in the section Connecting BusAdapter BA 2×FC (Page 21).

Pin assignment

The following table shows the signal name and description of the pin assignment of BusAdapter BA SCRJ/FC.

Table 8- 1 PROFINET IO pin assignment with BusAdapter BA SCRJ/FC

<table>
<tr><th>View</th><th colspan="2">Signal name</th><th>Description</th></tr>

<tr><td>4</td><td>TD</td><td>Transmit Data +</td></tr>
</table>

Procedure

To connect PROFINET IO to the PROFINET device via the BusAdapter BA SCRJ/FC, follow these steps:

1. Plug the BusAdapter BA SCRJ/FC into the PROFINET device.
2. Screw the BusAdapter BA SCRJ/FC to the PROFINET device (1 screw with 0.2 Nm tightening torque). To do this, use a screwdriver with a 3 to 3.5 mm blade, alternatively TX10.
3. Plug the RJ45 bus connector into the PROFINET port on the BusAdapter BA SCRJ/FC.

BusAdapter BA 2xLC

9

9.1 Product overview

Article number

6ES7193-6AG00-0AA0

View

Figure 9-1 BusAdapter BA 2xLC

Properties

- You connect PROFINET IO fiber-optic cables to the PROFINET device via the BusAdapter BA 2×LC. To do this, screw the BusAdapter BA 2×LC to the PROFINET device and insert the PROFINET connection cable.
- You loop through the PROFINET via the integrated 2-port switch.

9.2 Connecting

Installing the bus connector

Install the PROFINET connector in accordance with the instructions in the PROFINET Installation Guide (http://www.profibus.com/).

Tools required

3 to 3.5 mm screwdriver, alternatively TX10 (torx).

Accessories required

- If you prepare the FC FO cables with the IE FC FO LC plug, we recommend the FC FO Termination Kit (LC) (6GK1900-0RL00-0AA0). You can cleave the glass fiber precisely using the FC FO Termination Kit (LC).

CAUTION
Cleaving the glass fiber • Wear protective glasses during the cleaving process. • Dispose of the remaining fibers in a suitable waste container.

- Connector for PROFINET fiber-optic cable connection: IE FC FO LC Plug (10 duplex plugs: 6GK1900-1RB00-2AB0)
- Fiber-optic cable:
  - IE FC FO Standard Cable GP (62.5/200/230) (6XV1847-2A)
  - IE FC FO Trailing Cable (62.5/200/230) (6XV1847-2C)
  - IE FC FO Robust Cable (6XV1873-5Rxx)
  - IE FC FO Standard Cable (6XV1873-3Axx)

Pin assignment

The following table shows the signal name and description of the pin assignment of BusAdapter BA 2×LC:

Table 9- 1 PROFINET IO pin assignment with BusAdapter BA 2xLC

View	Signal name	Description
	①	Receive Data
	②	Transmit Data

Requirements

- Prepare the IE FC FO cable with the IE FC FO LC plug connectors. For detailed instructions, refer to the assembly instructions Preparing IE FC FO Cable with the plug-in connector IE FC FO LC Plug (A5E36312721).
- When installing the fiber-optic cable, make sure the bending radius is not less than permitted:
  - IE FC FO Standard Cable GP (62.5/200/230): 70 mm
  - IE FC FO Trailing Cable (62.5/200/230) (6XV1847-2C): 88 mm
- The maximum lengths of the fiber-optic cables are as follows:
  - IE FC FO Standard Cable GP (62.5/200/230): 2 km
  - IE FC FO Trailing Cable (62.5/200/230): 2 km
- When the interface module is the last device of the fiber-optic cable network, the unoccupied fiber-optic cable interface must be closed with a blanking plug. When the modules ship, the blanking plugs are inserted in the PROFINET sockets of the BusAdapter.

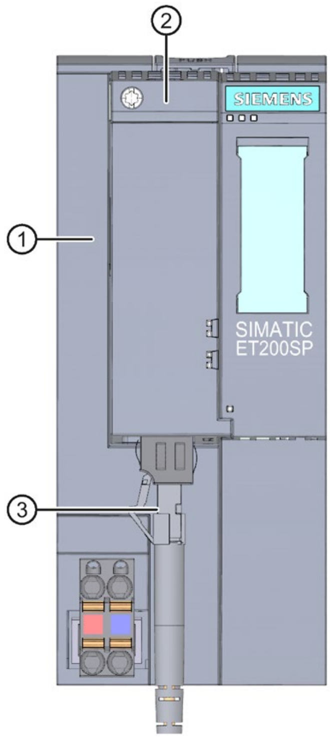
Procedure

To connect PROFINET IO to the PROFINET device via the BusAdapter BA 2xLC, follow these steps:

1. Plug the BusAdapter BA 2xLC into the PROFINET device.
2. Screw the BusAdapter BA 2xLC to the PROFINET device (1 screw with 0.2 Nm tightening torque). To do this, use a screwdriver with a 3 to 3.5 mm blade, alternatively TX10.
3. Remove the blanking plugs from the PROFINET sockets.
4. Hold the prepared connector by the housing. Insert it into the PROFINET socket on the BusAdapter BA 2xLC until you hear it click into place. The coding of the connectors ensures a safe connection.

CAUTION
Risk of damage to eyes
Do not look directly into the opening of the optical transmitter diodes. The emitted light beam damages your eyes.

BusAdapter BA 2xLC installed



① Interface module
② BusAdapter BA 2xLC
③ PROFINET glass fiber connecting cable

Figure 9-2 Connecting the BusAdapter BA 2xLC to the interface module

Reusing used fiber-optic cables

Note

Shorten both fiber-optic cores by the amount of the curved lengths and reassemble the connectors. This will prevent any attenuation losses caused by re-bent, heavily stressed portions of the fiber-optic cores.

Reference

For more information on the installation guidelines for fiber-optic cables, refer to the SIMATIC NET PROFIBUS Network Manual (https://support.industry.siemens.com/cs/de/de/view/1172302).

Strain relief 12

12.1 Product overview

Article number

6ES7193-6RA00-1AN0 (VPE: 5 strain relief units incl. screws)

View

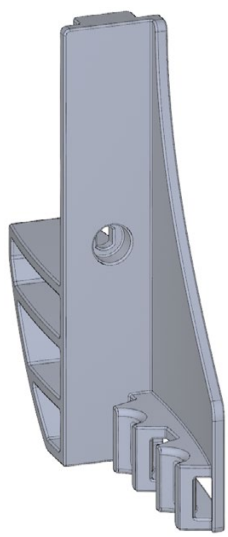

Figure 12-1 Strain relief

Properties

- The strain relief is a mechanical protective device for the electrical PROFINET cables on the BusAdapter.
- The strain relief is suitable for all optical and electrical PROFINET cables of the BusAdapter.
- The strain relief is an optional accessories.
- The cable ties are not included in the delivery. We recommend cable ties with a width of 4.8 mm. The maximum width is 7.0 mm. The length of the cable tie is min. 60 mm.

12.2 Installing

Requirement

- The PROFINET cables are not inserted on the BusAdapter. The inserted PROFINET cables hamper the mounting of the strain relief.
- BusAdapter and strain relief can be mounted separately.

Tools required

Screwdriver TX10 (torx).

Procedure

To install the strain relief, follow these steps:

1. Press the strain relief below the BusAdapter seat of the PROFINET device.

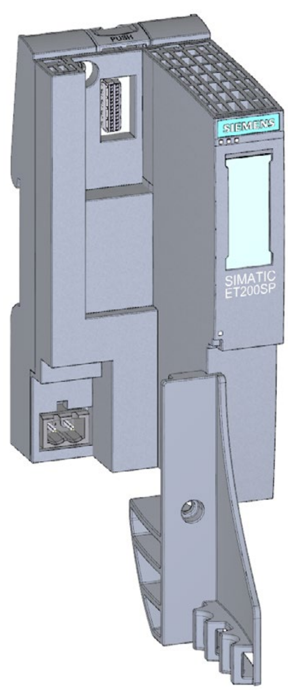

Figure 12-2 Strain relief before mounting

2. Fasten the strain relief (1 screw with 0.7 to 0.8 Nm tightening torque).
3. Plug the BusAdapter into the PROFINET device.

4. Screw the BusAdapter to the PROFINET device (1 screw with 0.2 Nm tightening torque).
5. Attach the PROFINET cables with the cable ties to the strain relief.

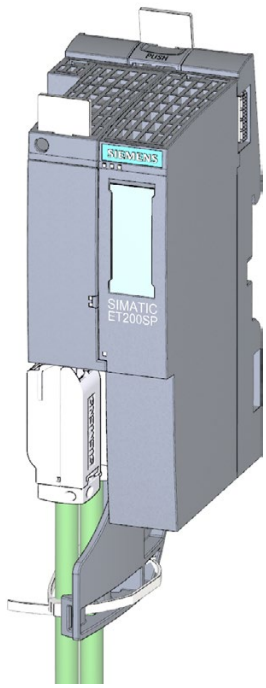

Figure 12-3 Strain relief installed

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

The controller offers various options for program execution with different run priorities. Cyclic-driven and time-driven program execution have the largest share. The response times of a controller are therefore significantly determined by the processing cycles.

There is also the possibility of event-driven program execution. The event-driven program execution is normally limited to a few selected events.

This manual provides information on the following topics:

- Types of program execution
- Run priorities
- Cycle and response times, and the influences to which they are subject
- Configuration options for the optimization of your user program

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the SIMATIC industrial automation system
- Knowledge of the use of Windows-based computers
- Knowledge of working with STEP 7

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation mainly covers the description of the CPU components of the cycle and response times of the following systems:

- S7-1500 automation system
- S7-1500R/H redundant system
- ET 200SP distributed I/O system
- CPU 1516pro-2 PN of the ET 200pro distributed I/O system

You can find links to more information on the ET 200MP, ET 200SP and ET 200pro distributed I/O systems at the corresponding points in this manual.

What's new in edition 10/2018 as compared to edition 09/2016?

What's new?		What are the customer benefits?	Where can I find information?
Changed contents	Scope of the function manual expanded to include CPUs of the S7-1500R/H redundant system	The determination of the cycle and response times of the S7-1500R/H redundant system follows the same principle as for the CPUs of the S7-1500 automation system.	Section Cycle and response times of the S7-1500R/H redundant system (Page 51)

What's new in the 09/2016 edition compared to the 02/2014 edition?

What's new?		What are the customer benefits?	Where can I find information?
Changed contents	Scope of the function manual expanded to include the CPUs of the ET 200SP distributed I/O system and CPU 1516pro-2 PN of the ET 200pro distributed I/O system	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP 65, IP 66 and IP 67).	Starting from section Program execution (Page 13)

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.
- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.
- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.
- **Forums**

  For answers and solutions concerning automation technology.
- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (https://support.industry.siemens.com).

Industry Mall

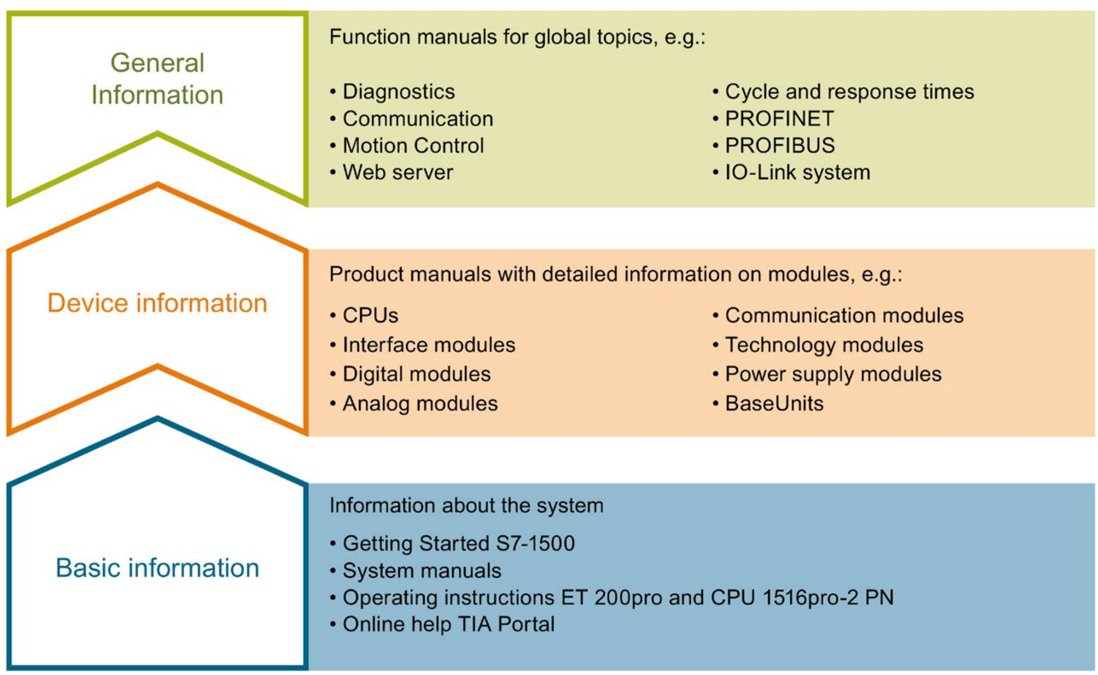
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742705).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Program execution 2

2.1 Principle of operation

Introduction

You often program your user program with a cyclic OB, usually in OB 1. With complex applications, problems are often encountered in complying with the response times required by the application. You can often meet the response time requirements by splitting the user program up into several parts with different response time requirements. The CPU offers a number of different OB types for this purpose, the properties (priority, frequency, etc.) of which can be adapted to meet your requirements.

Program organization

You can choose from the following types of program execution for running your user program:

Program execution in the cyclic program of the CPU:

The CPU executes the user program cyclically. When the execution has reached the end of a cycle, the program execution starts again in the next cycle. In the simplest case, you execute the entire user program in the cyclic program of the CPU. All tasks in the user program are then processed with equal rank. This also results in the same response times for all tasks.

In addition to program execution in the cyclic program, there is time-driven and event-driven program execution.

Time-driven execution:

In a complex user program, there are frequently portions with different response time requirements. You can optimize the response times by taking advantage of these differences in the requirements. To do so, you can break down the program parts with higher response time requirements into higher-priority OBs with shorter cycles, for example cyclic interrupt OBs.

The execution of these parts can thus occur at different frequencies and with different priorities.

Event-driven execution:

Depending on the I/O modules used, you can configure hardware interrupts for specific process events (such as an edge change of a digital input) that result in the call of the assigned hardware interrupt OB. The hardware interrupts have a higher priority and interrupt the cyclic program of the CPU. You can achieve very short response times in the CPU with hardware interrupts by directly triggering program execution.

Keep in mind that the time characteristics of your application becomes less predictable with intense use of hardware interrupts. The reason for this is that the time at which the triggering events occur can result in drastically different response times.

Tip: Use hardware interrupts only for a few selected events.

Special consideration for hardware interrupts: If you have assigned an OB to an event (hardware interrupt), the OB then has the priority of the event.

Using process image partitions

If you have distributed a program over various OBs, for example, due to different response time requirements, it is advisable and often necessary to assign the update of the used I/O data directly to these OBs. You can use process image partitions for this purpose.

You group the input and output data in a process image partition according to their use in the program and assign the data to the OB.

A process image partition of the inputs (PIPI) permits the associated input data for an OB program to be updated immediately before the OB program starts.

A process image partition of the outputs (PIPQ) permits the output data associated with an OB program to become effective on the outputs immediately after the OB program runs.

You have 32 (0 … 31) process image partitions at your disposal. The I/O is assigned to the process image partition 0 by default (setting: "Automatic update"). Process image partition 0 is permanently assigned to cyclic execution.

You have to configure the "system-side update of process image partitions". You can find additional information on configuration of process image partitions in the online help for STEP 7 under the keyword "Assign process image/process image partition".

Interruptibility of program execution

Each organization block is processed according to the priority it has been assigned. You can adapt the priority according to the response time requirements for most organization blocks.

All cycle OBs always have the lowest priority of 1. The highest priority is 26.

Communication tasks always have priority 15. If necessary, you can change the priority of your blocks and select a higher priority than the communication.

Organization blocks or system activities with higher priority interrupt organization blocks or system activities with lower priority. Organization blocks or system activities with higher priority interrupt thus extend the runtime of the interrupted organization blocks or system activities. If two pending tasks have the same priority, these tasks are processed in the order in which the tasks occurred.

Note

Higher priority OBs

Communication functionality is strongly influenced by too many and/or runtime-intensive OBs with a priority > 15.

When using OBs with a priority > 15, you should therefore consider the runtime load that they cause.

Reference

You can find additional information on the subject of "priorities" in the "Events and OBs" section of the following manuals:

- S7-1500 automation system (https://support.industry.siemens.com/cs/ww/en/view/59191792) system manual
- S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual
- ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual
- CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416) operating instructions

You can find additional information on organization blocks and their priorities for Motion Control in the S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326) function manual.

2.2 Overload behavior

CPU overload behavior

An occurring event triggers the execution of the associated OB. Depending on the OB priority and the current processor load, a time delay may occur before the OB is executed when there is an overload. The same event can therefore occur once or several times before the user program processes the OB belonging to the preceding event. The CPU handles such a situation as follows: The operating system queues the events in the queue associated with their priority in the order of their occurrence. The CPU then takes the oldest event for the highest priority and processes the associated OB. After the OB has been processed, the CPU processes the OB for the next event.

To control temporary overload situations, you can limit the number of queued events that originate from the same source. The next event is discarded as soon as the maximum number of pending triggers of a specific cyclic interrupt OB, for example, is reached.

Overload occurs when similar events occur faster than the CPU can process these events. Similar events are events from a single source, such as start events for a specific cyclic interrupt OB.

Configuration of the overload response

In the properties of an organization block in which an overload can occur, you can select the response to the overload response under "Attributes" and "Event queuing".

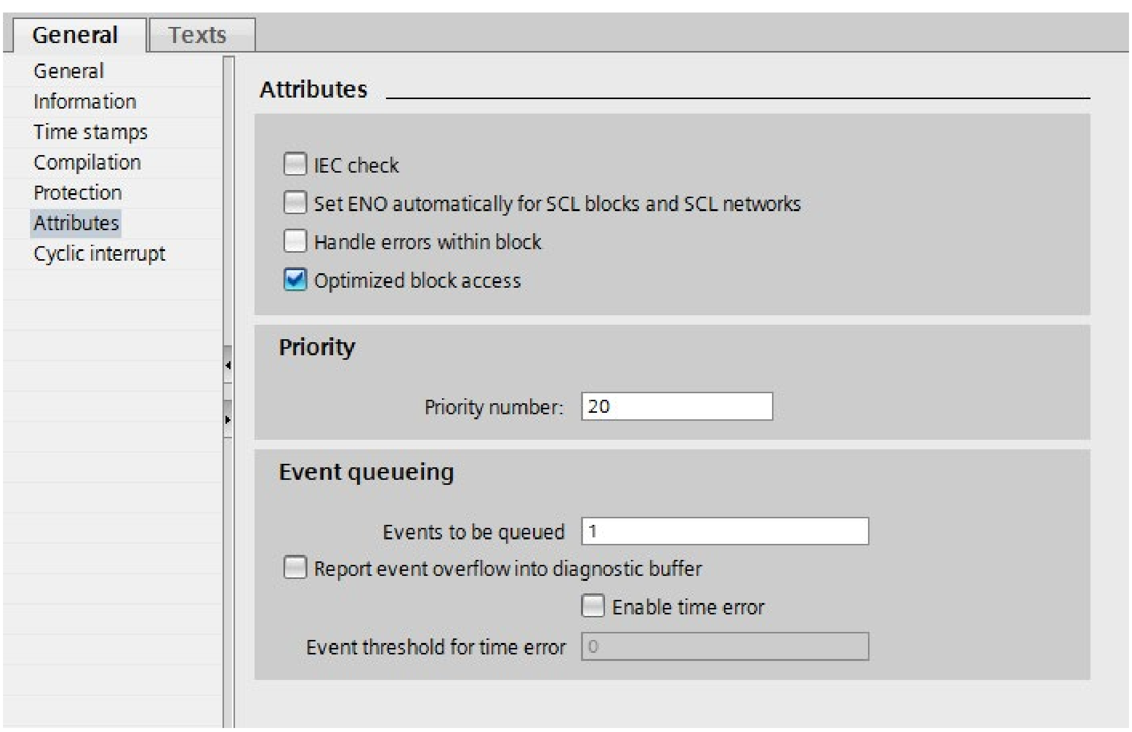


Figure 2-1 Configuration of the overload response in the block properties

Events to be queued

The OB parameter "Events to be queued" is used to specify how many similar events the operating system places in the associated queue and therefore post-processes. If this parameter has the value 1, for example, exactly one event is stored temporarily.

If the maximum number of similar start events is reached in the queue, each additional start event is only counted and subsequently discarded. During the next scheduled processing of the event, the CPU provides the number of discarded start events in the "Event_Count" input parameter (in the start information). You can then react appropriately to the overload situation. The CPU then resets the counter for lost events to zero.

Note

Post-processing of cyclic events is often not desirable, as this can lead to an overload with OBs of the same or lower priority. Therefore, it is generally advantageous to discard similar events and to react to the overload situation during the next scheduled OB processing. A low value of the "Events to be queued" parameter mitigates an overload situation.

To ensure that the CPU processes the OB of at least one queued event, the minimum number of events to be queued is "1". The maximum number of events that can be queued is "12".

Report event overflow into diagnostic buffer

If the CPU first discards a start event of a cyclic interrupt OB, for example, its further behavior depends on the OB parameter "Report event overflow into diagnostic buffer". If you have selected the check box, the CPU enters the event DW#16#0002:3507 in the diagnostic buffer for the overload situation at this event source. If an overload situation occurs again (overflow counter changes from 0 to 1), another diagnostic buffer entry is made at the next OB end.

Enable time error

The cyclic interrupt OB parameter "Enable time error" is used to specify whether the CPU is to call a time error OB when a specific overload level is reached for similar events. You use the OB parameter "Enable time error" to program a reaction to an overload before the limit for similar events is reached. The reaction occurs before the CPU discards similar events.

By default, the "Enable time error" parameter is not set.

Event threshold for time error

Select the "Enable time error" check box to enable the "Event threshold for time error" OB parameter. You use the "Event threshold for time error" OB parameter to specify how many similar events in the queue are permitted before the CPU calls a time error OB.

The following value range applies to the "Event threshold for time error" parameter:

1 ≤ "Event threshold for time error" ≤ "Events to be queued".

Example 1

The following example shows the response of the CPU when multiple similar events occur faster than the CPU can process the associated OBs. In example 1, the user selected the following parameter assignment:

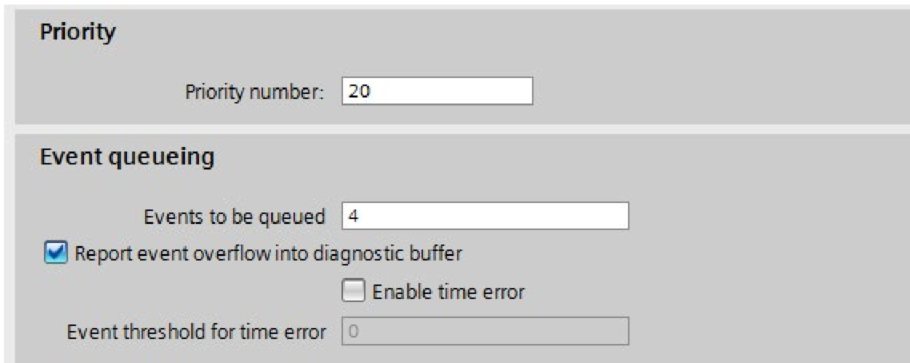

Figure 2-2 Example of parameter assignment for the overload behavior

The figure below shows the processing sequence as soon as an event calls an associated OB.

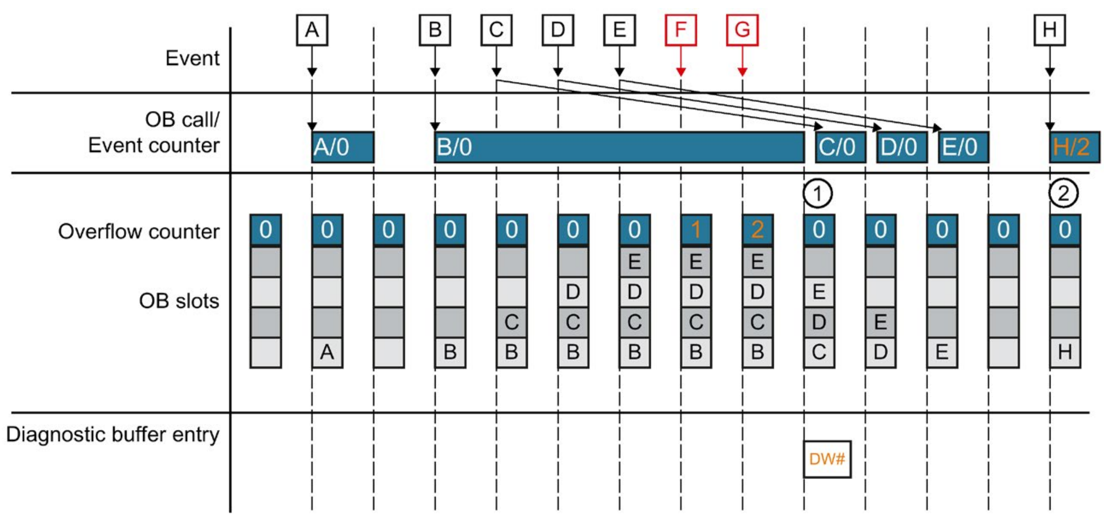

Figure 2-3 Example 1

As soon as an occurring event calls an OB, the event occupies a slot of the OB. The occupied slot is free again as soon as the CPU has processed the event. If the CPU has not completed processing the OB of an occurring event, additional occurring events each occupy an additional slot of the OB during this time. As soon as this number exceeds the configured number of events to be queued, these events are discarded and counted by the overflow counter. When an OB which takes a long time to run is completed, the CPU creates an entry in the diagnostic buffer and sets the overflow counter to zero (①). After the CPU has processed this long-running OP, the CPU then processes the OBs of the events that are queued one after the other. At the next new occurring event, the CPU writes the previous value of the reset overflow counter to the start information of the OB. The CPU then processes the OB (②).

Example 2

In example 2, the user has selected the following parameter assignment:

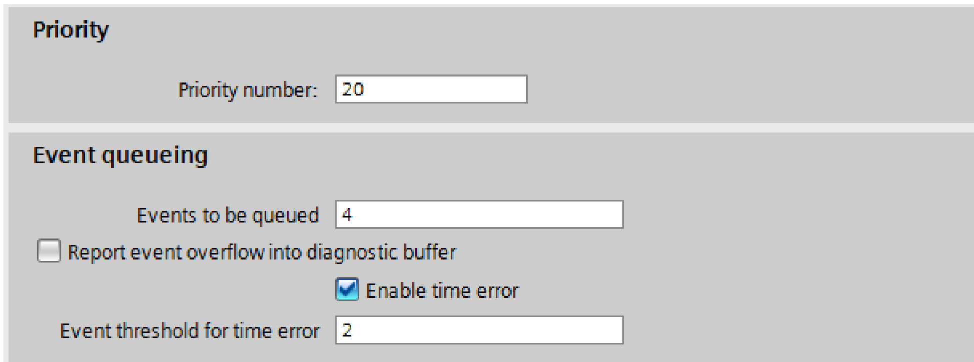

Figure 2-4 Example of parameter assignment for the overload behavior

Contrary to example 1, the CPU in example 2 requests a time error as soon as the configured event threshold has been exceeded. An additional time error can then only occur if all slots of the OB have been free once in the meantime.

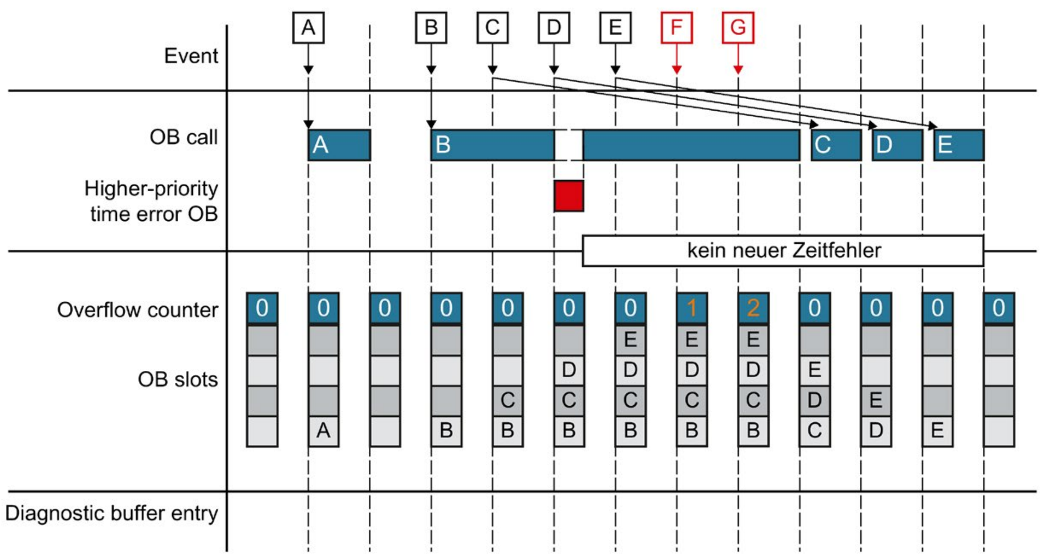

Figure 2-5 Example 2

3 Cyclic program execution

Validity

The statements of the section "Cyclic program execution" apply to the CPU components of the following systems:

- S7-1500 automation system
- ET 200MP and ET 200SP distributed I/O systems
- CPU 1516pro-2 PN of the ET 200pro distributed I/O system
- S7-1500R/H redundant system (in RUN-Solo system state)
  In RUN-Redundant system state, the statements of section "Cycle and response times of the S7-1500R/H redundant system (Page 51)" apply.

Restrictions

With the S7-1500R/H redundant system, there are restrictions compared to the S7-1500 automation system. The S7-1500R/H redundant system does not support all hardware properties and firmware functions of the S7-1500 automation system (for example, it does not support PROFIBUS DP, central I/O, web server, etc.).

The restrictions are described in the S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual.

3.1 Cycle

Definition of cycle

A cycle includes the following sections:

- Update of process image partition 0 of the outputs (PIPQ 0)
- Automatic update of the process image partition 0 of the inputs (PIPI 0)
- Execution of the cyclic program

The process image partition 0 is automatically updated in the cycle. You assign the I/O addresses to these process image partitions (PIPI 0/PIPQ 0) when you configure the I/O modules via the "Automatic update" setting (default).

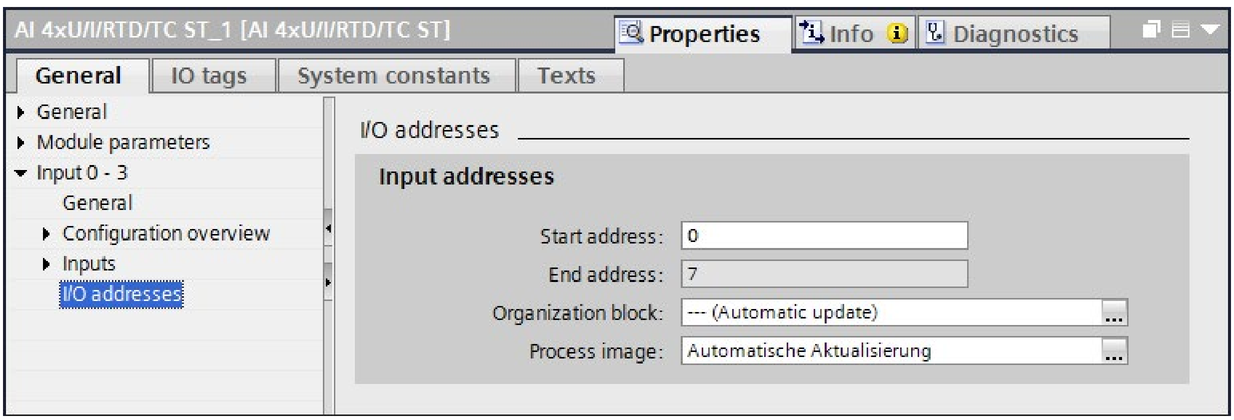

Figure 3-1 Assigning I/O addresses to process image partitions

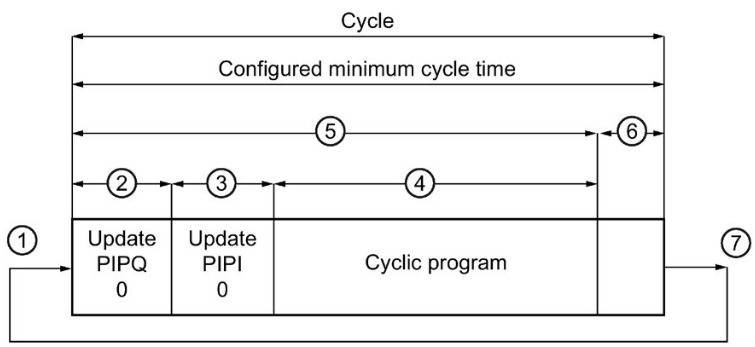
The figure below illustrates the phases that are passed through during a cycle. In the example below the user has configured a minimum cycle time. Updating of the process image partitions and processing of the cyclic program is completed before the end of the configured minimum cycle time. Therefore, the CPU waits until the configured minimum cycle time has expired before the next program cycle starts.



① The operating system starts measurement of the cycle time.

② The CPU writes the states from the process image output to the output modules.

③ The CPU reads the status of the inputs at the input modules and writes the input data to the process image input.

④ The CPU processes the user program and executes the instructions specified in the program.

⑤ The CPU updates the process image partitions and processes the cyclic program.

⑥ Wait phase until end of configured minimum cycle time

⑦ The operating system restarts the monitoring of the maximum cycle time, evaluates the calculated cycle time, and starts the new measurement.

Figure 3-2 Cycle

Cycle control point

When the cycle control point is reached, the CPU has completed the cycle program and is no longer executing OBs. All user data are consistent at this time. Requirement is that no communication that modifies user data (such as HMI communication or PUT/GET communication) is active.

The cycle control point marks:

- The end of a cycle and its cycle time statistics
- The start of the next cycle and its cycle time statistics
- The restart of the monitoring of the configured maximum cycle time (time-out counter is reset)

The cycle control point is reached depending on which of the following events occurred last:

- End of the last cyclic OB
- Expiry of the minimum cycle time (if configured)

After the cycle control point has been reached, the CPU executes the following steps:

1. Writes the process image outputs to the output modules
2. Reads the state of the inputs into the input modules
3. Executes the first cyclic OB

3.2 Cycle time

Definition of cycle time

The cycle time is the time the CPU needs for:

- Updating the process image inputs/outputs
- Executing the cyclic program
- All program parts and system activities interrupting this cycle
- Waiting for the minimum cycle time (if it is parameterized and is longer than the program execution time)

3.2.1 Different cycle times

Introduction

The cycle time (T_{cyc}) is not the same in each cycle because the processing times may vary. Causes of this include:

- For example, different program runtimes:
  - Program loops
  - Conditional commands
  - Conditional block calls
  - Different program paths
- Lengthening due to interruptions, for example:
  - Time-driven interrupt processing
  - Event-driven interrupt processing
  - Communication

Causes of different cycle times

The figure below shows the different cycle times T_{cyc1} and T_{cyc2} using an example.

Because the cyclic program is interrupted by a cyclic interrupt OB in this example (for example: OB 30), the cycle time T_{cyc2} is greater than T_{cyc1}. The cyclic interrupt OB in turn is interrupted by Motion Control functions and communication.

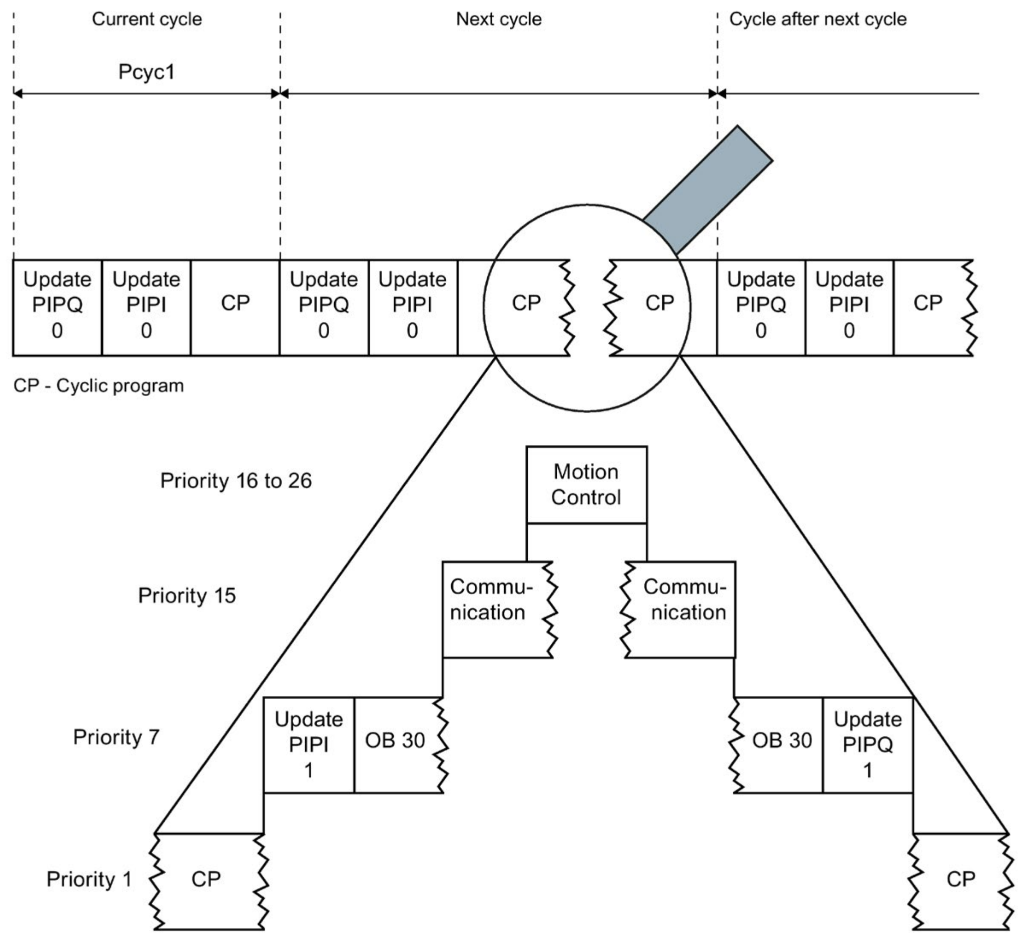


Figure 3-3 Possible causes of differing cycle times

Minimum cycle time

In STEP 7, you can set a minimum cycle time for a CPU. The default for the minimum cycle time is one millisecond. It is advisable to increase this setting in the following cases:

- To reduce the cycle time's fluctuation range.
- To make remaining computing time available for communication tasks. The CPU then processes these communication tasks until the minimum cycle time has expired. Making the remaining computing time available to communication tasks offers the following advantages:
  - Longer minimum cycle times prevent that process images are updated unnecessarily often and thus lead to less load on the backplane bus.
  - Longer minimum cycle times result in an increase in communication performance.

Maximum cycle time

The maximum cycle time is a configurable high limit of the cyclic program runtime. The task of the cycle time is to monitor the response time required for the respective process.

The maximum cycle time of non-redundant CPUs is set to 150 ms by default. You can set this value from 1 ms to 6000 ms when assigning parameters to the CPU. When the cycle time is longer than the maximum cycle time, the time error OB (OB 80) is called.

You have the option of restarting the maximum cycle time using the "RE_TRIGR" instruction, and thus extending it.

You specify how the CPU responds to the time error with the user program in OB 80. The CPU switches to STOP under the following conditions:

- If you have not loaded an OB 80.
- If the cycle is still not completed after an additional maximum cycle time.

Note

Behavior of the CPU on the second cycle timeout

Note that you can only extend the cycle time a maximum of once. On the second consecutive cycle timeout, the CPU always goes into STOP state.

Cycle time statistics

You can read the cycle time statistics either directly from STEP 7 ("Online tools" task card) or with the "RT_INFO" instruction.

You can use the "RT_INFO" instruction to generate statistics in STEP 7 on the runtime of specific organization blocks for communication or for the user program. For example, this includes

- The shortest and longest cycle time
- The portions of runtime used for communication and the user program

---

Note

Showing the cycle time statistics on the display and Web server

With the S7-1500 CPUs, you also have the option of calling the cycle time statistics via the display of the CPU. As of firmware version 2.0 of the CPUs, the cycle time statistics are also displayed in the Web server.

To view the cycle time statistics directly in STEP 7, follow these steps:

1. Establish an online connection to the CPU with STEP 7.
2. Select the "Online tools" task card.

Result: The diagram of the cycle time statistics is displayed in the cycle time section.

The following figure shows an extract from STEP 7 with the cycle time statistics. In this example, the cycle time fluctuates between 7 ms and 12 ms. The current cycle time is 10 ms. The maximum cycle time that can be set in this example is 40 ms.

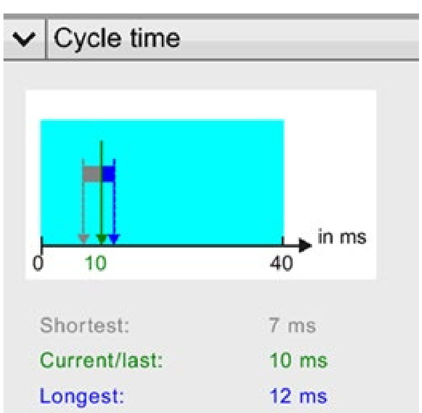

Figure 3-4 Cycle time statistics

You can find additional information on the runtime characteristics of the CPU with the "RT_INFO" instruction in the user program. The instruction includes information about:

- The utilization of the CPU by the user program and communication in percentage
- The runtimes of the individual OBs

Reference

Additional information on the "RT_INFO" instruction is available in the STEP 7 online help.

3.2.2 Influences on the cycle time

3.2.2.1 Update time for process image partitions

Estimating update time for process image partitions

The update time of the process image partitions depends on the volume of assigned central and distributed I/O module data.

You can estimate the update time using the following formula:

	Base load for process image update
+	Number of words in the process image x copy time for central I/O
+	Number of words in the process image via DP x copy time for PROFIBUS I/O
+	Number of words in the process image via PROFINET x copy time for PROFINET I/O
=	**Update time of the process image partition**

Update times of the process image partitions

The following table contains the times for estimating the typical update times of the process image partitions.

Table 3- 1 Data for estimating the typical update time of the process image partitions

Components	Update times of the CPUs			
	S7-1500			
	1511(F)-1 PN 1511T(F)-1 PN 1511C-1 PN 1512C-1 PN 1513(F)-1 PN	1515(F)-2 PN 1515T(F)-2 PN 1516(F)-3 PN/DP 1516T(F)-3 PN/DP	1517(F)-3 PN/DP 1517T(F)-3 PN/DP	1518(F)-4 PN/DP 1518(F)-4 PN/DP MFP
Basic load for updating process image partitions	35 µs	30 µs	7 µs	5 µs
Copy time for central I/O	9 µs/word	8 µs/word	5 µs/word	4 µs/word
Copy time for distributed I/O via PROFIBUS	0.5 µs/word	0.5 µs/word	0.4 µs/word	0.3 µs/word
Copy time for distributed I/O via PROFINET	0.5 µs/word	0.5 µs/word	0.4 µs/word	0.3 µs/word

3.2.2.2 User program execution time

Introduction

Organization blocks or system activities with higher priority interrupt organization blocks or system activities with lower priority, and thus extend their runtime.

Program execution time without interruptions

The user program has a certain runtime without interruptions. The runtime depends on the number of operations that are executed in the user program.

The following table contains the typical durations of operations.

Table 3- 2 Duration of an operation

	S7-1500

Note

Instruction "RUNTIME"

You can measure the runtimes of program sequences with the instruction "RUNTIME".

Extension due to nesting of higher-priority OBs and/or interrupts

The interruption of a user program at the end of an instruction by a higher-priority OB causes a certain basic time expenditure. Take account of this basic time expenditure in addition to the update time of the assigned process image partitions and the execution time of the contained user program. The following tables contain the typical times for the various interrupts and error events.

Table 3- 3 Basic time expenditure for an interrupt

3.2.2.3 Extension of cycle time due to communication load

Impact of communication on the cycle time

In the sequence model of the CPU, communication tasks are processed with priority 15. All program parts with priority > 15 (e.g. for Motion Control functions) are unaffected by communication.

Configured communication load

The CPU operating system provides the maximum specified percentage of total CPU processing power for communication tasks. The communication load is preset in STEP 7 at 50%, for example, for the CPUs of the S7 series. If the processing power is not needed for communication, then the processing power is available to the operating system and the user program.

Communication is allocated the requisite computing time in 1 ms increments, with priority 15. At 50% communication load, 500 µs of each 1 millisecond are used for communication.

The following formula may be used to estimate the extension of the cycle time by communication.

$$\text{Actual cycle time} = \text{Cycle time without communication} \times \frac{100}{100 - \text{"configured communication load in \%"}}$$

Figure 3-5 Formula: Impact of communication load

With a complete use of the communication load of 50% (default), the following value results:

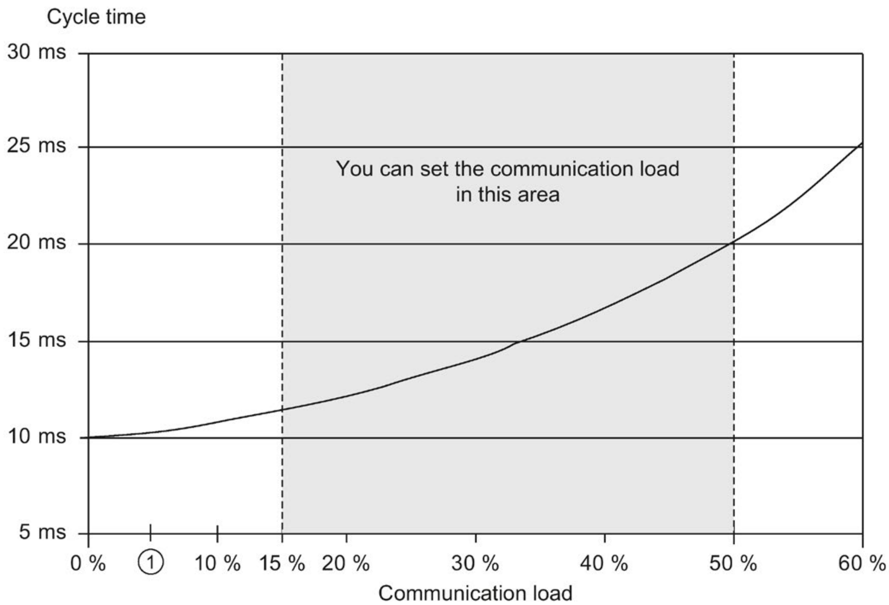
$$\text{Actual cycle time} = \text{Cycle time without communication} \times 2$$

Figure 3-6 Extension of cycle time due to communication load

The actual cycle time is up to twice as long as the cycle time without communication when you use the default communication load.

Dependency of maximum cycle time on the configured communication load

The diagram shows the nonlinear relationship between maximum cycle time and configured communication load with a pure cycle time of 10 ms. No interruptions occur in the example.



① CPUs 1516T(F)-3 PN/DP, 1517(F)-3 PN/DP, CPU 1517T(F)-3 PN/DP, CPU 1518(F)-4 PN/DP, 1518(F)-4 PN/DP MFP: The (minimum) communication load that can be set is 5%.

Figure 3-7 Maximum cycle time depending on the configured communication load

The described influence of the communication load on the execution time applies to all OBs with a priority < 15.

Reducing the cycle time with a lower communication load

You can reduce the setting for the communication load in the hardware configuration. If you set a communication load of 20% instead of 50%, for example, the cycle time extension due to the communication is reduced from a factor of 2 to 1.25.

Effect on the actual cycle time

Communication is only one cause of extension of the cycle time. All configured events that extend the cycle time (e.g. hardware interrupts) mean that more asynchronous events can occur within a cycle. These asynchronous events further extend the cyclic program. The extension depends on the number of events that occur and are processed in the cycle.

Note

Checking parameter changes

- Check the effects of a value change on the "Cycle load due to communication" parameter during system operation. You can use the "RT_INFO" instruction to determine which portions of runtime are used for communication and the user program.
- Take the communication load into consideration when setting the maximum cycle time to prevent time errors (for example, exceeding the cycle time within a cycle) from occurring.

Tips

Whenever possible, use the default setting for the configured communication load.

If you reduce the value of the communication load, keep in mind that communication tasks are interrupted by higher-priority OBs. This means it will also take longer to process the communication.

3.2.2.4 Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2)

If you configure the PROFINET IO communication at the 2nd PROFINET interface (X2) on the following CPUs as of firmware version 2.0, an additional system load occurs:

- CPU 1515(F)-2 PN
- CPU 1515T(F)-2 PN
- CPU 1516(F)-3 PN/DP
- CPU 1516(F)pro-2 PN
- CPU 1516T(F)-3 PN/DP

This additional system load has priority 26 and extends the runtime of the program. The execution of synchronous cycle interrupts or hardware interrupts, for example, can be delayed as a result.

The additional system load depends on:

- Communication traffic at the 2nd PROFINET interface (X2)
  The communication traffic at the interface in frames per second causes communication load as well as system load. You cannot limit the communication traffic using the "Communication load" parameter.
- Number of IO devices which the CPU at the 2nd PROFINET interface (X2) updates within a millisecond

You determine the additional system load with the "RT_INFO" (read RUNTIME statistics) instruction at the Mode parameter with mode 10 or mode 20.

Reducing additional system load

You reduce the communication load at the 2nd PROFINET interface, e.g. with:

- Fewer HMI devices or slower update cycles of the HMI devices
- Less or slower communication with other CPUs

Increase the update times in STEP 7 for all IO devices that are assigned to the 2nd PROFINET interface (X2):

1. Select the "IO Communication" in the "Network view" of STEP 7.
2. Set the "Update mode" parameter to "Adjustable".
3. Select a higher value for the "Update time [ms]" parameter in the drop-down list.
4. Repeat this setting for the other IO devices.

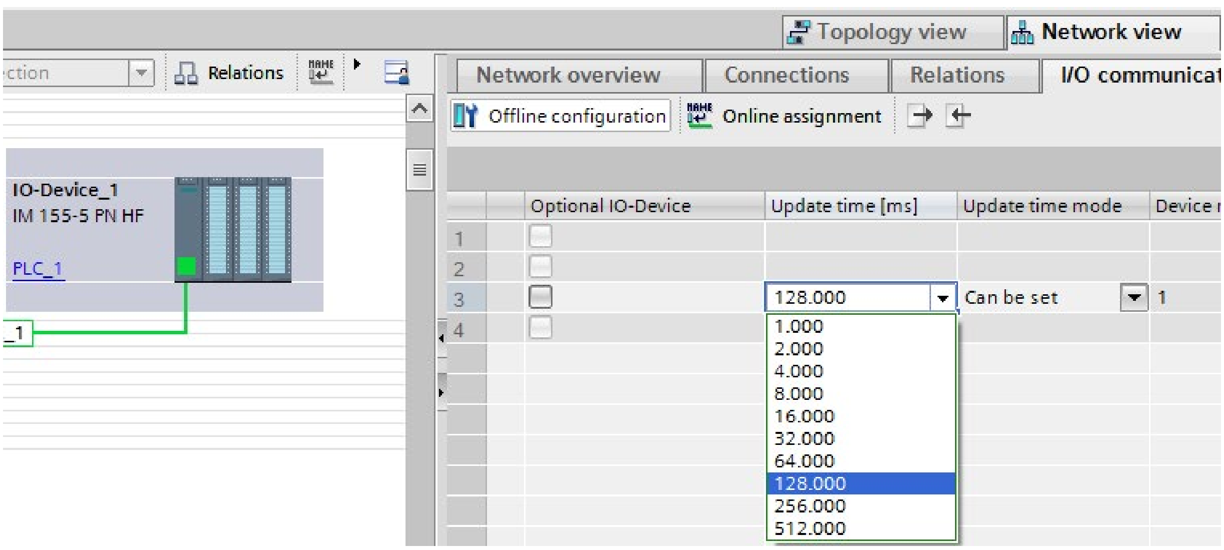


Figure 3-8 Increasing update times

3.3 Time-driven program execution in cyclic interrupts

With a cyclic interrupt you have the option of having a specific OB processed in a time interval. The time interval is independent of the execution time of the cyclic program. A priority from 2 to 24 can be selected for the cyclic interrupt. This makes the priority of cyclic interrupts higher than the priority of the cyclic program. A cyclic interrupt increases the execution time of the cyclic program.

Tip: By shifting program sections to cyclic interrupts, you can reduce the response times or better adapt them to your requirements.

In STEP 7 the organization blocks OB 30 to OB 38 are intended for processing cyclic interrupts. You can create additional cyclic interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Cyclic interrupt

A cyclic interrupt is an interrupt initiated according to a defined cycle that causes a cyclic interrupt OB to be processed. A cyclic interrupt OB is assigned to the "Cyclic interrupt" event class.

Cycle of a cyclic interrupt

The cycle of a cyclic interrupt is defined as the time from the call of a cyclic interrupt OB to the next call of a cyclic interrupt OB.

The following figure shows an example of the cycle of a cyclic interrupt.

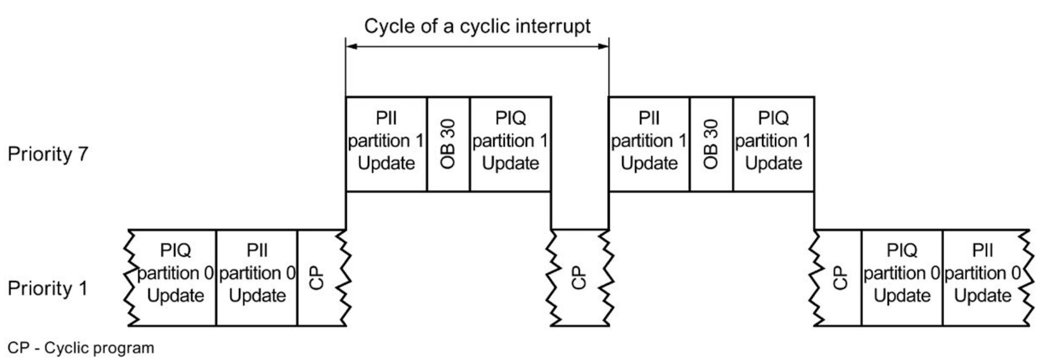

Figure 3-9 Call interval of a cyclic interrupt

Accuracy of a cyclic interrupt

Even if a cyclic interrupt is not delayed by a higher-priority OB or communication activities, the accuracy with which it is started is nevertheless subject to system-dependent fluctuations.

The following table shows the accuracy with which a cyclic interrupt is triggered:

Table 3- 5 Accuracy of cyclic interrupts

	S7-1500

3.4 Response time for cyclic and time-driven program execution

Introduction

In this section you learn:

- How the response time is composed
- How to calculate the response time

Definition

The response time in the case of cyclic or time-controlled program execution is the time between the detection of an input signal and the change of a connected output signal.

Fluctuation in the response time of the CPU

The actual response time of the CPU fluctuates between one and two cycles for cyclic program execution and between one and two cyclic interrupt cycles for time-controlled program execution.

You should always assume the longest response time when configuring your system.

The following figure shows the shortest and longest response times of the CPU to an event.

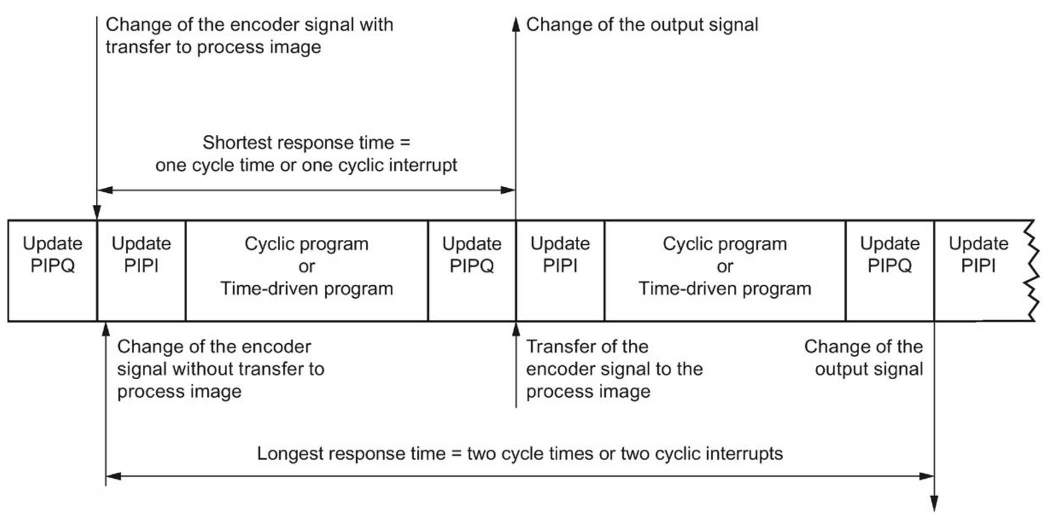

Figure 3-10 Shortest and longest response times of the CPU

Factors

To determine the process response time, you must take account of the following factors in addition to the CPU response time described above:

- Delay of the inputs and outputs at the I/O module
- Switching times of the sensors and actuators used
- Update times for PROFINET IO or DP cycle times on PROFIBUS DP; update time of the backplane bus for ET 200SP CPUs

Delay at the inputs and outputs of the modules

The delay and cycle times can be found in the technical specifications of the I/O modules.

Update times for PROFINET IO and DP cycle times on PROFIBUS DP

When distributed I/O is used, the maximum response time is additionally extended by the bus transmission times of PROFIBUS or PROFINET. These bus transmission times occur during both the reading and output of the process image partitions. The bus transmission times correspond to the bus update cycle of the distributed device.

PROFINET IO

If you use STEP 7 to configure your PROFINET IO system, STEP 7 calculates the update time. To display the update time, follow these steps:

- Select the PROFINET interface of the I/O module.
- In the General tab, select "Advanced options > Real time settings > IO cycle".

The update time is displayed in the "Update time" field and can be set for each IO device.

PROFIBUS DP

If you use STEP 7 to configure your PROFIBUS DP master system, STEP 7 calculates the DP cycle time. To display the DP cycle time, follow these steps:

- Select the PROFIBUS subnet in the network view.
- In the General tab of the Inspector window, navigate to the Bus parameters.

The DP cycle time is displayed in the "Parameters" field at "Typical Ttr".

The following figure illustrates the additional bus runtimes using distributed I/O.

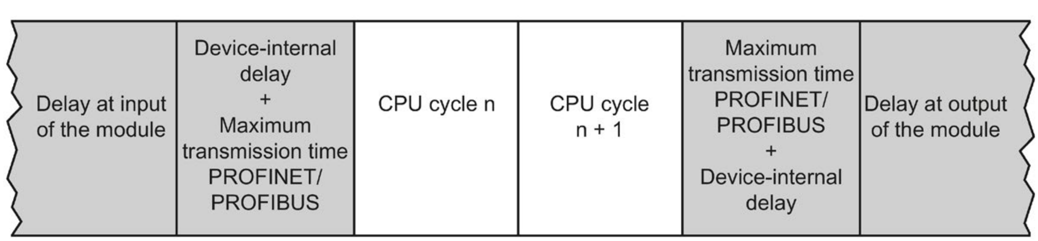

Figure 3-11 Additional bus runtimes with distributed I/O

A further optimization of the response times is achieved by using isochronous mode.

Update time of the backplane bus for ET 200SP CPUs

The following table shows the central (typical) update times of the backplane bus for the ET 200SP CPUs.

Table 3- 6 Update time of the ET 200SP CPUs

	Update time of the CPU		
	ET 200SP		
	1510SP(F)-1 PN	1512SP(F)-1 PN	1515SP(F)-PC
Update time for central I/O	250 μs to 1 ms, depending on number and type of central I/O modules[1]		

[1] The duration of the update time depends on the number of the I/O modules and their type (ST, HF, HS). The update time is set at 1 ms for a max. central I/O configuration with standard I/O modules. You can reduce the update time down to 250 μs, for example, by using HF I/O modules and by reducing the number of modules.

The table below is an orientation guide. It shows the approximate relationship between the number of ET 200SP I/O modules and the bus cycle that is used. As an example, 8 bytes of I/O data per I/O module are assumed in the table.

Number of ET 200SP I/O modules	Input data (bytes)	Output data (bytes)	Used bus cycle (μs)
8	64	64	250
16	128	128	250
24	192	192	281.25
32	256	256	312.5
40	320	320	343.75
48	384	384	375
56	448	448	406.25
64	512	512	437.5

For I/O modules with more than 32 bytes of I/O data, the bus cycle is calculated with an I/O module of 32 bytes. In this case the I/O module requires multiple bus cycles to update its I/O data.

3.5 Summary of response time with cyclic and time-controlled program execution

Estimation of the shortest and longest response time

The following formulas may be used to estimate the shortest and longest response time:

Estimation of the shortest response time

The shortest response time is the sum of:

	1 x delay of the input/output module for inputs
+	1 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for the ET 200SP CPUs)
+	1 x transfer time of the process image input
+	1 x execution of the user program
+	1 x transfer time of the process image output
+	1 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for the ET 200SP CPUs)
+	1 x delay of the input/output module for outputs
=	**Shortest response time**

* Time is dependent on the configuration and the extent of the network.

The shortest response time is equivalent to the sum of the cycle time plus the input and output delay times.

Estimation of the longest response time

The longest response time is the sum of:

1 x delay of the input/output module for inputs
+ 2 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for the ET 200SP CPUs)
+ 2 x transfer time of the process image input
+ 2 x execution of the user program
+ 2 x transfer time of the process image output
+ 2 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for the ET 200SP CPUs)
+ 1 x delay of the input/output module for outputs

= Longest response time

* Time is dependent on the configuration and the extent of the network.

The longest response time is equivalent to the sum of twice the cycle time plus the delay times of the inputs and outputs. Twice the update time for PROFINET IO or twice the DP cycle time on PROFIBUS DP is added to the longest response time.

Event-driven program execution 4

4.1 Response time of the CPUs when program execution is event-controlled

Introduction

Hardware interrupts are used to detect events in the process in the user program and to react to them with an appropriate program. In STEP 7, the organization blocks OB 40 to OB 47 are intended for processing hardware alarms. You can create additional hardware interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Hardware interrupt

A hardware interrupt is an interrupt that occurs during the running program execution, due to an interrupt-triggering process event. The operating system calls the assigned interrupt OB; as a result, the execution of the program cycle or of lower priority program parts is interrupted. A hardware interrupt OB is assigned to the "Hardware interrupt" event class.

Interrupt response times of the CPUs for hardware interrupts

The interrupt response time starts with the occurrence of a hardware interrupt event in the CPU. The interrupt response time ends with the start of processing of the assigned hardware interrupt OB.

This time is subject to system-inherent fluctuations, and this is expressed using a minimum and maximum interrupt response time.

The following table contains the length of the typical response times of the CPUs for hardware interrupts.

Table 4- 1 Response times of the CPUs for hardware interrupts

		S7-1500			
		1511(F)-1 PN 1511T(F)-1 PN 1511C-1 PN 1512C-1 PN 1513(F)-1 PN	1515(F)-2 PN 1515T(F)-2 PN 1516(F)-3 PN/DP 1516T(F)-3 PN/DP	1517(F)-3 PN/DP 1517T(F)-3 PN/DP	1518(F)-4 PN/DP 1518(F)-4 PN/DP MFP
Interrupt response times	Min.	100 µs	90 µs	30 µs	20 µs
	Max.	400 µs	360 µs	120 µs	90 µs

		S7-1500R/H* in RUN-Solo system state		
		1513R-1 PN	1515R-2 PN	CPU 1517H-3 PN
Interrupt response times	Min.	100 µs	90 µs	30 µs
	Max.	400 µs	360 µs	120 µs

* Additional information about cycle and response times of R/H CPUs is available in the section "Cycle and response times of the S7-1500R/H redundant system"

		ET 200SP		
		1510SP(F)-1 PN	1512SP(F)-1 PN	1515SP(F)-PC
Interrupt response times	Min.	100 µs	100 µs	90 µs
	Max.	400 µs	400 µs	360 µs

		ET 200pro
		1516pro(F)-2 PN
Interrupt response times	Min.	90 µs
	Max.	360 µs

The specified times are extended:

- If higher-priority interrupts are queued for execution
- If the hardware interrupt OB is assigned to a process image partition

You can find these times in the tables in the section "Extension due to nesting of higher-priority OBs and/or interrupts" in the chapter User program execution time (Page 31).

If you need fast interrupt response times, do not assign a process image partition to the hardware interrupt OB and use direct access in the hardware interrupt OB.

You can find additional information on determining response times for PROFINET in the application example with the entry ID 21869080 on the Service&Support (http://support.automation.siemens.com/WW/view/en/21869080) Internet page.

Influence of input modules on the interrupt response times of hardware interrupts

Digital input modules:

Interrupt response time of hardware interrupts = internal interrupt processing time + input delay (see section Technical specifications in the relevant manual)

Analog input modules:

Interrupt response time of hardware interrupts = internal interrupt processing time + conversion time (see section Technical specifications in the relevant manual)

Impact of communication on interrupts

Communication tasks are always processed by the CPU with priority 15. If you do not want the interrupt execution to be delayed or interrupted by communication, configure the interrupt execution with priority > 15. The default setting for interrupt execution is priority 16.

Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2)

Additional information on this is available in section Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2) (Page 38).

4.2 Process response time when program execution is event-driven

When program execution is event-driven, the process response time is determined by the following:

- Delay times of the input and output modules used
- Update times for PROFIBUS/PROFINET for distributed modules; update time of the backplane bus for ET 200SP CPUs
- Interrupt response time of CPU
- Runtimes of the interrupt OB including update of the process image partition

The following figure shows the individual execution steps for event-driven program execution.

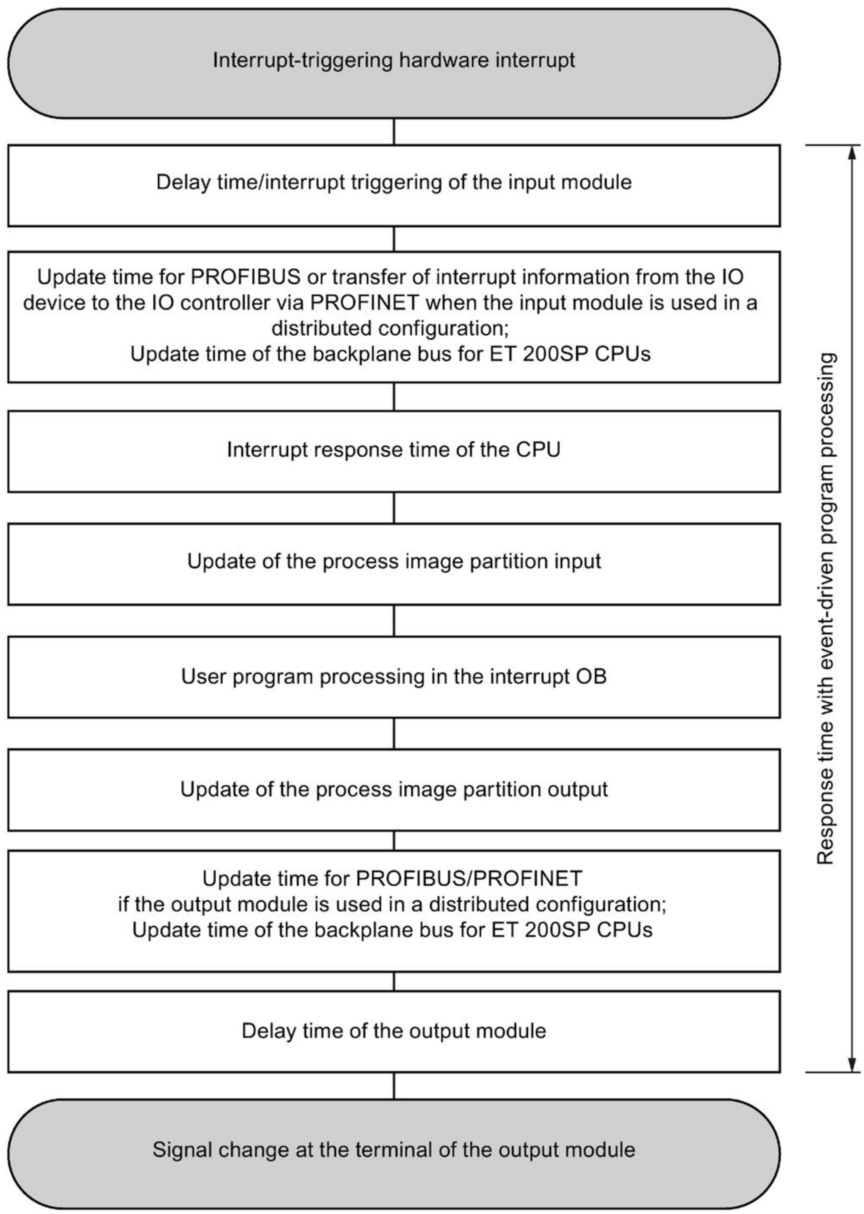

Figure 4-1 Schematic representation of event-driven program execution

Cycle and response times of the S7-1500R/H redundant system 5

5.1 Introduction

CPUs of the S7-1500R/H redundant system are designed as being redundant. The goal of the redundant configuration is to avoid production downtimes. When a CPU fails, the other CPU maintains control over the process.

Compared to non-redundant CPUs, the CPUs of the S7-1500R/H redundant system have the following special features:

- Longer cycle and response times
- Specific operating and system states
- Additional load and delays through synchronization

Contents of this section

This section describes the effects of the mode of operation of the S7-1500R/H redundant system on the cycle and response times.

It also describes how to estimate and control the cycle response times of the CPUs. This prevents excessive cycle times.

Note

Classification of this chapter

The statements in the previous chapters describe the response of an individual CPU.

The section "Cycle and response times of the S7-1500R/H redundant system" supplements the information of the previous sections with information on the S7-1500R/H redundant system.

5.2 Maximum cycle time and time errors

Maximum cycle time

As with non-redundant CPUs, you can parameterize a high limit of the cyclic program by setting the maximum cycle time.

The cycle time of redundant CPUs is usually longer as compared to non-redundant CPUs.

The factor by which the cycle time for redundant CPUs is higher than that for non-redundant CPUs depends very strongly on your specific automation task.

Note

Maximum cycle time in SYNCUP system state

The length of the parameterized maximum cycle time also affects the SYNCUP system state.

If the following condition is fulfilled during the SYNCUP, the system initiates a transition to RUN-Redundant:
The actual cycle time is ≤ 80% of the maximum cycle time over several cycles.

More information on this is available in section Influences on the cycle time in SYNCUP system state (Page 55).

Maximum cycle time in RUN-Redundant system state

On the failure of one of the two CPUs, the cycle time also contains a dead time of up to 300 ms for R-CPUs and up to 50 ms for the H-CPU. You must schedule this time as cycle time reserve in case of failure of one of the two CPUs. Therefore, ensure that the longest cycle time plus this dead time is < 60% of the configured maximum cycle time in RUN-Redundant system state. By doing so, you prevent the parameterized maximum cycle time from being exceeded in case of load fluctuations and delays due to synchronization.

Time error

As with non-redundant CPUs, you can specify the response to a time error for the CPUs of the S7-1500R/H redundant system. In RUN-Solo system state, the redundant CPUs behave like non-redundant CPUs when the maximum cycle time is exceeded (see section Cycle time (Page 24)).

In the SYNCUP and RUN-Redundant system states the redundant CPUs behave as follows:

Behavior without OB 80

Without loaded OB 80 the backup CPU switches to STOP operating state after a maximum cycle time has been exceeded once in the same cycle.

Note

System state change after STOP without OB 80

The primary CPU also switches to STOP after the maximum cycle time has been exceeded twice in the same cycle.

Behavior with OB 80

When OB 80 is loaded, the backup CPU switches to STOP operating state after the maximum cycle time has been exceeded twice in the same cycle.

Note

System state change after STOP with OB 80

The primary CPU also switches to STOP after the maximum cycle time has been exceeded three times in the same cycle.

Ensure that the actual maximum cycle time is < 60% of the parameterized maximum cycle time.

Switchover of the backup CPU to STOP operating state when the maximum cycle time is exceeded

A switchover of the backup CPU to STOP operating state reduces the synchronization load and stabilizes the primary CPU.

5.3 Influences on the cycle time of the S7-1500R/H redundant system

5.3.1 Influences on the cycle time in RUN-Solo system state

RUN-Solo system state

In RUN-Solo system state, the primary CPU is in RUN operating state. The primary CPU executes the cyclic, time- and interrupt-controlled program execution on its own. The backup CPU is in STOP operating state, is switched off or defective.

Influence on the cycle time

In RUN-Solo system state, the primary CPU behaves exactly the same as a standard CPU (non-redundant CPU) with regard to cycle time monitoring. Additional information on this is available in section "Cycle time (Page 24)".

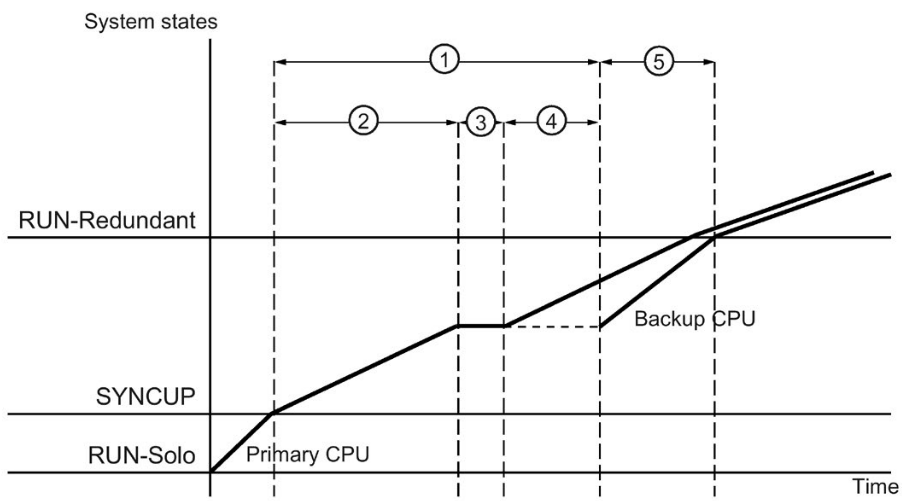
5.3.2 Influences on the cycle time in SYNCUP system state

SYNCUP system state

In SYNCUP system state, the primary CPU is in RUN-Syncup operating state. The backup CPU is in SYNCUP operating state. The task of the SYNCUP system state is to synchronize the data of both CPUs so that the CPUs can subsequently work redundantly.

Influence on the cycle time

The figure below shows the chronological behavior of primary CPU and backup CPU during the SYNCUP system state.



① Synchronization of data from the primary CPU to the backup CPU
② Copying the load memory and terminating the asynchronous instructions
③ Snapshot of the work memory contents
④ Transfer of the work memory contents to the backup CPU
⑤ Backup CPU makes up the time lag to the primary CPU

Figure 5-1 Effects of the SYNCUP on the cycle times of the CPUs

In SYNCUP system state, all relevant data is synchronized from the primary CPU to the backup CPU. At the end of SYNCUP, the backup CPU makes up the time lag to the primary CPU caused by the synchronization.

CAUTION

SYNCUP system state

- The synchronization of data, in particular the snapshot of the work memory contents, extends the cycle time. In addition, no test and commissioning functions can be carried out during the SYNCUP.
- During SYNCUP, hardware interrupts are processed with a very significant delay.
- The cycle time increases greatly during the transition from SYNCUP system state to RUN-Redundant.

Therefore, only execute the SYNCUP during uncritical process states.

① Synchronization of data from the primary CPU to the backup CPU

During this phase all relevant contents of the load memory, work memory, and system memory of the primary CPU are synchronized to the backup CPU.

② Copying the load memory and terminating the asynchronous instructions

The primary CPU copies parts of its load memory from its SIMATIC memory card to the SIMATIC memory card of the backup CPU. The backup CPU restarts and automatically switches to SYNCUP operating state. The backup CPU copies the transferred load memory contents to its work memory. Data blocks, process image, etc. are immediately overwritten with current data from the primary CPU.

③ Snapshot of the work memory contents

The primary CPU saves a consistent snapshot of its work memory contents at the next cycle control point.

④ Transfer of work memory contents to the backup CPU

During this phase the consistent snapshot is transferred from the primary CPU to the backup CPU. The transfer of the work memory contents extends the cycle time. The time required for the transfer of the work memory contents depends on the performance capability of the CPU and the amount of work memory data.

⑤ Backup CPU makes up the time lag to the primary CPU

During this phase the backup CPU makes up the time lag in program execution to the primary CPU. As in redundant mode, events are already synchronized during this phase as needed.

Note

No switchover possible during SYNCUP

If a fault occurs in the primary CPU during SYNCUP, no switchover to the backup CPU is possible. The SYNCUP is canceled and the backup CPU returns to STOP operating state.

Switchover from SYNCUP to RUN-Redundant

The system checks continuously which cycle time would result from a change to the RUN-Redundant system state. If this cycle time would be ≤ 80% of the maximum cycle time over multiple cycles, the transition is initiated.

Note

Determination of the cycle time during the SYNCUP

You can track the progress of the SYNCUP on the display of the primary CPU and backup CPU. At each cycle control point the backup CPU sends a status message on its program progress to the primary CPU. The display of the primary CPU indicates the duration of the time lag of the backup CPU.

In addition to viewing the progress in the displays, the progress of the SYNCUP can also be read out using the "RT_INFO" instruction.

Reasons for cancellation of the SYNCUP

Possible causes for the cancellation of the SYNCUP are:

- The load of the user program or the load on the redundancy connections between primary and backup CPU is too high
- The maximum cycle time of the primary CPU was exceeded

An overview of all reasons for the cancellation of the SYNCUP and remedial measures is available in the system manual S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833).

Disable SYNCUP

To avoid the described effects of the SYNCUP on the cycle times during critical process states, use the instruction "RH_CTRL".

The "RH_CTRL" instruction can be used to disable the SYNCUP system state for the S7-1500R/H redundant system. If the disable is no longer required, the "RH_CTRL" instruction can be used to enable the SYNCUP system state once again.

More information on the "RH_CTRL" instruction is available in the system manual S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833).

Minimum cycle time

It is often necessary to set a longer minimum cycle time for the CPUs of the S7-1500R/H redundant system than for those of the non-redundant CPUs.

Recommendation: Select the minimum cycle time so that the cyclic program does not have to be executed more frequently than your process requires. A longer minimum cycle time that has been adapted to your process optimizes the entire system. The computing power that is available per cycle by extending the minimum cycle time is then available for system tasks such as communication.

Note

Too low cycle times

Cycle times that are too low can result in an excessive synchronization load and thus terminate the SYNCUP.

5.3.3 Influences on the cycle time in RUN-Redundant system state

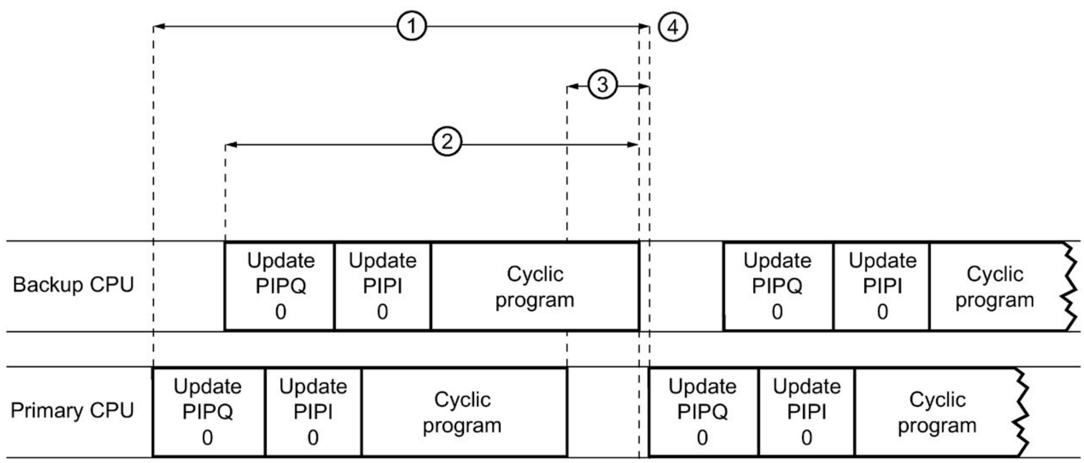
RUN-Redundant system state

In RUN-Redundant system state, the primary CPU guides the process. The primary CPU continuously synchronizes itself with the backup CPU. In the event of a failure of the primary CPU, the backup CPU adopts its role and thus control over the process.

Cycle time without interruption of the cyclic program

In RUN-Redundant system state, the backup CPU has a time lag compared to the primary CPU. This time lag results from the time required for event-controlled synchronization of data from the primary CPU to the backup CPU.

The following figure shows the phases which the CPUs run through without an interruption of the cyclic program.



① Cycle time
② Cycle of the backup CPU
③ Time lag
④ Cycle end and start of the next cycle (cycle control point)

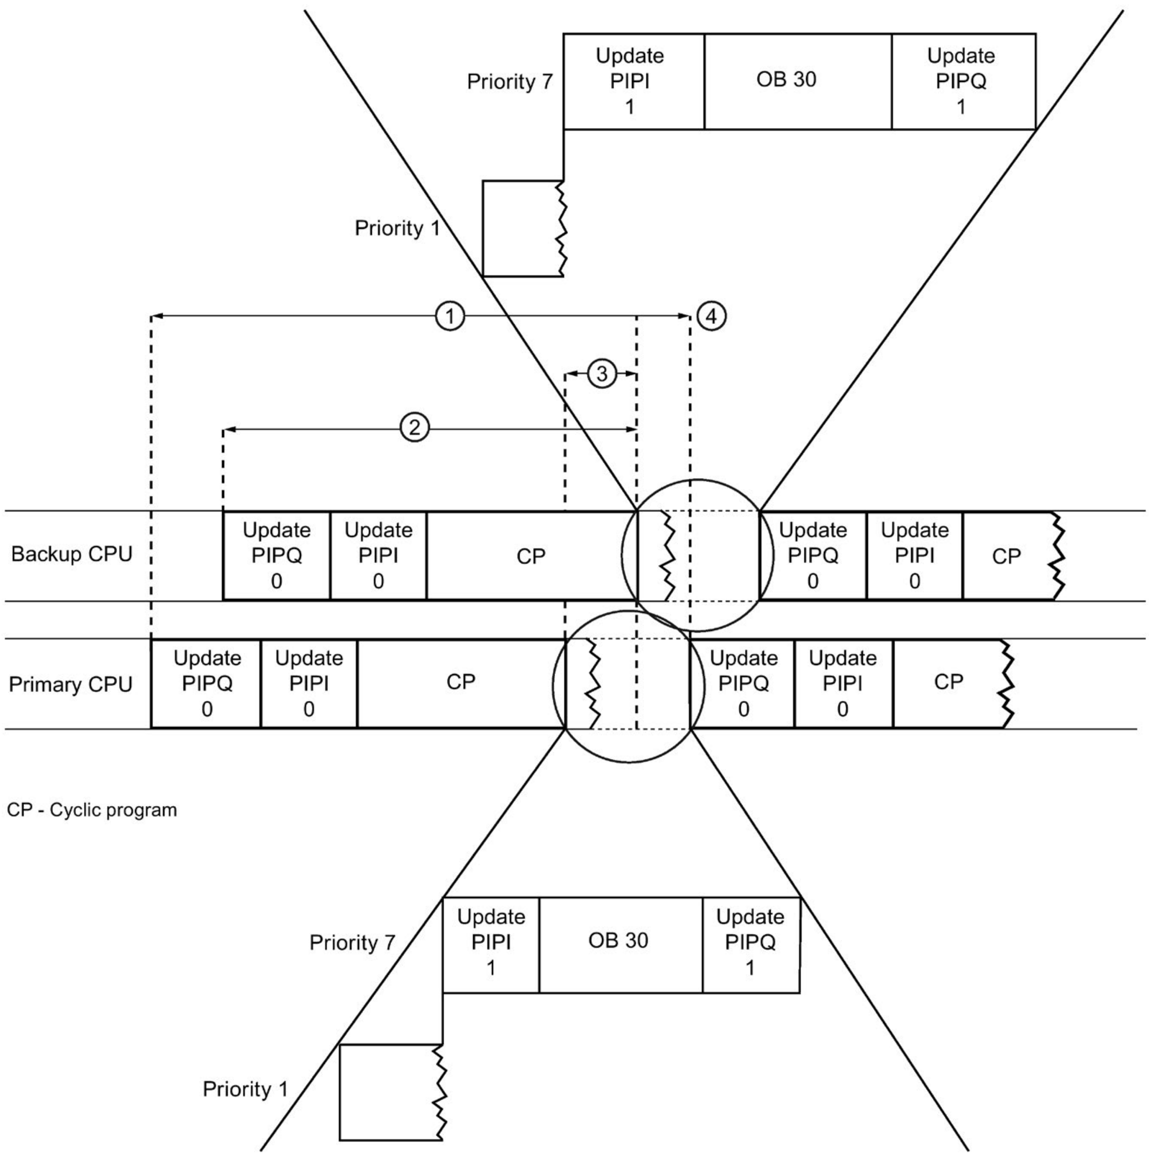
Figure 5-2 Cycle time without interruption of the cyclic program

The cycle time ① includes the cycle of the backup CPU ② and the time lag ③ of the backup CPU compared to the primary CPU. The time lag results from the time required for the synchronization of the data between primary CPU and backup CPU. The synchronization between primary CPU and backup CPU occurs automatically if required. The more data has to be synchronized between the CPUs during a cycle, the greater the time lag. The program cycle ends as soon as the backup CPU has reached the end of its cyclic program. The primary CPU starts the next cycle as soon as the backup CPU reports the cycle end to the primary CPU ④.

Extension of the cycle

As with non-redundant CPUs, an occurring event and the associated OB can extend the cycle. Events can occur both during the execution of the cyclic program and during the time lag.

In the following example the CPU must process a higher-priority OB (OB 30 with priority 7), while the primary CPU waits for the end of the cycle of the backup CPU. The figure below shows the phases which the CPUs run through in such a case.



① Cycle time
② Cycle of the backup CPU
③ Time lag
④ Cycle end and start of the next cycle (cycle control point)

Figure 5-3 Processing of a higher-priority OB

Execution of the cyclic program (CP with priority 1) is complete. While the primary CPU waits for the end of the cycle of the backup CPU, a higher priority OB (OB 30 with priority 7) starts. The primary CPU starts the next cycle as soon as the following conditions have been fulfilled:

- The primary CPU has received the message from the backup CPU that the backup CPU has finished processing the cyclic program.
- The primary CPU has processed OB 30 and updated PIPQ1.

Note

Due to the change of the run level and the synchronization, interruptions of the program cycle by higher-priority OBs result in a higher load. Interruptions of the program cycle extend the cycle time.

Differences between the synchronization times

The available bandwidth has a significant impact on the synchronization time.

With the R-CPUs both the synchronization of data and the synchronization of communication tasks operate over the PROFINET ring. 25% of the bandwidth is reserved for the synchronization.

With the H-CPU, synchronization works independently of the PROFINET ring over fiber optic cables. The full bandwidth on the PROFINET cable is available for PROFINET IO communication.

The table below provides an overview of performance features of R-CPUs and H-CPU.

Table 5- 1 Performance features of S7-1500R and S7-1500H

<table>
<tr><th rowspan="2"></th><th colspan="2">S7-1500R</th><th>S7-1500H</th></tr>
<tr><th>CPU 1513R-1 PN</th><th>CPU 1515R-2 PN</th><th>CPU 1517H-3 PN</th></tr>
<tr><td rowspan="2">Performance</td><td colspan="2">• Data transfer rate of 100 Mbps (for synchronization and communication)</td><td rowspan="2">• Significantly greater performance than S7-1500R due to
– Separate redundancy connections over fiber-optic cables
– Greater computing power
• Transmission rate of 1 Gbps (for the synchronization)
• Data work memory: max. 8 MB
• Code work memory: max. 2 MB</td></tr>
<tr><td>• Data work memory: max. 1.5 MB
• Code work memory: max. 300 KB</td><td>• Data work memory: max. 3 MB
• Code work memory: max. 500 KB</td></tr>
<tr><td>Hardware</td><td colspan="2">• The CPUs are identical in design with the respective S7-1500 standard versions.
• The synchronization of the CPUs takes place over the PROFINET ring.
• The H-Sync-Forwarding function is recommended for all devices in the PROFINET ring.
• Part of the bandwidth on the PROFINET cable is used to synchronize the CPUs. Less bandwidth is therefore available for PROFINET IO communication.</td><td>• The CPUs each have two optical interfaces.
• The synchronization of the CPUs operates independently of the PROFINET ring over fiber-optic cables.
• The full bandwidth on the PROFINET cable is available for PROFINET IO communication.</td></tr>
</table>

Technical specifications

More information about the technical specifications is available in the manuals of the specific CPUs.

5.3.4 Influences on the cycle time when a CPU fails

If one of the two CPUs fails during redundant operation, the other CPU controls the process alone. If a CPU fails, the system state switches from RUN-Redundant to RUN-Solo. The CPU continues executing the user program in RUN operating state.

Note

Dead time in case of a CPU failure

On the failure of a CPU, the cycle time also contains a dead time of up to 300 ms for R-CPUs and up to 50 ms for the H-CPU. You must schedule this time as cycle time reserve for a CPU failure.

To avoid excessive cycle times after a CPU failure, further increase the maximum cycle time by this value.

Note

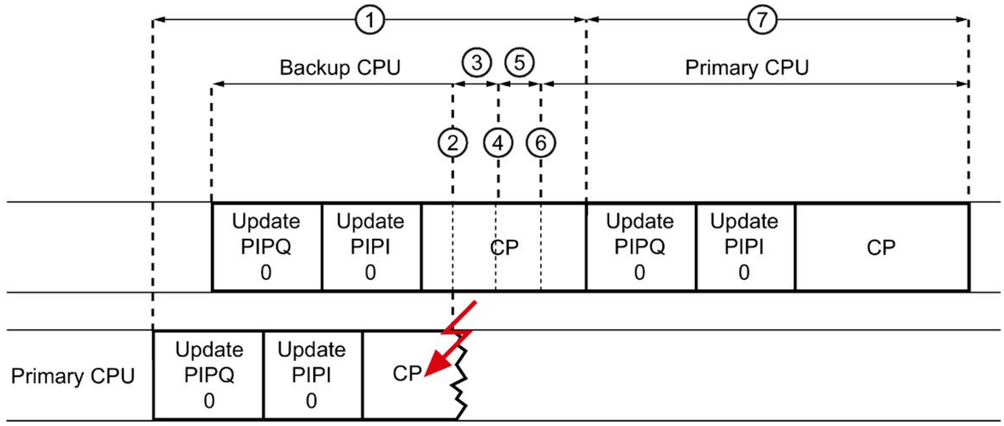
Change of the system state from RUN-Redundant to Run-Solo by the user

If you deliberately trigger a change of the system state, e.g. by switching the backup CPU to STOP via the display, this will also extend the cycle time. However, the cycle time will not increase to the same extent as with switchover of the CPUs in the event of an error (failure of one of the CPUs).

Information on the causes for the failure of a CPU is available in the S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual.

Failure of the primary CPU

The figure below shows the impact of the failure of the primary CPU on the cycle time.



CP - Cyclic program

① Cycle time
② Failure of the primary CPU
③ Backup CPU continues processing the program
④ Backup CPU no longer receives synchronization telegrams
⑤ Backup CPU waits for the monitoring time to expire
⑥ End of the monitoring time, switchover time and system state transition
⑦ Cycle time of the new primary CPU in RUN operating state

Figure 5-4 Impact of the failure of the primary CPU on the cycle time

The example shows the failure of the primary CPU ② while it is processing the cyclic program. The primary CPU no longer sends any synchronization telegrams to the backup CPU. During the period ③, the backup CPU continues operating only on the basis of the synchronization data transferred before the failure of the primary CPU. At ④, the backup CPU has reached the point in the program where the primary CPU stopped sending synchronization telegrams. During the phase ⑤, the backup CPU waits to see whether data will again be sent from the primary CPU after all. Because the synchronization data is not transferred even after the monitoring time has expired, the backup CPU becomes the new primary CPU at point ⑥. The redundant system switches from RUN-Redundant system state to RUN-Solo system state.

The cycle time ① extends from the time processing of the cyclic program is started in RUN-Redundant to the time when processing of the cyclic program ends in RUN-Solo.

Because data can no longer be synchronized in the RUN-Solo system state, the cycle time ⑦ is shorter than the cycle time ①.

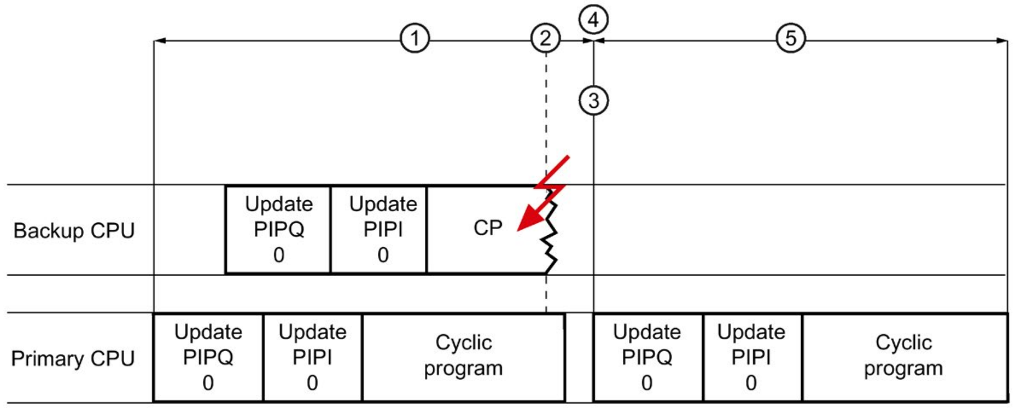
Note

Monitoring time

The monitoring time is an internal time with fixed duration. You cannot assign parameters for the internal time. The monitoring time starts as soon as the synchronization data arrives at the backup CPU. If no synchronization data is received from the primary CPU, the system automatically performs a system state change after the monitoring time has expired.

Failure of the backup CPU

The figure below shows the impact of the failure of the backup CPU on the cycle time.



CP = Cyclic program

① Cycle time
② Failure of the backup CPU
③ Expiration of the monitoring time
④ System status transition
⑤ Cycle time of the primary CPU in RUN-Solo operating state

Figure 5-5 Impact of the failure of the backup CPU on the cycle time

The backup CPU fails before processing of the cyclic program has ended ②. The primary CPU detects the failure of the backup CPU because no synchronization data has been received until the monitoring time ③ has expired. The primary CPU terminates the synchronization with the backup CPU. The redundant system switches from RUN-Redundant system state to RUN-Solo system state ④.

Because no more data can be synchronized in RUN operating state, the cycle time ⑤ is shorter than the cycle time ①.

5.4 Response time of R/H CPUs

Relationship between the cycle time and response time

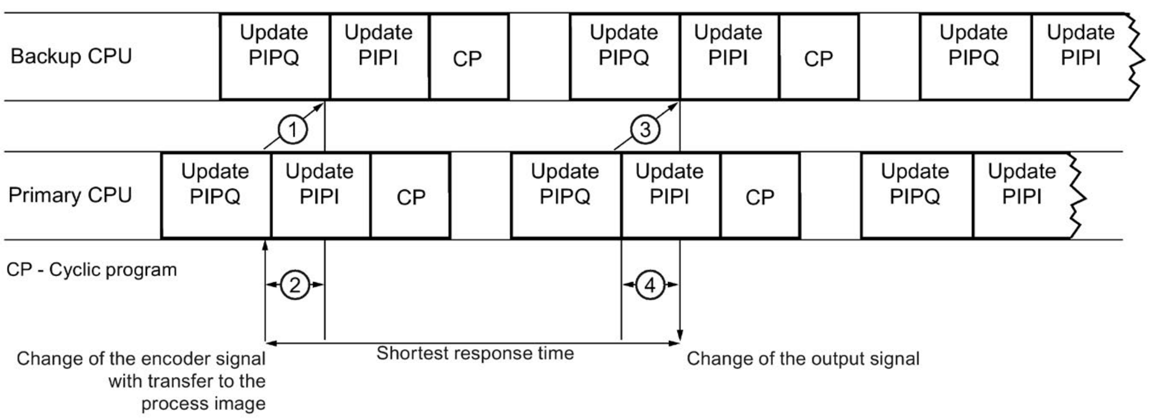
The cycle time of the system also forms the basis for its response time. The response time depends, among other things, on the cycle time of the individual program cycles.

Fluctuation of the response time

The actual response time fluctuates between one and two cycles during cyclic program execution. The actual response time fluctuates between one and two cyclic interrupt cycles for time-controlled program execution.

You should always assume the longest response time when configuring your system.

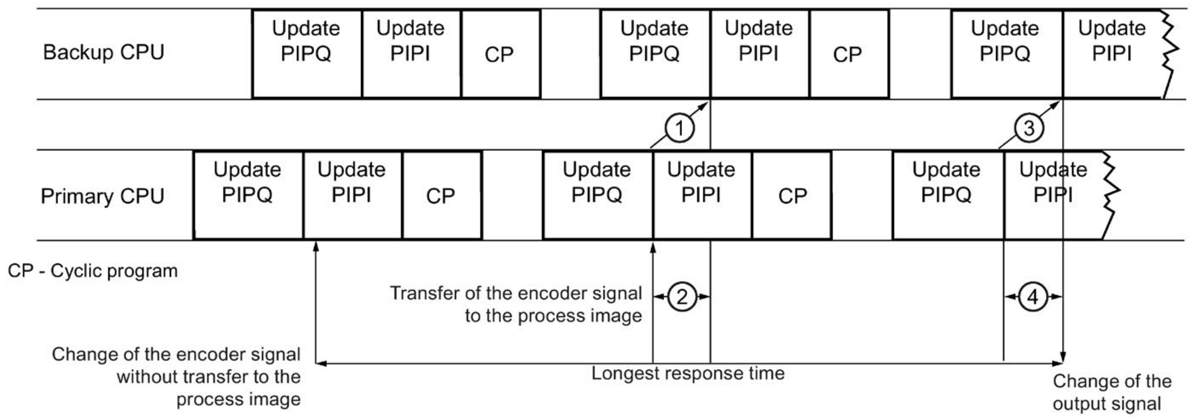
In the figure below the process image is updated immediately after the change of the encoder signal. The output can therefore respond to the signal change after a cycle has ended.



① Synchronization of the encoder signal change in the backup CPU
② Time lag of the backup CPU to the primary CPU
③ Synchronization of the output signal change in the backup CPU
④ Time lag of the backup CPU to the primary CPU until actual output of the signal change to the IO devices in the PROFINET ring

Figure 5-6 Shortest response time

In the figure below, the process image has already been updated by the time of the signal change. It therefore takes one cycle until the system detects the change and sets the input in the process image. The output signal is changed after an additional cycle.



① Synchronization of the encoder signal change in the backup CPU
② Time lag of the backup CPU to the primary CPU
③ Synchronization of the output signal change in the backup CPU
④ Time lag of the backup CPU to the primary CPU until actual output of the signal change to the IO devices in the PROFINET ring

Figure 5-7 Longest response time

The cycle times include the time lag. The time lag of the backup CPU to the primary CPU depends on the synchronization load. The synchronization load results from the data to be synchronized in the user program and in the communication.

Note

Effect of the time lag

The synchronization and transfer of the changes requires computing time. The time lag therefore affects both CPUs (from the primary CPU to the backup CPU and from the backup CPU to the primary CPU). The slower the CPU and the slower and longer the synchronization connection, the greater the time lag.

Determination of cycle and response times

At the end of the cyclic program, the primary CPU waits until the backup CPU too has acknowledged the end of the cyclic program. The cycle time of the primary CPU therefore also includes the time lag of the backup CPU. The cycle is extended by the time lag.

Advantages

The fact that the cycle time includes the time lag of the backup CPU to the primary CPU offers the following advantages:

- By monitoring the maximum cycle time in STEP 7, in the HMI or in the user program after SYNCUP, it is possible to determine the cycle time for a switchover of the CPUs in case of an error.
  Requirement: You have reset the maximum cycle time after the end of SYNCUP.
- During commissioning it is not necessary to perform complicated tests to determine whether the required response time can still be complied with if a CPU fails.
- During commissioning and ongoing operation you can estimate whether your automation task can meet the response times required for the process.

The same functions as those for the non-redundant CPUs are available for determining the cycle and response times:

Table 5- 2 Functions for determining the cycle and response times

Function	Additional information
Defining the minimum cycle time and the maximum cycle time in STEP 7	Section Cycle time (Page 24)
Defining the desired response of the user program if the maximum cycle time has been exceeded	
Reading out the cycle time statistics via STEP 7 and the display of the CPU Note that this function always shows the cycle time statistics from the primary CPU viewpoint, even when you go online via the backup CPU.	
Reading out the cycle time and reading out the progress in the SYNCUP system state with the instruction "RT_INFO"	
Display of measurements (traces) which record special time-critical signal characteristics	Function manual Using the trace and logic analyzer functions (http://support.automation.siemens.com/WW/view/en/64897128)
Reading out the progress of the SYNCUP system state using the display of the CPU	S7-1500R/H redundant system (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual

5.5 Timetables for the RUN-Redundant system state

The following section describes the typical times of the CPUs of the S7-1500R/H redundant system in the RUN-Redundant system state.

Update times of the process image partitions

The following table contains the times for estimating the typical update times of the process image partitions.

Table 5- 3 Data for estimating the typical update time of the process image partitions

	Update times of the CPUs in the RUN-Redundant system state		
	CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Basic load for updating process image partitions	63 µs	57 µs	13 µs
Copy time for distributed I/O via PROFINET	6.5 µs/word	6.5 µs/word	2.6 µs/word

A table of the update times of the CPUs in the RUN-Solo system state is available in section Update time for process image partitions (Page 28).

Program execution time without interruptions

The user program has a certain runtime without interruptions. The runtime depends on the number of operations that are executed in the user program.

The following table contains the typical durations of operations.

Table 5- 4 Duration of an operation

	Program execution times of the CPUs in RUN-Redundant system state		
	CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Bit operations, typ.	80 ns	60 ns	4 ns
Word operations, typ.	96 ns	72 ns	6 ns
Fixed-point arithmetic, typ.	128 ns	96 ns	6 ns
Floating-point arithmetic, typ.	512 ns	384 ns	24 ns

A table of the program execution times of the CPUs in the RUN-Solo system state is available in section User program execution time (Page 31).

Extension due to nesting of higher-priority OBs and/or interrupts

The interruption of a user program at the end of an instruction by a higher-priority OB causes a certain basic time expenditure. Take account of this basic time expenditure in addition to the update time of the assigned process image partitions and the execution time of the contained user program. The following tables contain the typical times for the various interrupts and error events.

Table 5- 5 Basic time expenditure for an interrupt

	Basic time expenditure of the CPUs for an interrupt in the RUN-Redundant system state		
	CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Hardware interrupt	560 µs	430 µs	70 µs
Time-of-day interrupt	560 µs	430 µs	70 µs
Time-delay interrupt	560 µs	430 µs	70 µs
Cyclic interrupt	560 µs	430 µs	70 µs

A table of the time expenditure of the CPUs for an interrupt in the RUN-Solo system state is available in section User program execution time (Page 31).

Table 5- 6 Basic time expenditure for an error OB

	Basic time expenditure of the CPUs for an error OB in the RUN-Redundant system state		
	CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Programming error	560 µs	430 µs	70 µs
I/O access error	560 µs	430 µs	70 µs
Time error	560 µs	430 µs	70 µs
Diagnostic interrupt	560 µs	430 µs	70 µs
Module failure/recovery	560 µs	430 µs	70 µs
Station failure/recovery	560 µs	430 µs	70 µs

A table with the basic time expenditure of the CPUs for an error OB in the RUN-Solo system state is available in section User program execution time (Page 31).

Accuracy of a cyclic interrupt

Even if a cyclic interrupt is not delayed by a higher-priority OB or communication activities, the accuracy with which it is started is nevertheless subject to system-dependent fluctuations.

The following table shows the accuracy with which a cyclic interrupt is triggered:

Table 5- 7 Accuracy of cyclic interrupts

	Accuracy of cyclic interrupts of the CPUs in the RUN-Redundant system state		
	CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Cyclic interrupt	±5.8 ms	±3.2 ms	±1.6 ms

A table with the accuracy of cyclic interrupts of the CPUs in the RUN-Solo system state is available in section Time-driven program execution in cyclic interrupts (Page 40).

Interrupt response times for hardware interrupts

The interrupt response times of the CPUs start with the occurrence of a hardware interrupt event in the CPU and end with the start of the assigned hardware interrupt OB.

This time is subject to system-inherent fluctuations, and this is expressed using a minimum and maximum interrupt response time.

The following table contains the length of the typical response times of the CPUs for hardware interrupts.

Table 5- 8 Interrupt response times for hardware interrupts

		Interrupt response times of the CPUs for hardware interrupts in the RUN-Redundant system state		
		CPU 1513R-1 PN	**CPU 1515R-2 PN**	**CPU 1517H-3 PN**
Interrupt response times	Min.	180 µs	150 µs	40 µs
	Max.	1420 µs	1360 µs	470 µs

A table of the interrupt response times of the CPUs in the RUN-Solo system state is available in section Response time of the CPUs when program execution is event-controlled (Page 47).

Glossary

Backup CPU

Role of a CPU in the S7-1500R/H redundant system. If the R/H system is in RUN-Redundant system state, the primary CPU guides the process. The backup CPU processes the user program synchronously and can take over the process management if the primary CPU fails.

Cycle time

The cycle time represents the time a CPU requires to process the user program once.

Data block

Data blocks (DBs) are data areas in the user program that contain user data. The following data blocks exist:

- Global data blocks which you can access from all code blocks.
- Instance data blocks that are assigned to a specific FB call.

Diagnostic interrupt

See "Interrupt, diagnostic"

Diagnostics

Monitoring functions include:

- The detection, localization and classification of errors, faults and alarms.
- Displaying and further evaluation of errors, faults and alarms.

They run automatically during plant operation. This increases the availability of systems by reducing commissioning times and downtimes.

Diagnostics buffer

The diagnostics buffer represents a backup memory in the CPU, used to store diagnostics events in their order of occurrence.

Distributed I/O system

System with I/O modules that are configured on a distributed basis, at a large distance from the CPU controlling them.

Firmware of the CPU

In SIMATIC, a distinction is made between the firmware of the CPU and user programs.

The firmware is a software embedded in electronic devices, which means it is permanently connected with the hardware functionally. It is usually saved in a flash memory, such as EPROM, EEPROM or ROM, and cannot be replaced by the user or only with special means or functions.

User program: see glossary entry "User program"

H-Sync Forwarding

H-Sync Forwarding enables a PROFINET device with MRP to forward synchronization data (synchronization frames) only within the PROFINET ring.

Through H-Sync Forwarding, the synchronization data is also forwarded during reconfiguration of the PROFINET ring. This reduces the cycle time utilization.

H-Sync Forwarding is recommended for PROFINET devices that you use in the PROFINET ring of redundant S7-1500R systems.

H-Sync Forwarding is not relevant for redundant S7-1500H systems.

I/O module

Device of the distributed I/O that is used as interface between the controller and the process.

Interrupt

The CPU's operating system distinguishes between various priority classes that control the execution of the user program. These priority classes include interrupts, such as hardware interrupts. When an interrupt occurs, the operating system automatically calls an assigned organization block. The required response is programmed in the organization block (for example, in an FB).

Interrupt, cyclic

The CPU generates a cyclic interrupt periodically within a parameterizable time grid and then processes the corresponding organization block.

Interrupt, diagnostics

Diagnostics-capable modules signal detected system errors to the CPU using diagnostic interrupts.

Interrupt, hardware

A hardware interrupt is triggered by interrupt-triggering modules due to a certain event in the process. The hardware interrupt is reported to the CPU. The CPU then processes the assigned organization block according to the priority of this interrupt.

Interrupt, time-delay

The time-delay interrupt is one of the program execution priority classes of SIMATIC S7. The time-delay interrupt is generated after the expiration of a timer started in the user program. The CPU then processes the corresponding organization block.

Interrupt, time-of-day

The time-of-day interrupt is one of the program execution priority classes of SIMATIC S7. The time-of-day interrupt is generated depending on a specific date and time. The CPU then processes the corresponding organization block.

IO controller

See "PROFINET IO controller"

IO device

See "PROFINET IO device"

Operating states

Operating states describe the behavior of a single CPU at a specific time.

The CPUs of the SIMATIC standard systems have the STOP, STARTUP and RUN operating states.

The primary CPU of the redundant system S7-1500R/H has the operating states STOP, STARTUP, RUN, RUN-Syncup and RUN-Redundant. The backup CPU has the operating states STOP, SYNCUP and RUN-Redundant.

Organization block

Organization blocks (OBs) form the interface between the CPU operating system and the user program. The organization blocks determine the order in which the user program is executed.

Parameter

- Tag of a STEP 7 code block:
- Tag for setting the behavior of a module (one or more per module). In as-delivered state, every module has an appropriate basic setting, which you can change by configuring in STEP 7. There are static and dynamic parameters.

Parameters, dynamic

Dynamic parameters of modules can be changed during operation by calling an SFC in the user program, for example, limit values of an analog input module.

Parameters, static

Static parameters of modules cannot be changed by the user program but only by the configuration in STEP 7, e.g. input delay of a digital input module.

Primary CPU

If the R/H system is in RUN-Redundant system state, the primary CPU guides the process. The backup CPU processes the user program synchronously and can take over the process management if the primary CPU fails.

Process image (I/O)

The CPU transfers the values from the input and output modules to this memory area. At the start of the cyclic program, the CPU transfers the process image output as a signal state to the output modules. The CPU then transfers the signal states of the input modules into the process image input. The CPU then executes the user program.

PROFINET

PROcess **FI**eld **NET**work, open Industrial Ethernet standard which further develops PROFIBUS and Industrial Ethernet. A cross-manufacturer communication, automation, and engineering model defined by PROFIBUS International e.V. as an automation standard.

PROFINET IO

Communication concept for the realization of modular, distributed applications within the scope of PROFINET.

PROFINET IO controller

Device used to address connected I/O devices (e.g. distributed I/O systems). The IO controller exchanges input and output signals with assigned I/O devices. The IO controller often corresponds to the CPU in which the automation program is running.

PROFINET IO device

Distributed field device that can be assigned to one or more IO controllers (e.g. distributed I/O system, valve terminals, frequency converters, switches).

Redundancy connection

The redundancy connection in an S7-1500R system is the PROFINET ring with MRP. The redundancy connection uses part of the bandwidth on the PROFINET cable to synchronize the CPUs, which means the bandwidth is not available for PROFINET IO communication.

Contrary to S7-1500R, PROFINET ring and redundancy connection are separate in an S7-1500H. The two redundancy connections are fiber-optic cables which directly connect the CPUs to each other via synchronization modules. The bandwidth on the PROFINET cable is available for PROFINET IO communication.

Redundant systems

Redundant systems are identified by the fact that important automation components are available in multiple units (redundant). If one redundant component fails, control of the process is maintained.

Retentivity

A memory area whose content is retained even after a power failure and after a transition from STOP to RUN is retentive. The non-retentive bit memory area, timers and counters are reset after a power failure and after a STOP-RUN transition.

System states

The system states of the S7-1500R/H redundant system result from the operating states of the primary and backup CPU. The term system state is used as a simplified expression that identifies the operating states of the two CPUs that occur at the same time. The S7-1500R/H redundant system features the STOP, STARTUP, RUN-Solo, SYNCUP and RUN-Redundant system states.

TIA Portal

Totally Integrated Automation Portal

The TIA Portal is the key to the full performance capability of Totally Integrated Automation. The software optimizes all operating, machine and process sequences.

Timers

Timers are components of the CPU system memory. The operating system automatically updates the content of the "timer cells" asynchronously to the user program. STEP 7 instructions define the precise function of the timer cell (e.g. on-delay) and trigger its execution.

User program

In SIMATIC, a distinction is made between user programs and the firmware of the CPU.

The user program contains all instructions, declarations and data by which a system or process can be controlled. The user program is assigned to a programmable module (for example, CPU, FM) and can be structured in smaller units.

Firmware: see glossary entry "Firmware of the CPU"

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation describes the various memory areas of the SIMATIC S7-1500 automation system, the SIMATIC S7-1500-based CPU 1516pro-2 and the ET 200SP distributed I/O system and shows you how to optimally use these memory areas.

In addition, this manual shows you how to reduce work memory utilization by using recipes and data logs.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the SIMATIC industrial automation system
- Knowledge about the use of computers
- Proficiency with STEP 7

Conventions

STEP 7: in this documentation, "STEP 7" is used as a synonym for all versions of the "STEP 7 (TIA Portal)" configuring and programming software.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation is valid for the central modules of the S7-1500 and ET 200SP systems and for the ET 200pro CPU 1516pro-2 PN.

The CPUs of the redundant system S7-1500R/H do not support all the memory objects described in this function manual. The limitations of the redundant S7-1500R/H system are pointed out where appropriate in the manual. You can find a list of the unsupported functions in the Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual.

What's new in Edition 10/2018 compared to Edition 09/2016

What's new?		What are the customer benefits?	Where can I find information?
Changed contents	Scope of the function manual expanded to include the CPUs of the redundant system S7-1500R/H.	The CPUs of the redundant system S7-1500R/H support the memory structure familiar from the S7-1500 automation system. Information on the particularities of the redundant S7-1500R/H system is provided where appropriate in the manual.	• In the corresponding sections of the manual • System manual Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)

What's new in Edition 09/2016 compared to Edition 01/2013

What's new?		What are the customer benefits?	Where can I find information?
New contents	Analyzing memory requirements and memory usage	You have various options for analyzing the memory requirements and the memory usage of the CPU: • With STEP 7 • With the display of the CPU • With the web server of the CPU	Section Memory requirements and memory usage (Page 18)
	Memory requirements in load memory for downloading software changes	When loading software changes to the SIMATIC memory card, the files in question are only deleted after creation of the new files. For this reason, the CPU requires adequate free memory space on the SIMATIC memory card. You have various options for creating memory space; these will be explained.	Section Memory requirements for downloading software changes (Page 34)
	Service life of SIMATIC memory cards	Using calculation examples of the service life of a SIMATIC memory card, you can estimate which SIMATIC memory card is required for your automation task.	Section Service life of the SIMATIC memory card (Page 68)
Changed contents	Scope of the function manual expanded to include the CPUs of the ET 200SP distributed I/O system and the CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	• Manual CPU 1510SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157130) • Manual CPU 1512SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157013) • Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (https://support.industry.siemens.com).

Industry Mall

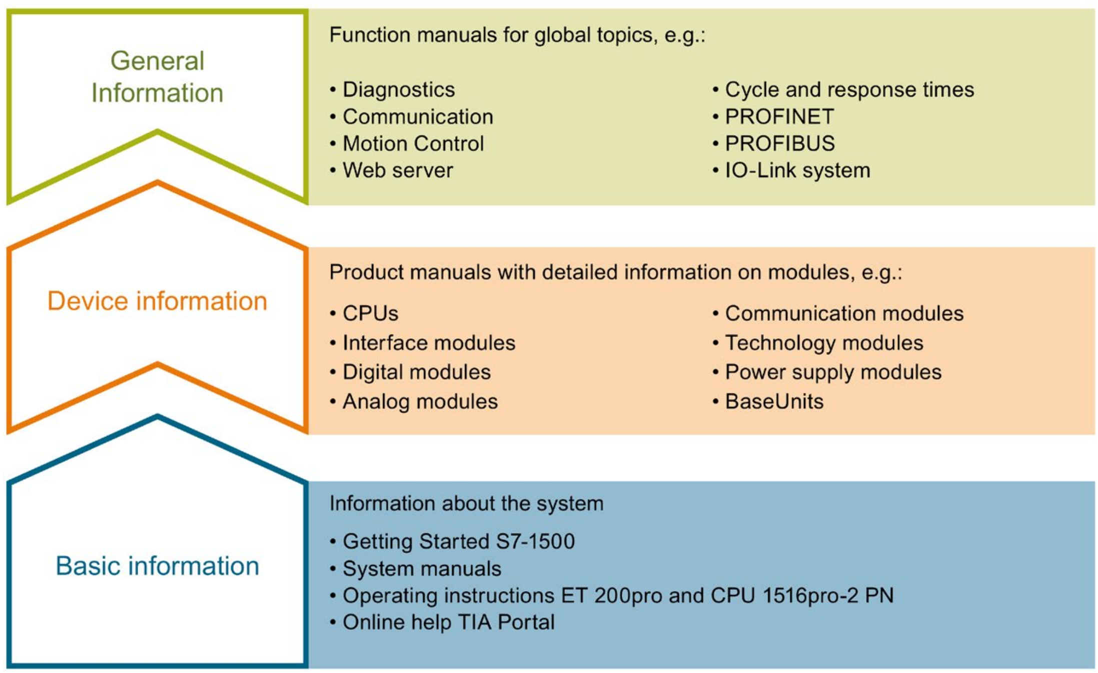
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742705).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Memory areas and retentive memory

2.1 Memory areas

The automation data is located in the automation system in different memory areas.

The offline data of the project created in STEP 7 is located on the hard disk of the programming device. The online data of the project is located in the load memory on the SIMATIC memory card. In addition, the work memory, retentive memory and other memory areas are located on the CPU.

The following figure shows an overview of the memory areas of the CPUs:

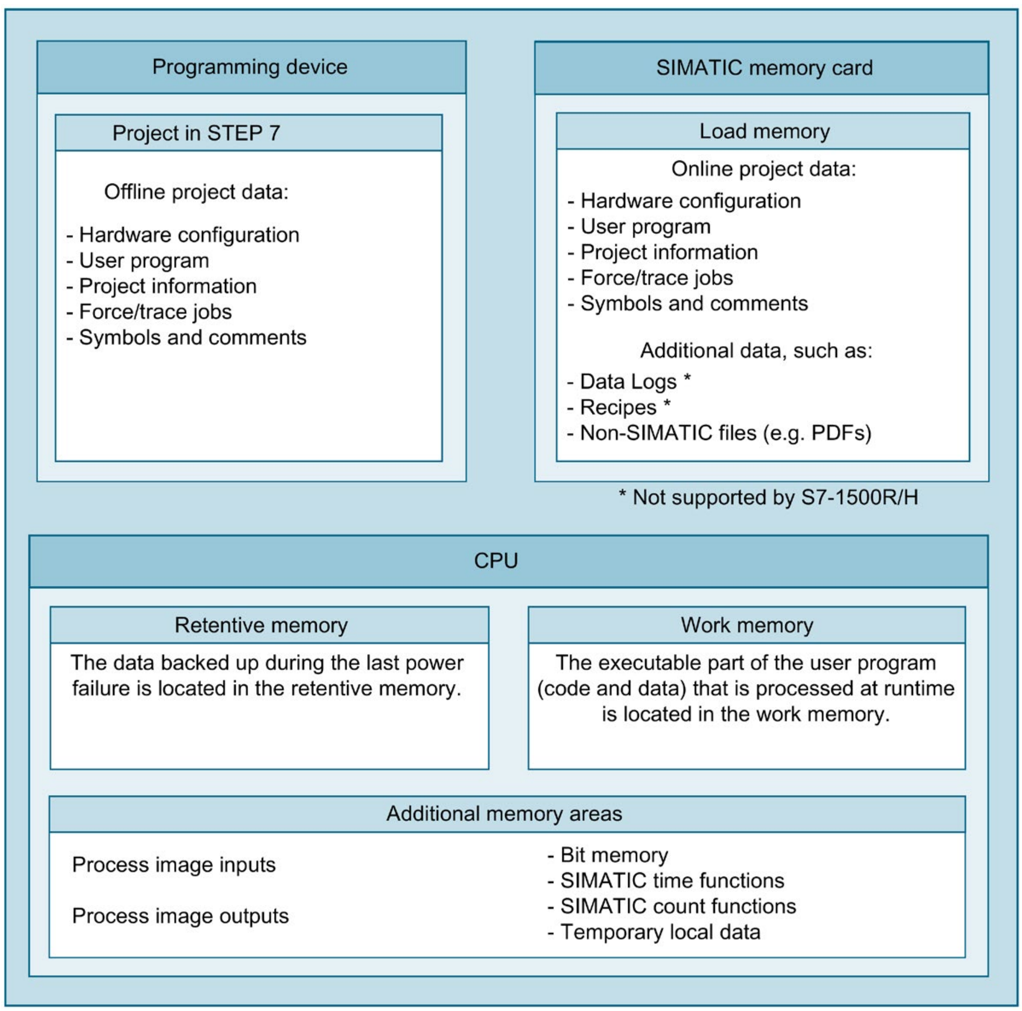


Figure 2-1 Memory areas

Load memory

Load memory is non-volatile memory for code blocks, data blocks, technology objects and the hardware configuration. This load memory is located on the SIMATIC memory card. STEP 7 transfers the project data from the programming device to the load memory.

You can copy additional data (e.g. HMI backups and other files) to the SIMATIC memory card using the web server or Explorer. This data can then be found in the load memory on the SIMATIC memory card.

Note

An inserted SIMATIC memory card is required to operate the CPU.

Load memory: CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP

On these CPUs additional memory space is used in the load memory by:

- Linux runtime, which runs in parallel with the CPU runtime
- C/C++ runtime applications
- Files that are needed for C/C++ runtime applications
- CPU function libraries

Note

CPU runtime

In the context of the CPU 1518-4 PN/DP MFP and the CPU 1518F-4 PN/DP MFP as well as the Open Development Kit (ODK), the term "CPU runtime" has the following meaning:

The CPU runtime is the runtime environment in which a CPU runtime application can be executed. CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP run a Linux runtime in parallel with the CPU runtime. The Linux runtime is the runtime environment for applications that are executable in Linux, e.g. C/C++ runtime applications.

For additional information on the CPUs, refer to the CPU 1518-4 PN/DP MFP (https://support.industry.siemens.com/cs/ww/en/view/109749061) manual and the CPU 1518(F)-4 PN/DP MFP (https://support.industry.siemens.com/cs/ww/en/view/109756478) product information. You can find information on creating C/C++ runtime applications in the SIMATIC S7-1500 ODK 1500S (https://support.industry.siemens.com/cs/ww/en/view/109752683) manual.

Work memory

The work memory is volatile memory that contains the code and data blocks. The work memory is integrated into the CPU and cannot be extended. The work memory is only used in operation of the CPU.

In the CPUs, the work memory is divided into two areas:

- Code work memory: The code work memory contains runtime-relevant parts of the program code.
- Data work memory: The data work memory contains the runtime-relevant parts of the data blocks and technology objects.
  Tags of global data blocks, instance data blocks and technology objects are initialized with their start values at the operating states changes below. Retentive tags receive their actual values saved in the retentive memory.
  – POWER ON → STARTUP
  – STOP → STARTUP

Work memory of CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP

Additional work memory is needed for use of the CPU function libraries and C/C++ runtime applications.

Retentive memory

The retentive memory is non-volatile memory for saving a limited amount of data in the event of power failure.

The following actions delete certain memory objects of the retentive memory:

- Memory reset
- Reset to factory settings

You can find an overview of the retentive behavior of the individual memory objects in section Retentive behavior of the memory objects (Page 30).

You can find additional information on the memory reset and reset to factory settings functions in the following manuals:

- System manual S7-1500, ET 200MP Automation System (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
- Operating instructions ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

Additional memory areas

Besides the memory areas that have been described for the user program and data, the CPU has additional memory areas available.

The additional memory areas include the following:

- Process images
- Temporary local data

The CPU-specific sizes can be found in the technical specifications for the respective CPU.

2.1.1 Specifics of the CPUs of the redundant system S7-1500R/H

The redundant system S7-1500R/H consists of two CPUs. A SIMATIC memory card must be inserted in each of the CPUs. During redundant operation, both CPUs execute the user program in parallel. In so doing, one CPU takes the role of the leading CPU (Primary CPU) and one CPU takes the role of the following CPU (Backup CPU). If one CPU fails, the second CPU maintains control over the process.

Memory areas

The two CPUs of the redundant system S7-1500R/H have the same memory areas as the CPUs of non-redundant systems.

You create the hardware configuration of the offline project data only once in STEP 7 STEP 7 loads the offline project data into the current primary CPU. The system synchronizes all data required for redundant operation from the primary CPU to the backup CPU.

Both CPUs receive identical online project data. The online project data contains the hardware configuration of the H-system.

Particularities of the retentive memory

Like for non-redundant CPUs, the retentive memory is a non-volatile memory. The retentive memory saves a limited amount of data in the event of power failure.

Each of the CPUs of the redundant system S7-1500R/H has its own retentive memory. If one of the CPUs changes to POWER OFF and the second CPU is still in RUN, the retentive data of the CPU in RUN continues to be updated. If the remaining CPU also goes from RUN to POWER OFF, the retentive memory of this CPU contains the most up-to-date retentive data. Note the following for when you switch the CPUs back to RUN afterwards.

Note

Characteristics of retentive data after a STOP or POWER OFF of both CPUs

After a STOP or POWER OFF of both CPUs, switch the CPU with the more up-to-date data to RUN first. The more up-to-date data is located in the CPU that controlled the process before STOP or POWER OFF. This procedure gives you certainty that you are using the most up-to-date retentive data. The precondition for this is that you did not change any data using STEP 7 or the HMI while the CPUs were in STOP.

Redundancy ID

Unlike in a non-redundant CPU, an additional memory object is contained in the retentive memory of the respective redundant CPU. Each CPU saves its respective redundancy ID in this memory object. The redundancy IDs can assume the values 1 and 2. Different redundancy IDs are required for redundant operation in order to clearly identify the CPUs and assign the project data to the respective CPUs. For additional information on redundancy IDs of the CPUs, refer to the Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833) system manual.

You can find an overview of the retentive behavior of the individual memory objects in section Retentive behavior of the memory objects (Page 30).

2.2 Memory requirements and memory usage

You can access information regarding the memory areas of the CPUs in the following ways depending on product family used:

Product family	Information regarding the memory areas of the CPU is accessible via:		
	STEP 7	Web server	Display
S7-1500	✓	✓	✓
S7-1500R/H	✓	--	✓
ET 200SP	✓	✓	--
ET 200pro CPU 1516pro-2 PN	✓	✓	--

Memory requirements of the program in the offline project

During creation or modification of a project, the display of memory utilization in STEP 7 shows you the size of the project in the following memories:

- Load memory
- Work memory
- Retentive memory

You can find this information for the CPU under "Program info" in the project tree, "Resources" tab.

- Total size of the memory areas of the respective CPU project (in the figure below line "Total:")
- Memory requirements of the program elements (blocks, data types, objects for motion technology and PLC tags)
- Memory amounts in the respective memory area of the offline project (in figure below, line "Used:")
- Used inputs and outputs

The following figure shows an overview of the utilization of the various memory areas of the "Resources" tab:

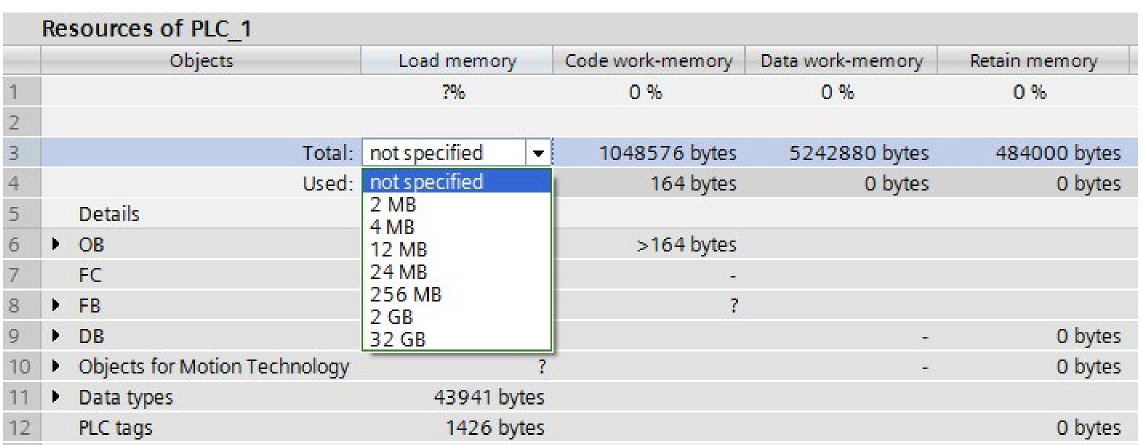

Figure 2-2 Display of the utilization of the various memory areas

For a CPU, you can select the total size of the load memory in a drop-down list. Select the size of the load memory in accordance with the size of the SIMATIC memory card you are using. The percentage shown in the Load memory column depends on the selected size of the load memory. As soon as the memory size exceeds the size of the load memory of the memory card you are using, the sizes indicated turn red.

Note

Determination of the memory utilization

Note that the SIMATIC memory card also contains data other than the user program that you cannot determine using "Resources". This data includes:

- Hardware configuration
- Recipes, data logs and HMI backups (not supported for S7-1500R/H)
- Non-SIMATIC files, such as PDF, etc.

Therefore, the drop-down list with the size of your SIMATIC memory card only serves as a visual orientation aid.

Also refer to the FAQ "How do you estimate the memory requirements of your project in the load memory of a SIMATIC S7-1500" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/97553417).

Note

Display of the memory utilization under "Program info"

The display of the memory utilization in the program information is an offline display in STEP 7 and only shows the memory requirements of the program in the project. The program on the memory card of the CPU may differ, however, e.g. if the program:

- is more up to date
- contains blocks generated by other projects
- contains blocks generated on the CPU

Data on the SIMATIC memory card

In addition to the program and the associated program elements (blocks, data types, objects for motion control and PLC tags), the following data is also stored on the memory card:

- Hardware configuration
- Project information
- Force jobs
- Trace recordings (not supported for S7-1500R/H)
- Symbols and comments

The following further data may also be found on the memory card:

- Recipes, data logs and HMI backups (not supported for S7-1500R/H)
- Non-SIMATIC files that were copied to the memory card via the web server of the CPU or offline in Explorer (e.g. PDF files etc.)

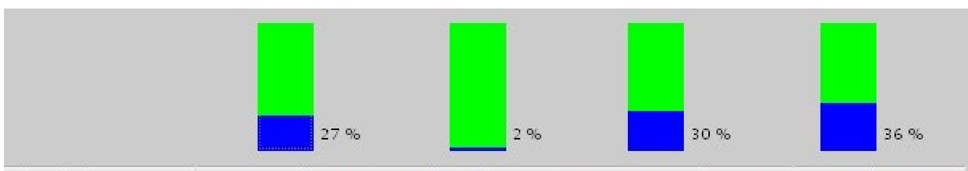
Display of the memory utilization in STEP 7

In online mode, the online function "Memory" provides you with the following up-to-date memory information:

- Size of the total free and already allocated load memory on the SIMATIC memory card.
- Size of the total free and already allocated work memory, separated by code and data.
- Size of the total free and already allocated retentive memory.

The online function "Memory" can be found in Online & Diagnostics under "Diagnostics > Memory". You can access the functions under Online & Diagnostics in various ways:

- In the project tree under each configured CPU.
- In the project tree under Online access > Accessible devices, in order to display the memory utilization of CPUs that were not configured in the project.
- In all views of the device configuration (topology view, network view, device view) by selecting a CPU with the right mouse button.



Sizes in bytes	Load memory	Code work-memory	Data work-memory	Retain memory
Free:	6291456	1048576	5242880	524288
In use:	2316997	17355	2299642	301234
Total:	8608453	1065931	7542522	825522

Figure 2-3 "Memory" online function

Note

Fill levels of the CPUs of the redundant system S7-1500R/H

The CPUs of the redundant system S7-1500R/H can have CPU-specific fill levels in non-redundant operation.

The fill levels of the load memory of the CPUs can differ in redundant operation and non-redundant operation (e.g. due to stored PDF files or SIMATIC memory cards of different sizes).

You can have the memory utilization of both CPU 1 and CPU 2 displayed in STEP 7.

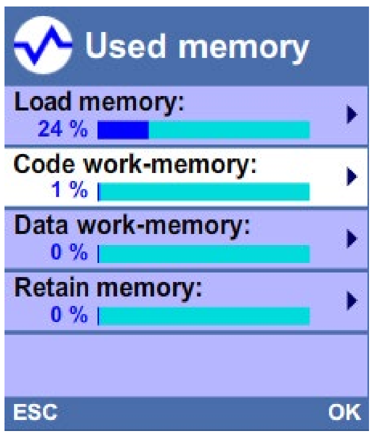
Alternatively to the "Memory" online function, you will also find a display of the current memory functions on the "Online tools" task card in the "Memory" section.

Display of the memory utilization on the display of the CPU

To obtain information about the available memory via the display, proceed as follows:

- Select the "Diagnostics" menu on the display with the help of the arrow keys.
- Select the "Used memory" command from the "Diagnostics" menu.

Under the "Used memory" menu item, you can find information about the utilization of the various memory areas (see following figure). Note that the memory usage is a snapshot of the memory used at the time of the request and is not continuously updated.



To find out details about the respective memory areas (e.g. code work memory), select the required memory area with the help of the arrow keys (see following figure).

In the detail view, e.g. of the code work memory, the display provides you with the following information:

- Memory space which is still available in the code work memory.
- Memory space which is already allocated in the code work memory.
- Total available memory space in the code work memory.

Note

Display of the memory utilization of redundant system S7-1500R/H in non-redundant operation

The CPU displays indicate the local memory utilization of the respective CPU.

Display of the memory utilization of redundant system S7-1500R/H in redundant operation

Irrespective of the sizes of the inserted SIMATIC memory cards, both CPU displays indicate the same (synchronized) fill level.

Display of the memory usage in the Web server

On the Web server, you can find information about the current usage of the individual memory areas on the Web page "Diagnostics" in the "Memory" tab.

Detailed information about the use of the Web server can be found in the S7-1500 Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) function manual.

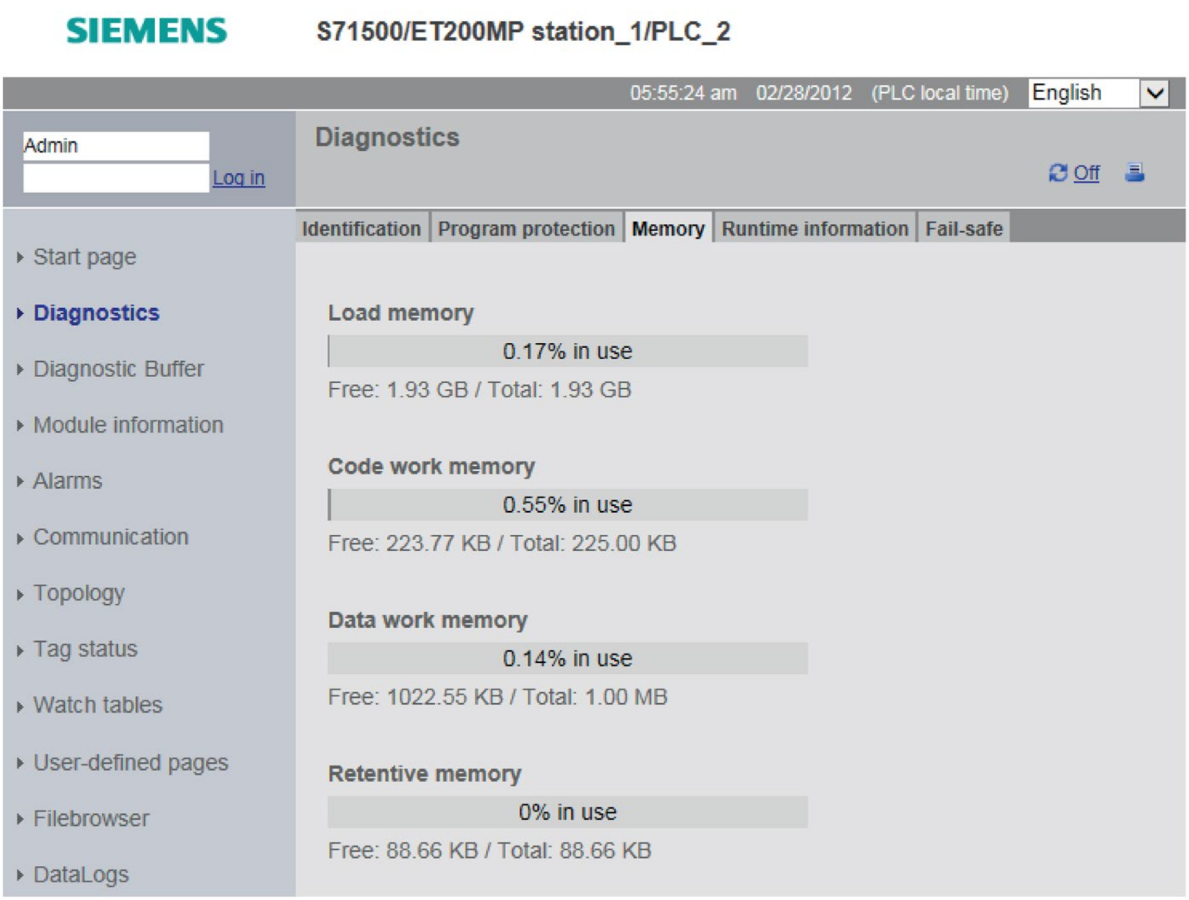


Figure 2-4 Display of the memory usage in the Web server

Note

Redundant system S7-1500R/H

The web server is not supported by the CPUs of the redundant system S7-1500R/H.

2.3 Retentive memory areas

Introduction

The CPUs have a memory for storing retentive data at POWER OFF. You can find the size of the retentive memory in the technical specifications of the respective CPU.

You can find the utilization of the retentive memory of the configured CPU in STEP 7 offline under "Program info > Resources" or online under Online & diagnostics with "Diagnostics > Memory".

If you define data as retentive, its content is retained for the startup of a program after STOP or a power failure.

You can define the following data and objects as retentive:

- Tags of global data blocks
- Tags of instance data blocks of a function block
- Bit memories, timers and counters

Tags of technology objects are retentive, e.g. calibration values of absolute encoders. STEP 7 manages the retentivity of the technology object tags automatically. Hence, you do not have to configure retentivity.

The retentive tags of technology objects are unaffected by a memory reset. You can delete these retentive tags only by a reset to factory settings.

Tags of a global data block

In a global data block, you can define either individual tags from a block or all of its tags collectively as retentive, depending on the setting for the "Optimized block access" attribute:

- "Optimized block access" activated: In the declaration table of the data block, you can define individual tags as retentive.

	Name	Data type	Start value	Retain	Visible in HMI	Comment
1	▼ Static			☐	☐	
2	var1	Bool	false	☑	☑	
3	var2	Bool	false	☐	☑	
4	var3	Bool	false	☑	☑	
5	var4	Bool	false	☐	☑	
6	var5	Bool	false	☑	☑	

Figure 2-5 Retentivity setting "Optimized block access" activated

- "Optimized block access" not activated: In the declaration table of the data block, you can only define the retentivity of all tags collectively.

	Name	Data type	Offset	Start value	Retain	Visible in HMI	Comment
1	▼ Static				☐	☐	
2	var6	Bool	...	false	☑	☑	
3	var7	Bool	...	false	☑	☑	
4	var8	Bool	...	false	☑	☑	
5	var9	Bool	...	false	☑	☑	
6	var10	Bool	...	false	☑	☑	

Figure 2-6 Retentivity setting "Optimized block access" not activated

You can find additional information on optimized and non-optimized data blocks in the Programming guideline for S7-1200/S7-1500 (https://support.industry.siemens.com/cs/de/de/view/90885040/en).

Tags of an instance data block of a function block

You can define the tags of the instance data block of a function block as retentive in STEP 7. Depending on the setting for the "Optimized block access" attribute, you can define retentivity either for individual tags from a block or for all of its tags collectively:

- "Optimized block access" activated: In the interface of the function block, you can define individual tags as retentive.
- "Optimized block access" not activated: In the instance data block, you can only define the retentivity of all tags collectively.

Creation of a data block in the user program

The instruction "CREATE_DB" is used to create a new data block in the load and/or work memory. For data blocks which you create in the load memory, depending on the selection for the ATTRIB parameter, the generated data block either has the property "retentive" or the property "non-retentive". Setting the retentivity for individual tags is not possible here. The "Optimized block access" attribute is disabled.

You can find additional information on the "CREATE_DB" instruction in the STEP 7 online help under "Programming a PLC > Instructions > Extended instructions > Data block control > CREATE_DB: Create data block".

Note

Redundant S7-1500R/H system

The "CREATE_DB" instruction is not supported by the CPUs of the redundant system S7-1500R/H.

Tags of technology objects

Tags of technology objects are retentive, e.g. calibration values of absolute encoders. STEP 7 manages the retentivity of the technology object tags automatically. Hence, you do not have to configure retentivity.

The retentive tags of technology objects are unaffected by a memory reset. They can be deleted only by a reset to factory settings.

Note

Redundant S7-1500R/H system

Technology objects are not supported by the CPUs of the redundant system S7-1500R/H.

Bit memories, timers and counters

You can define the number of retentive bit memories, timers and counters in STEP 7 in the PLC tag table using the "Retain" button.

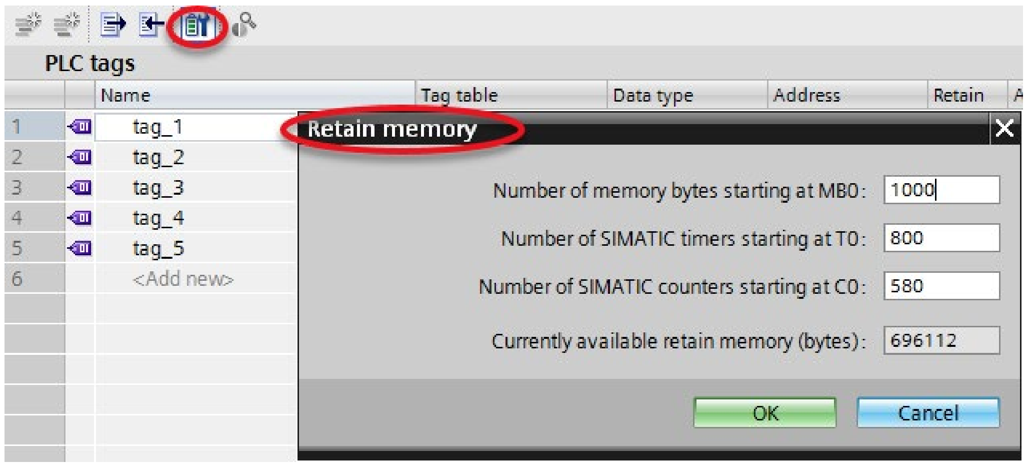

Figure 2-7 Definition of the number of retentive bit memories, timers and counters (beginning at 0, continuing without gaps) using the "Retain" button

Reference

You can find additional information on setting the retentivity in the STEP 7 online help.

2.4 Summary of retentive behavior

2.4.1 Retentive behavior of the memory objects

This section gives an overview of the retentive behavior of the memory objects of the CPUs.

In addition to the retentive memory areas described, there are other objects with retentive characteristics, for example, the diagnostics buffer. These objects do not occupy any storage space in the retentive memory.

The following table shows the retentive behavior of the memory objects in the case of the following:

- STOP → STARTUP
- POWER ON → STARTUP
- POWER ON → STOP
- "Memory reset"
- "Reset to factory settings"

Table 2- 1 Retentive behavior of the memory objects

Memory object	STOP → STARTUP POWER ON → STARTUP POWER ON → STOP	Memory reset	Reset to factory settings
Actual values of the data blocks, instance data blocks	Can be set in the properties of the DB in STEP 7 1)	-	-
Bit memories, timers and counters - configured as retentive	x	-	-
Bit memories, timers and counters - configured as non-retentive	-	-	-
Retentive tags of technology objects (e.g. calibration values of absolute encoders) 2)	x	x	-
Diagnostic buffer entries	x	x	-
Operating hours counter	x	x	-
Clock time	x	x	-
Redundancy ID 3)	x	x	-
x = content is retained – = object is initialized			

1) For DBs with optimized access the retentive behavior is configurable for specific tags.

2) Not for the CPUs of the redundant system S7-1500R/H

3) Only for the CPUs of the redundant system S7-1500R/H

Diagnostics buffer

The 500 most recent entries in the diagnostics buffer are retained after power failure and are not affected by a memory reset. The diagnostics buffer can be cleared only by a reset to factory settings. The entries in the diagnostics buffer do not occupy any memory space in the retentive memory.

Operating hours counter

The operating hours counters of the CPUs are retentive and are not affected by a memory reset. By resetting to factory settings, the operating hours counters are set to zero.

Clock time

The clock time of the CPUs is retentive and is not affected by a memory reset. By resetting to factory settings, the clock time is reset.

Reference

You can find additional information on the memory reset and reset to factory settings functions in the following manuals:

- System manual S7-1500, ET 200MP Automation System (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
- Operating instructions ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)
- System manual Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)

2.5 Memory behavior when loading software changes

Introduction

You can download software changes in STOP and RUN without affecting the actual values of previously loaded tags.

You load changes to the software in STEP 7 (in the project tree and with selected PLC station) under "Download to device > Software (only changes)".

Note

Redundant system S7-1500R/H

The CPUs of the redundant system S7-1500R/H permit the downloading of software changes only in the STOP or RUN-Solo system state.

Impact of software changes on PLC tags

You can load the following software changes without affecting the actual values of PLC tags that have already been loaded:

- Name change
- Comment change
- Addition of new tags
- Deletion of tags
- Change of retentivity settings for Retentive memory areas (Page 26)

The actual values are affected by loading the following software changes:

- Data type change
- Address change

Memory reserve of global DBs and instance DBs

Each function block or data block with the "Optimized block access" attribute activated contains, by default, a memory reserve which you can use for subsequent interface changes. The memory reserve is initially not used. When you have compiled and loaded the block, and then observe that you want to reload interface changes, activate the memory reserve. All tags that you subsequently declare will be placed in the memory reserve. During the next load, the new tags are then initialized to their start values. Tags which have already been loaded are not reinitialized.

The setting of the memory reserve can be found in STEP 7 under the data block properties in the "Download without reinitialization" category.

Impacts of software changes on data blocks without memory reserve

If you are not using memory reserve, you can load the following software changes without this reinitializing the actual values of DB tags that have already been loaded:

- Change of start value
- Comment change

Impacts of software changes on data blocks with memory reserve

If you are using the memory reserve for data blocks ("Optimized block access" attribute and "Enable download without reinitialization for retentive tags" button selected), you can load the following software changes. The actual values of previously downloaded DB tags are not reinitialized by this.

- Change of start value
- Comment change
- Addition of new tags

If the button "Enable download without reinitialization for retentive tags" is deactivated, then all actual values of the data block are reinitialized on the next loading of the following software changes:

- Name change
- Data type change
- Retentivity change
- Deletion of tags
- Changes to the memory reserve settings

Reference

You can find additional information on setting and activating the memory reserve and on downloading block changes in the STEP 7 online help under "Programming a PLC > Compiling and downloading PLC programs > Downloading blocks for S7-1200/1500 > Loading block extensions without reinitialization".

2.6 Memory requirements for downloading software changes

Memory requirements in RUN state

For the consistent and atomic execution of the complete download operation, the CPU requires adequate free memory space in the work memory and on the SIMATIC memory card. The files affected by loading the software changes to the CPU are only deleted after the new files have been created. This SIMATIC memory card therefore requires free memory space corresponding approximately to the space required for all program objects to be loaded on the memory card.

If this amount of memory is not available on your SIMATIC memory card, the following message is displayed in STEP 7 during the download operation to the CPU: "There is insufficient memory on the memory card for this amount of data."

In order to still enable the loading of changes to the CPU in such a case, we recommend one or more of the following options:

- Download in RUN state
  - Delete any files no longer required (e.g. CSV files, panel backups, etc.) on the memory card using the Web server.
  - Preferably, you should download extensive changes in RUN state in multiple steps or perform the download after each change step.
- Download in STOP state
  - If downloading in several steps is not possible, load extensive changes in STOP state. Note that when loading in STOP state, the actual values of non-retentive data are not initialized.
- Use a larger memory card
  - In order to perform extensive downloads in RUN state of the CPU in the future, use a larger memory card. A description of how to change the memory card can be found in the section "Changing the memory card without loss of retentive data".

