Parameter assignment

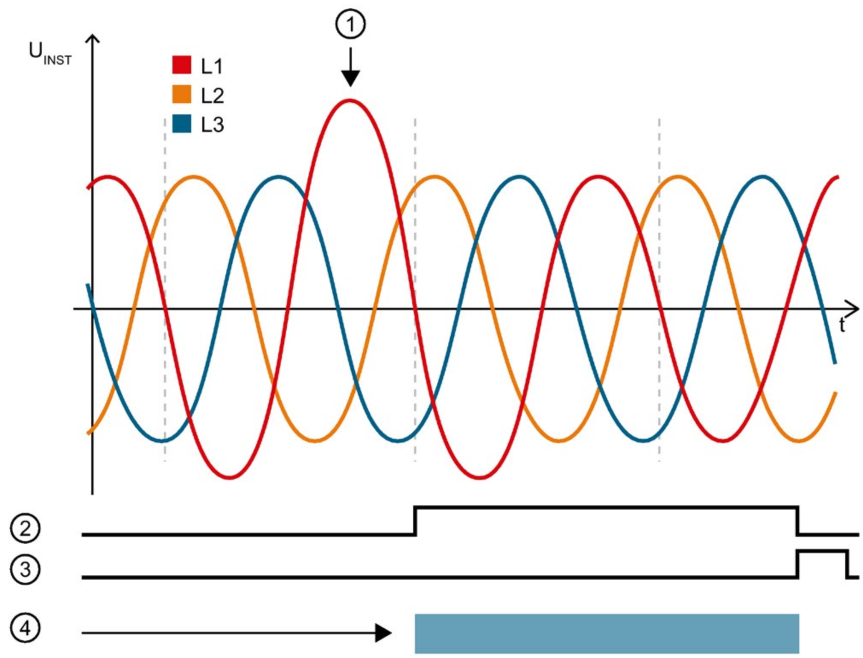
The following table shows the necessary parameters:

Table 14- 12 Parameter assignment

Parameter	
Power quality analysis function (module)	Enable
Determine peak value voltage (channel)	Enable

Example

The following figure is a schematic diagram of the principle of operation:



① Voltage peak in L1
② Status "Power quality voltage peak"
③ Bit "Reset status "power quality""
④ Max. voltage peaks instantaneous value can be read out

Figure 14-6 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 13 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Determination of voltage peak value L1	Enable
Determination of voltage peak value L2	Enable
Determination of voltage peak value L3	Enable

The module detects the voltage peak in phase 1 and sets the qualifier bit 2 for phase 1. You can find the maximum voltage value, for example, in the data record DS 160 in bytes 174 to 177 ("Voltage peak value L1").

14.4.2 Current diagnostics

14.4.2.1 Diagnostics: Overload

Introduction

As long as one of the following conditions is met, the module reports the diagnostics "Overload" for each phase:

- Parameterized maximum relative measured current longer than the parameterized "Tolerance time overcurrent" is exceeded.
- Maximum permissible secondary voltage of 424 mV at a current measuring channel of the AI Energy Meters HF is exceeded.

Calculation of the parameterizable maximum measured current

The tolerance value for the maximum relative measured current is calculated with the following formula:

Tolerance factor for maximum relative measured current = "Nominal value current" + ("Tolerance factor overcurrent [%]" × "Nominal value current")

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

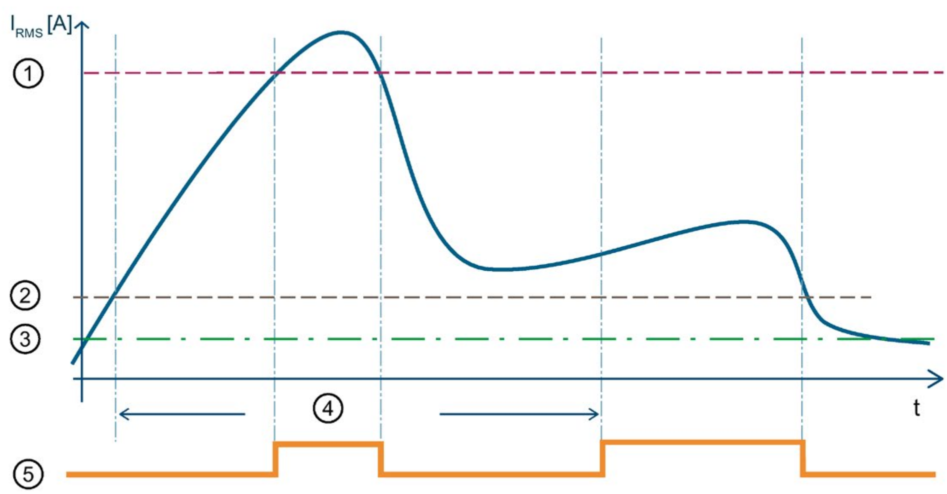
The following table shows the necessary parameters:

Table 14- 14 Parameter assignment

Parameter	
Diagnostics overload	Enable
Nominal value current	0 ... 99999 A
Current transformer primary rated current	1 ... 16000 A
Current transformer secondary voltage	10 ... 600 mV
Tolerance factor overcurrent	1 ... 6000%
Tolerance time overcurrent	0 ... 60000 ms

Example

The following figure is a schematic diagram of the signal wave for the diagnostics "Overload":



① Maximum relative measured current at permissible secondary voltage of 424 mV
The module reports the diagnostics Overload when the maximum permissible secondary voltage amounting to 424 mV is exceeded (primary current = 424 mV x 10000 A / 333 mV = 12732 A).

② Tolerance value measured current
After the "Tolerance time overcurrent" of 40000 ms has expired, the module reports the diagnostics "Overload" as long as the configured tolerance value for the maximum measured current of 2400 A
(= 2000 A + 20% x 2000 A) is exceeded.

③ Nominal value current

④ Tolerance time

⑤ Diagnostics "overload"

Figure 14-7 Diagnostics "overload" of the effective current value

The following table shows the parameter assignment for the example:

Table 14- 15 Parameter assignment

Parameter	
Diagnostics overload	Enable
Nominal value current	2000 A
Current transformer primary rated current	10000 A
Current transformer secondary voltage	333 mV
Tolerance factor overcurrent	20%
Tolerance time overcurrent	40000 ms

14.4.2.2 Low limit for measuring current undershot

Introduction

With the function "Low limit for measuring current undershot" the AI Energy Meter HF monitors the low limit of the effective value of the current per phase.

If the low limit for measuring current is undershot, the module sets the current value to 0. Information as to which current measured values are set to 0 can be found under Basics for reading measured values (Page 38).

You activate the function by setting the parameter "Low limit for measuring current" > 0%.

Calculation of low limit for measuring current

The low limit for measuring current is calculated using the following formula:

Low limit measured current = "Nominal value current" × "Low limit for measuring current [%]"

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

The following table shows the necessary parameters:

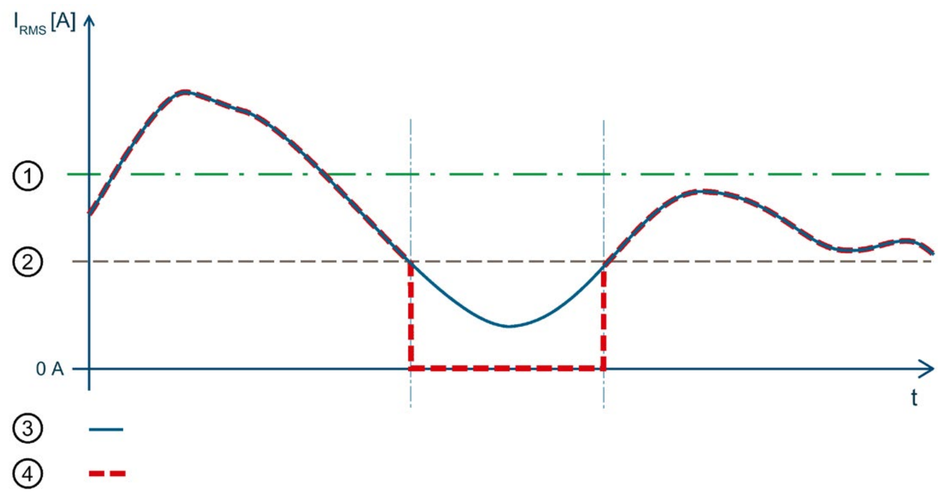
Table 14- 16 Parameter assignment

Parameter	
Nominal value current	0 ... 99999 A
Current transformer primary rated current	1 ... 16000 A
Current transformer secondary voltage	10 ... 600 mV
Low limit for current measurement	0 ... 20% *

* 0% means deactivation of the function

Example

The following figure is a schematic diagram of the principle of operation:



① Nominal current
② Low limit measured current
③ Measured value
④ Returned value

Figure 14-8 Behavior in the event of value falling below "Low limit for measuring current undershot"

The following table shows the parameter assignment for the example:

Table 14- 17 Parameter assignment

Parameter	
Nominal value current	2000 A
Current transformer primary rated current	5000 A
Current transformer secondary voltage	333 mV
Low limit for current measurement	10%

In this example you define the "Low limit for measuring current" with 10%. This corresponds to an effective value of the primary voltage of 200 A.

If the value falls below the calculated low limit current measurement ②, the module sets all the current-dependent measured values (effective value current, active power, reactive power, apparent power, phase angle and power factor) to 0 A until the low limit measuring current is exceeded again. The energy meters and operating hours counters are stopped during this time.

14.4.2.3 Peak values of the instantaneous values for current

Introduction

The AI Energy Meter HF determines the maximum instantaneous value for the current for up to three phases.

The function "Detect peak value current" returns the largest current value and the associated phase. The module sets the qualifier bit 3 ("Power quality current peak") for the phase in question. You can read the maximum current value, for example, in the data record DS 160 (Page 258).

Current peak detection is based on the function for recording swells of the supply voltage in accordance with IEC 61000-4-30. This function is used to record the maximum current value in the supply network. In three-phase systems this function is only useful if current recording is symmetrical and if all phases show the same current measuring transformers.

Accordingly, measurement always records only the peak value over all phases. In addition to the requirements of IEC 61000-4-30, the phase on which the peak value current occurred is detected.

For metrological reasons, only the phase concerned that shows this maximum value can be returned. This may mean that the maximum current values of the other phases remain "0". With a "reset power quality analysis" the analysis starts afresh and the current results are discarded.

Parameter assignment

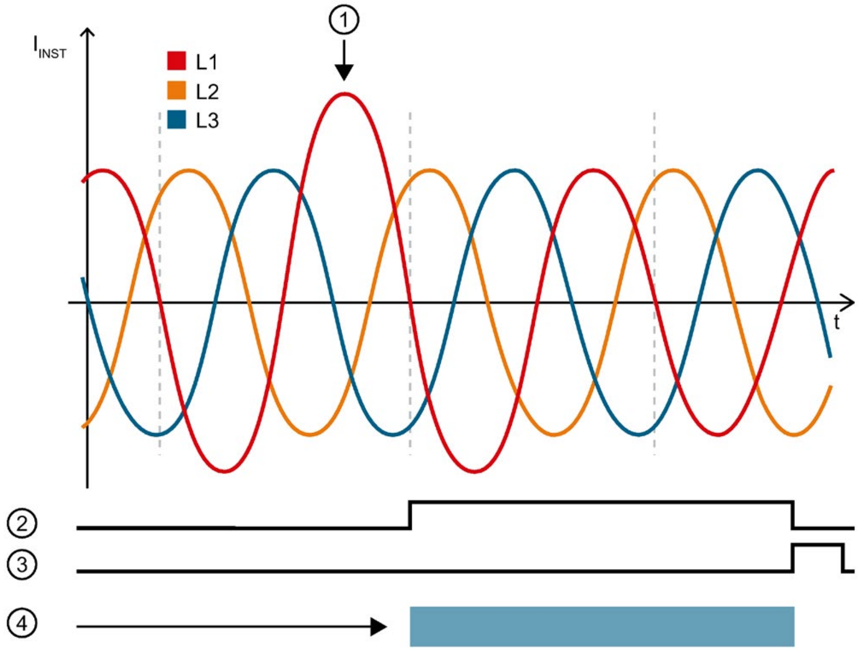
The following table shows the necessary parameters:

Table 14- 18 Parameter assignment

Parameter	
Power quality analysis function (module)	Enable
Determine peak value current (Channel)	Enable

Example

The following figure is a schematic diagram of the principle of operation:



① Current peak in L1
② Status "Power quality current peak"
③ Bit "Reset status "power quality""
④ Max. current peaks instantaneous value can be read out

Figure 14-9 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 19 Parameter assignment

Parameter	
Power quality analysis function	Enable
Determine peak value current (L1)	Enable
Determine peak value current (L2)	Enable
Determine peak value current (L3)	Enable

The module detects the peak value current in phase 1 and sets the qualifier bit 3 for phase 1. You can find the maximum current value, for example, in the data record DS 160 in bytes 186 to 189 ("Current peak value L1").

14.4.2.4 Overcurrent of the current half value

Introduction

The AI Energy Meter HF returns the maximum overcurrent value of the current half-wave value. If the value to be monitored is exceeded, the module reports the diagnostics "Power quality" and the qualifier bit 7 is set. The module also sets Bit 4 for the respective phase in data record DS 160 (Page 258). In the event that the current half-value is exceeded again, only the diagnostics "Power quality" is reported again and, if applicable, the maximum current swell value is updated.

Calculation of overcurrent limit

The overcurrent limit is calculated based on the following formula:

Overcurrent limit = "Nominal value current" + ("Threshold overcurrent [%]" × "Nominal value current")

The "Nominal value current" is the primary current at the operating point.

Parameter assignment

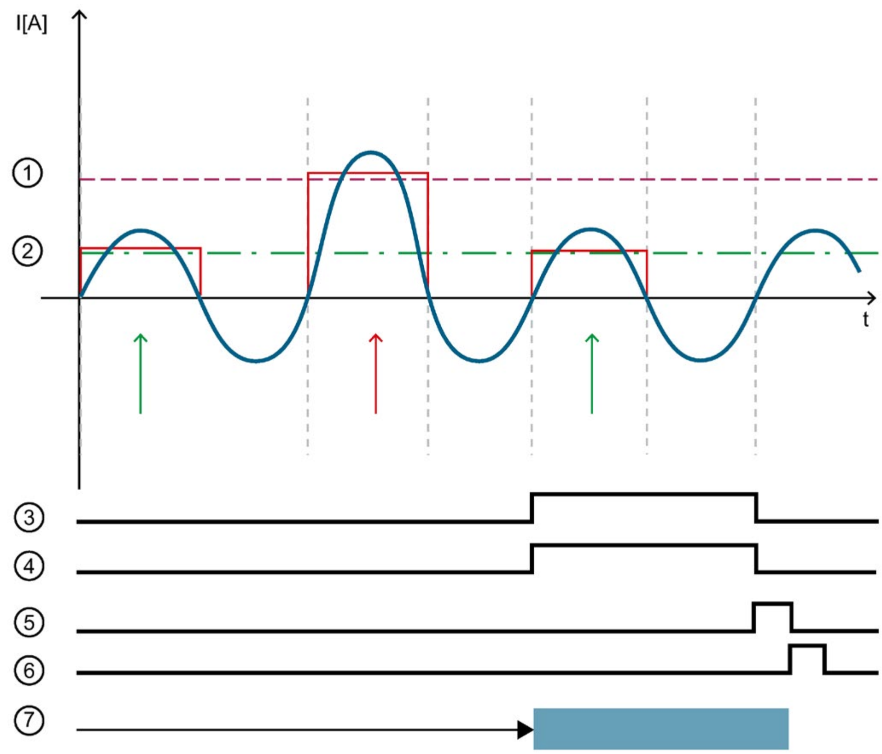
The following table shows the necessary parameters:

Table 14- 20 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics power quality	Enable
Determining the overcurrent	Enable
Nominal value current	0 ... 99999 A
Threshold overcurrent	1 ... 6000%

Example

The following figure is a schematic diagram of the principle of operation:



① Threshold overcurrent
② Nominal current
③ Qualifier Bit 7
④ Diagnostics power quality
⑤ Status "power quality overcurrent"
⑥ Bit "Reset status "power quality""
⑦ Max. overcurrent (half-wave) value can be read

Figure 14-10 Example of principle of operation

The following table shows the parameter assignment for the example:

Table 14- 21 Parameter assignment

Parameter	
Power quality analysis functions	Enable
Diagnostics power quality	Enable
Determining the overcurrent	Enable
Nominal value current	2000 A
Threshold overcurrent	100%

In this example you define the Threshold overcurrent of 100%. This corresponds to a primary current of 4000 A.

If the "Threshold overcurrent" is exceeded, the module sets Bit 4 "Overcurrent" for the phase in the data record DS 160.

As long as the "Threshold overcurrent" is exceeded, the module reports the diagnostics "Power quality" and the qualifier bit 7 is set.

Technical specifications 15

15.1 Technical specifications

Technical specifications of the AI Energy Meter HF

The following table shows the technical specifications as of 07/2018. You will find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7134-6PA20-0CU0/td?dl=en).

Article number	6ES7134-6PA20-0CU0
General information	
Product type designation	AI Energy Meter 480 VAC/RC HF, PU 1
Firmware version	V6.0
• FW update possible	Yes
usable BaseUnits	BU type U0
Color code for module-specific color identification plate	CC20
Supported power supply systems	TT, TN, IT
Product function	
• Voltage measurement	Yes
– without voltage transformer	Yes
– with voltage transformer	Yes
• Current measurement	Yes
– without current transformer	No
– with current transformer	No
– with Rogowski coil	Yes
– with current/voltage transformer	Yes; 333 mV interface
• Energy measurement	Yes
• Frequency measurement	Yes
• Power measurement	Yes
• Active power measurement	Yes
• Reactive power measurement	Yes
• Power factor measurement	Yes
• Active factor measurement	Yes
• Reactive power compensation	Yes
• Line analysis	Yes

Article number	6ES7134-6PA20-0CU0
– Monitoring of instantaneous and half-wave values	Yes
– THD measurement for current and voltage	Yes
– Harmonics for current and voltage	Yes
– Voltage dip (DIP)	Yes
– Voltage swell	Yes
• I&M data	Yes; I&M0 to I&M3
• Isochronous mode	No
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	STEP 7 V15 or higher
• STEP 7 configurable/integrated as of version	Configurable via GSD file
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	V2.3
Operating mode	
• Switching between operating modes in RUN	Yes; For module version 32 I/20 Q, it is possible to dynamically switch between 25 user data variants, 23 of which are pre-defined and 2 of which can be defined by the specific user
• Cyclic measured value access	Yes
• Acyclic measured value access	Yes
• Fixed measured value sets	Yes
• Freely definable measured value sets	Yes
CiR – Configuration in RUN	
Reparameterization possible in RUN	Yes
Calibration possible in RUN	Yes
Installation type/mounting	
Mounting position	Any
Supply voltage	
Design of the power supply	DC
Type of supply voltage	24 V DC
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Input current	
Current consumption (rated value)	12.5 mA
Current consumption, max.	17 mA

Article number	6ES7134-6PA20-0CU0
Power loss	
Power loss, typ.	400 mW; 3x 230 V AC
Address area	
Address space per module	
• Inputs	256 byte
• Outputs	20 byte
Hardware configuration	
Automatic encoding	Yes
• Mechanical coding element	Yes
Selection of BaseUnit for connection variants	
• 2-wire connection	BU type U0
Time of day	
Operating hours counter	
• present	Yes
Analog inputs	
Cycle time (all channels), typ.	50 ms; Time for consistent update of all measured and calculated values (cyclic und acyclic data)
Cable length	
• shielded, max.	200 m
• unshielded, max.	30 m
Analog value generation for the inputs	
Sampling frequency, max.	2 048 kHz
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes
• Hardware interrupt	Yes; Monitoring of up to 16 freely selectable process values (exceeding or undershooting of value)

Article number	6ES7134-6PA20-0CU0
Diagnostic messages	
• Line quality	Yes
• Supply voltage	Yes
• Hardware interrupt lost	Yes
• Parameter assignment error	Yes
• Module fault	Yes
• Channel not available	Yes
• Overflow/underflow	Yes
• Overload current	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Integrated Functions	
Measuring functions	
• Measuring procedure for voltage measurement	TRMS
• Measuring procedure for current measurement	TRMS
• Type of measured value acquisition	seamless
• Curve shape of voltage	Sinusoidal or distorted
• Buffering of measured variables	Yes
• Parameter length	128 byte
• Bandwidth of measured value acquisition	3.2 kHz; Harmonics: 63 / 50 Hz, 52 / 60 Hz
Measuring range	
– Frequency measurement, min.	45 Hz
– Frequency measurement, max.	65 Hz

Article number	6ES7134-6PA20-0CU0
Measuring inputs for voltage	
– Measurable line voltage between phase and neutral conductor	300 V
– Measurable line voltage between the line conductors	519 V
– Measurable line voltage between phase and neutral conductor, min.	3 V
– Measurable line voltage between phase and neutral conductor, max.	300 V
– Measurable line voltage between the line conductors, min.	6 V
– Measurable line voltage between the line conductors, max.	519 V
– Measurement category for voltage measurement in accordance with IEC 61010-2-030	CAT II
– Internal resistance line conductor and neutral conductor	1.5 MΩ
– Power consumption per phase	60 mW; 300 V AC
– Impulse voltage resistance 1,2/50µs	2.5 kV
Measuring inputs for current (Rog. or I/U converter)	
– Measurable current at AC, max.	424 mV
– Continuous voltage, maximum permissible	2 V
– Rated value, short-time withstand voltage restricted to 1 s	30 V
– Input resistance	120 kΩ
– Zero point suppression	Yes; 0 ... 20%, referred to the nominal current

Article number	6ES7134-6PA20-0CU0
Accuracy class according to IEC 61557-12	
– Measured variable voltage	0,2
– Measured variable current	0,2
– Measured variable apparent power	0.5
– Measured variable active power	0.5
– Measured variable reactive power	1
– Measured variable power factor	0.5
– Measured variable active energy	0.5
– Measured variable reactive energy	1
– Measured variable neutral current	0,2
– Measured variable phase angle	±0.5 °; not covered by IEC 61557-12
– Measured variable frequency	0.05
– Measured variable harmonic	1
– Measured variable THDU	1
– Measured variable THDI	1
Accuracy class line analysis acc. to IEC 61000-4-30	
– Measured variable voltage	Class S
– Measured variable current	Class S
– Measured variable frequency	Class S
– Measured variable voltage interruption	Class S
– Measured variable voltage dip and swell	Class S
– Measured variable harmonic voltage	Class S
– Measured variable harmonic current	Class S
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• Between the channels and load voltage L+	Yes; Including FE
Isolation	
Isolation tested with	Between channels and backplane bus, 24 V supply: Routine test, 1 920 V AC, 2 s; between backplane bus and 24 V supply: Type test, 707 V DC

Article number	6ES7134-6PA20-0CU0
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C; On request: Ambient temperatures lower than 0 °C (without condensation)
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C; On request: Ambient temperatures lower than 0 °C (without condensation)
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	3 000 m; Restrictions for installation altitudes > 2 000 m, see manual
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight (without packaging)	45 g
Other	
Data for selecting a voltage transformer	
• Secondary side, max.	300 V

Parameter data records A

A.1 Configuration via parameter data records

The parameter data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Overview of the parameter data records

- Parameter data record DS 128 for the complete module
- Parameter data record DS 129 for limit monitoring
- Parameter data records DS 130/131 for user data mapping
- Parameter data record DS 135 for data record mapping

Parameter assignment in the user program

You can reassign the module parameters in RUN mode, for example change the diagnostics behavior, define new limits or configure a modified user data mapping.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module via the respective data record. The parameters set in STEP 7 do not change in the CPU, which means the parameters set in STEP 7 are still valid after a restart.

If you reconfigure a module (so that the user data size changes) and diagnostics are pending prior to the reconfiguration, these diagnostics are not signaled as "outgoing". The diagnostics "Supply voltage missing" is signaled as outgoing.

STATUS output parameter

If errors occur during the transfer of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. However, a corresponding error code is written to the STATUS output parameter.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help.

A.2 Structure of the parameter data record 128 for the entire module

Structure of data record 128

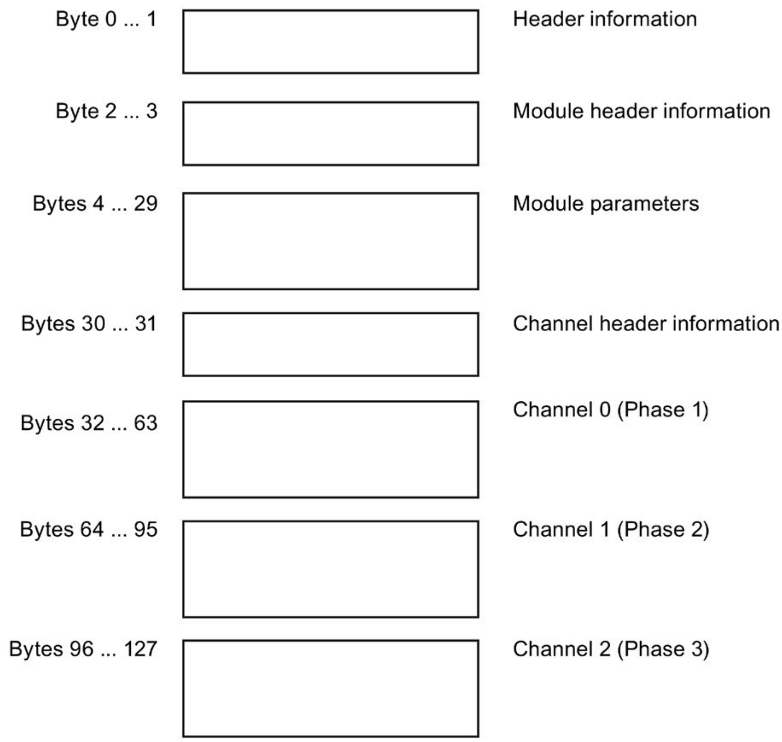

Figure A-1 Parameter data record 128

Header information

The figure below shows the structure of the header information.

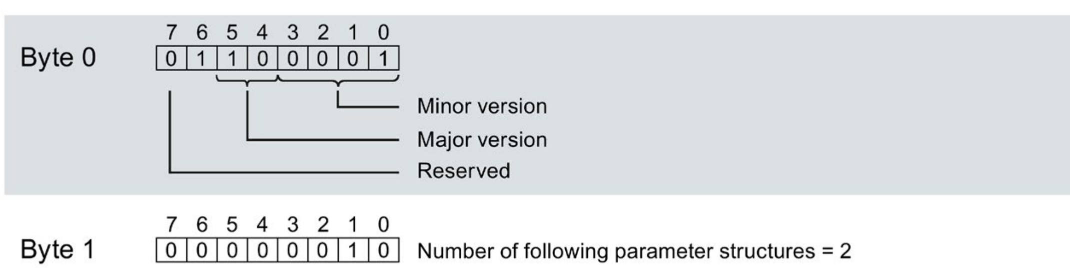

Figure A-2 Header information

Module header information

The figure below shows the structure of the header information for a module.

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 128.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check bytes 1 to 3, 32, 33, 52, 53, 72 and 73. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check bytes 8, 14, 15, 30, 31, 34, 42, 50...53, 54, 62, 70...73, 74, 82, 90...93 and set the reserved bits back to 0.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	05	"Voltage measuring range" invalid	Check Byte 5. Permitted values: 01_H to $0C_H$
DF	80	E1	20	"Connection type" invalid	Check Byte 4. Permitted values: 00_H, $0B_H$ ... 01_H
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Check Byte 9. Select a different user data variant or change the configuration.
DF	80	E1	22	"User data variant" invalid	Check Byte 9. Select a valid code for the user data variant.
DF	80	E1	23	"Line frequency" invalid	Check Byte 6. Enter valid values.
DF	80	E1	29	"Tolerance factor overcurrent in relation to nominal value current [0.1%]" invalid	Check bytes 35, 55 and 75. Enter valid values.
DF	80	E1	2A	"Tolerance time overcurrent" invalid	Check bytes 36...37, 56...57, 67...77. Enter valid values.
DF	80	E1	2B	"Low limit current measurement" in relation to nominal value current [0.1%] invalid	Check bytes 43, 63 and 83. Enter valid values.
DF	80	E1	2C	"Current transformer primary rated current [A]" invalid.	Check bytes 40...41, 60...61, 80...81 Enter valid values.
DF	80	E1	2D	"Voltage transformer primary voltage [V]" invalid	Check bytes 46...49, 66...69, 66...69, 88...89. Enter valid values.
DF	80	E1	2E	"Voltage transformer secondary voltage [V]" invalid	Check bytes 44…45, bytes 64…65 and bytes 84…85. Enter valid values.
DF	80	E1	2F	"End value energy meter" invalid	Check Bit 4...6 in Byte 6. Enter valid values.
DF	80	E1	30	Invalid data record number.	Check the data record number. Enter a valid data record number.
DF	80	E1	3E	Only for connection type 3P4W1 and 3P3W1. Current or voltage transformer parameters for the different phases are not identical.	Check bytes 38...42 with bytes 58...62 and bytes 78...82 as well as bytes 44...49 with bytes 64...69 and bytes 84...80 for identical values. Enter identical values for current measuring transformer (secondary current, primary current, direction of current) and voltage transformer (secondary voltage, primary voltage) at all three phases.
DF	80	E1	3F	"End value for energy meter" or transmission ratio (primary value, secondary value) of current and voltage too low.	Increase the end value of the energy meter or the ratio of primary to secondary current for current measuring transformer and/or primary rated current to secondary voltage for voltage transformer.
DF	80	E1	42	"Current transformer type for line conductors L1, L2, L3 and neutral conductor" invalid	Check Bit 0... in Byte 14. Enter valid values.
DF	80	E1	44	"Voltage dip limit value in relation to nominal value voltage [0.1%]" invalid	Check bytes 16...17. Enter valid values (voltage dip limit value must be smaller than the respective nominal voltage)

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	45	"Voltage swell limit value in relation to nominal value voltage [0.1%]" invalid	Check bytes 20...23. Enter valid values (voltage swell limit value must be greater than the respective nominal voltage)
DF	80	E1	46	"Threshold overcurrent in relation to nominal value current [0.1%]" invalid	Check bytes 24...27. Enter valid values (threshold overcurrent must be greater than primary current)
DF	80	E1	47	"Number of cycles for analysis of voltage swell/dip" invalid	Check bytes 28...29. Enter valid values.
DF	80	E1	48	"Current transformer secondary voltage " invalid	Check bytes 10...11, 38...39, 58...59 and 78...79. Enter valid values.
DF	80	E1	49	Current transformer parameter for "residual current analysis" invalid	Only with connection type 3P4W and 3P4WI and if neutral current is measured. Current measuring transformer primary rated current and secondary voltage and direction of current of the three phases must have identical parameters.
DF	80	E1	4 A	Voltage transformer parameters for voltage swell/dip invalid	Check the parameters secondary voltage, primary voltage, nominal value voltage. Enabled channels must have identical parameters.
DF	80	E1	4B	Current transformer parameter for "Detect overcurrent" invalid	Check the parameters secondary voltage, primary rated current, nominal value current and direction of current. Enabled channels must have identical parameters.
DF	80	E1	4C	Parameters for determining the neutral current invalid	Neutral current can only be determined with connection type 3P4W and 3P4WI Current transmission parameters primary current, secondary voltage, nominal value current and direction of current of the three phases must be identical.
DF	80	E1	4D	"Nominal value current [A]" invalid	Check bytes 34...37, 66...69, 98...101. Enter valid values.
DF	80	E1	4E	"Nominal value voltage [V]" invalid	Check bytes 50...53, 82...85, 114...117. Enter valid values.
DF	80	E1	4F	"Low limit current measurement in relation to nominal value current [0.1%]" invalid	Check bytes 42...43, 74...75, 106...107. Enter valid values.
DF	80	E1	50	The combination of "Nominal value voltage [V]" and "Voltage dip limit value in relation to nominal value voltage [0.1%]" invalid.	Select the permissible value in % so that the secondary measuring voltage of 0 V is not undershot.
DF	80	E1	51	The combination of "Nominal value voltage [V]" and "Voltage swell limit value in relation to nominal value voltage [0.1%]" invalid.	Select the permissible value in % so that the secondary measuring voltage of 300 V is not exceeded.
DF	80	E1	52	The combination of "Nominal value current [A]" and "Threshold overcurrent in relation to nominal value current [0.1%]" invalid	Select the permissible value in % so that the secondary measuring voltage of 424 mA is not exceeded.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	53	The combination of "Nominal value current [A]" and "Tolerance factor overcurrent in relation to nominal value current [0.1%]" invalid	Select the permissible value in % so that the secondary measuring voltage of 424 mA is not exceeded.
DF	80	E1	54	The combination of "Nominal value voltage [V]" and "Tolerance factor overvoltage/undervoltage in relation to nominal value voltage [0.1%]" lies outside the permissible range.	Select the permissible value in % so that the secondary measuring voltage of 300 V is not exceeded.
DF	80	E1	55	"Nominal value current [A]" is too high. "Nominal value current" x transmission factor current generates a secondary current measured variable which exceeds its value range.	Select the permissible value in A so that the secondary measuring voltage of 424 mA is not exceeded. The transmission factor current is calculated from "Current transformer primary rated current [A]" / "Current transformer secondary voltage [0.1 mV]"
DF	80	E1	56	"Nominal value voltage [V]" is too high. "Nominal value voltage" x transmission factor voltage generates a secondary voltage measured variable which exceeds its value range.	Select the permissible value in V so that the secondary measuring voltage of 300 V is not exceeded. The transmission factor voltage is calculated from "Voltage transformer primary voltage [V]" / "Voltage transformer secondary voltage [V]"

A.3 Structure of the parameter data record 129 for limit monitoring

Structure of data record 129

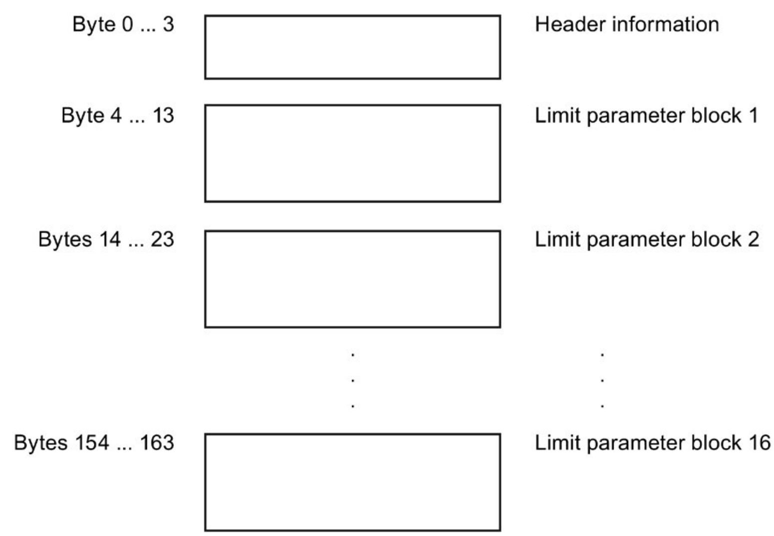

Figure A-9 Structure of data record 129

Header information

The figure below shows the structure of the header information.

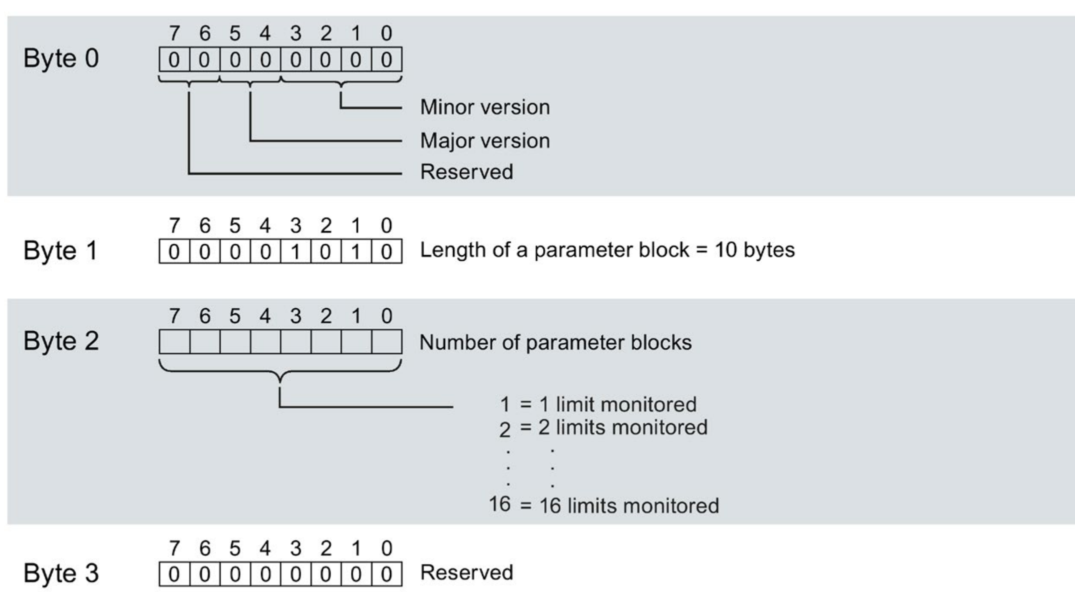

Figure A-10 Header information DS 129

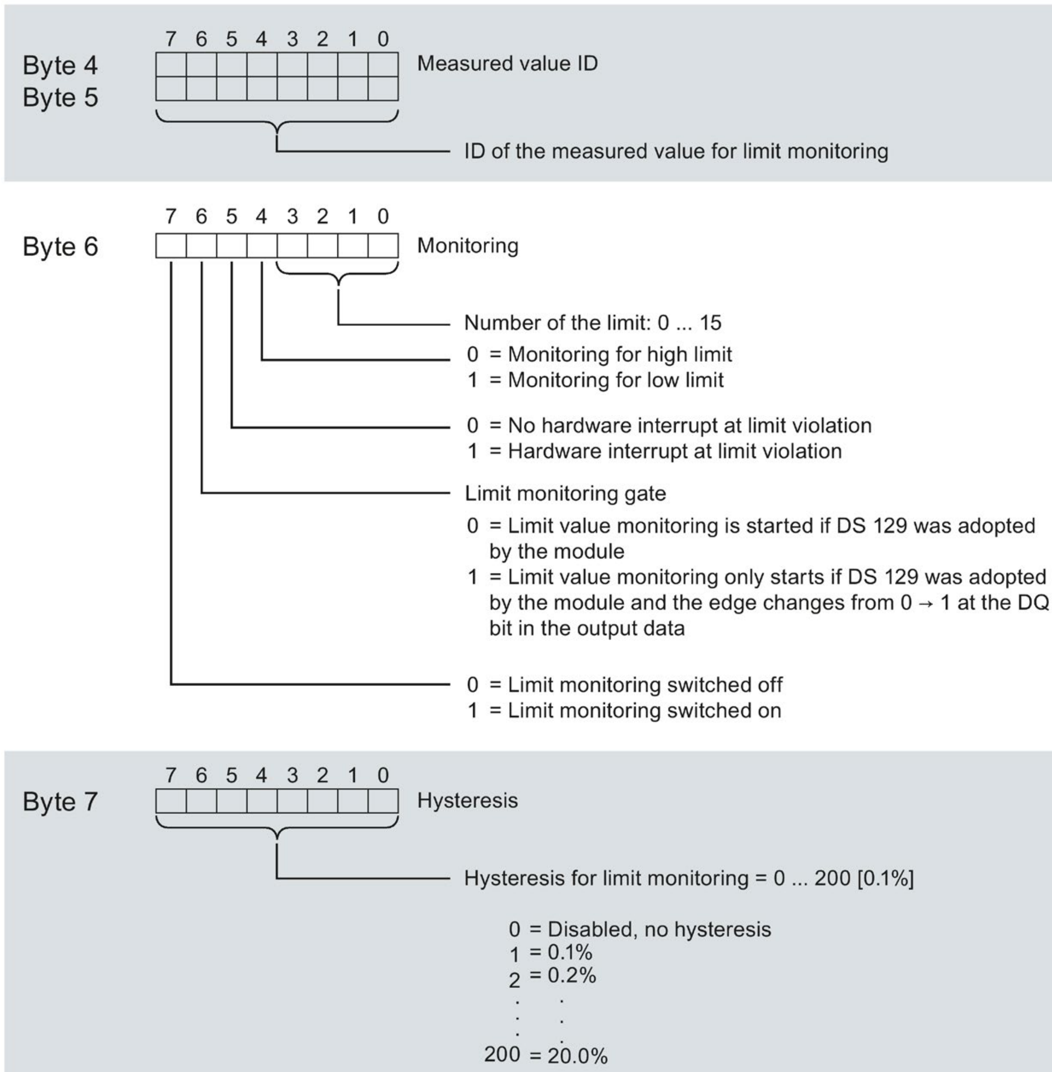
Limit parameter block

The following diagram shows the structure of the parameter blocks for limit monitoring.