Impact of minor program changes on the load procedure

Under the objects of a program, there are dependencies, e.g.

- Of code blocks to called code blocks
- Of code blocks to data blocks
- Of data blocks to data types (PLC data types, FB types)

This means that the load procedure for a minor change may be very time-consuming if the change affects a large number of dependent objects.

Example:

A STEP 7 program contains an organization block (OB), 20 functions (FC) and a data block (DB). The OB calls the 20 FCs. All the FCs access the DB. If you change the program code in one of the FCs, the following load procedure only contains the changed FC. If you change the data type of a tag in the DB, however, the following load procedure then contains all the FCs and the DB.

The following figure shows the objects in the load procedure in a preview.

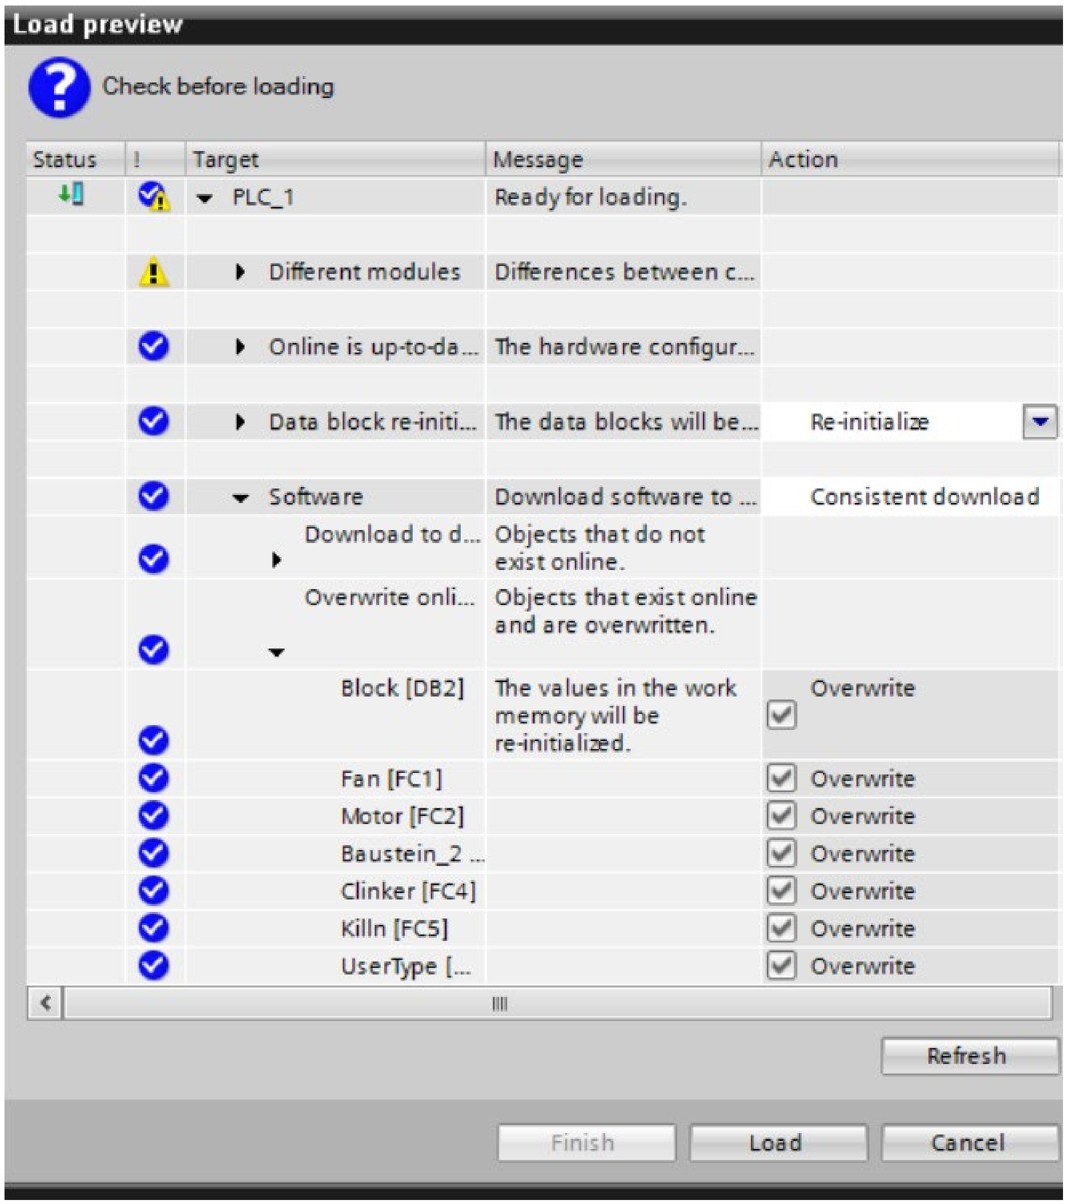

Figure 2-8 Preview for loading

To find the interdependencies of the individual objects, double-click "Program info" in the project tree. Change to the "Dependency structure" tab in the "Program info" dialog.

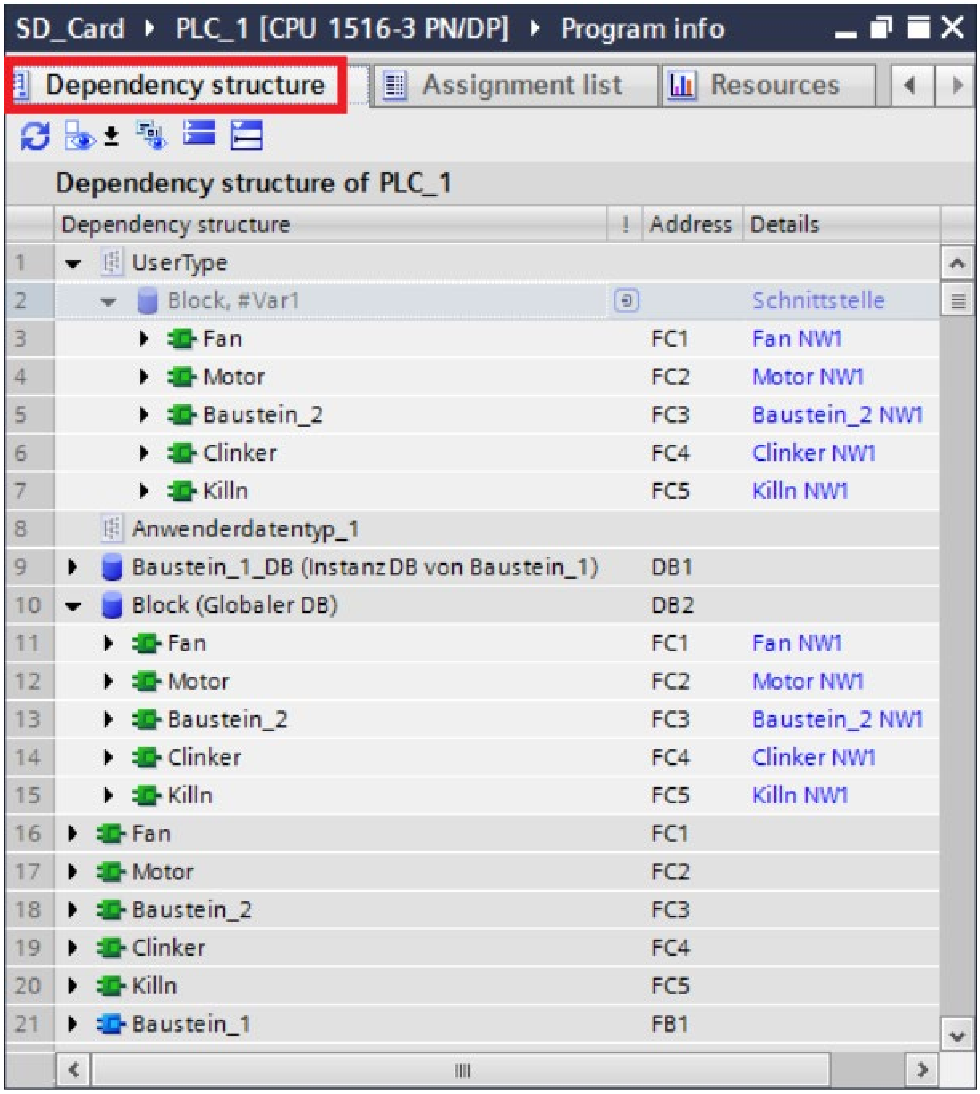

Figure 2-9 Dependency structure

Memory requirements in STOP state

Even when downloading in STOP state, a certain amount of reserve memory is required, because your CPU needs sufficient free memory on the memory card for consistent downloading of individual data blocks. The files affected by loading the data blocks are only deleted after the new files have been created. Therefore, for the modifications you must have available at least the memory requirement of the largest data block.

If insufficient reserve memory is available on your SIMATIC memory card when loading in STOP state, the following message is displayed in STEP 7 during the download to the CPU: "There is insufficient memory on the memory card for this amount of data."

In order to still enable the loading of changes to the CPU in such a case, we recommend one or more of the following options:

- Delete any files no longer required (e.g. CSV files, panel backups, etc.) from the memory card using the Web server.
- Use a larger memory card. A description of how to change the memory card can be found in the section "Changing the memory card without loss of retentive data".

Note

Please note that retentive data and possibly also project data is lost with the following three options. Therefore only use the following options described if the two options described previously did not lead to the desired result.

- In STEP 7, download your program to the CPU with menu command "Online > Download and reset PLC program".
- Remove the memory card from the slot of the CPU. Delete the content that is longer needed from the memory card with your programming device.
- Delete the entire contents, e.g. by formatting the memory card. A description of how to format the memory card can be found in the section "Formatting a SIMATIC memory card".

Note also the following FAQs:

- "When downloading to the S7-1500 CPU, why is the message "There is insufficient memory on the memory card for this amount of data" displayed although there is still enough memory available?" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/107108015).
- "Why can you not load the project data into the load memory of the S7-1500 CPU when the number of alarms and messages is too large?" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109751485).

3 Memory usage and application examples

3.1 Memory usage for recipes

Introduction

A recipe is a collection of parameter sets with the same structure. These recipe data records are located in a non-runtime-relevant data block in the load memory, and do not occupy any storage space in the work memory. You have the option of reading individual recipe data records into a data block in the work memory and accessing the data in the user program. You can write a recipe data record that has been changed in the user program back to the recipe data block.

For example, recipes contain the related data of a particular batch in production. You can export recipe data records of a recipe DB as a csv file. A web browser can read data via the web server of the CPU, even when the CPU is in STOP state. You can also directly access the data of the SIMATIC memory card using a card reader on the programming device.

Note

Redundant S7-1500R/H system

Recipes are not supported by the CPUs of the redundant system S7-1500R/H.

Processing sequence

- **Storing the recipe in the load memory**
  STEP 7 fills the individual data records of a recipe into a non-runtime-relevant DB and downloads the DB to the CPU. In order to configure a non-runtime-relevant DB, you must enable the "Only store in load memory" block attribute. The recipes then only use memory space in the load memory and not in the work memory.
- **Working with recipe data in the user program**
  You use the "READ_DBL" instruction to copy a data record of the current recipe from the DB in the load memory to a runtime-relevant DB in the work memory. As a result, the work memory only has to accommodate the data for the currently required recipe data record. The user program can now access the data of the current data record.
- **Saving back changed recipe data records**
  The "WRIT_DBL" instruction writes new or changed data records of a recipe from the user program back to the load memory. The data written to the load memory is portable and not affected by a memory reset. To back up changed data records (recipes), you must upload the data blocks and back them up on the PG/PC.
  You can find information on uploading data blocks in the STEP 7 online help under "Programming a PLC > Compiling and downloading blocks > Downloading blocks for S7-1200/1500 > Uploading blocks from a memory card".

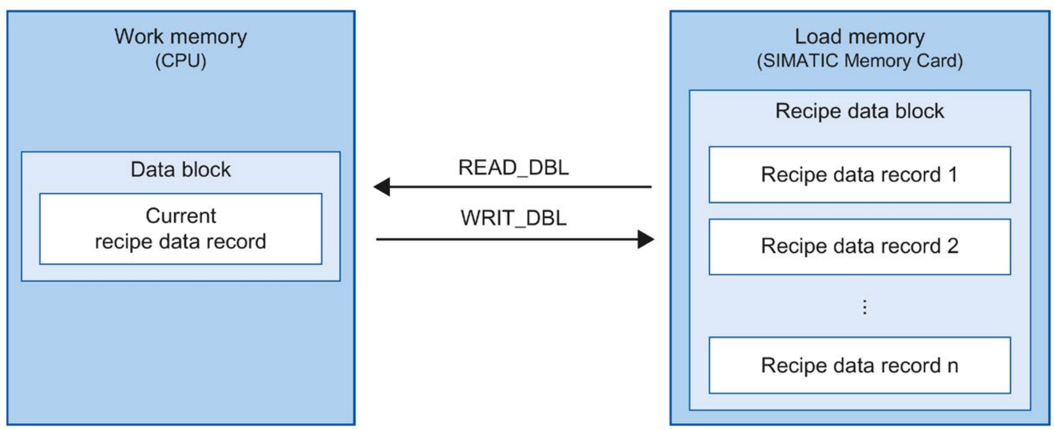

Figure 3-1 Processing sequence with "READ_DBL" and "WRIT_DBL"

Also note the FAQ "How do you configure data blocks with the "Only store in load memory" attribute for the S7-1200/S7-1500? " in the Internet (https://support.industry.siemens.com/cs/ww/en/view/53034113).

Note

Instructions that access the SIMATIC memory card have a lower performance than instructions that access the work memory. The associated blocks (e.g. READ_DBL and WRIT_DBL) are therefore asynchronous. Their execution extends if necessary over several cycles.

NOTICE
Service life of the SIMATIC memory card Only a limited number of delete and write operations are possible on the SIMATIC memory card. After expiration of the service life, there is a risk that the card can no longer be used. Therefore, use a SIMATIC memory card with sufficient memory for your particular purposes. Additional information on the service life of the SIMATIC memory card can be found in the section Service life of the SIMATIC memory card (Page 68).

Import and export of recipe data

You have the option of exporting recipe data records of a recipe DB as a CSV file, and importing them from a CSV file into a DB. The CSV file is located in the "\recipes" directory on the SIMATIC memory card. You can open and process this file further with a spreadsheet program, e.g. Microsoft Excel.

You can easily work with CSV files on the SIMATIC memory card via the web server of the CPU (e.g. rename, save to hard disk, delete, etc.). To avoid undesired manipulation, set access rights for the web server in STEP 7. You can find additional information on the Web server in the Web Server (http://support.automation.siemens.com/WW/view/en/59193560) function manual.

- **Export of recipe data**

  The "RecipeExport" instruction exports all the recipe data records of a recipe DB from the load memory to a CSV file on the SIMATIC memory card. The CSV file has the same name as the recipe of the DB. The CSV file is stored in the "\recipes" directory on the SIMATIC memory card.

  The "RecipeExport" instruction only exports valid and unencrypted recipe data records.

- **Import of recipe data**

  The "RecipeImport" instruction imports all recipe data records from the CSV file into the recipe DB in the load memory. The name of the CSV file must match the name of the recipe DB.

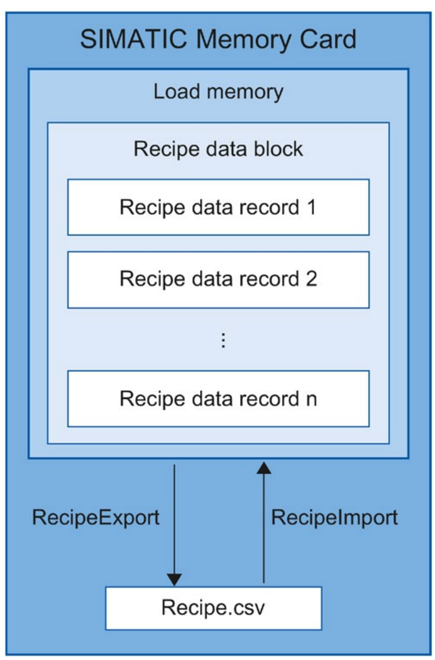

Figure 3-2 Import and export of recipe data

Note

Asynchronous instructions

Please note that the "RecipeExport" and "RecipeImport" instructions are asynchronous instructions.

In contrast to synchronous instructions, this means the execution of an asynchronous instruction can extend over multiple calls before execution is completed. The CPU processes asynchronous instructions in parallel with the cyclic user program.

A CPU can process several asynchronous instruction jobs in parallel. The CPU can process a maximum of 10 jobs of the instructions listed in parallel.

You can find additional information about asynchronous instructions in the following manuals:

- System manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
- Operating instructions ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

Reference

You can find additional information on the instructions for recipes in the STEP 7 online help under "Programming a PLC > Instructions > Instructions (S7-1200, S7-1500) > Extended instructions > Recipes and data logging > Recipe functions".

Note also FAQ "Using recipe functions for persistent data with SIMATIC S7-1200 and S7 1500" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109479727).

3.2 Memory usage for data logging

3.2.1 Overview of data logging

With data logging, you save selected process values from the user program in a file, the data log. The data logs are saved on the SIMATIC memory card in csv format and stored in the "\datalogs" directory. A web browser can read data via the web server of the CPU, even when the CPU is in STOP state. You can also directly access the data of the SIMATIC memory card using a card reader on the programming device.

NOTICE
Service life of the SIMATIC memory card Only a limited number of delete and write operations are possible on the SIMATIC memory card. Cyclic write operations to the SIMATIC memory card by the user program reduce the service life of the SIMATIC memory card. After expiration of the service life, there is a risk that the card can no longer be used. Therefore, use a SIMATIC memory card with sufficient memory for your particular purposes. Information on the service life of the SIMATIC memory card can be found in the section Service life of the SIMATIC memory card (Page 68).

The "data logging" instructions may be used in your program to create, open, write, and close data logs. You decide which tags are logged by creating a data block that defines a single data log data record. Your data block is used as temporary storage for a new data log data record. New current values for the tags must be transferred into the data block during runtime by means of user program instructions. If all tag values have been updated, you can execute the "DataLogWrite" instruction, in order to transfer data from the data block into the data log.

You manage your data logs with the integrated web server. You can download data logs from the standard "File Browser" website. After you have transferred a data log to your PC, you can analyze the data using popular spreadsheet programs, e.g. Microsoft Excel.

Note

Redundant system S7-1500R/H

Data logging is not supported by the CPUs of the redundant system S7-1500R/H.

The following figure shows the basic sequence for creating a data log:

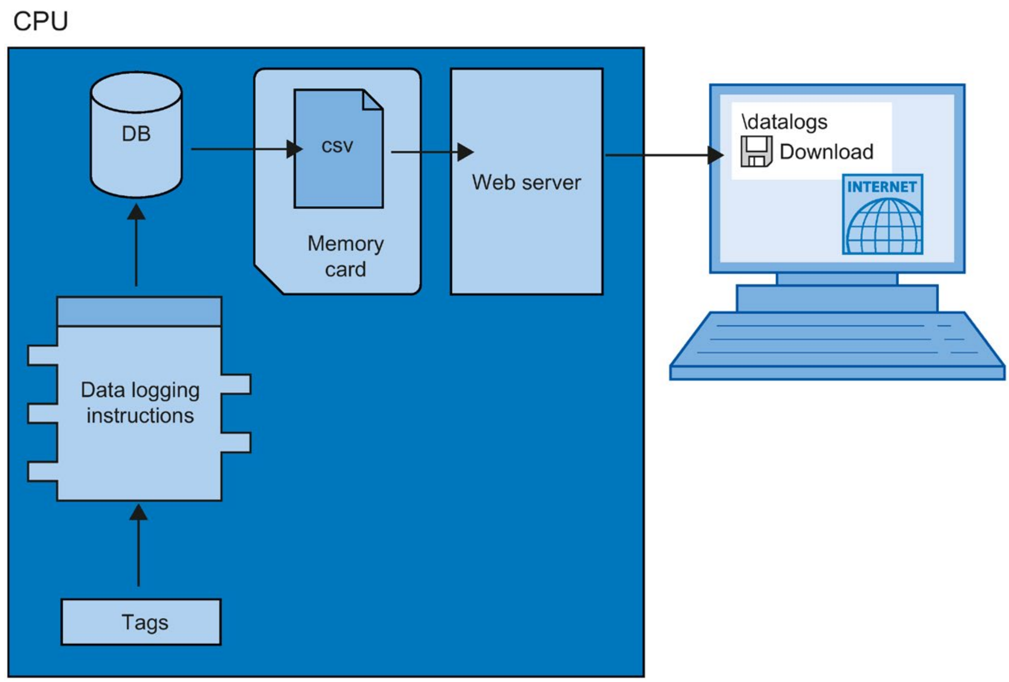

Figure 3-3 Basic sequence during the creation of a data log

3.2.2 Data structure of the data logs

Introduction

You use the "DataLogCreate" instruction to create a data log in STEP 7. The NAME parameter assigns the data log a name. The DATA and HEADER parameters specify the data type of all data elements in a data log data record, and the header line of the data log. The RECORDS parameter indicates the maximum number of records in the data log.

NAME parameter for the "DataLogCreate" instruction

You use the NAME parameter to assign a name for the data log. This is the name under which the data log is saved in the "\datalogs" directory of the SIMATIC memory card.

DATA parameter for the "DataLogCreate" instruction

The DATA block parameter specifies the structure of the data log's records. The columns and data types of a data record in the data log are determined by the elements of the structure declaration or array declaration of this data buffer. Each element of a structure or array corresponds to a column in a row in the data log.

HEADER parameter for the "DataLogCreate" instruction

Using the HEADER block parameter, you can assign a heading in the header row to each column in the data log.

RECORDS parameter for the "DataLogCreate" instruction

The RECORDS parameter specifies the maximum number of records that can be stored in a data log. When the specified maximum number of data records in a data log is reached, the next write operation overwrites the oldest data record.

3.2.3 Instructions for data logging

Overview

The following table gives an overview of the instructions for data logging. You will find the data logging instructions in "STEP 7" in the "Instructions" task card, under "Extended instructions > Recipe and data logging > Data Logging".

Table 3- 1 Overview of the data logging instructions

Name of the instruction	Description
"DataLogCreate": Create data log	With the "DataLogCreate" instruction you create a data log. The data log is saved on the SIMATIC memory card in the "\datalogs" directory. You can use the data logging instructions to save process data. The amount of data in a data log depends on the available memory space on the SIMATIC memory card.
"DataLogOpen": Open data log	With the "DataLogOpen" instruction, you open an existing data log on the SIMATIC memory card. A data log must be open before you can write new data records to it. The data log opens automatically when the "DataLogCreate" and "DataLogNewFile" instructions are executed. A maximum of 10 data logs can be open at any one time. The data log to be opened can be selected using the ID or name of the data log. The maximum file size of data logs is 2 GB. A maximum number of 1000 data log files is possible with firmware version V2.0.
"DataLogWrite": Write data log	With the "DataLogWrite" instruction you write a data record into an existing data log. Use the ID parameter to select the data log to which the data record is to be written. To write a new data record, the data log must be open.
"DataLogClose": Close data log	With the "DataLogClose" instruction, you close an open data log. You select the data log using the ID parameter. When the CPU changes to STOP state, all open data logs are closed.
"DataLogNewFile": Data log in new file	With the "DataLogNewFile" instruction you create a new data log. The new data log has the same properties as an already existing data log. By creating a new data log, you prevent cyclic overwriting of existing data records. When the instruction is called it creates a new data log on the SIMATIC memory card using the name defined in the NAME parameter. You use the ID parameter to specify the ID of the old data log whose properties you want to apply to the new data log. The ID parameter then outputs the ID of the new data log.
"DataLogClear": Empty data log	The "DataLogClear" instruction deletes all data records in an existing data log. The header of the data log is not deleted (see description of parameter Data structure of the data logs (Page 45)).
"DataLogDelete": Delete data log	The "DataLogDelete" instruction is used to delete a data log from the SIMATIC memory card. Select the data log to be deleted using the NAME and ID parameters.

Note

Asynchronous instructions

Note that the instructions in the table are asynchronous instructions.

In contrast to synchronous instructions, this means the execution of an asynchronous instruction can extend over multiple calls before execution is completed. The CPU processes asynchronous instructions in parallel with the cyclic user program.

A CPU can process several asynchronous instruction jobs in parallel. The CPU can process a maximum of 10 jobs of the instructions listed in the table in parallel.

You can find additional information about asynchronous instructions in the following manuals:

- System manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/109482416)
- Operating instructions ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

3.2.4 Example program for data logging

This example program shows the storing of process values for counter content, temperature, and pressure in a data log.

The example shows the basic functioning of the instructions for data logs. The complete program logic is not shown.

Note

General use of data logs

- Data logs are automatically opened after execution of the "DataLogCreate" and "DataLogNewFile" instructions.
- Data logs are automatically closed at a change of the CPU from RUN to STOP or a restart of the CPU.
- A data log must be open so that data can be written to the data log with the "DataLogWrite" instruction.
- A maximum of 10 data logs can be open at any one time, even when more than 10 data logs exist.

Tags of the data block

The following figure shows the tags of the "My_Datalog_Vars" data block. These tags are used by the "Data logging" instructions "DataLogCreate" and "DataLogNewFile". The "MyDataLogName" and "MyNEWDataLogName" tags are called in the NAME block parameter, and give the data logs a name. The "MyData" structure is called in the DATA block parameter and specifies the structure of the csv file. The three MyData tags temporarily store new values. The tag values at these DB addresses are transferred to a data log using the "DataLogWrite" instruction. The "MyDataLogHeaders" tag is called in the HEADER block parameter and specifies a header for the data log.

My_Datalog_Vars

	Name	Data type	Start value
1	Static		
2	MyNEWDataLogName	String	'MyNEWDataLog'
3	MyDataLogName	String	'MyDataLog'
4	MyDataLogID	DWord	0
5	MyDataLogHeaders	String	'Count,Temperature,Pressure'
6	MyData	Struct	
7	MyCount	Int	0
8	MyTemperature	Real	0.0
9	MyPressure	Real	0.0

Figure 3-4 Declaration table with the data block's tags

Network 1

A rising edge at REQ starts the creation of the data log.

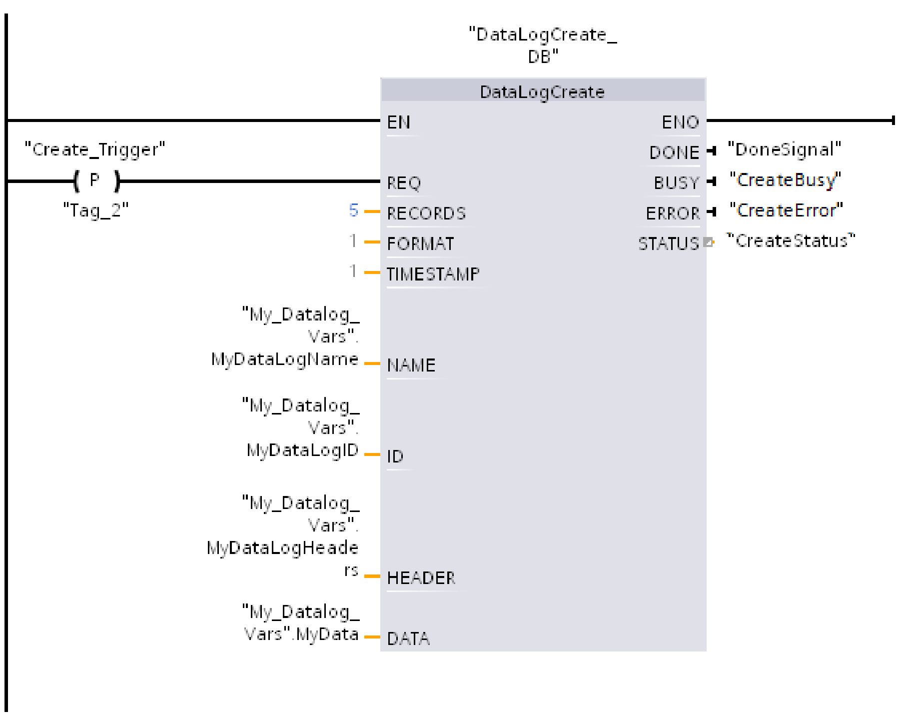

Figure 3-5 Network 1

Network 2

Detect the output DONE of "DataLogCreate", because after the execution of "DataLogCreate" it is only set to 1 for one cycle.

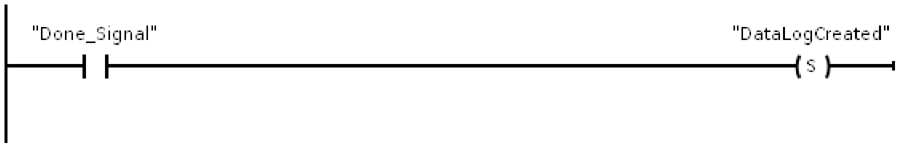

Figure 3-6 Network 2

Network 3

A rising edge triggers the point in time at which new process values are stored in the MyData structure.

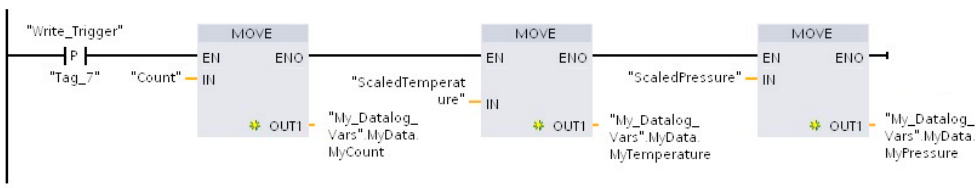

Figure 3-7 Network 3

Network 4

The state of the input EN is based on the point in time at which the execution of "DataLogCreate" was completed. One execution of "DataLogCreate" extends over multiple cycles, and must be completed before a write operation is executed. The rising edge at input REQ is the event that triggers an activated write operation.

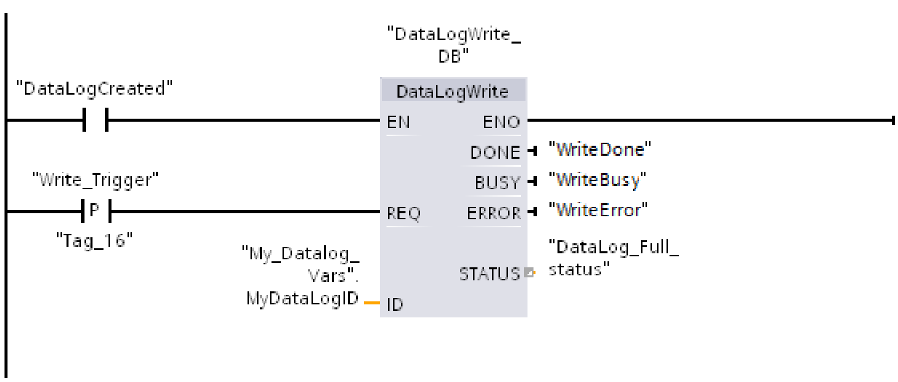

Figure 3-8 Network 4

Network 5

Close the data log after the last data record has been written. After execution of the "DataLogWrite" instruction, which writes the last data record, the STATUS output is set to "1".

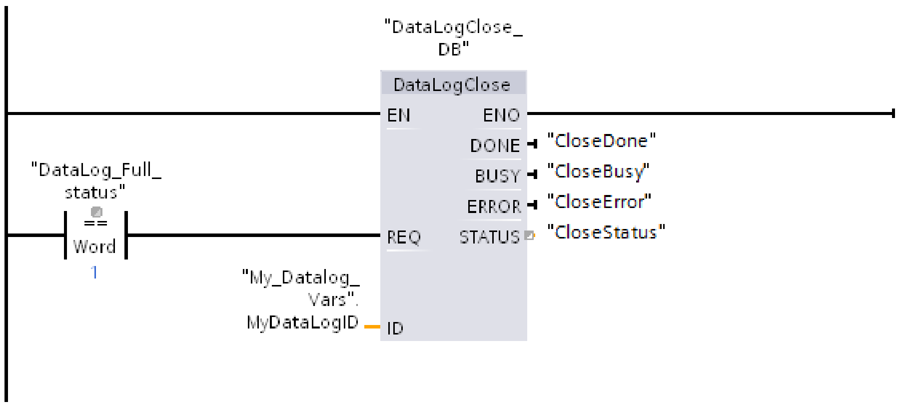

Figure 3-9 Network 5

Network 6

A rising edge at the input REQ of the instruction "DataLogOpen" simulates that the user presses a button on an HMI device, which opens a data log. If you open a data log in which all records are occupied by process data, then the next execution of the "DataLogWrite" instruction overwrites the oldest data record. You can however also preserve the old data log, and create a new data log instead. This is shown in network 7.

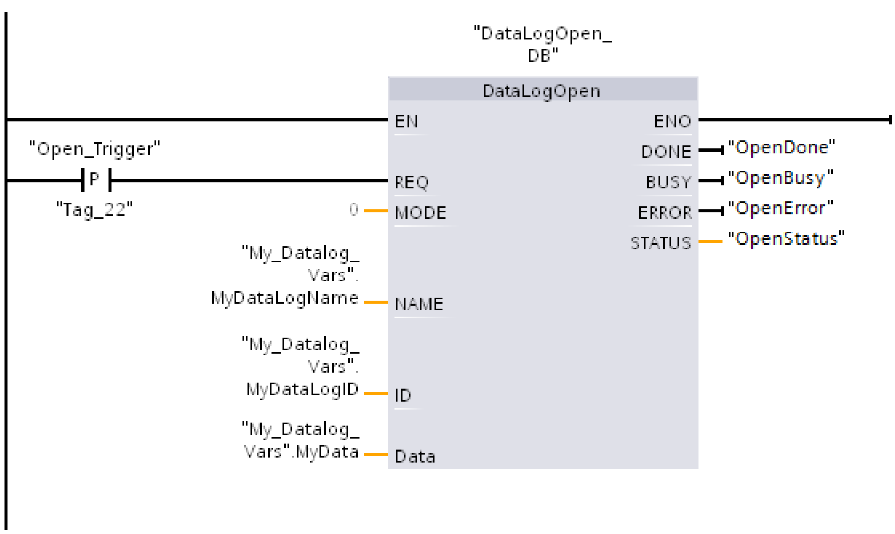

Figure 3-10 Network 6

Network 7

The ID parameter is an IN/OUT type. First you indicate the ID value of the existing data log whose structure you want to copy. After the "DataLogNewFile" instruction has been executed, a new and unique ID value for the new data log is written back into the address of the ID reference. The required detection DONE bit = TRUE is not shown. An example for the logic of the DONE bit can be found in networks 1, 2 and 4.

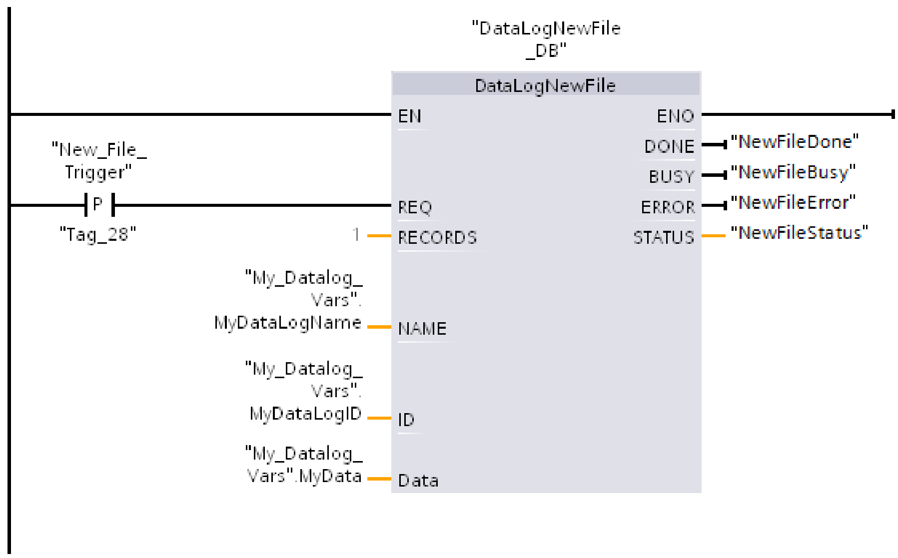

Figure 3-11 Network 7

The data logs created in the example program can be found on the CPU Web server's standard "File browser" Web page in the "\datalogs" folder.

The following figure shows the standard Web page of the Web server using the example of the CPU 1516-3 PN/DP.

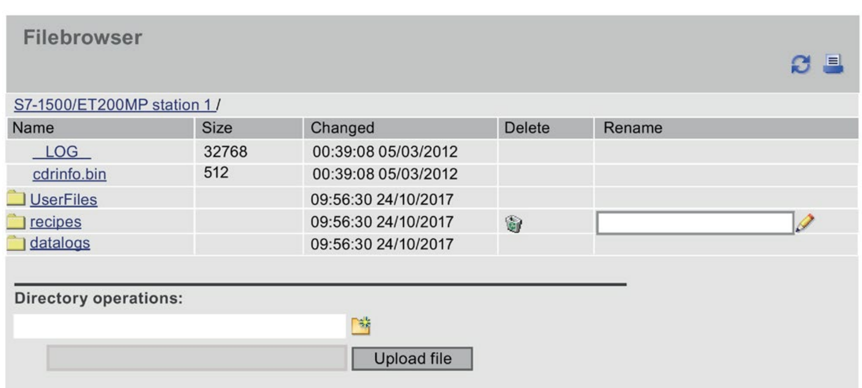

Figure 3-12 Standard "File browser" web page of the Web server

In the file browser, you can download the data logs created in the example program. It is not possible to delete or rename the data logs in the Web server. To delete a data log you either use the "DataLogDelete" instruction or you format the SIMATIC memory card.

On the DataLogs web page, you can have all the data logs that you created displayed. You can call and empty the relevant data log file by clicking the icon .

Note

Manipulation of the data logs using a card reader

Do not delete or change the data logs using a card reader on the PG/PC. You can copy the data logs on the SIMATIC memory card, however, using a card reader on the PG/PC.

The recommended medium for viewing, downloading (copying) and deleting data logs is the file browser of the web server, however. Direct file access via Windows Explorer brings with it the risk of inadvertent deletion of modification of data logs or system files. This can cause the files to be damaged or the SIMATIC memory card to become unusable.

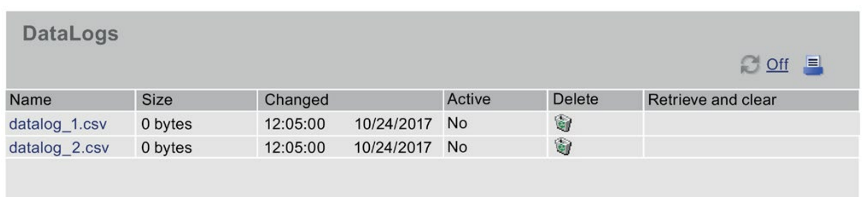

Figure 3-13 Example - Data logs in the folder "\datalogs" of the file browser

Table 3- 2 Downloaded examples of data logs displayed in Microsoft Excel

Two data records written in a data log which contains a maximum of five data records.

	A	B	C	D	E	F
1	Record	Date	Time	Count	Temperature	Pressure
2	1	1/3/2012	10:16:47	5	5,00E+00	5,00E+00
3	2	1/3/2012	10:16:48	5	5,00E+00	5,00E+00
4	//END					
5						

Five data records written in a data log which contains a maximum of five data records.

	A	B	C	D	E	F
1	Record	Date	Time	Count	Temperature	Pressure
2	1	1/3/2012	10:08:23	1	9,86E+01	3,52E+01
3	2	1/3/2012	10:08:39	2	1,00E+02	3,73E+01
4	3	1/3/2012	10:08:54	3	9,99E+01	3,68E+01
5	4	1/3/2012	10:09:11	4	9,95E+01	3,64E+01
6	5	1/3/2012	10:09:28	5	9,92E+01	3,74E+01
7						

After another data record has been written, the 6th write operation overwrites the oldest data record (record 1) with data record 6. Another write operation overwrites data record 2 with data record 7, etc.

	A	B	C	D	E	F
1	Record	Date	Time	Count	Temperature	Pressure
2	6	1/3/2012	10:09:42	6	9,87E+01	3,58E+01
3	2	1/3/2012	10:08:39	2	1,00E+02	3,73E+01
4	3	1/3/2012	10:08:54	3	9,99E+01	3,68E+01
5	4	1/3/2012	10:09:11	4	9,95E+01	3,64E+01
6	5	1/3/2012	10:09:28	5	9,92E+01	3,74E+01
7						

3.2.5 Calculation of the data log size

The maximum memory size is allocated when you create the data log. Besides ensuring enough memory space for all the data records, you must take into account the memory space of the following elements for the memory allocation:

- Data log header (if used)
- Time stamp header (if used)
- Data record index header
- Minimum block size

The formula below represents a method to help you determine the estimated size of your data log. Make sure that you observe the rule for the maximum size.

Data bytes of the data log = ((data bytes in a data record + time stamp bytes + 12 bytes) * number of data records)

Header

Header bytes of the data log = header character bytes + 2 bytes

Header character bytes

- No data header and no time stamp = 7 bytes
- No data header and time stamp (with time stamp header) = 21 bytes
- Data header and no time stamp = Number of character bytes in all column headers including separating commas
- Data header and time stamp (with time stamp header) = Number of character bytes in all column headers including separating commas + 21 bytes

Data

Data bytes of the data log = ((data bytes in a data record + time stamp bytes + 12 bytes) * number of data records)

Data bytes in a data record

The DATA parameter of the "DataLogCreate" instruction points to a structure. The structure assigns the number of data fields and the data type of each data field for a data log data record.

Multiply the number of the respective data type with the number of bytes required for this data type. Repeat this step for each data type in a data record. Add all the data bytes to obtain the sum of all the data elements in a data record.

Size of the individual data types

The data in data logs is saved as character bytes in csv format (comma separated values). The table below shows the number of bytes that are required to save each data type.

Data type	Bytes
Any	10
Bool	1
Byte	4
Char	1
Date	10
DInt	12
DTL	31
DWORD	11
Int	7
LDT	31
LReal	25
Real	16
Sint	5

Data type	Bytes
String	**Example 1:** MyString String[10] The maximum character string size is specified with 10 characters. • Text character + automatic filling with spaces = 10 bytes • Quotation marks at the start and end + comma character = 3 bytes 10 + 3 = 13 bytes total **Example 2:** Mystring2 String If no size is specified in square brackets, 254 bytes are assigned by default. • Text character + automatic filling with spaces = 254 bytes • Quotation marks at the start and end + comma character = 3 bytes 254 + 3 = 257 bytes total
Time	14
Tod	12
UDInt	12
UInt	7
USInt	5
WChar	1
Word	6

Number of data records in a data log

The RECORDS parameter of the "DataLogCreate" instruction specifies the maximum number of data records that can be stored in a data log.

Time stamp bytes in a data record

- No time stamp = 0 bytes
- Time stamp = 22 bytes

Example for size of a CSV file

The figure "Open CSV file" shows a CSV file opened in a spreadsheet program with five written data records in one data log.

The figure "Size of the header and the data records" shows the size of the header used in the CSV file and the size of the individual data records on the SIMATIC memory card.

The figure "Column size" shows the size of the respective columns depending on the data type used.

Open CSV file

	A	B	C	D	E	F
1						
2	Record	Date	UTC Time	Count	Temperature	Pressure
3	1	9/30/2010	20:26:56	1	9.86E+01	3.52E+01
4	2	9/30/2010	20:28:43	2	1.00E+02	3.73E+01
5	3	9/30/2010	20:29:03	3	9.99E+01	3.68E+01
6	4	9/30/2010	20:29:21	4	9.95E+01	3.64E+01
7	5	9/30/2010	20:30:19	5	9.92E+01	3.74E+01
8						

Size of the header and the data records

G
49 (42 characters + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
77 (72 + 5 commas)
Total = 442

Column size

9			Size of each column:			
10	index	Date	Time	int	real	real
11	11	10	12	7	16	16

Each data record also has a separator comma. Therefore, the calculation of the total size per column also includes 1 byte for each separator comma.

Note that the calculation of the size of the header, the data records and the columns is not an integral component of the open CSV file. The size information was added manually to illustrate the elements that make up the size of a data log. You can have the total size of a data log you have created as CSV file displayed in the web server on the "DataLogs" page.

4 SIMATIC memory card

4.1 SIMATIC memory card - Overview

Introduction

The automation system uses a SIMATIC memory card as the program memory. The SIMATIC memory card is a preformatted memory card compatible with the Windows file system. The memory card is available in different memory sizes and can be used for the following purposes:

- Transportable data carrier
- Program card
- Firmware update card
- Service data card

When you transfer the user program to the CPU via an online connection, it is written to the SIMATIC memory card. The SIMATIC memory card must be in the card slot of the CPU for this.

You can also write the SIMATIC memory card in the programming device or PC. A commercially available SD card reader is needed to read or write the SIMATIC memory card with the programming device or PC. You use this, for example, to copy files directly to the SIMATIC memory card with Windows Explorer.

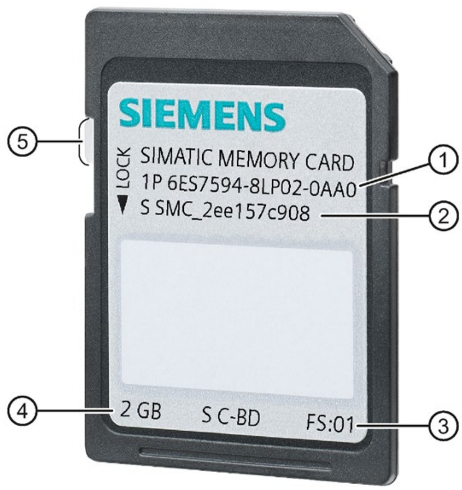
The SIMATIC memory card is mandatory for operation of the CPU.

Note

SIMATIC memory cards of the redundant system S7-1500R/H

For the redundant system S7-1500R/H you need a SIMATIC memory card for each of the two CPUs. During redundant operation, both CPUs access the memory cards.

Labeling of the SIMATIC memory card



① Article number
② Serial number
③ Production version
④ Memory size
⑤ Slider for setting the write protection:
- Slider up: not write-protected
- Slider down: write-protected

Figure 4-1 Labeling of the SIMATIC memory card

Folders and files on the SIMATIC memory card

The following folders and files can be found on the SIMATIC memory card:

Table 4- 1 Folder structure

Folder	Description
FWUPDATE.S7S	Firmware update files for CPU and I/O modules
SIMATIC.S7S	User program, i.e. all blocks (OBs, FCs, FBs, DBs) and system blocks, project data of the CPU
SIMATIC.HMI	HMI-relevant data
DataLogs*	DataLog files
Recipes*	Recipe files
UserFiles*	You have to manually create the folder named "UserFiles" on the memory card for your user data. Only files in this folder (*.pdf, *.txt, *.csv, etc) are also loaded into the STEP 7 project with the "Upload device as new station" function.
Backups	Files for backing up and restoring via the display

* The content of these folders is also loaded into the STEP 7 project with the "Upload device as new station" function.

Table 4- 2 File structure

File type	Description
S7_JOB.S7S	Job file
SIMATIC.HMI\Backup*.psb	Panel backup files
SIMATICHMI_Backups_DMS.bin	Protected file (necessary for use of panel backup files in STEP 7)
__LOG__	Protected system file (necessary for use of card)
crdinfo.bin	Protected system file (necessary for use of card)
DUMP.S7S	Service data file
*.pdf, *.txt, *.csv, etc.	Additional file with different formats that you can also store in folders of the SIMATIC memory card If you store the files in the "UserFiles" folder, the files are stored in the STEP 7 project with "Upload device as new station" and can be used, for example, for restoring files in the event of a defective SIMATIC memory card.

Additional folders and files: CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP

The SIMATIC memory card of the CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP also contain the following folders and files:

- The following C/C++ runtime containers are located in the "/CppEnv1.MFP" directory on the SIMATIC memory card and are mounted in the file system in Linux:
  - System.img → Mount point: "/etc/mfp" (system files)
  - User.img → Mount point: "/home" (home directories of users, for C/C++ runtime application, for example)
  - Data.img → Mount point: "/var/userdata" (e.g. log data)
- RAM-Disk → Mount point: "/var/volatile"

Note

First-time startup of CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP with empty SIMATIC memory card

When the CPU starts up for the first time with an empty SIMATIC memory card, the card is prepared for use with C/C++ runtime. This process takes up to three minutes. Do not turn off the CPU during this phase; the STOP LED flashes.

Note

Impact on performance of the CPU 1518-4 PN/DP MFP and CPU 1518F-4 PN/DP MFP

Depending on the type of programming, C/C++ runtime applications, such as mass storage accesses to the SIMATIC memory card, can affect the performance of the CPU.

You can find additional information on these CPUs in the CPU 1518-4 PN/DP MFP (https://support.industry.siemens.com/cs/ww/en/view/109749061) manual and the CPU 1518(F)-4 PN/DP MFP (https://support.industry.siemens.com/cs/ww/en/view/109756478) product information.

You can find information on creating C/C++ runtime applications in the SIMATIC S7-1500 ODK 1500S (https://support.industry.siemens.com/cs/ww/en/view/109752683) manual.

Using the serial number for copy protection

You can set up copy protection for CPUs that binds execution of the block to a specific SIMATIC memory card. You can then only execute the block if it is on the SIMATIC memory card with the specified serial number.

Note

Redundant system S7-1500R/H

The copy protection function is not supported by the CPUs of the redundant system S7-1500R/H.

You can find additional information about copy protection in the following manuals:

- System manual S7-1500, ET 200MP Automation System (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
- Operating instructions ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

Removing a SIMATIC memory card from the CPU

Only remove the SIMATIC memory card in POWER OFF or STOP of the CPU. Ensure that no writing functions (online functions with the programming device, e.g. loading/deleting a block, test functions) are active in STOP or were active before POWER OFF.

If you remove the SIMATIC memory card during a write operation, the following problems can occur:

- The data content of a file is incomplete.
- The file is no longer readable, or no longer exists.
- The entire data content is corrupted.

Inserting the SIMATIC memory card in the CPU in STOP state triggers a re-evaluation of the SIMATIC memory card. The CPU compares the content of the configuration on the SIMATIC memory card with the backed-up retentive data. If the backed-up retentive data matches the data of the configuration on the SIMATIC memory card, the retentive data is retained. If the data differs, the CPU automatically performs a memory reset. A memory reset deletes the retentive data on the CPU. After the memory reset, the CPU goes to STOP.

With regard to removal of the SIMATIC memory card, note also the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/59457183).

Note

Using the SIMATIC memory card as a firmware update card

If you use the SIMATIC memory card as a firmware update card, removing and inserting the card will not result in the loss of retentive data.

Removing a SIMATIC memory card from Windows computers

If you are using the card in a commercially available card reader under Windows, use the "Eject" function before you remove the card from the card reader. If you remove the card without using the "Eject" function, you may lose data.

Deleting contents of the SIMATIC memory card

You have the following options for deleting the content of the SIMATIC memory card:

- Delete files with Windows Explorer
- Format with STEP 7

Note

If you format the card with Windows tools, you will render the SIMATIC memory card unusable as a storage medium for a CPU.

Deletion of files and folders is permitted, with the exception of the "__LOG__" and "crdinfo.bin" system files. The CPU needs these system files. When you delete the files, you will no longer be able to use the SIMATIC memory card with the CPU.

If you have deleted the "__LOG__" and "crdinfo.bin" system files, format the SIMATIC memory card as described in the following section.

Formatting a SIMATIC memory card

NOTICE
Formatting the SIMATIC memory card Do **not** format the memory card with Windows tools. Formatting with Windows renders the memory card unusable by a CPU initially. You can find information on how to repair an inconsistent or incorrectly formatted card in the following FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/69063974).

To free up memory space on your SIMATIC memory card, you have the option of formatting the SIMATIC memory card. During formatting, the entire content of the memory card is deleted with the exception of the IP address.

The SIMATIC memory card may only be formatted in the CPU. With a SIMATIC memory card inserted, follow these steps:

Formatting with STEP 7:

- Establish an online connection.
- Double-click "Online & diagnostics" in the project tree.
- In the dialog window select "Functions > Format memory card" and then select the "Format" button.

Formatting via the display of the CPU

- In the display of the CPU, select the menu "Settings" > "Card functions" > "Format card" and confirm with OK.

Changing the memory card without loss of retentive data

You can change the memory card or use a larger SIMATIC memory card without losing the retentive data. When you switch off the CPU, the retentive data is backed up in the retentive memory of the CPU. While the CPU is switched off, you can remove the memory card and copy its content to a larger memory card. After switching on the CPU, the data backed up in the CPU when the CPU was switched off is restored.

4.2 Setting the card type

Introduction

You can use the SIMATIC memory card as a program card or as a firmware update card.

Procedure

1. To set the card type, insert the SIMATIC memory card into the card reader of the programming device.
2. Select the "SIMATIC Card Reader" folder in the project tree.
3. In the properties of the selected SIMATIC memory card, specify the card type:

- **Program card**

  You use a program card as an external load memory for the CPU. It contains the complete user program for the CPU. The CPU transfers the user program from the load memory to the work memory. The user program runs in the work memory.

  The following folder is created on the SIMATIC memory card: SIMATIC.S7
- **Firmware update card**

  You can save firmware for a CPU and for I/O modules on a SIMATIC memory card. This enables you to perform a firmware update with the help of a specially prepared SIMATIC memory card.

  The following folder is created on the SIMATIC memory card: FWUPDATE.S7S

Reference

You can find additional information in the STEP 7 online help.

4.3 Data transfer with SIMATIC memory cards

Transferring objects from the project to the SIMATIC memory card

When the SIMATIC memory card is inserted in the programming device or in the external card reader, you can transfer the following objects from the project tree (STEP 7) to the SIMATIC memory card:

- Individual blocks (multiple selection possible)

  In this case, the transfer is consistent, i.e. the function takes dependencies between blocks due to block calls into account.
- CPU folder

  In this case, all the runtime-relevant objects, such as blocks and the hardware configuration, are transferred to the SIMATIC memory card, just as with downloading.
- Service data
  In this case, the service data saved beforehand is transferred to the SIMATIC memory card. You will find additional information on the service data in the following manuals:
  – System manual S7-1500, ET 200MP Automation System (http://support.automation.siemens.com/WW/view/en/59191792)
  – System manual Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)
  – System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
  – Operating instructions ET 200pro CPU 1516pro-2 PN (http://support.automation.siemens.com/WW/view/en/58649293)

You have the following options for performing the transfer:

- Transfer the objects using drag-and-drop.
- Use the "Card Reader/USB memory > Write to memory card" command in the "Project" menu.

Transferring trace recordings to the SIMATIC memory card

The "Save measurements on device (memory card)" function allows you to save trace recordings on your SIMATIC memory card.

Note

Redundant system S7-1500R/H

The CPUs of the redundant system S7-1500R/H do not support the saving of measurements on the SIMATIC memory card.

Response when number reached

The "Deactivate recording" parameter repeats the measurements until the configured "Number of measurements" is reached.

The "Overwrite oldest recording" parameter replaces the oldest measurement with the latest measurement when the configured "Number of measurements" is reached. Note, however, that continuously writing data to the SIMATIC memory card shortens its service life.

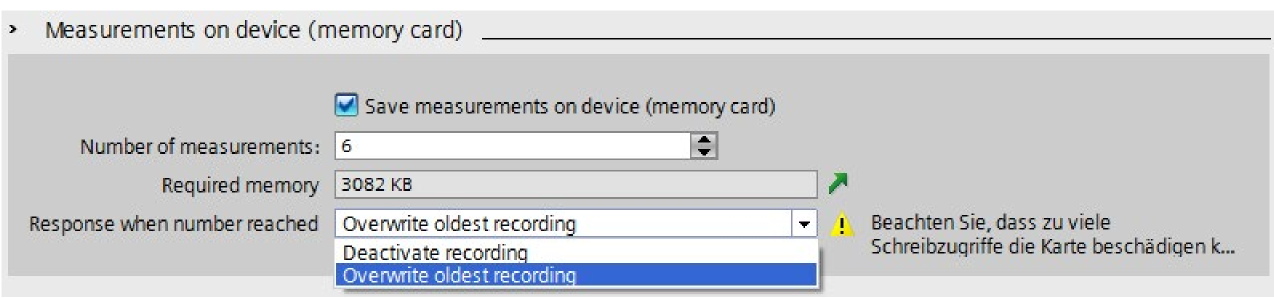


Figure 4-2 Dialog of settings for saving measurements on the memory card in STEP 7

Number of measurements

The CPU supports a maximum of 999 measurements. The CPU writes the trace recordings to the load memory of the memory card. Meanwhile, the CPU pauses the checking of trigger conditions for the trace job. Once the CPU finishes saving the trace recordings, the CPU continues checking the trigger conditions.

NOTICE
Memory required on the SIMATIC memory card When the trace function "Measurements on device (memory card)" requires more memory than is available on the SIMATIC memory card, undesired effects may result. Ensure there is always sufficient free memory space to use the "Measurements on device (memory card)" function. In addition to the "Measurements on device (memory card)" trace function, other functions such as storing data logs use memory space on the SIMATIC memory card. Ensure there is always sufficient memory space available for all functions that use memory.

You can find additional information about trace measurements and trace recordings in the following:

- Function manual Using the Trace and Logic Analyzer Function (http://support.automation.siemens.com/WW/view/en/64897128)
- Function manual Web Server (http://support.automation.siemens.com/WW/view/en/59193560)
- STEP 7 online help

Firmware update using SIMATIC memory card

You can find information on how to perform a firmware update in the following:

- System manual S7-1500, ET 200MP Automation System (http://support.automation.siemens.com/WW/view/en/59191792)
- System manual Redundant System S7-1500R/H (https://support.industry.siemens.com/cs/ww/en/view/109754833)
- System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)
- Operating instructions ET 200pro CPU 1516pro-2 PN (http://support.automation.siemens.com/WW/view/en/58649293)

Reference

You can find additional information about the SIMATIC memory card in the STEP 7 online help.

4.4 Service life of the SIMATIC memory card

Calculation of the theoretical service life of a SIMATIC memory card serves as a decision-making aid for selecting which card you need for your automation task. The following examples only return a guide value, however. A precise calculation of the service life is not possible due to the fact that the description cannot cover all the theoretically possible scenarios.

Influences on the service life

You can influence the service life of SIMATIC memory cards by the following factors:

- Size of card
- Number and type of write operations

  The number of physical write operations to the memory blocks of the card results from the following:

  – Number of write operations from the application

  – Type of write operations from the application

Structure of a SIMATIC memory card

The internal flash memory of the SIMATIC memory card is organized in memory blocks. A memory block is a memory area of a fixed size. A write operation always addresses entire memory blocks on the SIMATIC memory card. When a memory block has been written once it must be deleted before it can be written again. The number of delete/write operations per memory block is limited. The service life of the SIMATIC memory card is measured by the maximum number of supported delete or write operations per memory block.

In contrast to delete or write operations, read operations have a negligible impact on the service life. Therefore, the impact of the read operations on the service life is not included in this calculation. A very high number of read operations can, however, influence the service life to a small extent.

Maximum number of write/delete operations

The internal controller of the memory card ensures that the available memory blocks are evenly used. In this way, a maximum number of write operations is possible on the SIMATIC memory card. Internal algorithms distribute the write accesses to the same logical memory area over changing physical memory areas in order to use the memory blocks evenly.

The following table shows the maximum possible number of write/delete operations as a function of the SIMATIC memory card used. The number of maximum write/delete operations of the respective SIMATIC memory card is also available online in the technical specifications of the respective SIMATIC memory card.

Memory size of the SIMATIC memory card *	Article number	Max. number of write/delete operations per memory block
4 MB	6ES7954-8LCxx-0AA0	500 000
12 MB	6ES7954-8LExx-0AA0	500 000
24 MB	6ES7954-8LFxx-0AA0	500 000
256 MB	6ES7954-8LL02-0AA0	200 000
2 GB	6ES7954-8LP01-0AA0	100 000
2 GB	6ES7954-8LP02-0AA0	60 000
32 GB	6ES7954-8LT02-0AA0	50 000

* The memory size figures named in the table are theoretical values. The actual existing memory size in practice is below the theoretical value. The reason for this is that the internal controller of the card and the file system reserve part of the existing memory for internal memory management.

Note

Write or delete operations

Write or delete operations, particularly repeated (cyclic) write/delete operations by the user program on the SIMATIC memory card reduces its service life.

Cyclic execution of the following instructions reduces the service life of the memory card depending on the number of write operations and data:

- "CREATE_DB" (with ATTRIB "Create DB in load memory")
- "DataLogWrite"
- "RecipeExport"
- "RecipeImport" (if target DB in load memory)
- "WRIT_DBL"
- "SET_TIMEZONE"

Note also that, in addition to the cyclic write/delete operations, the writing or deleting of very large amounts of data also adversely affects the service life of the SIMATIC memory card.

Note

Redundant system S7-1500R/H

The CPUs of the redundant system S7-1500R/H do not support the instructions specified in this "Write or delete operations" notice, except for "SET_TIMEZONE".

Guaranteed data retention time

If you do not use your SIMATIC memory card for an extended period of time, there is the risk that data contained on the memory card may no longer be readable after a certain amount of time.

The guaranteed data retention time of a SIMATIC memory card is 10 years on delivery and with proper storage. With a number of ≤ 10% of the maximum write/delete operations, the data stored on the card has a retention time of 10 years.

Please note that increasing numbers of write/delete operations to the card reduces its data retention time. If 90% of the maximum write/delete operations is reached, the guaranteed data retention time is reduced to 1 year. If 100% of the maximum write/delete operations is reached, the retention time of the saved data can no longer be guaranteed.

Determining the current usage level of a SIMATIC memory card in STEP 7

When you activate the "Aging of the SIMATIC memory card" option, you enter a threshold value as a percentage in the text box below. As soon as the service life of the SIMATIC memory card has reached the specified threshold value (e.g.: 80%), the CPU outputs a diagnostics alarm.

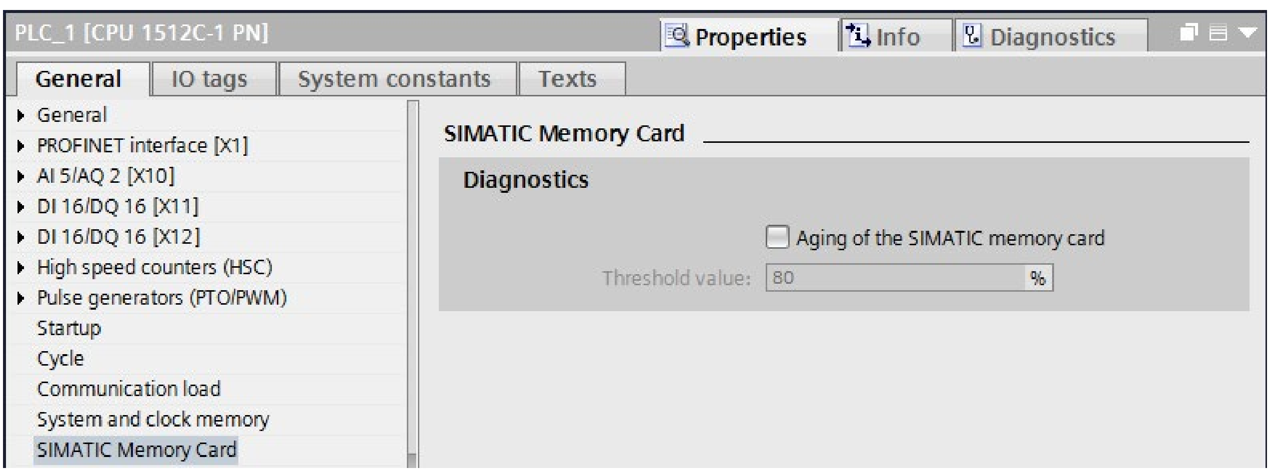

Figure 4-3 Enabled option "Aging of the SIMATIC memory card"

Calculation of the theoretical service life of a SIMATIC memory card

We will use the following example as a basis for calculation:

The user is using a new **256** MB memory card. In accordance with the table, this memory card type supports **200000** write operations. After parameter changes, the user would like to write **200** data blocks of **5** Kbytes each to the SIMATIC memory card at a frequency of **50** times per day with the "RecipeExport" instruction.

Step 1: Calculating the write operations

First use the following formula to calculate the service life of the SIMATIC memory card:

$$\text{Write operations} = \frac{\text{Size of the memory card} \quad * \quad \text{Maximum number of write operations}}{\text{Number of written bytes}}$$

We first use the sizes from the example in the formula "Write operations" as a basis for calculating the service life:

- Size of the memory card: **256** MB = **268435456** bytes
- Maximum number of write operations: **200000**
- Number of written bytes: **1024000** bytes (**200** x **5** KB)

If we use the sizes from the example in the formula, we obtain the following result:

$$\text{Write operations} = \frac{268\ 435\ 456\ \text{byte} \quad * \quad 200\ 000}{1\ 024\ 000\ \text{byte}} = 52\ 428\ 800\ \text{write operations}$$

Step 2: Calculating the service life

Use the following formula to calculate the service life in years:

$$\text{Service life} = \frac{\frac{\text{Write operations}}{\text{Write operations per day}}}{365\ \text{days}} : \text{Net-gross factor} = \text{years}$$

Note

Net-gross factor

Internal data (metadata) are also written to the SIMATIC memory card with each write operation. Due to this additional data, include the net-gross factor **10** when calculating the service life.

If we use the sizes from the example in the formula, we obtain the following result:

$$\text{Service life} = \frac{\frac{52\ 428\ 800}{50}}{365\ \text{days}} : 10 = 287\ \text{years}$$

Calculation with more frequent write accesses and a higher number of bytes written

If the frequency of write accesses and the number of bytes written per day increases, the service life of the SIMATIC memory card is reduced.

The following table shows, based on empirical values, how the service life of a SIMATIC memory card with a size of 256 MB is reduced

Write accesses per day	Number of bytes written per instruction	Service life of the SIMATIC memory card in years
50	1024000	287
100	1024000	143
400	1024000	36
400	2048000	18
400	4096000	9

The following table shows how the same values impact the service life of a SIMATIC memory card with a size of 2 GB (6ES7954-8LP01-0AA0).

Write accesses per day	Number of bytes written per instruction	Service life of the SIMATIC memory card in years
50	1024000	1149
100	1024000	575
400	1024000	144
400	2048000	72
400	4096000	36

The result shows that a high number of write accesses together with a high number of written bytes significantly shortens the service life of the SIMATIC memory card.

Reference

You can find an alternative method for calculating the service life of a SIMATIC memory card in an FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109482591).

GetSMCinfo instruction

In STEP 7 (TIA Portal) you have the option of reading out the inserted SIMATIC memory card using the GetSMCinfo instruction. The following information can be read out with the instruction:

- Memory size in KB
- Memory space used in KB
- Maintenance information: Previously used up portion of the service life in %
- Configured amount of the service life in % after which the CPU creates a diagnostics buffer entry and the maintenance LED switches on.

You can find additional information on the GetSMCinfo instruction in the STEP 7 online help.

4.5 Expanding the load memory of the CPUs of the redundant system S7-1500R/H

Memory requirements

If the memory space on one of the two SIMATIC memory cards is not sufficient, you can replace this card during operation of the redundant system S7-1500R/H.

Note

To avoid errors on the SIMATIC memory card due to insufficient memory, use memory cards with enough memory space.

Expanding the load memory during operation

To expand the load memory of the CPUs of the redundant system S7-1500R/H during operation, follow these steps:

Action		System response
1.	Switch the first CPU to STOP while in redundant operation.	The system changes to system state RUN-Solo.
2.	Remove the existing SIMATIC memory card from the CPU that is in STOP. Insert a larger SIMATIC memory card.	The CPU performs a memory reset.
3.	After the memory reset switch the CPU back to RUN.	The CPU performs a SYNCUP.
4.	Wait until the SYNCUP of the CPU is complete and then switch the second CPU to STOP.	The system changes to system state RUN-Solo again.
5.	Remove the existing SIMATIC memory card from the CPU that is in STOP. Insert a larger SIMATIC memory card.	The CPU performs a memory reset.
6.	After the memory reset, switch the CPU back to RUN.	The CPU performs a SYNCUP.
7.	Wait until the SyncUp of the CPU is complete.	The CPUs now have a larger load memory and are in system state RUN-Redundant again.

Glossary

Backup CPU

When the R/H system is in RUN-Redundant system state, the Primary CPU controls the process. The Backup CPU synchronously executes the user program and can take over the process control at a failure of the Primary CPU.

Bit memory

Bit memory is a component of the system memory of the CPU for saving intermediate results. You access the bit memory from the user program in bit, byte, word or double-word mode.

Code block

In SIMATIC S7, a code block contains a portion of the STEP 7 user program.

Consistent data

Consistent data is data whose content belongs together. Consistent data is read and written contiguously.

Counter

Counters are components of the system memory of the CPU. You can modify the content of the "counter cells" using STEP 7 instructions. Example: Count up or down.

Data block

Data blocks (DBs) are data areas in the user program that contain user data. The following data blocks are available:

- Global data blocks that you access from all code blocks.
- Instance data blocks that are assigned to a particular FB call.

Data log

Data logs are CSV files for the saving of tag values. The data logs are stored on the SIMATIC memory card in the "\datalogs" directory. Instructions in the user program write data records of tag values to a data log.

Diagnostics

Monitoring functions include:

- Detection, localization, classification of errors, faults and alarms.
- Display and further evaluation of errors, faults and alarms.

The monitoring functions run automatically during system operation. This increases the availability of systems because commissioning times and downtimes are reduced.

Diagnostics buffer

The diagnostics buffer is a buffered memory area in the CPU in which diagnostics events are stored in their order of occurrence.

Firmware of the CPU

In SIMATIC, a distinction is made between the firmware of the CPU and user programs.

Firmware is software that is embedded in electronic devices, i.e. functionally connected permanently to the hardware. It is usually saved in a flash memory, EPROM, EEPROM or ROM and cannot be replaced by the user or can only be replaced with special tools or functions.

User program: see glossary entry "User program"

Firmware update

You use a firmware update to update the firmware of modules. A firmware update is performed, e.g. for functional extensions of a CPU or interface module.

Function block

A function block (FB) is a code block with static data. An FB allows you to pass parameters in the user program. Function blocks are thus suited for programming frequently recurring complex functions, such as closed-loop controls or operating states selection.

Global data block (DB)

Every function block, every function, and every organization block can read the data from a global data block, or write its own data to a global data block. This data is retained in the data block, even when the data block is exited.

I/O module

Device of the distributed I/O that is used as an interface between the controller and the process.

Instance data block (DB)

Each call of a function block in the STEP 7 user program is assigned a data block that is automatically generated. Values of the input, output and in/out parameters, as well as local block data, are stored in the instance data block.

IP address

The IP address is made up of four decimal numbers, each with a value range of 0 to 255. The decimal numbers are separated by a dot (e.g. 192.162.0.0).

The IP address consists of the following:

- Address of the network
- Device address (PROFINET interface of the IO controller/IO devices)

Local data

This memory area accepts the temporary local data of a block for the duration of processing.

Memory reset

Procedure for setting the memories of the CPU to a defined initial state.

Operating states

Operating states describe the behavior of an individual CPU at any given point in time.

The CPUs of the SIMATIC standard systems feature the STOP, STARTUP and RUN operating states.

The primary CPU of the redundant system S7-1500R/H has the operating states STOP, STARTUP, RUN, RUN-Syncup and RUN-Redundant. The backup CPU has the operating states STOP, SYNCUP and RUN-Redundant.

Optimized block access

Data blocks with optimized access have no fixed structure. In the declaration, the data elements only receive a symbolic name, and no fixed address within the block. The elements are automatically arranged in the block's available memory area in such a way that its capacity is optimally exploited.

In these data blocks, you can only address tags symbolically. For example, you would access the "FillState" tag in the "Data" DB as follows:

"Data".FillState

Optimized access offers the following advantages:

- The data is structured and saved in a manner that is optimal for the CPU used. This allows you to increase CPU performance.
- Access errors, e.g. from the HMI, are not possible.
- You can selectively define individual tags as retentive.

Organization block

Organization blocks (OBs) form the interface between the operating system of the CPU and the user program. The organization blocks determine the order in which the user program is executed.

Parameter

- Variable of a STEP 7 code block
- Variable for setting the behavior of a module (one or more per module). In delivery state, each module has an appropriate basic setting that can be changed by configuring in STEP 7. There are static and dynamic parameters.

Parameters, dynamic

In contrast to static parameters, you can change dynamic parameters of modules during operation by calling an SFC in the user program, e.g. limit values of an analog input module.

Parameters, static

In contrast to dynamic parameters, you cannot change static parameters of modules with the user program but only by configuring in STEP 7, e.g. input delay of a digital input module.

Primary CPU

When the R/H system is in RUN-Redundant system state, the Primary CPU controls the process. The Backup CPU synchronously executes the user program and can take over the process control at a failure of the Primary CPU.

Process image (I/O)

The CPU transfers the values from the input and output modules to this memory area. At the start of the cyclic program, the CPU transfers the process image output as a signal state to the output modules. The CPU then reads the signal states of the input modules to the process image of the inputs. Then the CPU executes the user program.

Redundant systems

Redundant systems are characterized in that important automation components are present multiple times (redundantly). Process control is maintained if a redundant component fails.

Reset to factory settings

Resetting to factory settings restores the CPU settings to the delivery state.

Restart

A restart (warm restart) deletes all non-retentive bit memory and resets non-retentive DB contents to the start values from the load memory. Retentive bit memory and retentive DB contents are retained. Program execution begins at the call of the first startup OB.

Retentivity

A memory area whose content is retained after power failure and after a transition from STOP to RUN is retentive. The non-retentive bit memory area, timers and counters are reset after power failure and after a STOP to RUN transition.

SIMATIC memory card

Memory for the user program for programmable modules and communications processors. You can also use the SIMATIC memory card for exchange of user software and user data.

Standard access

Data blocks with standard access have a fixed structure. In the declaration, the data elements contain both a symbolic name and a fixed address within the block. The address is displayed in the "Offset" column.

In these data blocks, you can address tags both symbolically and absolutely:

"Data".FillState

DB1.DBW2

System states

The redundant S7-1500R/H system has various system states. The system states result from the operating states of the Primary and Backup CPUs. The concept of the system state is used to obtain a simplified expression that characterizes the simultaneously occurring operating states of the two CPUs. The following system states are available for the redundant system S7-1500R/H: STOP, STARTUP, RUN-Solo, SYNCUP and RUN-Redundant.

Timer

Timers are components of the system memory of the CPU. The operating system automatically updates the content of the "timer cells" asynchronously to the user program. STEP 7 instructions specify the precise function of the timer cell (e.g. on delay) and trigger its execution.

User program

In SIMATIC, a distinction is made between user programs and the firmware of the CPU.

The user program contains all instructions, declarations and data that enable a plant or process to be controlled. The user program is assigned to a programmable module (e.g. CPU, FM) and can be structured in smaller units.

Firmware: see glossary entry "Firmware of the CPU"

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation supports you in the operation of the Web server.

The Web server offers, among other things, web page access to diagnostic data and to process data of the CPU.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge in the field of automation technology
- Knowledge of the industrial automation system SIMATIC
- Experience of working with Windows-based computers
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of the documentation

This documentation is valid for CPUs as of firmware version V2.5 and contains illustrations of the Web server user interface. The images used are identical for all CPUs of the S7-1500 automation system and distributed I/O system ET 200SP and the CPU 1516pro-2 PN of distributed I/O system ET 200pro.

The displayed illustrations can differ from the interface of the Web server in some details, e.g. depending on the browser used.

What's new in the Web Server function manual, Version 12/2017 compared to Version 09/2016

What's new?		What are the customer benefits?	Where can I find the information?
New contents	New web page "User files"	You can download ASCII files (files in binary format) from the SIMATIC Memory Card, directory UserFiles\ to the web page and delete them.	Section User files (Page 115)
	Time display as Coordinated Universal Time (UTC) or as PLC local time	The display of the UTC allows you to use a uniform time for the web pages. You can set the format of the time display to Coordinated Universal Time (UTC) or PLC local time (default setting).	Section Start page with general CPU information (Page 35)
	Automated downloading, reading out and archiving of DataLogs	You can, for example, read out and archive DataLogs daily from one or more CPUs at a specific time via the Web server. Automatic downloading of DataLogs is realized either by the execution of scripts in, for example, Bash or via JavaScript on your HTML user page.	Section Automated reading out of data logs (Page 113)
	The “Permit access only with HTTPS" check box is activated in the default setting of a configured CPU.	The web pages are transmitted by default via a secure connection and are protected from attacks by third parties.	Section Configuring the Web server (Page 21)
Changed contents	Web page "Module information”: New column Device number	You can read the assignment of the device number to the device name.	Section Module information (Page 47)
	Web page "Topology": Selection of the available PROFINET interfaces, for example X1, X2, CM 1542-1	You can select the topology display for the PROFINET interfaces X1, X2 and for connected PROFINET communication modules.	Section Topology (Page 62)
	Web page "DataLogs": New column for deleting DataLog files	You can delete DataLog files via the Web server.	Section DataLogs (Page 112)
	Web page "Trace": Changes in the display of Trace recordings	You can evaluate the Trace recordings in more detail through the extension of the display.	Section Trace (Page 133)
	Web page "Trace": New arithmetic functions	In the case of completed measurements you can combine the measured signals mathematically with each other and this generate signals that were not recorded. You can, for example, form the difference of two signals in order to better display the deviation of the current pressure of a boiler from the set setpoint value.	

What's new in the Web Server function manual, Version 09/2016 compared to Version 12/2014

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Handling of certificate modified	You protect the Web server against tapping or distortion of the communication through access via the secure transmission protocol "HTTPS" including a special Web server certificate.	Section Configuring the Web server (Page 21)
	Four additional languages for the Web server interface	You can set the Web server interface to the following languages: • Korean • Russian • Turkish • Portuguese (Brazil)	Section Start page with general CPU information (Page 35)
	Assignment of different project languages extended	You can assign up to three different project languages for comments, alarm texts and diagnostic information to the user interface languages of the Web server.	Section Language settings (Page 31)
	"Start page" web page extended	The display of the TIA project name immediately indicates whether the desired project is selected.	Section Start page with general CPU information (Page 35)
	"Diagnostics" web page extended by one tab: • "Program protection" • "Runtime information" • "Fail-safe" (with an F-CPU)	Here you can find information about: • Know-how protection or copy protection of the PLC program • Program/communication load and cycle time • F-collective signatures, cycle times and runtimes of the F-runtime group(s)	Section Diagnostics (Page 40)
	"Alarms" web page extended	You can acknowledge alarms of the CPU via the Web server.	Section Alarms (Page 55)
	"Tag status" and "Watch tables" web pages extended	You can change the value of tags and write them to the CPU, also using the absolute address.	Section Tag status (Page 72) Section Watch tables (Page 75)
	New web page "Online backup"	You can back up and restore the CPU configuration to/from the SIMATIC memory card via the Web server.	Section Online backup (Page 120)
	New "Motion Control diagnostics" web page	You can monitor statuses, errors, technology alarms and the current values of configured technology objects (TOs) with the Web server without STEP 7.	Section Motion Control diagnostics (Page 125)
	New web page "Online backup"	You can read, view and save trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance without STEP 7.	Section Trace (Page 133)

What's new?		What are the customer benefits?	Where can I find the information?
Changed contents	Scope of the function manual expanded to include CPUs of the distributed I/O system ET 200SP and the CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	Manual CPU 1510SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157130) Manual CPU 1512SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157013) Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)
	Web page "Watch tables": Note added on the maximum configuration limits.		Section Watch tables (Page 75)
	Web page "User pages": Note added on the maximum size of the HTML pages.		Section User pages (Page 77)

Conventions

In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

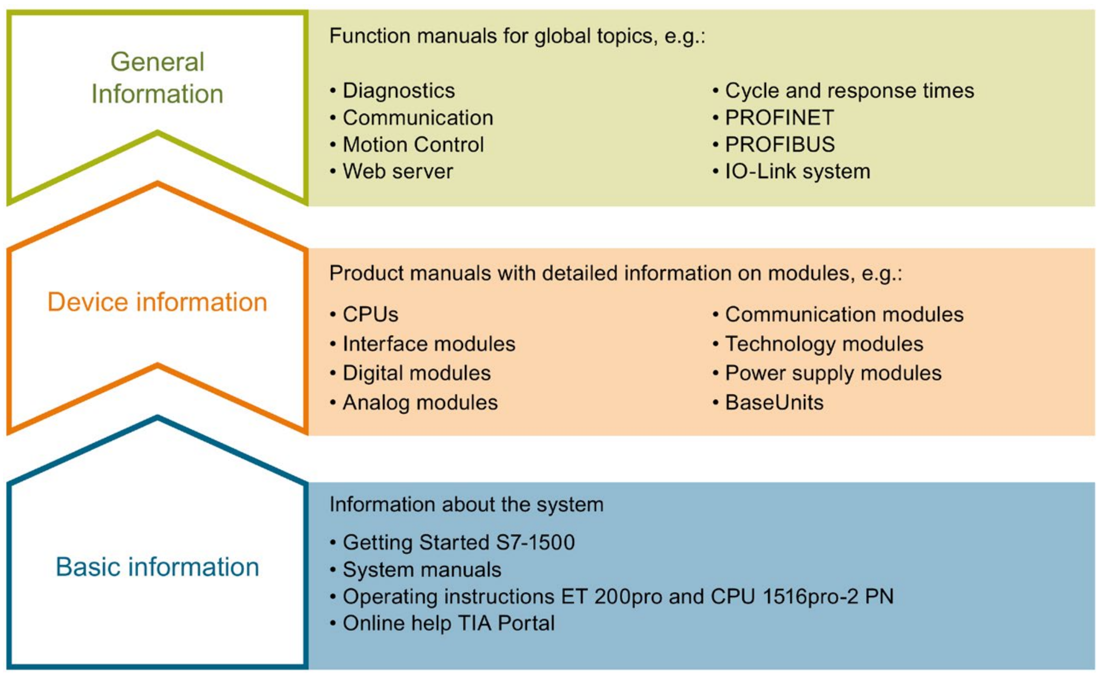
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742705).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

General information 2

2.1 Properties of the Web server

Benefits of the Web server

The Web server lets you monitor and administer the CPU through authorized users by means of a network. Evaluations, diagnostics, and modifications are thus possible over long distances. Monitoring and evaluation is possible without STEP 7; all you need is a web browser. Make sure that you take appropriate measures (e.g., limiting network access, using firewalls) to protect the CPU from being compromised.

Activating the Web server

The Web server is deactivated in the delivery state of the CPU. This means that you must load a project in which the Web server is activated to enable access using the Web browser.

Security functions

The Web server provides the following security functions:

- Access via the secure transmission protocol "HTTPS" using the CA-signed Web server certificate
- User authorizations you can configure by means of user list
- Activation for specific interfaces

Web browser

You need a web browser to access the HTML pages of the CPU.

The following web browsers have been tested for communication with the CPU. Other web browsers may also work, especially newer versions. However, if problems occur with web browsers not mentioned here that cannot be rectified, use one of the following tested web browsers:

- Internet Explorer (Version 11)
- Microsoft Edge (Version 40)
- Google Chrome (versions 47 to 62)
- Mozilla Firefox (version 47 to 56)
- Opera (Version 48)
- Mobile Safari and Chrome for iOS (iOS 10)
- Android browser (Android 6)
- Android Chrome (Android 6 to 8 (Certificate only works with restriction under Android 8))

Note

If you are using Internet Explorer, disable "Compatibility view" in the settings ("Options" menu).

Note

For access to display devices with low screen resolution, we recommend the use of basic websites, see section Basic websites (Page 155).

Note

Older versions of the web browsers mentioned which previously supported access to the HTML pages of the CPU continue to do so. However, these older versions do not support the new functions and HTML pages described in this edition.

Note

Two reserved communication connections are available to the Web server for communication with the CPU.

Depending on the web browser used, different numbers of connections to the CPU are established. If more connections are available, more communication connections will be established.

If no more connections are available, display or functional problems may occur, because the Web server will reject all other communication connections apart from the two that are reserved.
For this reason, the web pages may not load fully.

Note

If you access the Web server of the CPU using a communication processor (CP), ensure that the cache (temporary Internet files) is enabled in your browser. Choose the "Automatically" option in the cache settings of your browser.

If the cache is disabled or if a setting other than "Automatically" is made in the cache settings of your browser, this may result in slow access times and incomplete display.

Note

After a firmware update of the CPU, incorrect display of Web pages can occur in various Web browsers. This is caused by problems of the new CPU firmware with the cache of the Web browser.

Solution: Press F5 or clear the Web browser cache.

Reading out data

With the Web server, you can read out the following data from the CPU and, in some cases, modify and write back the data to the CPU:

- Start page with general CPU information (Page 35)
- Information on Diagnostics (Page 40)
  - Identification
  - Program protection
  - Memory
  - Runtime information
  - Fail-safe (with an F CPU)
- Contents of the diagnostics buffer (Page 45)
- Module information (Page 47)
- Firmware update (Page 52)
- Alarms (Page 55)
- Information on Communication (Page 57)
  - Important interface parameters
  - Port statistics
  - Display of the communication resources
  - Display of the communication connections
- PROFINET Topology (Page 62)
  - Graphical view (set and actual topology)
  - Table view (actual topology)
  - Status overview
- Tag status (Page 72)
- Watch tables (Page 75)
- User pages (Page 77)
- Filebrowser (Page 111)
- DataLogs (Page 112)
- User files (Page 115)
- Online backup and restoration of the configuration (Page 120)
- Diagnostic information for technology objects (Page 125)
- Evaluation of trace recordings (Page 133)
- Reading out service data (Page 154)
- Basic websites (Page 155)

On the following pages, you will find more detailed descriptions of the HTML pages.

Note

Max. characters at data type WSTRING

Note that the data type WSTRING is limited to 254 characters for the display in the Web server. If the 254 characters are exceeded, the Web server does not display the superfluous characters.

Web access to the CPU via PG/PC, HMI devices and mobile terminal devices

Proceed as follows to access the Web server:

1. Use STEP 7 to download a project in which the Web server is enabled to the CPU.
2. Connect the display device (PG/PC, HMI, mobile terminal device) with the CPU or a communication module using a PROFINET interface.
   If you are working with WLAN, activate the WLAN on the display device and establish a connection to the access point (e.g. SCALANCE W788-1RR or SCALANCE W784-1), which is in turn connected to the CPU.
3. Open the web browser on the display device.
4. Enter the IP address of the interface of the CPU which is connected to the client in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (sample input: http://192.168.3.141).
   The CPU intro page opens. From the intro page you can navigate to additional information.

Additional information on access using the secure transmission protocol "HTTPS" is available in the section Configuring the Web server (Page 21) under "Permit access only with HTTPS".

Additional information

Using a smartphone, you can access the Web server of the CPU either via WLAN or access to the CPU via the SIMATIC S7 app (using Web server functionality). You can find additional information in the FAQ entry ID 103473392 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103473392) Internet page.

Note: The Web server must also be activated for access to the CPU via the SIMATIC S7 app.

The SIMATIC S7 app offers you additional functions. You can find a detailed application example with further documentation and example projects on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/84133612) Internet page.

2.2 Configuring the Web server

To use the full range of functions offered by the Web server, you need to make the settings in STEP 7 listed below:

Procedure

You have opened the properties dialog of the CPU in the STEP 7 project view.

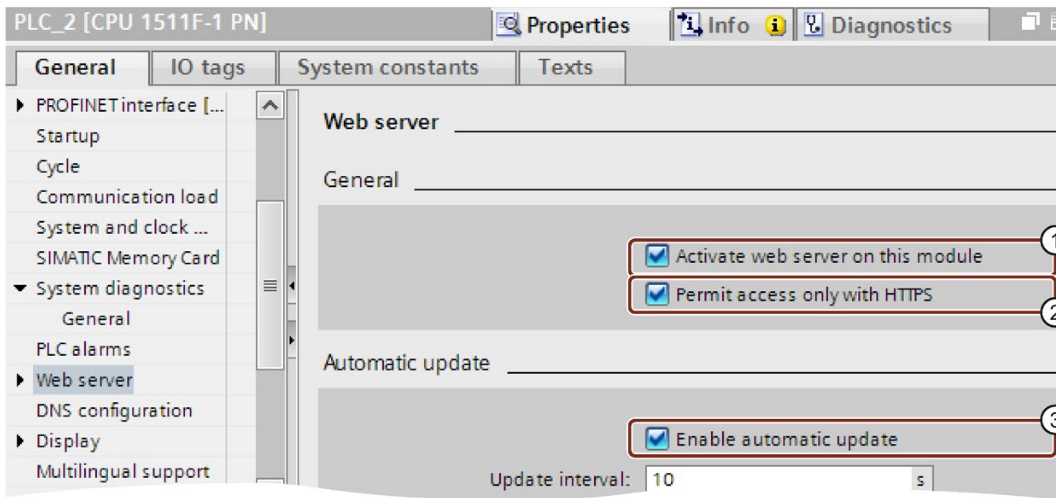


Figure 2-1 Web server settings in STEP 7

① Activate Web server

In the default setting of a configured CPU, the Web server is disabled. Proceed as follows to enable the Web server:

1. Open the "Devices & Networks" view with a double-click in the STEP 7 project tree.
2. Select the required CPU in the device view, network view or topology view.
3. Navigate to the "Web server" area in the Inspector window properties, "General" tab.
4. Select the "Activate web server on this module" check box.
   The following note is output:

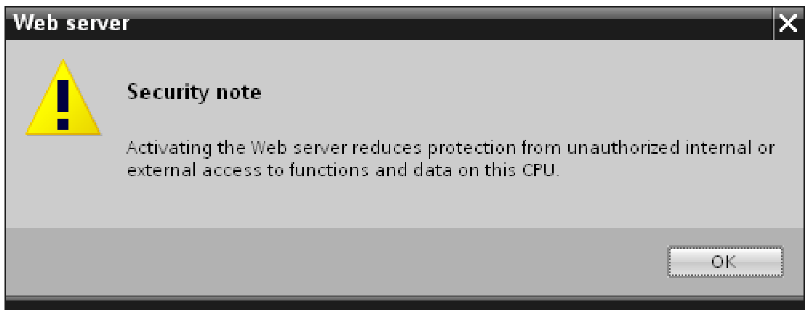

Figure 2-2 Security note upon activation of the Web server in STEP 7

Note

When projects from deliveries are applied in which the Web server was already activated and configured on the module, this security note is not shown.

Creating and assigning a Web server certificate

The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate.

With SIMATIC S7-1500 CPUs as of firmware V2.0, you have to create the certificate for the Web server of the CPU with STEP 7 yourself and assign it to the Web server in the CPU properties. When the hardware configuration is downloaded to the CPU, this certificate is also automatically downloaded. STEP 7 itself has a Certification Authority (CA) certificate, with which the device certificate (end-entity certificate) of the Web server is signed.

Note

If you update the firmware of a SIMATIC S7-1500 CPU or ET 200SP with firmware version < V2.0 to firmware version ≥ V2.0, a valid server certificate is automatically generated and used. The same applies to the replacement parts scenario in which a newer CPU replaces a CPU with firmware version < V2.0.

You can create different Web server certificates:

- If you use the certificate manager in the global security settings, the certificate authority of the project (CA certificate) signs the device certificate of the Web server. During loading, the CA certificate of the project is automatically loaded as well.
- If you do not use the certificate manager in the global security settings, STEP 7 generates the device certificate as a self-signed certificate.

NOTICE

Utilizing the full functionality of the Web server

A valid CA-signed Web server certificate in the CPU is a requirement for:

- User management with password-protected users
- The use of safety-related functions (online backup and restore of the CPU configuration, saving and downloading diagnostic information in csv files)

To use the full functionality of the Web server, we therefore recommend that you use the Certificate Manager to create a CA-signed server certificate in the global security settings and assign it to the CPU.

Creating a self-signed server certificate

To create a self-signed Web server certificate, follow these steps:

1. in the Inspector window Properties of the CPU, "General" tab, navigate to the "Web server > Security" area.
2. Click the "Add" button in the drop-down list to select a certificate.
   The "Create a new certificate" dialog opens.
3. Select the "Self-signed" check box in the subsequent dialog.
4. Enter the parameters for the new certificate or confirm the default settings.
   – Select "Web server" in the "Usage" box.
   – Enter the IP address(es) of the interface(s) or the domain name of the configured CPU in the "Subject Alternative Name" field.
5. Click "OK" to confirm.
6. Compile and load the configuration into the CPU.
   The device certificate of the Web server is a component of the configuration.

Creating and assigning a CA-signed Web server certificate

To create a CA-signed Web server certificate, follow these steps:

1. In the Inspector window Properties of the CPU, "General" tab, navigate to the "Protection & Security > Certificate Manager" area and select the "Use global security settings for certificate manager" option.
   The "Global security settings" appear in the project tree.

   Note

   To edit the Certificate Manager in the global security settings, you require the "Configure security" configuration permission.

   ---

2. Log on as a user in the project tree in the "Global security settings > User logon" area.
   The "Administrator" role is the default for the first logon for a new project.
3. in the Inspector window Properties of the CPU, "General" tab, navigate to the "Web server > Security" area.
4. Click the "Add" button in the drop-down list to select a certificate.
   The "Create a new certificate" dialog opens.
5. In the following dialog, select the "Signed by certificate authority" check box and select the certificate authority from the drop-down list.
6. Enter the parameters for the new certificate or confirm the default settings.
   – Select "Web server" in the "Usage" box.
   – Enter the IP address(es) of the interface(s) or the domain name of the configured CPU in the "Subject Alternative Name" field.
7. Click "OK" to confirm.
8. Compile and load the configuration in the CPU.
   The device certificate of the Web server and the CA certificate are components of the configuration.

NOTICE
Addressing the Web server of the CPU via domain names If you enter the IP address(es) of the interface(s) of the configured CPU in the "Subject Alternative Name" field, the generated certificate may not be accepted by all Internet browsers. You also need to create and load a new server certificate (end-entity certificate) every time you change the IP address of an Ethernet interface of the CPU, since the identity of the CPU changes along with the IP address. You can avoid this problem by addressing the Web server of the CPU using domain names instead of IP address(es), e.g. "myconveyer-cpu.room13.myfactory.com". For this purpose, you have to manage the domain names of your CPU via a DNS server.

Additional information

Detailed information on local self-signed certificates and global CA certificates, on the "Public Key Infrastructure" (PKI) and on certificate management can be found in the Communication function manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and in the online help for STEP 7, keyword "Secure communication".

② Permit access only with HTTPS

Note: The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate in the CPU. See "Creating and assigning a Web server certificate" in the section above.

To ensure secure access to the Web server the "Permit access only with HTTPS" check box is activated in the basic setting of a configured CPU.

The web pages are transmitted by default via a secure connection and are protected from attacks by third parties. Note that the URL of the CPU starts with "https://" in this case.

For error-free HTTPS access to the CPU, the following conditions must be met:

- The current date/time must be set in the CPU.

Note

When using secure communication (e.g. HTTPS), make sure that the corresponding modules have the current time of day and the current date. Otherwise, the modules evaluate the used certificates as invalid and the secure connection will not be established.

- The IP address of the CPU must be set.
- A valid server certificate offered by the CPU is installed in the Web browser.

NOTICE
Safety-related functions only possible with CA-signed Web server certificate Online backup and restore of the CPU configuration, see section Online backup (Page 120), as well as saving and downloading diagnostic information to csv files are only possible with a CA-signed Web server certificate. A valid CA-signed Web server certificate in the CPU is also required for user administration with password-protected users. To use the full functionality of the Web server, we therefore recommend that you use the Certificate Manager to create a CA-signed server certificate in the global security settings and assign it to the CPU.

If no CA-signed Web server certificate is installed, a warning is output recommending that you do not use the page. To view the page, you may need to "Add an exception", depending on the Web browser used.

A valid CA certificate is available for download from the "Intro" web page under "Download certificate".

You can find instructions for installing the certificate in the help system of your Web browser and in the FAQ with the entry ID 103528224 at the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103528224) website.

Note

To protect against manipulation from the outside, download the certificate only in an environment that is guaranteed not to be compromised. Installation of the CA certificate has to be carried out once for each display device you wish to use.

Access protection

The certificate establishes an encrypted connection that prevents tapping or distortion of the communication but does not provide access protection. This means you have to protect your CPU from unauthorized access with the corresponding configuration in the user management.

You can find additional information on access protection in the online help for STEP 7, keyword: "Protection".

③ Automatic update

Automatic updating is activated in the default setting of a configured CPU.

The following web pages are updated automatically:

- Start page
- Diagnostics (memory, runtime information, fail-safe)
- Diagnostics buffer
- Module information
- Alarms
- Communication
- Topology
- Tag status
- Watch tables
- Filebrowser
- DataLogs
- User files
- Motion Control diagnostics
- Trace

Note

The preset activation interval is 10 seconds.
Larger amounts of data or several HTTP-/HTTPS connections increase the update time.

Setting the language for the Web

In total, you can assign up to three different project languages to the user interface languages of the Web server.

In STEP 7, activate the project languages you wish to use and then assign one of the activated project languages to each interface language of the Web server.

You can find additional information about the language settings and a description of how to assign a project language to the interface languages in the section Language settings (Page 31).

Amending user management

Note: A valid CA-signed Web server certificate in the CPU along with a secure HTTPS connection are required for user administration with password-protected users. See "Creating and assigning a Web server certificate" and "Permit access only with HTTPS" in this section.

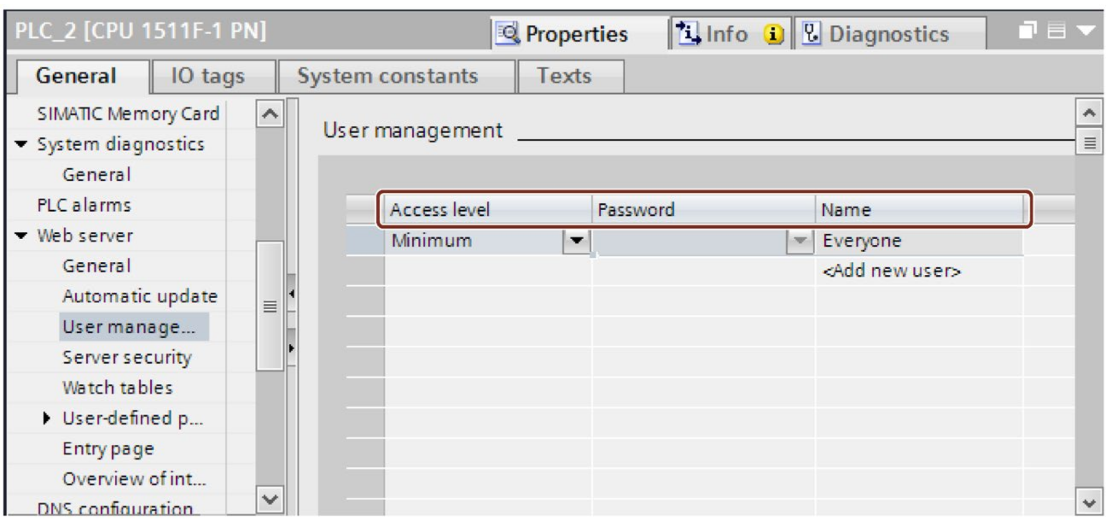

Figure 2-3 User management in STEP 7

In STEP 7, you can manage the user list in the "Web server > User management" area.

The user list provides the following options:

- Create users
- Specify access permissions
- Assign passwords

Users only have access to the options that are permanently linked to the access rights.

You can assign different user rights depending on the used CPU and firmware.

The available user rights can be available for selection as follows in STEP 7:

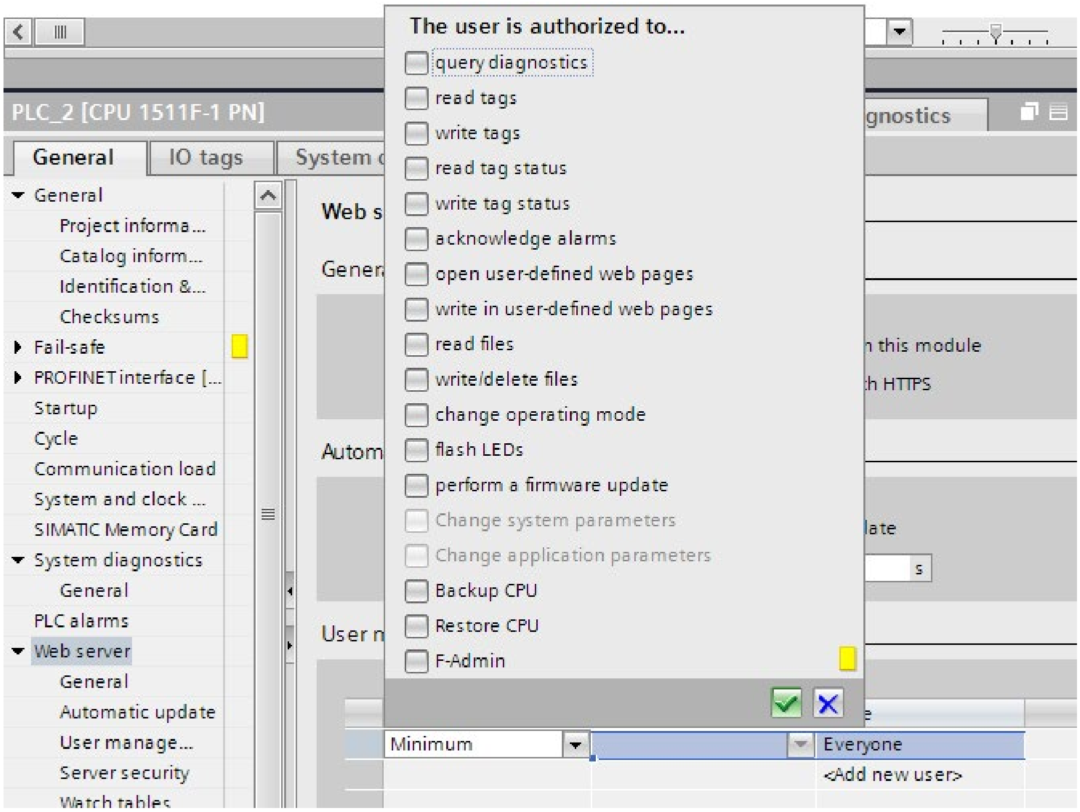

Figure 2-4 Assignment of user rights in STEP 7

If you are not logged in, you automatically access the Web server as the user "Everybody". It does not matter in this case whether you have configured additional users.

User "Everybody"

A user with the name "Everybody" is preset in the user list; this user has minimum access rights. These are read-only access to the intro page and start page. The user "Everybody" is defined without a password. However, you can assign all access authorizations available in STEP 7 to this user.

You can create a maximum of 20 users and a user "Everybody".

Because the user "Everybody" is defined in STEP 7 without assignment of a password, be careful of the access authorizations that you assign to this user.
Certain authorizations, such as the possibility of changing the operating mode, could represent a security risk.
For the assignment of security-relevant authorizations, we recommend that you create a user with password protection in STEP 7.

WARNING

With an F-CPU, do **not** assign the access authorization "F-Admin" to the user "Everybody".

Make sure that you observe the warnings relating to this in the section "Restoring a backup of the safety program to an S7-300/1500 F-CPU" in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

Passwords should always be more than 8 characters in length and contain uppercase and lowercase characters as well as special characters and numbers (?!+%$1234...). Computer keyboard character strings and words from the dictionary are unsuitable. Change the password regularly.

Note

When assigning rights, note that read or write access to the watch tables and tag status is retained even if you have disabled the "Accessible from HMI/OPC UA" attribute in the PLC tag table when configuring the data block in STEP 7.

User pages

In the "User pages" area you can download your own web pages to the CPU and make your own web applications available via the web browser.

You can find additional information in section User pages (Page 77).

Activation of the Web server for specific interfaces

In the area "Overview of interfaces", you have the option to enable or disable access to the Web server.

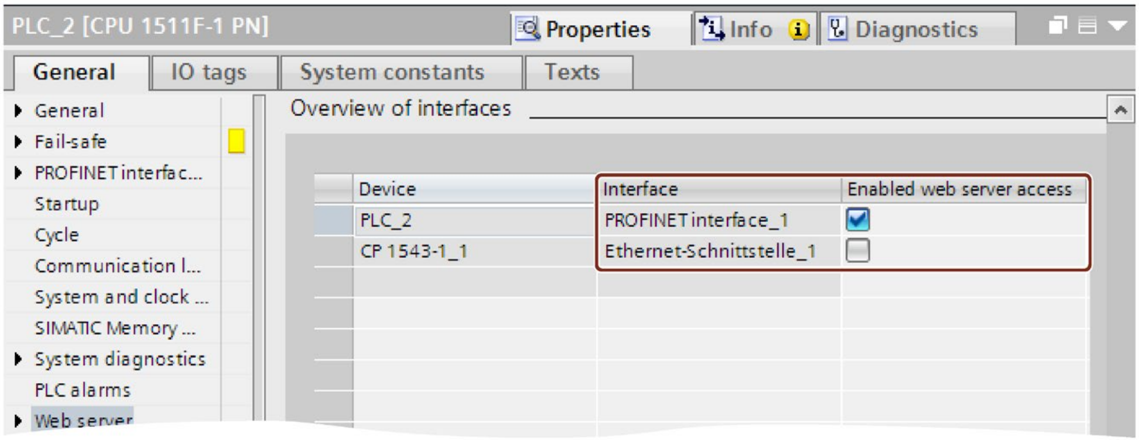

Figure 2-5 Activation of access to the Web server via the interfaces

2.3 Language settings

Introduction

The Web server provides the user interface in the following languages:

- German (Germany)
- English (U.S.)
- French (France)
- Italian (Italy)
- Spanish (traditional sort)
- Japanese
- Chinese (Simplified)
- Korean
- Russian
- Turkish
- Portuguese (Brazil)

Requirements for the availability of the East Asian languages

The following requirements must be met for the East Asian languages:

- The corresponding support package for East Asian languages is installed on the display device (e.g., PC).
  For this purpose, activate the "Install files for East Asian languages" option in the "Regional and Language Options > Languages" tab of the Windows Control Panel.
- STEP 7 for East Asian languages is installed on the programming device used to configure the CPU.

Note

East Asian languages are not supported for SIMATIC HMI devices with Windows CE operating system.

Requirements for multilingual output of text

To ensure that the Web server displays alarms, comments and diagnostic information correctly in the various project languages, you have to assign a project language of the Web server to each required interface language in STEP 7.

Note

The project languages of the STEP 7 project you want to assign must be activated and the corresponding texts (translations) must be available in the project. The project languages selection is available in the project tree under "Languages & Resources".

Setting the language for the Web

Once you have activated the Web server on your module, assign a project language of the STEP 7 project from the drop-down list to each interface language.

1. Navigate to the "Multilingual support" area in the Inspector window Properties of the CPU, "General" tab.
2. Assign a project language from the drop-down list to each interface language of the Web server.

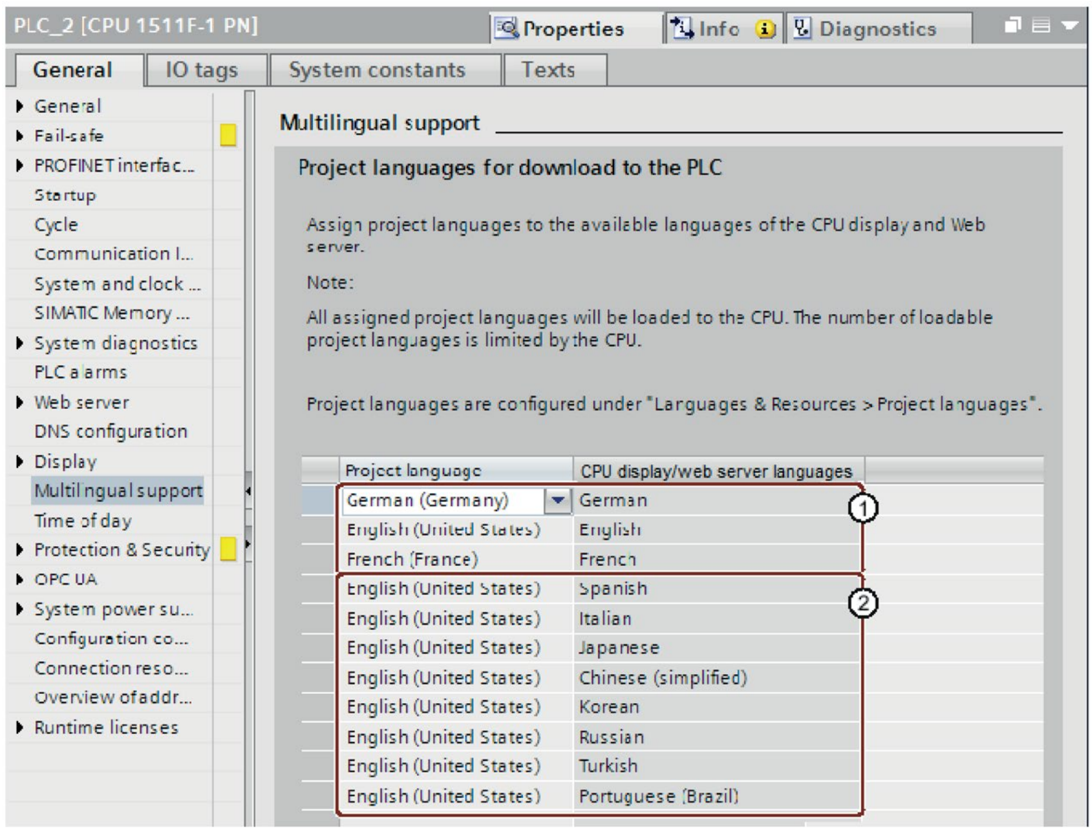

Figure 2-6 Language settings for the Web server in STEP 7

You can also assign interface languages the same project language, for example:

- ① Project language German for user interface language German, English (US) for English, French for French.
- ② Project language English (US) for all other available interface languages of the Web server.

In total, you can assign up to three different project languages of the STEP 7 project to the user interface languages of the Web server.

Reference

You can find additional information on how to set the project language in STEP 7 in the online help for STEP 7, keyword: "Selecting project languages".

See also

Configuring the Web server (Page 21)

2.4 Updating and saving information

Updating the screen content

Automatic updating is activated in the default setting. The preset update time is 10 s.

You update the web pages manually with the <F5> function key.

Disabling automatic updating for an individual web page

Click Off to temporarily deactivate automatic updating for a web page.
Note that the deactivation affects only the currently visited web page. Automatic updating is activated again when you change to a different web page.

You reactivate automatic updating by clicking On.

Note

If the load on the CPU is very high during operation, for example, due to a large number of PROFINET interrupts or extensive communication jobs, the updating of web pages may be significantly delayed for the duration of this high CPU load.

Printing web pages

The Web server offers you a print preview on most web pages. Click the symbol to open it.

Created printouts always contain the current information in the CPU. This means that it is possible that the information in the print preview is more up-to-date than the information in the standard view.

Web pages 3

3.1 Start page with general CPU information

Connecting to the Web server

Establish a connection to the Web server by entering the IP address of the interface of the configured CPU which is connected to the client in the address bar of the web browser, for example, http://192.168.3.141 or https://192.168.3.141. The connection is set up and the "Intro" page opens.

The examples in the next section provide information about the different web pages.

Intro

The figure below shows the first page (Intro) called by the Web server.

Figure 3-1 Intro page of the Web server of the CPU 1516-3 PN/DP

Click the NEXT link to go to the Web server pages.

Note

Select the "Skip Intro" check box in order to skip the intro. The Web server will then take you directly to its start page in future. This setting is saved in the user profile of the current PC user.

You can undo the setting "Skip Intro" by clicking the "Intro" link in the left-hand navigation bar of a web page.

Setting the user interface language

You can change the language for the Web server interface, e.g., from English to German, in the upper right corner. This option is available to you on all web pages of the Web server.

Switching the time display

You can set the format of the time display to Coordinated Universal Time (UTC) or PLC local time (default setting) on the left next to the language setting.

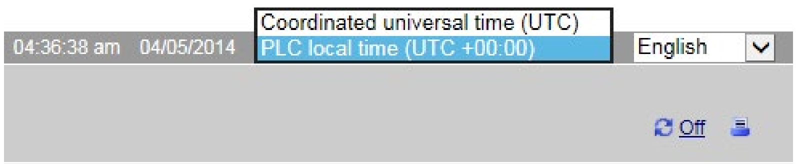

Figure 3-2 Switching the time display

You can switch the time display on all the Web pages that provide this drop-down list.

The displayed PLC local time result from the time zone and Daylight Savings Time / Standard Time setting that are set in the CPU properties.

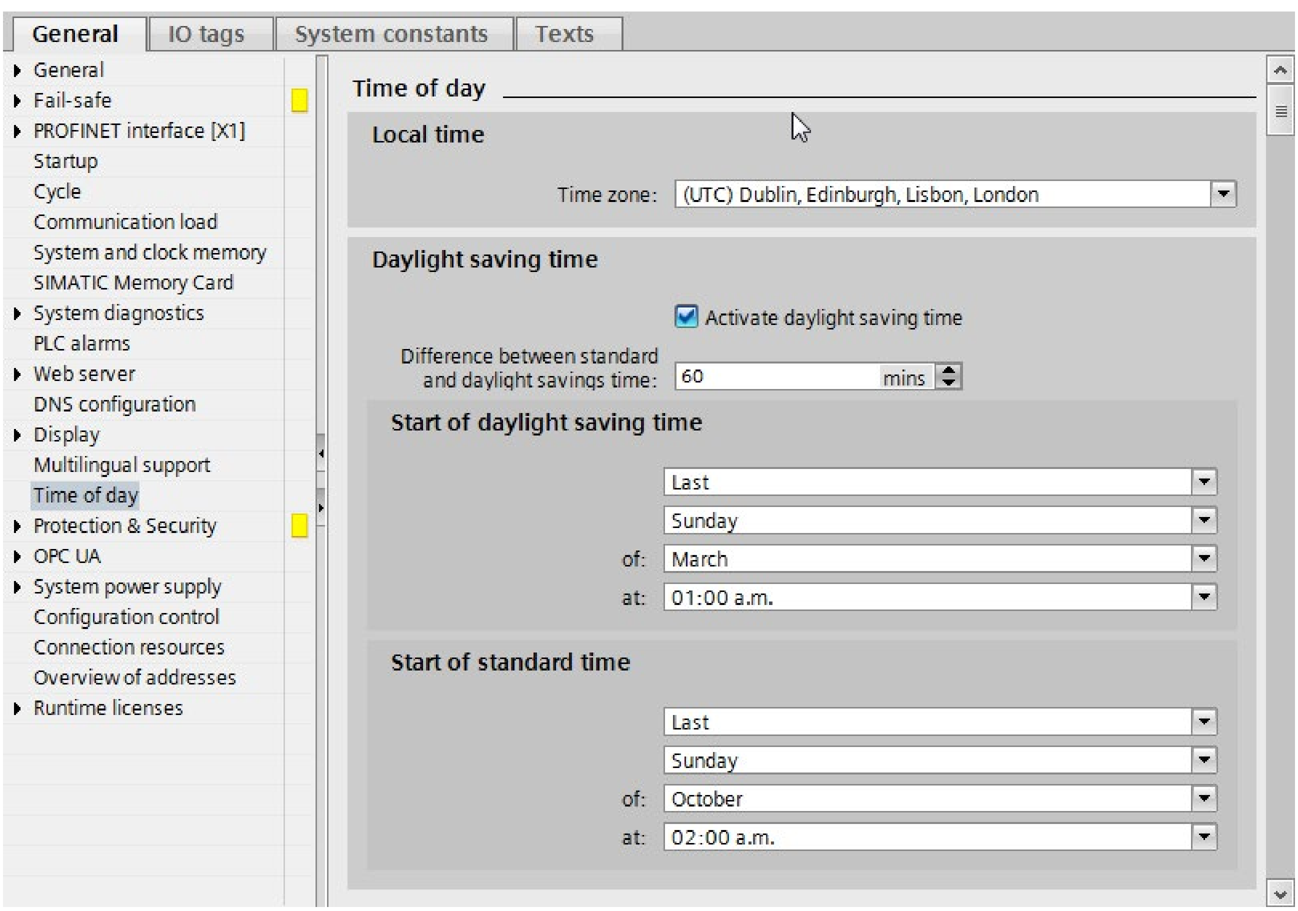

Figure 3-3 Setting the time in the CPU properties

The switchover has an effect on the following Web pages:

Table 3- 1 Switching the time display: Display on Web pages

Web pages	Display as Coordinated Universal Time (UTC) or as PLC local time
Start page	Last F-change
Diagnostics buffer	Date and time of the diagnostic buffer entry
Alarms	Date and time of the alarms
Online backup	Backup file with date and time of the backup
DataLogs	Date of change and time of change
File browser	Date of change and time of change
User files	Date of change and time of change
Save service data	File with time stamp of the storage

Start page

The start page before login offers information as shown in the figure below. The CPU image with LEDs returns the actual CPU status at the time of the data request.

Figure 3-4 Start page before login

Log in

To use the full functionality of the web pages, you must be logged in. Log in with a user name and password specified in the Web configuration in STEP 7. You now have corresponding permissions to access the web pages released for this user. If you have not configured a user, read-only access is granted to intro and start pages by default.

Note

After carrying out your required actions, log out explicitly from the Web server by clicking "Logout" in order to minimize the risk of unauthorized external access.

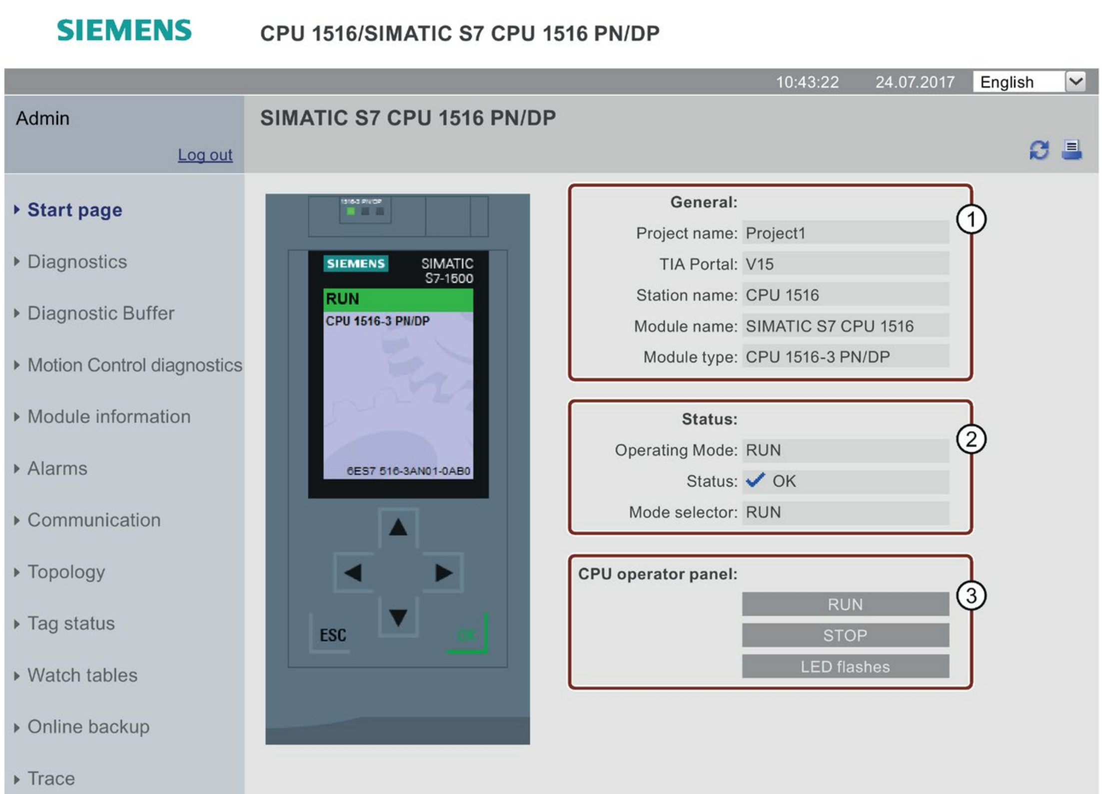

Figure 3-5 Start page after login

① "General"

"General" contains information on the CPU with the Web server to which you are currently connected, as well as the version of the TIA Portal with which the CPU was configured.

② "Status"

"Status" contains information about the CPU at the moment of the query.

③ "CPU operator panel"

If you have the necessary access permissions, you can change the operating mode of the CPU ("RUN"/"STOP" buttons) or have the LEDs flash ("Flash LED" button) in the "CPU operator panel" area.

Additional information for F-CPUs

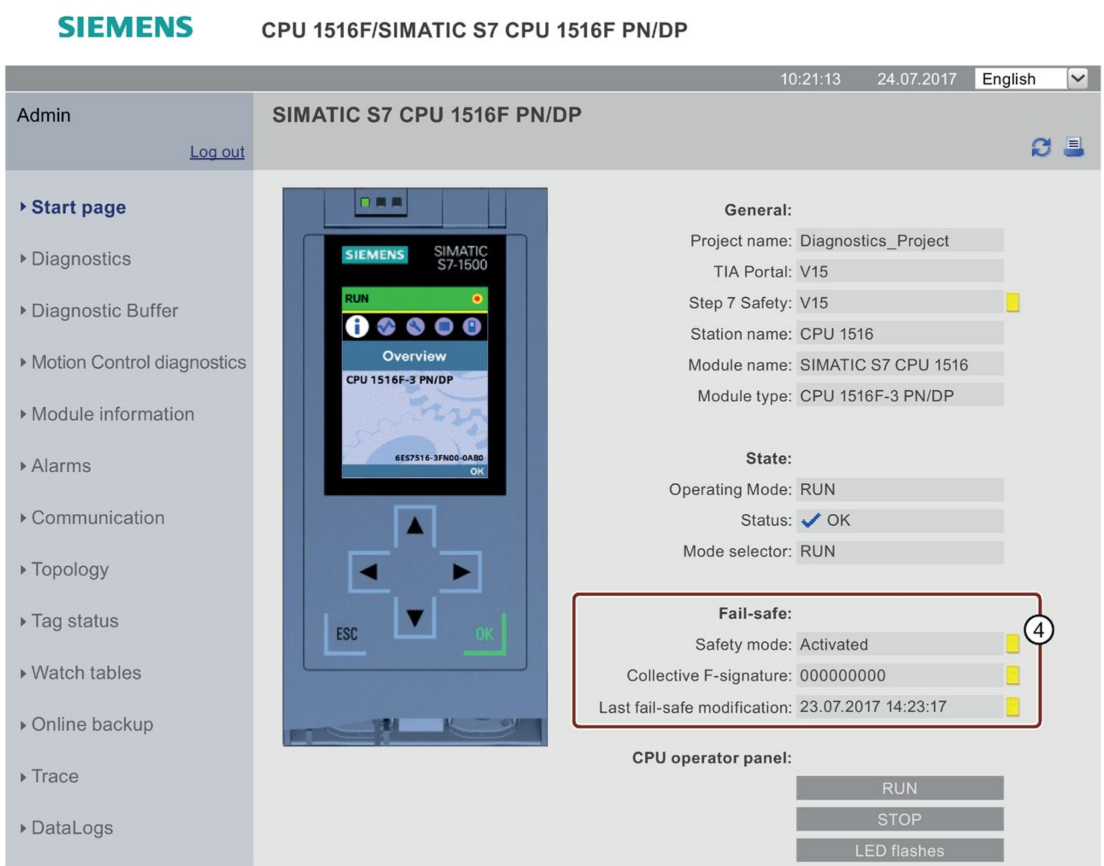

Figure 3-6 Start page after login to an F-CPU

④ "Fail-safe"

"Fail-safe" contains additional information on the F-CPU. Further information about the specification is available in the Programming and Operating Manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/de/de/view/54110126/en?dl=en).

Reference

You can find additional information in the section Configuring the Web server (Page 21).

3.2 Diagnostics

Overview

The "Diagnostics" web page provides more information about the tabs:

- Identification
- Program protection
- Memory
- Runtime information
- Fail-safe (with an F CPU)

"Identification" tab

The CPU characteristics are available in the "Identification" tab.

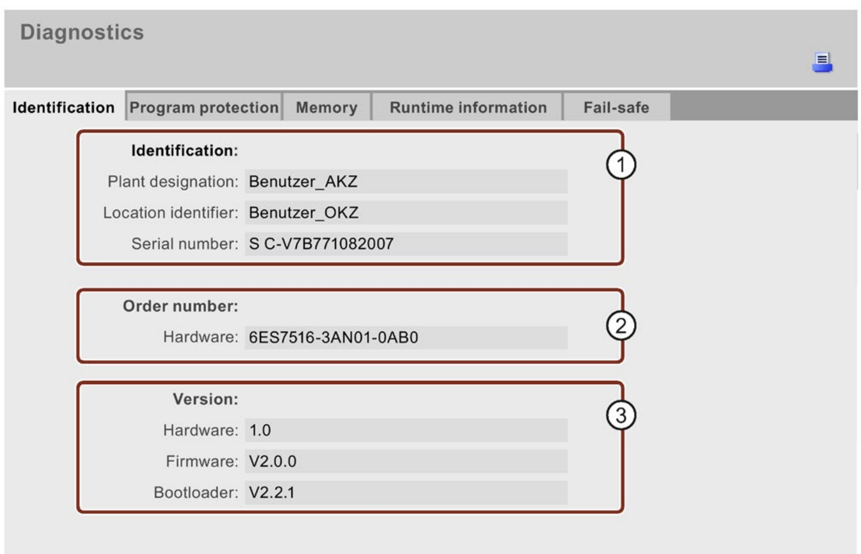

Figure 3-7 Identification tab

①"Identification"

The "Identification" info box contains the plant and location designation and the serial number. Plant and location designations can be configured in STEP 7 in the properties dialog box of the CPU, in the "General" tab.

②"Order number"

The "Order number" info box contains the order number for the hardware.

③"Version"

You can find the hardware, firmware and bootloader versions in the "Version" info box.

"Program protection" tab

The "Program protection" tab provides information on whether the PLC program contains know-how protection or copy protection.

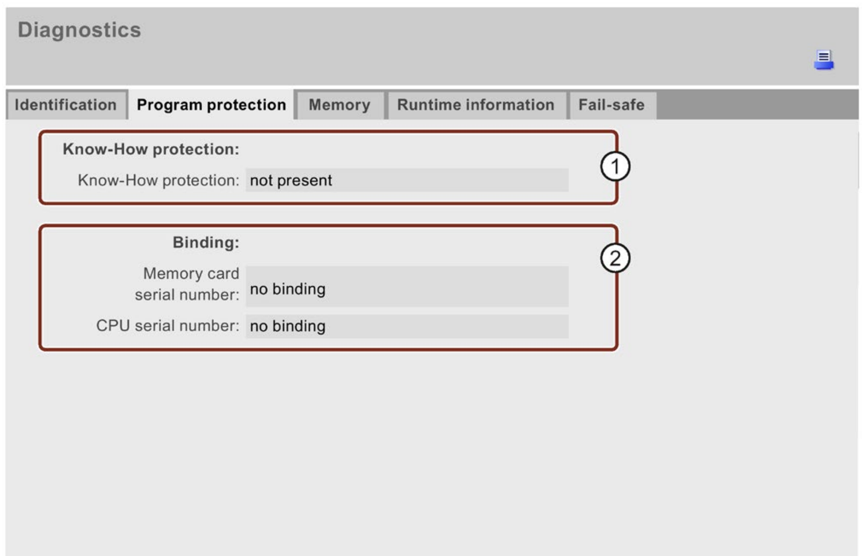

Figure 3-8 "Program protection" tab

① "Know-how protection"

Information on whether the PLC program contains at least one block with know-how protection or not can be found in the info field "Know-how protection".

②"Binding"

In the info field "Binding" you can find information on whether copy protection has been activated by binding at least one program block of the PLC program to the serial number of the CPU or memory card.

- "Binding"
- "No binding"
- "No matching binding": At least one block is bound to a different serial number (load process is rejected)

"Memory" tab

The "Memory" tab contains current values on the memory currently in use.

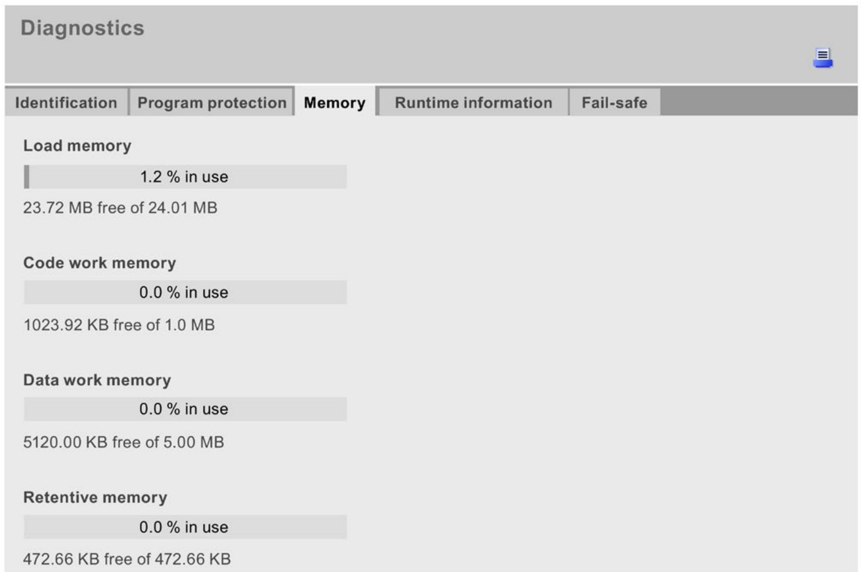

Figure 3-9 "Memory" tab

"Runtime information" tab

Current information on program/communication load and cycle time can be found in the "Runtime information" tab. This enables you to see whether there may be runtime problems during execution of your user program.

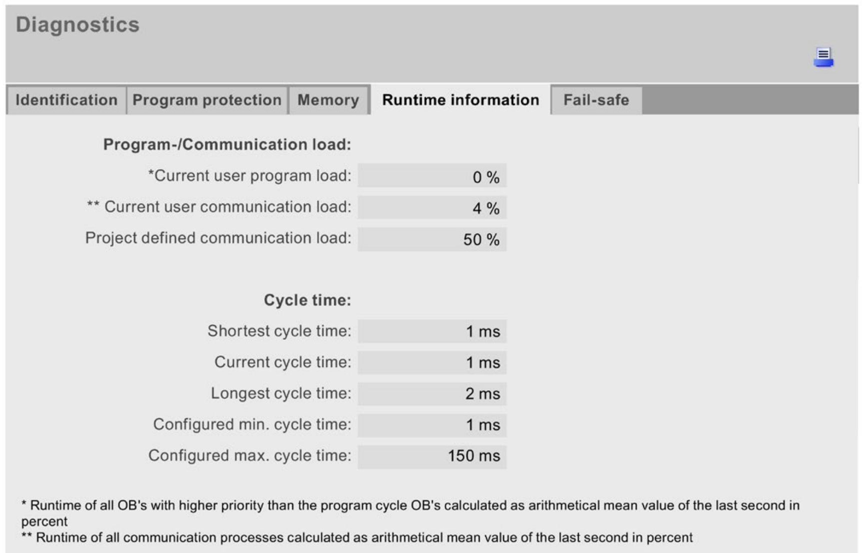

Figure 3-10 "Runtime information" tab

The current user communication load is the actual load arising through communication, for example through Web server access or PROFINET communication. In the example above, 4% of the project-defined communication load is “used”. The remaining 46% is available for the operating system and the user program. You can find additional information about the influence of the communication on the cycle time in the Cycle and Response Times (https://support.industry.siemens.com/cs/us/en/view/59193558) function manual.

"Fail-safe" tab (with an F-CPU)

The safety program of an F-CPU consists of one or two F-runtime groups. You can find their F-runtime group signature, cycle times (F-monitoring time) and runtimes in the "Fail-safe" tab.

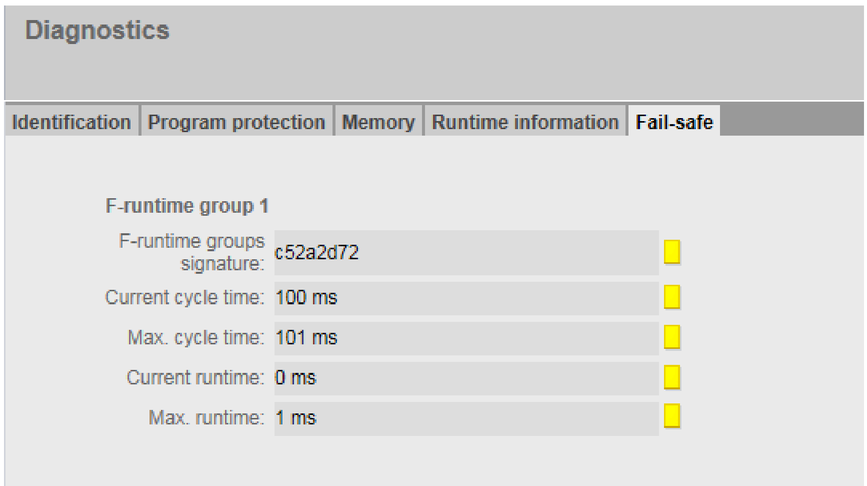

Figure 3-11 "Fail-safe" tab

3.3 Diagnostics buffer

Requirements

The Web server is activated, languages are set, the text libraries are loaded and the project has been compiled and downloaded with STEP 7.

Diagnostics buffer

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" web page.

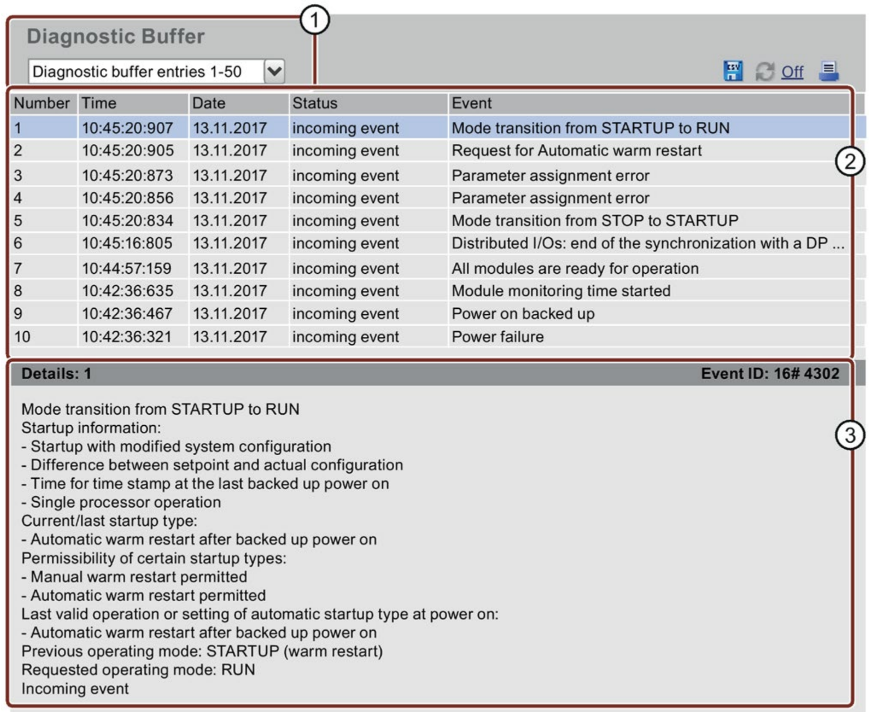

Figure 3-12 Diagnostics buffer

① "Diagnostics buffer entries 1-50"

The diagnostics buffer can accommodate different numbers of alarms depending on the CPU used.
For information on the maximum number of diagnostics buffer entries, refer to the technical specifications of the CPU used.

Select an interval for the entries from the drop-down list. Each interval comprises 50 entries.

② "Event"

The "Event" info box contains the diagnostics interrupts with date and time.

Note that the diagnostics events are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 31).

③ "Details"

This field outputs detailed information about a selected event. Select the corresponding event from the ② "Event" info field.

Saving diagnostics buffer entries

You can save diagnostics buffer entries to a csv file for further processing in a spreadsheet program or database program.
Save the data by clicking the icon.

A dialog opens in which you can specify the file name and target directory.

3.4 Module information

Module information

The status of a device is indicated by means of symbols and comments on the "Module information" web page.

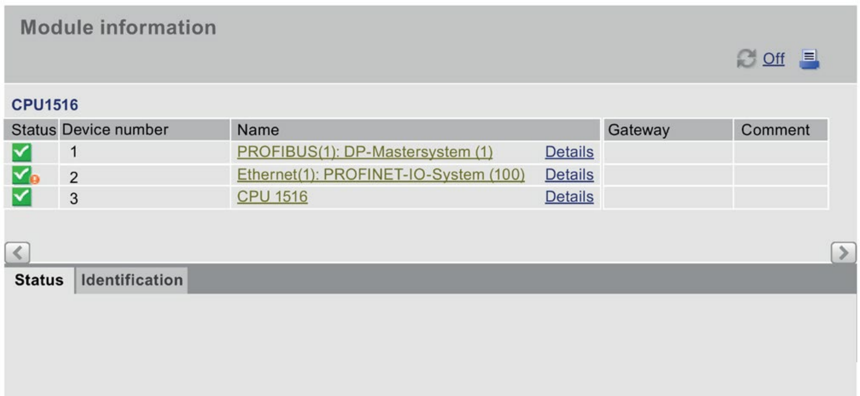

Figure 3-13 Module information

Meaning of the symbols in the "Status" column

Table 3- 2 Meaning of symbols

Symbol	Symbol color	Meaning
	Green	Component is OK
	Gray	Deactivated PROFIBUS slaves or PROFINET devices.
	Gray	State cannot be determined • "State cannot be determined" is displayed during system diagnostics for all configured I/O modules and I/O systems after restart of the CPU. • However, this state can also be displayed temporarily during operation if a diagnostics interrupt burst occurs for all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	Red	Component "not reachable" "Not reachable" is displayed when a module has been removed or a module has been configured but does not exist.
	Black	No input or output data available. Input or output channels of the (sub)module are disabled.
	Green	Maintenance required (Maintenance Required)
	Yellow	Maintenance demanded (Maintenance Demanded)
	Red	Error - component faulty or not available due to an incorrect type
	Red	A module in a lower module level does not have the status "Component OK"

Navigation to further module levels

The status of individual components/modules/submodules is displayed when you navigate to the further module levels:

- To the next higher module level using the links in the display of the module levels
- To the next lower module level using the links in the "Name" column

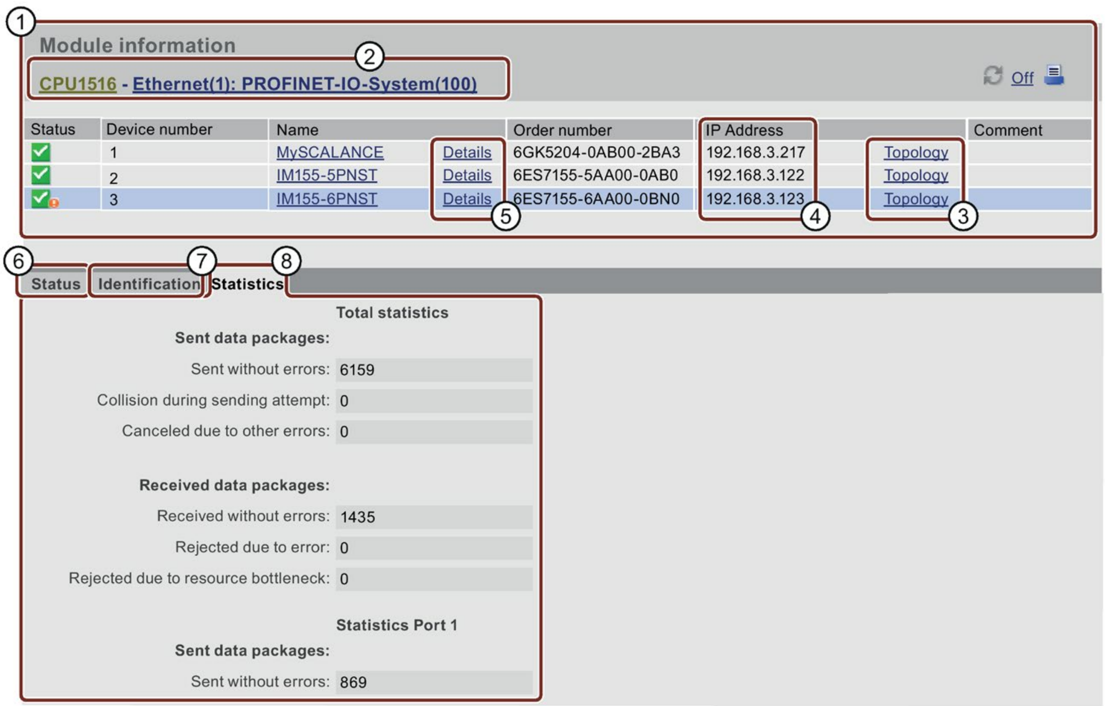

Figure 3-14 Navigation to further module levels

① "Module information"

Depending on the selected level, the table contains information about the rack, the DP master system, the PROFINET IO master system, about the devices, the individual modules, as well as the modules or submodules of the device.

② "Display of the module levels"

The links are used to access the "Module information" of the higher module levels.

③ "Topology"

The two web pages, "Topology" and "Module information", are linked. A click on "Topology" of the selected module automatically takes you to this module in the graphic view of the set topology on the "Topology" web page. The module is displayed in the visible area of the "Topology" web page. The device header of the selected module flashes for a few seconds.

④ "IP address"

If a link is available, you can use it to access the Web server of the configured device you selected.

⑤ "Details"

Additional information about the selected module is provided in the "Status" and "Identification" tabs via the "Details" link.

⑥ "Status" tab

The tab contains information about the status of the selected module when a fault or alarm exists.

⑦ "Identification" tab

The tab contains data on the identification of the selected module.

Note

This tab displays only the data configured offline of the module.

---

⑧ "Statistics" tab

The tab is only displayed for PROFINET IO devices and includes the following information on communication statistics of the selected IO device:

- "Total statistics - Sent data packages"

  You can assess the data transmission on the transmit line based on the key data in this info box.
- "Total statistics - Received data packages"

  You can assess the data transmission on the receive line based on the key data in this info box.
- "Statistics port x - Sent data packages"

  You can assess the data transmission on the transmit line for each port based on the key data in this info box.
- "Statistics port x - Received data packages"

  You can assess the data transmission on the receive line for each port based on the key data in this info box.

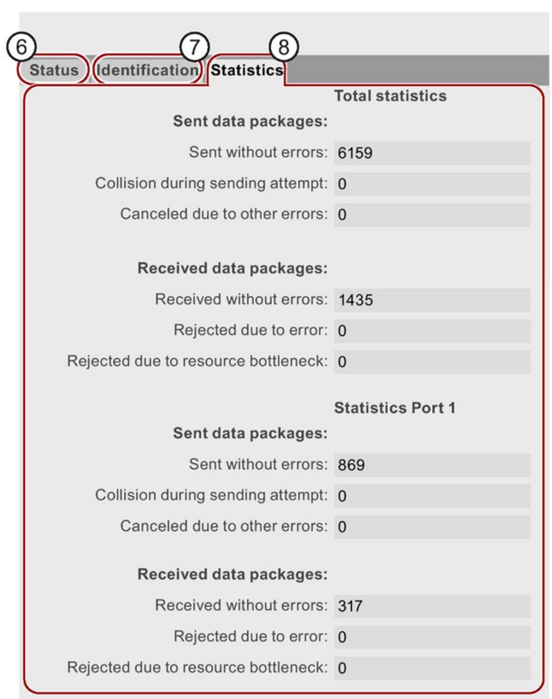

Figure 3-15 "Statistics" tab

Reference

You can find additional information in the "Statistics" tab in the section Communication (Page 57).

Example: Module information - module

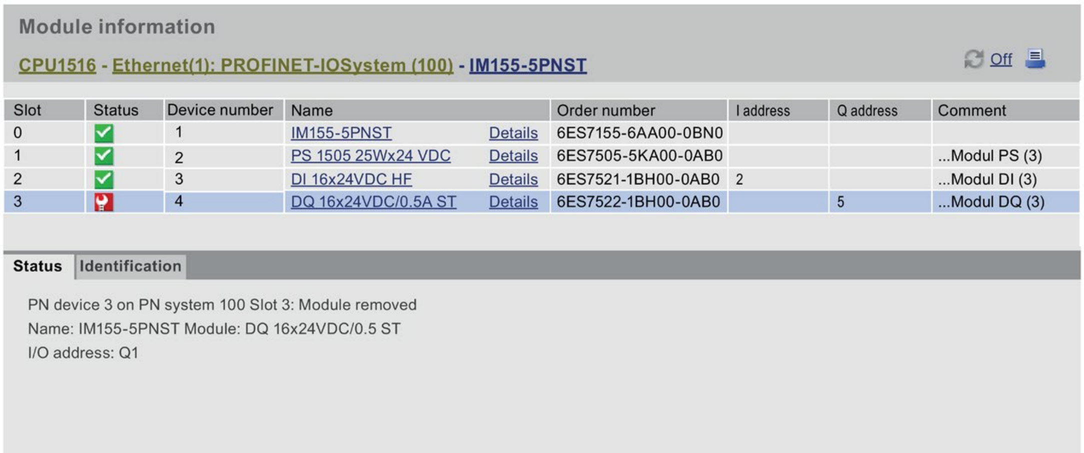

Figure 3-16 Example: Module information - module

Note

If you are using the function Configuration control (option handling) in the central configuration of your plant, the information text in the headings area of the web page informs you that the status of the I/O modules may be displayed inconsistently. No corresponding text is displayed for the distributed I/O.

Example: Module information - submodule

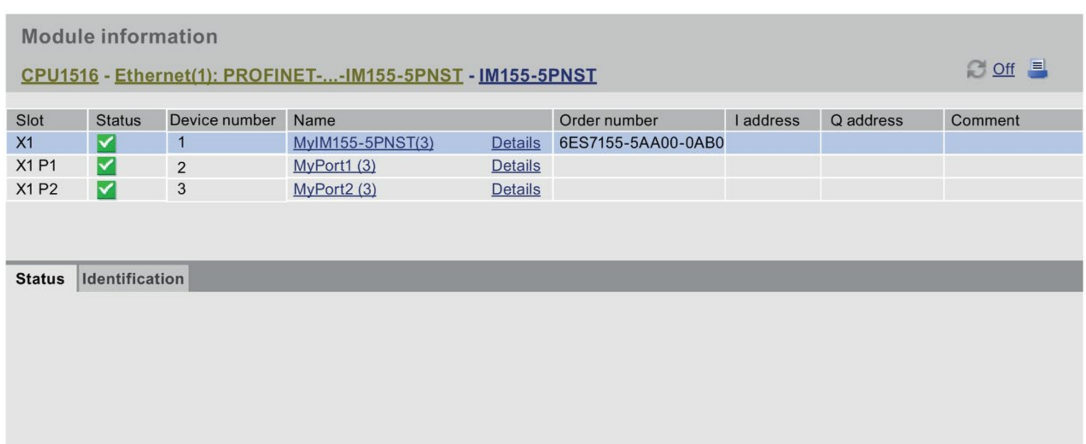

Figure 3-17 Example: Module information - submodule

Reference

You can find additional information on the "Module information" in the online help for STEP 7, keyword: "Module information".

3.5 Firmware update

Introduction

You update the firmware as a user with the corresponding access rights on the "Module information" web page at the module level. You will find information on user management in section Configuring the Web server (Page 21) under "Amending user management".
You use an update file to update the firmware of the CPU, the display of the CPU, or the individual central or distributed modules. Note that all modules you want to update must be compatible with the TIA Portal as of V12.0.

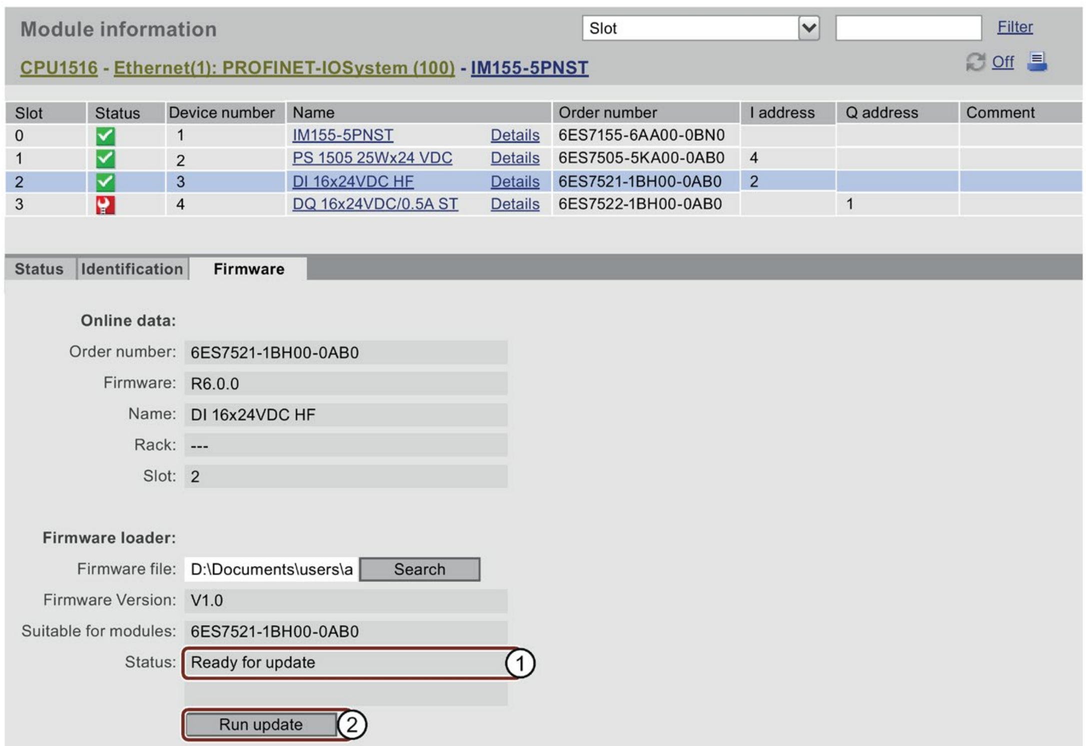
Note

A firmware update is not possible if access is via a mobile terminal device with the "iOS" operating system.

Procedure

The following steps are required to perform a firmware update:

- Click on "Browse" in the Firmware Loader area.
- Select the file you would like to use for the firmware update. You can find the available firmware updates on the Service&Support page on the Internet (http://support.automation.siemens.com).



① Status of the selected firmware file
② Button to execute the update

Figure 3-18 Module information, "Firmware" tab, "Ready for update" status

- If the status is "Ready for update", click "Run update". If the CPU is in RUN mode during the update, the following alarm is output:

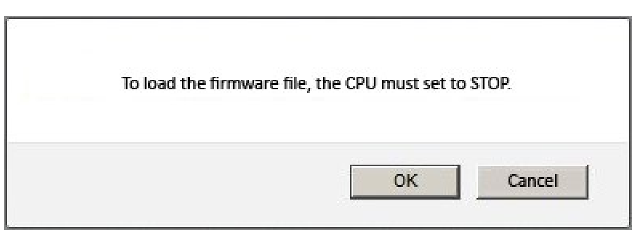


Figure 3-19 Alarm after clicking "Run update"

Acknowledge the alarm output by clicking "OK". The CPU is set to STOP mode and the firmware update is executed.
If you click "Cancel", the CPU remains in the current mode and the firmware update is canceled.

- A alarm informs you about the order number and version ID of the updated firmware once the update is complete.
  The CPU is automatically placed in RUN mode when the mode selector of the CPU is in RUN and when you acknowledge the alarm with "OK". This may take a few minutes; there is no progress indicator.
  If you click "Cancel", the CPU remains in STOP mode and you can run additional updates.

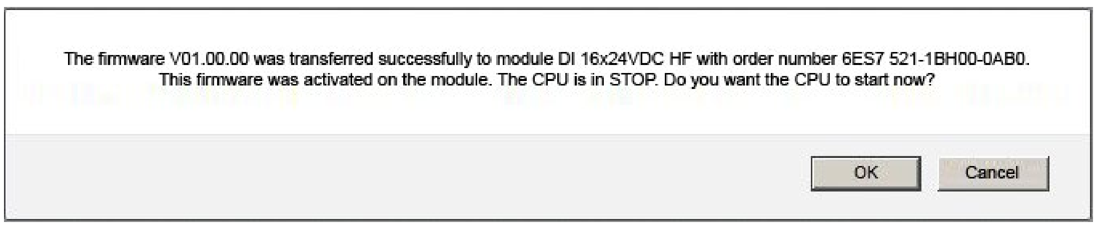

Figure 3-20 Alarm: Firmware successfully transferred

3.6 Alarms

Requirements

The alarm texts were configured in the user-specific languages. For information about configuring alarm texts, refer to STEP 7 and to the Service&Support pages (http://www.siemens.com/automation/service&support).

Alarms

To receive compact information on fault analysis, we recommend that you always first read out the content of the alarm buffer. This is the most effective method to get an overview of the pending faults.

The browser displays the content of the alarm buffer on the "Alarms" web page.

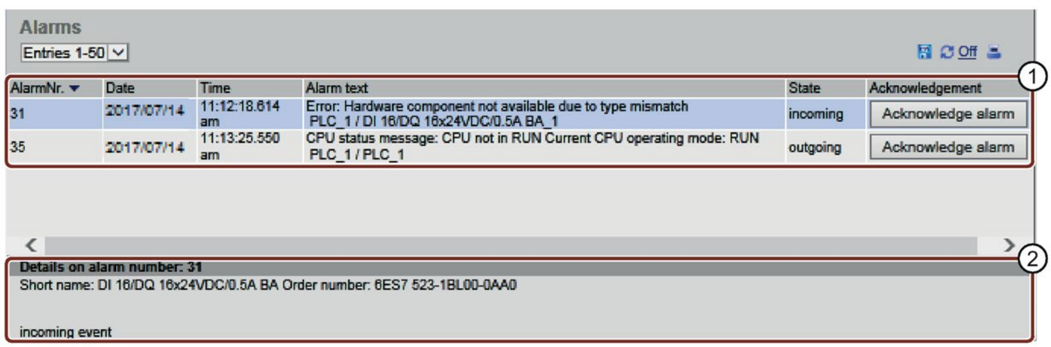

Figure 3-21 Alarms

① "Alarms"

CPU alarms are displayed in descending chronological order with **date** and **time** in info box ①.

The **alarm text** parameter is an entry which contains the alarm texts configured for the corresponding fault definitions.

Note that the alarm texts are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 31).

Sorting

You also have the option to display the individual parameters of the currently displayed web page (max. 50 entries) sorted in ascending or descending order. For this purpose, click on one of the parameters in the column header:

- Alarm number
- Date
- Time (of the CPU)
- Alarm text
- Status
- Acknowledgment

The alarms are returned in chronological order when you click the "Date" entry. Incoming and outgoing events are output at the **Status** parameter.

If you have the appropriate user rights (see section Configuring the Web server (Page 21)), for alarms which can be acknowledged, a button is available to you in the "Acknowledgment" column with which you can acknowledge the alarm.

② "Details on alarm number"

You can view detailed alarm information in this info box. Select the corresponding alarm from the info field ②.

Saving alarms

You can save alarms to a csv file for further processing in a spreadsheet program or database program.
Save the data by clicking the  icon.

A dialog opens in which you can specify the file name and target directory.

3.7 Communication

Overview

The "Communication" web page provides detailed information about the following tabs:

- Parameters
- Statistics
- Resources
- Connections

① "Parameter" tab

A summary of the information on the PROFINET and Ethernet interfaces of the selected CPU is available in the "Parameter" tab.

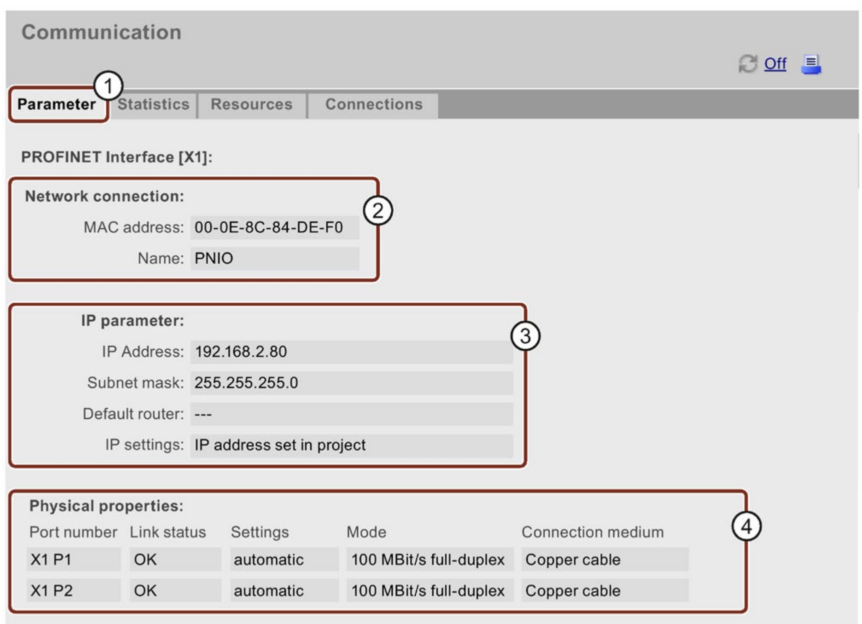

Figure 3-22 Parameters of the integrated PROFINET and Ethernet interfaces

② "Network connection"

The item "Network connection" includes information for identification of the integrated PROFINET and Ethernet interfaces of the corresponding CPU. The MAC address is located on the CPU above the respective PROFINET or Ethernet interface.

③ "IP parameter"

This parameter includes information on the configured IP address and number of the subnet in which the corresponding CPU is located.

④ "Physical properties"

The following information on the interface hardware is available in the "Physical properties" field:

- Port number
- Link status
- Settings
- Mode
- Connection medium

① "Statistics" tab

Information on the data transmission can be found on the "Statistics" tab.

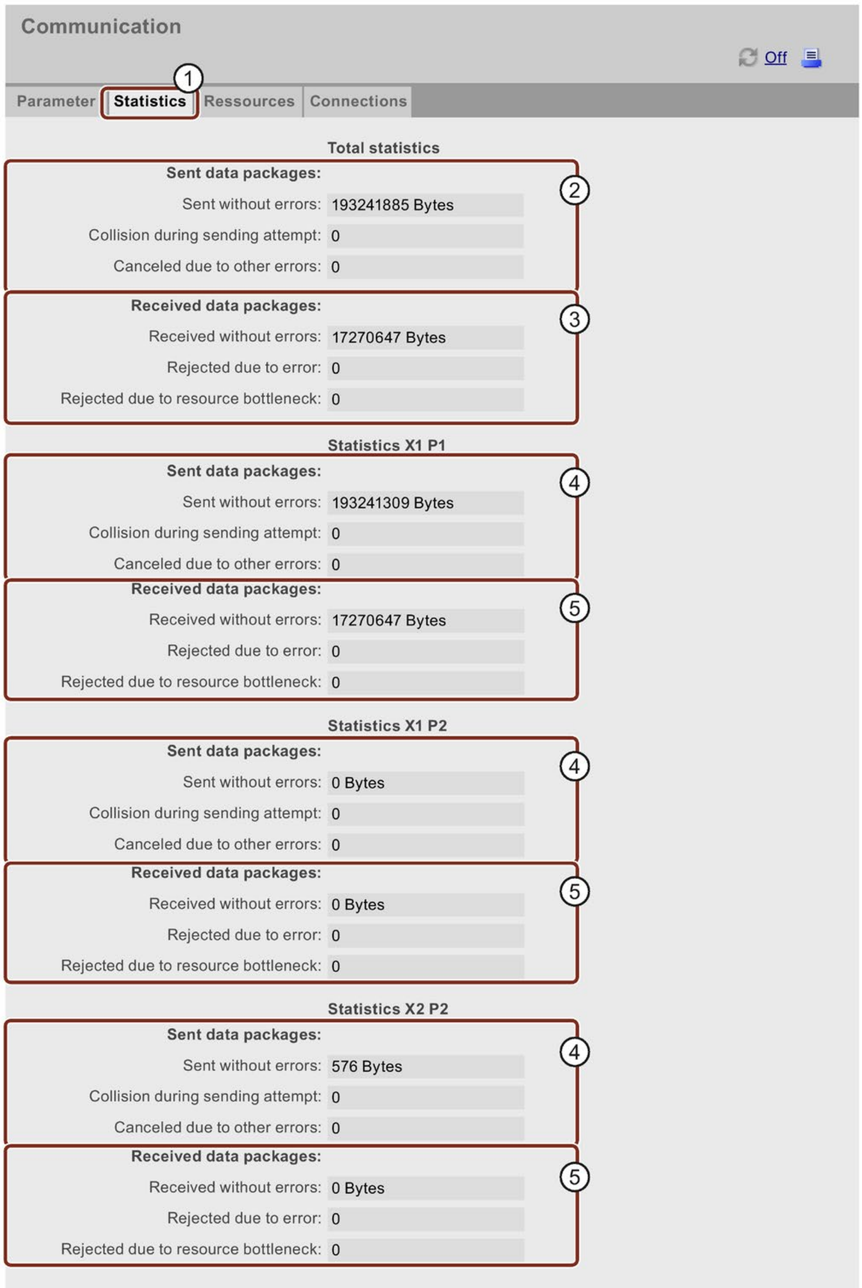

Figure 3-23 "Statistics" tab with key data on data transmission

② "Total statistics - Sent data packages"

You can assess the data transmission on the transmit line based on the key data in this info box.

③ "Total statistics - Received data packages"

You can assess the data transmission on the receive line based on the key data in this info box.

④ "Statistics Port x - Sent data packages"

You can assess the data transmission on the transmit line for each port based on the key data in this info box.

⑤ "Statistics port x - Received data packages"

You can assess the data transmission on the receive line for each port based on the key data in this info box.

① The "Resources" tab

For information about the resource consumption of the connections, refer to the "Resources" tab.

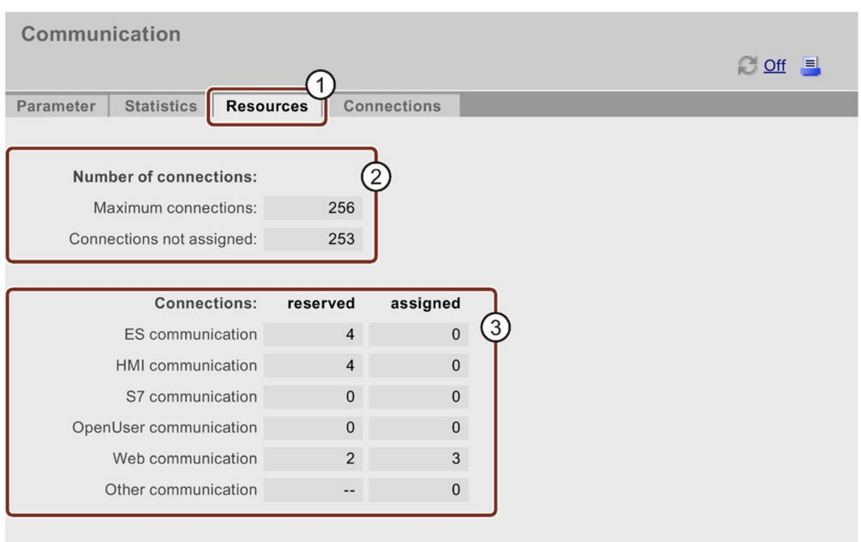

Figure 3-24 "Resources" tab

② Number of connections

Under "Number of connections", you will find information on the maximum number of connections and the number of connections not assigned.

③ Connections

The item "Connections" provides information on the number of connections reserved or used for ES, HMI, S7, OpenUser, web communication and other communication functions.

① "Connections" tab

The "Connections" tab contains information on the status of the communication connections.

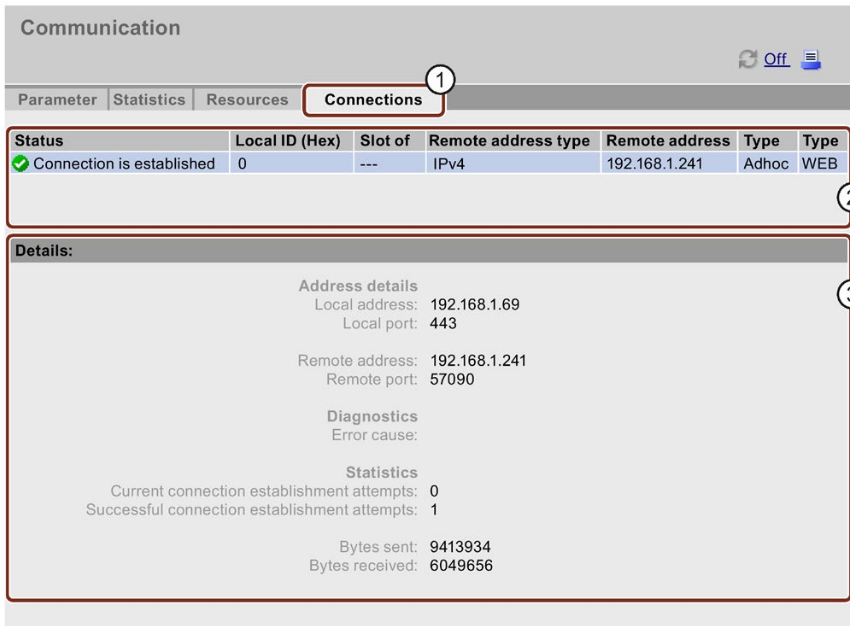

Figure 3-25 "Connections" tab

② Status

Under "Status", you will find an overview of the communication connections being established and the already established communication connections.

For each connection, the table contains the following information: status of the connection, local ID, slot of gateway, remote address (IP address), the corresponding remote address type, method of connection, and type of connection.

③ Details

Under "Details", you will find detailed information about the selected connection.

Reference

For an explanation of the error message displayed when a connection is interrupted or an attempt to establish a connection fails, refer to the STEP 7 online help.

3.8 Topology

3.8.1 Introduction

Topology of the PROFINET devices

The "Topology" web page provides information on the topological configuration and status of the PROFINET devices on your PROFINET IO system.

There are three tabs for the following views:

- Graphical view (set and actual topology)
- Table view (actual topology only)
- Status overview (excluding topological correlations)

You can print the table view and status overview. Before printing, use the print preview of your browser and, if necessary, correct the format.

Set topology

The set topology is displayed if you have topologically interconnected the connections in the configuration with STEP 7.

This view identifies the topological assignment of PROFINET devices that have failed, the differences between the set and actual topology, and interchanged ports.

Note

The configured set topology is always displayed by default in the following scenarios:

- When the "Topology" web page is called via the navigation bar
- When you change from the overview of PROFINET IO devices on the "Module information" web page to the "Topology" web page by means of the "Topology" link.

If a setpoint topology was not configured, the actual topology is displayed.

Actual topology

Displays the current topological structure of the "configured" PROFINET devices of a PROFINET IO system and the directly adjacent, non-configured PROFINET devices (display of the neighbor relationships, provided these can be determined; but the status of these adjacent PROFINET devices is not displayed).

3.8.2 Graphical view

Requirements

For error-free operation of the topology, the following conditions must be met:

- You have made the Language settings (Page 31).
- In the Topology Editor of STEP 7, you configured the topological interconnection of ports (requirement for display of the set topology and the corresponding topological target connections).
- The project has been compiled in STEP 7.
- The project is completely loaded.

Set and actual topology - graphical view

You can select the interface with the topology you want to display (X1, X2, X3 or PROFINET communication modules such as CM 1542-1) at the top left of the "Topology" Web page.

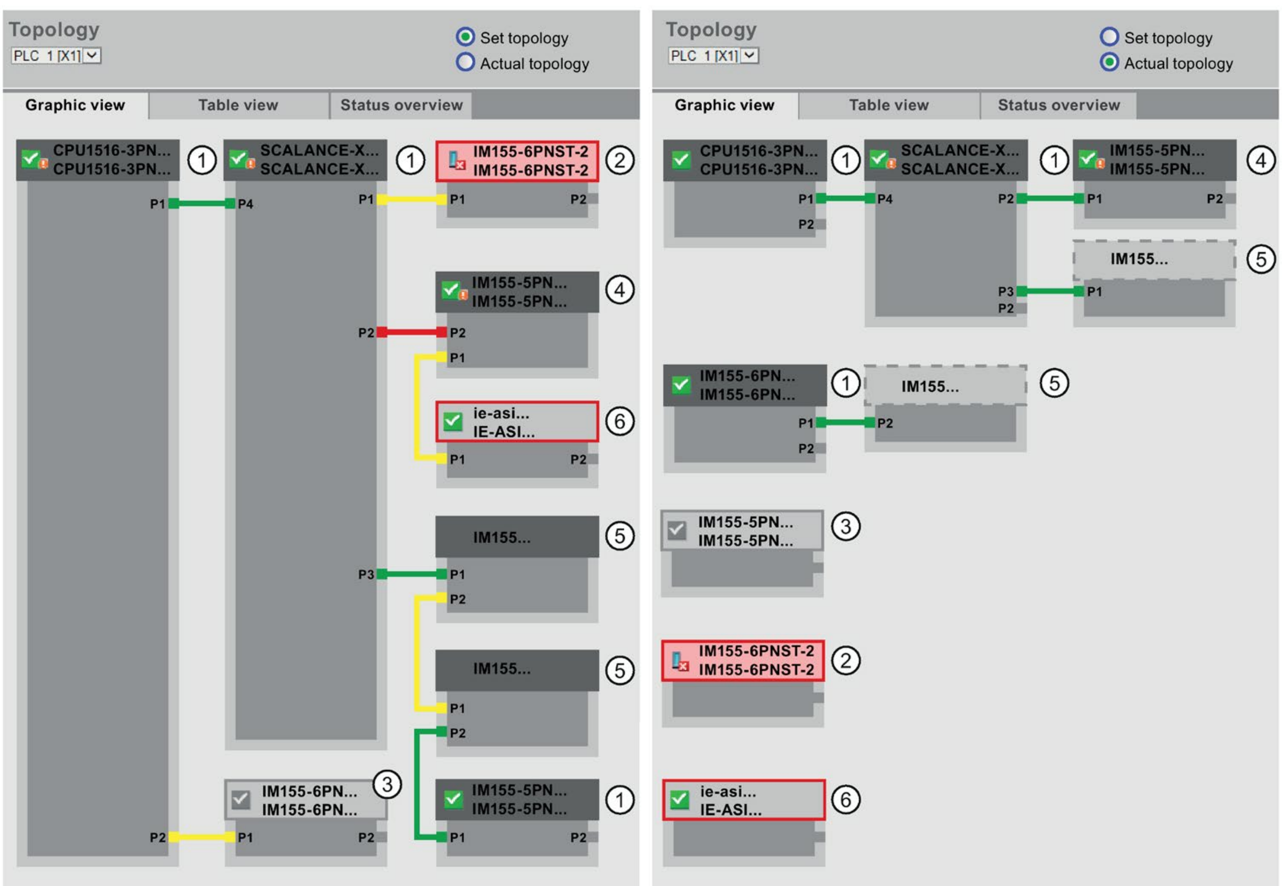

Figure 3-26 Graphical view - Set and actual topology

Meaning of the colored connections in the set/actual topology:

Table 3- 3 Meaning of the colored connections in the set/actual topology

Connection	Meaning	
	Set topology	Actual topology
Green	The current actual connection matches the configured target connection.	Connections detected
Red	Mismatch between the current actual connection and the configured target connection (e.g., port interchanged).	-
Yellow	Connection diagnostics not possible. Causes: • Malfunction of communication with a device (e.g., cable was removed) • Connection to a passive component (e.g., switches or cables) • Connection to devices/PROFINET devices on a different IO controller or IO subsystem.	-

① Configured and accessible PROFINET devices

Configured and accessible PROFINET devices are displayed in dark gray. Connections indicate the ports used to connect the PROFINET devices of a station.

② Configured but inaccessible PROFINET devices

Configured but inaccessible PROFINET devices are indicated in pink with red frame (e.g., device failure, cable disconnected).

③ Deactivated devices

All deactivated, configured PROFINET devices are displayed in light gray.

④ Interchanged ports

Interchanged ports are highlighted in red in the set topology view. The actual topology view indicates the actually connected ports, while the set topology view displays the configured target connections.

⑤ PROFINET devices of a different PROFINET IO subsystem

- In the set topology:

  A PROFINET device of a different PROFINET IO subsystem is indicated by means of a green link (or red link for interchanged ports) if it is available on the bus and directly adjacent to an accessible configured PROFINET device ①. If the PROFINET device of a different PROFINET IO subsystem is inaccessible, it is identified by means of a yellow connecting line.
  The connection between two PROFINET devices which both belong to a different PROFINET IO subsystem cannot be identified and is always indicated in yellow color.

- In the actual topology:

  The PROFINET device of a different PROFINET IO subsystem is not displayed unless it is directly adjacent to a configured PROFINET device. The PROFINET device is shown in light gray with a dashed line around the device header.

The status of PROFINET devices of a different PROFINET IO subsystem is **not** displayed in the device header.

⑥ Displaying faulty neighbor relationships

Devices from which the relation data could not be read completely or with error are highlighted in light gray with a red frame.

Note

Displaying faulty neighbor relationships

If a device does not have the matching firmware, the relationships cannot be displayed correctly. This means a firmware update of the respective device is required in case a faulty neighbor relationship is displayed.

Views after changes to the configuration

- If a device fails, it remains at the same position in the "Set topology" view. This error state is indicated with a red border around the device header and the icon .
- If a device fails, it is displayed in the "Actual topology" view. This error state is indicated separately in the bottom area with a red border around the device header and the icon .

Link between the "Topology" and "Module information" web pages

The two web pages, "Topology" and "Module information", are linked. A click on the header of a selected module in the topology view automatically takes you to this module on the "Module information" web page.

You can find additional information on this in the section Module information (Page 47).

Reference

Additional examples for graphical topology view are available in the section Examples for graphical topology views (Page 69).

3.8.3 Tabular view

Topology - tabular view

The "Tabular view" always shows the "Actual topology".

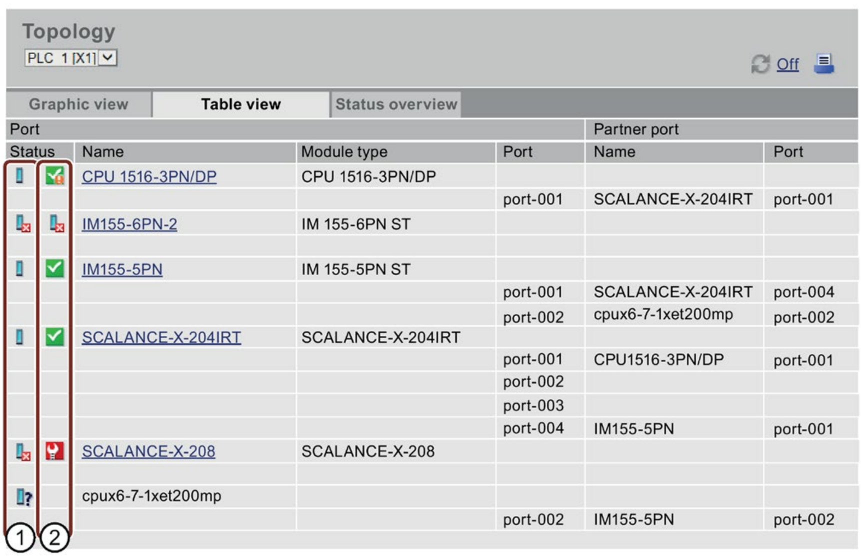

Figure 3-27 Topology - tabular view

① Meaning of the symbols relating to the status of the PROFINET devices

Table 3- 4 Meaning of the symbols relating to the status of the PROFINET devices

Symbol	Meaning
	Configured and accessible PROFINET devices
	Unconfigured and accessible PROFINET devices
	Configured but inaccessible PROFINET devices
	Devices for which neighbor relations cannot be determined, or for which the neighbor relationship could not be read out completely, or only with errors

② Meaning of the symbols relating to the module status of the PROFINET devices

Table 3- 5 Meaning of the symbols relating to the module status of the PROFINET devices

Symbol	Color	Meaning
	green	Component is OK.
	gray	Deactivated PROFIBUS slaves or PROFINET devices
	black	State cannot be determined • For example, "Status cannot be determined" is always displayed while the CPU is in STOP mode, or during startup evaluation of "Report system error" for all configured I/O modules and I/O systems after a CPU restart. • However, this status can also be displayed temporarily during operation if a diagnostics interrupt burst occurs at all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	red	Component failed or is not reachable • "Not reachable" is displayed for e.g. a module that has been removed or a module that has been configured but does not exist.
	green	Maintenance required (Maintenance Required)
	yellow	Maintenance demanded (Maintenance Demanded)
	red	Error - component faulty or not available due to an incorrect type.
	-	A module in a lower module level does not have the status "Component OK".

Reference

For additional information on the "Report System Error" function, refer to the STEP 7 online help, keyword: "System diagnostics".

3.8.4 Status overview

Topology - status overview

The "Status overview" provides a clear presentation of all PROFINET IO devices/PROFINET devices (without connection relations) on one page. A quick error diagnostics is possible based on the symbols that show the module statuses.

The overview also provides a link of the modules to the Web page Module information (Page 47).

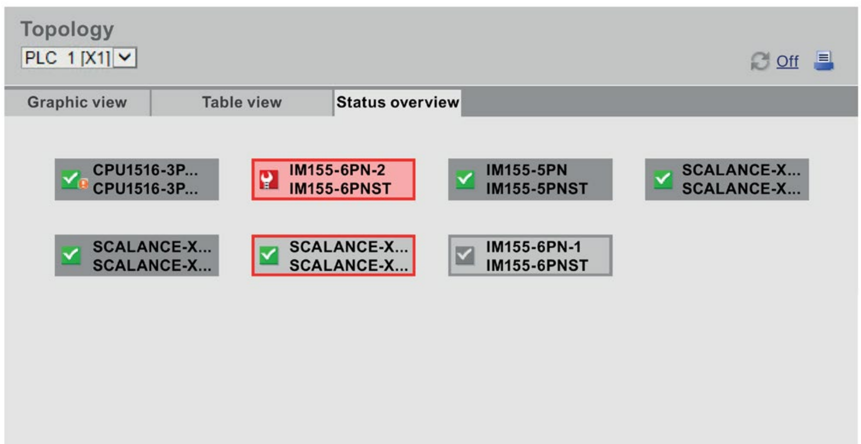

Figure 3-28 Topology - status overview

3.8.5 Examples for graphical topology views

The following section shows, as an example, some displays of the different topology views for a simple project.

"Set topology" is OK

Here you see the connections as they are configured in the topology editor by STEP 7. The configuration and wiring match.

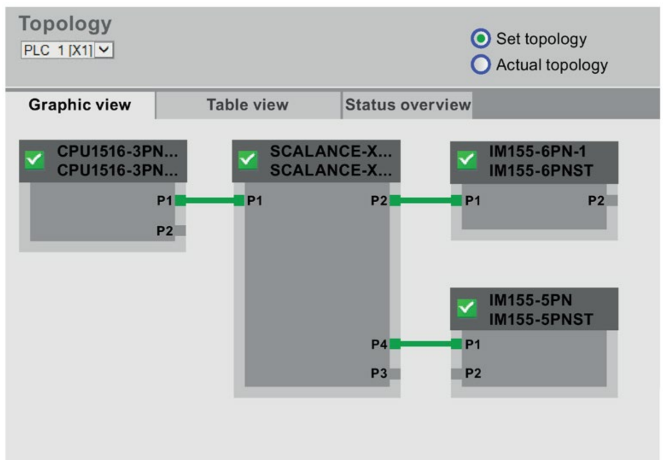

Figure 3-29 "Set topology" is OK

"Actual topology" is OK

Shows the actual layout of all configured devices that can be reached topologically.

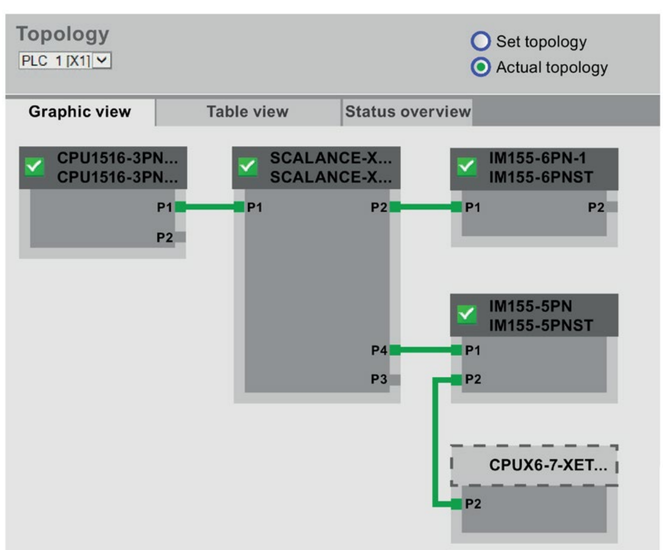

Figure 3-30 "Actual topology" is OK

"Set topology" with failed device

If a device has failed in the meantime, this device remains in the same place in the "Set topology" view. The failed device is displayed with a red border around the device header and the icon.

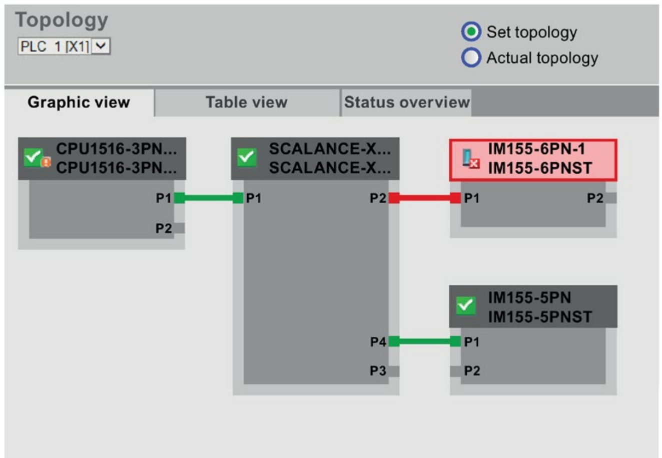

Figure 3-31 "Set topology" with failed device

"Actual topology" with failed device

In the "Actual topology" view, the device that has failed in the meantime is displayed separately in the bottom area of the view. The failed device is displayed with a red border around the device header and the icon.

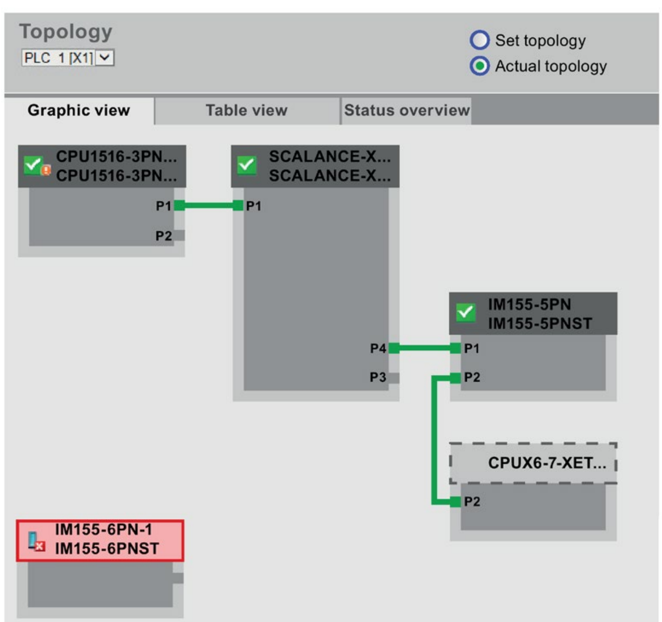

Figure 3-32 "Actual topology" with failed device

"Set topology" with interchanged ports

If a port was interchanged for a configured, directly adjacent PROFINET device, this device remains in the same place in the "Set topology" view. The interchanged connection is indicated by a red line.

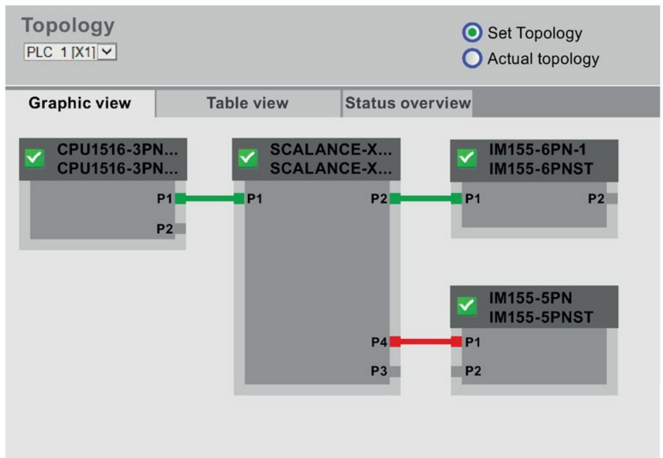

Figure 3-33 "Set topology" with interchanged ports

3.9 Tag status

Tag status

The browser outputs the tag status on the web page of the same name.

Note

Saving the tag status as a bookmark

When the page is exited, the entries made on it are not saved. If you want to monitor the same entered tags again later on, then create a bookmark in your Web browser for the "Tag status" page. Otherwise, you will have to enter the tags again when the page is reopened.

If you have defined your user page as start page of the Web server, you cannot access the tag status via the saved bookmarks. You can find additional information in section Defining the user page as start page (Page 98).

Note

Selected tag addresses are copied to the URL

The maximum number of characters for the URL of the tag status page is 2083. You can see the URL which corresponds to your current tag status page in the address bar of your Web browser.

To monitor several tags, we recommend the use of the watch tables (Page 75).

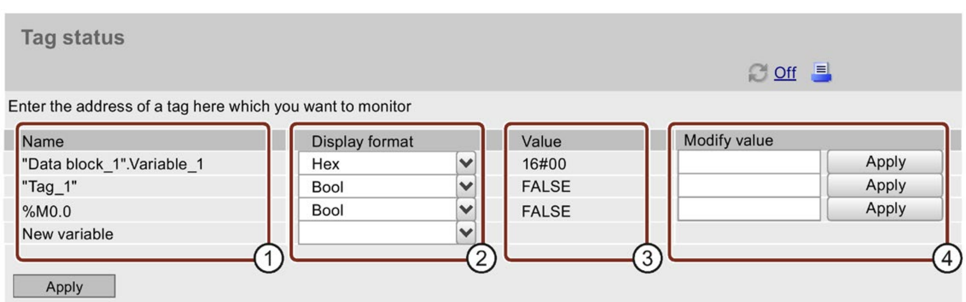

Figure 3-34 Tag status

① "Name"

In the "Name" text box, enter the address of the tag whose behavior you want to monitor. This may be a symbolic or absolute address.

- PLC tags (inputs and outputs, bit memories, times and counters) and DB tags in blocks with standard access have an absolute and a symbolic address.
- DB tags in blocks with optimized access have a symbolic address and no absolute address.

Example for access to the absolute address of a data block with standard access:
The absolute address consists of the preceding address ID %, the number of the data block and the absolute address of the tags in the data block, separated by a period: `%DB1.DBX1.0` = absolute addressing of the tags "DBX1.0" in the global data block "DB1".

Invalid entries are displayed in red font.

② "Display format"

Using the drop-down list box, select the desired display format of the respective tag. If the tag cannot be displayed in the desired format, it will be displayed in hexadecimal format.

③ "Value"

Under "Value", the value of the corresponding operand is displayed in the selected format.

④ "Modify value"

You can change the value of tags and write them to the CPU in this column. To transfer several changed values in one operation, click the "Apply" button below the table.

To be able to read values and write values to the CPU, you need to have configured a user with the appropriate access rights in STEP 7.

If the value you entered is not valid (e.g. binary value in a BOOL field), the entry is not applied and the corresponding input field remains empty. A specific message relating to this is not output.

You can change the values of the following data types:

- Bool, Byte
- DWord, LWord, Word
- Int, DInt, LInt, SInt, UDInt, UInt, ULInt, USInt
- Real, LReal
- LDT
- Counter, Date
- Time, LTime, Time_Of_Day, LTime_Of_Day, Timer
- S5Time
- Char, WChar, String

Note

The following generally applies: To be able to write data, the "Referrer" transfer must be activated in your Web browser (this is the default in all common browsers).

Special considerations when changing languages

You can change the language, e.g., from German to English, in the upper right corner. Note that the German mnemonics differ from those of the other languages.

For monitoring available data types

In principle, all data types of PLC tags that can be monitored in STEP 7 can also be monitored via the Web server.

Note that structured data types such as ARRAY, STRUCT and DTL are not available as data types for PLC tags because of their data volume.

Reference

You can find additional information on the available data types in the STEP 7 online help, keyword: "Overview of the valid data types".

See also

Configuring the Web server (Page 21)

3.10 Watch tables

Watch tables

The browser displays the content of the configured, web-enabled watch tables on the web page of the same name.

Note

Please note that you can observe a maximum of 50 of the watch tables configured in STEP 7 in the Web server.

Each of these tables is displayed in the Web server with a maximum of 200 entries.

If you are monitoring many large watch tables in the Web server, the update time may increase due to the large data volumes.

The number of watch tables that you can monitor download into the CPU also depends on the size of the SIMATIC memory card used.

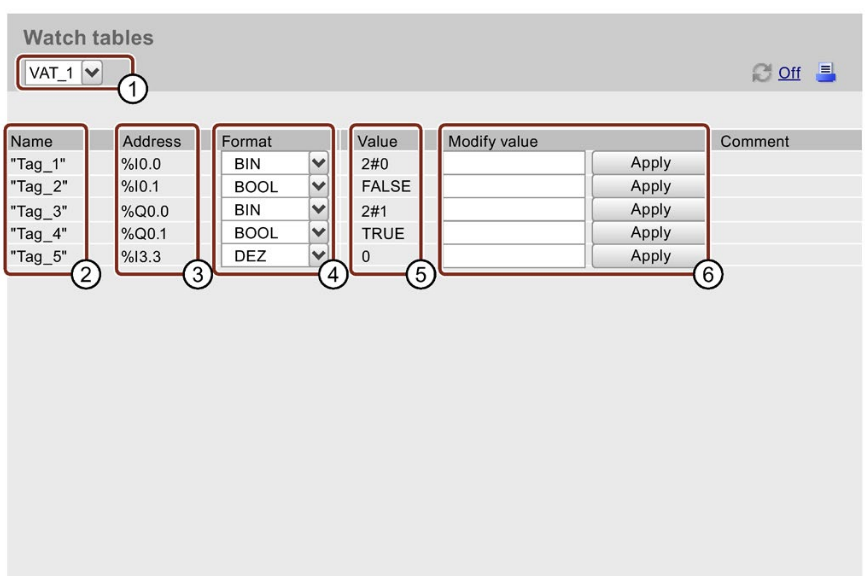

Figure 3-35 Watch tables

① Selection

Select one of the configured watch tables from the drop-down list.

② "Name"

The symbolic name of the tag is shown in this info box.

③ "Address"

The absolute address of the tags is displayed within this info field (if present, e.g. for inputs or outputs; DB tags in blocks with optimized access have no absolute address).

③ "Format"

Select the display format of the respective tag from the drop-down list.

⑤ "Value"

This column shows the values in the corresponding display format.

⑥ "Modify value"

You can change the value of tags and write them to the CPU in this column.

To be able to read values and write values to the CPU, you need to have configured a user with the appropriate access rights in STEP 7.

If the value you entered is not valid (e.g. binary value in a BOOL field), the entry is not applied and the corresponding input field remains empty. A specific message relating to this is not output.

Note

The following generally applies: To be able to write data, the "Referrer" transfer must be activated in your Web browser (this is the default in all common browsers).

Note that the comments are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 31).

Reference

You can find additional information on the available data types in the STEP 7 online help, keyword: "Overview of the valid data types".

3.11 User pages

User pages

In the "User pages" area of the Web server you can upload HTML pages you have created yourself for reading out data of the target system.

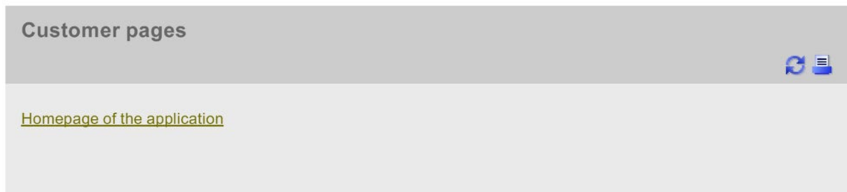

Figure 3-36 User pages

You create the pages with an HTML editor of your choice from which you generate data blocks (Web control DB and Fragment DBs) in STEP 7 and download them to the CPU. The "WWW" instruction synchronizes the user program with the Web server on the CPU and initializes the Web server. With the first call of the "WWW" instruction, the link to the user page is displayed on the web page of the CPU. A click on the link opens the user page in a new window.

Note

Write access to user pages allows the process parameters and, thus, the operation of the CPU to be influenced.
To prevent external manipulation, always assign a password for users with write access to user pages in the user management. You will find information on user management in section Configuring the Web server (Page 21) under "Amending user management".

Requirements

- You have assigned symbolic names to the tags you want to use on your web page in STEP 7 .
- In the Inspector window under "Properties > General > Web server", you have at least:
  - Activated the Web server
  - Assigned read-only or read and write permissions to the users for user pages (see section Configuring the Web server (Page 21))
- You have completed all necessary communication settings (IP address parameter, subnet mask, etc.).
- You have downloaded the configuration.
- You have created your user page in an HTML editor of your choice:
  - Automatic HTML pages, if you want to **disable** control of the page layout by means of the user program (requires at least one call of SFC 99).
    Changes in mode from RUN to STOP do not affect the call of the user pages.
  - Manual HTML pages, if you want to **enable** control of the page layout by means of the user program (cyclic call of SFC 99 required).

Creating user pages

You can use any HTML editor to create your own user page(s). Make sure that your HTML code complies with the standards of the W3C (World Wide Web Consortium), because STEP 7 does not check the HTML syntax in any way. In addition to the simple HTML code, you can also use JavaScript commands in your user pages.

Proceed as follows:

1. Create the HTML file for your user page with an HTML editor.
   To allow data from the CPU to be output on your web page, integrate the AWP commands as HTML comments (see section AWP commands (Page 81)).
2. Store the HTML file and all associated source files (e.g., *.gif, *.jpg, *.js, etc.) in a directory on your PG/PC and note the storage path.
3. Call the "WWW" instruction in STEP 7 and program it (see section Programming the WWW instruction (Page 96)).
4. Configure the user page in STEP 7 (see section Configuring user pages (Page 94)). In this way, you compile the contents of your HTML files, among other things, into data blocks.
5. Download the configuration and the user program to the CPU.
6. Open your user page with your display device by means of a web browser in the Web server of the CPU.

Note

Extensive HTML pages, especially those with a lot of images, take up a lot of space in the load memory. Make sure you select a SIMATIC memory card with enough memory to provide sufficient load memory.

If the **sum of the HTML pages** > 1 MB, performance losses may occur as only 1 MB data is saved in the cache.

We recommend that you create **each individual file of an HTML page** with a size not exceeding 512 KB; otherwise, problems can occur when sending the file from the Web server to the browser. You can view the size of the respective file in the file explorer of the directory.

Updating user pages

User pages are not updated automatically in the browser. You can program the HTML code so that the pages are updated automatically.

Pages which read out data from the controller are always up-to-date due to regular updates.

Note

If the HTML page contains form fields for data input, automatic update can impair the correct data input by the user.

To update the entire page automatically, you can add the following instruction to the <head> area of your HTML page, whereby the number "10" stands for the update interval in seconds:

```
<meta http-equiv="refresh" content="10">
```

References

The description of a user page is available in the section Example of a user page (Page 100).

Additional help for visualization with user pages is available in the application examples on the Internet:

- Creating and using your own Web pages for S7-1200 (http://support.automation.siemens.com/WW/view/en/58862931)
- Creating and using your own Web pages for S7-1200 / S7-1500 (https://support.industry.siemens.com/cs/de/en/view/68011496)

- How do you integrate the string contents in your user-defined Web page of the S7-1500 CPU as of Firmware V1.6? (https://support.industry.siemens.com/cs/ww/en/view/98754370)

You will find more information on JavaScript commands in the ECMAScript specification on the Internet (http://www.ecma-international.org/ecma-262/5.1/).

For more information about how to automatically update web pages and how to incorporate user pages with relative path names, refer to the FAQ with entry ID 62543256 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/62543256) Internet page.

3.11.1 AWP commands

Overview

Automation Web Programming (AWP) commands are a special command syntax for data exchange between CPU and user page (HTML file).

AWP commands are entered as HTML comments and offer the following options for your user pages:

- Reading PLC tags
- Writing PLC tags
- Reading special tags
- Writing special tags
- Defining enum types
- Assigning enum types to tags
- Defining data block fragments
- Importing data block fragments
- Accessing the values of an array
- Accessing the values of a PLC tag of STRUCT data type

General syntax

All AWP commands, except for the command for reading a PLC tag, have this structure:

```
<!-- AWP_< command name and parameter> -->
```

Files including AWP commands:

- must be UTF-8 encoded.
  To define UTF-8 as character set of the page, add the following line to your HTML code:
  ```
  <meta http-equiv="content-type" content="text/html; charset utf-8">
  ```

Note

Saving the HTML page

Make sure that you save the file in the editor in UTF 8 character encoding as well.

- may not include the following sequence:]]>
- may not include the following sequence outside "read tag areas" (:="<Varname>":):
- depending on the use, must identify special characters in tag names or data block names with character escape sequences or quotation marks
- are case-sensitive
- should be additionally enclosed by JavaScript comments ("/*...*/") in JavaScript files

Overview of AWP commands

Table 3- 6 AWP commands

Function	Representation
Reading PLC tags	:=<Varname>:
Writing PLC tags	<!-- AWP_In_Variable Name='<Varname1>' -->
Reading special tags	<!-- AWP_Out_Variable Name='<Typ>:<Name>' -->
Writing special tags	<!-- AWP_In_Variable Name='<Typ>:<Name>' -->
Defining enum types	<!-- AWP_Enum_Def Name='<Name Enum-Typ>' Values='0: "<Text_1>",1:"<Text_2>",...,x:"<Text_y>"' -->
Assigning enum types to tags	<!-- AWP_Enum_Ref Name='<Varname>' Enum='<Name Enum-Typ>' -->
Defining data block fragments	<!-- AWP_Start_Fragment Name='<Name>'[Type=<Typ>] [ID=<Id>] -->
Importing data block fragments	<!-- AWP_Import_Fragment Name='<Name>' -->
Accessing the values of an array	<!-- AWP_Start_Array Name='"<DB name>".<array name>' --> ... <!-- AWP_End_Array -->
Accessing the values of a PLC tag of STRUCT data type	<!-- AWP_Start_Struct Name='"<DB name>".<struct name>' --> ... <!-- AWP_End_Struct -->

3.11.1.1 PLC tags

Introduction to PLC tags

User pages can read PLC tags from the CPU and write data to the CPU.

To do so, PLC tags must:

- be enclosed by double quotation marks ("...").
- also be enclosed by single quotation marks ('" ... "') or with quotation marks masked with a backslash ("\" ... "\").
- be specified by a PLC tag name.
- if the PLC tag name includes the characters \ (backslash) or ', identify these characters with the escape sequence \\ or \' as normal characters of the PLC tag name.
- be enclosed with single quotation marks ('...'), if an absolute address (input, output, bit memory) is used in the AWP command.

Reading PLC tags

These out-tags (output direction as seen from the controller) are inserted at any place in the HTML text with the syntax described below.

Syntax

```
:=<Varname>:
```

<Varname> corresponds to the tag to be read from your STEP 7 project and can be a simple shared tag or a complete tag path to a structural element. Make sure that you use the name of the data block and not its number when you use data blocks.

Examples

```
:="Conveying speed":
:="My_datablock".bitmemory1:
:=%MW100:
```

Reading tags of the String and Character type

Below, these types of quotation marks are used in the explanation: single quotation marks ('), double quotation marks (").

As of firmware V1.6, with the "Read PLC tags" function, the CPU outputs tags of the String or Character type enclosed in single quotation marks to the browser.
For example:

- "Varname".MyString = ABC string tag
- You read the tag in HTML using the function :="Varname".MyString:
- The Web server outputs the character string 'ABC' to the browser

Using String or Character tags in expressions

On your HTML page, you use an expression in which the character string for reading a tag is enclosed in quotation marks, for example in forms.

Possible HTML code used:
```
<input type="text" name="appfield" value="myvalue">
```

If you read the displayed value for the "value" attribute from a PLC tag in this expression, the HTML code appears as follows:
```
<input type="text" name="appfield" value=":="Varname".MyString:">
```

By reading the PLC tag, the Web server outputs the value 'ABC'. In HTML, the code is then represented as follows:
```
<input type="text" name="appfield" value=" 'ABC' ">
```

If you have used single quotation marks instead of double quotation marks in your HTML code to enclose the attributes, the Web server passes on the content of the tags enclosed in two single quotation marks to the browser. As a result of this, the browser does not output the content of the String or Character tag, since two consecutive single quotation marks each form a closed sequence. The values to be read are located between these sequences and are not output by the browser.

In this context, note in particular that the character string with double quotation marks is not identical to two single quotation marks even if they appear to be identical.

Note

The code is not adapted automatically during an update to firmware as of V1.6.
Adapt your HTML code if you have used single quotation marks to enclose attributes for the "Read PLC tags" function.

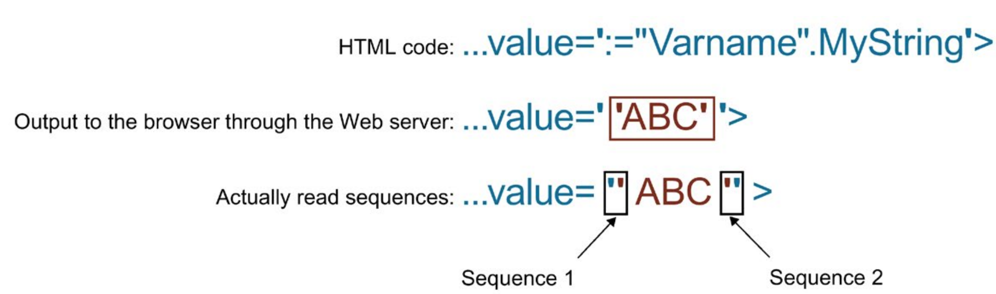

Figure 3-37 Example of HTML code with attribute in single quotation marks

Writing PLC tags

These in-tags (input direction as seen from the controller) are set on the browser page. This can take place in a form on your HTML page, for example, with text input or list selection boxes that correspond to the tags that can be written.

The tags are either set in the HTTP Header (per cookie or POST method) or in the URL (GET method) by the browser in the HTTP request and are then written by the Web server into the respective PLC tag.

Note

Write access during operation

For data to be written from a user page to the CPU, a user must have the required write permissions and be logged on as this user. This applies to all write accesses of web pages to the CPU.

Syntax

```
<!-- AWP_In_Variable Name='"<Varname1>"' Name='"<Varname2>"'
Name='"<Varname3>"' -->
```

If the name of the tag that you are using for the web application is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter.

```
<!-- AWP_In_Variable Name='<Varname_Webapp>' Use='<PLC_Varname>' -->
```

Examples with HTML input boxes

```
<!-- AWP_In_Variable Name='"Target_Level"' -->
<form method="post">
<p>Input Target Level: <input name='"Target_Level"'
type="text"><input type="submit" value="Write to PLC"> </p>
</form>

<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->
<form method="post">
<p>Braking: <input name='"Data_block_1".Braking' type="text"> <input
type="submit" value="Write to PLC"></p>
</form>
```

Examples with HTML drop-down list

```
<!-- AWP_In_Variable Name='"Data_block_1".ManualOverrideEnable' -->
<form method="post">
<select name='"Data_block_1".ManualOverrideEnable'>
<option value=1>Yes</option>
<option value=0>No</option>
</select><input type="submit" value="submit setting"> </form>
```

3.11.1.2 Special tags

Special tags

Special tags are mainly the HTTP tags specified in the definitions of the World Wide Web Consortium (W3C). Special tags are also used for cookies and server tags.

Reading special tags

The Web server can read PLC tags and transfer them to special tags in the HTTP response header. You can, for example, read out a path name from a PLC tag to redirect the URL to another storage location with the special tag "HEADER:Storage location".

Syntax

```
<!-- AWP_Out_Varible Name='<Type>:<Name>' Use='<Varname>' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- COOKIE_VALUE
- COOKIE_EXPIRES

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Status: HTTP status code (if no other value was set, status code 302 is returned).
  - Location: path for redirection to another page. Status code 302 must be set.
  - Retry-After: time for which the service is most likely not available. Status code 503 must be set.
- COOKIE_VALUE:name: value of the named cookie.
- COOKIE_EXPIRES:name: expiration time of the named cookie in seconds.

Examples

The HTTP HEADER tag is written to the PLC tag of the same name:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' -->
```

If the name of the special tag is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' Use='"Status"' -->
```

Writing special tags

The Web server gives you the option to write values of special tags written in the HTTP header in the CPU. You can, for example, save information on the cookie of a user page or on the user that accesses a page in STEP 7.

Syntax

```
<!-- AWP_In_Variable Name='<Type>:<Name>' Use='Varname' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- SERVER
- COOKIE_VALUE

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Accept-Language: accepted or preferred language
  - User-Agent: information on the browser
  - Authorization: credentials for a requested resource
- SERVER tags:
  - current_user_id: Indicates whether a user is logged on:
    current_user_id=0: No user is logged on / access by "Everybody" user.
    current_user_id=1: At least one user is logged on.
  - current_user_name: user name of the logged-on user
- COOKIE_VALUE:name: value of the named cookie.

Examples

The HTTP-SERVER tag is written to the PLC tag of the same name:

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"' -->
```

The HTTP-SERVER tag is written to the PLC tag "My_userID":

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"'
Use='"My_userID"' -->
```

3.11.1.3 Enum types

Enumeration types (enum types)

Enum types convert numerical values from the PLC program into texts or vice versa. The numerical values may also be assigned for use with several languages.

Define enum types

You can define enum types in your user pages and assign the values in an AWP command.

Syntax

```
<!-- AWP_Enum_Def_Name='<Name Enum-Typ>' Values='0:"<Text_1>",
1:"<Text_2>",...,x:"<Text_y>"' -->
```

Examples

To store German values as HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"Fault"' -
->
```

To store English values as HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -
->
```

Assigning enum types to tags

The assignment of tags from the user program to the individual enum types takes place by means of a separate AWP command. The used tag can be used at a different location of the user pages in a read operation or in a write operation.

For a read operation, the Web server replaces the value read from the CPU with the enum text value defined correspondingly. For a write operation, the Web server replaces the defined enum text value with the corresponding integer value of the enumeration before the value is written to the CPU.

Syntax

```
<!-- AWP_Enum_Ref_Name='<Varname>' Enum="<Enum-Type>" -->
```

<Varname> is the symbolic tag name from the user program; <Enum-Type> the previously specified name of the enum type.

Example for a declaration

```
<!-- AWP_Enum_Ref_Name='"Alarm"' Enum="AlarmEnum" -->
```

Example for use when reading a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<p> The current value of "Alarm" is :="Alarm": </p>
```

If the value of "Alarm" in the CPU is 2, the HTML page shows 'The current value of "Alarm" is container is empty' because the definition of the enum type assigns the numerical value 2 to the character sequence "Container is empty".

Example for use when writing a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_In_Variable_Name='"Alarm"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<form method="post">
<p><input type="hidden" name ='"Alarm"' value='Container is full'
/></p>
<p><input type="submit" value='Set container is full' /></p>
</form>
```

The value 1 is written to the PLC tag "Alarm" because the definition of the enum type assigns the numerical value 1 the text "Container is full".

Keep in mind that the name specified in "AWP_In_Variable" must be exactly the same in "AWP_Enum_Ref".

3.11.1.4 Fragments

Fragments

Fragments are "short paragraphs" of a website that the CPU processes separately.

Fragments are usually entire pages, but they can be individual elements, such as files (e.g. images) or documents.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned to the enum type name with the appropriate AWP command.

Defining fragments

A fragment extends to the beginning of the next fragment or to the end of the file.

Syntax

```
<!-- AWP_Start_Fragment_Name='<Name>' [Type="<Typ>"] [ID="<Id>"] -->
```

This command specifies the start of a fragment.

- <Name> Specifies the name of the fragment. The name must start with a letter [a-zA-Z] or an underscore (_). This first character can be followed by letters, underscores or numbers [0-9].
- <Type> Specifies the type of the fragment.
  - "manual": The user program is notified of the request for a fragment and can react accordingly. The function of the fragment must be controlled with STEP 7 and the tags of the control DB.
  - "automatic": The page is automatically processed (default)
- <Id> You can specify a numerical ID for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual), the fragment can be addressed with this ID in the user program of the CPU.

  Note

  ID assignment

  Set the ID as low as possible because the highest ID influences the size of the Web control DB.

- <Modus>
  - "visible": The contents of the fragment are displayed on the user page (default).
  - "hidden": The contents of the fragment are **not** displayed on the user page.

Importing fragments

You can specify a fragment in an HTML page and import this fragment into other websites.

Note

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage, because this import can result in the enum assignment being located in a different fragment than the enum usage.

Example

A company logo is to be displayed on all websites of a web application.

The HTML code for the fragment that displays the company logo exists only once. You can import the fragment as often and into as many HTML files as necessary.

Syntax

```
<!-- AWP_Import_Fragment_Name='<Name>' -->
```

<Name> corresponds to the name of the fragment to be imported.

Example

HTML code within a website that creates a fragment for displaying an image:

```
<!-- AWP_Start_Fragment Name='My_company_logo' -->
<p><img src="Company logo.jpg"></p>
```

HTML code that imports the created fragment into another website:

```
<!-- AWP_Import_Fragment Name='My_company_logo' -->
```

3.11.1.5 Arrays

Arrays

The Web server provides the user program commands AWP_Start_Array and AWP_End_Array for accessing all values of an array.

Only one-dimensional arrays are supported.

Multidimensional arrays of the form array[x][y] are not supported.

Syntax

```
<!-- AWP_Start_Array Name='"<DB name>".<array name>' -->
... Content of the array, utilized keywords: ArrayIndex and value..
<!-- AWP_End_Array -->
```

Parameter

- <Name> defines the name of the array with the elements you want to access.
  - You require the DB name and the name of the array corresponding to the data block structure defined in STEP 7.
  - The name must be within single or double quotation marks.
  - The DB name is within double quotation marks.
- <ArrayIndex> Index of an array element
- <value> Value of an array element

Example

The example reads all elements of the "MyArray" structure in the "DB_Name" data block of the CPU and displays the index and the values of the tags on the user-defined web page.

DB_Name

	Name	Data type	Start value
1	Static		
2	myArray	Array [0..2] of Int	
3	myArray[0]	Int	42
4	myArray[1]	Int	43
5	myArray[2]	Int	44

```
<!-- AWP_Start_Array Name='"DB_Name".MyArray' -->
Index: :=ArrayIndex: Value: :=value:
<!-- AWP_End_Array -->
```

The code indicated above generates the following display:

Index: 1 Value: 42

Index: 2 Value: 43

Index: 3 Value: 44

Representation of arrays of the BOOL data type

The output of arrays of the BOOL type is always filled to the next full 8 bits. This particular feature only occurs with BOOL arrays.

Example:

```
"DB_1".bitArray is a BOOL array with 5 elements.
<!-- AWP_Start_Array Name='"DB_1".bitArray' -->
:=ArrayIndex: -> :=value:
<!-- AWP_End_Array -->
```

Edition:

0 -> Value from "DB_1".bitArray[0]

1 -> Value from "DB_1".bitArray[1]

2 -> Value from "DB_1".bitArray[2]

3 -> Value from "DB_1".bitArray[3]

4 -> Value from "DB_1".bitArray[4]

5 -> 0

6 -> 0

7 -> 0

3.11.1.6 Structures

Structures

The Web server provides user program commands for accessing structures in order to access the values of a PLC tag of the STRUCT data type.

Syntax

```
<!-- AWP_Start_Struct Name='"<DB name>".<struct name>' -->
... Content of structure ...
<!-- AWP_End_Struct -->
```

Parameter

- <Name> defines the name of the structure with the elements you want to access.
  - You require the DB name and the name of the structure corresponding to the data block structure defined in STEP 7.
  - The name must be within single or double quotation marks.
  - The DB name is within double quotation marks.

Example

The example reads elements of the "MyStruct" structure in the "DB_Name" data blocks of the CPU and displays the value of the tag on the user-defined web page.

DB_Name1

	Name	Data type	Start value
1	Static		
2	myStruct	Struct	
3	A	Int	0
4	B	Word	16#0
5	C	Bool	false

```
<!-- AWP_Start_Struct Name='"DB_Name".MyStruct' -->
:=A:
:=B:
:=C:
<!-- AWP_End_Struct -->
```

The code indicated above corresponds to the following commands:

```
:="DB_Name".MyStruct.A:
:="DB_Name".MyStruct.B:
:="DB_Name".MyStruct.C:
```

3.11.2 Configuring user pages

Configuring user pages

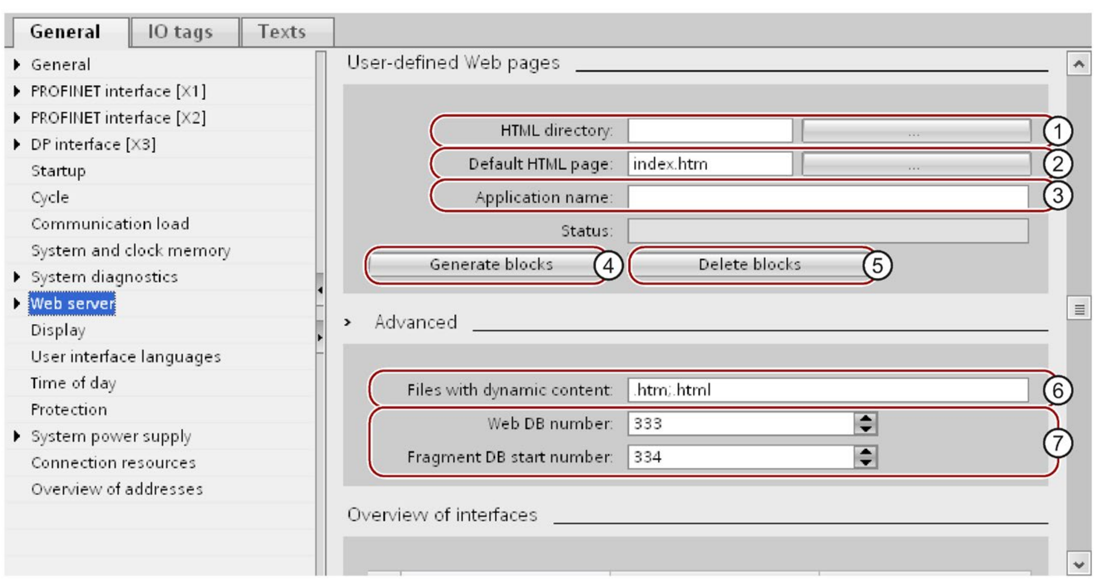

Figure 3-38 Configuring user pages in STEP 7

Proceed as follows to configure the user pages in STEP 7:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. In the area "User pages" under ① "HTML directory", select the folder on your display device in which you have saved your HTML page.
4. Enter the name of the HTML page under ② "Start HTML page" that is to open when you start the application.
5. You can also specify a name for your application under ③ "Application name". This name is used to further divide or group the webpages. If an application name already exists, the URL is displayed in the following format: http://a.b.c.d/awp/<application name>/<page name>.html
6. In the "Extended" area, enter the file extensions that have to be checked for AWP commands in input box ⑥ "Files with dynamic contents". By default, STEP 7 analyses files with the extensions ".js", ".htm" and ".html". Here you can enter other file extensions that you have used when creating your user page.
7. You can accept the number for the Web DB ⑦ and the fragment DB start number ⑦ or you can assign a new number of your choice that is not assigned.
8. Click the button ④ "Create blocks" to create data blocks from the source files. The created data blocks are stored in the STEP 7 project tree in the folder "System blocks > Web server". These data blocks consist of a control data block (Web control DB) that controls the display of the webpages and one or several data block fragments (fragment DBs) with the compiled webpages.
9. In the network view, select the CPU you want to download and select the command "Download to device" in the "Online" menu to download the blocks. The compilation of the blocks is implicitly triggered before the download. If errors are signaled during this process, they must be remedied before you can download the configuration.

Deleting data blocks

Click the "Delete block" button ⑤ to delete previously generated data blocks. STEP 7 deletes the Web Control DB and all fragment DBs from the project containing your user pages.

3.11.3 Programming the WWW instruction

The WWW instruction

The WWW instruction initializes the Web server of the CPU or synchronizes the user pages with the user program in the CPU. The Web control DB is the input parameter for the WWW instruction and specifies the content of the pages as they are displayed in the fragment DBs as well as the status and control information. STEP 7 creates the Web control DB when you click the button "Create blocks".

Note

DB number of the web control DB.

If you change the DB number of the DB 333, the user pages in the Web server can no longer be reached at renewed downloading into the CPU. Error code W#16#007F is output at the parameter RET_VAL. Therefore observe the default setting DB 333 for the Web Control DB.

If you want to change the DB number nevertheless, you have to switch the CPU POWER-OFF → POWER ON, so that the user pages in the Web server can be reached.

Programming the WWW instruction

The user program must execute the WWW instruction so that the user pages can be accessed in the Web server.

Table 3- 7 WWW instruction

LAD/FBD	SCL	Description

	`ret_val`
	`:=WWW(ctrl_db:=uint_in_)`
	`;`
		Access to user pages by means of the Web server

Parameters

The table below shows the parameters of the WWW instruction.

Table 3- 8 Parameters

Parameters	Declaration	Data type	Description
CTRL_DB	Input	DB_WWW	Data block that describes the user pages (Web control DB)
RET_VAL	Output	INT	Error information

RET_VAL parameter

Table 3- 9 RET_VAL

Error code (W#16#...)	Explanation
0000	No error has occurred. There are no pending website requests that must be released by the user program.
00xy	x: indicates if an error occurred during initialization of the Web control DB (CTRL_DB): x=0: No errors occurred. x=1: Error(s) occurred. The error is encoded in the "CTRL_DB.last_error" byte of the Web control DB. y: Number of the pending request. Several requests are possible (e.g., request "0" and "1" are pending: y="3"). y="1": Request "0" y="2": Request "1" y="4": Request "2" y="8": Request "3"
803A	The specified Web Control DB does not exist on the CPU.
8081	Incorrect version or incorrect format of the Web Control DB.
80C1	There are no resources available to initialize the Web application.

3.11.4 Defining the user page as start page

Defining the user page as start page

In addition to the default intro page, you can also define the start page of your user pages as the start page of the Web server.

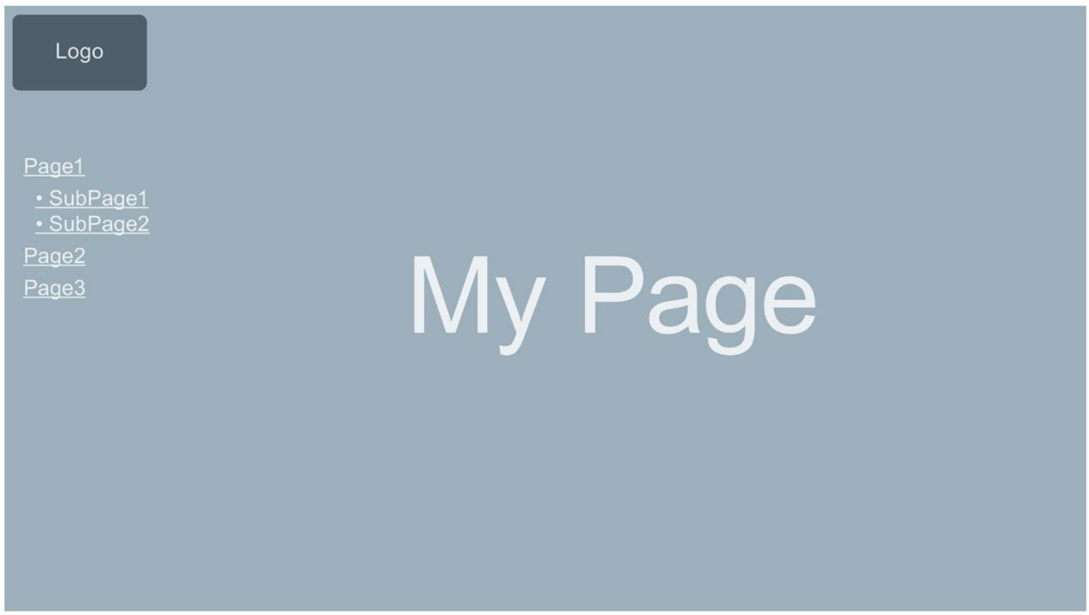

Figure 3-39 Example of user page as start page of the Web server

Requirements

The following requirements must be met before the user page is displayed as the start page of the Web server:

- You have configured the user page as the start page.
- You have configured a user in STEP 7 whom you have assigned at least the authorization "... open user-defined web pages".
- The CPU is in RUN mode.

Procedure

Proceed as follows to define the user pages in STEP 7 as start page of the Web server:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. Select the entry "AWP1" in the area "Entry page" under "Select entry page".

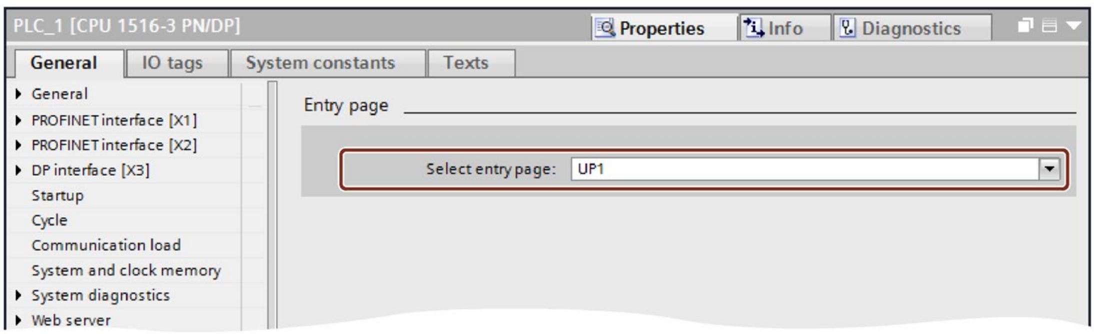

Figure 3-40 Setting user page in STEP 7 as start page

4. Download the configuration to the CPU.

If you now enter the IP address of the CPU in the browser, a connection is automatically established to your user pages.

If you want to access the web pages of your CPU again, link the web pages from your user pages, via the URL "http://a.b.c.d./Portal/Portal.mwsl?PriNav=Start" or "https://a.b.c.d/Portal/Portal.mwsl?PriNav=Start" for example. In this case, the information "a.b.c.d" represents, as an example, the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/Portal/Portal.mwsl?PriNav=Start">SIMATIC web pages</a>
```

Note

If you define your user page as start page of the Web server, all direct access to the web pages of the CPU is disabled. This applies also to the bookmarks you saved for the web pages of the CPU as well as the page for reading out the service data.

Reading out service data

If you define your user page as start page of the Web server, all direct access to the web pages for reading out the service data is also disabled.
If you want to continue to read out service data via the Web server when servicing is required, here is how you can link the service data page directly to your user page.
Just as for the web pages of the CPU, link the service data page e.g. via the URL "http://a.b.c.d/save_service_data" or "https://a.b.c.d/save_service_data", the "a.b.c.d" here is an example of the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/save_service_data">Service data</a>
```

Reference

You can find additional information on the topic of user page as start page in the FAQ with entry ID 67184104 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/67184104) Internet page.

3.11.5 Example of a user page

3.11.5.1 Website for monitoring and controlling a wind turbine

Example of a user page

Here you see a user page for monitoring and controlling a wind turbine:

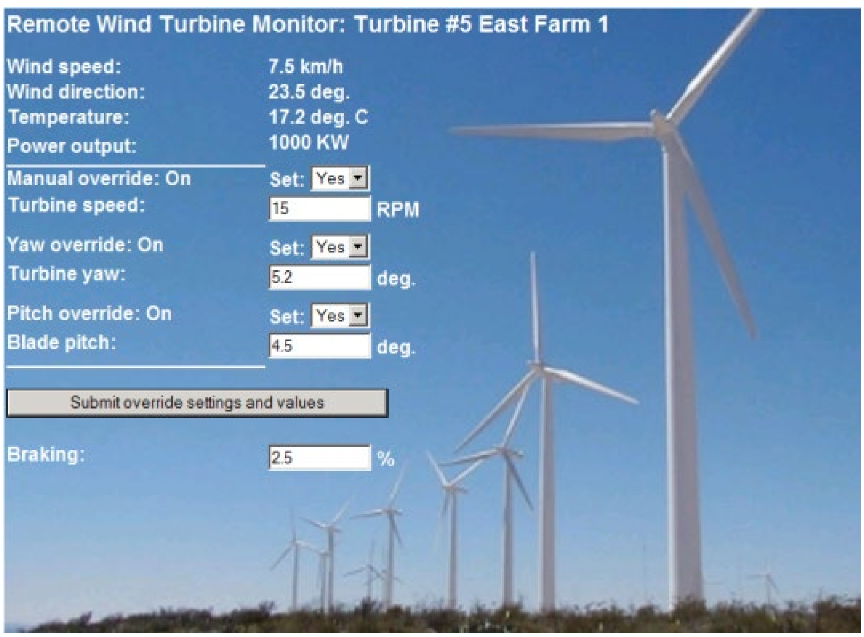

Figure 3-41 Overview of user page wind turbine

The user page was created in English in this example, but you can select any language you wish when you create your own user page.

In this application, each wind turbine of the wind farm has a data block in STEP 7 with specific data for the respective location and the turbine.

The user page gives you the option to access the turbine remotely with a display device. A user can open the standard websites for a CPU of a specific wind turbine and go to the "Remote Wind Turbine Monitor" user page to view the turbine data. A user with the corresponding access permissions can also set the turbine into the manually controlled mode and thus control the tags for speed, orientation and angle of attack of the turbine by means of the website. The user can also specify a brake value regardless of manual or automatic control of the turbine.

STEP 7 checks the Boolean values for override of the automatic control and, if set, uses the values for speed, orientation and angle of attack of the turbine as defined by the user.

Files used

Three files are used in the application example:

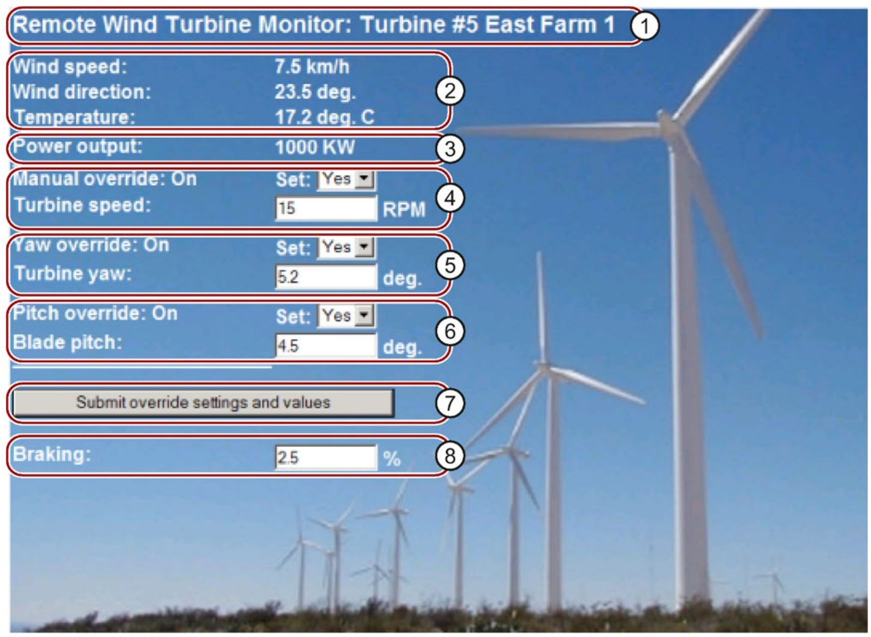
- Wind_turbine.html: The user page in the figure shown above. The control data is accessed by AWP commands.
- Wind_turbine.css: The Cascading Style Sheet which includes the formatting specifications of the user page. The use is optional but can simplify the design of the user page.
- Wind_turbine.jpg: The background image displayed on the user page. The use of images is optional, user pages with lots of images require a lot more memory in the load memory.

These files are not part of your installation but they are described as an example below.

Implementation

The user page uses AWP commands to read out values from the CPU as well as writing values to it. The user page also uses AWP commands for the definition of enum types, such as the assignment of tags to enum types for handling the ON/OFF settings.

The user page is structured as follows:



① Header of the website with number and location of the wind turbine.

② Atmospheric conditions at the turbine, wind speed, wind direction and current temperature are displayed.

③ Read-out power output.

④ Manual override: Activates manual override of the turbine. To make manual settings for speed, orientation and angle of attack, the STEP 7 user program requires that manual override has been activated.

⑤ Override of the orientation: Activates manual override of the turbine orientation.

⑥ Override of the angle of attack: Activates manual override of the angle of attack of the rotor blades.

⑦ By clicking this button, you transfer the override settings to the CPU.

⑧ Manual setting of a percentage value for braking. The setting "Manual override" is not required to enter a brake value.

Figure 3-42 Overview of user page wind turbine

The user page also uses an AWP command which writes the special tag into the tag table; it includes the user ID of the user who currently accesses the page.

3.11.5.2 Reading and displaying data from the CPU

Example HTML code for reading out and displaying data from the CPU

This part of the HTML code is used for displaying the power output on the user side.

The text "Power Output:" is displayed on the left-hand side; on the right-hand side, the value of the tags for the power output including the unit ("KW") is displayed.

The AWP command `:="Data_block_1".PowerOutput` executes the reading operation. The data block is referenced by its symbolic name here and not by its number ("Data_block_1" instead of "DB1").

The code used in the example is:

```
<tr style="height:2%;">
<td>
<p>Power output:</p>
</td>
<td>
<p style="margin-bottom:5px;"> :="Data_block_1".PowerOutput: KW</p>
</td>
</tr>
```

See also

PLC tags (Page 82)

3.11.5.3 Using enum types

Definition of enum types

The described user page uses enum types in three locations. "On" or "Off" is displayed for a Boolean value at these locations.

The enum type for "On" results in a value of 1; the enum type for "Off" results in a value of 0. The following excerpts from the HTML code of the user page show the declaration of an enum type with the name "OverrideStatus" and the values "0" and "1" for "Off" or "On" as well as the specification of an enum type reference of "OverrideStatus" for the tag "ManualOverrideEnable" in the data block "Data_block_1".

Note

Assignment of enum types

If the user page writes into a tag by using an enum type, there has to be a declaration "AWP_In_Variable" for each "AWP_Enum_Ref" declaration.

The code used in the example is:

```
<!-- AWP_In_Variable_Name='"Data_block_1".ManualOverrideEnable' -->
<!-- AWP_Enum_Def_Name="OverrideStatus" Values='0: "Off",1:"On"' -->
<!-- AWP_Enum_Ref_Name='"Data_block_1".ManualOverrideEnable'
Enum="OverrideStatus" -->
```

The following code describes a display box for displaying the current status of "ManualOverrideEnable". A normal read command for tags is used but because of the declared and referenced enum type, the website displays the values "On" and "Off" instead of "1" and "0".

```
<td style="width:24%; border-top-style: Solid; border-top-width:
2px; border-top-color: #ffffff;">
<p>Manual override: :="Data_block_1".ManualOverrideEnable:</p>
</td>
```

The following code describes a drop-down list for changing "ManualOverrideEnable" by the user. The drop-down list consists of the "Yes" and "No" options that are assigned to the "On" or "Off" values by means of the enum type reference. If you make no selection, the status remains the same.

```
<select name='"Data_block_1"ManualOverrideEnable'>
<option value=':"Data_block_1".ManualOverrideEnable:'> </option>
<option value="On">Yes</option>
<option selected value="Off">No</option>
</select>
```

The drop-down list is included in the form on the website. The form is uploaded, when the user clicks on the "Send" button. If the user has selected "Yes", the value "1" is written in the tag "ManualOverrideEnable" in the "Data_block_1" data block; if the user has selected "No", the value "0" is written.

3.11.5.4 Writing user inputs into the controller

Setting options

The user page "Remote Wind Turbine Monitor" includes different AWP commands for writing data into the controller. A user with the corresponding access permissions can control the wind turbine manually, activate the override for the turbine speed and the turbine orientation as well as the angle of attack of the rotor blades with the declaration of different "AWP_In_Variable" write commands. The user can also specify floating-point numbers for turbine speed, orientation angle of attack and percentage of braking. The user page uses an HTTP command in the format "POST" to write the tags into the controller.

The code used in the example for setting the brake value is:

```
<!-- AWP_In_Variable Name='"Data_block_1"' -->
...
<tr sytle="vertical-align: top; height: 2%;">
<td style="width: 22%;"><p>Braking:</p></td>
<td>
<form method="POST">
<p><input name='"Data_block_1".Braking' size="10" type ="text">
%</p>
</form>
</td>
</tr>
```

This excerpt from the HTML code first defines a "AWP_In_Variable" for the "Data_block_1" data block which enables the user page to write any number of tags into the data block. The text "Braking:" is displayed on the left-hand side; on the right-hand side is a box in which the user can make entries for the "Braking" tag in the data block.

The user page reads out the actual braking value from the controller and displays it in the text box. A user with the corresponding access permissions can then write a brake value that controls the braking process into the data block of the CPU.

Note

Declaration of data blocks

If you declare an entire data block by means of a "AWP_In_Variable", each tag in the data block can be written by means of the user page. If only certain tags in the data block are to be writable, you declare this specifically using `<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->`, for example.

3.11.5.5 Writing special tags

Using special tags

The user page "Remote Wind Turbine Monitor" writes the special tag "Server:current_user_id" into a tag of the CPU. The tag value contains the value "1" if a user is logged on and "0" if a user is not logged on. In this example, a user is logged on, so the tag value is set to "1". The special tag is written into the CPU by the user page and does not need a user interface.

The code used in the example is:

```
<!-- AWP_in_variable Name="SERVER:current_user_id" Use="User_ID" -->
```

3.11.5.6 HTML code of the user page "Remote Wind Turbine Monitor"

The complete HTML code of the example user page "Remote Wind Turbine Monitor" as well as the used Cascading Style Sheet (CSS) is listed below.

Wind_turbine.html

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd"><!--
This test program simulates a website for monitoring and operating a
wind turbine.
Required PLC tags and data block tags in STEP 7:
PLC tag:
User_ID: Int
Data blocks:
Data_block_1
Tags in Data_Block_1:
TurbineNumber: Int
WindSpeed: Real
WindDirection: Real
Temperature: Real
PowerOutput: Real
ManualOverrideEnable: Bool
TurbineSpeed: Real
YawOverride: Bool
Yaw: Real
PitchOverride: Bool
Pitch: Real
Braking: Real
The user-defined website shows the current values for the PLC data
and offers a drop-down list to specify the three Boolean values with
the assigned enumeration type. The selected Boolean values as well
as the data text boxes for speed, orientation and angle of attack of
the turbine are uploaded with the "Send" button. The brake value can
be specified without the "Send" button.

No actual STEP 7 program is required for using this page. The STEP 7
program would theoretically only respond to the values for speed,
orientation and angle of attack of the turbine, if the assigned
Boolean values were specified. The only requirement for STEP 7 is
that the WWW instruction is called with the DB number of the
generated data blocks for this page.

```

3.12 Filebrowser

Requirements

Access rights must be assigned for the user in the user management.

Filebrowser

The browser displays the content of the SIMATIC memory card on the "Filebrowser" web page. This means, for example, that you can read and edit the log files generated by the CPU without having to use STEP 7.

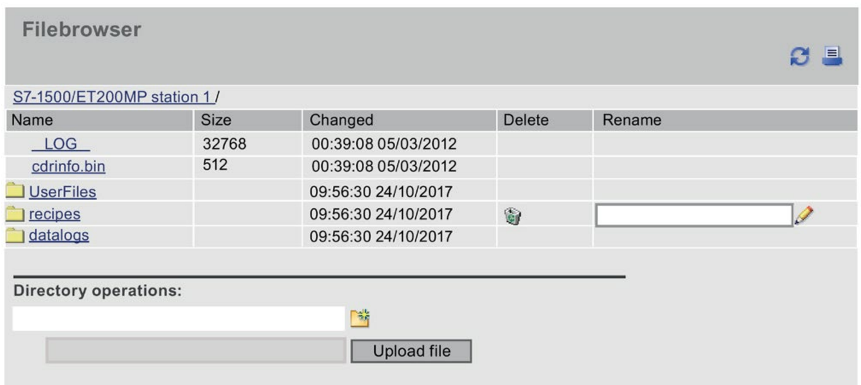

Figure 3-43 Filebrowser view

The Filebrowser lists all existing files and directories on the SIMATIC memory card. You can download, delete, rename and upload the files. You can create, delete and rename the directories.

Note

The Filebrowser only grants you read access to the “DataLogs”, "Backups" and “UserFiles” directories.

Exception system files

The system files include the job file and all special directories including their contents to which the job file refers. System files are not displayed, and cannot be changed or deleted.

3.13 DataLogs

DataLogs

On the DataLogs web page, you can view all the DataLogs that you have created.

You can sort the DataLogs according to individual parameters in ascending or descending order.
For this purpose, click on one of the parameters in the column header:

- Name
- Size
- Changed

You can download the relevant DataLog file by clicking the file name.

The "Active" column shows whether the respective DataLog file is used (is active) or not.

When the DataLog file is active, you can call (download) and empty the relevant DataLog file by clicking the icon . The file must be closed. The empty DataLog file is still maintained in the list of DataLogs.

You delete the DataLog file by clicking the icon in the "Delete" column. The file must be closed.

You close an opened DataLog file in STEP 7 by using the "DataLogClose" instruction.

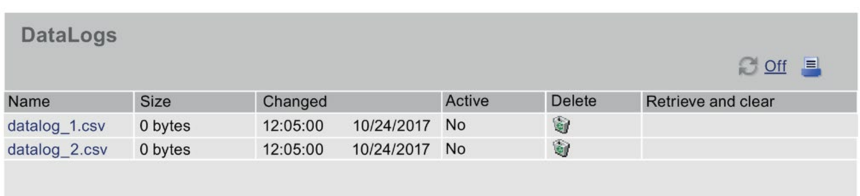

Figure 3-44 DataLogs

3.13.1 Automated reading out of DataLogs

In addition to the downloading of individual DataLogs via the user interface of the Web server, you can download, read out and archive DataLogs. Automatic downloading of DataLogs is realized either by the execution of scripts in, for example, Bash or on your HTML user page via JavaScript.

A typical application for this functionality is the daily reading out and archiving of DataLogs from one or more CPUs at a specific time.

Calling up of the DataLogs from the SIMATIC memory card

The CPU makes a URL in the following format available so that you can download DataLogs automatically from the SIMATIC memory card of your CPU:
`http[s]://[ip]/DataLogs?Action=List`

Enter the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS), for example `https://192.168.2.132/DataLogs?Action=LIST`. Subsequently call up the URL in your browser or command line interpreter.

The URL returns a list of the DataLogs on the SIMATIC memory card. Each entry returns the URL by which you download the corresponding DataLog.

For simple syntax analysis of the list by command line interpreters (such as Bash) or web-based programming languages (such as JavaScript) the individual URLs are separated by a line break `<CR><LF>`. The following example shows the syntax of two URLs that access the DataLog files `Test.txt` and `Test2.txt`:

```
/DataLogs?Path=/DataLogs/Test.txt&Action=DOWNLOAD&E=1<CR><LF>

/DataLogs?Path=/DataLogs/Test2.txt&Action=DOWNLOAD&E=1<CR><LF>

<CR><LF>
```

When the URLs are called successfully, the CPU returns the status code `200 OK`. The CPU also returns this status code if no DataLogs exist on the SIMATIC memory card.

Note

Access authorization to the CPU for the reading out of data

In order to download DataLogs from the CPU, the user has to dispose of reading rights on the CPU. If the user does not have the required rights, the CPU returns the status code `403 FORBIDDEN` in the HTTP Response.

Downloading of the DataLogs via Bash scripts

The following example shows how you can download DataLogs automatically from the CPU by using a Bash script. Replace the URL of the example by the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS).

```
wget --content-disposition -i
"http://192.168.2.132/DataLogs?Action=LIST"
```

Downloading of the DataLogs via JavaScript

The following example shows how you can download DataLogs automatically by using JavaScript. Replace the URL of the example by the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS).

```
<html>
 <head>
  <title>DataLog JavaScript Test</title>
  <script type="text/javascript" src="jquery-
1.12.4.min.js"></script>
 </head>
 <body>
  <h1>DataLog JavaScript Test</h1>
  <div><button id="load">Load DataLogs</button></div>
  <div><ul id="list"></ul></div>
  <script type="text/javascript">
   $('#load').click(function(){
    $.get('http://192.168.2.132/DataLogs', {'Action': 'LIST'},
     function(data){
      $('#list').empty();
      $.each(data.split(/\r\n/), function(){
       if (this.length == 0) continue;
       $('#list').append('<li><a href="http://192.168.2.132' +
        this + '">' + this + '</a></li>');
      });
     });
    });
  </script>
 </body>
</html>
```

3.14 UserFiles

Introduction

You read and write with the instructions "FileReadC" (Compact Read Data of a File) or "FileWriteC" (Compact Write Data to a File) in STEP 7 ASCII files (files in binary format).

Requirements

You need to save the UserFiles in the "UserFiles" directory on the SIMATIC memory card. You specify the storage location in the path of the "FileReadC" or "FileWriteC" instruction.

Path and file name for UserFiles have to fulfill the following rules:

- The file name must not be longer than 55 characters.
- The following characters are permitted for the directory and file name: 0 to 9, a to z in upper- and lower-case, "-" and "_"
- The path name must not start with "/", "\" or "."
- The path name must not contain ".."

Examples:

- UserFiles\Lift16_DataBase.txt
- UserFiles\2017-04-13_ErrorLog.bin

"User files" Web page

The browser displays the content of the SIMATIC memory card, directory UserFiles\ on the "User files" Web page.

You can sort the UserFiles according to the individual parameters in ascending or descending order.
To do this, click on one of the parameters in the column header:

- Name
- Size
- Changed

You can download, delete, and upload files.

You download the UserFile by clicking the file name.

By clicking on the X icon, you can delete the UserFile. The file must be closed.

Figure 3-45 User files view

NOTICE
Size UserFiles
When you open a large UserFile through this Web page, the processing times of the instructions that process this file can increase notably.

3.14.1 Reading or upload user files automatically

In addition to the Web server's user interface, you can automatically list, delete, download and upload UserFiles. Use JavaScript or Bash for this, for example.

Opening UserFiles from the SIMATIC memory card

The CPU makes a URL in the following format available so that you can list UserFiles automatically from the SIMATIC memory card of your CPU:
`http[s]://[ip]/UserFiles?Action=List`

Enter the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS), e.g. `https://192.168.2.132/UserFiles?Action=LIST`. Subsequently call up the URL in your browser or command line interpreter.

The URL returns a list of the UserFiles on the SIMATIC memory card. Each entry returns the URL by which you download or delete the corresponding UserFile from the CPU. The actions to be performed are separated by a vertical line "|".

For simple syntax analysis of the list by web-based programming languages (such as JavaScript), the individual URLs are separated by a line break <CR><LF>. The following example shows the syntax of two URLs that access the UserFiles `File1.csv` and `File2.csv`:

```
File1.csv|/UserFiles?Name=File1.csv&Action=DOWNLOAD&E=1|/UserFiles?Name=File1.csv&Action=DELETE&E=1<CR><LF>

File2.csv|/UserFiles?Name=File2.csv&Action=DOWNLOAD&E=1|/UserFiles?Name=File2.csv&Action=DELETE&E=1<CR><LF>

<CR><LF>
```

When the URLs are called successfully, the CPU returns the status code `200 OK`. The CPU also returns this status code if there are no UserFiles on the SIMATIC memory card.

Note

Access authorization to the CPU for the reading out of data

In order to download UserFiles from the CPU, the user must have reading rights for the CPU. If the user does not have the required rights, the CPU returns the status code `403 FORBIDDEN` in the HTTP Response.

Uploading UserFiles to the SIMATIC memory card

The CPU makes a URL in the following format available so that you can upload UserFiles automatically to the SIMATIC memory card of your CPU:
`http[s]://[ip]/UserFiles?Action=UPLOAD`

The following example shows how you can upload a UserFile to your HTML user page automatically using JavaScript.

Replace the URL of the example by the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS).

```
<html>
 <head>
  <title>UserFiles Upload</title>
 </head>
 <body>
  <form method="POST"
action="https://192.168.2.132/UserFiles?Action=UPLOAD&E=1"
enctype="multipart/form-data">
   <input type="file" name="File" />
   <input type="submit" />
  </form>
 </body>
</html>
```

When the upload of the UserFile is successful, the CPU returns the status code `201 CREATED`. If the UserFile already exists on the SIMATIC memory card, the CPU returns the status code `409 CONFLICT`.

Note

Access authorization to the CPU for uploading data

In order to download UserFiles to the CPU, the user must have write rights for the CPU. If the user does not have the required rights, the CPU returns the status code `403 FORBIDDEN` in the HTTP Response.

Downloading UserFiles via Bash scripts

The following example shows how you can download UserFiles automatically from the CPU using a Bash script. Replace the URL of the example by the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS).

```
wget --content-disposition -i
"http://192.168.2.132/UserFiles?Action=LIST"
```

Downloading UserFiles via JavaScript

The following example shows how you can download UserFiles automatically using JavaScript. Replace the URL of the example by the correct IP address of the interface of your CPU at this URL and use the appropriate transfer protocol (HTTP or HTTPS).

```
<html>
 <head>
  <title>UserFiles JavaScript Test</title>
  <script type="text/javascript" src="jquery-
1.11.2.min.js"></script>
 </head>
 <body>
  <h1>UserFiles JavaScript Test</h1>
  <div><button id="load">Load UserFiles</button></div>
  <table
border="1"><thead><th>Name</th><th>Operation</th></thead><tbody
id="list"></tbody></div>
  <div><form method="POST"
action="http://192.168.2.132/UserFiles?Action=UPLOAD&E=1"
enctype="multipart/form-data"><input type="file" name="File"
/><input type="submit" /></form></div><br>
  <script type="text/javascript">
   function Delete(url) {
    $.post('http://192.168.2.132/UserFiles' + url, {}, function(){
     $('#load').click();
    });
   }
   $('#load').click(function(){
    $('#list').empty();
    $.get('http://192.168.2.132/UserFiles', {'Action': 'LIST'},
function(data){
     $.each(data.split(/\r\n/), function(){
      var data = this.split("|");
      if (data.length == 3)