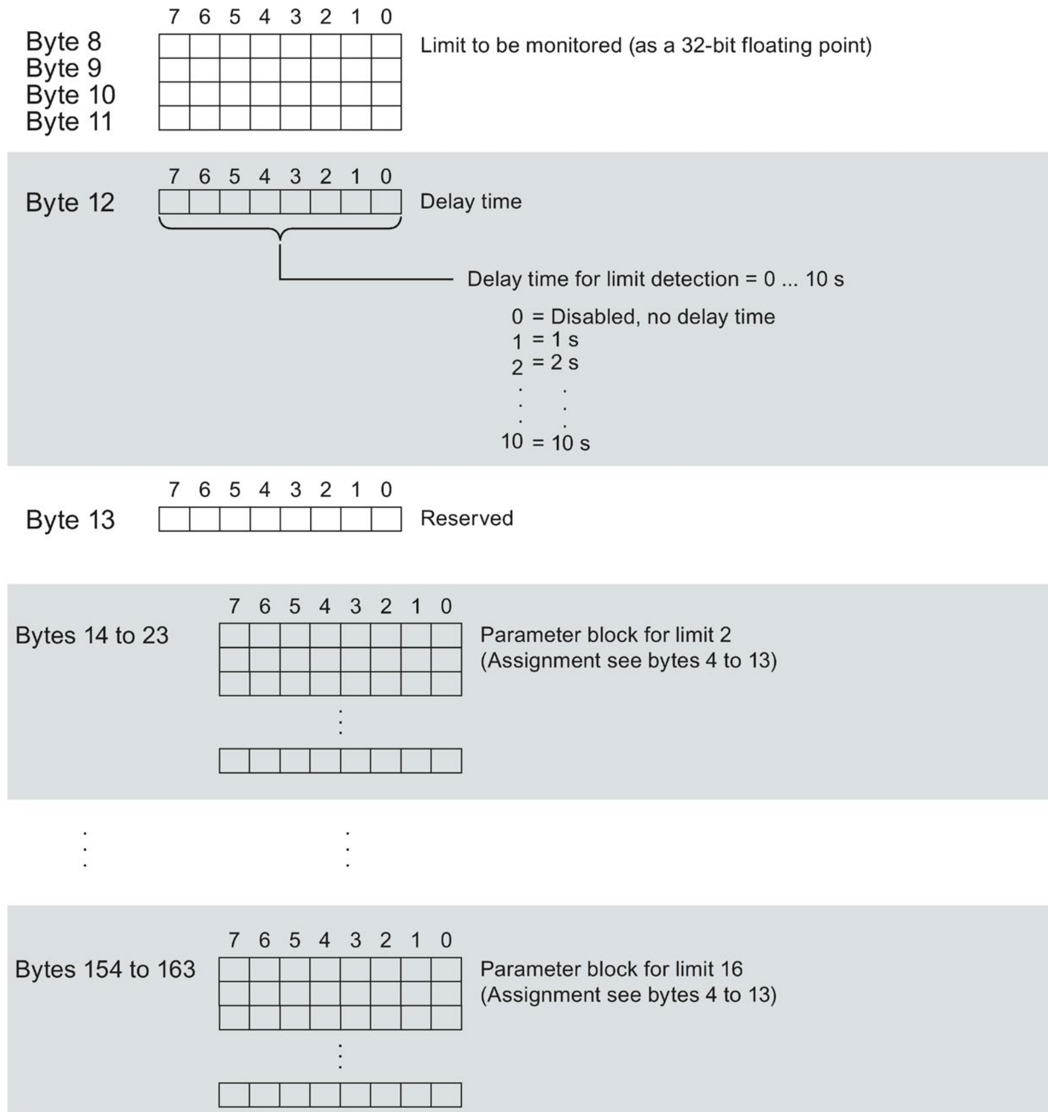


Figure A-11 Limit parameter data block

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 129.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check bytes 3, 13, 23, 33...163 and set the reserved bits back to 0.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	34	Parameters for monitoring the limits invalid	Check bits 0...3 in Byte 6. Enter valid values.
DF	80	E1	35	"Number of limit" in 'Monitoring assigned multiple times' parameter	Check bits 0...3 in Byte 6. Do not use limit number several times.
DF	80	E1	36	"Hysteresis for limit monitoring" invalid	Check Byte 7. Enter valid values.
DF	80	E1	37	"Limit" invalid.	Check Byte 8...11. Enter valid values.
DF	80	E1	38	"Delay time for limit monitoring" invalid.	Check Byte 12. Enter valid values.

A.4 Structure of the parameter data records 130/131 for user-data mapping

Structure of data record 130/131

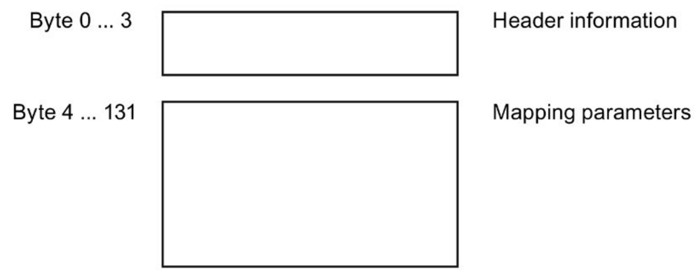

Figure A-12 Structure of data record 130/131

Header information

The figure below shows the structure of the header information.

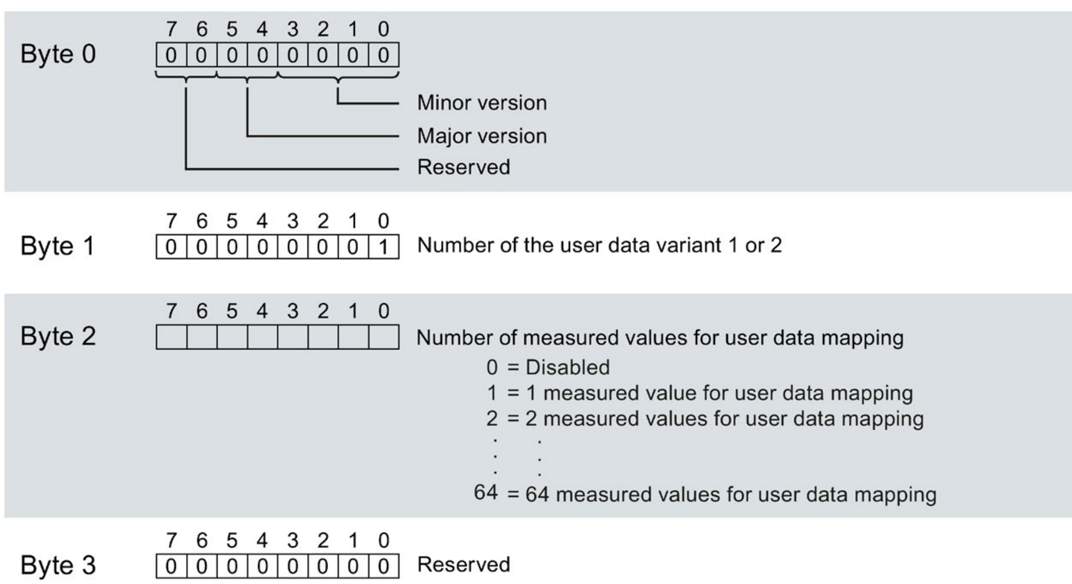

Figure A-13 Header information DS 130/131

Parameter block for user data mapping

The following diagram shows the structure of the parameter blocks for user data mapping.

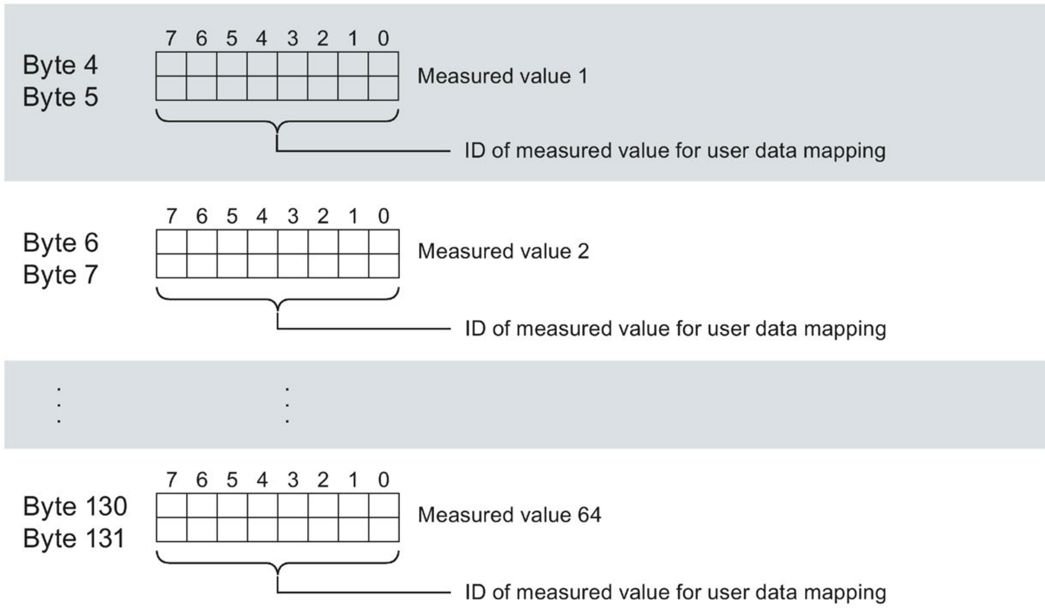

Figure A-14 Parameter block for user data mapping

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 130/131.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the mod-ule is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	01	Reserved bits are not 0.	Check Byte 3 and set reserved bits back to 0.
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Select a different user data variant or change the configuration.
DF	80	E1	30	Data record number invalid	Check the data record number. Enter a valid data record number.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.
DF	80	E1	3B	"ID of the type of user data mapping" not permitted.	Check Byte 1. Number for user-specific user data variant has to be 01_H or 02_H.

Measured variables for user data mapping

You can find the measured variables under Measured variables for connection type (Page 162). The following measured variables are not available to you for user data mapping:

- 220 to 226
- 62110 to 62116
- 62210 to 62216
- 62310 to 62316

A.5 Structure of the parameter data record 135 for data record mapping

Structure of data record 135

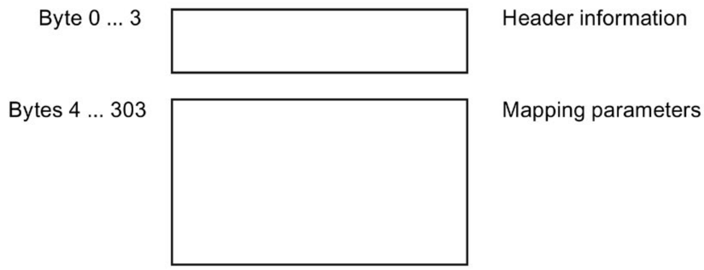

Figure A-15 Structure of data record 135

Header information

The figure below shows the structure of the header information.

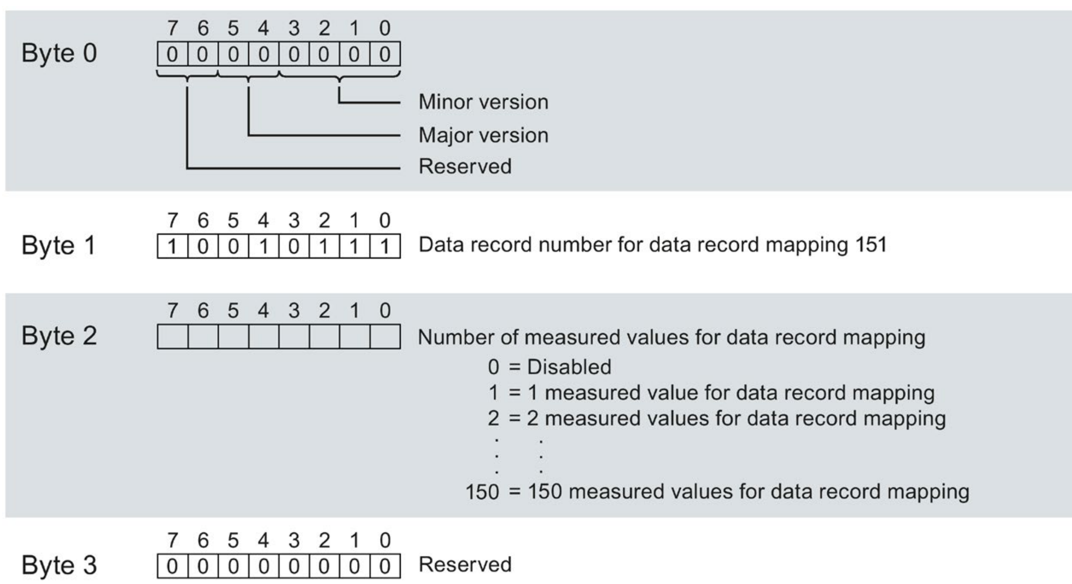

Figure A-16 Header information DS 135

Parameter block for data record mapping

The following diagram shows the structure of the parameter blocks for data record mapping.

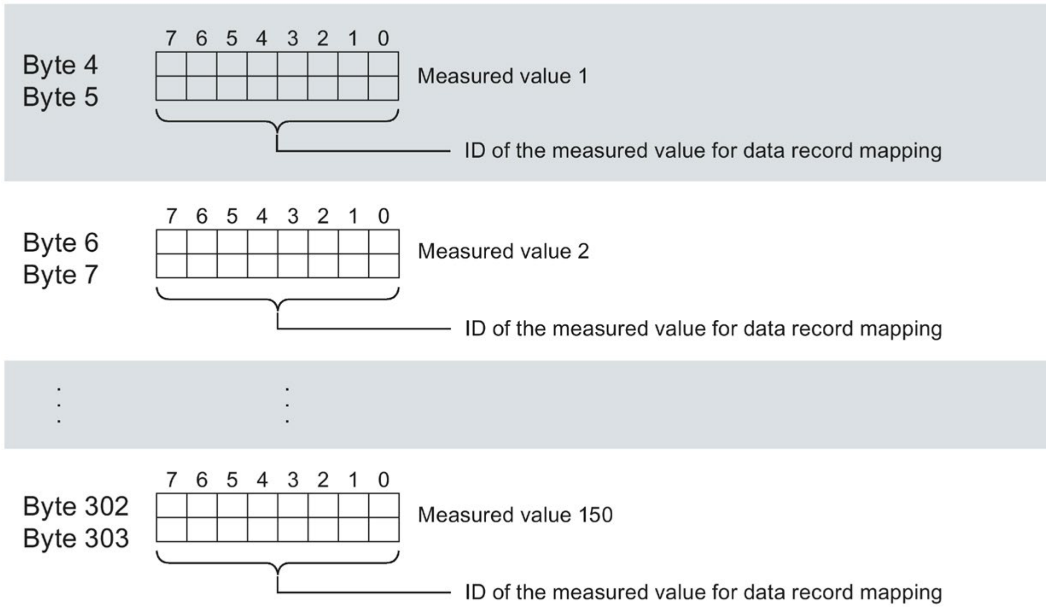

Figure A-17 Parameter block for data record mapping

Data record length DS 135 and DS151

The table below shows the data record lengths of the parameter data record DS 135 and the user-defined data record DS 151 (Page 257).

The length of the data records depends on the number and the format of the measured values.

Number Measured values	Data record length in bytes		
	REAL measured values		LREAL measured values
	DS 135	DS 151	DS 151
29	62	118	234
30	64	122	242 *
40	84	162	322 *
50	104	202	402 *
59	122	238	474 *
100	204	402 *	802 *
118	240	474 *	946 *
150	304*	602 *	1202 *

* not with PROFIBUS DP

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the parameter data record 130/131/135.

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	01	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E0	01	Incorrect version	Check Byte 0. Enter valid values.
DF	80	E0	02	Error in the header information	Check Bytes 1 and 2. Correct the length and number of the parameter blocks.
DF	80	E1	01	Reserved bits are not 0.	Check Byte 3 and set reserved bits back to 0.
DF	80	E1	21	"User data variant" not possible or input data configuration not large enough	Select a different user data variant or change the configuration.
DF	80	E1	30	Data record number invalid	Check the data record number. Enter a valid data record number.
DF	80	E1	31	"Length of the parameter block" invalid.	Check Byte 1. Length = 10 bytes
DF	80	E1	32	"Number of parameter blocks" invalid.	Check Byte 2. Enter valid values.
DF	80	E1	33	"ID of the measured value for limit monitoring" invalid.	Check Bytes 4 and 5. Enter valid values.

Measured variables for data record mapping

You can find the measured variables under Measured variables for connection type (Page 162). The following measured variables are not available to you for data record mapping:

- 220 to 226
- 62110 to 62116
- 62210 to 62216
- 62310 to 62316

Measured variables

B

B.1 Measured variables for connection type

Measured variables for data records and user data

The following table provides an overview of all measured variables that are used in the data records and user data.

Note that the format and unit differ in the evaluation of records and user data.

On the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755917) you can find an overview of the assignment of the measured values to the user data variants and data records.

Table B- 1 Measured variables for data records and user data

Measured value ID	Measured variables	Data type	Unit	Value range	Connection type							
					1P 2W	2P 3W	3x 1P2W	3P 4W	3P 4W1	3P 3W	3P 3W1	3P 4WI

Z = additionally possible measured values in the current path (e.g. instead of neutral current)

[1] Effective value

[2] IEC 61557-12

[3] floating arithmetic average value above 200 ms

[4] floating arithmetic average value above 10 s

[5] Simple summation

[6] Calculation from the start/restart (inflow and outflow values are positive numbers)

[7] floating arithmetic average value above 3 s

[8] floating arithmetic average value above 600 s

[9] floating arithmetic average value above 900 s

[10] Block measurement over 900 s

[11] direct measurement of the signal wave at 8 ksps

[12] Total of the parts / number of parts

[13] THD (Total Harmonic Distortion) is calculated once per second by the RMS of the fundamental oscillation and the total effective value (IEEE standard 1459–2010)

[14] Min./Max: Slave pointer function of the respective basic value from start/reset

[15] Calculation according to DIN EN 61000-3-316 half-wave value

[16] Half-wave value

[17] Instantaneous value

[18] FFT (Fast Fourier Transformation)

[19] While pure RMS measured values only contain AC voltage components of the signal, 10/12 and half-wave measured values also show DC voltage components of the signal

Format

Table B- 2 Format and its length in bytes

Format in STEP 7 (TIA Portal)	Format to IEEE	Length in bytes	Comment
BYTE	BYTE	1 byte	Bit field with 8 bit
WORD	WORD	2 bytes	Bit field with 16 bit
SINT	INT8 (signed)	1 byte	Fixed-point number 8 bits with sign
USINT	INT8 (unsigned)	1 byte	Fixed-point number 8 bits without sign
INT	INT (signed)	2 bytes	Fixed-point number 16 bits with sign
UINT	INT (unsigned)	2 bytes	Fixed-point number 16 bits without sign
UDINT	INT32 (unsigned)	4 bytes	Fixed-point number 32 bits without sign
DINT	INT32 (signed)	4 bytes	Fixed-point number, 32 bits with sign
REAL	Float32	4 bytes	Floating-point number 32 bits with sign
LREAL	Float64	8 bytes	Floating-point number 64 bits with sign

Module versions C

C.1 Module version "2 I / 2 Q"

User data of the module

The module has 2 bytes of input user data and 2 bytes of output user data for status and control information. At this module version measured variables can be read solely via measured value data records (no measured variables can be evaluated via user data).

Structure of input user data

The structure of the input user data is fixed.

Table C- 1 Structure of input user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Constant = 0x80
1	Module	Quality information	Quality bits to describe the quality of the basic measured values

Allocation of the input user data

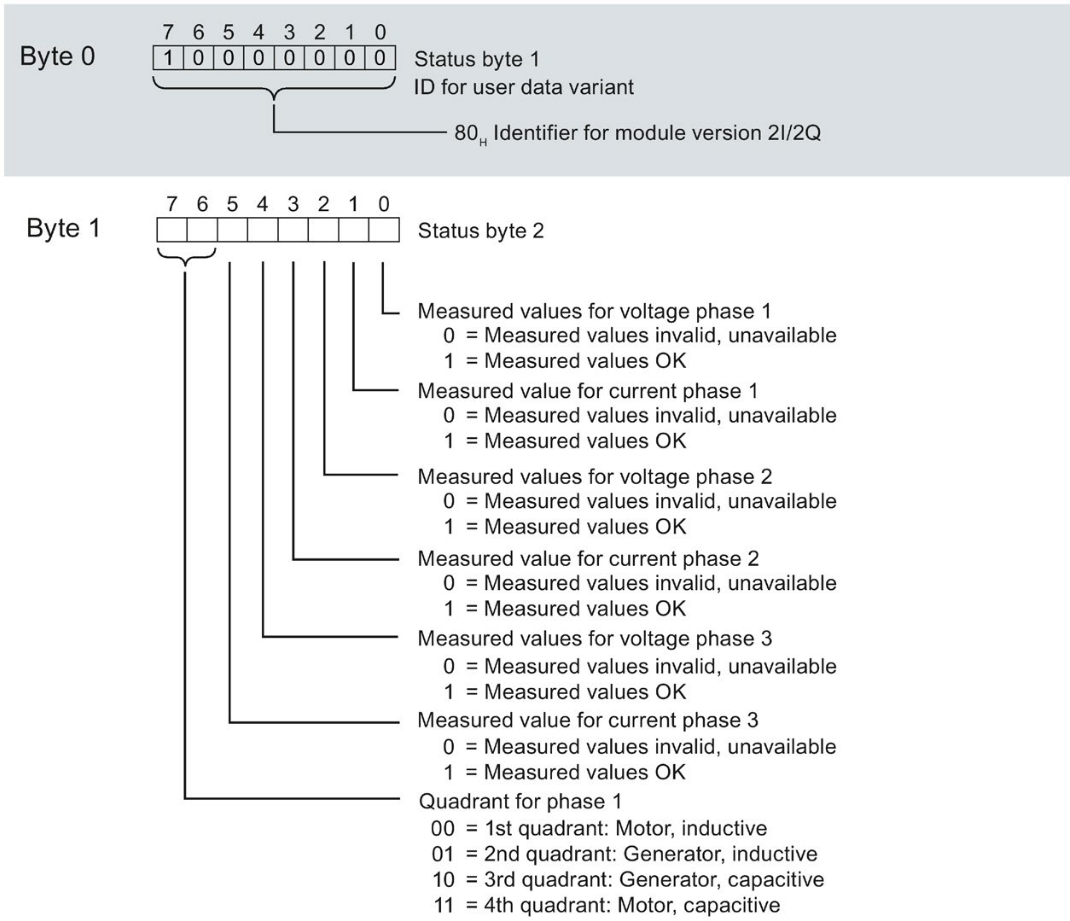

Figure C-1 Allocation of the status bytes in the input user data (2 bytes)

Structure of output user data

The structure of the output user data is fixed.

Table C- 2 Structure of output user data (2 bytes)

Byte	Validity	Designation	Comment
0	Module	Reserved	Reserved
1	Module	Control outputs	Reset of values and counters, gate

Assignment of the output user data

Via the output user data you control for all phases

- Resetting for all minimum values, maximum values, limits, operating hours counter and energy meters.
- The counter gates for operating hours counter and energy counters.

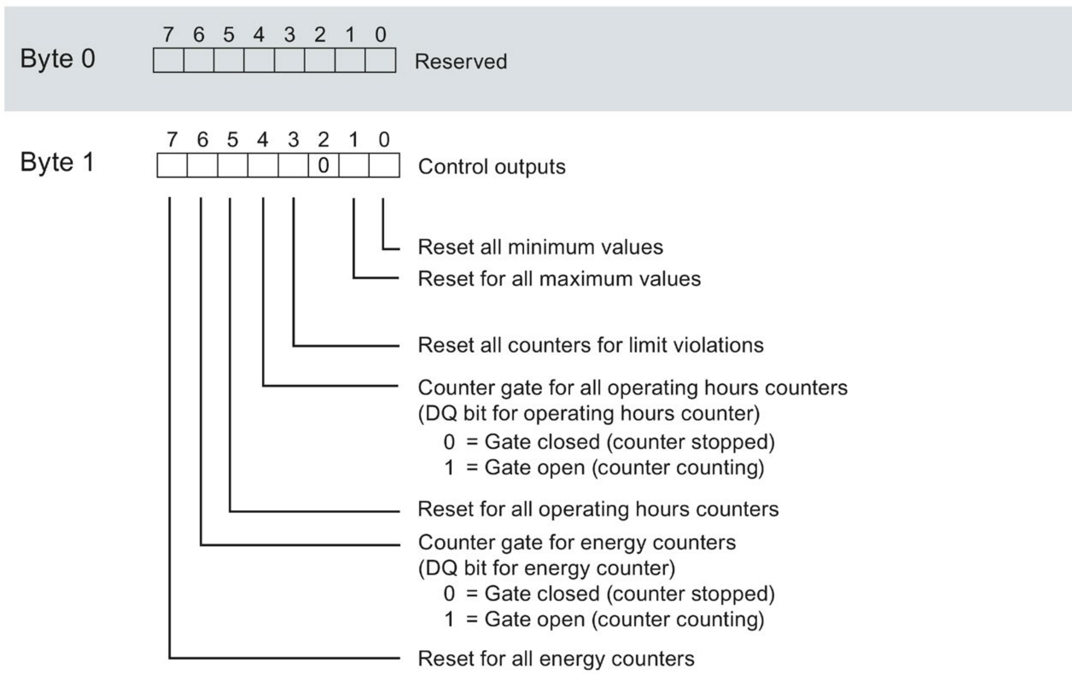

Figure C-2 Allocation of the control byte in the output user data (1 byte)

Note

For module version 2 I / 2 Q, a reset of the selected variables always acts on **all** measured values/counter levels of the three phases.

- Reset energy counter: Acts on all active, reactive and apparent energies of all phases
- Reset operating hours counter: Acts on the counters of Phases 1 to 3
- Reset minimum / maximum values: Acts on the minimum and maximum value calculations of Phases 1-3
- Reset all counters for limit violations: Acts on all 16 limit values.

C.2 Module version "32 I / 20 Q"

User data of the module

The module occupies 32 bytes of input user data and 20 bytes of output user data. Of these the module uses 2 bytes input data for status information and 20 bytes output data for control information. Measured variables can be read cyclically via user data (Bytes 2 to 31) or acyclically via measured value data records

Structure of input user data

You can set the contents of the input user data dynamically. You can choose between different user data variants.

Table C- 3 Structure of input user data (32 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 31	Module or phase	Data	2 or 4 byte measured values or cumulative values according to user data variant

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

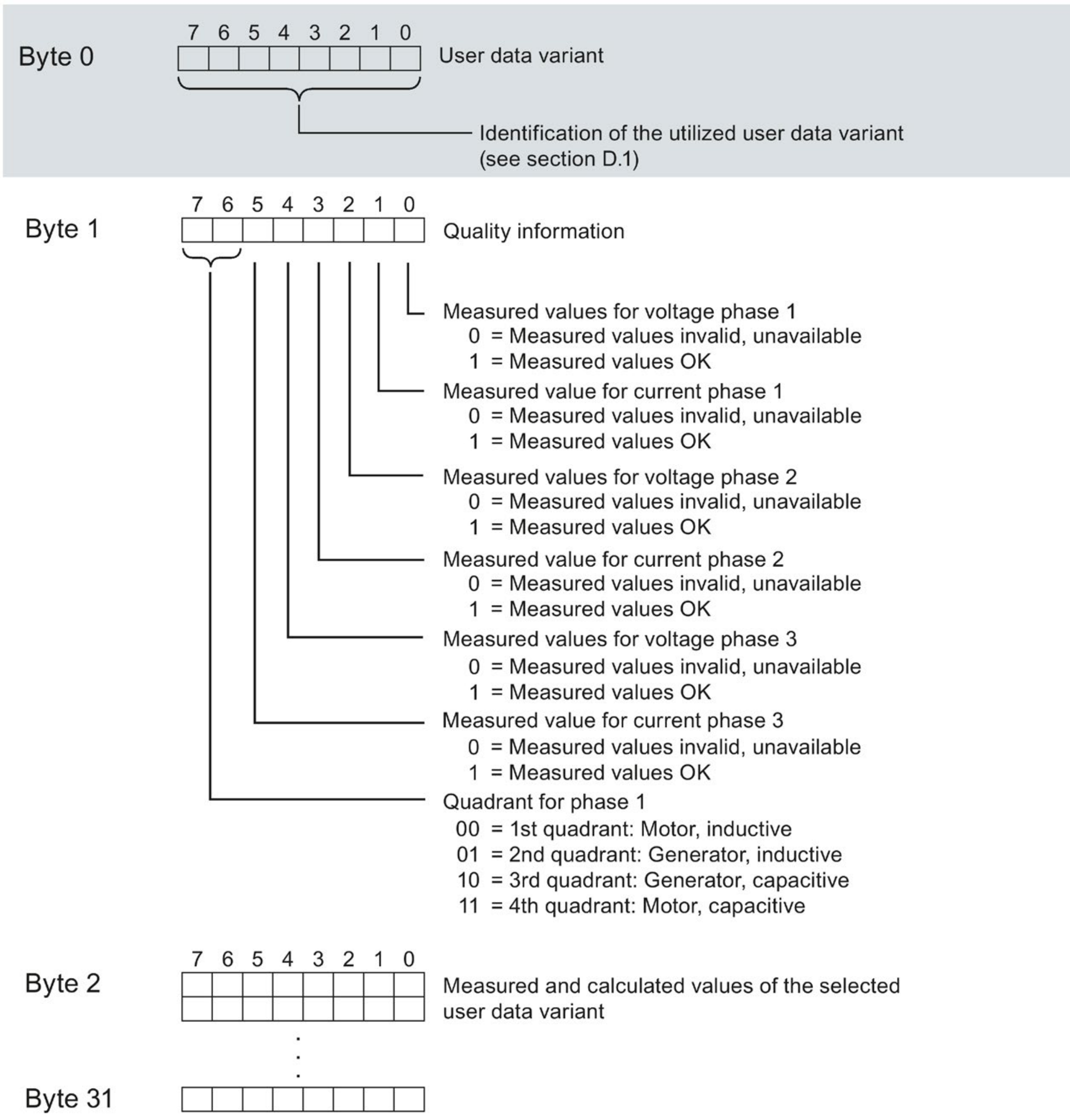

Figure C-3 Assignment of the input user data (32 bytes)

Structure of output user data

The structure of the output user data is fixed and is the same at all the selectable user data variants.

Via the output user data you control globally or phase-specifically

- Resetting for minimum values, maximum values, limits, operating hours counter and energy meters.
- The counter gates for operating hours counter and energy counters.
- Gate for limits, minimum values and maximum values.

Table C- 4 Structure of output user data (20 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	Control byte for switching the user data variant
1	Module	Control byte 1	Global resetting of values and counters, gate
2	Module	Control byte 2	Selection of the energy counter to be reset
3	Module	Control byte 3	Control of the limit monitoring of limit values 9 to 16
4	Module	Control byte 4	Control of the limit monitoring of limit values 1 to 8
5	Module	Reserved	-
6	Phase L1	Control byte 6	Phase-specific resetting of values and counters, gate for Phase L1
7	Phase L1	Control byte 7	
8	Phase L2	Control byte 8	Phase-specific resetting of values and counters, gate for Phase L2
9	Phase L2	Control byte 9	
10	Phase L3	Control byte 10	Phase-specific resetting of values and counters, gate for Phase L3
11	Phase L3	Control byte 11	
12	Module and phases L1, L2, L3	Control byte 12	Phase-specific deletion of power quality analysis results
13	Reserved		
14	Reserved		
15	Reserved

Control bytes for limit monitoring

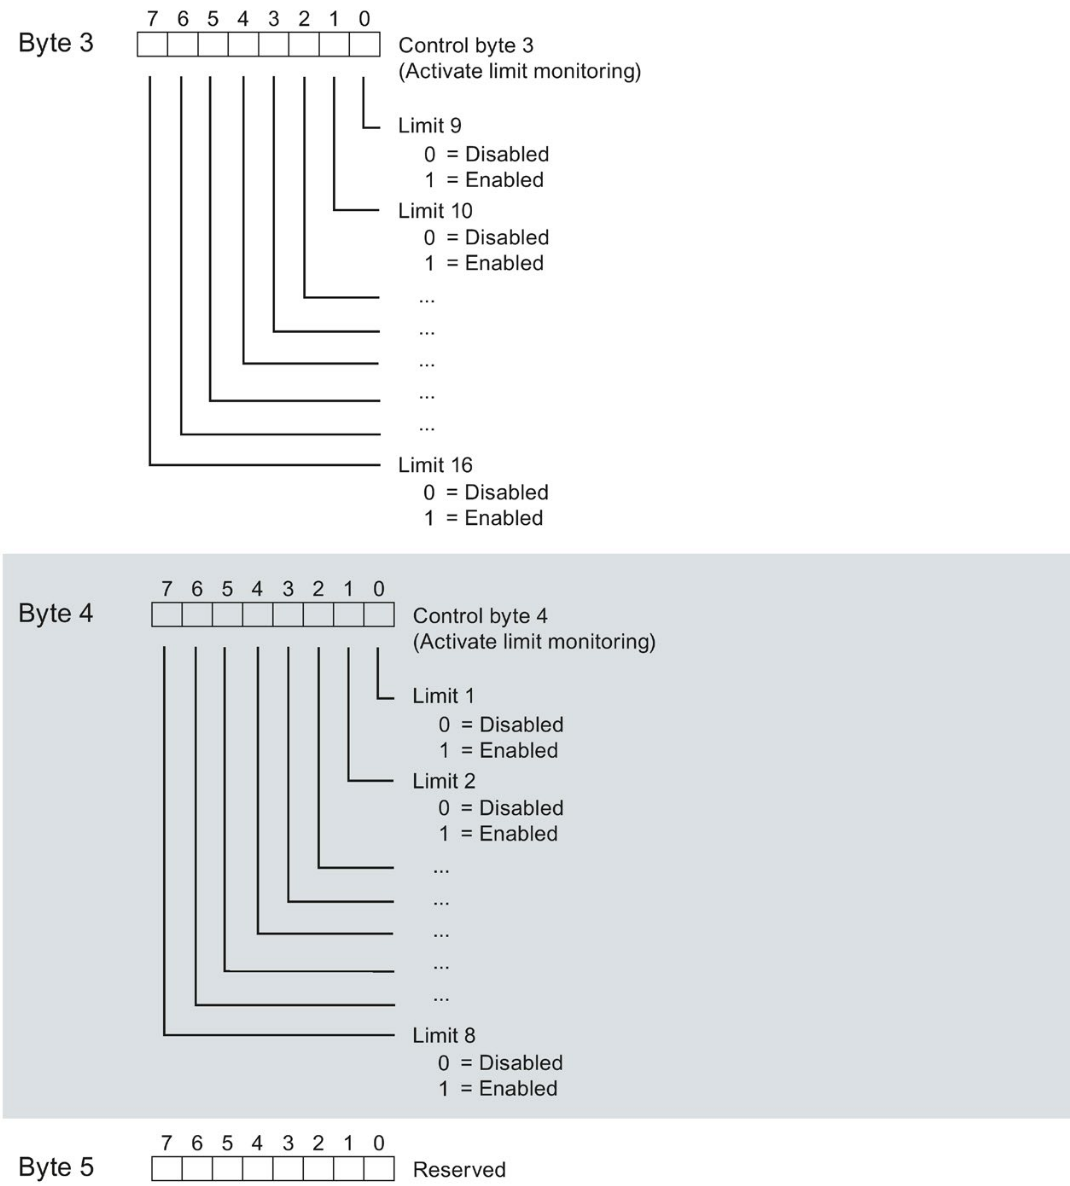

Figure C-6 Allocation of the control bytes for limit monitoring (bytes 3 to 5)

Control bytes for each individual phase

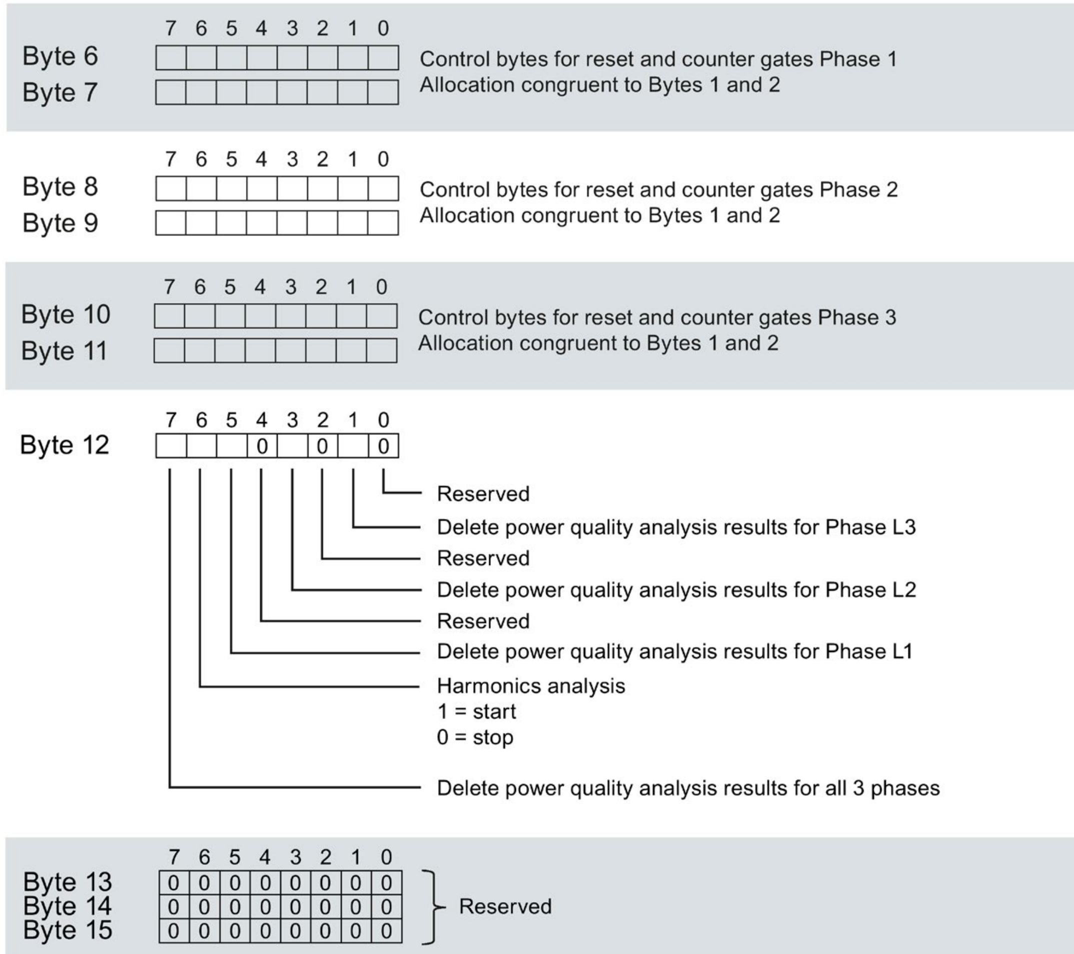

Figure C-7 Allocation of the control bytes for each individual phase (bytes 6 to 15)

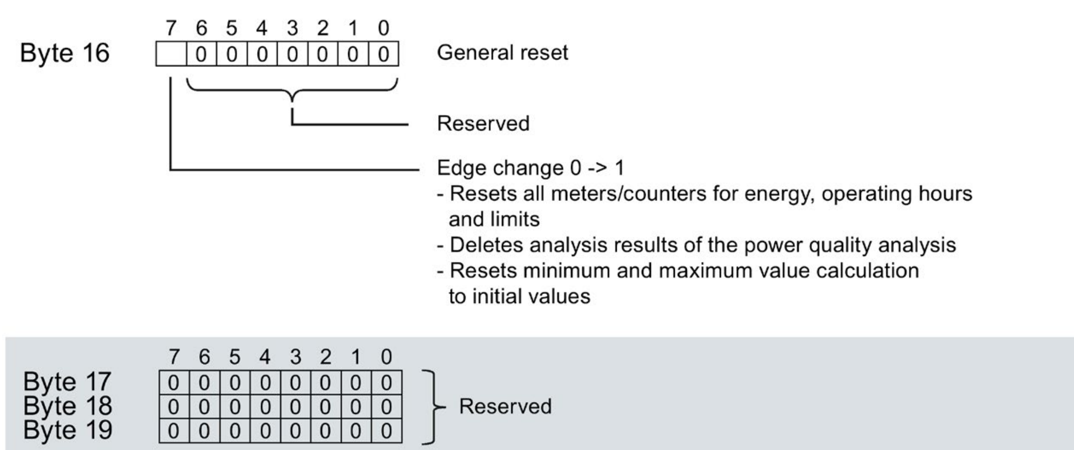

Figure C-8 Allocation of the control bytes for each individual phase (bytes 16 to 19)

C.3 "User-specific" module version

User data of the module

The module occupies between 16 and 256 bytes of input user data and 20 bytes of output user data. Of these the module uses 2 bytes input data for status information and 20 bytes output data for control information. Measured variables can be read cyclically via user data (as of Byte 2) or acyclically via measured value data records

Structure of input user data

You configure the structure of the input user data starting at Byte 2 at this module version itself. An input user data length of 32 bytes also allows you to set the input user data dynamically. You can choose between different user data variants.

Table C- 5 Structure of input user data (16 to 256 bytes)

Byte	Validity	Designation	Comment
0	Module	User data variant	-
1	Module	Quality information	Quality bits to describe the quality of the basic measured values
2 ... 255	Module or phase	Data	Measured values or calculated values in accordance with their configuration: • At configuration in STEP 7 the size of the input user data is calculated automatically. • With configuration via the GSD file the size of the input user data amounts to 32, 64, 128 or 256 bytes. The memory area has to be sufficiently large for the measured variables defined in parameter data record 130 or 131.

Allocation of the input user data

You can change the measured variables during operation. You can choose between different user data variants.

The allocation of the status information in bytes 0 and 1 corresponds to the module version 32 I / 20 Q, see appendix Module version "32 I / 20 Q" (Page 194).

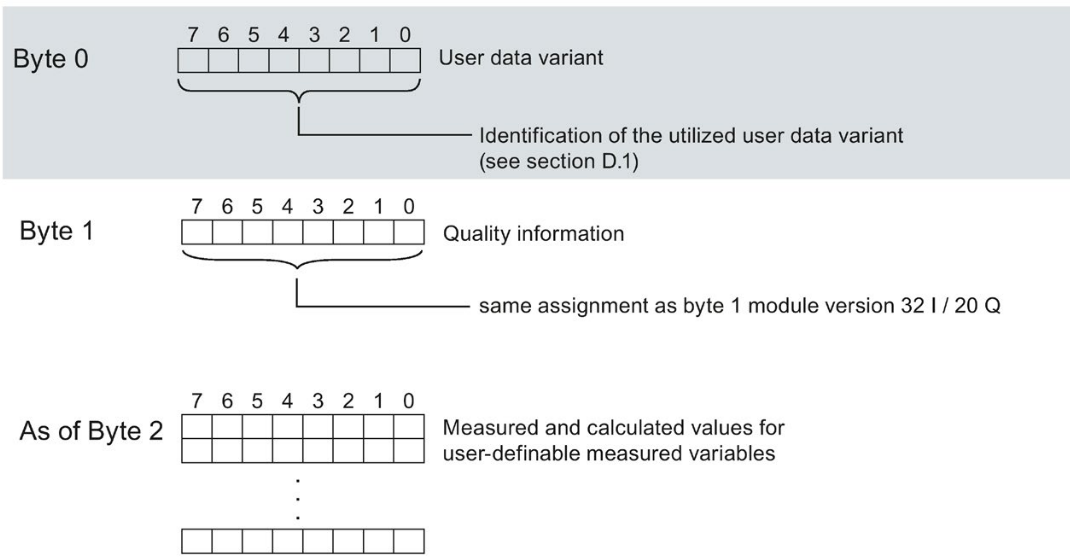

Figure C-9 Allocation of the input user data ("User-specific" module version"

Note

Behavior at switchover in case of the input user data being too small

If the configured size of the variable input user data is smaller than the sized of the fixed user data variant, the response depends on the type of switchover:

- Re-assigning parameters via parameter data records DS 128 / DS 130 / DS 131: Output of a parameter assignment error (33). No switchover.
- Switchover using output byte 0 of a user data variant: No switchover and no error message.

Structure of output user data

The structure of the 20-byte output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 20 Q" (Page 194).

C.4 Module version "EE@Industry measurement data profile E0 / E1 / E2 / E3"

User data of the module

The four versions according to EE@Industry use between 4 and 104 bytes of input user data and 20 bytes of output user data. A dynamic switchover of the input user data is not possible.

Structure of input user data

The structure of the input user data for the module versions according to the EE@Industry standard is fixed and depends on the selected measurement data profile.

Table C- 6 Measurement data profile E0

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0...3	Current L1	REAL	1 A	0.0 … 100000.0	7

100...103	Power factor L3	REAL	-	0.0 … 1.0	21

Structure of output user data

The structure of the 20-byte output user data is fixed and is identical to the output user data (control bytes) of the Module version "32 I / 20 Q" (Page 194).

User data variants D

D.1 User data variants with 32 bytes input data / 20 bytes output data

User data

The following table shows the existing user data variants.

Table D- 1 Overview of the user data variants

User data	User data variant
Total power L1L2L3	254 (FE_H) - default setting
Active power L1L2L3	253 (FD_H)
Reactive power L1L2L3	252 (FC_H)
Apparent power L1L2L3	251 (FB_H)
Basic measured values L1L2L3	250 (FA_H)
Total energy L1L2L3	249 ($F9_H$)
Energy L1	248 ($F8_H$)
Energy L2	247 ($F7_H$)
Energy L3	246 ($F6_H$)
Basic variables three-phase measurement L1L2L3	245 ($F5_H$)
Reactive power compensation	244 ($F4_H$)
Quality values three-phase measurement	240 ($F0_H$)

Measured value data records

E

E.1 Overview of all measured value data records

The AI Energy Meter HF writes the measured values in several data records that you can read acyclically using the RDREC instruction in the user program.

The following tables show the structure of the individual data records:

- Data record DS 142 for basic measured values version 2 (read only).
- Data record DS 142 for basic measured values version 3 (read only).
- Data record DS 143 for energy counters (read and write).
- Data record DS 144 for basic measured values version 1 (read only).
- Data record DS 154 for maximum values with time stamp (read only).
- Data record DS 145 for minimum values version 1 (read only).
- Data record DS 155 for minimum values with time stamp (read only).
- Data record DS 147 for phase-specific measured values L1 version 0 (read only).
- Data record DS 147 for phase-specific measured values L1 version 1 (read only).
- Data record DS 148 for phase-specific measured values L2 DS version 0 (read only).
- Data record DS 148 for phase-specific measured values L2 DS version 1 (read only).
- Data record DS 149 for phase-specific measured values L3 DS version 0 (read only).
- Data record DS 149 for phase-specific measured values L3 DS version 1 (read only).
- Data record DS 150 for advanced measurement and status values version 1 (read only).
- Data record DS 151 for user-defined data record (read only).
- Data record DS 160 for power quality analysis (read only).
- Data record DS 161 for harmonics voltage (DS 161) (read only).
- Data record DS 163 for harmonics current (DS 163) (read only).
- Data record DS 170 information data record on available measured values.

Note

- The cumulative value of the energy counters in 3-phase operation is obtained from the sums of the respective individual values of the phases.
- Inflow and outflow energy meters are always positive values.
- The operating hours counter for the entire module is calculated from the maximum of the operating hours of the individual phases.

E.2 Measured value data record for base measurements (DS 142)

E.2.1 Measured value data record for basic measured values (DS 142) version 2

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix (Measured variables for connection type (Page 162)).

Neutral current

If you operate the AI Energy Meter HF with connection type 3P4W, 3P4W1 or 3P3W, the neutral current is also calculated under the following conditions:

- Transmission factors of all phase currents (primary rated current and secondary voltage) are identical.
- Measured phase currents are greater than the value of the "Low limit for measuring current parameter.
- The parameter "Reverse current direction" must be the same on all phases.

If one of the conditions is not met, 0 is entered as the value for the neutral current. You can read the neutral current calculated using measured value data record 142.

Procedure

Data record 142 is located on the AI Energy Meter HF. Use the RDREC instruction to read out the data record from the module. This system function block is stored in the STEP 7 library.

E.2.2 Measured value data record for basic measured values (DS 142) version 3

Measured variables of the module

The following table provides an overview of all the measured variables that data record 142 supplies. Please note that, depending on the connection type used the display of some measured variables does not make sense and that the module deletes measured values that are not relevant.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix (Measured variables for connection type (Page 162)).

Neutral current

If you operate the AI Energy Meter HF with connection type 3P4W, 3P4W1 or 3P3W, the neutral current is also calculated under the following conditions:

- Transmission factors of all phase currents (primary rated current and secondary voltage) are identical.
- Measured phase currents are greater than the value of the "Low limit for measuring current parameter.
- The parameter "Reverse current direction" must be the same on all phases.

If one of the conditions is not met, 0 is entered as the value for the neutral current. You can read the neutral current calculated using measured value data record 142.

Procedure

Data record 142 is located on the AI Energy Meter HF. Use the RDREC instruction to read out the data record from the module. This system function block is stored in the STEP 7 library.

E.3 Structure for energy counters (DS 143)

Energy meter data record 143 for different actions

The energy meter data record 143 includes all energy meters available on the module phase-by-phase. The data record can be used for different actions:

- Reset the energy meters to user-specific value (e.g. "0")
- Reading the current values of the energy counters
- Reading the overflow counters
- Reading the operating hours

Energy meter data record 143

166...169	Operating hours counter L3 (initial value)	REAL	h		65507

Status information

When data record 143 is read with the RDREC instruction, Bytes 2 to 7 supply phase-specific status information for energy counters, overflow counters and operating hours counters.

The status information enables you can see which counters are returning their values in the data record 143. If energy counters return their values in the status byte 1, you can determine the type of energy counter with status byte 2.

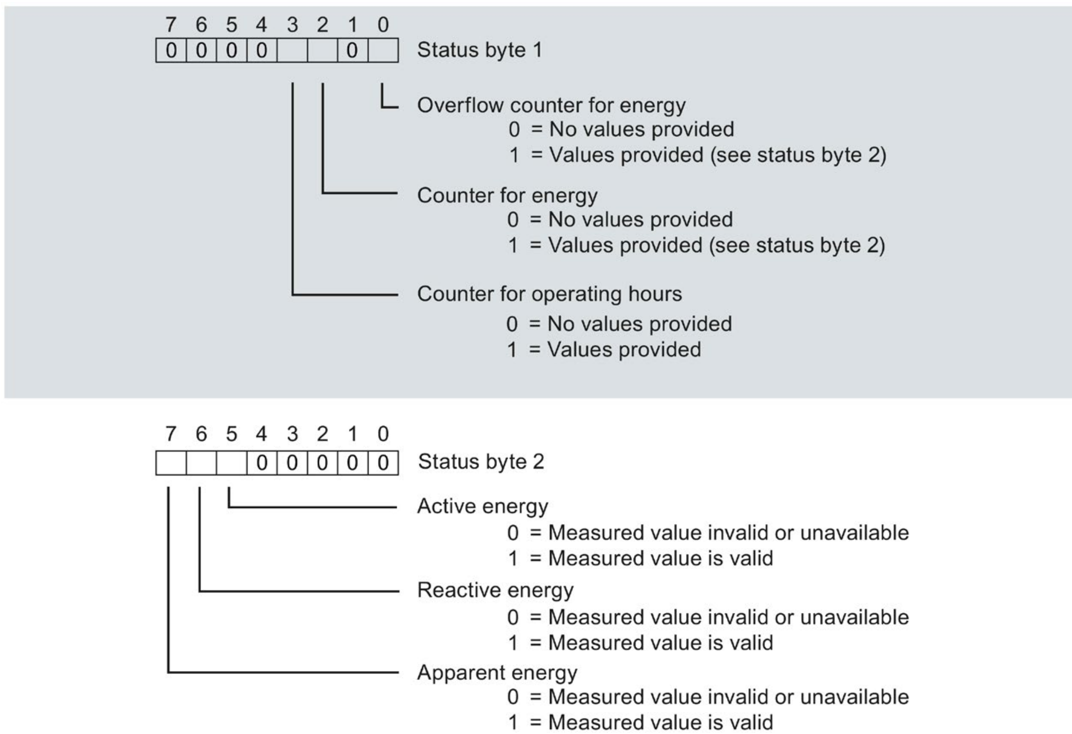

Figure E-1 Status information DS 143 (read access)

Control information

When data record 143 is written with the WRREC instruction, Bytes 2 to 7 are used as phase-specific control information for energy counters, overflow counters and operating hours counter. The length of the control information amounts to 2 bytes for each phase:

- In control byte 1 you determine which counter you want to reset and the time at which counters are reset.
- In Control byte 2 you determine which energy counters and which overflow counters you want to reset.

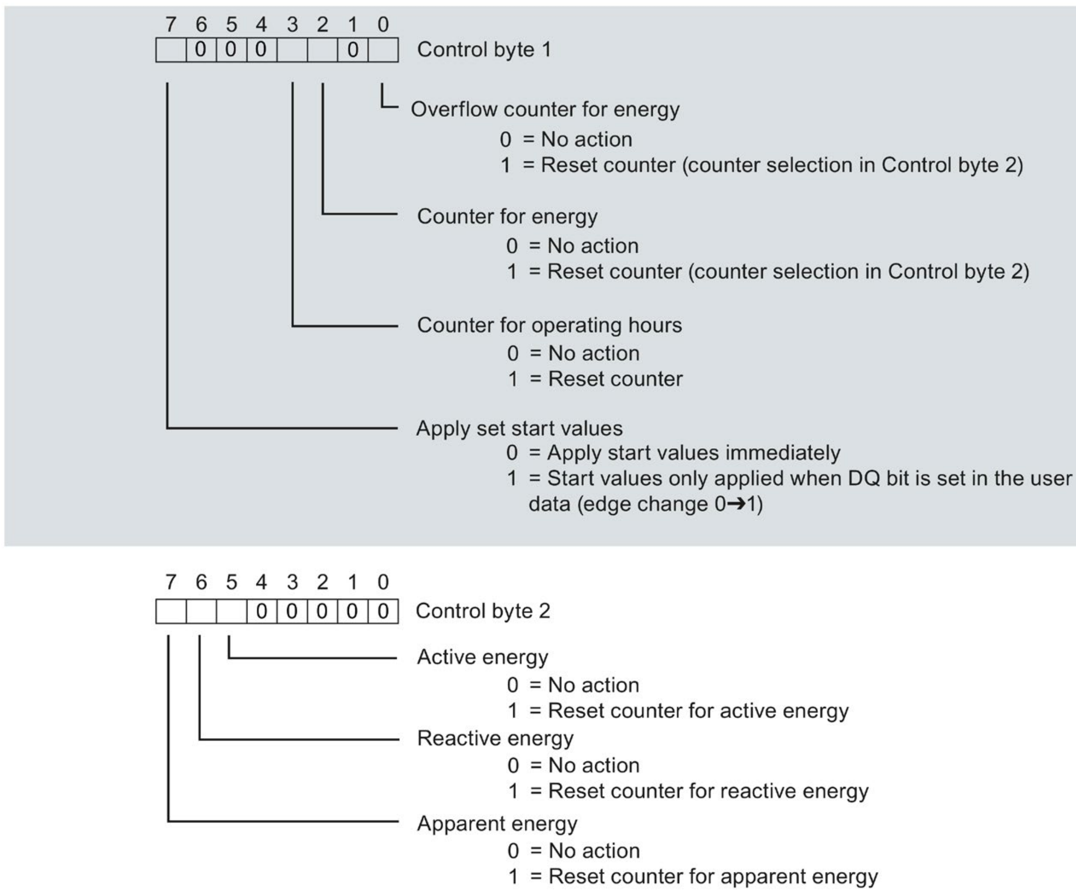

Figure E-2 Control information DS 143 (write access)

Error while transferring the data record

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The WRREC instruction for writing data records returns corresponding error codes when errors occur in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for the measured value data record 143:

Error code in STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Number of the data record unknown	Enter a valid number for the data record.
DF	80	B1	00	Length of the data record incorrect	Enter a valid value for the data record length.
DF	80	B2	00	Slot invalid or cannot be accessed.	Check the station whether the module is plugged or drawn. Check the assigned values for the parameters of the WRREC instruction
DF	80	E1	01	Reserved bits are not 0.	Check Byte 2...7 and set the reserved bits back to 0.
DF	80	E1	39	Incorrect version entered.	Check Byte 0. Enter a valid version.
DF	80	E1	3A	Incorrect data record length entered.	Check the parameters of the WRREC instruction. Enter a valid length.
DF	80	E1	3C	At least one start value is invalid.	Check Bytes 8...103 and Bytes 158...169. The start values may not be negative.
DF	80	E1	3D	At least one start value is too large	Check Bytes 8...103 and Bytes 158...169. Observe the ranges of values for start values.

E.4 Measured value data record for maximum values (DS 144)

E.4.1 Measured value data record for maximum values (DS 144) version 1

Measured variables of the module

The largest values ever measured or calculated from the time AI Energy Meter HF was started are stored in this data record.

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables for connection type (Page 162)).

1 The values reference the amount of the current measured value

E.5 Measured value data record for maximum values with time stamp (DS 154)

Measured variables of the module

The largest values ever measured or calculated from the time AI Energy Meter HF was started are stored in this data record.

The measured values (REAL 4-byte) are each followed by a time stamp (PN Time 12 bytes).

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables for connection type (Page 162)).

Byte	Measured variable	Data type	Unit	Default	Measured value ID

[1] The values reference the amount of the current measured value

Structure of time stamp

The table below shows the structure of the time stamp:

Byte	PN Time	Format	Length
0	Status 0: Synchronization from system time master available 1: local synchronization available 2: no synchronization	UINT16	2 bytes
2	Seconds high	UINT16	2 bytes
4	Seconds low	UINT32	4 bytes
8	Nanoseconds	UINT32	4 bytes

The start value (initial value) is 01.01.1970, 0:00

Note

If you use the FAQ from the section Time-of-day synchronization and time stamp (Page 50), the status is always 2.

E.15 Measured value data record for harmonics current (DS 163)

Measured variables of the module

The measured value identification (measured value ID) is an index which references the overview table of the measured variables in appendix B (Measured variables for connection type (Page 162)).

Byte	Measured variable	Data type	Unit	Value range	Meas-ured value ID
0	Version	BYTE	-	-	-
1	Reserved	BYTE	-	-	-
2...5	THD+N current L1	REAL	1%	0% to 100%	62121

Tips and tricks

F

F.1 Tips and tricks

Processing and visualizing energy data

On the basis of an application example we show you how the measured values of the AI Energy Meter can be processed further and visualized.

You can find this application example on the Internet (http://support.automation.siemens.com/WW/view/en/86299299).

Overview of the measuring data

We provide you with an overview of the assignment of the measured values to the user data variants and data records in an Excel file.

You will find the Excel file on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755917).

Time-of-day synchronization and time stamp

In an application example we show you how to synchronize the time with the AI Energy Meter HF and work with measured values with time stamps.

You can find this application example on the Internet (http://support.automation.siemens.com/WW/view/en/109754890).

Measured values in STEP 7 as of V5.5

Measured values are represented as negative values in STEP 7 as of V5.5 if the value range of the integer format (32767 dec) is exceeded. This is not an error in the measured value. Solution: Select hexadecimal representation.

Conversion of 64-bit floating-point numbers

If you cannot process 64-bit floating-point numbers in your automation system, we recommend conversion to 32-bit floating-point numbers. Note the conversion can cause loss of accuracy. For a description of the conversion of the 64-bit floating-point numbers (data type LREAL) into 32-bit floating-point numbers (data type REAL) please refer to the Internet (http://support.automation.siemens.com/WW/view/en/56600676).

SIEMENS

SIMATIC
ET 200SP
Product information on the "AI Energy Meter 480VAC/CT HF" and "AI Energy Meter 480VAC/RC HF" device manuals

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

General amendments to the documentation

This product information contains supplements and corrections to the "Analog input module AI Energy Meter 480VAC/CT HF" (6ES7134-6PA00-0CU0) and "Analog input module AI Energy Meter 480VAC/RC HF" (6ES7134-6PA20-0CU0) device manuals.

The product information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

Voltage swell or voltage dip of the voltage half-wave value

For technical reasons, the **voltage swell** and **voltage dip** functions display a voltage increase duration or voltage dip duration that is slightly too long when the process value of the voltage goes to "0".

Information on startup characteristics

For technical reasons, the **frequency**, all **measured values of harmonic distortion** THD+N current and voltage as well as the **minimum and maximum values** are delivered with a delay of approx. 2 seconds after connecting the module or switching on the load voltage.

Peak values of the instantaneous values for current and voltage

For technical reasons, both the "Detect current peaks" and "Detect voltage peaks" functions are activated at the same time internally to ensure the correct evaluation of the **peak value detection of current and/or voltage** of a phase. AI Energy Meter HF always shows the phase that exhibits the highest instantaneous value for current or voltage respectively. If peak values are displayed for several phases, you can correlate the available phase values to determine the maximum value of the module.

Peak value detection of the instantaneous values of current and voltage only works when the module is correctly connected to the corresponding phases selected for the connection type. That is to say, if you use connection type 1P2W, only phase 1 should be connected; for 2P3W, only phases 1 and 2 should be connected accordingly.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

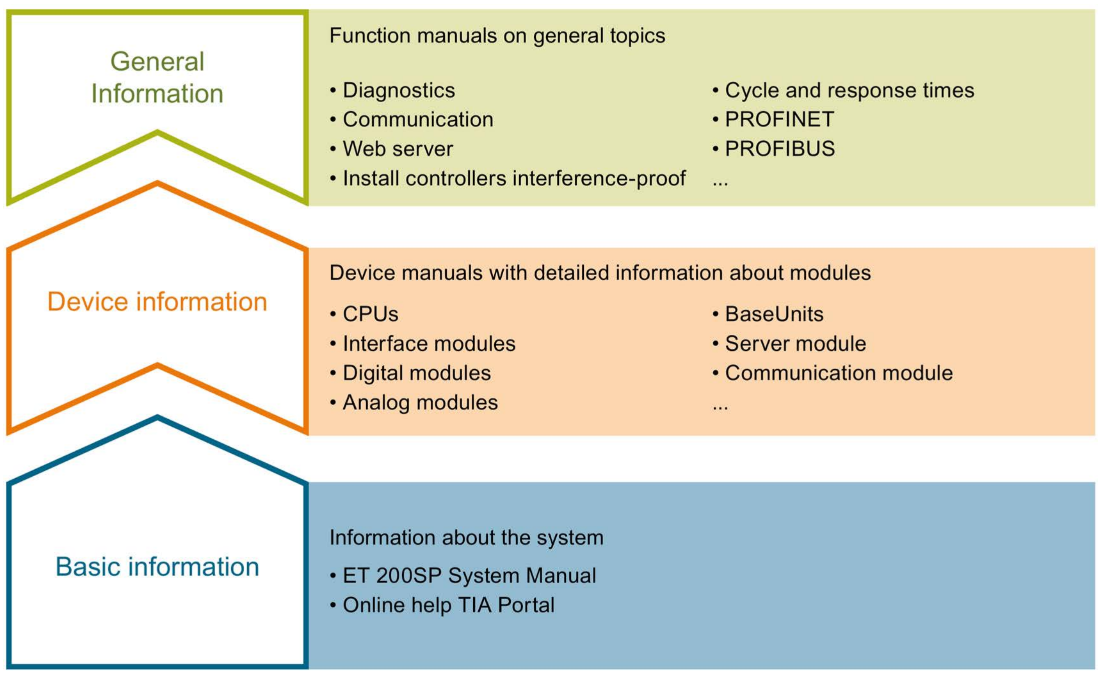
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

⑪ Article number

Image 2-1 View of the module AQ 2xI ST

Properties

The module has the following technical properties:

- Analog output module with 2 outputs
  - for current output
- Output range for current output:
  - ±20 mA, resolution 16 bits including sign
  - 0 mA to 20 mA, resolution 15 bits
  - 4 to 20 mA, resolution 14 bits
- Electrically isolated from supply voltage L+
- Configurable diagnostics (per module)

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Value status

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AQ 2xI ST with the terminal assignments.

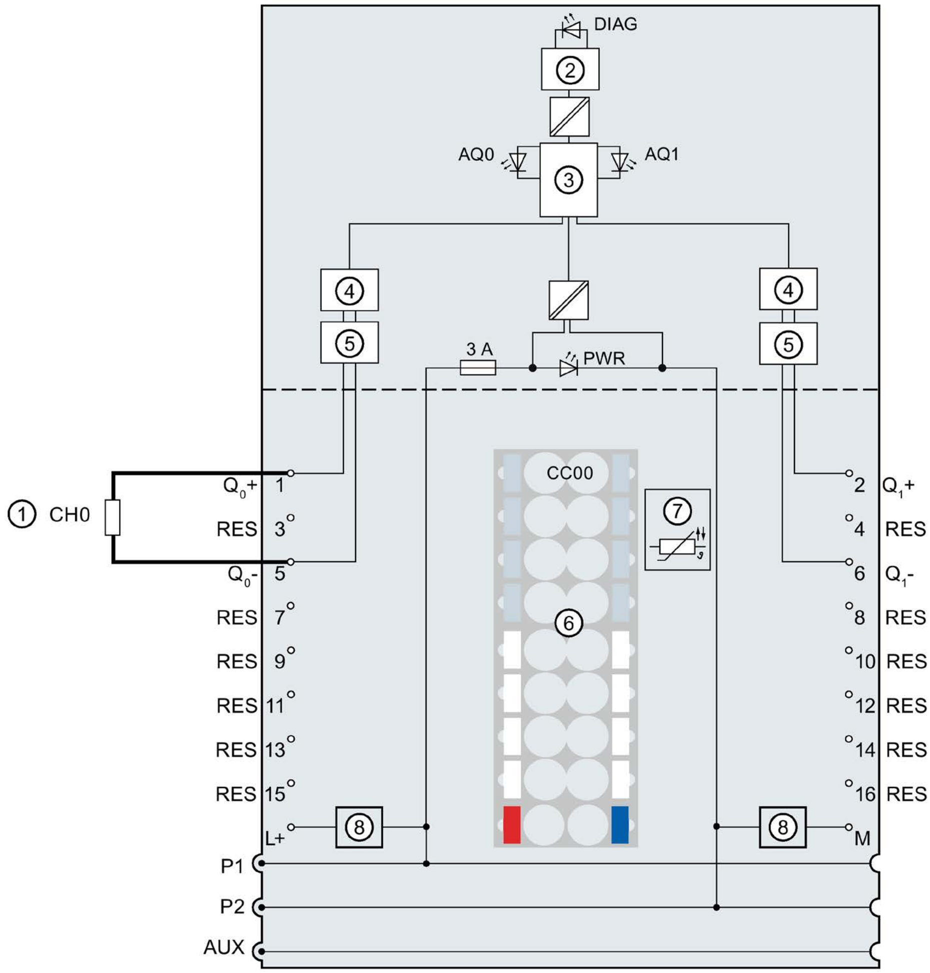
You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: Current output 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog output module AQ 2xI ST on the BaseUnit BU type A0/A1.



①	2-wire connection for current output	Qn+	Analog output current positive, channel n
②	Backplane bus interface	Qn-	Analog output current negative, channel n
③	Microcontroller	RES	Reserve, must remain unused for future function extensions
④	Digital-to-analog converter (DAC)	L+	24 V DC (infeed only with light-colored Ba-seUnit)
⑤	Output conditioner	M	Ground
⑥	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑦	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑧	Filter connection supply voltage (only when light-colored BaseUnit is present)	AQ0, AQ1	Channel status LED (green)
		PWR	Power LED (green)

Image 3-1 Wiring and block diagram for current output 2-wire connection

Parameters/address space 4

4.1 Output ranges

The analog output module AQ 2×I ST has the following output ranges:

Table 4- 1 Output ranges

Output type	Output ranges	Resolution
Current	± 20 mA	16 bits incl. sign
	0 mA to 20 mA	15 bits
	4 mA to 20 mA	14 bits

The tables of the output ranges, overflow, overrange, etc. can be found in section Representation of analog values (Page 30).

4.2 Parameters

Parameters of the AQ 2xI ST

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 26).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Overflow [1]	• Disable • Enable	Disable	Yes	Module	Module [1]
Diagnostics: Underflow [1]	• Disable • Enable	Disable	Yes	Module	
Diagnostics: Wire break [2]	• Disable • Enable	Disable	Yes	Module	Module
Output type/range	• Deactivated • Current +/- 20 mA • Current 0 - 20 mA • Current 4 - 20 mA	Current 4 - 20 mA	Yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value	Turn off	Yes	Channel	Module

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Substitute value	For permissible substitute values for the various output ranges, see appendix Parameter assignment and structure of the parameter data record (Page 26), Substitute values → Codes for substitute values table	0	Yes	Channel	Channel
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 7 bytes.

[2] No diagnostics detection between -3 and +3 mA (no wire break detection)

Note

Unused channels

A disabled channel always returns the value "no current or voltage".

4.3 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Overflow

Enabling of the diagnostics when the output value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the output value exceeds the overrange, falls below the minimum output value or reaches underflow.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Output type / output range

See section Output ranges (Page 13).

Reaction to CPU STOP

Determines the behavior of the module at CPU STOP.

Substitute value

The substitute value is the value that the module outputs in case of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 and 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: There are no errors on the module.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AQ 2×I ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

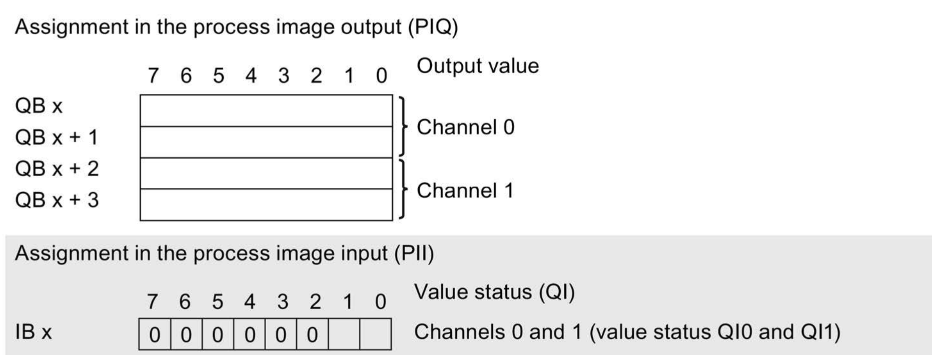


Image 4-1 Address space of the AQ 2×I ST with value status

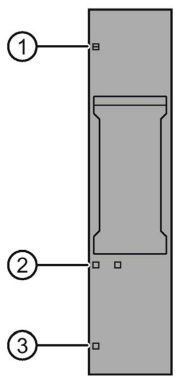
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The following figure shows you the LED display of the AQ 2xI ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Image 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 21).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel disabled
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The AQ 2×I ST analog output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Line break (current)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Wire break	6_H	Actuator circuit impedance too high	Use a different actuator type or modify the wiring, e.g. use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable the channel ("output type" parameter) • Connect the channel
High limit violated	7_H	The output value specified by the user program exceeds the overrange.	Correct the output value
Low limit violated	8_H	The output value specified by the user program is below the underrange.	Correct the output value
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update. • Restart the firmware update.

Analog value generation for the outputs	
Oscillation time	
For resistive load	0.1 ms; typ. value
For inductive load	0.5 ms
Errors/accuracies	
Linearity error (in relation to output range), (+/-)	0.03%
Temperature error (in relation to output range), (+/-)	0.005%/K
Crosstalk between outputs, min.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to output range), (+/-)	0.05%
Operational limit in the entire temperature range	
Voltage in relation to output range, (+/-)	0.5%
Current in relation to output range, (+/-)	0.5%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to output range, (+/-)	0.3%
Current in relation to output range, (+/-)	0.3%
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No

	6ES7135-6GB00-0BA1
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Wire break	Yes
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and backplane bus	Yes
Between the channels and voltage supply of the electronics	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic isolation)
Isolation	
Isolation tested with	707 V DC (type test)
Environmental conditions	
Ambient temperature in operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Dimension drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record

A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the output type and output range for PROFINET.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Overflow	Underflow	Wire break		
Deactivated		*	*	*	*	*	*
Current	±20 mA	x	x	x	x	x	x
	0 mA to 20 mA	x	x	x	x	x	x
	4 mA to 20 mA	x	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the output type and output range for PROFIBUS.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Overflow	Underflow	Wire break		
Deactivated		*	*	*	*	*	*
Current	±20 mA	x	x	x	x	x	x
	0 mA to 20 mA	x	x	x	x	x	x
	4 mA to 20 mA	x	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

You can change the parameters of the module in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

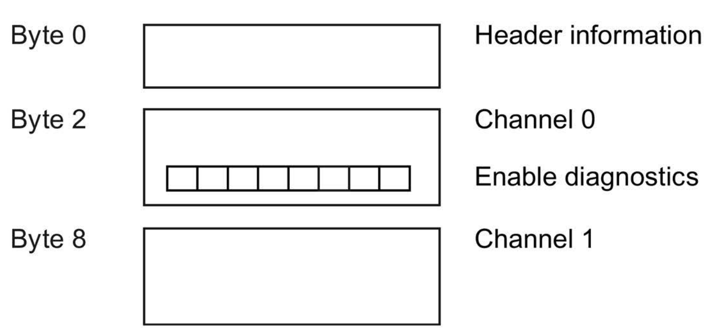

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

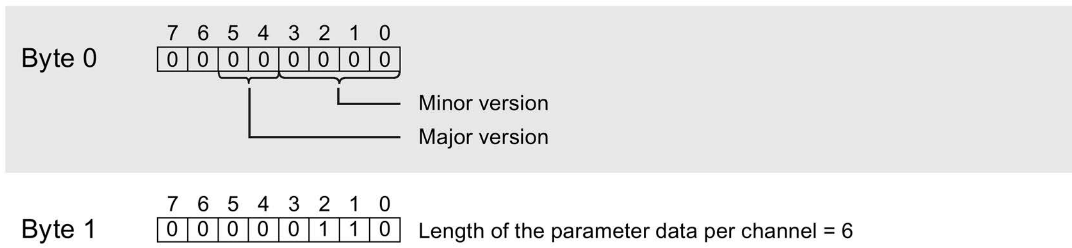

Image A-2 Header information

Parameters

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".

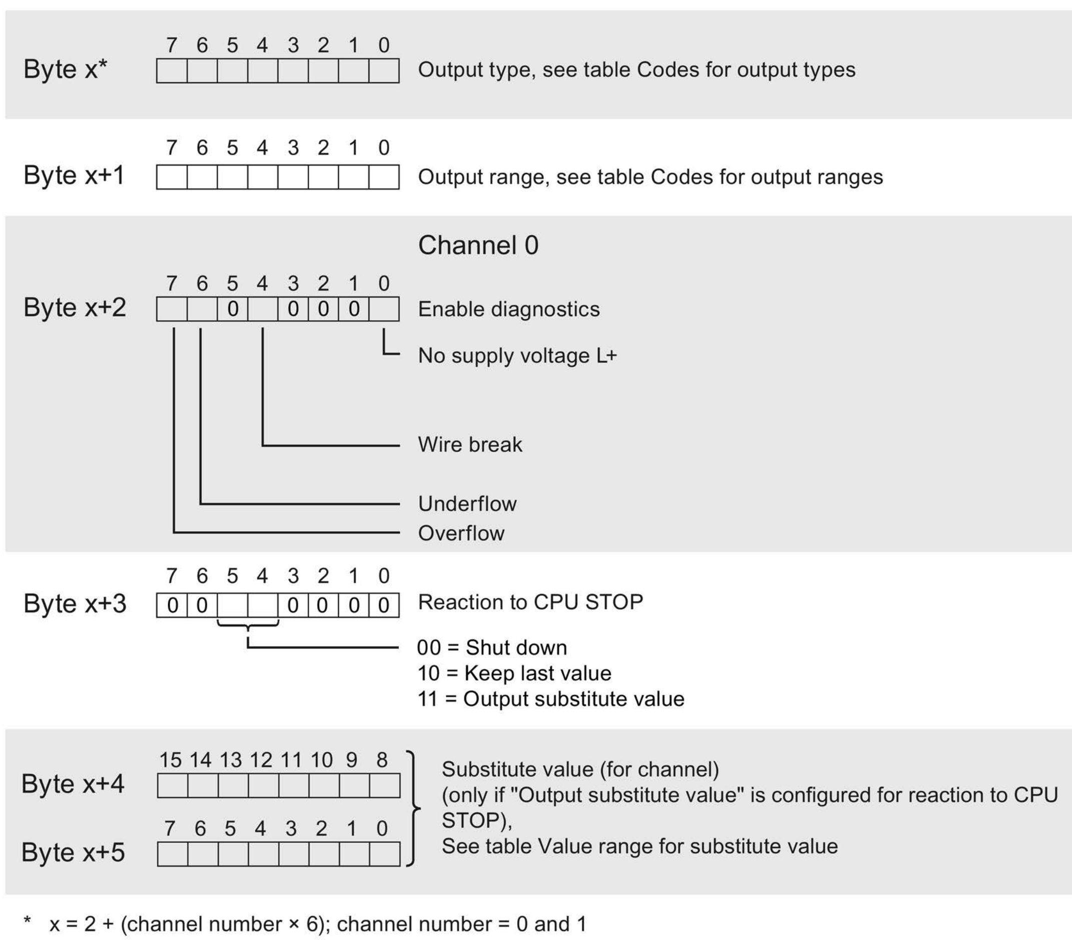

Image A-3 Structure of bytes x to x+5 for channels 0 and 1

Codes for output types

The following table contains the codes for the output types of the analog output module. You enter this coding in byte x (see previous figure).

Table A- 1 Codes for output types

Output type	Code
Deactivated	0000 0000
Current	0000 0011

Codes for output ranges

The following table contains the codes for the output ranges of the analog output module. You enter these codes in byte x+1 of data record 128 (see previous figure).

Table A- 2 Codes for output ranges

Output range	Code
Current	
±20 mA	0000 0000
0 mA to 20 mA	0000 0001
4 mA to 20 mA	0000 0010

Value range for substitute value

The following table contains the value ranges for the substitute values. You must enter the corresponding codes in bytes x+4 and x+5 (see previous figure).

Output range	Permissible value range
Current	
±20 mA	-29031 to 29030
0 mA to 20 mA	0 to 29030
4 to 20 mA	-692 to 29376

Error transmitting the data record

The module always checks all values of the transmitted data record. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error codes if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine if the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	I0	xx	Incorrect version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	I1	xx	Parameter error	Check the parameters of the module.

Representation of analog values B

B.1 Representation of analog values

This appendix describes the analog values for all output ranges supported by the AQ 2xI ST analog module.

Measured value resolution

The digitized analog value is the same for all output values at the same nominal range. Analog values are output as fixed point numbers in two's complement.

In the following table, you will find the representation of the binary analog values and the associated decimal or hexadecimal units of the analog values.

The resolutions 15 and 16 bits including sign are shown. Each analog value is entered left aligned into the ACCU. The bits marked with "x" are set to "0".

Table B- 1 Possible resolutions of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.2 Representation of output ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar range output ranges. The resolution is 16 bits.