$('#list').append('<tr><td>'+decodeURIComponent(data[0])+'</td><td><
a href="http://192.168.2.132'+data[1]+'">Download</a><br><button
type="button"
onclick="Delete(\''+data[2]+'\')">Delete</button></td></tr>');
     });
    });
   });
  </script>
 </body>
</html>
```

3.15 Online backup

Backing up and restoring the CPU configuration

You can back up a CPU configuration using the Web server with the corresponding access rights. If necessary, you can also restore this configuration at a later time using the Web server.

You can create as many backups as you want and store a variety of configurations for a CPU.

NOTICE
Prior to every restoration of the CPU configuration, always first perform an online backup of the current CPU configuration and save this backup file to a local directory of your PC. This ensures that you can undo a restoration which failed (e.g. due to a damaged backup file) or which does not show the desired result.

Note

You can also perform online backup and restoration of the CPU configuration in STEP 7 (see online help for STEP 7, keyword: "Creating a backup of an S7 CPU").

With a backup using STEP 7, the backup file is saved within the STEP 7 project. With a backup using the Web server, the backup file is saved to a local directory of your PG/PC (e.g. "Downloads" directory). Web server backup files cannot be restored via STEP 7, nor can STEP 7 backup files be restored directly using the Web server.

To restore a STEP 7 backup file using the Web server, first save the STEP 7 backup file to a local directory of your PG/PC (e.g. "Downloads" directory). From there, you can restore the backup with the Web server.

Requirements

- You access the CPU via the secure transmission protocol "HTTPS".
- A valid CA-signed certificate is installed in the Web browser; see section Configuring the Web server (Page 21).

Online backup

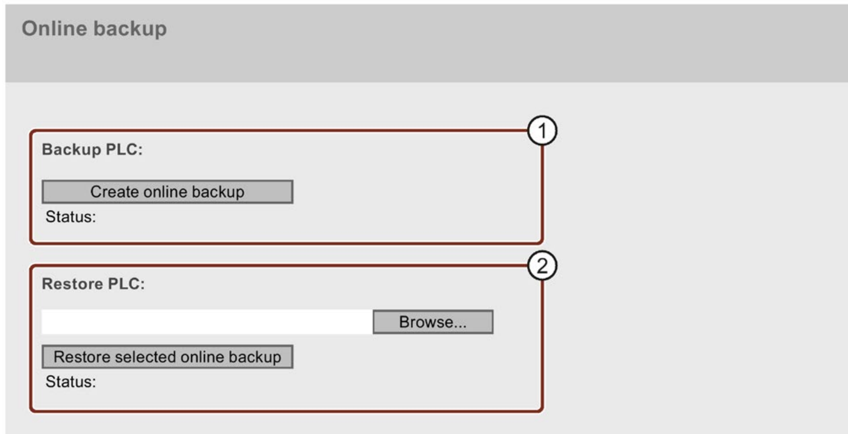

Figure 3-46 Online backup

① Perform online backup of the configuration

To perform an online backup of the CPU configuration, proceed as follows:

1. Click the "Create online backup" button in the "PLC backup" area.
2. If the CPU is in RUN mode, the following alarm is output:
   "Creation of an online backup requires PLC STOP. Do you want to set the PLC to STOP mode?"

   Acknowledge the alarm output by clicking "OK". The CPU is set to STOP mode and online backup is performed. (If you click "Cancel", the CPU remains in the current mode and the online backup is canceled.)
3. Save the backup file to a local directory of your PC.
4. Set the CPU back to RUN mode ("RUN" button in the "CPU operator panel" area of the start page).

Scope of the backup

The backup includes all data needed to restore a particular state of a CPU, i.e. the specific combination of the configuration of the CPU with the current values of the user-related retentive data.

The following data of the configuration of the CPU is backed up:

- The contents of the SIMATIC memory card, e.g. configuration, program code, recipes and archives, DataLogs

The following user-relevant retentive data is backed up:

- Retentive memory areas of data blocks, bit memories, counters and timers
- Front-panel settings, dynamic IP configuration data, operating hours counters, retentive Motion Control sensor data

Note:

- Entries in the diagnostic buffer are not included in the backup.
- The current time of day is not backed up for a SIMATIC S7-1500 CPU.
- The entire contents of the SIMATIC memory card are backed up, i.e. any data stored on the card (e.g. PDF files, GSD files).
- The backup file is assigned the name of the CPU and the project with the time and date of the backup, e.g. "2015-09-10_11-01_03_online backup_PLC69_machineControl.s7pbkp".
- The backup file of an F-CPU also contains the collective signature of the safety program in the file name. Check whether it is the expected F-collective signature.
- You can rename the backup, but you cannot make any changes to the contents of the backup.

② Restore the configuration

To restore the CPU configuration, follow these steps:

1. Enter the password of the currently logged-in user in the "PLC restore" area.
2. Click the "Browse" button and select the backup file of the configuration that you want to restore.
3. Click "Load online backup".
4. If the CPU is in RUN mode, the following alarm is output:
   "Download online backup to device. The CPU is set to STOP and the contents of the CPU will be overwritten. Do you want to continue?"

   If the CPU is already in STOP mode, the following alarm is output:
   "Download online backup to device. The contents of the CPU will be overwritten. Do you want to continue?"

   Acknowledge the alarm output by clicking "OK". The CPU is set to "STOP" mode if required, and the online backup is downloaded. (If you click "Cancel", the CPU remains in the current mode and downloading is canceled.)
5. An alarm informs you that you must not leave the web page during the "restore procedure". Acknowledge the alarm output by clicking "OK".

   The restoration of the CPU configuration starts and you will be continuously informed of the current status:

   – "Download of online backup has been started."

   – "Checking backup file."

   – "Formatting memory card and resetting CPU."

6. If you have started the restoration procedure with a user name and password defined in the Web server configuration, you will be asked to enter these again after restoration of the CPU. Enter the required information and click "Login".

   If you have started the restoration procedure as the user "Everybody" without a password (but with appropriate access rights), this prompt is not displayed.

   Note

   To restore the configuration of an F-CPU whose security program and/or password has been changed for the F-CPU in the meantime, you also need the access authorization "F-Admin"; see "Amending user management" in the section Configuring the Web server (Page 21).

   WARNING

   The authorization "F-admin" for the Web server without password protection (User "Everybody") is only for test purposes, commissioning etc. i.e. only when the system is in productive operation. In this case, you have to ensure the security of the plant through other organizational measures, e.g. through spatial protection.

   Prior to the transition to productive operation, you must remove the right "F-Admin" for the user "Everybody".

   The password of the user of the Web server with the right "F-Admin" should only be accessible to authorized persons.

   The restoration of the CPU configuration starts and you will be continuously informed of the current status:

   – "Loading configuration."

   – "Resetting CPU."

   This may take a few minutes.

7. When the procedure is complete, you will be logged out and the "Reload page..." button will be displayed.

   If you did not receive an error message during the restoration procedure, the restoration of the CPU configuration was successfully completed and you will receive a corresponding message.

   Click the "Reload page..." button and log on to the newly downloaded CPU configuration with your user name and password.

   You will receive the following error message if:

   – the newly downloaded CPU configuration does not contain the same IP address as the former one

   – the Web server is deactivated in the newly downloaded CPU configuration

   – the browser does not receive a response from the CPU after 3 minutes

   Error message: "The CPU is not reachable anymore. Please check the IP address and the Web server configuration. The result of the restore can be checked in the ASLog."

3.16 Motion Control diagnostics

Overview

The Web server displays statuses, errors, technology alarms and the current values of the configured technology objects (TOs):

- Speed-controlled axis (TO_SpeedAxis)
- Positioning axis (TO_PositioningAxis)
- Synchronous axis (TO_SynchronousAxis)
- External encoder (TO_ExternalEncoder)
- Measuring input (TO_MeasuringInput)
- Output cam (TO_OutputCam)
- Cam track (TO_CamTrack)

The "Motion Control Diagnostics" web page provides detailed information on the configured technology objects in the following views:

- Diagnostics
- Service overview

Diagnostics

The "Diagnostics" view offers you:

- ① An overview list of the configured technology objects
- ② The status and error messages of a selected technology object
- ③ Values and limits of the status of a selected axis/cam

① "Diagnostics" view

Under "Status", you will find an overview list of the configured technology objects with the designation and type, which indicates whether the technology object in question is "released" and "referenced".

The technology object is enabled: The axis can be moved with motion jobs.

The technology object is homed: The relationship between the position in the technology object and the mechanical position was successfully created.

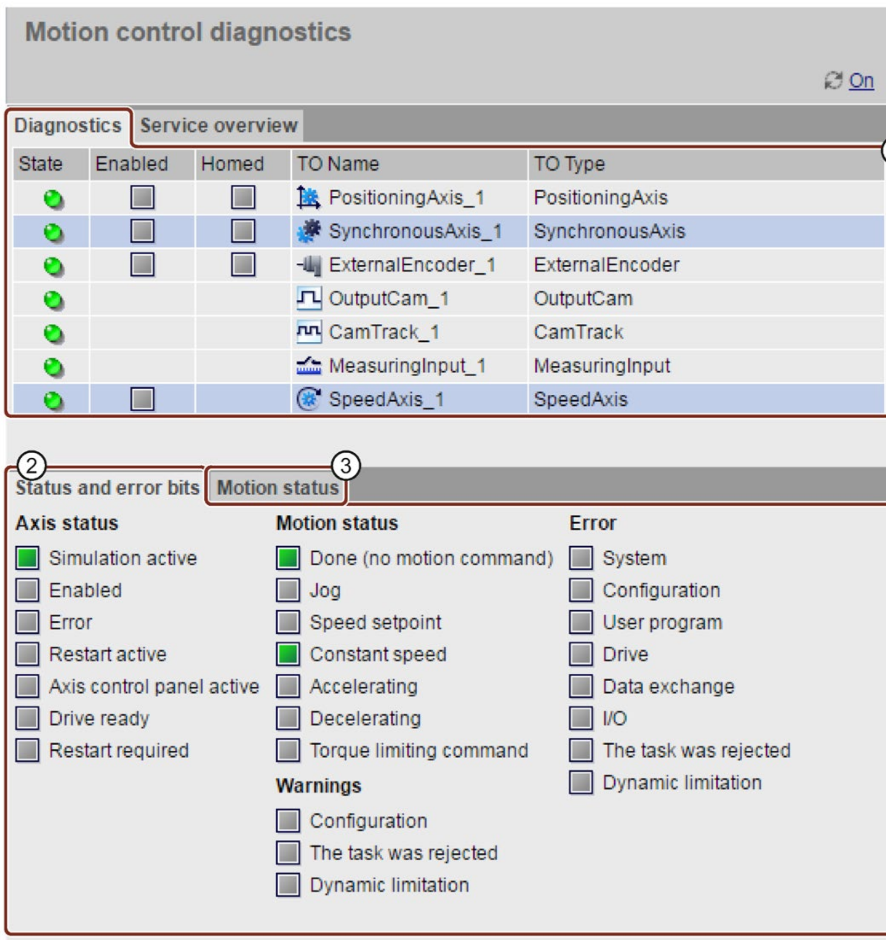

Figure 3-47 Motion Control diagnostics: Status and error bits

Meaning of the symbols in the "Status" column

Table 3- 10 Meaning of symbols

Symbol	Symbol color	Meaning
	Green	Component is OK
	Yellow	Warning pending
	Red	Error - component faulty or not available

Select the required technology object. The related diagnostics information is shown in the bottom tabs.

② "Status and error bits" tab

You use the "Status and error bits" tab to monitor the status and error messages for the technology object as in STEP 7.

③ "Motion status"/"Cam track status" tab

You use the "Motion status" tab to monitor the motion status of the axis as in STEP 7.

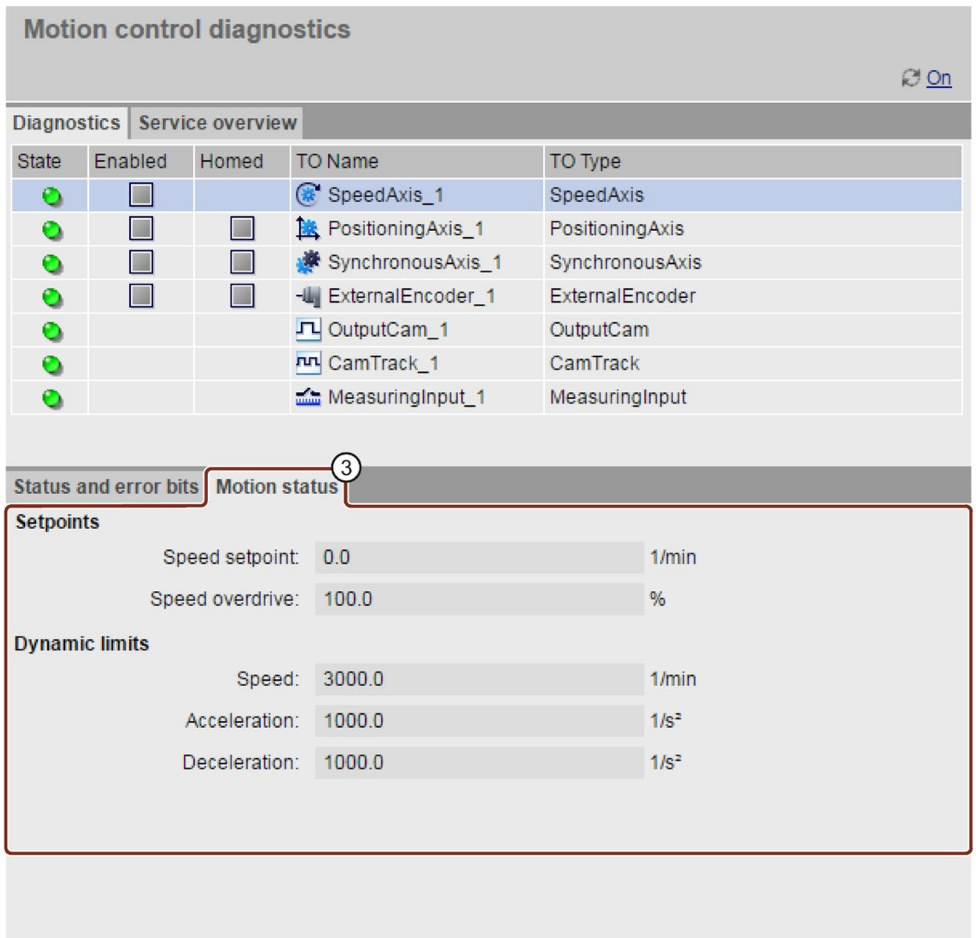

Figure 3-48 Motion Control diagnostics: Motion status

You use the "Cam track status" tab to monitor the cam track status as in STEP 7.

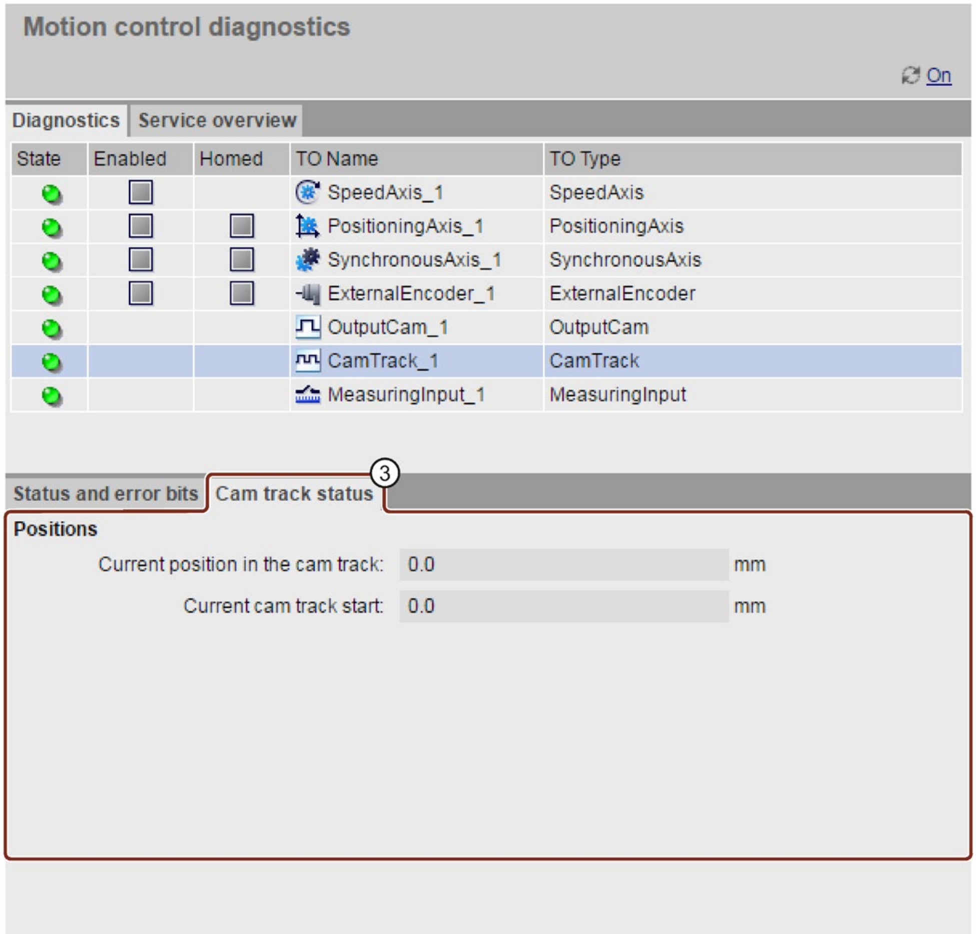

Figure 3-49 Motion Control diagnostics: Cam track status

Service overview

The "Service overview" view offers you:

- ① Diagnostics information for several technology objects
- ② A filter option for selecting the displayed technology objects

① "Service overview" view

The "Service overview" shows the diagnostics information for several technology objects in table form.

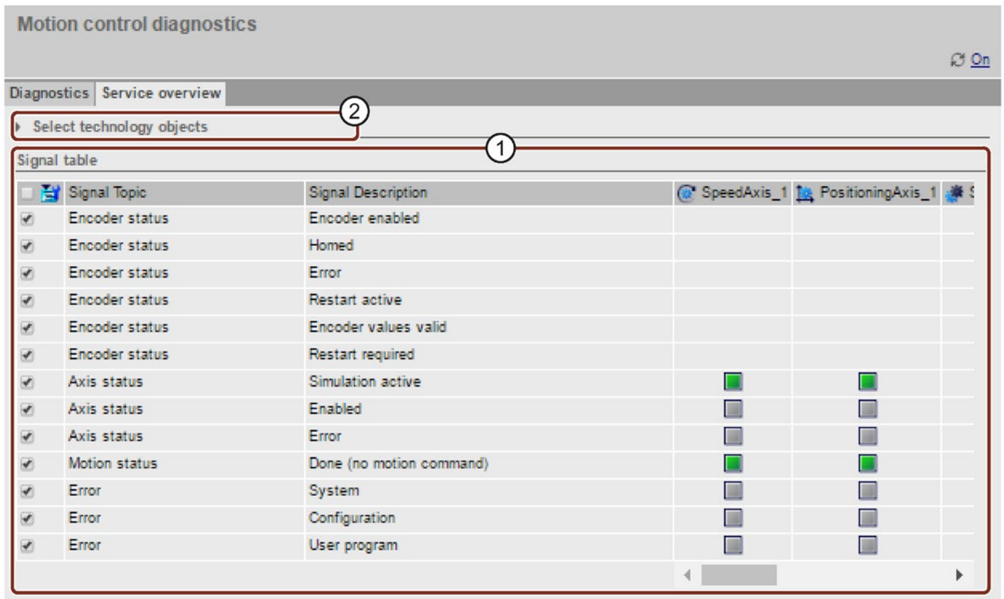

Figure 3-50 Motion Control diagnostics, service overview: Status and error information

To select the information to be displayed, click the list symbol in the first column of the table. Make your selection in the next window. Click the list symbol again to leave the selection window.

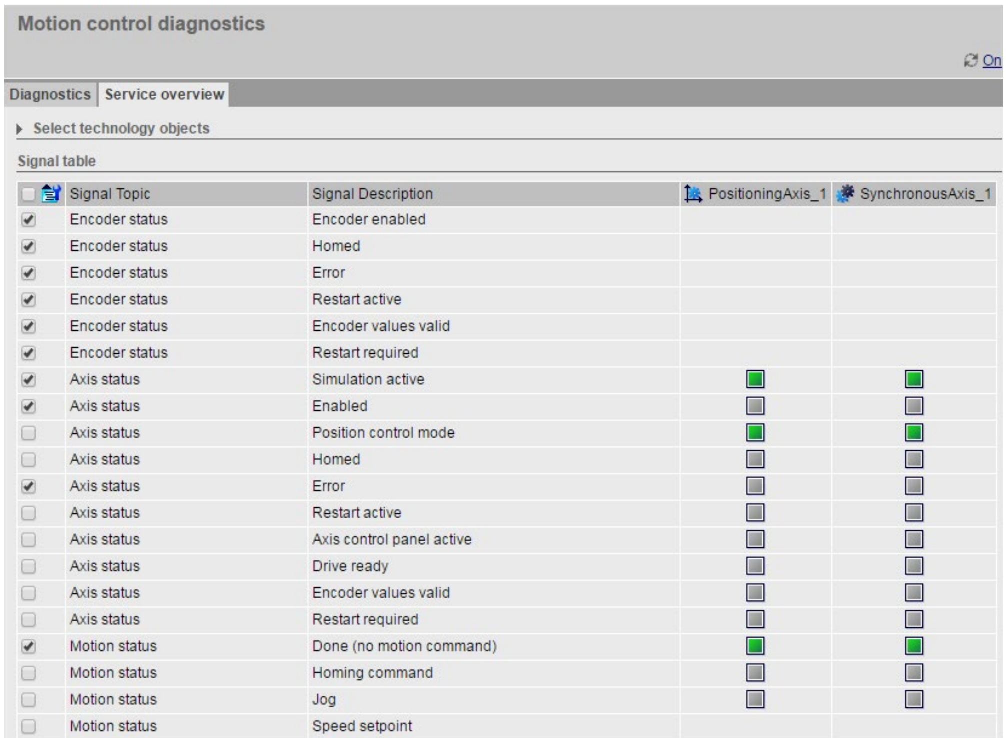

Figure 3-51 Motion Control diagnostics, service overview: Configuring the status and error information

② Selection "Select technology objects"

You can make a selection of the displayed technology objects with the selection "Select technology objects".

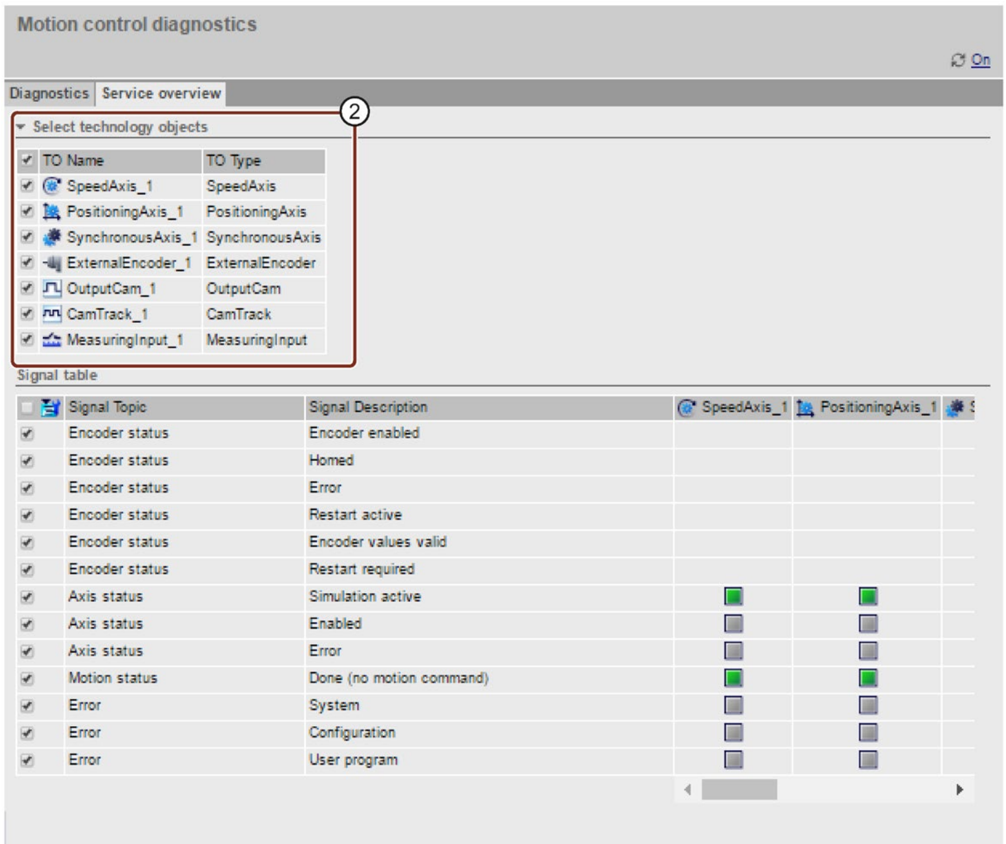

Figure 3-52 Motion Control diagnostics, service overview: Status and error information - Select technology objects

Reference

You can find explanations of the diagnostics functions "Status and error bits" and "Motion status"/Cam track status" of the individual technology objects in the online help for STEP 7.

3.17 Trace

Trace and logic analyzer function

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU.

The recordings are saved on the device and can be read out by users with appropriate access rights via the Web server and saved. The trace and logic analyzer function is therefore suitable for monitoring highly dynamic processes in the Web server.

Requirements

- A trace configuration has been created, i.e. you have defined the recording and trigger conditions and selected the signals to be recorded.
  - Note: Only measurements which are saved on the SIMATIC memory card can be displayed on the "Trace" Web page.

    For the CPU to save the measurements on the SIMATIC memory card, you must make the following settings for the trace configuration in STEP 7:

    1. Set the "Trigger mode" to "Trigger on tag".

    2. Select the "Save measurements on device (memory card)" check box.
- You have transferred the trace configuration to the device and activated it there.
- You have been assigned the access right "The user is authorized to..." > "...query diagnostics" in the user administration of the Web server; see section Configuring the Web server (Page 21).

Space requirements for storing trace recordings

The "Save measurements on device (memory card)" function in STEP 7 saves Trace recordings on your SIMATIC memory card.

Response when number reached

The "Deactivate recording" parameter repeats the measurements until the configured "Number of measurements" is reached.

The "Overwrite oldest recording" parameter replaces the oldest measurement with the latest measurement when the configured "Number of measurements" is reached. Note, however, that continuously writing data to the SIMATIC memory card shortens its service life.

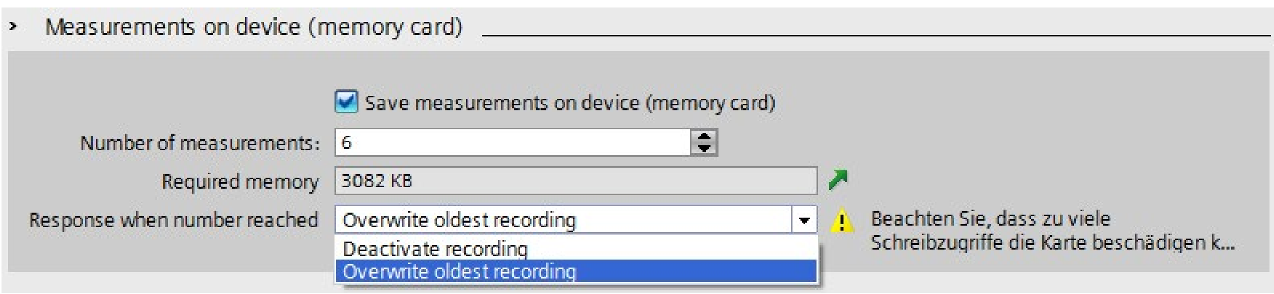

Figure 3-53 Dialog of settings for storing measurements on the memory card in STEP 7

Number of measurements

The CPU supports a maximum of 999 measurements. While the CPU writes the trace recordings to the load memory of the memory card, it pauses monitoring of the trigger conditions for the trace job. After the CPU has terminated the storing of Trace recordings, the CPU continues checking of the trigger conditions.

NOTICE
Required memory on the SIMATIC memory card Note that the "Save measurements on device (memory card)" function needs >1024 KB of free space on your SIMATIC memory card. This amount of required space is independent of the size of the SIMATIC memory card you are using. If this space is no longer available, the CPU stops storing measurements on the memory card and writes a corresponding entry to the diagnostic buffer. Therefore, ensure that there is enough space on the SIMATIC memory card before running the "Save measurements on device (memory card)" function. Delete trace recordings no longer required from the SIMATIC memory card.

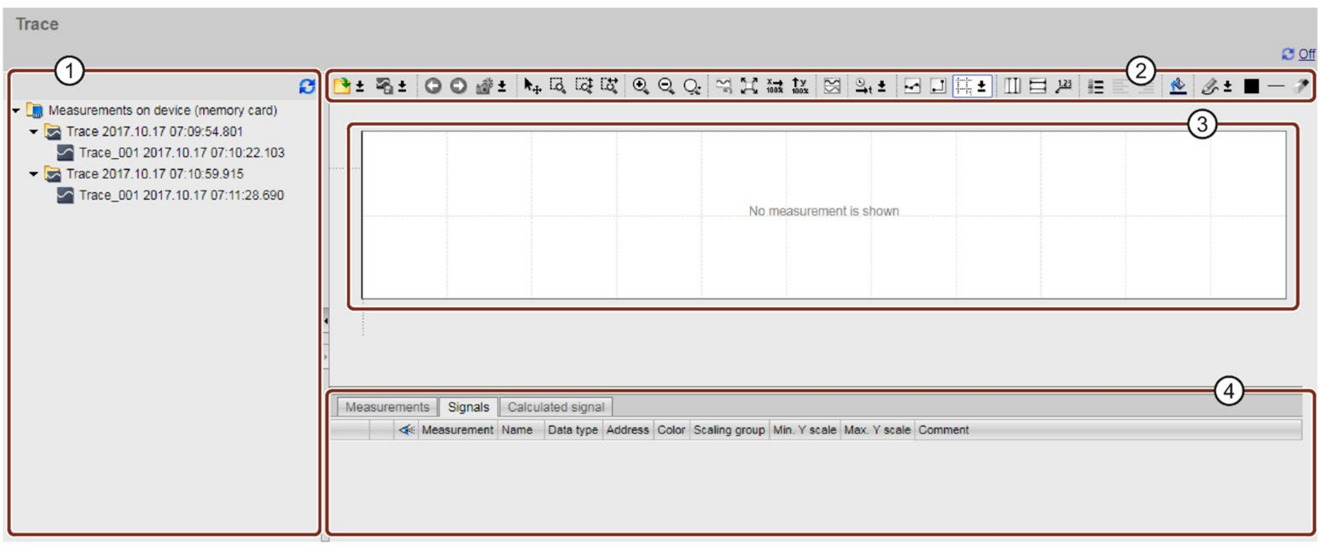
You can view the current values on the currently used space in the load memory in the "Memory" tab on the "Diagnostics" web page.

Additional information

The operation of the interface of the "Trace" web page largely corresponds to the operation of the trace function in STEP 7. See the Using the trace and logic analyzer function manual (https://support.industry.siemens.com/cs/ww/en/view/64897128) and the online help for STEP 7 for more on this.

Displaying the trace recordings

The web page of the trace and logic analyzer function consists of several areas. The example in the figure below shows how the Web server user interface is divided when the "Trace" web page is first called.



① Trace recordings
② Toolbar of the trend diagram
③ Trend diagram and bit track
④ Signal tables

Figure 3-54 Trace start page without measurement

Opening measurements

To open a measurement, right-click on a measurement to select it from the "Trace recordings" area. Then select the command "Display in diagram" in the shortcut menu.

The measurement is displayed in the "Curve diagram and bit track" area.

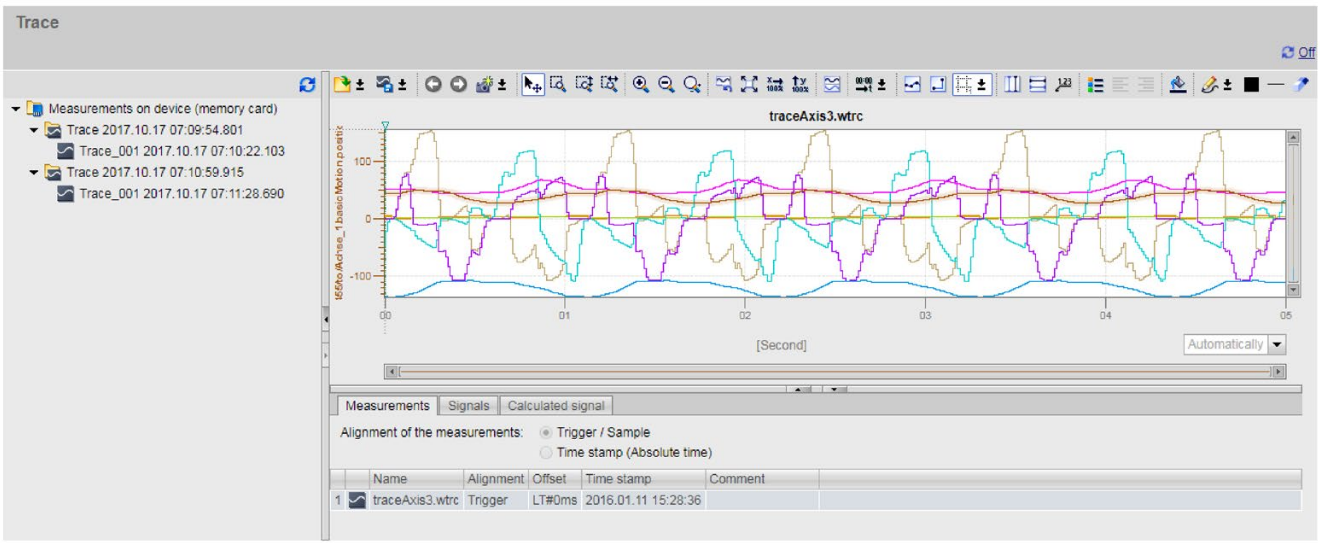


Figure 3-55 Displaying an individual measurement

To display multiple measurement at once, right-click on a measurement to select it from the "Trace recordings" area. Then select the command "Add to table" in the shortcut menu.

The measurements are displayed in the "Curve diagram and bit track" area.

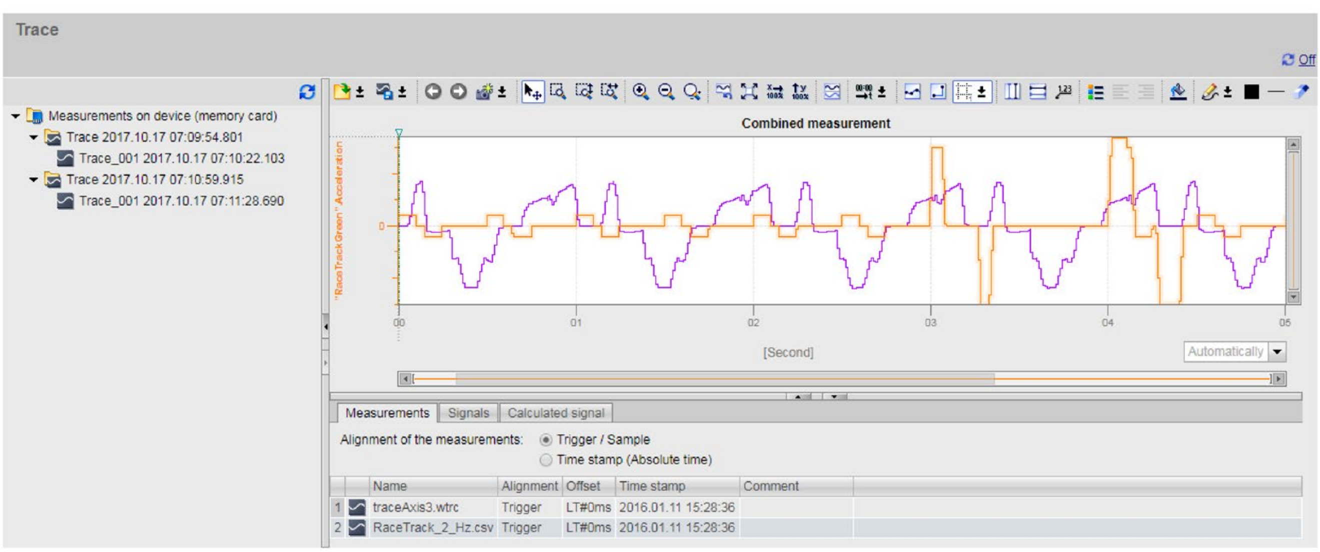

Figure 3-56 Displaying several measurements

Trace recordings

The "Trace recordings" area shows a list of all existing measurements, sorted by date and time of the trace recordings. A measurement always consists of a trace configuration with an associated recording.

The following table shows the special Web server shortcut menu commands in the Trace recordings area:

Table 3- 11 Web server shortcut menu commands in the trace recordings area

Shortcut menu command	Description
"Delete"	Deletes the selected measurement on the memory card of the CPU. A confirmation dialog opens. After deletion, the display in the trend diagram is not automatically overwritten.
"Save as"	Saves the selected measurement.
"Show in chart"	Loads the selected measurement to the display area of the Web server.

Some data types offer the display of individual bit tracks. Enable the individual bit tracks of the signal opened in the signal table using the icon.

You can adjust the display of the signals in the signal table and with the toolbar of the curve diagram.

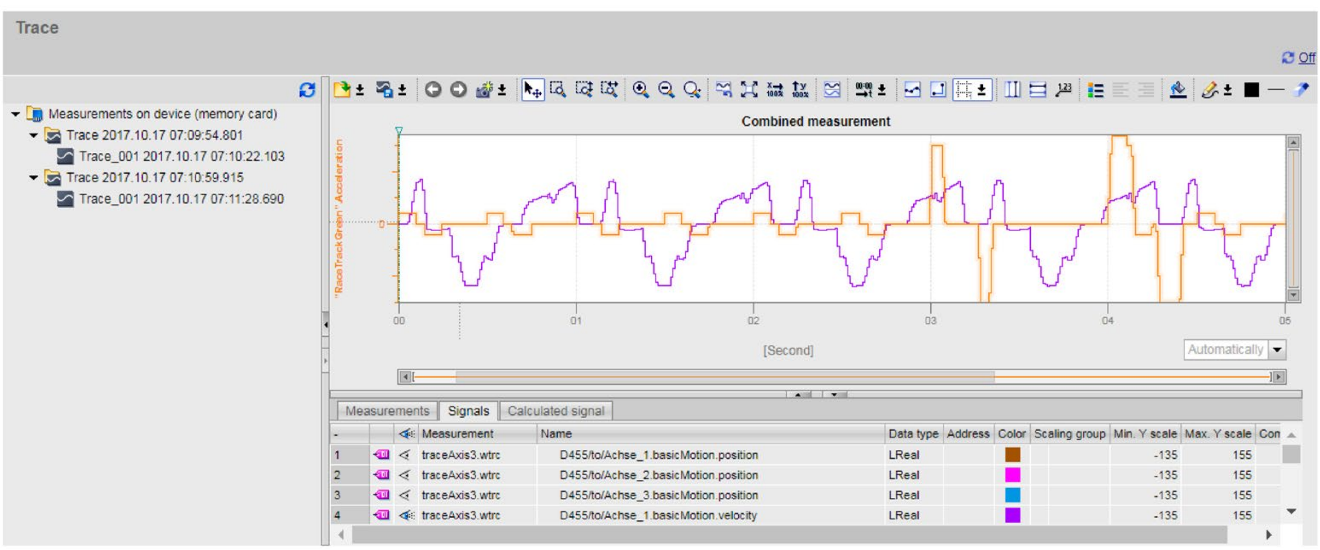

Figure 3-57 Trace measurement - All areas visible

Toolbar of the trend diagram

As in STEP 7, tools are available for adapting the display via buttons of the toolbar of the trend diagram.

The following table shows the Web server buttons in the trend diagram toolbar:

Table 3- 12 Buttons of the trend diagram toolbar

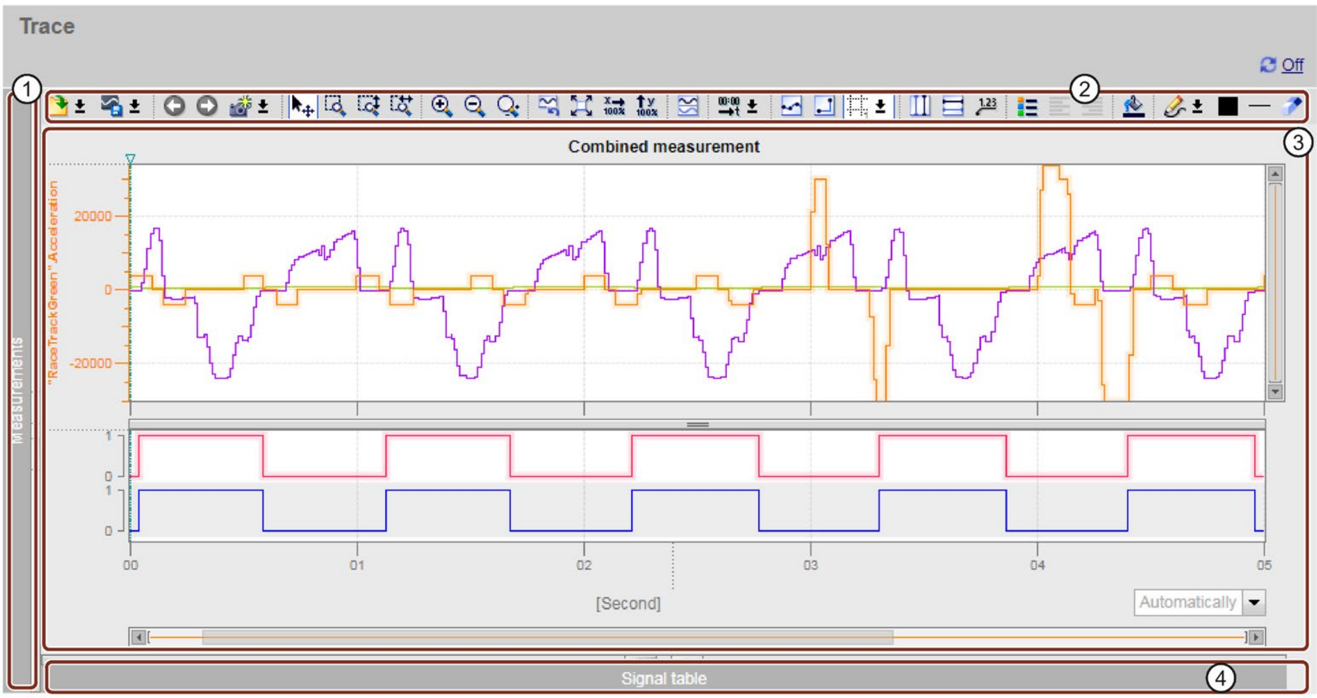
Symbol	Function	Description
	Open / add measurement	Opens measurements or adds measurement to an existing meas-urement.
	Save as	Saves measurement(s) as a file with the extension .csv, .wtrc (SIMOTION format for saving Trace data) or .ttrecx (TIA Portal format for saving Trace data). In addition to the measured data the command also saves the diagram, snapshots, marking and calculated signals.
	Undo move / zoom	Undoes the move / zoom function executed last. If you have car-ried out several move / zoom functions, you can undo these step-by-step.
	Repeat move / zoom	Redoes the last undone move / zoom function. If you have undone several move / zoom functions, you can redo these step-by-step.
	Snapshot	Saves the current view as a snapshot (see the section "Settings and displays of the Snapshot symbol").
	Move view	Moves the display with a pressed mouse button - corresponds to the  button in STEP 7.
	Zoom selection	Selection of an arbitrary range with the mouse button pressed. The button scales the display to the range selection.
	Vertical zoom selection	Selection of a vertical range with the mouse button pressed. The button scales the display to the range selection.
	Horizontal zoom selection	Selection of a horizontal range with the mouse button pressed. The button scales the display to the range selection.
	Zoom in	Enlargement of the display. The ranges of the X axis and Y axis are reduced every time the button is clicked. The curves are dis-played larger.
	Zoom out	Reduction of the display. The ranges of the X axis and Y axis are reduced every time the button is clicked. The curves are displayed smaller.
	Scaling	Scales all the signals or also only signal / signal group vertically and horizontally.
	Restore standard view	The button undoes scaling and move commands. The view is reset to the status at the time of loading of the measurement. Hid-den signals are also reset but remain disabled.
	Display all	The button moves all the signals completely into the display area without changing the relative positions of the signals to each other.
	Scale X automatically	Automatic scaling of all visible signals on the horizontal X area.
	Scale Y automatically	Automatic scaling of all visible signals on the vertical Y area.

Symbol	Function	Description
	Arrange in tracks	Activate or deactivate the trace arrangement. When the trace arrangement is activated the signals are arranged among themselves with the relevant value axes. Signal groups are displayed in the same trace. This setting does not affect the display for the bit tracks.
/	Unit switching of the time axis	Switching the unit of the time axis You can enter the following information: • Measuring points • Time (relative time related to the trigger time) • Trigger stamp of the measurement points
	Display measurement points	The button displays the measurement point as small circles on the curves.
/	Interpolation on/off	The buttons activate / deactivate the interpolation of the data of the trend diagram.
	Grid	The button activates / deactivates the grid of the trend diagram and regulates its brightness in the Levels 1 to 9.
	Vertical measurement cursor	Display of vertical measurement cursor. The vertical position of the two measurement cursors can be moved with the mouse. The values of the signals and the difference between two measuring points are displayed in the signal table for all displayed signals and also in the trend diagram for the selected signal. The measuring point or the relative/absolute time to the measurement cursors is displayed depending on the set unit of the time axis (X axis) in the movable pop-up window "Measuring points/Time values".
	Horizontal measurement cursor	Display of the horizontal measurement cursors. The horizontal position of the two measurement cursors can be moved with the mouse. The Y values of the measurement cursor for the selected signal are displayed in the movable pop-up window "Y values".
	Difference of the measurement cursor	Display of the difference of the horizontal and vertical measurement cursors and the Y values at the intersections with the vertical measurement cursors.
	Show legend	Showing or hiding of the legend in the curve diagram and the bit track labels.
	Align the chart legend to the left	Display of the legend and the bit track labels on the left side of the curve diagram.
	Align the chart legend to the right	Display of the legend and the bit track labels on the right side of the curve diagram.
	Change background color	Changeover between various background colors.
	Identification	The following table provides an overview of marked signal areas. Note that markings are only possible for analog signal.

All icons in the toolbar are equipped with tooltips.

Trend diagram

The trend diagram displays the selected signals of a recording. Bits are shown in the lower diagram as a bit track.



① Trace recordings (minimized)
② Toolbar of the trend diagram
③ Trend diagram and bit track
④ Signal table (minimized)

Figure 3-58 Trace measurement - only trend diagram visible

The following table shows the special Web server shortcut menu commands of a selected signal in the trend diagram:

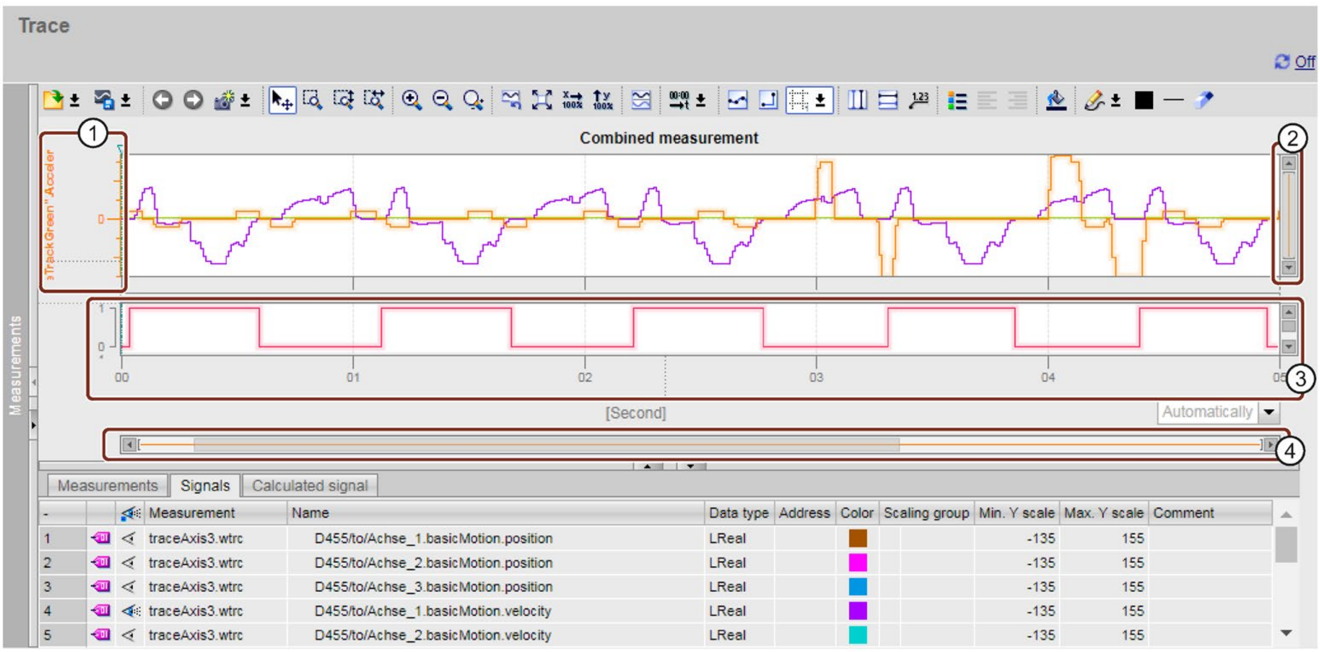
Table 3- 13 Web server shortcut menu commands in the trend diagram area

Shortcut menu command	Description
"Scale Y automatically"	Automatic scaling of the selected signal in Y direction.
"Hide signal"	Hides the selected signal in the trend diagram.

Use of the trend diagram

You can zoom the display area as you like. Measurement cursors (see "② Toolbar of the trend diagram") can be used to select individual values for display in the signal table.

The following image shows how you can change the display area of the trend diagram as required with rulers and scroll bars.



① Vertical ruler
② Vertical scroll bar
③ Horizontal ruler
④ Horizontal scroll bar

Figure 3-59 Trace measurement - rulers and scroll bars

Using the vertical ruler

- If you click the vertical ruler at the top or the bottom, you increase the size of the display at the top or bottom.
- If you click the vertical ruler at the top or the bottom while keeping the shift key pressed, you scale both ends.
- If you click the vertical ruler at the top or the bottom while keeping the Ctrl key pressed, you move the display up or down.

Using the horizontal ruler

- If you click the horizontal ruler on the left or the right, you increase the size of the display on the left or right.
- If you click the horizontal ruler on the left or right while keeping the shift key pressed, you scale both ends.
- If you click the horizontal ruler on the left or the right while keeping the Ctrl key pressed, you move the display to the left or right.

Using the mouse wheel

- If you activate the mouse wheel in the display, you move the display up or down.
- If you activate the mouse wheel in the display while keeping the shift key pressed, you move the display to the left or right.
- If you activate the mouse wheel in the display while keeping the Ctrl key pressed, you increase/reduce the size of the display at the position of the mouse pointer.

Signal tables

The signal tables list the signals of the selected measurement and provides setting options for some properties. The area of the signal tables is divided into the tabs "Measurements", "Signals" and "Calculated signal".

Settings and displays in the "Signals" tab

The following figure shows the signal table of the "Signals" tab.

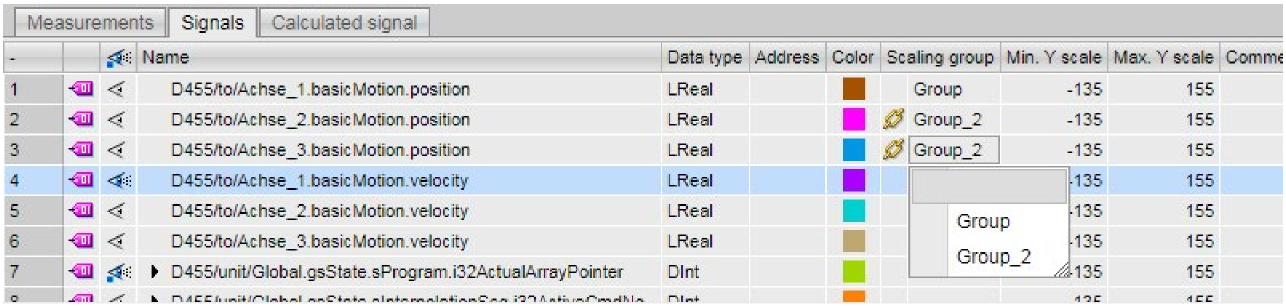


Figure 3-60 Display in the "Signals" tab

The following table shows the settings and displays of the recorded signals of the "Signals" tab:

Column	Description
Signal or error symbol	
	Signal symbol
	Symbol for calculated signals (formulas)
	Error in the formula of the calculated signal
	Selection for the display in the trend diagram
	The point indicates that at least one bit has been selected for display as bit track for the signal in the bit selection.
Signal number	Automatically generated number of the signal The signal can be accessed via the signal number in the formulas.
Name	Display of the signal name A click on the name of a displayed signal updates the scale in the trend diagram.
	Open bit selection Individual bits can also be selected for the following data types for display as a bit track in the lower curve diagram: • Byte, Word, DWord, LWord • SInt, USInt, Int, UInt, DInt, UDInt, LInt, ULInt Example of an opened bit selection for the DWORD data type:  Select or deselect the relevant bit for display by clicking the icon.
Data type	Display of the data type

Column	Description
Address	Display of the address of the signal The field remains empty with optimized / type correct tags.
Color	Display and setting option for the color of the signal
Signal group	Display or input of the signal group name for one signal group The Y-scales are scaled identically for all signals of one signal group. Enter an identical signal group name for those signals that you want to scale identically. To remove signals from a signal group: • Delete the signal group name. • Click the empty entry in the shortcut menu of the signal group Note that you cannot group binary signals.
Gray field for the chain icon of the signal group	To add or delete the signal from a signal group, move the mouse pointer over the grey field or the chain icon (or), Clicking the chain icon adds the signal to a signal group or creates a new signal group. Clicking the chain icon removes the signal from the signal group. For a selected signal with signal group, the chain icon displays all signals of the same signal group.
Input field of the signal group	The input field displays the signal group name. As an alternative to the chain icon, you can assign or delete a group name via text input in this field.
Min. Y-scale	Display or input of the minimum value for the scaling of the signal
Max. Y-scale	Display or input of the maximum value for the scaling of the signal
Comment	Display and input option for a comment about the signal

The following table shows the possible Web server shortcut menu commands of the "Signals" tab:

Table 3- 14 Web server shortcut menu commands of the "Signals" tab

Shortcut menu command	Description
"Scale Y automatically"	Automatic scaling of the selected signal in Y direction.
"Show signal"	Shows the signal in the trend diagram
"Hide signal"	Hides the signal in the trend diagram
"Show all bits"	Shows all the bits of a signal
"Hide all bits"	Hides all the bits of a signal

Settings and displays in the "Measurements" tab

The following figure shows the display of the "Measurements" tab and the shortcut menu of the "Alignment" column of a selected measurement.

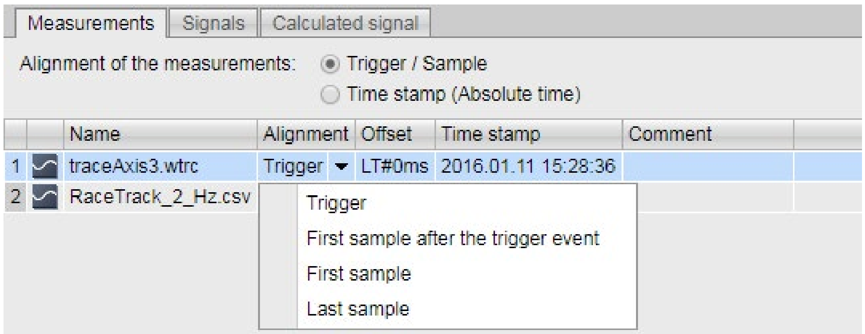

Figure 3-61 Tab "Measurements" with shortcut menu

The following table shows the settings and displays for the measurements:

Column	Description
Alignment of the measurements	
Trigger/Sample	Alignment of the measurements in accordance with the trigger or measurement point. The individual zero point for the measurement is predefined in the table under the "Alignment" column.
Time stamp (absolute time)	Alignment of the measurements in accordance with their time stamp. The signals are aligned in accordance with the time from the absolute time stamp.
Table columns	
	Static display of the measurement icon
Name	Display and change options for the name Note that the name must be unique.
Alignment	Alignment of the measurement (only adjustable with the "Trigger/Sample" check box selected). Determines the individual zero point for a measurement. All signals for the measurement are displayed in relation to this zero point. The following settings are possible: • Trigger • First sample after the trigger event • First sample • Last sample
Offset	Offset related to the time axis Moves the measurement left or right by the offset stated on the time axis. If you enter solely a numerical value without a unit of measurement, the system automatically assigns the unit "ms" (for example 0=0ms, 100=100ms, 1000=1s, -1001=-1s 1ms , LT#2000ms=2s, LT#-3605000ms=-1h 5s , LT#-1h5s=-1h 5s)
Time stamp	Display of the trigger time
Comments	Display and input option for a comment about the signal
Shortcut menu commands	
"Save as WTRC"	Saves the measurement(s) as a file with the extension .csv, .wtrc (SIMOTION format for saving Trace data) or .ttrecx (TIA Portal format for saving Trace data).
"Save as CSV"	Exports a measurement as a file with the file extension .´csv. Note that the command only saves the measured data. The command does not save the diagram, snapshots, markings and calculated signals.
"Edit name"	Switches the name in editing mode
"Edit offset"	Switches the offset in editing mode
"Edit comment"	Switches the comment in editing mode

Settings and displays in the "Calculated signal" tab

You can use this function to calculate new signals based on real signals. The system calculates the Y-values of the signal points in the process.

To parameterize the signals to be calculated, open the "Calculated signal" tab.

In the "General" section specify the name, the data type and color of a signal to be calculated. Note that the name of the signal to be calculated must differ from the name of a real signal.

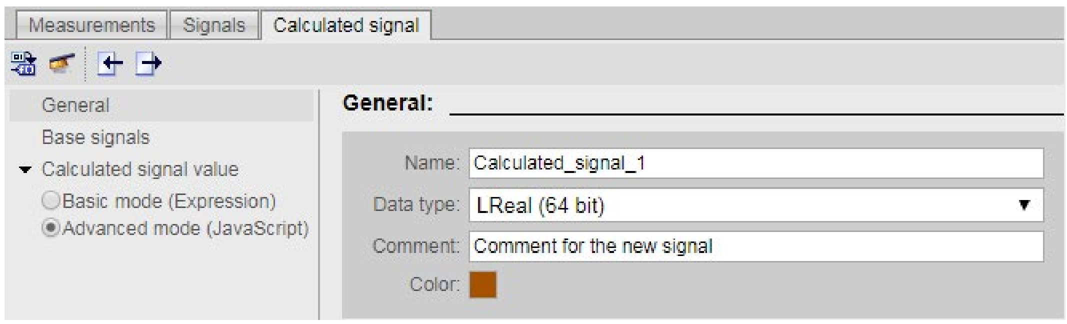

Figure 3-62 "General" section of the "Calculated signal" tab

Add the basic signals in the "Basic signals" section. The basic signals form the basis for calculating the new signal. You can change the default name of the variable in the "Name" column. You select real signals for the specification of the number of signal points to be calculated in the "Signal" column.

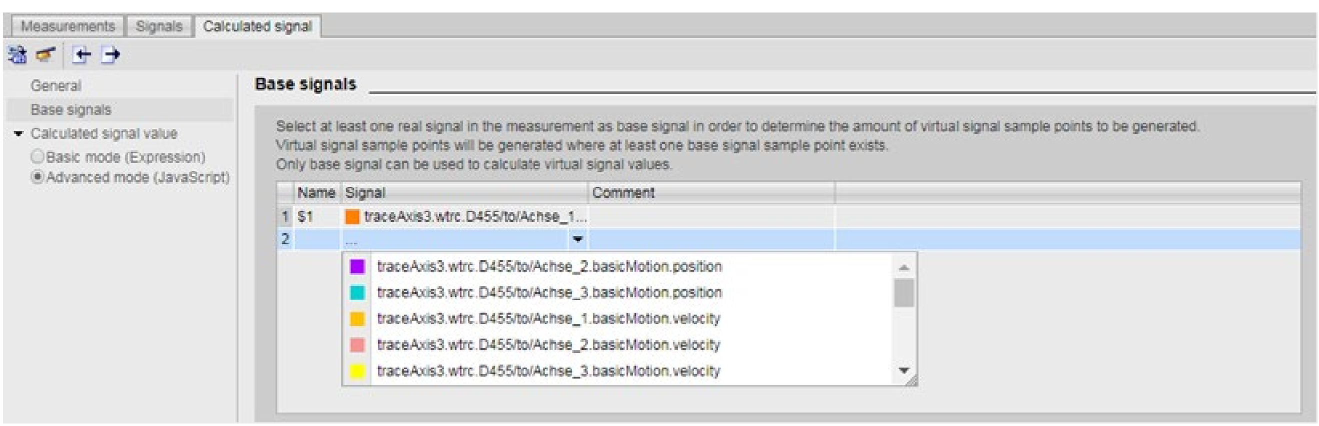

Figure 3-63 "Basic signals" section of the "Calculated signal" tab

Enter the code for the calculation of the Y values of the signal points in the "Calculated signal value" section. The section is divided into:

- Basic mode (expression)
- Advanced mode (JavaScript)

Use the JavaScript syntax to enter the code for both modes. Take into account, however, that not the full JavaScript functionality is supported.

Basic mode (expression)

In this mode you use the following to create your code:

- Standardized JavaScript expressions and operators (for example +, -, /, *, %, ~, &, |, ?, !)
- Standardized math libraries
- The tag names specified under "Basic signals"
(the system writes the Y-value directly to the variable name)

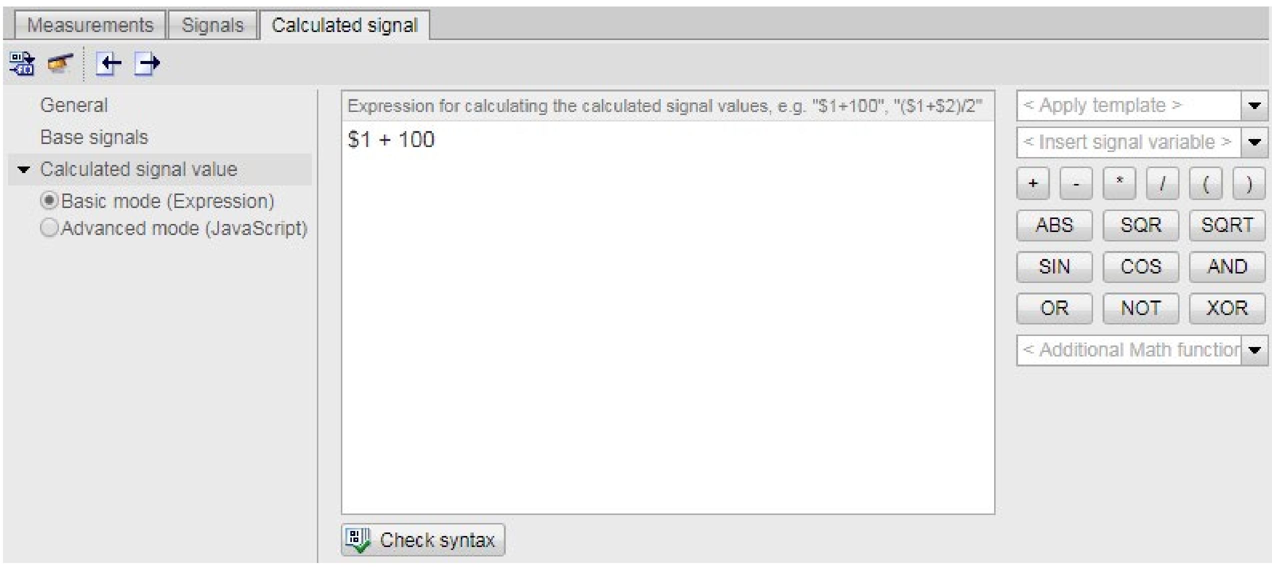

Figure 3-64 Basic mode (expression)

Advanced mode (JavaScript)

This mode offers you an advanced functional scope for the calculation of the Y value by means of a complex JavaScript code. You can, for example, specify own static tags for the iteration of code sections:

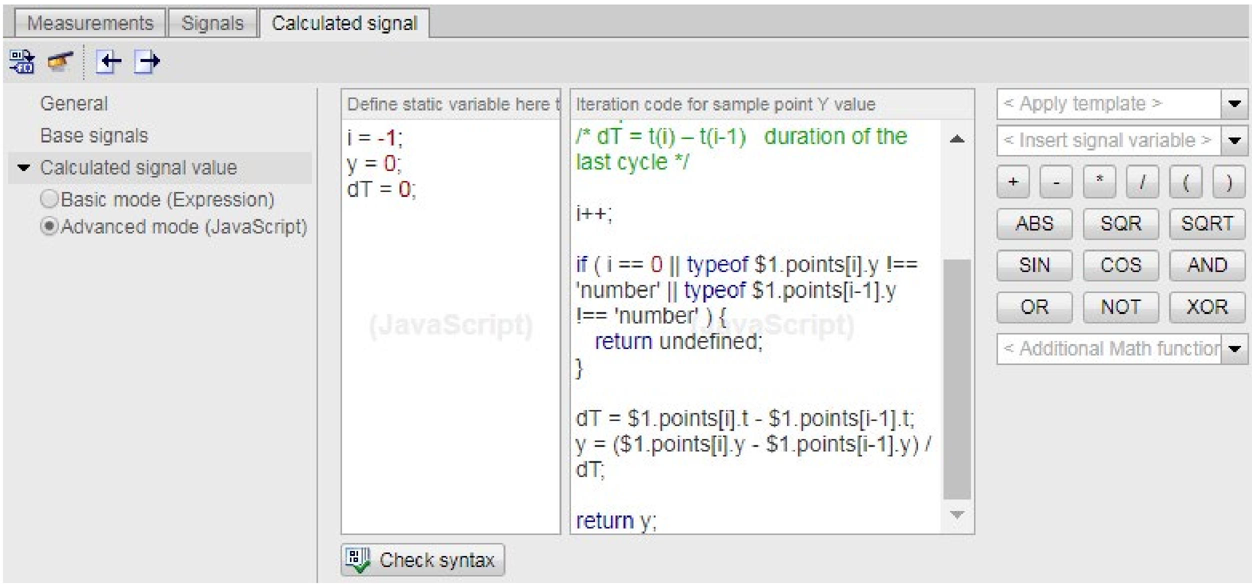

Figure 3-65 Advanced mode (JavaScript)

The following table shows all the elements that you can use for your code:

<table>
<tr><th colspan="7">Reserved words (case-sensitive)</th></tr>
<tr><td>if</td><td>var</td><td>Math</td><td>Array</td><td>catch</td><td>typeof</td><td>unescape</td></tr>
<tr><td>encodeURI</td><td>in</td><td>for</td><td>else</td><td>break</td><td>escape</td><td>delete</td></tr>
<tr><td>Infinity</td><td>decodeURI</td><td>do</td><td>Date</td><td>case</td><td>false</td><td>String</td></tr>
<tr><td>Object</td><td>continue</td><td>parseFloat</td><td>new</td><td>case</td><td>true</td><td>while</td></tr>
<tr><td>return</td><td>Number</td><td>parseInt</td><td>try</td><td>null</td><td>isNaN</td><td>throw</td></tr>
<tr><td>switch</td><td>default</td><td>undefined</td><td colspan="4"></td></tr>
<tr><th colspan="7">Operators</th></tr>
<tr><td>%</td><td>-</td><td>*=</td><td>!=</td><td><=</td><td>|=</td><td>&&</td></tr>
<tr><td>!==</td><td>+</td><td>--</td><td>/</td><td>></td><td>=</td><td>||</td></tr>
<tr><td>^</td><td>===</td><td>++</td><td>-=</td><td>/=</td><td>>=</td><td>==</td></tr>
<tr><td>&</td><td>~</td><td>+=</td><td>*</td><td>!</td><td><</td><td>|</td></tr>
<tr><td>&=</td><td>?</td><td colspan="5"></td></tr>
<tr><th colspan="7">Delimiters</th></tr>
<tr><td>(</td><td>)</td><td>{</td><td>}</td><td>[</td><td>]</td><td>.</td></tr>
<tr><td>,</td><td>:</td><td>;</td><td colspan="4"></td></tr>
<tr><th colspan="7">Comments</th></tr>
<tr><td>/*</td><td>*/</td><td colspan="5"></td></tr>
</table>

Every signal point consists of the following attributes:

1. x (measuring point)
2. t (relative ^time in milliseconds)
3. y (Y value)
4. points (number of signal points that are available for the calculation of a new signal)

In "Advanced mode (JavaScript)" you can access all four attributes (e.g. "$1.y", 485 "$1.t", "$1.x", $1.points[i].y, …).

The following function tables support you in writing expressions or complex code in JavaScript. The function table contains the functions used most often:

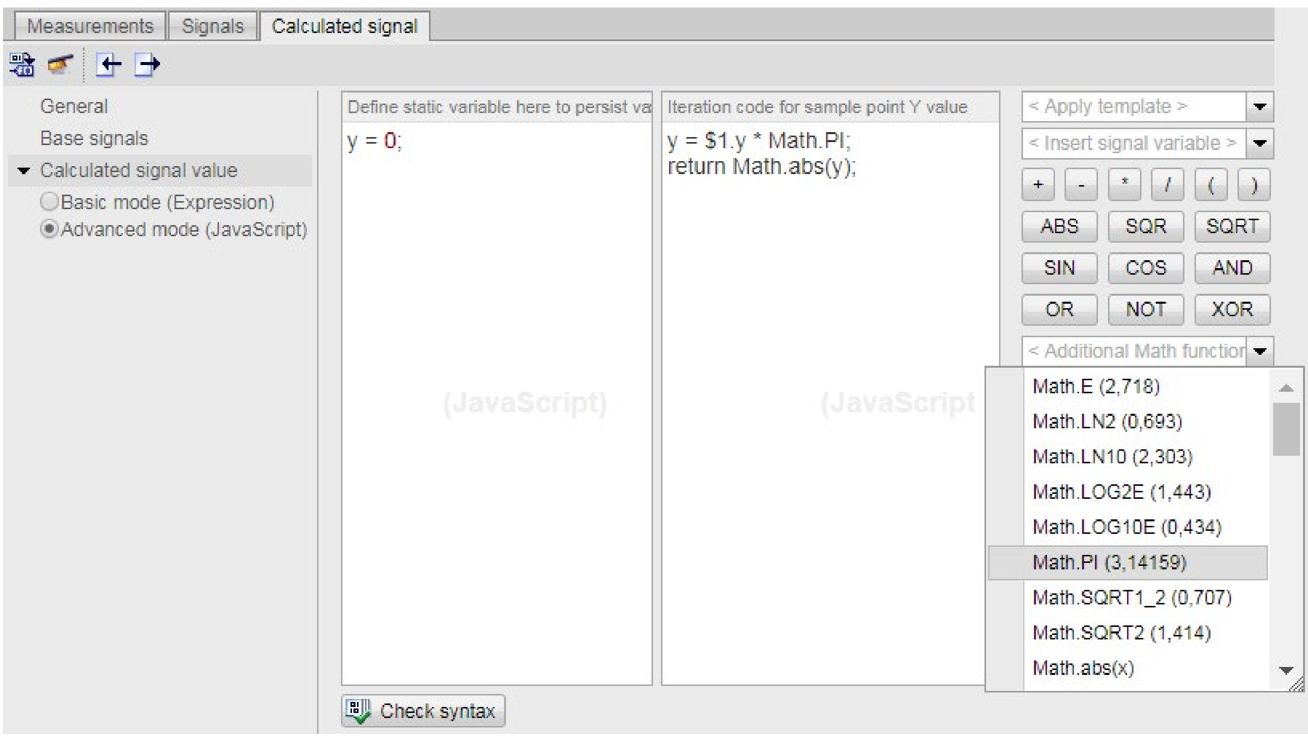

Figure 3-66 "Calculated signal" tab with function table

You also have the possibility to generate the JavaScript code of a real signal from the "Signals" tab. Alternatively you can also select one of predefined templates of the function table, change the code and generate a calculated signal.

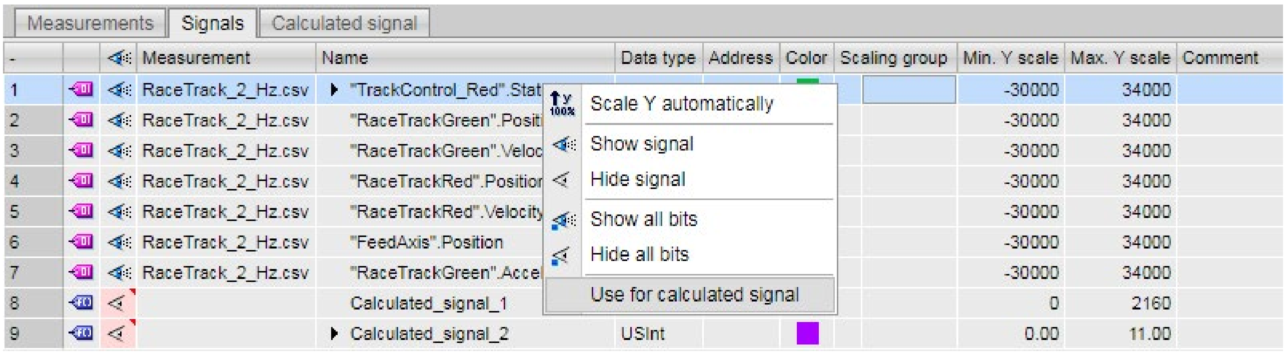

Figure 3-67 Real signals of the "Signals" tab

The following templates are available in the function table:

- Numerical differentiation
- Numerical integration
- Arithmetic mean

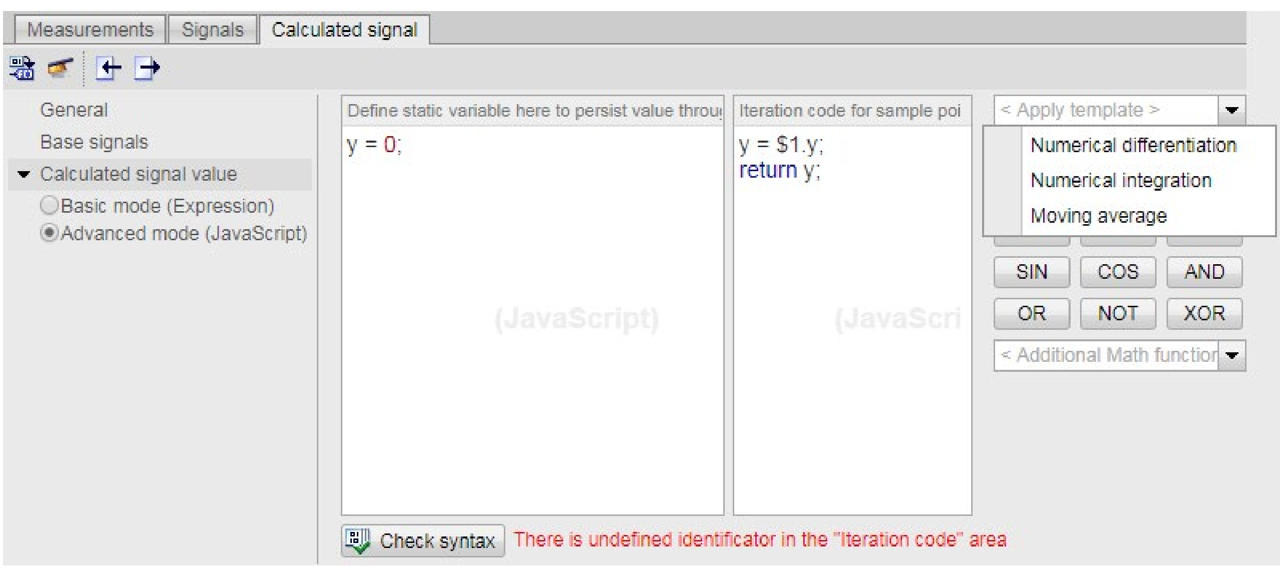

Figure 3-68 Templates

To check the syntax click the symbol "Check syntax" or generate the signal by clicking the  icon in the toolbar. If the code has any errors, these are displayed to the right of the "Check syntax" icon in red lettering. If the code does not have any errors, the "Syntax check successful" message is displayed.

How does the system calculate a new signal?

The system checks:

- Whether you have selected a basic signal for the calculation of a new signal
- The name of the signal to be calculated
- The syntax of your JavaScript code

Subsequently the system defines the counting of the measuring points and executes the code for each measuring point to be calculated. In each iteration the system stores the measuring points of the new signal on the basis of the following four attributes:

- Measuring point
- Relative time
- Calculated Y value
- Signal point with x-, t, y-values

The course is displayed after calculation has been completed.

Example for calculating on the basis of a basic signal

You use a single basic signal to calculate the new signal. The basic signal consists of 1000 measuring points.

In this case the system carries out your written code a thousand times. The calculated signal then consists of 1000 calculated signal points with the same x- and t-values, but with own y-values.

Importing/exporting settings

You can import/export certain parameters (formulas, calculation method, signal type and signal name. To import parameters click the icon in the toolbar of the "Calculated signal" tab. To export parameters click the icon in the toolbar of the "Calculated signal" tab.

Settings and displays of the Snapshot icon

With the "Snapshot" icon in the toolbar of the trend diagram you save the current signal course in the form of a snapshot.

To create a snapshot of the signal course click the icon. To manage the created snapshots click the arrow on the left next to the "Snapshot" icon and select the entry "Manage snapshots".

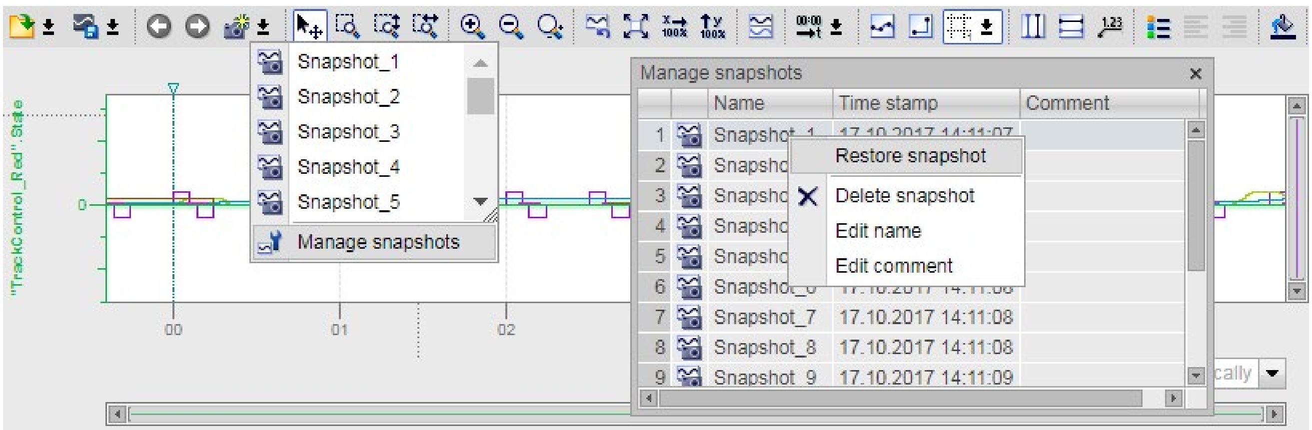

Figure 3-69 Managing snapshots

The following table shows the settings and displays of the "Managing snapshots" window.

Column	Description
	Static display of the snapshot icon
Name	Display and change options for the name
Time stamp	Display of the creation time of the snapshot
Comments	Display and input option for a comment

Several rows can be selected.

The following table shows the possible shortcut menu commands:

Shortcut menu command	Description
"Restore snapshot"	Shows the measurement with the saved view in the "Diagram" tab.
"Remove snapshot"	Deletes the snapshot.
"Edit name"	Switches the name in editing mode
"Edit comment"	Switches the comment in editing mode

Several rows can be selected.

Note

Delete measurement

If you delete a measurement of a calculated signal, all the associated snapshots are also deleted.

3.18 Reading out service data

The Web server gives you the option to save service data. In addition to the content of the diagnostic buffer, they include additional information on the internal status of the CPU. If you should encounter a problem with the CPU that cannot be resolved otherwise, you therefore have the option to submit the service data to the Service&Support team.

Procedure

1. Enter the following address in the address bar of your web browser:
   "http://<CPU IP address>/save_service_data", e.g.,
   "http://192.168.3.141/save_service_data"
2. Your screen displays the service data page with a button for saving the service data.

3. Save the service data locally on your display device by clicking "Save ServiceData".

Result

The data is saved into a .dmp file with the following naming convention: "<MLFB><serial number><time stamp>.dmp". The user can change the file name at a later time.

Note

If you have defined your user page as the start page, observe the note on reading out service data in section Defining the user page as start page (Page 98).

3.19 Basic websites

Web pages with reduced contents

Basic websites are offered for display devices with smaller screens, for example HMI, on the Web server.
Basic websites are web pages with reduced content that are adapted to the requirements of small screens with low resolution.
These sites do not support JavaScript for the sake of fast access. This means that not all standard websites are available as basic websites. The basic website can also have fewer functions than the standard website.

The switch to basic websites takes place automatically for HMI devices.
You access basic websites from other end devices by entering the IP address of the configured and the extension "/basic" in the address bar of the Web browser, for example http://192.168.3.141/basic or https://192.168.3.141/basic.

The following standard websites are also available as basic websites:

- Start page (in Basic: "Status")
- Diagnostics (without the "Program protection", "Runtime information" and "Fail-safe" tabs)
- Diagnostics buffer
- Memory usage
- Module information
- Alarms (without acknowledgment option)
- Communication
- Tag status
- Watch tables
- User pages
- Filebrowser (read access only)
- DataLogs
- Intro

The basic websites are displayed as follows:

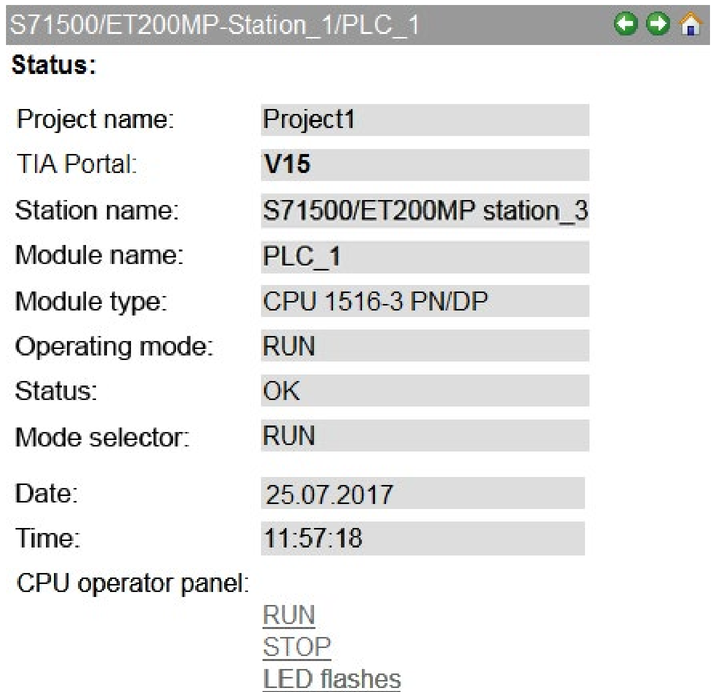

Figure 3-70 Example basic websites, "Status" web page

Glossary

Automation system

An automation system is a programmable logic controller that consists of at least one CPU, various input and output modules, as well as operating and monitoring devices.

AWP

Automation Web Programming

AWP commands

Special command syntax for data exchange between CPU and HTML file.

Configuration

Systematic arrangement of individual modules (design).

CSS

A CSS (Cascading Style Sheet) specifies how an area or content marked up in HTML is displayed.

Device

Device that can send, receive or amplify data via the bus, e.g., IO controller.

Diagnostics

The detection, localization, classification, visualization and further evaluation of errors, malfunction and alarms.

Diagnostics provides monitoring functions that run automatically during plant operation. This increases the availability of plants by reducing commissioning times and downtimes.

Firewall

A firewall is used to restrict the network access based on sender or target address of the used services. The firewall decides based on specified rules which of the network packets it handles are forwarded and which are not. This way the firewall tries to prevent unauthorized network access.

It is not the function of a firewall to detect attacks. It only implements rules for network communication.

HTTP

Hypertext Transfer Protocol (HTTP). Protocol for data transmission across a network.

HTTPS

Hypertext Transfer Protocol Secure (HTTPS). Protocol for tap-proof transmission of sensitive data across a network.

Identification data

Identification data is stored on a module, and contains information which supports the user in

- Checking the system configuration
- Locating hardware changes in a system
- Correcting errors in a system

Modules can be clearly identified online using the identification data.

Master

The master in possession of the token is an active device. This master has the option to receive data from other devices and to send data to other devices.

PROFIBUS

PROcess **FIeld BUS**, process and field bus standard specified in standard IEC 61784-1:2002 Ed1 CP 3/1. It specifies functional, electrical, and mechanical properties for a bit-serial field bus system.

PROFIBUS is available with the protocols DP (= Distributed I/O), FMS (= Fieldbus Message Specification), PA (= Process Automation), or TF (= Technological Functions).

PROFINET

Within the framework of Totally Integrated Automation (TIA), PROFINET represents the consistent continuation of:

- PROFIBUS DP, the established field bus
- Industrial Ethernet, the communications bus for the cell level

Experience gained from both systems was and is being integrated into PROFINET.

PROFINET as an Ethernet-based automation standard from PROFIBUS International (previously PROFIBUS User Organization) defines a vendor-independent communication, automation, and engineering model.

PROFINET component

A PROFINET component includes the entire data of the hardware configuration, the parameters of the modules, and the corresponding user program. The PROFINET component is made up as follows:

- Technological Function

  The (optional) technological (software) function includes the interface to other PROFINET components in the form of interconnectable inputs and outputs.

- Device

  The device is the representation of the physical programmable controller or field device including the I/O, sensors and actuators, mechanical parts, and the device firmware.

PROFINET IO

As part of PROFINET, PROFINET IO is a communication concept that is used to implement modular, distributed applications.

PROFINET IO allows you to create automation solutions which are familiar to you from PROFIBUS.

PROFINET IO is implemented by the PROFINET standard for automation devices on the one hand, and on the other hand by the engineering tool STEP 7.

That is, you have the same application view in STEP 7, regardless of whether you configure PROFINET or PROFIBUS devices. Programming your user program is essentially the same for PROFINET IO and PROFIBUS DP if you use the extended blocks and system status lists for PROFINET IO.

PROFINET IO controller

Device used to address connected I/O devices. This means that the IO controller exchanges input and output signals with assigned field devices. The IO controller is often the controller on which the automation program runs.

PROFINET IO device

A distributed field device that is assigned to one of the IO controllers (e.g., remote IO, valve terminals, frequency converters, switches).

URL

Uniform Resource Locator (URL). Identifies and localizes a source, such as a web page, uniquely via the method of access used and the location of the source in computer networks.

UTF-8

Abbreviation for 8-bit UCS (Universal Character Set) transformation format. Most popular coding of Unicode characters.

Each Unicode character is assigned a specially coded byte string of variable length in this format. UTF-8 supports up to four bytes on which all Unicode characters can be mapped.

Web browser

Web browsers are visualization programs for web pages and can communicate with Web servers.

Typical web browsers are, for example:

- Microsoft Internet Explorer
- Mozilla Firefox

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual describes the simulation software, SIMATIC S7-PLCSIM Advanced V2.0. You can use this software to simulate and test your SIMATIC STEP 7 programs on a virtual controller.

You can obtain updates to the function manual as downloads on the Internet (https://support.industry.siemens.com/cs/us/en/view/109739154).

An application example for S7-PLCSIM Advanced is also available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109739660).

Scope

This function manual is valid for the following order versions

- 6ES7823-1FA01-0YA5 - SIMATIC S7-PLCSIM Advanced V2.0 Floating License (DVD)
- 6ES7823-1FE01-0YA5 - SIMATIC S7-PLCSIM Advanced V2.0 Floating License (Download)
- 6ES7823-1FA01-0YE5 - Upgrade SIMATIC S7-PLCSIM Advanced V1.0 → V2.0 (DVD)
- 6ES7823-1FE01-0YE5 - Upgrade SIMATIC S7-PLCSIM Advanced V1.0 → V2.0 (Download)

The articles each contain one license for up to three instances.

Basic knowledge required

The system may only be used by qualified staff.
The following knowledge is required:

- Industrial Automation and Automation Technology
- Programming with STEP 7 (TIA Portal)
- SIMATIC CPUs and CPU programming
- PC-based automation using S7-1500 and WinCC Runtime Advanced
- Development of software in C++ or C#
- PC technology
- Windows operating system

Conventions

Conventions STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

We also abbreviate SIMATIC S7-PLCSIM Advanced V2.0 as "PLCSIM Advanced".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens’ products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens’ guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens’ products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer’s exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

Tables

Figures

1 Guide

1.1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200SP systems. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742691).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500 (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500 (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

The TIA Selection Tool can be used to select, configure and order devices for Totally Integrated Automation (TIA). It assembles the configuration editors for automation technology already familiar into a single tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Instances of PLCSIM Advanced can communicate via Softbus with PLCSIM V5.4 SP8.</td></tr>
</table>

1 Via C++ and C# programs and simulation software

2 Can be monitored with PLCSIM V15 in the TIA Portal; can also be monitored with PLCSIM Advanced V2.0 in the Web server.

3 With PLCSIM V15 the axes are always in simulation mode irrespective of the axis configuration.
With PLCSIM Advanced V2.0 the axes can also be operated in "Real" mode over the API.

Product overview 2

2.1 What is S7-PLCSIM Advanced?

Using PLCSIM Advanced, you can simulate your CPU programs on a virtual controller. You do not need any real controllers for this. You can configure your CPU with STEP 7 in the TIA Portal, program your application logic and then load the hardware configuration and the program into the virtual controller. From there you can run your program logic, observe the effects of simulated inputs and outputs and adapt your programs.

In addition to communicating via Softbus, PLCSIM Advanced provides a full Ethernet connection and can thus also communicate distributed.

PLCSIM Advanced enables interaction with native C++/C# programs or simulation software over the **user interface (API)**.

Application areas

- Verification of the user program (TIA Portal)
- Automatic testing of the STEP 7 program
- Software in the loop simulation for the virtual commissioning of machine tools/production machines, production cells and production lines in a plant.

Advantages

The use of PLCSIM Advanced offers numerous advantages:

- Improve quality of automation projects by early error detection
- Avoid costs for hardware in simulation environments
- Reduced response times
- Reduce risk for commissioning
- Earlier training of operator is possible
- Increase production efficiency by optimizing program components
- Increase efficiency during replacement of machine components
- Increase efficiency during expansion of existing plants

2.2 Compatibility during upgrade

Compatibility of API and Runtime versions

The installation of PLCSIM Advanced V2.0 leads to an upgrade of an existing earlier version. However, the Runtime Manager of PLCSIM Advanced V2.0 is compatible with projects that were created with the API version V1.0. You can therefore continue to use already created projects.

Note

PLCSIM Advanced V2.0 contains the API versions V1.0 (SP1) and V2.0 and the Runtime version V2.0.

An API with higher version number cannot connect with the Runtime of an earlier version.

Table 2- 1 Compatibility of API and Runtime versions

API version	Runtime version	Supported
V1.0 (SP1)	V1.0 (SP1)	Yes
V1.0 (SP1)	V2.0	Yes
V2.0	V1.0 (SP1)	No[1]
V2.0	V2.0	Yes

1 The combination leads to a "WRONG_VERSION" error.

2.3 Security for S7-PLCSIM Advanced

Restrictions for security

Note the following restrictions when using PLCSIM Advanced:

Authentication

- The user interfaces (API) do not have options for authentication and authorization. There is no protection using user accounts and passwords.
- The Runtime Manager communication is not protected by authentication.

Communication

- The multi-computer simulation communication is not encrypted.
- A TCP/IP port is opened on the PC for cross-network communication.
- The installed WinPcap component provides access to TCP/IP network communication.

Note

For cross-computer communication, it is recommended to use a closed simulation network that is not connected to a production network.

Know-how protection

Note

If know-how-protected blocks for the simulation support are enabled, the know-how protection is limited.

2.4 Simulations support

Requirement for simulation

Note

Enable simulation capability

To use a STEP 7 project with simulation, you must select the "Support simulation during block compilation" option in the "Protection" tab in the properties of the project and confirm with OK.

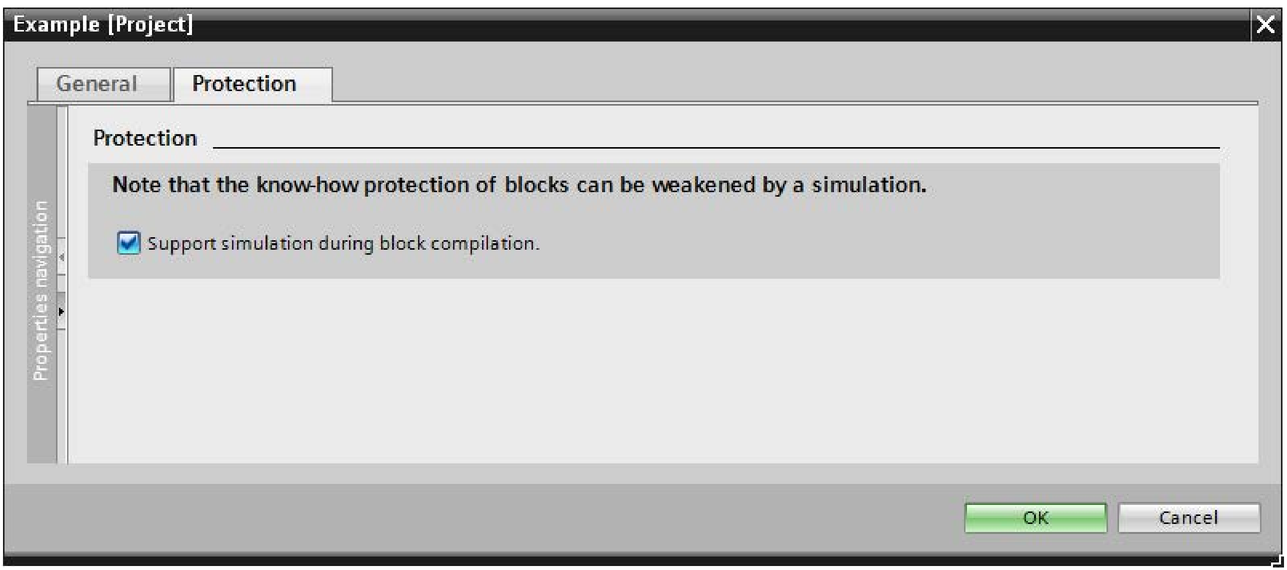

Figure 2-1 Enable simulation capability

Know-how protection

If a know-how-protected block is to be used for the simulation, it must be unlocked by entering a password. Only through unlocking can the "Simulation with SIMATIC S7-PLCSIM Advanced" option in the tab "General > Compilation" in the properties of the block be activated.

Global libraries

You cannot use know-how protection with global libraries, because the libraries are write-protected.

The "Simulation with SIMATIC S7-PLCSIM Advanced" option must be set when generating the blocks (source of the blocks).

2.5 Supported CPUs

Supported CPUs from the S7-1500 family

PLCSIM Advanced V2.0 supports the simulation of the following CPUs:

Table 2- 2 Supported CPUs

Type	Version V1.8, V2.0, V2.1, V2.5	
Standard CPUs	CPU 1511-1 PN	CPU 1511F-1 PN
	CPU 1513-1 PN	CPU 1513F-1 PN
	CPU 1515-2 PN	CPU 1515F-2 PN
	CPU 1516-3 PN/DP	CPU 1516F-3 PN/DP
	CPU 1517-3 PN/DP[2]	CPU 1517F-3 PN/DP[2]
	CPU 1518-4 PN/DP[2]	CPU 1518F-4 PN/DP[2]
	CPU 1518-4 PN/DP ODK[2, 3]	CPU 1518F-4 PN/DP ODK[2, 3]
	CPU 1518-4 PN/DP MFP[2, 3]	CPU 1518F-4 PN/DP MFP[2, 3]
Compact CPUs[1]	CPU 1511C-1 PN	
	CPU 1512C-1 PN	
ET 200SP CPUs	CPU 1510SP-1 PN	CPU 1510SP F-1 PN
	CPU 1512SP-1 PN	CPU 1512SP F-1 PN
Technology CPUs	CPU 1511T-1 PN	CPU 1511TF-1 PN
	CPU 1515T-2 PN	CPU 1515TF-2 PN
	CPU 1516T-3 PN/DP[2]	CPU 1516TF-3 PN/DP[2]
	CPU 1517T-3 PN/DP[2]	CPU 1517TF-3 PN/DP[2]

1 The on-board I/O within the compact CPUs is not simulated. The simulation interface corresponds to the process image.

2 The simulation of this CPU only supports Motion Control Resources (MCR) and Extended Motion Control Resources (EMCR) to a limited extent.

3 The ODK functionality of this CPU is not simulated.

Unsupported CPUs

PLCSIM Advanced does not support the simulation of the following CPUs:

- S7-1200 CPUs
- ET 200pro, ET 200pro F CPUs
- ET 200SP Open Controller CPU 1515SP PC
- Software Controller

Compatibility to the TIA Portal

The following versions of PLCSIM Advanced and the TIA Portal are compatible:

Table 2- 3 Compatibility to the TIA Portal

PLCSIM Advanced version	TIA Portal version	Supported CPU version
V1.0 SP1	V14 (SP1), V15	V1.8, V2.0
V2.0	V14 (SP1), V15	V1.8, V2.0, V2.1, V2.5

Note

Firmware version

The firmware used in PLCSIM Advanced corresponds to that of a CPU S7-15xx V2.5.

You can configure a CPU with an earlier firmware version (for example V1.8) and load it onto PLCSIM Advanced. The online diagnostics then also displays the firmware version V2.5.

Downloading a CPU with a newer firmware version results in aborting.

See also

Restrictions with Motion Control (Page 352)

2.6 Differences between a simulated and a real CPU

The virtual controller cannot fully simulate a real CPU down to the individual details. Even if a program is downloaded without errors to the CPU and running successfully, this does not necessarily mean that the virtual controller in the simulation behaves exactly like a real CPU.

Deterministic

PLCSIM Advanced runs on a PC with the Windows operating system. Therefore, the scan cycle time and the exact time of actions in PLCSIM Advanced are not the same as when these actions run on physical hardware. This is because that several programs share the processing resources on your PC.

To provide the best possible deterministic behavior under these conditions, PLCSIM Advanced as of V2.0 requires one free Core (CPU core) per instance.

If your program depends heavily on the time required to execute actions, then make sure that you do not evaluate your program based only on the results of the simulation time.

Know-how protection

Projects with know-how protection for blocks can only be simulated if they are enabled for simulation. You need the block password for this purpose.

Instructions

Instructions are simulated with a few exceptions, see Restrictions for instructions (Page 351).

Programs that are based on the instructions behave different than real CPUs in the simulation.

Display of the quantity structure

In STEP 7 the maximum quantity structure that is based on the CPU 1518-4 PN/DP is shown in the project navigation under "Program info" for all the CPUs.

The maximum quantity structure of the currently simulated CPU is displayed under "Online & diagnositics".

2.6.1 Restrictions for all supported CPUs

Bus systems

PLCSIM Advanced does not simulate bus systems (PROFINET IO, PROFIBUS DP, backplane bus).

I/O

PLCSIM Advanced simulates the real CPU, but not configured I/O modules and the on-board I/O of the compact CPUs.

Process image partitions

Process image partitions are supported as with the real CPU.

Address spaces that are not assigned to a process image partition are updated at the cycle control point.

Update

PLCSIM Advanced does not support updating of the process image partitions for IO systems that are connected to the CPU via CMs or CPs.

Diagnostics / diagnostic alarms

With PLCSIM Advanced, simple diagnostics buffer entries can be simulated according to PROFINET standard.

PROFIBUS-specific diagnostics (e.g. via DS0, DS1) and user-specific text lists are not supported.

Online and diagnostic functions

Some online and diagnostic functions are not very useful in the simulation and are therefore not supported. These include, for example, the functions "Format memory card" and "Firmware update".

Status indicators LED flashing

In STEP 7, you can have the LED displayed on an CPU flash using the "Extended download to device" dialog. PLCSIM Advanced does not simulate this function.

Data logging

PLCSIM Advanced does not simulate data logging.

Recipes

PLCSIM Advanced does not simulate the use of recipes.

Copy protection

PLCSIM Advanced does not simulate copy protection.

Limited support

PLCSIM Advanced simulates some functions to a limited extent. You can find an overview in the section Restrictions (Page 347).

2.7 Simulating Motion Control

Restrictions

PLCSIM Advanced supports STEP 7 projects with configurations and functions for motion control for the CPUs S7-1500 (F), S7-1500C, S7-1500T (F) und ET 200SP (F).

PLCSIM Advanced provides only limited support for technology objects in some CPUs, see Restrictions with Motion Control (Page 352).

Simulation with external simulation software

Note

In a virtual S7-1500 controller, the technology objects are connected to the process image. Simulation software can thus access the process image via the user interfaces (API) of PLCSIM Advanced and simulate the behavior of the other connected axes.

Simulation mode in STEP 7

The simulation mode in STEP 7 is a standard function of the technology objects and is independent of PLCSIM Advanced.

If you want to move an axis in simulation mode, select the "Activate simulation" check box in STEP 7 under "Technology Object > Configuration> Basic Parameters > Simulation". No additional setting is required for a virtual axis.

Feedback of the axis position

The speed setpoint of the simulated drive is integrated into the actual position value with a time delay (PT1). The result of this calculation is returned to the technology object as position actual value of the axis.

Reference point approach of the axis

If you selected "Use zero mark via PROFIdrive frame" in STEP 7 for the reference point approach, PLCSIM Advanced responds immediately to any active (mode 2, 3, 8) or passive (mode 4, 5) reference point approach command (MC_Home). The actual position is predefined as the reference point.

Additional information

Information on "Setting in the drive and encoder connection" for actual value calculation of a virtual axis and on the topic "Virtual axis/Simulation" is available in the S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326) function manual.

3 Installing

3.1 Introduction

3.1.1 System requirements

You need high-performance computer hardware if you intend to run multiple instances of PLCSIM Advanced at the same time or to simulate communication between PLCSIM Advanced V2.0 and HMI devices as of version 14.0.

Recommendation: Create up to 4 local instances on your PC or virtualization platform.

Minimum requirements for hardware

Preferably, you should install PLCSIM Advanced stand-alone on a Siemens field programming device or PC, independent of STEP 7. Alternatively, you can install PLCSIM Advanced on the configuration PC on which STEP 7 is already installed.

For PLCSIM Advanced to operate efficiently, the computer hardware must meet minimum requirements.

Table 3- 1 Minimum requirements for hardware

Hardware	Requirement
Processor	• 2.2 GHz Intel® Celeron® Dual Core for one instance • One further free core per additional instance
RAM	• 4 GB for one instance • 8 GB for 4 instances
Free hard disk space	5 GB
Screen resolution	Minimum 1024 x 768

Operating systems (64-bit versions)

PLCSIM Advanced V2.0 supports the following operating systems:

- Windows 7 Home Premium SP1
- Windows 7 Professional SP1
- Windows 7 Enterprise SP1
- Windows 7 Ultimate SP1
- Windows 10 Home Version 1703
- Windows 10 Pro Version 1703
- Windows 10 Enterprise Version 1703 (for Field PG M5)
- Windows 10 Enterprise 2016 LTSB
- Windows 10 IoT Enterprise 2016 LTSB
- Windows Server 2012 R2 StdE (full installation)
- Windows Server 2016 Standard (full installation)

Note

Make sure that the Windows operating system you are using is up to date.

Virtualization platforms

You can install STEP 7 and PLCSIM Advanced on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 6.5
- VMware Workstation 12.5.5
- VMware Workstation Player 12.5.5

The information that you need to install STEP 7 (TIA Portal) on a virtual machine is available on the Internet (https://support.industry.siemens.com/cs/en/en/view/78788417).

3.1.2 Licenses

Floating license

PLCSIM Advanced is supplied with a floating type license. It can be stored locally and shared for a network.

Note

Validity

A license is valid for up to three instances within a PLCSIM Advanced installation.

PLCSIM Advanced V2.0 cannot be used with a V1.0 license.

PLCSIM Advanced V1.0 can be used with a V2.0 license.

Handling licenses

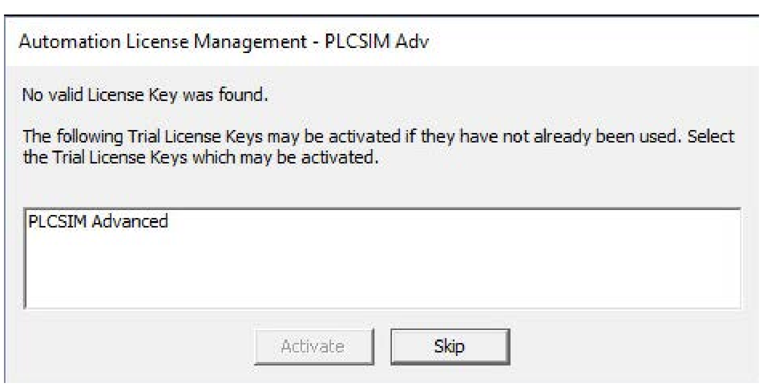
Handling of licenses is described in the Help for SIMATIC Automation License Manager (ALM).

3.1.3 Trial License

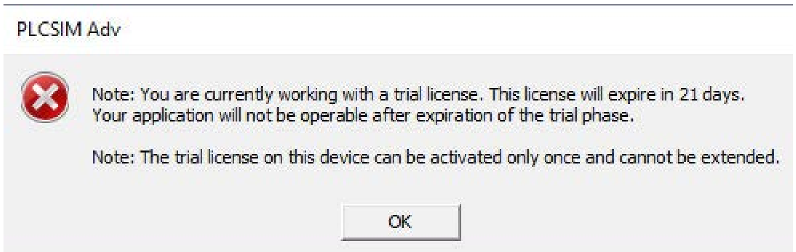
A license is available for the limited period of 21 days for S7-PLCSIM Advanced V2.0.

Activating the Trial License

As soon as you start an instance in the Control Panel, the Automation License Manager (ALM) searches the network for a valid license. If a Floating License is available for S7-PLCSIM Advanced, the ALM offers the Trial License for activation.



A message at the start of the instances shows the remaining number of days.



Note

Remote access

With remote access, the message must be confirmed on the computer on which the instance was started.

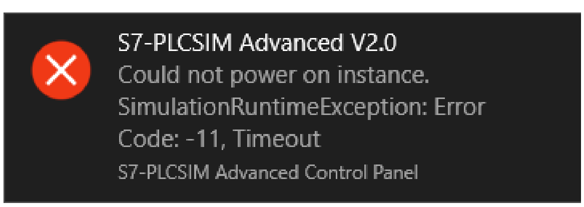
Note

Sequence of the Trial License

If no valid license is available after the Trial License has elapsed, the instance is no longer started.

Timeout alarm

If you do not confirm the message for the license in a certain amount of time, the instance is not started and the following message appears:



Remedy

Start the instance again and confirm the message for the license.

API functions for licenses

- Return values for API function PowerOn() (Page 144) and callback function OnOperatingStateChanged (Page 243)
  - `SREC_OK` when a floating license is available.
  - `SREC_WARNING_TRIAL_MODE_ACTIVE` when an instance is started with the Trial License.
- Return value for callback function `OnOperatingStateChanged`
  - `SREC_LICENSE_NOT_FOUND` when the instance is automatically shut down after 21 days.

3.1.4 Installation log

The log files contains automatically recorded information on the following installation processes:

- Installation of S7-PLCSIM Advanced
- Change or update of installation of S7-PLCSIM Advanced
- Repair of an existing installation of S7-PLCSIM Advanced
- Uninstallation of S7-PLCSIM Advanced

You can evaluate installation errors and warnings using the log files. You can troubleshoot the installation yourself or contact Siemens Technical Support. Product Support personnel need information from the installation log to analyze the problem. Send the folder with the log files as a ZIP file to Support.

Memory location of the installation log

The memory location of the log file depends on the operating system. To open the folder with the log files, enter the environment variable "%autinstlog%" in the address bar in Windows Explorer. Alternatively, you reach the appropriate directory by entering "cd %autinstlog%" in the command line.

The log files are named as follows:

- SIA_S7-PLCSIM_Advanced_V02@<DATE_TIME>.log
- SIA_S7-PLCSIM_Advanced_V02@<DATE_TIME>_summary.log

Setup_Report (CAB file)

An archive file with the installation log and all other required files is stored in CAB format. This archive file can be found at "%autinstlog%\Reports\Setup_report.cab".

If you need help during installation, send this CAB file to SIEMENS Technical Support. Technical Support personnel can troubleshoot your installation based on the information in the CAB file.

A separate CAB file with a date ID is saved for each installation.

3.2 S7-PLCSIM Advanced

The S7-PLCSIM Advanced package contains the following software:

- S7-PLCSIM Advanced
- Automation License Manager
- S7-PLCSIM V5.4
- .NET Framework
- WinPcap

The package is available as download and on DVD.

- SIMATIC S7-PLCSIM Advanced V2.0 Floating License Download
- SIMATIC S7-PLCSIM Advanced V2.0 Floating License (DVD)

  After installing PLCSIM Advanced, keep the DVD in a secure, easily accessible place.

Setup program

You can use the Setup program to change, repair or uninstall your installation, if necessary.

3.3 Installing S7-PLCSIM Advanced

Installation requirements

The Setup program starts automatically with a double-click on the download package or when you insert the DVD in the drive. Make sure that the following conditions are met before you begin the installation process:

- The hardware and software of the computer meet the system requirements.
- You have administrator rights on the installation computer.
- No other programs are active. This also applies to the Siemens Automation License Manager and other Siemens applications.
- All S7-PLCSIM versions prior or equal to V14 are uninstalled.

Note

Security settings

For licensing via the ALM, you must agree during installation that port 4410 for TCP can be entered as an exception in the Windows Firewall (procedure step 5).

Installing S7-PLCSIM Advanced

To install, follow these steps:

1. Double-click the download package or insert the installation medium into the DVD drive of your computer. The setup program starts up automatically, provided you have not disabled the Autostart function on the computer. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file. The "General settings" window is displayed.
2. Click the "Read installation notes" button. After you have read the notes, close the file.
3. Click the "Read product information" button. After you have read the information, close the file.
4. Click the "Browse" button if you want to change the default installation path. The installation path must not exceed 89 characters. The path name must not contain any UNICODE characters. If you select a different installation path than the default installation path, the desktop icon may not be displayed correctly.
5. Click "Next". The window with the security settings is displayed. To continue the installation, select the check box at the bottom of the screen to accept changes to the security and permissions settings of your system.
6. Click "Next". The window with the installation settings is displayed. You can save or print a report of the settings by clicking "Save report" or "Print report". Check the settings for correctness. If you want to make any changes, click "Back" until you reach the point in the installation process where you want to make changes. Once you have completed your changes, click "Next".

7. The overview screen shows your installation details. Click the "Install" button. The installation then starts.
8. After completion of the setup program, you must restart your computer. Select "Yes, I want to restart the computer now" to restart the computer immediately or select "No, I will restart computer later" to restart the computer later.
9. Click "Restart". If the computer is not restarted, click "Finish".

Error during installation of S7-PLCSIM Advanced

When PLCSIM Advanced is installed, any existing installation of S7-PLCSIM is displayed.

A requirement for installation of S7-PLCSIM Advanced is that no other S7-PLCSIM installation prior or equal to V14 is located on the same computer.

Even though no installation of S7-PLCSIM is displayed in the "Programs and Features" list, it is still possible that the computer has an existing installation.

Remedy

Run the setup for S7-PLCSIM prior or equal to V14 and uninstall the program.

When the setup is not available, download the setup files for S7-PLCSIM via Siemens Mall (https://support.industry.siemens.com/cs/ww/en/view/65601780).

3.4 Changing S7-PLCSIM Advanced

Requirements

The following conditions must be met before you can start changing the installation:

- The hardware and software of the computer meet the system requirements.
- You have administrator rights on the installation computer.
- No other programs are active.

Procedure

To change your S7-PLCSIM Advanced installation, follow these steps:

1. Double-click the download package or insert the installation medium into the drive. The setup program starts up automatically, provided you have not disabled the Autostart function on the computer. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
2. Follow the prompts until you reach the "Configuration" window.
3. Select the "Change upgrade" check box.
4. Follow the remaining prompts to change your installation.
5. Complete the installation operation by restarting your computer.

Note

Target directory

You cannot change the target directory because you are changing an existing installation.

3.5 Repairing S7-PLCSIM Advanced

Requirements

The following conditions must be met before you can start repairing the installation:

- The hardware and software meet the system requirements.
- You have administrator rights on the installation computer.
- No other programs are active.

Procedure

To repair your installation, follow these steps:

1. Double-click the download package or insert the installation medium into the drive. The setup program starts up automatically, provided you have not disabled the Autostart function on the computer. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
2. Follow the prompts until you reach the "Configuration" window. Select the "Repair" check box.
3. Follow the remaining prompts to repair your installation.
4. Complete the repair operation by restarting your computer.

3.6 Uninstalling S7-PLCSIM Advanced

You have two options for uninstalling S7-PLCSIM Advanced:

- You uninstall the program using the Windows Control Panel.
- You uninstall the entire product using the Setup program.

Uninstalling S7-PLCSIM Advanced using the Windows Control Panel

Proceed as follows:

1. Double-click the "Programs and Features" option in the Windows Control Panel.
2. Right-click "Siemens S7-PLCSIM Advanced V2.0" and select "Uninstall".
3. Follow the prompts for uninstallation.
4. Complete the uninstallation operation by restarting your computer.

   If you do not perform a restart, the Runtime Manager continues running.

If problems occur when uninstalling PLCSIM Advanced using the Windows Control Panel, use the installation medium for uninstalling.

Uninstalling S7-PLCSIM Advanced using the Setup program

Proceed as follows:

1. Double-click the download package or insert the installation medium into the drive. The setup program starts up automatically, provided you have not disabled the Autostart function on the computer. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   If you do not perform a restart, the Runtime Manager continues running.
2. Follow the prompts until you reach the "Configuration" window. Your previous installation is detected. Select the "Uninstall" check box.
3. Follow the prompts for uninstallation.
4. Complete the uninstallation operation by restarting your computer.

   If you do not perform a restart, the Runtime Manager continues running.

Uninstalling additional software

During uninstalling the following software from the S7-PLCSIM Advanced package remains installed:

- Automation License Manager
- S7-PLCSIM V5.4
- .NET Framework
- WinPcap

If you also want to uninstall this software, use the Windows Control Panel.

4 Communication paths

Local and distributed communication

The following paths are open for communication between STEP 7 V15 or higher and the instances of PLCSIM Advanced user interfaces:

Communication paths	Local	Local	Distributed
Protocol	Softbus	TCP/IP	TCP/IP
Communication interface in PLCSIM Advanced	PLCSIM	PLCSIM Virtual Ethernet Adapter	PLCSIM Virtual Ethernet Adapter
STEP 7 and instances	On a PC / VM	On a PC / VM	Distributed
Communication...			
between STEP 7 and instances	Yes	Yes	Yes
among instances	Yes	Yes	Yes
possible via OPC UA server and Web server	No	Yes	Yes
between an instance and a real hardware CPU	No	No	Yes
between an instance and a real HMI V14 and higher	No	No	Yes
between an instance and a simulated HMI V14 and higher	Yes	Yes	Yes

Softbus

Softbus is a communication path via a virtual software interface.

The communication is limited to a local PC or a virtual machine. The advantage here is that no data can be accidentally downloaded to a hardware CPU or communicate with real hardware.

Selecting a communication interface

You program the communication interface via the user interfaces (API) or select them in the Control Panel under "Online Access". The setting is valid for all generated instances. The default setting is the communication via "PLCSIM" (Softbus).

Additional network settings are necessary for the distributed communication via the "PLCSIM Virtual Ethernet Adapter" (TCP/IP), see Network addresses in the simulation (Page 66).

API functions for selecting the communication interface

- GetCommunicationInterface() (Page 133)
- SetCommunicationInterface() (Page 133)
- CommunicationInterface { get; set; } (Page 134)

See also

Interfaces - Information and settings (Page 130)

S7 PLCSIM Advanced Control Panel (Page 60)

4.1 Local communication

Local communication can be performed via the Softbus protocol or TCP/IP.

For local communication, the PLCSIM Advanced instance is on the same PC or on the same virtualization platform (VMware) as STEP 7 or another communication partner.

Local communication via Softbus

Local communication is performed via Softbus in PLCSIM Advanced by default.

This ensures that no data can be accidentally downloaded to a hardware CPU or that there is communication with real hardware.

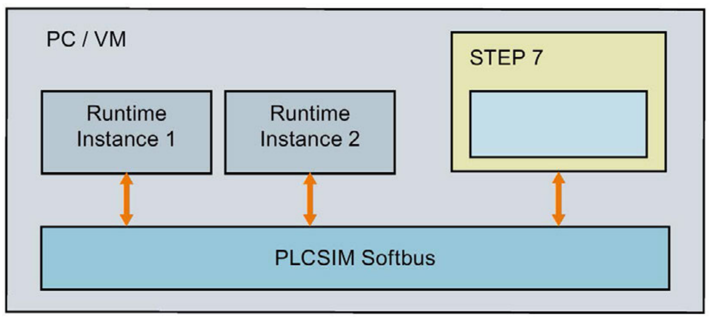


Figure 4-1 Local communication via Softbus

Local communication via TCP/IP

Communication is performed via the PLCSIM Virtual Ethernet Adapter, a virtual network interface that behaves like a real network interface.

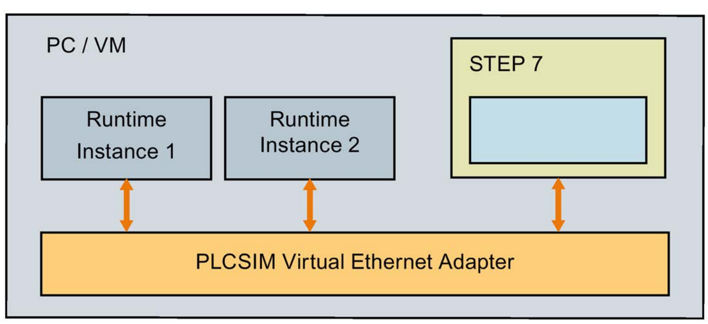

Figure 4-2 Local communication via TCP/IP

4.2 Communication via TCP / IP

Distributed communication

Distributed communication via TCP/IP means that the PLCSIM Advanced instances communicate with the other devices via the Virtual Switch . Communication is possible with real or simulated CPUs, real or simulated HMIs.

The PLCSIM Virtual Switch must be activated on the PLCSIM Virtual Ethernet Adapter for instances on the network to be visible.

Example 1: Distributed communication

In the following example, STEP 7 is on a PC and the PLCSIM Advanced instances are on another PC. The PCs are connected via the Ethernet adapter.

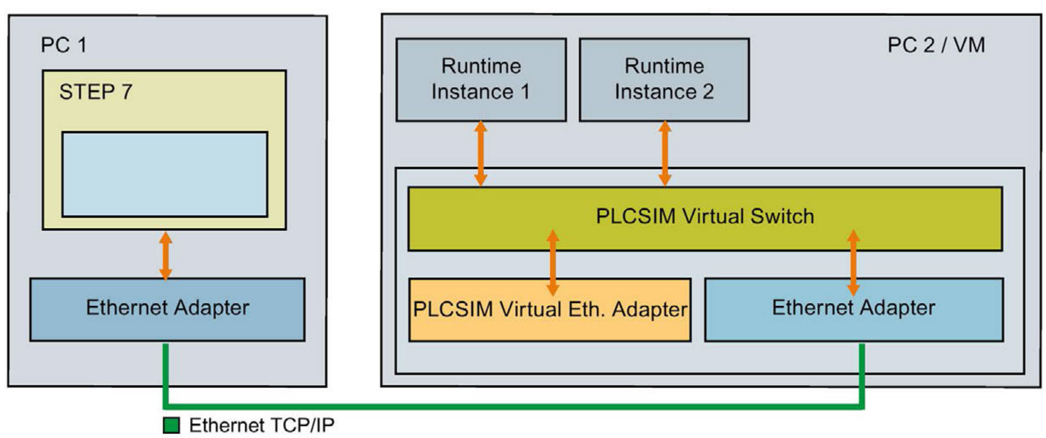

Figure 4-3 Distributed communication via Ethernet

Example 2: Distributed communication

In the following example, STEP 7 is on a PC and the PLCSIM Advanced instances are on a virtual machine on the same PC. PC and virtual machine are connected via the network adapters.

Recommendation

Use to ensure the VMware settings as the network adapter type for the Bridged Mode to ensure error-free operation.

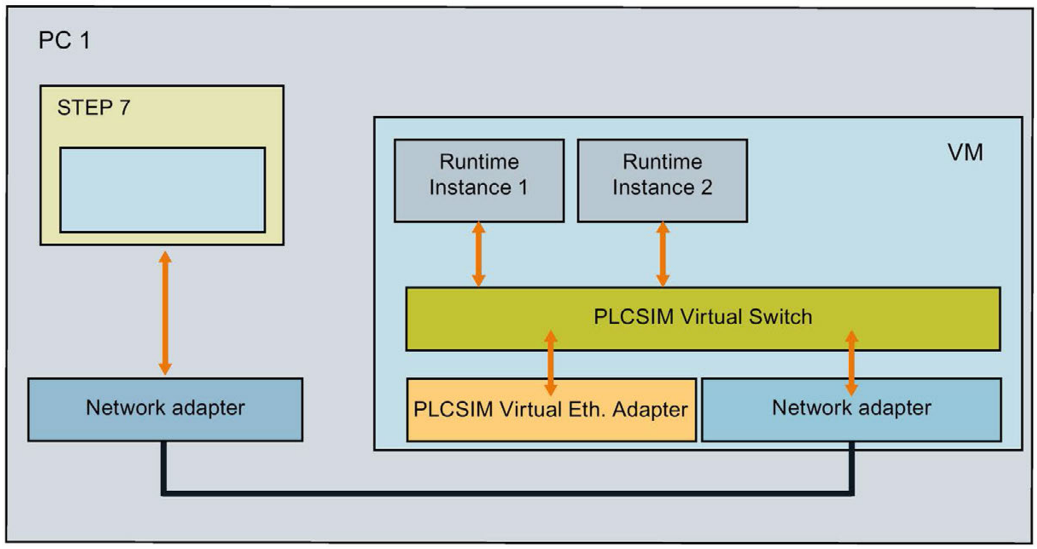

Figure 4-4 Distributed communication via network adapters

4.3 Enable distributed communication

By default, the PLCSIM Virtual Switch can only communicate locally. For a distributed, i.e. multi-computer, communication to be possible, you must activate the PLCSIM Virtual Switch for a real network adapter.

Note

Network adapter

Make sure that only one network adapter of the PLCSIM Virtual Switch is activated.

The Control Panel of PLCSIM Advanced checks the activation and may report an incorrect configuration (error code -50).

Activate PLCSIM Virtual Switch

To make the PLCSIM instances visible on the network and to reach other devices, activate the PLCSIM Virtual Switch in the Control Panel of PLCSIM Advanced or under Windows:

1. To do this, open the "Network and Sharing Center" in the Windows Control Panel.
2. Open the properties of the desired network adapter, for example, for the "Local Area Connection".
3. Select the check box for the "Siemens PLCSIM Virtual Switch" and confirm with OK.

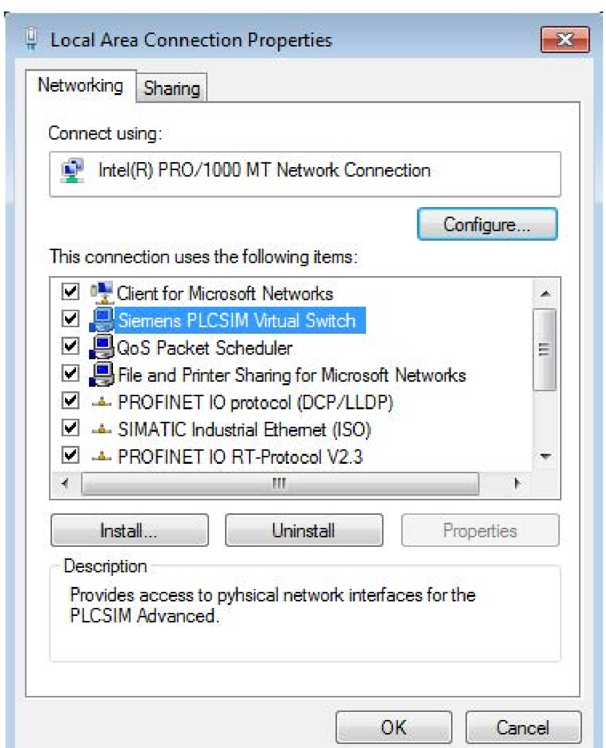

Figure 4-5 Activate PLCSIM Virtual Switch

Accessible devices

When the PLCSIM Virtual Switch is activated, STEP 7 shows the devices available on the Virtual Ethernet Adapter in the project tree.

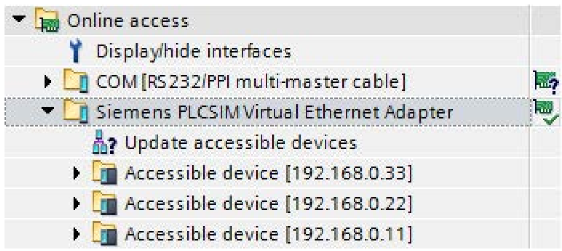

Figure 4-6 Accessible devices on the Virtual Ethernet Adapter

Distributed communication via WLAN

When using distributed communication via WLAN, it may happen that the WinPcap software installed by PLCSIM Advanced does not work with the integrated WLAN adapter of the computer. In this case, no WLAN connection can be established.

Remedy

Use the wired network adapter of the PC/notebook and connect a WLAN adapter upstream.

Simulate CPU 5

5.1 Basic procedure for the simulation

The following overview shows the basic steps to perform simulation with an instance of a virtual controller.

Requirements

The following requirements must be met for starting simulation via local communication:

- STEP 7 as of V14 and S7-PLCSIM Advanced V2.0 are installed on the same PC.
- The CPU hardware is configured in STEP 7.

Note

Enable simulation support

In the "Protection" tab in the properties of the project in STEP 7, select the check box "Support simulation during block compilation".

Create and activate an instance via the Control Panel

- Open PLCSIM Advanced Control Panel
- Open the "Start Virtual S7-1500 PLC" options
- Enter a name for an instance
- Select CPU type
- Create an instance using the "Start" button

In STEP 7, perform the download and start the simulation

- Download the program to the virtual controller
- Switch the controller to RUN to start the simulation
- Perform diagnostics
- ...

Simulations support (Page 33)

5.2 User interface

5.2.1 S7 PLCSIM Advanced Symbol

After installing PLCSIM Advanced, the following icons are on the Windows desktop:

Figure 5-1 PLCSIM Advanced Symbol

After double-clicking the icon, the icon appears in the taskbar of the information area.

You can use Windows functions to permanently display the icon in the information area of the taskbar.

Opening a graphical interface

Right-clicking on the icon in the taskbar opens the graphical interface of PLCSIM Advanced, the Control Panel.

If the Control Panel is open, you can use the mouse-over function to display messages about the current status of the instances.

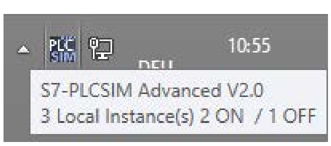

Figure 5-2 Example: Message in the taskbar

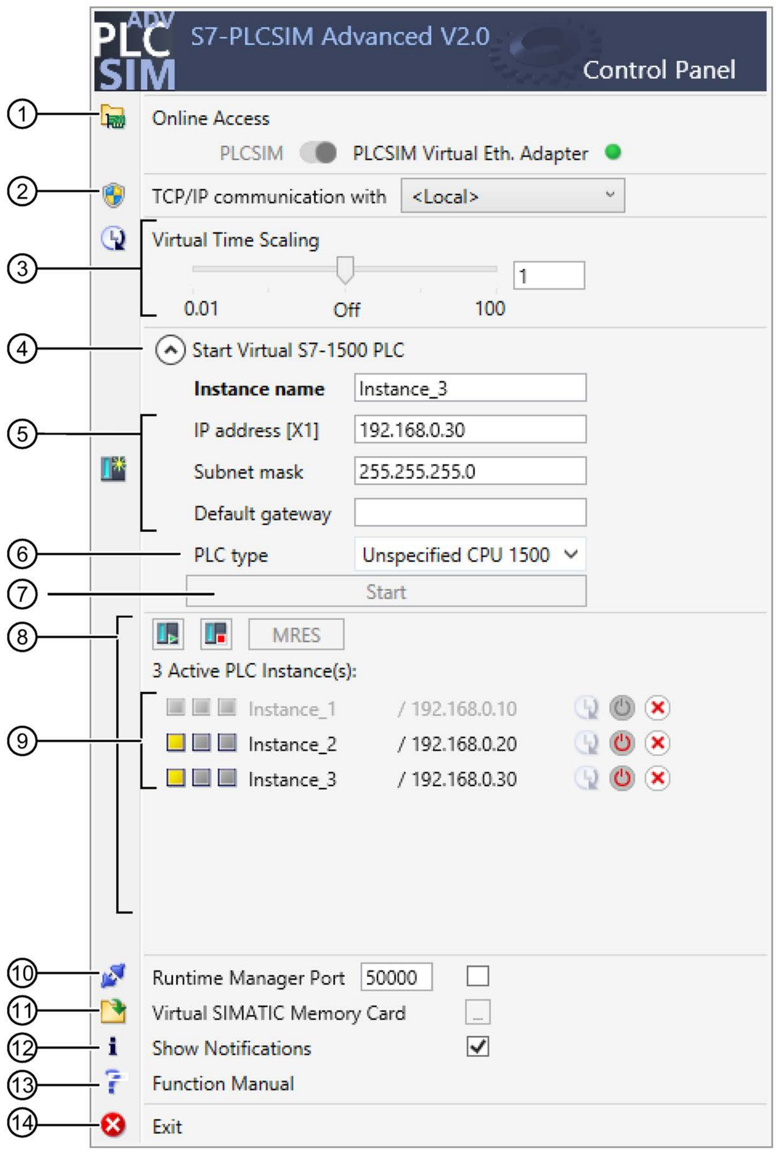
5.2.2 S7 PLCSIM Advanced Control Panel

Control Panel

The Control Panel is optional and is not needed to use PLCSIM Advanced via the API. It is available in English in version 2.0.



①	Online access	Switch to select the communication interface
②	TCP/IP communication	Selection of network adapter for distributed communication
③	Virtual time	Slider to adjust the scaling factor
④	**Start Virtual S7-1500 PLC**	
	Name of the instance	Here you enter a unique name for the instance. Enter a minimum of 3, a maximum of 64 characters. If the name is unique in the network, the "Start" button is enabled.

⑤	• IP address • Subnet mask • Standard gateway	The input boxes are visible when you switch the communication interface to "PLCSIM Virtual Ethernet Adapter". The IP address is entered automatically.
⑥	CPU type	Here you select the type of CPU to be simulated.
⑦	"Start" button	Use the button to create and start an instance with the entered or selected name.
⑧	Instance list	The "RUN", "STOP" and "MRES" buttons for the operating mode and memory reset. The list displays the available **local** instances of the CPUs.
⑨	LED displays	The meaning of the LED is displayed when you move the mouse over it.
⑩	Runtime Manager Port	Here you open a port on the local PC.
⑪	Virtual SIMATIC Memory Card ...	Open an Explorer window here in which you select the path to the virtual memory card.
⑫	Display messages	Here you disable the PLCSIM Advanced messages in the Windows task bar for the duration of the operation.
⑬	Function manual	This is where you open the S7 PLCSIM Advanced Function Manual in a standard PDF viewer.
⑭	Exit	Exit switches all instances off and closes the Control Panel.

Figure 5-3 Control Panel

Switch for communication interface

Use the switch to select the communication interface for all instances to be created:

- "PLCSIM corresponds to the local communication via Softbus (default).
- "PLCSIM Virtual Ethernet Adapter corresponds to the communication via TCP/IP.

The setting applies to all other instances. The selected communication interface for starting an instance is maintained until all instances are shut down.

When an instance is already started, it sets "its" communication interface as the default for other instances.

To change the communication interface, switch off all instances and enable the other interface.

TCP/IP communication

You can select a real network adapter from the drop-down list during operation. You thus activate the PLCSIM Virtual Switch and establish TCP/IP communication between the instances and the real network.

The <Local > setting disables the PLCSIM Virtual Switch and disconnects the instances from the real network. Only local TCP/IP communication over virtual adapter is possible in this case.

Virtual time

Use the slider or the mouse wheel to select the scaling factor for the virtual time.

The selected scaling factor applies to the instances for which the virtual time is enabled.

Clicking on "Off" restores the default (1) again. For more information, seeVirtual time response (Page 73).

Create instance (local)

To create an instance, enter a unique name under "Instance Name". If the name already exists in the directory of the Virtual SIMATIC Memory Card, the existing instance is started.

In the "PLC-Type" drop-down list, select the Unspecified CPU 1500 or Unspecified ET 200SP CPU type. The CPU is named with the first download of the TIA Portal.

Recommendation: Create up to 4 local instances on your PC or virtualization platform. Remote instances cannot be created through the Control Panel.

Instance list

The list contains the active instances of the CPU that are started locally on the PC or virtualization platform. Instances that have already been started on the runtime API are detected and displayed in the list.

Select the operating mode of the instance with the "RUN" and "STOP" buttons. Select one or more instances for this purpose. Perform a memory reset with the "MRES" button.

The LED displays show the status of the instance that corresponds to those of the hardware CPU.
RUN and STOP are displayed depending on the current operating state of the instance.

You can "operate" the instance with icons:

Apply scaling factor for the virtual time, disable virtual time,

Switch on instance, Switch off instance,

Switch off instance and log out of the Runtime Manager

Runtime Manager Port

A remote connection can be established to another Runtime Manager via the specified port. The value must be greater than 1024.

If you select the check box, the port remains stored. You can use the remote connection without having to make this setting every time you start the Control Panel. To use this functionality, the Control Panel must be started and running in the background.

Virtual SIMATIC Memory Card

The user program, the hardware configuration and the retentive data are stored on the Virtual SIMATIC Memory Card. Use the button to open an Explorer window in which you select the path to the virtual memory card or in which the path is displayed.

Display messages

Each time the panel starts, help information and messages relating to the Control Panel are displayed, for example, when changing the IP address or when a license is missing. Disable the display if you do not need the messages.

Exit

- The command switches off all local instances on the PC or the VM and logs them off from the Runtime Manager.
- This command closes the Runtime Manager if there is no remote connections to other Runtime Managers.
- If the Runtime Manager has remote connections to instances on additional PCs, these instances and the Runtime Manager continue to run.

Minimize Control Panel

Clicking on an empty area on the desktop minimizes the Control Panel. The instances are not affected.

5.3 Download

Requirements

You can download the STEP 7 project to the virtual controller when the following conditions are met:

- The instance is created via the Control Panel.
- The check box "Support simulation during block compilation" is selected.

Selecting the communication interface

In the Download dialog box, select the PG/PC interface:

- "PLCSIM" for download via Softbus
- "Siemens PLCSIM Virtual Ethernet Adapter" for download via TCP/IP
- For distributed communication the real adapter that is connected to the network

Display in the download dialog

The dialog in STEP 7 at the first download of the CPU shows the compatible PLCSIM Advanced instances.

If the instance has not yet been configured after the first download only **one** interface is visible and it appears with the device type "CPU-1500 Simulation".

If the instance has been configured, the number of interfaces visible is determined my the number the CPU type has.

The lifelist shows the interfaces of an instance with their IP addresses.

Perform download

1. Select the PG/PC interface.
2. Click "Download".

   → In the "Load preview" window, STEP 7 shows the message "The downloads are performed on a simulated CPU".

   → After the first download, the PLCSIM Advanced instance displays the CPU type.

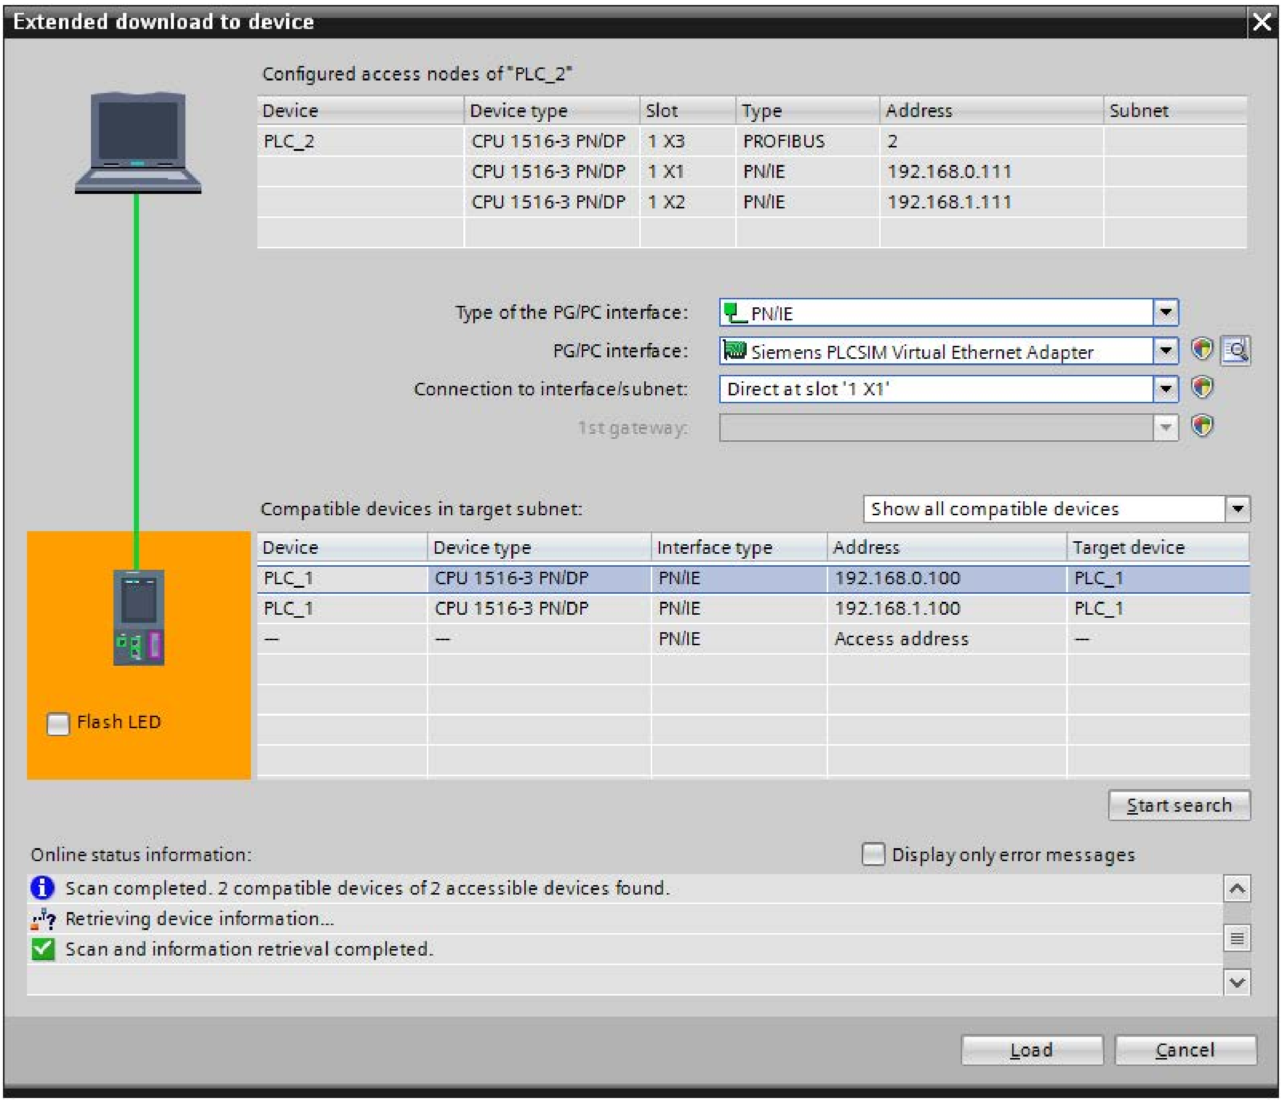


Figure 5-4 Example: Download via the "PLCSIM Virtual Ethernet Adapter" (TCP/IP) after naming

5.4 Network addresses in the simulation

5.4.1 Siemens PLCSIM Virtual Ethernet Adapter

IP address

At the PLCSIM Virtual Ethernet Adapter you assign a static IP address or obtain an IP address via DHCP (default).

MAC address

A randomly generated MAC address is assigned to the PLCSIM Virtual Ethernet Adapter during its installation.

PLCSIM Advanced only uses MAC addresses that are designated as "locally administered" (bit 2 in LSB).

The Siemens-specific prefix is: 02-1B-1B

Three bytes follow, which are determined at random.

Storage location

This MAC address is stored in the registry key "PlcsimvminiMacAddress".

You can overwrite this value.

5.4.2 PLCSIM Advanced instances

Detect CPUs and instances

If Ethernet interfaces of CPUs and PLCSIM Advanced instances are mixed in a network, the instances can be recognized by the "PLCSIM" suffix on the station type.

Structure of the MAC address for an instance

The following figure shows the structure of the dynamically generated, locally managed MAC address:

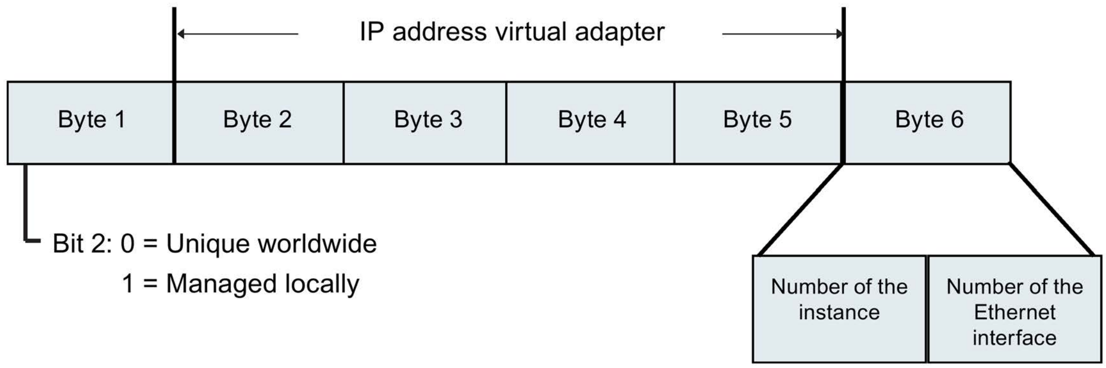

Figure 5-5 Structure of the MAC address for an instance

The MAC address tells you the PC on which a PLCSIM Advanced instance has been started.

Assignment of the Ethernet interfaces

Port configurations of the Ethernet interfaces cannot be simulated in PLCSIM Advanced V2.0. Topological interconnection is not supported. A MAC address for a port is reserved internally for each Ethernet interface.

Table 5- 1 Assignment of the Ethernet interfaces, for example, for a CPU 1518-4 PN/DP

Ethernet interface	Last digit of the MAC Address
IE 1 IE 1 / Port 1	...........0 1
IE 2 IE 2 / Port 1	...........2 3
IE 3 IE 3 / Port 1	...........4 5

Example

02-C0-A8-00-83-10 means:

02 → locally managed MAC address of a PLCSIM Advanced instance

C0-A8-00-83 → IP of the Siemens PLCSIM Virtual Ethernet adapter = 192.168.0.131

1 → Instance 1

0 → Ethernet interface IE 1

If no Virtual SIMATIC Memory Card is loaded during startup of PLCSIM Advanced, the interfaces of PLCSIM Advanced display instances with their locally managed MAC address.

5.5 Simulate peripheral I/O

The Runtime API writes to and reads from a memory area. This memory is synchronized with the internal process image of the virtual S7-1500 controller at the cycle control point and when calling cyclic and acyclic OBs (process image partitions, interrupts, events). The direct I/O accesses are made to this memory area. Only one process can access this memory at a given time.

The virtual controller must be in RUN to apply changes made by the API.

Note

Dominance of the API when synchronizing

The API dominates when synchronizing. If the user program writes to the same address range as the API, the changes of the API overwrite those of the virtual controller.

See also

Deviating I/O values in the STEP 7 user program (Page 356)

5.6 Simulate communication

5.6.1 Communication services that can be simulated

PLCSIM Advanced V2.0 supports the following communication options:

Table 5- 2 Supported communication options

Communications options	Functionality / instructions
PG communication	On commissioning, testing, diagnostics
Open communication using TCP/IP	• TSEND_C / TRCV_C • TSEND / TRCV • TCON[1, 3] • T_DISCON
Open communication using ISO-on-TCP	• TSEND_C / TRCV_C • TSEND / TRCV • TCON • T_DISCON
Open communication via UDP[2]	• TUSEND / TURCV • TCON • T_DISCON
Communication via Modbus TCP	• MB_CLIENT • MB_SERVER
E-mail[2, 3]	• TMAIL_C
S7 communication	• PUT / GET • BSEND / BRCV • USEND / URCV
OPC UA Server[2]	Data exchange with OPC UA clients
Web server[2, 3]	Data exchange via HTTP

1 When the "PLCSIM" interface (Softbus) is set, communication is performed **internally** via ISO-on-TCP.

2 Only via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP)

3 Secure TCP communication is not supported.

Special conditions apply when communicating with TUSEND/TURCV, see Restrictions for communications services (Page 351).

TMAIL_C

When the TMAIL_C instruction is used, the mail server may not be located on the same computer as the PLCSIM Advanced instance.

Remedy

Make the mail server available via a different computer in the network.

5.6.2 Communication between instances

PLCSIM Advanced supports communication between instances. An instance may be a simulation in PLCSIM Advanced V2.0 or a simulation in WinCC Runtime as of V14.

You can run two instances of PLCSIM Advanced, which then communicate with each other. To enable instances to communicate with each other, they must have a unique IP address.

Each simulated CPU requires a unique IP address

If the CPUs have the same IP address, you cannot run multiple simulations. Each simulated CPU requires a unique IP address.

Make sure that the IP addresses in STEP 7 are unique before you start your simulations.

T-block instructions and UDP

PLCSIM Advanced simulates T-block connections for which the UDP protocol is configured only via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP).

T-block instructions and data segmentation

PLCSIM Advanced implements T-block instructions with a data segmentation of 4 KB. A real CPU has data segmentation of 8192 bytes.

If you send more than 4 KB in a single TSEND instruction and receive data in ad hoc mode with a TRCV instruction, the TRCV instruction generates new data with only 4 KB. You must perform the TRCV instruction several times to receive additional bytes.

5.7 Provide project data offline for simulation

Simulations regardless of STEP 7

To perform simulations independent of STEP 7, you can save the user program and the hardware configuration in STEP 7 in a directory.

Provide project data offline

1. Create a "User-defined Card Reader" for your project data under Card Reader/USB storage in the project tree of STEP 7 for the CPU.
2. In the "Load preview" dialog for the target device, select "PLC Simulation Advanced" as an action, click in the selection field for this.
   → The project is saved to the <Virtual Memory Card>\SIMATIC.S7S\OMSSTORE directory.
3. Save the folder\SIMATIC.S7S with the project data to a medium of your choice.

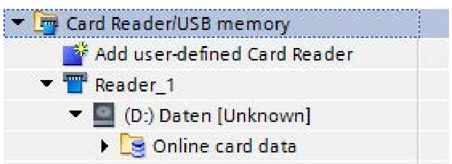

Figure 5-6 Add card reader

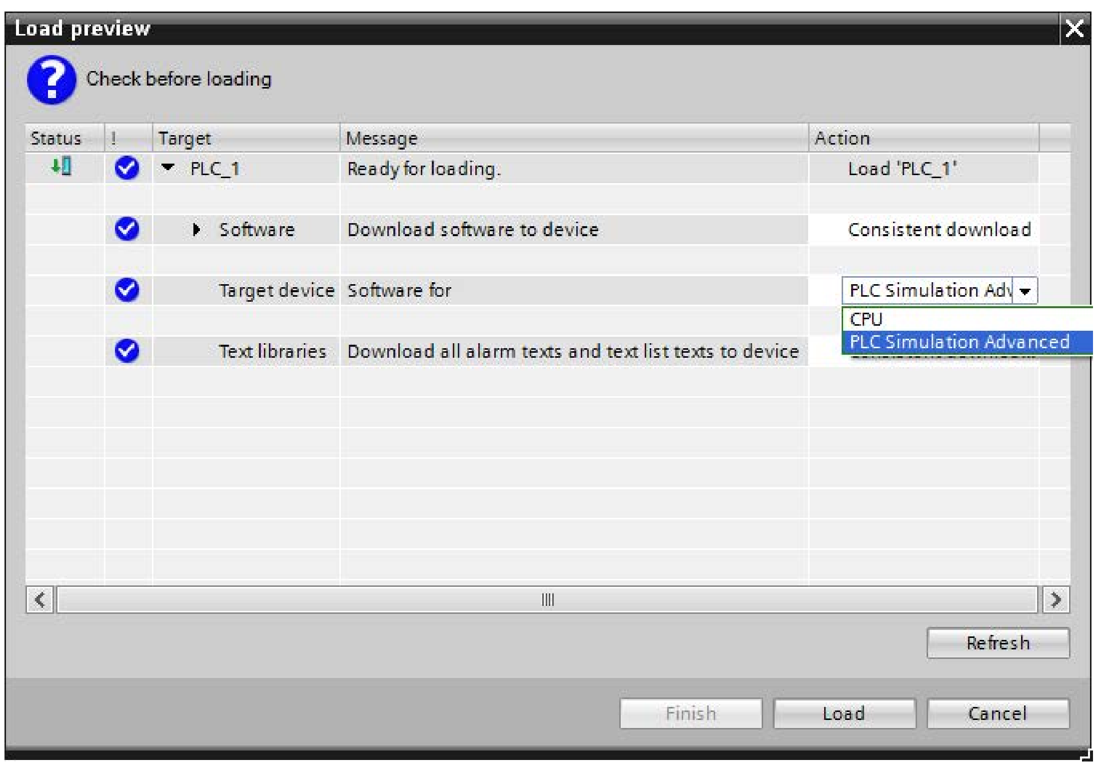

Figure 5-7 Preview of download dialog

Provide project data for simulation

1. On the PC on which PLCSIM Advanced is installed, create the directory \SIMATIC_MC in the directory in which the instance saves its data.
2. Move the \SIMATIC.S7S folder to the directory you have created.
   → The instances can be started with the project data.

API functions

The project data can be used for an instance via the user interface. Use of the following functions for this:

API functions

- GetStoragePath() (Page 140)
- StoragePath { get; set; } (Page 141)

See also

Controller - Information and settings (Page 136)

6 Virtual time response

The virtual controller uses internally two types of clocks for simulation: A virtual clock and a real clock. The virtual clock is always the basis for the user program. It is used by components that are relevant for running the STEP 7 user program, such as cyclic OBs, cycle time monitoring, minimum cycle time, virtual system time and time calculations. Also, the time between two cycle control points is measured in virtual time.

The virtual time can be accelerated or slowed for test purposes.

The real clock always runs unchanged. It is used by components that are not subject to control processes, for example, communication with STEP 7.

Virtual system time

When you start PLCSIM Advanced, the virtual system time of the virtual controller starts with the system time of Windows.

The virtual system time is based on the virtual clock, i.e. if a scaling factor is used, the system time runs correspondingly faster or slower.

All events that the virtual controller sends to the API provides a time stamp based on the system time.

Note

Difference between system time and local time

- System time: UTC ± 0 with daylight saving / standard time
- Local time: UTC ± time zone with daylight saving time / winter time

---

API functions

- GetSystemTime() (Page 220)
- SetSystemTime() (Page 221)
- SystemTime { get; set; } (Page 221)

Time offset

Note

Keep in mind that the time information of virtual system time and real local time differs by the time offset that is formed in addition to the selected scaling factor from the time zone offset and the daylight saving time/standard time offset.

Scaling factor

Using a scaling factor, you can speed up or slow down the virtual clock of the virtual controller for simulations.

- The default is 1, i.e. the course of the virtual time corresponds to the course of real time.
- **Fast forward:** A scaling factor greater than 1 accelerates the virtual clock.

  Example: Scaling factor 2.0 → The virtual time is running twice as fast.
- **Slow motion**: A scaling factor less than 1 decelerates the virtual clock.

  Example: Scaling factor 0.5 → The progress of the virtual time slows down to 50%.

API functions

- GetScaleFactor() (Page 221)
- SetScaleFactor() (Page 222)
- ScaleFactor { get; set; } (Page 223)

See also

Settings for the virtual time (Page 220)

6.1 Speed up and slow down simulation

Influence of fast forward and slow motion

Simulations can be accelerated and slowed down. Fast forward and slow motion only affects time-based components, for example, cyclic OBs. Compared to the real time, they are performed more frequently with fast forward and less frequently with slow motion.

Fast forward and slow motion do not change the execution speed of the CPU machine codes. For example, the speed at which all operations of an OB1 cycle are executed does not change. The execution speed depends on the processor of the PC on which the virtual controller running. If you change the scaling factor, more or fewer cycle control points are reached in a given period of virtual time.

Fast forward

To speed up the virtual time, select a scaling factor greater than 1 in the Control Panel or in the API.

Note

Performance

The performance depends on the size of your project, among other things.

If the scaling factor is too high and the cycle-time monitoring indicates that the PC was incapable of calculating the OB1 or cyclic OBs in the specified time, the virtual controller goes to STOP.

Recommendation: To avoid this, start with a small scaling factor and gradually increase it step-by-step while keeping the virtual controller in RUN.

Slow motion

To slow down the virtual time, select a scaling factor less than 1 in the Control Panel or in the API.

API functions

- GetScaleFactor() (Page 221)
- SetScaleFactor() (Page 222)
- ScaleFactor { get; set; } (Page 223)

Cycle control (Page 223)

Settings for the virtual time (Page 220)

Error with overflow of cyclical events and motion OBs (Page 355)

6.2 Stop simulation

Freeze state of the virtual controller

To stop a simulation and to synchronize a simulation partner, a virtual controller can be set to a freeze state via the API. When the virtual controller has reached a synchronization point, it sends the event `OnSyncPointReached` to the API clients.

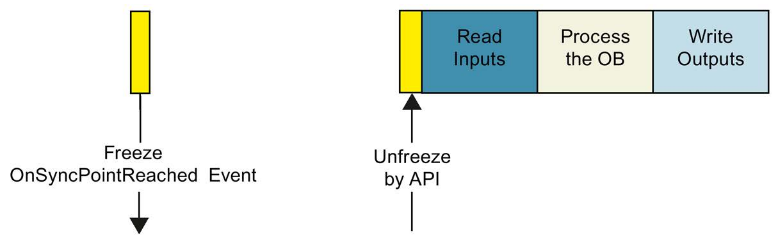

Figure 6-1 Freeze state of the virtual controller

The following occurs in the freeze state:

- The virtual time is stopped.
- No OBs and no timers are running.
- The user program is no longer executed.
- The virtual controller is still accessible from the TIA Portal.
- The input and output data of the virtual controller are in a consistent state.

Note

Cancelation of the freeze state during downloading

During a download the freeze state is canceled. After completion of the download the virtual controller at the synchronization point is reset to the freeze state.

Note

Freeze-state ≠ operating state

The freeze state is an internal operating state of the virtual controller. It does not correspond to RUN/STOP mode of a CPU. In the freeze state, the virtual controller maintains the last operating state.

- The LED display on the Control Panel and on the Web server accordingly shows RUN or STOP for instance.
- The instance shows the operating state `SROS_FREEZE` / `Freeze`, see EOperatingState (Page 330).

Synchronization points

A synchronization point always exists **before** inputs are read in, for example at the cycle control point or at the beginning of a cyclic OB.

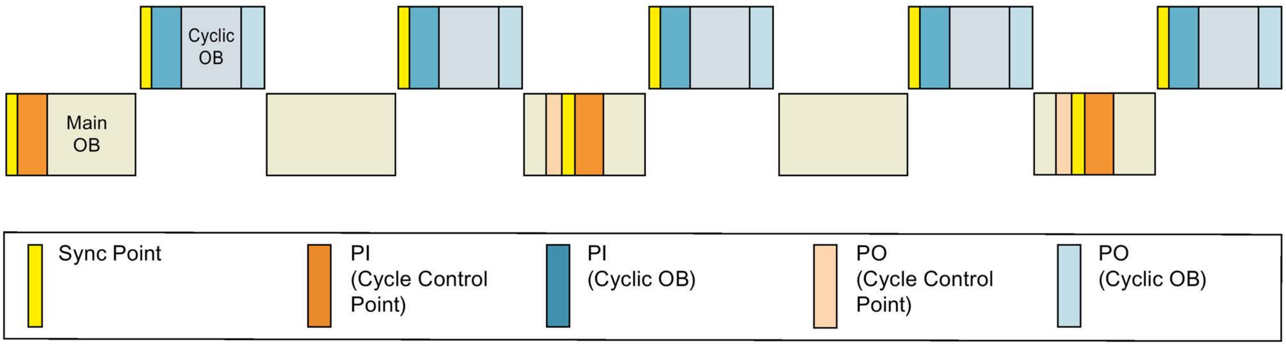

Figure 6-2 Overview of the synchronization points

Trigger freeze state

To trigger the freeze state, following modes are available for the virtual controller:

- SingleStep operating modes

  See Synchronize simulation partner cycle-controlled (Page 78).
- TimespanSynchronized operating modes

  See Synchronize simulation partner time-controlled (Page 80).

In Default operating mode, the virtual controller does not change into a freeze state.

API functions

- Settings for the cycle control (Page 223)
- GetOperatingMode() (Page 223)
- SetOperatingMode() (Page 223)
- OperatingMode { get; set; } (Page 224)
- EOperatingMode (Page 331)

6.3 Synchronize simulation partner

6.3.1 Synchronize simulation partner cycle-controlled

SingleStep operating modes

Several simulation partners (clients) are synchronized cycle-controlled with the SingleStep operating modes of the virtual controller. The operating modes define the synchronization point at which the virtual controller changes to the freeze state and sends the `OnSyncPointReached` event.

Table 6- 1 Cycle-controlled operating modes (SingleStep)

Operating mode	Synchronization point		Minimum cycle time[1]
	Cycle control point	Before reading in the process image partition	
	"C"	"P"	"T"
`SingleStep_C`	✓		
`SingleStep_P`		✓	
`SingleStep_CP`	✓	✓	
`SingleStep_CT`	✓		✓
`SingleStep_CPT`	✓	✓	✓

[1] In addition, the minimum cycle time of the OB 1 is overwritten in this operating mode. When you define a minimum cycle time of 200 ms via the API, the minimum distance between two cycle control points is 200 virtual milliseconds. The default setting is 100 ms.

API functions / events

- GetOverwrittenMinimalCycleTime_ns() (Page 225)
- SetOverwrittenMinimalCycleTime_ns() (Page 225)
- OverwrittenMinimalCycleTime_ns { get; set; } (Page 226)
- RunToNextSyncPoint() (Page 226)
- OnSyncPointReached (Page 247)
- EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32 (Page 284) / Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32 (Page 296)

Terminating the freeze state

The `RunToNextSyncPoint()` function cancels the freeze state and induces the virtual controller to continue running until the next synchronization point.

Switching to the Default operating mode also terminates the freeze state.

Example

The figure schematically shows the sequence in the `SingleStep_CP` operating mode.

In addition to the `OnSyncPointReached` event the virtual controller also sends the virtual time since the last synchronization point of the same process image partition ID or of any process image partition ID has been reached (`TimeSinceSameSyncPoint_ns` / `TimeSinceAnySyncPoint_ns`).

The `RunToNextSyncPoint()` function cancels the freeze state.

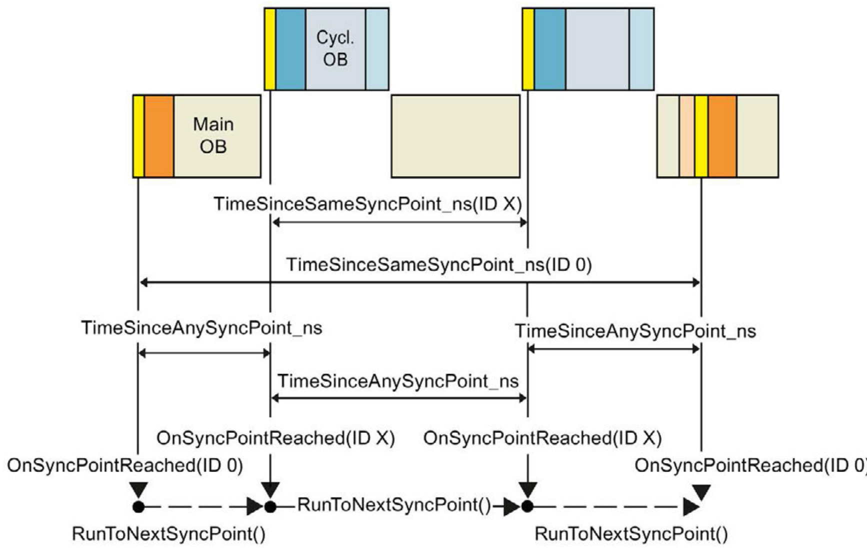

Figure 6-3 Example: Sequence in the SingleStep_CP operating mode

Changing the settings in the watch table

Note

Selecting triggers for monitoring of tags in the SingleStep operating modes

In TIA Portal the watch table in basic mode shows the values for outputs and bit memories **before** the processing.

In order to display the tag values **after** the processing, select the extended mode for the watch table and then select "Permanently, at end of scan cycle" in the "Monitor with trigger" column.

See also

Cycle control (Page 223)

6.3.2 Synchronize simulation partner time-controlled

TimespanSynchronized operating modes

Several simulation partners (clients) are synchronized time-controlled with the TimespanSynchronized operating modes of the virtual controller. The operating modes define the synchronization point at which the virtual controller changes to the freeze state and sends the `OnSyncPointReached` event.

Table 6- 2 Time-controlled operating modes (TimespanSynchronized)

Operating mode	Synchronization point	
	Cycle control point	Before reading in the process image partition
	"C"	"P"
`TimespanSynchronized_C`	✓	
`TimespanSynchronized_CP`	✓	✓
`TimespanSynchronized_P`		✓

API functions / events

- Settings for cycle control (Page 223)
- StartProcessing() (Page 227)
- OnSyncPointReached (Page 247)

Terminating the freeze state

The `StartProcessing(t)` function cancels the freeze state and induces the virtual controller to continue running at least as long as required (on the basis of the virtual time) before it changes back to the freeze state at the next synchronization point.

Switching to the Default operating mode also terminates the freeze state.

Example

The figure schematically shows the sequence in the `TimespanSynchronized_CP` operating mode.

In addition to the `OnSyncPointReached` event the virtual controller also sends the runtime since the last call of the `StartProcessing`(t) (`TimeSinceSameSyncPoint_ns` / `TimeSinceAnySyncPoint_ns`) function.

The `StartProcessing()` function cancels the freeze state.

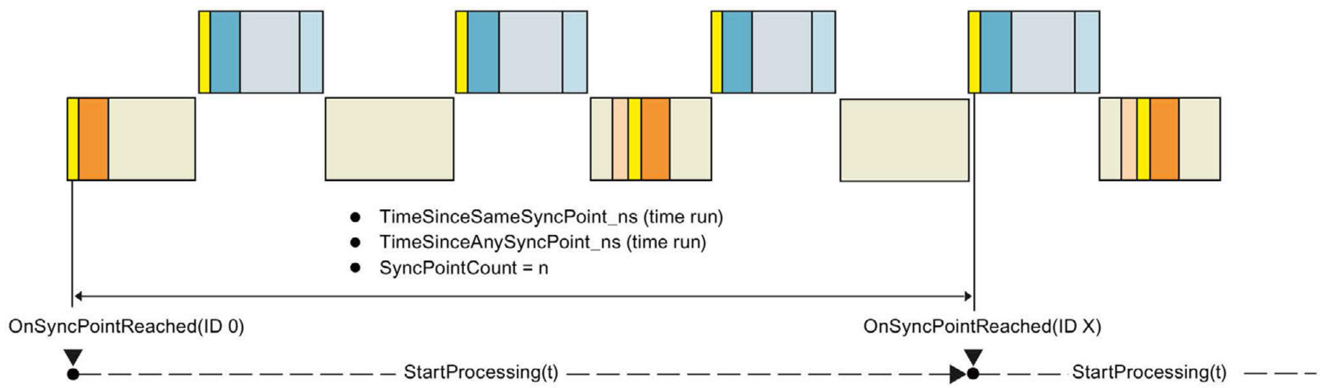

Figure 6-4 Example: Sequence in the TimespanSynchronized_CP operating mode

Description

At least two clients are synchronized on the basis of a virtual period for the time-controlled operating modes. A client can be an instance of a virtual controller or an application that uses the Runtime API (API client). The synchronization must be performed by a synchronization master.

The synchronization master instructs a client to run for a specific period. The time period is specified by the master in nanoseconds. The client then runs for the expected period before he goes into the freeze state at the next synchronization point. Before switching to the freeze state, the client sends the master the exact amount of time that he currently needed. Thereafter, the master signals the next client to catch up.

API client as master

The API client as master signals each client when it should start. The master receives events from every client when they occur.

An API client can only "time manage" instances of a virtual controller. The API client does not receive events from other API clients. It cannot send messages to other API clients.

7 User interfaces (API)

7.1 Introduction

Components of the Simulation Runtime

The following components are relevant for handling the Simulation Runtime of PLCSIM Advanced:

- Runtime
  - Siemens.Simatic.Simulation.Runtime.Manager.exe
  - Siemens.Simatic.Simulation.Runtime.Instance.exe
- Libraries
  - Siemens.Simatic.Simulation.Runtime.Api.x86.dll
  - Siemens.Simatic.Simulation.Runtime.Api.x64.dll
  - SimulationRuntimeApi.h
- Documentation of interfaces with examples in native C++ and .NET (Managed Code)

Description

Runtime and libraries	Description
Siemens.Simatic.Simulation. Runtime.Manager.exe	A Windows process that runs in the background. Main component of Runtime that manages all other Runtime components. The process is started automatically as soon as an application attempts to initialize the Runtime API. It is ended automatically as soon as there is no longer any application running that initialized the Runtime API.
Siemens.Simatic.Simulation. Runtime.Instance.exe	The process of the instance that loads a DLL of a virtual controller. Each virtual controller generates its own process.
Siemens.Simatic.Simulation. Runtime.Api.x86.dll Siemens.Simatic.Simulation. Runtime.Api.x64.dll	API libraries that must load an application to use the Simulation Runtime. The libraries contain interfaces for native code and managed code. The "Runtime.Api.x86.dll" is loaded exclusively by 32-bit applications, and the "Runtime.Api.x64.dll" by 64-bit applications.
SimulationRuntimeApi.h	Header file that describes all data types that require a native C++ application to use the API library.

External applications and Simulation Runtime

The following figure schematically presents the access of external applications to Simulation Runtime via the Runtime API. The Simulation Runtime Manager manages the Runtime instances. These load the libraries of the virtual controllers.

An external application can be other simulation software or a graphical user interface (GUI), for example.

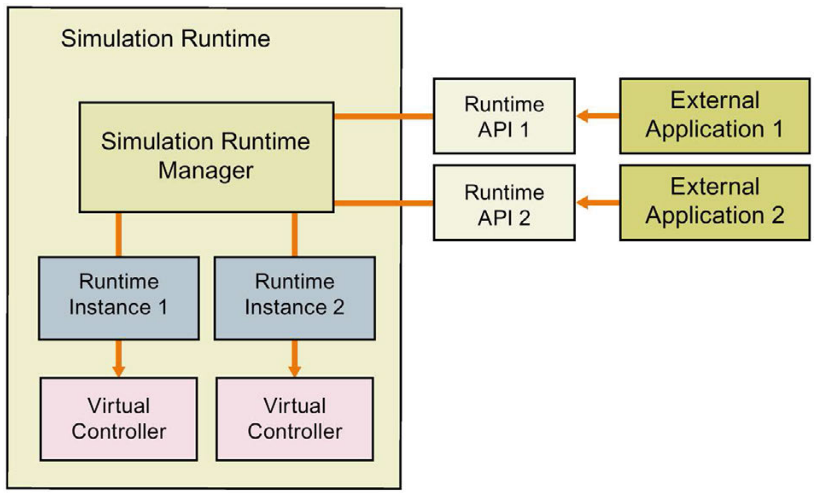

Figure 7-1 External applications and Simulation Runtime

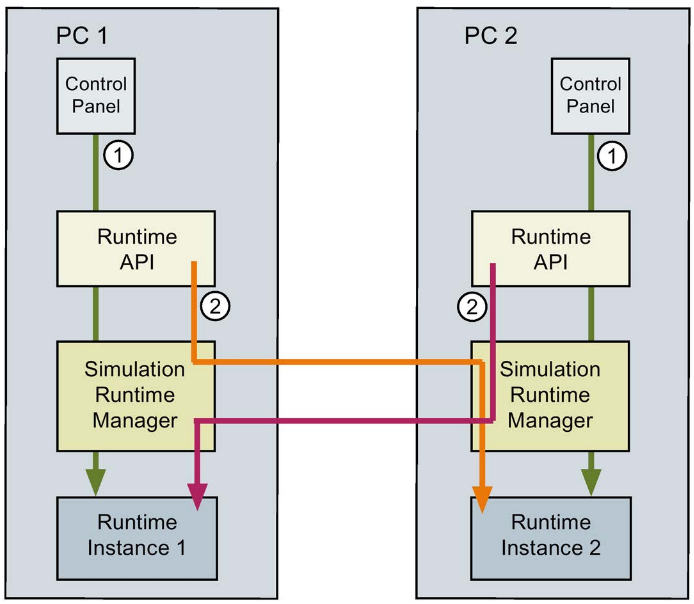
7.1.1 Access to instances

Access via the Control Panel and the API

You can access only one instance that is available locally on the PC via the Control Panel. It does not matter on which PC an instance was created and started. With distributed communication, the Runtime API accesses the instance of the other PCs via the Simulation Runtime Manager.



① Access to a local instance via the Control Panel
② Access to a remote instance on the Runtime API

Figure 7-2 Access to instances with distributed communication

7.1.2 User interfaces (API)

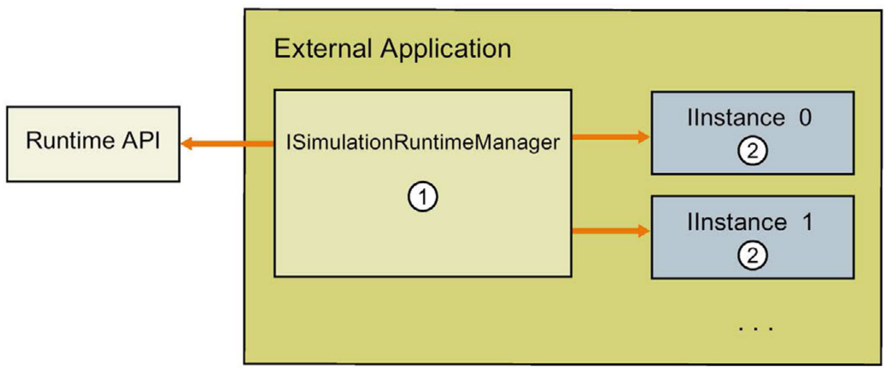
The user interfaces of Simulation Runtime include functions you use, for example, to create instances, to change the operating state of a virtual controller, or to exchange I/O data.

Simulation Runtime has the following user interfaces:

- ISimulationRuntimeManager
- IInstances
- IRemoteRuntimeManager

API and external applications

The Runtime API makes the interfaces available to an external application.



① **ISimulationRuntimeManager**
Interface of the Runtime Manager. It is used to register new Runtime instances, to search through existing Runtime instances, and to receive an interface of a registered instance.
Up to 16 instances can be registered in one Runtime Manager.

② **IInstances**
Interface of a Runtime instance. It is used to change the operating state of a virtual controller and to exchange I/O data.
Each instance has a unique name and an ID.

Figure 7-3 API and external applications

Access to API functions and data types

Required functions and data types are available for native C++ and .NET (C#).

- Overview of user interfaces for native C++ (Page 86)
- Overview of data types for native C++ (Page 93)
- Overview of user interfaces for managed code (Page 90)

7.2 Initialize API

7.2.1 Load API library

Description

With PLCSIM Advanced the interfaces of the API V2.0 are not compatible with the interfaces of the API V1.0. However, the Runtime Manager of PLCSIM Advanced V2.0 is compatible with the API of PLCSIM Advanced V1.0.

Earlier versions of the API are also installed during the installation of PLCSIM Advanced V2.0.

The default path is:

- C:\Program Files (x86)\Common Files\Siemens\PLCSIMADV\API\1.0
- C:\Program Files (x86)\Common Files\Siemens\PLCSIMADV\API\2.0

The installation path of PLCSIM Advanced is contained in the registry:

- Key: "HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Siemens\Shared Tools\PLCSIMADV_SimRT"
- Value: "Path"

To maintain the path to the API, add the character string of the following subdirectory at the end: "API\<API version>" (e.g. "API\2.0").

When you use this path the API library (DLL) is loaded directly from the installation directory.

Reference

Additional information can be found in:

- For Native C++ in section InitializeApi() (Page 96).
- For .NET via the call of the function "System.Reflection.Assembly.LoadFile(string)" in the online documentation for MSDN.

7.2.2 Native C++

7.2.2.1 InitializeApi()

Description

The `InitializeApi` function loads the API library (DLL) and initializes the API. The function loads the version of the DLL that is compatible with the architecture of your application and which is also compatible with the header file of the API (SimulationRuntimeApi.h).

To load the DLL, the function `InitializeApi` searches in the following directories one after the other:

- In the directory to which the parameter of the function leads (`in_SimulationRuntimeApiDllPath`)
- In the directory of your application that calls this function.
- In the installation directory of PLCSIM Advanced

If no DLL is available, the function accesses the next directory.

The function returns an interface to the Simulation Runtime Manager. Use this interface to create a new instance of the virtual controller or to obtain access to an existing instance.

Table 7- 18 InitializeApi() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode InitializeApi(
 ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface
);
ERuntimeErrorCode InitializeApi(
 WCHAR* in_SimulationRuntimeApiDllPath,
 ISimulationRuntimeManager** in-
out_SimulationRuntimeManagerInterface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface</code>:
Pointer to a Runtime Manager interface pointer. The pointer must be initialized with <code>NULL</code>. The interface is created within the function. See Data types (Page 279).
<code>WCHAR* in_SimulationRuntimeApiDllPath</code>:
The path to the Runtime API library.</td></tr>
<tr><td rowspan="7">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The pointer to the Runtime Manager interface does not equal <code>NULL</code>.</td></tr>
<tr><td><code>SREC_WRONG_VERSION</code></td><td>The required version of the interface is incompatible with the version used to compile the API.
The version of the API is not compatible with Runtime.
See Compatibility during upgrade (Page 31).</td></tr>
<tr><td><code>SREC_CONNECTION_ERROR</code></td><td>Unable to establish a connection to the Runtime Manager.</td></tr>
<tr><td><code>SREC_ERROR_LOADING_DLL</code></td><td>The API library cannot be loaded.</td></tr>
<tr><td><code>SREC_RUNTIME_NOT_AVAILABLE</code></td><td>No Runtime Manager runs in this Windows user session.</td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// Prepare The Variables
ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;
ISimulationRuntimeManager* api = NULL;

// Initialize The API And Get The RuntimeManager Interface
result = InitializeApi(&api);</pre></td></tr>
</table>

Note

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

7.2.2.2 RuntimeApiEntry_Initialize

Description

Use the function `RuntimeApiEntry_Initialize` only if the API library (DLL) is to be loaded from a different directory than the directory of your application that calls this function.

When the API is initialized, the API library is first loaded and the `Initialize` function is then imported and called.

The function returns an interface to the Simulation Runtime Manager. Use this interface to create a new instance of the virtual controller or to obtain access to an existing instance.

Table 7- 19 RuntimeApiEntry_Initialize - Native C++

Syntax	`__declspec(dllexport) ERuntimeErrorCode RuntimeApiEntry_Initialize(`
	`ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface,`
	`UINT32 in_InterfaceVersion`
	`);`	

Parameters	• `ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface:` Pointer to a Runtime Manager interface pointer. The pointer must be initialized with `NULL`. The interface is created within the function. See Data types (Page 279). • `UINT32 in_InterfaceVersion:` Version of the API interface to be downloaded: `DAPI_DLL_INTERFACE_VERSION`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the Runtime Manager interface does not equal `NULL`.
	`SREC_WRONG_VERSION`	• The required version of the interface is incompatible with the version used to compile the API. • The version of the API is not compatible with Runtime. See Compatibility during upgrade (Page 31).
	`SREC_CONNECTION_ERROR`	Unable to establish a connection to the Runtime Manager.
	`SREC_RUNTIME_NOT_AVAILABLE`	No Runtime Manager runs in this Windows user session.

<table>
<tr><td>Example C++</td><td><pre>// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// Prepare The Variables
ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;
HMODULE dllHandle = NULL;
ApiEntry_Initialize Initialize = NULL;
ISimulationRuntimeManager* api = NULL;

// Load The DLL And Import The "Initialize" Function (using the Win32 API)
dllHandle = LoadLibrary(DAPI_DLL_NAME_X86);
if (dllHandle != NULL)
{
 Initialize = (ApiEntry_Initialize)GetProcAddress(dllHandle, DAPI_ENTRY_INITIALIZE);
}

// Initialize The API And Get The RuntimeManager Interface
if (Initialize != NULL)
{
 result = Initialize(&api, DAPI_DLL_INTERFACE_VERSION);
}</pre></td></tr>
</table>

Note

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

7.2.3 .NET (C#)

7.2.3.1 Initialize

Description

The entry point to the API is the static class `Siemens.Simatic.Simulation.Runtime.SimulationRuntimeManager`.
The API is initialized when a function of this class is used the first time.

Table 7- 20 Initialize - .NET (C#)

Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationInitializationException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.ConnectionError`	Unable to establish a connection to the Runtime Manager.
	`ERuntimeErrorCode.WrongVersion`	The version of the API is not compatible with Runtime. See Compatibility during upgrade (Page 31).
	`ERuntimeErrorCode.RuntimeNotAvailable`	No Runtime Manager runs in this Windows user session.

7.3 Shut down API

7.3.1 Native C++

Basic procedure for deleting the user interfaces

To delete all user interfaces, generally follow these steps:

1. Delete the interfaces IInstances and IRemoteRuntimeManager.
2. Call the `Shutdown()` function of the ISimulationRuntimeManager interface.
3. Delete the ISimulationRuntimeManager interface.
4. Unload the API library (DLL) with the Win32 API-Funktion `FreeLibrary()`.

Deleting the user interfaces via functions

Deleting the user interfaces is also possible via functions.

If the API was initialized using the `InitializeApi()` function, you delete the user interfaces using the following functions:

- FreeApi() (Page 103)
- ShutdownAndFreeApi() (Page 104)

7.3.1.1 DestroyInterface()

Description

A function pointer to the `RuntimeApiEntry_DestroyInterface` function. The function pointer `DestoyInterface()` is only valid if the `InitializeApi` function has been successfully called.

The function unloads the memory of an ISimulationRuntimeManager, IRemoteRuntimeManager or IInstance interface.

Table 7- 21 DestroyInterface() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode DestroyInterface(
 IBaseInterface* in_Interface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>IBaseInterface* in_Interface:</code>
The interface to be deleted.</td></tr>
<tr><td rowspan="3">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The pointer to the interface is <code>NULL</code>.</td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// The Interfaces
ERuntimeErrorCode result;
ISimulationRuntimeManager* api = NULL;
IInstance* instance = NULL;

// Init the DLL and create an instance
result = InitializeApi(&api);
result = api->RegisterInstance(&instance);

// Destroy Instance Interfaces
result = DestroyInterface(instance);
instance = NULL;</pre></td></tr>
</table>

7.3.1.2 RuntimeApiEntry_DestroyInterface

Description

Use the `RuntimeApiEntry_DestroyInterface` function only if the API library (DLL) is to be loaded from a different directory than the Startup directory of the application that calls this function.

If the API was initialized using the `InitializeApi` function, you select the DestroyInterface() (Page 101) function.

The function unloads the memory of an ISimulationRuntimeManager, IRemoteRuntimeManager or IInstance interface.

Table 7- 22 RuntimeApiEntry_DestroyInterface() - Native C++

Syntax	`__declspec(dllexport) ERuntimeErrorCode RuntimeApiEntry_DestroyInterface( IBaseInterface* in_Interface );`	
Parameters	• `IBaseInterface* in_Interface:` The interface to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is `NULL`.
Example C++	see below	

```
// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// Prepare The Variables
ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;
HMODULE dllHandle = NULL;
ApiEntry_DestroyInterface Destroy = NULL;
IInstance* instance = NULL;

// Load The DLL And Import The "DestroyInterface" Function (using the Win32 API)
dllHandle = LoadLibraryA(DAPI_DLL_NAME_X86);
if ( dllHandle != NULL )
{
 Destroy = (ApiEntry__DestroyInterface)GetProcAddress(dllHandle, DAPI_ENTRY_DESTROY_INTERFACE);
}
…
// Frees the memory of an IInstance interface
result = Destroy(instance);
```

7.3.1.3 FreeApi()

Description

The `FreeApi()` function unloads the library of the Runtime API.

This function can only be called after the successful call of the `InitializeApi` function. If the `InitializeApi` function was not called, the library must be unloaded using the Win32 API function `FreeLibrary()`.

Table 7- 23 FreeApi() - Native C++

Syntax	`ERuntimeErrorCode FreeApi();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_API_NOT_INITIALIZED`	The `InitializeApi` function was not called successfully.
Example C++	See code below	

```
// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// The Interfaces
ERuntimeErrorCode result;
ISimulationRuntimeManager* api = NULL;
IInstance* instance = NULL;

// Init the API
result = InitializeApi(&api);