Table B- 2 Bipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥32512	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
≤ -32513	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	Minimum output value

Table B- 3 Unipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥32512	117.589	0	1	1	1	1	1	1	1	x	x	x	x	x	x	x	x	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
≤ 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Minimum output value

B.3 Representation of analog values in the current output ranges

The tables below list the decimal and hexadecimal values (codes) of the possible current output ranges.

Table B- 4 Current output range ±20 mA

Values			Current output range	Range
	Dec.	Hex.	±20 mA	
118.5149%	32767	7FFF	21 mA	Overflow*
	29031	7167		
105%	29030	7166	21 mA	Overrange
	27649	6C01	20 mA + 723.4 nA	
100%	27648	6C00	20 mA	Nominal range
75%	20736	5100	15 mA	
0.003617%	1	1	723.4 nA	
0%	0	0	0 mA	
	-1	FFFF	-723.4 nA	
-75%	-20736	AF00	-15 mA	
-100%	-27648	9400	-20 mA	
	-27649	93FF	-20 mA + 723.4 nA	Underrange

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

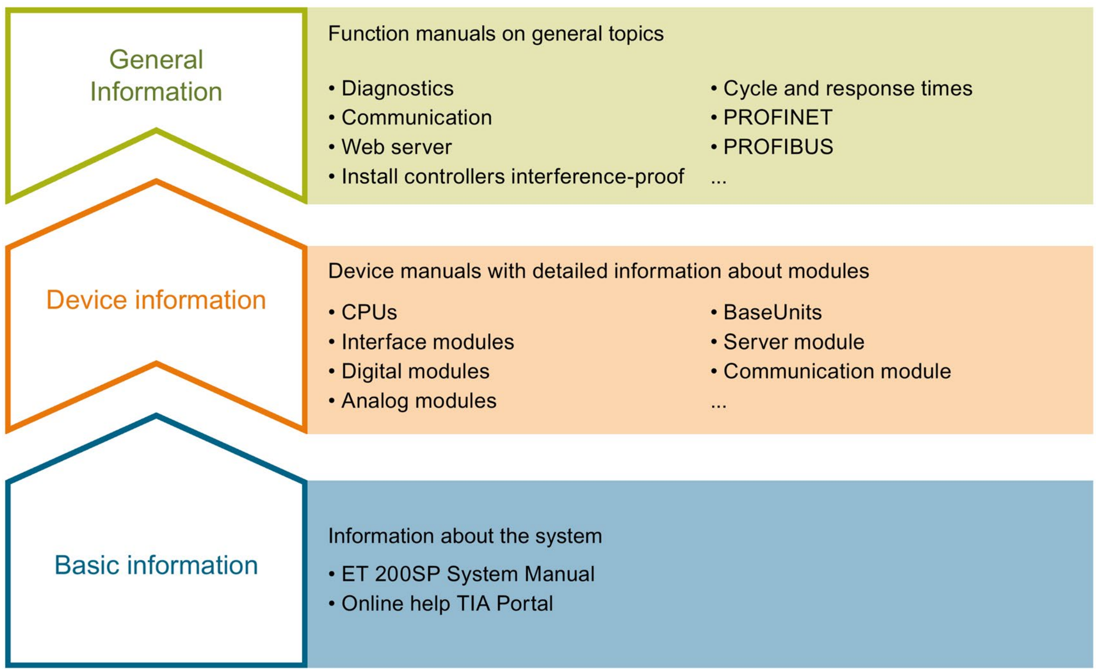
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

2 Product overview

⑪ Article number

Image 2-1 View of the module AQ 2×U ST

Properties

The module has the following technical properties:

- Analog output module with 2 outputs
  - for voltage output
- Output range for voltage output:
  - ±10 V, resolution 16 bits including sign
  - ±5 V, resolution 15 bits including sign
  - 0 to 10 V, resolution 15 bits
  - 1 to 5 V, resolution 13 bits
- Electrically isolated from supply voltage L+
- Configurable diagnostics (per module)

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy
- Value status

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Wiring 3

3.1 Wiring and block diagram

This section includes the block diagram of the AQ 2xU ST module with the terminal assignments for a 2-wire connection.

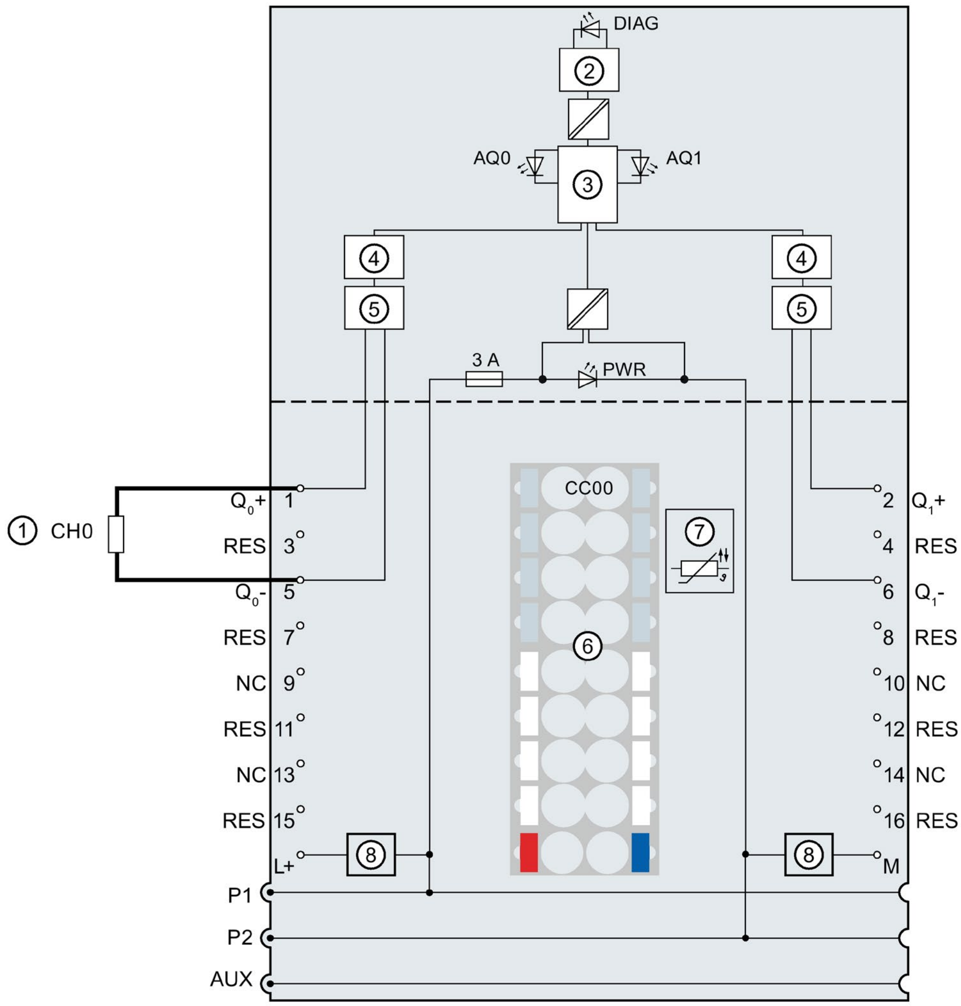
You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Wiring: Voltage output 2-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog output module AQ 2xU ST on the BaseUnit BU type A0/A1.



①	2-wire connection for voltage output	Qn+	Analog output voltage positive, channel n
②	Backplane bus interface	Qn-	Analog output voltage negative, channel n
③	Microcontroller	NC	Not connected
④	Digital-to-analog converter (DAC)	RES	Reserve, must remain unused for future function extensions
⑤	Output conditioner	L+	24 V DC (infeed only with light-colored BaseUnit)
⑥	Color-coded label with color code CC00 (optional)	M	Ground
⑦	Temperature recording for BU type A1 only (function cannot be used for this module)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑧	Filter connection supply voltage (only when light-colored BaseUnit is present)	DIAG	Diagnostics LED (green, red)
		AQ0, AQ1	Channel status LED (green)
		PWR	Power LED (green)

Image 3-1 Wiring and block diagram for voltage output 2-wire connection

Parameters/address space 4

4.1 Output ranges

The analog output module AQ 2×U ST has the following output ranges:

Table 4- 1 Output ranges

Output type	Output ranges	Resolution
Voltage	± 10 V	16 bits incl. sign
	± 5 V	15 bits including sign
	0 to 10 V	15 bits
	1 to 5 V	13 bits

The tables of the output ranges, overflow, overrange, etc. can be found in section Representation of analog values (Page 28).

4.2 Parameters

Parameters of the AQ 2xU ST

The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an ET 200SP CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to section Parameter assignment and structure of the parameter data record (Page 24).
The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics Short-circuit to ground[1]	• Disable • Enable	Disable	Yes	Module	Module
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Module	Module [2]
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Module	

Parameters	Range of values	Default	Parameter reassignment in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Output type/range	• Deactivated • Voltage +/- 10 V • Voltage +/- 5 V • Voltage 0..10 V • Voltage 1..5 V	Voltage +/- 10 V	Yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value	Turn off	Yes	Channel	Module
Substitute value	For permissible substitute values for the various output ranges, see appendix Parameter assignment and structure of the parameter data record (Page 24), Substitute values → Codes for substitute values table	0	Yes	Channel	Channel
Potential group	• Use potential group of the left module (module plugged into a dark-colored BaseUnit) • Enable new potential group (module plugged into light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] No diagnostics detection between -0.5 V and +0.5 V (no short-circuit detection)

[2] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 7 bytes.

Note

Unused channels

A deactivated channel always returns the value "no voltage".

4.3 Explanation of the parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Diagnostics: Overflow

Enabling of the diagnostics when the output value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the output value exceeds the overrange, falls below the minimum output value or reaches underflow.

Output type / output range

See section Output ranges (Page 13)

Reaction to CPU STOP

Determines the behavior of the module at CPU STOP.

Substitute value

The substitute value is the value that the module outputs in case of a CPU STOP.

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station, which are supplied via a common supply voltage.

A potential group begins with a light-colored BaseUnit through which the required voltage is supplied for all modules of the potential group. The light-colored BaseUnit interrupts the three self-assembling voltage buses P1, P2 and AUX to the left neighbor.

All additional I/O modules of this potential group are plugged into dark-colored BaseUnits. You take the potential of the self-assembling voltage buses P1, P2 and AUX from the left neighbor.

A potential group ends with the dark-colored BaseUnit, which follows a light-colored BaseUnit or server module in the station configuration.

See also

You can find additional information in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 and 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: There are no errors on the module.

Bit = 0: Channel is deactivated or there is a fault on the module.

If a fault occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AQ 2×U ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

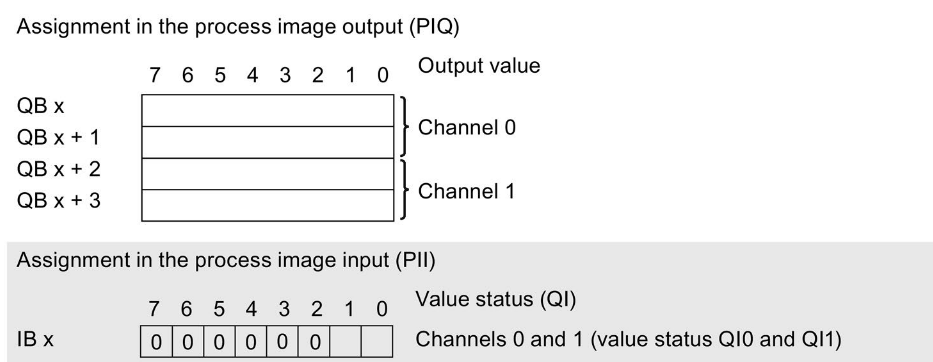


Image 4-1 Address space of the AQ 2×U ST with value status

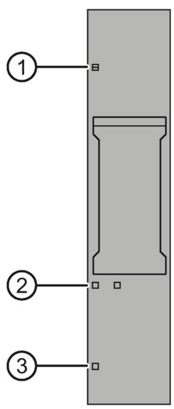
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The following figure shows you the LED display of the AQ 2xU ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Image 5-1 LED display

Meaning of the LEDs

The following tables show the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 19).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
Off	Channel disabled
On	Channel activated

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Missing supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The AQ 2×U ST analog output module supports diagnostics interrupts.

Diagnostics interrupts

The module generates a diagnostic interrupt at the following events:

- Short-circuit (voltage)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- Supply voltage missing
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is generated and the DIAG-LED flashes on the module for each diagnostics event. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and corrective measures

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit	1_H	Short-circuit of the actuator supply	Correct the process wiring
High limit violated	7_H	The output value specified by the user program exceeds the overrange.	Correct the output value
Low limit violated	8_H	The output value specified by the user program is below the underrange.	Correct the output value
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update • Restart the firmware update

0 to 10 V	Yes; 15 bits
1 V to 5 V	Yes; 13 bits
-5 V to +5 V	Yes; 15 bits including sign
-10 V to +10 V	Yes; 16 bits incl. sign
Connection of actuators	
for voltage output two-wire connection	Yes
for voltage output four-wire connection	No
Load resistance (in nominal range of the output)	
For voltage outputs, min.	2 kΩ
For voltage outputs, capacitive load, max.	1 µF
Destruction limit for externally applied voltages and currents	
Voltages at the outputs	30 V
Cable length	
Shielded, max.	200 m
Analog value generation for the outputs	
Oscillation time	
For resistive load	0.1 ms
For capacitive load	1 ms
Errors/accuracies	
Linearity error (in relation to output range), (+/-)	0.03%
Temperature error (in relation to output range), (+/-)	0.005%/K
Crosstalk between outputs, min.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to output range), (+/-)	0.05%
Operational limit in the entire temperature range	
Voltage in relation to output range, (+/-)	0.5%
Current in relation to output range, (+/-)	0.5%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to output range, (+/-)	0.3%
Current in relation to output range, (+/-)	0.3%
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	No
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes

	6ES7135-6FB00-0BA1
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of the supply voltage	Yes
Short-circuit	Yes
Group error	Yes
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of the supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	No
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and backplane bus	Yes
Between the channels and voltage supply of the electronics	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic isolation)
Isolation	
Isolation tested with	707 V DC (type test)
Environmental conditions	
Ambient temperature in operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the output type and output range for PROFINET.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow		
Deactivated		*	*	*	*	*	*
Voltage	±10 V	x	x	x	x	x	x
	±5 V	x	x	x	x	x	x
	0 V to 10 V	x	x	x	x	x	x
	1 V to 5 V	x	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the output type and output range for PROFIBUS.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow		
Deactivated		*	*	*	*	*	*
Voltage	±10 V	x	x	x	x	x	x
	±5 V	x	x	x	x	x	x
	0 V to 10 V	x	x	x	x	x	x
	1 V to 5 V	x	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

You can reassign the module parameters in RUN. For example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 includes the diagnostics enable for the entire module.

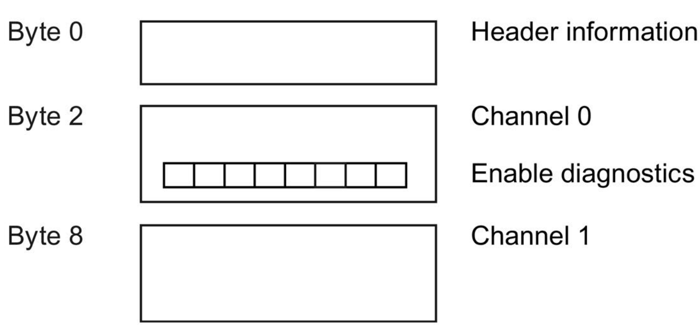

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

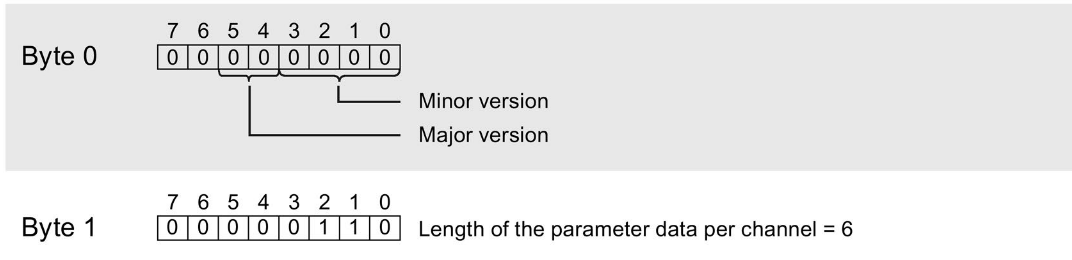

Image A-2 Header information

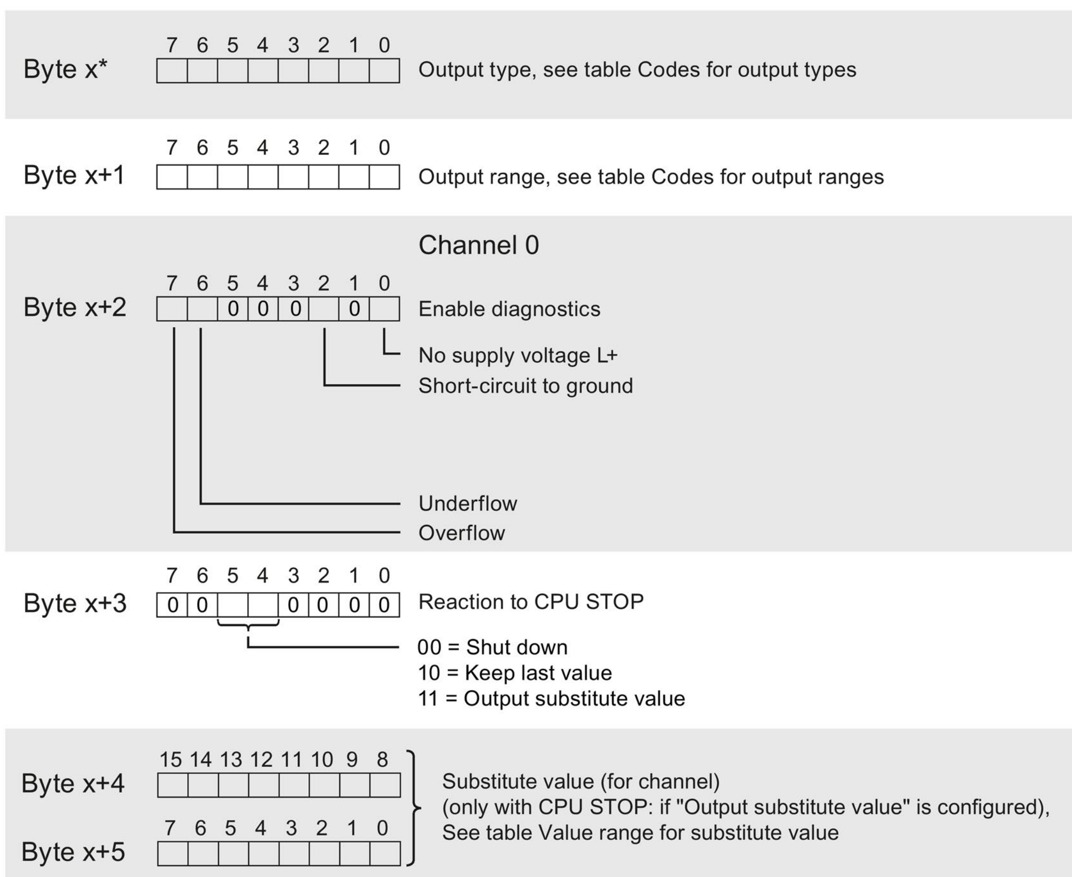
Parameters

The following figure shows the structure of the parameters for channels 0 and 1.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 6); channel number = 0 and 1

Image A-3 Structure of bytes x to x+5 for channels 0 and 1

Codes for output types

The following table contains the codes for the output types of the analog output module. You enter this coding in byte x (see previous figure).

Table A- 1 Codes for output types

Output type	Code
Deactivated	0000 0000
Voltage	0000 0001

Codes for output ranges

The following table contains the codes for the output ranges of the analog output module. You enter these codes in byte x+1 of data record 128 (see previous figure).

Table A- 2 Codes for output ranges

Output range	Code
Voltage	
±10 V	0000 0000
±5 V	0000 0001
0 to 10 V	0000 0010
1 to 5 V	0000 0011

Value range for substitute value

The following table contains the value ranges for the substitute values. You must enter the corresponding codes in bytes x+4 and x+5 (see previous figure).

Output range	Permissible value range
Voltage	
±10 V	-32512 to 32511
±5 V	-32512 to 32511
0 to 10 V	0 to 32511
1 to 5 V	-6912 to 32511

Error transmitting the data record

The module always checks all values of the transmitted data record. The module applies the values from the data record only when all values have been transmitted without errors.

The WRREC instruction for writing data records returns the appropriate error codes if there are errors in the STATUS parameter.

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Error code in the STATUS parameter (hexadecimal)				Meaning	Solution
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	xx	Number of the data record unknown	Enter valid number for data record.
DF	80	B1	xx	Length of the data record incorrect	Enter valid value for data record length.
DF	80	B2	xx	Slot invalid or unavailable	• Check the station to determine if the module is plugged in or pulled. • Check assigned values for the parameters of the WREC instruction.
DF	80	I0	xx	Incorrect version or error in the header information	Correct the version, length and number of parameter blocks.
DF	80	I1	xx	Parameter error	Check the parameters of the module.

Representation of analog values

B

B.1 Representation of analog values

This appendix describes the analog values for all output ranges supported by the AQ 2xU ST analog module.

Measured value resolution

The digitized analog value is the same for all output values at the same nominal range. Analog values are output as fixed point numbers in two's complement.

In the following table, you will find the representation of the binary analog values and the associated decimal or hexadecimal units of the analog values.

The resolutions 13, 14, 15 and 16 bits including sign are shown. Each analog value is entered left aligned into the ACCU. The bits marked with "x" are set to "0".

Table B- 1 Possible resolutions of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
13	8	8_H	Sign 0 0 0 0 0 0 0	0 0 0 0 1 x x x
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.2 Representation of output ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar range output ranges. The resolution is 16 bits.

Table B- 2 Bipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
≥32512	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
≤ -32513	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	Minimum output value

Table B- 3 Unipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	
≥32512	117.589	0	1	1	1	1	1	1	1	x	x	x	x	x	x	x	x	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
≤ 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Minimum output value

B.3 Representation of analog values in the voltage output ranges

The tables below list the decimal and hexadecimal values (codes) of the possible voltage output ranges.

Table B- 4 Voltage output ranges ±10 V and ±5 V

Values			Voltage output range		Range
	Dec.	Hex.	±10 V	±5 V	
118.5149%	32767	7FFF	11.76 V	5.88 V	Overflow*
	32512	7F00

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens’ products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens’ guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

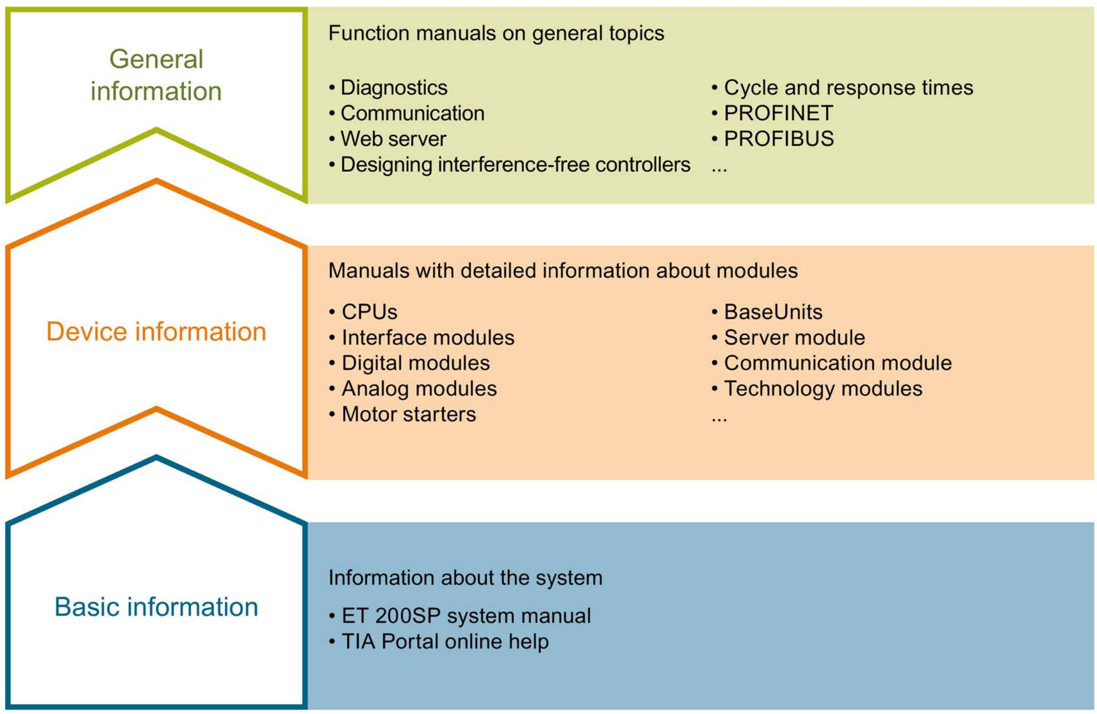
Siemens’ products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer’s exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Table of contents

1 Documentation Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Figure 2-1 View of the AQ 2×U/I HS module

Properties

The module has the following technical properties:

- Analog output module with 2 outputs
  - For current output and
  - Voltage output
- Output ranges for current output:
  - ±20 mA, resolution 16 bit including sign
  - 0 to 20 mA, resolution 15 bit
  - 4 to 20 mA, resolution 14 bit
- Output ranges for voltage output:
  - ±10 V, resolution 16 bit including sign
  - ±5 V, resolution 15 bit incl. sign
  - 0 to 10 V, resolution 15 bit
  - 1 to 5 V, resolution 13 bit
- Electrically isolated from supply voltage L+
- Configurable diagnostics (per channel)

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN
- PROFIenergy

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Basic version	1	V1.0.0
Isochronous mode with send clock up to 250 µs	2	V1.1.0
Value status	2	V1.1.0
Oversampling channel 0	2	V1.1.0
Oversampling channel 0 and 1	2	V2.0.0
Isochronous mode with send clock up to 125 µs	2	V2.0.1

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

Connecting 3

3.1 Wiring and block diagram

This section includes the block diagram of the module with the AQ 2xU/I HS pin assignments for a 2-wire, 3-wire and 4-wire connection for voltage output.

The 3-wire and 4-wire connection are used for the compensation of the voltage drop on the connection cables.

You can find information on wiring the BaseUnit in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Note

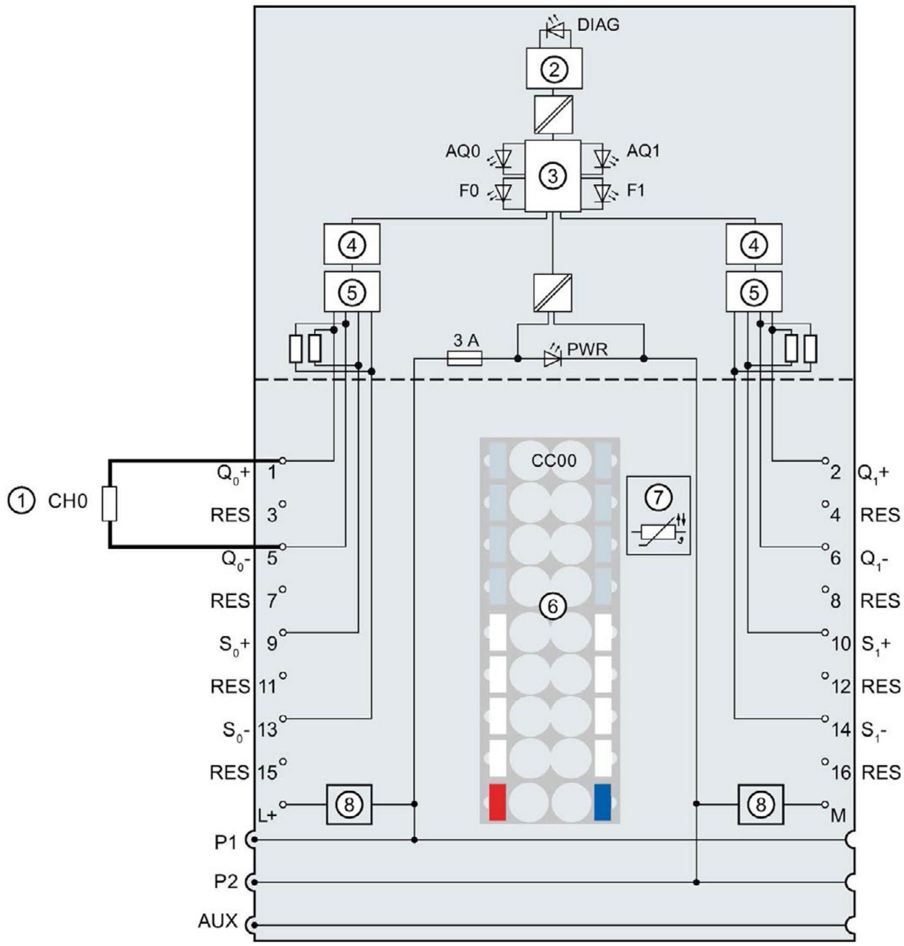
You may use and combine the different wiring options for all channels.

Note

The load group of the module must begin with a light-colored BaseUnit. Keep this in mind also during the configuration.

Connection: Current output 2-wire connection

The figure below shows the block diagram and an example of the terminal assignment of the analog output module AQ 2xU/I HS on the BaseUnit BU type A0/A1.

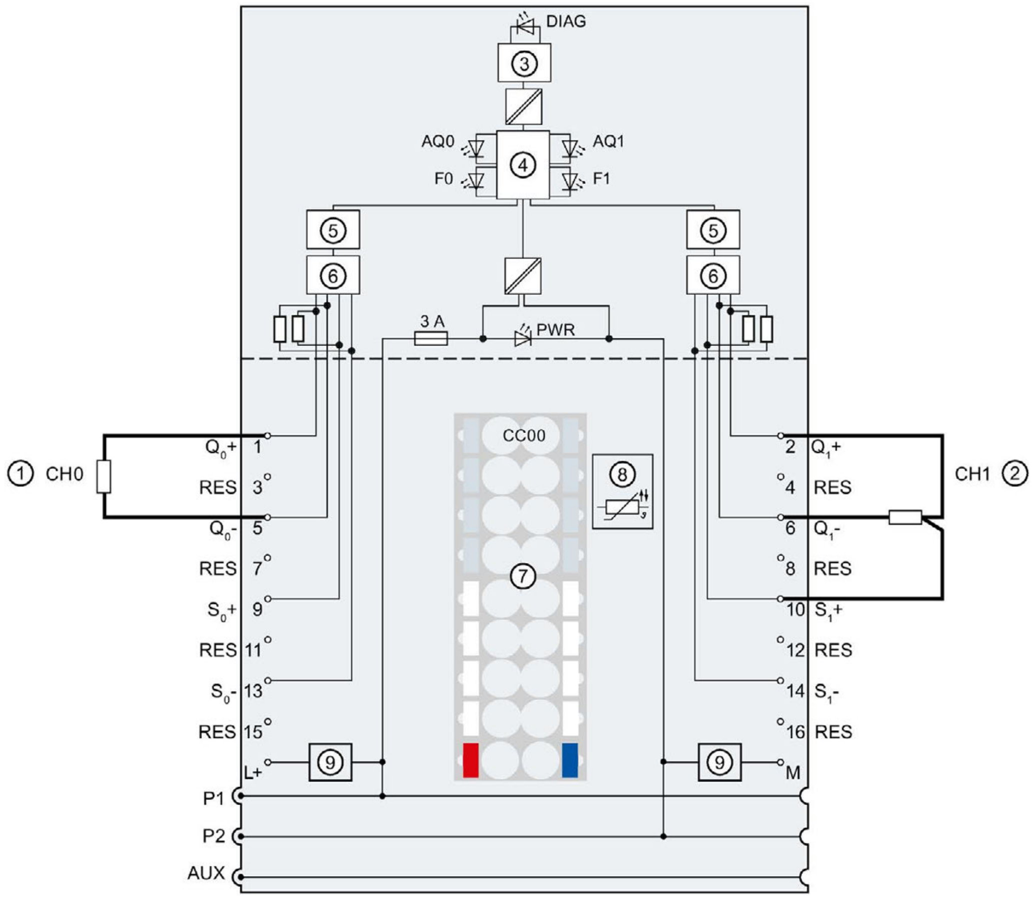


①	2-wire connection for current output	S_n+	Sensor cable positive, channel n
②	Backplane bus interface	S_n-	Sensor cable negative, channel n
③	Microcontroller	RES	Reserve, must remain unused for future function extensions
④	Digital-to-analog converter (DAC)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Output conditioner	M	Ground
⑥	Color identification label CCxx (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑦	Temperature recording for BU type A1 only (function cannot be used for this module)	DIAG	Diagnostics LED (green, red)
⑧	Filter connection supply voltage (only when light-colored BaseUnit is present)	AQ0, AQ1	Channel status LED (green)
Q_n+	Analog output voltage/current positive, channel n	F0, F1	Channel fault LED (red)
Q_n-	Analog output voltage/current negative, channel n	PWR	Power LED (green)

Figure 3-1 Wiring and block diagram for current output 2-wire connection

Connection: Voltage output 2-wire and 3-wire connection

The following figure shows the block diagram and an example of the terminal assignment of the analog output module AQ 2xU/I HSon the BaseUnit BU type A0/A1.

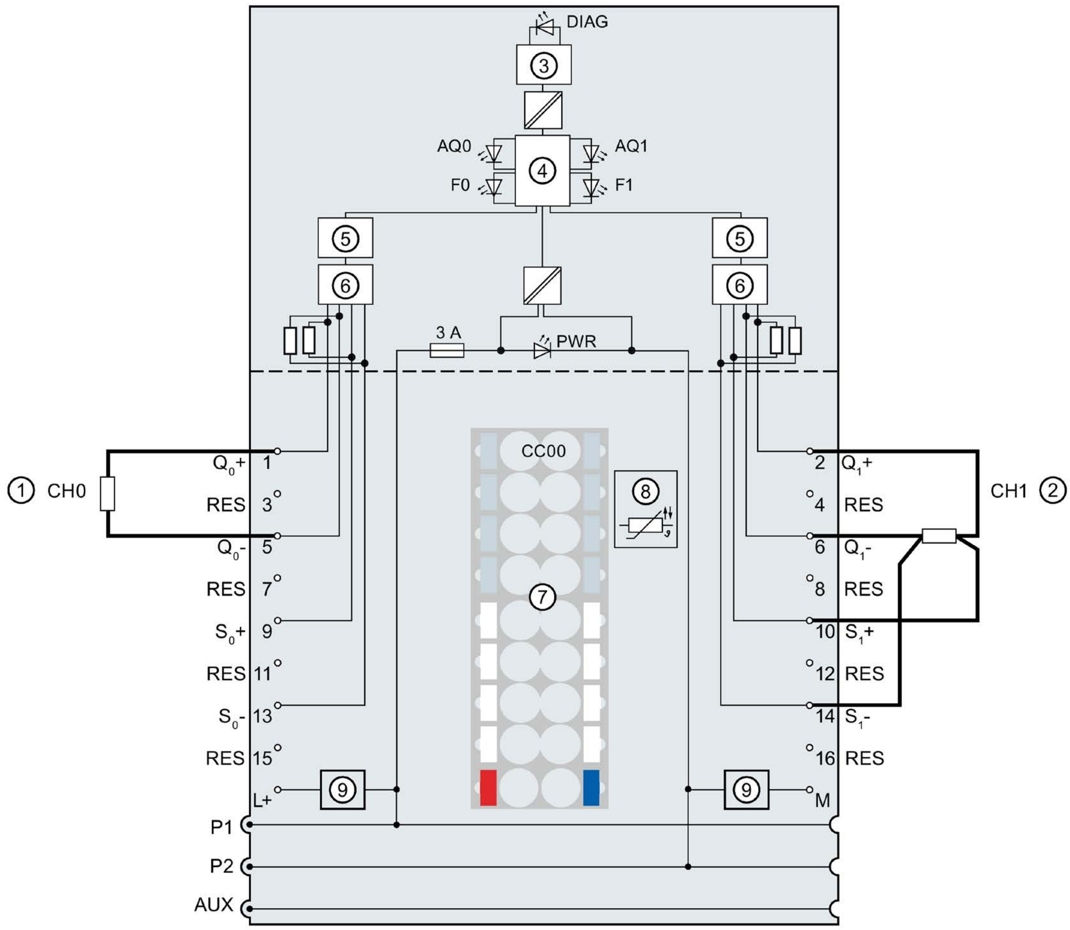


①	2-wire connection for voltage output	S_n+	Sensor cable positive, channel n
②	3-wire connection for voltage output	S_n-	Sensor cable negative, channel n
③	Output conditioner	RES	Reserve, must remain unused for future function extensions
④	Digital-to-analog converter (DAC)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Microcontroller	M	Ground
⑥	Backplane bus interface	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored Ba-seUnit)
⑦	Color identification label CCxx (optional)	DIAG	Diagnostics LED (green, red)
⑧	Temperature recording for BU type A1 only (func-tion cannot be used for this module)	AQ0, AQ1	Channel status LED (green)
⑨	Filter connection supply voltage (only when light-colored BaseUnit is present)	F0, F1	Channel fault LED (red)
Q_n+	Analog output voltage/current positive, channel n	PWR	Power LED (green)
Q_n-	Analog output voltage/current negative, channel n		

Figure 3-2 Wiring and block diagram for voltage output 2-wire and 3-wire connection

Connection: Voltage output 2-wire and 4-wire connection

The figure below shows the block diagram and an example of the terminal assignment of the analog output module AQ 2xU/I HS on the BaseUnit BU type A0/A1.



①	2-wire connection for voltage output	S_n+	Sensor cable positive, channel n
②	4-wire connection for voltage output	S_n-	Sensor cable negative, channel n
③	Output conditioner	RES	Reserve, must remain unused for future function extensions

Parameters/address space 4

4.1 Output types and output ranges

The analog output module AQ 2×U/I HS has the following output ranges:

Table 4- 1 Output ranges

Output type	Output range	Resolution
Current	±20 mA	16 bit incl. sign
	0 to 20 mA	15 bit
	4 to 20 mA	14 bit
Voltage	± 10 V	16 bit incl. sign
	± 5 V	15 bit incl. sign
	0 to 10 V	15 bit
	1 to 5 V	13 bit

You will find the tables of output ranges and overflow, overrange, etc. in the section Representation of analog values (Page 43) and the "Analog value processing" function manual.

4.2 Parameters

Parameters of the AQ 2×U/I HS

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Central operation on an ET 200SP oder an einem ET 200SP Open Controller CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

In addition to assigning parameters with the configuration software, you can also set the parameters in RUN mode (dynamically) using the user program. When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module by means of data records; see section Parameter assignment and structure of parameter data record (Page 38).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Sampling rate	1 value/cycle	1 value/cycle	No	Module	Module
Diagnostics: No supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground [1]	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Overflow	• Disable • Enable	Disable	Yes	Channel	Channel [3]
Diagnostics: Underflow	• Disable • Enable	Disable	Yes	Channel	
Diagnostics: Wire break[2]	• Disable • Enable	Disable	Yes	Channel	Channel
Output type/range	• Deactivated • Voltage +/- 10 V • Voltage +/- 5 V • Voltage 0 to 10 V • Voltage 1 to 5 V • Current +/- 20 mA • Current 0 to 20 mA • Current 4 to 20 mA	Current 4 to 20 mA	Yes	Channel	Channel

Parameter	Value range	Default	Reconfiguration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Reaction to CPU STOP	• Shut down • Keep last value • Output substitute value	Shut down	Yes	Channel	Module [3]
Substitute value	For permissible substitute values for the various output ranges, see Parameter assignment and structure of the parameter data record (Page 38) appendix, Substitute values → Codes for substitute values table	0	Yes	Channel	Channel
Potential group	• Use potential group of the left module (dark-colored BaseUnit) • Enable new potential group (light-colored BaseUnit)	Use potential group of the left module	No	Module	Module

[1] No diagnostics detection between -0.5 V and +0.5 V (no short-circuit detection)

[2] No diagnostics detection between -3 mA and +3 mA (no wire break detection)

[3] Due to the limited number of parameters of a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the parameter assignment options are restricted. If required, you can still assign these parameters using the data record 128 as described in the column "GSD file PROFINET IO" (see table above). The parameter length of the I/O module is 7 bytes.

Note

Unused channels

A deactivated channel always returns the value "no current or voltage".

4.3 Description of parameters

Diagnostics: No supply voltage L+

Enabling of the diagnostics alarm for missing or insufficient supply voltage L+.

Diagnostics: Short-circuit to ground

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Diagnostics: Overflow

Enabling of the diagnostics when the output value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the output value falls below the underrange or reaches the minimum output value or underflow.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Output type/output range

See the section Output types and output ranges (Page 18).

Reaction to CPU STOP

Determines the behavior of the module at CPU STOP.

Substitute value

The substitute values are values issued by the outputs (the output) in the event of a CPU STOP.

Potential group

You can use the "Potential group" parameter to specify whether the module is inserted in a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the dark-colored BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

(http://support.automation.siemens.com/WW/view/en/58649293)

4.4 Oversampling

Function

Oversampling is the output of data in constant bus cycle segments (sub-cycles), whereby n sub-cycles correspond to one PROFINET bus cycle. A data packet is transmitted from the controller to the module, which outputs the packet in n constant bus sub-cycles.

Oversampling is useful whenever you require output of data with high time resolution but without using an extremely short PROFINET bus cycle and thus fast CPU cycles.

With oversampling, a PROFINET bus cycle is divided into constant bus sub-cycles:

- Each sub-cycle returns an output value.
- The minimum PROFINET bus cycle for oversampling is 250 μs.
- You can configure oversampling for:
  - Channel 0 (1-channel operation)
  - Channel 0/1 (2-channel operation)
- The number of sub-cycles can be set as follows:
  - From 2 to 16 for one channel
  - From 2 to 8 for two channels

Requirement

Oversampling is only possible when isochronous mode is set.

Configuration

You configure oversampling with the following parameter:

- Sampling rate

Note

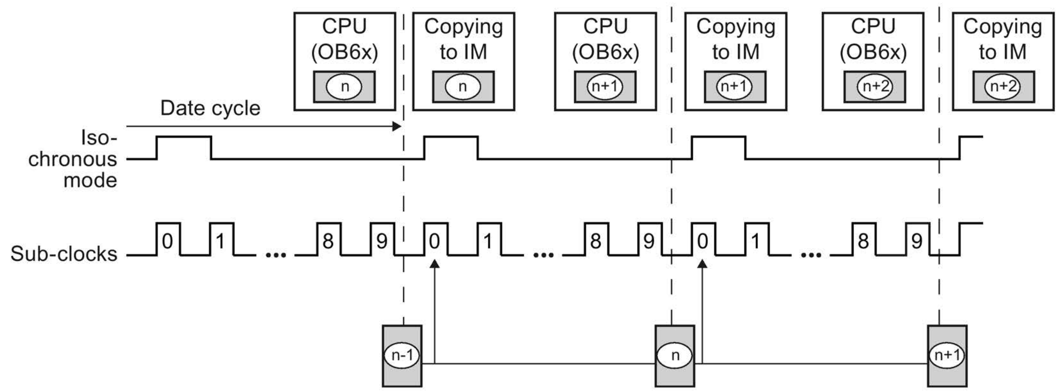
Do not use a reduction ratio for blocks in the case of configuration with oversampling in the runtime groups of your user program. This will ensure that the data processing in the user program of the CPU is synchronized with the acquisition on the module.

Overview of the operating modes

Function	Normal operation	Oversampling in normal operation	
		1-channel operation	2-channel operation
Isochronous mode	Yes, optional	Yes, required	
• Shortest send clock	125 µs	250 µs	
Oversampling	No	Yes	Yes
• Number of over-sampling levels (output rate)	-	2 to 16	2 to 8
• Shortest sub-cycle (= shortest sampling time)	-	35 µs	45 µs
±10 V	x	x	
0 to 10 V	x	x	
±5 V	x	x	
1 to 5 V	x	x	
±20 mA	x	x	
0 to 20 mA	x	x	
4 to 20 mA	x	x	
Overflow	x	x	
Underflow	x	x	
Wire break for current	x	x	
Short-circuit for voltage	x	x	
Load voltage diagnostics	x	x	
Value status (QI)	x	-	
Reaction to CPU STOP	x	x	
Data length	4 bytes	32 bytes	

Chronological sequence

The figure shows the chronological sequence for oversampling. The output data present in the CPU is output in the data cycle after the next one, distributed across the sub-cycles which are generated on the actual module.



① n = output values from bus cycle n

Figure 4-1 Oversampling

4.5 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the analog module. Bit 0 and 1 in this byte are assigned to the module. They provide information about the validity of the analog value.

Bit =1: No fault is present on the channel.

Bit =0: The wiring, the value created on the channel, or similar is incorrect.

Address space

The following figure shows the assignment of the address space for the AQ 2xU/I HS with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

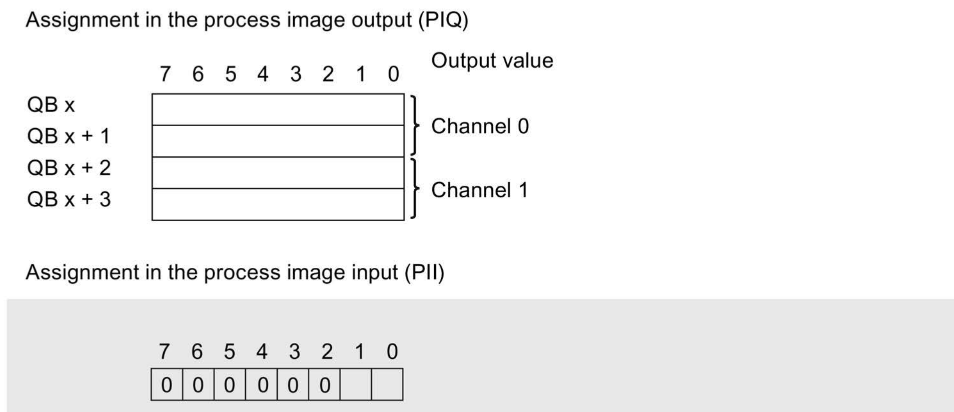


Figure 4-2 Address space of the AQ 2xU/I HS with value status

Address space of the AQ 2xU/I HS for oversampling with one channel

The following figure shows the assignment of the address space for oversampling with one channel. Writing always starts from QB x. Only a maximum of 16 sub-cycles are possible.

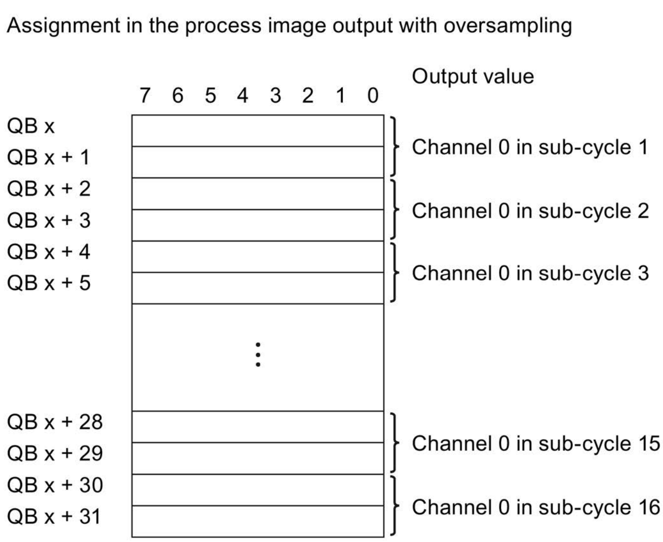

Figure 4-3 Address space of the AQ 2xU/I HS for oversampling with one channel

Address space of the AQ 2xU/I HS for oversampling with two channels

The following figure shows the assignment of the address space for oversampling with two channels. Writing always starts from QB x. Only a maximum of 8 sub-cycles are possible.

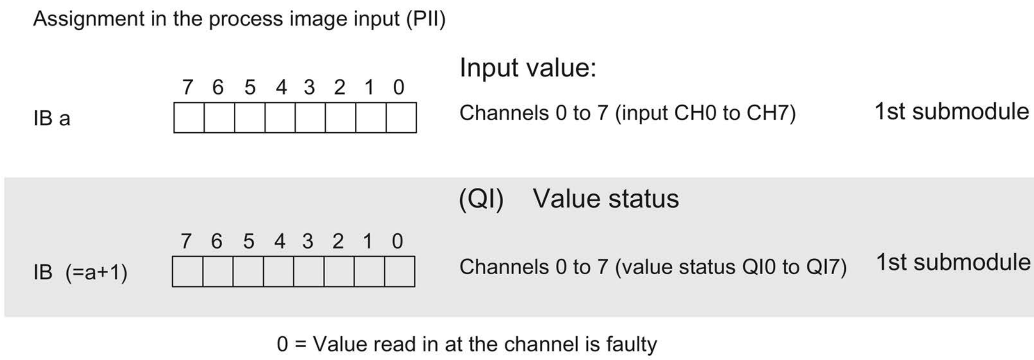

Figure 4-4 Address space of the AQ 2xU/I HS for oversampling with two channels

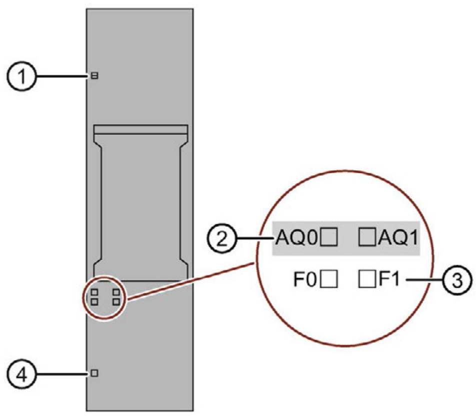
Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED display

The figure below shows the LED displays of the AQ 2×U/I HS.



① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 5-1 LED displays

Meaning of the LEDs

The following table contains the meaning of the status and error displays. Corrective measures for diagnostics alarms can be found in section Diagnostics alarms (Page 30).

DIAG LED

Table 5- 1 Error display of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status/channel fault LED

Table 5- 2 Status/error display of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Channel deactivated or no load voltage L+
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (error)

PWR LED

Table 5- 3 Status display of the PWR LED

PWR	Meaning
Off	No supply voltage L+
On	Supply voltage L+ present

5.2 Interrupts

The analog output module AQ 2×U/I HS supports diagnostics interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt at the following events:

- Short-circuit
- Overtemperature
- Wire break
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- No load voltage
- Channel temporarily unavailable

5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED flashes on the module. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program

Table 5- 4 Error types

Diagnostics alarm	Error code	Meaning	Solution
Short-circuit (current)	1_H	Short-circuit of the actuator supply	Correct the process wiring
Overtemperature	4_H	Thermal overload of the I/O module	Reduce the ambient temperature, pay attention to derating
Wire break (current)	6_H	Impedance of actuator circuit too high	Use a different actuator type or modify the wiring, for example, using cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Deactivate the channel ("Output type" parameter) • Deactivate diagnostics • Connect the channel
High limit violated	7_H	The output value defined by the user program is above the overrange.	Correct the output value
Low limit violated	8_H	The output value defined by the user program is below the underrange.	Correct the output value
Error	9_H	Internal module error occurred	Replace the module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type
Channel temporarily unavailable	$1F_H$	Firmware update is currently in progress or has been canceled. The module does not output any process or substitute values in this state.	• Wait for firmware update • Restart the firmware update

Technical specifications 6

6.1 Technical specifications

Technical specifications of the AQ 2×U/I HS

	6ES7135-6HB00-0DA1
Product type designation	ET 200SP, AQ 2xU/I High Speed
General information	
Firmware version	V2.0.1
Usable BaseUnits	BU type A0, A1
Color code for module-specific color identification label	CC00
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
Operating mode	
Oversampling	Yes; 2 channels per module
CiR Configuration in RUN	
Reconfiguration in RUN possible	Yes
Calibration in RUN possible	Yes
Supply voltage	
Rated value (DC)	24 V
Valid range, low limit (DC)	19.2 V
Valid range, high limit (DC)	28.8 V
Input current	
Current consumption (rated value)	45 mA; no load
Power loss	
Power loss, typ.	0.9 W
Address area	
Address space per module	
Address space per module, max.	4 byte; + 1 byte for QI information (32 bytes in oversampling mode)

	6ES7135-6HB00-0DA1
Analog outputs	
Number of analog outputs	2
Voltage output, short-circuit protection	Yes
Voltage output, short-circuit current, max.	45 mA
Cycle time (all channels), min.	125 µs
Analog output with oversampling	Yes
• Values per cycle, max.	16
• Resolution, min.	45 µs; (2 channels), 35 µs (1 channel)
Output ranges, voltage	
0 to 10 V	Yes; 15 bit
1 V to 5 V	Yes; 13 bit
-5 V to +5 V	Yes; 15 bit incl. sign
-10 V to +10 V	Yes; 16 bit incl. sign
Output ranges, current	
0 to 20 mA	Yes; 15 bit
-20 mA to +20 mA	Yes; 16 bit incl. sign
4 mA to 20 mA	Yes; 14 bit
Wiring the actuators	
for voltage output two-wire connection	Yes
for voltage output four-wire connection	Yes
for current output two-wire connection	Yes
Load resistance (in rated range of the output)	
For voltage outputs, min.	2 kΩ
For voltage outputs, capacitive load, max.	1 µF
For current outputs, max.	500 Ω
For current outputs, inductive load, max.	1 mH
Destruction limit for externally applied voltages and currents	
Voltages at the outputs	30 V
Cable length	
Shielded, max.	1000 m; 200 m for voltage output
Formation of analog values for the outputs	
Settling time	
For resistive load	0.05 ms
For capacitive load	0.05 ms; max. 47 nF and 20 m cable length
For inductive load	0.05 ms

	6ES7135-6HB00-0DA1
Errors/accuracies	
Output ripple (in relation to output range, bandwidth 0 kHz to 50 kHz), (+/-)	0.02%
Linearity error (in relation to output range), (+/-)	0.03%
Temperature error (in relation to output range), (+/-)	0.003%/K
Crosstalk between outputs, max.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to output range), (+/-)	0.03%
Operational limit in the entire temperature range	
Voltage in relation to output range, (+/-)	0.2%
Current in relation to output range, (+/-)	0.2%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to output range, (+/-)	0.1%
Current in relation to output range, (+/-)	0.1%
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes
Execution and activation time (TCO), min.	70 μs
Bus cycle time (TDP), min.	125 μs
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	Yes; channel-based, only for output type current
Short-circuit	Yes; channel-based, only for output type voltage
Overflow/underflow	Yes
Diagnostics display LED	
Monitoring of supply voltage (PWR LED)	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Insulation	
Insulation tested with	707 V DC (type test)

	6ES7135-6HB00-0DA1
Ambient conditions	
Ambient temperature during operation	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Output type	Output range	Diagnostics					Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to ground	Overflow	Underflow	Wire break		
Deactivated		*	*	*	*	*	*	*
Voltage	±5 V	x	x	x	x	-	x	x
	±10 V	x	x	x	x	-	x	x
	1 to 5 V	x	x	x	x	-	x	x
	0 to 10 V	x	x	x	x	-	x	x
Current	±20 mA	x	-	x	x	x	x	x
	0 to 20 mA	x	-	x	x	x	x	x
	4 to 20 mA	x	-	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to ground	Overflow/ Underflow	Wire break		
Deactivated		*	*	*	*	*	*
Voltage	±5 V	x	x	x	-	x	x
	±10 V	x	x	x	-	x	x
	1 to 5 V	x	x	x	-	x	x
	0 to 10 V	x	x	x	-	x	x
Current	±20 mA	x	-	x	x	x	x
	0 to 20 mA	x	-	x	x	x	x
	4 to 20 mA	x	-	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

The module can be re-configured in RUN (for example, the voltage or current ranges of selected channels can be changed in RUN without having an effect on the other channels).

Note

Following a firmware update, you need to re-configure the I/O module before you can use the new functions.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means the parameters set in STEP 7 are valid again after a restart.

Note

Changing parameters in RUN

A parameter data record that has content different from the startup parameter assignment results in a brief exit from clocked measuring mode and renewed synchronization with the fieldbus cycle. The slowest channel provides the "internal" measuring cycle.

STATUS output parameter

The module ignores errors that occur during the transfer of parameters with the "WRREC" instruction and continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

The description of the "WRREC" instruction and the error codes is available in the STEP 7 online help.

Structure of data record 128 for entire module

The figure below shows the structure of the channel header information.

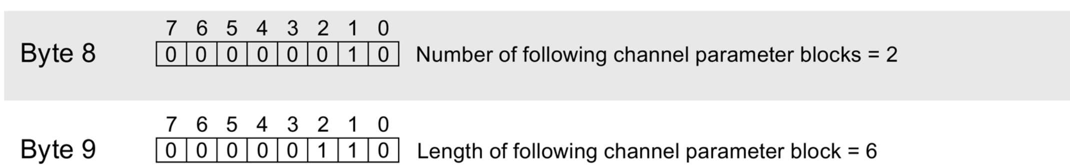

Figure A-5 Channel header information

Channel parameter block

The figure below shows the structure of the channel parameter block.

Enable a parameter by setting the corresponding bit to "1".

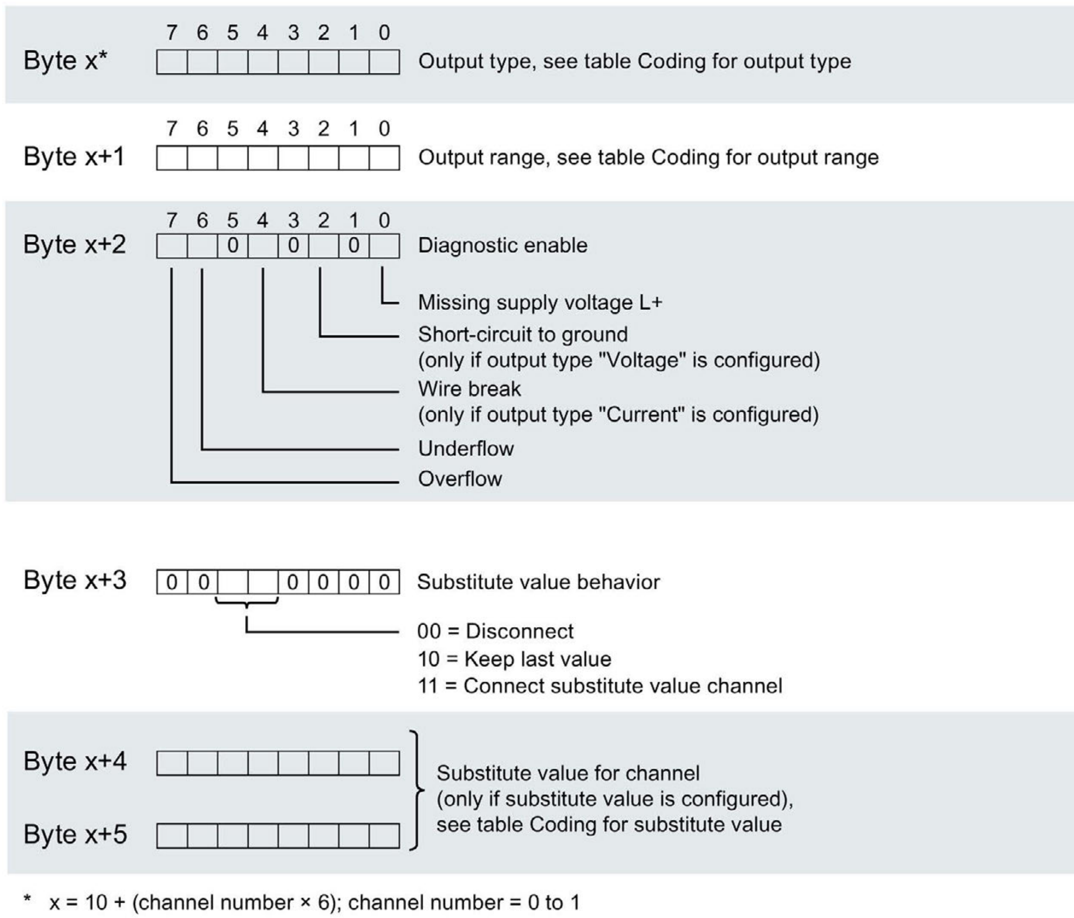

Figure A-6 Structure of byte x to x+5 for channels 0 and 1

Codes for output types

The table below contains the codes for the output types of the analog output module. You must enter these codes in bytes x of the channel parameter block of data record 128 (see previous figure).

Table A- 1 Codes for output types

Output type	Code
Deactivated	0000 0000
Voltage	0000 0001
Current	0000 0011

Codes for output ranges

The table below contains the codes for the output ranges of the analog output module. You must enter these codes in bytes x+1 of the channel parameter block of data record 128 (see previous figure).

Table A- 2 Codes for output ranges

Output range	Code
Voltage	
±10 V	0000 0000
±5 V	0000 0001
0 to 10 V	0000 0010
1 to 5 V	0000 0011
Current	
±20 mA	0000 0000
0 to 20 mA	0000 0001
4 to 20 mA	0000 0010

Codes for substitute values

The table below contains the codes for the substitute values. You must enter these codes in bytes x+4 and x+5 (see previous figure).

Table A- 3 Codes for substitute values

Output range for	Permitted substitute value
Voltage	
±10 V	-32512 ... +32511
±5 V	-32512 ... +32511
0 to 10 V	0 ... +32511
1 to 5 V	-6912 ... +32511
Current	
±20 mA	-29031 ... +29030
0 to 20 mA	0 ... +29030
4 to 20 mA	-692 ... +29030

Representation of analog values B

This appendix describes the analog values for all output ranges supported by the AQ 2xU/I HS analog output module.

Measured value resolution

The digitized analog value is the same for input and output values at the same nominal range. The analog values are represented as a fixed point number in the two's complement.

The following table shows the representation of the binary analog values and the associated decimal and hexadecimal units of the analog values.

The resolutions 13, 14, 15, and 16 bit including sign are displayed. Each analog value is entered in the ACCU left-justified. The bits marked with "x" are set to "0".

Table B- 1 Possible resolutions of the analog values

Resolution in bit	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
13	8	8_H	Sign 0 0 0 0 0 0 0	0 0 0 0 1 x x x
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of output ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar range output ranges. The resolution is 16 bits.

Table B- 2 Bipolar output ranges

Dec. value	**Output value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥32512	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
≤ -32513	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	Minimum output value

Table B- 3 Unipolar output ranges

Dec. value	**Output value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥32512	117.589	0	1	1	1	1	1	1	1	x	x	x	x	x	x	x	x	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
≤ 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Minimum output value

B.2 Representation of analog values in the voltage output ranges

The tables below list the decimal and hexadecimal values (codes) of the possible voltage output ranges.

Table B- 4 Voltage output ranges ±10 V and ±5 V

Values			Voltage output range		Range
	Dec.	Hex.	±10 V	±5 V	
118.515%	32767	7FFF	11.76 V	5.88 V	Overflow*
	32512	7F00			
117.589%	32511	7EFF	11.76 V	5.88 V	Overrange
	27649	6C01			
100%	27648	6C00	10 V	5 V	Nominal range
75%	20736	5100	7.5 V	3.75 V	
0.003617%	1	1	361.7 µV	180.8 µV	
0%	0	0	0 V	0 V

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Guide to documentation 1

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the ET 200SP distributed I/O system consists of a system manual, function manuals and product manuals.

The STEP 7 information system (online help) also supports you during the configuration and programming of your automation system.

Overview of documentation for analog output module AQ 2×U/I HF

The following table shows additional documentation that you need when using the AQ 2×U/I HF analog output module.

Product overview

2

2.1 Properties

Article number

6ES7135-6HB00-0CA1

View of the module

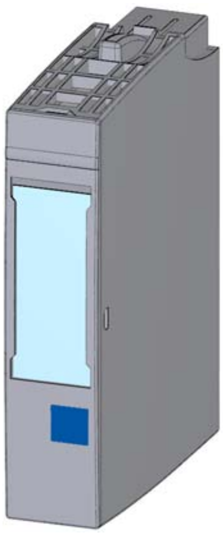

Figure 2-1 View of the module AQ 2×U/I HF

Properties

The module has the following technical properties:

- Analog output module with 2 outputs
- Resolution: Up to 16 bits including sign
- Voltage output can be set for each channel
- Current output can be set for each channel
- Configurable diagnostics for each channel

The module supports the following functions:

- Firmware update
- I&M identification data
- Reconfiguration in RUN
- PROFIenergy
- Calibration in runtime
- Isochronous mode (PROFINET IO only)
- Value status (PROFINET IO only)

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connection

See also

For more information on accessories, refer to the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

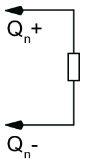
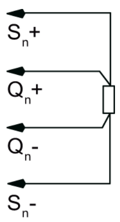
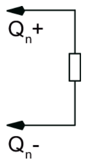
Voltage 2-wire connection



Voltage 4-wire



Current



[1] Usable BaseUnit types, can be identified by the last two digits of the article number. See also "ET 200SP distributed I/O system" system manual.

Note

The first BaseUnit of a station must be a light-colored BaseUnit. Keep this in mind also during the configuration.

3.2 Block diagram

Block diagram

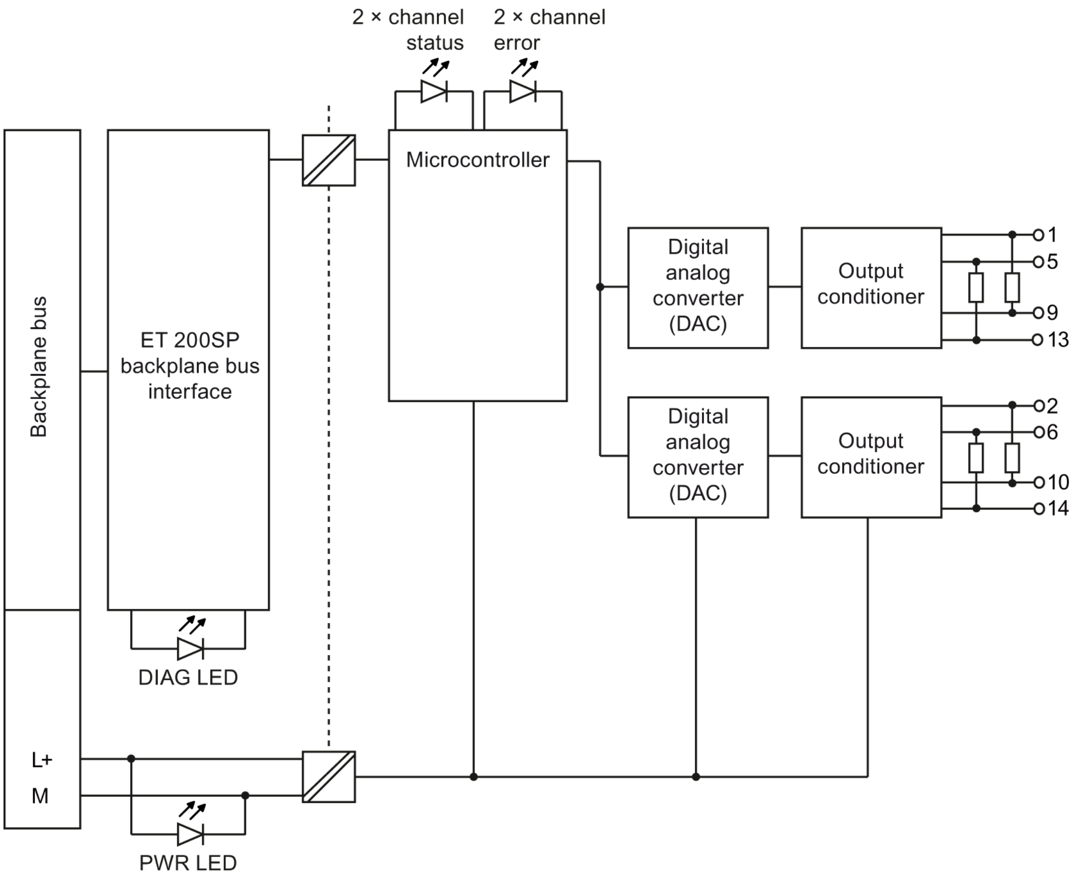

Figure 3-1 Block diagram of AQ 2xU/I HF

Parameters/address space 4

4.1 Output type and output ranges

The following table shows the output type and the respective output ranges.

Table 4- 1 Output ranges

Output type	Output ranges	Resolution
Current	± 20 mA 0 to 20 mA 4 to 20 mA	16 bit including sign 15 bit 14 bit
Voltage	± 10 V ± 5 V 0 to 10 V 1 to 5 V	16 bit including sign 15 bit including sign 15 bit 13 bit

You can find the tables of output ranges and overflow, overload, etc. in the section Representation of analog values (Page 30) and in the function manual Analog value processing (http://support.automation.siemens.com/WW/view/en/67989094).

4.2 Parameters

Parameters of the AQ 2xU/I HF

The following table lists the configurable parameters. The effective range of the configurable parameters depends on the type of configuration. The following configurations are possible:

- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the WRREC instruction to transfer the parameters to the module by means of data records; refer to the section Parameter assignment and structure of parameter data record (Page 25).

The following parameter settings are possible:

Table 4- 2 Configurable parameters and their defaults (GSD file)

Parameter	Value range	Default	Reconfiguration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [3]
Diagnostics: Missing supply voltage L+	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Short-circuit to ground [1]	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Overflow [3]	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Underflow [3]	• Disable • Enable	Disable	Yes	Channel	Channel
Diagnostics: Wire break [2]	• Disable • Enable	Disable	Yes	Channel	Channel
Output type/range	• Deactivated • Voltage ±10 V • Voltage ±5 V • Voltage 0..10 V • Voltage 1..5 V • Current ±20 mA • Current 0 - 20 mA • Current 4 - 20 mA	Current 4 - 20 mA	Yes	Channel	Channel

Parameter	Value range	Default	Reconfigu-ration in RUN	Scope with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP [3]
Reaction to CPU STOP [3]	• Turn off • Keep last value • Output substitute value	Turn off	Yes	Channel	Module
Substitute value	For permissible substitute values for the various measuring ranges, see device manual AQ 2xU/I HF, Substitute values → Codes for substitute value table	0	Yes	Channel	Channel
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module	Module

1 No diagnostics detection between -0.5 and +0.5 V (no short-circuit detection)

2 No diagnostics detection between -3 and +3 mA (no wire break detection)

3 Due to the limited number of parameters at a maximum of 244 bytes per ET 200SP station with a PROFIBUS GSD configuration, the configuration options are restricted. If required, you can still assign these parameters using data record 128 as described in the "GSD file PROFINET IO" column (see table above). The parameter length of the I/O module is 8 bytes.

Note

Unused channels

"Deactivate" the unused outputs in the parameter assignment.

A deactivated output always returns the value "no current or voltage".

4.3 Explanation of parameters

Diagnostics: Missing supply voltage L+

Enabling of the diagnostics for missing or insufficient supply voltage L+.

Diagnostics: Short-circuit

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Diagnostics: Overflow

Enabling of the diagnostics when the output value exceeds the overrange.

Diagnostics: Underflow

Enabling of the diagnostics when the output value falls below the underrange or reaches the minimum output value or underflow.

Diagnostics: Wire break

Enabling of the diagnostics if the line to the actuator is broken.

Substitute value

The substitute value is the value that the module outputs in case of a CPU STOP.

Potential group

Specifies that a BaseUnit with incoming voltage supply is located on this slot (see system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

4.4 Address space

Address space of the analog output module AQ 2×U/I HF

The following figure shows the assignment of the address space for the AQ 2xU/I HF with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

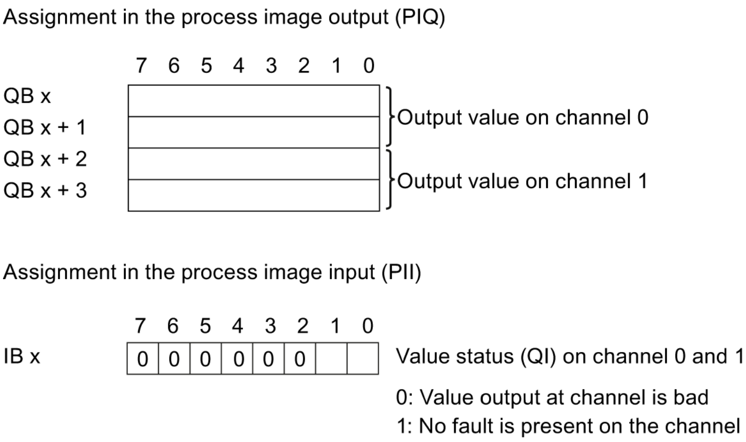

Figure 4-1 Address space of the analog output module AQ 2×U/I HF

Configuration options of the AQ 2xU/I HF

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

An additional byte is occupied in the input address space if you enable the value status for the analog module. Bits 0 to 1 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: No fault is present on the channel.

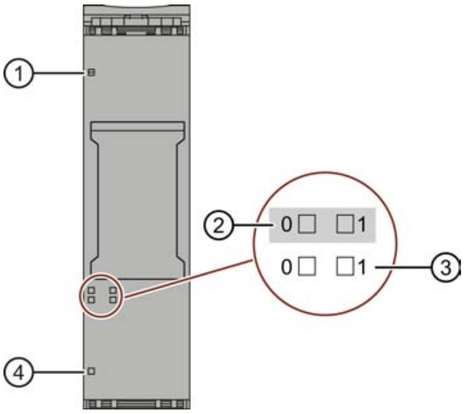
Bit = 0: The wiring, the value created on the channel, or similar is incorrect.

Interrupts/diagnostics alarms 5

5.1 Status and error displays

LED displays

The figure below shows the LED displays of the AQ 2xU/I HF.



① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 5-1 LED display

Meaning of the LED displays

The following tables contain the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostics alarms (Page 19).

Table 5- 1 Error display of the DIAG LED

DIAG LED	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
On	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Table 5- 2 Status display of Channel status/channel error LED

Channel status	Channel error	Meaning
Off	Off	Channel deactivated or load voltage L+ missing
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
On	On	Not permitted (error)

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ present

5.2 Interrupts

The analog output module AQ 2×U/I HF supports diagnostic error interrupts.

Diagnostic error interrupt

The module generates a diagnostic error interrupt at the following events:

- Channel temporarily unavailable
- Short-circuit
- Overtemperature
- Wire break
- Violation of high limit
- Violation of low limit
- Error
- Parameter assignment error
- Load voltage missing

You can obtain detailed information on the event in the hardware interrupt organization block with the "RALARM" (read additional interrupt information) instruction and in the STEP 7 online help.

5.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED on the module flashes. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and remedies

Diagnostics alarm	Error code	Meaning	Remedy
Channel temporarily unavailable	$1F_H$	Firmware update is being performed. Channel 0 applies to the entire module. The module is currently not performing any measurements.	–
		The channel is currently being calibrated.	
Short-circuit	1_H	Short-circuit of the actuator supply	Correct the process wiring
Overtemperature	4_H	Thermal overload of the I/O module	Correct the process wiring
Wire break	6_H	Actuator circuit resistance too high	Use a different actuator type or change the wiring, for example, use cables with larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Deactivate the channel ("Measurement type" parameter) • Connect the channel
Violation of high limit	7_H	The output value specified by the user program exceeds the overrange.	Correct the output value
Violation of low limit	8_H	The output value specified by the user program falls below the underrange.	Correct the output value
Error	9_H	Internal module error has occurred (diagnostics alarm on channel 0 applies to the entire module).	Replace module
Parameter assignment error	10_H	The module cannot evaluate parameters for the channel: Module plugged in does not match the configuration. Incorrect parameter assignment.	• Correct the configuration (comparison of preset and actual setup). • Correct the parameter assignment (diagnostics wire break set only with the permitted measuring ranges).
Load voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

Technical specifications of AQ 2×U/I HF

	6ES7135-6HB00-0CA1
Product type designation	AQ 2xU/I HF
General information	
Firmware version	V1.0
Usable BaseUnits	BU type A0, A1
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 / V13
STEP 7 can be configured/integrated as of version	V5.5 SP3 / V5.5 SP4
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.3
CiR Configuration in RUN	
Reconfiguration in RUN possible	Yes
Calibration in RUN possible	Yes
Installation type/mounting	
Rack mounting possible	Yes
Front installation possible	Yes
Rail mounting possible	Yes
Supply voltage	
Type of supply voltage	DC
Rated value (DC)	24 V
Valid range low limit (DC)	19.2 V
Valid range high limit (DC)	28.8 V
Input current	
Current consumption (rated value)	45 mA; no load
Current consumption, max.	90 mA; 2 channels current output 20 mA
Power loss	
Power loss, typ.	0.9 W
Address area	
Address space per module	
Address space per module, max.	4 bytes; + 1 byte for QI information

	6ES7135-6HB00-0CA1
Analog outputs	
Number of analog outputs	2
Voltage output, short-circuit protection	Yes
Voltage output, short circuit current, max.	45 mA
Cycle time (all channels), min.	750 µs
Output ranges, voltage	
0 to 10 V	Yes; 15 bits
1 to 5 V	Yes; 13 bits
-5 to +5 V	Yes; 15 bits incl. sign
-10 to +10 V	Yes; 16 bits incl. sign
Output ranges, current	
0 to 20 mA	Yes; 15 bits
-20 to +20 mA	Yes; 16 bits incl. sign
4 to 20 mA	Yes; 14 bits
Connecting the actuators	
For voltage output 2-wire connection	Yes
For voltage output 4-wire connection	Yes
For current output 2-wire connection	Yes
Load resistance (in nominal range of the output)	
For voltage outputs, min.	2 kΩ
For voltage outputs, capacitive load, max.	1 µF
For current outputs, max.	500 Ω
For current outputs, inductive load, max.	1 mH
Destruction limit for externally applied voltages and currents	
Voltages at the outputs	30 V
Cable length	
Cable length shielded, max.	200 m; 1000 m for current output
Analog value generation	
Settling time	
For resistive load	0.05 ms
For capacitive load	0.05 ms; max. 47 nF and 20 m cable length
For inductive load	0.05 ms
Errors/accuracies	
Output ripple (in relation to output range, bandwidth 0 to 50 kHz), (+/-)	± 0.02%
Linearity error (in relation to output range), (+/-)	± 0.03%
Temperature error (in relation to output range)	± 0.003%
Crosstalk between outputs, max.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to output range), (+/-)	± 0.03%

	6ES7135-6HB00-0CA1
Operational limit in entire temperature range	
Voltage in relation to output range, (+/-)	± 0.2%
Current in relation to output range, (+/-)	± 0.2%
Basic error limit (operational limit at 25 °C)	
Voltage in relation to output range, (+/-)	± 0.1%
Current in relation to output range, (+/-)	± 0.1%
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes
Execution and activation time (TCO), min.	500 µs
Bus cycle time (TDP), min.	750 µs
Jitter, max.	5 µs
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostic error interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	Yes; channel-based, only for output type current
Short-circuit	Yes; channel-based, only for output type voltage
Overflow/underflow	Yes
Diagnostics indicator LED	
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between different circuits	75 VDC / 60 VAC (basic insulation)
Insulation	
Insulation tested with	707 VDC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Dimension drawing

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFINET.

Measurement type	Measuring range	Diagnostics				
		Underflow	Overflow	Wire break	Short-circuit to ground	Missing supply voltage L+
Deactivated	*	*	*	*	*	*
Voltage	±10 V	x	x	–	x	x
	±5 V	x	x	–	x	x
	0 to 10 V	x	x	–	x	x
	1 to 5 V	x	x	–	x	x
Current	±20 mA	x	x	x	–	x
	0 to 20 mA	x	x	x	–	x
	4 to 20 mA	x	x	x	–	x

x = property is allowed, – = property is **not allowed**, * = property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the measurement type and measuring range for PROFIBUS.