…

// Shutdown The API
api->Shutdown();
result = DestroyInterface(api);
api = NULL;
result = FreeApi();
```

7.3.1.4 ShutdownAndFreeApi()

Description

The `ShutdownAndFreeApi()` function shuts down the Runtime API, deletes the IRuntimeManager interface and unloads the library of the Runtime API.

This function can only be called after the successful call of the `InitializeApi` function. If the `InitializeApi` function was not called, the library must be unloaded using the Win32 API-Funktion `FreeLibrary()`.

Table 7- 24 ShutdownAndFreeApi() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode ShutdownAndFreeApi(
 ISimulationRuntimeManager* in_SimulationRuntimeManagerInterface
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>ISimulationRuntimeManager* in_SimulationRuntimeManagerInterface:</code>
The interface of the Runtime Manager to be deleted.</td></tr>
<tr><td rowspan="4">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_API_NOT_INITIALIZED</code></td><td>The <code>InitializeApi</code> function was not called successfully.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The pointer to the interface is <code>NULL</code>.</td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>// Include The Headerfile Of The API
#include "SimulationRuntimeApi.h"

// The Interfaces
ERuntimeErrorCode result;
ISimulationRuntimeManager* api = NULL;
IInstance* instance = NULL;

// Init the API
result = InitializeApi(&api);

…

// Shutdown The API
result = ShutdownAndFreeApi(api);
api = NULL;</pre></td></tr>
</table>

7.3.2 .NET (C#)

7.3.2.1 Shut down API

You can terminate the .NET components of the API for the IInstance and IRemoteRuntimeManager interfaces by calling the Dispose (Page 130) function.

In addition these interfaces can also be cleared automatically by the .NET Garbage Collector.

Manually clearing the API

To manually clear the API, follow these steps:

1. Delete all interfaces. Interfaces - Information and settings (Page 130)
2. Call the Shutdown() (Page 111) function of the ISimulationRuntimeManager interface.

7.4 Global functions (Native C++)

The global functions `GetNameOf...` return the name of the enumeration entry.

GetNameOfAreaSection()

Table 7- 25 GetNameOfAreaSection() - Native C++

Syntax	`const WCHAR* GetNameOfAreaSection(`
	` EArea in_AreaSection`
	`);`

Parameters	• `EArea in_AreaSection:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfCPUType()

Table 7- 26 GetNameOfCPUType() - Native C++

Syntax	`const WCHAR* GetNameOfCPUType(`
	` ECPUType in_CPUType`
	`);`

Parameters	• `ECPUType in_CPUType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfCommunicationInterface()

Table 7- 27 GetNameOfCommunicationInterface() - Native C++

Syntax	`const WCHAR* GetNameOfCommunicationInterface(`
	` ECommunicationInterface in_CommunicationInterface`
	`);`

Parameters	• `ECommunicationInterface in_CommunicationInterface:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfDataType()

Table 7- 28 GetNameOfDataType() - Native C++

Syntax	`const WCHAR* GetNameOfDataType(`
	` EDataType in_DataType`
	`);`

Parameters	• `EDataType in_DataType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfErrorCode()

Table 7- 29 GetNameOfErrorCode() - Native C++

Syntax	`const WCHAR* GetNameOfErrorCode(`
	` ERuntimeErrorCode in_ErrorCode`
	`);`

Parameters	• `ERuntimeErrorCode in_ErrorCode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfLEDMode()

Table 7- 30 GetNameOfLEDMode() - Native C++

Syntax	`const WCHAR* GetNameOfLEDMode(`
	` ELEDMode in_LEDMode`
	`);`

Parameters	• `ELEDMode in_LEDMode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfLEDType()

Table 7- 31 GetNameOfLEDType() - Native C++

Syntax	`const WCHAR* GetNameOfLEDType(`
	` ELEDType in_LEDType`
	`);`

Parameters	• `ELEDType in_LEDType:` Enumeration entry.
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfOperatingMode()

Table 7- 32 GetNameOfOperatingMode() - Native C++

Syntax	`const WCHAR* GetNameOfOperatingMode(`
	` EOperatingMode in_OperatingMode`
	`);`

Parameters	• `EOperatingMode in_OperatingMode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfErrorCode()

Table 7- 33 GetNameOfErrorCode() - Native C++

Syntax	`const WCHAR* GetNameOfErrorCode( ERuntimeErrorCode in_ErrorCode );`
Parameters	• `ERuntimeErrorCode in_ErrorCode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfOperatingState

Table 7- 34 GetNameOfOperatingState() - Native C++

Syntax	`const WCHAR* GetNameOfOperatingState( EOperatingState in_OperatingState );`
Parameters	• `EOperatingState in_OperatingState:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfPrimitiveDataType

Table 7- 35 GetNameOfPrimitiveDataType() - Native C++

Syntax	`const WCHAR* GetNameOfPrimitiveDataType( EPrimitiveDataType in_DataType );`
Parameters	• `EPrimitiveDataType in_DataType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfTagListDetails

Table 7- 36 GetNameOfTagListDetails() - Native C++

Syntax	`const WCHAR* GetNameOfTagListDetails( ETagListDetails in_TagListDetails );`
Parameters	• `ETagListDetails in_TagListDetails:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfRuntimeConfigChanged()

Table 7- 37 GetNameOfRuntimeConfigChanged() - Native C++

Syntax	`const WCHAR* GetNameOfRuntimeConfigChanged( ERuntimeConfigChanged in_RuntimeConfigChanged); );`
Parameters	• `ERuntimeConfigChanged in_RuntimeConfigChanged:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfInstanceConfigChanged()

Table 7- 38 GetNameOfInstanceConfigChanged() - Native C++

Syntax	`const WCHAR* GetNameOfInstanceConfigChanged( EInstanceConfigChanged in_InstanceConfigChanged); );`
Parameters	• `EInstanceConfigChanged in_InstanceConfigChanged:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfDirection()

Table 7- 39 GetNameOfDirection() - Native C++

Syntax	`const WCHAR* GetNameOfDirection( EDirection in_Direction );`
Parameter	• `EDirection in_Direction:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfDiagSeverity()

Table 7- 40 GetNameOfDiagSeverity() - Native C++

Syntax	`const WCHAR* GetNameOfDiagSeverity( EDiagSeverity in_DiagSeverity );`
Parameter	• `EDiagSeverity in_DiagSeverity:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfRackOrStationFaultType()

Table 7- 41 GetNameOfRackOrStationFaultType() - Native C++

Syntax	`const WCHAR* GetNameOfRackOrStationFaultType( ERackOrStationFaultType in_RackOrStationFaultType );`
Parameter	• `ERackOrStationFaultType in_RackOrStationFaultType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

EDataType (Page 338)

Enumerations (Page 326)

7.5 API ISimulationRuntimeManager

7.5.1 Interfaces - Information and settings

GetVersion() / Version { get; }

Returns the version of Runtime Manager. If the function fails, version 0.0 is returned.

Table 7- 42 GetVersion() - Native C++

Syntax	`UINT32 GetVersion();`
Parameters	None
Return values	`UINT32`: Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

Table 7- 43 Version { get; } - .NET (C#)

Syntax	`UInt32 Version { get; }`
Parameters	None
Return values	`Uint32`: Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

IsInitialized() / IsInitialized { get; }

Returns a value that indicates whether the API was successfully initialized.

Table 7- 44 IsInitialized() - Native C++

Syntax	`bool IsInitialized();`
Parameters	None
Return values	• `false`: If the API was not initialized. • `true`: If the API was initialized.

Table 7- 45 IsInitialized { get; } - .NET (C#)

Syntax	`bool IsInitialized { get; }`
Parameters	None
Return values	• `false`: If the API was not initialized. • `true`: If the API was initialized.

IsRuntimeManagerAvailable() / IsRuntimeManagerAvailable { get; }

The function returns `false` when the connection to Runtime Manager is interrupted. This happens only when the Runtime Manager process is closed.

Subscribe to the `OnRuntimeManagerLost()` event to find out whether the connection is interrupted. See Events (Page 124).

Table 7- 46 IsRuntimeManagerAvailable() - Native C++

Syntax	`bool IsRuntimeManagerAvailable();`
Parameters	None
Return values	• `false:` If the connection is interrupted. • `true:` If the connection is active.

Table 7- 47 IsRuntimeManagerAvailable { get; } - .NET (C#)

Syntax	`bool IsRuntimeManagerAvailable{ get; }`
Parameters	None
Return values	• `false:` If the connection is interrupted. • `true:` If the connection is active.

Shutdown()

Ends communication with Runtime Manager and clears the interfaces.

Call this function in the following cases:

- Immediately before the API library (DLL) is unregistered (native C++).
- When your application is no longer using Runtime Manager.

Table 7- 48 Shutdown() - Native C++

Syntax	`ERuntimeErrorCode Shutdown()`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.

Table 7- 49 Shutdown() - .NET (C#)

Syntax	`void Shutdown()`
Parameters	None
Return values	None

7.5.2 Simulation Runtime instances

GetRegisteredInstancesCount()

Returns the number of instances that are registered in Runtime Manager. If the function fails, the return value is 0.

Table 7- 50 GetRegisteredInstancesCount() - Native C++

Syntax	`UINT32 GetRegisteredInstancesCount();`
Parameters	None
Return values	`UINT32`: Number of available instances.

GetRegisteredInstanceInfoAt()

Returns information about an already registered instance. You can use the ID or name to create an interface of this instance, see `CreateInterface()`.

Table 7- 51 GetRegisteredInstanceInfoAt() - Native C++

Syntax	`ERuntimeErrorCode GetRegisteredInstanceInfoAt( UINT32 in_Index, SInstanceInfo* out_InstanceInfo );`	
Parameters	• `UINT32 in_Index:` Index of the created instance from which you want to receive the information. The index must be less than the value you receive when you call `GetRegisteredInstanceCount()`. • `SInstanceInfo* out_InstanceInfo:` The information with name and ID of the instance. See Data types (Page 306).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_DOES_NOT_EXIST`	There is no instance information for this index.
	`SREC_INDEX OUT_OF_RANGE`	The index is greater than 15.

RegisteredInstanceInfo { get; }

Returns information about all already registered instances. Use the ID or name of this instance to create an interface of this instance, see `CreateInterface()`.

Table 7- 52 RegisteredInstanceInfo { get; } - .NET (C#)

Syntax	`SInstanceInfo[] RegisteredInstanceInfo { get; }`	
Parameters	None	
Return values	`SInstanceInfo[]`: An array of information about all registered instances.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RegisterInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 53 RegisterInstance() - Native C++

Syntax	`ERuntimeErrorCode RegisterInstance(`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` ECPUType in_CPUType,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` ECPUType in_CPUType,`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`	

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is "`SRCT_1500_Unspecified`". When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `WCHAR* in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name "`Instance_#`" (# is the ID of the instance). If this name already exists, the name "`Instance_#.#`" is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 306). • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with `ZERO`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name or the IInstance pointer is invalid.
	`SREC_LIMIT_REACHED`	There are already 16 instances registered in Runtime Manager.
	`SREC_ALREADY_EXISTS`	An instance with this name already exists.

Example C++	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`// Example: How To Create And Register An Instance`
	`IInstance* psa = ZERO;`
	`if (result == SREC_OK)`
	`{`
	` result = api->RegisterInstance(&psa);`
	`}`	

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

Table 7- 54 RegisterInstance() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>IInstance RegisterInstance();
IInstance RegisterInstance(
 string in_InstanceName
);
IInstance RegisterInstance(
 ECPUType in_CPUType
);
IInstance RegisterInstance(
 ECPUType in_CPUType
 string in_InstanceName
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>ECPUType in_CPUType:</code>
Defines which CPU type is simulated at the start of the instance. The default setting is "<code>ECPUType.Unspecified</code>".
When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.
<code>string in_InstanceName:</code>
Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name "<code>Instance_#</code>" (# is the ID of the instance). If this name already exists, the name "<code>Instance_#.#</code>" is used, in which the second # is a counter that is incremented until the name is unique. <tr><td>Example C++</td><td colspan="2"><pre>ISimulationRuntimeManager * api = ZERO;
ERuntimeErrorCode result = Initialize(&api);

// Example: How To Create And Register An Instance
IInstance* psa = ZERO;
if (result == SREC_OK)
{
 result = api->RegisterCustomInstance("C:\\Temp\\vplc.dll");
}</pre></td></tr>
</table>

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

Table 7- 56 RegisterCustomInstance() - .NET (C#)

Syntax	`IInstance RegisterCustomInstance(`
	` string in_VplcDll`
	`);`
	`IInstance RegisterCustomInstance(`
	` string in_VplcDll,`
	` string in_InstanceName`
	`);`	

Parameters	• `string in_VplcDll:` The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn. • `string in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 306).	
Return values	If the function is successful, an interface of a virtual controller; otherwise a Null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name or the ID is invalid.
	`ERuntimeErrorCode.LimitReached`	There are already 16 instances registered in Runtime Manager.
	`ERuntimeErrorCode.AlreadyExists`	An instance with this name already exists.

CreateInterface()

Creates and returns an interface of an already registered instance of a virtual controller.

The instance could have been registered via the application or another application that uses the Simulation Runtime API.

Table 7- 57 CreateInterface() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode CreateInterface(
 WCHAR* in_InstanceName,
 IInstance** out_InstanceInterface
);
ERuntimeErrorCode CreateInterface(
 INT32 in_InstanceID,
 IInstance** out_InstanceInterface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>INT32 in_InstanceID:</code>
The ID of the registered instance from which you want to receive the interface.
<code>WCHAR* in_InstanceName:</code>
The name of the registered instance from which you want to receive the interface.
<code>IInstance** out_InstanceInterface:</code>
Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with <code>ZERO</code>. The interface is created within the function.</td></tr>
<tr><td rowspan="5">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The name, the ID or the IInstance pointer is invalid.</td></tr>
<tr><td><code>SREC_DOES_NOT_EXIST</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>ISimulationRuntimeManager * api = ZERO;
ERuntimeErrorCode result = Initialize(&api);

IInstance* psa1 = ZERO;
IInstance* psa2 = ZERO;
if (result == SREC_OK)
{
 result = api->CreateInterface(0, &psa1);
 result = api->CreateInterface(0, &psa2); // psa2 will be the same as
psa1
}</pre></td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>ISimulationRuntimeManager * api = ZERO;
ERuntimeErrorCode result = Initialize(&api);

IInstance* psa = ZERO;
if (result == SREC_OK)
{
 result = api->CreateInterface(L"My SimulationRuntime Instance",
&psa);
}</pre></td></tr>
</table>

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

Table 7- 58 CreateInterface() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>IInstance CreateInterface(
 string in_InstanceName
);
IInstance CreateInterface(
 INT32 in_InstanceID
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>INT32 in_InstanceID:</code>
The ID of the registered instance from which you want to receive the interface.
• <code>string in_InstanceName:</code>
The name of the registered instance from which you want to receive the interface.</td></tr>
<tr><td>Return values</td><td colspan="2">If the function is successful, an interface of a virtual controller; otherwise a Null pointer.</td></tr>
<tr><td rowspan="5">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>

<tr><td><code>ERuntimeErrorCode.WrongArgument</code></td><td>The name or the ID is invalid.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExists</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
</table>

7.5.3 Remote connections

OpenPort()

Opens a port to which another Runtime Manager can connect.

Table 7- 59 OpenPort() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode OpenPort(
 UINT16 in_Port
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT16 in_Port:</code>
The port. The value must be greater than 1024.</td></tr>
<tr><td rowspan="6">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>SREC_ALREADY_EXISTS</code></td><td>A port is already open.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The port is invalid.</td></tr>
<tr><td><code>SREC_CONNECTION_ERROR</code></td><td>The port cannot be opened.</td></tr>
</table>

Table 7- 60 OpenPort() - .NET (C#)

Syntax	`void OpenPort( UInt16 in_Port );`	
Parameters	• `UInt16 in_Port:` The port. The value must be greater than 1024.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.AlreadyExists`	A port is already open.
	`ERuntimeErrorCode.WrongArgument`	The port is invalid.
	`ERuntimeError-Code.ConnectionError`	The port cannot be opened.

ClosePort()

Closes an open port and all open connections that another Runtime Manager has created to this open port.

Table 7- 61 ClosePort() - Native C++

Syntax	`ERuntimeErrorCode ClosePort();`	
Parameters	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WARNING_INVALID_CALL`	No port is open.

Table 7- 62 ClosePort() - .NET (C#)

Syntax	`void ClosePort( UInt16 in_Port );`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetPort() / Port { get; }

Returns the open port. If no port is open or the function fails, the return value is 0.

Table 7- 63 GetPort() - Native C++

Syntax	`UINT16 GetPort();`
Parameters	None
Return values	`UINT16`: The open port. 0, if no port is open.

Table 7- 64 Port { get; } - .NET (C#)

Syntax	`UInt16 Port { get; }`
Parameters	None
Return values	`UInt16`: The open port. 0, if no port is open.
Exceptions	None

GetRemoteConnectionsCount()

Supplies the number of open remote connections.

Table 7- 65 GetRemoteConnectionsCount() - Native C++

Syntax	`UINT32 GetRemoteConnectionsCount();`
Parameters	None
Return values	`UINT32`: Number of open remote connections.

GetRemoteConnectionInfoAt()

Returns information about an open connection.

Table 7- 66 GetRemoteConnectionInfoAt()- Native C++

Syntax	`ERuntimeErrorCode GetRemoteConnectionInfoAt(`
	`UINT32 in_Index,`
	`SConnectionInfo* out_ConnectionInfo`
	`);`	

Parameters	• `UINT32 in_Index:` Index of the connection information that is expected. • `SConnectionInfo* out_ConnectionInfo:` The connection information for this index.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	Connection information for this index does not exist.

RemoteConnectionInfo { get; }

Returns an array of information about all open connections.

Table 7- 67 RemoteConnectionInfo { get; } - .NET (C#)

Syntax	`SConnectionInfo[] RemoteConnectionInfo { get; }`	
Parameters	None	
Return values	`SConnectionInfo[]`: An array of information about all open connections.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RemoteConnect()

Creates a new connection to a remote Runtime Manager or uses an existing connection to create an IRemoteRuntimeManager interface.

Table 7- 68 RemoteConnect() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode RemoteConnect(
 UINT8 in_IP3,
 UINT8 in_IP2,
 UINT8 in_IP1,
 UINT8 in_IP0,
 UINT16 in_Port,
 IRemoteRuntimeManager** out_RemoteRuntimeManagerInterface
ERuntimeErrorCode RemoteConnect(
 UIP in_IP,
 UINT16 in_Port,
 IRemoteRuntimeManager** out_RunTimeManagerInterface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">
<code>UINT8 in_IP3:</code>
First part of the IP address of the remote PC.
<code>UINT8 in_IP2:</code>
Second part of the IP address of the remote PC.
<code>UINT8 in_IP1:</code>
Third part of the IP address of the remote PC.
<code>UINT8 in_IP0:</code>
Last part of the IP address of the remote PC.
<code>UIP in_IP:</code>
IP address of the remote PC.
<code>UINT16 in_Port:</code>
The port that is open on the remote PC.
<code>IRemoteRuntimeManager** out_RemoteRuntimeManagerInterface:</code>
Pointer to a remote Runtime Manager interface pointer. The pointer must be initialized with <code>ZERO</code>. The interface is created in the function.
</td></tr>
<tr><td rowspan="6">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>SREC_CONNECTION_ERROR</code></td><td>The connection to the remote Runtime Manager cannot be established.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>IP, port or IInstance pointer is invalid.</td></tr>
<tr><td><code>SREC_WRONG_VERSION</code></td><td>The version of the API is not compatible with Runtime.
See Compatibility during upgrade (Page 31).</td></tr>
<tr><td>Example C++</td><td colspan="2"><pre>ISimulationRuntimeManager* api = ZERO;
ERuntimeErrorCode result = Initialize(&api);

IRemoteRuntimeManager * client = ZERO;

if (result == SREC_OK)
{
 result = api->RemoteConnect(192,203,145,144, 4444, &client);
}</pre></td></tr>
</table>

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

Table 7- 69 RemoteConnect() - .NET (C#)

Syntax	`IRemoteRuntimeManager RemoteConnect(`
	` string in_ConnectionString`
	`);`
	`IRemoteRuntimeManager RemoteConnect(`
	` SIP in_IP,`
	` UInt16 in_Port`
	`);`
	`IRemoteRuntimeManager RemoteConnect(`
	` Byte in_IP3,`
	` Byte in_IP2,`
	` Byte in_IP1,`
	` Byte in_IP0,`
	` UInt16 in_Port`
	`);`

Parameters	• `Byte in_IP3:` First part of the IP address of the remote PC. • `Byte in_IP2:` Second part of the IP address of the remote PC. • `Byte in_IP1:` Third part of the IP address of the remote PC. • `Byte in_IP0:` Last part of the IP address of the remote PC. • `string in_ConnectionString:` A string in the form of "<IP3>.<IP2>.<IP1>.<IP0>:<Port>" Example: "182.203.145.144:4444". • `SIP in_IP:` IP address of the remote PC. • `UInt16 in_Port:` The port that is open on the remote PC.
Return values	`IRemoteRuntimeManager:` Interface to the remote Runtime Manager.
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`

Runtime error code	Condition
`ERuntimeError-Code.ConnectionError`	Connection to the remote Runtime Manager cannot be established.
`ERuntimeErrorCode.Timeout`	The function does not return on time.
`ERuntimeErrorCode.WrongArgument`	IP or port is invalid.
`ERuntimeErrorCode.WrongVersion`	The version of the API is not compatible with Runtime. See Compatibility during upgrade (Page 31).

Data types (Page 279)

7.5.4 Events

Events for the ISimulationRuntimeManager interface

The following events are differentiated in the API:

Table 7- 70 Events for the ISimulationRuntimeManager interface

Event	Cause
OnConfigurationChanged (Page 124)	This event is triggered at a change of the Runtime Manager configuration. For example, when a new instance is registered, an instance is removed or a connection to a client is established. The Control Panel uses such an event to update the list of available instances.
OnRuntimeManagerLost (Page 127)	The event is triggered when the connection to Runtime Manager is interrupted.

7.5.4.1 OnConfigurationChanged events

OnConfigurationChanged

Registers or unregisters an event handler method.

Table 7- 71 OnConfigurationChanged - .NET (C#)

Syntax	`event Delegate_SRCC_UINT32_UINT32_INT32 OnConfigurationChanged;`
Parameters	None. See Delegate_SRCC_UINT32_UINT32_INT32 (Page 297).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. The registration of a new callback function causes the previous callback function to be deleted.

Table 7- 72 RegisterOnConfigurationChangedCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangedCallback(`
	` EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction`
	`);`

Parameters	• `EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction`: A callback function to subscribe to an event. See EventCallback_SRCC_UINT32_UINT32_INT32 (Page 285).
Return values	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 73 RegisterOnConfigurationChangedEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangedEvent();`
	`void RegisterOnConfigurationChangedEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

Table 7- 74 RegisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void RegisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 75 UnregisterOnConfigurationChangedCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangedCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedEvent()

Unregisters the event object.

Table 7- 76 UnregisterOnConfigurationChangedEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

Table 7- 77 UnregisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangedEvent()

The function blocks the program until the registered event object is set to the signaled state or the timeout interval is exceeded.

Table 7- 78 WaitForOnConfigurationChangedEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 79 WaitForOnConfigurationChangedEvent - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.5.4.2 OnRuntimeManagerLost events

OnRuntimeManagerLost

Registers or unregisters an event handler method.

Table 7- 80 OnRuntimeManagerLost - .NET (C#)

Syntax	`event Delegate_Void OnRuntimeManagerLost;`
Parameters	None. See Delegate_Void (Page 293).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnRuntimeManagerLostCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. The registration of a new callback function causes the previous callback function to be deleted.

Table 7- 81 RegisterOnRuntimeManagerLostCallback() - Native C++

Syntax	`void RegisterOnRuntimeManagerLostCallback(`
	` EventCallback_VOID in_CallbackFunction`
	`);`

Parameters	• `EventCallback_VOID in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_VOID (Page 281).
Return values	None
Note	The event handler method runs in a separate thread.

RegisterOnRuntimeManagerLostEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 82 RegisterOnRuntimeManagerLostEvent() - Native C++

Syntax	`void RegisterOnRuntimeManagerLostEvent();`
	`void RegisterOnRuntimeManagerLostEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event handle is registered. • `HANDLE* in_Event:` A user-specific event handle is registered.
Return values	None

Table 7- 83 RegisterOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`void RegisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

UnregisterOnRuntimeManagerLostCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 84 UnregisterOnRuntimeManagerLostCallback() - Native C++

Syntax	`void UnregisterOnRuntimeManagerLostCallback();`
Parameters	None
Return values	None

UnregisterOnRuntimeManagerLostEvent()

Unregisters the event object.

Table 7- 85 UnregisterOnRuntimeManagerLostEvent() - Native C++

Syntax	`void UnregisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

Table 7- 86 UnregisterOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`void UnregisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

WaitForOnRuntimeManagerLostEvent()

The function will block the program until the registered event object is set to the signaled state or the timeout interval is exceeded.

Table 7- 87 WaitForOnRuntimeManagerLostEvent() - Native C++

Syntax	`bool WaitForOnRuntimeManagerLostEvent();`
	`bool WaitForOnRuntimeManagerLostEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined timeout interval.

Table 7- 88 WaitForOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`bool WaitForOnRuntimeManagerLostEvent();`
	`bool WaitForOnRuntimeManagerLostEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined timeout interval.

7.6 API IInstances

7.6.1 Interfaces - Information and settings

Dispose()

Deletes the managed interface and unloads the native components of the user interfaces.

Table 7- 89 Dispose() - .NET (C#)

Syntax	`void Dispose()`
Parameters	None
Return values	None

GetID() / ID { get; }

Returns the instance ID. The ID is assigned by Runtime Manager when the instance is registered.

Table 7- 90 GetID() - Native C++

Syntax	`INT32 GetID();`
Parameters	None
Return values	`INT32`: Instance ID

Table 7- 91 ID { get; } - .NET (C#)

Syntax	`UInt32 ID { get; }`
Parameters	None
Return values	`Uint32`: Instance ID
Exceptions	None

GetName() / Name { get; }

Returns the name of the instance.

Table 7- 92 GetName() - Native C++

Syntax	`ERuntimeErrorCode GetName(`
	` WCHAR inout_Name[],`
	` UINT32 in_ArrayLength`
	`);`	

Parameters	• `WCHAR inout_Name[]:` A user-allocated storage for the name of the instance. The field length should be at least as long as `DINSTANCE_NAME_MAX_LENGTH`. See Definitions and constants (Page 306). • `UINT32 in_ArrayLength:` Field length (Wide character)	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_WRONG_ARGUMENT`	The name does not fit in the storage.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	` result = api->RegisterInstance(&psa);`
	`}`
	
	`WCHAR name[DINSTANCE_NAME_MAX_LENGTH];`
	`if (result == SREC_OK)`
	`{`
	` result = psa->GetName(name, DINSTANCE_NAME_MAX_LENGTH);`
	`}`	

Table 7- 93 Name { get; } - .NET (C#)

Syntax	`string Name { get; }`	
Parameters	None	
Return values	Name of the instance.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.

GetCPUType()

Returns the CPU type of the virtual controller.

Table 7- 94 GetCPUType() - Native C++

Syntax	`ECPUType GetCPUType();`
Parameters	None
Return values	An enumeration element that defines the CPU type. See ECPUType (Page 332).

SetCPUType()

Sets the CPU type of the virtual controller. A change of CPU type occurs only when the controller is restarted.

Table 7- 95 SetCPUType() - Native C++

Syntax	`void SetCPUType(ECPUType in_Value);`
Parameters	• `ECPUType in_Value:` Defines which CPU type is simulated at the start of the instance. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.
Return values	None

CPUType { get; set; }

Returns or sets the CPU type of the virtual controller. A change of CPU type occurs only when the controller is restarted.

When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.

Table 7- 96 CPUType { get; set; } - .NET (C#)

Syntax	`ECPUType CPUType { get; set; }`
Parameters	None
Return values	An enumeration element that defines the CPU type.
Exceptions	None

GetCommunicationInterface()

Returns the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 97 GetCommunicationInterface() - Native C++

Syntax	`ECommunicationInterface GetCommunicationInterface();`
Parameters	None
Return values	• `SRCI_NONE` Cannot be selected. Is returned if the instance interface is no longer valid. • `SRCI_SOFTBUS` Is returned if the virtual controller uses the Softbus. • `SRCI_TCPIP` Is returned if the virtual controller communicates over the virtual adapter.

SetCommunicationInterface()

Sets the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 98 SetCommunicationInterface() - Native C++

Syntax	`void SetCommunicationInterface(ECommunicationInterface in_Value);`
Parameters	• `SRCI_NONE` Cannot be selected. • `SRCI_SOFTBUS` Is set to activate communication via Softbus. • `SRCI_TCPIP` Is set to activate communication over the virtual adapter.
Return values	None

CommunicationInterface { get; set; }

Sets or returns the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 99 CommunicationInterface { get; set; } - .NET (C#)

Syntax	`ECommunicationInterface CommunicationInterface { get; set; }`
Parameters	None
Return values	• `ECommunicationInterface.None` Cannot be selected. Is returned if the instance interface is no longer valid. • `ECommunicationInterface.Softbus` Is returned if the virtual controller uses the Softbus. • `ECommunicationInterface.TCPIP` Is returned if the virtual controller communicates over the virtual adapter.
Exceptions	None

GetInfo() / Info { get; }

Returns a structure that provides information about the instance.

Table 7- 100 GetInfo() - Native C++

Syntax	`SInstanceInfo GetInfo();`
Parameters	None
Return values	`SInstanceInfo`: A structure that provides information about the instance. See SInstanceInfo (Page 314).

Table 7- 101 Info { get; } - .NET (C#)

Syntax	`SInstanceInfo Info { get; }`
Parameters	None
Return values	`SInstanceInfo`: A structure that provides information about the instance.
Exceptions	None

UnregisterInstance()

Unregisters this instance from Runtime Manager.

Note

Loss of the interfaces

Other applications that are connected to this instance will lose their interface to this instance.

Table 7- 102 UnregisterInstance() - Native C++

Syntax	`ERuntimeErrorCode UnregisterInstance();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 103 UnregisterInstance() - .NET (C#)

Syntax	`void UnregisterInstance();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.2 Controller - Information and settings

GetControllerName() / ControllerName { get; }

Returns the downloaded name of the virtual controller.

Table 7- 104 GetControllerName() - Native C++

Syntax	`ERuntimeErrorCode GetControllerName( WCHAR inout_Name[], UINT32 in_ArrayLength );`	
Parameters	• `WCHAR inout_Name[]:` A user-allocated storage for the name. • `UINT32 in_ArrayLength:` The length of the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The name does not fit in the storage.

Table 7- 105 ControllerName { get; } - .NET (C#)

Syntax	`string ControllerName { get; }`	
Parameters	None	
Return values	`string:` The downloaded name of the virtual controller.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetControllerShortDesignation() / ControllerShortDesignation { get; }

Returns the downloaded short designation of the virtual controller.

Table 7- 106 GetControllerShortDesignation() - Native C++

Syntax	`ERuntimeErrorCode GetControllerShortDesignation( WCHAR inout_ShortDesignation[], UINT32 in_ArrayLength );`	
Parameters	• `WCHAR inout_ShortDesignation[]:` A user-allocated storage for the short designation. • `UINT32 in_ArrayLength:` The length of the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The name does not fit in the storage.

Table 7- 107 ControllerShortDesignation { get; } - .NET (C#)

Syntax	`string ControllerShortDesignation { get; }`	
Parameters	None	
Return values	`string:` The downloaded short designation of the virtual controller.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetControllerIPCount()

Returns the number of configured IP addresses of the virtual controller. If the function fails, the return value is 0.

Table 7- 108 GetControllerIPCount() - Native C++

Syntax	`UINT32 GetControllerIPCount();`
Parameters	None
Return values	`INT32:` Number of configured IP addresses of the virtual controller.

GetControllerIP() / ControllerIP { get; }

Returns a configured IP address of the instance.

Table 7- 109 GetControllerIP() - Native C++

Syntax	`UIP GetControllerIP();`
	`UIP GetControllerIP(`
	` UINT32 in_Index`
	`);`

Parameters	• `WCHAR in_Index:` The index of the IP address you want to receive. The index must be less than the value you receive from `GetControllerIPCount()`. The default setting is 0.
Return values	`UIP`: IP address of the virtual controller. If the function fails, the return value is 0.

Table 7- 110 ControllerIP { get; } - .NET (C#)

Syntax	`string[] ControllerIP { get; }`
Parameters	None
Return values	`string`: All downloaded IP addresses of the virtual controller. If the function fails, the field is empty.
Exceptions	None

GetControllerIPSuite4() / ControllerIPSuite4 { get; }

Returns the IP suite instance. If the "Softbus" communication interface is used, the subnet mask and default gateway are 0.

Table 7- 111 GetControllerIPSuite4() Native C++

Syntax	`SIPSuite4 GetControllerIPSuite4();`
	`SIPSuite4 GetControllerIPSuite4(`
	` UINT32 in_Index`
	`);`

Parameters	• `WCHAR in_Index:` The index of the IP address you want to receive. The index must be less than the value you receive from `GetControllerIPCount()`. The default setting is 0.
Return values	`SIPSuite4`: The IP suite of the virtual controller. If the function fails, the return values are 0.

Table 7- 112 ControllerIPSuite4 { get; } - .NET (#)

Syntax	`SIPSuite4[] ControllerIPSuite4 { get; };`
Parameters	None
Return values	`SIPSuite4[]`: All downloaded IP suites of the virtual controller. If the function fails, the field is empty.
Exceptions	None

SetIPSuite()

Sets the IP suite of the network interface of a virtual controller.

Table 7- 113 SetIPSuite() - Native C++

Syntax	`ERuntimeErrorCode SetIPSuite( UINT32 in_InterfaceID, SIPSuite4 in_IPSuite, bool in_IsRemanent );`	
Parameters	• `UINT32 in_InterfaceID:` The ID of the network interface. • `SIPSuite4 in_IPSuite:` The IP suite that is to be assigned to the network interface. The IP suite contains the IP address, the subnet mask and the standard gateway. If the communication interface is "Softbus", the subnet mask and standard gateway are ignored. • `bool in_IsRemanent:` If `true`, the IP suite is saved after restart of the virtual controller. If the communication interface is "Softbus", this flag is ignored.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	There is no network interface with this ID.
	`SREC_INVALID_OPERATING_STATE`	The virtual controller has not yet completed the boot process or is already in the shutdown phase.

Table 7- 114 SetIPSuite() - .NET (C#)

Syntax	`void SetIPSuite(`
	` UInt32 in_InterfaceID,`
	` SIPSuite4 in_IPSuite,`
	` bool in_IsRemanent );`	

Parameters	• `UInt32 in_InterfaceID:` The ID of the network interface. • `SIPSuite4 in_IPSuite:` If the communication interface is "Softbus", the subnet mask and standard gateway are ignored. • `bool in_IsRemanent:` If `true`, the IP suite is saved after restart of the virtual controller. If the communication interface is "Softbus", this flag is ignored.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	There is no network interface with this ID.
	`ERuntimeErrorCode.InvalidOperatingState`	The virtual controller has not yet completed the boot process or is already in the shutdown phase.

GetStoragePath()

Returns the full directory in which the instance stores its data.

Table 7- 115 GetStoragePath() - Native C++

Syntax	`ERuntimeErrorCode GetStoragePath(`
	` WCHAR inout_StoragePath[],`
	` UINT32 in_ArrayLength`
	`);`	

Parameters	• `WCHAR inout_StoragePath[]:` A user-allocated storage for the storage path. The length of the array should be at least as long as `DSTORAGE_PATH_MAX_LENGTH`. See Data types (Page 279). • `UINT32 in_ArrayLength:` Length of the array (Wide character)	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The path does not fit in the storage.

SetStoragePath()

Sets the full path of the directory in which the instance stores its data. This can also be a network share.

Set the path before you start the instance. A change to the path takes effect only when the controller is restarted.

If no path is set, the default setting:
<My Documents>>\Siemens\Simatic\Simulation\Runtime\Persistence\<Instance Name> is used.

Table 7- 116 SetStoragePath() - Native C++

Syntax	`ERuntimeErrorCode SetStoragePath( WCHAR* in_StoragePath );`	
Parameters	• `WCHAR* in_StoragePath:` Full name of the storage path. The length of the name must be less than `DSTORAGE_PATH_MAX_LENGTH`. See Data types (Page 279).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The length of the path exceeds the limit.
	`SREC_WRONG_ARGUMENT`	The path contains invalid characters.

StoragePath { get; set; }

Returns or sets the full path of the directory in which the instance stores its retentive data. This can also be a network share.

Set the path before you start the instance. A change to the path takes effect only when the controller is restarted.

If no path is set, the default setting:
<My Documents>>\Siemens\Simatic\Simulation\Runtime\Persistence\<Instance Name> is used.

Table 7- 117 StoragePath { get; set; } - .NET (C#)

Syntax	`string StoragePath { get; set; }`	
Parameters	None	
Return values	`string:` The configured storage path.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.IndexOutOfRange`	The length of the path exceeds the limit.
	`ERuntimeErrorCode.WrongArgument`	The path contains invalid characters.

ArchiveStorage()

The user program, the hardware configuration and the retentive data are stored in a file, the Virtual SIMATIC Memory Card. `ArchiveStorage()` stores this file as a ZIP file. The instance of the virtual controller must be in OFF operating state for this.

Table 7- 118 ArchiveStorage() - Native C++

Syntax	`ERuntimeErrorCode ArchiveStorage( WCHAR* in_FullFileName );`	
Parameters	• `WCHAR in_FullFileName:` The full path to the ZIP file. The path relates to directories of the computer where the API is being called.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INVALID_OPERATING_STATE`	The instance is not in OFF operating state.
	`SREC_INVALID_ARCHIVE_PATH`	The archive path is invalid.
	`SREC_CREATE_DIRECTORIES_FAILED`	The directory for the ZIP file could not be created.
	`SREC_ARCHIVE_STORAGE_FAILED`	The ZIP file could not be created.
	`SREC_STORAGE_TRANSFER_ERROR`	Error during network data transfer. Memory data between client and server computers do not match.

Table 7- 119 ArchiveStorage() - .NET (C#)

Syntax	`void ArchiveStorage( string in_FullFileName );`	
Parameters	• `string in_FullFileName:` The full path to the ZIP file. The path relates to directories of the computer where the API is being called.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InvalidOperatingState`	The instance is not in OFF operating state.
	`ERuntimeError-Code.InvalidArchivePath`	The archive path is invalid.
	`ERuntimeError-Code.CreateDirectoriesFailed`	The directory for the ZIP file could not be created.
	`ERuntimeError-Code.ArchiveStorageNotCreated`	The ZIP file could not be created.
	`ERuntimeError-Code.StorageTransferError`	Error during network data transfer. Memory data between client and server computers do not match.

RetrieveStorage()

`RetrieveStorage()` creates a Virtual SIMATIC Memory Card from the archived ZIP file. The virtual controller must be in OFF operating state for this.

Table 7- 120 RetrieveStorage() - Native C++

Syntax	`ERuntimeErrorCode RetrieveStorage( WCHAR* in_FullFileName );`	
Parameters	• `WCHAR* in_FullFileName:` The full path to the ZIP file. The path relates to directories of the computer where the API is being called.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INVALID_OPERATING_STATE`	The instance is not in OFF operating state.
	`SREC_INVALID_ARCHIVE_PATH`	The archive path is invalid.
	`SREC_DELETE_EXISTING_STORAGE_FAILED`	The old storage cannot be deleted.
	`SREC_RETRIEVE_STORAGE_FAILURE`	The ZIP file cannot be unzipped.
	`SREC_STORAGE_TRANSFER_ERROR`	Error during network data transfer. Memory data between client and server computers do not match.

Table 7- 121 RetrieveStorage() - .NET (C#)

Syntax	`void RetrieveStorage( string in_FullFileName );`	
Parameters	• `string in_FullFileName:` The full path to the ZIP file. The path relates to directories of the computer where the API is being called.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InvalidOperatingState`	The instance is not in OFF operating state.
	`ERuntimeErrorCode.InvalidArchivePath`	The archive path is invalid.
	`ERuntimeErrorCode.DeleteExistingStorageFailed`	The old storage cannot be deleted.
	`ERuntimeErrorCode.RetrieveStorageFailure`	The ZIP file cannot be unzipped.
	`ERuntimeErrorCode.StorageTransferError`	Error during network data transfer. Memory data between client and server computers do not match.

7.6.3 Operating state

GetOperatingState() / OperatingState { get; }

Returns the operating state of the virtual controller. When the operating state changes, the OnOperatingStateChanged() (Page 243) event is triggered. For details about the operating state, see Data types (Page 330).

Table 7- 122 GetOperatingState() - Native C++

Syntax	`EOperatingState GetOperatingState();`
Parameters	None
Return values	• `SROS_INVALID_OPERATING_STATE:` If the function fails. • `SROS_OFF:` If the Simulation Runtime instance is not running. • `SROS_BOOTING:` If `PowerOn()` was called while in this state and the virtual controller is not yet ready to start the user program. • `SROS_STOP:` If the virtual controller is in STOP state. • `SROS_STARTUP:` If the user program is currently changing from STOP to RUN. • `SROS_RUN:` If the user program is running. • `SROS_FREEZE:` If the user program is being stopped (Freeze status). • `SROS_HOLD:` If the user program is set to HOLD when the breakpoint is reached. • `SROS_SHUTTING_DOWN`: If `PowerOff()` was called but the virtual controller is still in the Shutdown phase.

Table 7- 123 OperatingState { get; } - .NET (C#)

Syntax	`EOperatingState OperatingState { get; }`
Parameters	None
Return values	• `EOperatingState.InvalidOperatingState:` If the function fails. • `EOperatingState.Off:` If the Simulation Runtime instance is not running. • `EOperatingState.Booting:` If `PowerOn()` was called while in this state and the virtual controller is not yet ready to start the user program. • `EOperatingState.Stop:` If the virtual controller is in STOP state. • `EOperatingState.Startup:` If the user program is currently changing from STOP to RUN. • `EOperatingState.Run:` If the user program is running. • `EOperatingState.Freeze:` If the user program is being stopped (Freeze status). • `EOperatingState.Hold`: If the user program is set to HOLD when the breakpoint is reached. • `EOperatingState.ShuttingDown`: If `PowerOff()` was called but the virtual controller is still in the Shutdown phase.

PowerOn()

The function creates the process for the Simulation Runtime instance and starts the firmware of the virtual controller.

Table 7- 124 PowerOn() - Native C++

Syntax	`ERuntimeErrorCode PowerOn();`
	`ERuntimeErrorCode PowerOn(`
	` UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. – Expected operating states if this function is successful: `{ SROS_STOP , SROS_RUN }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_ERROR_LOADING_DLL`	The Siemens.Simatic.Simulation.Runtime.Instance.exe cannot load the Siemens.Simatic.PlcSim.Vplc1500.dll.
	`SREC_STORAGE_PATH_ALREADY_IN_USE`	The selected path for this instance is already being used by another instance.
	`SREC_NO_STORAGE_PATH_SET`	The path could not be created. The length of the `DSTORAGE_PATH_MAX_LENGTH` characters may be exceeded.
	`SREC_WARNING_ALREADY_EXISTS`	Warning. The instance is started.
	`SREC_WARNING_TRIAL_MODE_ACTIVE`	No license available. You can use the instance without restrictions with the Trial License. Afterwards, the instance is shut down.
	`SREC_VIRTUAL_SWITCH_MISCONFIGURED`	The virtual switch is configured incorrectly.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is no longer running.

Table 7- 125 PowerOn() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode PowerOn();

<tr><td><code>ERuntimeError-Code.VirtualSwitchMisconfigured</code></td><td>The virtual switch is configured incorrectly.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code></td><td>The process of the virtual controller is no longer running.</td></tr>
</table>

PowerOff()

Shuts down the Simulation Runtime and closes its process.

Table 7- 126 PowerOff() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode PowerOff();
ERuntimeErrorCode PowerOff(
 UINT32 in_Timeout_ms
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT32 in_Timeout_ms:</code>
A timeout value in milliseconds.
– If no timeout value is set, the function returns immediately. Subscribe to the <code>OnOperatingStateChanged()</code> event to find out when the operation has been completed.

Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The expected operating state does not occur on time.</td></tr>
<tr><td><code>ERuntimeError-
Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
</table>

MemoryReset()

Shuts down the virtual controller, closes its processes and performs a restart.

Table 7- 128 MemoryReset() - Native C++

Syntax	`ERuntimeErrorCode MemoryReset();`
	`ERuntimeErrorCode MemoryReset(`
	` UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ SROS_STOP , SROS_RUN }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 129 MemoryReset() - .NET (C#)

Syntax	`void MemoryReset();`
	`void MemoryReset(`
	` UInt32 in_Timeout_ms`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Run, EOperatingState.Stop }`	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.

Run()

Calls on the virtual controller to change to RUN operating state.

Table 7- 130 Run() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode Run();
ERuntimeErrorCode Run(
 UINT32 in_Timeout_ms
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT32 in_Timeout_ms:</code>
A timeout value in milliseconds.
– If no timeout value is set, the function returns immediately. Subscribe to the <code>OnOperatingStateChanged()</code> event to find out when the operation has been completed.
– If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout.

<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The expected operating state does not occur on time.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
</table>

Stop()

Calls on the virtual controller to change to STOP operating state.

Table 7- 132 Stop() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode Stop();
ERuntimeErrorCode Stop(
 UINT32 in_Timeout_ms
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT32 in_Timeout_ms:</code>
A timeout value in milliseconds.
– If no timeout value is set, the function returns immediately. Subscribe to the <code>OnOperatingStateChanged()</code> event to find out when the operation has been completed.
– If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout.

<tr><td><code>ERuntimeError-Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The expected operating state does not occur on time.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
</table>

7.6.4 Tag list

UpdateTagList()

The function reads the tags from the virtual controller and writes them to the shared storage arranged by name.

If the tag is an array or a structure, there are multiple entries.

In the case of a structure, there is an entry for the structure itself and an additional entry for each structure element.

Entry_1: "StructName"

Entry_2: "StructName.ElementName_1"

..

Entry_N: "StructName.ElementName_n"

In the case of an array, in this example a two-dimensional array, there is an entry for the array itself and an additional entry for each array element.

Entry_1: "ArrayName"

Entry_2: "ArrayName[a,b]", where {a} and {b} correspond to the first index of the respective dimension

..

Entry_N: "ArrayName[x,y]", where {x} and {y} correspond to the last index of the respective dimension

Memory for up to 500000 entries (not PLC tags) is reserved for the list. If the list becomes too large, the function returns the error/exception "NOT_ENOUGH_MEMORY".

If there are problems with the maximum number of entries and not all tags are needed, two filters can be used when refreshing the tag table.

Table 7- 134 UpdateTagList() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode UpdateTagList();
ERuntimeErrorCode UpdateTagList(
 ETagListDetails in_TagListDetails
);
ERuntimeErrorCode UpdateTagList(
 ETagListDetails in_TagListDetails,
 bool in_IsHMIVisibleOnly
);
ERuntimeErrorCode UpdateTagList(
 ETagListDetails in_TagListDetails,
 bool in_IsHMIVisibleOnly,
 WCHAR* in_DataBlockFilterList
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>ETagListDetails in_TagListDetails:</code>

Every combination of the following four areas:

IO: Inputs and Outputs
M: Bit memory
CT: Counters and Timers
DB: Data Blocks

The default setting is IOMCTDB.

Example: IOM reads only the tags from the area Inputs / Outputs and Bit memory.

• <code>bool in_IsHMIVisibleOnly:</code>

If <code>true</code>, only tags marked with "HMI Visible" are read. The default setting is <code>true</code>.

• <code>WCHAR* in_DataBlockFilterList:</code>

A string that includes the name of all data blocks that are supposed to be available in the tag table. The string must be in quotation marks.

Example: ""\"DB_1\", \"DB_2\" \"DB_3\"|\"DB_4\"\"DB_5\""

All characters within the quotation marks are interpreted as a DB name. If the data block does not exist in the PLC program, it is not added to the tag table memory. No error is triggered in the process.

For this list to be taken into consideration, <code>in_DataBlockFilterList</code> has to be unequal to NULL and <code>in_TagListDetails</code> has to contain "DB".</td></tr>

</table>

GetTagListStatus()

Returns the current update status of the tag list storage.

"`inout_TagListDetails`" is `NONE`, if the list needs to be updated.

Table 7- 136 GetTagListStatus() - Native C++

Syntax	`ERuntimeErrorCode GetTagListStatus( ETagListDetails* out_TagListDetails, bool* out_IsHMIVisibleOnly );`	
Parameters	• `ETagListDetails out_TagListDetails:` Status of the tag list details. `SRTLD_NONE` when an update of the list is required. • `bool out_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are available in the list.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 137 GetTagListStatus() - .NET (C#)

Syntax	`void GetTagListStatus( out ETagListDetails out_TagListDetails, out bool out_IsHMIVisibleOnly );`	
Parameters	• `out ETagListDetails out_TagListDetails:` Status of the tag list details. `ETagListDetails.None` when an update of the list is required. • `out bool out_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are available in the list.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetTagInfoCount()

Returns the number of entries in the tag list storage. If the function fails, the return value is 0.

Table 7- 138 GetTagInfoCount() - Native C++

Syntax	`UINT32 GetTagInfoCount();`
Parameters	None
Return values	Number of entries in the tag list storage.

GetTagInfos() / TagInfos { get; }

Returns a list of all tags.

Table 7- 139 GetTagInfos() - Native C++

Syntax	`ERuntimeErrorCode GetTagInfos( UINT32 in_BufferLength, STagInfo* inout_TagInfos, UINT32* out_TagCount );`	
Parameters	• `UINT32 in_BufferLength:` The number of elements that the storage can accommodate. • `STagInfo* inout_TagInfos:` The user-allocated storage that accommodates the tags. • `UINT32* out_TagCount:` Returns the number of tags that were written to the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	The elements do not fit in the storage.

Table 7- 140 TagInfos { get; } - .NET (C#)

Syntax	`STagInfo[] TagInfos { get; }`	
Parameters	None	
Return values	An array that contains all available entries of the storage.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.

CreateConfigurationFile()

Writes all entries from the tag list to an XML file.

Table 7- 141 CreateConfigurationFile() - Native C++

Syntax	`ERuntimeErrorCode CreateConfigurationFile( WCHAR* in_FullFileName );`	
Parameters	• `WCHAR* in_FullFileName:` Full file name of the XML file: <Path> + <File name> + <File extension>.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The file name is invalid.

Table 7- 142 CreateConfigurationFile() - .NET (C#)

Syntax	`void CreateConfigurationFile( string in_FullFileName );`	
Parameters	None	
Return values	• `string in_FullFileName:` File name of the XML file that is to be written to: <Path> + <File name> + <File extension>.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The file name is invalid.

7.6.5 I/O access

7.6.5.1 Synchronizing inputs and outputs

Description

In PLCSIM Advanced the complete scope of the input and output area is used (see GetAreaSize/AreaSize (Page 158)). This is also possible when no IO module is configured.

Inputs and outputs that are defined via configured IO modules are synchronized to the defined update of the process image partition (PIP).

Inputs and outputs that are not assigned to an IO module are synchronized in the cycle control point.

Note the following when synchronizing these inputs and outputs:

- Inputs can only be used as inputs.

  You can write the values via the API, but values which are written via the user program (TIA Portal) are not visible in the API.
- Outputs can be used as output and as input.

  You can write the values via the API and via the CPU / the user program (TIA Portal). If API and user program write to the same area, the values from the API will overwrite the vales from the user program.

7.6.5.2 I/O access via address - Reading

InputArea { get; }, MarkerArea { get; }, OutputArea { get; }

Returns an interface that you use to call the .NET functions in this section.

Table 7- 143 InputArea { get; } MarkerArea { get; } OutputArea { get; } - .NET (C#)

Syntax	`IIOArea InputArea { get; }`
	`IIOArea MarkerArea { get; }`
	`IIOArea OutputArea { get; }`

Parameters	None
Return values	`IIOArea`: The interface is used to call the "I/O access via address" functions.

GetAreaSize() / AreaSize { get; }

Returns the size of the area in bytes.

Table 7- 144 GetAreaSize() - Native C++

Syntax	`UINT32 GetAreaSize(`
	` EArea in_Area`
	`);`

Parameters	• `EArea in_Area:` The area whose size you want to receive. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330).
Return values	`UINT32:` Size of the area in bytes. If the function was successful, the value is not equal to 0.

Table 7- 145 AreaSize { get; } - .NET (C#)

Syntax	`UInt32 InputArea.AreaSize { get; }`
	`UInt32 MarkerArea.AreaSize { get; }`
	`UInt32 OutputArea.AreaSize { get; }`

Parameters	None
Return values	`Uint32:` Size of the area in bytes. If the function was successful, the value is not equal to 0.

ReadBit()

Reads an individual bit from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name (Page 173) and not via the address areas.

Table 7- 146 ReadBit() - Native C++

Syntax	`ERuntimeErrorCode ReadBit( EArea in_Area, UINT32 in_Offset, UINT8 in_Bit, bool* out_Value );`	
Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT8 in_Bit:` The bit offset within the byte. The value must be between 0 and 7. • `bool* out_Value:` Returns the bit value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invaid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 147 ReadBit() - .NET (C#)

Syntax	`bool InputArea.ReadBit( UInt32 in_Offset, Byte in_Bit );`
	`bool MarkerArea.ReadBit( UInt32 in_Offset, Byte in_Bit );`
	`bool OutputArea.ReadBit( UInt32 in_Offset, Byte in_Bit );`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `Byte in_Bit:` The bit offset within the byte. The value must be between 0 and 7.	
Return values	`bool:` Bit value	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.IndexOutOfRange`	Offset or bits are invaid.

ReadByte()

Reads an individual bit from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name and not via the address areas.

Table 7- 148 ReadByte() - Native C++

Syntax	`ERuntimeErrorCode ReadByte( EArea in_Area, UINT32 in_Offset, BYTE* out_Value);`	
Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `BYTE* out_Value:` Returns the byte value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset is invalid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 149 ReadByte() - .NET (C#)

Syntax	`Byte InputArea.ReadByte(`
	` UInt32 in_Offset`
	`);`
	`Byte MarkerArea.ReadByte(`
	` UInt32 in_Offset`
	`);`
	`Byte OutputArea.ReadByte(`
	` UInt32 in_Offset`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns.	
Return values	`Byte:` Byte value.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset is invalid.

ReadBytes()

Reads a byte array from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name and not via the address areas.

Table 7- 150 ReadByte() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode ReadBytes(
 EArea in_Area,
 UINT32 in_Offset,
 UINT32 in_BytesToRead,
 UINT32* out_BytesRead,
 BYTE inout_Values[]
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>EArea in_Area:</code>
The area from which you want to read. Permissible values: <code>{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}</code>. See EArea (Page 330).
<code>UINT32 in_Offset</code>:
The byte offset within the area. The value must be between 0 and the value that <code>GetAreaSize()</code> returns.
<code>UINT32 in_BytesToRead:</code>
Contains the size of the value storage.
<code>UINT32* out_BytesRead:</code>
Returns the number of bytes that were just written to the value storage.
<code>BYTE inout_Values[]:</code>
The storage for the bytes that are read from the area.</td></tr>
<tr><td rowspan="7">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>

<tr><td><code>ERuntimeError-Code.IndexOutOfRange</code></td><td>The offset is outside the area size. No byte could be read.</td></tr>
</table>

ReadSignals()

Structures and fields can be emulated through signal lists and be read by using the `ReadSignals()` function.

The function also takes into consideration the byte order (Endianness).

Only primitive data type signals are supported, but the function is not type-safe.

Note

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name (Page 173) and not via the address areas.

Table 7- 152 ReadSignals() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode ReadSignals(
 EArea in_Area,
 SDataValueByAddress* inout_Signals,

</table>

7.6.5.3 I/O access via address - Writing

WriteBit()

Writes an individual bit to the area.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name (Page 191) and not via the address areas.

Table 7- 154 WriteBit() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode WriteBit(
 EArea in_Area,
 UINT32 in_Offset,
 UINT8 in_Bit,
 bool in_Value
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>EArea in_Area:</code>
The area that is to be written.
Permissible values: <code>{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}.</code>
See EArea (Page 330).
<code>UINT32 in_Offset:</code>
The byte offset within the area. The value must be between 0 and the value that <code>GetAreaSize()</code> returns.
<code>UINT8 in_Bit:</code>
The bit offset within the byte. The value must be between 0 and 7.
<code>bool in_Value:</code>
Bit value.</td></tr>
<tr><td rowspan="7">Return values</td><td>Runtime error code</td><td>Condition</td></tr>

</table>

Table 7- 155 WriteBit() - .NET (C#)

Syntax	`void InputArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`
	`void MarkerArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`
	`void OutputArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `Byte in_Bit:` The bit offset within the byte. The value must be between 0 and 7. • `bool in_Value:` Bit value.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset or bits are invaid.

WriteByte()

Writes an individual byte to the area.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name (Page 191) and not via the address areas.

Table 7- 156 WriteByte() - Native C++

Syntax	`ERuntimeErrorCode WriteByte( EArea in_Area, UINT32 in_Offset, BYTE in_Value);`	
Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `BYTE in_Value:` Byte value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset is invalid.
	`SREC_WRONG_ARGUMENT`	Area is invalid.

Table 7- 157 WriteByte() - .NET (C#)

Syntax	`void InputArea.WriteByte( UInt32 in_Offset, Byte in_Value );`
	`void MarkerArea.WriteByte( UInt32 in_Offset, Byte in_Value );`
	`void OutputArea.WriteByte( UInt32 in_Offset, Byte in_Value );`	

Parameters	• `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `BYTE in_Value:` Byte value.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset is invalid.

WriteBytes()

Writes a byte array to the area.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

In particular, do not write to bytes that belong to other applications or contain internal data, for example, qualifier bits for fail-safe I/O modules.

Therefore, use access via the tag name (Page 191) and not via the address areas.

Table 7- 158 WriteBytes() - Native C++

Syntax	`ERuntimeErrorCode WriteBytes(`
	` EArea in_Area,`
	` UINT32 in_Offset,`
	` UINT32 in_BytesToWrite,`
	` UINT32* out_BytesWritten,`
	` BYTE in_Values[])`
	`;`	

Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT32 in_BytesToWrite:` Contains the size of the array value to be written. • `UINT32* out_BytesWritten:` Contains the number of bytes that were just written. • `BYTE in_Values[]:` Byte array that is to be written to the area.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	The offset is outside the area size. No byte could be written.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 159 WriteBytes() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>UInt32 InputArea.WriteBytes(
 UInt32 in_Offset,
 Byte[] in_Values
);
UInt32 InputArea.WriteBytes(
 UInt32 in_Offset,
 UInt32 in_BytesToWrite,
 Byte[] in_Values

);
UInt32 MarkerArea.WriteBytes(
 UInt32 in_Offset,
 Byte[] in_Values
);
UInt32 MarkerArea.WriteBytes(
 UInt32 in_Offset,
 UInt32 in_BytesToWrite,
 Byte[] in_Values
);
UInt32 OutputArea.WriteBytes(
 UInt32 in_Offset,
 Byte[] in_Values
);
UInt32 OutputArea.WriteBytes(
 UInt32 in_Offset,
 UInt32 in_BytesToWrite,
 Byte[] in_Values
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>UINT32 in_Offset:</code>
The byte offset within the area. The value must be between 0 and the value that <code>AreaSize</code> returns.
<code>UInt32 in_BytesToWrite:</code>
Contains the number of bytes to be written. The value must be between 1 and the size of the array value.
<code>BYTE in_Value:</code>
Byte value.</td></tr>
<tr><td>Return values</td><td colspan="2"><code>Uint32:</code> Contains the number of bytes that were just written.</td></tr>
<tr><td rowspan="5">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeError-Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code>

<code>ERuntimeError-Code.IndexOutOfRange</code></td><td>The process of the virtual controller is not running.

The offset is outside the area size. No byte could be written.</td></tr>
</table>

WriteSignals()

Writes multiple signals within an API call. The function also takes into consideration the byte order (Endianness).

The function supports only primitive data type signals, but it is not typical.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Therefore, use access via the tag name (Page 191) and not via the address areas.

Table 7- 160 WriteSignals() - Native C++

Syntax	`ERuntimeErrorCode WriteSignals( EArea in_Area, SDataValueByAddress* in_Signals, UINT32 in_SignalCount );`	
Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 330). • `SDataValueByAddress* inout_Signals:` The signal list to be written. • `UINT32 in_SignalCount:` Number of signals in the list.	
Signal error	Error code	Condition
	`SREC_OK`	The signal operation is successful.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invalid.
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_SIGNAL_CONFIGURATION_ERROR`	At least one signal error is in the list.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 161 WriteSignals() - .NET (C#)

Syntax	`void InputArea.WriteSignals( SDataValueByAddress[] in_Signals );`
	`void MarkerArea.WriteSignals( SDataValueByAddress[] in_Signals );`
	`void OutputArea.WriteSignals( SDataValueByAddress[] in_Signals );`	

Parameters	• `SDataValueByAddress[] in_Signals:` The signal list to be written.	
Return values	None	
Signal error	Error code	Condition
	`ERuntimeErrorCode.OK`	The signal operation is successful.
	`ERuntimeError-Code.IndexOutOfRange`	Offset or bits are invalid.
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.SignalConfigurationError`	At least one signal error is in the list.

7.6.5.4 I/O access via tag name - Reading

Individual access to IO data is used for displaying and writing values that are not refreshed regularly in a graphical user interface (GUI).

Note

To simulate a regular exchange of signals, create a signal list for each set of signals. Use this signal list for all further accesses. Create a new list as soon as the set of signals changes.

For the signal lists use the functions `ReadSignals()` and `WriteSignals()`.

Read()

Reads the value of a PLC tag.

Table 7- 162 Read() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode Read(
 WCHAR* in_Tag,
 SDataValue* inout_Value
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>WCHAR* in_Tag:</code>
The name of the PLC tag that is to be read.
<code>SDataValue* inout_Value:</code>
Contains the value and the expected type of the PLC tag. If the expected type is <code>UNSPECIFIC</code>, it is set to the stored type when the function was successful. The <code>STRUCT</code> type is not supported.
Structures and fields can be emulated through signal lists and be read by using the <code>ReadSignals()</code> function.</td></tr>
<tr><td rowspan="9">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>SREC_INSTANCE_NOT_RUNNING</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>SREC_DOES_NOT_EXIST</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>SREC_NOT_SUPPORTED</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>SREC_TYPE_MISMATCH</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td><code>SREC_NOT_UP_TO_DATE</code></td><td>The stored tag list must be updated.</td></tr>
</table>

Table 7- 163 Read() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><code>SDataValue Read(
 string in_Tag
)</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>string in_Tag:</code>
The name of the PLC tag that is to be read.</td></tr>
<tr><td>Return values</td><td colspan="2"><code>SDataValue:</code> Contains the value and the type of the PLC tag.</td></tr>
<tr><td rowspan="9">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeError-
Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeError-
Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMismatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 336).</td></tr>
<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

ReadBool()

Reads the value of a PLC tag.

Table 7- 164 ReadBool() - Native C++

Syntax	`ERuntimeErrorCode ReadBool( WCHAR* in_Tag, bool* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `bool* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 165 ReadBool() - .NET (C#)

Syntax	`bool ReadBool( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`bool:` Contains the value of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt8()

Reads the value of a PLC tag.

Table 7- 166 ReadInt8() - Native C++

Syntax	`ERuntimeErrorCode ReadInt8( WCHAR* in_Tag, INT8* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT8* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 167 ReadInt8() - .NET (C#)

Syntax	`Int8 ReadInt8( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int8:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt16()

Reads the value of a PLC tag.

Table 7- 168 ReadInt16() - Native C++

Syntax	`ERuntimeErrorCode ReadInt16( WCHAR* in_Tag, INT16* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT16* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 169 ReadInt16() - .NET (C#)

Syntax	`Int16 ReadInt16( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int16:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt32()

Reads the value of a PLC tag.

Table 7- 170 ReadInt32() - Native C++

Syntax	`ERuntimeErrorCode ReadInt32( WCHAR* in_Tag, INT32* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT32* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 171 ReadInt32() - .NET (C#)

Syntax	`Int32 ReadInt32( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int32:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt64()

Reads the value of a PLC tag.

Table 7- 172 ReadInt64() - Native C++

Syntax	`ERuntimeErrorCode ReadInt64( WCHAR* in_Tag, INT64* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT64* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 173 ReadInt64() - .NET (C#)

Syntax	`Int64 ReadInt64( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int64:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt8()

Reads the value of a PLC tag.

Table 7- 174 ReadUInt8() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt8( WCHAR* in_Tag, UINT8* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT8* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 175 ReadUInt8() - .NET (C#)

Syntax	`UInt8 ReadUInt8( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt8:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt16()

Reads the value of a PLC tag.

Table 7- 176 ReadUInt16() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt16( WCHAR* in_Tag, UINT16* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT16* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 177 ReadUInt16() - .NET (C#)

Syntax	`UInt16 ReadUInt16( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt16:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt32()

Reads the value of a PLC tag.

Table 7- 178 ReadUInt32() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt32( WCHAR* in_Tag, UINT32* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT32* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 179 ReadUInt32() - .NET (C#)

Syntax	`UInt32 ReadUInt32( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Uint32:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt64()

Reads the value of a PLC tag.

Table 7- 180 ReadInt64() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt64( WCHAR* in_Tag, UINT64* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT64* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 181 ReadUInt64() - .NET (C#)

Syntax	`UInt64 ReadUInt64( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt64:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadFloat()

Reads the value of a PLC tag.

Table 7- 182 ReadFloat() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode ReadFloat(
 WCHAR* in_Tag,
 float* out_Value
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>WCHAR* in_Tag:</code>
The name of the PLC tag that is to be read.
<code>float* out_Value:</code>
Contains the value of the PLC tag.</td></tr>
<tr><td rowspan="9">Return values</td><td>Runtime error code</td><td>Condition</td></tr>

</table>

ReadDouble()

Reads the value of a PLC tag.

Table 7- 184 ReadDouble() - Native C++

Syntax	`ERuntimeErrorCode ReadDouble( WCHAR* in_Tag, double* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `double* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 185 ReadDouble() - .NET (C#)

Syntax	`double ReadDouble( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`double:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadChar()

Reads the value of a PLC tag.

Table 7- 186 ReadChar() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode ReadChar(
 WCHAR* in_Tag,
 char* out_Value
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>WCHAR* in_Tag:</code>
The name of the PLC tag that is to be read.
<code>char* out_Value:</code>
Contains the value of the PLC tag.</td></tr>
<tr><td rowspan="9">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>

<tr><td><code>SREC_NOT_SUPPORTED</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>SREC_TYPE_MISMATCH</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td><code>SREC_NOT_UP_TO_DATE</code></td><td>The stored tag list must be updated.</td></tr>
</table>

Table 7- 187 ReadChar() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>sbyte ReadChar(
 string in_Tag
)</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>string in_Tag:</code>
The name of the PLC tag that is to be read.</td></tr>
<tr><td>Return values</td><td colspan="2"><code>sbyte:</code> Contains the value and the type of the PLC tag.</td></tr>
<tr><td rowspan="9">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeError-Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMismatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

ReadWChar()

Reads the value of a PLC tag.

Table 7- 188 ReadWChar() - Native C++

Syntax	`ERuntimeErrorCode ReadWChar( WCHAR* in_Tag, WCHAR* out_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `WCHAR* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 189 ReadWChar() - .NET (C#)

Syntax	`char ReadWChar( string in_Tag )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`char:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadSignals()

Reads multiple signals within an API call. When the function is called for the first time, it stores internal information in the structures `SDataValueByName*` to improve the performance of the subsequent calls.

Note

To simulate a regular exchange of signals, create a signal list for each set of signals. Use this signal list for all further accesses. Create a new list as soon as the set of signals changes.

Table 7- 190 ReadSignals() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode ReadSignals(
 SDataValueByName* inout_Signals,
 UINT32 in_SignalCount
);
ERuntimeErrorCode ReadSignals(
 SDataValueByNameWithCheck* inout_Signals,
 UINT32 in_SignalCount
 bool* out_SignalsHaveChanged
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>SDataValueByName* inout_Signals:</code>
Contains the name, the value and the expected type of the PLC tag. If the expected type is <code>UNSPECIFIC</code>, it is set to the stored type when the function was successful. The <code>STRUCT</code> type is not supported.
<code>SDataValueByNameWithCheck* inout_Signals:</code>
Contains the name, the value and the expected type of the PLC tag. If the expected type is <code>UNSPECIFIC</code>, it is set to the stored type when the function was successful. The <code>STRUCT</code> type is not supported. <code>"ValueHasChanged"</code> is set to <code>true</code> if the value of the signal has changed since the preceding call.
<code>UINT32 in_SignalCount:</code>
The number of signals to be read.
<code>bool* out_SignalsHaveChanged:</code>
Returns <code>true</code> if the value of at least one signal has changed since the preceding call.</td></tr>
<tr><td rowspan="5">Signal error</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The signal operation is successful.</td></tr>
<tr><td><code>SREC_DOES_NOT_EXIST</code></td><td>The entry does not exist in the stored tag table.</td></tr>
<tr><td><code>SREC_NOT_SUPPORTED</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>SREC_TYPE_MISMATCH</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td rowspan="7">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>SREC_INSTANCE_NOT_RUNNING</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>SREC_NOT_UP_TO_DATE</code></td><td>The stored tag list must be updated.</td></tr>
<tr><td><code>SREC_SIGNAL_CONFIGURATION_ERROR</code></td><td>At least one signal error is in the list.</td></tr>
</table>

Table 7- 191 ReadSignals() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>void ReadSignals(
 ref SDataValueByName[] inout_Signals
)
void ReadSignals(
 ref SDataValueByNameWithCheck[] inout_Signals
 out bool out_SignalsHaveChanged
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>ref SDataValueByName[] inout_Signals:</code>
Contains the name, the value and the expected type of the PLC tag. If the expected type is <code>UNSPECIFIC</code>, it is set to the stored type when the function was successful. The <code>STRUCT</code> type is not supported.
<code>ref SDataValueByNameWithCheck[] inout_Signals:</code>
Contains the name, the value and the expected type of the PLC tag. If the expected type is <code>UNSPECIFIC</code>, it is set to the stored type when the function was successful. The <code>STRUCT</code> type is not supported. <code>"ValueHasChanged"</code> is set to <code>true</code> if the value of the signal has changed since the preceding call.
<code>out bool out_SignalsHaveChanged:</code>
Returns <code>true</code> if the value of at least one signal has changed since the preceding call.</td></tr>
<tr><td>Return values</td><td colspan="2"><code>SDataValue:</code> Contains the value and the type of the PLC tag.</td></tr>
<tr><td rowspan="5">Signal error</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeErrorCode.OK</code></td><td>The signal operation is successful.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag table.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMismatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td rowspan="6">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeErrorCode.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeErrorCode.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

7.6.5.5 I/O access via tag name - Writing

Individual access to IO data is used for displaying and writing values that are not refreshed regularly in a graphical user interface (GUI).

Note

To simulate a regular exchange of signals, create a signal list for each set of signals. Use this signal list for all further accesses. Create a new list as soon as the set of signals changes.

For the signal lists use the functions `ReadSignals()` and `WriteSignals()`.

Write()

Writes the value of a PLC tag.

Table 7- 192 Write() - Native C++

Syntax	`ERuntimeErrorCode Write( WCHAR* in_Tag, SDataValue* in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `SDataValue* in_Value:` Contains the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported. Structures and fields can be emulated through signal lists and then be read by using the `ReadSignals()` function and written by using the `WriteSignals()` function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.
	`SREC_WRONG_ARGUMENT`	The expected type is `UNSPECIFIC`.

Table 7- 193 Write() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>void Write(
 string in_Tag
 SDataValue in_Value
)</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>string in_Tag:</code>
The name of the PLC tag that is to be written.
• <code>SDataValue in_Value:</code>
Contains the value and the expected type of the PLC tag. The <code>UNSPECIFIC</code> and <code>STRUCT</code> types are not supported.
Structures and fields can be emulated through signal lists and then be written by using the <code>WriteSignals()</code> function.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>
<tr><td rowspan="9">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>ERuntimeError-Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeError-Code.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMismatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
<tr><td></td><td><code>ERuntimeErrorCode.WrongArgument</code></td><td>The expected type is <code>UNSPECIFIC</code>.</td></tr>
</table>

WriteBool()

Writes the value of a PLC tag.

Table 7- 194 WriteBool() - Native C++

Syntax	`ERuntimeErrorCode WriteBool( WCHAR* in_Tag, bool in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `bool in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 195 WriteBool() - .NET (C#)

Syntax	`void WriteBool( string in_Tag bool in_Value )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `bool in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 337).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt8()

Writes the value of a PLC tag.

Table 7- 196 WriteInt8() - Native C++

Syntax	`ERuntimeErrorCode WriteInt8( WCHAR* in_Tag, INT8 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT8 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 197 WriteInt8() - .NET (C#)

Syntax	`void WriteInt8(`
	` string in_Tag`
	` Int8 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int8 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt16()

Writes the value of a PLC tag.

Table 7- 198 WriteInt16() - Native C++

Syntax	`ERuntimeErrorCode WriteInt16(`
	` WCHAR* in_Tag,`
	` INT16 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT16 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 199 WriteInt16() - .NET (C#)

Syntax	`void WriteInt16( string in_Tag Int16 in_Value )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int16 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt32()

Writes the value of a PLC tag.

Table 7- 200 WriteInt32() - Native C++

Syntax	`ERuntimeErrorCode WriteInt32( WCHAR* in_Tag, INT32 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT32 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 201 WriteInt32() - .NET (C#)

Syntax	`void WriteInt32(`
	` string in_Tag`
	` Int32 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int32 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt64()

Writes the value of a PLC tag.

Table 7- 202 WriteInt64() - Native C++

Syntax	`ERuntimeErrorCode WriteInt64( WCHAR* in_Tag, INT64 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT64 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 203 WriteInt64() - .NET (C#)

Syntax	`void WriteInt64(`
	` string in_Tag`
	` Int64 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int64 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt8()

Writes the value of a PLC tag.

Table 7- 204 WriteUInt8() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt8( WCHAR* in_Tag, UINT8 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT8 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 205 WriteUInt8() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><code>void WriteUInt8(</code>
<code> string in_Tag</code>
<code> UInt8 in_Value</code>
<code>)</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>string in_Tag:</code>
The name of the PLC tag that is to be written.
• <code>UInt8 in_Value:</code>
Contains the value of the PLC tag.</td></tr>

</table>

WriteUInt16()

Reads the value of a PLC tag.

Table 7- 206 WriteUInt16() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt16( WCHAR* in_Tag, UINT16 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT16 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 207 WriteUInt16() - .NET (C#)

Syntax	`void WriteUInt16(`
	` string in_Tag`
	` UInt16 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt16 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteUInt32()

Writes the value of a PLC tag.

Table 7- 208 WriteUInt32() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt32( WCHAR* in_Tag, UINT32 in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT32 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 209 WriteUInt32() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>void WriteUInt32(
 string in_Tag
 UInt32 in_Value
)</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>string in_Tag:</code>
The name of the PLC tag that is to be written.
<code>UInt32 in_Value:</code>
Contains the value of the PLC tag.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>
<tr><td rowspan="8">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>

<tr><td><code>ERuntimeErrorCode.TypeMissmatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td></td><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

WriteUInt64()

Writes the value of a PLC tag.

Table 7- 210 WriteUInt64() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt64(`
	` WCHAR* in_Tag,`
	` UINT64 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT64 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 211 WriteUInt64() - .NET (C#)

Syntax	`void WriteUInt64( string in_Tag UInt64 in_Value )`	
Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt64 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteFloat()

Writes the value of a PLC tag.

Table 7- 212 WriteFloat() - Native C++

Syntax	`ERuntimeErrorCode WriteFloat(`
	` WCHAR* in_Tag,`
	` float in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `float in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	SREC_OK	The function is successful.
	SREC_INTERFACE_REMOVED	The instance is not registered in Runtime Manager.
	SREC_TIMEOUT	The function does not return on time.
	SREC_INSTANCE_NOT_RUNNING	The process of the virtual controller is not running.
	SREC_DOES_NOT_EXIST	The entry does not exist in the stored tag list.
	SREC_NOT_SUPPORTED	Access to entire structures or arrays is not supported.
	SREC_TYPE_MISMATCH	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	SREC_NOT_UP_TO_DATE	The stored tag list must be updated.

Table 7- 213 WriteFloat() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><code>void WriteFloat(</code>
<code> string in_Tag</code>
<code> float in_Value</code>
<code>)</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>string in_Tag:</code>
The name of the PLC tag that is to be written.
• <code>float in_Value:</code>
Contains the value of the PLC tag.</td></tr>

<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMissmatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

WriteDouble()

Writes the value of a PLC tag.

Table 7- 214 WriteDouble() - Native C++

Syntax	`ERuntimeErrorCode WriteDouble( WCHAR* in_Tag, double in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `double in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 215 WriteDouble() - .NET (C#)

Syntax	`void WriteDouble(`
	` string in_Tag`
	` double in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `double in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteChar()

Writes the value of a PLC tag.

Table 7- 216 WriteChar() - Native C++

Syntax	`ERuntimeErrorCode WriteChar(`
	` WCHAR* in_Tag,`
	` char in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `char in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 217 WriteChar() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>void WriteChar(
 string in_Tag
 sbyte in_Value
)</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>string in_Tag:</code>
The name of the PLC tag that is to be written.
<code>sbyte in_Value:</code>
Contains the value of the PLC tag.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>

<tr><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

WriteWChar()

Writes the value of a PLC tag.

Table 7- 218 WriteWChar() - Native C++

Syntax	`ERuntimeErrorCode WriteWChar( WCHAR* in_Tag, WCHAR in_Value );`	
Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `WCHAR in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 219 WriteWChar() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><pre>void WriteWChar(
 string in_Tag
 char in_Value
)</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>string in_Tag:</code>
The name of the PLC tag that is to be written.
• <code>char in_Value:</code>
Contains the value of the PLC tag.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>
<tr><td rowspan="8">Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>

<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeErrorCode.InstanceNotRunning</code></td><td>The process of the virtual controller is not running.</td></tr>
<tr><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>The entry does not exist in the stored tag list.</td></tr>
<tr><td><code>ERuntimeErrorCode.NotSupported</code></td><td>Access to entire structures or arrays is not supported.</td></tr>
<tr><td><code>ERuntimeErrorCode.TypeMissmatch</code></td><td>The expected type does not match the stored type. See Compatible primitive data types (Page 335).</td></tr>
<tr><td></td><td><code>ERuntimeErrorCode.NotUpToData</code></td><td>The stored tag list must be updated.</td></tr>
</table>

WriteSignals()

Writes multiple signals within an API call. When the function is called for the first time, it stores internal information in the structures `SDataValueByName`* to improve the performance of the subsequent calls.

Note

To simulate a regular exchange of signals, create a signal list for each set of signals. Use this signal list for all further accesses. Create a new list as soon as the set of signals changes.

Table 7- 220 WriteSignals() - Native C++

Syntax	`ERuntimeErrorCode WriteSignals( SDataValueByName* inout_Signals, UINT32 in_SignalCount );`	
Parameters	• `SDataValueByName* inout_Signals:` Contains the name, the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported. • `UINT32 in_SignalCount:` Number of signals.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 335).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.
	`SREC_WRONG_ARGUMENT`	The expected type is `UNSPECIFIC`.

Table 7- 221 WriteSignals() - .NET (C#)

Syntax	`void WriteSignals( SDataValueByName[] in_Signals )`	
Parameters	• `SDataValueByName:` Contains the name, the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 337).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.
	`ERuntimeErrorCode.WrongArgument`	The expected type is `UNSPECIFIC`.

7.6.6 Settings for the virtual time

GetSystemTime()

Returns the virtual system time of the virtual controller. Returns an empty structure when the function fails.

Table 7- 222 GetSystemTime() - Native C++

Syntax	`SYSTEMTIME GetSystemTime();`
Parameters	None
Return values	`SYSTEMTIME:` System time of the virtual controller.

SetSystemTime()

Sets the virtual system time of the virtual controller. A system time between "Jan 1 1970 00:00:00:000" and "Dec 31 2200 23:59:59:999" is valid.

Table 7- 223 SetSystemTime() - Native C++

Syntax	`ERuntimeErrorCode SetSystemTime( SYSTEMTIME in_SystemTime );`	
Parameters	• `SYSTEMTIME in_SystemTime:` System time that is to be set for the virtual controller.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

SystemTime { get; set; }

Sets or returns the virtual system time of the virtual controller. A system time between "Jan 1 1970 00:00:00:000" and "Dec 31 2200 23:59:59:999" is valid.

Table 7- 224 SystemTime { get; set; } - .NET (C#)

Syntax	`DateTime SystemTime { get; set; }`	
Parameters	None	
Return values	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

GetScaleFactor()

Returns the scaling factor with which the virtual time advances.

Table 7- 225 GetScaleFactor() - Native C++

Syntax	`double GetScaleFactor();`
Parameters	None
Return values	`double:` Scaling factor of the virtual time.

SetScaleFactor()

Sets the scaling factor with which the virtual time advances.

Start with a small scaling factor and incrementally approach a scaling factor at which the virtual controller remains in RUN.

A value between 0.01 and 100 is valid. The default setting is 1.

- If the value is less than 1, the virtual time of the virtual controller runs X-times slower than the real time.
- If the value is greater than 1, the virtual time of the virtual controller runs X-times faster than the real time.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 226 SetScaleFactor() - Native C++

Syntax	`ERuntimeErrorCode SetScaleFactor ( double in_Value );`	
Parameters	• `double in_Value:` Scaling factor of the virtual time.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

ScaleFactor { get; set; }

Sets or returns the scaling factor with which the virtual time advances.

Start with a small scaling factor and incrementally approach a scaling factor at which the virtual controller remains in RUN.

A value between 0.01 and 100 is valid. The default setting is 1.

- If the value is less than 1, the virtual time of the virtual controller runs X-times slower than the real time.
- If the value is greater than 1, the virtual time of the virtual controller runs X-times faster than the real time.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 227 ScaleFactor { get; set; } - .NET (C#)

Syntax	`double ScaleFactor { get; set; }`	
Parameters	None	
Return values	`double`: Scaling factor of the virtual time.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

7.6.7 Cycle control

GetOperatingMode()

Returns the operating mode (Page 331) of the virtual controller.

Table 7- 228 GetOperatingMode() - Native C++

Syntax	`EOperatingMode GetOperatingMode();`
Parameters	None
Return values	`EOperatingMode`: Operating mode of the virtual controller

SetOperatingMode()

Sets the operating mode of the virtual controller.

A change in the value during runtime only takes effect at the synchronization point.

Table 7- 229 SetOperatingMode() - Native C++

Syntax	`void SetOperatingMode( EOperatingMode in_OperatingMode );`	
Parameters	• `EOperatingMode in_OperatingMode`: Operating mode of the virtual controller	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

OperatingMode { get; set; }

Returns or sets the operating mode of the virtual controller.

A change in the value during runtime only takes effect at the synchronization point.

Table 7- 230 OperatingMode { get; set; } - .NET (C#)

Syntax	`EOperatingMode OperatingMode { get; set; }`	
Parameters	None	
Return values	`EOperatingMode`: Operating mode of the virtual controller	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

SetSendSyncEventInDefaultModeEnabled()

Sets the `SendSyncEventInDefault` mode. In this mode the `OnSyncPointReached` event is triggered after each cycle end in the Default operating mode. See OnSyncPointReached (Page 247).

Table 7- 231 SetSendSyncEventInDefaultModeEnabled() - Native C++

Syntax	`ERuntimeErrorCode SetSendSyncEventInDefaultModeEnabled( bool in_Enable );`	
Parameters	• `bool in_Enable`: If `true`, the `OnSyncPointReached` event is triggered after each cycle in the Default operating mode.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

IsSendSyncEventInDefaultModeEnabled()

Returns the `SendSyncEventInDefaultMode` mode. When the function fails, the return value is `false`.

Table 7- 232 IsSendSyncEventInDefaultModeEnabled() - Native C++

Syntax	`bool IsSendSyncEventInDefaultModeEnabled();`
Parameters	None
Return values	• `false`: The event is not triggered (unless the Sync-Freeze mode is active). • `true`: The event is triggered after every cycle.

IsSendSyncEventInDefaultModeEnabled { get; set; }

Returns or sets the `SendSyncEventInDefaultMode` *mode.* In this mode the `OnSyncPointReached` event is triggered after each cycle end for every operating mode. If the event is also to be received in the Default operating mode, set the return value to `true`. See OnSyncPointReached (Page 247).

Table 7- 233 IsSendSyncEventInDefaultModeEnabled { get; set; } - .NET (C#)

Syntax	`bool IsSendSyncEventInDefaultModeEnabled { get; set;}`	
Parameters	None	
Return values	• `false`: The event is not triggered (unless the Sync-Freeze mode is active). • `true`: The event is triggered after every cycle.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetOverwrittenMinimalCycleTime_ns()

Returns the overwritten minimum cycle time (in nanoseconds) that is used in the `SingleStep_CT` and `SingleStep_CPT` operating modes.

Table 7- 234 GetOverwrittenMinimalCycleTime_ns() - Native C++

Syntax	`INT64 GetOverwrittenMinimalCycleTime_ns();`
Parameters	None
Return values	`INT64`: The overwritten minimum cycle time in nanoseconds.

SetOverwrittenMinimalCycleTime_ns()

Sets the overwritten minimum cycle time (in nanoseconds) that is used in the `SingleStep_CT` and `SingleStep_CPT` operating modes.

A value between 0 and 6000000000 is valid. The default setting is 100 ms.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 235 SetOverwrittenMinimalCycleTime_ns() - Native C++

Syntax	`ERuntimeErrorCode SetOverwrittenMinimalCycleTime_ns( INT64 in_CycleTime_ns );`	
Parameters	• `INT64 in_CycleTime_ns`: The overwritten minimum cycle time in nanoseconds.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

OverwrittenMinimalCycleTime_ns { get; set; }

Returns or sets the overwritten minimum cycle time in nanoseconds that is used in the `SingleStep_CT` and `SingleStep_CPT` operating modes.

A value between 0 and 6000000000 is valid. The default setting is 100 ms.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 236 OverwrittenMinimalCycleTime_ns { get; set; } - .NET (C#)

Syntax	`Int64 OverwrittenMinimalCycleTime_ns { get; set; }`	
Parameters	None	
Return values	`Int64`: The overwritten minimum cycle time in nanoseconds.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

RunToNextSyncPoint()

If the virtual controller is running in a SingleStep operating mode, it is stopped at the synchronization point (Freeze state). The `RunToNextSyncPoint()` function cancels the freeze state. The virtual controller continues to run until the next synchronization point.

Table 7- 237 RunToNextSyncPoint() - Native C++

Syntax	`ERuntimeErrorCode RunToNextSyncPoint();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 238 RunToNextSyncPoint() - .NET (C#)

Syntax	`void RunToNextSyncPoint();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.

StartProcessing()

If the virtual controller is running in a TimespanSynchronized operating mode, it is stopped at the synchronization point (Freeze state). The `StartProcessing()` function cancels the freeze state. The virtual controller will now run for at least the requested time before it changes to Freeze state at the next synchronization point.

Table 7- 239 StartProcessing() - Native C++

Syntax	`ERuntimeErrorCode StartProcessing( INT64 in_MinimalTimeToRun_ns );`	
Parameters	• `INT64 in_MinimalTimeToRun_ns:` The minimum virtual time (in nanoseconds) that the virtual controller runs before it changes to Freeze state.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_WRONG_ARGUMENT`	The value is less than 0.

Table 7- 240 StartProcessing() - .NET (C#)

Syntax	`void StartProcessing( Int64 in_MinimalTimeToRun_ns );`	
Parameters	• `Int64 in_MinimalTimeToRun_ns:` The minimum virtual time (in nanoseconds) that the virtual controller runs before it changes to Freeze state.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.WrongArgument`	The value is less than 0.

Additional information

For further information, see sections Virtual time response (Page 73), Stop simulation (Page 76).

7.6.8 Acyclic services

7.6.8.1 Overview

The acyclic services of PLCSIM Advanced include:

- Interrupt and event information which the I/O modules send to the CPU.
- Read and write processes of parameter and status data from the user program of the PLC to the I/O modules.

API methods and associated events

Events which are triggered by the I/O modules and associated API methods:

Table 7- 241 Overview - API methods and associated events

OB	Name	API methods for triggering the OB (query)	API event after OB execution (alarm)
4x	Hardware Interrupt	ProcessEvent (Page 234)	OnProcessEventDone (Page 259)
55	Status	StatusEvent (Page 238)	OnStatusEventDone (Page 261)
56	Update	UpdateEvent (Page 240)	OnUpdateEventDone (Page 263)
57	Profile	ProfileEvent (Page 239)	OnProfileEventDone (Page 262)
82	Diagnostic error Interrupt	AlarmNotification (Page 232)	OnAlarmNotificationDone (Page 258)
83	Pull or Plug of module	PullOrPlugEvent (Page 236)	OnPullOrPlugEventDone (Page 260)
86	Rack or station failure	RackOrStationFaultEvent (Page 242)	OnRackOrStationFaultEventDone (Page 264)

Flowchart for the simulation of events which are triggered by the I/O modules.

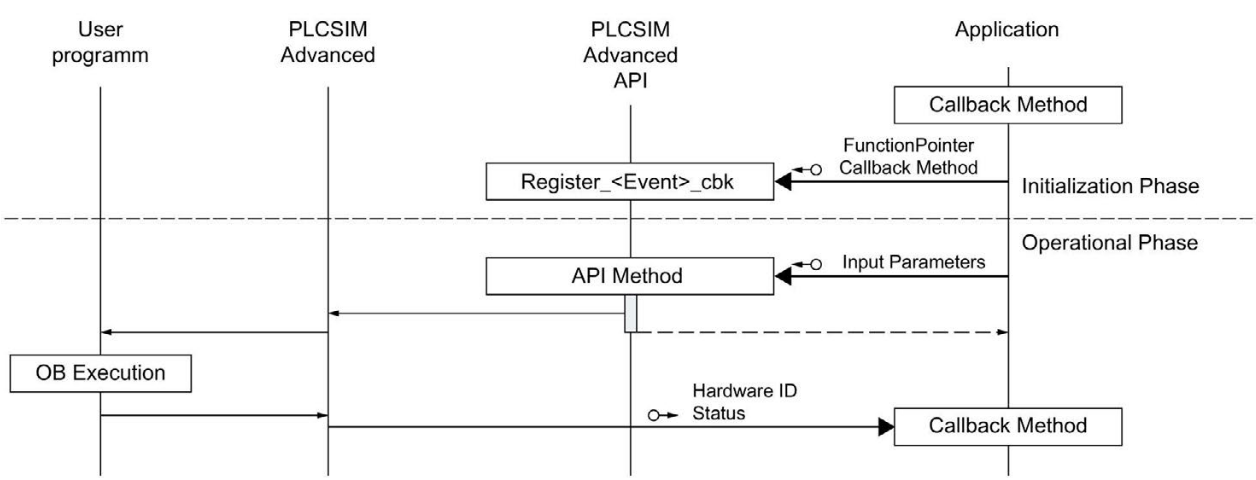

Figure 7-4 Flowchart for the simulation of events

Events

Events triggered by the user program (TIA Portal), which have logged on for the notification:

SFB	Name	API event for triggering the SFB	API method (alarm)
52	RDREC	OnDataRecordRead (Page 257)	ReadRecordDone (Page 230)
53	WRREC	OnDataRecordWrite (Page 257)	WriteRecordDone (Page 230)

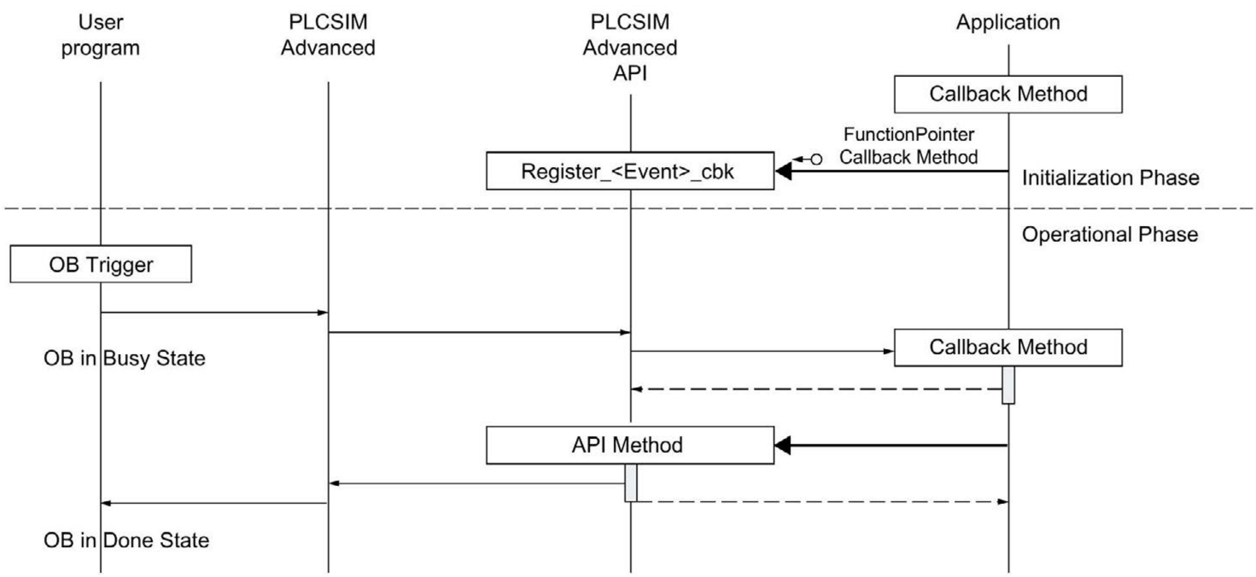

Figure 7-5 Flowchart

7.6.8.2 ReadRecordDone / WriteRecordDone

ReadRecordDone()

With this API method, the simulation of an I/O module signals to the CPU that the asynchronous reading of a data record has been completed. The simulation hereby makes the read information available.

Table 7- 242 ReadRecordDone() - Native C++

Syntax	`ERuntimeErrorCode ReadRecordDone( SDataRecordInfo in_RecordInfo, BYTE* in_Data, UINT32 in_Status );`	
Parameters	• `SDataRecordInfo in_RecordInfo:` Structure which contains the data record information. See SDataRecordInfo (Page 321). • `BYTE* in_Data:` Byte array of the read data record with the length defined by `DataSize` in the structure `SDataRecordInfo`. • `UINT32 in_Status:` Status of the job execution	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_DOES_NOT_EXIST`	No hardware identifier of the module.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 243 ReadRecordDone() - .NET (C#)

Syntax	`void ReadRecordDone( SDataRecordInfo in_RecordInfo, BYTE[] in_Data, UInt32 in_Status );`	
Parameters	• `SDataRecordInfo in_RecordInfo:` Structure which contains the data record information. See SDataRecordInfo (Page 321). • `BYTE[] in_Data:` Byte array of the read data record with the length defined by `DataSize` in the structure `SDataRecordInfo`. • `UInt32 in_Status:` Status of the job execution	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.DoesNotExist`	No hardware identifier of the module.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

WriteRecordDone()

With this API method, the simulation of an I/O module signals to the CPU that the asynchronous writing of a data record has been completed.

Table 7- 244 WriteRecordDone() - Native C++

Syntax	`ERuntimeErrorCode WriteRecordDone( SDataRecordInfo in_RecordInfo, UINT32 in_Status );`	
Parameters	• `SDataRecordInfo in_RecordInfo:` Structure which contains the data record information. See SDataRecordInfo (Page 321). • `UINT32 in_Status:` Status of the job execution	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_DOES_NOT_EXIST`	No hardware identifier of the module.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 245 WriteRecordDone() - .NET (C#)

Syntax	`void WriteRecordDone( SDataRecordInfo in_RecordInfo, UInt32 in_Status );`	
Parameters	• `SDataRecordInfo in_RecordInfo:` Structure which contains the data record information. See SDataRecordInfo (Page 321). • `UInt32 in_Status:` Status of the job execution	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.DoesNotExist`	No hardware identifier of the module.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.8.3 AlarmNotification

AlarmNotification()

This function triggers diagnostic alarms according to the PROFINET standard.

Each call of this function calls the OB 82 once, regardless of the number and the severity level of the transferred diagnostic entries.

Table 7- 246 AlarmNotification() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode AlarmNotification(
 UINT16 in_HardwareIdentifier,
 UINT16 in_ModuleState,
 UINT16 in_NumberOfDiagnosisEvents,
SDiagExtChannelDescription* in_ArrayOfDiagnosisEvents,
UINT16* out_SequenceNumber
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2">
<code>UINT16 in_HardwareIdentifier:</code>
The hardware identifier of the module or submodule which sends the diagnostics entry.
The identifier must belong to a hardware component in the currently loaded project.
<code>UINT16 in_ModuleState:</code>
Module status. The following statuses are valid:
DMODULE_STATE_OK,
DMODULE_STATE_ERROR,
DMODULE_STATE_MAINT_DEMANDED,
DMODULE_STATE_MAINT_REQUIRED
<code>UINT16 in_NumberOfDiagnosisEvents:</code>
Multiple diagnostic entries can be sent to the CPU with a single API call.
Valid range: 0 to 16. 0 means that no diagnostics entry should appear for the submodule or the channel.
<code>SDiagExtChannelDescription* in_ArrayOfDiagnosisEvents:</code>
Pointer to a field with diagnostic entries. The field must match the number of diagnostic entries. It can also be a zero pointer. For definitions, see SDiagExtChannelDescription (Page 324).
<code>UINT16* out_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to PROFINET standard the sequence number is 10 bits wide (1 to 7FF_H). When the highest number is reached the numbering starts again at 1.
</td></tr>
<tr><td rowspan="8">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>SREC_DOES_NOT_EXIST</code></td><td>No hardware identifier of the module.</td></tr>
<tr><td><code>SREC_INDEX_OUT_OF_RANGE</code></td><td>The field size of <code>in_ArrayOfDiagnosisEvents</code> is less than the number of the currently available diagnostic events.</td></tr>
<tr><td><code>SREC_WRONG_MODULE_TYPE</code></td><td>The channel number does not exist for the module.</td></tr>
<tr><td><code>SREC_WRONG_ARGUMENT</code></td><td>The value for the module status is invalid.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
</table>

Table 7- 247 AlarmNotification() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2">

```
void AlarmNotification(
 ushort in_HardwareIdentifier,
 ushort in_ModuleState,
 ushort in_NumberOfDiagnosisEvents,
SDiagExtChannelDescription [] in_ArrayOfDiagnosisEvents,
Out ushort out_SequenceNumber
);
```

</td></tr>
<tr><td>Parameters</td><td colspan="2">

- `ushort in_HardwareIdentifier:`

  The hardware identifier of the module or submodule which sends the diagnostics entry.

  The identifier must belong to a hardware component in the currently loaded project.
- `ushort in_ModuleState:`

  Module status. The following statuses are valid:

  ModuleState.Ok,
ModuleState.Error,
ModuleState.MaintenanceDemanded,
ModuleState.MaintenanceRequired
- `ushort in_NumberOfDiagnosisEvents`

  Multiple diagnostic entries can be sent to the CPU with a single API call.

  Valid range: 0 to 16. 0 means that no diagnostics entry should appear for the submodule or the channel.
- `SDiagExtChannelDescription [] in_ArrayOfDiagnosisEvents:`

  Pointer to a field with diagnostic entries. The field must match the number of diagnostic entries. It can also be a zero pointer. For definitions, see SDiagExtChannelDescription.
- `Out ushort out_SequenceNumber:`

  PLCSIM Advanced assigns a unique consecutive number to each alarm event.

  According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.

</td></tr>
<tr><td rowspan="7">Exceptions</td><td colspan="2">Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</td></tr>
<tr><td>Runtime error code</td><td>Condition</td></tr>
<tr><td>ERuntimeErrorCode.InterfaceRemoved</td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td>ERuntimeErrorCode.DoesNotExist</td><td>No hardware identifier of the module.</td></tr>
<tr><td>ERuntimeErrorCode.WrongArgument</td><td>The value for the module status is invalid.</td></tr>
<tr><td>ERuntimeErrorCode.WrongModuleType</td><td>The channel number does not exist for the module.</td></tr>
<tr><td>ERuntimeErrorCode.IndexOutOfRange</td><td>The field size of in_ArrayOfDiagnosisEvents is less than the number of the currently available diagnostic events.</td></tr>
<tr><td></td><td>ERuntimeErrorCode.Timeout</td><td>The function does not return on time.</td></tr>
</table>

7.6.8.4 ProcessEvent

ProcessEvent()

Process events from central and distributed input modules can be simulated with this function.

Table 7- 248 ProcessEvent() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode ProcessEvent(
 UINT16 in_HardwareIdentifier,
 UINT16 in_Channel,
EProcessEventType in_ProcessEventType,
UINT16* out_SequenceNumber);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT16 in_HardwareIdentifier:</code>
The hardware identifier of the module or submodule which sends the process event.
The identifier must belong to a hardware component in the currently loaded project.
• <code>UINT16 in_Channel:</code>
The channel of the IO module which sends the process event.
• <code>EProcessEventType in_ProcessEventType:</code>
A value from the list of predefined types of events for S7 modules, see EProcessEventType (Page 344).
• <code>UINT16* out_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.</td></tr>
<tr><td rowspan="6">Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td><code>SREC_DOES_NOT_EXIST</code></td><td>No hardware identifier of the module.</td></tr>
<tr><td><code>SREC_NOT_SUPPORTED_BY_MODULE</code></td><td>The module is not supported by this user action.</td></tr>
<tr><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
</table>

Table 7- 249 ProcessEvent() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2">

```
void ProcessEvent(
ushort in_HardwareIdentifier,
ushort in_Channel,
EProcessEventType in_ProcessEventType,
Out ushort out_SequenceNumber
);
```

</td></tr>
<tr><td>Parameters</td><td colspan="2">

- `ushort in_HardwareIdentifier:`

  The hardware identifier of the module or submodule which generates the process event.

  The identifier must belong to a hardware component in the currently loaded project.
- `ushort in_Channel:`

  The channel of the IO module which generates the process event.
- `EProcessEventType in_ProcessEventType:`

  A value from the list of predefined types of events for S7 modules, see EProcessEventType (Page 344).
- `Out ushort out_SequenceNumber:`

  PLCSIM Advanced assigns a unique consecutive number to each interrupt event.

  According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.

</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>

<tr><td>ERuntimeError-Code.NotSupportedByModule</td><td>The module is not supported by this user action.</td></tr>
<tr><td>ERuntimeErrorCode.Timeout</td><td>The function does not return on time.</td></tr>
</table>

7.6.8.5 PullOrPlugEvent

PullOrPlugEvent()

This function triggers pull/plug events. The interrupt OB (OB 83) "Pull or plug of modules" is executed for these events.

Table 7- 250 PullOrPlugEvent() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode PullOrPlugEvent(
UINT16 in_HardwareIdentifier,
EPullOrPlugEventType in_PullOrPlugEventType,
UINT16* out_SequenceNumber
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT16 in_HardwareIdentifier:</code>
The hardware identifier of the module or submodule which generates the pull/plug event.
The identifier must belong to a hardware component in the currently loaded project.
• <code>EPullOrPlugEventType in_PullOrPlugEventType:</code>
A value from the list of predefined types of pull/plug events, see EPullOr-PlugEventType (Page 344).
• <code>UINT16* out_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.</td></tr>
<tr><td rowspan="8">Return values</td><td>Runtime error code</td><td>Condition</td></tr>

<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
</table>

7.6.8.6 StatusEvent

StatusEvent()

This function is used to trigger the status event OB (OB 55). Status events are only supported for modules in a distributed IO system.

Table 7- 252 StatusEvent() - Native C++

Syntax	`ERuntimeErrorCode StatusEvent( UINT16 in_HardwareIdentifier, UINT16 in_Specifier );`	
Parameters	• `UINT16 in_HardwareIdentifier:` The hardware identifier of the module that generates the status event. The identifier must belong to a hardware component in the currently loaded project. • `UINT16 in_Specifier:` The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 55 call.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_NOT_SUPPORTED_BY_MODULE`	The module is not supported by this user action.
	`SREC_DOES_NOT_EXIST`	No hardware identifier of the module.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 253 StatusEvent() - .NET (C#)

Syntax	`void StatusEvent( ushort in_HardwareIdentifier, ushort in_Specifier );`	
Parameters	• `ushort in_HardwareIdentifier:` The hardware identifier of the module that generates the status event. The identifier must belong to a hardware component in the currently loaded project. • `ushort in_Specifier:` The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 55 call.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.DoesNotExist`	No hardware identifier of the module.
	`ERuntimeErrorCode.NotSupportedByModule`	The module is not supported by this user action.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.8.7 ProfileEvent

ProfileEvent()

This function is used to trigger the Profile event OB (OB 57). Profile events are only supported for modules in a distributed IO system.

Table 7- 254 ProfileEvent() - Native C++

Syntax	`ERuntimeErrorCode ProfileEvent( UINT16 in_HardwareIdentifier, UINT16 in_Specifier );`	
Parameters	• `UINT16 in_HardwareIdentifier:` The hardware identifier of the module that generates the profile event. The identifier must belong to a hardware component in the currently loaded project. • `UINT16 in_Specifier:` The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 57 call.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_NOT_SUPPORTED_BY_MODULE`	The module is not supported by this user action.
	`SREC_DOES_NOT_EXIST`	No hardware identifier of the module.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 255 ProfileEvent() - .NET (C#)

Syntax	`void ProfileEvent( ushort in_HardwareIdentifier, ushort in_Specifier );`	
Parameters	• `ushort in_HardwareIdentifier:` The hardware identifier of the module that generates the profile event. The identifier must belong to a hardware component in the currently loaded project. • `ushort in_Specifier:` The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 57 call.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.DoesNotExist`	No hardware identifier of the module.
	`ERuntimeErrorCode.NotSupportedByModule`	The module is not supported by this user action.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.8.8 UpdateEvent

UpdateEvent()

This function is used to trigger the Update event OB (OB 56). Update events are only supported for modules in a distributed IO system.

Table 7- 256 UpdateEvent() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><code>ERuntimeErrorCode UpdateEvent(
UINT16 in_HardwareIdentifier,
UINT16 in_Specifier
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>UINT16 in_HardwareIdentifier:</code>
The hardware identifier of the module that triggers the update event.
The identifier must belong to a hardware component in the currently loaded project.
• <code>UINT16 in_Specifier:</code>
The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 56 call.</td></tr>
<tr><td>Return values</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td></td><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td></td><td><code>SREC_INTERFACE_REMOVED</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td></td><td><code>SREC_NOT_SUPPORTED_BY_MODULE</code></td><td>The module is not supported by this user action.</td></tr>
<tr><td></td><td><code>SREC_DOES_NOT_EXIST</code></td><td>No hardware identifier of the module.</td></tr>
<tr><td></td><td><code>SREC_TIMEOUT</code></td><td>The function does not return on time.</td></tr>
</table>

Table 7- 257 UpdateEvent() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><code>void UpdateEvent(
ushort in_HardwareIdentifier,
ushort in_Specifier
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>ushort in_HardwareIdentifier:</code>
The hardware identifier of the module that triggers the update event.
The identifier must belong to a hardware component in the currently loaded project.
• <code>ushort in_Specifier:</code>
The parameter is transferred to the interrupt frame as interrupt specifier. It is available as input parameter of the OB 56 call.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>
<tr><td>Exceptions</td><td colspan="2"><code>Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException</code></td></tr>
<tr><td></td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td></td><td><code>ERuntimeError-
Code.InterfaceRemoved</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
<tr><td></td><td><code>ERuntimeErrorCode.DoesNotExist</code></td><td>No hardware identifier of the module.</td></tr>
<tr><td></td><td><code>ERuntimeError-
Code.NotSupportedByModule</code></td><td>The module is not supported by this user action.</td></tr>
<tr><td></td><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
</table>

7.6.8.9 GetConfiguredProcessEvent

GetConfiguredProcessEvents()

With this API method, the process events configured in the TIA Portal can be read out during runtime.

If no process events are present, `SREC_OK` is returned. The value for `EventsCount` is then 0.

Table 7- 258 GetConfiguredProcessEvents() - Native C++

Syntax	`ERuntimeErrorCode GetConfiguredProcessEvents( UINT16* out_EventsCount, );`	
Parameters	• `SConfiguredProcessEvents* inout_ProcessEvents:` Pointer or reference to a user-defined memory which contains the field with the downloaded configured process events. The structure SConfiguredProcessEvents (Page 323) contains information about these process events. • `UINT16* out_EventsCount:` Pointer or reference to a tag which contains the number of configured process events.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 259 GetConfiguredProcessEvents() - .NET (C#)

Syntax	`SConfiguredProcessEvents [] GetConfiguredProcessEvents( );`	
Parameters	None	
Return values	Field with configured process events and field size provide the number of configured process events.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.8.10 RackOrStationFaultEvent

Description

This function is used to trigger the RackOrStationFault event OB (OB 86). These events are only supported for distributed devices.

Table 7- 260 RackOrStationFaultEvent() - Native C++

Syntax	`ERuntimeErrorCode RackOrStationFaultEvent( UINT16 in_HardwareIdentifier, ERackOrStationFaultType in_EventType );`	
Parameter	• `UINT16 in_HardwareIdentifier:` The hardware identifier of the device that sends the event. • `ERackOrStationFaultType in_EventType:` A value from the list of predefined types of events, see ERackOrStation-FaultType (Page 346).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_WRONG_MODULE_TYPE`	The specified HW identifier is not that of a distributed device.
	`SREC_WRONG_MODULE_STATE`	The device with the specified HW identifier already reports the status Fault/Return.
	`SREC_DOES_NOT_EXIST`	The specified HW identifier of the device does not exist.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 261 RackOrStationFaultEvent() - .NET (C#)

Syntax	`void RackOrStationFaultEvent( ushort in_HardwareIdentifier, ERackOrStationFaultType in_EventType );`	
Parameter	• `ushort in_HardwareIdentifier:` The hardware identifier of the device that sends the event. • `ERackOrStationFaultType in_EventType:` A value from the list of predefined types of events, see ERackOrStation-FaultType (Page 346).	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.DoesNotExist`	The specified HW identifier of the device does not exist.
	`ERuntimeError-Code.WrongModuleType`	The specified HW identifier is not that of a distributed device.
	`ERuntimeError-Code.WrongModuleState`	The device with the specified HW identifier already reports the status Fault/Return.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.9 Events

Events for IInstances

The following events are differentiated in the API:

Table 7- 262 Events for the IInstances interface

Event	Cause
OnOperatingStateChanged (Page 243)	This event is always triggered when the operating state of the virtual controller has changed.
OnSyncPointReached (Page 247)	This event is triggered when the virtual controller reaches a synchronization point. If the virtual controller is being operated in Default mode, the `SendSyncEventInDefaultMode` flag must be set to receive the event. See SendSyncEventInDefaultMode (Page 223).
OnConfigurationChanging (Page 249)	This event is triggered when changing of the configuration of the virtual controller starts. • During power up from the Virtual SIMATIC Memory Card • At the start of a download When this event is triggered, the stored tag list is reset.
OnConfigurationChanged (Page 252)	This event is triggered when the configuration of the virtual controller has changed: • After power up from the Virtual SIMATIC Memory Card • At the end of a download • When the IP address changes
OnLedChanged (Page 254)	This event is triggered when the LED display of the virtual controller has changed.

7.6.9.1 OnOperatingStateChanged events

OnOperatingStateChanged

Registers or unregisters an event handler method.

Table 7- 263 OnOperatingStateChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_EOS_EOS OnOperatingStateChanged;`
Parameters	None. See Delegate_II_EREC_DT_EOS_EOS (Page 294).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnOperatingStateChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 264 RegisterOnOperatingStateChangedCallback() - Native C++

Syntax	`void RegisterOnOperatingStateChangedCallback( EventCallback_II_SREC_ST_SROS_SROS in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_SROS_SROS in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_SROS_SROS (Page 282).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnOperatingStateChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 265 RegisterOnOperatingStateChangedEvent() - Native C++

Syntax	`void RegisterOnOperatingStateChangedEvent();` `void RegisterOnOperatingStateChangedEvent( HANDLE* in_Event );`
Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None
Example C++	see code below

```
// Thread 1 --------------------------------------------------
ISimulationRuntimeManager * api = NULL;
ERuntimeErrorCode result = Initialize(&api);

IInstance* psa = NULL;
if (result == SREC_OK)
{
 result = api->RegisterInstance(&psa);
}

// Register the internal event object
psa->RegisterOnOperatingStateChangedEvent();

// Thread 2 --------------------------------------------------
while (condition)
{
 // Wait for the event to be set (timeout after 10s)
 bool isEventSet = psa-
>WaitForOnOperatingStateChangedEvent(10000);
 if (isEventSet)
 {
 // Do Something
 …
 }
}
```

Example C++	<pre>// Thread 1 --
	ISimulationRuntimeManager * api = NULL;
	ERuntimeErrorCode result = Initialize(&api);
	
	IInstance* psa = NULL;
	if (result == SREC_OK)
	{
	 result = api->RegisterInstance(&psa);
	}
	
	// Create an event object
	HANDLE eventHandle = CreateEvent(NULL, FALSE, FALSE, NULL);
	
	// Register the user created event object
	psa->RegisterOnOperatingStateChangedEvent(&eventHandle);
	
	// Do Something
	…
	// Clean up the handle
	CloseHandle(eventHandle);
	
	// Thread 2 --
	while (condition)
	{
	 // Wait for the event to be set //OR:
	 WaitForSingleObject(eventHandle, INFINITE); //psa-
	>WaitForOnOperatingStateChangedEvent();
	
	 // Do Something
	 …
	}</pre>

UnregisterOnOperatingStateChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 266 UnregisterOnOperatingStateChangedCallback() - Native C++

Syntax	`void UnregisterOnOperatingStateChangedCallback();`
Parameters	None
Return values	None

UnregisterOnOperatingStateChangedEvent()

Unregisters the event object.

Table 7- 267 UnregisterOnOperatingStateChangedEvent() - Native C++

Syntax	`void UnregisterOnOperatingStateChangedEvent();`
Parameters	None
Return values	None

Table 7- 268 UnregisterOnOperatingStateChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnOperatingStateChangedEvent();`
Parameters	None
Return values	None

WaitForOnOperatingStateChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 269 WaitForOnOperatingStateChangedEvent() - Native C++

Syntax	`bool WaitForOnOperatingStateChangedEvent();`
	`bool WaitForOnOperatingStateChangedEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 270 WaitForOnOperatingStateChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnOperatingStateChangedEvent();`
	`bool WaitForOnOperatingStateChangedEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.9.2 OnSyncPointReached events

OnSyncPointReached

Registers or unregisters an event handler method.

Table 7- 271 OnSyncPointReached - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32 OnSyncPointReached;`
Parameters	None. See Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32 (Page 296).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnSyncPointReachedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 272 RegisterOnSyncPointReachedCallback() - Native C++

Syntax	`void RegisterOnSyncPointReachedCallback( EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32 (Page 281).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnSyncPointReachedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 273 RegisterOnSyncPointReachedEvent() - Native C++

Syntax	`void RegisterOnSyncPointReachedEvent();`
	`void RegisterOnSyncPointReachedEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnSyncPointReachedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 274 UnregisterOnSyncPointReachedCallback() - Native C++

Syntax	`void UnregisterOnSyncPointReachedCallback();`
Parameters	None
Return values	None

UnregisterOnSyncPointReachedEvent()

Unregisters the event object.

Table 7- 275 UnregisterOnSyncPointReachedEvent() - Native C++

Syntax	`void UnregisterOnSyncPointReachedEvent();`
Parameters	None
Return values	None

Table 7- 276 UnregisterOnSyncPointReachedEvent() - .NET (C#)

Syntax	`void UnregisterOnSyncPointReachedEvent();`
Parameters	None
Return values	None

WaitForOnSyncPointReachedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 277 WaitForOnSyncPointReachedEvent() - Native C++

Syntax	`SOnSyncPointReachedResult WaitForOnSyncPointReachedEvent();`
	`SOnSyncPontReachedResult WaitForOnEndOfCycleOnSyncPoin-tReachedEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None`: The time limit is set to `INFINITE`. • `UINT32 in_Time_ms`: Value for the time limit in milliseconds.
Return values	• `SOnSyncPointReachedResult`: A structure that supplies information about the event. See SOnSyncPointReachedResult (Page 319).

Table 7- 278 WaitForOnSyncPointReachedEvent() - .NET (C#)

Syntax	`SOnSyncPointReachedResult WaitForOnSyncPointReachedEvent();`
	`SOnSyncPointReachedResult WaitForOnSyncPointReachedEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None`: The time limit is set to `INFINITE`. • `UInt32 in_Time_ms`: Value for the time limit in milliseconds.
Return values	• `SOnSyncPointReachedResult`: A structure that supplies information about the event. See SOnSyncPointReachedResult (Page 319).

7.6.9.3 OnConfigurationChanging events

OnConfigurationChanging

Registers or unregisters an event handler method.

Table 7- 279 OnConfigurationChanging - .NET (C#)

Syntax	`event Delegate_II_EREC_DT OnConfigurationChanging;`
Parameters	None. See Delegate_II_EREC_DT (Page 294).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangingCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 280 RegisterOnConfigurationChangingCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangingCallback(`
	` EventCallback_II_SREC_ST in_CallbackFunction`
	`);`

Parameters	• `EventCallback_II_SREC_ST in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST (Page 281).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConfigurationChangingEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 281 RegisterOnConfigurationChangingEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangingEvent();`
	`void RegisterOnConfigurationChangingEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnConfigurationChangingCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 282 UnregisterOnConfigurationChangingCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangingCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangingEvent()

Unregisters the event object.

Table 7- 283 UnregisterOnConfigurationChangingEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangingEvent();`
Parameters	None
Return values	None

Table 7- 284 UnregisterOnConfigurationChangingEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangingEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangingEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 285 WaitForOnConfigurationChangingEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangingEvent();`
	`bool WaitForOnConfigurationChangingEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 286 WaitForOnConfigurationChangingEvent() - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangingEvent();`
	`bool WaitForOnConfigurationChangingEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.9.4 OnConfigurationChanged events

OnConfigurationChanged

Registers or unregisters an event handler method.

Table 7- 287 OnConfigurationChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_SRICC_UINT32_UINT32_UINT32_UINT32 OnConfigurationChanged;`
Parameters	None. See Delegate_II_EREC_DT_SRICC_UINT32_UINT32_UINT32_UINT32 (Page 298).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 288 RegisterOnConfigurationChangedCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangedCallback( EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32 in_CallbackFunction`: A callback function that subscribes to an event. See EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32 (Page 286) .
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConfigurationChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 289 RegisterOnConfigurationChangedEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangedEvent();`
	`void RegisterOnConfigurationChangedEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnConfigurationChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 290 UnregisterOnConfigurationChangedCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangedCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedEvent()

Unregisters the event object.

Table 7- 291 UnregisterOnConfigurationChangedEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

Table 7- 292 UnregisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 293 WaitForOnConfigurationChangedEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 294 WaitForOnConfigurationChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.9.5 OnLedChanged events

OnLedChanged

Registers or unregisters an event handler method.

Table 7- 295 OnLedChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_ELT_ELM OnLedChanged;`
Parameters	None. See Delegate_II_EREC_DT_ELT_ELM (Page 295).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnLedChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 296 RegisterOnLedChangedCallback() - Native C++

Syntax	`void RegisterOnLedChangedCallback( EventCallback_II_SREC_ST_SRLT_SRLM in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_SRLT_SRLM in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST_SRLT_SRLM (Page 283).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnLedChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 297 RegisterOnLedChangedEvent() - Native C++

Syntax	`void RegisterOnLedChangedEvent();` `void RegisterOnLedChangedEvent( HANDLE* in_Event );`
Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnLedChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 298 UnregisterOnLedChangedCallback() - Native C++

Syntax	`void UnregisterOnLedChangedCallback();`
Parameters	None
Return values	None

UnregisterOnLedChangedEvent()

Unregisters the event object.

Table 7- 299 UnregisterOnLedChangedEvent() - Native C++

Syntax	`void UnregisterOnLedChangedEvent();`
Parameters	None
Return values	None

Table 7- 300 UnregisterOnLedChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnLedChangedEvent();`
Parameters	None
Return values	None

WaitForOnLedChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 301 WaitForOnLedChangedEvent() - Native C++

Syntax	`bool WaitForOnLedChangedEvent();`
	`bool WaitForOnLedChangedEvent(`
	` UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 302 WaitForOnLedChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnLedChangedEvent();`
	`bool WaitForOnLedChangedEvent(`
	` UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.10 Events for acyclic services

7.6.10.1 OnDataRecordRead / OnDataRecordWrite events

OnDataRecordRead

Registers or unregisters an event handler method.

Table 7- 303 OnDataRecordRead - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_SDRI OnDataRecordRead;`
Parameter	None. See Delegate_II_EREC_DT_SDRI (Page 300).
Return values	None
Exceptions	None
Note	The Event-Handler Methode runs in a separate thread.

OnDataRecordWrite

Registers or unregisters an event handler method.

Table 7- 304 OnDataRecordWrite - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_SDR OnDataRecordWrite;`
Parameter	None. See Delegate_II_EREC_DT_SDR (Page 299).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnDataRecordReadCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 305 RegisterOnDataRecordReadCallback() - Native C++

Syntax	`void RegisterOnDataRecordReadCallback ( Event Callback_II_SREC_ST_SDRI in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_SDRI in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_SDRI (Page 288).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnDataRecordReadCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 306 UnregisterOnDataRecordReadCallback() - Native C++

Syntax	`void UnregisterOnDataRecordReadCallback();`
Parameters	None
Return values	None

7.6.10.2 OnAlarmNotification events

OnAlarmNotificationDone()

Registers or unregisters an event handler method.

Table 7- 307 OnAlarmNotificationDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32_UINT32 OnAlarmNotificationDone;`
Parameters	None. See Delegate_SREC_ST_UINT32_UINT32 (Page 304).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnAlarmNotificationDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 308 RegisterOnAlarmNotificationDoneCallback() - Native C++

Syntax	`void RegisterOnAlarmNotificationDoneCallback ( Event Callback_II_SREC_ST_SDRI in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32_UINT32 (Page 292).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnAlarmNotificationDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 309 UnregisterOnAlarmNotificationDoneCallback() - Native C++

Syntax	`void UnregisterOnAlarmNotificationDoneCallback ();`
Parameters	None
Return values	None

7.6.10.3 OnProcessEvent events

OnProcessEventDone()

Registers or unregisters an event handler method.

Table 7- 310 OnProcessEventDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32_UINT32_EPET_UINT32 OnProcessEvent-Done;`
Parameters	None. See Delegate_SREC_ST_UINT32_UINT32_EPET_UINT32. (Page 302)
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnProcessEventDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 311 RegisterOnProcessEventDoneCallback() - Native C++

Syntax	• `void RegisterOnProcessEventDoneCallback ( EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32 (Page 290)
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnProcessEventDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 312 UnregisterOnProcessEventDoneCallback() - Native C++

Syntax	`void UnregisterOnProcessEventDoneCallback ();`
Parameters	None
Return values	None

7.6.10.4 OnPullOrPlugEvent events

OnPullOrPlugEventDone()

Registers or unregisters an event handler method.

Table 7- 313 OnPullOrPlugEventDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32_EPPET_UINT32 OnPullOrPlugEventDone;`
Parameters	None. See Delegate_SREC_ST_UINT32_EPPET_UINT32 (Page 301).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnPullOrPlugEventDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 314 RegisterOnPullOrPlugEventDoneCallback() - Native C++

Syntax	• `void RegisterOnPullOrPlugEventDoneCallback ( EventCallback_II_SREC_ST_UINT32_EPPET_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32_EPPET_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32_EPPET_UINT32 (Page 289).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnPullOrPlugEventDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 315 UnregisterOnPullOrPlugEventDoneCallback() - Native C++

Syntax	`void UnregisterOnPullOrPlugEventDoneCallback ();`
Parameters	None
Return values	None

7.6.10.5 OnStatusEvent events

OnStatusEventDone()

Registers or unregisters an event handler method.

Table 7- 316 OnStatusEventDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32 OnStatusEventDone;`
Parameters	None. See Delegate_SREC_ST_UINT32 (Page 303).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnStatusEventDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 317 RegisterOnStatusEventDoneCallback() - Native C++

Syntax	• `void RegisterOnStatusEventDoneCallback ( EventCallback_II_SREC_ST_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32 (Page 291).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnStatusEventDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 318 UnregisterOnStatusEventDoneCallback() - Native C++

Syntax	`void UnregisterOnStatusEventDoneCallback ();`
Parameters	None
Return values	None

7.6.10.6 OnProfileEvent events

OnProfileEventDone()

Registers or unregisters an event handler method.

Table 7- 319 OnProfileEventDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32 OnProfileEventDone;`
Parameters	None. See Delegate_SREC_ST_UINT32 (Page 303).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnProfileEventDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 320 RegisterOnProfileEventDoneCallback() - Native C++

Syntax	• `void RegisterOnProfileEventDoneCallback ( EventCallback_II_SREC_ST_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32 (Page 291).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnProfileEventDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 321 UnregisterOnProfileEventDoneCallback() - Native C++

Syntax	`void UnregisterOnProfileEventDoneCallback ();`
Parameters	None
Return values	None

7.6.10.7 OnUpdateEvent events

OnUpdateEventDone()

Registers or unregisters an event handler method.

Table 7- 322 OnUpdateEventDone() - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32 OnUpdateEventDone;`
Parameters	None. See Delegate_SREC_ST_UINT32 (Page 303).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnUpdateEventDoneCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 323 RegisterOnUpdateEventDoneCallback() - Native C++

Syntax	• `void RegisterOnUpdateEventDoneCallback ( EventCallback_II_SREC_ST_UINT32 in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST_UINT32 in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32 (Page 291).
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnUpdateEventDoneCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 324 UnregisterOnUpdateEventDoneCallback() - Native C++

Syntax	`void UnregisterOnUpdateEventDoneCallback ();`
Parameters	None
Return values	None

7.6.10.8 RackOrStationFault events

OnRackOrStationFaultEvent

Registers or unregisters an event handler method.

Table 7- 325 OnRackOrStationFaultEvent - .NET (C#)

Syntax	`event Delegate_SREC_ST_UINT32_ERSFET OnRackOrStationFault;`
Parameter	None. See Delegate_SREC_ST_UINT32_ERSFET (Page 305).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnRackOrStationFaultEventCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 326 RegisterOnRackOrStationFaultEventCallback() - Native C++

Syntax	`void RegisterOnRackOrStationFaultEventCallback ( EventCallback_II_SREC_ST_UINT32_ERSFET in_CallbackFunction );`
Parameter	• `EventCallback_II_ SREC_ST_UINT32_ERSFET in_CallbackFunction.` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_UINT32_ERSFET (Page 293)
Return values	None
Note	The callback function runs in a separate thread.

UnregisterOnRackOrStationFaultEventCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 327 UnregisterOnRackOrStationFaultEventCallback() - Native C++

Syntax	`void UnregisterOnRackOrStationFaultEventCallback ();`
Parameter	None
Return values	None

7.7 API IRemoteRuntimeManager

7.7.1 Interfaces - Information and settings

Dispose()

Deletes the managed interface and unloads the native components of the user interfaces.

Note

When the interface of the Remote Runtime Manager is deleted, no IInstance interface which was generated by the IRemoteRuntimeManager interface can be used.

The .NET Garbage Collector clears its IRemoteRuntimeManager interface when no active references are present.

Table 7- 328 Dispose() - .NET (C#)

Syntax	`void Dispose()`
Parameters	None
Return values	None

GetVersion()

Returns the version of the remote Runtime Manager. If the function fails, version 0.0 is returned.

Table 7- 329 GetVersion() - Native C++

Syntax	`UINT32 GetVersion();`
Parameters	None
Return values	`UINT32`: Remote Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

Table 7- 330 Version { get; } - .NET (C#)

Syntax	`UInt32 Version { get; }`
Parameters	None
Return values	`Uint32`: Remote Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

GetIP() / IP { get; }

Returns the IP address of the PC on which the remote Runtime Manager is running. If the function fails, the return value is 0.

Table 7- 331 GetIP() - Native C++

Syntax	`UIP GetIP();`
Parameters	None
Return values	`UIP`: Returns the IP address of the PC on which the Runtime Manager is running.

Table 7- 332 IP { get; } - .NET (C#)

Syntax	`SIP IP { get; }`
Parameters	None
Return values	`SIP`: Returns the IP address of the PC on which the Runtime Manager is running.

GetPort() / Port { get; }

Returns the open port of the PC on which the remote Runtime Manager is running. If the function fails, the return value is 0.

Table 7- 333 GetPort() - Native C++

Syntax	`UINT16 GetPort();`
Parameters	None
Return values	`UINT16`: Open port of the PC on which the remote Runtime Manager is running.

Table 7- 334 Port { get; } - .NET (C#)

Syntax	`UInt16 Port { get; }`
Parameters	None
Return values	`UInt16`: Open port of the PC on which the remote Runtime Manager is running.

GetRemoteComputerName() / RemoteComputerName { get; }

Returns the name of the PC on which the remote Runtime Manager is running.

Table 7- 335 GetRemoteComputerName() - Native C++

Syntax	`ERuntimeErrorCode GetRemoteComputerName( WCHAR* inout_Name, UINT32 in_ArrayLength );`	
Parameters	• `WCHAR* inout_Name:` A user-allocated array for the computer name. • `UINT32 in_ArrayLength:` The array length. The array should be longer than `MAX_COMPUTERNAME_LENGTH`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_INDEX_OT_OF_RANGE`	The array is too small to accommodate the computer name.

Table 7- 336 RemoteComputerName { get; } - .NET (C#)

Syntax	`string RemoteComputerName { get; }`	
Parameters	None	
Return values	`string:` Name of the PC on which the remote Runtime Manager is running.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeError-Code.IndexOutOfRange`	The array is too small to accommodate the computer name.

Disconnect()

Closes the connection to the remote Runtime Manager.

Note

All applications that are connected to the remote Runtime Manager lose this connection.

Table 7- 337 Disconnect() - Native C++

Syntax	`ERuntimeErrorCode Disconnect();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 338 Disconnect() - .NET (C#)

Syntax	`void Disconnect();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.7.2 Simulation Runtime instances

7.7.2.1 Simulation Runtime instances (remote)

GetRegisteredInstancesCount()

Returns the number of instances that are registered in Runtime Manager. If the function fails, the return value is 0.

Table 7- 339 GetRegisteredInstancesCount() - Native C++

Syntax	`UINT32 GetRegisteredInstancesCount();`
Parameters	None
Return values	`UINT32`: Number of available instances.

GetRegisteredInstanceInfoAt()

Returns information about an already registered instance.

You can use the ID or name to create an interface of this instance (see `CreateInterface()`).

Table 7- 340 GetRegisteredInstanceInfoAt() - Native C++

Syntax	`ERuntimeErrorCode GetRegisteredInstanceInfoAt(`
	` UINT32 in_Index,`
	` SInstanceInfo* out_InstanceInfo`
	`);`	

Parameters	• `UINT32 in_Index:` Index of the created instance from which you want to receive the information. The index must be less than the value you receive when you call `GetRegis-teredInstanceCount()`. • `SInstanceInfo* out_InstanceInfo:` The information with name and ID of the instance. See SInstanceInfo (Page 314).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX OUT_OF_RANGE`	There is no instance information for this index.

RegisteredInstanceInfo { get; }

Returns information about an already registered instance. You can use the ID or name of this instance to create an interface of this instance, see `CreateInterface()`.

Table 7- 341 RegisterInstanceInfo { get; } - .NET (C#)

Syntax	`SInstanceInfo[] RegisteredInstanceInfo { get; }`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RegisterInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 342 RegisterInstance() - Native C++

Syntax	`ERuntimeErrorCode RegisterInstance(`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` ECPUType in_CPUType,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	` ECPUType in_CPUType,`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is `"SRCT_1500_Unspecified"`. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `WCHAR* in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 306). • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer **must** be initialized with `NULL`. The interface is created within the function.

Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name or the IInstance pointer is invalid.
	`SREC_LIMIT_REACHED`	There are already 16 instances registered in Runtime Manager.
	`SREC_ALREADY_EXISTS`	An instance with this name already exists.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`// Example: How To Create And Register An Instance`
	`// And To Get An Interface Of The Instance The Same Time`
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	` result = api->RegisterInstance(&psa);`
	`}`	

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 101).

Table 7- 343 RegisterInstance() - .NET (C#)

<table>
<tr><td>Syntax</td><td colspan="2"><code>IInstance RegisterInstance();
IInstance RegisterInstance(
 string in_InstanceName
);
IInstance RegisterInstance(
 ECPUType in_CPUType
);
IInstance RegisterInstance(
 ECPUType in_CPUType
 string in_InstanceName
);</code></td></tr>
<tr><td>Parameters</td><td colspan="2">• <code>ECPUType in_CPUType:</code>

Defines which CPU type is simulated at the start of the instance. The default setting is <code>"ECPUType.Unspecified"</code>.

When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.

• <code>string in_InstanceName:</code>

Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name <code>"Instance_#"</code> (# is the ID of the instance). If this name already exists, the name <code>"Instance_#.#"</code> is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than <code>DINSTANCE_NAME_LENGTH</code>. See Data types (Page 306).</td></tr>
<tr><td>Return values</td><td colspan="2">If the function is successful, an interface of a virtual controller. Otherwise, a Null pointer.</td></tr>

<tr><td><code>ERuntimeError-
Code.InterfaceRemoved</code></td><td>The interface is disconnected from the remote Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.Timeout</code></td><td>The function does not return on time.</td></tr>
<tr><td><code>ERuntimeErrorCode.WrongArgument</code></td><td>The name is invalid.</td></tr>
<tr><td><code>ERuntimeErrorCode.LimitReached</code></td><td>There are already 16 instances regis-
tered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.AlreadyExists</code></td><td>An instance with this name already ex-
ists.</td></tr>
</table>

RegisterCustomInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 344 RegisterCustomInstance() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode RegisterCustomInstance(
 WCHAR* in_VplcDll,
 IInstance** out_InstanceInterface
);
ERuntimeErrorCode RegisterCustomInstance(
 WCHAR* in_VplcDll,
 WCHAR* in_InstanceName,
 IInstance** out_InstanceInterface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>WCHAR* in_VplcDll:</code>
The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn.
<code>WCHAR* in_InstanceName:</code>
Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name <code>"Instance_#"</code> (# is the ID of the instance). If this name already exists, the name <code>"Instance_#.#"</code> is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than <code>DINSTANCE_NAME_LENGTH</code>. See Data types (Page 306).

<tr><td><code>ERuntimeErrorCode.LimitReached</code></td><td>There are already 16 instances registered in Runtime Manager.</td></tr>
<tr><td><code>ERuntimeErrorCode.AlreadyExists</code></td><td>An instance with this name already exists.</td></tr>
</table>

CreateInterface()

Creates and returns an interface of an already registered instance of a virtual controller.

The instance could have been registered via the application or another application that uses the Simulation Runtime API.

Table 7- 346 CreateInterface() - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>ERuntimeErrorCode CreateInterface(
 WCHAR* in_InstanceName,
 IInstance** out_InstanceInterface
);
ERuntimeErrorCode CreateInterface(
 INT32 in_InstanceID,
 IInstance** out_InstanceInterface
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>INT32 in_InstanceID:</code>
The ID of the registered instance from which you want to receive the interface.
<code>WCHAR* in_InstanceName:</code>
The name of the registered instance from which you want to receive the interface.

<tr><td><code>ERuntimeErrorCode.DoesNotExists</code></td><td>The instance is not registered in Runtime Manager.</td></tr>
</table>

7.7.3 Events

7.7.3.1 OnConnectionLost events

Description

The event is triggered when the connection to the Remote Runtime Manager has been terminated.

OnConnectionLost

Registers or unregisters an event handler method.

Table 7- 348 OnConnectionLost - .NET (C#)

Syntax	`event Delegate_IRRTM OnConnectionLost;`
Parameters	None. See Delegate_IRRTM (Page 297)
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConnectionLostCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be unregistered.

Table 7- 349 RegisterOnConnectionLostCallback() - Native C++

Syntax	`void RegisterOnConnectionLostCallback(`
	` EventCallback_IRRTM in_CallbackFunction`
	`);`

Parameters	• `EventCallback_IRRTM in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_IRRTM (Page 285).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConnectionLostEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 350 RegisterOnConnectionLostEvent() - Native C++

Syntax	`void RegisterOnConnectionLostEvent();`
	`void RegisterOnConnectionLostEvent(`
	` HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

Table 7- 351 RegisterOnConnectionLostEvent() - .NET (C#)

Syntax	`void RegisterOnConnectionLostEvent();`
Parameters	None
Return values	None

UnregisterOnConnectionLostCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 352 UnregisterOnConnectionLostCallback() - Native C++

Syntax	`void UnregisterOnConnectionLostCallback();`
Parameters	None
Return values	None

UnregisterOnConnectionLostEvent()

Unregisters the event object.

Table 7- 353 UnregisterOnConnectionLostEvent() - Native C++

Syntax	`void UnregisterOnConnectionLostEvent();`
Parameters	None
Return values	None

Table 7- 354 UnregisterOnConnectionLostEvent() - .NET (C#)

Syntax	`void UnregisterOnConnectionLostEvent();`
Parameters	None
Return values	None

WaitForOnConnectionLostEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 355 WaitForOnConnectionLostEvent() - Native C++

Syntax	`bool WaitForOnConnectionLostEvent();`
	`bool WaitForOnConnectionLostEvent(`
	` UINT32 in_Time_ms )`
	`;`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 356 WaitForOnConnectionLostEvent() - .NET (C#)

Syntax	`bool WaitForOnConnectionLostEvent();`
	`bool WaitForOnConnectionLostEvent(`
	` UInt32 in_Time_ms )`
	`;`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.8 Data types

Note

Unsupported data types

The Runtime API does not support the `STRING` and `WSTRING` data types.

Supported data types

In PLCSIM Advanced V2.0, the Runtime API supports the data types of the S7-1500 CPUs.

Converting data types

When writing, data types are not transferred BCD-coded but mapped onto primitive data types.

The data types Counter, Date and Time must be transferred to the API BDC-coded so that the values are written to the counter and no incorrect values are returned when reading.

For these data types, you must perform a BCD conversion before writing and a BCD back-conversion after reading.

Example:

If the value 999 is transferred to the API as 2457_H, then `Write` modifies the value 2457_H to 999. Without BCD conversion, there is no `UInt16` value and `Write` writes no value at all.

Additional information

For information on data types and conversion, refer to section "Data types" in the STEP 7 Professional (https://support.industry.siemens.com/cs/ww/en/view/109747136) System Manual.

7.8.1 DLL import functions (Native C++)

7.8.1.1 ApiEntry_Initialize

Description

Type of the central entry point for the API library (DLL).

Table 7- 357 ApiEntry_Initialize - Native C++

Syntax	`typedef ERuntimeErrorCode(*ApiEntry_Initialize)( ISimulationRuntimeManager** out_RuntimeManagerInterface );`	
Parameters	• `ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface:` Pointer to a Runtime Manager interface pointer. The pointer must be initialized with NULL. The interface is created within the function. • `UINT32 in_InterfaceVersion:` Version of the API interface to be downloaded: `API_DLL_INTERFACE_VERSION`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the Runtime Manager interface is NULL.
	`SREC_WRONG_VERSION`	The version of the interface in use does not match the version of the API library (DLL).
	`SREC_CONNECTION_ERROR`	Unable to establish a connection to the Runtime Manager.

7.8.1.2 ApiEntry_DestroyInterface

Description

Type of the entry point for DestroyInterface (Page 101).

Table 7- 358 ApiEntry_DestroyInterface - Native C++

Syntax	`typedef ERuntimeErrorCode(*ApiEntry_DestroyInterface)( IBaseInterface* in_Interface );`	
Parameters	• `IBaseInterface* in_Interface:` The interface to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is NULL.

7.8.2 Event callback functions (Native C++)

7.8.2.1 EventCallback_VOID

Description

Table 7- 359 EventCallback_VOID - Native C++

Syntax	`typedef void (*EventCallback_VOID)();`
Parameters	None
Return values	None

7.8.2.2 EventCallback_II_SREC_ST

Description

Table 7- 360 EventCallback_II_SREC_ST - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered.
Return values	None

7.8.2.3 EventCallback_II_SREC_ST_SROS_SROS

Description

Table 7- 361 EventCallback_II_SREC_ST_SROS_SROS - Native C++

<table>
<tr><td>Syntax</td><td colspan="2"><pre>typedef void (*EventCallback_II_SREC_ST_SROS_SROS)(
 IInstance* in_Sender,
 ERuntimeErrorCode in_ErrorCode,
 SYSTEMTIME in_SystemTime,
 EOperatingState in_PrevState,
 EOperatingState in_OperatingState
);</pre></td></tr>
<tr><td>Parameters</td><td colspan="2"><code>IInstance* in_Sender:</code>
An interface of the instance that receives this event.
<code>ERuntimeErrorCode in_ErrorCode:</code>
A possible error code.
<code>SYSTEMTIME in_SystemTime:</code>
The virtual system time of the virtual controller at the time when this event was triggered.
<code>EOperatingState in_PrevState:</code>
The operating state before the change.
<code>EOperatingState in_OperatingState:</code>
The current operating state.</td></tr>
<tr><td>Return values</td><td colspan="2">None</td></tr>
<tr><td rowspan="5">Error codes</td><td>Runtime error code</td><td>Condition</td></tr>
<tr><td><code>SREC_OK</code></td><td>The function is successful.</td></tr>
<tr><td><code>SREC_WARNING_TRIAL_MODE_ACTIVE</code></td><td>No license available. You can use the instance without restrictions with the Trial License. Afterwards, the instance is shut down.</td></tr>
<tr><td><code>SREC_LICENSE_NOT_FOUND</code></td><td>Test mode has expired.</td></tr>
<tr><td><code>SREC_COMMUNICATION_INTERFACE_NOT_AVAILABLE</code></td><td>A problem has occurred with the selected communication interface. Check your settings.</td></tr>
</table>

7.8.2.4 EventCallback_II_SREC_ST_SRLT_SRLM

Description

Table 7- 362 EventCallback_II_SREC_ST_SRLT_SRLM - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_SRLT_SRLM)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` ELEDType in_LEDType,`
	` ELEDMode in_LEDMode,`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `ELEDType in_LEDType:` The LED type that changed its state. • `ELEDMode in_LEDMode:` The new state of the LED display.
Return values	None

7.8.2.5 EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32

Description

Table 7- 363 EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32 - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_UINT32_INT64_INT64_UINT32)( IInstance* in_Sender, ERuntimeErrorCode in_ErrorCode, SYSTEMTIME in_SystemTime, UINT32 in_PipId, INT64 in_TimeSinceSameSyncPoint_ns, INT64 in_TimeSinceAnySyncPoint_ns, UINT32 in_SyncPointCount );`
Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 in_PipId:` The ID of the process image partition (PIP) that triggers this event. 0 for the cycle control point (End of cycle). • `INT64 in_TimeSinceSameSyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of the same process image partition ID was reached. For the time-controlled operating modes (Page 80): The runtime since the last call of the `StartProcessing()` function. • `INT64 in_TimeSinceAnySyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of any process image partition ID was reached. For the time-controlled operating modes: The runtime since the last call of the `StartProcessing()` function. • `UINT32 in_SyncPointCount:` The number of synchronization points since the last event. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.
Return values	None

7.8.2.6 EventCallback_IRRTM

Description

Table 7- 364 EventCallback_IRRTM - Native C++

Syntax	`typedef void (*EventCallback_IRRTM)( IRemoteRuntimeManager* in_Sender );`
Parameters	• `IRemoteRuntimeManager* in_Sender:` An interface of the remote Runtime Manager that receives this event.
Return values	None

7.8.2.7 EventCallback_SRCC_UINT32_UINT32_INT32

Description

Table 7- 365 EventCallback_SRCC_UINT32_UINT32_INT32 - Native C++

Syntax	`ERuntimeConfigChanged in_RuntimeConfigChanged, UINT32 in_Param1, UINT32 in_Param2, INT32 in_Param3 );`			
Parameters	`ERuntimeConfigChanged in_RuntimeConfigChanged`	`UInt32 in_Param1`	`UInt32 in_Param2`	`Int32 in_Param3`
	`SRCC_INSTANCE_REGISTERED`	-	-	ID of the registered instance
	`SRCC_INSTANCE_UNREGISTERED`	-	-	ID of the unregistered instance
	`SRCC_CONNECTION_OPENED`	IP of the remote Runtime Manager	Port of the remote Runtime Manager	-
	`SRCC_CONNECTION_CLOSED`	IP of the remote Runtime Manager	Port of the remote Runtime Manager	-
	`SRCC_PORT_OPENED`	The open port	-	-
	`SRCC_PORT_CLOSED`	-	-	-
Return values	None			

7.8.2.8 EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32

Description

Table 7- 366 EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32 - Native C++

<table>
<tr><td>Syntax</td><td colspan="5"><pre>typedef void

7.8.2.9 EventCallback_II_SREC_ST_SDRI

Description

Table 7- 367 EventCallback_II_SREC_ST_SDRI - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_SDRI)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` SDataRecordInfo in_DataRecordInfo`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `SDataRecordInfo in_DataRecordInfo:` The structure `SDataRecordInfo` contains the following information: – The HW identifier from which the CPU wants to read the data record – The index of the collected data record – The maximum size of the data record which the IO device can transfer.
Return values	None

7.8.2.10 EventCallback_II_SREC_ST_SDR

Description

Table 7- 368 EventCallback_II_SREC_ST_SDR - .NET (C#)

Syntax	`typedef void (*EventCallback_II_SREC_ST_SDR)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` SDataRecord in_DataRecord`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `SDataRecord in_DataRecord:` The structure `SDataRecord` contains the following information: – The HW identifier to which the CPU wants to write the data record – The index of the supplied data record – Size of data record – The data record
Return values	None

7.8.2.11 EventCallback_II_SREC_ST_UINT32_EPPET_UINT32

Description

Table 7- 369 EventCallback_II_SREC_ST_UINT32_EPPET_UINT32 - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_UINT32_EPPET_UINT32)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SYSTEMTIME,`
	` UINT32 in_HardwareIdentifier,`
	`EPullOrPlugEventType in_PullOrPlugEventType,`
	`UINT32 in_SequenceNumber`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SYSTEMTIME:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which sends the pull/plug event. • `EPullOrPlugEventType in_PullOrPlugEventType:` A value from the list of predefined types of events for S7 modules, see EPullOrPlugEventType (Page 344). • `UINT32 in_SequenceNumber:` PLCSIM Advanced assigns a unique consecutive number to each interrupt event. According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1. **Note** In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt. During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.
Return values	None

7.8.2.12 EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32

Description

Table 7- 370 EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32 - Native C++

<table>
<tr><td>Syntax</td><td><pre>typedef void (*EventCallback_II_SREC_ST_UINT32_UINT32_EPET_UINT32)(
 IInstance* in_Sender,
 ERuntimeErrorCode in_ErrorCode,
 SYSTEMTIME in_SystemTime,
 UINT32 in_HardwareIdentifier,
UINT32 in_Channel,
 EProcessEventType in_ProcessEventType,
UINT32 in_SequenceNumber
);</pre></td></tr>
<tr><td>Parameters</td><td>

<code>IInstance* in_Sender:</code>
An interface of the instance that receives this event.
<code>ERuntimeErrorCode in_ErrorCode:</code>
A possible error code.
<code>SYSTEMTIME in_SystemTime:</code>
The virtual system time of the virtual controller at the time when this event was triggered.
<code>UINT32 in_HardwareIdentifier:</code>
The hardware identifier of the IO module that sends the process event.
<code>UINT32 in_Channel:</code>
The channel of the IO module which sends the process event.
<code>EProcessEventType in_ProcessEventType:</code>
A value from the list of predefined types of events for S7 modules, see EProcessEventType (Page 344).
<code>UINT32 in_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.
Note
In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt.
During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.

7.8.2.13 EventCallback_II_SREC_ST_UINT32

Description

Table 7- 371 EventCallback_II_SREC_ST_UINT32 - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_UINT32)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` UINT32 in_HardwareIdentifier);`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SYSTEMTIME:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which generates the status, update or Profile event. The identifier must belong to a hardware component in the currently loaded project.
Return values	None

7.8.2.14 EventCallback_II_SREC_ST_UINT32_UINT32

Description

Table 7- 372 EventCallback_II_SREC_ST_UINT32_UINT32 - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_UINT32_UINT32)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` UINT32 in_HardwareIdentifier),`
	`UINT32 in_SequenceNumber`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SYSTEMTIME:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which sends the diagnostics event. • `UINT32 in_SequenceNumber:` PLCSIM Advanced assigns a unique consecutive number to each interrupt event. According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1. **Note** In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt. During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.
Return values	None

7.8.2.15 EventCallback_II_SREC_ST_UINT32_ERSFET

Description

Table 7- 373 EventCallback_II_SREC_ST_UINT32_ERSFET - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_UINT32_ERSFET)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` UINT32 in_HardwareIdentifier,`
	`ERackOrStationFaultType in_EventType`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SYSTEMTIME:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which sends the diagnostics event. • `ERackOrStationFaultType in_EventType:` A value from the list of predefined RackOrStationFault event types. See ERackOrStationFaultType (Page 346).
Return values	None

7.8.3 Delegate definitions (managed code)

7.8.3.1 Delegate_Void

Description

Table 7- 374 Delegate_Void - .NET (C#)

Syntax	`delegate void Delegate_Void();`
Parameters	None
Return values	None

7.8.3.2 Delegate_II_EREC_DT

Description

Table 7- 375 Delegate_II_EREC_DT - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT ( IInstance in_Sender, ERuntimeErrorCode in_ErrorCode, DateTime in_DateTime );`
Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered.
Return values	None

7.8.3.3 Delegate_II_EREC_DT_EOS_EOS

Description

Table 7- 376 Delegate_II_EREC_DT_EOS_EOS - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_EOS_EOS( IInstance in_Sender, ERuntimeErrorCode in_ErrorCode, DateTime in_DateTime, EOperatingState in_PrevState, EOperatingState in_OperatingState );`
Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `EOperatingState in_PrevState:` The operating state before the change. • `EOperatingState in_OperatingState:` The current operating state.

Return values	None	
Error codes	Runtime error code	Condition
	`ERuntimeErrorCode.OK`	The function is successful.
	`ERuntimeError-Code.WarningTrialModeActive`	No license available. You can use the instance without restrictions with the Trial License. Afterwards, the instance is shut down.
	`ERuntimeError-Code.LicenseNotFound`	Test mode has expired.
	`ERuntimeError-Code.CommunicationInterfaceNotAvailable`	A problem has occurred with the selected communication interface. Check your settings.

7.8.3.4 Delegate_II_EREC_DT_ELT_ELM

Description

Table 7- 377 Delegate_II_EREC_DT_ELT_ELM - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_ELT_ELM( IInstance in_Sender, ERuntimeErrorCode in_ErrorCode, DateTime in_DateTime, ELEDType in_LEDType, ELEDMode in_LEDMode, );`
Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `ELEDType in_LEDType:` The LED type that changed its state. • `ELEDMode in_LEDMode:` The new state of the LED display.
Return values	None

7.8.3.5 Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32

Description

Table 7- 378 Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32 - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_UINT32_INT64_INT64_UINT32 (`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` UInt32 in_PipId,`
	` Int64 in_TimeSinceSameSyncPoint_ns,`
	` Int64 in_TimeSinceAnySyncPoint_ns,`
	` UInt32 in_SyncPointCount`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UInt32 in_PipId:` The ID of the process image partition (PIP) that triggers this event. 0 for the cycle control point (End of cycle). • `Int64 in_TimeSinceSameSyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of the same process image partition ID was reached. Or the process time for the time-controlled operating modes (Page 80). • `Int64 in_TimeSinceAnySyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of any process image partition ID was reached. Or the process time for the time-controlled operating modes (Page 80). • `UInt32 in_SyncPointCount:` The number of synchronization points since the last event. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.
Return values	None

7.8.3.6 Delegate_IRRTM

Description

Table 7- 379 Delegate_IRRTM - .NET (C#)

Syntax	`delegate void Delegate_IRRTM(`
	` IRemoteRuntimeManager in_Sender,`
	`);`

Parameters	• `IRemoteRuntimeManager in_Sender:` An interface of the remote Runtime Manager that receives this event.
Return values	None

7.8.3.7 Delegate_SRCC_UINT32_UINT32_INT32

Description

Table 7- 380 Delegate_SRCC_UINT32_UINT32_INT32 - .NET (C#)

Syntax	`delegate void Delegate_SRCC_UINT32_UINT32_INT32(`
	` ERuntimeConfigChanged in_RuntimeConfigChanged,`
	` UInt32 in_Param1,`
	` UInt32 in_Param2,`
	` Int32 in_Param3`
	`);`			

Parameters	`ERuntimeConfigChanged in_RuntimeConfigChanged`	`UInt32 in_Param1`	`UInt32 in_Param2`	`Int32 in_Param3`
	`InstanceRegistered`	-	-	ID of the registered instance
	`InstanceUnregistered`	-	-	ID of the unregistered instance
	`ConnectionOpened`	IP of the Remote Runtime Manager	Port of the remote Runtime Manager	-
	`ConnectionClosed`	IP of the Remote Runtime Manager	Port of the remote Runtime Manager	-
	`PortOpened`	The open port	-	-
	`PortClosed`	-	-	-
Return values	None

7.8.3.9 Delegate_II_EREC_DT_SDRI

Description

Table 7- 382 Delegate_II_EREC_DT_SDRI - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_SDRI (`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` SDataRecordInfo in_DataRecordInfo`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `SDataRecordInfo in_DataRecordInfo:` The structure `SDataRecordInfo` contains the following information: – The HW identifier to which the CPU wants to write the data record – The index of the supplied data record – Size of data record – The data record
Return values	None

7.8.3.10 Delegate_II_EREC_DT_SDR

Description

Table 7- 383 Delegate_II_EREC_DT_SDR - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_SDR ( IInstance in_Sender, ERuntimeErrorCode in_ErrorCode, DateTime in_DateTime, SDataRecord in_DataRecord );`
Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `SDataRecord in_DataRecord:` The structure `SDataRecord` contains the following information: – The HW identifier to which the CPU wants to write the data record – The index of the supplied data record – Size of data record – The data record
Return values	None

7.8.3.11 Delegate_SREC_ST_UINT32_EPPET_UINT32

Description

Table 7- 384 Delegate_SREC_ST_UINT32_EPPET_UINT32 - .NET (C#)

<table>
<tr><td>Syntax</td><td><pre>delegate void Delegate_SREC_ST_UINT32 (
 IInstance in_Sender,
 ERuntimeErrorCode in_ErrorCode,
 DateTime in_DateTime,
 UInt32 in_HardwareIdentifier,
EPullOrPlugEventType in_PullOrPlugEventType,
UInt32 in_SequenceNumber
);</pre></td></tr>
<tr><td>Parameters</td><td>

<code>IInstance in_Sender:</code>
An interface of the instance that receives this event.
<code>ERuntimeErrorCode in_ErrorCode:</code>
A possible error code.
<code>DateTime in_DateTime:</code>
The virtual system time of the virtual controller at the time when this event was triggered.
<code>UInt32 in_HardwareIdentifier:</code>
The hardware identifier of the module or submodule which sends the pull/plug event.
<code>EPullOrPlugEventType in_PullOrPlugEventType:</code>
A value from the list of predefined types of events for S7 modules, see EPullOrPlugEventType (Page 344).
<code>UInt32 in_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to the PROFINET standard, the sequence number is only 10 bits wide, from 1 to 0x7FF. When the highest number is reached the numbering starts again at 1.
Note
In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt.
During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.

</td></tr>
<tr><td>Return values</td><td>None</td></tr>
</table>

7.8.3.12 Delegate_SREC_ST_UINT32_UINT32_EPET_UINT32

Description

Table 7- 385 Delegate_SREC_ST_UINT32_UINT32_EPET_UINT32 - Native C++

<table>
<tr><td>Syntax</td><td><pre>delegate void Delegate_SREC_ST_UINT32_UINT32_EPET_UINT32(
 IInstance in_Sender,
 ERuntimeErrorCode in_ErrorCode,
 DateTime in_DateTime,
 UInt32 in_HardwareIdentifier
UInt32 in_Channel,
 EProcessEventType in_ProcessEventType,
UInt32 in_SequenceNumber
);</pre></td></tr>
<tr><td>Parameters</td><td>
<code>IInstance in_Sender:</code>
An interface of the instance that receives this event.
<code>ERuntimeErrorCode in_ErrorCode:</code>
A possible error code.
<code>DateTime in_DateTime:</code>
The virtual system time of the virtual controller at the time when this event was triggered.
<code>UInt32 in_HardwareIdentifier:</code>
The hardware identifier of the module or submodule that sends the process event.
<code>UInt32 in_Channel:</code>
The channel of the IO module which sends the process event.
<code>EProcessEventType in_ProcessEventType:</code>
A value from the list of predefined types of events for S7 modules, see EProcessEventType (Page 344).
<code>UInt32 in_SequenceNumber:</code>
PLCSIM Advanced assigns a unique consecutive number to each interrupt event.
According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1.
Note
In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt.
During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.

7.8.3.13 Delegate_SREC_ST_UINT32

Description

Table 7- 386 Delegate_SREC_ST_UINT32 - .NET (C#)

Syntax	`delegate void Delegate_SREC_ST_UINT32 (`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` UInt32 in_HardwareIdentifier`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UInt32 in_HardwareIdentifier:` The ID of the module which generates the status event, update event or profile event.
Return values	None

7.8.3.14 Delegate_SREC_ST_UINT32_UINT32

Description

Table 7- 387 Delegate_SREC_ST_UINT32_UINT32 - .NET (C#)

Syntax	`delegate void Delegate_SREC_ST_UINT32 (`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` UInt32 in_HardwareIdentifier`
	`UInt32 in_SequenceNumber`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UInt32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which sends the diagnostics entry. • `UInt32 in_SequenceNumber:` PLCSIM Advanced assigns a unique consecutive number to each interrupt event. According to PROFINET standard the sequence number is 10 bits wide (1 to $7FF_H$). When the highest number is reached the numbering starts again at 1. **Note** In a real hardware system the IO controller uses the sequence number to check if it has lost a hardware interrupt. During the simulation, the sequence number creates the relation between interrupt request and the associated acyclic alarm.
Return values	None

7.8.3.15 Delegate_SREC_ST_UINT32_ERSFET

Description

Table 7- 388 Delegate_SREC_ST_UINT32_ERSFET - .NET (C#)

Syntax	`delegate void Delegate_SREC_ST_UINT32_ERSFET(`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` UInt32 in_HardwareIdentifier,`
	`ERackOrStationFaultType in_EventType`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UInt32 in_HardwareIdentifier:` The hardware identifier of the module or submodule which sends the diagnostics entry. • `ERackOrStationFaultType in_EventType:` A value from the list of predefined RackOrStationFault event types. See ERackOrStationFaultType (Page 346).
Return values	None

7.8.4 Definitions and constants

The following identifiers are used in the API:

Table 7- 389 Definitions - Native C++

Identifier	Value	Description
DINSTANCE_NAME_MAX_LENGTH	64	The unique name of an instance must be less than this value.
DSTORAGE_PATH_MAX_LENGTH	130	The maximum path length to the virtual memory card. Including ZERO termination.
DTAG_NAME_MAX_LENGTH	300	The maximum length of the name of a PLC tag. Including ZERO termination.
DTAG_ARRAY_DIMENSION	6	The maximum number of dimension for a multi-dimensional field.
DCONTROLLER_NAME_MAX_LENGTH	128	The maximum length of the controller name. Including ZERO termination.
DCONTROLLER_SHORT_DESIGNATION_MAX_LENGTH	32	The maximum length of the abbreviation of the controller (CPU type). Including ZERO termination.
DALARM_NOTIFICATION_MAX_DIAG_EVENTS	100	The maximum number of diagnostic events that are sent in a diagnostic alarm.
DPROCESS_EVENT_NAME_MAX_LENGTH	123	The maximum length of the name for the process event. Including NULL termination.
DPROCESS_EVENTS_MAX_ITEMS	256	The maximum number of configurable process events.
DMODULE_STATE_OK	0	AlarmNotification: Module status OK
DMODULE_STATE_ERROR	1	AlarmNotification: Module status faulty
DMODULE_STATE_MAINT_DEMANDED	2	AlarmNotification: Maintenance demanded
DMODULE_STATE_MAINT_REQUIRED	4	AlarmNotification: Maintenance required

Table 7- 390 Constants - .NET (C#)

Identifier	Value	Description
RuntimeConstants.InstanceNameLength	64	The unique name of an instance must be less than this value.
RuntimeConstants.StoragePathMaxLength	130	The maximum path length to the virtual memory card. Including ZERO termination.
RuntimeConstants.TagNameMaxLength	300	The maximum length of the name of a PLC tag. Including ZERO termination.
RuntimeConstants.TagArrayDimension	6	The maximum number of dimension for a multi-dimensional field.
RuntimeConstants.ControllerNameMaxLength	128	The maximum length of the controller name. Including ZERO termination.
RuntimeConstants.ControllerShortDesignationMaxLength	32	The maximum length of the abbreviation of the controller (CPU type). Including ZERO termination.
ModuleState.Ok	0	AlarmNotification: Module status OK
ModuleState.Error	1	AlarmNotification: Module status faulty
ModuleState. MaintenanceDemanded	2	AlarmNotification: Maintenance demanded
ModuleState. MaintenanceRequired	4	AlarmNotification: Maintenance required

7.8.5 Unions (Native C++)

7.8.5.1 UIP

Description

Contains an IPv4 address.

Table 7- 391 UIP - Native C++

Syntax	`union UIP { DWORD IP; BYTE IPs[4]; };`
Member	• `DWORD IP:` The IP address in a single DWORD • `BYTE IPs[4]:` The four elements of IP in descending order
Example	Example for an IP address: 192.168.0.1 UIP.IP = 0xC0A80001 UIP.IPs[3] = 192, UIP.IPs[2] = 168, UIP.IPs[1] = 0, UIP.IPs[0] = 1

7.8.5.2 UDataValue

Description

Contains the value of a PLC tag.

Table 7- 392 UDataValue - Native C++

Syntax	`union UDataValue`
	`{`
	`bool Bool;`
	`INT8 Int8;`
	`INT16 Int16;`
	`INT32 Int32;`
	`INT64 Int64;`
	`UINT8 UInt8;`
	`UINT16 UInt16;`
	`UINT32 UInt32;`
	`UINT64 UInt64;`
	`float Float;`
	`double Double;`
	`CHAR Char;`
	`WCHAR WChar;`
	`};`

Member	• `bool Bool:` 1 byte boolean value • `INT8 Int8:` 1 byte integer with sign • `INT16 Int16:` 2 byte integer with sign • `INT32 Int32:` 4 byte integer with sign • `INT64 Int64:` 8 byte integer with sign • `UINT8 UInt8:` 1 byte integer without sign • `UINT16 UInt16:` 2 byte integer without sign • `UINT32 UInt32:` 4 byte integer without sign • `UINT64 UInt64:` 8 byte integer without sign • `float Float:` 4 byte floating-point value • `double Double:` 8 byte floating-point value • `CHAR Char:` 1 byte value character • `WCHAR WChar:` 2 byte value character

7.8.6 Structures

7.8.6.1 SDataValue

Description

The structure contains the value and type of a PLC tag.

Table 7- 393 SDataValue - Native C++

Syntax	`struct SDataValue`
	`{`
	` UDataValue Value;`
	` EPrimitiveDataType Type;`
	`};`

Member	• `UDataValue Value:` The value of the PLC tags • `EPrimitiveDataType Type:` Type of PLC tag

Table 7- 394 SDataValue - .NET (C#)

Syntax	`struct SDataValue`
	`{`
	`bool Bool { get; set; }`
	`Int8 Int8 { get; set; }`
	`Int16 Int16 { get; set; }`
	`Int32 Int32 { get; set; }`
	`Int64 Int64 { get; set; }`
	`UInt8 UInt8 { get; set; }`
	`UInt16 UInt16 { get; set; }`
	`UInt32 UInt32 { get; set; }`
	`UInt64 UInt64 { get; set; }`
	`float Float { get; set; }`
	`double Double { get; set; }`
	`sbyte Char { get; set; }`
	`char WChar { get; set; }`
	`EPrimitiveDataType Type { get; set; }`
	`}`

Member	• `bool Bool:` 1 byte boolean value • `Int8 Int8:` 1 byte integer with sign • `Int16 Int16:` 2 byte integer with sign • `Int32 Int32:` 4 byte integer with sign • `Int64 Int64:` 8 byte integer with sign • `UntT8 UInt8:` 1 byte integer without sign • `UInt16 UInt16:` 2 byte integer without sign • `UInt32 UInt32:` 4 byte integer without sign • `UInt64 UInt64:` 8 byte integer without sign • `float Float:` 4 byte floating-point value • `double Double:` 8 byte floating-point value • `sbyte Char:` 1 byte value character • `char WChar:` 2 byte value character • `EPrimitiveDataType Type:` Type of PLC tag

7.8.6.2 SDVBNI

Description

This structure is for internal use only. Do not change this structure.

Table 7- 395 SDVBNI - Native C++

Syntax	`struct SDVBNI`

Table 7- 396 SDVBNI - .NET (C#)

Syntax	`struct SDVBNI`

7.8.6.3 SDataValueByAddress

Description

This structure represents a PLC tag that is accessed via its address.

Table 7- 397 SDataValueByAddress - Native C++

Syntax