Measurement type	Measuring range	Diagnostics			
		Underflow / overflow	Wire break	Load voltage L+	Short-circuit to ground
Deactivated	*	*	*	*	*
Voltage	±10 V	x	–	x	x
	±5 V	x	–	x	x
	0 to 10 V	x	–	x	x
	1 to 5 V	x	–	x	x
Current	±20 mA	x	x	x	–
Current (2-wire connection)	0 to 20 mA	x	x	x	–
	4 to 20 mA	x	x	x	–

x = property is allowed, – = property is **not allowed**, * = property is not relevant

A.2 Parameter assignment and structure of parameter data record

The data records of the module have an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO.

Parameter assignment in the user program

The module parameter settings can be changed in RUN (for example, the voltage or current values of selected channels can be edited in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set with STEP 7 will not be changed on the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. However, the STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

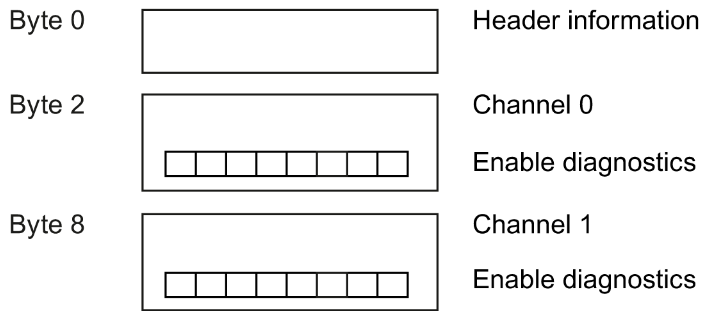

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

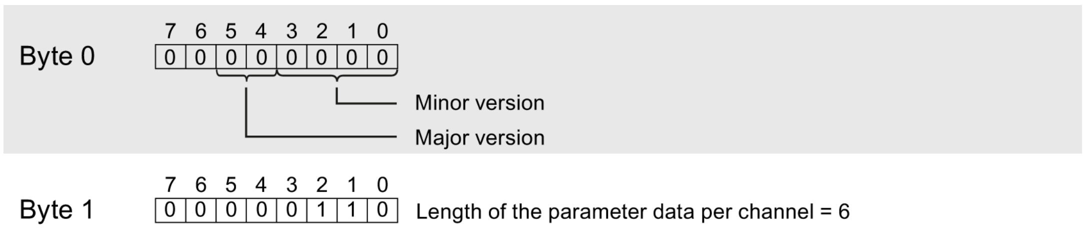

Figure A-2 Header information

Parameters

The figure below shows the structure of the parameters for channels 0 to 1.

You can activate a parameter by setting the corresponding bit to "1".

* x = 2 + (channel number x 6); channel number = 0 to 1

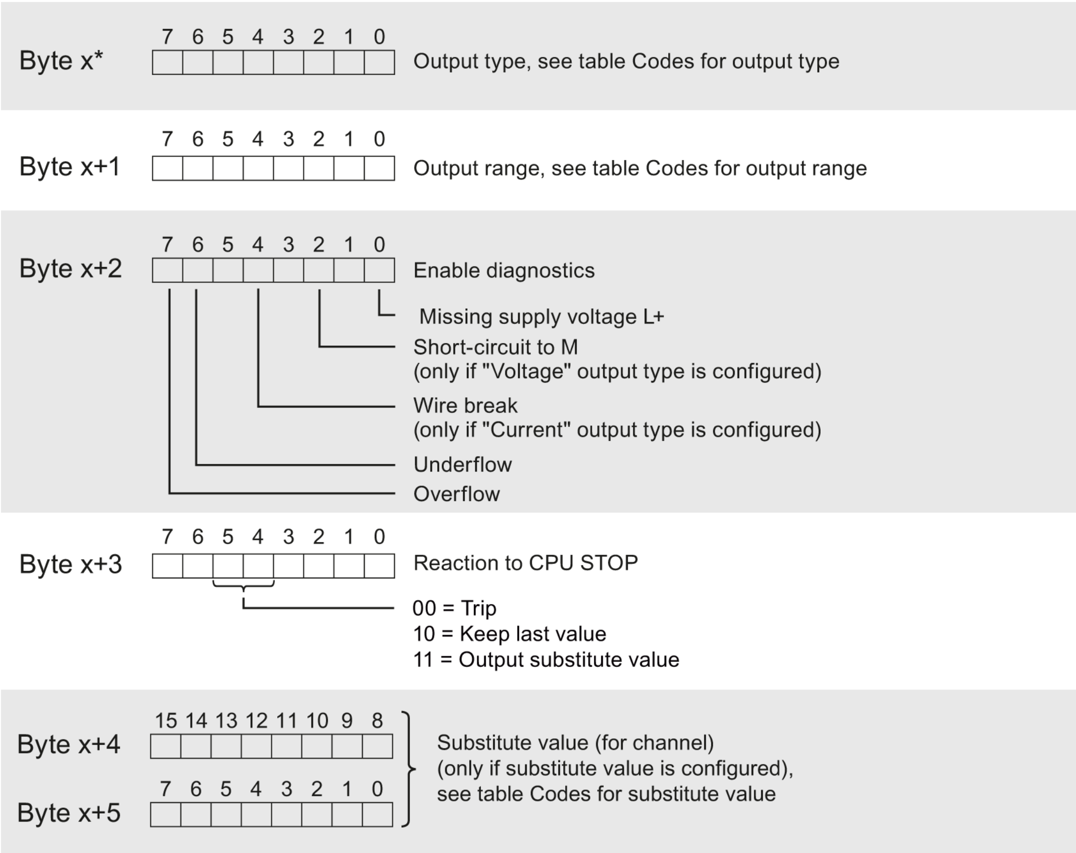

Figure A-3 Structure of byte x to x+5 for channel 0 and 1

Codes for output type

The following table contains the codes for the output types of the analog output module. You must enter these codes in byte x (see previous figure).

Table A- 1 Codes for output type

Output range for voltage	Code
Deactivated	0000 0000
Voltage	0000 0001
Current	0000 0011

Codes for output range

The following table contains the codes for the output ranges of the analog output module. You must enter these codes in byte x+1 (see previous figure).

Table A- 2 Codes for output range

Output range for voltage	Code
±10 V	0000 0000
±5 V	0000 0001
0 to 10 V	0000 0010
1 to 5 V	0000 0011
Output range for current	**Code**
±20 mA	0000 0000
0 to 20 mA	0000 0001
4 to 20 mA	0000 0010

Codes for substitute value

The following table contains the codes for the substitute values. You must enter these codes in bytes x+4 and x+5 (see previous figure).

Table A- 3 Codes for substitute value

Output range for voltage and current	Valid substitute value
±10 V	-32512 to 32511
±5 V	-32512 to 32511
0 to 10 V	0 to 32511
1 to 5 V	-6912 to 32511
±20 mA	-29031 to 29030
0 to 20 mA	0 to 29030
4 to 20 mA	-692 to 29376

Representation of analog values B

This appendix describes the analog values for all output ranges supported by the AQ 2xU/I HF analog module.

Measured value resolution

The digitized analog value is the same for all output values at the same nominal range. The analog values are represented as a fixed point number in the two's complement.

The resolutions 13, 14, 15, and 16 bit including sign are displayed. Each analog value is entered in the ACCU left-justified. The bits marked with "x" are set to "0".

Table B- 1 Possible resolutions of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
13	8	8_H	Sign 0 0 0 0 0 0 0	0 0 0 0 1 x x x
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of output ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar range output ranges. The resolution is 16 bits.

Table B- 2 Bipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥ 32512	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
-1	-0.003617	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	
-27648	-100.000	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	
-27649	-100.004	1	0	0	1	0	0	1	1	1	1	1	1	1	1	1	1	Underrange
-32512	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	
≤ -32513	-117.593	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	Minimum output value

Table B- 3 Unipolar output ranges

Dec. value	Output value in %	Data word																Range
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥ 32512	117.589	0	1	1	1	1	1	1	1	x	x	x	x	x	x	x	x	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange
27649	100.004	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	
27648	100.000	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0	0	Nominal range
1	0.003617	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
0	0.000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
≤ 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Minimum output value

B.2 Representation of analog values in the voltage output ranges

The tables below list the decimal and hexadecimal values (codes) of the possible voltage output ranges.

Table B- 4 Voltage output ranges ±10 V and ±5 V

Values			Voltage output range		Range
	Dec.	**Hex.**	**±10 V**	**±5 V**	
118.515%	32767	7FFF	11.76 V	5.88 V	Overflow*
	32512	7F00			
117.589%	32511	7EFF	11.76 V	5.88 V	Overrange
	27649	6C01			
100%	27648	6C00	10 V	5 V	Nominal range
75%	20736	5100	7.5 V	3.75 V

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Changes compared to previous version

Changes described in this manual, compared to the edition 07/2014:

- 3-wire connection for voltage output
- Derating trend for current output for modules as of hardware version FS 06.

Conventions

CPU: When the term "CPU" is used in this manual, it applies to the CPUs of the S7-1500 automation system as well as to the CPUs/interface modules of the distributed I/O system ET 200SP.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

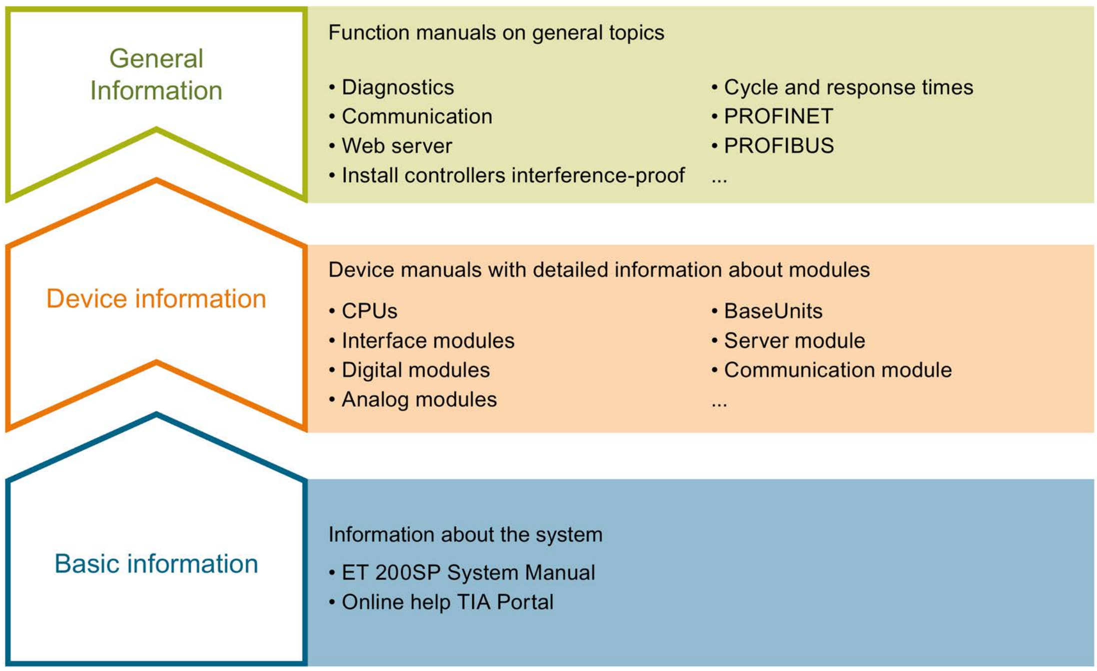
For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

1 Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Product overview

2

2.1 Properties

Article number

6ES7135-6HD00-0BA1

View of the module

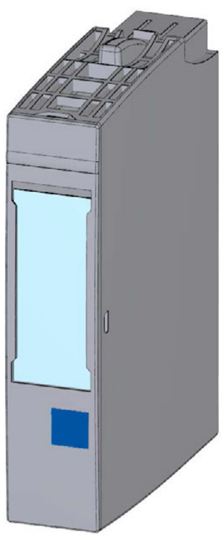


Image 2-1 View of the module AQ 4×U/I ST

Properties

The module has the following technical properties:

- Analog output module with 4 outputs
  - For current output and
  - voltage output
- Output range for current output:
  - ±20 mA, resolution 16 bits including sign
  - 0 to 20 mA, resolution 15 bits
  - 4 to 20 mA, resolution 14 bits
- Output range for voltage output:
  - ±10 V, resolution 16 bits including sign
  - ±5 V, resolution 15 bits including sign
  - 0 to 10 V, resolution 15 bits
  - 1 to 5 V, resolution 13 bits
- Electrically isolated from supply voltage L+
- Configurable diagnostics per module

The module supports the following functions:

- Firmware update
- I&M identification data
- Configuration in RUN
- PROFIenergy

Table 2- 1 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of
Value status	1	V1.1.0

You can configure the module with STEP 7 (TIA Portal) and with a GSD file.

Accessories

The following accessories must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You will find additional information on the accessories in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

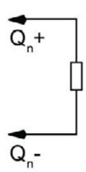
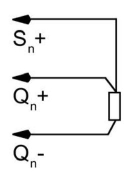
3.1 Terminal assignment

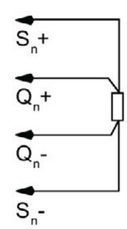
General terminal assignment

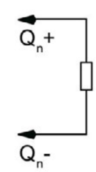
Table 3- 1 Terminal assignment

Terminal assignment for AQ 4×U/I ST (6ES7135-6HD00-0BA1)						
Terminal	**Assign-ment**	**Terminal**	**Assignment**	**Explanation**	**BaseUnit**[1]	**Color identifica-tion label**
1	Q_0+	**2**	Q_1+	• Q_n+: Analog output voltage/current (positive), channel n • Q_n-: Analog output voltage/current (negative), channel n • S_n+: Sensor line positive, channel n • S_n-: Sensor line negative, channel n	A0	---
3	Q_2+	**4**	Q_3+		A1	
5	Q_0-	**6**	Q_1-			
7	Q_2-	**8**	Q_3-			
9	S_0+	**10**	S_1+			
11	S_2+	**12**	S_3+			
13	S_0-	**14**	S_1-			
15	S_2-	**16**	S_3-			
L+	24 VDC	**M**	M			

Voltage 2-wire connection	Voltage 3-wire connection	Voltage 4-wire connection	Current
			








[1] Usable BaseUnit types, can be identified by the last two digits of the article number.

Note

The first BaseUnit of a station must be a light-colored BaseUnit. Also keep this in mind during the configuration.

You will find additional information on the BaseUnit types in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Schematic circuit diagram

Schematic circuit diagram

Parameters/address space

4

4.1 Output ranges

The analog output module AQ 4×U/I ST has the following measuring ranges:

Table 4- 1 Output ranges

Output type	Output ranges	Resolution
Current	± 20 mA	16 bits including sign
	0 to 20 mA	15 bits
	4 to 20 mA	14 bits
Voltage	±10 V	16 bits including sign
	±5 V	15 bits including sign
	0 to 10 V	15 bits
	1 to 5 V	13 bits

The tables of the output ranges, overflow, overrange, etc. can be found in section Representation of analog values (Page 34).

4.2 Parameters

Parameters of the AQ 4xU/I ST

The effective range of the parameters depends on the type of configuration. The following configurations are possible:

- Central operation with an S7-1500 CPU
- Distributed operation on PROFINET IO in an ET 200SP system
- Distributed operation on PROFIBUS DP in an ET 200SP system

When assigning parameters in the user program, use the "WRREC" instruction to transfer the parameters to the module using the data records; refer to the section Parameter assignment and structure of the parameter data record (Page 31).

The following parameter settings are possible:

Table 4- 2 Settable parameters and their defaults (GSD file)

Parameters	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Diagnostics No supply voltage L+	• Disable • Enable	Disable	yes	Module	Module
Diagnostics: Short-circuit[1]	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Overflow	• Disable • Enable	Disable	yes	Module	Module
Diagnostics Underflow	• Disable • Enable	Disable	yes	Module	Module
Diagnostics wire break[2]	• Disable • Enable	Disable	yes	Module	Module
Output type/range	• deactivated • Voltage +/- 10 V • Voltage +/- 5 V • Voltage 0..10 V • Voltage 1..5 V • Current +/- 20 mA • Current 0 - 20 mA • Current 4 - 20 mA	Current 4 - 20 mA	yes	Channel	Channel
Reaction to CPU STOP	• Turn off • Keep last value • Output substitute value	Turn off	yes	Channel	Module

Parameters	Value range	Default	Configuration in RUN	Effective range with configuration software, e.g. STEP 7 (TIA Portal)	
				GSD file PROFINET IO	GSD file PROFIBUS DP
Substitute value	For permissible substitute values for the various output ranges, see appendix Parameter data record (Page 30), Substitute values → Codes for substitute value table	0	yes	Channel	Channel
Potential group	• Use potential group of the left module • Allow new potential group	Use potential group of the left module	no	Module	Module

1 no diagnostics detection between -0.5 V and +0.5 V (no short-circuit detection)

2 no diagnostics detection between -3 mA and +3 mA (no wire break detection)

Note

Unused channels

"Disable" the unused channels in the parameter assignment. This improves the temperature characteristics of the module, see Derating, section Technical specifications (Page 25).

A disabled channel always returns the value "no current or voltage".

4.3 Explanation of the parameters

Diagnostics no supply voltage L+

Enabling of the diagnostics for no or insufficient supply voltage L+.

Diagnostics: Short-circuit

Enabling of the diagnostics when a short-circuit of the actuator supply occurs.

Diagnostics overflow

Enabling of the diagnostics when the output value exceeds the overrange.

Diagnostics underflow

Enabling of the diagnostics when the output value exceeds the overrange, falls below the minimum output value or reaches underflow.

Diagnostics wire break

Enabling of the diagnostics if the line to the actuator is broken.

Output type / output range

See section Output ranges (Page 16)

Reaction to CPU STOP

Determines the behavior of the module at CPU STOP.

Substitute value

The substitute value is the value that the module outputs in case of a CPU STOP.

Potential group

Specifies that a BaseUnit with voltage supply feed-in is located in this slot (see system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)).

4.4 Address space

Configuration options

The following configurations are possible:

- Configuration 1: Without value status
- Configuration 2: With value status

Evaluating the value status

If you enable the value status for the analog module, an additional byte is occupied in the input address space. Bits 0 to 3 in this byte are assigned to a channel. They provide information about the validity of the analog value.

Bit = 1: There are no faults/errors on the module.

Bit = 0: Channel is disabled or there is a fault/error on the module.

If a fault/error occurs on a channel with this module, the value status for all channels is 0.

Address space

The following figure shows the assignment of the address space for the AQ 4×U/I ST with value status (Quality Information (QI)). The addresses for the value status are only available if the value status is enabled.

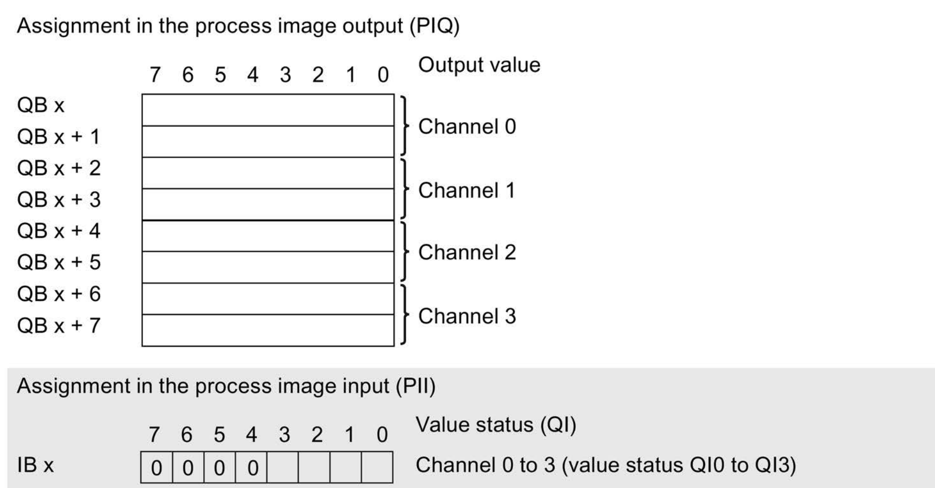

Image 4-1 Address space of the AQ 4×U/I ST with value status

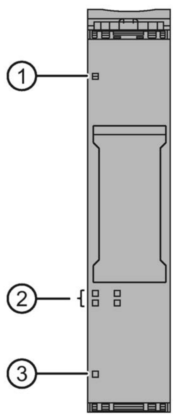
Interrupts/diagnostics alarms 5

5.1 Status and error display

LED display

The figure below shows the LED displays of the AQ 4xU/I ST.



① DIAG (green/red)
② Channel status (green)
③ PWR (green)

Image 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Measures for dealing with diagnostics alarms can be found in the section Diagnostics alarms (Page 24).

DIAG LED

Table 5- 1 DIAG LED fault/error display

DIAG LED	Meaning
off	Backplane bus supply of the ET 200SP not OK
Flashes	Module parameters not assigned
on	Module parameters assigned and no module diagnostics
Flashes	Module parameters assigned and module diagnostics

Channel status LED

Table 5- 2 Status display of the channel status LED

Channel status LED	Meaning
off	Channel disabled
on	Channel enabled

PWR LED

Table 5- 3 Status display of the PWR LED

PWR LED	Meaning
off	No supply voltage L+
on	Supply voltage L+ present

5.2 Interrupts

The analog output module AQ 4×U/I ST supports diagnostic interrupts.

Diagnostics interrupt

The module generates a diagnostics interrupt for the following events:

- Channel temporarily unavailable
- Short-circuit (voltage)
- Overtemperature
- Line break (current)
- High limit violated
- Low limit violated
- Error
- Parameter assignment error
- No load voltage

5.3 Diagnostics alarms

A diagnostics alarm is output for each diagnostics event and the DIAG LED on the module flashes. The diagnostics alarms can, for example, be read from the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 4 Diagnostics alarms, their meaning and how to deal with them

Diagnostics alarm	Error code	Meaning	Remedy
Channel temporarily unavailable	$1F_H$	Firmware being updated. The module is currently not performing any outputs.	–
		The channel is currently being calibrated.	
Short-circuit	1_H	Short-circuit of the actuator supply	Correct the process wiring
Overtemperature	4_H	Thermal overload of the I/O module	Correct the process wiring
Wire break	6_H	Actuator circuit impedance too high.	Use a different actuator type or wire differently, e.g. use cables with a larger cross-section
		Wire break between the module and actuator	Connect the cable
		Channel not connected (open)	• Disable the channel ("output type" parameter) • Connect the channel
High limit violated	7_H	The output value specified by the user program exceeds the overrange.	Correct the output value
Low limit violated	8_H	The output value specified by the user program is below the underrange.	Correct the output value
Error	9_H	Internal module error occurred.	Replace module
Parameter assignment error	10_H	• The module cannot evaluate parameters for the channel. • Incorrect parameter assignment.	Correct the parameter assignment
No load voltage	11_H	No or insufficient supply voltage L+	• Check supply voltage L+ on the BaseUnit • Check BaseUnit type

6 Technical specifications

6.1 Technical specifications

Technical specifications of AQ 4×U/I ST

	6ES7135-6HD00-0BA1
Product type designation	AQ 4xU/I ST
General information	
Firmware version	V1.1
Usable BaseUnits	BU type A0, A1
Color code for module-specific color identification label	CC00
Product function	
I&M data	Yes
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V11 SP2 / V13
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	GSD revision 5
PROFINET as of GSD version/GSD revision	V2.3 / -
CiR Configuration in RUN	
Configuration in RUN possible	Yes
Installation type/mounting	
Rack mounting possible	Yes
Front installation possible	Yes
Rail mounting possible	Yes
Wall/direct mounting possible	No
Supply voltage	
Type of supply voltage	DC
Rated value (DC)	24 V
Valid range low limit (DC)	19.2 V
Valid range high limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	150 mA
Power loss	
Power loss, typ.	1.5 W
Address area	
Address space per module	
Address space per module, max.	8 bytes; + 1 byte for QI information

	6ES7135-6HD00-0BA1
Analog outputs	
Number of analog outputs	4
Voltage output, short-circuit current, max.	45 mA
Cycle time (all channels), min.	5 ms
Output ranges, voltage	
0 to 10 V	Yes; 15 bits
1 to 5 V	Yes; 13 bits
-5 to +5 V	Yes; 15 bits including sign
-10 to +10 V	Yes; 16 bits including sign
Output ranges, current	
0 to 20 mA	Yes; 15 bits
-20 to +20 mA	Yes; 16 bits including sign
4 to 20 mA	Yes; 14 bits
Connection of actuators	
for voltage output two-wire connection	Yes
for voltage output three-wire connection	Yes
for voltage output four-wire connection	Yes
for current output two-wire connection	Yes
Load resistance (in nominal range of the output)	
For voltage outputs, min.	2 kΩ
For voltage outputs, capacitive load, max.	1 µF
For current outputs, max.	500 Ω
For current outputs, inductive load, max.	1 mH
Destruction limit for externally applied voltages and currents	
Voltages at the outputs	30 V
Cable length	
Cable length shielded, max.	1000 m; 200 m for voltage output
Analog value formation	
Oscillation time	
For resistive load	0.1 ms
For capacitive load	1 ms
For inductive load	0.5 ms
Errors/accuracies	
Linearity error (in relation to output range), (+/-)	±0.03 %
Temperature error (in relation to output range), (+/-)	0.005 %/K
Crosstalk between outputs, min.	-50 dB
Repeat accuracy in settled state at 25 °C (in relation to output range), (+/-)	±0.05 %
Operational limit in the entire temperature range	
Voltage in relation to output range, (+/-)	±0.5 %
Current in relation to output range, (+/-)	±0.5 %

	6ES7135-6HD00-0BA1
Basic error limit (operational limit at 25 °C)	
Voltage in relation to output range, (+/-)	±0.3 %
Current in relation to output range, (+/-)	±0.3 %
Interrupts/diagnostics/status information	
Substitute values can be applied	Yes
Interrupts	
Diagnostics interrupt	Yes
Diagnostics alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Wire break	Yes
Short-circuit	Yes
Overflow/underflow	Yes
Diagnostics display LED	
Monitoring of the supply voltage (PWR LED)	Yes; green LED
Channel status display	Yes; green LED
For module diagnostics	Yes; green/red LED
Electrical isolation	
Electrical isolation of channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between different circuits	75 VDC / 60 VAC (basic isolation)
Insulation	
Insulation tested with	707 VDC (type test)
Environmental conditions	
Operating temperature	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	31 g

Derating trend for permitted load during power output and horizontal mounting position:

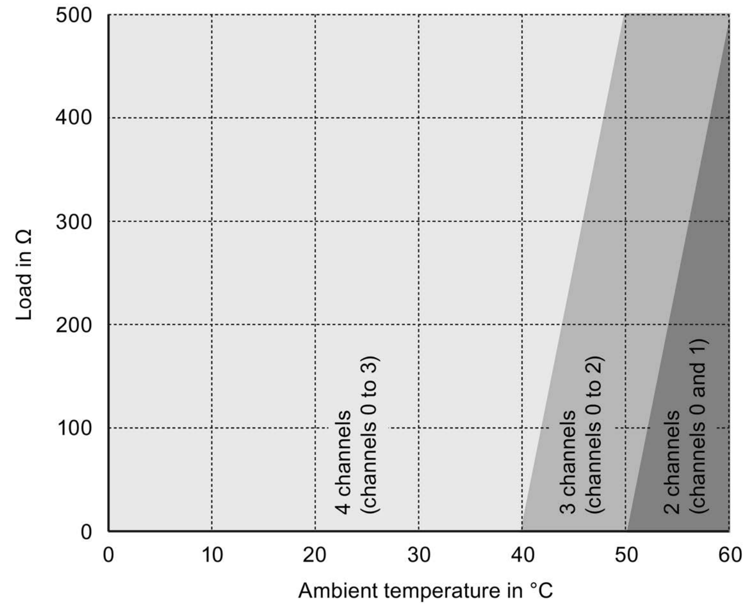


Image 6-1 Derating trend current output (horizontal)

Derating trend for permitted load during power output and vertical mounting position:

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/59753521)

Parameter data record A

A.1 Dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the settings of some parameters are dependent on each other.

Configuring with a PROFINET GSD file

The table lists the properties and their dependencies on the output type and output range for PROFINET.

Output type	Output range	Diagnostics					Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to M	Overflow	Underflow	Wire break		
deactivated		*	*	*	*	*	*	*
Voltage	±5 V	x	x	x	x	-	x	x
	±10 V	x	x	x	x	-	x	x
	1..5 V	x	x	x	x	-	x	x
	0..10 V	x	x	x	x	-	x	x
Current	±20 mA	x	-	x	x	x	x	x
	0..20 mA	x	-	x	x	x	x	x
	4..20 mA	x	-	x	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

Configuring with a PROFIBUS GSD file

The table lists the properties and their dependencies on the output type and output range for PROFIBUS.

Output type	Output range	Diagnostics				Reaction to CPU STOP	Substitute value
		No supply voltage L+	Short-circuit to M	Overflow/ Underflow	Wire break		
deactivated		*	*	*	*	*	*
Voltage	±5 V	x	x	x	-	x	x
	±10 V	x	x	x	-	x	x
	1..5 V	x	x	x	-	x	x
	0..10 V	x	x	x	-	x	x
Current	±20 mA	x	-	x	x	x	x
	0..20 mA	x	-	x	x	x	x
	4..20 mA	x	-	x	x	x	x

x = Property is allowed, - = Property is **not allowed**, * = Property is not relevant

A.2 Parameter assignment and structure of the parameter data record

Parameter assignment in the user program

The module can be re-configured in RUN (for example, the voltage or current values of selected channels can be changed in RUN without having an effect on the other channels).

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transferring parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Structure of data record 128

Note

Channel 0 contains the diagnostics for the entire module.

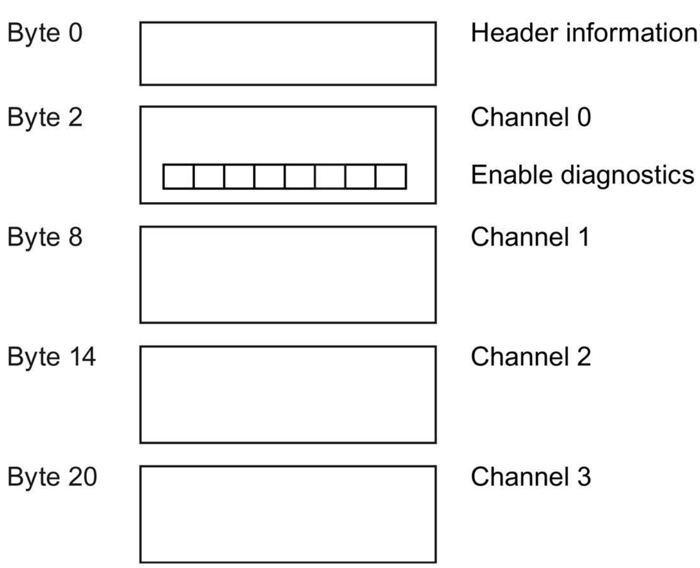

Image A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

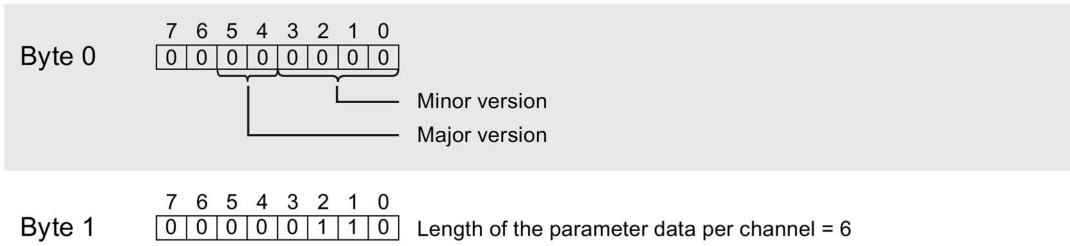

Image A-2 Header information

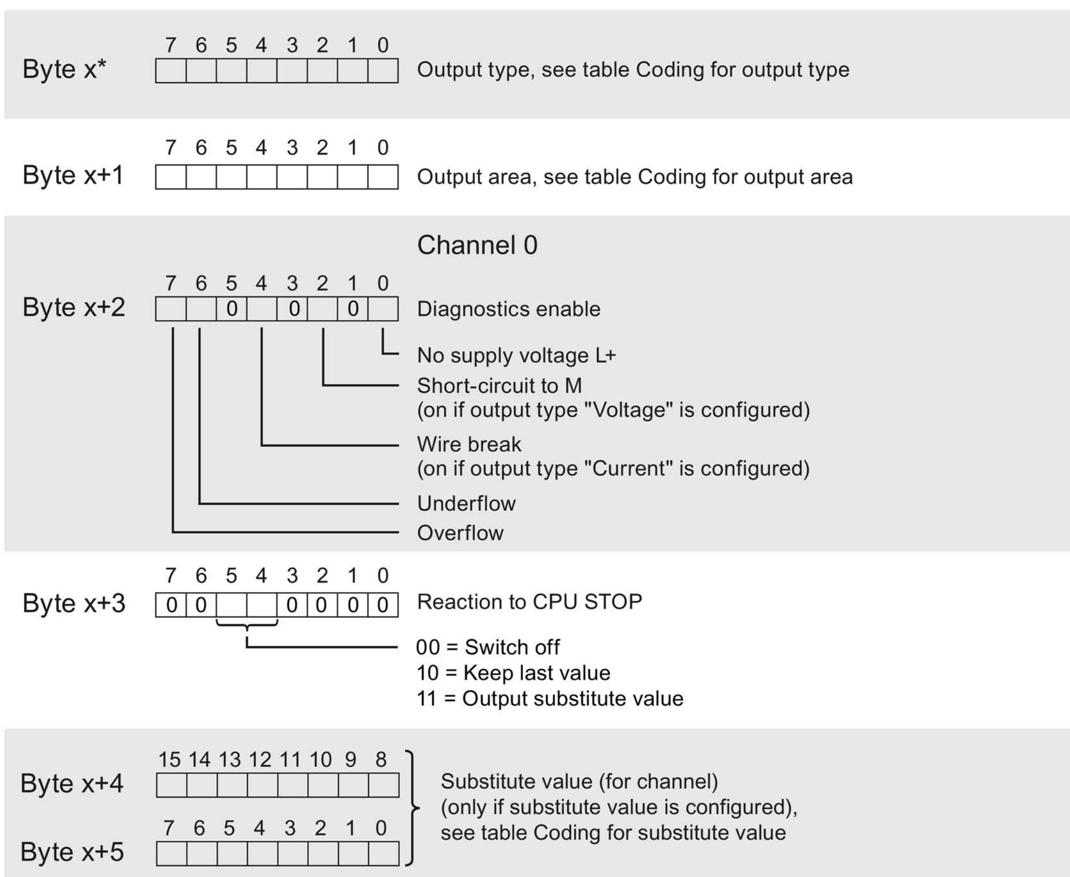
Parameters

The figure below shows the structure of the parameters for channels 0 to 3.

You enable a parameter by setting the corresponding bit to "1".



* x = 2 + (channel number × 6); channel number = 0 to 3

Image A-3 Structure byte x up to x+5 for the channel 0 to 3

Codes for output type

The following table contains the codes for the output types of the analog output module. You enter this coding in byte x (see previous figure).

Table A- 1 Codes for output type

Output type	Coding
Deactivated	0000 0000
Voltage	0000 0001
Current	0000 0011

Codes for output range

The following table contains the codes for the output ranges of the analog output module. You enter these codes in byte x+1 of data record 128 (see previous figure).

Table A- 2 Codes for output range

Output range	Coding
Voltage	
±10 V	0000 0000
±5 V	0000 0001
0 to 10 V	0000 0010
1 to 5 V	0000 0011
Current	
±20 mA	0000 0000
0 to 20 mA	0000 0001
4 to 20 mA	0000 0010

Codes for substitute value

The following table contains the codes for the substitute values. You enter these codes in bytes x+4 and x+5 (see previous figure).

Output range	Permissible substitute value
Voltage	
±10 V	-32512 to 32511
±5 V	-32512 to 32511
0 to 10 V	0 to 32511
1 to 5 V	-6912 to 32511
Current	
±20 mA	-29031 to 29030
0 to 20 mA	0 to 29030
4 to 20 mA	-692 to 29376

Representation of analog values B

This appendix describes the analog values for all output ranges that you can use with the analog module AQ 4xU/I ST.

Measured value resolution

The digitized analog value is the same for all output values at the same nominal range. Analog values are output as fixed point numbers in two's complement.

In the following table, you will find the representation of the binary analog values and the associated decimal or hexadecimal units of the analog values.

The resolutions 14, 15 and 16 bits including sign are shown. Each analog value is entered in the ACCU left-justified. The bits marked with "x" are set to "0".

Table B- 1 Possible resolutions of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
14	4	4_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 1 x x
15	2	2_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 1 x
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of output ranges

In the following tables, you can find the digitized representation of the bipolar and unipolar range output ranges. The resolution is 16 bits.

Table B- 2 Bipolar output ranges

Dec. value	**Output value in %**	**Data word**																**Range**
		2^{15}	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}	
≥32512	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Maximum output value
32511	117.589	0	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1	Overrange

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual includes module-specific information on wiring, diagnostics and the technical specifications of the technology module.

General information regarding design and commissioning of the ET 200SP is available in the ET 200SP system manual.

The counting and measuring functions of the TM Count 1x24V technology module are described in more detail in the Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820) function manual.

Conventions

Please observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Open Source Software

Open-source software is used in the firmware of the product described. Open Source Software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

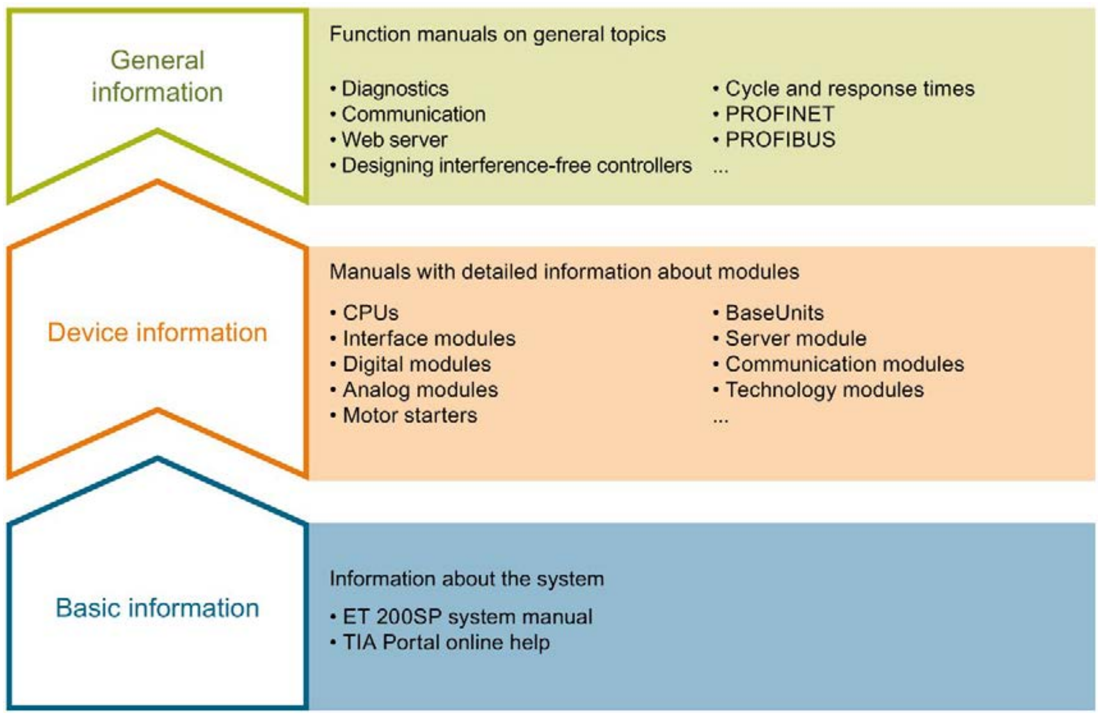
For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information on this on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109740777).