```
struct SDataValueByAddress
{
 UINT32 Offset;
 UINT8 Bit;
 SDataValue DataValue;
 ERuntimeErrorCode ErrorCode;
};
```

Table 7- 398 SDataValueByAddress - .NET (C#)

Syntax

```
struct SDataValueByAddress
{
 UInt32 Offset;
 UInt8 Bit;
 SDataValue DataValue;
 ERuntimeErrorCode ErrorCode;
}
```

7.8.6.4 SDataValueByAddressWithCheck

Description

This structure represents a PLC tag that is accessed via its address.

Table 7- 399 SDataValueByAddressWithCheck - Native C++

Syntax	`struct SDataValueByAddressWithCheck`
	`{`
	` UINT32 Offset;`
	` UINT8 Bit;`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` bool ValueHasChanged;`
	`};`

Table 7- 400 SDataValueByAddressWithCheck - .NET (C#)

Syntax	`struct SDataValueByAddressWithCheck`
	`{`
	` UInt32 Offset;`
	` UInt8 Bit;`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` bool ValueHasChanged;`
	`}`

7.8.6.5 SDataValueByName

Description

This structure represents a PLC tag that is called by its name.

Table 7- 401 SDataValueByName - Native C++

Syntax	`struct SDataValueByName`
	`{`
	` WCHAR Name[DTAG_NAME_MAX_LENGTH];`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` SDVBNI Internal;`
	`};`

Table 7- 402 SDataValueByName - .NET (C#)

Syntax	`struct SDataValueByName`
	`{`
	` String Name;`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` SDVBNI Internal;`
	`}`

7.8.6.6 SDataValueByNameWithCheck

Description

This structure represents a PLC tag that is called by its name.

Table 7- 403 SDataValueByNameWithCheck - Native C++

Syntax	`struct SDataValueByNameWithCheck`
	`{`
	` WCHAR Name[DTAG_NAME_MAX_LENGTH];`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` SDVBNI Internal;`
	` bool ValueHasChanged;`
	`};`

Table 7- 404 SDataValueByNameWithCheck - .NET (C#)

Syntax	`struct SDataValueByNameWithCheck`
	`{`
	` String Name;`
	` SDataValue DataValue;`
	` ERuntimeErrorCode ErrorCode;`
	` SDVBNI Internal;`
	` bool ValueHasChanged;`
	`}`

7.8.6.7 SConnectionInfo

Description

This structure contains the IP address and port of a TCP/IP connection.

Table 7- 405 SConnectionInfo - Native C++

Syntax	`struct SConnectionInfo`
	`{`
	` UIP IP;`
	` UINT16 Port;`
	`};`

Table 7- 406 SConnectionInfo - .NET (C#)

Syntax	`struct SConnectionInfo`
	`{`
	` SIP IP;`
	` UInt16 Port;`
	`}`

7.8.6.8 SInstanceInfo

Description

This structure contains an IPv4 address.

Table 7- 407 SInstanceInfo - Native C++

Syntax	`struct SInstanceInfo`
	`{`
	` INT32 ID;`
	` WCHAR Name[DINSTANCE_NAME_MAX_LENGTH];`
	`};`

Member	• `INT32 ID:` The ID of the instance • `WCHAR Name[DINSTANCE_NAME_MAX_LENGTH]:` The name of the instance

Table 7- 408 SInstanceInfo - .NET (C#)

Syntax	`struct SInstanceInfo`
	`{`
	` Int32 ID;`
	` String Name;`
	`}`

Member	• `Int32 ID:` The ID of the instance • `String name:` The name of the instance

7.8.6.9 SDimension

Description

This structure contains information about the dimension of a field.

Table 7- 409 SDimension - Native C++

Syntax	`struct SDimension`
	`{`
	` INT32 StartIndex;`
	` UINT32 Count;`
	`};`

Table 7- 410 SDimension - .NET (C#)

Syntax	`struct SDimension`
	`{`
	` Int32 StartIndex;`
	` UInt32 Count;`
	`}`

7.8.6.10 STagInfo

Description

This structure contains information about a PLC tag.

Table 7- 411 STagInfo - Native C++

Syntax	`struct STagInfo`
	`{`
	` WCHAR Name[DTAG_NAME_MAX_LENGTH];`
	` EArea Area;`
	` EDataType DataType;`
	` EPrimitiveDataType PrimitiveDataType;`
	` UINT16 Size;`
	` UINT32 Offset;`
	` UINT8 Bit;`
	` UINT8 DimensionCount;`
	` UINT32 Index;`
	` UINT32 ParentIndex;`
	` SDimension Dimension[DTAG_ARRAY_DIMENSION];`
	`};`

Member	• `WCHAR Name[DTAG_NAME_MAX_LENGTH]:` The name of the tag • `EArea area:` The CPU area where the tag is located. • `EDataType DataType:` The CPU data type of the tag • `EPrimitiveDataType PrimitiveDataType:` The primitive data type of the tag • `UINT16 size:` The size of the tag in bytes • `UINT32 offset:` The byte offset of the tag if it is not located in a data block. • `UINT8 bit:` The bit offset of the tag if it is not located in a data block. • `UINT8 DimensionCount:` The number of dimensions of the array. 0 if it is not a field for the tag. • `UINT32 index:` The index of the tag • `UINT32 ParentIndex:` If this tag is embedded in another tag (for example, an element of a structure), this value then displays the index of the parent tag. The value is 0 if the tag has no parent tag. • `SDimension Dimension[DTAG_ARRAY_DIMENSION]:` Information about each dimension of the field

Table 7- 412 STagInfo - .NET (C#)

<table>
<tr><td>Syntax</td><td><pre>public struct STagInfo
{
 String Name;
 EArea Area;
 EDataType DataType;
 EPrimitiveDataType PrimitiveDataType;
 UInt16 Size;
 UInt32 Offset;
 UInt8 Bit;
 UInt32 Index;
 UInt32 ParentIndex;
 SDimension[] Dimension;
}</pre></td></tr>
<tr><td>Member</td><td>
<code>String name:</code>
The name of the tag
<code>EArea area:</code>
The CPU area where the tag is located.
<code>EDataType DataType:</code>
The CPU data type of the tag
<code>EPrimitiveDataType PrimitiveDataType:</code>
The primitive data type of the tag
<code>UInt16 size:</code>
The size of the tag in bytes.
<code>UInt32 offset:</code>
The byte offset of the tag if it is not located in a data block.
<code>UInt8 bit:</code>
The bit offset of the tag if it is not located in a data block.
<code>UInt32 index:</code>
The index of the tag
<code>UInt32 ParentIndex:</code>
If this tag is embedded in another tag (for example, an element of a structure), this value then displays the index of the parent tag. The value is 0 if the tag has no parent tag.
<code>SDimension[] Dimension:</code>
Information about each dimension of the field. Empty, if the tag is not an array.
</td></tr>
</table>

7.8.6.11 SIP

Description

This structure contains an IPv4 address.

Table 7- 413 SIP - .NET (C#)

Syntax	`struct SIP`
	`{`
	` byte[] IPArray { get; set; }`
	` UInt32 IPDWord { get; set; }`
	` string IPString { get; set; }`
	`}`

Member	• `UInt32 IPDWord:` The IP address in a single DWORD • `byte[] IPArray:` The four elements of IP in descending order • `string IPString:` The IPv4 address as a string
Example	Example for an IP address: 192.168.0.1 SIP.IPDWord = 0xC0A80001 SIP.IPArray[3] = 192, SIP.IPArray[2] = 168, SIP.IPArray[1] = 0, SIP.IPArray[0] = 1 SIP.IPString = "192.168.0.1"

7.8.6.12 SIPSuite4

Description

This structure contains an IPv4 suite.

Table 7- 414 SIPSuite4 - Native C++

Syntax	`struct SIPSuite4`
	`{`
	` UIP IPAddress;`
	` UIP SubnetMask;`
	` UIP DefaultGateway;`
	`};`

Member	• `UIP IPAddress:` The IP address • `UIP SubnetMask:` The subnet mask • `UIP DefaultGateway:` The standard gateway

Table 7- 415 SIPSuite4 - .NET (C#)

Syntax	`struct SIPSuite4`
	`{`
	`SIP IPAddress;`
	`SIP SubnetMask;`
	`SIP DefaultGateway;`
	`}`

Member	• `SIP IPAddress:` The IP address • `SIP SubnetMask:` The subnet mask • `SIP DefaultGateway:` The standard gateway

7.8.6.13 SOnSyncPointReachedResult

Description

This structure contains the results of the OnSyncPointReached event.

Table 7- 416 SOnSyncPointReachedResult - Native C++

Syntax	`struct SOnSyncPointReachedResult`
	`{`
	` ERuntimeErrorCode ErrorCode;`
	` SYSTEMTIME SystemTime;`
	` UINT32 PipId;`
	` INT64 TimeSinceSameSyncPoint_ns;`
	` INT64 TimeSinceAnySyncPoint_ns;`
	` UINT32 SyncPointCount;`
	`};`

Member	• `ERuntimeErrorCode ErrorCode:` A possible error code (Page 327). If no event was triggered during the defined time interval: `SREC_TIMEOUT`. • `SYSTEMTIME SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UINT32 PipId:` The ID of the process image partition (PIP) that triggers this event. 0 for the cycle control point (End of cycle). • `INT64 TimeSinceSameSyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of the same process image partition ID was reached. For the time-controlled operating modes (Page 80): The runtime since the last call of the `StartProcessing()` function. • `INT64 TimeSinceAnySyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of any process image partition ID was reached. For the time-controlled operating modes (Page 80): The runtime since the last call of the `StartProcessing()` function. • `UINT32 SyncPointCount:` The number of synchronization points since the last event. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.

Table 7- 417 SOnSyncPointReachedResult - .NET (C#)

Syntax	`struct SOnSyncPointReachedResult`
	`{`
	` ERuntimeErrorCode ErrorCode;`
	` DateTime SystemTime;`
	` UInt32 PipId;`
	` Int64 TimeSinceSameSyncPoint_ns;`
	` Int64 TimeSinceAnySyncPoint_ns;`
	` UInt32 SyncPointCount;`
	`}`

Member	• `ERuntimeErrorCode ErrorCode:` A possible error code (Page 327). If no event was triggered during the defined time interval: `ERuntimeErrorCode.Timeout`. • `DateTime DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `UInt32 PipId:` The ID of the process image partition (PIP) that triggers this event. 0 for the cycle control point (End of cycle). • `Int64 TimeSinceSameSyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of the same process image partition ID was reached. For the time-controlled operating modes: The runtime since the last call of the `StartProcessing()` function. • `Int64 TimeSinceAnySyncPoint_ns:` The virtual time (in nanoseconds) since the last synchronization point of any process image partition ID was reached. For the time-controlled operating modes: The runtime since the last call of the `StartProcessing()` function. • `UInt32 SyncPointCount:` The number of synchronization points since the last event. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.

7.8.6.14 SDataRecordInfo

Description

This structure contains read/write data record information.

Table 7- 418 SDataRecordInfo - Native C++

Syntax	`struct SDataRecordInfo`
	`{`
	` UINT32 HardwareId;`
	` UINT32 RecordIdx;`
	` UINT32 DataSize;`
	`};`

Member	• `UINT32 HardwareId:` The ID of the hardware module (hardware identifier) • `UINT32 RecordIdx:` The data record number • `UINT32 DataSize:` The data record size

Table 7- 419 SDataRecordInfo - .NET (C#)

Syntax	`struct SDataRecordInfo`
	`{`
	` UInt32 HardwareId;`
	` UInt32 RecordIdx;`
	` UInt32 DataSize;`
	`}`

Member	• `UInt32 ID:` The ID of the hardware module • `UInt32 RecordIdx:` The data record number • `UInt32 DataSize:` The data record size

7.8.6.15 SDataRecord

Description

This structure contains read/write data record information and data records.

Table 7- 420 SDataRecord - Native C++

Syntax	`struct SDataRecord`
	`{`
	`SDataRecordInfo Info;`
	`BYTE Data[DDATARECORD_MAX_SIZE];`
	`};`

Member	• `SDataRecordInfo Info:` The data record information, see SDataRecordInfo (Page 321) • `BYTE Data[DDATARECORD_MAX_SIZE]:` The array length of the user data `DDATARECORD_MAX_SIZE`

Table 7- 421 SDataRecord - .NET (C#)

Syntax	`struct SDataRecord`
	`{`
	`UInt32 HardwareId;`
	`byte[] Data`
	`}`

Member	• `SDataRecordInfo Info:` The data record information, see SDataRecordInfo (Page 321) • `byte[] Data:` The array length

7.8.6.16 SConfiguredProcessEvents

Description

This structure contains information about the configured process events.

Table 7- 422 SConfiguredProcessEvents - Native C++

Syntax	`struct SConfiguredProcessEvents { UINT16 HardwareIdentifier; UINT16 Channel; EProcessEventType ProcessEventType; WCHAR Name[DPROCESS_EVENT_NAME_MAX_LENGTH]; };`
Member	• `UINT16 HardwareIdentifier:` The HW identifier • `UINT16 Channel:` The channel of the IO module which generates the process event. • `EProcessEventType ProcessEventType:` The type of the configured process event • `WCHAR Name[DPROCESS_EVENT_NAME_MAX_LENGTH]:` The name of the process event

Table 7- 423 SConfiguredProcessEvents - .NET (C#)

Syntax	`public struct SConfiguredProcessEvents { ushort HardwareIdentifier; ushort Channel; EProcessEventType ProcessEventType; string Name; }`
Member	• `ushort HardwareIdentifier:` The HW identifier • `ushort Channel:` The channel of the IO module which generates the process event. • `EProcessEventType ProcessEventType:` The type of the configured process event • `String name:` The name of the process event

7.8.6.17 SDiagExtChannelDescription

Description

This structure contains read/write data record information and data records.

Table 7- 424 SDiagExtChannelDescription - Native C++

Syntax	`struct SDiagExtChannelDescription`
	`{`
	` UINT16 ChannelNumber;`
	` UINT16 ErrorType;`
	` UINT16 ExtErrorType;`
	` EDiagSeverity Severity;`
	` EDiagProperty Direction;`
	`};`

Member	• `UINT16 ChannelNumber:` If the interrupt relates to a specific channel of the IO device (e.g. short circuit), this parameter must contain the number of the faulty channel. If the interrupt was generated by a module or submodule, the number of the channel must be set to 0x8000. • `UINT16 ErrorType:` The parameter defines error types according to PROFINET standard, see "Error types" section. • `EDiagSeverity Severity:` The value of the severity for the diagnostics, see EDiagSeverity (Page 346). • `EDiagProperty Direction:` The value for the incoming/outgoing information, see EDiagProperty (Page 345). • `UINT16 ExtErrorType:` This parameter provides the option of defining more details for the diagnostic interrupt. This is helpful in combination with PDEV error types which are generated for CPU-internal modules. Should be 0 by default.

Table 7- 425 SDiagExtChannelDescription - .NET (C#)

Syntax	`struct SDiagExtChannelDescription`
	`{`
	` UInt16 ChannelNumber;`
	` UInt16 ErrorType;`
	` UInt16 ExtErrorType;`
	` EDiagSeverity Severity;`
	` EDiagProperty Direction;`
	`};`

Member	• `UInt16 ChannelNumber:` If the interrupt relates to a specific channel of the IO device (e.g. short circuit), this parameter must contain the number of the faulty channel. If the interrupt was generated by a module or submodule, the number of the channel must be set to 0x8000. • `UInt16 ErrorType:` The parameter defines error types according to PROFINET standard, see "Error types" section. • `EDiagSeverity Severity:` The value of the severity for the diagnostics, see EDiagSeverity (Page 346). • `EDiagProperty Direction:` The value for the incoming/outgoing information, see EDiagProperty (Page 345). • `UInt16 ExtErrorType:` This parameter provides the option of defining more details for the diagnostic interrupt. This is helpful in combination with PDEV error types which are generated for CPU-internal modules. Should be 0 by default.

Error types

The following table contains important error types (`ErrorType`) according to PROFINET standard:

Table 7- 426 Error types according to PROFINET standard

Value	Meaning
0x0000	Reserved / unknown error
0x0001	Short-circuit
0x0002	Undervoltage
0x0003	Overvoltage
0x0004	Overload
0x0005	Overtemperature
0x0006	Wire break
0x0007	High limit violated
0x0008:	Low limit violated
0x0009	Error

The following table contains error types `ExtChannelErrorType` for `ChannelErrorType` "Remote mismatch":

Table 7- 427 ExtChannelErrType error types

Value	Meaning	Use
0x0000	Reserved	-
0x0001 to 0x7FFF	Manufacturer ID	Interrupt/diagnostics
0x8000	Peer name of station mismatch	Interrupt/diagnostics
0x8001	Peer name of port mismatch	Interrupt/diagnostics
0x8002	Peer RT_CLASS_3 mismatch	Interrupt/diagnostics
0x8003	Peer MAU Type mismatch	Interrupt/diagnostics

7.8.7 Enumerations

The following enumerations are available:

- ERuntimeErrorCode (Page 327)
- EArea (Page 330)
- EOperatingState (Page 330)
- EOperatingMode (Page 331)
- ECPUType (Page 332)
- ECommunicationInterface (Page 334)
- ELEDType (Page 334)
- ELEDMode (Page 335)
- EPrimitiveDataType (Page 335)
- EDataType (Page 338)
- ETagListDetails (Page 342)
- ERuntimeConfigChanged (Page 343)
- EInstanceConfigChanged (Page 343)
- EPullOrPlugEventType (Page 344)
- EProcessEventType (Page 344)
- EDirection (Page 345)
- EDiagProperty (Page 345)
- EDiagSeverity (Page 346)
- ERackOrStationFaultType (Page 346)

Global functions (Native C++) (Page 106)

7.8.7.1 ERuntimeErrorCode

Description

This enumeration contains all error codes that are used by the Simulation Runtime API. Most API functions return one of these error codes. If the function is successful, the return value is always `SREC_OK`. Errors are returned with negative values, and alarms with positive values.

Table 7- 428 ERuntimeErrorCode - Native C++

7.8.7.2 EArea

Description

This enumeration contains all PLC areas that contain the available PLC tags.

Table 7- 430 EArea - Native C++

Syntax	`enum EArea`
	`{`
	` SRA_INVALID_AREA = 0,`
	` SRA_INPUT = 1,`
	` SRA_MARKER = 2,`
	` SRA_OUTPUT = 3,`
	` SRA_COUNTER = 4,`
	` SRA_TIMER = 5,`
	` SRA_DATABLOCK = 6,`
	
	` SRA_ENUMERATION_SIZE = 7`
	`};`

Table 7- 431 EArea - .NET (C#)

Syntax	`public enum EArea`
	`{`
	` InvalidArea = 0,`
	` Input = 1,`
	` Marker = 2,`
	` Output = 3,`
	` Counter = 4,`
	` Timer = 5,`
	` DataBlock = 6,`
	`}`

7.8.7.3 EOperatingState

Description

This enumeration contains all the operating states of a virtual controller.

Table 7- 432 EOperatingState - Native C++

Syntax	`enum EOperatingState`
	`{`
	` SROS_INVALID_OPERATING_STATE = 0,`
	` SROS_OFF = 1,`
	` SROS_BOOTING = 2,`
	` SROS_STOP = 3,`

	` SROM_SINGLE_STEP_CP = 6,`
	` SROM_SINGLE_STEP_CPT = 7,`
	` SROM_TIMESPAN_SYNCHNRONIZED_CP = 8`
	`};`

Table 7- 435 EOperatingMode - .NET (C#)

Syntax	`public enum EOperatingMode`
	`{`
	` Default = 0,`
	` SingleStep_C = 1,`
	` SingleStep_CT = 2,`
	` TimespanSynchronized_C = 3,`
	` SingleStep_P = 4,`
	` TimespanSynchronized_P = 5,`
	` SingleStep_CP = 6,`
	` SingleStep_CPT = 7,`
	` TimespanSynchronized_CP = 8`
	`}`

7.8.7.5 ECPUType

Description

This enumeration contains all CPU types that can be loaded in a virtual controller.

Table 7- 436 ECPUType - Native C++

Syntax	```enum ECPUType { SRCT_1500_Unspecified = 0x000005DC, SRCT_1511 = 0x000005E7, SRCT_1511v2 = 0x010005E7, SRCT_1511v3 = 0x020005E7, SRCT_1513 = 0x000005E9, SRCT_1513v2 = 0x010005E9, SRCT_1513v3 = 0x020005E9 SRCT_1515 = 0x000005EB, SRCT_1515v2 = 0x010005EB, SRCT_1516 = 0x000005EC, SRCT_1516v2 = 0x010005EC, SRCT_1517 = 0x000005ED, SRCT_1518 = 0x000005EE, SRCT_1511C = 0x000405E7, SRCT_1511Cv2 = 0x010405E7, SRCT_1512C = 0x000405E8, SRCT_1512Cv2 = 0x010405E8, SRCT_1511F = 0x000105E7, SRCT_1511Fv2 = 0x010105E7, SRCT_1511Fv3 = 0x020105E7, SRCT_1513F = 0x000105E9, SRCT_1513Fv2 = 0x010105E9, SRCT_1513Fv3 = 0x020105E9, SRCT_1515F = 0x000105EB, SRCT_1515Fv2 = 0x010105EB, SRCT_1516F = 0x000105EC, SRCT_1516Fv2 = 0x010105EC, SRCT_1517F = 0x000105ED, SRCT_1518F = 0x000105EE, SRCT_1511T = 0x000805E7, SRCT_1515T = 0x000805EB, SRCT_1516T = 0x000805EC, SRCT_1517T = 0x000805ED, SRCT_1511TF = 0x000905E7, SRCT_1515TF = 0x000905EB, SRCT_1516TF = 0x000905EC, SRCT_1517TF = 0x000905ED, SRCT_1518ODK = 0x001005EE, SRCT_1518FODK = 0x001105EE, SRCT_1518MFP = 0x004005EE, SRCT_1518FMFP = 0x004105EE, SRCT_ET200SP_Unspecified = 0x000205DC, SRCT_1510SP = 0x000205E6, SRCT_1510SPv2 = 0x010205E6, SRCT_1512SP = 0x000205E8, SRCT_1512SPv2 = 0x010205E8, SRCT_1510SPF = 0x000305E6, SRCT_1510SPFv2 = 0x010305E6, SRCT_1512SPF = 0x000305E8, SRCT_1512SPFv2 = 0x010305E8 }```

	`}`

7.8.7.6 ECommunicationInterface

Description

This enumeration contains the available communication interfaces of a virtual controller.

Table 7- 438 ECommunicationInterface - Native C++

Syntax	`enum ECommunicationInterface { SRCI_NONE = 0, SRCI_SOFTBUS = 1, SRCI_TCPIP = 2, SRCI_ENUMERATION_SIZE = 3 };`

Table 7- 439 ECommunicationInterface - .NET (C#)

Syntax	`enum ECommunicationInterface { None = 0, Softbus = 1, TCPIP = 2, }`

7.8.7.7 ELEDType

Description

This list includes all types of LEDs of a virtual controller.

Table 7- 440 ELEDType - Native C++

Syntax	`enum ELEDType { SRLT_STOP = 0, SRLT_RUN = 1, SRLT_ERROR = 2, SRLT_MAINT = 3, SRLT_REDUND = 4, SRLT_FORCE = 5, SRLT_BUSF1 = 6, SRLT_BUSF2 = 7, SRLT_BUSF3 = 8, SRLT_BUSF4 = 9, SRLT_ENUMERATION_SIZE = 10 };`

Table 7- 441 ELEDType - .NET (C#)

Syntax	`enum ELEDType { Stop = 0, Run = 1, Error = 2 Maint = 3, Redund = 4, Force = 5, Busf1 = 6, Busf2 = 7, Busf3 = 8, Busf4 = 9 }`

7.8.7.8 ELEDMode

Description

This list contains all the LED states of a virtual controller.

Table 7- 442 ELEDMode - Native C++

Syntax	`enum ELEDMode { SRLM_OFF = 0, SRLM_ON = 1, SRLM_FLASH_FAST = 2, SRLM_FLASH_SLOW = 3, SRLM_INVALID = 4 };`

Table 7- 443 ELEDMode - .NET (C#)

Syntax	`enum ELEDMode { Off = 0, On = 1, FlashFast = 2, FlashSlow = 3, Invalid = 4 }`

7.8.7.9 EPrimitiveDataType

Description

This list contains all the primitive data types that are used by the I/O access functions.

Table 7- 444 EPrimitiveDataType - Native C++

Syntax	`enum EPrimitiveDataType { SRPDT_UNSPECIFIC = 0, SRPDT_STRUCT = 1, SRPDT_BOOL = 2, SRPDT_INT8 = 3, SRPDT_INT16 = 4, SRPDT_INT32 = 5, SRPDT_INT64 = 6, SRPDT_UINT8 = 7, SRPDT_UINT16 = 8, SRPDT_UINT32 = 9, SRPDT_UINT64 = 10, SRPDT_FLOAT = 11, SRPDT_DOUBLE = 12, SRPDT_CHAR = 13, SRPDT_WCHAR = 14 };`

Table 7- 445 EPrimitiveDataType - .NET (C#)

Syntax	Code

Syntax	<pre>enum EPrimitiveDataType
	{
	 Unspecific = 0,
	 Struct = 1,
	 Bool = 2,
	 Int8 = 3,
	 Int16 = 4,
	 Int32 = 5,
	 Int64 = 6,
	 UInt8 = 7,
	 UInt16 = 8,
	 UInt32 = 9,
	 UInt64 = 10,
	 Float = 11,
	 Double = 12,
	 Char = 13,
	 WChar = 14
	}</pre>

Compatible primitive data types

The following tables shows the primitive data types of the user interface (API) and the data types of the PLCSIM Advanced instance that are configured in the stored tag list. The data types that can be used as compatible are marked with "X".

Table 7- 446 Compatible primitive data types - Reading

API	PLCSIM Advanced instance												
	Bool	INT8	INT16	INT32	INT64	UINT8	UINT16	UINT32	UINT64	Float	Double	Char	WChar
Bool	X

7.8.7.12 ERuntimeConfigChanged

Description

This list contains all possible causes of a OnConfigurationChanged event that the Runtime Manager sends.

Table 7- 452 ERuntimeConfigChanged - Native C++

Syntax	`enum ERuntimeConfigChanged`
	`{`
	` SRCC_INSTANCE_REGISTERED = 0,`
	` SRCC_INSTANCE_UNREGISTERED = 1`
	` SRCC_CONNECTION_OPENED = 2,`
	` SRCC_CONNECTION_CLOSED = 3,`
	` SRCC_PORT_OPENED = 4,`
	` SRCC_PORT_CLOSED = 5`
	`};`

Table 7- 453 ERuntimeConfigChanged - .NET (C#)

Syntax	`enum ERuntimeConfigChanged`
	`{`
	` InstanceRegistered = 0,`
	` InstanceUnregistered = 1,`
	` ConnectionOpened = 2,`
	` ConnectionClosed = 3,`
	` PortOpened = 4,`
	` PortClosed = 5`
	`}`

7.8.7.13 EInstanceConfigChanged

Description

This list contains all possible causes for a OnConfigurationChanged event that the virtual controller sends.

Table 7- 454 EInstanceConfigChanged - Native C++

Syntax	`enum EInstanceConfigChanged`
	`{`
	` SRICC_HARDWARE_SOFTWARE_CHANGED = 0,`
	` SRICC_IP_CHANGED = 1`
	`};`

Table 7- 455 EInstanceConfigChanged - .NET (C#)

Syntax	`enum EInstanceConfigChanged`
	`{`
	` HardwareSoftwareChanged = 0,`
	` IPChanged = 1`
	`}`

7.8.7.14 EPullOrPlugEventType

Description

This enumeration contains predefined types of pull/plug events for S7 modules.

Table 7- 456 EPullOrPlugEventType - Native C++

Syntax	`enum EPullOrPlugEventType`
	`{`
	` SR_PPE_UNDEFINED = 0,`
	` SR_PPE_PULL_EVENT = 1,`
	` SR_PPE_PLUG_EVENT = 2,`
	` SR_PPE_PLUG_EVENT_ERROR_REMAINS = 3,`
	` SR_PPE_PLUG_WRONG_MODULE_EVENT = 4`
	`};`

Table 7- 457 EPullOrPlugEventType - .NET (C#)

Syntax	`enum EPullOrPlugEventType`
	`{`
	` Undefined = 0,`
	` Pull = 1,`
	` Plug = 2,`
	` PlugErrorRemains = 3,`
	` PlugWrongModule = 4`
	`}`

7.8.7.15 EProcessEventType

Description

This enumeration contains predefined types of process events for S7 modules.

Table 7- 458 EProcessEventType - Native C++

Syntax	`enum EProcessEventType`
	`{`
	` SR_PET_UNDEFINED = 0,`
	` SR_PET_RISING_EDGE = 1,`
	` SR_PET_FALLING_EDGE = 2,`
	` SR_PET_LIMIT1_UNDERRUN = 3,`
	` SR_PET_LIMIT1_OVERRUN = 4,`
	` SR_PET_LIMIT2_UNDERRUN = 5,`
	` SR_PET_LIMIT2_OVERRUN = 6`
	`};`

Table 7- 459 EProcessEventType - .NET (C#)

Syntax	`enum EProcessEventType`
	`{`
	` Undefined = 0,`
	` RisingEdge = 1,`
	` FallingEdge = 2,`
	` Limit_1_Underrun = 3,`
	` Limit_1_Overrun = 4,`
	` Limit_2_Underrun = 5,`
	` Limit_2_Overrun = 6`
	`}`

7.8.7.16 EDirection

Description

This enumeration contains properties of the diagnostic alarm.

Table 7- 460 EDirection - Native C++

Syntax	`enum EDirection`
	`{`
	` SRD_DIRECTION_INPUT = 0,`
	` SRD_DIRECTION_OUTPUT = 1`
	`};`

Table 7- 461 EDirection - .NET (C#)

Syntax	`enum EDirection`
	`{`
	` Input = 0,`
	` Output = 1`
	`}`

7.8.7.17 EDiagProperty

Description

This enumeration contains the incoming/outgoing information of the diagnostic alarm.

Table 7- 462 EDiagProperty - Native C++

Syntax	`enum EDiagProperty`
	`{`
	` SRP_DIAG_APPEAR = 1,`
	` SRP_DIAG_DISAPPEAR = 2`
	`};`

Table 7- 463 EDiagProperty - .NET (C#)

Syntax	`enum EDiagProperty`
	`{`
	` Appear = 1,`
	` Disappear = 2`
	`}`

7.8.7.18 EDiagSeverity

Description

This enumeration contains the severity of the diagnostic alarm (error, maintenance demanded, maintenance required).

Table 7- 464 EDiagSeverity - Native C++

Syntax	`enum EDiagSeverity { SRDS_SEVERITY_FAILURE = 0, SRDS_SEVERITY_MAINTENANCE_DEMANDED = 1, SRDS_SEVERITY_MAINTENANCE_REQUIRED = 2 };`

```
enum EDiagSeverity
{
 SRDS_SEVERITY_FAILURE = 0,
 SRDS_SEVERITY_MAINTENANCE_DEMANDED = 1,
 SRDS_SEVERITY_MAINTENANCE_REQUIRED = 2
};
```

Table 7- 465 EDiagSeverity - .NET (C#)

Syntax	`enum EDiagSeverity { Failure = 0, MaintDemanded = 1, MaintRequired = 2 }`

```
enum EDiagSeverity
{
 Failure = 0,
 MaintDemanded = 1,
 MaintRequired = 2
}
```

7.8.7.19 ERackOrStationFaultType

Description

This enumeration contains the types of the RackOrStationFault event.

Table 7- 466 ERackOrStationFaultType - Native C++

Syntax	`enum ERackOrStationFaultType { SR_RSF_FAULT = 0, SR_RSF_RETURN = 1 };`

```
enum ERackOrStationFaultType
{
 SR_RSF_FAULT = 0,
 SR_RSF_RETURN = 1
};
```

Table 7- 467 ERackOrStationFaultType - .NET (C#)

Syntax	`enum ERackOrStationFaultType { Fault = 0, Return = 1 }`

```
enum ERackOrStationFaultType
{
 Fault = 0,
 Return = 1
}
```

Restrictions 8

8.1 Overview

Certain actions or events may lead to behavior in PLCSIM Advanced or in STEP 7 which deviates from that of a hardware CPU. Restrictions and possible remedies can be found in the following sections:

8.2 Restrictions with fail-safe CPUs

Error downloading program changes

The error message "Corrupt" appears when downloading program changes to an F-CPU. The F-CPU remains in STOP mode when the "Start all" check box is selected.

Remedy

Deselect the "Start all" check box in the "Load results" dialog.

Once the download is complete, set the CPU to RUN mode manually using the RUN button.

8.3 OPC UA server

With OPC UA, data exchange is performed through an open, standardized and manufacturer-independent communication protocol. The CPU acting as the OPC UA server can communicate with OPC UA clients, for example, with HMI panels V14 and SCADA systems.

For technical reasons, the security settings in PLCSIM Advanced differ from a hardware CPU. Some features are disabled for simulations or are available to a limited extent.

Configuring OPC UA server

Start the instances via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP) to use the OPC UA server.

The OPC UA server functionality is not available if communication takes place via the Softbus.

OPC UA security settings

Based on the OPC UA security settings, the same settings can be made in STEP 7 for the hardware CPU. However, PLCSIM Advanced does not take these security settings into consideration. This ensures that the user does not have his project change to perform a simulation.

Certificate

Note

Server certificate

PLCSIM Advanced uses its own certificate in the firmware and not that of STEP 7. The certificate need not be changed for simulations. However, it does not have the same security level as a downloaded server certificate and cannot be used for secure connections!

- **Server Security Endpoints**

  PLCSIM Advanced only supports Security Endpoint "none".

- **Client certificate**

  PLCSIM Advanced does not evaluate certificates the imported and configured in STEP 7 . PLCSIM Advanced accepts all client certificates automatically. This setting cannot be changed.

- **User authentication**

  PLCSIM Advanced does not use the user name configured in STEP 7.

  Only one logon is possible as "guest" or "anonymous".

User authorization for OPC UA

The PLCSIM Advanced license also contains the user authorization for OPC UA.

The user authorization applies for three instances.

8.4 Web server

The Web server integrated in a CPU enables monitoring and administering of the CPU by authorized users over a network. This permits evaluation and diagnostics over long distances.

Each PLCSIM Advanced instance can simulate its own Web server.

The simulation of the Web server is restricted under S7-PLCSIM Advanced V2.0.

- It is not possible to back up and restore a configuration via the Web server.
- The freeze state of a virtual controller is not shown as an internal operating state.

Configuring the Web server

S7 PLCSIM Advanced

Start the instances via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP) to use the Web server.

The Web server functionality is not available if the communication is performed via the Softbus.

STEP 7

Configure the Web server in STEP 7 in the CPU properties.

Restricted Web server functionality

- **Logon**

  "PLCSIM" is preset as the user. There is no logon for users.

  A user configured in STEP 7 and his rights have no effect on the "PLCSIM" user.
- There is no access via the secure transmission protocol "HTTPS".
- The information may not be fully displayed on some websites due to different data handling.
- There is no topology information.
- "Online Backup&Restore" is not available.
- FW updates are not supported.

Number of maximum connections

A fixed value of 384 is displayed in the Web server for the maximum possible number of connections.

Remedy

The correct value can be found in the technical data for the loaded CPU.

8.5 Backing up and restoring the configuration of a PLCSIM Advanced instance

Backing up and restoring the configuration

As of PLCSIM Advanced V2.0 it is possible to back up and restore a PLCSIM Advanced instance.

You can create as many backups as you want and store a variety of configurations for a PLCSIM Advanced instance.

You perform the backup and restore in the TIA Portal as you would in a real CPU.

Backup and restore via the Web server and (simulated) display are not supported.

A backup that was created with PLCSIM Advanced can only be used with PLCSIM Advanced.

It is not possible to restore the configuration of a real CPU with a backup from PLCSIM Advanced.

Requirements

- The configuration of a PLCSIM Advanced instance is backed up and restored over the TCP/IP protocol, Softbus is not supported.
- It is only possible to restore the configuration of a PLCSIM Advanced instance with the corresponding backup from PLCSIM Advanced.

8.6 Restrictions for file paths

The following restrictions apply for user interfaces which expect a path or a complete file name as the transfer parameter:

Restrictions for local paths	Write permissions to system-critical directories such as the Windows directory (%Windows%) or the program directories (%Program Files%, %Program Files (x86)%) are not allowed. In this case the C++ user interface returns the error code `SREC_WRONG_ARGUMENT`. In this case the managed user interface returns an exception with the error code `RuntimeErrorCode.WrongArgument`.
Restrictions for network paths	In order to be able to use network paths, you must incorporate them as a network drive. Otherwise, the C++ user interface returns the error code `SREC_WRONG_ARGUMENT`. The managed user interface returns an exception with the error code `RuntimeErrorCode.WrongArgument`.

8.7 Restrictions for communications services

TUSEND / TURCV

When you run the UDP blocks TUSEND and TURCV via the "PLCSIM" communication interface (Softbus), you get error code 0x80C4 at the transmission end and receiving end:

Temporary communications error. The specified connection is temporarily down.

Remedy

Set "PLCSIM Virtual Ethernet Adapter" (TCP/IP) as the communication interface in PLCSIM Advanced.

Secure TCP connections

PLCSIM Advanced does not support TLS (Transport Layer Security) and has no certificate management. It is therefore not possible to establish secure TCP connections from the simulation.

This means that the following connections are not supported:

- Secure OUC connections (Secure Open User Communication)
- Secure connections to a mail server using TMAIL_C
- HTTPS connections to the Web server

8.8 Restrictions for instructions

PLCSIM Advanced simulates instructions for CPUs S7-1500 and ET 200SP as close to reality as possible. PLCSIM Advanced checks the input parameters for validity and returns outputs that are valid but do not necessarily correspond to those that a real CPU with physical inputs/outputs would return.

Instructions not supported

Unsupported instructions are handled as not ready, their value is always "OK". PLCSIM Advanced does not support the following instructions:

- DP_TOPOL
- PORT_CFG

8.9 Restrictions with Motion Control

8.9.1 MCR and EMCR

There are Motion Control resources (MCR) and Extended Motion Control resources (EMCR) on each CPU that can be distributed to the technology objects.

Note

PLCSIM Advanced does not support the complete quantity structure of MCR und EMCR. The simulation of motion control is therefore restricted for the following CPUs:

Table 8- 1 CPUs with limited Motion Control resources (MCR, EMCR) during the simulation

Type	Motion Control resources	
	MCR	EMCR
CPU 1516T-3 PN/DP CPU 1516TF-3 PN/DP	5120	128
CPU 1517-3 PN/DP CPU 1517F-3 PN/DP	5120	-
CPU 1517T-3 PN/DP CPU 1517TF-3 PN/DP	5120	128
CPU 1518-4 PN/DP CPU 1518F-4 PN/DP CPU 1518-4 PN/DP ODK[1] CPU 1518F-4 PN/DP ODK[1] CPU 1518-4 PN/DP MFP[1] CPU 1518F-4 PN/DP MFP[1]	5120	-

[1] The ODK functionality of this CPU is not simulated.

Exceeding the quantity structure

STEP 7 checks whether the quantity structure for a configured CPU is complied with, and alerts you when it is exceeded. When you load a project into a CPU, another message appears.

Note

A project that uses more MCRs / EMCRs than PLCSIM Advanced supports can be downloaded to a virtual controller. However, there is no message indicating that the quantity structure has been exceeded.

Only when the user program accesses the technology objects do you recognize by the error message at the block and the value 0 of the object that motion control objects cannot be used due to an overrun of the quantity structure.

8.9.2 Technology modules

PLCSIM Advanced simulates the real CPU, but not configured, connected technology modules or other I/O devices.

It is possible to download a project with technology modules for operation of motion control. However, the built-in logic of the technology modules is not part of the simulation, which is why the associated Motion Control instructions are not supported.

Additional information

For more information on Motion Control, refer to the following manuals:

- Device manuals to support SIMATIC controllers (https://support.industry.siemens.com/cs/ww/en/view/109744173)
- Function manual S7-1500 Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109739589)
- Function manual S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326)

8.9.3 OB 91 and OB 92

If you convert a Motion Control project which contains the OB 91 and OB 92 from STEP 7 V13, then you cannot load this project to a PLCSIM Advanced.

Remedy

Delete OB 91 and OB 92 in the project and recompile the project.

The OBs are thus created again with the simulation support required for PLCSIM Advanced.
Compilation resets the properties of the blocks to the default values.
Restore the required settings in the properties.

8.10 Restrictions to local communication via Softbus

Identical IP addresses for instances

If the "PLCSIM" communication interface (Softbus) is set, then identical IP addresses are created automatically for all instances when creating the instances through the Control Panel.

In STEP 7, only one instance is therefore displayed in the lifelist.

Remedy

Use the API function `SetIPSuite()` to assign a unique address for each instance, then all instances are displayed in STEP 7 with their IP addresses.

API function

- SetIPSuite() (Page 139)

Online and diagnostics

If the "PLCSIM" (Softbus) communication interface is set, no details are displayed for the "Online and Diagnostics" function under the PROFINET interface (IP address, MAC address, etc.).

See also

Controller - Information and settings (Page 136)

8.11 Restrictions of security with VMware vSphere Hypervisor (ESXi)

When you use the virtualization platform VMware vSphere Hypervisor (ESXi), you must change the policy exception to communicate over TCP/IP.

Remedy

Accept the "Promiscuous mode and "Forged transmit" options for the Virtual Switch of the ESXi.

NOTICE
Restrictions of security For security reasons, Promiscuous mode is disabled by default. If you accept the Promiscuousmode, the real Ethernet adapter even receives telegrams that are not addressed to it.

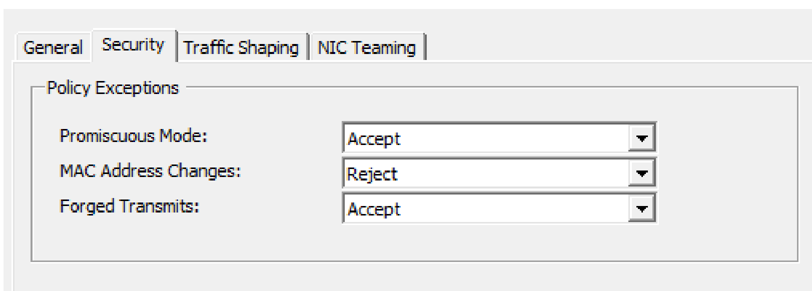

Figure 8-1 Policy exceptions for VMware vSphere Hypervisor (ESXi)

8.12 Error with overflow of cyclical events and motion OBs

If your simulation contains cyclic interrupts, the queue of PLCSIM Advanced may overflow for cyclic events and for motion OBs. Due to the execution speed of PLCSIM Advanced compared to real hardware, the time required to create the diagnostics buffer entry may be longer than the time until the next cyclic interrupt.

In this case, an additional entry is placed in the queue, causing another overflow. In the event of an overflow, PLCSIM Advanced provides visual information in the form of diagnostics buffer messages and a red error icon in the project tree.

See also

Speed up and slow down simulation (Page 75)

8.13 Deviating I/O values in the STEP 7 user program

Updated values

Each value change made by a STEP 7 user program in the I/O address areas is overwritten in the cycle control point with the updated value that was written via the API functions `Write...()`. The API functions `Read...()` only return this updated value and not the value from STEP 7 **for the input range**.

Non-updated values

If the value was not updated via the API functions `Write...()`, the API functions `Read...()` return the value from STEP 7 **for the output range**.

See also

Simulate peripheral I/O (Page 68)

8.14 Multiple simulations and possible collision of IP addresses

You can simultaneously simulate multiple CPUs, but each simulated CPU interface requires a unique IP address.

Make sure your CPUs have different IP addresses before starting the simulation.

8.15 Lacking access to an IP address

Special feature of distributed communication

If you use multiple network nodes on the same subnet through different virtual or real adapters, the operating system may search for the node on the wrong adapter.

Remedy

Repeat your requests or enter "arp -d <IP address>" in the command line editor of Windows.

8.16 Simulation in standby mode

If your computer or programming device goes into standby or hibernation mode, the simulation may be stopped. In this case, the communication between STEP 7 and PLCSIM Advanced is stopped. When your computer or programming device starts up again, the communication may need to be reestablished. In some cases, it may also be necessary to open the simulation project again.

To prevent this situation, disable the standby mode on your computer or programming device.

8.17 Error installing the antivirus software from Kaspersky

When using the Anti-Virus virus scanner from Kaspersky, the network settings may not be set correctly during the installation of PLCSIM Advanced. The result is that communication via TCP/IP cannot be used (error code -50 in the Control Panel).

Remedy

Check your network settings as described in the sectionEnable distributed communication (Page 56).

List of abbreviations A

Abbreviation	Term
ALM	Automation License Manager Tool for managing license keys in STEP 7
API	Application Programming Interface user interface
arp	Address resolution protocol

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides an overview of the diagnostics options for the automation system SIMATIC S7-1500, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL.

The documentation covers the following:

- Illustration of the uniformity and consistency of system diagnostics
- Overview of the options for establishing system diagnostics information

Basic knowledge required

The following knowledge is required in order to understand the function manual:

- General knowledge in the field of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge of working with STEP 7 and WinCC
- Knowledge about the use of Microsoft Windows operating systems

Scope of the documentation

This documentation is the basic documentation for all products of the S7-1500, ET 200MP, ET 200SP and ET 200AL systems, as well as for CPU 1516pro-2 PN. The product documentation is based on this documentation.

What's new compared to the previous version of the function manual (09/2016 edition)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Description of the diagnostics of the S7-1500R/H redundant system	You obtain information in compact form on the special features of the diagnostics in the S7-1500R/H redundant systems.	Section Diagnostics of the S7-1500R/H redundant system (Page 100)
Changed contents	Scope of the function manual expanded to include the S7-1500R/H redundant system	Functions with which you are familiar from the SIMATIC S7-1500 automation system are implemented for the S7-1500R/H redundant system.	Redundant System S7-1500R/H System Manual (https://support.industry.siemens.com/cs/ww/en/view/109754833)

What's new compared to the previous version of the function manual (06/2014 edition)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Extended functionality of the Web server	• You obtain information about: – Know-how protection or copy protection of the PLC program – Program/communication load and cycle time – F-collective signatures, cycle times and runtimes of the F-runtime group(s) (with an F-CPU) • You can monitor statuses, errors, technology alarms and the current values of technology objects (TOs) with the Web server. • You can read, view and save trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance without STEP 7. • You can set four additional languages for the Web interface.	Section Diagnostics information using the web server (Page 51), Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual, Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/ww/en/view/64897128) function manual
	Assignment of different project languages extended	You can assign up to three different project languages for comments and alarm texts to the user interface languages of display devices.	Section Editing alarms in the alarm editor (Page 81)
Changed contents	Scope of the function manual expanded to include CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)
	Security events added	You know which types of events are registered as security events in the diagnostics buffer and can configure group alarms for them.	Section CPU diagnostics buffer (Page 45)
	Influence of the value status explained	You know which factors influence the bit in the value status and can take this into account during configuration.	Section System diagnostics using process image inputs (Page 76)
	Note added on the maximum configuration limits of program alarms.		Section Creating alarms with the "Program_Alarm" instruction (Page 80).

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

This document contains illustrations of the described devices. The illustrations may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (https://support.industry.siemens.com).

Industry Mall

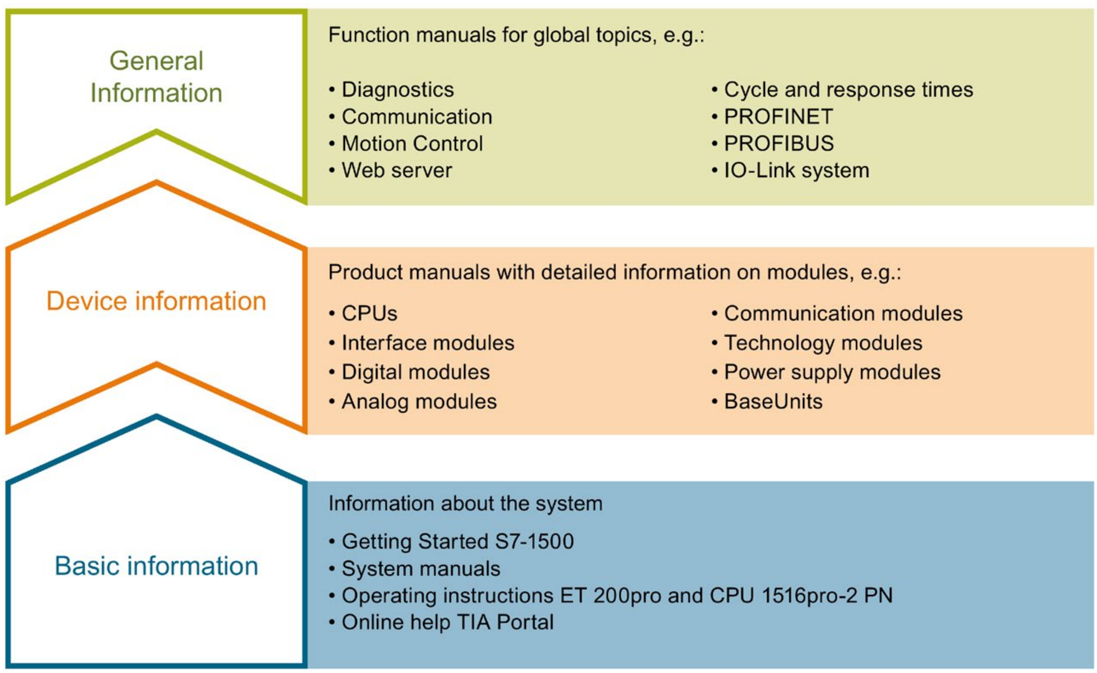
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742705).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Overview of system diagnostics

2.1 Properties of system diagnostics

Introduction

In the SIMATIC environment, the term "system diagnostics" refers to diagnostics of devices and modules.

All SIMATIC products have integrated diagnostic functions that you can use to detect and remedy faults. The components automatically flag a potential fault in the operation and provide detailed information. You can minimize unscheduled standstill times with plant-wide diagnostics.

The SIMATIC automation system monitors the following states in the running plant:

- Device failure/recovery
- Insert/remove event
- Module fault
- I/O access error
- Channel fault
- Parameter assignment error
- Failure of the external auxiliary voltage

Properties of SIMATIC system diagnostics

- Integrated as standard in the hardware
- System-wide across bus limits
- Automatic localization of the error source
- Automatic output of the cause of the error in plain text
- Plant-wide diagnostics of all components
- Archiving and logging of alarms
- Configurability of alarms

Consistent diagnostics from the field level all the way to the management level

The various diagnostics media give you a uniform view of maintenance-related information of every automation component in the plant: System status (module and network status, alarms for system errors) are available plant-wide in a uniform display.

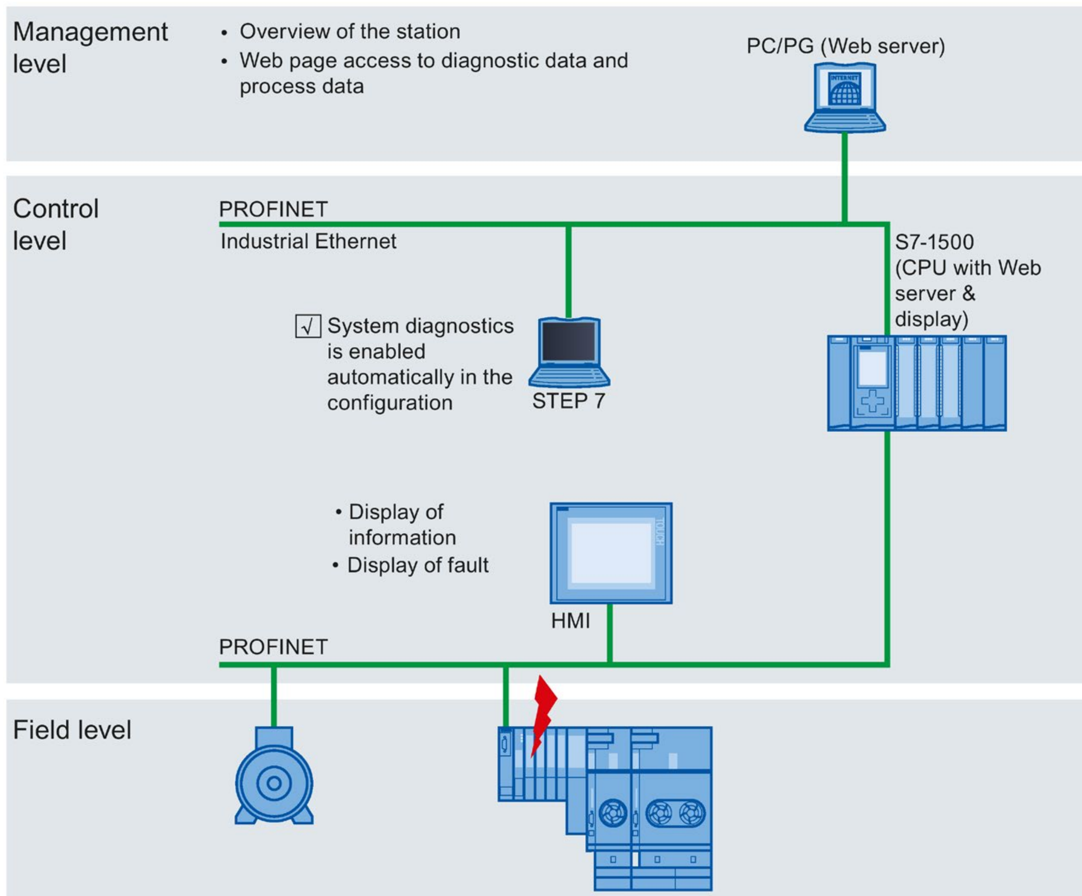


Figure 2-1 Overview of system diagnostics in a plant

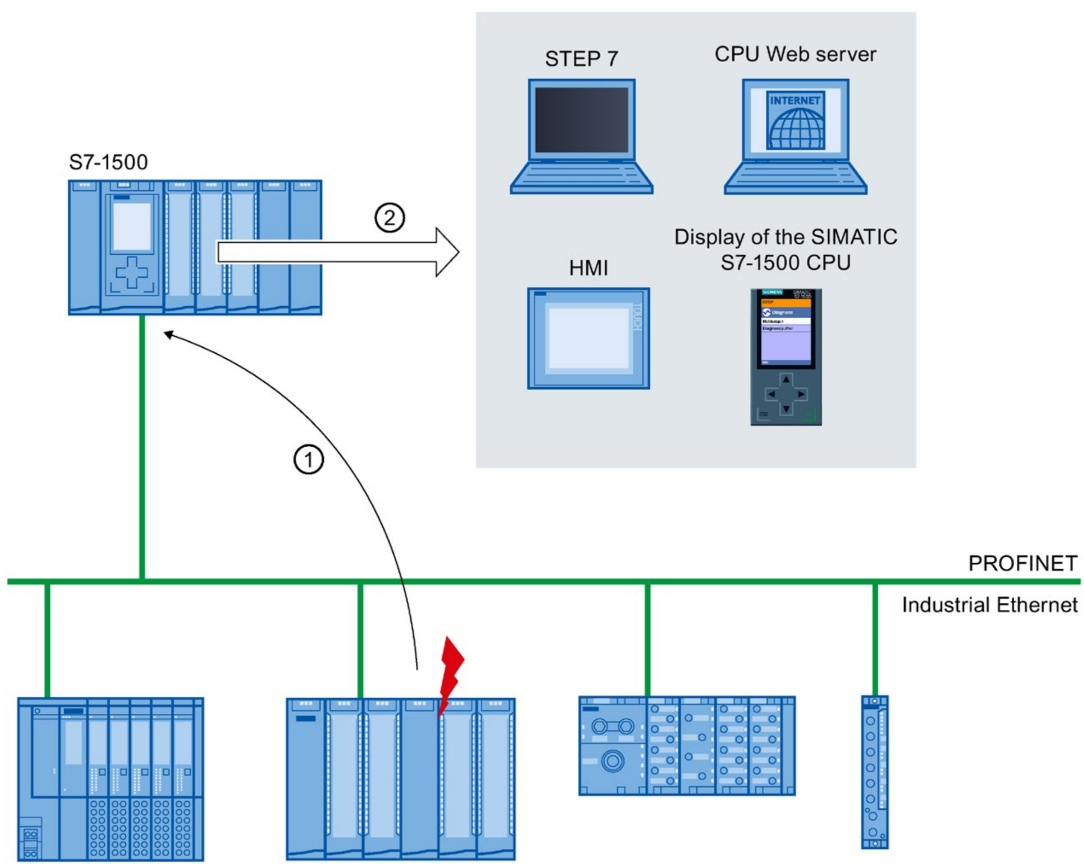
2.2 Benefits of innovative system diagnostics

System diagnostics is also possible in STOP

The system diagnostics is integrated in the firmware of the CPU and works independently of the cyclic user program. This means it is also available in the STOP CPU operating mode. Faults are detected immediately and signaled to the higher-level HMI devices, the Web server and the display of the SIMATIC S7-1500 CPU, even in STOP mode. This makes system diagnostics consistent with the actual plant state at all times.

Uniform display concept

All clients of a system are provided with diagnostics information by a uniform mechanism. The same system diagnostics information is used regardless of the display medium.



Step	Description
①	The device detects an error and sends diagnostics data to the assigned CPU.
②	The CPU informs the connected display media. The display of the system diagnostics is updated.

Figure 2-2 Sequence of the system diagnostics

3 Quick start

Introduction

The following chapters of this documentation describe the different options for establishing system diagnostics. All described options can be used independently of one another.

This chapter gives you an overview of the basic procedure to get initial diagnostics information fast.

Note

System diagnostics is generally available for the devices of the SIMATIC series.

3.1 Using the display of the CPU

The display of the SIMATIC S7-1500 CPU offers a fast and direct option to get diagnostics information. You can call up status information in different menus on the display.

Requirements

- A project has been created.
- The project has been downloaded to the CPU.

Determining diagnostics information using the display of the SIMATIC S7-1500 CPU

To determine diagnostics information using the display, follow these steps:

1. Select the "Diagnostics" menu on the display.
2. Select the "Diagnostics buffer" command from the "Diagnostics" menu.

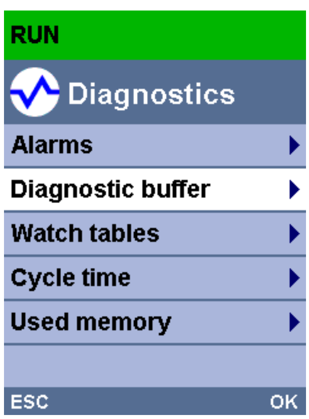


Figure 3-1 Display of SIMATIC S7-1500 CPU

Result

The diagnostics events are displayed in the diagnostics buffer in the sequence in which they occur.

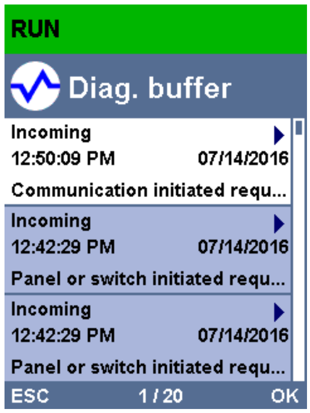

Figure 3-2 Display of the diagnostics buffer in the display of the SIMATIC S7-1500 CPU

Note

Automatic updating of diagnostics information

You set automatic updating of the diagnostics information under: "Display" > "DiagnosticRefresh".

Additional information

You can find information about the configuration of alarms in the section Configuring alarms for system diagnostics (Page 26).

3.2 Using STEP 7

Getting started with STEP 7 gives you fast access to detailed diagnostics information.

Requirements

- A project has been created.
- The project has been downloaded to the CPU.
- An error has occurred.
- The programming device must be able to establish a connection to the CPU via an interface.

Determining diagnostics information using STEP 7

To determine diagnostics information using STEP 7, follow these steps:

1. Open the respective project in STEP 7.
2. Open the portal view of STEP 7.
3. Select the "Online & Diagnostics" portal.
4. Select the "Online status" action.

   The "Select device" dialog opens. The dialog is an image of the configured devices in the project.

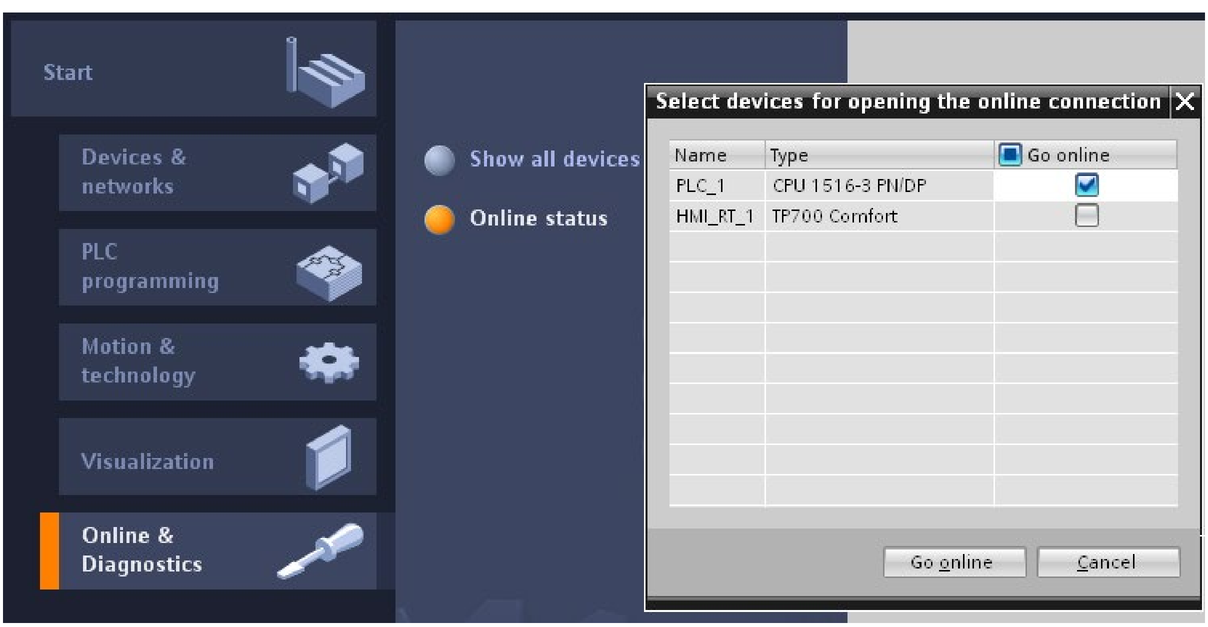

Figure 3-3 Device selection for online connection in the portal view

5. Activate the "Go online" option button for the device that you want to use to establish an online connection.
6. Click on the "Go online" button.

7. The "Go online" dialog opens.

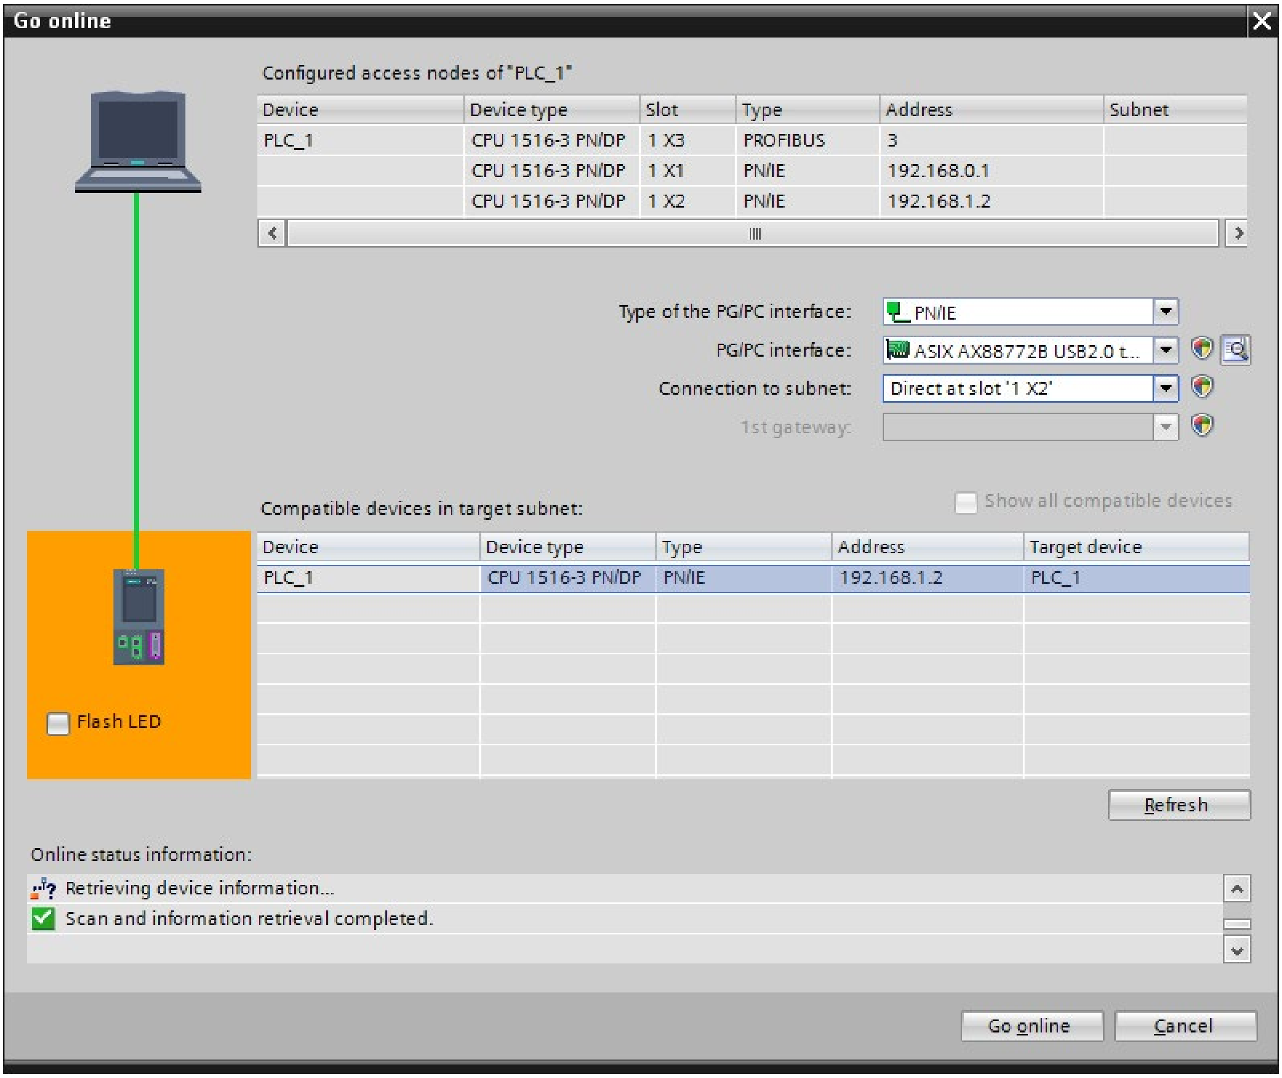

Figure 3-4 Establishing an online connection

8. Make the settings for the interface.

9. Click on the "Go online" button.

   The project view of STEP 7 opens. The network view is opened in the work area.

   The symbols in the project tree provide initial information about the faulty modules.

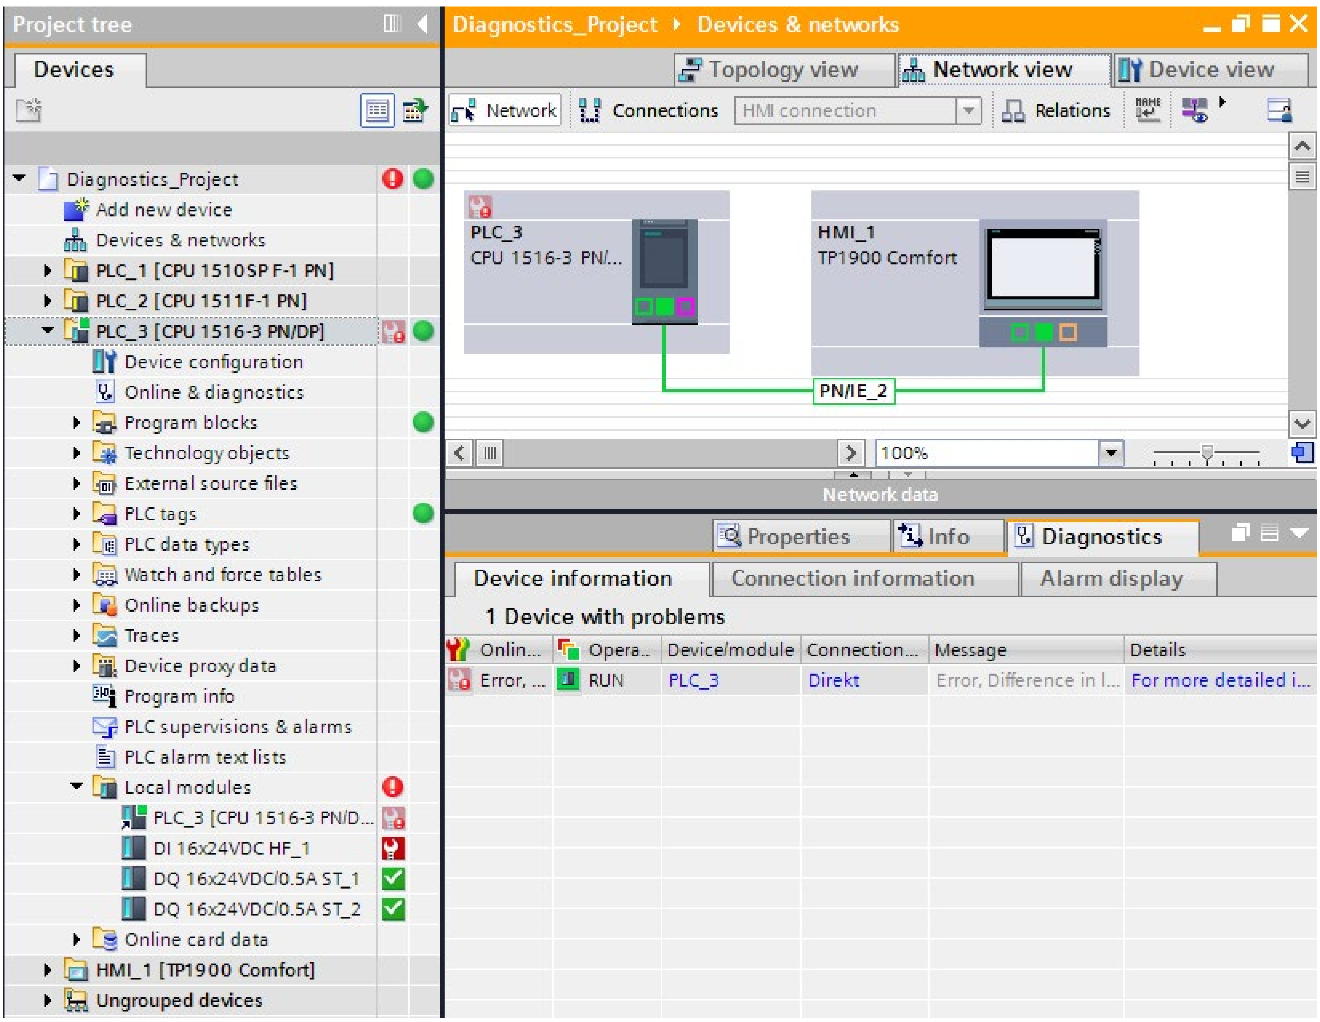

Figure 3-5 Display of the fault in the network view

10. Double-click the device which displays an alarm message to access the faulty module directly. This is the CPU in the example.

    The device view of the CPU is opened in the work area. In this view you can see directly in which module the error has occurred.

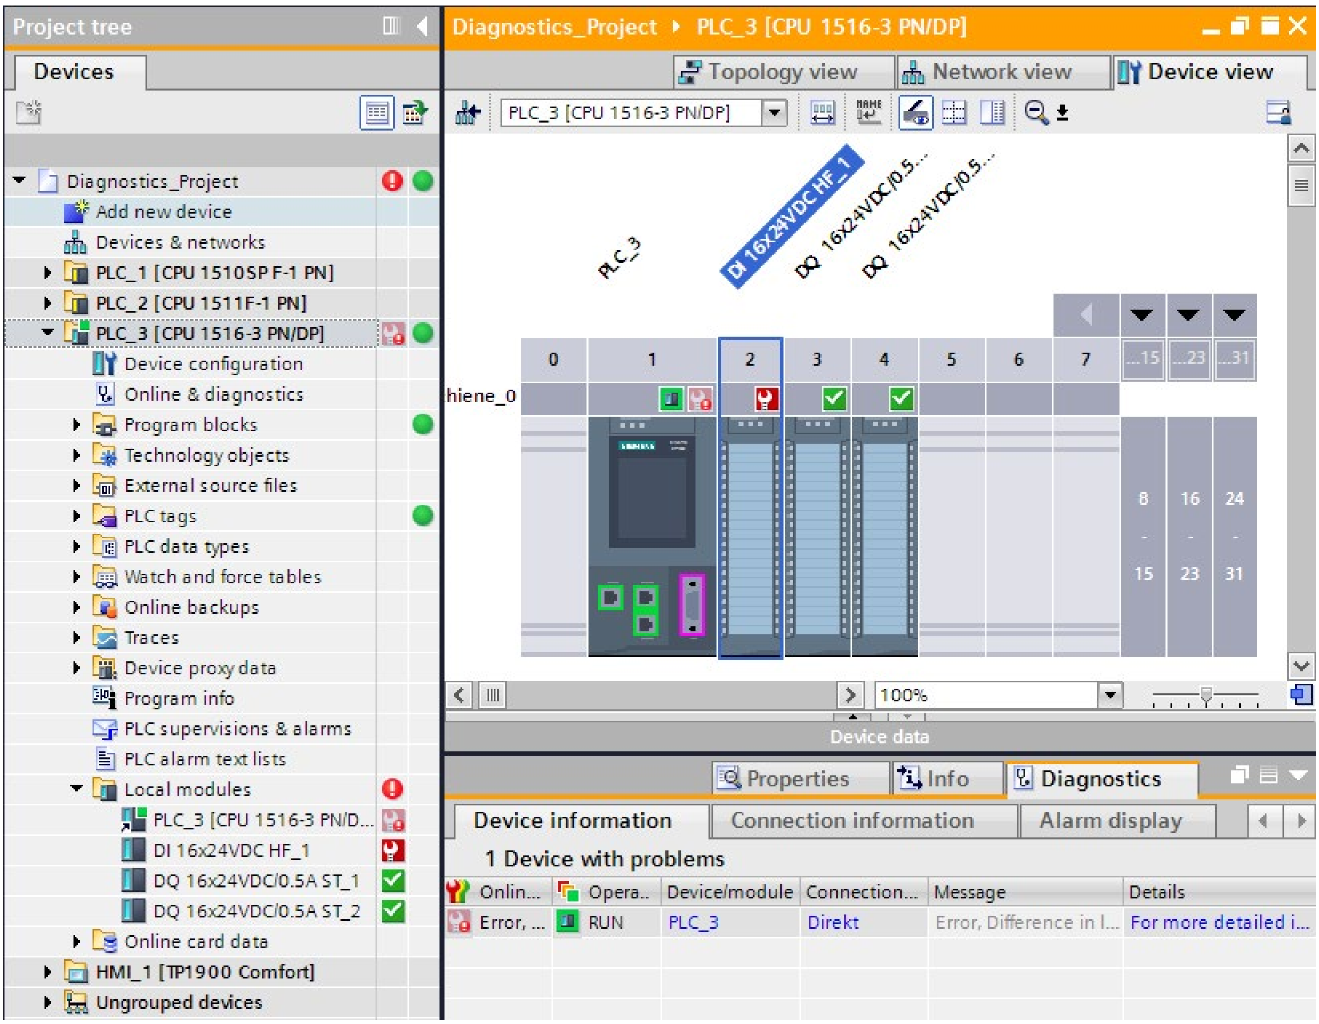

Figure 3-6 Display of the faulty module in the device view

11. Open the "Diagnostics" tab and the subordinate "Device information" tab in the Inspector window for a more detailed error description.

Result

The link in the "Details" table column takes you to the online and diagnostics view of the device and to the diagnostics buffer there, for example. This includes more information on all diagnostics events in the order in which they occurred.

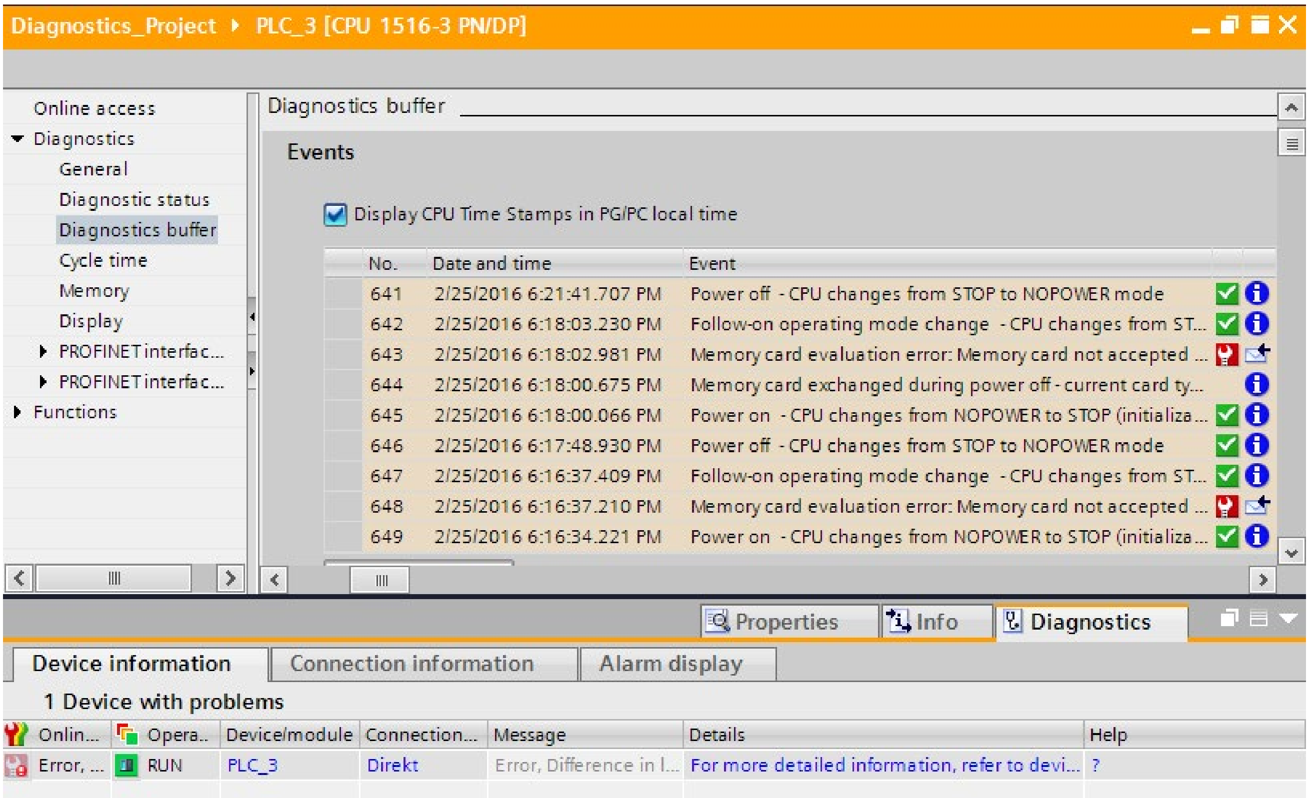

Figure 3-7 Diagnostics buffer with detailed error description

---

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 32) and in the online help for STEP 7.

Setting and determining system diagnostics 4

Introduction

System diagnostics is generally available for the devices of the SIMATIC series.

In the properties of each individual CPU, you can specify if you want to receive alarms for system diagnostics on your display device. Alarms are provided on the display of the SIMATIC S7-1500 CPU, the CPU Web server and the HMI device. Alarms are enabled by default. If you do not want to receive alarms for system diagnostics on your display devices, you can disable the sending of alarms.

4.1 Configuring alarms for system diagnostics

Predefined alarm texts are available for establishing the system diagnostics.

Requirements

- STEP 7 is open.
- A project is open.

Procedure

To make alarm settings for system diagnostics of the project in STEP 7, follow these steps:

1. Open the "Common data" folder in the project tree.
2. Double-click the "System diagnostics settings" entry.

   You now have access to the alarm settings. System diagnostics is enabled by default. System diagnostics cannot be disabled for the use of a CPU from the SIMATIC S7-1500 product series.

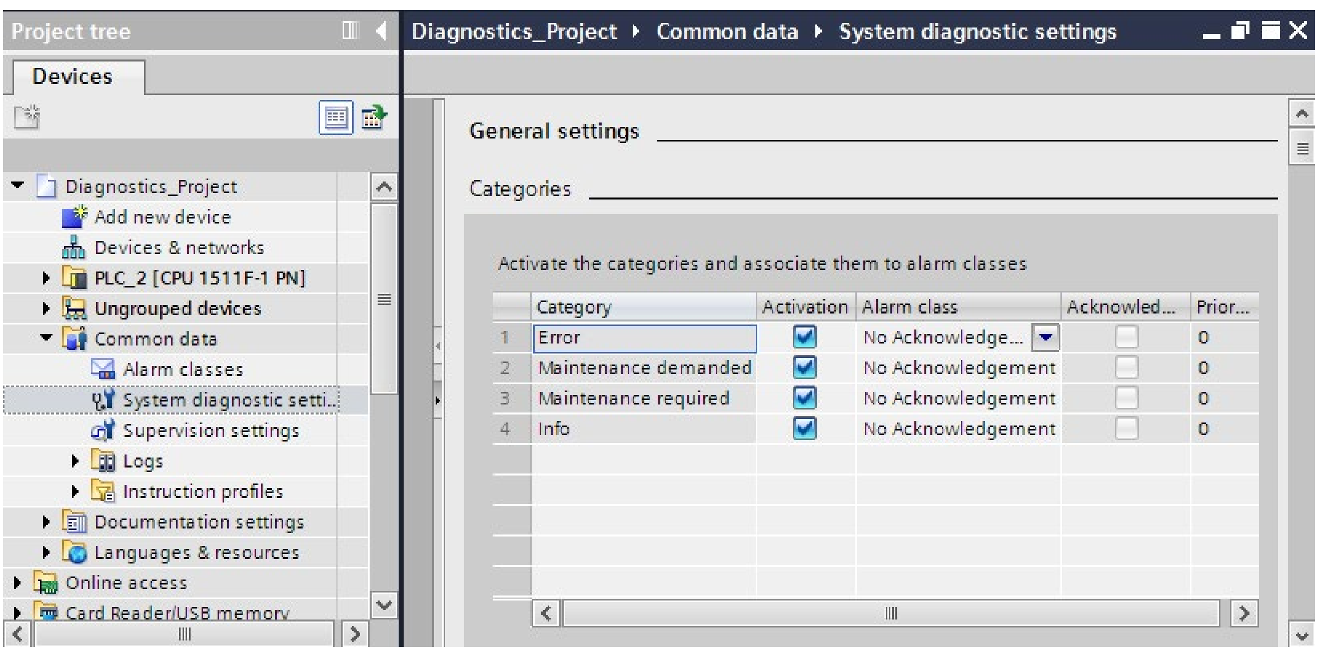

Figure 4-1 Properties of system diagnostics and alarm settings

3. In the settings, specify the alarm category that is to be displayed and if it needs to be acknowledged.

   The check boxes in the "Activation" column are enabled by default. When you disable all check boxes, the status of the HMI system diagnostics view is still updated with the "Info Report" functionality.

Result

You have configured the alarms for system diagnostics of the project in STEP 7.

The settings are saved with the project and become effective after the compiling and downloading of the hardware configuration to the involved components.

Maintenance events (maintenance demanded, maintenance required) are entered in the alarm buffer of the CPU just like any other event.

4.2 Options for displaying system diagnostics

Example

This section includes a diagnostics example to show how system diagnostics is established with the help of different display options. The example includes a CPU from the SIMATIC S7-1500 product series that is connected to an ET 200S distributed I/O system and an HMI Comfort Panel via PROFINET.

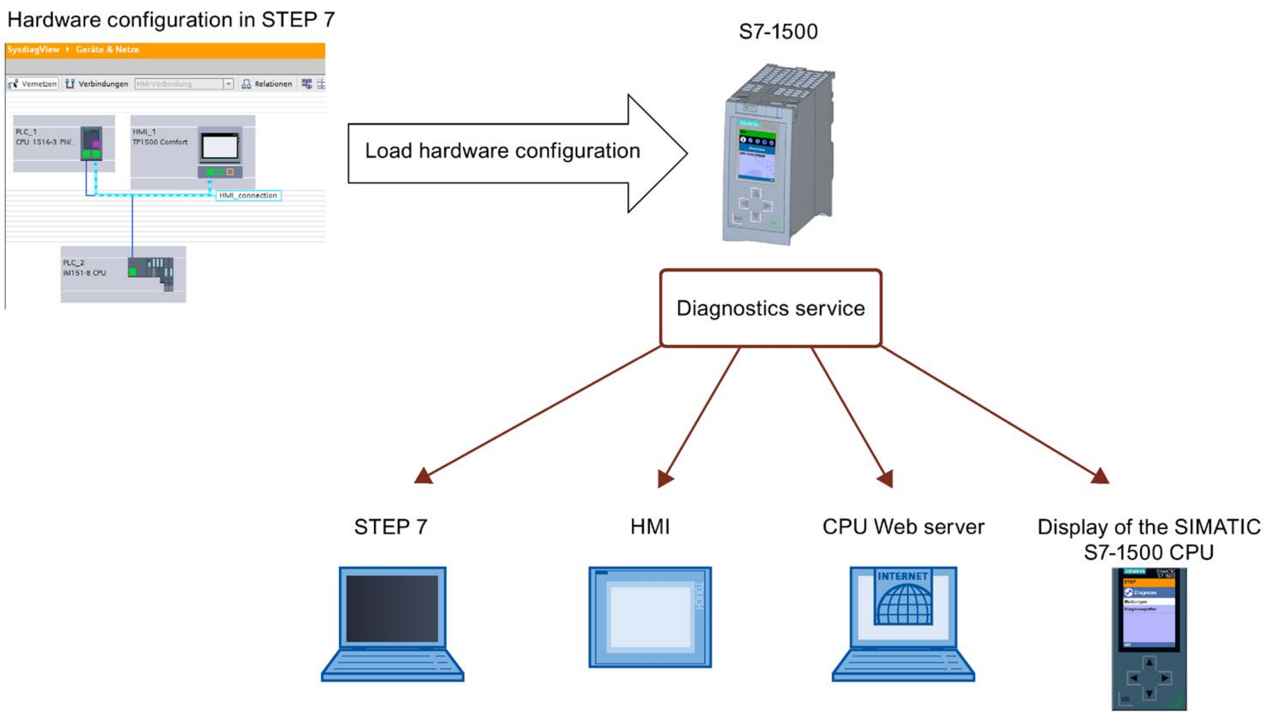

Figure 4-2 System diagnostics display options

The following sections include figures that illustrate how diagnostics information is displayed with the help of different display options.

- Using the LEDs on the hardware (Page 29)
- Local error analysis via the display of the CPU (Page 30)
- Using STEP 7 as of V12 (Page 32)
- Remote diagnostics using the Web server (Page 51)
- Stationary system diagnostics using the HMI diagnostics view (Page 62)

4.2.1 Diagnostics information at the devices

4.2.1.1 LEDs

Overview

All hardware components, such as CPUs, interface modules and modules, provide information about their operating mode as well as internal and external errors through their LEDs. Diagnostics by means of LEDs is an initial tool for error localization.

The graphics below include examples for the arrangement of LEDs on some modules.

Table 4- 1 LED displays on the modules

	CPU 1516-3 PN/DP	IM 155-5 PN ST	DI 32x24VDC HF	PS 25W 24VDC
				①	RUN/STOP LED (two-colored LED: green/yellow)	RUN LED (two-colored LED: green/yellow)	RUN LED (single-colored LED: green)	RUN LED (single-colored LED: green)
②	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)
③	MAINT LED (single-colored LED: yellow)	MAINT LED (single-colored LED: yellow)	without function	MAINT LED (single-colored LED: yellow)
④	X1 P1 (two-colored LED: green/yellow)	X1 P1 (single-colored LED: green)	LED CHx (two-colored LED: green/red)	
⑤	X1 P2 (two-colored LED: green/yellow)	X1 P2 (single-colored LED: green)		
⑥	X2 P1 (two-colored LED: green/yellow)			

Additional information

The meaning of the individual LED displays, their different combinations and the remedial measures resulting from them in case of errors are device-specific. The explanation can be found in the manuals of the modules.

4.2.1.2 Display of the CPU

Introduction

Each CPU in the S7-1500 automation system has a front cover with a display and operating keys. You can display status information in various menus on the display of the CPU. You use the operating keys to navigate through the menus.

Figure 4-3 Display - diagnostics screen

Display options

The display of the SIMATIC S7-1500 CPU shows the following diagnostics information:

- CPU operating state

"Diagnostics" menu

- Error and alarm texts (system diagnostics alarms)
- Information entered in the diagnostics buffer
- Watch tables
- Information on the cycle times of the user program
- Utilization of the CPU memory

"Modules" menu

- Information on modules and the network
- Detailed device view with diagnostics symbols
- Order number, CPU version and central I/O modules
- Module status for central and distributed modules
- Information about the currently installed firmware

Additional information

For additional information on the topic "Functions and operation of the display of the SIMATIC S7-1500 CPU", see the documentation for the S7-1500 automation system (http://support.automation.siemens.com/WW/view/en/59191792).

You can find detailed information on the individual options, a training course and a simulation of the available menu commands of the display for the CPU in the SIMATIC S7-1500 Display Simulator (http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/disp_tool/start_en.html).

4.2.2 Diagnostics information in STEP 7

4.2.2.1 Explanation of diagnostics symbols

Diagnostics symbols for modules and devices

When the online connection to a device is established in STEP 7, the diagnostics status of the device and its lower-level components and, if applicable, the device operating mode are also determined. The following table shows the possible symbols and their meaning.

Table 4- 2 Diagnostics symbols for modules and devices

Symbol	Meaning
	The connection with a CPU is being established.
	The CPU is not reachable at the set address.
	The configured CPU and the CPU actually present are of incompatible types. Example: An existing CPU 315-2 DP is incompatible with a configured CPU 1516-3 PN/DP.
	On establishment of the online connection to a protected CPU, the password dialog was terminated without specification of the correct password.
	No fault
	Maintenance required
	Maintenance demanded
	Error
	The module or device is deactivated.
	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
	Diagnostics data is not available because the current online configuration data differ from the offline configuration data.
	The configured module or device and the module or device actually present are incompatible (valid for modules or devices under a CPU).
	The configured module does not support display of the diagnostics status (valid for modules under a CPU).
	The connection is established, but the module status has not yet been determined or is unknown.
	Hardware error in lower-level component: A hardware fault has occurred in at least one lower-level hardware component (occurs as a separate symbol only in the project tree).

Symbols for the comparison status

The diagnostics symbols can be combined at the bottom right with additional smaller symbols that indicate the result of the online/offline comparison. The following table shows the possible comparison symbols and their meaning.

Table 4- 3 Symbols for the comparison status

Symbol	Meaning
	Hardware error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level hardware component.
	Software error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level software component.
	Online and offline versions of the object are different
	Object only exists online
	Object only exists offline
	Online and offline versions of the object are the same

Operating mode symbols for CPUs and CPs

The following table shows the possible symbols and their respective operating states.

Table 4- 4 Operating mode symbols for CPUs and CPs

Symbol	Operating mode
	RUN
	STOP
	STARTUP
	DEFECTIVE
	Unknown operating mode
	The configured module does not support display of the operating mode.

Event table

The following information is displayed in the table for each diagnostics event:

- Sequential number of the entry

  The first entry contains the latest event.
- Date and time of the diagnostics event

  If no date and time are shown, the module has no integrated clock.
- Short designation of the event and, if applicable, the reaction of the CPU
- Symbol for information on incoming/outgoing status

The following table shows the possible symbols and their meaning.

Table 4- 5 Symbols in the event table

Symbol	Meaning
	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

Additional information

For additional information on the individual symbols, please refer to the online help for STEP 7.

4.2.2.2 Accessible devices (without project)

Accessible devices

Accessible devices are all devices that are connected to a PG/PC either directly by an interface or by means of a subnet and that are switched on. These devices can display diagnostic information even without an offline project.

Requirements

- STEP 7 is open.
- The portal view or project view is open.

Procedure

To display diagnostic information for specific devices even without an offline project, follow these steps:

1. Establish a connection to the respective CPU.
2. Select the command "Accessible devices" from the "Online" menu.

   The "Accessible devices" dialog opens.

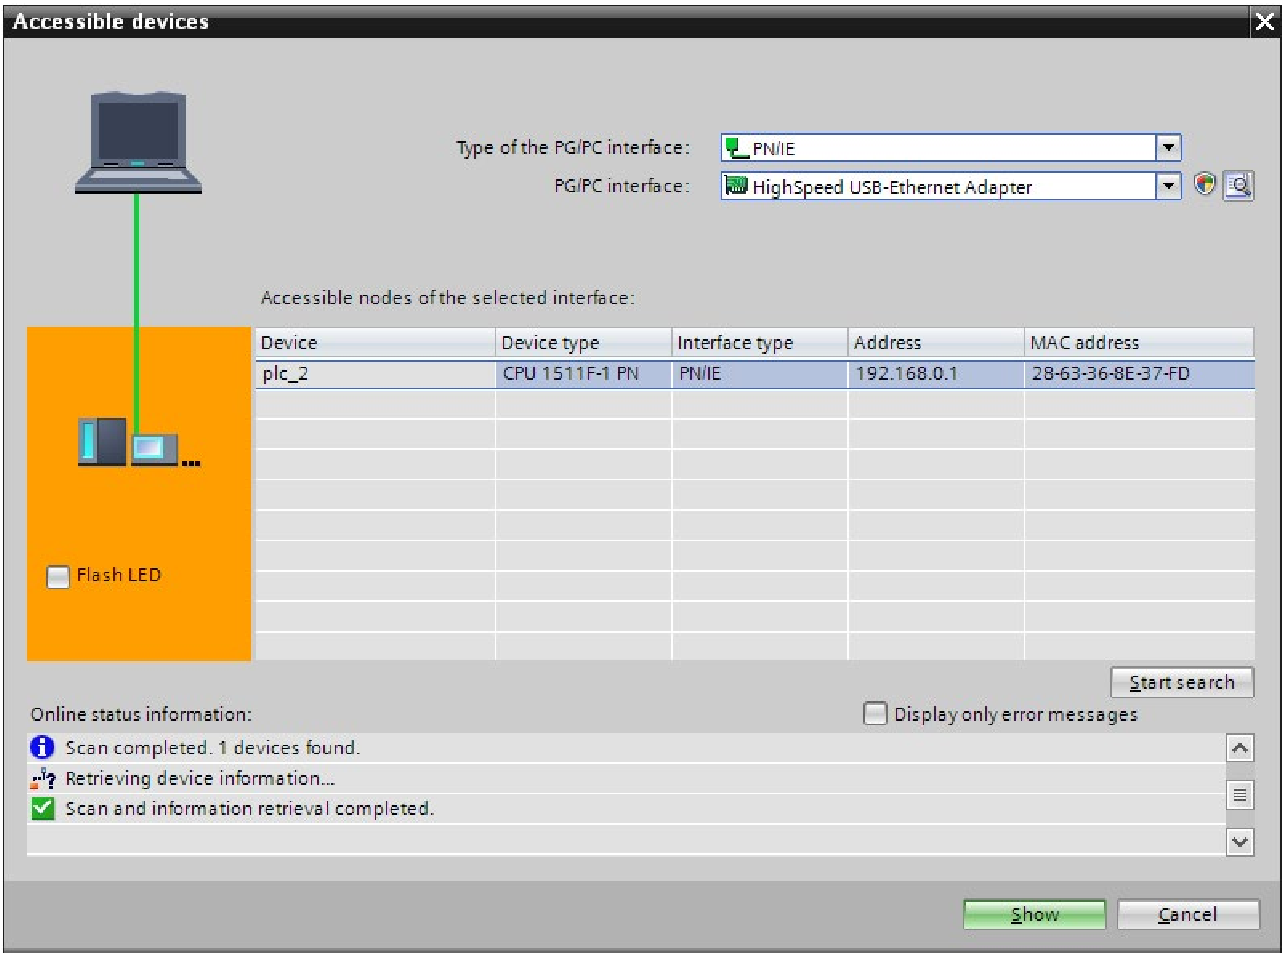

Figure 4-4 "Accessible devices" dialog

3. Make the settings for the interface.
4. Select the respective device under "Accessible nodes of the selected interface".
5. Confirm the dialog with the "Display" button.

Result

The device is displayed in the project tree. You open the diagnostic information in the work area with a double-click on "Online & Diagnostics".

Information is available on the diagnostic status, cycle times, memory usage and the diagnostics buffer.

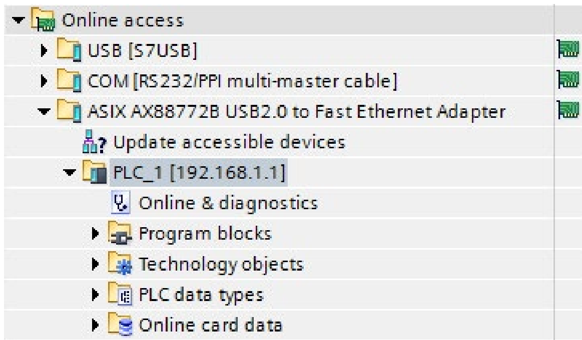

Figure 4-5 Device in the project tree

4.2.2.3 Devices & networks

Devices & networks - Go online

You can get an overview of the current state of your automation system in the device view or network view.

You implement the following tasks in the device view:

- Device configuration and parameter assignment
- Module configuration and parameter assignment

You implement the following tasks in the network view:

- Device configuration and parameter assignment
- Networking devices

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To get an overview of the current state of your automation system, follow these steps:

1. Open the "Network view" in the working area.
2. Select the CPU.
3. Click the "Go online"  button in the toolbar.

   The "Go online" dialog opens.

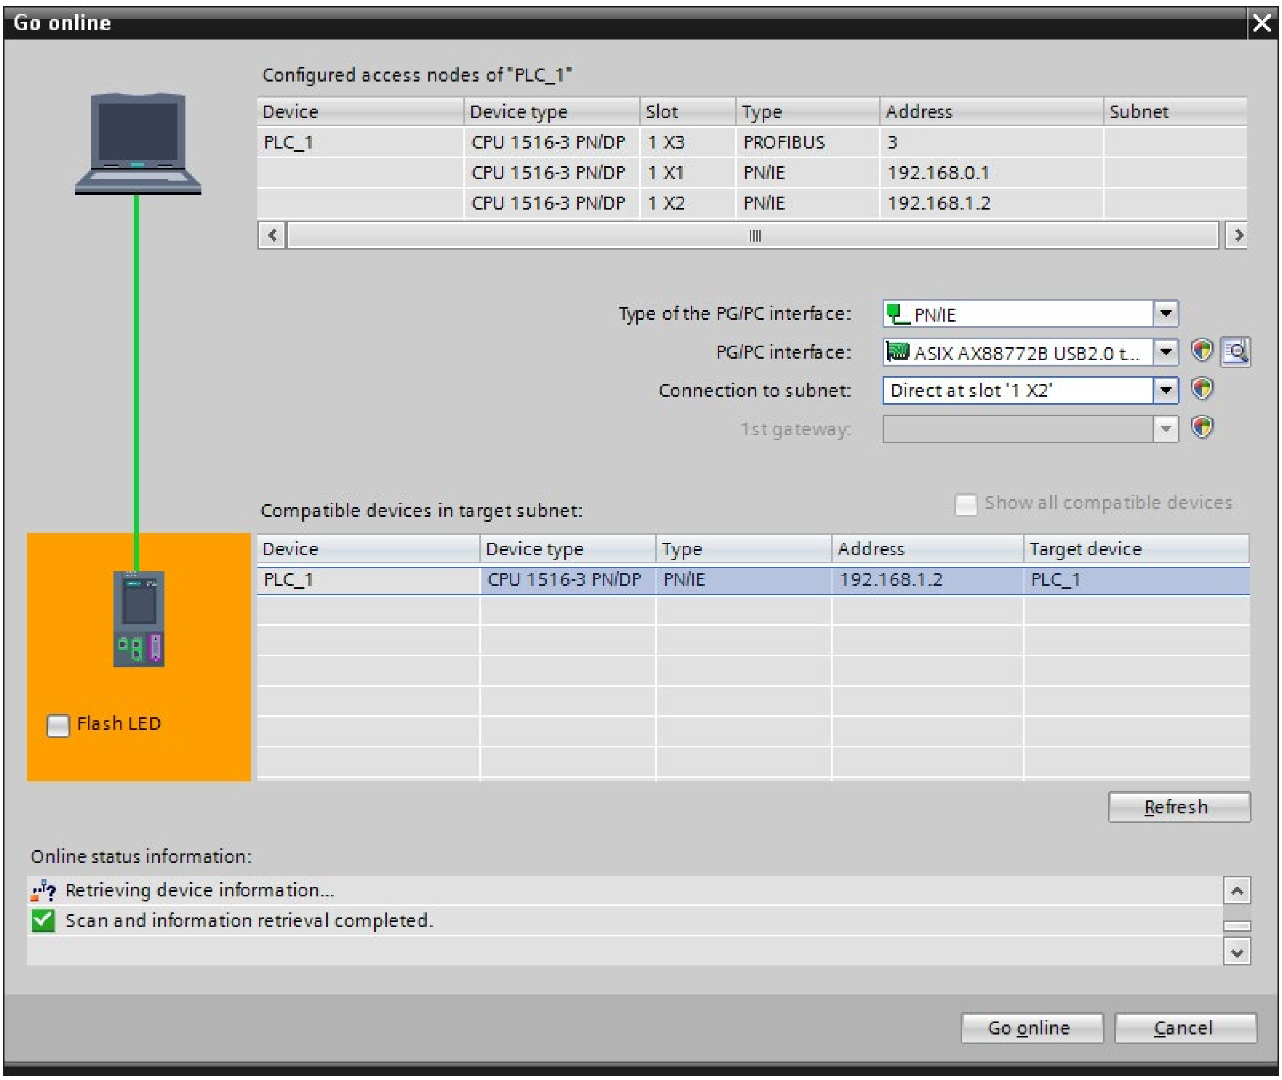

Figure 4-6 Go online

4. Make the settings for the interface.
5. Select the respective device under "Compatible devices in the target subnet".
6. Confirm the dialog with the "Connect" button.

   The online mode is started.

Result

The connected devices are now displayed with diagnostic information in the network view in the working area. Here you get an overview of the current state of your automation device.

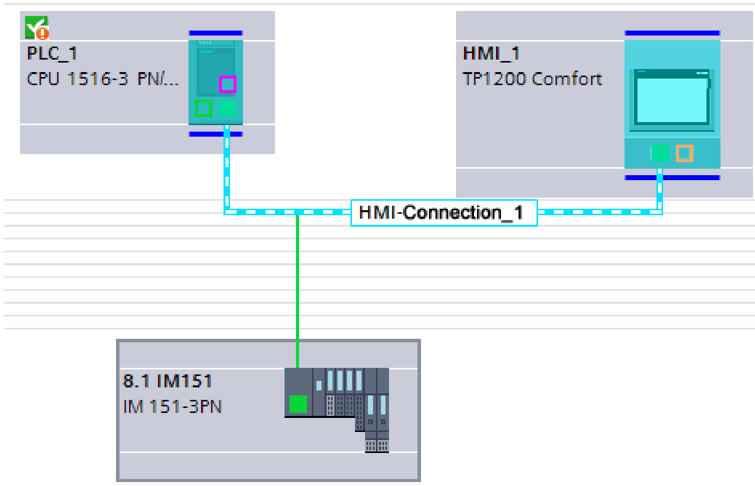

Figure 4-7 CPU with diagnostic information

You get to the "Device view" with a double-click on the device. The diagnostic information for the individual modules is displayed in this view.

Note

Symbols and their meaning

You will find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 32) and in the online help for STEP 7.

4.2.2.4 Online & diagnostics

Online mode

In online mode there is an online connection between your PG/PC and one or several devices. Depending on the properties of a device, you are offered specific diagnostics options and certain functions in online mode.

- Diagnostics
  - General module information
  - Diagnostics status
  - Cycle time
  - Memory
  - Diagnostics buffer
  - Display
  - Interface information (e.g. IP parameter, port information)
- Functions
  - Assign IP address
  - Set time and date of the CPU
  - Firmware update (e.g. for PLC, display)
  - Assign device name
  - Reset to factory settings
  - Format memory card
  - Save service data

To establish an online connection at least one PG/PC interface must be installed that is physically connected with a device, for example, with an Ethernet cable. The current online status of a device is indicated by a symbol to the right of the device in the project tree.

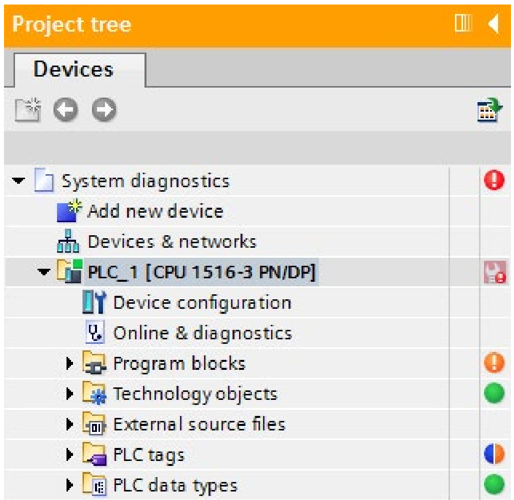

Figure 4-8 Partial view of network view

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To display an overview of the faulty devices, follow these steps:

1. Select the affected device folder in the project tree.
2. Select the shortcut menu command "Online & Diagnostics".

   The online and diagnostics view of the module to be diagnosed is started.

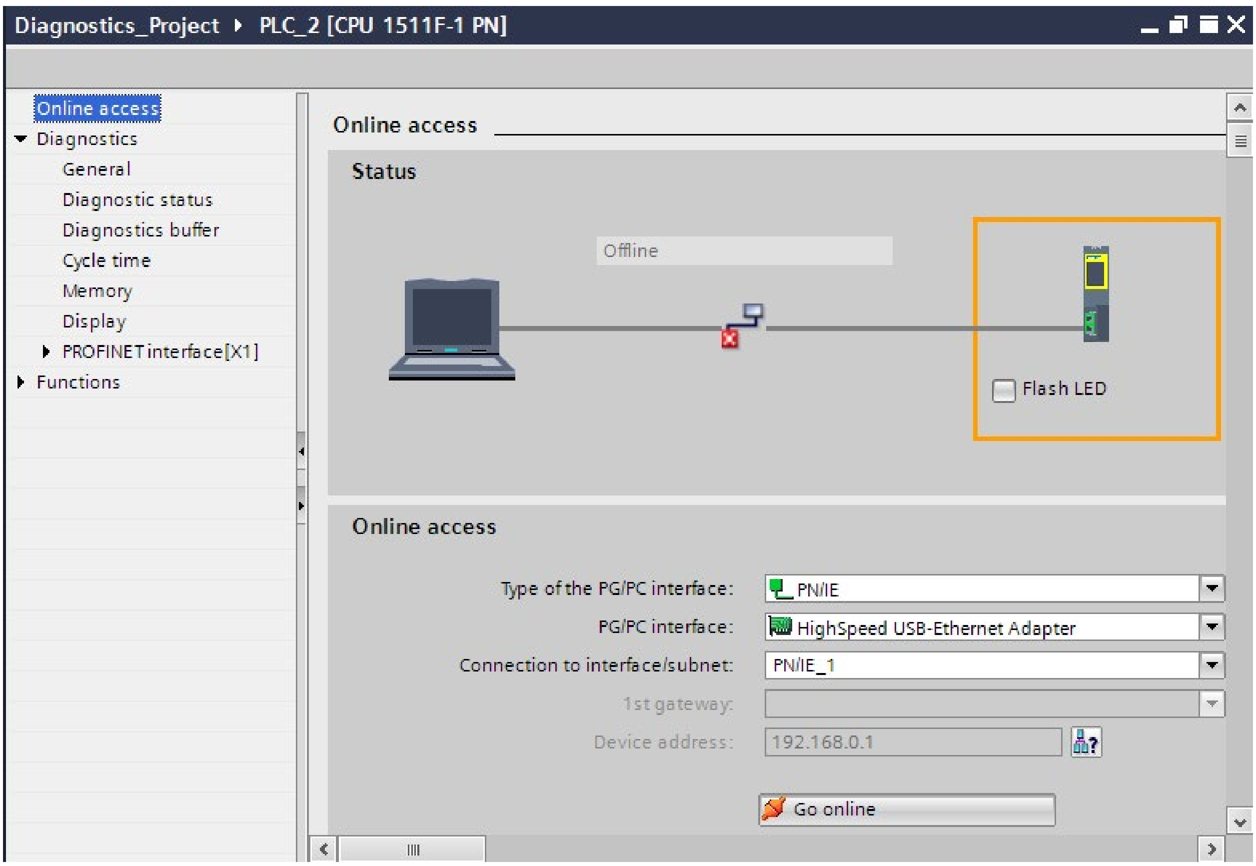

Figure 4-9 Setting online access

3. Make the settings for the interface.

   Here you can change an interface access that has already been set for an online connection that was successfully established previously.
4. Click on the "Go online" button.

   The online connection is established.

Result

You can find detailed diagnostics information on each device in the Inspector window, in the "Diagnostics" section of the area navigation on the "Properties" tab.

4.2.2.5 "Diagnostics" tab in the Inspector window

"Diagnostics" tab in the Inspector window

The "Diagnostics" tab of the Inspector window includes information on diagnostics events and configured alarm events.

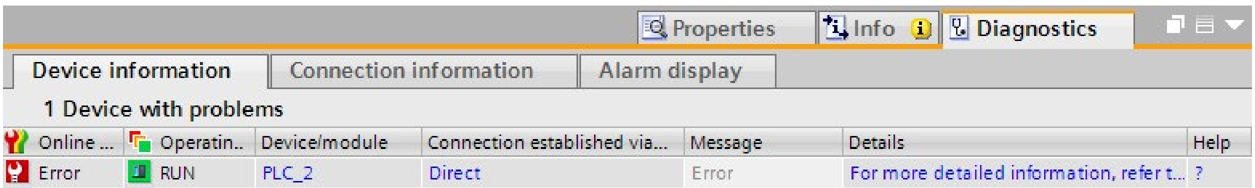

Figure 4-10 Diagnostics in the Inspector window, "Device information" tab

---

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 32) and in the online help for STEP 7.

Subordinate "Device information" tab

This tab gives you an overview of faulty devices to which an online connection exists or has existed. The table provides the following diagnostics information on the faulty devices:

- Online status: Includes the online status as diagnostics symbol and in words
- Operating mode: Includes the operating mode as symbol and in words
- Device/module: Name of the affected device or the affected module
- Connection established via ...: Specifies the path used to establish the connection to the failed device.
- Alarm: This explains the entry in the previous columns and displays an alarm, if necessary
- Details: The link opens the online and diagnostics view associated with the device or puts it in the foreground.
  If the device cannot be reached, the link opens the "Go online" dialog.
- Help: The link provides additional information on the fault.

Note

Communication and access errors

Errors that occur in the user program (e.g., communication errors, access errors) are not reported in the "Diagnostics" tab of the device information. You must read out the diagnostics buffer of the CPU in the online and diagnostics view to get this information. The link in the "Details" column opens the diagnostics buffer.

Subordinate "Connection information" tab

The "Connection information" tab displays detailed diagnostics information for connections.

There will only be information on the "Connection information" tab if there is an active online connection to at least one end point of the relevant connection.

If a connection has been selected (connection table), the tab contains the following groups:

- Connection details
- Address details of the connection

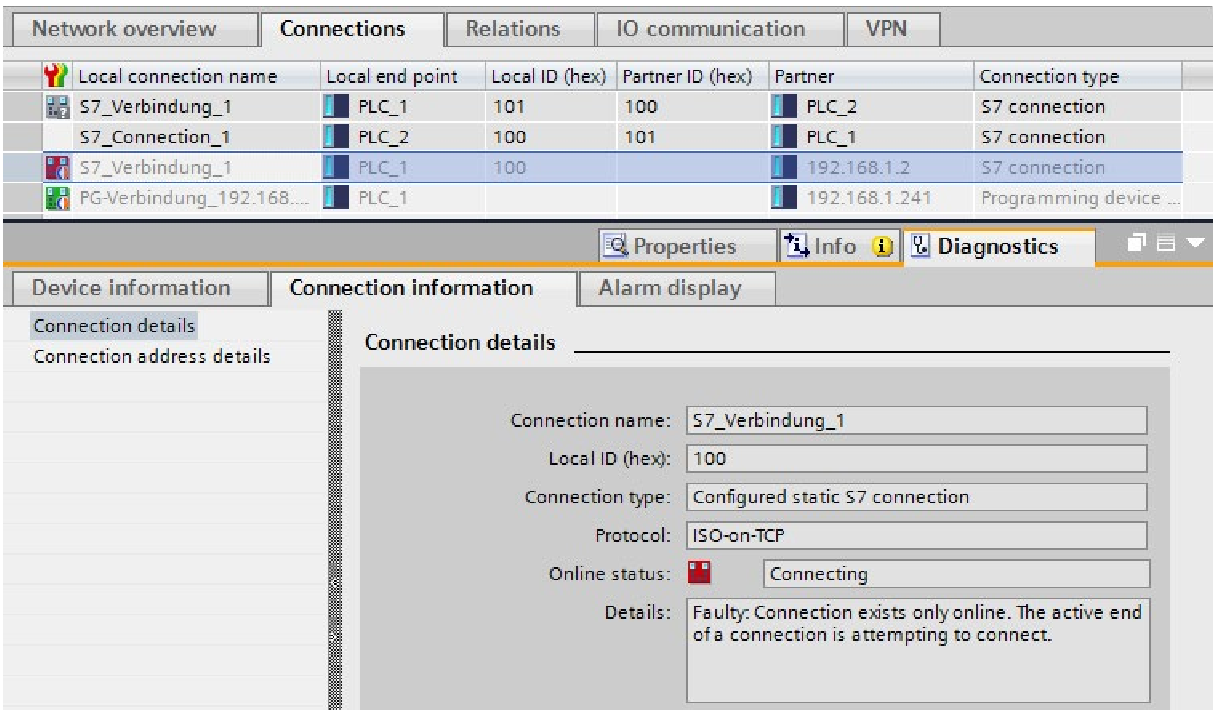

Figure 4-11 "Connection information" tab and open connection overview

If a module has been selected (network view), the tab contains the following group:

- Connection resources

Subordinate "Alarm display" tab

System diagnostics alarms are output in the "Alarm display" tab.

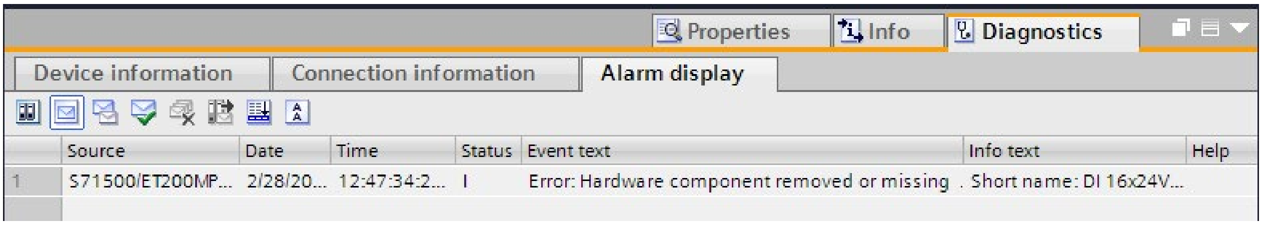

Figure 4-12 "Alarm display" tab

To receive alarms in STEP 7, follow these steps:

1. Open the project view.
2. Select the required CPU in the project tree.
3. To connect online with the respective CPU, select the shortcut menu command "Go online".
4. Select the required CPU once again in the project tree and select the shortcut menu command "Receive alarms".

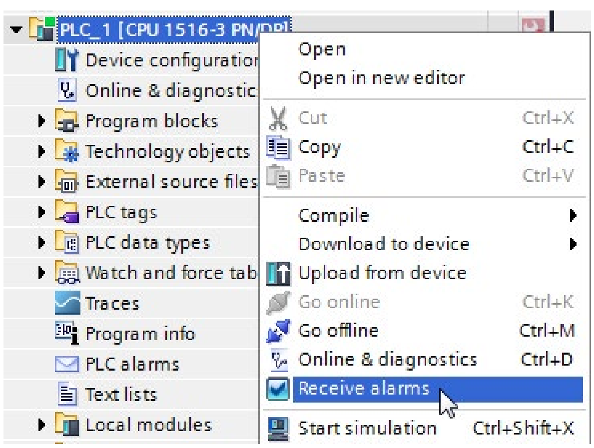

Figure 4-13 Receive alarms

5. Alarms are now displayed in the alarm display. "Archive view" is enabled by default.
6. To display the latest alarms, click the "Active alarms" icon.

4.2.2.6 CPU diagnostics buffer

Definition

Each CPU and some other modules have their own diagnostics buffer, in which detailed information on all diagnostic events is entered in the order in which they occurred.

The CPU diagnostics buffer can be displayed on all display media (STEP 7, SIMATIC HMI devices, SIMATIC S7-1500 Web server and display of the CPU).

Diagnostic events

The entries available in the diagnostics buffer include:

- Internal and external errors on a module
- System errors in the CPU
- Operating mode transitions (e.g., from RUN to STOP)
- Errors in the user program
- Removal/insertion of modules
- Security events

The contents of the diagnostics buffer are stored in the retentive memory in case of a memory reset of the CPU. Errors or events can be evaluated even after a longer period of time thanks to the diagnostics buffer to determine the cause of a STOP or to trace the occurrence of a single diagnostic event and to be able to assign it.

Procedure

To display the diagnostics buffer of a CPU in STEP 7, follow these steps:

1. Select the respective CPU.
2. Select the shortcut menu command "Online & Diagnostics".

   The "Online access" view is opened in the work area.

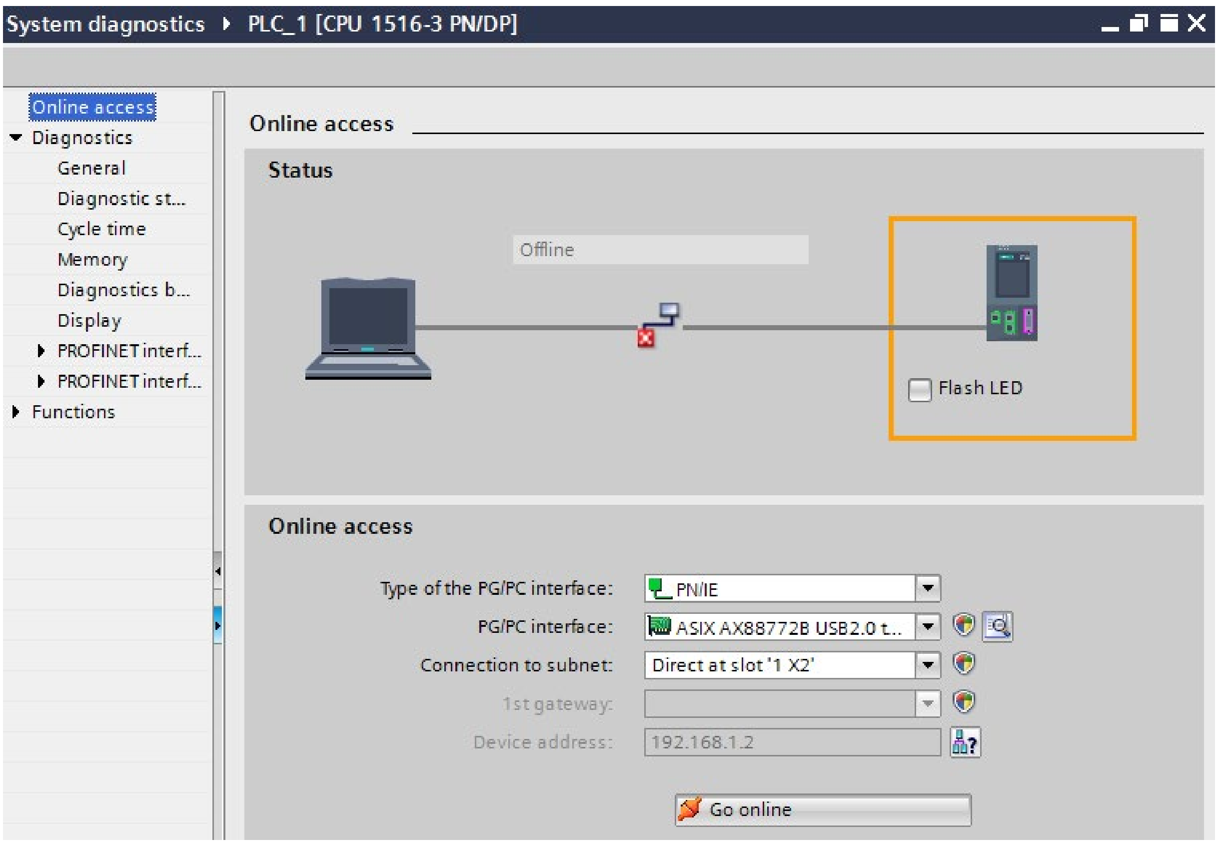

Figure 4-14 Setting up online access

3. Set the interface.

4. Click Go online.
5. Select the area "Diagnostics buffer".

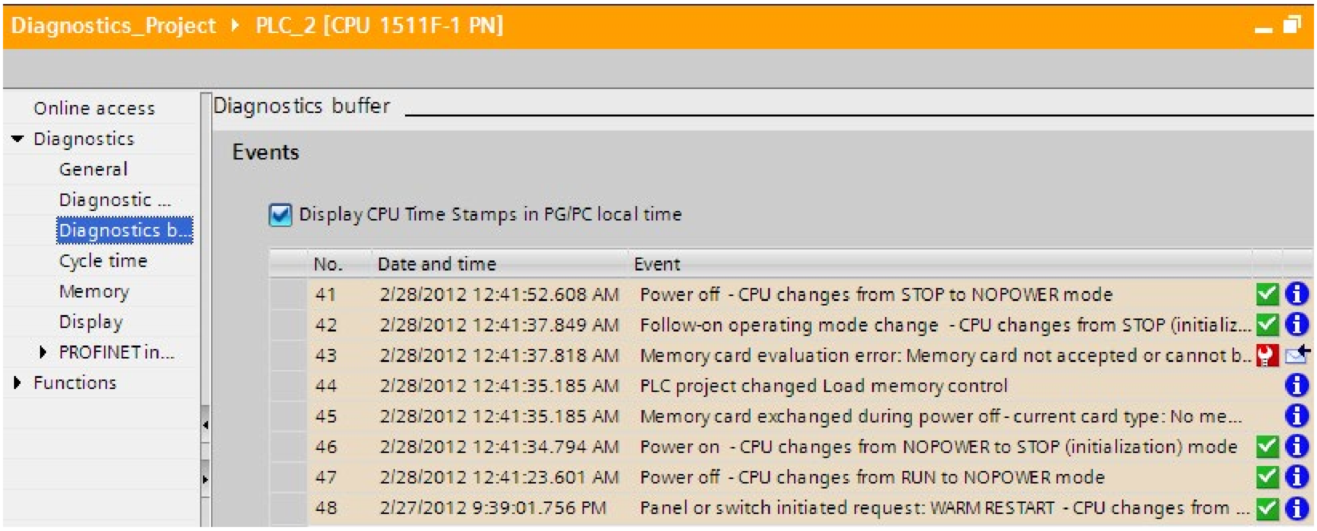

Figure 4-15 Diagnostics buffer in STEP 7

Note

Filtering events

You can filter the entries in the diagnostics buffer in the settings of the "Diagnostics buffer" area to only display specific types of events. This means that specific events, such as "CPU and configuration-internal events" or "Connection diagnostics events", can be displayed separately.

Security events

The following security events (event types) result in an entry in the diagnostics buffer.

- Going online with the correct or incorrect password
- Manipulated communications data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (by instruction or CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive
- Logging on to the Web server with the correct or incorrect password
- Creating a backup of the CPU
- Restoring the CPU configuration (Restore)

To prevent the diagnostics buffer being "swamped" by large numbers of identical security events, you can set parameters so that these events are entered in the diagnostics buffer as a group alarm. For every interval (monitoring time), the CPU then only generates one group alarm per event type.

Configuring a group alarm for security events

To configure group alarms for security events, follow these steps:

1. Click on the CPU icon in the network view.

   The properties of the CPU are displayed in the Inspector window.
2. Navigate to the "Protection" > "Security event" area.
3. Click "Security event".
4. Select the option "Summarize security events in case of high message volume" to enable group alarms for security events.
5. Set the duration of an interval (monitoring period); the default is 20 seconds.

4.2.2.7 "Online tools" task card

Online view in the "Online tools" task card

The following requirements must be met to display the online view of the "Online tools" task card in STEP 7:

- An online connection to the CPU is available.
- You have selected the CPU in the topology view, network view or device view.

The "Online tools" task card provides an overview of the CPU state, the cycle time and the memory usage.

- The "CPU operator panel" pane displays the current state of some LEDs and the mode selector of a CPU.
- The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.
- The "Memory" pane contains the current memory usage of the associated CPU. The free memory is shown both as a bar graph and as a numerical value (percentage).
  The display for "Load memory" contains, in addition to the online project data (program code, data blocks, hardware configuration etc.), all other data that may be on the SIMATIC memory card, such as recipes, data logs, HMI backups or non-SIMATIC files that have been copied to the memory card via the Web server of the CPU or offline in Explorer (for example, PDF files).

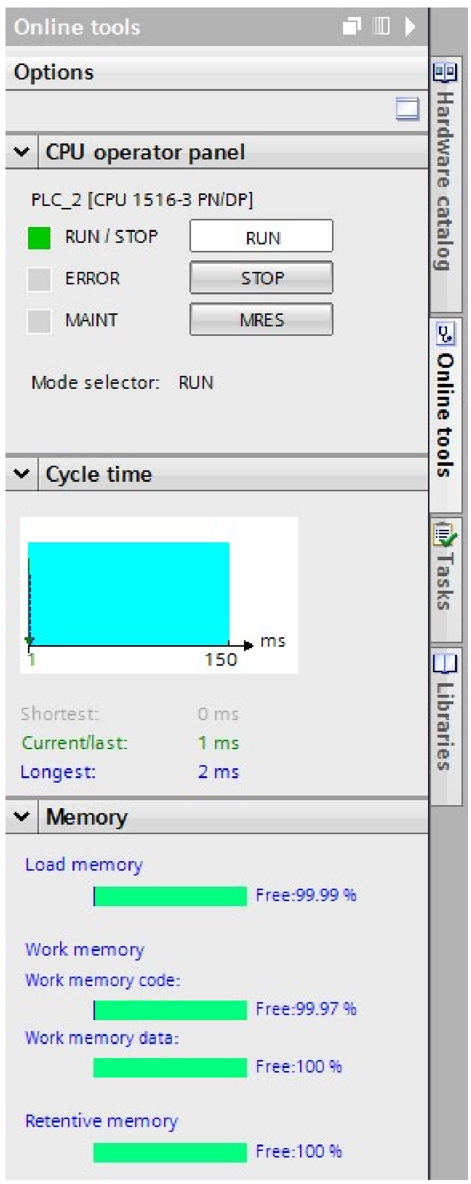

Figure 4-16 "Online tools" task card

4.2.2.8 Configuring the settings for I/O modules in STEP 7

You can also make settings for system diagnostics in STEP 7 for I/O modules. The parameters you have to configure depend on the I/O module.

The settings are optional.

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.
- A design with I/O modules has been configured.

Procedure

To make settings for system diagnostics of I/O modules in STEP 7, follow these steps:

1. Select the respective I/O module in the device view.
2. Open the "Properties" tab in the Inspector window.
3. Select the area "Inputs", for example.

   You have access to the settings for system diagnostics of the I/O module. If you select "Wire break", for example, a possible wire break for the channel is signaled during operation.

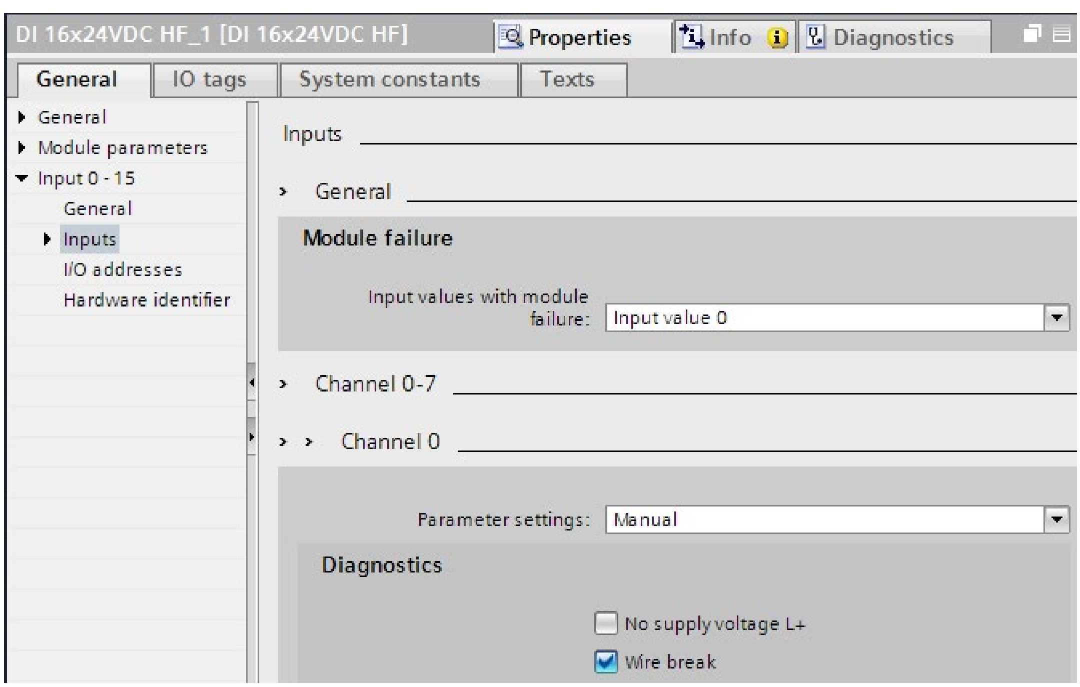

Figure 4-17 I/O setting with a digital input module

4. Save the hardware configuration.
5. Download the new hardware configuration to the CPU.

Additional information

The documentation for the respective module includes additional information on parameter assignment of I/O modules.

4.2.3 Diagnostics information using the web server

System diagnostics using the CPU Web server

The CPUs of the SIMATIC series have an integrated Web server and let you display the system diagnostics information by means of PROFINET. Any terminal devices, such as PCs or smartphones, can thus access module data, user program data and diagnostics data of a CPU by using an Internet browser. This means access to CPUs is possible without installed STEP 7.

In addition to normal websites, the Web server provides so-called basic websites with reduced content that are adapted to the requirements of small screens with low resolution.

Using CPU 1516-3 PN/DP as an example, the following figure shows the start page of the Web server:

Figure 4-18 Web server, Start page

The following diagnostics options are available with the integrated Web server:

- Start page with general CPU information
- Information on diagnostics
- Contents of the diagnostics buffer
- Module information
- Alarms
- Information about communication
- PROFINET topology
- Motion Control diagnostics
- Trace

Configuring the Web server in STEP 7

Proceed as follows to activate the Web server:

Requirements

- You have opened STEP 7.
- You have added a CPU to the project.
- You have opened the project view.

Procedure

1. Open the network view.
2. Select the CPU.
3. Open the "Properties" tab in the Inspector window.
4. Select the entry "Web server" in the "General" area navigation.

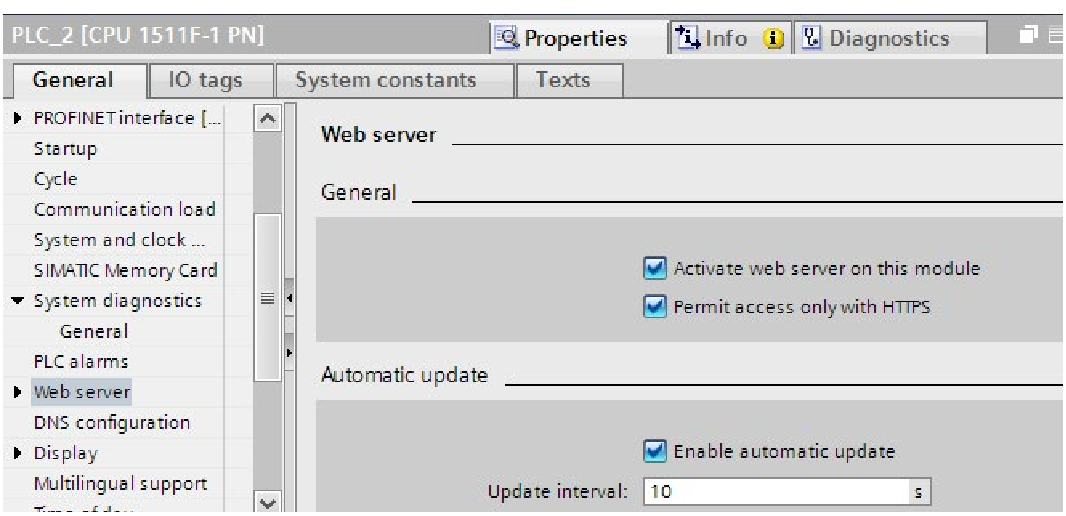

Figure 4-19 Activate the Web server

5. Select the "Activate web server on this module" check box.
6. "Permit access only with HTTPS": The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate in the CPU.

> **NOTICE**
>
> **Utilizing the full functionality of the Web server**
>
> A valid CA-signed Web server certificate in the CPU is a requirement for:
>
> - User management with password-protected users
> - The use of safety-related functions (online backup and restore of the CPU configuration, saving and downloading diagnostic information in csv files)
>
> To use the full functionality of the Web server, we recommend that you create a CA-signed server certificate and assign it to the CPU.
>
> To create a CA-signed Web server certificate, you must enable the Certificate Manager in the global security settings of STEP 7 and assign a CA-signed server certificate to the Web server in the properties of the CPU.
>
> You can find additional information on handling Web server certificates in the "Configuring the Web server" section of the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).
>
> Detailed information on Certification Authority (CA) certificates, device certificates (End Entity certificate), "Public Key Infrastructure" (PKI) and certificate management can be found in the Communication function manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and in the online help for STEP 7, keyword "Secure communication".

7. Automatic updating is activated in the default setting of a configured CPU.
8. Activate the Web server also for each interface via which you want to access the Web server.
   To do this, open the "Properties" tab in the Inspector window and select the "Web server" entry in the "General" area navigation. In the "Overview of interfaces" area, select the "Enabled web server access" check box for the corresponding interface.
9. Compile and load the configuration into the CPU.

Accessing the Web server

To access the Web server, proceed as follows:

1. Connect the display device (PG/PC, HMI, mobile terminal device) with the CPU or a communication module using a PROFINET interface.
   If you are working with WLAN, activate the WLAN on the display device and establish a connection to the access point (e.g. SCALANCE W788-1RR or SCALANCE W784-1), which is in turn connected to the CPU.
2. Open the web browser on the display device.
3. Enter the IP address of the interface of the CPU which is connected to the client in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (example input: https://192.168.3.141).
   The intro page of the CPU opens.
4. You need to perform the installation of the CA certificate again for each display device you want to use. A valid CA certificate is available for download from the "Intro" web page under "Download certificate". You can find instructions for installing the certificate in the help system of your Web browser and in the FAQ with the entry ID 103528224 at the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103528224) website.
5. Click the NEXT link to go to the Web server pages.

Note

Managing access rights

In STEP 7, you can create users, define access rights and assign passwords under "Web server > User management". Users only have access to the options that are permanently linked to the access rights.

You can find additional information on managing access rights in the "Configuring the Web server" section of the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

"Diagnostics" option

The "Diagnostics" web page provides more information about the tabs:

- Identification

  This tab contains the characteristics of the CPU (serial number, article number, hardware and firmware version, etc.).
- Program protection

  This tab provides information on whether the PLC program contains know-how protection or copy protection.
- Memory

  This tab contains current values on the memory currently in use.
- Runtime information

  Current information on program/communication load and cycle time can be found in this tab.
- Fail-safe (only with an F CPU)

  The safety program of an F-CPU consists of one or two F-runtime groups. You can find their cycle time (F-monitoring time) and runtime in this tab.

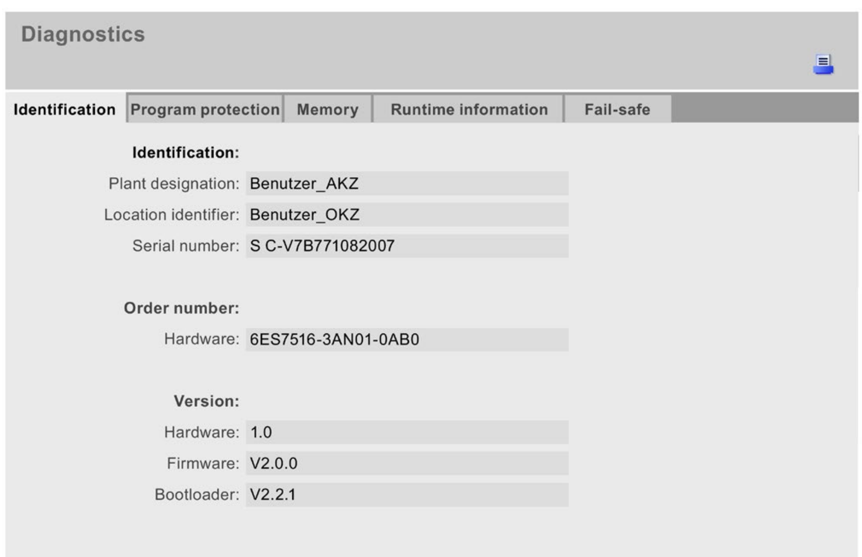

Figure 4-20 Web server, "Diagnostics" Web page

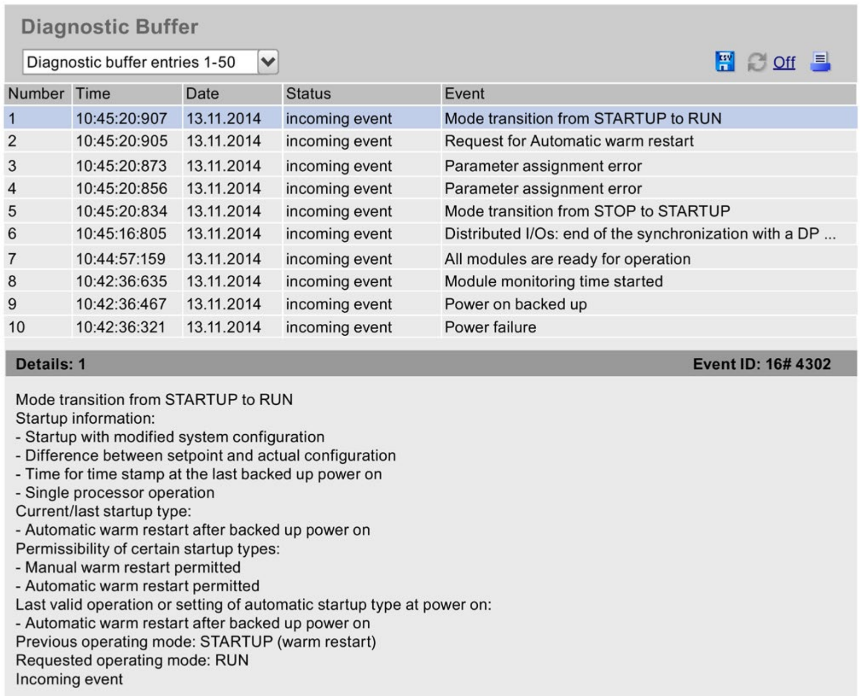
Diagnostics option "Diagnostics buffer"

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" Web page.



Diagnostic Buffer

Diagnostic buffer entries 1-50

Off

Number	Time	Date	Status	Event
1	10:45:20:907	13.11.2014	incoming event	Mode transition from STARTUP to RUN
2	10:45:20:905	13.11.2014	incoming event	Request for Automatic warm restart
3	10:45:20:873	13.11.2014	incoming event	Parameter assignment error
4	10:45:20:856	13.11.2014	incoming event	Parameter assignment error
5	10:45:20:834	13.11.2014	incoming event	Mode transition from STOP to STARTUP
6	10:45:16:805	13.11.2014	incoming event	Distributed I/Os: end of the synchronization with a DP ...
7	10:44:57:159	13.11.2014	incoming event	All modules are ready for operation
8	10:42:36:635	13.11.2014	incoming event	Module monitoring time started
9	10:42:36:467	13.11.2014	incoming event	Power on backed up
10	10:42:36:321	13.11.2014	incoming event	Power failure

Details: 1 **Event ID: 16# 4302**

Mode transition from STARTUP to RUN
Startup information:
- Startup with modified system configuration
- Difference between setpoint and actual configuration
- Time for time stamp at the last backed up power on
- Single processor operation
Current/last startup type:
- Automatic warm restart after backed up power on
Permissibility of certain startup types:
- Manual warm restart permitted
- Automatic warm restart permitted
Last valid operation or setting of automatic startup type at power on:
- Automatic warm restart after backed up power on
Previous operating mode: STARTUP (warm restart)
Requested operating mode: RUN
Incoming event

Figure 4-21 Web server, "Diagnostics buffer" Web page

Diagnostics option "Module information"

The status of a device is indicated by the Web browser with symbols and comments on the "Module information" Web page.

Modules are displayed on the "Module information" Web page in the "Name" column with a link. You can thus get to the faulty module in hierarchical order.

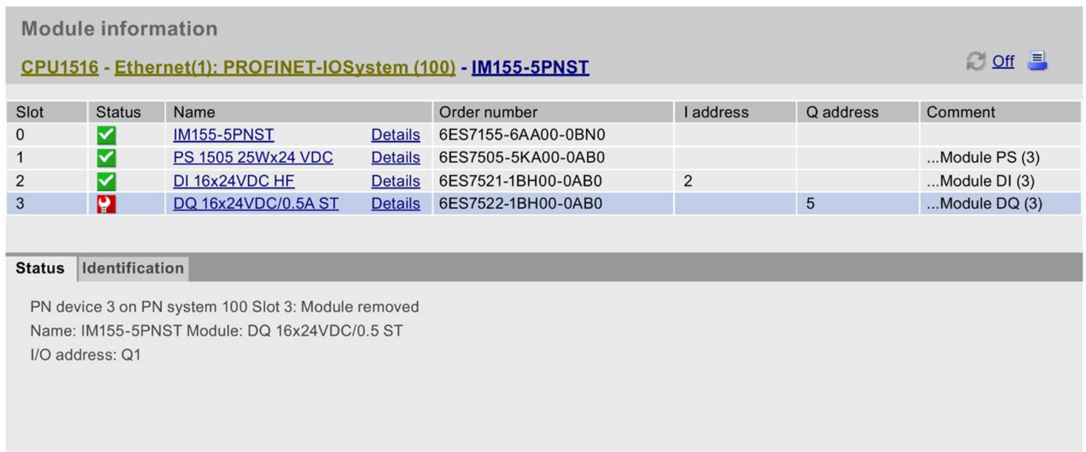


Figure 4-22 Web server, "Module information" Web page

Diagnostics option "Messages"

The Web browser displays the content of the message buffer on the "Messages" Web page. The messages can be acknowledged via the Web server if you have the appropriate user rights.

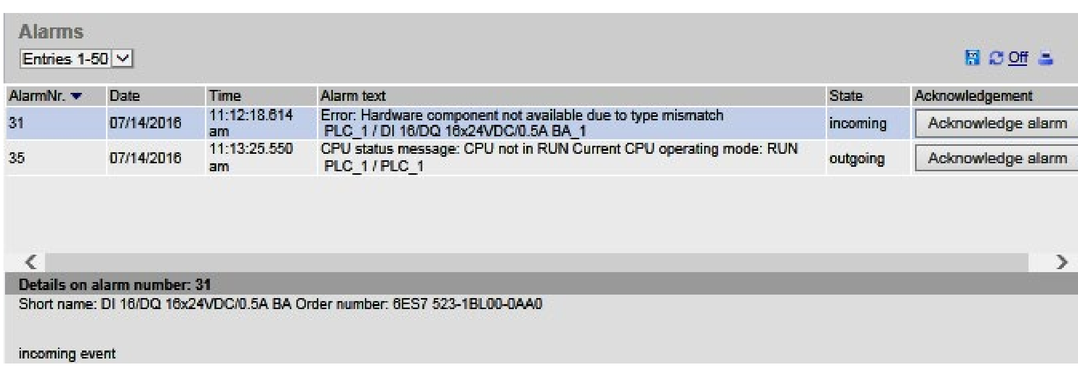

Figure 4-23 Web server, "Messages" Web page

Diagnostics option "Communication"

The "Communication" web page provides detailed information about the following tabs:

- Parameter

  A summary of the information on the PROFINET and Ethernet interfaces of the selected CPU is available in this tab.

- Statistics

  You will find information on data transmission in this tab.

- Resources

  Information about the resource consumption of the connections is available in this tab.

- Connections

  Information about the status of the communication connections is available in this tab.

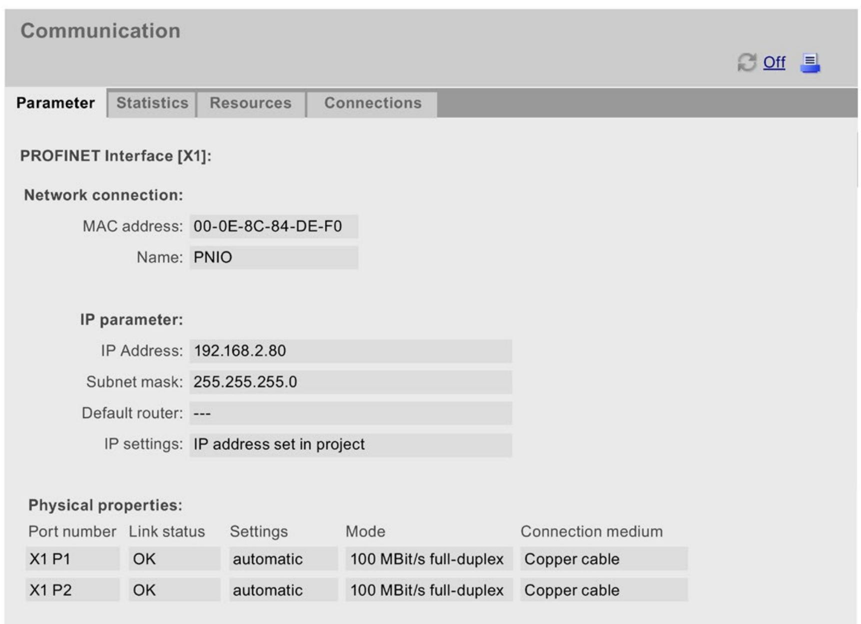

Figure 4-24 Web server, "Communication" Web page

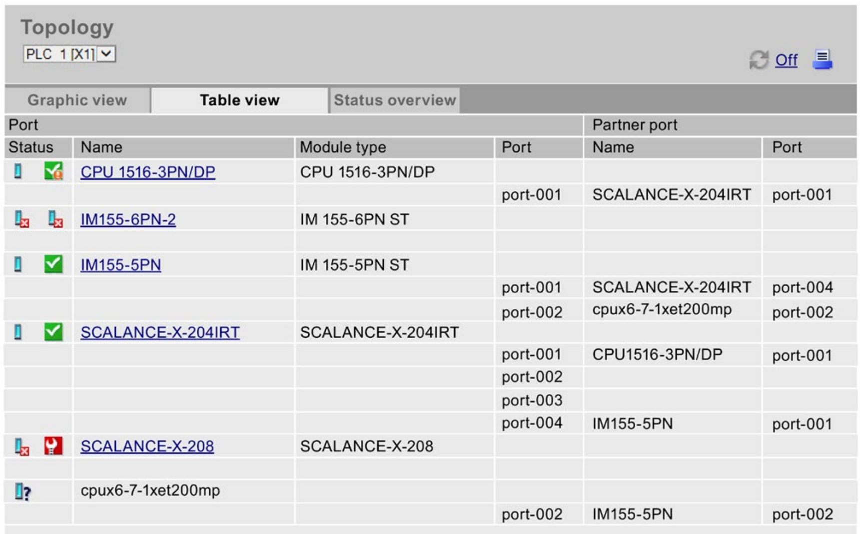
"Topology" diagnostics option

The "Topology" Web page provides information on the topological configuration and status of the PROFINET devices in your PROFINET IO system.



Port				Partner port	
Status	Name	Module type	Port	Name	Port
	CPU 1516-3PN/DP	CPU 1516-3PN/DP			
			port-001	SCALANCE-X-204IRT	port-001
	IM155-6PN-2	IM 155-6PN ST			
	IM155-5PN	IM 155-5PN ST			
			port-001	SCALANCE-X-204IRT	port-004
			port-002	cpux6-7-1xet200mp	port-002
	SCALANCE-X-204IRT	SCALANCE-X-204IRT			
			port-001	CPU1516-3PN/DP	port-001
			port-002		
			port-003		
			port-004	IM155-5PN	port-001
	SCALANCE-X-208	SCALANCE-X-208			
	cpux6-7-1xet200mp				
			port-002	IM155-5PN	port-002

Figure 4-25 Web server, "Topology" Web page

"Motion Control Diagnostics" diagnostic option

The Web server displays statuses, errors, technology alarms and the current values of the configured technology objects (TOs).

The "Motion Control Diagnostics" web page provides detailed information on the configured technology objects in the following views:

- Diagnostics

  This view provides an overview list of configured technology objects, the status and error messages of a selected technology object, as well as values and limits of the movement status for a selected axis.

- Service overview

  This view contains diagnostic information for multiple technology objects and a filter option for selecting the displayed technology objects.

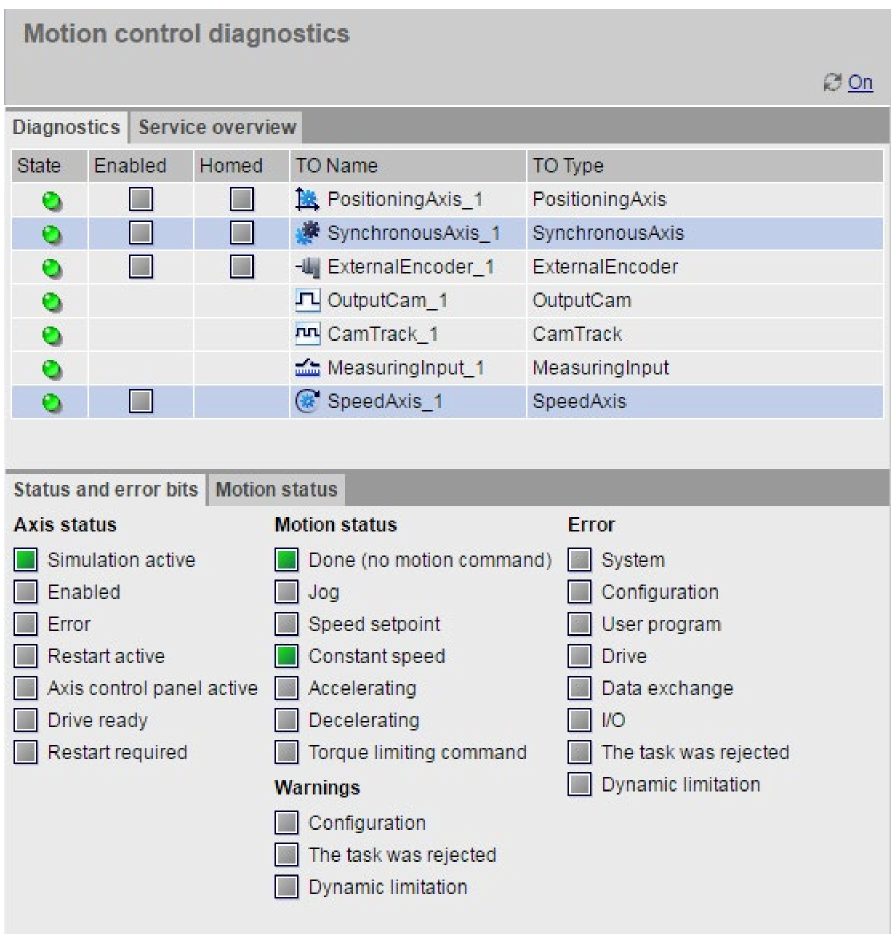


Figure 4-26   Web server, "Motion Control diagnostics" webpage

"Trace" diagnostic options

You can read, view and save the trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance.

The web page of the trace and logic analyzer function consists of several areas. The example in the figure below shows how the Web server user interface is divided when the "Trace" web page is first called.

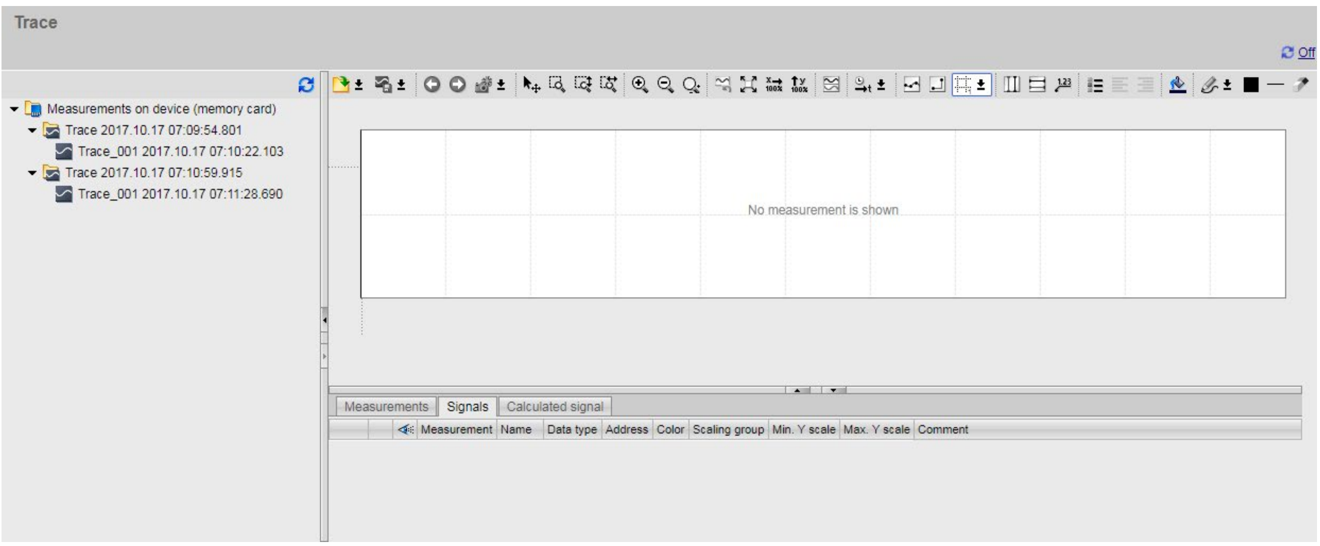

Figure 4-27 Web server, "Trace" home page (without measurement)

Additional information

Additional information on the topic is available in the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

You can find additional information on the trace function in the Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/ww/en/view/64897128) function manual.

4.2.4 Diagnostics information using the HMI diagnostics view

Objects for system diagnostics

The full functionality of the HIM diagnostics view is only available with Comfort Panels and WinCC RT Advanced . Basic Panels do not support the complete range of system diagnostics functions.

Two objects are available for system diagnostics on an HMI device.

System diagnostics view

The system diagnostics view reflects the current status of all accessible devices in your plant. You navigate directly to the cause of the error and the associated device. You have access to all diagnostics-capable devices that you have configured in the STEP 7 hardware and network editor.

System diagnostics window

The system diagnostics window is an operating element and display object.

The functions of the system diagnostics window are the same as for the system diagnostics view. Because the system diagnostics window is configured in the "Global screen", you can also specify, for example, if the object can be closed in WinCC Runtime.

Note

Compatibility with Basic Panels

Only the "System diagnostics view" object is available with Basic Panels.

Basic Panels do not support the "System diagnostics window" object or the graphic symbol "System diagnostics indicator".

4.2.4.1 Configuring system diagnostics

Introduction

You add a system diagnostics view or a system diagnostics window to your project to get an overview of all devices available in your plant.

The system diagnostics window behaves like the system diagnostics view but is only available in the global screen.

Requirements

- At least one CPU has been set up in the project.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- CPU and the HMI device are connected with each other by an HMI connection.
- You have created a screen (for the system diagnostics view).
- The global screen is open (for the system diagnostics window).
- The Inspector window is open.

Procedure

Proceed as follows to configure the system diagnostics:

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.

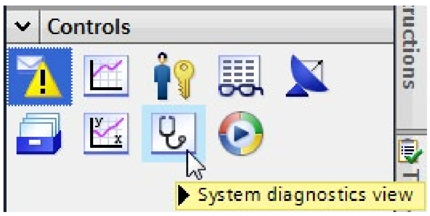

Figure 4-28 Adding a system diagnostics view

2. Select the "Properties" tab in the Inspector window.
3. Select the area "Columns".
4. Enable the columns that you require in the device view for WinCC Runtime, for example:
   – Status
   – Name
   – Operating mode
   – Slot
   – Address
5. Enable the columns that you require in the detail view for WinCC Runtime, for example:
   – Status
   – Name
   – Operating mode
   – Plant designation
   – Address
6. You can change the column headers in the "Columns" area, if necessary.
7. Select the "Display" area.
8. Enable "Column settings > Columns moveable" to move the columns in WinCC Runtime.
9. To close the system diagnostics window in WinCC Runtime, select "Properties > Window > Closable" in the "Properties" tab of the Inspector window.

Result

The system diagnostics view has been added to the screen. The diagnostics status of the entire plant is displayed in the system diagnostics view in WinCC Runtime.

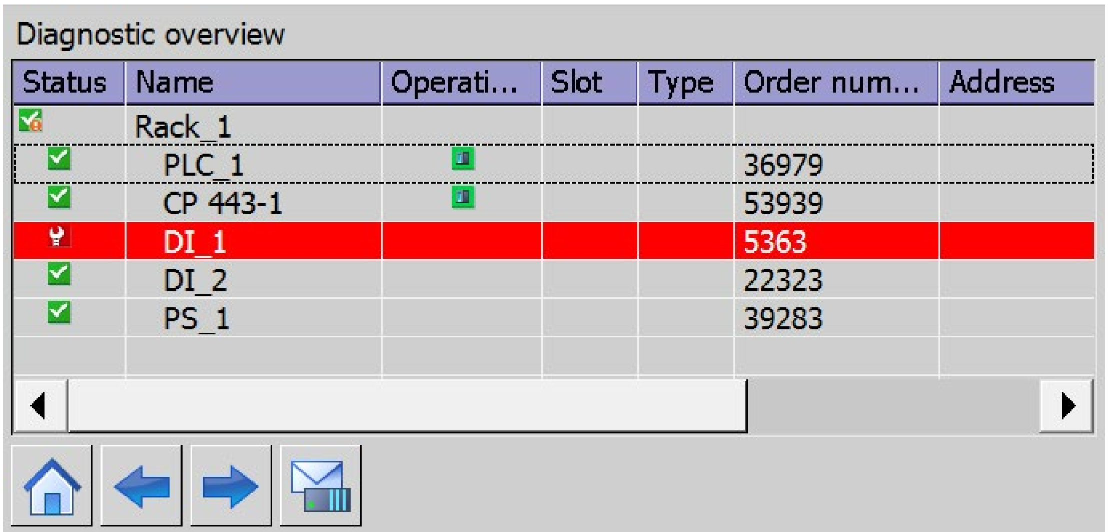

Figure 4-29 System diagnostics view in the screen

The system diagnostics window has been added to the global screen. If there is an error message in the plant, the system diagnostics window responds and displays the affected device.

4.2.4.2 Different views of the HMI diagnostics view

Introduction

There are three different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Details view
- Distributed I/O view (only for PROFIBUS and PROFINET systems)

Device view

The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the lower-level devices or the detail view. Symbols in the first column provide information about the current state of the device.

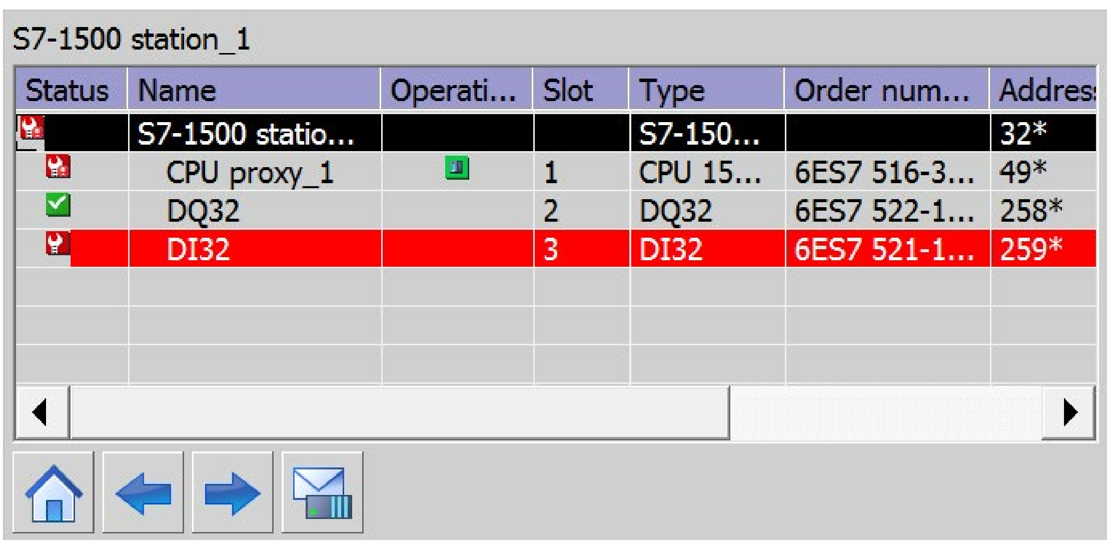

Figure 4-30 Device view

Details view

The detail view gives detailed information about the selected device and any pending errors. Check whether the data is correct in the detail view.

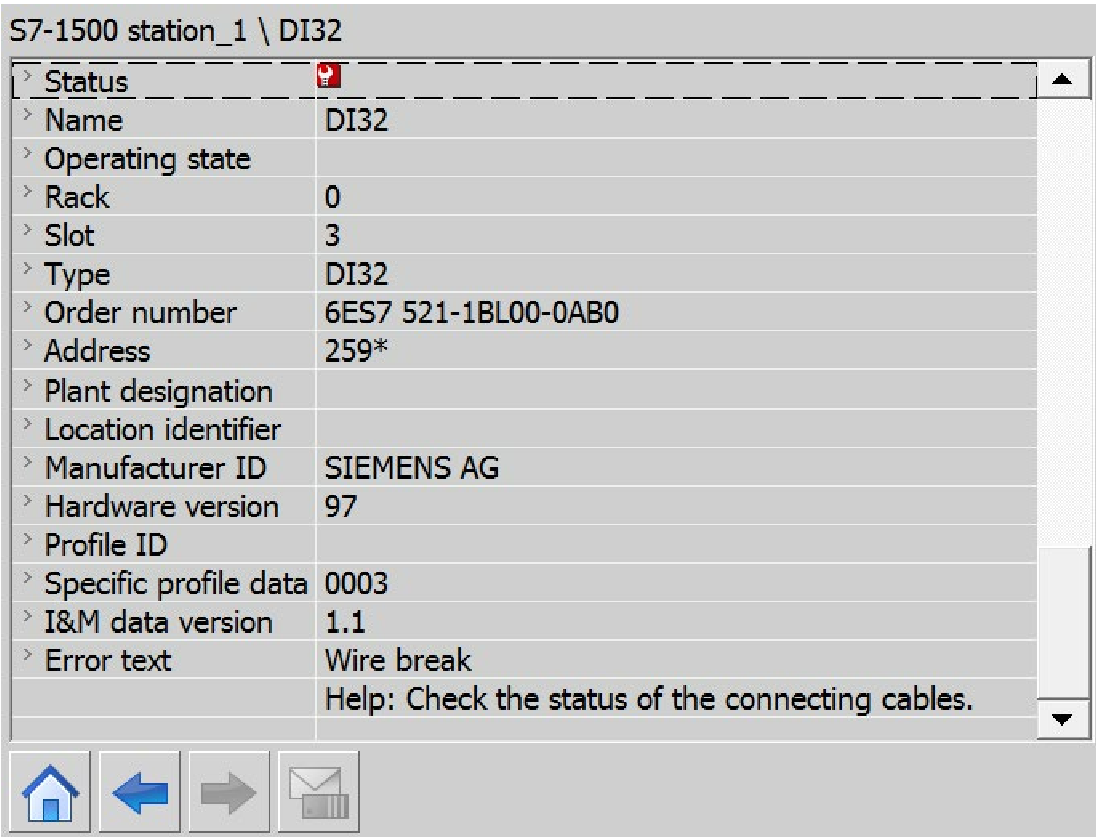

Figure 4-31 Details view

Distributed I/O view

The distributed I/O view is only available for distributed I/O systems. The distributed I/O view shows the status of the devices of the PROFIBUS/PROFINET subnet.

Each element in the view shows the device name, the device type and the IP address or the PROFIBUS address.

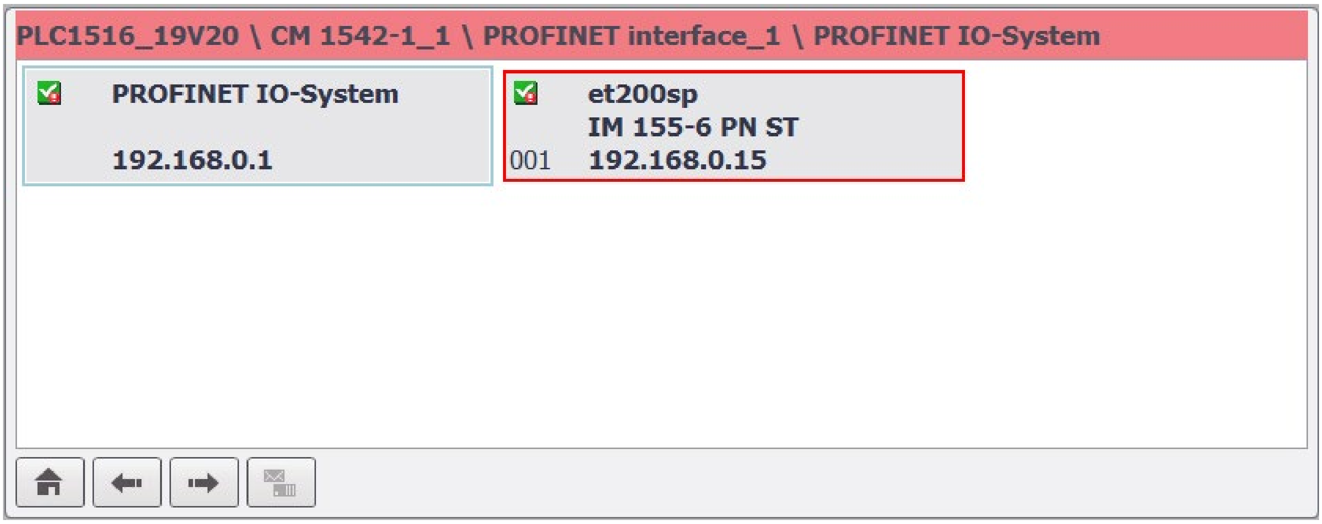

Figure 4-32 Distributed I/O view

Navigation buttons

Button	Function
	Opens the lower-level devices or the detail view if there are no lower-level devices.
	Opens the higher-level device or the device view if there is no higher-level device.
	Opens the device view.

4.2.4.3 Inserting system diagnostics indicator

Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your plant.

The library object shows two different states:

- No error
- Error

Requirements

- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Libraries" task card is opened.
- The global library "Buttons and Switches > DiagnosticsButtons" is open.
- A screen is open.
- The system diagnostics window has been set up in the global screen.

Procedure

1. Select the "DiagnosticsIndicator" object in the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.

   The library object is added.

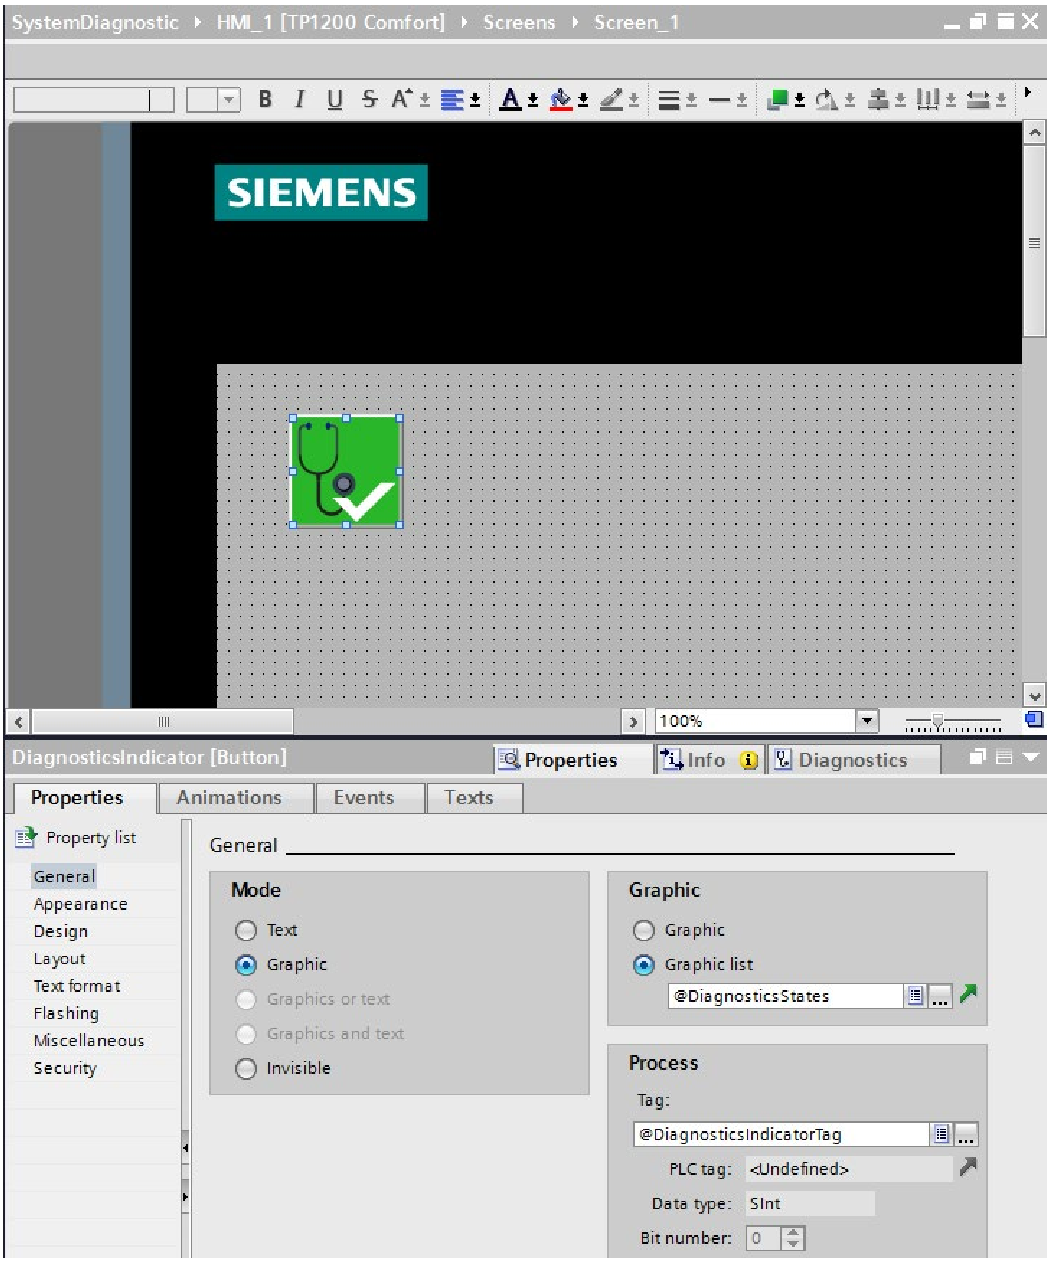

Figure 4-33 Inserting library object in the work area

3. Select the library object.
4. Open the "Events" tab in the Inspector window.

   The "ShowSystemDiagnosticsWindow" is preset for the event "Click".

Result

The system diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in WinCC Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics windows.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Open the "Properties" tab in the Inspector window.
3. Select an authorization in the "Security in Runtime" area.

A logon dialog opens when you click on the system diagnostics indicator in WinCC Runtime. The system diagnostics window does not open unless you have the required authorization.

4.2.4.4 Configuring button as system diagnostics indicator

Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can, for example, configure a button in "Graphic" mode to indicate errors in your plant.

Requirements

- At least one CPU has been created.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the states.
- A screen is open.
- You have created a system diagnostics view.

Procedure

Follow these steps to configure a button as system diagnostics indicator:

1. Double-click the "Button" object in the "Tools" task card. A button is added to the screen.
2. Enable the "Properties" tab in the Inspector window and the "Graphic" mode in the "General" area.
3. Select the bit graphics list as graphics list.
4. Select the "Properties" tab in the Inspector window and select the tag @DiagnosticsIndicatorTag under "Tag" in the "General" area.
5. To assign a function to the button, select the "Events" tab in the Inspector window.
6. Select the "Click" event.
7. Click on "Add function" in the table.
8. Select "EnableSystemDiagnosticsView".
9. Select the system diagnostics view.

Result

You have configured an interface that reacts to error events from the CPU. The button changes when an error event occurs in Runtime.

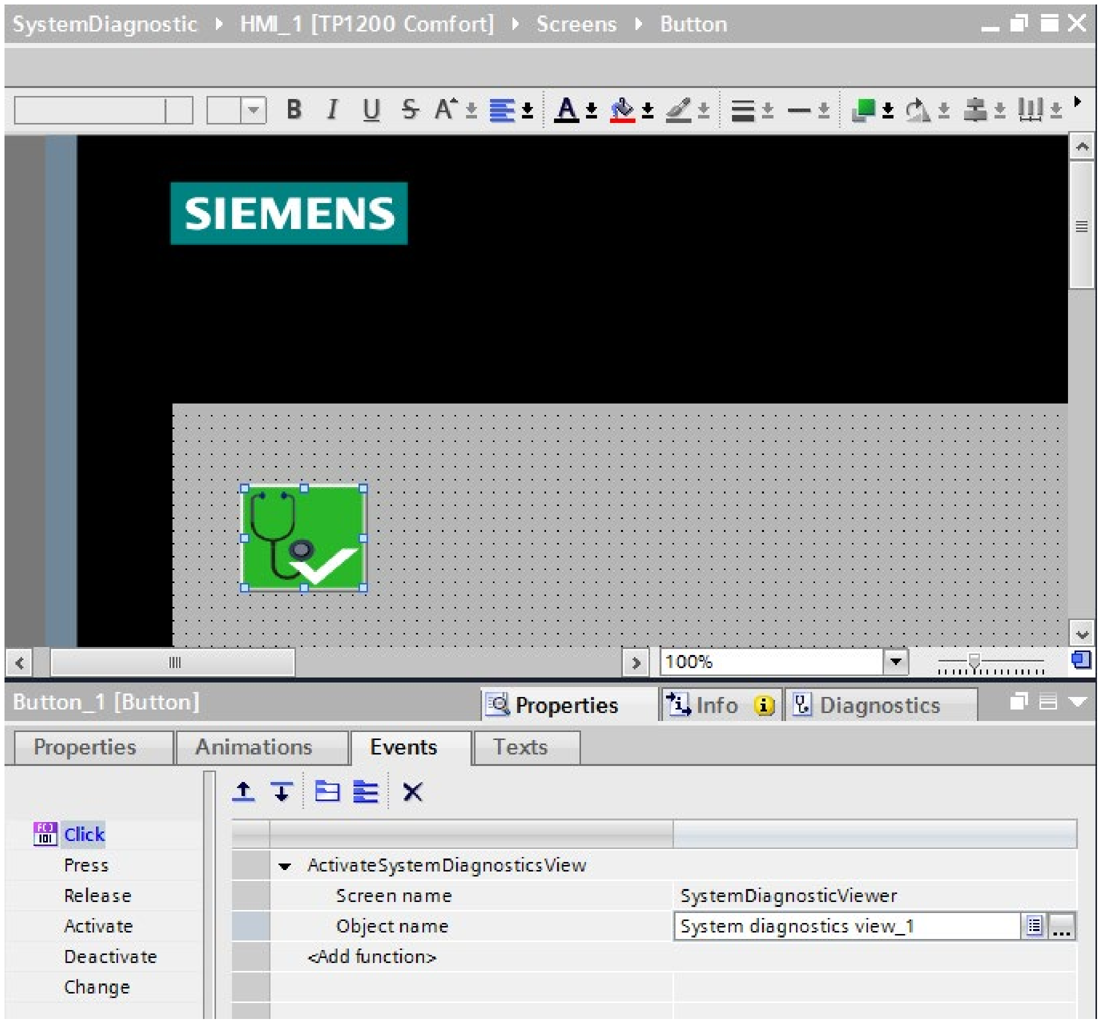

Figure 4-34 Configured button

The button has two states.

- Error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the detail view of the affected device.

- No error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the device view.

System diagnostics by means of the user program 5

5.1 Options of system diagnostics in the user program

Introduction

You can configure responses to diagnostics alarms in the user program. You can, for example, specify that your plant is stopped in case of specific diagnostics alarms.

Instructions

A vendor-independent structure of data records with diagnostics information applies. The following instructions are available for determining the system diagnostics of a device:

Table 5- 1 Instructions for determining the system diagnostics

Instruction	Description
RDREC	• Reads data records of a component (module or submodule) of a DP slave/IO device that may contain error information • Works asynchronously, which means processing takes place across several calls
RALRM	• Reads the start information of the OB when calling the diagnostics interrupt OB (OB 82) • Provides information on cause and location of error
DPNRM_DG	• Reads the current diagnostics data of a DP slave (DP standard diagnostics)
GEN_DIAG	• Generates diagnostics information • To generate diagnostics information, the module or submodule is identified with its logical address
Gen_UsrMsg	• Generates an alarm that is entered in the diagnostics buffer
GET_DIAG	• Provides diagnostics information • To provide diagnostics information, the module or submodule is selected
GET_NAME	• Reads the name of an IO device
T_DIAG	• Provides diagnostics and status information on a connection • Works asynchronously, which means processing takes place across several calls
RD_SINFO	• Reads the start information of the OB called last that has not been processed completely and the startup OB started last • Provides general error information
LED	• Reads the status of the module LED
Get_IM_Data	• Reads the Information&Maintenance data of the CPU • Works asynchronously, which means processing takes place across several calls
Transfer_IM_Data	• Transmits the Information&Maintenance data of the CPU
DeviceStates	• Outputs the state of all devices of an IO system
ModuleStates	• Outputs the state of all modules of a device

Additional information

Online help

In the online help for STEP 7, you can find:

- Additional information on instructions for system diagnostics
- Information about further options for evaluating diagnostic information in the user program (e.g. with the "RDREC", "RALRM", "GET_DIAG" instructions)
- Information on SIMATIC ProDiag. This functionality enables targeted and fast machine and plant diagnostics for SIMATIC S7-1500 and SIMATIC HMI:
  - Standardized diagnostics concept for different SIMATIC components
  - No additional configuration work for diagnostics functionality
  - Reduces the load on PLC memory and program run time

  You can find details in the online help under "Supervising machinery and plants with ProDiag".

Manuals

You can find additional information about evaluating diagnostic information in the user program in the following manuals:

- PROFINET function manual (http://support.automation.siemens.com/WW/view/en/49948856)
- From PROFIBUS DP to PROFINET IO (https://support.industry.siemens.com/cs/ww/en/view/19289930) programming manual
- Manual for the respective module

Application examples

You can find detailed application examples with further documentation and example projects on the Service&Support Website:

- Diagnostics in the user program with S7-1500 (https://support.industry.siemens.com/cs/ww/en/view/98210758)
- System diagnostics with S7-1500 and TIA Portal (https://support.industry.siemens.com/cs/ww/en/view/68011497)

FAQ

For more information about how to realize channel diagnostics in the user program of the SIMATIC S7-1500, refer to the FAQ with entry ID 109480387 on the Service&Support Website (https://support.industry.siemens.com/cs/ww/en/view/109480387).

5.2 System diagnostics using process image inputs

Introduction

In addition to event-driven system diagnostics, the input and output modules of the SIMATIC series provide diagnostics information using the process image input.

The system diagnostics described in the preceding sections is made available asynchronously to the program processing. To ensure the correct processing of the input and output data in the case of faults while reading the input and output data, some modules offer the so-called value status (QI = Quality Information) for evaluation.

Requirement for evaluation of the value status

The diagnostics information about the process image input is transmitted synchronized with the user data. Select the "Value status" check box in the properties of the I/O module in STEP 7 if you want to evaluate the value status of the channel.

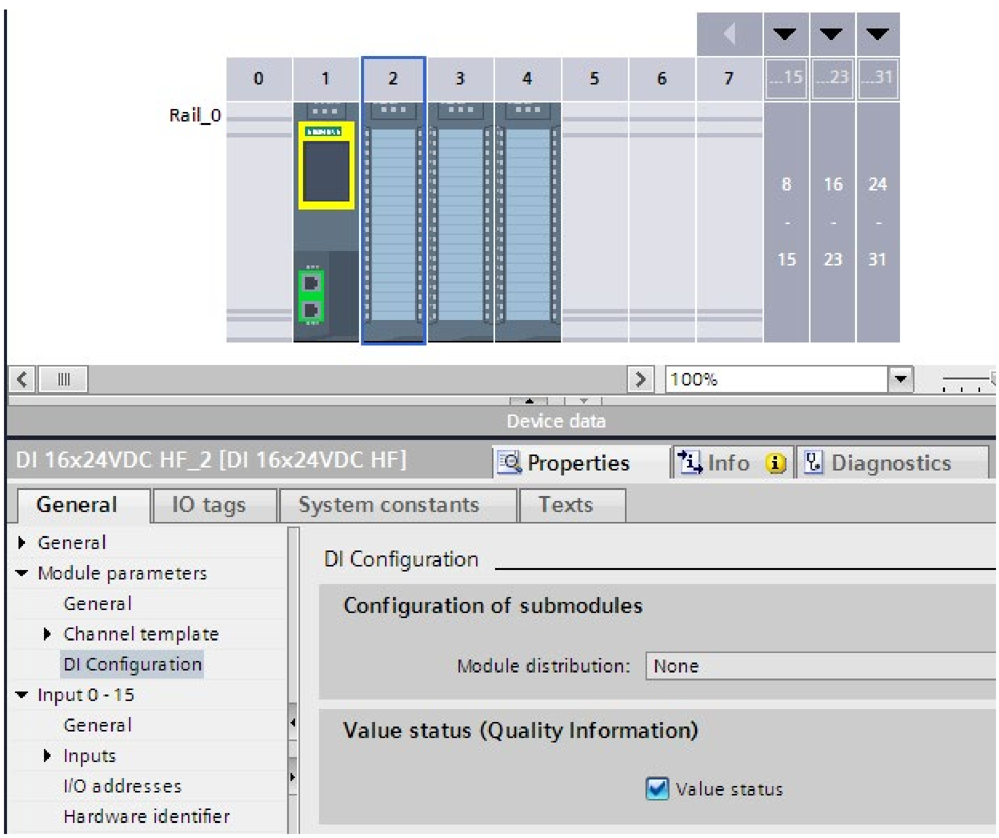

Figure 5-1 Enable value status

Evaluation of the value status

If you have enabled the value status for an I/O module, this module provides additional information on the value status in addition to the user data. This information is directly available in the process image input and can be called with simple binary operations.

Each channel is uniquely assigned one bit in the value status. The bit in the value status indicates the validity of the read-in value in the user data.

Table 5- 2 Example for evaluation of the user datum in case of a wire break for a digital input module

	Bit in user datum	Bit in value status	Value in user datum
Faulty channel	Logical 0	0	Invalid
Fault-free channel	Logical 0 (actual value)	1	Valid

Influence of the value status

The value status of an active channel is "Invalid" when any **one** of the following factors is given:

- Channel diagnostics pending (regardless of whether diagnostics, for example wire break, is configured for this channel)
- For output channels: "Reaction to CPU STOP" feature is active (due to CPU STOP, interrupted connection)
- For output channels of the digital on-board I/O of compact CPUs: If a channel is used for technology functions, it returns the value status 0 ("Invalid"). It does not matter in this context whether the output value is incorrect or not.
- PROFIenergy is active, i.e. hibernation is enabled (except in "Continue working mode")

When working with non-fail-safe modules, note that an invalid active channel also sets the value status of all other active channels to "Invalid". We therefore recommend that you disable all unconnected or unused channels.

Example - Evaluation of the value status for the input channel of an analog input module

The example below shows the basic evaluation of the value status for the input channel of an analog input module in the user program. The diameter of a cylinder is measured by means of a channel and its circumference is calculated.

- If the value status indicates the channel is error-free, the circumference is to be calculated.
- If the value status indicates the channel is defective, the value "0" is to be output as substitute value for the circumference.

The figure below shows the evaluation of the value status in the user program.

Perimeter

	Name	Data type	Default value	Comment
1	Input			
2	Diameter	Real	0.0	Tag for analog input channel
3	QualityInformation	Bool	false	Tag for QI of analog input channel
4	Output			
5	Perimeter	Real	0.0	Tag for result of calculation
6	InOut			
7	Static			
8	Temp			
9	Constant			
10	PI	Real	3.14	Constant for pi
11	SubstituteValue	Real	0.0	Constant for substitute value

IF... CASE... OF... FOR... TO DO... WHILE... DO... (*...*)