Table of contents

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Product overview

2.1 Properties

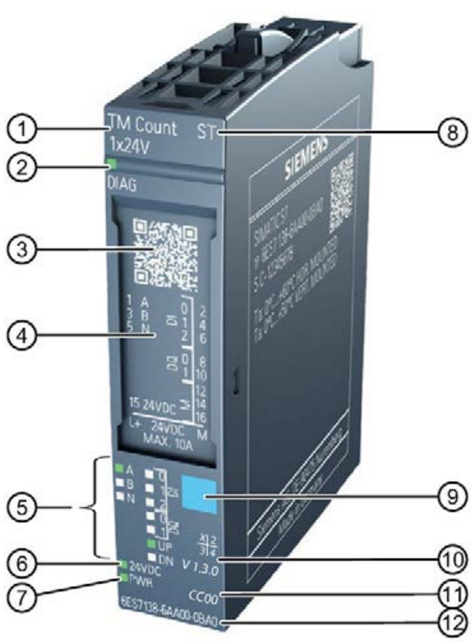
Article number

6ES7138-6AA00-0BA0

Firmware version

This manual describes the properties of the module with firmware version V1.3.

View of the module



① Module type and designation
② LED for diagnostics
③ 2D matrix code
④ Wiring diagram
⑤ LEDs for channel status
⑥ LED for encoder supply
⑦ LED for supply voltage
⑧ Function class
⑨ Module type color coding
⑩ Function and firmware version
⑪ Color code for selecting the color-coded labels
⑫ Article number

Figure 2-1 View of the TM Count 1x24V module

Properties

The TM Count 1x24V technology module has the following properties:

- Technical properties
  - One channel
  - Interfaces:

    24 V encoder signals A, B and N from sourcing, sinking or push-pull encoders and sensors

    24 V encoder supply, short-circuit-proof

    DI0, DI1 and DI2 digital input signals

    DQ0 and DQ1 digital output signals

    Supply voltage L+
  - Count range: 32 bits
  - Monitoring of encoder signals for wire break
  - Hardware interrupts configurable
  - Input filters for suppression of interferences at encoder inputs and digital inputs can be configured
- Supported encoder/signal types
  - 24 V incremental encoder with N signal
  - 24 V incremental encoder without N signal
  - 24 V pulse encoder with direction signal
  - 24 V pulse encoder without direction signal
  - 24 V pulse encoder with up/down counting signal
- Supported system functions
  - Isochronous mode
  - Firmware update
  - Identification data I&M

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	Firmware version of module	Configurable as of			
		STEP 7 (TIA Portal)	STEP 7	GSD	
				PROFINET IO	PROFIBUS DP
Firmware update	V1.0 or higher	V13	V5.5 SP4	X	—
I&M identification data	V1.0 or higher	V13	V5.5 SP4	X	X
Parameter reassignment in RUN	V1.0 or higher	V13	V5.5 SP4	X	X
Isochronous mode	V1.0 or higher	V13	V5.5 SP4	—	—
Counting/measuring	V1.0 or higher	V13	V5.5 SP4 or V5.5 SP3 with HSP0240 V1.0	X	X
Operating with "Counting and measurement" technology object	V1.0 or higher	V13	—	—	—
Position input for "Motion Control" technology object	V1.0 or higher	V13	—	—	—
Central operation on CPU 151xSP	V1.1 or higher	V13 SP1	—	—	—
Fast Mode	V1.2 or higher	V14 SP1 or V14 with HSP0199	V5.6 or V5.5 SP4 with HSP0240 V5.0	X	X
Operating with "Measuring input" technology object	V1.3 or higher	V15 with HSP0256	—	—	—
Position value range of 32 bits	V1.3 or higher	V15 with HSP0256	—	X	X

Accessories

The following accessories can be used with the module and are not included in the scope of delivery:

- Labeling strip
- Color identification labels
- Reference identification labels
- Shield connector

A BaseUnit of the A0 type is required to operate the technology module. You can find an overview of the BaseUnits that you can use with the technology module in the product information for the documentation of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/73021864).

For detailed information on the installation procedure, refer to the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2 Functions

2.2.1 Detection of counting signals

Counting is the detecting and adding up of events. The counters of the technology module detect encoder signals and pulses and evaluate them accordingly. The count direction can be specified using encoder or pulse signals or through the user program.

You can control the counting processes with the digital inputs. In addition, you can read the signal state of the respective digital input via the feedback interface.

You can specify the counter characteristics using the functions described below.

Counting limits

The counting limits define the counter value range used. The counting limits are configurable and can be modified during runtime with the user program.

You can configure the behavior of the counter at the counting limits.

Start value

You can configure a start value within the counting limits. The start value can be modified during runtime with the user program.

Gate control

You can define the time window in which the count signals are acquired with the hardware gate (HW gate) and software gate (SW gate).

Capture (Latch)

You can configure an external reference signal edge that triggers the saving of the current counter value as Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input
- Rising edge of the N signal at the encoder input

The "Frequency of Capture function" parameter specifies whether the function is executed at each configured edge or only once after each enable.

Measuring input

If you use Position input for Motion Control (Page 17), you can use the "Measuring input" technology object to execute a measuring input function with a hardware digital input.

Hardware interrupts

The technology module can trigger a hardware interrupt in the CPU, for example, if a comparison event occurs, in the event of overflow or underflow, in the event of a zero crossing of the counter and/or of a change of count direction (direction reversal). You can specify which events during operation are to trigger a hardware interrupt.

2.2.2 Measured value determination

The following high-accuracy measurement functions are available (accuracy up to 100 ppm):

- Frequency measurement with the unit of hertz
- Period measurement with the unit of seconds
- Velocity measurement with a flexibly adaptable unit

Update time

You can configure the interval at which the technology module updates the measured values cyclically as the update time.

Gate control

You can define the time window in which the count signals are acquired with the hardware gate (HW gate) and software gate (SW gate).

2.2.3 Switching the outputs at comparison values

The available digital outputs DQ0 and DQ1 can be directly activated/switched by the specified comparison values or via the user program. The comparison values are configurable and can be modified during runtime with the user program. This enables very fast reaction times to be achieved.

Comparison values in the Counting mode

You define two comparison values in the Counting mode. If the current counter value meets the configured comparison condition, the corresponding digital output can be set to directly initiate control processes in the process.

Comparison values in the Measuring mode

You define two comparison values in the Measuring mode. If the current measured value meets the configured comparison condition, the corresponding digital output can be set to directly initiate control processes in the process.

2.2.4 Position input for Motion Control

You can use the technology module for position detection for the following axis technology objects of S7-1500 Motion Control :

- TO_PositioningAxis
- TO_SynchronousAxis
- TO_ExternalEncoder

In this operating mode, you can use the measuring input technology object (TO_MeasuringInput) to execute a measuring input function with hardware digital input DI1.

Additional information

You can find a detailed description of the use of Motion Control and its configuration in the following:

- Function manual S7-1500 Motion Control available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59381279)
- Function manual S7-1500T Motion Control available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481326)

2.2.5 Fast Mode

You can use the technology module in Fast Mode for very fast acquisition of counter or position value with compressed functionality. A reduced feedback interface but no control interface is available in Fast Mode. This allows you to use a shorter send clock for the CPU.

2.2.6 Additional functions

Synchronization

You can configure the edge of an external reference signal that loads the counter with the specified start value. The following external signals can trigger a synchronization:

- Rising or falling edge of a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input depending on the level of the assigned digital input

The "Frequency of synchronization" parameter specifies whether the function is executed at each configured edge or only once after each enable.

Hysteresis

You can specify a hysteresis for the comparison values within which a digital output will be prevented from switching again.

Diagnostic interrupt

The technology module can trigger diagnostic interrupts. You enable the diagnostic interrupts in the device configuration.

Input filter

To suppress interference, you can configure an input filter for the 24 V encoder inputs and for the digital inputs.

Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables counter values and measured values to be acquired in a defined system cycle.

Wiring 3

3.1 Pin assignment and block diagram

Das TM Count 1x24V is used with a BaseUnit of type A0 (article number 6ES7193-6BPx0-0xA0).

You connect the encoder signals, the digital input and output signals and the encoder supplies to the BaseUnit of the technology module. The supply voltage feed on the light BaseUnit BU...D of the associated potential group supplies the module and the digital outputs, and generates the encoder supply voltage.

BaseUnit

The BaseUnit is not included in the scope of delivery of the module and must be ordered separately.

You can find an overview of the BaseUnits that you can use with the technology module in the product information for the documentation of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/73021864).

You can find information about selecting a suitable BaseUnit in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual and ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) device manual.

You can find information on wiring the BaseUnit, connecting cable shields, etc. in the Connecting section of the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Supply voltage L+/M

You connect the supply voltage to terminals L+ and M on a light BaseUnit. For a dark BaseUnit, the supply voltage of the module to the left is used. An internal protection circuit protects the technology module from reverse polarity of the supply voltage. The technology module monitors whether the supply voltage is connected.

Encoder supply

For supplying the encoders and sensors connected to the digital inputs, the technology module provides a 24 V DC supply voltage at output 24VDC (terminal 15) with reference to M (terminals 12, 14 and 16). The voltage is monitored for short-circuit and overload.

Digital inputs DI0, DI1 and DI2

The digital inputs are used for gate control, synchronization and the Capture function.

The digital inputs are not isolated from each other.

Input delay for digital inputs

In order to suppress noise you can configure an input delay for the digital inputs.

Note

If you select the "None" or "0.05 ms" option, you must use shielded cables for connection of the digital inputs.

Digital outputs DQ0 and DQ1

The digital outputs are not isolated from each other.

The digital outputs are 24 V sourcing outputs in reference to M and can carry a rated load current of 0.5 A. They are protected against overload and short-circuit.

Relays and contactors can be directly connected without an external protective circuit. You can find information on the maximum possible operating frequencies and the inductive loads connected to the digital outputs in section Technical specifications (Page 83).

24 V encoder signals/count signals

The 24 V encoder signals are designated with the letters A, B and N. You can connect the following encoder types:

- Incremental encoder with N signal:

  The A, B and N signals are connected using the correspondingly marked terminals. The A and B signals are the two 90° phase-shifted incremental signals. N is the zero mark signal that supplies one pulse per revolution.

- Incremental encoder without N signal:

  The A and B signals are connected using the correspondingly marked terminals. The A and B signals are the two 90° phase-shifted incremental signals. The N terminal remains unconnected.

- Pulse encoder without direction signal:

  The counting signal is connected to the A terminal. The count direction can be specified via the control interface. The B and N terminals remain unconnected.

- Pulse encoder with direction signal:

  The counting signal is connected to the A terminal. The direction signal is connected to the B terminal. Counting down takes place at a high level of the direction signal. The N terminal remains unconnected.

- Pulse encoder with up/down counting signal:

  The up counting signal is connected to the A terminal. The down counting signal is connected to the B terminal. The N terminal remains unconnected.

The inputs are not isolated from each other. The inputs are isolated from the backplane bus.

You can connect the following encoders or sensors to the A, B and N inputs:

- Sourcing output:
  The A, B and N inputs are switched by the encoder or sensor to 24VDC .
- Sinking output:
  The A, B and N inputs are switched by the encoder or sensor to ground M .
- Push-pull:
  The A, B and N inputs are switched by the encoder or sensor alternately to 24VDC and ground M . Monitoring for wire break is possible with this type of encoder/sensor. The procedure of the wire break detection (alternate switching) requires that, in the event of a fault (wire break), the count can also change without a counting pulse until the wire break is detected.

Pin assignment of the BaseUnit

The table below shows the pin assignment, using the BaseUnit BU15-P16+A0+2B as an example.

Table 3- 1 Pin assignment of the BaseUnit BU15-P16+A0+2B

Configuring/address space 4

4.1 Operating with "Counting and measurement" technology object

4.1.1 Configuring

Introduction

You configure the technology module and assign its parameters with STEP 7 (TIA Portal).

The technology object is used to control and monitor the functions of the technology module.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter setting with High_Speed_Counter technology object	High_Speed_Counter instruction
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM Count 1x24V		

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

4.1.2 Reaction to CPU STOP

You set the response of the technology module to CPU STOP for each channel in the basic parameters of the device configuration.

Table 4- 1 Response of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "At comparison value for a pulse duration" is set at CPU stop, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.

4.1.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 91).

You set the parameters of the module as follows in this operating mode:

1. Insert the module from the hardware catalog under "Technology modules".
2. Set the device configuration in the hardware configuration.
   "Operating with "Counting and measurement" technology object" must be set as the operating mode.
3. Insert the High_Speed_Counter technology object from the project tree in folder "Technology objects > Add new object > Counting and measurement".
   You can find information on configuring with a technology object in function manual Counting, measurement and position detection (http://support.automation.siemens.com/WW/view/en/59709820).
4. Open the configuration of the High_Speed_Counter technology object, e.g. using the Configuration button in the instruction for the technology object.
5. Set the parameters of the technology object.
6. Download the project to the CPU.

Parameters of the TM Count 1x24V

The following parameter settings are possible in the hardware configuration:

Table 4- 2 Settable parameters and their default setting

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	No	Module
Reaction to CPU STOP	• Output substitute value • Keep last value • Continue operation	Output substitute value	Yes	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diagnos-tic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Syn-chronization of the counter by an external signal	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate start	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate stop	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Over-flow (high counting limit violated)	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware inter-rupt:Underflow (low count-ing limit violated)	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Direc-tion reversal	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Hardware interrupt: Com-parison event for DQ0 occurred	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Com-parison event for DQ1 occurred	• Deactivated • Activated	Deactivated	Yes	Channel

The following parameter settings are possible in the technology object:

Table 4- 3 Settable parameters and their default setting

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Filter frequency for counter inputs	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz	200 kHz	Yes	Channel
Sensor type	• Sourcing output • Sinking output • Push-pull (sinking and sourcing output)	Sourcing output	Yes	Channel
Reaction to signal N	• No reaction to signal N • Synchronization at signal N • Capture at signal N	No reaction to signal N	Yes	Channel
Frequency of synchronization	• Once • Periodic	Once	Yes	Channel
Frequency of Capture func-tion	• Once • Periodic	Once	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Counting high limit	-2147483648...2147483647	2147483647	Yes	Channel
Start value	-2147483648...2147483647	0	Yes	Channel
Counting low limit	-2147483648...2147483647	-2147483648	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue counting	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at sig-nal N • Capture • Digital input without function	• DI0: Gate start/stop (lev-el-triggered) • DI1: Digital input without function • DI2: Digital input without function	Yes	Channel
Input delay for digital inputs	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Edge selection for DI	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Select level for DI	• Active with high level • Active with low level	Active with high level	Yes	Channel
Behavior of counter value after Capture with DI	• Continue counting • Set to start value and continue counting	Continue counting	Yes	Channel
Comparison value 0	-2147483648...2147483647	0	Yes	Channel
Comparison value 1	-2147483648...2147483647	10	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Operating mode	• Use count value as reference • Use measured value as reference	Use count value as reference	No	Channel
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between comparison value and high limit	Yes	Channel
Count direction of DQ function	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10]	0...65535	5000 (corresponds to 0.5 s)	Yes	Channel
Substitute value for DQ0	• 0 • 1	0	Yes	Channel
Substitute value for DQ1	• 0 • 1	0	Yes	Channel
Hysteresis (in increments)	0...255	0	Yes	Channel
Measured variable	• Frequency • Period • Velocity	Frequency	Yes	Channel
Update time [ms] of measuring function	0...25000	10	Yes	Channel
Time base for velocity measurement	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit	1...65535	1	Yes	Channel

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection in sections Basic parameters and Configuring the High_Speed_Counter available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.1.4 Address space

Address space of the technology module

Table 4- 4 Size of input and output addresses of the TM Count 1x24V when operating with "Counting and measurement" technology object

	Inputs	**Outputs**
Range	16 bytes	12 bytes

4.1.5 Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables counter values and measured values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode. The High_Speed_Counter instruction is called in the assigned OB.

The update time for the measured value is synchronized with the system cycle in a suitable ratio and, if necessary, adapted in length. If you set "0", the measured value is updated once per system cycle.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the counter value and the measured value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the "Filter frequency" parameter can affect the isochronous mode parameters of the sync domain.

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.2 Position input for ""Motion Control"" technology object

4.2.1 Configuring

Introduction

You configure the technology module and assign its parameters with STEP 7 (TIA Portal).

The technology object is used to control and monitor the functions of the technology module.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter setting with axis and measuring input technology objects	Motion Control instructions
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM Count 1x24V		

Additional information

You can find a detailed description of the use of Motion Control and its configuration in the following:

- Function manual S7-1500 Motion Control available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59381279)
- Function manual S7-1500T Motion Control available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481326)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Motion Control > Motion Control (S7-1200, S7-1500)"

You can find a description of configuring the technology module for position detection in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

4.2.2 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available.

You set the parameters of the module as follows in this operating mode:

1. Insert the module from the hardware catalog under "Technology modules".
2. Set the device configuration and the parameters of the module in the hardware configuration.
   "Position input for "Motion Control" technology object" must be set as the operating mode.
3. Insert the axis technology object and, if necessary, the measuring input technology object from the project tree in folder "Technology objects > Add new object > Motion Control".
   You can find information on configuring with axis technology objects in function manual S7-1500T Motion Control
   (https://support.industry.siemens.com/cs/ww/en/view/109481326).
4. Open the configuration of the axis technology object, e.g. using the Configuration button in the respective instruction for the technology object.
5. Set the parameters of the technology objects.
6. Download the project to the CPU.

Parameters of the TM Count 1x24V

The following parameter settings are possible:

Table 4- 5 Settable parameters and their default setting

Parameter	Value range	Default setting	Scope HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	Module
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Channel
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Channel

Parameter	Value range	Default setting	Scope
			HSP for STEP 7 (TIA Portal)
Filter frequency for counter inputs	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz	200 kHz	Channel
Sensor type	• Sourcing output • Sinking output • Push-pull (sinking and sourcing output)	Sourcing output	Channel
Signal selection for reference mark 0	• DI0 • Signal N of incremental encoder	DI0	Channel
Measuring input	DI1	DI1	Channel
Increments per revolution / steps per revolution	1...65535	1	Channel
Reference speed	6.00...210000.00 U/min	3000.00 U/min	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Channel
Enable additional diagnostic interrupts	• Deactivated • Activated	Deactivated	Channel

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, section Module parameters (position input for Motion Control) available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.2.3 Address space

Address space of the technology module

Table 4- 6 Size of input and output addresses of the TM Count 1x24V with position input for "Motion Control" technology object

	Inputs	Outputs
Range	16 bytes	4 bytes

4.2.4 Isochronous mode

The technology module supports the "Isochronous mode" system function. Counter values can be acquired in a fixed system cycle with this system function.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "MC-Servo" in this operating mode. Isochronous mode is needed when using the output cam and cam track technology objects. When the measuring input technology is used in combination with hardware digital input DI1, isochronous mode is not needed.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the counter value and the status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the "Filter frequency" parameter can affect the isochronous mode parameters of the sync domain.

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.3 Manual operation (without technology object)

4.3.1 Configuring

Introduction

You configure the technology module and assign its parameters with the configuration software.

The functions of the technology module are controlled and checked by the user program via the control and feedback interface.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration and parameter setting with hardware configuration	Direct access to control and feedback interface in the I/O data
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration and parameter setting with hardware configuration	
Distributed operation with an S7-300/400 CPU	• S7-300/400 or S7-1200 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter setting with HSP (up to firmware version V1.2) or GSD file	
Distributed operation with an S7-1200 CPU	• S7-300/400 or S7-1200 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation in a third-party system	• Third-party automation system • ET 200SP distributed I/O system • TM Count 1x24V	Third-party configuration software: Device configuration and parameter setting with GSD file	

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

STEP 7 (TIA Portal)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

STEP 7

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/23183356).

GSD file

You can find the respective GSD file for the ET 200SP distributed I/O system for download on the Internet:

- GSD file for PROFINET IO (http://support.automation.siemens.com/WW/view/en/57138621)
- GSD file for PROFIBUS DP (http://support.automation.siemens.com/WW/view/en/73016883)

4.3.2 Reaction to CPU STOP

You set the response of the technology module to CPU STOP for each channel in the basic parameters of the device configuration.

Table 4- 7 Response of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "At comparison value for a pulse duration" is set at CPU stop, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.

4.3.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 91).

You set the parameters of the module as follows in this operating mode:

Parameter setting using...	Basic procedure
Hardware configuration in STEP 7 (TIA Portal)	1. Insert the module from the hardware catalog under "Technology modules". 2. Set the device configuration and the parameters of the module in the hardware configuration. "Manual operation (without technology object)" must be set as the operating mode. 3. Download the project to the CPU.
Hardware configuration in STEP 7 with HSP	1. Install the appropriate HSP file. You will then find the module in the hardware catalog under "ET 200SP". 2. Set the device configuration and the parameters in the hardware configuration. 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFINET IO	1. Install the current PROFINET GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFINET IO > I/O". 2. Set the parameters in the hardware configuration. You can find information on the respective dependencies of the parameters in function manual Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820). 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFIBUS DP	1. Install the current PROFIBUS GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFIBUS DP > I/O". 2. Set the parameters in the hardware configuration. You can find information on the respective dependencies of the parameters in function manual Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820). The parameters marked with [1] in the following tables are not configurable in the PROFIBUS GSD file. 3. Download the project to the CPU. The parameters marked with [1] in the following tables are downloaded with their default setting. 4. If necessary, set the parameters marked with [1] in the user program using data record 128.

Parameters of the TM Count 1x24V

The following parameter settings are possible:

Table 4- 8 Settable parameters and their default setting

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	No	Module
Operating mode[3]	• Counting • Measuring	Counting	No	Channel
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substitute value	Yes	Channel
Substitute value for DQ0[1]	• 0 • 1	0	Yes	Channel
Substitute value for DQ1[1]	• 0 • 1	0	Yes	Channel
Enable diagnostic interrupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diagnostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Synchronization of the counter by an external signal[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate start[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate stop[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Overflow (high counting limit violated)[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt:Underflow (low counting limit violated)[1]	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Hardware interrupt: Direction reversal[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Comparison event for DQ0 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Comparison event for DQ1 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Invert direction[1] (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel
Filter frequency for counter inputs[1]	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz	200 kHz	Yes	Channel
Sensor type	• Sourcing output • Sinking output • Push-pull (sinking and sourcing output)	Sourcing output	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Reaction to signal N[1]	• No reaction to signal N • Synchronization at signal N • Capture at signal N	No reaction to signal N	Yes	Channel
Frequency of synchronization[1]	• Once • Periodic	Once	Yes	Channel
Frequency of Capture function[1,4]	• Once • Periodic	Once	Yes	Channel
High counting limit[1]	-2147483648...2147483647	2147483647	Yes	Channel
Start value[1]	-2147483648...2147483647	0	Yes	Channel
Counting low limit[1]	-2147483648...2147483647	-2147483648	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue count-ing	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at sig-nal N • Capture • Digital input without function	• DI0: Gate start/stop (level-triggered) • DI1: Digital input with-out function • DI2: Digital input with-out function	Yes	Channel
Select level for DI[1]	• Active with high level • Active with low level	Active with high level	Yes	Channel
Edge selection for DI[1]	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Behavior of counter value after Capture with DI [1]	• Continue counting • Set to start value and continue counting	Continue count-ing	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between com-parison value and high limit	Yes	Channel
Comparison value 0[1]	-2147483648...2147483647	0	Yes	Channel
Comparison value 1[1]	-2147483648...2147483647	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both direc-tions	Yes	Channel
Pulse duration [ms/10][1]	0...65535	5000 (corre-sponds to 0.5 s)	Yes	Channel
Hysteresis (in incre-ments)[1]	0...255	0	Yes	Channel
Measured variable	• Frequency • Period • Velocity	Frequency	Yes	Channel
Update time [ms] of the measuring function[1]	0...25000	10	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Time base for velocity measurement[1]	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit[1]	1...65535	1	Yes	Channel

[1] Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

[2] When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

[3] When configuring with HSP for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

[4] Not available with HSP for STEP 7

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, sections Basic parameters and Manual operation available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.3.4 Address space

Address space of the technology module

Table 4- 9 Size of input and output addresses of the TM Count 1x24V with manual operation

	Inputs	Outputs
Range	16 bytes	12 bytes

4.3.5 Control and feedback interface

Note

The control and feedback interface is compatible with the control and feedback interface of the TM Count 2x24V, TM PosInput 2 and TM PosInput 1 technology modules of the S7-1500 automation system.

4.3.5.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface

The following table shows the assignment of the control interface:

<table>
<tr><th>Byte offset from start address ↓</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>0…3</td><td colspan="8">SLOT_0:
DINT or REAL: Load value (meaning of the value is specified in LD_SLOT_0)
Value range: –2147483648 to 2147483647$_D$ or 80000000 to 7FFFFFFF$_H$</td></tr>
<tr><td>4…7</td><td colspan="8">SLOT_1:
DINT or REAL: Load value (meaning of the value is specified in LD_SLOT_1)
Value range: –2147483648 to 2147483647$_D$ or 80000000 to 7FFFFFFF$_H$</td></tr>
<tr><td>8</td><td colspan="4">LD_SLOT_1</td><td colspan="4">LD_SLOT_0</td></tr>
<tr><td>9</td><td>EN_ CAPTURE</td><td>EN_ SYNC_DN</td><td>EN_ SYNC_UP</td><td>SET_DQ1</td><td>SET_DQ0</td><td>TM_ CTRL_DQ1</td><td>TM_ CTRL_DQ0</td><td>SW_GATE</td></tr>
</table>

Byte offset from start address ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
10	SET_DIR	Reserved					RES_ EVENT	RES_ ERROR
11	Reserved							

Explanations

Control bit/value	Explanations
EN_CAPTURE	Use this bit to enable the Capture function. Resetting this bit resets a set EVENT_CAP in the feedback interface.
EN_SYNC_DN	Use this bit to enable the synchronization of the counter when counting in downward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
EN_SYNC_UP	Use this bit to enable the synchronization of the counter when counting in upward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
LD_SLOT_m	Use this load request to specify the meaning of the value in SLOT_m: • 0000 means: No action, idle • 0001 means: Load counter value • 0010 not permitted • 0011 means: Load start value • 0100 means: Load comparison value 0 • 0101 means: Load comparison value 1 • 0110 means: Load counting low limit • 0111 means: Load counting high limit • 1000 to 1111 not permitted The technology module executes the respective action as soon as LD_SLOT_m changes. If values are loaded simultaneously using LD_SLOT_0 and LD_SLOT_1, the value from SLOT_0 is internally applied first and then the value from SLOT_1 . This can produce unexpected intermediate states.
RES_EVENT	Use this bit to trigger the reset of the saved events in the EVENT_ZERO, EVENT_OFLW, EVENT_UFLW, EVENT_CMP0, EVENT_CMP1 feedback bits.
RES_ERROR	Use this bit to trigger the reset of the saved error states LD_ERROR and ENC_ERROR .
Reserved	Reserve bits must be set to 0.
SET_DIR	Use this bit to specify the count direction for signal type "Pulse (A)". • 0 means: Up • 1 means: Down
SET_DQ0	Use this bit to set digital output DQ0 when TM_CTRL_DQ0 is set to 0. In the case of the function "After set command from CPU until comparison value", SET_DQ0 is effective regardless of TM_CTRL_DQ0 as long as the counter value is not equal to the comparison value.

Control bit/value	Explanations
SET_DQ1	Use this bit to set digital output DQ1 when TM_CTRL_DQ1 is set to 0. In the case of the function "After set command from CPU until comparison value", SET_DQ1 is effective regardless of TM_CTRL_DQ1 as long as the counter value is not equal to the comparison value.
SW_GATE	Use this bit to open and close the software gate when using an incremental encoder or pulse encoder. Together, the software gate and the hardware gate form the internal gate. The technology module only counts when the internal gate is open. • 0 means: Software gate closed • 1 means: Software gate open The digital inputs of the technology module externally control the hardware gate. The hardware gate can be activated by parameter assignment. The software gate cannot be deactivated.
TM_CTRL_DQ0	Use this bit to enable the technological function of digital output DQ0. • 0 means: SET_DQ0 defines the state of DQ0 • 1 means: assigned function defines the state of DQ0
TM_CTRL_DQ1	Use this bit to enable the technological function of digital output DQ1. • 0 means: SET_DQ1 defines the state of DQ1 • 1 means: assigned function defines the state of DQ1

4.3.5.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Byte offset from start address ↓	**Bit 7**	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0…3	COUNT_VALUE: DINT: Current counter value							
4…7	CAPTURED_VALUE: DINT: The last acquired Capture value							
8...11	MEASURED_VALUE: REAL: Current measured value							
12	Reserved					LD_ERROR	ENC_ERROR	POWER_ERROR
13	Reserved		STS_SW_GATE	STS_READY	LD_STS_SLOT_1	LD_STS_SLOT_0	RES_EVENT_ACK	Reserved
14	STS_DI2	STS_DI1	STS_DI0	STS_DQ1	STS_DQ0	STS_GATE	STS_CNT	STS_DIR
15	STS_M_INTERVAL	EVENT_CAP	EVENT_SYNC	EVENT_CMP1	EVENT_CMP0	EVENT_OFLW	EVENT_UFLW	EVENT_ZERO

Explanations

Feedback bit/value	Explanations
CAPTURED_VALUE	This DINT value indicates the last acquired Capture value. The following external signals can trigger the Capture function: • Rising or falling edge of a digital input • Both edges of a digital input The "Frequency of Capture function" parameter specifies whether the function is executed at each configured edge or only once after each enable.
COUNT_VALUE	This DINT value indicates the current counter value.
ENC_ERROR	This bit indicates that one of the following errors has occurred at the encoder signals (retentive) for the respective technology module: • Wire break of digital input A, B or N (with push-pull encoder) • Invalid transition of A/B signals (with incremental encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the manual for the respective technology module. The bit is reset once you have acknowledged the error with RES_ERROR .
EVENT_CAP	This bit indicates that a Capture event has occurred and a counter value has been saved in CAPTURED_VALUE . You reset the status by resetting EN_CAPTURE .
EVENT_CMP0	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ0 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP0 is not set.
EVENT_CMP1	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ1 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP1 is not set.
EVENT_OFLW	This bit indicates the saved status that the counter value had an overflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_SYNC	When an incremental or pulse encoder is used, this bit indicates the saved status that the counter was loaded with the start value by an external reference signal (synchronization). You reset the status by resetting EN_SYNC_UP or EN_SYNC_DN .
EVENT_UFLW	This bit indicates the saved status that the counter value had an underflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_ZERO	This bit indicates the saved status that the counter value or position value had a zero crossing. You reset the status by acknowledgment with RES_EVENT. When the "Zero crossing" hardware interrupt is enabled, for system-related reasons it can also be triggered if "0" is outside the configured value range.
LD_ERROR	This bit indicates that an error occurred (latching) during loading via the control interface. The loaded values were not applied. When using an incremental or pulse encoder, one of the following conditions is not fulfilled: • Low counting limit <= counter value <= high counting limit • Low counting limit <= start value <= high counting limit • Low counting limit <= comparison value 0/1 <= high counting limit The bit is reset once you have acknowledged the error with RES_ERROR .
LD_STS_SLOT_0	This bit indicates by a status change (toggling) that the load request for SLOT_0 (LD_SLOT_0) was detected and performed.

Feedback bit/value	Explanations
LD_STS_SLOT_1	This bit indicates by a status change (toggling) that the load request for SLOT_1 (LD_SLOT_1) was detected and performed.
MEASURED_VALUE	This value indicates the current measured value with data type REAL: • Frequency: The mean frequency is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the unit of hertz. • Period: The mean period is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the unit of seconds. • Velocity: The mean velocity is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the configured unit. The measured values are returned as a signed value. The sign indicates whether the counter value went up or down in the relevant time interval. The update time is asynchronous to the opening of the internal gate, i.e. the update time is not started when the gate opens. After the internal gate closes, the last calculated measured value continues to be returned.
POWER_ERROR	This bit indicates that supply voltage L+ is too low. If you have enabled the diagnostic interrupts (Page 77), the diagnostics interrupt "Supply voltage missing" is triggered at a supply voltage error. When supply voltage L+ is available at a sufficient level once again, POWER_ERROR is automatically set to 0.
RES_EVENT_ACK	This bit indicates that the reset of event bit EVENT_SYNC, EVENT_CMP0, EVENT_CMP1, EVENT_OFLW, EVENT_UFLW, EVENT_ZERO is active.
Reserved	Reserved bits are set to 0.
STS_CNT	This bit indicates that at least one count pulse or a position value change has occurred in the last ca. 0.5 s.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DI2	This bit indicates the status of digital input DI2.
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. • 0 means: Down • 1 means: Up
STS_DQ0	This bit indicates the status of digital output DQ0.
STS_DQ1	This bit indicates the status of digital output DQ1.
STS_GATE	This bit indicates the status of the internal gate when using an incremental or pulse encoder. • 0 means: Gate closed • 1 means: Gate open
STS_M_INTERVAL	This bit indicates that at least one count pulse or a position value change was detected in the previous measurement interval.
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.
STS_SW_GATE	This bit indicates the status of the software gate. • 0 means: Gate closed • 1 means: Gate open

4.3.6 Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables counter values and measured values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode. The input and output data are processed in the assigned OB.

The update time for the measured value is synchronized with the system cycle in a suitable ratio and, if necessary, adapted in length. If you set "0", the measured value is updated once per system cycle.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the counter value and the measured value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the "Filter frequency" parameter can affect the isochronous mode parameters of the sync domain.

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.4 Fast Mode

You can use the technology module in Fast Mode for very fast acquisition of the counter value with compressed functionality. A reduced feedback interface but no control interface is available in Fast Mode. This allows you to use a shorter send clock for the CPU.

The scope of functions of the technology module has the following additional restrictions in Fast Mode:

- Parameter change in RUN only possible with data record 128
- Count/position value range: 25 bits
- No measured value available
- No software gate available
- No Capture function available
- No hardware interrupts available
- Combined error message (feedback bit) that is acknowledged automatically

4.4.1 Configuring

Introduction

You configure the technology module and assign its parameters with the configuration software.

The functions of the technology module are controlled and checked by the user program via the feedback interface.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration and parameter setting with hardware configuration	Direct access to feedback interface in the I/O data
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): • Device configuration and parameter setting with hardware configuration	
Distributed operation with an S7-300/400 CPU	• S7-300/400 or S7-1200 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter setting with HSP (up to firmware version V1.2) or GSD file	
Distributed operation with an S7-1200 CPU	• S7-300/400 or S7-1200 automation system • ET 200SP distributed I/O system • TM Count 1x24V	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation in a third-party system	• Third-party automation system • ET 200SP distributed I/O system • TM Count 1x24V	Third-party configuration software: Device configuration and parameter setting with GSD file	

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

STEP 7 (TIA Portal)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

STEP 7

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/23183356).

GSD file

You can find the respective GSD file for the ET 200SP distributed I/O system for download on the Internet:

- GSD file for PROFINET IO (http://support.automation.siemens.com/WW/view/en/57138621)
- GSD file for PROFIBUS DP (http://support.automation.siemens.com/WW/view/en/73016883)

4.4.2 Reaction to CPU STOP

You set the response of the technology module to CPU STOP for each channel in the basic parameters of the device configuration.

Table 4- 10 Response of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "At comparison value for a pulse duration" is set at CPU stop, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the start value and the digital outputs switch according to the parameter assignment.

4.4.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 91).

You set the parameters of the module as follows in this operating mode:

Parameter setting using...	Basic procedure
Hardware configuration in STEP 7 (TIA Portal)	1. Insert the module from the hardware catalog under "Technology modules". 2. Set the device configuration and the parameters of the module in the hardware configuration. "Fast Mode" must be set as the operating mode. 3. Download the project to the CPU.
Hardware configuration in STEP 7 with HSP	1. Install the appropriate HSP file. You will then find the module in the hardware catalog under "ET 200SP". 2. Set the device configuration and the parameters in the hardware configuration. 3. Download the project to the CPU.

Parameter setting using...	Basic procedure
Hardware configuration with GSD file for distributed operation on PROFINET IO	1. Install the current PROFINET GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFINET IO > I/O". 2. Set the parameters in the hardware configuration. 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFIBUS DP	1. Install the current PROFIBUS GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFIBUS DP > I/O". 2. Set the parameters in the hardware configuration. The parameters marked with [1] in the following tables are not configurable in the PROFIBUS GSD file. 3. Download the project to the CPU. The parameters marked with [1] in the following tables are downloaded with their default setting. 4. If necessary, set the parameters marked with [1] in the user program using data record 128.

Parameters of the TM Count 1x24V

The following parameter settings are possible:

Table 4- 11 Settable parameters and their default setting

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the poten-tial group of the left module (dark BaseUnit)	No	Module
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substi-tute value	Yes	Channel
Substitute value for DQ0[1]	• 0 • 1	0	Yes	Channel
Substitute value for DQ1[1]	• 0 • 1	0	Yes	Channel
Enable diagnostic inter-rupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diag-nostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Invert direction[1] (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel
Filter frequency for counter inputs[1]	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz	200 kHz	Yes	Channel
Sensor type	• Sourcing output • Sinking output • Push-pull (sinking and sourcing output)	Sourcing output	Yes	Channel
Reaction to signal N[1]	• No reaction to signal N • Synchronization at signal N	No reaction to signal N	Yes	Channel
Counting high limit[1]	1...33554431	33554431	Yes	Channel
Start value[1]	0...33554431	0	Yes	Channel
Counting low limit[1]	0...33554430	0	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue count-ing	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at signal N • Digital input without function	Digital input without function	Yes	Channel
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Select level for DI[1]	• Active with high level • Active with low level	Active with high level	Yes	Channel
Edge selection for DI[1]	• At rising edge • At falling edge	At rising edge	Yes	Channel
Frequency of synchronization[1]	• Once • Periodic	Once	Yes	Channel
Count direction for synchronization	• Up • Down • In both directions	Up	Yes	Channel
Set output	• Between comparison value and high limit • Between comparison value and low limit • At comparison value for a pulse duration • Between comparison value 0 and 1 • Digital output without function	DQ0, DQ1: Digital output without function	Yes	Channel
Comparison value 0[1]	0...33554431	0	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Comparison value 1[1]	0...33554431	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10][1]	0...65535	5000 (corresponds to 0.5 s)	Yes	Channel
Hysteresis (in increments)[1]	0...255	0	Yes	Channel

[1] Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

[2] When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

4.4.4 Explanation of parameters

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station that are supplied from a common supply voltage.

A potential group begins with a light BaseUnit, which feeds the required supply voltage for all modules of the potential group. The light BaseUnit interrupts the three self-configuring voltage bars P1, P2 and AUX to the neighboring modules on the left.

All other I/O modules of this potential group are plugged into dark BaseUnits. They take on the potentials of the self-configuring busbars P1, P2 and AUX from the neighboring modules on the left.

A potential group ends with the dark BaseUnit, which is followed by a light BaseUnit or server module in the station configuration.

Signal type

You can select from the following signal types:

Signal type	Meaning
Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.
Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.
Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.
Pulse (A)	A pulse encoder (signal A) without direction signal is connected.
Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.

Invert direction

You can invert the counting direction to adapt it to the process.

The inverting of the direction is configurable and active for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Signal evaluation

With the parameter assignment of the signal evaluation, you specify which edges of the signals are counted.

You can select from the following options:

Signal evaluation	Meaning
Single	The edges of signal A are evaluated during a low level of signal B.
Double	Each edge of signal A is evaluated.
Quadruple	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counting inputs A, B and N.

The selected filter frequency is based on a pulse/break ratio of between around 40:60 and around 60:40. This results in a specific minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Filter frequency	Minimum pulse/break time
100 Hz	4.0ms
200 Hz	2.0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8.0 µs
100 kHz	4.0 µs
200 kHz	2.0 µs

Reaction to signal N

You use this parameter to specify which reaction to signal N is triggered.

You can select from the following options:

Option	Meaning
No reaction to signal N	The counter is not affected by signal N.
Synchronization at signal N	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.

Note

You can only select the reaction to signal N if you have selected the "Incremental encoder (A, B, N)" signal type.

Note

If you select "Synchronization at signal N", you can choose the "Enable synchronization at signal N" function for a digital input.

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Count direction of the synchronization

You use this parameter to specify the count direction for which the following functions are enabled:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
In both directions	Synchronization takes place regardless of the count direction.
Up	Synchronization only takes place when the counter is counting up.
Down	Synchronization only takes place when the counter is counting down.

Sensor type

With the parameter assignment of the sensor type, you specify how the counter inputs are switched.