```
IF #QualityInformation = true                  //Validity check of diameter

    THEN                                       //Program run, if quality information is positive
        #Perimeter := #Diameter * #PI;         //Calculation of perimeter

    ELSE                                       //Program run, if quality information is negative
        #Perimeter := #SubstituteValue;        //Substitute value assigned to perimeter
```

Figure 5-2 Example - Evaluation of the value status in the user program

Additional information

Depending on the I/O module, the value status reserves different addresses in the process image input. The manual for the module used includes specific information on the assignment and arrangement.

Alarms 6

Introduction

Alarms allow you to display events from processing in the automation system and to quickly detect errors, to precisely localize them and to remove them. Downtimes are significantly reduced in a plant.

Before alarms can be output, they need to be configured.

You can create, edit and compile event-dependent alarms along with their alarm texts and alarm attributes and display them on display devices.

In STEP 7, you create program alarms in the user program with the "Program_Alarm" instruction. You edit the attributes and alarm texts in the alarm editor in STEP 7.

You can output the alarm status with the "Get_AlarmState" instruction.

Advantages of program alarms

Compared to other alarm methods, such as HMI discrete alarms, program alarms offer the following advantages:

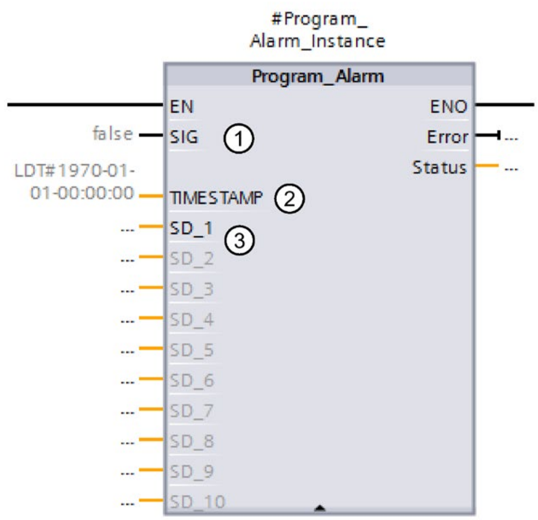
- Central engineering in STEP 7: You only configure a program alarm once for the CPU. The program alarm is automatically transferred from the CPU to all registered HMI devices.
- System-supported acknowledgment: The acknowledgment of a program alarm on an HMI device is automatically updated on other HMI devices by the CPU.
- Time stamping close to the event in the CPU
- Identical time stamps of the alarms on multiple HMI devices without time synchronization

6.1 Creating alarms with the "Program_Alarm" instruction

"Program_Alarm" instruction

You create a program alarm in STEP 7 with the "Program_Alarm" instruction.

The figure below shows the "Program_Alarm" instruction with the most important input tags.



① The "Program_Alarm" instruction monitors the signal at the SIG block input and generates a program alarm in case of a signal change at the SIG parameter. The instruction generates an incoming alarm when the signal changes from 0 to 1 and an outgoing program alarm if the signal changes from 1 to 0. The program alarm is triggered synchronously to program execution.

② The time stamp is automatically created when the alarm event occurs in the automation system and is passed along with the alarm.

③ You can append up to ten associated values to the program alarm at the parameters SD_i (1 ≤ i ≤10). The associated values are acquired at the time of the signal change at the SIG parameter and assigned to the program alarm.
Associated values are used to display dynamic contents in alarms.
Example: The temperature in the tank <associated value 1> is <associated value 2> °C.
You can find more information on associated values in the STEP 7 online help.

Figure 6-1 "Program_Alarm" instruction

Note

The "Program_Alarm" instruction can only be called in a function block.

A program alarm can be up to 256 bytes long in total (with associated values and texts from the text list).

The associated values can be a maximum of 512 bytes in length. Text lists are not affected by this.

The CPUs of the SIMATIC S7-1500 product series have the following memory for text lists:

- CPU 1510-x to CPU 1513-x: 2.25 MB
- CPU 1515-x to CPU 1516-x: 4.5 MB
- CPU 1517-x to CPU 1518-x: 6.75 MB

The number of configurable program alarms depends on the CPU used. With a CPU 1515-2 PN, for example, a maximum of 10,000 program alarms are possible. You can find this information in the device manual for the respective CPU under "Number of configurable alarms".

The number of simultaneously active "Program_Alarms" depends on the CPU used. With a 1515-2 PN CPU, for example, a maximum of 600 program alarms are possible. You can find this information in the device manual for the respective CPU under "Number of reserved user interrupts".

Sometimes, it is not possible for all program alarms that are active at the same time to be output within one cycle. Query the status of each "Program_Alarm" and activate the instruction again, if necessary. The cycle time is increased for a short time by simultaneously activating/sending multiple "Program_Alarms".

A maximum of 40,000 program alarms should be configured in a STEP 7 project on a 64-bit operating system.

Additional information

You can find more information on creating program alarms in the STEP 7 online help under "Creating and editing alarms".

6.2 Editing alarms in the alarm editor

Introduction

You can edit the created alarms in STEP 7 either in the program editor or in the alarm editor.

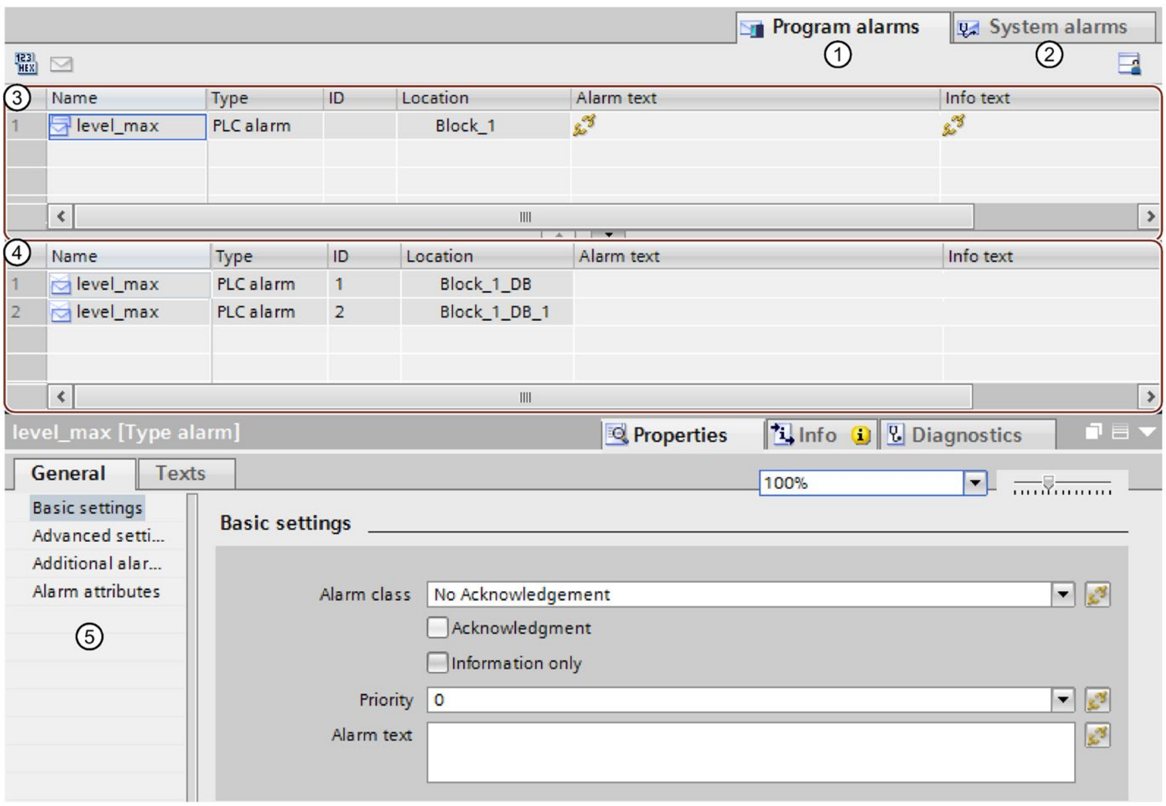
You can find additional information on editing alarms in the program editor in the STEP 7 online help under "Creating and editing alarms".

Editing alarms in the alarm editor

You can edit alarm texts in the alarm editor and specify attributes such as alarm class or priority for the alarms.

1. Double-click "PLC supervisions & alarms" in the project tree. Select the "Alarms" tab. The alarm editor opens.
2. Enter the required texts and attributes in the appropriate columns.

The figure below shows the layout of the alarm editor.



① "Program alarms" tab: You can edit program alarms here.

② "System alarms" tab: System alarms can only be viewed but not edited. To edit these alarms, you must navigate to the device view ("Go to device" menu command), where you can modify the system diagnostics alarms in the Inspector window.

③ "Type alarms" area:
This is where the type alarms created in a function block with the "Program_Alarm" instruction are displayed. Type alarms serves as templates for instance alarms (④).
All the inputs you make for the type alarm are automatically included in the instance alarms derived from it.
You can find more information on type alarms in the STEP 7 online help under "Alarm types and alarms".

④ "Instance alarms" area:
When you assign an instance DB to the message block (for example, call in an OB, FB, FC), instance alarms are automatically generated based on the template of the type alarm and alarm numbers are assigned.
You can modify the instance alarms for specific instances.
You can find more information on instance alarms in the STEP 7 online help under "Alarm types and alarms".

⑤ Properties of the selected type and instance alarm in the Inspector window

Figure 6-2 Layout of the alarm editor

You can enter or modify the necessary parameters, texts and attributes in the table or in the Inspector window.

Multilingual alarms

You can have program alarms displayed in multiple languages by assigning different project languages to the interface languages of the display devices.

Note

The project languages you want to assign must be activated and the corresponding texts (translations) must be available in the project. The project language selection can be found in the project tree under "Languages & Resources".

To create the texts of the program alarm as multilingual, follow these steps:

1. In the Inspector window of the alarm editor, open the "Properties" tab and the lower-level "Texts" tab.
2. Enter the text in the desired project language.
3. Open the "Properties" tab in the Inspector window of the CPU and select the "Display" command in the "General" area navigation. Under "Multilingual", assign one of the activated project languages to each interface language of the display devices. Overall, you can assign up to three different project languages to the user interface languages. All assigned project languages are loaded into the CPU.

Additional information

You can find additional information on texts and attributes in the STEP 7 online help under "Texts and attributes".

You can find more information on text lists in the STEP 7 online help under "Text lists for alarms".

6.3 Display of program alarms

Program alarms you create with the "Program_Alarm" instruction are automatically made available to the display devices.

You have the following options to display the alarms:

- STEP 7
- HMI
- Web server of the CPU
- Display of the CPU

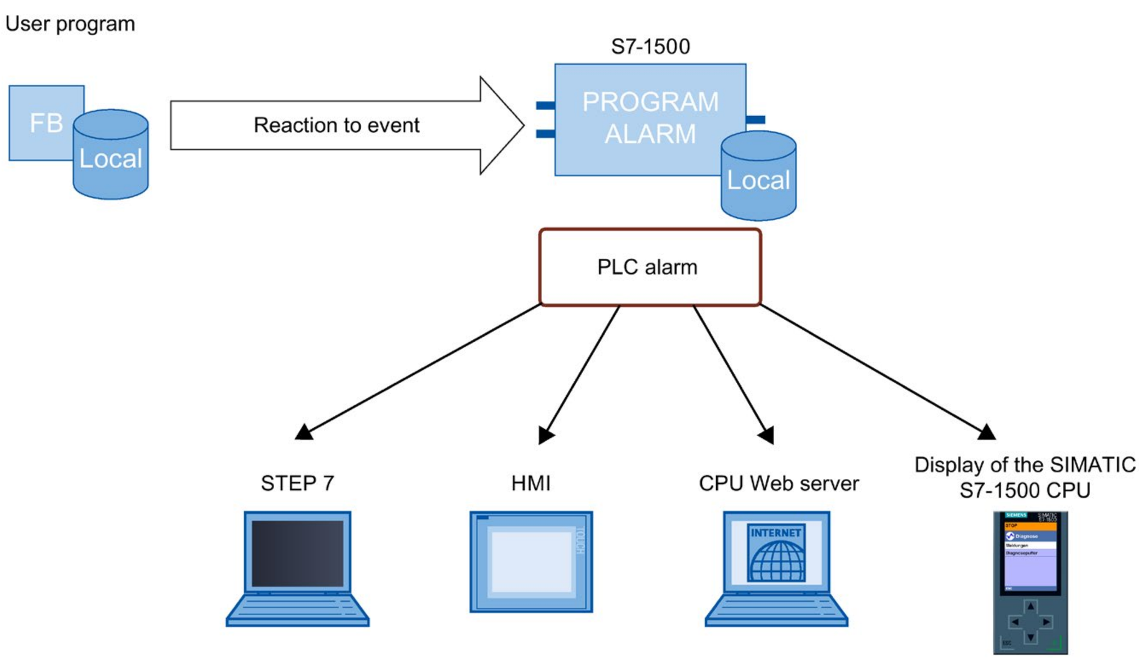


Figure 6-3 Display of program alarms

Multilingual alarms

You can have program alarms displayed in multiple languages by assigning different project languages to the interface languages. See section Editing alarms in the alarm editor (Page 81).

6.4 Output of the alarm state with the "Get_AlarmState" instruction

"Get_AlarmState" instruction

The "Get_AlarmState" instruction outputs the alarm state of a program alarm. The output of the alarm state always refers to a program alarm that was created using the "Program_Alarm" instruction.

The program alarm is selected with the "Alarm" input parameter. Specify the instance DB of the "Program_Alarm" instruction at the "Alarm" parameter.

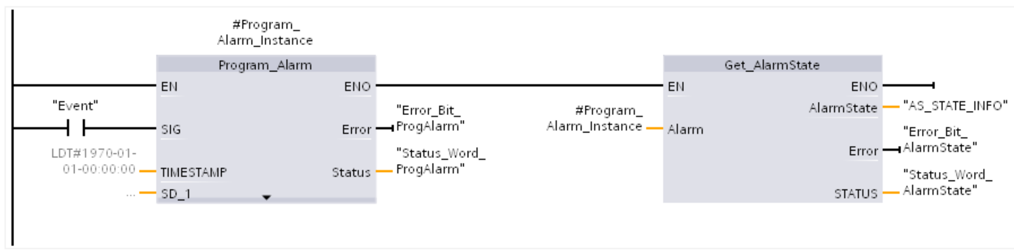

Figure 6-4 Call - Get_AlarmState

Additional information

You can find additional information on evaluation of the "Get_AlarmState" instruction in the STEP 7 online help.

6.5 Example program for program alarms

6.5.1 Task

Introduction

This section describes the basic configuration of program alarms with the "Program_Alarm" instruction based on two examples. The two examples solve the same problem but use a different approach. Example 1 does not use associated values. In example 2, an associated value is assigned to the program alarm to reference a text list.

Example - Minimum/maximum fill level of a tank

A tank is filled with a liquid. The fill level is monitored by two sensors.

If the liquid in the tank drops below a minimum fill level, an alarm is output for low fill level.

If the liquid in the tank exceeds a maximum fill level, an alarm is output for high fill level.

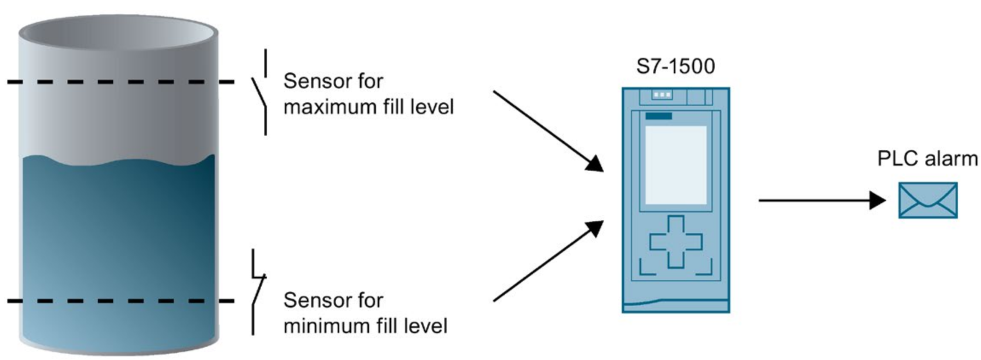

Figure 6-5 Example for fill level alarms

6.5.2 Example 1: Program alarm without associated values

Introduction

In this example, you create a program alarm for the maximum and the minimum fill level.

How the example works

When the maximum fill level is exceeded in the tank, a program alarm with the alarm text for the excessive fill level is output.

When the minimum fill level is undershot in the tank, a program alarm with the alarm text indicating that the fill level is too low is output.

Steps

The following steps are necessary for this example:

1. Define tags for signal acquisition
2. Create function block
3. Create program alarms
4. Call function block
5. Edit alarm text

Define tags for signal acquisition

The following table shows the tags that are used in this example. Define these tags in the standard tag table. The standard tag table is available in the project tree under "PLC tags".

Table 6- 1 Tags for fill level alarms

Name	Data type	Description
max	BOOL	Tag for maximum fill level If "max" = 1, the maximum fill level is exceeded.
min	BOOL	Tag for minimum fill level If "min" = 1, the minimum fill level is undershot.

The figure below shows the standard tag table with the defined tags "max" and "min".

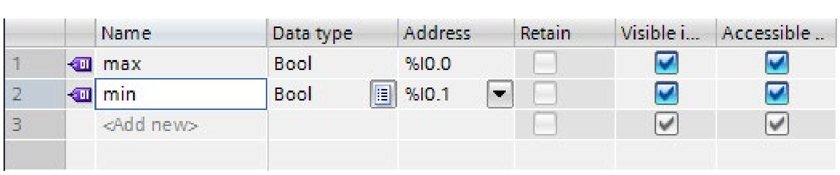

Figure 6-6 Define tags

Create function block

To create a function block, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Double-click "Add new block".
   The "Add new block" dialog opens.
3. Select the button "Function block".

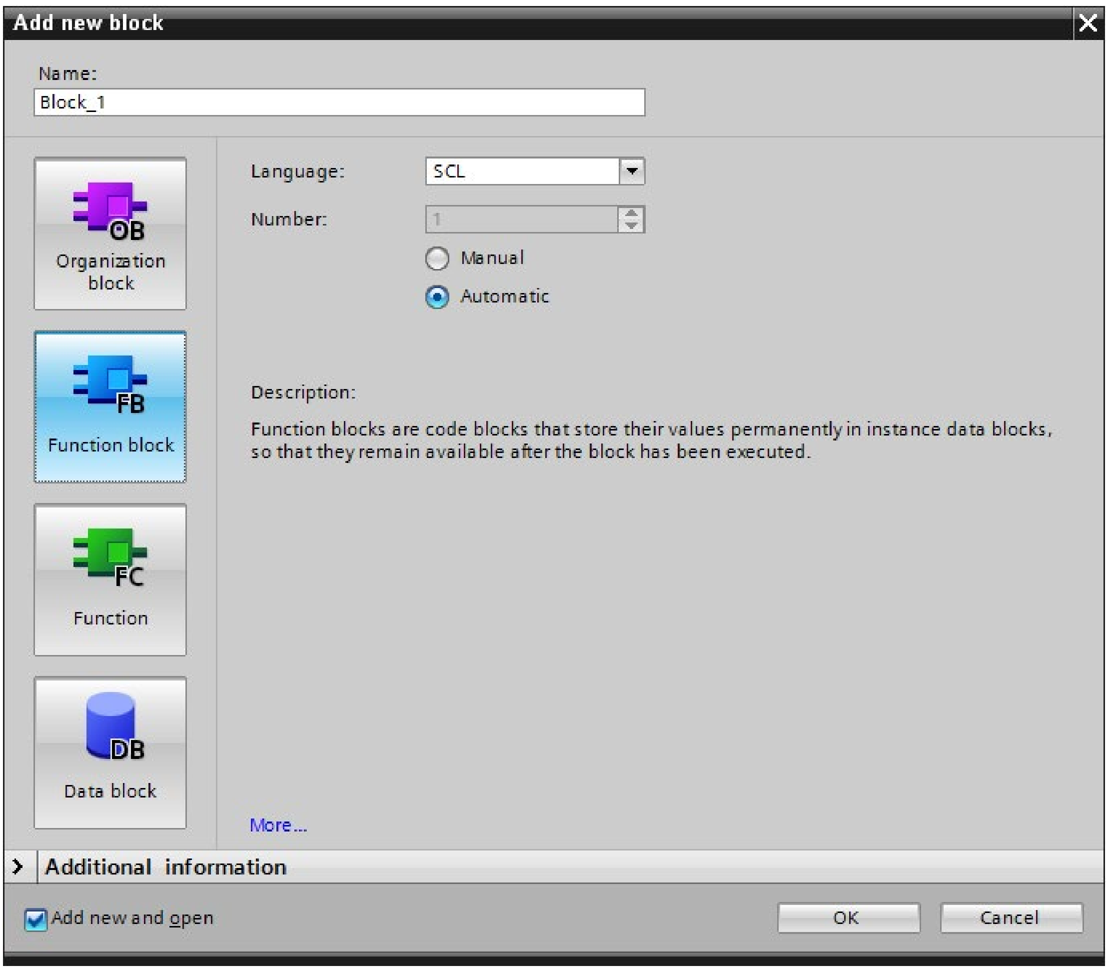

Figure 6-7 Create FB

4. Enter a name for the new block.
5. Select the language SCL.
6. Click on "OK" to confirm your input.

Result: You have created a function block.

Create program alarms

To create the program alarm for the example program, follow these steps:

1. Select the created function block (FB) in the "Program blocks" folder in the project tree and double-click the function block to open it.
2. Insert the call of the "Program_Alarm" instruction in the instruction part of the function block. The "Program_Alarm" instruction is available in the "Instructions" task card under "Extended instructions" > "Alarms".

   The "Call options" window opens.

   
   Figure 6-8 Call Program_Alarm

3. Enter "level_max" as the name and confirm the call options by clicking "OK".

   Result: The input tags of the "Program_Alarm" instruction are displayed in the instruction part.
4. Supply the SIG input tag of the "Program_Alarm" instruction with the tags for the maximum fill level.
   ```
   #level_max(SIG:="max");
   ```
   SIG: If a signal change occurs at the SIG input tag, the "Program_Alarm" instruction generates a program alarm.
5. Insert another call of the "Program_Alarm" instruction.
   The "Call options" window opens.
6. Enter "level_min" as the name and confirm the call options by clicking "OK".

   Result: The input tags of the "Program_Alarm" instruction are displayed in the instruction part.
7. Supply the SIG input tag of the "Program_Alarm" instruction with the tags for the minimum fill level.
   ```
   #level_min(SIG:="min");
   ```

Result: You have created two type alarms.

Call function block

To call the function block in the user program, follow these steps:

1. In the "Program blocks" folder, select the cycle OB (e.g., OB1) in which you want to call the function block and open the cycle OB with a double-click.
2. Select the function block you want to call in the "Program blocks" folder.
3. Drag the function block into the instruction part of the cycle OB.
   The "Call options" window opens.

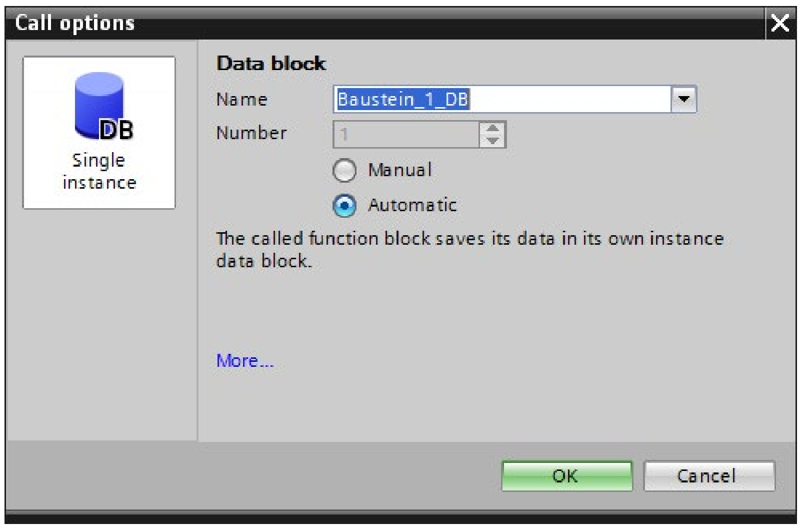

Figure 6-9 Call function block

4. Confirm the call options by clicking "OK".

Result: You have called the alarm block in the user program and created an instance alarm.

Edit alarm text

To edit the alarm text, follow these steps:

1. Double-click "PLC supervisions & alarms" in the project tree. Select the "Alarms" tab. The alarm editor opens.
2. Select the type alarm for the maximum fill level.
3. Enter the alarm text for the maximum fill level in the "Alarm text" column.
4. Select the type alarm for the minimum fill level.
5. Enter the alarm text for the minimum fill level in the "Alarm text" column.

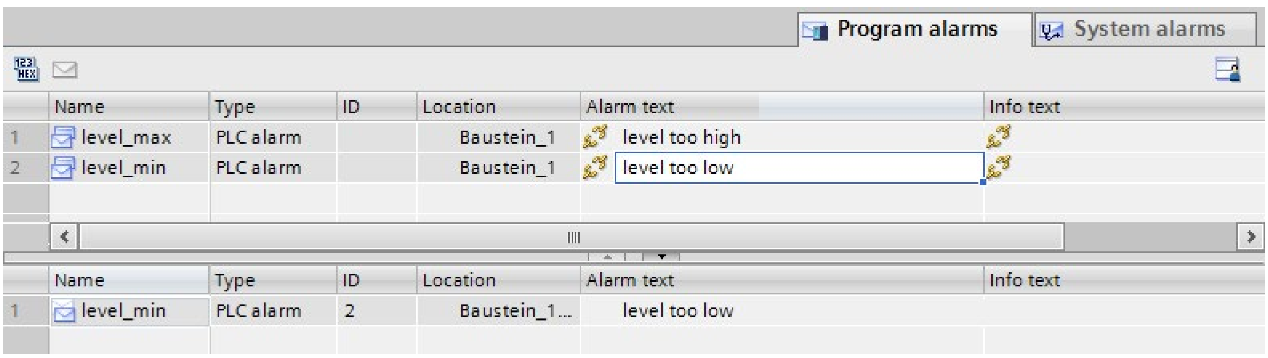

Figure 6-10 Edit alarm text

Result: You have created the alarm texts for both type alarms.

Additional information

You can learn how to create multilingual texts under "Multilingual alarms" in the section Editing alarms in the alarm editor (Page 81).

6.5.3 Example 2: Program alarm with associated value

Introduction

In this example, you create a shared program alarm for the maximum and the minimum fill level. The program alarm is given an associated value. The program alarm uses the associated value to access a text list entry and outputs a separate alarm text for the minimum and the maximum fill level.

How the example works

The program alarm is output if either the minimum fill level is undershot or the maximum fill level is exceeded.

The associated value 1 of the "Program_Alarm" instruction is assigned the tag for the maximum fill level. The associated value references a text list with the entries "0" and "1".

The following scenarios are possible for output of the alarm text:

- Associated value is "0": The entry "0" of the text list with the alarm text for the undershot fill level is output.
- Associated value is "1": The entry "1" of the text list with the alarm text for the excessive fill level is output.

Steps

The following steps are necessary for this example:

1. Define tags for signal acquisition
2. Create function block
3. Create program alarm
4. Call function block
5. Create a text list
6. Edit alarm text

Define tags for signal acquisition

The following table shows the tags that are used in this example. Define these tags in the standard tag table. The standard tag table is available in the project tree under "PLC tags".

Table 6- 2 Tags for fill level alarms

Name	Data type	Description
max	BOOL	Tag for maximum fill level If "max" = 1, the maximum fill level is exceeded.
min	BOOL	Tag for minimum fill level If "min" = 1, the minimum fill level is undershot.

The figure below shows the standard tag table with the defined tags "max" and "min".

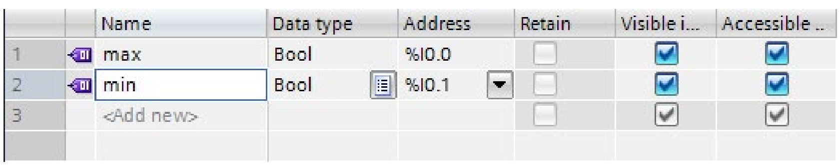

Figure 6-11 Define tags

Create function block

To create a function block, follow these steps:

1. Open the "Program blocks" folder in the project tree.
2. Double-click "Add new block".
   The "Add new block" dialog opens.
3. Select the button "Function block".

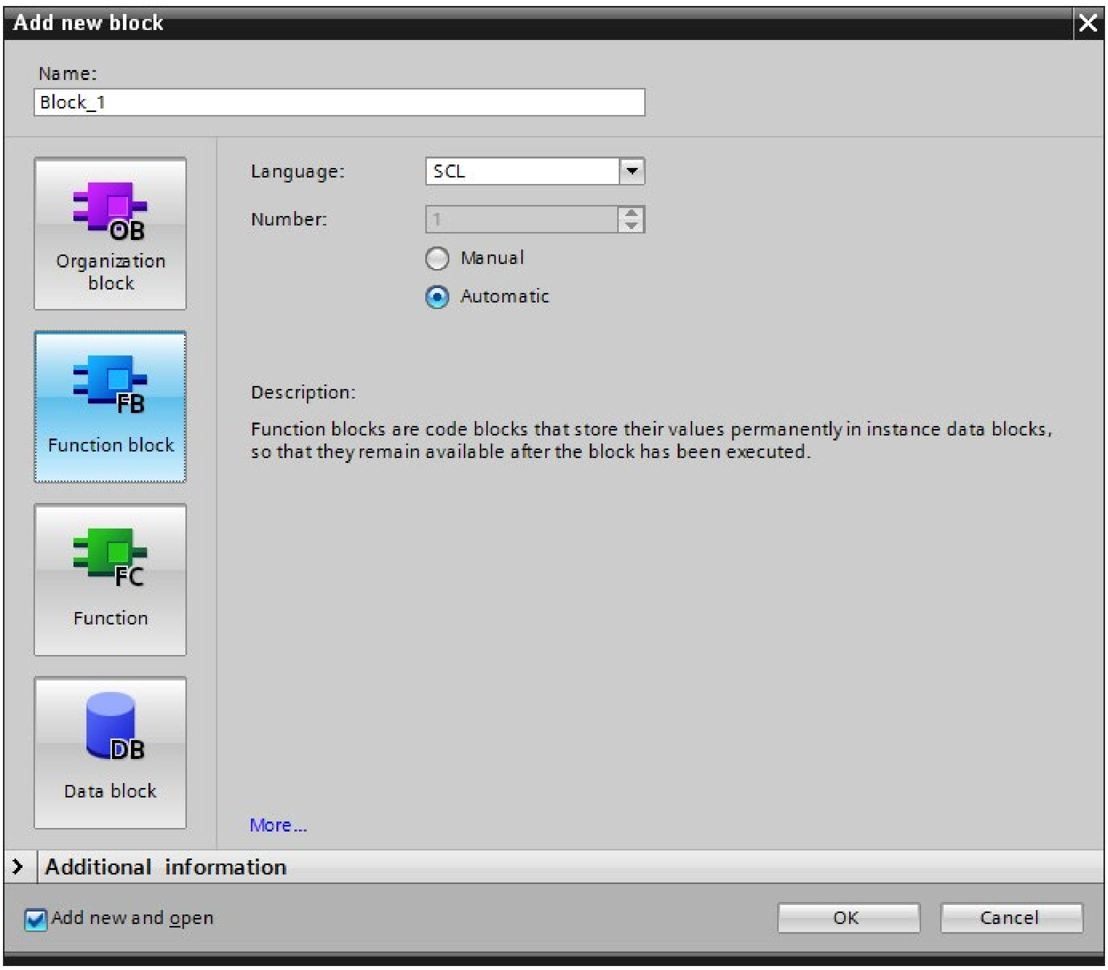

Figure 6-12 Create FB

4. Enter a name for the new block.
5. Select the language SCL.
6. Click on "OK" to confirm your input.

Result: You have created a function block.

Create program alarm

To create the program alarm for the example program, follow these steps:

1. Select the created function block (FB) in the "Program blocks" folder in the project tree.
2. Insert the call of the "Program_Alarm" instruction in the instruction part of the function block. The "Program_Alarm" instruction is available in the "Instructions" task card under "Extended instructions" > "Alarms".
   The "Call options" window opens.

   
   Figure 6-13 Call Program_Alarm

3. Enter "level_alarm" as the name and confirm the call options by clicking "OK".

   Result: The input tags of the "Program_Alarm" instruction are displayed in the instruction part.
4. Supply the SIG input tag of the "Program_Alarm" instruction with the XOR logic operation of the tags for minimum and maximum fill level and the input tag SD_1 with the tag for the maximum fill level.
   ```
   #level_alarm(SIG:="min"XOR"max",SD_1:="max");
   ```
   SIG: If a signal change occurs at the SIG input tag, the "Program_Alarm" instruction generates a program alarm.
   SD_1: The associated value is acquired at the time of the signal change at the input tag and assigned to the program alarm.

Result: You have created a type alarm.

Call function block

To call the function block in the user program, follow these steps:

1. In the "Program blocks" folder, select the cycle OB (e.g., OB1) in which you want to call the function block and open the cycle OB with a double-click.
2. Select the function block you want to call in the "Program blocks" folder.
3. Drag the function block into the instruction part of the cycle OB.
   The "Call options" window opens.

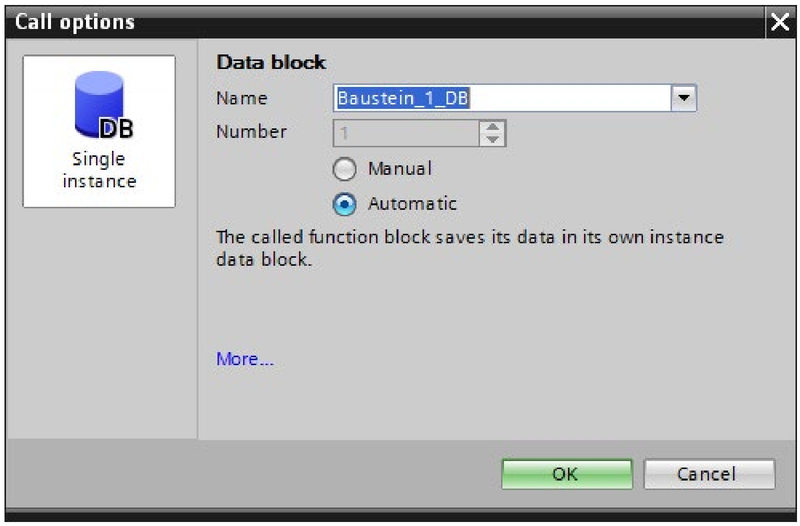

Figure 6-14 Call function block

4. Confirm the call options by clicking "OK".

Result: You have called the alarm block in the user program and created an instance alarm.

Creating a text list

To create the text list for the example program, follow these steps:

1. Double-click on the "Text lists" command in the program tree.
   The text list editor opens.
2. Double-click "<Add>" in the Text lists area.
   A new text list is added.
3. Name the text list "level_textlist".
4. Double-click "<Add>" in the Text list entries area of level_textlist.
   A new text list entry is added in the level_textlist text list.
5. Enter the alarm text for the maximum fill level in the "Entry" column.
6. Add another entry in the text list.
7. Enter the alarm text for the minimum fill level in the "Entry" column.

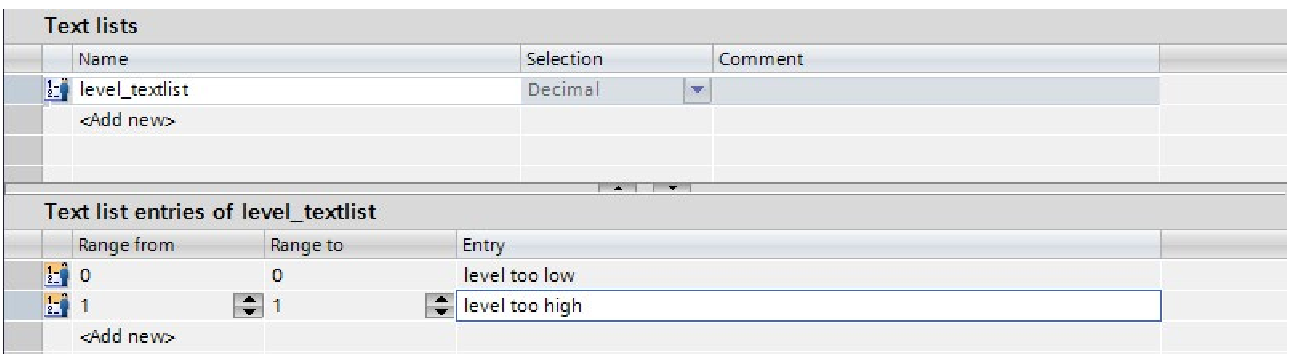

Figure 6-15 Creating a text list

Result: You have created the text list for the alarm text.

Edit alarm text

To edit the alarm text for the example program, follow these steps:

1. Double-click "PLC supervisions & alarms" in the project tree. Select the "Alarms" tab. The alarm editor opens.
2. Select the type alarm created for the example.
3. Click in the "Alarm text" column.
4. Open the shortcut menu and select the command "Insert a dynamic parameter (text list)".

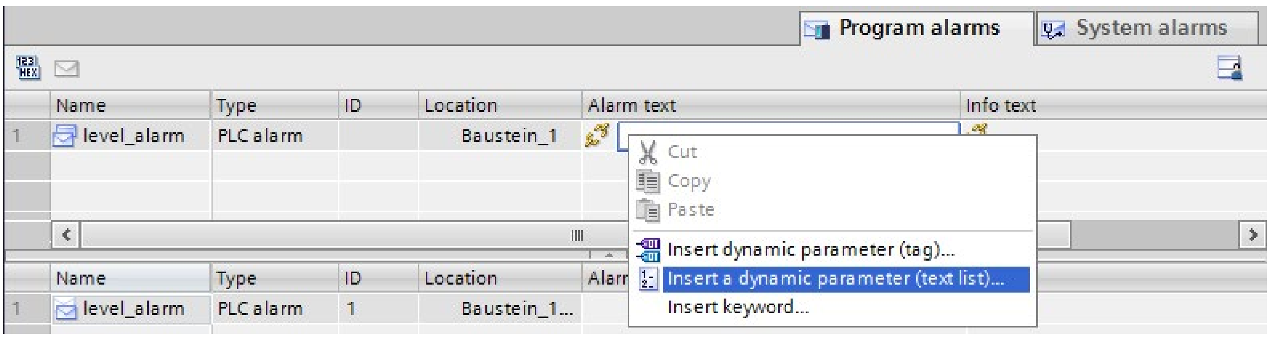

Figure 6-16 Edit alarm text

The window below opens.

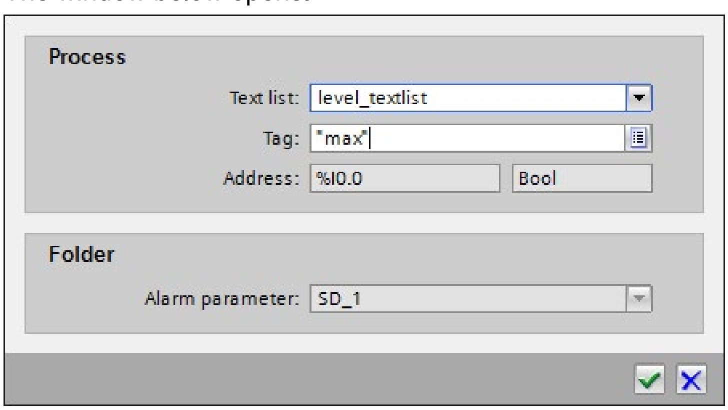

Figure 6-17 Insert a dynamic parameter (text list)

5. Select the text list "level_textlist" and the tag "max". Confirm your selection by clicking "OK".

Result: You have created the alarm text for the type alarms.
If the tag "max" (associated value 1) is 0, the alarm text "level too low" is output.
If the tag "max" (associated value 1) is 1, the alarm text "level too high" is output.

Additional information

You can learn how to create multilingual texts under "Multilingual alarms" in the section Editing alarms in the alarm editor (Page 81).

6.5.4 Displaying the alarm

Displaying the alarm in the Web server

The figure below shows the display of the alarm in the Web server for both examples.

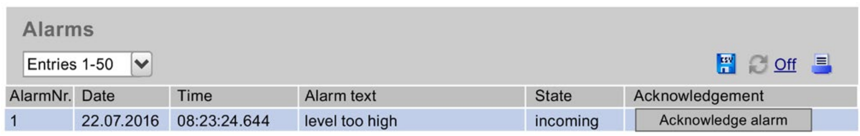

Figure 6-18 Displaying the alarm in the Web server

Displaying the alarm in STEP 7

Note

Displaying alarms in STEP 7

To display alarms in STEP 7, enable the option "Receive alarms" in the shortcut menu of the CPU.

The figure below shows the display of the alarm in STEP 7 for both examples.

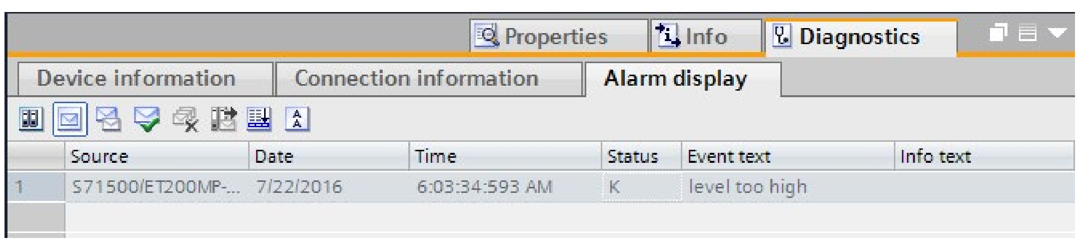

Figure 6-19 Display in STEP 7

7 Diagnostics of the S7-1500R/H redundant system

S7-1500R/H diagnostics

Diagnostics for a S7-1500R/H redundant system is basically the same as a standard S7-1500. You have the following display options:

- Via STEP 7
- Via HMI devices
- Via the display of the CPUs

The CPUs provide information about their operating states as well as internal and external errors through their LEDs.

The special features of the diagnostics of S7-1500R/H redundant systems are described below. In addition, the information of the current function manual and the STEP 7 online help also apply to S7-1500R/H redundant systems.

Diagnostics information in STEP 7

Hardware diagnostics can be performed as follows:

- Via the Online and Diagnostics view
- Via the "Online Tools" task card
- Via the "Diagnostics > Device Information" area of the Inspector window
- Via diagnostics icons, for example, in the device view and in the project tree

Diagnostics view in STEP 7 in dependence on the online connection and system states

The diagnostics view for S7-1500R/H redundant systems is partly dependent on:

- Which of the two CPUs the programming device / PC currently has a connection to
- The current system state in the redundant system

The table below provides an overview. The following sections illustrate the diagnostics view for S7-1500R/H using examples.

Table 7- 1 Diagnostics view in dependence on the online connection and system states

Diagnostics view in STEP 7	An online connection is available to the	System state	Examples in section
Online data and diagnostics of the redundant system	Primary CPU or backup CPU	RUN-Redundant	Online and Diagnostics view (Page 103)
Online data and diagnostics of the primary CPU The following are not displayed: Online data and diagnostics from the backup CPU	Primary CPU	RUN-Solo or STOP	Online and Diagnostics view (Page 103) and Restrictions in the RUN-Solo system state (Page 120)
Online data and diagnostics of the backup CPU The following are not displayed: • Online data and diagnostics from the primary CPU • Online data and diagnostics of the distributed I/O	Backup CPU	RUN-Solo or STOP	
Display of the 3 operator panels in the "Online Tools" task card	Primary CPU or backup CPU	Not relevant	"Online Tools" task card (Page 106)
Cycle time of the primary CPU (of the system) and memory of the primary CPU in "Online Tools" task card	Primary CPU or backup CPU	RUN-Redundant	
Cycle time and memory of the primary CPU in the "Online Tools" task card	Primary CPU	RUN-Solo or STOP	
Cycle time and memory of the backup CPU in the "Online Tools" task card	Backup CPU	RUN-Solo or STOP	
Memory reset of the primary CPU via "Online Tools" task card	Primary CPU	STOP	
Memory reset of the backup CPU via "Online Tools" task card	Backup CPU	RUN-Solo or STOP	
"Alarm display" tab: Alarms from the primary CPU	Primary CPU	Not relevant	Diagnostics view in the project tree and in the device view and network view (Page 109)
"Alarm display" tab: Alarms from the backup CPU	Backup CPU	Not relevant	
Diagnostics of the distributed I/O	Primary CPU or backup CPU	RUN-Redundant	Diagnostics in the RUN-Redundant system state (Page 114)
Diagnostics of the distributed I/O	Primary CPU	RUN-Solo	Restrictions in the RUN-Solo system state (Page 120)

Accessible devices

As for standard S7-1500 systems, the following can be displayed in STEP 7:

- All devices accessible from programming device/PC
- The diagnostics information of devices of a redundant system, for example, from the R/H CPUs

The procedure is described in the section Accessible devices (without project) (Page 34).

7.1 Online and Diagnostics view

Introduction

You open the Online and Diagnostics view for the redundant system or for each CPU of the redundant system.

Online & diagnostics for the redundant system

"Online access":

For the S7-1500R/H redundant system, it is displayed whether an online connection exists between the programming device/PC and a CPU. The additional note "Online (via Primary CPU)" or "Online (via Backup CPU)" indicates which role the "Online" connected CPU has.

If you enable "Receive alarms", you receive asynchronous alarms of diagnostics events from the CPU with online connection. The display corresponds to the representation for standard CPUs.

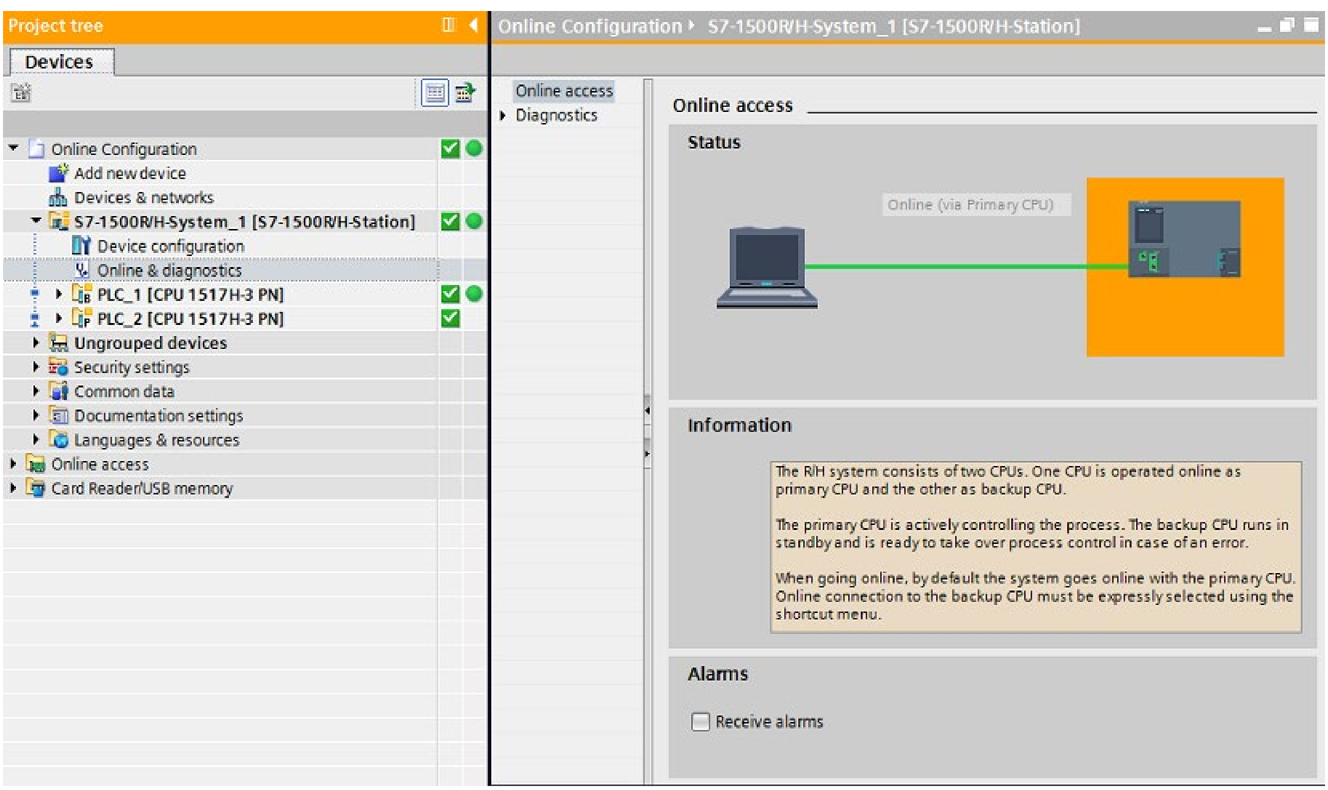

Figure 7-1 Online and Diagnostics view: Redundant system S7-1500R/H

"Diagnostics":

"Diagnostics" provides an overview for the redundant system about the:

- System state
- Pairing state
- Operating states of the CPU
- Status of which CPU is the primary CPU and which CPU is the backup CPU

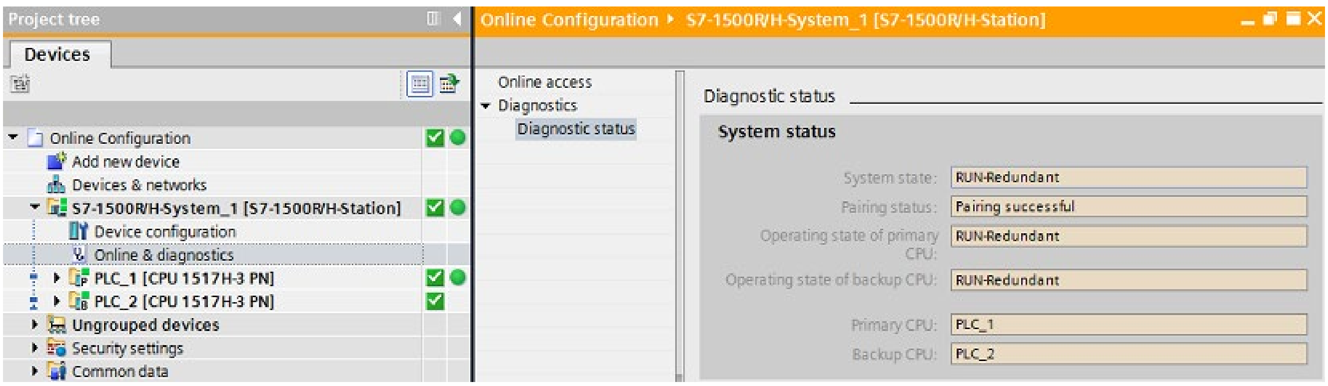

Figure 7-2 Online and Diagnostics view: Diagnostics status of the S7-1500R/H system

Online & diagnostics for the primary CPU or backup CPU

The Online and Diagnostics view for the CPUs of the redundant system match the display for standard CPUs.

In the RUN-Redundant system state, the primary and backup CPU display the online data of the redundant system irrespective of which of the two CPUs the online connection has been made.

In the RUN-Solo system state, the programming device/PC displays the data of the CPU for which there is an online connection, i.e. either the primary CPU or of the backup CPU.

You select the CPU for display of the online data in the project tree.

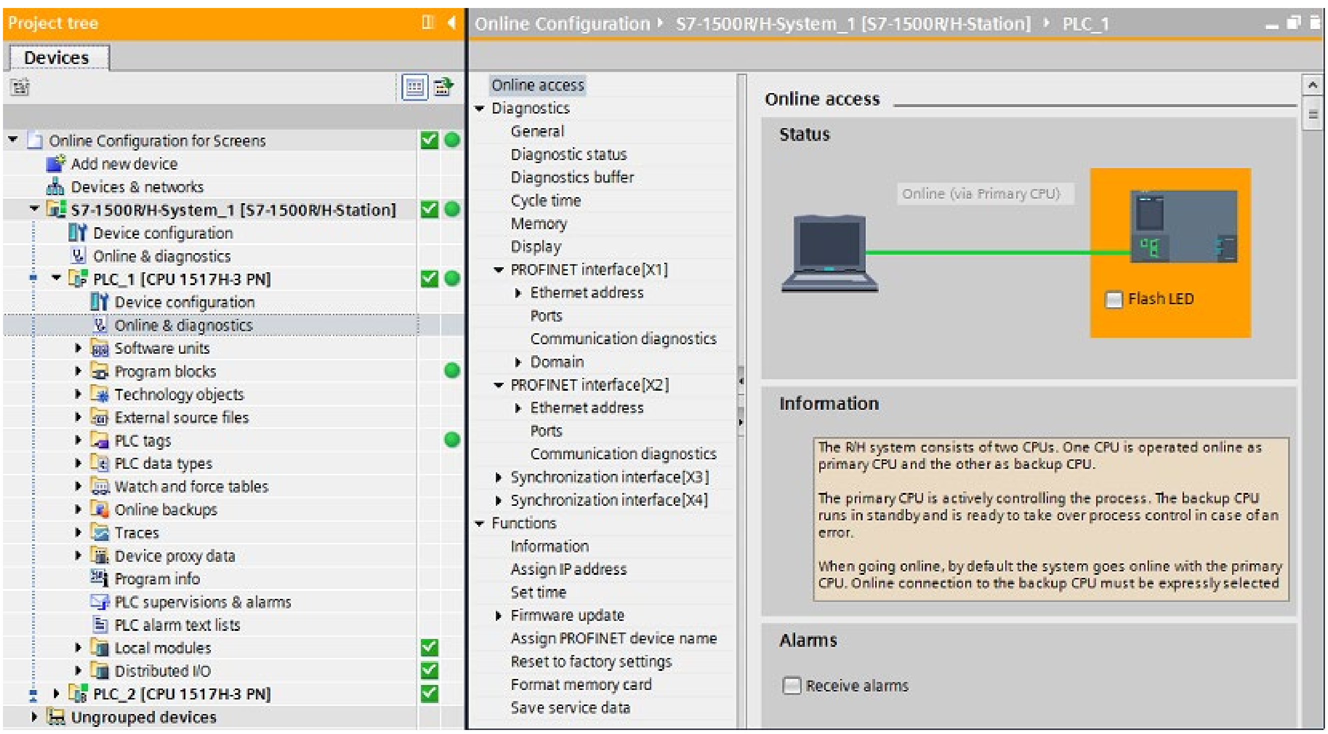

Figure 7-3 Online and Diagnostics view: CPU (RUN-Redundant system state)

Reference

You can find information on the operating and system states in the Redundant System S7-1500R/H System Manual (https://support.industry.siemens.com/cs/ww/en/view/109754833).

7.2 "Online Tools" task card

Introduction

If an online connection exists to a CPU of the redundant system, the "Online Tools" task card displays online information for the redundant system.

For a S7-1500R/H redundant system, "Online Tools" displays:

- 3 panes operator panel
- Cycle time
- Memory

R/H system operator panel

For the redundant system, the "R/H system operator panel" pane shows the:

- Current states of the LEDs of the primary CPU
- System state
- Status of which CPU is the primary CPU and which CPU is the backup CPU with their current operating states

The "STOP R/H-System" button can be used to switch the S7-1500R/H system to the system state STOP.

Note

Reaching RUN-Redundant system state

Note that you cannot switch the S7-1500R/H to RUN-Redundant system state using the R/H-System operator panel. You reach the RUN-Redundant system state by switching the operating state for each CPU to RUN in the operator panel of the respective CPU.

CPU operator panel

The two "CPU operator panel" panes show for the respective CPU of the redundant system:

- The role of the CPU, primary CPU or backup CPU
- The current states of the LEDs
- The operating state of the CPU

Use the "RUN / STOP" button to change the operating state for the respective CPU.

Use the "MRES" button to perform a memory rest for the CPU, under the following conditions:

- Online connection to this CPU is available
- The CPU is in STOP operating state.

Example

The following figure shows an example of the "Online Tools" task card for the RUN-Solo system state. The primary CPU is in RUN operating state, the backup CPU in STOP operating state.

As long as the backup CPU is in STOP operating state, the backup CPU does not establish any connection to the I/O devices. Therefore, the ERROR LED of the backup CPU always flashes red in the system states STOP and RUN-Solo.

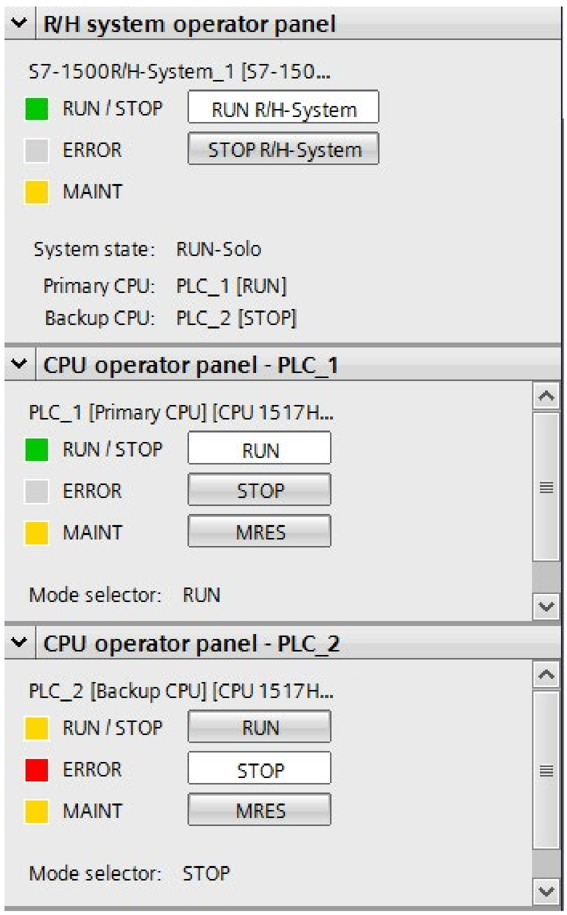

Figure 7-4 "Online Tools" task card: Operator panel (RUN-Solo system state)

Cycle time and memory

In the RUN-Redundant system state, the "Cycle time" and "Memory" panes show the current values of the primary CPU. In redundant mode, the cycle time of the primary CPU matches the cycle time of the system.

In the RUN-Solo system state, the panes show the current values for the CPU for which there is an online connection.

The display corresponds to the representation for standard CPUs.

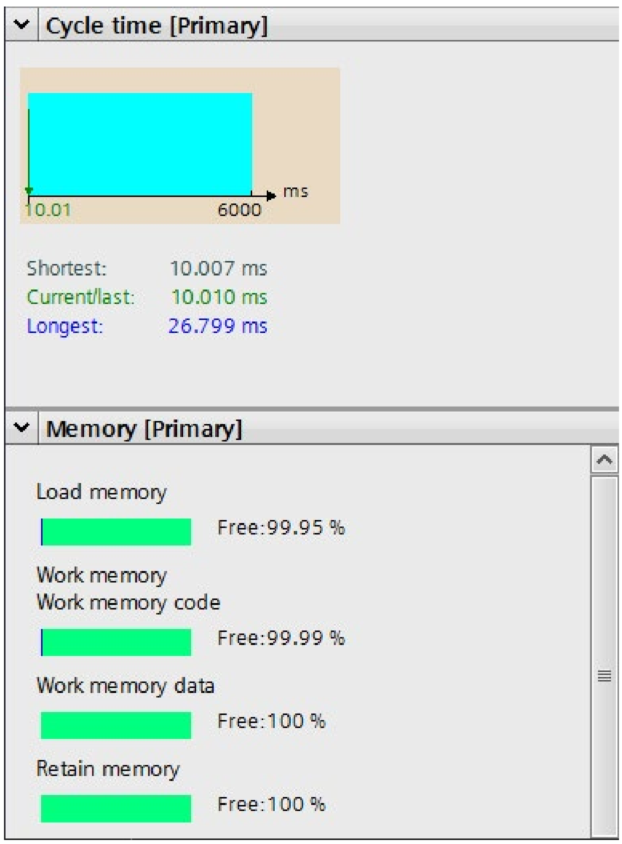

Figure 7-5 "Online Tools" task card: Cycle time and memory of the primary CPU

Reference

You can find information on the operating and system states in the Redundant System S7-1500R/H System Manual (https://support.industry.siemens.com/cs/ww/en/view/109754833).

7.3 Diagnostics view in the project tree and in the device view and network view

Additional icons for redundant systems in the project tree

Table 7- 2 Icons for redundant systems in the project tree of STEP 7

Icon in the project tree	Meaning
	Identifier of the folder S7-1500R/H-System: RUN-Redundant system state
	Identifier of the folder S7-1500R/H-System: RUN-Solo system state
	Identifier of the folder S7-1500R/H-System: STARTUP system state
	Identifier of the folder S7-1500R/H-System: STOP system state
	Identifier of the folder for the primary CPU: RUN operating state
	Identifier of the folder for the backup CPU: RUN operating state
	Identifier of the folder for the primary CPU: STARTUP operating state
	Identifier of the folder for the backup CPU: STARTUP operating state
	Identifier of the folder for the primary CPU: STOP operating state
	Identifier of the folder for the backup CPU: STOP operating state
	Identifier of the folder of a CPU of the redundant system: "Online via partner": The other CPU of the redundant system is connected online to the programming device / PC.

Example: Diagnostics view in the project tree and in the device view and network view

An example of the diagnostics view for a S7-1500R/H system is shown below.

The sample configuration consists of two CPUs S7-1517H-3 PN and one interface module IM 155-6 PN HF as PROFINET IO device. PLC_1 is the primary CPU (in RUN operating state). PLC_2 is the backup CPU (in STOP operating state). The hardware configuration and the user program were loaded in the primary CPU.

The system is connected online via PLC_1 (primary CPU) and is in RUN-Solo system state.

View of the system in the project tree

The system is in RUN-Solo system state. PLC_1 is in RUN operating state, PLC_2 is in STOP operating state.

Because the system is in RUN-Solo system state, the following is displayed:

- For the system, maintenance demanded with problem in lower-level component
- For PLC_1, maintenance demanded

For PLC_2, online connection via partner is displayed, as the programming device/PC is connected online to PLC_1.

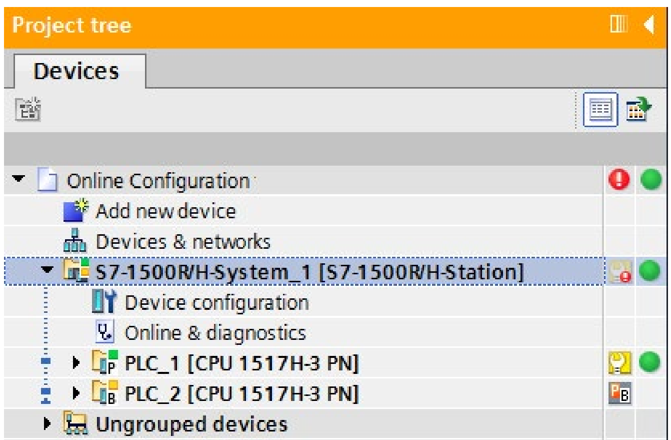

Figure 7-6 Diagnostics example: Redundant system project tree (RUN-Solo)

Network view of the system

The network view shows no faults for the H-CPUs or the IO device.

Maintenance demanded in lower-level component indicated for the system, since the system is in RUN-Solo system state.

No operating states and system states of the redundant system are displayed in the network view.

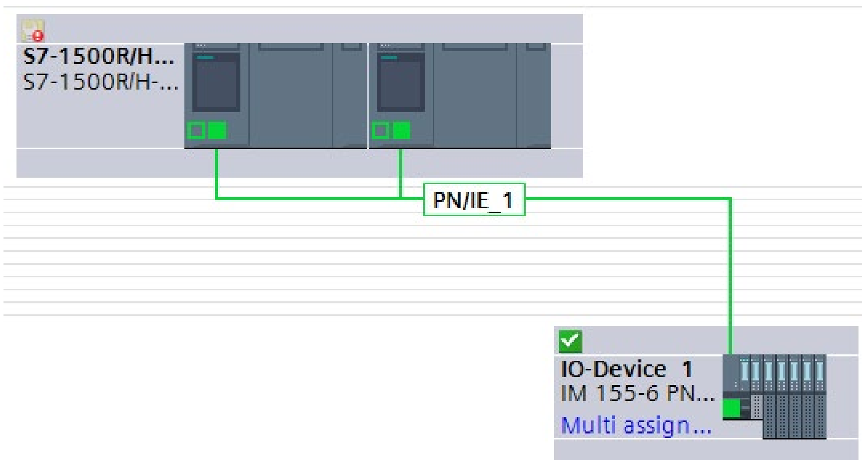

Figure 7-7 Diagnostics example: Network view of redundant system (RUN-Solo)

Doubling-clicking on the system gives you access to the device view of both CPUs.

Device view of the system

In the device view, you see the operating states of the CPUs based on the icons above PLC_1:

- Green icon: PLC_1 is in the RUN operating state.
- Yellow icon for maintenance demanded: PLC_2 is in the STOP operating state.

PLC_2 indicates that the online connection is available through the partner (PLC_1).

You can find more detailed information on the system faults in the "Diagnostics" tab, in "Device information". The device information indicates maintenance demanded and RUN operating state for PLC_1.

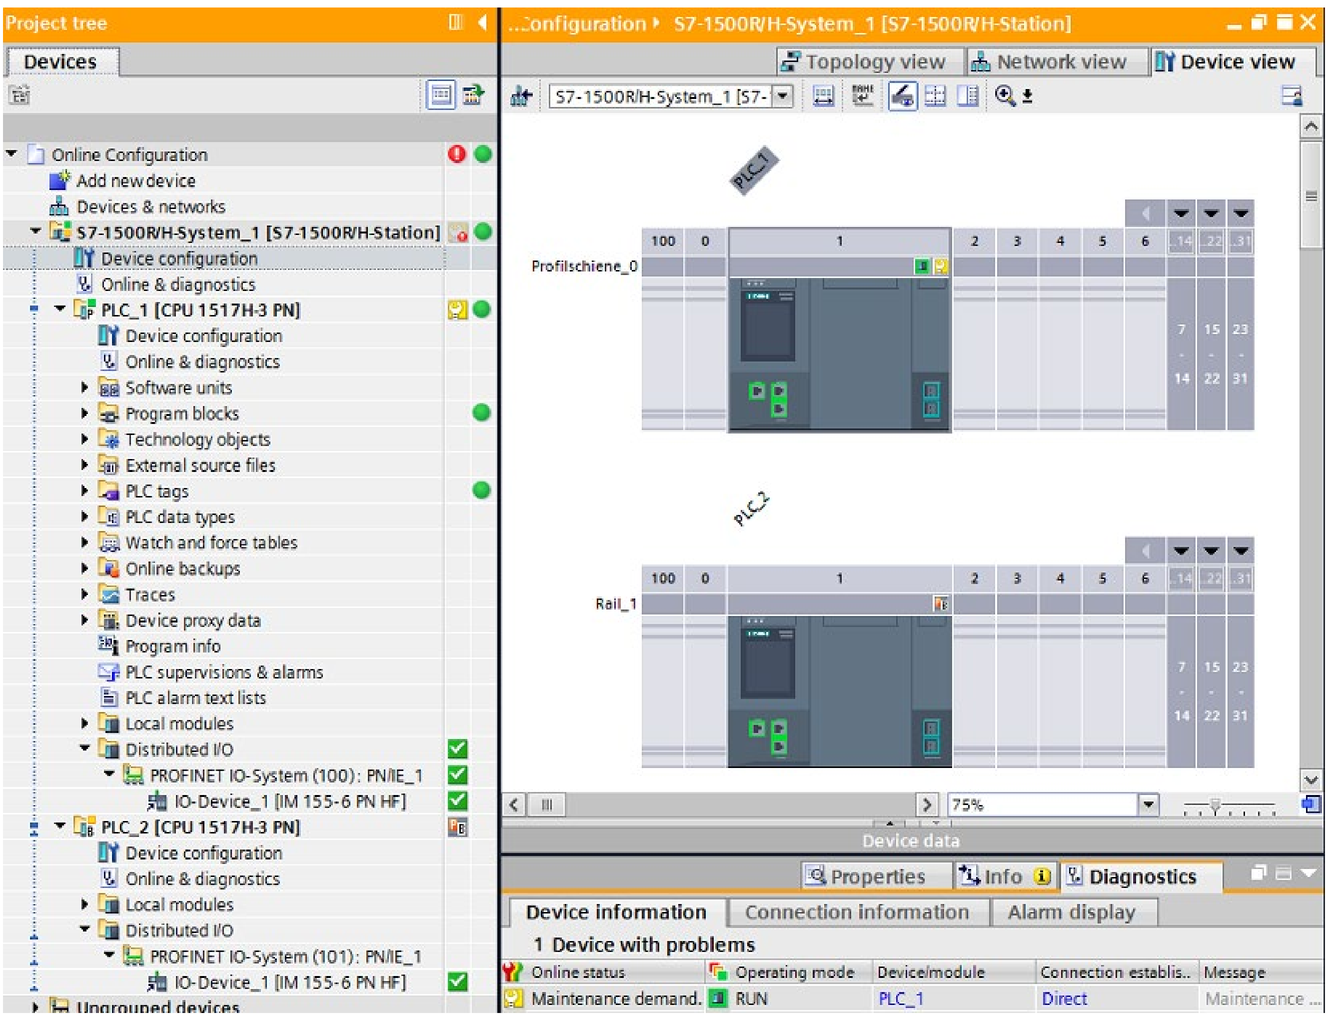

Figure 7-8 Diagnostics example: Device view of redundant system (RUN-Solo)

Alarm display of the system

As in the RUN-Solo system state, the alarms of the CPU for which there is an online connection are displayed via the "Alarm display" tab (in the example from PLC_1).

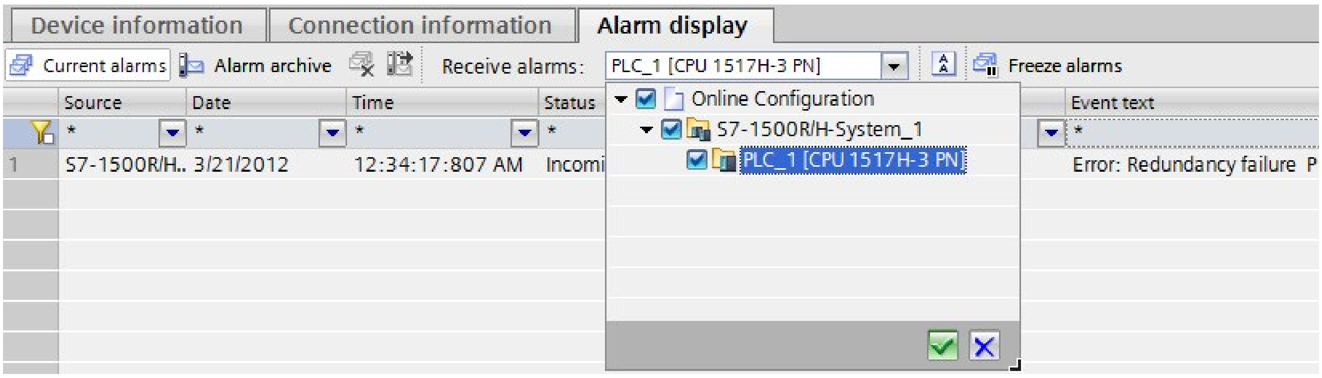

Figure 7-9 Diagnostics example: Alarm display of redundant system (RUN-Solo)

Device view of the IO device

The IO device is an interface module IM 155-6 PN HF with two I/O modules and one server module. The device view shows that there is no faults in the modules.

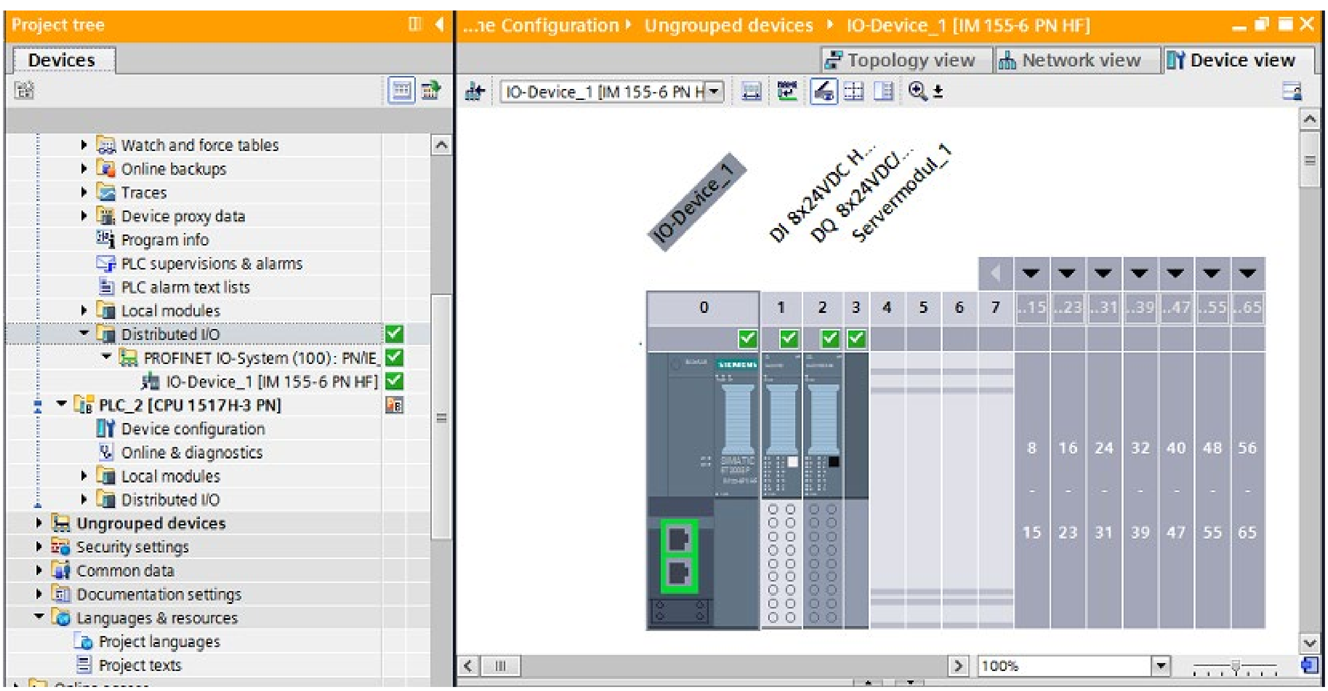

Figure 7-10 Diagnostics example: Device view of IO device

7.4 Diagnostics in the RUN-Redundant system state

Diagnostics view in redundant mode

Primary CPU and backup CPU are each in the RUN-Redundant operating state.

In the RUN-Redundant system state, the primary and backup CPU display the online data of the redundant system irrespective of which of the two CPUs the online connection has been made.

The diagnostics between the two CPUs is synchronized (diagnostics entries, diagnostics events).

As in the RUN-Solo system state, the alarms of the CPU to which there is an online connection are displayed via the "Alarm display" tab. You can find more information in the Diagnostics view in the project tree and in the device view and network view (Page 109).

No error in RUN-Redundant system state

If no error is detected in the RUN-Redundant system state, all diagnostics icons in the navigation tree and in the network view show "No fault".

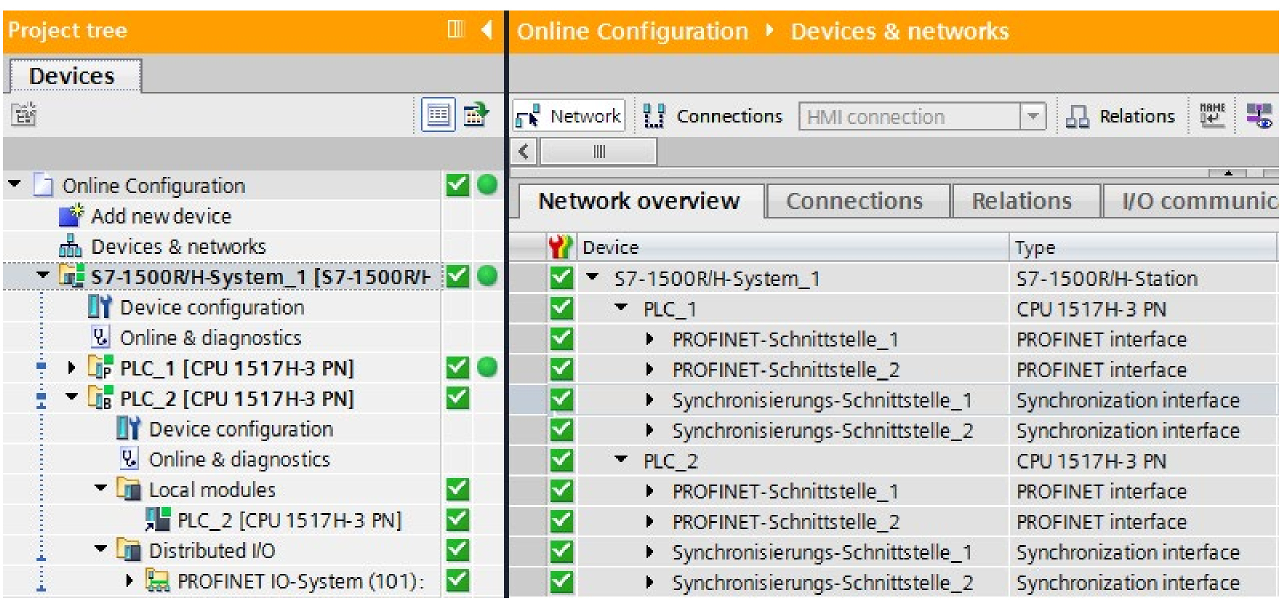

Figure 7-11 Diagnostics example: No fault in the RUN-Redundant project tree

Error in the RUN-Redundant system state

If there are too many errors in the redundant system, the RUN-Redundant system state is retained, for example, if a module in an IO device fails. The diagnostics view is similar to the standard S7-1500 systems.

Special examples of a redundant system S7-1500H are shown below:

S7-1500H Example 1:

The PROFINET ring was interrupted.

Evaluate diagnostics via LINK TX/RX LEDs on the CPU

TX/RX X1 P1 LED is not illuminated. This means:

- No Ethernet connection between the P1 port of the respective PROFINET interface and the communication partner

Diagnostics in STEP 7

The diagnostics in the project tree shows:

- Maintenance demanded in lower-level component in the S7-1500H system
- Maintenance demanded in lower-level component for PLC_1 and PLC_2
- Maintenance demanded in lower-level components of local modules of PLC_2

The diagnostics in the network view indicates errors at the affected port of the PROFINET interfaces of PLC_2.

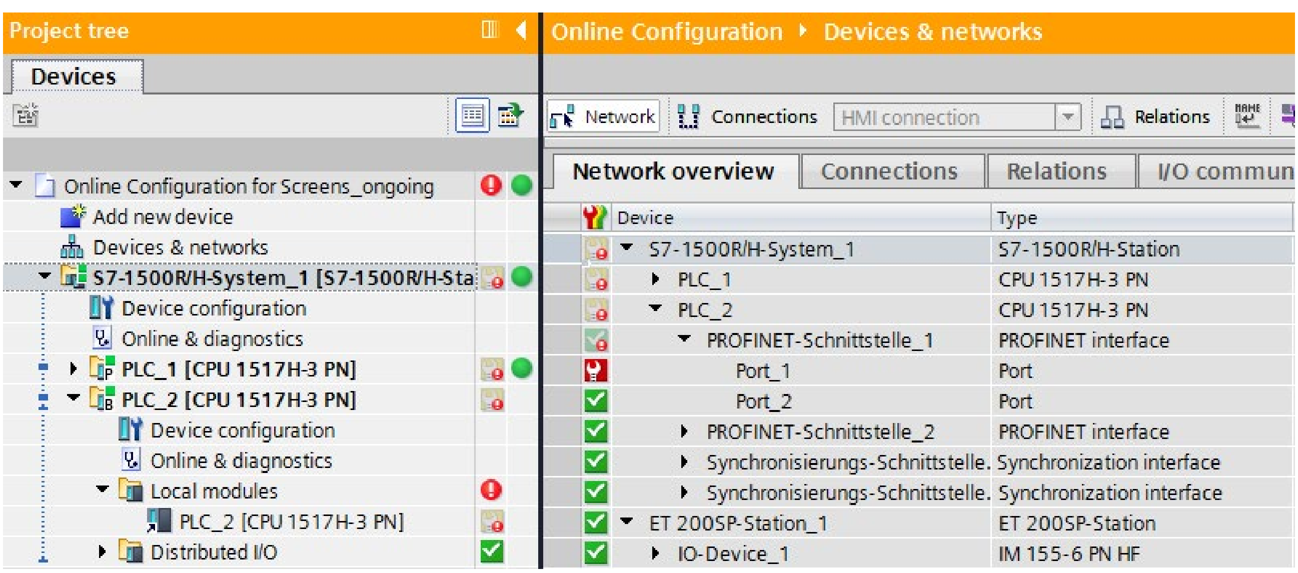

Figure 7-12 Diagnostics example: RUN-Redundant system state, open PROFINET ring

You can evaluate the diagnostics using the displays of the CPUs via the "Diagnostics" menu as with standard CPUs. You can find additional information in the section Display of the CPU (Page 30).

S7-1500H Example 2:

A synchronization module has been removed in S7-1500H.

Evaluating diagnostics via X3 and X4 LEDs on the CPU

The X3 LED on PLC_2 CPU is not illuminated. This means:

- The redundancy connection on the synchronization module was interrupted at the H-Sync interface X3.

  or
- There is no synchronization module at the H-Sync interface X3.

Diagnostics in STEP 7

The diagnostics in the project tree shows:

- Maintenance demanded in lower-level component in the S7-1500H system
- Maintenance demanded for PLC_1
- Maintenance demanded in lower-level component for PLC_2
- Hardware fault in local modules of PLC_1 and PLC_2

The diagnostics in the network view indicates that synchronization module 1 of PLC_2 is not accessible.

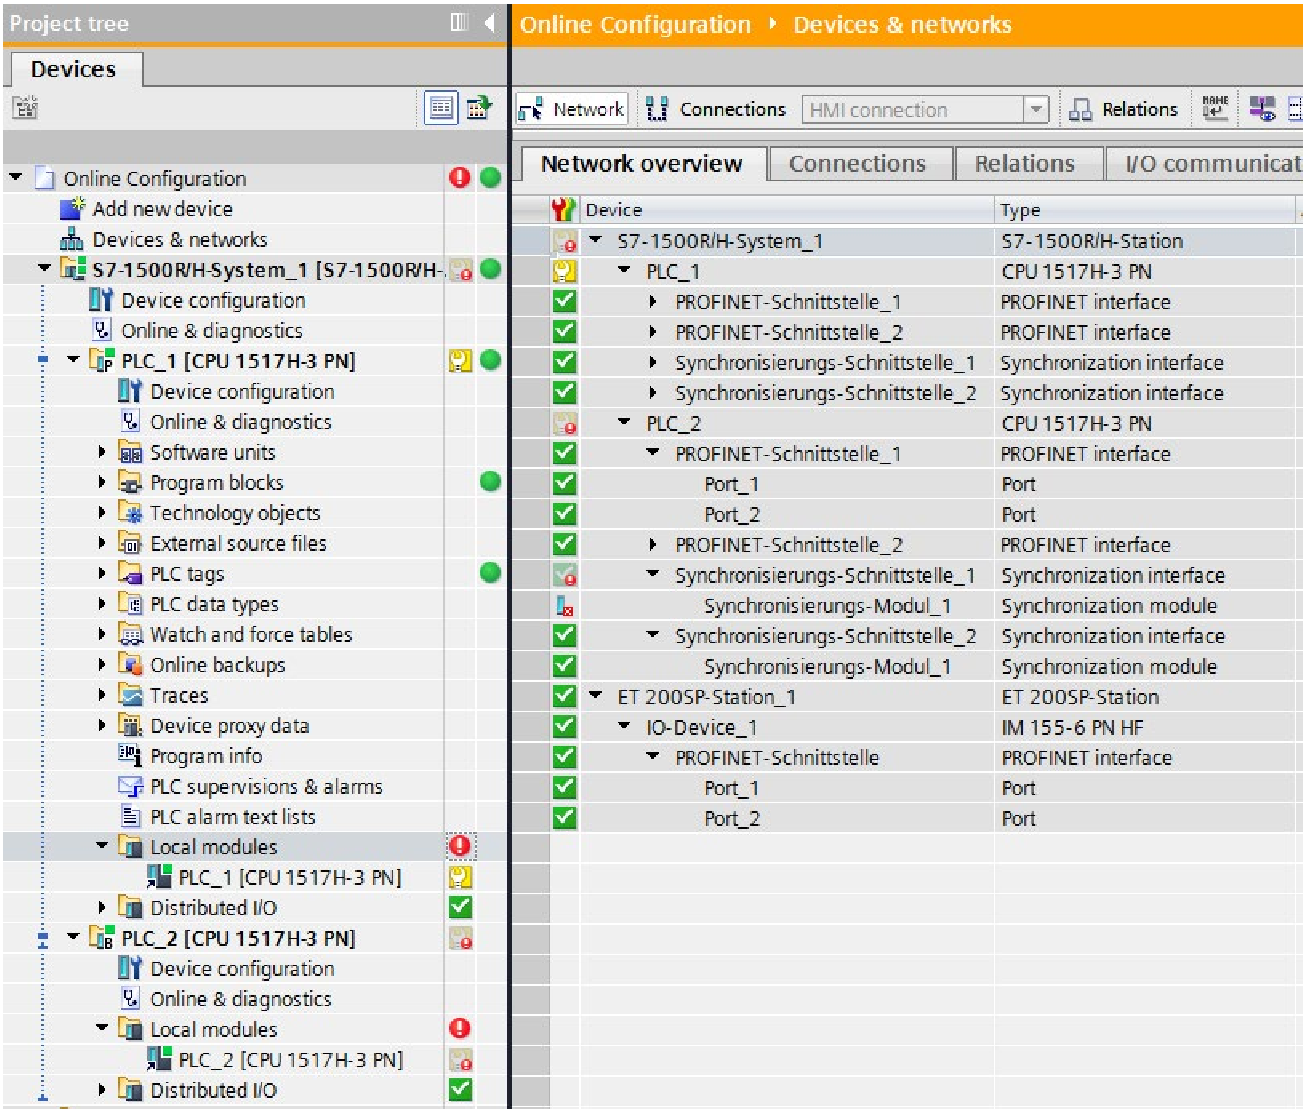

Figure 7-13 Diagnostics example: RUN-Redundant system state, a synchronization module fails

Evaluate diagnostics on the display

For example 2, display of the PLC_2 CPU shows:

- In the "Overview" menu command: A message is available in the next lower level page.
- In the "Diagnostics" menu command: A message is available in the next lower level page.
- In the Module menu command: An error has occurred.

To evaluate the display, proceed as follows:

1. Navigate to "Pairing state" via the menu commands "Overview" > "Redundancy".
2. This is displayed as the pairing state: Single paired (X4).

   This means that the redundancy connection is available at the H-Sync interface X4, but not at the X3.
3. Navigate to "Alarms" via the "Diagnostics" menu command.
4. View the details of the alarm (evaluate diagnostics buffer).

S7-1500H Example 3:

A redundancy connection in S7-1500H is interrupted.

Evaluating diagnostics via X3 and X4 LEDs on the CPU

The X4 LED on PLC_2 CPU is not illuminated. This means:

- The redundancy connection on the synchronization module was interrupted at the H-Sync interface X4.

  or that
- There is no synchronization module at the H-Sync interface X4.

Diagnostics in STEP 7

The diagnostics in the project tree shows:

- Maintenance demanded in lower-level component in the S7-1500H system
- Maintenance demanded for PLC_1 and PLC_2
- Hardware fault in local modules of PLC_1 and PLC_2

Maintenance demanded is displayed for both CPUs in the network view. The lower-level components have no fault.

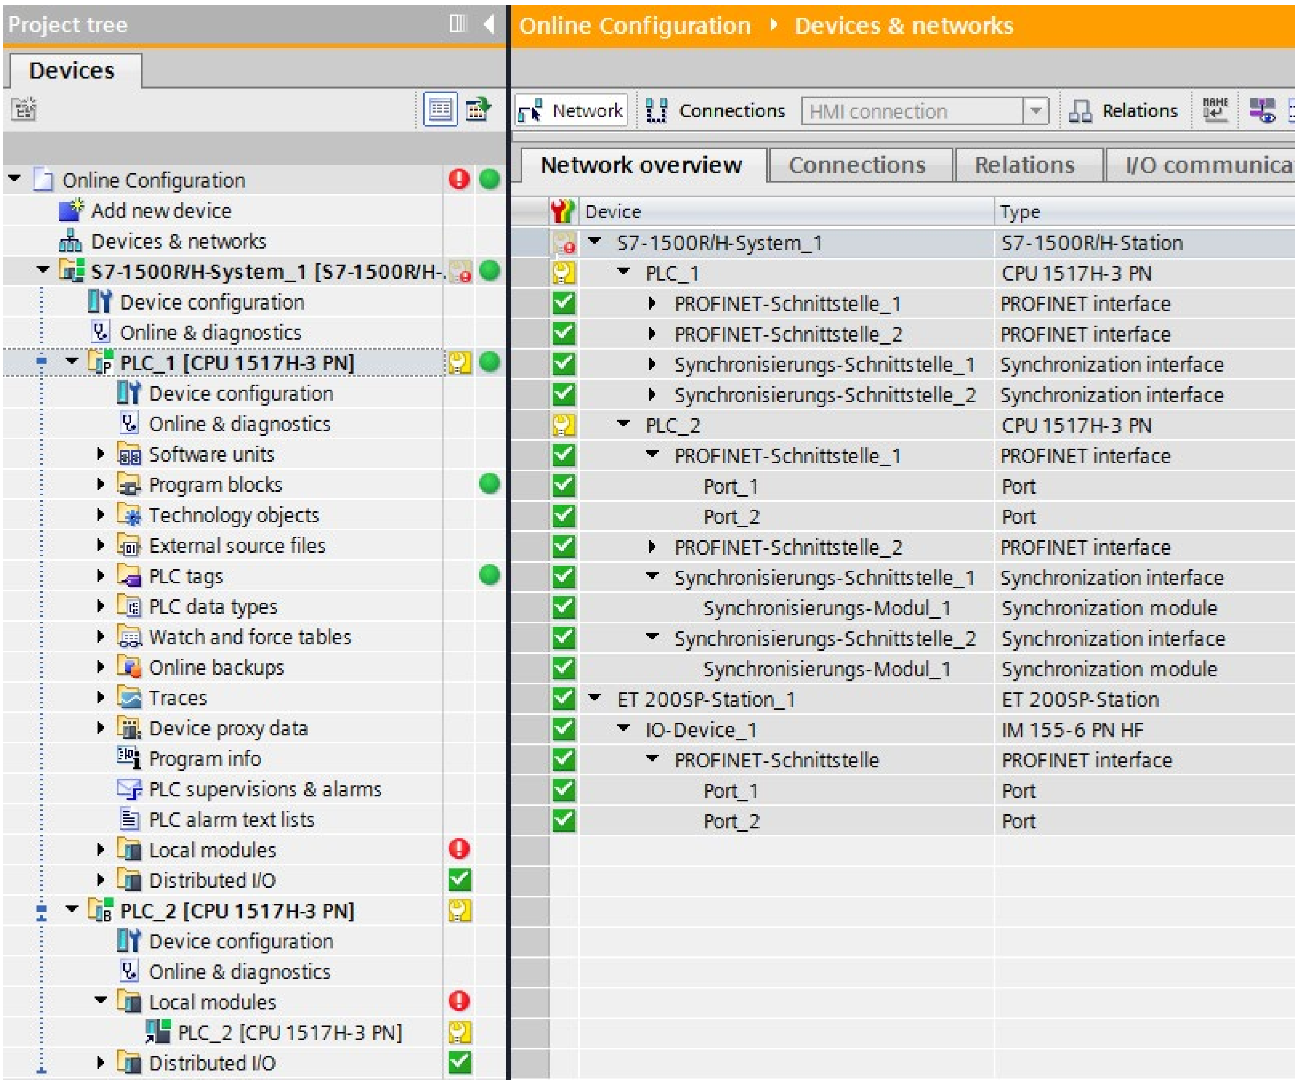

Figure 7-14 Diagnostics example: RUN-Redundant system state, a redundancy connection has failed

Evaluate diagnostics on the display

Perform the analysis of the display of PLC_2 CPU exactly as for example 2.

7.5 Restrictions in the RUN-Solo system state

The primary CPU is in RUN operating state. The Backup CPU is in STOP operating state, is switched off, defective, or not available.

Restrictions in the RUN-Solo system state

The primary CPU records the diagnostics states of the distributed I/O.

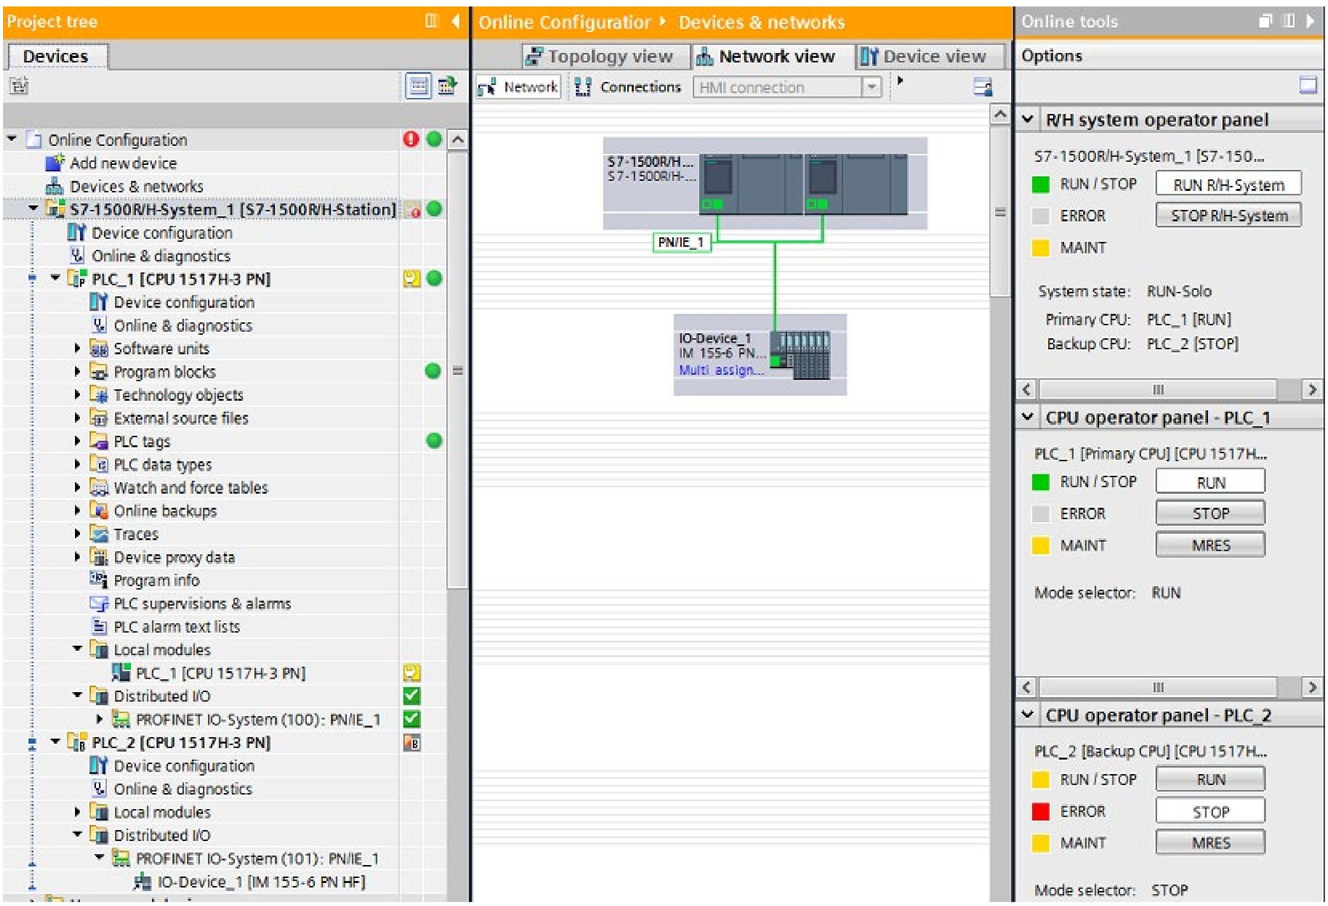

Figure 7-15 Diagnostics of the primary CPU and backup CPU in RUN-Solo system state

Diagnostics of the backup CPU

The following restrictions apply to the backup CPU:

- Diagnostics information from the backup CPU is only available when there is an online connection to the backup CPU.
- The distributed I/O is not accessible from the backup CPU. As a result the ERROR LED of the backup CPU always flashes red in the STOP and RUN-Solo system states.
- A memory reset can only be performed with the backup CPU operator panel when an online connection to the backup CPU is available.

Reference

You can evaluate the diagnostics using the displays of the CPUs via the "Diagnostics" menu as with standard CPUs. You can find additional information in the section Display of the CPU (Page 30).

7.6 System diagnostics by means of the user program

Instructions

Instructions for determining the system diagnostics are listed in the section System diagnostics options in the user program (Page 74).

The following instructions for diagnostics **cannot** be used for S7-1500R/H redundant systems:

- GEN_DIAG: Generate diagnostics information
- GEN_UsrMsg: Generate user diagnostic alarms
- GetStationInfo: Read information of an IO device
- DeviceStates: Read module state information in an IO system

  Please note: The "DeviceStates" instruction can be selected in STEP 7. The S7-1500R/H CPUs with firmware version V2.6 do not support the "DeviceStates" instruction. Do **not** use the "DeviceStates" instruction. To read out the module state information, use the "Get_DIAG" instruction.

Glossary

Alarm

An message sent to the operator due to events or states of the system.

Backup CPU

Role of a CPU in the S7-1500R/H redundant system. If the R/H system is in RUN-Redundant system state, the primary CPU controls the process. The backup CPU processes the user program synchronously and can take over the process control if the primary CPU fails.

Button (WinCC)

Object in WinCC that points out faults in the plant

Channel fault

Channel-related error of an individual channel - an I/O with inputs, for example, wire break or short circuit

Device

Modules with a network connection are referred to as device. Devices are installed on racks where they can be interconnected with other modules.

Diagnostics buffer

A buffered memory area in the CPU; it stores diagnostics events in the order of their occurrence

Firmware of the CPU

In SIMATIC, a distinction is made between the firmware of the CPU and user programs.

The firmware is a software embedded in electronic devices, which means it is permanently connected with the hardware functionally. It is usually saved in a flash memory, such as EPROM, EEPROM or ROM, and cannot be replaced by the user or only with special means or functions.

User program: see glossary entry "User program"

Global screen (WinCC)

A screen that is opened in the system diagnostics window is a global screen.

HMI device

Human Machine Interface, device for visualization and control of automation processes.

HMI diagnostics view (WinCC)

The HMI diagnostics view is an object in WinCC. The HMI diagnostics view can only be used with Comfort Panels and WinCC Advanced RT.

I/O module

Device of the distributed I/O that is used as interface between the controller and the process.

Industrial Ethernet

Guideline for setting up Ethernet in an industrial environment. The main difference to the standard Ethernet is the mechanical current carrying capacity and interference immunity of the individual components.

Memory reset

Procedure to set the memories of the CPU to a defined initial state.

Operating states

Operating states describe the behavior of a single CPU at a specific time.

The CPUs of the SIMATIC standard systems feature the STOP, STARTUP and RUN operating states.

The primary CPU of the S7-1500R/H features the STOP, STARTUP, RUN, RUN-Syncup and RUN-Redundant operating states. The backup CPU features the STOP, SYNCUP and RUN-Redundant operating states.

PLC

Programmable Logic Controller: Component of the CNC by which the machine manufacturer coordinates the interaction between the NC requirements (part program), the inputs of the machine operator and the current machine state.

Primary CPU

Role of a CPU in the S7-1500R/H redundant system. If the R/H system is in RUN-Redundant system state, the primary CPU controls the process. The backup CPU processes the user program synchronously and can take over the process control if the primary CPU fails.

PROFIBUS

Standard for fieldbus communication in automation technology.

PROFINET

PROcess FIeld NETwork, open industrial Ethernet standard which further develops PROFIBUS and industrial Ethernet. A cross-manufacturer communication, automation, and engineering model defined by PROFIBUS International e.V., as an automation standard.

Redundant systems

Redundant systems are identified by the fact that important automation components are available in multiple units (redundant). Process control is maintained if a redundant component fails.

Subnet

Part of a network whose parameters must be synchronized with the devices (e.g., with PROFINET). It includes the bus components and all connected stations. Subnets can be linked by means of gateways, for example, to form a network.

Synchronization module

The synchronization module is used to provide a redundant connection between the CPUs of the S7-1500H redundant system. You require two synchronization modules per CPU, which you connect using a fiber-optic cable.

System diagnostics

In the SIMATIC environment, the term "system diagnostics" refers to diagnostics of devices and modules. System diagnostics is used, for example, to monitor the states of the following components in the system: Power supply, device, I/O.

System diagnostics indicator (WinCC)

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your plant and displays two states: No error, error

System states

The system states of the S7-1500R/H redundant system result from the operating states of the primary and backup CPU. The term 'system state' is used as simple expression that identifies the operating states of the two CPUs that occur at the same time. The S7-1500R/H redundant system features the system states STOP, STARTUP, RUN-Solo, SYNCUP and RUN-Redundant.

Topology

Structure of a network. Common structures include:

- Linear bus topology
- Ring topology
- Star topology
- Tree topology

User program

In SIMATIC, a distinction is made between user programs and the firmware of the CPU.

The user program contains all instructions, declarations and data by which a plant or process can be controlled. It is assigned to a programmable module (for example, CPU, FM) and can be structured in smaller units.

Firmware: see glossary entry "Firmware of the CPU"

Value status

The value status describes a specific signal state. The value status is constantly updated and cyclically transmitted by the field device as quality statement together with the measured value.

Web server

Software/ communication service for data exchange using Ethernet. The web server provides the documents by means of standardized transmission protocols (HTTP, HTTPS) to a web browser. Documents can be static or dynamic upon request by the web browser composed from different sources by the web server.

WinCC

Windows **C**ontrol **C**enter: a PC-based process visualization system

WinCC Runtime

Component of the basic software WinCC

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

The diagnostics options available with the trace and logic analyzer function are described in this documentation. Depending on the device used, the recording options can vary.

Required basic knowledge

In order to understand this documentation, the following knowledge is required:

- General knowledge in the field of automation
- Knowledge about the use of Windows-based computers
- S7-1200/1500 CPUs, ET 200SP, ET 200Pro
  - Knowledge of the SIMATIC industrial automation system
  - Knowledge of working with STEP 7
- SINAMICS Drives
  - Knowledge of working with the drive
- SIRIUS SIMOCODE pro, SIRIUS Soft Starter 3RW
  - Proficiency in using these systems

Validity of the documentation

This documentation applies to all products of the product series S7-1200, S7-1500, S7-1500 Software Controller, ET 200SP, CPU 1516(F)pro-2 PN, SINAMICS drives, SIRIUS SIMOCODE pro and SIRIUS Soft Starter 3RW as of TIA Portal V15.

Conventions

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

"mySupport"

With "mySupport", your personal working area, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en/).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Further support

- The range of technical documentation for the individual SIMATIC products and automation systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the online ordering system is available on the Internet (https://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Description 1

1.1 Supported hardware

If a device supports the trace and logic analyzer function, "Traces" is offered for selection in the project tree below the device.

The following devices (Page 71) support the trace and logic analyzer function:

- SIMATIC S7-1200 CPUs (as of firmware version V4.0)
- SIMATIC S7-1500, ET 200SP and CPU 1516pro-2 PN CPUs
- SIMATIC S7-1500 Software Controller
- SINAMICS drives that are supported in Startdrive
- SIRIUS SIMOCODE pro (with Simocode ES)
- SIRIUS Soft Starter 3RW (with Soft Starter ES)

1.2 Recording of measured values with the trace function

Introduction

The trace and logic analyzer function can be called in the project navigator (Page 14) by double-clicking an entry in the "Traces" system folder. The measurements on the memory card can also be read and displayed via the diagnostic interface of the Web server.

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU. The number of installed traces is hardware-dependent.

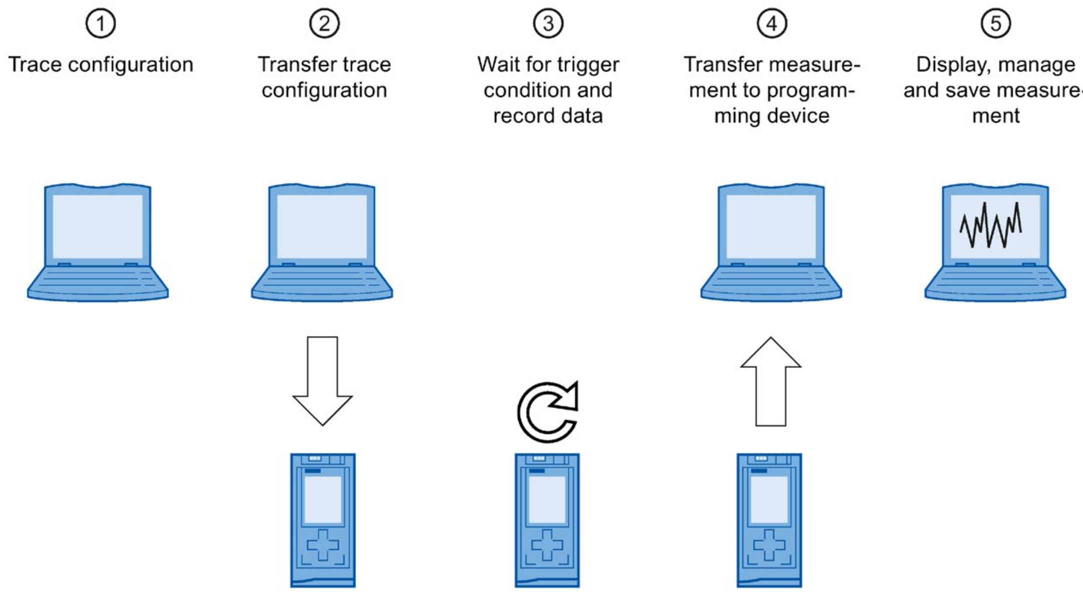
The recordings are saved on the device and, when required, can be read out with the engineering system (ES) and saved permanently. The trace and logic analyzer function is therefore suitable for monitoring highly dynamic processes. The recorded values are overwritten when the recording is activated again.

The trace and logic analyzer functions are also used in the commissioning editors of technology objects (for example, axle control panels). Active recordings from the axis control panel are displayed in the "Traces" system folder as installed traces. Recordings can be added to the measurements in the curve diagram of the axis control panel or the PID via a shortcut menu command.

Depending on the device (Page 71) used, the recording options can vary.

A quick start (Page 45) for working with the trace and logic analyzer function can be found in the Operation section.

The following figure shows the method of operation of the "Traces":



① Trace configuration on the programming device (PG) in the TIA Portal

You can specify the signals to be recorded, the duration of the recording and the trigger condition in the trace configuration. The trace configuration depends on the device and is described at the respective device (Page 71).

② Transferring the trace configuration from the PG to the device

You can transfer the complete trace configuration (Page 53) to the device when an online connection is established.

③ Waiting for the recording

If the installed trace configuration is activated (Page 54), then the recording is performed independently of the PG. The recording is started as soon as the trigger condition is satisfied.

④ Transferring the measurement from the device to the PG

The saving of the measurement in the project (Page 57) stores the measurement in the opened project of the TIA Portal. The measurement can be saved at any time after completing the recording, irrespective of the time of the measurement.

⑤ Evaluating, managing and saving the measurement

Numerous options are available for the evaluation of the measurement in the curve diagram and in the signal table (Page 55). Various display types are possible, for example, a bit representation for binary signals.
Signal waves from different measurements can be put together as an overlay measurement and compared with each other.
Measurements can also be exported and imported as a file.
With the saving of the project (Page 57) in the TIA Portal, the measurements transferred to the project are also saved.

Additional features

The following features are supported as of TIA Portal V14:

- Saving of trace configurations and measurements in libraries
- Multiuser support for trace configurations and measurements (device-dependent)
- Global search in the project

1.3 Trace configuration, recording, installed trace and measurement

This section explains the meaning and relationships of the terms: trace configuration, recording, installed trace and measurement.

Trace configuration

Implement the following settings in the trace configuration:

- Signals to be recorded
- Recording conditions
  - Sampling
  - Trigger
  - Installed measurements (memory card)

Recording

A recording is performed in the device. There is only one recording for each installed trace configuration. When a new recording is started, the old recording is overwritten.

An installed recording is not retentive (it is lost when the device is switched off/on) but can be saved permanently in the project as a measurement.

Installed trace

An installed trace consists of a trace configuration and optionally a recording. The maximum number of installed traces depends on the device.

The trace configuration is stored retentively on the device. The retentivity of the trace configuration may also be configurable depending on the device, e.g. with the S120.

Measurement

A measurement consists of a trace configuration and a recording, provided that recorded data is present. Each installed trace can be saved as a measurement in the project.

The recording of a measurement can be viewed offline.

The configuration for a measurement can be transferred to the “Traces” folder using drag & drop.

Installed measurements (memory card)

The folder contains measurements that are saved on the device (e.g. on the memory card). These measurements are retentive and can only be deleted by the user.

The installed measurements can be transferred to the Measurements folder using drag & drop and are then saved as measurements in the project.

Trace configuration with an installed trace of the same name

Usually, there is a trace configuration in the project with the same name for an installed trace. When there is an online connection, this trace is displayed with the icon in the project tree.

See also User interface - “Traces” project tree folder (Page 16).

Overlay measurement

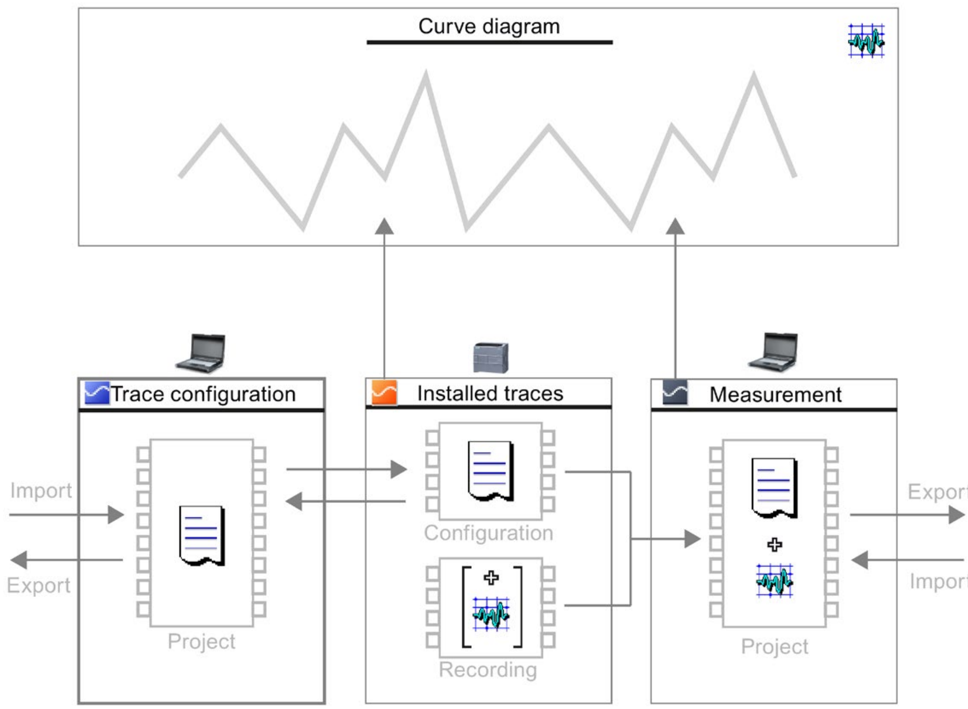
The overlay measurement allows a comparison and analysis of signals from different measurements with each other.

The measurements can be synchronized with each other and displayed as overlay measurements.

1.4 Data storage

The trace toolbar and the curve diagram also enable the transfer of the trace configuration and the viewing of the recording.

The following figure is a schematic diagram of the data storage:



Note

Saving the trace configuration and measurement

You save the trace configuration and measurement with the project in the TIA Portal.

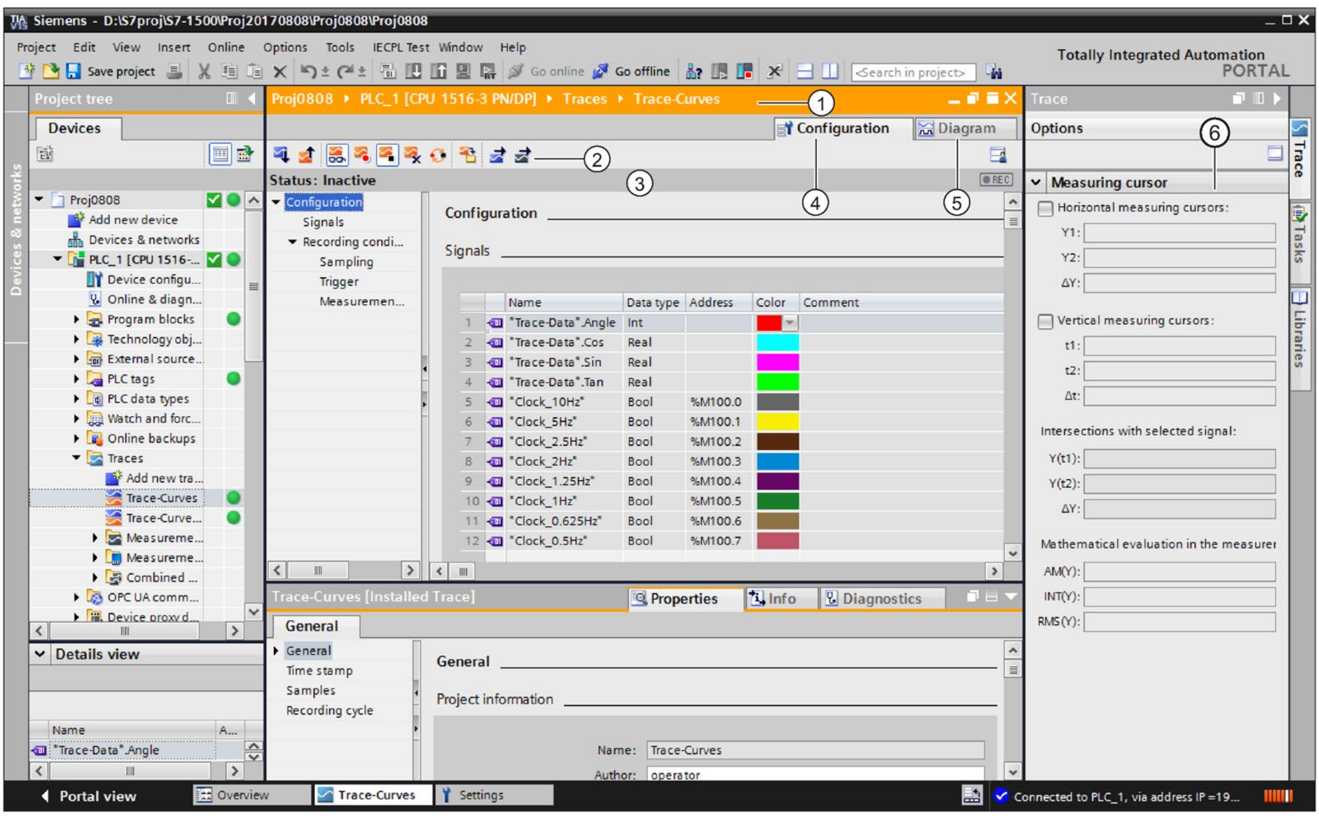
If you close the project without saving, the trace configurations and the measurements transferred to the project are discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

Software user interface 2

Display areas

The user interface of the trace and logic analyzer function consists of several areas.

The example in the figure below shows the division of the user interface in the TIA Portal:



<table>
<tr><td colspan="2">Project navigator
Management and creation of the trace and measurements directly in the project tree and via context menu commands.</td></tr>
<tr><td colspan="2">Working area</td></tr>
<tr><td></td><td>① Title bar of the working area
Shows the device to which the current display belongs.</td></tr>
<tr><td></td><td>① Trace toolbar
Buttons for managing the trace in the project and device:
• Activation/deactivation of installed traces
• Deletion of installed traces

2.1 Project navigator

2.1.1 User interface - “Traces” project tree folder

Trace configurations and installed traces are displayed in the "Traces" folder.

More information about the “Traces” sub-folder is provided in the following sections.

Double-click a trace to open the corresponding "Diagram" or "Configuration" tab in the working area.

Icons in the "Traces" folder

The following table explains the icons in the "Traces" folder:

Icon	Description
	Add trace configuration Double-click the icon to add a new trace configuration.
	Trace configuration (offline) Double-click the icon to open the "Configuration" tab.
	Installed trace (online) The icon is only displayed when there is no offline trace configuration of the same name for the installed trace. Double-click the icon to open the "Diagram" tab.
	Trace configuration with an installed trace of the same name If the button is deactivated, the trace configuration from the project is displayed. The trace corresponds to a trace configuration. If the button is activated, the trace configuration from the device is displayed. The trace corresponds to an installed trace. Double-click on the symbol to open the "Diagram" tab of the trace in the device.

Status

When there is an online connection, the status is displayed in the right-hand column of the project tree. The status is also displayed as tooltip above the respective icon.

The following table shows the meaning of the icons:

Icon	Description
	Online and offline configuration are identical
	Online and offline configuration are different
	Configuration only exists online

Shortcut menu commands

The following table shows the shortcut menu commands for the "Traces" system folder:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
“Add new trace”	Inserts a new trace configuration and opens the configuration tab.
"Import trace configuration"	Imports a trace configuration from a file.

The following table shows the shortcut menu commands for trace configurations and installed traces / :

Shortcut menu command	Trace configuration	Installed trace	Description
"Copy"	x	-	Copies the trace configuration or trace to the clipboard.
"Paste"	x	-	Inserts a trace configuration or measurement from the clipboard.
"Delete"	x	x	Deletes the selected objects from the project tree or from the device.
"Rename"	x	-	Switches the selected object to the editing mode.
"Export trace configuration"	x	-	Export a trace configuration as a file with the file extension "* .ttcfgx" or a trace in the device with the file extension "* .ttrecx". For reasons of compatibility, the "* .ttcfg" and "* .ttrec" file extensions are supported by TIA Portal V12, although they do not contain any information about the device family.

The trace configuration can also be copied across devices within the same device family.

Several objects can be selected.

2.1.2 User interface - “Measurements” project tree folder

The “Measurements" folder shows the saved measurements.

Icons in the “Measurements" folder

The following table explains the icons in the “Measurements" folder:

Icon	Description
	Measurement (offline) Double-click the icon to open the "Diagram" tab. The configuration for a measurement can be transferred to the “Traces” folder using drag & drop.

Shortcut menu commands

The following table shows the shortcut menu commands for the "Measurements" system folder:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
"Import measurement"	Imports a measurement from a file with the "*.ttrecx" file extension. The import is device-independent. For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.

The following table shows the shortcut menu commands for measurements :

Shortcut menu command	Description
"Copy"	Copies the trace configuration of the selected objects to the clipboard.
"Paste"	Inserts a measurement from the clipboard.
"Delete"	Deletes the selected objects from the project tree or from the device.
"Rename"	Switches the selected object to the editing mode.
“Generate new overlay measurement”	Generates a new overlay measurement with the selected measurements.
"Export measurement"	Exports a measurement with the last saved standard view The measurement is saved with the extension "*.ttrecx" or "*.csv". For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.

The measurements can also be copied independent of the device family.

Several objects can be selected.

2.1.3 User interface - “Installed measurements (memory card)” project tree folder

The folder shows all measurements present on the memory card. The folder is only displayed when there is an online connection to the device.

Drag folders or measurements contained here to the “Measurements” system folder using drag & drop. This transfers the measurements to the project.

Icons in the "Traces" folder

The following table explains the icons in the system folder :

Icon	Description
	Folders generated automatically with information on the recording activation time: The name of the folder cannot be changed.
	Installed measurement Double-click the icon to open the "Diagram" tab. The time stamp in the name shows the occurrence of the trigger event.

Shortcut menu commands

The following table shows the shortcut menu commands for the folder :

Shortcut menu command	Description
"Copy"	Copies the selected objects to the clipboard.
"Delete"	Deletes the selected objects from the project tree and from the device.

The following table shows the shortcut menu commands for measurements :

Shortcut menu command	Description
“Open”	Opens the measurement in the “Diagram” tab.
"Copy"	Copies the selected objects to the clipboard.
"Delete"	Deletes the selected objects from the project tree and from the device.
"Export measurement"	Exports a measurement as a file with the extension "*.ttrecx" or "*.csv". For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.
“Properties”	Displays the general properties of the measurement (Page 44).

Several objects can be selected.

2.1.4 User interface - “Overlay measurements” project tree folder

The system folder “Overlay measurements" shows the configured overlay measurements.

Icons in the “Overlay measurements" folder

The following table explains the icons in the system folder “Overlay measurements”:

Icon	Description
	Add new overlay measurements Double-click the icon to add a new overlay measurement and open the “Diagram” tab.
	Overlay measurement Double-click the icon to open the "Diagram" tab.

Shortcut menu commands

The following table shows the shortcut menu commands for the system folder “Overlay measurements" or for a group folder contained within this:

Shortcut menu command	Description
“Add new group”	Inserts a new folder.
“Add new overlay measurement”	Inserts a new overlay measurement and opens the “Diagram” tab.
"Import overlay measurement"	Imports an overlay measurement from a file with the file extension "*.ttcbmx"

The following table shows the shortcut menu commands for overlay measurements:

Shortcut menu command	Description
“Open”	Opens the selected overlay measurements in the working area.
"Import measurement"	Imports a measurement from a file with the file extension "*.ttrecx" For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.
"Export overlay measurement"	Exports an overlay measurement The overlay measurement is saved with the extension "*.ttcbmx" or "*.csv". The "*.ttcbmx" format can also be imported again.
"Copy"	Copies the selected objects to the clipboard.
"Paste"	Pastes measurements, measurements from traces in the device or from an overlay measurement from the clipboard. Multiple objects can be inserted from the clipboard if they are all of the same type.
"Delete"	Deletes the selected objects from the project tree or from the device.
"Rename"	Switches the selected object to the editing mode.
“Properties”	Displays the general properties for the overlay measurements.

The overlay measurements can also be copied device-wide.

Several objects can be selected.

2.2 Working area

2.2.1 User interface - trace toolbar

Tools are available for handling the trace via buttons.

The following table shows the functions of the buttons:

Icon	Description
	Transfer the selected trace configuration to the device The selected trace configuration is transferred to the device.
	Transfer the selected trace configuration from the device The selected trace configuration is transferred from the device to the project.
	Observe on/off Change of the display between online and offline. **Note** Once monitor and automatic scaling are activated at the same time, no more actions can be undone using the “Undo” button. **Note** When an installed trace is first started the display in the curve diagram is set to automatic scaling by default. Make sure when the recording is restarted that any changes to the scaling settings are retained. Reactivate automatic scaling manually if necessary in order to monitor the recording.
	Activate recording If the recording of an installed trace is repeated, then the settings relevant for the display (curve diagram and signal table) are also retained for the new recording. **Note** When a recording is restarted, the previously recorded values are lost. To save the recorded values, save the measurement in the project (Page 57) before you activate the recording again.
	Deactivate recording
	Delete installed trace Deletes the selected trace from the device.
	Automatically repeat recording After a recording, the recording is automatically activated again. The display of the curve is refreshed when the recording is completed. This type of refresh is particularly suitable for monitoring fast signals (Page 66).
	Transfer the selected measurement from the device to the project The measurement is added to the  "Measurements" system folder. **Note** In order to be able to save the installed trace data as a measurement, it must first have been displayed once in the curve diagram. The recording data is loaded from the device when displayed. If necessary wait until the display is updated, as only the displayed data is transferred to the project in all cases.

Icon	Description
	Export trace configuration Exports a trace configuration as a file with the file extension "*.ttcfgx". For reasons of compatibility, the "*.ttcfg" file extension is supported by V12, although it does not contain information about the device family.
	Generate a trace configuration Generates a new trace configuration from the measurement.
	Export measurement with the settings from the current view Exports a measurement as a file with the file extension "*.ttrecx" or "*.csv". For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.
	Import measurement (only with overlay measurements) Imports a measurement from a file with the file extension "*.ttrecx". For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.
	Export overlay measurement (only with overlay measurements) The overlay measurement is saved with the extension "*.ttcbmx" or "*.csv". The "*.ttcbmx" format can also be imported again.
	Select a measurement (only with overlay measurements) The drop down list box contains the imported measurements. Select the desired measurement to display the configuration.

2.2.2 User interface - Configuration tab

2.2.2.1 User interface - Configuration

The trace configuration depends on the device and is described at the respective device (Page 71).

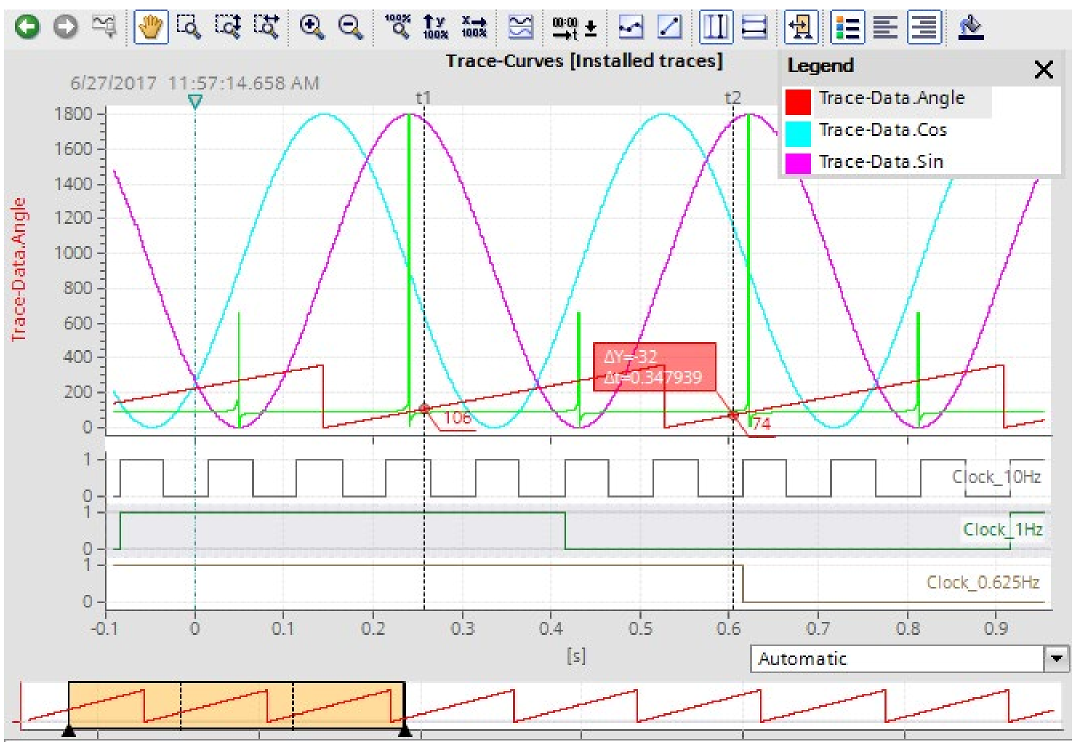
2.2.3 User interface - Diagram tab

2.2.3.1 User interface - curve diagram

The curve diagram displays the selected signals of a recording. Analog signals are displayed in the upper curve diagram. Binary signals are displayed as bit track in the lower diagram. You can adjust the display of the signals in the signal table (Page 29) and with the toolbar of the curve diagram.

Setting options and displays in the curve diagram

The following figure shows an example of the display in the TIA Portal:



The scale in the diagram applies to the selected (highlighted in gray) signal in the legend. The legend can be moved and its size can be adjusted with the mouse.

The ▽ icon shows the device trigger time with a vertical line.

A drop-down list for selecting the unit is available below the curve for the "Time" setting for the time axis. The "Automatic" setting automatically adjusts the unit based on the displayed time range.

Note

Non-interpretable data types

Some data types require a defined format, e.g. the S7 data type `LTime_of_Day`. If this format is not available, the data type is interpreted as INT.

Functions using the mouse wheel

The following table shows which functions are possible in the curve diagram using the mouse wheel:

Function of the mouse wheel	Description
Move the curve diagram vertically	Turning the mouse wheel moves the display in the upper curve diagram up or down. If the signals are arranged in traces the display for the group is shifted that is located below the cursor. The mouse pointer must be positioned above the curve with the analog signals.
Move the curve diagram horizontally	Turning the mouse wheel with the <Shift> button pressed down moves the display in the curve diagram to the left or the right. The cursor must be positioned above the curve diagram.
Zoom in and zoom out	Turning the mouse wheel with the <Ctrl> button pressed down zooms in or out of the display in the curve diagram. The cursor position is the starting point for zooming in or out. The value axis of the lower curve diagram (bit tracks) is not affected. The cursor must be positioned above the curve diagram.

Functions using the keyboard

The following table shows which keyboard commands are possible with a focus on the curve diagram:

Shortcut key	Description
Selecting a measurement cursor	
<Ctrl+Shift+1>	The vertical measurement cursor t1 is selected or deselected.
<Ctrl+Shift+2>	The vertical measurement cursor t2 is selected or deselected.
<Ctrl+Shift+3>	The horizontal measurement cursor Y1 is selected or deselected.
<Ctrl+Shift+4>	The horizontal measurement cursor Y2 is selected or deselected.
<Tab>	The next measurement cursor is selected.
Positioning a vertical measurement cursor	
<Left>, <Right>	With the unit "Samples", the selected measurement cursor is moved by one sample by the signal in the foreground. With the unit "Time", it is moved by one pixel.
<Shift+Left>, <Shift+Right>	With the unit "Samples", the selected measurement cursor is moved by 10 samples by the signal in the foreground. With the unit "Time", it is moved by 10 pixels.
Positioning a horizontal measurement cursor	
<Up>, <Down>	The selected measurement cursor is moved by one pixel along the value axis.
<Shift+Up>, <Shift+Down>	The selected measurement cursor is moved by 10 pixels along the value axis.
Display of vertical measurement cursors	
<Ctrl+Space>	The vertical measurement cursors are shown or hidden.
<Ctrl+Shift+Space>	The vertical measurement cursors are shown and centered for the current view.
Changing the view	
<Space>	Move view
<Ctrl+0>	Set 100% view in open editor
<Ctrl++>	Apply zoom in with 10%
<Ctrl+->	Apply zoom out with 10%

Shortcut menu commands

The following table shows the shortcut menu commands in the curve diagram:

Shortcut menu command	Description
"Save diagram as image"	Exports the current display in graphic format, e.g. as a bitmap.
"Copy image to clipboard"	Copies the current display to the clipboard.
"Center measurement cursors"	Positions the activated measurement cursors at a central point in the current display.
"Add to measurements" (only axis control panel and PID)	Adds the displayed recording to the  "Measurements" system folder.
“Automatic bit track height"	Automatically adjusts the height of the bit tracks and thereby determines the size of the lower curve diagram. The setting is automatically deactivated once you change the space allocation between the curve diagrams manually. **Note** You can change the vertical space allocation between the upper and lower curve diagram. To do this drag the time axis of the upper curve diagram up or down with the mouse.

Toolbar of the curve diagram

Tools are available for adapting the display via buttons.

The following table shows the functions of the buttons:

Icon	Function	Description
	Undo zoom	Undoes the zoom function executed last. If several zoom functions have been executed, they can be undone step-by-step.
	Redo zoom	Redoes the last undone zoom function. If several zoom functions have been undone, they can be redone step-by-step.
	Standard view	Uses the current view as standard for this recording. If the trace recording is shown again later, the standard view is restored.
	Move view	Moves the display with the mouse button pressed.
	Zoom selection	Selection of an arbitrary range with the mouse button pressed. The display is scaled to the range selection.
	Vertical zoom selection	Selection of a vertical range with the mouse button pressed. The display is scaled to the range selection.
	Horizontal zoom selection	Selection of a horizontal range with the mouse button pressed. The display is scaled to the range selection.
	Zoom in	Enlargement of the display. The ranges of the time axis and value axis are reduced every time the button is clicked. The curves are displayed larger.
	Zoom out	Reduction of the display. The ranges of the time axis and value axis are increased every time the button is clicked. The curves are displayed smaller.

Icon	Function	Description
	Display all	Scales the display of the available data so that the entire time range and all values are displayed.
	Automatic scaling of the value axis	Scaling of the display so that all values are displayed for the currently displayed time range. The relative scaling ratio between the signals may change. **Note** The automatic scaling of the value axis is stopped when the zoom function is activated for the value axis. This button reactivates the automatic adjustments to the minimum/maximum values.
	Show the overall time range	Scaling of the display so that the values in the value range currently displayed are displayed for the overall time range. The value range displayed only then changes if "Display all values" is activated. **Note** The automatic scaling of the time axis is stopped when a zoom function is activated for the time axis. This button reactivates the automatic adjustments for the time range.
	Arrange in tracks	Activate or deactivate the trace arrangement. When the trace arrangement is activated the signals are arranged among themselves with the relevant value axes. Signal groups are displayed in the same trace. This setting does not affect the display for the bit tracks.
	Unit changeover of the time axis	Switching the unit of the time axis The following units are adjustable: • Measurement points • Time (relative time related to the trigger time) • Trigger stamp of the measurement points
	Display samples	The samples are displayed as small circles on the curves.
	Interpolated representation	Linear interpolation between two consecutive measuring points for floating point numbers If linear interpolation is not enabled (default), the connection between the measuring points is drawn in steps.

Icon	Function	Description
	Display vertical measurement cursors	Display of the vertical measurement cursors. The vertical position of the two measurement cursors can be moved with the mouse. The associated measured values and the difference of the measurement cursors corresponding to the position are shown in the signal table. Display the “Measurement cursor” pane (Page 41) in the Trace task card in order to display further information. Also use the cursor keys. The following actions are possible for vertical measurement cursors with the cursor keys: • Select • Positioning • Show or hide measurement cursor • Center measurement cursors
	Display horizontal measurement cursors	Display of the horizontal measurement cursors. The horizontal position of the two measurement cursors can be moved with the mouse. Display the “Measurement cursor” pane (Page 41) in the Trace task card in order to display the values or to reposition the measurement cursor through entering the position. Also use the cursor keys. The following actions are possible for horizontal measurement cursors with the cursor keys: • Select • Positioning
	Time range display	Show or hide the time range display below the curve The time range display shows the area in the curve in yellow based on a selected signal. The yellow area can be moved with the mouse and the borders can be changed horizontally. 	Display chart legend	Showing or hiding of the legend in the curve diagram and the bit track labels.
	Align the chart legend to the left	Display of the legend and the bit track labels on the left side of the curve diagram.
	Align the chart legend to the right	Display of the legend and the bit track labels on the right side of the curve diagram.
	Change background color	Changeover between various background colors.

2.2.3.2 User interface - signal table

The signal table lists the signals of the selected measurement and provides setting options for some properties. If recording data of installed traces is displayed and the settings are changed in the signal table, these settings are retained until there is a change to the offline mode. If the installed trace is added to the measurements, the current settings of the signal table are saved in the measurement.

The signals can be sorted using drag-and-drop. The bits of a signal can be resorted within a signal.

Setting options and displays in the signal table

The following figure shows an example of the display in the TIA Portal:

			Si...	Name	Data type	Display format	Address	Formula		Color	Scaling gro...	Min. Y scale	Max. Y scale	Y(t1)	Y(t2)	Delt...	Unit	Comment
1			$0	"Trace-Data"....	Int	Dec +/-					Temp	0	1800	106	74	-32		
2			$1	"Trace-Data".C..	Real	Floating point					Temp	0	1800	-27....	27....	55....		
3			$2	"Trace-Data".Sir	Real	Floating point						-99.99971	99.99997	96....	96....	-0.0...		

The following table shows the settings and displays of the recorded signals:

Column	Description
Signal or error symbol	
	Signal
	Failsafe signal
	Signal from a data block
	Signal from a failsafe data block
	Calculated signal (formula)
	Error in the formula of the calculated signal
	Selection for the display in the curve diagram - a maximum of 16 signals can be selected. The point indicates that at least one bit has been selected for display as bit track for the signal in the bit selection.
"Signal reference"	Automatically generated number of the signal The signal can be accessed via the signal reference in the formulas.
"Name"	Display of the signal name A click on the name of a displayed signal updates the scale in the curve diagram. You can enter a name for a calculated signal in the last line without a signal symbol. The calculated signal is entered with its name.
"Measurement"	Display of the measurement (in the "Diagram" tab only with overlay measurements) Shows the name of the measurement to which the signal belongs.
	Open bit selection Individual bits can also be selected for the following data types for display as a bit track in the lower curve diagram. • Byte, Word, DWord, LWord • SInt, USInt, Int, UInt, DInt, UDInt, LInt, ULInt Example of an opened bit selection for the DWORD data type:  $0 "Tag_1" Byte Dez %MB10 $1 "Tag_2" DWord Dez %MD20 $1.x0 Bool Bin %M23.0 $1.x1 Bool Bin %M23.1 $1.x2 Bool Bin %M23.2 Select or deselect the relevant bit for display by clicking the icon.
"Data type"	Display of the data type
"Display format"	Display format of the signal The display formats supported for the signal are offered for selection. A display format suitable for the data type is set with "Default".
"Address"	Display of the address of the signal The field remains empty with optimized / type correct tags.

Column	Description
"Formula"	Display or entry of a formula A formula can contain mathematical functions with numbers and signals. Use the formula editor to conveniently create formulas.
	Call of the formula editor for calculated signals Click on the icon to open the formula editor.
"Color"	Display and setting option for the color of the signal
"Signal group"	Display or input of the signal group name for one signal group The Y-scales are scaled identically for all signals of one signal group. Enter an identical signal group name for those signals that are to be scaled identically. Signals can be removed from the signal group by deleting the signal group name. The signal groups can be saved via the function "Use current view as standard" (button). **Notes** Binary signals cannot be grouped. In hex display format, group only the signals with a format compatible to the sign for the display.
Gray field for chain icon	Move the cursor over the gray field or the chain icon (or) to add the signal to a signal group or delete the signal from the signal group. Clicking the chain icon adds the signal to a signal group or creates a new signal group. Clicking the chain icon removes the signal from the signal group. For a selected signal with signal group, the chain icon displays all signals of the same signal group.
Input field	The input field displays the signal group name. As an alternative to the chain icon, you can assign or delete a group name via text input in this field.
"Min. Y-scale"	Display or input of the minimum value for the scaling of the signal
"Max. Y-scale"	Display or input of the maximum value for the scaling of the signal
"Y(t1)"	Display of the value at the position of the first measurement cursor
"Y(t2)"	Display of the value at the position of the second measurement cursor
"ΔY"	Display of the value difference between the first and the second measurement cursor
"Unit"	Display of the unit (e.g. for used-based values from technology objects)
"Comment"	Display and input option for a comment about the signal

Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

Shortcut menu command	Description
"Insert calculated signal"	Inserts a new calculated signal at the top of the table
"Edit formula"	Opens the formula editor for the calculated signal
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Cannot be selected.
"Rename"	Cannot be selected
"Display format"	Allows you to switch the display format The display formats supported for the signal are offered for selection.
“Display signal(s)”	Displays the selected signals in the curve diagram.
“Hide signal(s)”	Hides the selected signals in the curve diagram.

See also

Use of the signal table (Page 64)

Using the signal group in the signal table (Page 65)

2.2.3.3 Interface - Formula editor

The formula editor provides various mathematical functions for analyzing signals. Open the editor in the signal table by clicking the button.

Configuration options and displays in the formula editor

The following figure shows an example of the display in the TIA Portal:

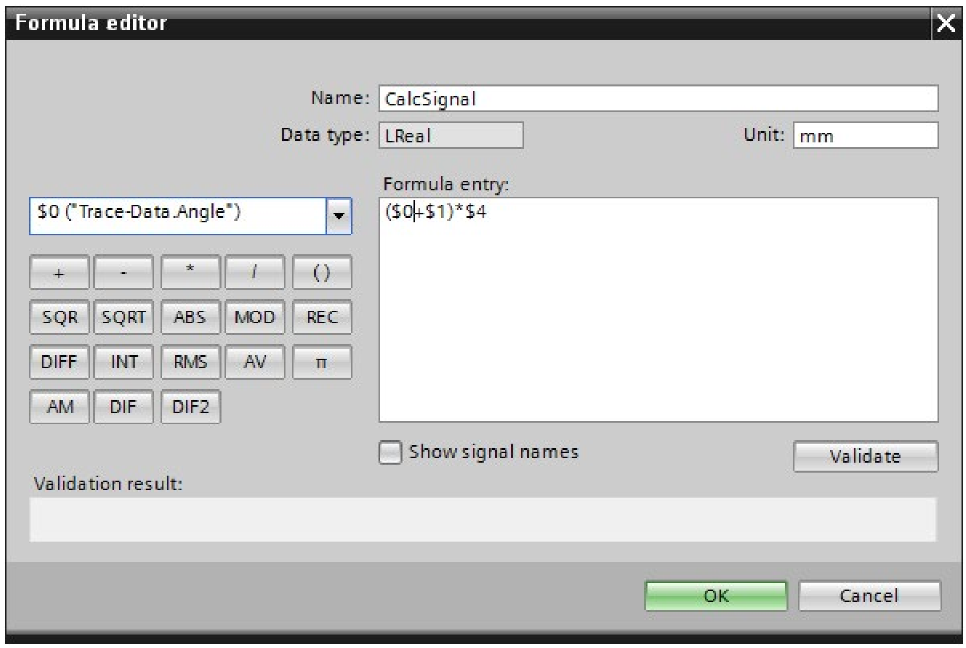

Figure 2-1 Formula editor

The following table shows the configuration options and displays of the formula editor:

Field/Button		Description
"Name"		Display and input of the name for the created formula The name must be unique and only contain characters that are allowed in Windows file names.
"Data type"		Display of formula data type The data type is pre-assigned with a floating-point number of LREAL type and cannot be changed.
"Unit"		Display and input of a unit Freely specified user-defined unit.
Drop-down list with signals		Selection of the signals The drop-down list contains the signals from the signal table and inserts a selected signal into the formula.
"Formula entry"		Text field to display and enter the formula Create a formula by typing into this text box or by using the buttons for the mathematical functions. Signals can be referenced in the text box using the signal reference with a prefixed $ character or the name in double quotes in the formula. Mixed input is possible. Bits from a bit selection (e.g. below the INT data type) are not allowed in the formula.
Mathematical functions		
	+	Addition
	-	Subtraction
	*	Multiplication
	/	Division
	()	Brackets Grouping expressions
	SQR	Square
	SQRT	Square root
	ABS	Absolute value Calculates the size of a number. **Examples** `ABS(5)` → 5 `ABS(-3)` → 3 `ABS(-3.14)` → 3.14
	MOD	Modulo Calculates the residual value of a division **Examples** `MOD(5,3)` → 2 `MOD(3.14,3)` → 0.14
	REC	Reciprocal value (1/x)

Field/Button		Description
	DIFF [1)]	Numerical differentiation **Examples** Formula: `DIFF($0,SAMPLETIME)`
	INT [1)]	Numerical integration **Examples** Formula: `INT($0,SAMPLETIME)`
	RMS [1)]	Quadratic mean The quadratic mean is given by first adding the squares of all the measured values and dividing them by the number of measured values. The quadratic mean is the square root of this value. **Examples** Formula: `RMS($0,SAMPLETIME)`
	AV	Mean value filter from 1st to 5th order If the specification of an order is missing, the mean filter of the 1st order is used. **Examples** `AV($0,1)` → Mean filter 1st order `AV($0,5)` → Mean filter 5th order
	π	Mathematical constant Pi
	AM	Arithmetic mean The arithmetic mean is a moving average over five measuring points.
	DIF	Simple subtraction with mean filter from 1st to 5th order If the specification of an order is missing, simple subtraction is performed with a 1st order filter. **Examples** `DIF($0,1)` → Single subtraction with 1st order filter `DIF($0,5)` → Single subtraction with 5th order filter `DIF($0)` → Single subtraction with 1st order filter **Example: Calculate an acceleration curve from a velocity signal** `$0`: Velocity signal in meters per second Cycle time of the constant cycle velocity recording: 1 ms Formula: `DIF($0,1)/0.001` Unit: m/s^2
	DIF2	Double subtraction with mean filter from 1st to 5th order If the specification of an order is missing, then double subtraction is executed with a 1st order filter. **Examples** `DIF2($0,1)` → Double subtraction with 1st order filter `DIF2($0,5)` → Double subtraction with 5th order filter `DIF2($0)` → Double subtraction with 1st order filter **Example: Calculate an acceleration curve from a position sequence** `$0`: Position sequence in meters Cycle time of the constant cycle position recording: 1 ms Formula: `DIF2($0,1)/SQR(0.001)` Unit: m/s^2

Field/Button	Description
"Show signal name"	Display of the signal names If the check box is selected, the signal names in the formula are displayed instead of the signal references.
"Validate"	Check the validity of the formula
"Result of validation"	Result of validation Displays the result of the validation and indicates errors and error locations.
"OK"	Transfer the entries in the formula editor
"Cancel"	Discard the entries in the formula editor

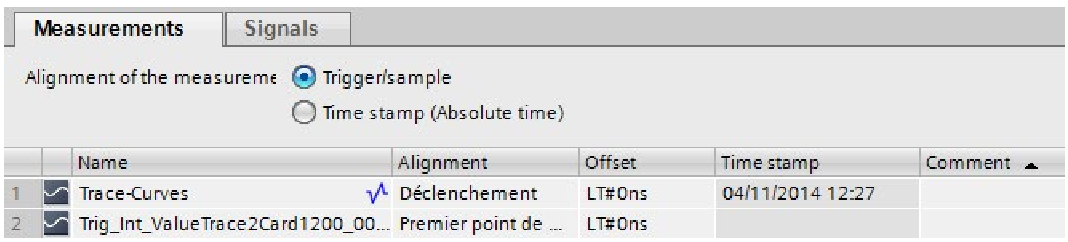
[1)] The constant `SAMPLETIME` is only available for equidistant recording cycles. Time unit for `SAMPLETIME` is always µs.

2.2.3.4 User interface - Measurements (overlay measurements)

The Measurements tab displays the individual measurements and among other things provides the setting options for synchronization.

Setting options and displays in the Measurements tab

The following figure shows an example of the display in the TIA Portal:



The following table shows the settings and displays for the measurements:

Column	Description
Alignment of the measurements	
"Trigger/ measurement point"	Alignment of the measurements in accordance with the trigger or measurement point The individual zero point for the measurement is predefined in the table under the "Alignment" column.
"Time stamp (absolute time)"	Alignment of the measurements in accordance with their time stamp The signals are aligned in accordance with the time from the absolute time stamp.
Table columns	
	Static display of the measurement icon
"Name"	Display and change options for the measurement name The name must be a unique one and can be changed.
"Alignment"	Alignment of the measurement (only adjustable with the "Trigger/ measurement point" check box activated) Determines the individual zero point for a measurement. All signals for the measurement are displayed in relation to this zero point. The following settings are possible: • Trigger • First measurement point following the trigger event • First measurement point • Last measurement point
"Offset"	Offset related to the time axis Moves the measurement left or right by the offset stated on the time axis. The offset can also be transferred via the clipboard to the cell from the ΔX value of the measurement cursor. See Align measurements precisely (overlay measurements) (Page 69).
"Time stamp"	Display of the trigger time
"Comment"	Display and input option for a comment about the signal

Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Cannot be selected.
"Rename"	Switches the selected cell to the editing mode.
"Import measurement"	Imports a measurement from a file, e.g. with the "*.ttrecx" file extension. The import is device-independent and also suitable, for example, for comparing measurements of a PLC with the measurements of a drive device. For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.
"Export measurement"	Exports a measurement as a file with the extension "*.ttrecx" or "*.csv". For reasons of compatibility, the "*.ttrec" file extension is supported in V12, although it does not contain any information about the device family.

2.2.4 User interface - Signal selection tab (overlay measurements)

2.2.4.1 User interface - Signal selection (overlay measurements)

The Signal selection tab shows the signals for all measurements and allows signals that are presented in the signal table of the diagram to be preselected.

Setting options and displays in the Signal selection tab.

The following figure shows an example of the display in the TIA Portal:

		Availa...	Measurement	Name	Data type	Address	Comment
1		☑	Trace-Curves	"Trace-Data".Angle	Int		
2		☑	Trace-Curves	"Trace-Data".Cos	Real		
3		☑	Trace-Curves	"Trace-Data".Sin	Real		
4		☐	Trace-Curves	"Trace-Data".Tan	Real		
5		☑	Trace-Curves	"Clock_10Hz"	Bool	%M100.0	
6		☑	Trace-Curves	"Clock_5Hz"	Bool	%M100.1	

The following table shows the settings and displays for the table:

Column	Description
	Static display of the signal icon
"Available in the diagram"	Selection for the display in the curve diagram When the selection is activated the signal is transferred to the signal table for the curve diagram.
“Measurement”	Display of the measurement to which the signal belongs
“Name”	Display of the signal name
“Data type “	Display of the data type
"Address"	Display of the address (not for symbolic tags)
"Comment"	Display of a comment on the signal

You will find further information on the specific settings in User interface - signal table (Page 29).

Shortcut menu commands

The following table shows the shortcut menu commands for the signal selection:

Shortcut menu command	Description
"Copy"	Copies the content of the selected lines to the clipboard.
“Display selection in the signal table”	The selected signals are displayed in the signal table and are available in the diagram.
“Remove selection from the signal table”	The removed signals are not available in the diagram.

Several objects can be selected.

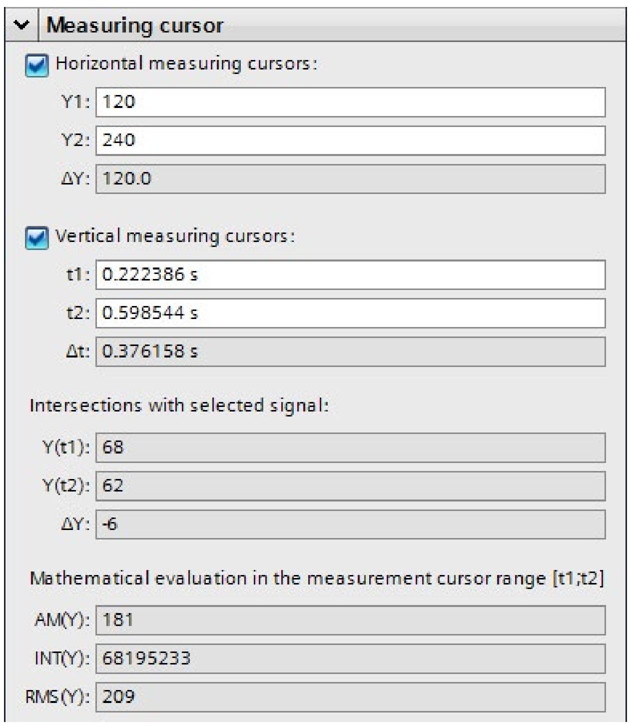
2.3 Trace task card

2.3.1 User interface - Measurement cursor pane

The “Measurement cursor” pane shows the position of the measurement cursor in the curve diagram and the values at the intersection points.

Setting options and displays of the "Measurement cursor” pane

The figure below shows the "Measurement cursor” pane:



The following table describes the settings and displays:

Setting/display		Description
Horizontal measurement cursor		
	Y1	Position of first measurement cursor The value states the position in relation to the scale of the signal currently selected. You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	Y2	Position of the second measurement cursor The value states the position in relation to the scale of the signal currently selected. You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	ΔY	Display of the position difference between the first and the second measurement cursor
Vertical measurement cursor		
	t1	Position of first measurement cursor You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	t2	Position of the second measurement cursor You also have the option of specifying a new position for the measurement cursor in this entry field for moving with the mouse.
	Δt	Display of the position difference between the first and the second measurement cursor
Intersection points with selected signal		
	Y(t1)	Display of the value at the position of the first measurement cursor
	Y(t2)	Display of the value at the position of the second measurement cursor
	ΔY	Display of the value difference between the first and the second measurement cursor
Mathematical analysis in the range of the measurement cursor·[t1;t2] for the selected signal		
	AM(Y)	Mean The arithmetic mean is calculated for the range between the vertical measurement cursors.
	INT(Y)	Integral The integral is calculated for the range between the vertical measurement cursors.
	RMS(Y)	RMS value The root-mean square (RMS value) is calculated for the range between the vertical measurement cursors.

See also

User interface - curve diagram (Page 23)

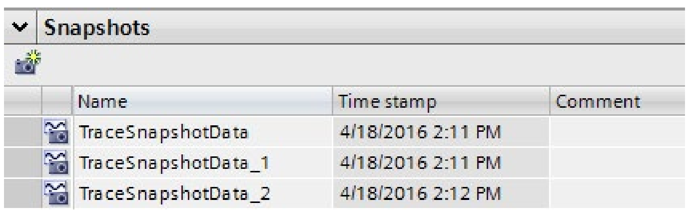
2.3.2 User interface - Snapshots pane

The “Snapshots” pane allows the user to save and restore different views for a measurement.

A snapshot is taken of the current view in the “Diagram” tab. The snapshots are saved in the measurement with the project.

Setting options and displays of the “Snapshots” pane

The figure below shows the “Snapshots” pane:



The following table shows the functions of the buttons:

Icon	Description
	Generate snapshot of the current view Saves the current view as a snapshot in the “Diagram” tab.

The following table shows the settings and displays:

Column	Description
	Static display of the snapshot symbol
“Name”	Display and change options for the name
“Time stamp"	Display of the snapshot generation time
"Comment"	Display and input option for a comment

Several rows can be selected and deleted.

Double-clicking on a row opens the measurement with the saved view in the “Diagram” tab.

Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
“Restore snapshot”	Shows the measurement with the saved view in the “Diagram” tab.
"Delete"	Deletes the snapshot
"Rename"	Switches the cell to the editing mode

Several rows can be selected and deleted.

2.4 Inspector window

2.4.1 Interface - Inspector window

The Inspector window displays general information about the trace.

Additional information is available for measurements:

- Time stamp range

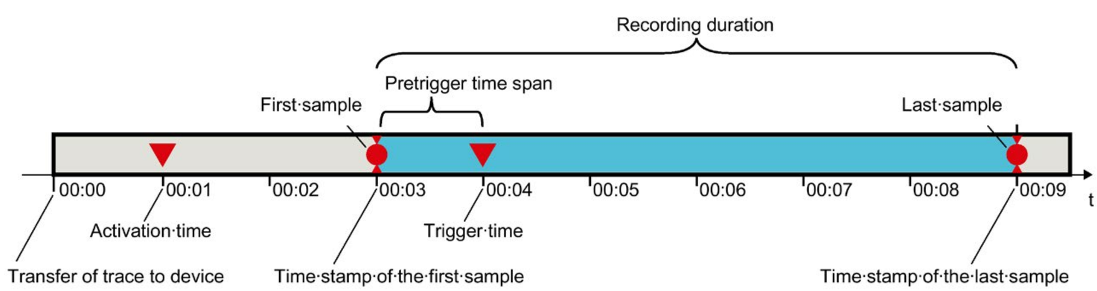
  The availability of the time stamps depends on the configured recording conditions.
- Measuring point range
- Cycle time range

  For equidistant cycle recordings, the time duration between two measurement points is displayed.

  This time, for example, can be used in the formula editor.

Sample time stamp

The following figure shows the time stamps for a measurement:



Note

Analysis of measurements with sporadically occurring recording condition

When evaluating your measurements, keep in mind that the recording condition between the activation time and the trigger time may not have been fulfilled.

Operation

3

3.1 Quick start

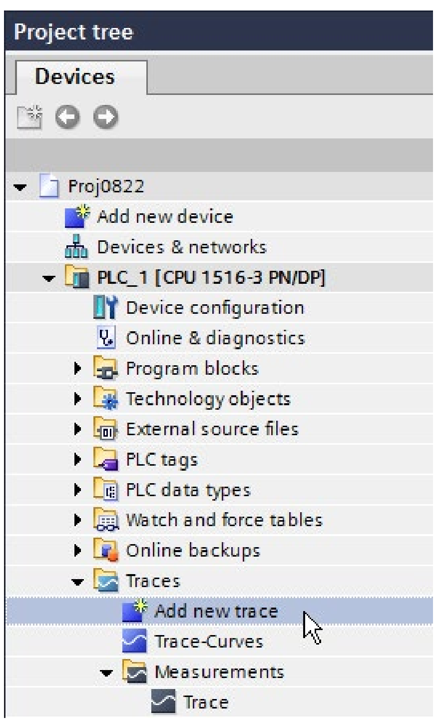
This description shows the steps for a recording of the S7-1500 CPU as an example. The displayed settings can differ depending on the device.

Requirement

A device is configured that supports the trace and logic analyzer function.

Creating a trace

The following figure shows the project tree with the "Traces" system folder below the device:



Procedure:

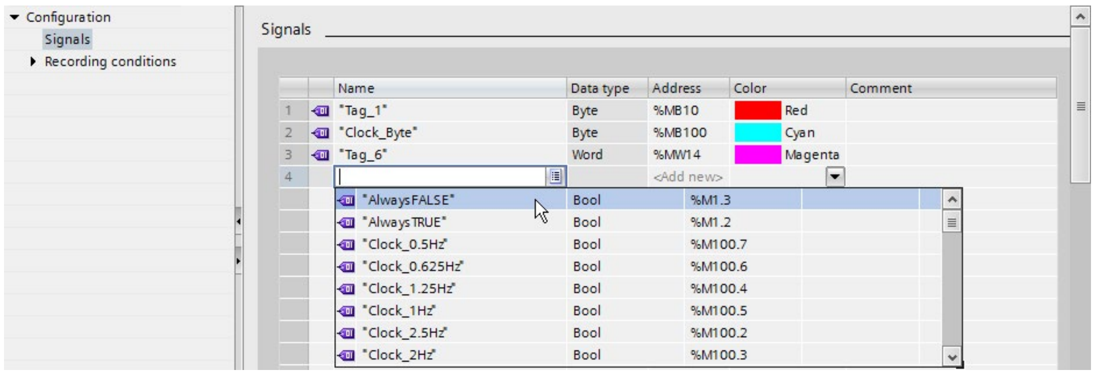
1. Double-click the "Add new trace" entry.

   A new trace configuration is created and the “Configuration" tab opens in the working area.

2. Adapt the name of the trace configuration by clicking the text.

Selecting signals

The following figure shows the configuration of the signals:



Procedure:

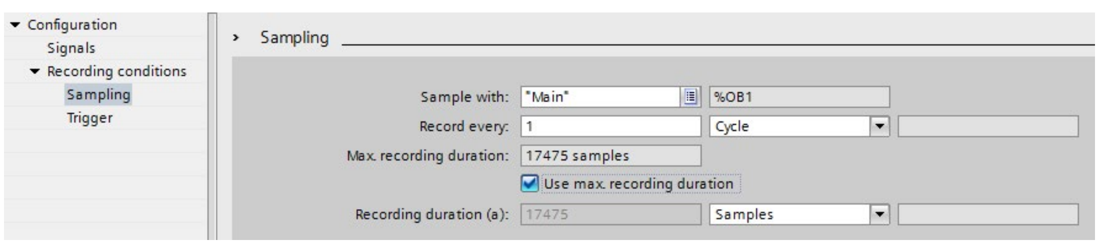
1. Select the signals to be recorded in the "Signals" area.

   Or:

2. Drag one or more signals, e.g. from a tag table, and drop them in the signal table.

Configuring the recording cycle

The following figure shows the configuration of the sampling:

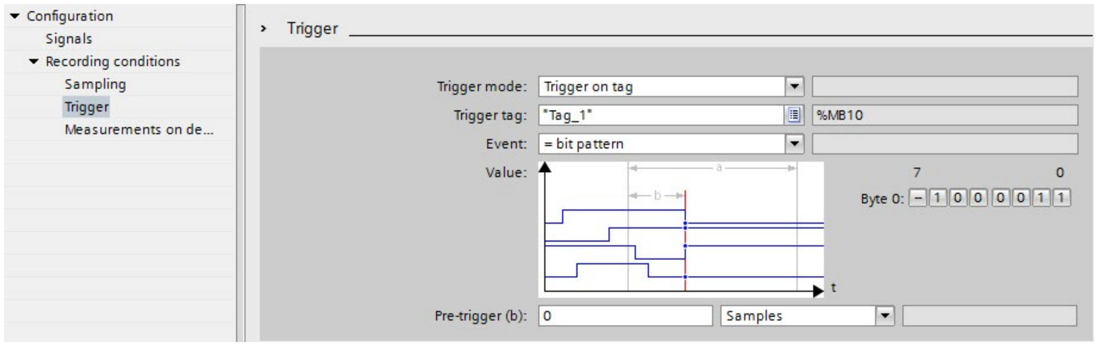


Procedure:

1. Configure the sampling.

Configuring the trigger

The following figure shows the configuration of the trigger:



Procedure:

1. Configure the trigger mode and the condition for the selected trigger.

Transferring the trace configuration to the device

Procedure:

1. Transfer the trace configuration to the device with the button.

   The following functions are executed:

   – An online connection is established to the device.

   – The trace configuration is transferred to the device.

   – The monitoring is activated.

   – The display switches to the "Diagram" tab.

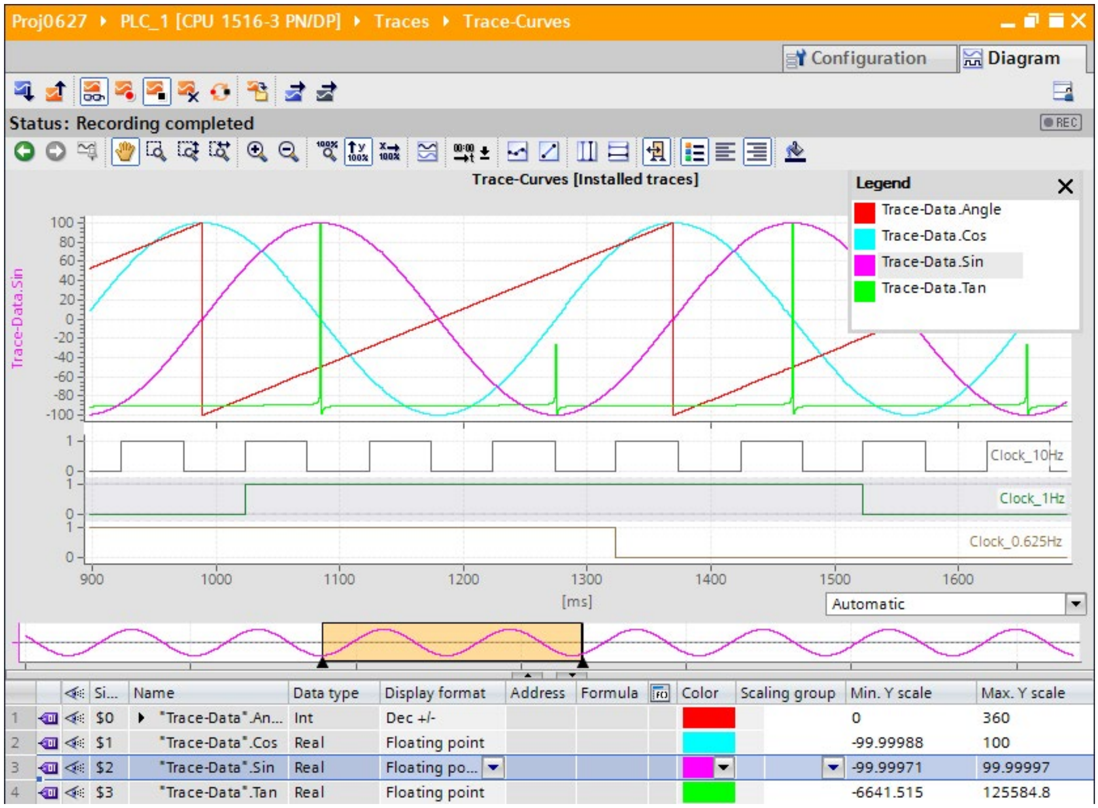
Activating a recording

Procedure:

1. Click the button.

Displaying the recording

The following figure shows the curve diagram with a recording:



Procedure:

1. Wait until the "Recording" or "Recording completed" status is displayed in the status display of the trace.
2. Switch to the "Diagram" tab.
3. Click the ▸ icon of a signal in the signal table.

   The individual bits of the signal are offered for display as a bit track.
4. In the signal table, select or deselect the individual signals and bits for display with the icon.

Saving the measurement in the project

Procedure:

1. Transfer the measurement to the project with the button.

   The measurement is displayed in the project tree under the "Measurements" system folder.

See also

User interface - trace toolbar (Page 21)

3.2 Using the trace function - overview

Requirement

A device is configured in the TIA Portal that supports the trace and logic analyzer function and to which an online connection has been established.

Procedure

The following table shows a procedural overview with typical steps when working with the trace and logic analyzer function.

Step	Description
1	Creating a trace (Page 50)
2	Configuring the trace (Page 61)
3	Transferring the trace configuration to the device (Page 53)
4	Activating/deactivating an installed trace (Page 54)
5	Monitoring the recording (Page 55)
6	Saving measurements in the project (Page 57)
7	Displaying the recording (Page 55)
8	Analyze an ongoing recording (Page 56)
9	Compare records (overlay measurements) (Page 67)

See also

Displaying a configuration (Page 50)

3.3 Project tree

3.3.1 Creating a trace

Traces can be created in the form of trace configurations in the project navigator.

The following instructions describe how you can create a trace configuration under the "Traces" system folder

Procedure

To create a trace configuration, proceed as follows:

1. Double-click the "Add new trace" entry.

A new trace configuration is created.

3.3.2 Displaying a configuration

Requirement

A trace configuration, an installed trace, a measurement or an overlay measurement is available in the "Traces" system folder.

Procedure

To display a trace configuration, proceed as follows:

1. Double-click the appropriate icon of a trace configuration, an installed trace, a measurement or an overlay measurement in the project tree.

   The "Configuration" or "Diagram" tab opens in the working area.
2. If required, click the "Configuration" tab for the display.

Note

Write protection

The configuration data of an installed trace and in all measurements is displayed with write protection.

See also

User interface - “Traces” project tree folder (Page 16)

3.3.3 Displaying a diagram

Requirement

An installed trace, a measurement or an overlay measurement is available in the "Traces" system folder.

Procedure

To display a diagram, proceed as follows:

1. Double-click the appropriate icon of an installed trace, a measurement or an overlay measurement in the project tree.

   The "Configuration" or "Diagram" tab opens in the working area.
2. If required, click the "Diagram" tab for the display.

See also

User interface - “Traces” project tree folder (Page 16)

3.3.4 Apply overlay measurement

Overlay measurements can be applied in the project tree with a comparison function for different measurements.

The following instructions describe how you can create an overlay measurement under the “Overlay measurements" system folder

Requirement

A device is configured that supports the trace and logic analyzer function.

Procedure

To apply an overlay measurement, proceed as follows:

1. Select one or more measurements in the “Measurements" system folder.
2. Drag the measurements to the “Overlay measurements” system folder.

A new overlay measurement is created. This contains copies of the selected measurements.

3.3.5 Configuring objects in groups

You can set up groups in system folders in the project navigator. Use this option to configure the view for multiple objects.

The following instructions use measurements as an example in order to describe how to consolidate the measurements into groups. The same functionality is also available for the Traces and Overlay measurements system folders.

Note

Traces in the device can also be displayed in groups

A trace configuration in a group with a trace of the same name in the device is displayed under the group. Therefore, all traces in the device on the first level in the "Traces" folder are not necessarily displayed.

Requirement

Measurements are available in the “Measurements" system folder.

Procedure

Proceed as follows to configure measurements into groups:

1. Select the shortcut menu command “Add new group” by right-clicking on the “Measurements" system folder.

   A new group folder is created.

2. Assign a meaningful name to the new group.
3. Repeat step 1 until all required groups have been created.

   (Sub-groups (groups within groups) can also be created.)

4. Drag & drop the corresponding measurements to the group folder that has been created.

3.4 Working area - general

3.4.1 Transferring the trace configuration to the device

Requirement

- A valid trace configuration is in the "Traces" system folder.
- The maximum number of installed traces has not been reached yet.

Procedure

To transfer a trace configuration to the device, proceed as follows:

1. Open a valid trace configuration in the working area.
2. Click the  button.

Result

The trace configuration is transferred to the device.

3.4.2 Activating/deactivating an installed trace

Requirement

- There is an online connection to the device.
- There is a trace in the device.
- The installed trace is displayed in the working area.
- The button is activated for viewing the displayed trace.

Activating an installed trace

To activate the recording for an installed trace, proceed as follows:

1. Click the button.

   The installed trace is activated and starts the recording according to the configured trigger condition. The trigger condition is device-specific and described in Section "Configuration" below the respective device (Page 71).

   The current status of the recording is displayed in the status display of the trace.

Note

When a recording is restarted, the previously recorded values are lost.

To save the recorded values, save the measurement in the project (Page 57) before you activate the recording again.

Deactivating an installed trace

To deactivate an activated installed trace, proceed as follows:

1. Click the button.

   The installed trace is deactivated.

   The status display of the trace changes to "Inactive".

3.4.3 Displaying the recording

Requirement

- There is an online connection to the device.
- There is a trace with recording in the device.

Or:

- A measurement is in the "Measurements" system folder.

Procedure

To display the recording, proceed as follows:

1. Select an installed trace.
2. Double-click the selected trace.
3. If required, activate the button for viewing.

Or:

1. Select a measurement in the "Measurements" system folder.
2. Double-click the selected measurement.

Result

The recording is displayed in the "Diagram" tab.

See also

User interface - “Traces” project tree folder (Page 16)

3.4.4 Analyze an ongoing recording

Requirements

- An ongoing recording is displayed in the "Diagram" tab.

Save the data currently recorded as a measurement

To analyze a certain time range for an ongoing recording, follow these steps:

1. Click the button.

   The data recorded up to now is added to the measurements.
   The current recording is not affected by this and continues running uninterrupted.

Analyze the measurement

To display the saved measurement, follow these steps:

1. In the “Measurements" system folder double-click the measurement that has just been saved in order to open it

   The “Diagram” tab for the measurement opens in the working area.

See also

Displaying the recording (Page 55)

Working area - Diagram tab (Page 62)

3.4.5 Saving measurements in the project

Requirement

- There is an online connection to the device.
- There is a trace with recording in the device.
- The installed trace data must have been displayed at least once in the curve diagram. The recording data is loaded from the device for the display.

Procedure

To save a recording in the project, proceed as follows:

1. Open the installed trace with the recorded data.
2. If required, make sure that the current data is loaded from the device by activating the button.
3. After activating the button wait until all data has been loaded and displayed.
4. Click the button.

   The measurement is added to the "Measurements" system folder.
5. Save the project in the TIA Portal.

Note

Generate measurements

A measurement of an installed trace can be generated at any time.

Use this functionality e.g. to save the data recorded up until this point in a recording and to analyze it as a static measurement.

3.4.6 Exporting and importing measurements

Requirement

At least one measurement is in the "Measurements" system folder for export.

Exporting measurements

To export a measurement, proceed as follows:

1. Right-click a measurement in the "Measurements" system folder and select the shortcut menu command “Export measurement".
2. Select a folder, a file name and a data type to save the measurement.
3. Click the "Save" button.

Importing measurements

To import a measurement, proceed as follows:

1. Right-click in the "Measurements" system folder and select the shortcut menu command "Import measurement".
2. Select the file e.g. of the "*.ttrecx" file type with the measurement to be imported.
3. Click the "Open" button.

   The imported measurement is displayed with the file name in the "Measurements" system folder.

Note

Export and import trace configurations

The same functionality is available for exporting and importing trace configurations.

3.4.7 Transferring the trace configuration from the device to the project

Requirement

- There is an online connection to the device.
- There is a trace in the device.

Procedure

To transfer a trace configuration to the project, proceed as follows:

1. Open an installed trace.
2. If required, activate the button for viewing.
3. Click the button to transfer the trace configuration from the device.

Result

The configuration is taken over as new trace configuration in the "Traces" system folder.

A trace configuration of the same name is overwritten in the system folder.

3.4.8 Deleting installed traces

Requirement

- There is an online connection to the device.
- There is a trace in the device.

Procedure

To delete an installed trace, proceed as follows:

1. Open an installed trace.
2. If required, activate the  button for viewing.
3. Click the  button.

   A confirmation prompt opens.
4. Confirm the prompt for deletion.

Or

1. Select one or more installed traces  /  in the project tree.
2. Press <Delete> to delete the installed traces.

   A confirmation prompt opens.
3. If required, select an option for deletion and confirm the prompt.

3.5 Working area - Configuration tab

3.5.1 Configuring the trace

Requirement

The "Configuration" tab is open in the working area.

Configuring the trace

In the configuration, you specify the recording and trigger conditions and select the signals to be recorded.

See Section "Configuration" below the respective device (Page 71).

Note

Saving the trace configuration

You save the trace configuration with the project in the TIA Portal.

If you close the project without saving, the configuration is discarded.

See also

Displaying a configuration (Page 50)

3.6 Working area - Diagram tab

3.6.1 Use of the curve diagram

The curve diagram shows the signals of a recording selected in the signal table.

The display area can be zoomed as required. Measurement cursors can be used to select individual values for display in the signal table.

The following operating instructions describe the use of the curve diagram and of the measurement cursors as examples.

Requirements

- An installed trace or a measurement has been selected for display.
- The button is activated to monitor an installed trace.
- The "Diagram" tab is open in the working area.

Monitor an ongoing recording.

To display all of the data in an ongoing recording, proceed as follows:

1. Activate “Display all" via the button.

The entire time range and all values for the ongoing recording are displayed.

To display a consistent time window in an ongoing recording, proceed as follows:

1. Activate “Display all" via the button.
2. Select the desired time range via the button.

The trend view is updated while the scaling of the time range remains the same.

Evaluation of a certain instant of a recording

To display the values for a specific sample, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required position in the recording.

   The values of the signals are displayed in the signal table and in the “Measurement cursor” pane of the “Trace” task card.

Evaluation of the difference between two samples

To display the difference, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move both measurement cursors with the mouse to the required samples in the recording.

   The values of the signals and the difference are displayed in the signal table and in the "Measurement cursor" pane of the "Trace" task card.

Using horizontal measurement cursors

To check whether a certain value has been reached, proceed as follows:

1. Display the horizontal measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required value of the recording.

   The values of the measurement cursors for the selected signal are displayed in the "Measurement cursor" pane of the "Trace" task card.

Moving the time range displayed

Proceed as follows to move the time range displayed:

1. Select a time range via the button.
2. Move the curve to the desired time range by turning the mouse wheel with the <Shift> key pressed down.

Bringing a signal into the foreground

1. Display the legend via the button.
2. Click a signal in the legend.

Or:

1. Click a signal in the curve diagram.

The signal is displayed in the foreground and is highlighted/selected in the signal table. The value axis is updated for the selected signal.

See also

Displaying a diagram (Page 51)

User interface - curve diagram (Page 23)

User interface - signal table (Page 29)

3.6.2 Use of the signal table

The signal table shows the signals of an installed trace or a measurement. The preselected signals in the signal selection are displayed with an overlay measurement. You can show or hide individual signals for the display in the table and adapt the properties for the display. Individual bits can be selected for some data types and displayed as a bit track.

The following operating instructions describe the operation of the signal table.

Requirements

- An installed trace or a measurement has been opened in the "Diagram" tab.
- The button is activated to monitor an installed trace.
- For the display of individual bits as a bit track:
  at least one recorded signal supports the display as a bit track.

Display or hide individual signals and change the color

To adapt the display to suit your requirements, proceed as follows:

1. Click the icon of the respective signal in the column to select or deselect it for the display.
2. Click in the "Color" column for the respective signal and select a color.

   The default color for the signal changes.

Bringing a signal into the foreground

1. In the signal table, select the line of the signal.

   The Y-scale of the signal is displayed.

   The signal curve is brought into the foreground in the curve diagram.

Selecting individual bits for display as a bit track

To display individual bits as a bit track in the lower curve diagram, proceed as follows:

1. Click the icon of a signal in the signal table.
2. Click the icon in the open bit selection of the signal.

   The bits are selected or deselected for display.

See also

Displaying the recording (Page 55)

3.6.3 Using the signal group in the signal table

Individual signals can be scaled identically in a signal group, which makes it easier to compare the curve characteristics.

Binary signals cannot be grouped.

The following operating instructions describe how to work with the signal group.

Note

Saving signal groups

The signal groups can be saved individually for each measurement via the "Use current view as standard" function (button).

If the signal groups and the project are not saved then the signal groups created will be lost when the "Diagram" tab is closed.

Requirements

- An installed trace or a measurement is displayed.
- The button is activated to monitor an installed trace.
- The "Diagram" tab is open in the working area.
- There are at least two signals in the signal table that are not of the BOOL type.

Assigning signals to a signal group

To apply a signal group and assign signals to this group, proceed as follows:

1. In the signal table, select the line or cell of the required signal.
2. Click the gray field in the "Signal group" column.

   The sequence icon is displayed in the gray field and the name of the signal group is pre-assigned: Group
3. Click the gray fields of further signals that are to be assigned to this signal group.

Or:

1. Click in the text field of the "Signal group" column for a signal to be grouped.
2. Enter a name for the group.
3. Enter the same group name in the respective text fields for further signals or select the group name via the drop-down list.

The Y-scales of the grouped signals are scaled with the values of the signal that was selected first. Changes to a scale value always affect the entire group.

Removing signals from a signal group

To delete the assignment of a signal to a signal group, proceed as follows:

1. Click the sequence icon for the required signal in the "Signal group" column.

Or:

1. Click the text field for the required signal in the "Signal group" column.
2. Press the <Del> key.

Or:

1. Select the respective text field in the "Signal group" column for several signals using the <Shift> and <Ctrl> keys.
2. Press the <Del> key.

The signals are removed from the signal group or the signal group is deleted.

3.6.4 Observation of fast signals

Requirements

- There is an online connection to the device.
- There is a trace in the device.

Procedure

To monitor the progress of a fast signal, proceed as follows:

1. Select a trace in the device.
2. Double-click the selected trace.
3. Click on the button for monitoring.
4. Click on the button to automatically repeat the recording.

Result

The recording is automatically re-activated at the end of each recording. The display in the curve is similar to the display of an oscilloscope.

3.6.5 Compare records (overlay measurements)

Requirement

- An overlay measurement is created or is created implicitly by dragging the measurements to the system folder “Overlay measurements”.

  See also Apply overlay measurement (Page 51).

Adding measurements for comparison

To compare measurements, insert the measurements to be compared to the overlay measurements. Proceed as follows for this:

1. In the project tree drag one or more measurements from the system folder “Measurements" to the icon for the overlay measurement .

Or:

1. Import saved measurements via the “Import measurement” shortcut menu command.

A copy of the measurements is added to the overlay measurement.

Note

Changes to the settings for measurements within the overlay measurement have no impact on the original measurements. The original measurements remain unchanged.

Select signals of the measurements for the signal table

Proceed as follows to select the signals for the signal table in the “Diagram” tab:

1. Double-click on the icon for the overlay measurement in the project tree.

   The tabs for the overlay measurement will be displayed in the working area.
2. Click the “Signal selection" tab in the working area.

   The signals for all measurements are displayed in the table.
3. Activate or deactivate the signal check box for those signals that should be visible or should not be visible in the signal table.

The activated signals are displayed in the signal table of the “Diagram” tab.

Use of the signal table

Proceed as follows to open and use the signal tables:

1. Click the “Diagram" tab in the working area.
2. Click on the “Signals” tab within the “Diagram” tab.
3. Use the signal tables as described under Use of the signal table (Page 64).

Align measurements

Proceed as follows to align the time axis for the measurements for the comparison:

1. Click on the “Measurements” tab within the “Diagram” tab.
2. Select the alignment for the measurements via the check box.
3. Adjust the alignment and if necessary set an offset for the alignment of the individual measurements.

The measurements are aligned with each other accordingly on the time axis.

(The precise alignment of two measurements is described in the next section.)

Use of the curve diagram

Proceed as follows to open and use the curve diagram:

1. Click the “Diagram" tab in the working area.
2. Use the curve diagram as described under Use of the curve diagram (Page 62).

See also

Align measurements precisely (overlay measurements) (Page 69)

3.6.6 Align measurements precisely (overlay measurements)

Requirement

- An overlay measurement is applied.
- Measurements for comparison are added to the overlay measurement.
- Signals of the measurements for the signal table are selected.
- The “Diagram” tab for the overlay measurement opens in the working area.

Align measurements precisely with position difference ΔX

Proceed as follows to align the time axis for two measurements precisely:

1. Display the vertical measurement cursors via the button.
2. Zoom into the time range, e.g. with the button until you are able to position the first measurement cursor precisely on the desired reference point for the first measurement.
3. Move the first measurement cursor with the mouse to the required position.
4. Search for the reference point for the second measurement, e.g. by switching to “Display all” with the button.
5. Zoom into the time range, e.g. with the button until you are able to position the second measurement cursor precisely on the desired reference point for the second measurement.
6. Move the second measurement cursor with the mouse to the required position.
7. Open the “Trace" task card.
8. In the “Measurement cursor” pane select the position difference value ΔX.
9. Copy the value to the clipboard.
10. Insert the value from the clipboard into the Offset cell of the first or second measurement.

Both measurements are precisely aligned with each other at the desired measurement points.

Note

When inserting the position difference as the offset make sure that you also adjust the leading character as necessary.

3.6.7 Printing a recording

The curve diagram supports the saving of the display as a graphic and the copying of the display to the clipboard. Also use these functions (Page 23) for printing.

Devices 4

4.1 S7-1200/1500 CPUs

4.1.1 Recordable variables

Device-dependent recording of tags

The following list shows the operand areas from which tags can be recorded:

- Process image input
- Process image output
- Bit memory
- Data blocks

Data types

A selection of elementary and composite data types can be recorded. The availability of the individual data types depends on the device used:

For more information, see the help under "Overview of valid data types".

The following table lists the supported data types:

Data types	Note
Binary numbers	
BOOL	-
Bit strings	
BYTE	-
WORD	-
DWORD	-
LWORD 1)	Symbolic name required
Integers	
SINT	-
USINT	-
INT	-
UINT	-
DINT	-
UDINT	-
LINT 1)	Symbolic name required
ULINT 1)	Symbolic name required

Data types	Note
Floating-point numbers	
REAL	-
LREAL	Symbolic name required
Timers	
TIME	-
LTIME 1)	-
Date and time	
DATE	-
TOD	-
LTOD 1)	-
LDT 1)	-

1) Not supported by S7-1200.

4.1.2 Lifetime of the installed trace configuration and recorded values

Installed trace configurations are retained after POWER OFF. The recording is activated again after the restart of the CPU.

Recorded values are lost during the restart.

Note

Downloading a configuration to the device in the "STOP" operating state

Note that after downloading a configuration in the "STOP" operating state, you must check the installed traces and, if required, reactivate them or transfer them again.

Note

If trigger tags that affect the address are changed, the trace configuration must also be transferred to the device again.

This is the case for example, when a data block is shortened or extended or the data type is changed.

4.1.3 Recording levels

All runtime levels can be used for the recording cycle. The cyclic execution levels are offered for selection via the button . In non-periodic recording levels, the recording time is undefined.

Note

The measured values are recorded at the end of the OB after the processing of the user program.

4.1.4 Quantity structure

The following table shows the maximum quantity structure that can be recorded with the trace and logic analyzer function:

Device	Maximum number of installed traces	Maximum number of signals per trace configuration
S7-1200 (as of firmware version V4.0)	2	16
S7-1500, ET 200SP, CPU 1516pro-2 PN, S7-1500 Software Controller	At least 4 (depending on the CPU type)	16

Example CPU 1516-3 PN/DP

- Maximum of 3854 samples for 16 signals from PLC tags of the DWORD data type
- Maximum of 21844 samples for 16 signals from PLC tags of the BOOL data type
- Maximum of 58250 samples for 1 signal from a PLC tag of the BOOL data type

Further information can also be found in the form of FAQs under the ID 102781176 (http://support.automation.siemens.com/WW/view/en/102781176).

4.1.5 CPU load through trace recording

A trace recording increases the runtime of the respective recording level that can result in an execution level overflow with high utilization of the CPU.

Remedy for execution level overflow:

- **Change the trace configuration**

  1) Configure fewer tags and signals.

  2) Then increase the number of tags and signals up to the maximum number of signals step-by-step without an execution level overflow.

- **Select a slower recording level**

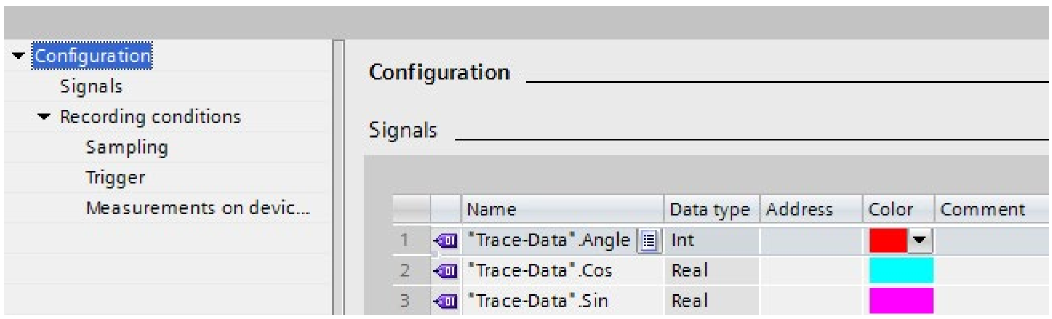
4.1.6 Software user interface of the configuration

4.1.6.1 Structure of the user interface

Display areas in the "Configuration" tab of the working area

The settings options differ depending on the configured device.

The following figure shows an example of the display in the TIA Portal:



The area navigation provides the following entries for selection:

- Configuration
  - Signals (Page 75)
  - Recording conditions (Page 77)

Displaying and changing properties of a trace configuration

A trace is selected in the project tree and displayed in the "Configuration" tab.

The trace configuration can only be changed offline and is displayed online with the write protection.

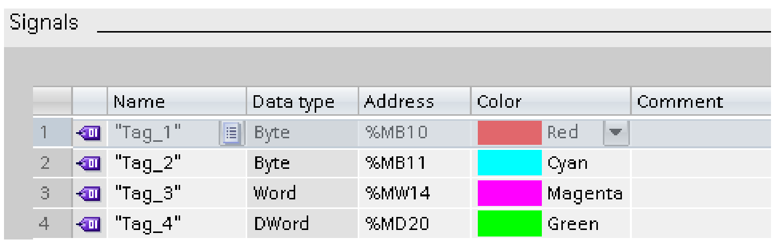
4.1.6.2 User interface - Signals

The "Signals" area shows a table in which the signals to be recorded are configured for the selected trace configuration.

Signals can also be inserted in the table using drag-and-drop.
The signals can be sorted using drag-and-drop.

Setting options and displays in "Signals"

The following figure shows an example of the display in the TIA Portal:



The following table shows the settings and displays:

Column	Icon	Description
		Display of the signal icon for a selected signal.
"Name"	-	Input field for the name or address of the signal. **Examples:** • “Data_block_1”.pressure • M0.0 • DB1.DBW3
-		Button to open the signal selection table. The button is displayed when the table line is selected. Clicking the icon opens a table which offers possible signals for selection. The selected signal is displayed in the input field.
"Data type"	-	Text field with display of the data type for the signal.
"Address"	-	Input field for the address of the signal. The field remains empty with optimized / type correct tags.
"Color"	-	Text field for display and selection of the color. Click the signal color to open the color selection dialog.
"Comment"		Input field for a comment on the signal.

Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard to the selected line. The existing contents are overwritten.
"Delete"	Deletes the selected lines from the table or deletes the content of the selected cell.
"Rename"	Switches the selected cell to the editing mode.

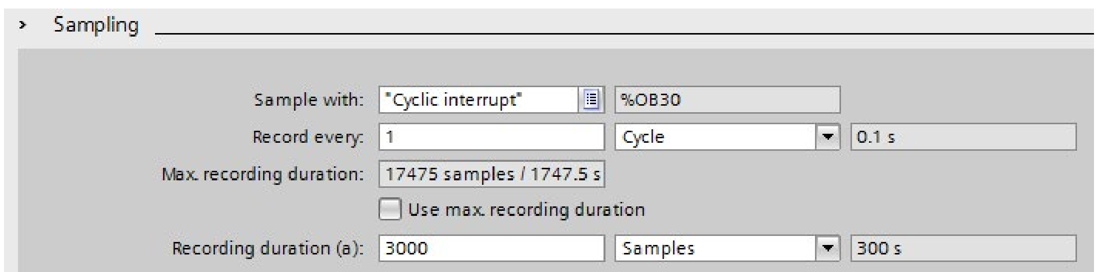
4.1.6.3 Recording conditions

User interface - Recording conditions

The "Recording conditions" area shows the trigger condition for the selected trace configuration and in which cycle, how fast and how long the recording is made. Configuration is possible when the trace configuration is displayed in offline mode or online mode with deactivated viewing .

Setting options and displays in "Recording conditions"

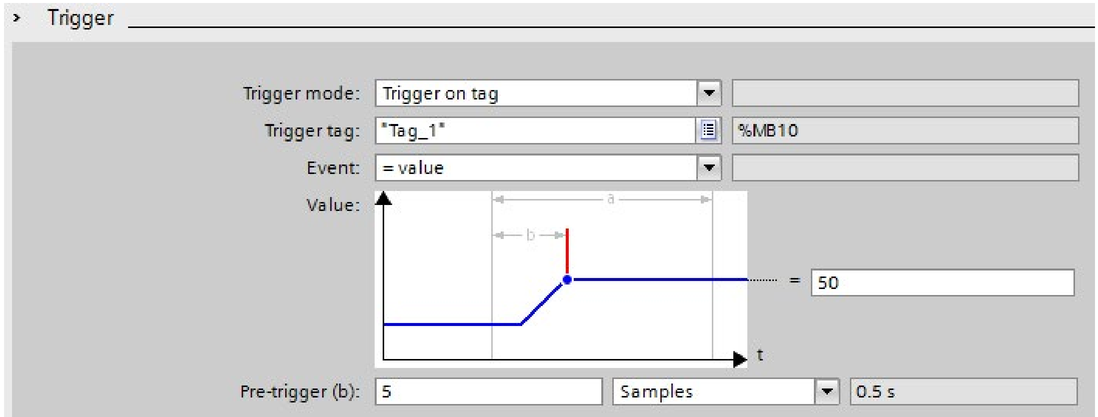
The following figure shows an example of the settings for the sampling in the TIA Portal:



The following table explains the settings and displays:

Setting/display		Description
"Recording time"		
	Recording level entry field	Selection of the recording time. See Recording levels (Page 73)
	Address of the OB text field	Detailed information on the selected recording time.
"Record every"		
	Reduction entry field	Input of the reduction in relation to the reduction ratio and the unit.
	Reduction ratio drop-down list	Selection of the reduction ratio unit The following settings are possible: • "Cycle" • "s" (setting option depends on the recording level selected under "recording time")
	Sampling time text field	Display of the sampling time, taking into account the configured reduction and the selected unit (only for constant bus cycle time OBs).
"Max. recording duration"		
	Max. recording duration text field	Displays the calculated maximum recording duration. The "Max. recording duration" depends on how many signals are recorded and the data type of these signals.
	"Use max. recording duration"	Set the recording duration to the maximum value. When the checkbox is activated, the recording duration is set to the maximum possible recording duration. The set reduction in the "Record every" input field is taken into account. The recording duration is also adapted when additional signals are added. Further information can also be found in the form of FAQs under the ID 102781176 (http://support.automation.siemens.com/WW/view/en/102781176).
"Recording duration"		
	Recording duration entry field	Input of the recording duration in relation to the selected unit. If the "Recording duration = max. recording duration" checkbox is activated, entries are overwritten by the value displayed in "Max. recording duration".
	Unit drop-down list	Selection of the unit for the recording duration. The following settings are possible: • "Samples" The maximum number of samples recorded is the number for which parameters are assigned under recording duration. • "s" (setting option depends on the recording level selected under "recording time")
	Calculated recording duration text field	Display of the calculated recording duration (only for constant bus cycle time OBs)

The following figure shows an example of the settings for the trigger in the TIA Portal:

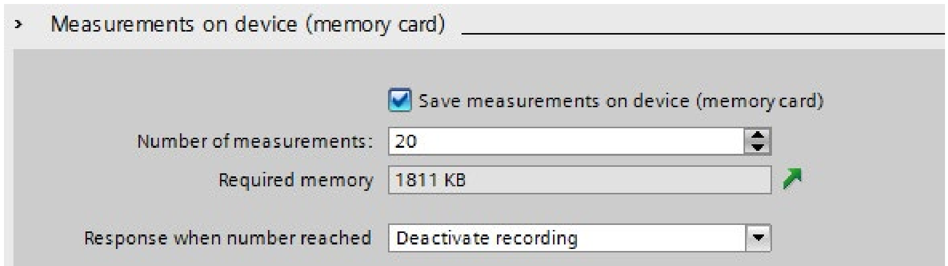


The following table explains the settings and displays:

Setting/display	Description
"Trigger mode"	Selection of the trigger mode.
Trigger mode drop-down list	The following settings are possible: • "Record immediately" The recording is made immediately after the device is activated. • "Trigger on tag" The recording is made as soon as the installed trace is activated and the configured trigger condition is fulfilled.
Text field	-
"Trigger tag"	The "Trigger tag" specifies a signal that triggers the recording.
Trigger tag entry field	Enter a signal. **Examples:** • "DataBlock_1".Temperature • M0.0 • DB1.DBW3 See also Data types for trigger tags (Page 84).
	Opens the signal selection table. Clicking the icon opens a table which offers possible signals for selection as trigger tag. The selected signal is displayed in the input field.
Trigger tag address text field	Display of the trigger tag address. With purely symbolic signals the field remains empty.
"Event"	The events that can be used on this trigger tag are offered for selection according to the data type of the trigger tag. The event can only be configured when a valid signal has been entered as trigger tag.
Trigger events drop-down list	Event selection for which the trigger tag is checked. The entries in the drop-down list are described in Section Trigger event (Page 84).
Text field	-
"Value"	Configuration of the selected event. The configuration options differ depending on the format of the trigger tag and the selected event. SeeTrigger event (Page 84).

Setting/display	Description
"Pre-trigger"	"Pre-trigger" defines the number of samples that are already recorded before the actual trigger condition is fulfilled. If the trigger event occurs immediately or shortly after the activation of the recording, this may result in a shorter recording duration. Examples of "Recording duration (a)" = 20 samples and "Pre-trigger (b)" = 5 samples: • Case 1: Trigger event occurs 50 samples after activation of the recording Actual recording duration (a) = 20 samples • Case 2: Trigger event occurs 2 samples after activation of the recording Actual recording duration (a) = 17 samples
Duration entry field	Input of the duration in relation to the selection in the drop-down list.
Unit drop-down list	Selection of the unit The following settings are possible: • "Samples" • "s" (setting option depends on the recording level selected under “recording time”)
Resulting pre-trigger duration text field	Display of the calculated "Pre-trigger" duration (only for recording in constant bus cycle time OBs)

The following figure shows an example of the settings for the saving of installed measurements:



Note

Available memory in the device (memory card)

The memory in the device (memory card) is partly used by system-relevant functions or reserved for that purpose.

Thus it is not possible for the entire memory to be used for saving measurements.

For further information please refer to the Function Manual Structure and Use of the CPU Memory (https://support.industry.siemens.com/cs/us/en/view/59193101).

Note

Memory requirements upon restart

Following a device reboot the maximum number of measurements saved in the device is the number configured under “Number of measurements”.

With repeated restarts note that the measurements already saved are not overwritten and the “Number of measurements” configured in the device is saved once again.

The following table explains the settings and displays:

Setting/display	Description
“Saving of installed measurements (memory card)”	Repeat measurement automatically and store in the device retentively This setting is only possible with “Trigger on tag” trigger mode. The measurements are stored on the “primary” memory card. For traces which have been saved in the device (memory card), the  function for automatically repeating the recording is not available. **Note** Only completed measurements are saved on the device. Any recording deactivated by the user is not saved on the device. **This function is available with the following firmware versions:** • S7-1200 as of V4.2 • S7-1500 as of V2.0 The function is not supported by CPU S7-1500 R/H.
“Number of measurements”	Input of the number of measurements to be saved on the card.
“Memory requirements”	Display of the expected memory requirement for all measurements
	Displaying memory usage Shows the tab with the memory usage
“Behavior if number reached”	Selection for the behavior once “Number of measurements” is reached The following settings are possible: • “Deactivating a recording” The measurements are repeated until the “Number of measurements on the card” is reached. • “Overwrite oldest recording” The measurements are saved in a ring buffer and repeated until the user deactivates the recording. Once the number of measurements exceeds the “Number of measurements on the card” the oldest measurement on the card is overwritten in each case. **Note** Note that write processes that are repeated frequently may damage the card.

Data types for trigger tags

The following table shows the supported data types for the trigger tag:

Memory requirement and format of the number	Data type
1 byte	BOOL
8-bit integers	SINT, USINT, BYTE
16-bit integers	INT, UINT, WORD, DATE
32-bit integers	DINT, UDINT, DWORD, TIME, TOD
64-bit integers 1)	LINT, ULINT, LWORD, LTIME, LTOD, LDT
32-bit floating-point numbers	REAL
64-bit floating-point numbers	LREAL

1) Not supported by S7-1200.

Trigger event

Depending on the selection in the drop-down list, the further settings differ for the "event".

The individual events are described below.

"=TRUE"

Supported data types: Bit (Page 84)

The recording starts when the state of the trigger is TRUE.

"=FALSE"

Supported data types: Bit (Page 84)

The recording starts when the state of the trigger is FALSE.

"Rising edge"

Supported data types: Bit (Page 84)

The recording is started when the trigger state changes from FALSE to TRUE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Rising signal"

Supported data types: Integers and floating-point numbers (Page 84) (no times, date and time of day)

The recording is started when the rising value of the trigger reaches or exceeds the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling edge"

Supported data types: Bit (Page 84)

The recording is started when the trigger state changes from TRUE to FALSE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling signal"

Supported data types: Integers and floating-point numbers (Page 84)
(no times, date and time of day)

The recording is started when the falling value of the trigger reaches or falls below the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"In the range"

Supported data types: Integers and floating-point numbers (Page 84)

The recording starts as soon as the value of the trigger is in the value range configured for this event.

"Outside of the range"

Supported data types: Integers and floating-point numbers (Page 84)

The recording starts as soon as the value of the trigger is outside the value range configured for this event.

"Value change"

All data types are supported.

The value is checked for change when the recording is activated. The recording starts when the value of the trigger changes.

This trigger event is supported as of V13 SP1. Older versions of the TIA Portal cannot interpret the trigger. Note that no explicit information is output in this case. This can occur, for example, when the trace is transferred from a CPU to a TIA Portal less than V13 SP1 or a trace configuration is imported.

"= value"

Supported data types: Integers (Page 84)

The recording starts when the value of the trigger is equal to the value configured for this event.

"<> value"

Supported data types: Integers (Page 84)

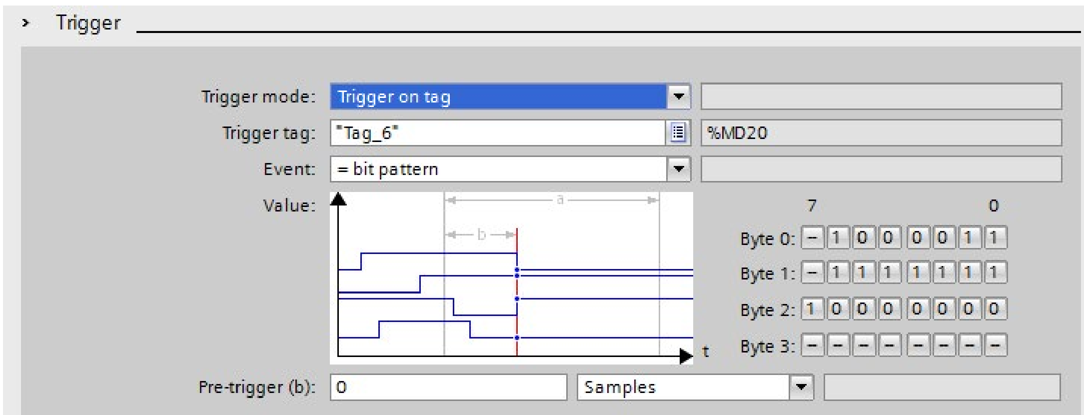
The recording starts when the value of the trigger is not equal to the value configured for this event.

"= bit pattern"

Supported data types: Integers and floating-point numbers (Page 84)
(no times, date and time of day)

The recording starts when the value of the trigger matches the bit pattern configured for this event.

The following figure shows the setting options for a "bit pattern":



It is possible to switch between the icons by clicking the respective button.

The following table shows the icons:

Icon	Description
–	Bit is not evaluated
0	Bit is checked for FALSE
1	Bit is checked for TRUE

"<> bit pattern"

Supported data types: Integers and floating-point numbers (Page 84)
(no times, date and time of day)

The recording starts when the value of the trigger does not match the bit pattern configured for this event.

Configuring the trigger conditions (Page 89)

Recordable variables (Page 71)

4.1.7 Configuration

4.1.7.1 Trace configuration - overview

The configuration of the recording conditions and the signals to be recorded is device-specific.

Requirement

A trace configuration has been created and opened in the working area of the "Configuration" tab.

Procedure

The following table shows the procedure for configuring.

Step	Description
1	Documentation of the configuration (optional) Enter a comment and an author for the configuration in the Inspector window.
2	Selecting signals (Page 88) Select the signals to be recorded in the "Signals" area.
3	Select a recording time, a cycle and the duration in the "Recording conditions" area.
4	Configuring the trigger conditions (Page 89) In the "Recording conditions" area, select whether the recording is to be performed immediately or depending on a trigger condition.
5	Configure installed measurements (memory card) (Page 90) In the "Recording conditions" area, select whether the recording is to be saved on the device (memory card).

4.1.7.2 Selecting signals

Requirement

- A trace configuration has been created and opened.
- The "Signals" area is open in the "Configuration" tab.

Procedure

To configure the signals to be recorded, proceed as follows:

1. Select a signal. The following options are available:
   – In the "Name" column, click the button and select a tag.
   – Enter the symbolic tag name in the cell in the "Name" column.
   – Enter the address directly in the "Address" column.
   – Drag a signal to the table using drag-and-drop.
2. Click in the "Color" column and select a color for the display of the signal.
3. Click in the "Comment" column and enter a comment for the signal.
4. Repeat the procedure from step 1 until all the signals to be recorded have been entered in the table.

4.1.7.3 Configuring the recording cycle and duration

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.

Procedure

To configure the cycle and the duration of a recording, proceed as follows:

1. Click the button for the recording time.
2. Select an OB for the recording time (Page 73).
3. Select a unit for the reduction factor in the drop-down list for "Record every".
4. Enter the factor for the reduction in the input field for "Record every".
5. Select a unit in the drop-down list for "Recording duration".
6. Specify the recording duration.
   The following options are available:
   – Enter a value for the duration in the input field for "Recording duration".
   – Activate the "Use max. recording duration" checkbox.

4.1.7.4 Configuring the trigger conditions

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.

"Record immediately" trigger condition

To start the recording immediately, proceed as follows:

1. Select the "Record immediately" entry in the drop-down list for "Trigger mode".

   The input fields for the trigger tag are hidden.

"Trigger on tag" trigger condition

To start the recording depending on a condition, proceed as follows:

1. Select the "Trigger on tag" entry in the drop-down list for "Trigger mode".
2. Select a trigger tag. The following options are available:
   – Click the button for the trigger tag and select a tag.
   – Enter the address or the symbolic name of the tag directly in the input field for the trigger tag.

   A drop-down list with events and input fields is displayed. The display depends on the data type of the tag.
3. Configure the event.
4. Select a unit for the pre-trigger in the drop-down list for "Pre-trigger".
5. In order to record a period before the trigger event, enter a value greater than 0 in the input field for the pre-trigger.

Note

Cyclic test of the trigger condition

The trigger condition is checked in every cycle irrespective of the setting in "Record every". To reliably identify the trigger, the trigger signal must be present for at least one full cycle.

4.1.7.5 Configure installed measurements (memory card)

Requirement

- A trace configuration has been created and opened.
- The "Recording conditions" area is open in the "Configuration" tab.
- The “Trigger on tag” trigger mode is set.
- The firmware on the device supports the recording of an installed measurement.

Procedure

Proceed as follows to save the installed measurement (on the memory card):

1. Select the "Save measurements on device (memory card)" check box.
2. Enter the number of measurements that ought to be saved on the card in the “Number of measurements” entry field.
3. Set the desired behavior once the “Number of measurements” has been reached in the “Behavior if number reached” drop-down list.

Note

No evaluation of the trigger during saving

No new trigger can be evaluated as long as the recording is saved.

Glossary

Curve diagram

Displays the selected signals of a recording.

Installed trace

Consists of a trace configuration and optionally a recording.

Measurement

Consists of a trace configuration with an associated recording.

Overlay measurement

Permits a comparison and analysis of signals from different measurements.

Pre-trigger

Defines the interval in which the signals are already recorded before the actual trigger condition is fulfilled.

Recording

Is performed in the device. There is only one recording for each installed trace configuration.

Recording condition

Sampling and trigger for a trace configuration.

Recording duration

Factor in number of samples. The factor of 100 means, for example, that 100 samples are recorded.

Reduction

Factor in number of cycles. A factor of 2 means, for example, that a recording is made every second cycle.

Sampling

Setting, in which cycle, how fast and how long the recording is to be made.

Signal table

Lists the signals of the selected measurement and provides setting options for some properties.

Snapshot

Contains the settings for the view for a measurement.

Trace configuration

Contains all the information required to record values in a device.

Trigger

Specifies the trigger mode and the condition for the "Trigger on tag" mode.

Trigger mode

Specifies whether the recording should be started immediately or based on a trigger tag.

Trigger tag

Signal to trigger the recording.

Trigger time

The meaning of the measurement trigger time depends on the device.

e.g. SIMATIC S7-1200/1500 CPUs: Specifies the absolute time of the control system at the start of recording.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides you with an overview of the communication options, the CPUs, communication modules and processors and PC systems of the SIMATIC S7-1500, ET 200MP, ET 200SP, ET 200AL and ET 200pro systems. This function manual describes the connection-oriented, asynchronous communication.

The documentation covers the following:

- Overview of the communication services
- Properties of the communication services
- Overview of the user activities for setting up the communication services

Basic knowledge required

The following knowledge is required in order to understand the Function manual:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of the documentation

This documentation is the basic documentation for all products of the SIMATIC S7-1500, ET 200MP, ET 200SP, ET 200AL and ET 200pro systems. The product documentation is based on this documentation.

What's new in the Communication Function Manual, Edition 10/2018 as compared to Edition 12/2017?

What's new?		What are the customer benefits?	Where can I find information?
New contents	Description of communication with the redundant system S7-1500R/H	You receive information on the particularities of communication with the redundant system S7-1500R/H	Section Communication with the redundant system S7-1500R/H (Page 283)
	Scope of the function manual expanded to include the redundant system S7-1500R/H	Functions with which you are familiar from the SIMATIC S7-1500 automation system are implemented for the redundant system S7-1500R/H.	Redundant System S7-1500R/H System Manual (https://support.industry.siemens.com/cs/ww/en/view/109754833)

What's new in the Communication Function Manual, Edition 12/2017 compared to Edition 09/2016

What's new?		What are the customer benefits?	Where can I find the information?
New contents	OPC UA Companion Specification	Through OPC UA Companion Specification, methods can be specified in a uniform and manufacturer-neutral way. Using these specified methods, you can easily integrate devices from various manufacturers into the plant and the production processes.	Section AUTOHOTSPOT
	Setting up a secure connection to a mail server over the CPU interface	You can set up a secure connection to a mail server without additional hardware.	Section Secure OUC via e-mail (Page 109)
	Secure communication over Modbus TCP	You can establish secure TCP connections between a Modbus TCP client and a Modbus TCP server.	Section Secure OUC with Modbus TCP (Page 108)

What's new in the Communication Function Manual, Edition 09/2016 compared to Edition 12/2014

What's new?		What are the customer benefits?	Where can I find the information?
New contents	OPC UA server	OPC UA is a uniform standard for data communication and is independent of any particular operating system platforms. OPC UA uses integrated safety mechanisms on various automation systems, for example with data exchange, at application level, for the legitimation of the user. The OPC UA server provides a large amount of data: • Values of PLC tags that clients can access • Data types of these PLC tags • Information about the OPC UA server itself and the CPU In this way, clients can gain an overview of the tag management and can read and write values.	Section AUTOHOTSPOT
	Secure Open User Communication	Secure data exchange with other devices.	Section Secure Open User Communication (Page 94)
	Certificate handling in STEP 7	You can manage certificates for the following applications in STEP 7: • OPC UA server • Secure Open User Communication • Web server of the CPU	Section Managing certificates with STEP 7 (Page 46)
	Deactivating SNMP for the CPU	You can deactivate SNMP for the CPU. This can make sense under certain conditions, for example if the security guidelines in your network do not permit SNMP.	Section Disabling SNMP (Page 60)

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)".

"S7-1500 CPUs" also refers to the CPU variants S7-1500F, S7-1500T, S7-1500TF, S7-1500C as well as S7-1500pro CPUs, ET200SP CPUs as well as the SIMATIC S7-1500 SW controller.

This documentation contains pictures of the devices described. The figures may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on handling of the product and on the section of the documentation to which you should pay particular attention.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (https://support.industry.siemens.com).

Industry Mall

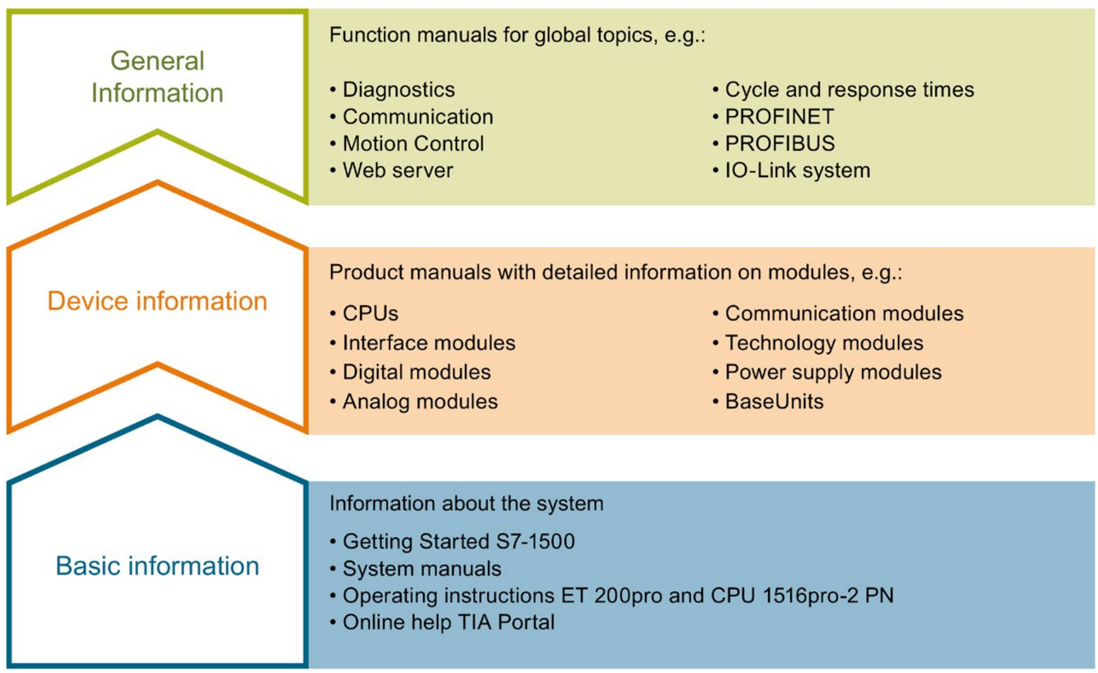
The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

You can find catalogs for all automation and drive products on the Internet (https://mall.industry.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742705).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

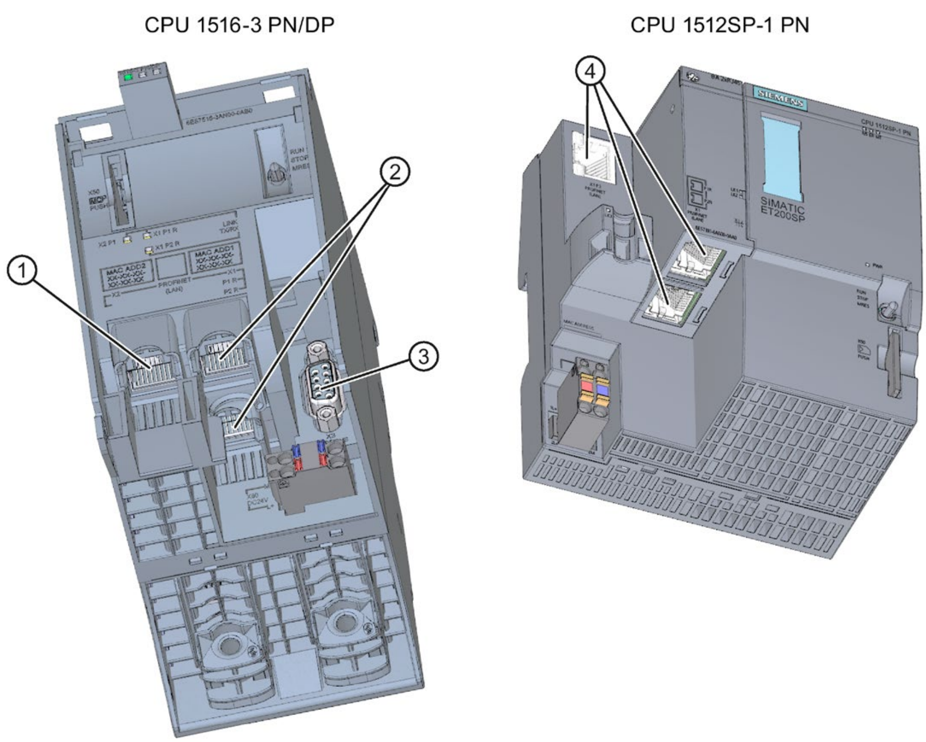
You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2 Product overview

CPUs, communications modules and processors, and PC systems of the S7-1500, , ET 200MPET 200SPET 200pro and ET 200AL systems provide you with interfaces for communication via PROFINET, PROFIBUS and point-to-point connections.

CPUs, communications modules and communications processors

PROFINET and PROFIBUS DP interfaces are integrated in the S7-1500 CPUs. The CPU 1516-3 PN/DP for example has two PROFINET interfaces and one PROFIBUS DP interface. Other PROFINET and PROFIBUS DP interfaces are available by using communications modules (CM) and communications processors (CP).

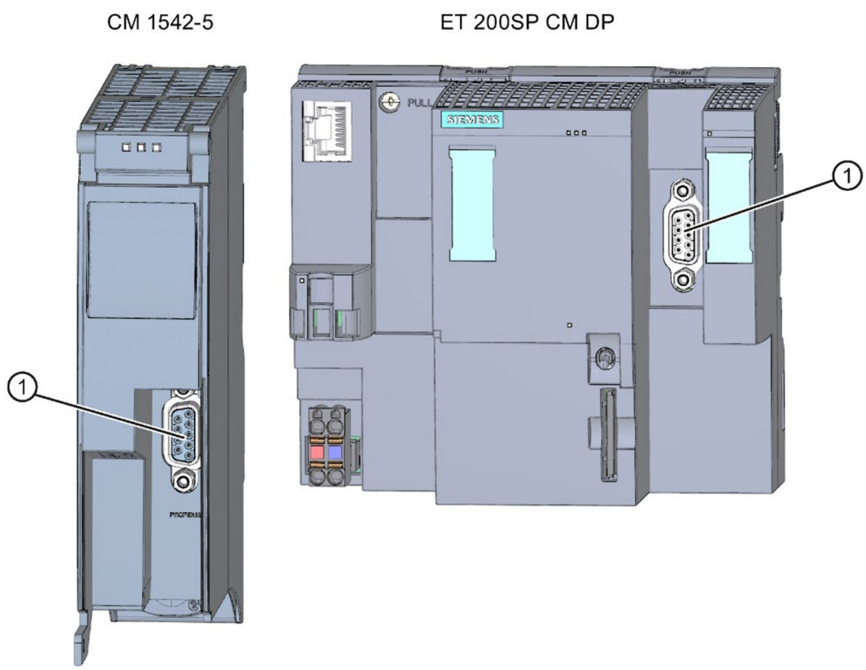


① PROFINET interface (X2) with 1 port
② PROFINET interface (X1) with 2-port switch
③ PROFIBUS DP interface (X3)
④ PROFINET interface (X1) with 3-port switch

Figure 2-1 Interfaces of the CPU 1516-3 PN/DP and CPU 1512SP-1 PN

Interfaces of communications modules

Interfaces of communications modules (CMs) extend the interfaces of CPUs (for example, the communication module CM 1542-5 adds a PROFIBUS interface to S7-1500 automation system).

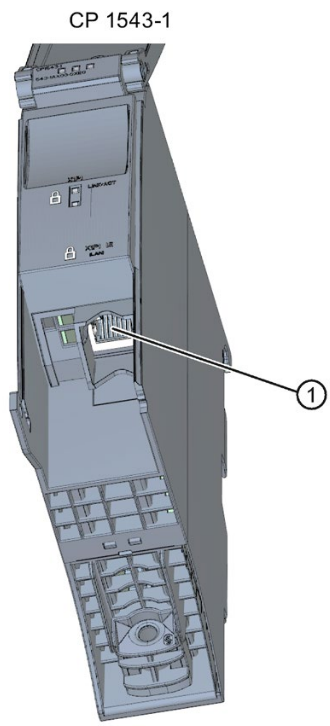


① PROFIBUS DP interface

Figure 2-2 PROFIBUS DP interface of the CM 1542-5 and CM DP

Interfaces of communications processors

Interfaces of communications processors (CPs) provide an additional functionality compared with the integrated interfaces of the CPUs. CPs allow special applications, for example the CP 1543-1 provides Industrial Ethernet security functions for protecting Industrial Ethernet networks via its Industrial Ethernet interface.



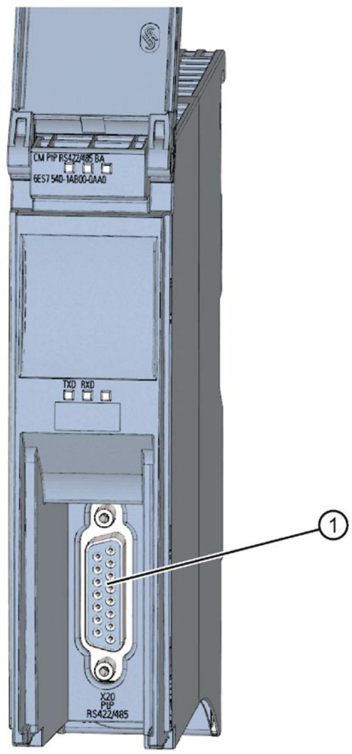
① Industrial Ethernet interface

Figure 2-3 Industrial Ethernet interface of the CP 1543-1

Interfaces of communications modules for point-to-point connections

The communication modules for point-to-point connections provide communication via their RS 232-, RS 422- and RS 485 interfaces, for example, Freeport or Modbus communication.

CM PtP RS422/485 BA

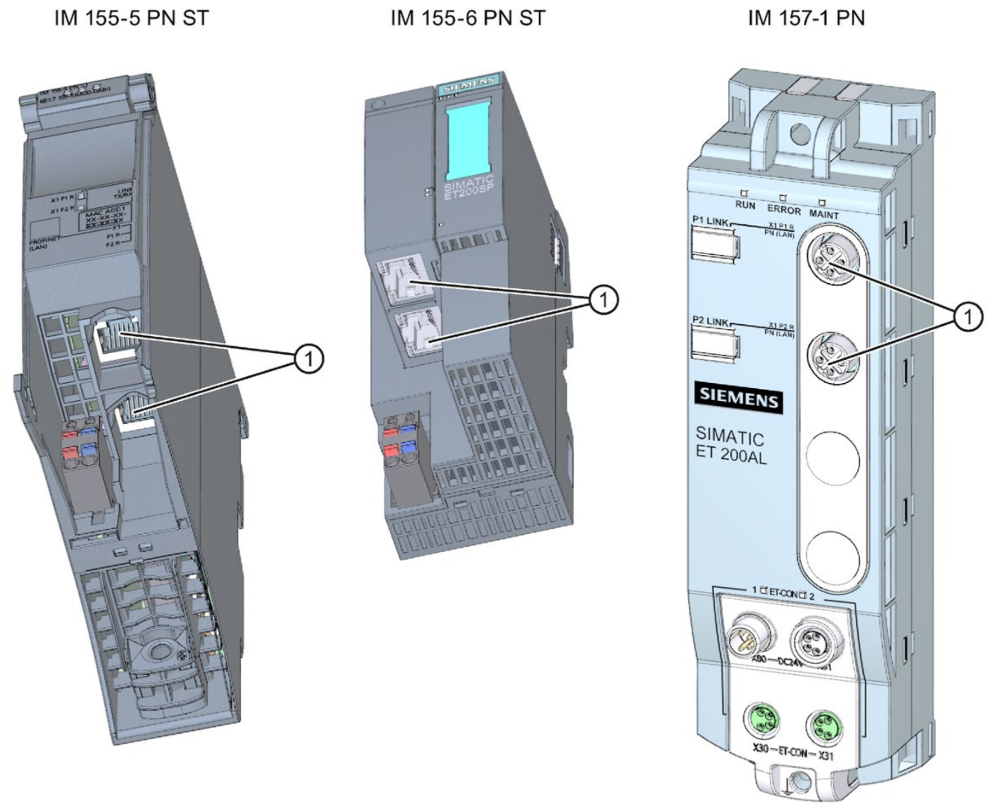


① Interface for point-to-point connections

Figure 2-4 Example of interface for point-to-point connection at the CM PtP RS422/485 BA

Interfaces of interface modules

PROFINET and PROFIBUS DP interfaces of the interface modules (IM) in ET 200MP, ET 200SP and ET 200AL are used to connect the distributed I/O ET 200MP, ET 200SP and ET 200AL to PROFINET or PROFIBUS of the higher-level IO controller or DP master.



① PROFINET interface with 2-port switch

Figure 2-5 PROFINET interfaces IM 155-5 PN ST (ET 200MP), IM 155-6 PN ST (ET 200SP), and IM 157-1 PN (ET 200AL)

Communications services

The communications services described below use the interfaces and communication mechanisms provided by the system via CPUs, communication modules and processors.

Communications services 3

3.1 Overview of communication options

Overview of communications options

The following communications options are available for your automation task.

Table 3- 1 Communications options

Communications options	Functionality	Via interface:		
		PN/IE[1]	DP	serial
PG communication[2]	On commissioning, testing, diagnostics	X	X	-
HMI communication[2]	On operator control and monitoring	X	X	-
Open communication via TCP/IP[2]	Data exchange via PROFINET/Industrial Ethernet with TCP/IP Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Open communication using ISO-on-TCP[2]	Data exchange via PROFINET/Industrial Ethernet with ISO-on-TCP Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Open communication via UDP[2]	Data exchange via PROFINET/Industrial Ethernet with UDP Instructions: • TSEND_C/TRCV_C • TUSEND/TURCV • TCON • T_DISCON	X	-	-

Communications options	Functionality	Via interface:		
		PN/IE[1]	DP	serial
Open communication via ISO (only CPs with PROFINET/Industrial Ethernet interface)	Data exchange via PROFINET/Industrial Ethernet with the ISO protocol Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Open communication with FDL (only CM 1542-5 as of firmware V2.0)	Data exchange via PROFIBUS with the FDL protocol Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TUSEND/TURCV • TCON • T_DISCON	-	X	-
OPC UA server (only via internal PROFINET interfaces of the CPU)	Data exchange with OPC UA clients	X	-	-
Communication via Modbus TCP	Data exchange via PROFINET with Modbus TCP protocol Instructions: • MB_CLIENT • MB_SERVER	X	-	-
E-mail	Sending process alarms via e-mail Instruction: • TMAIL_C	X	-	-
FTP (only CPs with PROFINET/Industrial Ethernet interface)	File management and file access via FTP (File Transfer Protocol); CP can be FTP client and FTP server Instruction: • FTP_CMD	X	-	-
Fetch/Write (only CPs with PROFINET/Industrial Ethernet interface)	Server services via TCP/IP, ISO-on-TCP and ISO Via special instructions for Fetch/Write	X	-	-
S7 communication	Data exchange via PROFINET/PROFIBUS with the S7 protocol. Instructions: • PUT/GET • BSEND/BRCV • USEND/URCV	X	X	-

Communications options	Functionality	Via interface:		
		PN/IE[1]	DP	serial
Serial point-to-point connection	Data exchange via point-to-point with Freeport, 3964(R), USS or Modbus protocol Via special instructions for PtP, USS or Modbus RTU	-	-	X
Web server	Data exchange via HTTP(S), for example for diagnostics	X	-	-
SNMP (Simple Network Management Protocol)	For monitoring and error recognition of IP networks, possibly parameterization of the IP network components via standard SNMP protocol	X	-	-
Time-of-day synchronization	Via PN/IE interface: CPU is NTP client (Network Time Protocol)	X	-	-
	Via DP interface: CPU/CM/CP is time-of-day master or time slave	-	X	-

1 IE - Industrial Ethernet

2 Observe the special characteristics for S7-1500R/H

Information on S7-1500R/H

You can find information on the communication possibilities with the redundant system S7-1500R/H in the section Communication with the redundant system S7-1500R/H (Page 283).

Additional information

- Application example: CPU-CPU communication with SIMATIC controllers (compendium) You can find the application example on the Internet (https://support.industry.siemens.com/cs/ww/en/view/20982954).
- This FAQ (https://support.industry.siemens.com/cs/ww/en/view/102420020) describes how to configure fetch/write communication via CP1543-1 with S7-1500.
- Additional information about the Fetch/Write services is available in the STEP 7 online help.
- You can find additional information on the PtP link in the function manual CM PtP - Configurations for Point-to-Point Connections (http://support.automation.siemens.com/WW/view/en/59057093).
- You will find the description of the web server functionality in the function manual Web server (http://support.automation.siemens.com/WW/view/en/59193560).
- You will find information about the standard protocol SNMP on the Service & Support pages on the Internet (http://support.automation.siemens.com/WW/view/en/15166742).
- You will find information about time-of-day synchronization in this FAQ (https://support.industry.siemens.com/cs/ww/en/view/86535497).

3.2 Communications protocols and port numbers used for Ethernet communication

This section provides an overview of the supported protocols and port numbers used for communication over PN/IE interfaces. For each protocol the address parameters, the respective communications layer as well as the communications role and the communications direction are specified.

This information makes it possible to match the security measures for protection of the automation system to the used protocols (for example firewall). Because security measures are limited to Ethernet or PROFINET networks, the tables do not include PROFIBUS protocols.

Note

Port numbers used

The specified port numbers are the standard port numbers used by the S7-1500 CPU. Many communication protocols and implementations enable you to use other port numbers.

The tables below show the different layers and protocols that are being used.

The following table shows the protocols supported by the S7-1500 CPUs, ET 200SP CPUs and the CPU 1516pro-2 PN. The S7-1500 software controllers also support the protocols listed in the following table for the Ethernet interfaces that are assigned to the software controller.

Table 3- 2 Layers and protocols of the S7-1500 CPUs and software controllers (via PROFINET interface of the CPU)

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET protocols				
DCP Discovery and basic configuration protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	Accessible devices PROFINET Discovery and configuration	DCP is used by PROFINET to discover PROFINET devices and provide basic settings.
LLDP Link Layer Discovery protocol	Not relevant	(2) Ethertype 0x88CC (LLDP)	PROFINET Link Layer Discovery protocol	LLDP is used by PROFINET to discover and manage neighbor relationships between PROFINET devices. LLDP uses the special multicast MAC address: 01-80-C2-00-00-0E
MRP Media Redundancy Protocol	Not relevant	(2) Ethertype 0x88E3 (IEC 62493-2-2010)	PROFINET medium redundancy	MRP provides control of redundant transmission paths by means of a ring topology. MRP uses standard-compliant Multicast MAC addresses.
PTCP Precision Transparent Clock Protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	PROFINET send clock and time synchronization, based on IEEE 1588	PTC provides a time delay measurement between RJ45 ports and thus send clock synchronization and time synchronization. PTCP uses standard-compliant Multicast MAC addresses.

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET IO data	Not relevant	(2) Ethertype 0x8892 (PROFINET)	PROFINET Cyclic IO data transfer	The PROFINET IO frames are used to transmit IO data cyclically between PROFINET IO controller and IO devices via Ethernet.
PROFINET Context Manager	34964	(4) UDP	PROFINET connection less RPC	The PROFINET Context Manager provides an endpoint mapper in order to establish an application relation (PROFINET AR).
Connection-oriented communications protocols				
SMTP Simple mail transfer protocol	25	(4) TCP	Simple mail transfer protocol	SMTP is used for sending e-mails.
SMTPS (SMTP over TLS)	465	(4) TCP	Secure SMTP	SMTP is used for sending e-mails over secure connections.
SMTP with STARTTLS	25 587	(4) TCP	Simple mail transfer protocol with the SMTP command "STARTTLS"	SMTP with STARTTLS is used for sending e-mails over secure connections.
HTTP Hypertext transfer protocol	80	(4) TCP	Hypertext transfer protocol	HTTP is used for communication with the CPU-internal web server.
ISO-on-TCP (according to RFC 1006)	102	(4) TCP	ISO-on-TCP protocol	ISO-on-TCP (according to RFC 1006) is used for message-oriented data exchange with remote CPU or software controller. S7 communication with ES, HMI, OPC server, etc.
NTP Network time protocol	123	(4) UDP	Network time protocol	NTP is used for synchronization of the CPU system time with the time of an NTP server.
SNMP Simple network management protocol	161 162 (trap)	(4) UDP	Simple network management protocol	SNMP is used for reading and setting of network management data (SNMP managed Objects) by the SNMP Manager.
HTTPS Secure Hypertext transfer protocol	443	(4) TCP	Secure Hypertext transfer protocol	HTTPS is used for communication with the CPU-internal web server via Secure Socket Layer (SSL).
Modbus TCP Modbus Transmission Control Protocol	502	(4) TCP	Modbus/TCP protocol	Modbus/TCP is used by MB_CLIENT/MB_SERVER instructions in the user program.

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
OPC UA Open Platform Communications Unified Architecture	4840	(4) TCP	Based on the TCP/IP protocol	Communication standard ranging from the enterprise level to the field level.
OUC[1] Open User Communication and Secure OUC	1 ... 1999 can be used to limited extent[2]	(4) TCP (4) UDP	Open User Communication (TCP/UDP) Secure Open User Communication (TLS)	OUC instructions provide connection establishment, connection termination and data transfer based on the socket layer.
	2000 ... 5000 Recommended			
	5001 ... 49151 can be used to limited extent[2]			
IGMPv2 Internet Group Management Protocol	Not relevant	(3) Network layer	Internet Group Management Protocol	Network protocol for the organization of multicast groups.
Reserved	49152 ... 65535	(4) TCP (4) UDP	-	Dynamic port area used for active connection end point if the application does not determine the local port number.

[1] Note: The open communication provides direct access to the UDP/TCP for the user. The user is responsible for observing the port restrictions/definitions of the IANA (Internet Assigned Numbers Authority).

[2] Do not use ports for OUC, which are already used by other protocols.

The following table shows the protocols that are supported by the S7-1500 software controller via the Ethernet interfaces assigned to Windows.

Table 3- 3 Layers and protocols of the S7-1500 Software Controller (via Ethernet interface on the Windows side)

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET protocols				
DCP Discovery and basic configuration protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	Accessible devices PROFINET Discovery and configuration	DCP is used by PROFINET to discover PROFINET devices and provide basic settings.

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
Connection-oriented communications protocols				
SMTP Simple mail transfer protocol	25	(4) TCP	Simple mail transfer protocol	SMTP is used for sending e-mails.
HTTP Hypertext transfer protocol	Adjustable [1]	(4) TCP	Hypertext transfer protocol	HTTP is used for communication with CPU-internal web server. You can change the port number to avoid conflict with other web servers on Windows. If you want to use web server access, you must activate the port in the Windows Firewall.
ISO-on-TCP (according to RFC 1006)	102	(4) TCP	ISO-on-TCP protocol	ISO-on-TCP (according to RFC 1006) for S7 communication with PG/PC or HMI.
OUC[2] Open User Communication and Secure OUC	1 ... 1999 can be used to limited extent[3, 4] 2000 ... 5000 recommended[4] 5001 ... 49151 can be used to limited extent[3, 4]	(4) TCP (4) UDP	Open User Communication (TCP/UDP) Secure Open User Communication (TLS)	OUC instructions provide connection establishment, connection termination and data transfer based on the socket layer. If you want to use OUC, you must activate the ports in the Windows Firewall.
IGMPv2 Internet Group Management Protocol	Not relevant	(3) Network layer	Internet Group Management Protocol	Network protocol for the organization of multicast groups.
Reserved	49152 ... 65535	(4) TCP (4) UDP	-	Dynamic port range that is used for the active connection end point, if the application does not determine the local port number. If you wish to use this communication, you must activate the ports in the Windows Firewall.

1 Default setting for Windows assigned interfaces: 81

2 Note: The open user communication provides direct access to the UDP/TCP for the user. The user is responsible for observing the port restrictions/definitions of the IANA (Internet Assigned Numbers Authority).

3 Do not use ports for OUC, which are already used by other protocols.

4 Do not use ports for OUC, which are already used by other Windows applications.

The following table shows the protocols that are supported in addition to those listed in the tables for the S7-1500 communications modules (e.g. CP 1543-1).

Table 3- 4 Layers and protocols of S7-1500 communications modules

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET/Industrial Ethernet protocols				
Connection-oriented communications protocols				
FTP File transfer protocol	20 (data) 21 (control)	(4) TCP	File transfer protocol	FTP is used for the transmission of files (only in connection with CP 1543-1).
secureFTP File transfer protocol	20 (data) 21 (control)	(4) TCP	File transfer protocol	SecureFTP is used for the transmission of files by means of a TSL connection (only in connection with CP 1543-1).
DHCP Dynamic Host Configuration Protocol	68	(4) UDP	Dynamic Host Configuration Protocol	DHCP is used to retrieve the IP Address Suite from a DHCP server when starting up the IE interface.
Secure NTPv3 Network time protocol	123	(4) UDP	Network time protocol	Secure NTP is used to synchronize the CP 1543-1 internal system clock with an NTP server.
SNMP Simple network management protocol	161 162 (trap)	(4) UDP	Simple network management protocol	SNMPv3 permits the CP 1543-1 to read network management data (MIBs) from SNMPv3 agent with authentication.

Special consideration S7-1500 MFP:
Port 111: The S7-1500 MFP uses Port 111 to the NFS service for internal communication.

3.3 Overview of connection resources

Connection resources

Some communications services require connections. Connections allocate resources on the CPUs, CPs and CMs involved (for example memory areas in the CPU operating system). In most cases one resource per CPU/CP/CM is allocated for a connection. In HMI communication, up to 3 connection resources are required per HMI connection.

The connection resources available depend on the CPU being used, the CPs and CMs and must not exceed a defined high limit for the automation system.

Available connection resources in a station

The maximum number of resources of a station is determined by the CPU.

Each CPU has reserved connection resources for PG, HMI and web server communication. There are also resources available that can be used for SNMP, e-mail connections, HMI, S7 communication as well as for open communication.

When are connection resources allocated?

The time for allocation of connection resources depends on how the connection is set up, automatic, programmed or configured (see section Setting up a connection (Page 30)).

Additional information

You will find more detailed information on the allocation of connection resources and the display of connection resources in STEP 7 in the section Connection resources (Page 267).

3.4 Setting up a connection

Automatic connection

STEP 7 sets up a connection automatically (for example PG or HMI connection) if you have connected the PG/PC interface to an interface of the CPU physically and have made the interface assignment in STEP 7 in the "Go online" dialog.

Setting up a programmed connection

You set up the programmed connection in the program editor of STEP 7 in the context of a CPU by assigning instructions for communication, for example TSEND_C.

When specifying the connection parameters (in the Inspector window, in the properties of the instruction), you are supported by the easy-to-use user interface.

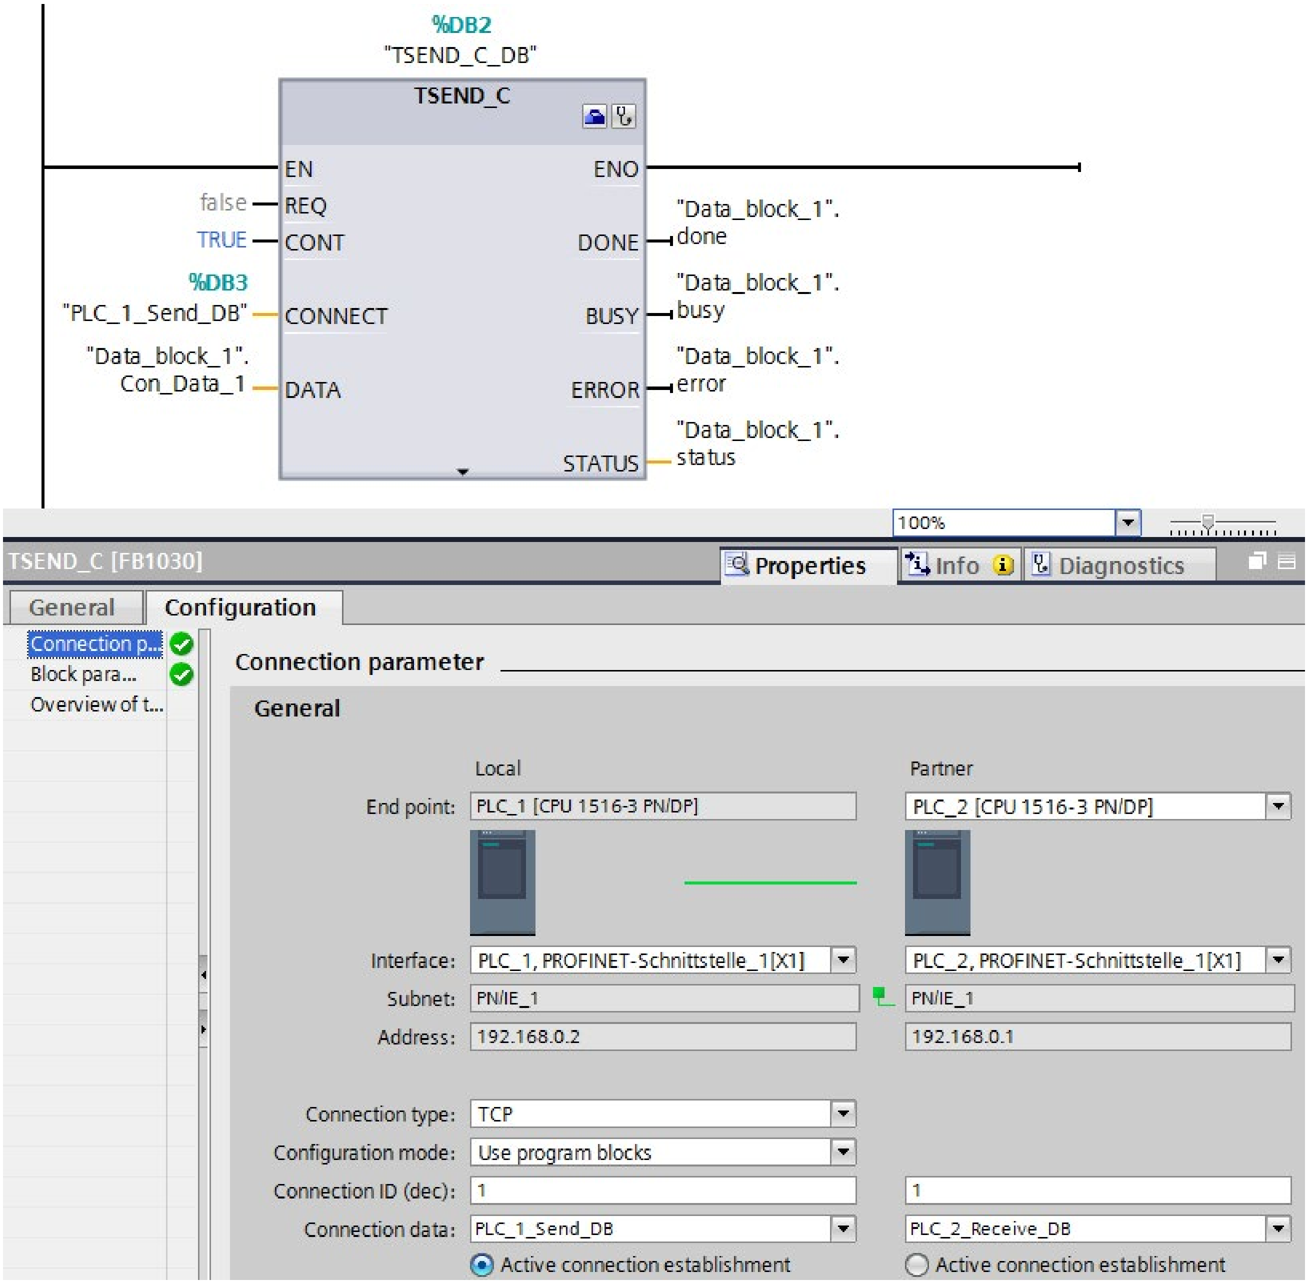


Figure 3-1 Programmed setup

Setting up a configured connection

You set up the configured connection in the network view of the Devices & networks editor of STEP 7 in the context of a CPU or a software controller.

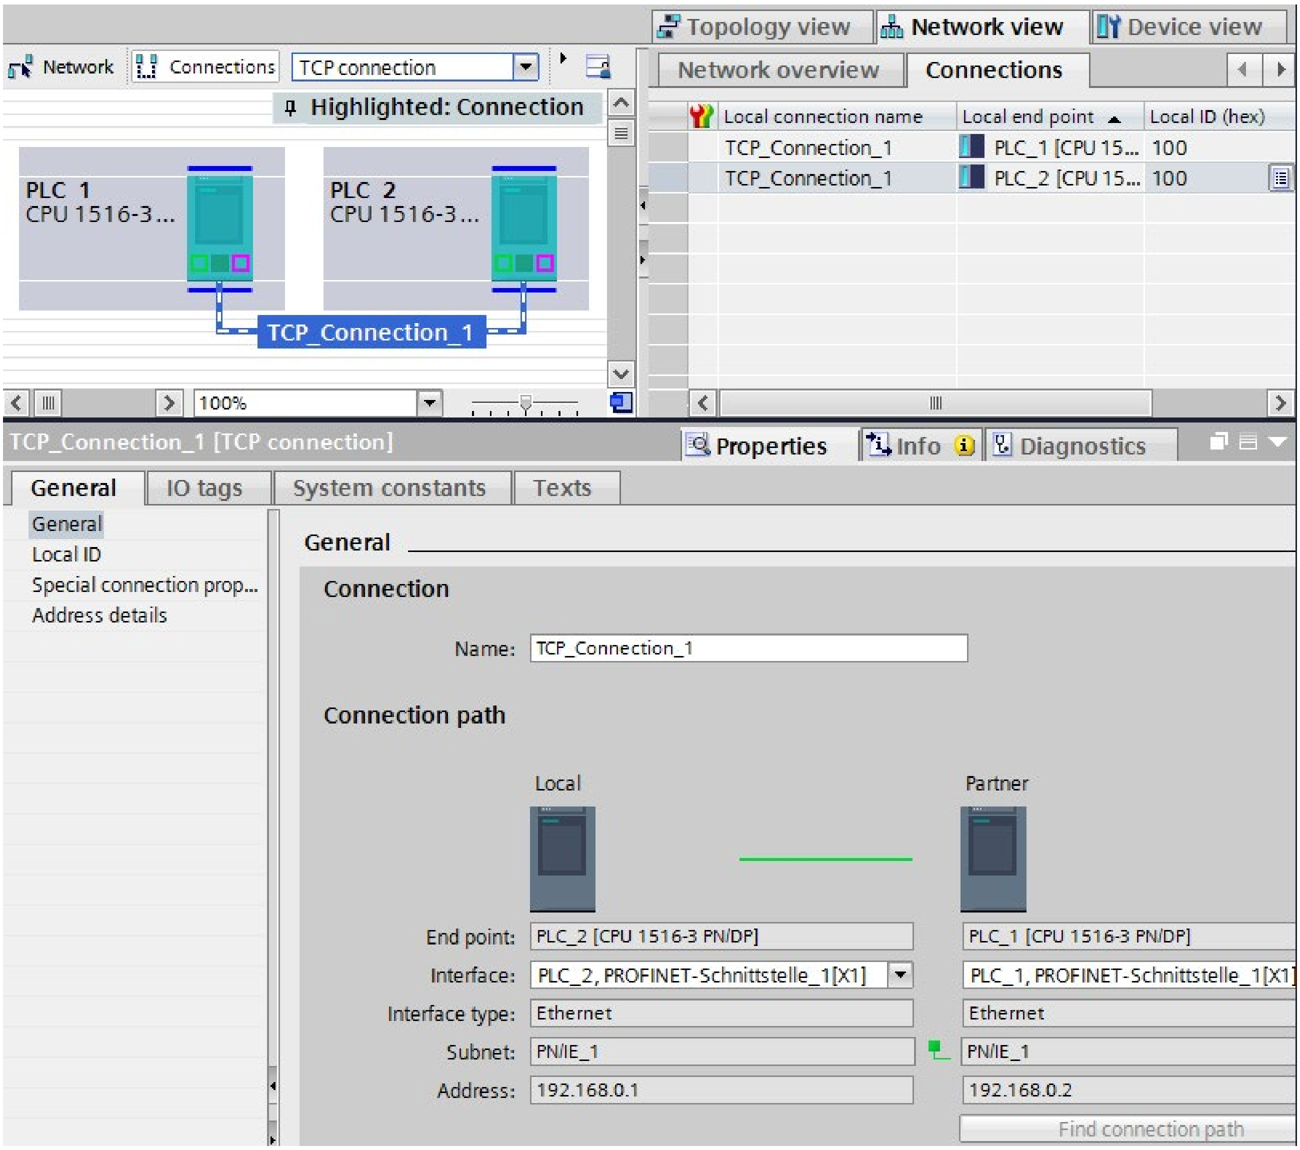

Figure 3-2 Configured setup

Effects on the connection resources of the CPU

You can often choose between a configured or a programmed connection. Programmed connection setup allows connection resources to be released following data transfer. Like routed connections, programmed connections are not guaranteed, meaning that they are only established when resources are available. With configured connection setup, the resource is available after download of the configuration until the configuration changes again. Corresponding resources are therefore reserved for connection establishment via configured connections. The "Connection resources" table in the Inspector window of the CPU displays an overview of connection resources already used and those still available.

How do I set up a connection?

Table 3- 5 Setting up the connection

Connection	Automatically	Programmed setup	Configured setup
Programming device connection	X	-	-
HMI connection	X	-	X
Open communication via TCP/IP connection	-	X	X
Open communication via ISO-on-TCP connection	-	X	X
Open communication via UDP connection	-	X	X
Open communication via ISO connection	-	X	X
Open communication via FDL connection	-	X	X
Communication via Modbus TCP connection	-	X	-
E-mail connection	-	X	-
FTP connection	-	X	-
S7 connection*	-	-	X

* Note that for an S7-1500 CPU with firmware version lower than V2.0, the use of PUT/GET communication must be enabled in the properties of the CPU. You can find more information on this topic in the STEP 7 online help.

Additional information

You will find further information on the allocation of connection resources and the display of connection resources in STEP 7 in the section Connection resources (Page 267).

3.5 Data consistency

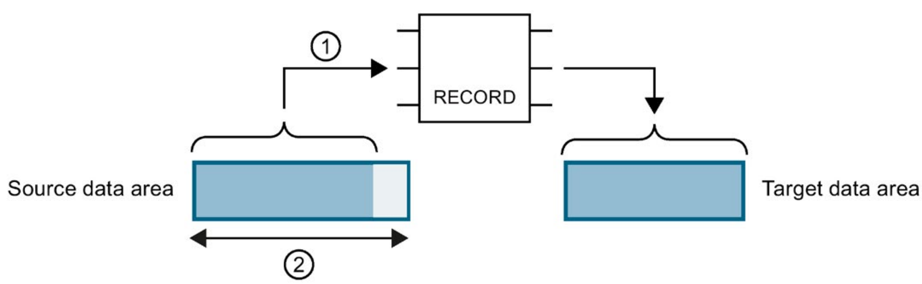
Definition

Data consistency is important for data transfer and you need to take this into account when configuring the communication task. Otherwise, malfunctions may occur.

A data area which cannot be modified by concurrent processes is called a consistent data area. This means that a data area which belongs together and which is larger than the maximum size of the consistent data area can consist in part of new and of old data at the same time.

An inconsistency can occur when an instruction for communication is interrupted, for example by a hardware interrupt OB with higher priority. This interrupts the transfer of the data area. If the user program in this OB now changes the data that has not yet been processed by the communication instruction, the transferred data originates from different times:

The following figure shows a data area that is smaller than the maximum size of the consistent data area. In this case, when transferring the data area, it is ensured that there is no interruption by the user program during data access so that the data is not changed.

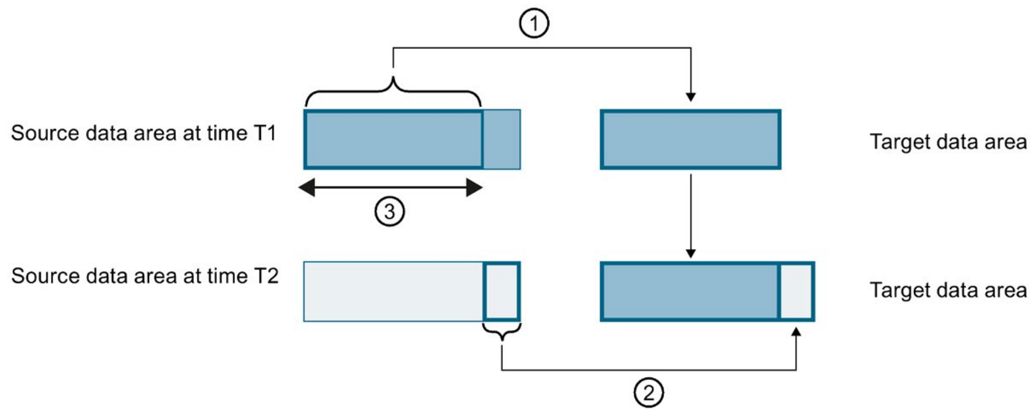


① The source data area is smaller than the maximum size of the consistent data area (②). The instruction transfers the data together to the destination data area.

② Maximum size of the consistent data area

Figure 3-3 Consistent transfer of data

The following figure shows a data area that is larger than the maximum size of the consistent data area. In this case, the data can be changed during an interruption of the data transfer. An interruption also occurs if, for example, the data area needs to be transferred in several parts. If the data is changed during the interruption, the transferred data originates from different times.



① The source data area is larger than the maximum size of the consistent data area (③). At time T1, the instruction only transfers as much data from the source data area into the destination data area as fits in the consistent data area.

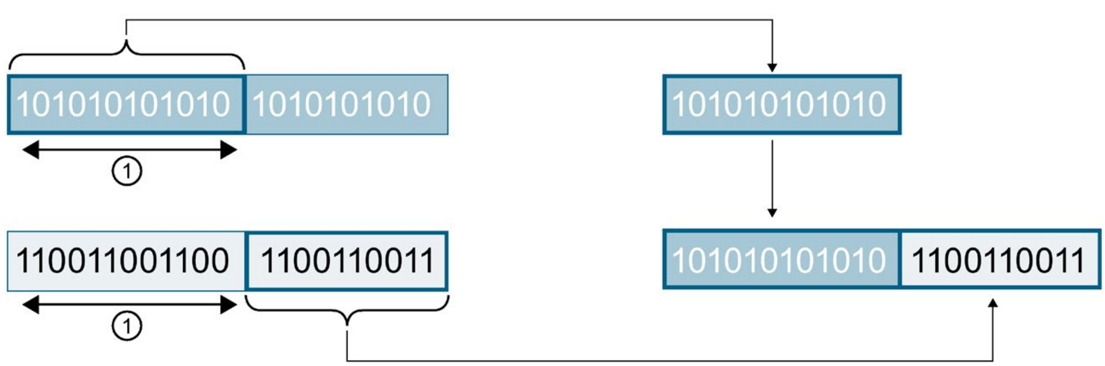
② At time T2, the instruction transfers the rest of the source data area to the destination data area. After the transfer, data from different points in time exist in the destination data area. If the data in the source data area has changed in the meantime, an inconsistency may result.

③ Maximum size of the consistent data area

Figure 3-4 Transfer of data larger than the maximum consistency area

Example of an inconsistency

The figure below shows an example of changing data during the transfer. The destination data area contains data from different points in time.



① Maximum size of the consistent data area

Figure 3-5 Example: Changing data during the transfer

System-specific maximum data consistency for S7-1500:

No inconsistency occurs if the system-specific maximum size of the consistent data is kept to. With an S7-1500, communication data is copied consistently into or out of the user memory in blocks of up to 512 bytes during the program cycle. Data consistency is not ensured for larger data areas. Where defined data consistency is required, the length of communication data in the user program of the CPU must not exceed 512 bytes. You can then access these data areas consistently, for example from an HMI device by reading/writing tags.

If more data than the system-specific maximum size needs to be transferred consistently, you yourself must ensure the data consistency with suitable measures in the user program.

Ensuring data consistency

Use of instructions for access to common data:

If the user program contains instructions for communication that access common data, for example TSEND/TRCV, you can coordinate access to this data area yourself, for example using the "DONE" parameter. The data consistency of the data areas that are transferred with an instruction for communication can therefore be ensured in the user program.

Note

Measures in the user program

To achieve data consistency, you can copy transferred data to a separate data area (for example, global data block). While the user program continues to work with the original data, you can transfer the data saved in the separate data area consistently with the communication instruction.

For the copying, use uninterruptible instructions such as UMOVE_BLK or UFILL_BLK. These instructions ensure data consistency up to 16 KB.

Use of PUT/GET instructions or Write/Read via HMI communication:

In S7 communication with the PUT/GET instructions or Write/Read via HMI communication, you need to take into account the size of the consistent data areas during programming or configuration. In the user program of an S7-1500 as server, there is no instruction available that can coordinate the data transfer in the user program. The data exchanged using PUT/GET instructions updates the S7-1500 while the user program is running. There is no point in time within the processing of the cyclic user program at which the data is exchanged consistently. The length of the data area to be transferred should be smaller than 512 bytes.

Additional information

- You will also find the maximum amount of consistent data in the device manuals of the communications modules in the Technical Specifications.
- You will find further information on data consistency in the description of the instructions in the STEP 7 online help.

3.6 Secure Communication

3.6.1 Basics of Secure Communication

For STEP 7 (TIA Portal) as of V14 and for S7-1500 CPUs as of firmware V2.0, the options for secure communication have been broadened considerably.

Introduction

The attribute "secure" is used for the identification of communication mechanisms that are based on a Public Key Infrastructure (PKI) (for example RFC 5280 for Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List Profile). A Public Key Infrastructure (PKI) is a system that can issue, distribute and check digital certificates. The digital certificates issued are used in the PKI to secure computer-based communication. If a PKI uses asymmetric key cryptography, the messages in a network can be digitally signed and encrypted.

Components that you have configured in STEP 7 (TIA Portal) for secure communication use an asymmetric key encryption scheme with a Public Key and Private Key. TLS (Transport Layer Security) is used as the encryption protocol. TLS is the successor for the SSL (Secure Sockets Layer) protocol.

Objectives of secure communication

Secure communication is used to achieve the following objectives:

- Confidentiality
  i.e. the data are secret / cannot by read by eavesdroppers.
- Integrity
  i.e. the message that reaches the recipient is the same message, unchanged, that the sender sent. The message has not been altered on the way.
- End point authentication
  i.e. the end point communication partner is exactly who it claims to be and the party who is to be reached. The identity of the partner has been checked.

These objectives were in the past primarily relevant to IT and networked computers. Now, industrial machinery and control systems with sensitive data are at equally high risk, as they are also networked, and consequently pose strict security requirements for data exchange.

Protection of the automation cell by means of the cell protection concept through firewall, or via connection through VPN, for example with the security module, was common in the past and remains so.

However, it is becoming increasingly necessary to also transfer data to external computers in encrypted form via Intranet or public networks.

Common principles of secure communication

Independent of the context, secure communication is based on the concept of the Public Key Infrastructure (PKI) and contains the following components:

- An asymmetric encryption scheme that allows:
  - Encryption or decryption of messages using public or private keys.
  - The verification of signatures in messages and certificates.

    The messages/certificates are signed by the sender/certificate subject with their private key. The recipient/verifier checks the signature with the public key of the sender/certificate subject.
- Transport and storage of the public key using X.509 certificates:
  - X.509 certificates are digitally signed data that allow public key authentication in terms of the bound identity.
  - X.509 certificates can contain information that describes in more detail or restricts use of the public key. For example the date as of which a public key in a certificate is valid and when it expires.
  - X.509 certificates contain information about the issuer of the certificate in secure form.

The following paragraphs give an overview of these basic concepts, which are required for managing certificates in STEP 7 (TIA Portal), for example, and for programming communication instructions for secure Open User Communication (sOUC).

Secure communication with STEP 7