You can select from the following options:

Option	Meaning
Sourcing output	The encoder or sensor switches the A, B and N inputs to 24 V DC.
Sinking output	The encoder or sensor switches the A, B and N inputs to M.
Push-pull (sinking and sourcing output)	The encoder or sensor switches the A, B and N inputs to alternately to M and 24 V DC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull encoder and the sensor type "Push-pull (sinking and sourcing output)" is configured, you can monitor the encoder signals for wire break.

Counting high limit

With the parameter assignment of the counting high limit, you limit the counting range. You can enter a value up to 33554431 (2^{25}-1). You must enter a value above the counting low limit.

Counting low limit

With the parameter assignment of the counting low limit, you limit the counting range. You can enter a value starting with 0. You must enter a value below the counting high limit.

Start value

With the parameter assignment of the start value, you specify the value at which counting is begun and is to continue in the case of defined events. You must enter a value at or within the counting limits.

Reaction to violation of a counting limit

You can configure the following reaction to violation of a counting limit:

Reaction	Meaning
Stop counting	After violation of a counting limit, counting is stopped and the internal gate is closed. To restart counting, you must close and reopen the SW gate or HW gate, if necessary.
Continue counting	Counting is continued with the start value or at the opposite counting limit depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit	The counter value is set to the opposite counting limit in each case.

Reaction to gate start

You can configure the following reaction to gate start:

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value	When the gate is opened, counting is continued with the last counter value.

Note

The parameter is only effective when you have configured a HW gate.

Set function of DI

With the parameter assignment of a digital input, you specify which function the digital input triggers when switched.

You can select from the following options:

Function of a digital input	Meaning
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the HW gate.
Gate start (edge-triggered)	The configured edge at the respective digital input opens the HW gate.
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the HW gate.
Synchronization	The configured edge at the respective digital input sets the counter to the start value.
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N.
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal status of the digital input via the feedback interface.

Note

Each function, except "Digital input without function", can be used only once per counter and can no longer be selected for the other digital inputs in each case.

Input delay

You use this parameter to suppress signal noise at the digital inputs. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

Note

If you select the "None" or "0.05 ms" option, you must use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be configured for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You use this parameter to specify the edge of the digital input at which the configured function is triggered.

You can select from the following options depending on the function selected:

- At rising edge
- At falling edge

The parameter can be configured for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options:

Function of a digital output	Meaning
Between comparison value and high limit	The respective digital output is active if: Comparison value <= counter value <= counting high limit
Between comparison value and low limit	The respective digital output is active if: Low limit <= counter value <= comparison value
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= counter value <= comparison value 1
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the counter value corresponds to the comparison value.
Digital output without function	The respective digital output is set to 0 irrespective of the reaction to CPU STOP.

Note

You can only set the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Digital output without function" function for digital output DQ0.

Comparison value 0

With the parameter assignment of the comparison value, you specify the counter value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than or equal to the counting low limit. If you use the DQ function "Between comparison value 0 and 1", comparison value 0 must be less than comparison value 1.

Comparison value 1

With the parameter assignment of the comparison value, you specify the counter value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is less than or equal to the counting high limit. If you use the DQ function "Between comparison value 0 and 1", comparison value 0 must be less than comparison value 1.

Count direction

You use this parameter to specify the count direction for which the selected functions is valid:

You can select from the following options:

Count direction	Meaning
In both directions	The comparison and switching of the respective digital output takes places regardless of the count direction.
Up	The comparison the switching of the respective digital output only takes place when the counter counts up.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down.

The parameter can be configured for the following functions:

- Between comparison value 0 and 1
- At comparison value for a pulse duration

Pulse duration

With the parameter assignment of the pulse duration for the "At comparison value for a pulse duration" function, you specify how many milliseconds the respective digital output is active.

If you enter "0" and the counter value corresponds to the respective comparison value, the digital output is active until the next count pulse.

Hysteresis (in increments)

With the parameter assignment of the hysteresis, you specify a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again before the counter value has left this range.

An encoder can stop at a certain position, and slight movements can cause the counter value to fluctuate around this position. If a comparison value or counting limit is within the fluctuation range and a hysteresis is not used, the associated digital output will switch on and off with corresponding frequency. The hysteresis prevents these unwanted switching actions.

Regardless of the hysteresis value, the hysteresis range ends at the low or counting high limit. If you enter "0", the hysteresis is turned off.

4.4.5 Address space

Address space of the technology module

Table 4- 12 Size of input and output addresses of the TM Count 1x24V with Fast Mode

	Inputs	Outputs
Range	4 bytes	0 bytes

4.4.6 Assignment of the feedback interface

The user program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Byte offset from start address ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	LS	STS_ READY	Reserved	EXT_F	STS_DI0	STS_DIR	STS_DI1	COUNT_ VALUE
1	COUNT_VALUE: DINT: Current counter value or position value							
2								
3								

Explanation of feedback bits

Feedback bit	Explanations
COUNT_VALUE	This value returns the current counter value in the first 25 bits of a DINT value.
EXT_F	This bit indicates that one of the following errors has occurred at the encoder signals for the technology module: • Load voltage missing • Wire break of digital input A, B or N (with push-pull encoder) • Invalid transition of A/B signals (with incremental encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to section Diagnostic alarms (Page 78). The bit is reset automatically as soon as an error no longer exists.
LS	As a life sign, this bit indicates by a status change (toggling) that isochronous mode is functioning and the module has updated the feedback interface in the respective bus cycle. In non-isochronous mode, this bit is set to 0.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DI2	This bit indicates the status of digital input DI2.
STS_DIR	This bit indicates the count direction of the last count pulse. 0 means: Down 1 means: Up
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.

4.4.7 Isochronous mode

The technology module supports the "Isochronous mode" system function. Counter values can be acquired in a fixed system cycle with this system function.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

This operating mode is especially well-suited for short send clocks of the CPU starting from 125 µs, because only input data is used.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode.

Data processing

At the time the input data is read in (T_i), the counter value and the status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the "Filter frequency" parameter can affect the isochronous mode parameters of the sync domain.

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

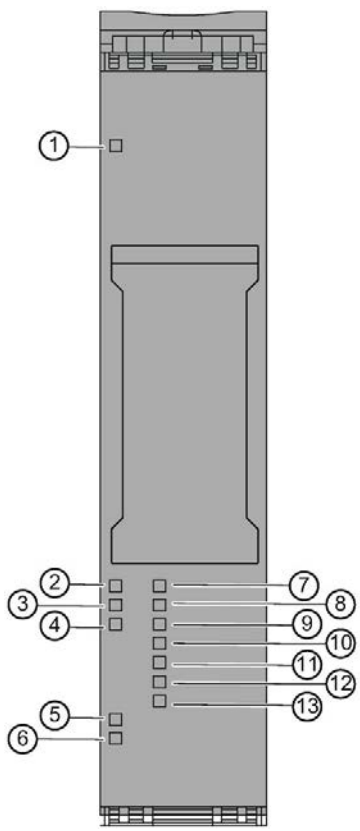
- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

Interrupts/diagnostic messages 5

5.1 Status and error display

LEDs

The following figure shows you the LED displays (status and error displays) of TM Count 1x24V.



① DIAG (green/red)
② Status A (green)
③ Status B (green)
④ Status N (green)
⑤ 24VDC (green)
⑥ PWR (green)
⑦ Status DI0 (green)
⑧ Status DI1 (green)
⑨ Status of DI2 (green)
⑩ Status DQ0 (green)
⑪ Status DQ1 (green)
⑫ Status UP (green)
⑬ Status DN (green)

Figure 5-1 LED displays of the TM Count 1x24V

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in section Diagnostic messages (Page 77).

Table 5- 1 Status and error displays DIAG

LED DIAG	Meaning	Remedy
Off	Backplane bus supply of the ET 200SP not OK	Check or switch on the supply voltage on the CPU or on the interface module.
Flashes	Technology module parameters not set	---
On	Technology module parameters set and no module diagnostics	
Flashes	Technology module parameters set and module diagnostics (at least one error is present)	Evaluate the diagnostic alarms and eliminate the error.

Table 5- 2 PWR/24VDC status displays

LEDs		Meaning	Remedy
PWR	24VDC		
Off	Off	Supply voltage missing	• Check the supply voltage. • Check the BaseUnit type and the wiring of the BaseUnit.
On	On	Supply voltage is present and OK	---
On	Off	Short-circuit or overload at the encoder supply or supply voltage too low	• Check the encoder wiring. • Check the loads connected to the encoder supply. • Check the supply voltage.

Channel LEDs

The A, B, N and DIm LEDs indicate the current level of the associated signals. The LEDs of the DQm digital outputs indicate the desired state.

The UP and DN LEDs indicate the logical counting direction.

The flashing frequency of the channel LEDs is limited to approximately 12 Hz. If higher frequencies are present, the channel LEDs will flash at 12 Hz instead of indicating the current status.

Table 5- 3 Status displays A/B/N/DIm/DQm

LEDs A/B/N/DIm/DQm	Meaning
□ Off	Counter input/digital input/digital output at 0 level
■ On	Counter input/digital input/digital output at 1 level

Table 5- 4 Status displays UP/DN

<table>
<tr><th colspan="2">LEDs</th><th rowspan="2">Meaning</th></tr>
<tr><th>UP</th><th>DN</th></tr>
<tr><td>□ Off</td><td>□ Off</td><td>No count pulse has been detected for the last 0.5 s.</td></tr>
<tr><td>■ On</td><td>□ Off</td><td>The last count pulse has incremented the counter and took place no more than 0.5 s ago.</td></tr>
<tr><td>□ Off</td><td>■ On</td><td>The last count pulse has decremented the counter and took place no more than 0.5 s ago.</td></tr>
</table>

5.2 Diagnostic messages

Enabling of diagnostic interrupts

You enable the diagnostic interrupts in the device configuration with the basic parameters.

The technology module can trigger the following diagnostic interrupts:

Table 5- 5 Possible diagnostic interrupts

Diagnostic interrupt	Monitoring
• Parameter error • Hardware interrupt lost[1] • Channel/component temporarily unavailable • Internal error • Watchdog tripped. Module is defective.	Monitoring is always active. A diagnostic interrupt is triggered each time an error is detected.
• Wire break at digital input A, B or N	Monitoring is active if a push-pull switching encoder has been configured. When an error is detected, a diagnostic interrupt is only triggered if "Enable diagnostic interrupt on wire break" is activated in the device configuration.
• Error • Load voltage missing • Short-circuit / overload at external encoder supply • Error at digital outputs • Supply voltage error[2] • Invalid transition of A/B signals • Overtemperature	Monitoring is always active. When an error is detected, a diagnostic interrupt is only triggered if "Enable additional diagnostic interrupts" is activated in the device configuration.

[1] Not available in "Position input for "Motion Control"" technology object" and "Fast Mode" operating modes

[2] No longer available as of module version V1.2 This case is then taken into account by diagnostic interrupt "Load voltage missing".

Reactions to a diagnostic interrupt

The following happens when an event occurs that triggers a diagnostic interrupt:

- The DIAG LED flashes red.

  When you have eliminated all errors, the DIAG LED stops flashing red and turns green.
- The S7-1500 CPU interrupts the processing of the user program. The diagnostic interrupt OB (e.g. OB 82) is called. The event that triggered the interrupt is entered in the start information of the diagnostic interrupt OB.
- The S7-1500 CPU remains in RUN, even if no diagnostic interrupt OB is present in the CPU. The technology module continues working unchanged if this is possible despite the error.

You can obtain detailed information on the error event in the error organization block with instruction "RALRM" (Read additional alarm information), in the information system of STEP 7 and in function manual Diagnostics (https://support.industry.siemens.com/cs/ww/en/view/59192926), section "System diagnostics in user program".

If the module is being operated as a distributed module in an ET 200SP system with PROFIBUS DP, you have the option of reading out diagnostic data with the RDREC or RD_REC instruction using data record 0 and 1. You can find the structure of the data records in the manual for the IM 155-6 DP HF interface module available for download on the Internet (https://support.industry.siemens.com/cs/ww/de/view/73098660).

Diagnostic alarms

The display of diagnostics is in plain text in STEP 7 (TIA Portal) in the online and diagnostics view. You can evaluate the error codes with the user program.

The following diagnostics can be signaled:

Table 5- 6 Diagnostic alarms, their meaning and remedies

Diagnostic alarm	Error code	Meaning	Remedy
Error	9_H	• Internal module error occurred • Possible cause: Technology module defective	Replace technology module
Parameter error	10_H	• The received parameter data record is invalid • The configured BaseUnit is not the used BaseUnit	• Check parameter data record • Check BaseUnit
Load voltage missing	11_H	• Missing or insufficient supply voltage L+ • Wiring of supply voltage L+ faulty • Possible cause: BaseUnit type incorrect	• Check BaseUnit type • Check supply voltage L+ on the BaseUnit • Check wiring of supply voltage L+ • Check total consumption of the load group

Diagnostic alarm	Error code	Meaning	Remedy
Hardware interrupt lost	16_H	• Module cannot issue interrupt because a preceding interrupt has not yet been processed • Possible cause: Too many hardware interrupts in too short a time	• Change interrupt processing in the CPU and re-assign technology module parameters correspondingly • Check frequency of interrupts from the process
Channel/component temporarily unavailable	$1F_H$	Firmware update in progress or update was aborted. The module reads no process values in this state.	• Wait for firmware update • If firmware update aborts: – Check minimum firmware version required – Check supply voltage – Repeat firmware update
Internal error	100_H	Technology module defective	Replace technology module
Watchdog tripped. Module is defective.	103_H	Firmware error	Run firmware update
		Technology module defective	Replace technology module
Short-circuit / overload at external encoder supply	$10E_H$	• Error at encoder supply • Possible causes: – Short circuit – Overload	• Check encoder wiring • Check consumers connected to encoder supply
Error at digital outputs	$10F_H$	• Error at digital outputs (LED display DQm lit red) • Possible causes: – Short circuit – Overload	• Check wiring at the digital outputs • Check consumers connected to the digital outputs
Supply voltage error[1]	110_H	• Error at supply voltage L+ • Possible causes: – Low voltage – Wiring of supply voltage L+ faulty	• Check supply voltage L+ on the BaseUnit • Check wiring of supply voltage L+ • Check total consumption of the load group
Invalid transition of A/B signals	500_H	• Time profile of signals A and B of the incremental encoder does not meet certain requirements (relative phase shift of the two signals is too small) • Possible causes: – Signal frequency too high – Encoder faulty – Process wiring faulty	• Check process wiring • Check encoder/sensor • Check parameter assignment
Wire break at digital input A, B or N	505_H	Channel not connected	Connect the channel
		Resistance of encoder circuit too high	• Use a different encoder type or modify the wiring, for example, use shorter cables with larger cross-sections • Check encoders

Diagnostic alarm	Error code	Meaning	Remedy
		Interruption of the line between technology module and encoder	Check process wiring
		Sensor used is sourcing output or sinking output only	Correct parameter assignment
Overtemperature	506_H	Possible causes: • Short-circuit or overload at the digital outputs or output of the encoder supply • Ambient temperature outside specifications • Contamination in the module prevents cooling	• Check process wiring • Improve cooling • Check connected loads

[1] No longer available as of module version V1.2. This case is then taken into account by diagnostic interrupt "Load voltage missing".

5.3 Hardware interrupts

Introduction

For the technology module, you can configure which events are to trigger a hardware interrupt during operation.

What is a hardware interrupt?

The technology module will trigger a hardware interrupt as configured in response to specific events/states. When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the assigned hardware interrupt OB. The event that triggered the interrupt is entered in the start information of the assigned hardware interrupt OB by the CPU.

Lost hardware interrupt

If an event occurs that is to trigger a hardware interrupt and the preceding event has not yet been processed, another hardware interrupt cannot be triggered. The hardware interrupt is lost and the diagnostic interrupt "Lost hardware interrupt" is triggered.

Enabling of hardware interrupts

A hardware interrupt is triggered when the condition for the change of the respective status or event bit in the feedback interface is met.

You enable the hardware interrupts in the device configuration with the basic parameters. You can configure hardware interrupts to be triggered for the following event types:

- Opening of internal gate (gate start)
- Closing of internal gate (gate stop)
- Overflow (high counting limit violated)
- Underflow (low counting limit violated)
- Comparison event for DQ0 has occurred
- Comparison event for DQ1 has occurred
- Zero crossing[3]
- New Capture value available[1]
- Synchronization of the counter by an external signal
- Direction reversal[2]

[1] Only configurable in Counting mode

[2] Feedback bit STS_DIR is preassigned with "0". If the first counter value change occurs in the *downwards direction* directly after switching on the technology module, no hardware interrupt is triggered.

[3] When the "Zero crossing" hardware interrupt is enabled, for system-related reasons it can also be triggered if "0" is outside the configured value range.

You can activate any combination of events to trigger hardware interrupts.

You can obtain detailed information on the event in the hardware interrupt organization block with instruction "RALRM" (Read additional alarm information) and in the information system of STEP 7.

Which event has triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of the local data double word 8.

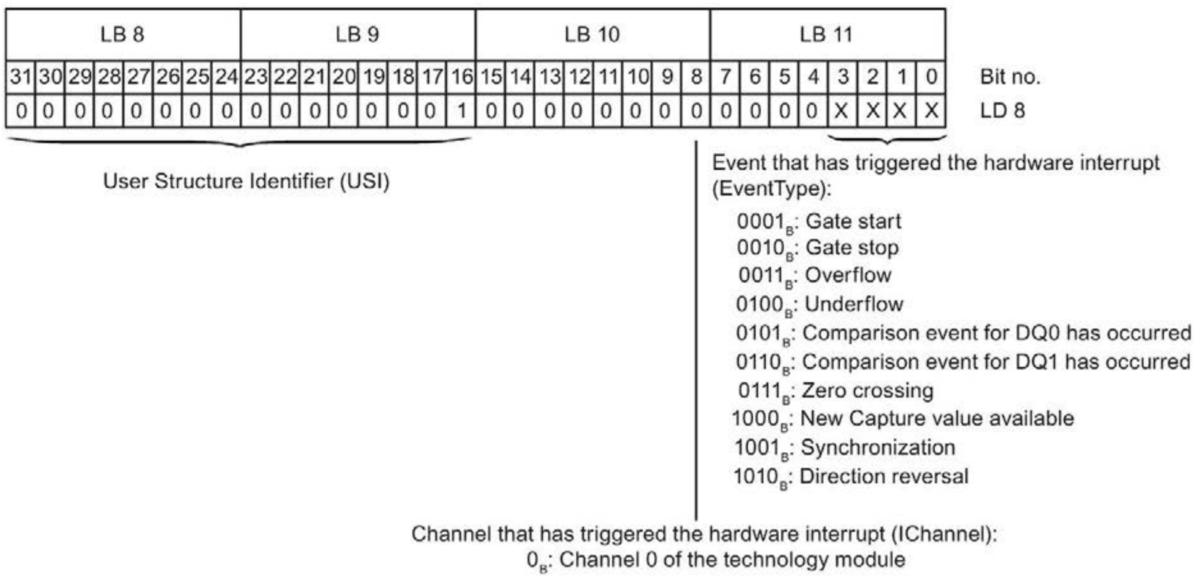


Figure 5-2 Start information of the organization block

• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 (FW V1.0), V14 (V1.2), V15 (FW V1.3) / V13 (FW V1.0), V14 SP1 (V1.2)
• STEP 7 configurable/integrated as of version	As of V5.5 SP3, only up to FW V1.2
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Supply voltage	
Load voltage L+	
• Rated value (DC)	24 V
• permissible range, lower limit (DC)	19.2 V
• permissible range, upper limit (DC)	28.8 V
• Reverse polarity protection	Yes
Input current	
Current consumption, max.	60 mA; without load
Encoder supply	
Number of outputs	1
24 V encoder supply	
• 24 V	Yes; L+ (-0.8 V)
• Short-circuit protection	Yes; electronic/thermal
• Output current, max.	300 mA
Power loss	
Power loss, typ.	1 W

Article number	6ES7138-6AA00-0BA0
Address area	
Occupied address area	
• Inputs	16 byte; 4 bytes in Fast mode
• Outputs	12 byte; 4 bytes for Motion Control, 0 bytes for Fast mode
Digital inputs	
Number of digital inputs	3
Digital inputs, parameterizable	Yes
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Digital input functions, parameterizable	
• Gate start/stop	Yes
• Capture	Yes
• Synchronization	Yes
• Freely usable digital input	Yes
Input voltage	
• Rated value (DC)	24 V
• for signal "0"	-5 ... +5 V
• for signal "1"	+11 to +30V
• permissible voltage at input, min.	-30 V; -5 V continuous, -30 V brief reverse polarity protection
• permissible voltage at input, max.	30 V
Input current	
• for signal "1", typ.	2.5 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms
– at "0" to "1", min.	6 μs; for parameterization "none"
– at "1" to "0", min.	6 μs; for parameterization "none"
for counter/technological functions	
– parameterizable	Yes
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m

Article number	6ES7138-6AA00-0BA0
Digital outputs	
Type of digital output	Transistor
Number of digital outputs	2
Short-circuit protection	Yes; electronic/thermal
• Response threshold, typ.	1 A
Limitation of inductive shutdown voltage to	L+ (-33 V)
Controlling a digital input	Yes
Digital output functions, parameterizable	
• Switching tripped by comparison values	Yes
• Freely usable digital output	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A; Per digital output
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	12 kΩ
Output voltage	
• for signal "1", min.	23.2 V; L+ (-0.8 V)
Output current	
• for signal "1" rated value	0.5 A; Per digital output
• for signal "1" permissible range, max.	0.6 A; Per digital output
• for signal "1" minimum load current	2 mA
• for signal "0" residual current, max.	0.5 mA
Output delay with resistive load	
• "0" to "1", max.	50 µs
• "1" to "0", max.	50 µs
Switching frequency	
• with resistive load, max.	10 kHz
• with inductive load, max.	0.5 Hz; Acc. to IEC 60947-5-1, DC-13; observe derating curve
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per module, max.	1 A
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m

Article number	6ES7138-6AA00-0BA0
Encoder	
Connectable encoders	
• 2-wire sensor	Yes
– permissible quiescent current (2-wire sensor), max.	1.5 mA
Encoder signals, incremental encoder (asymmetrical)	
• Input voltage	24 V
• Input frequency, max.	200 kHz
• Counting frequency, max.	800 kHz; with quadruple evaluation
• Cable length, shielded, max.	600 m; depending on input frequency, encoder and cable quality; max. 50 m at 200 kHz
• Signal filter, parameterizable	Yes
• Incremental encoder with A/B tracks, 90° phase offset	Yes
• Incremental encoder with A/B tracks, 90° phase offset and zero track	Yes
• Pulse encoder	Yes
• Pulse encoder with direction	Yes
• Pulse encoder with one impulse signal per count direction	Yes
Encoder signal 24 V	
– permissible voltage at input, min.	-30 V
– permissible voltage at input, max.	30 V
Interface types	
• Source/sink input	Yes
• Input characteristic curve in accordance with IEC 61131, type 3	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes

Article number	6ES7138-6AA00-0BA0
Interrupts/diagnostics/status information	
Substitute values connectable	Yes; Parameterizable
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• A/B transition error at incremental encoder	Yes
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for module diagnostics	Yes; green/red DIAG LED
• Status indicator backward counting (green)	Yes
• Status indicator forward counting (green)	Yes
Integrated Functions	
Number of counters	1
Counting frequency (counter) max.	800 kHz; with quadruple evaluation
Counting functions	
• Can be used with TO High_Speed_Counter	Yes
• Continuous counting	Yes
• Counter response parameterizable	Yes
• Hardware gate via digital input	Yes
• Software gate	Yes
• Event-controlled stop	Yes
• Synchronization via digital input	Yes
• Counting range, parameterizable	Yes
Comparator	
– Number of comparators	2
– Direction dependency	Yes
– Can be changed from user program	Yes

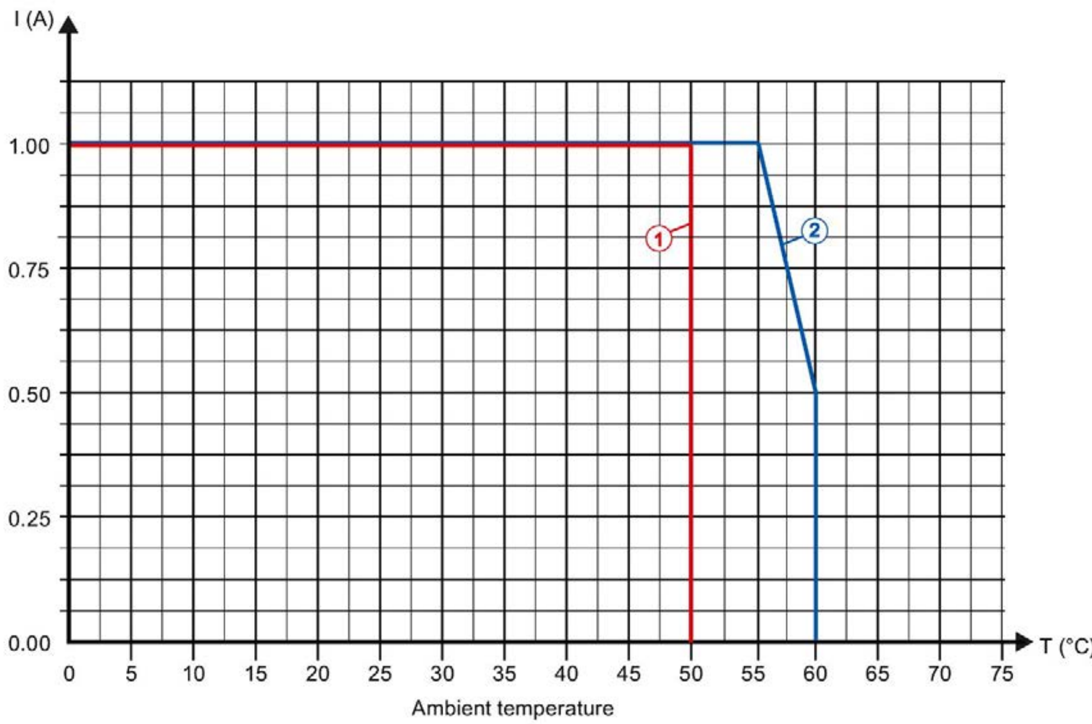
Article number	6ES7138-6AA00-0BA0
Position detection	
• Incremental acquisition	Yes
• Suitable for S7-1500 Motion Control	Yes
Measuring functions	
• Measuring time, parameterizable	Yes
• Dynamic measurement period adjustment	Yes
• Number of thresholds, parameterizable	2
Measuring range	
– Frequency measurement, min.	0.04 Hz
– Frequency measurement, max.	800 kHz
– Cycle duration measurement, min.	1.25 µs
– Cycle duration measurement, max.	25 s
Accuracy	
– Frequency measurement	100 ppm; depending on measuring interval and signal evaluation
– Cycle duration measurement	100 ppm; depending on measuring interval and signal evaluation
– Velocity measurement	100 ppm; depending on measuring interval and signal evaluation
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Decentralized operation	
to SIMATIC S7-300	Yes
to SIMATIC S7-400	Yes
to SIMATIC S7-1200	Yes
to SIMATIC S7-1500	Yes
to standard PROFIBUS master	Yes
to standard PROFINET controller	Yes
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	45 g

Derating information for total current of outputs

If the digital outputs of the TM Count 1x24V are operated with resistive or inductive loads, you should derate the total current of the loads at the digital outputs of the technology module. The total current is the sum of the load currents at all digital outputs of the module (without encoder supply).

The following derating curve shows the load capacity of the digital outputs depending on the ambient temperature and mounting position under the following conditions:

- Load resistance: 48 Ω (IEC 947-5-1)

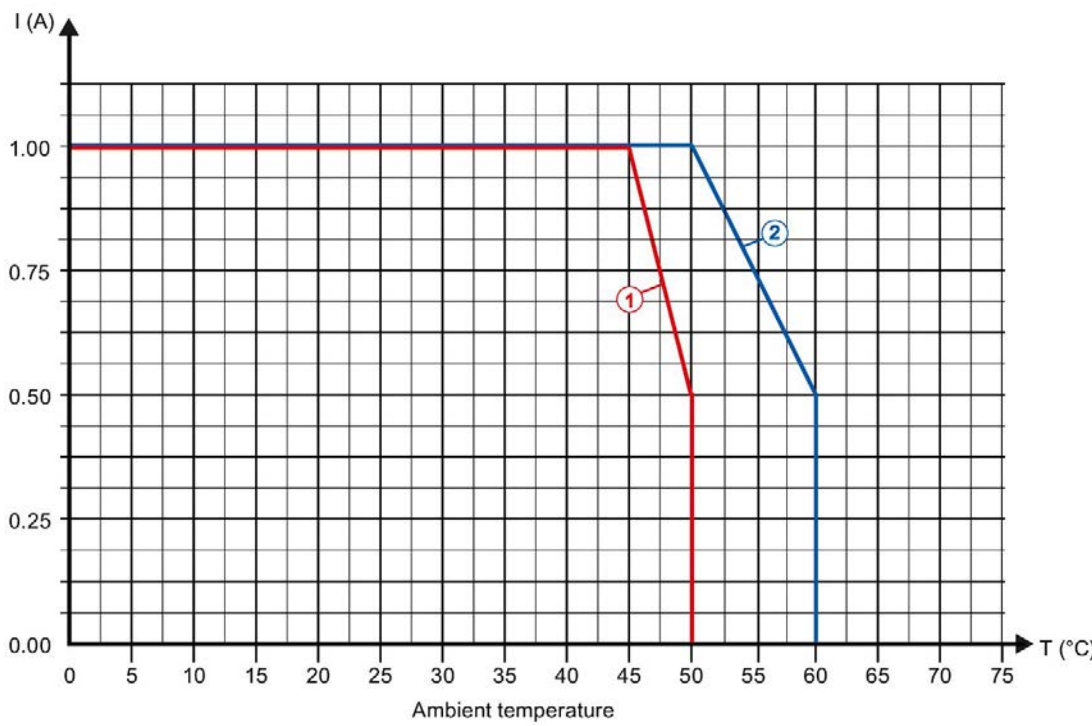


① Vertical installation of the system
② Horizontal installation of the system

Figure 6-1 Total current depending on ambient temperature and mounting position for resistive loads

The following derating curve shows the load capacity of the digital outputs depending on the ambient temperature and mounting position under the following conditions:

- Maximum switching frequency at digital outputs of 0.5 Hz
- Load resistance: 48 Ω (IEC 947-5-1)
- Load inductance: 1150 mH (IEC 947-5-1)



① Vertical installation of the system

② Horizontal installation of the system

Figure 6-2 Total current depending on ambient temperature and mounting position for inductive loads

---

Note

If the switching frequency is greater than 0.5 Hz or there is greater inductance at the digital outputs, the total current must be reduced further.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

You have the option of reassigning module parameters with the user program while the CPU is in RUN. The parameters are transferred to the module using data record 128, e.g. with the WRREC instruction.

If an error occurs while transferring or validating parameters with the WRREC instruction, the module continues operating with the existing parameter assignment. A corresponding error code is then written to the STATUS output parameter. If no errors occur, the STATUS output parameter contains the length of the actually transferred data.

You can find a description of the WRREC instruction and the error codes in section Parameter validation error (Page 101) or in the online help of STEP 7 (TIA Portal).

Structure of data record 128 for operation with technology object and manual operation

The following table shows you the structure of data record 128 for TM Count 1x24V for operation with technology object and manual operation without technology object. The values in byte 0 to byte 3 are fixed and must not be changed. The value in byte 4 can only be changed by means of new parameter assignment and not in RUN mode of the CPU.

Note

After each writing of data record 128, the module is set to its startup state and the counter value is set to the start value. If "Continue operation" is set for Reaction to CPU STOP, the module is then only set to its startup state when data record 128 has been changed.

Table A- 1 Data record 128: Operating modes "Operating with "Counting and measurement" technology object", "Manual operation (without technology object)"

</table>

1 You activate the respective parameter by setting the associated bit to 1.

2 Reserved bits must be set to 0

3 In isochronous mode, the parameter can affect the isochronous mode parameters of the sync domain. Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameter in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

4 Applies to: Set function of DI = 001_B; 010_B; 011_B; 101_B

Structure of the data record 128 in Fast Mode

The following table shows you the structure of data record 128 for TM Count 1x24V for Fast Mode. The values in byte 0 to byte 3 are fixed and must not be changed.

18	**Behavior of DI2**: See Byte 16							
19	Frequency of synchro-nization:	Count direction for syn-chronization		Reserved[2]	Input delay:			
	0_B: Once	00_B: Not permitted			0000_B: None			
	1_B: Periodic	01_B: Up			0001_B: 0.05 ms			
		10_B: Down			0010_B: 0.1 ms			
		11_B: In both directions			0011_B: 0.4 ms			
					0100_B: 0.8 ms			
					0101_B: 1.6 ms			
					0110_B: 3.2 ms			
					0111_B: 12.8 ms			
					1000_B: 20 ms			
					1001 to 1111_B: Not permitted			
20...43	**Values**							
20...23	High counting limit: DWORD: Value range: 1 to 33554431_D or 1 to $01FFFFFF_H$							
24...27	Comparison value 0: DWORD: Value range: 0 to 33554431_D or 0 to $01FFFFFF_H$							
28...31	Comparison value 1: DWORD: Value range: 0 to 33554431_D or 0 to $01FFFFFF_H$							
32...35	Start value: DWORD: Value range: 0 to 33554431_D or 0 to $01FFFFFF_H$							
36...39	Low counting limit: DWORD: Value range: 0 to 33554430_D or 0 to $01FFFFFE_H$							
40...43	Reserved[2]							

Bit → / Byte ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
44	**Counter behavior at limits and gate start**							
44	Reaction to gate start:		Reaction to violation of a counting limit:			Reset when counting limit is violated:		
	00_B: Set to start value		000_B: Stop counting			000_B: To opposite counting limit		
	01_B: Continue with current value		001_B: Continue counting			001_B: To start value		
	10 to 11_B: Not permitted		010 to 111_B: Not permitted			010 to 111_B: Not permitted		
45...47	Reserved[2]							
48	Set hysteresis range: Value range: 0 to 255_D:							
49...51	Reserved[2]							

1 You activate the respective parameter by setting the associated bit to 1.

2 Reserved bits must be set to 0

3 In isochronous mode, the parameter can affect the isochronous mode parameters of the sync domain. Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameter in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

4 Applies to: Set function of DI = 001_B; 010_B; 011_B

A.2 Parameter validation error

If you make the parameter settings in STEP 7 (TIA Portal) or in STEP 7 , the parameter values are checked before they are transferred to the technology module. This process prevents parameter errors.

In other use cases, the technology module checks the transferred parameter data record. If the technology module finds invalid or inconsistent parameter values, it outputs an error code (see below). The new parameter data record is rejected in this case, and work continues with the current parameter values until a valid parameter data record has been transferred.

WRREC

When the CPU is in RUN, you can change the parameter data record with the instruction WRREC (Write Record). In case of errors, the WRREC instruction returns corresponding error codes in the STATUS parameter.

Example:

Let us assume that an invalid value, for example 9, is written to the module for the operating mode with WRREC. As a consequence, the module rejects the entire parameter data record. You can recognize this by evaluating the STATUS output parameter of the WRREC instruction. The STATUS output parameter is output as an ARRAY[1..4] of BYTE data with the value 16#DF80E111:

Example of WRREC STATUS data	Address	Meaning
DF_H	STATUS[1]	Error when writing a data record via PROFINET IO (IEC 61158-6)
80_H	STATUS[2]	Error when reading or writing a data record via PROFINET IO (IEC 61158-6)
$E1_H$	STATUS[3]	Module-specific error
11_H	STATUS[4]	Error code from the table below: The "Operating mode" parameter has an invalid value.

Error codes

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Table A- 3 Error codes for parameter validation

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Data record number unknown	Enter valid number for data record.
DF	80	B1	01	Length of data record incorrect	Enter valid value for data record length.
DF	80	B2	00	Slot invalid or not accessible	• Check whether module is inserted or removed. • Check assigned values for parameters of the WRREC instruction.
DF	80	E0	01	Wrong version	• Check byte 0. • Enter valid values.
DF	80	E0	02	Error in the header information	• Check byte 1. • Correct the length of the parameter blocks.
DF	80	E1	00	Parameter invalid: No detailed information available	Check all parameter values.
DF	80	E1	11	"Operating mode" parameter invalid	Enter valid parameter value.
DF	80	E1	12	"Reaction to CPU STOP" parameter invalid	Enter valid parameter value.
DF	80	E1	13	"Signal type" parameter invalid	Enter valid parameter value.
DF	80	E1	14	"Sensor type" parameter invalid	Enter valid parameter value.
DF	80	E1	15	"Filter frequency" parameter invalid	Enter valid parameter value.
DF	80	E1	16	"Reaction to signal N" parameter invalid	Enter valid parameter value.
DF	80	E1	17	"Set function of DI" parameter invalid	Enter valid parameter value.
DF	80	E1	18	"Set function of DI" parameter configured the same for DI0 and DI1.	Enter different parameter values for DI0 and DI1.
DF	80	E1	19	• "Edge selection" parameter invalid • "Gate start (edge-triggered)" configured as function for DIm and "At rising and falling edge" • "Gate stop (edge-triggered)" configured as function for DIm and "At rising and falling edge" • "Synchronization" configured as function for DIm and "At rising and falling edge"	• Enter valid parameter value. • Only configure "Gate start (edge-triggered)" as function for DIm together with "At rising edge" or "At falling edge". • Only configure "Gate stop (edge-triggered)" as function for DIm together with "At rising edge" or "At falling edge". • Only configure "Synchronization" as function for DIm together with "At rising edge" or "At falling edge".
DF	80	E1	1A	"Input delay" parameter invalid	Enter valid parameter value.
DF	80	E1	1B	"Set output" parameter invalid	Enter valid parameter value.
DF	80	E1	1C	"Count direction" parameter invalid	Enter valid parameter value.
DF	80	E1	1D	"Reset when counting limit is violated" parameter invalid	Enter valid parameter value.
DF	80	E1	1E	"Reaction to violation of a counting limit" parameter invalid	Enter valid parameter value.
DF	80	E1	20	"Reaction to gate start" parameter invalid	Enter valid parameter value.

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	21[1,5]	• Low counting limit > comparison value 0 • Low counting limit > comparison value 1	• Low counting limit < comparison value 0 • Low counting limit < comparison value 1
DF	80	E1	22[1,5]	• Counting high limit < comparison value 0 • Counting high limit < comparison value 1	• High counting limit > comparison value 0 • High counting limit > comparison value 1
DF	80	E1	23	• "Start value" parameter invalid • "Low counting limit" parameter invalid	Enter valid parameter value: Start value > low counting limit
DF	80	E1	24	• "Start value" parameter invalid • "High counting limit" parameter invalid	Enter valid parameter value: Start value < high counting limit
DF	80	E1	25	"Update time" parameter invalid	Enter parameter value from range 0 to 25000000_D.
DF	80	E1	26[2]	"Reference speed" parameter invalid	Enter parameter value from range 6.00 to 210000.00_D.
DF	80	E1	27	"Measured variable" parameter invalid	Enter valid parameter value.
DF	80	E1	28	"Time base for velocity measurement" parameter invalid	Enter valid parameter value.
DF	80	E1	29	"Increments per unit" parameter invalid	Enter valid parameter value.
DF	80	E1	2A	• "High counting limit" parameter invalid • "Low counting limit" parameter invalid	Enter valid parameter value: Low counting limit < high counting limit
DF	80	E1	2B[3]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value: Comparison value 0 < comparison value 1
DF	80	E1	2C	"Signal evaluation" parameter invalid	Enter valid parameter value.
DF	80	E1	2D	• "Between comparison value 0 and 1" configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ0 • "Between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0	• Configure "Between comparison value 0 and 1" only for DQ1 • "Not between comparison value 0 and 1" configured only for DQ1 • Only configure "Between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0 • Only configure "Not between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0
DF	80	E1	2E	"Capture" configured for DIm in "Measuring" operating mode	Do not configure "Capture" for DIm in "Measuring" operating mode
DF	80	E1	36[4]	"Counting high limit" parameter invalid	Enter valid parameter value.
DF	80	E1	37[4,5]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value.
DF	80	E1	38[4]	"Start value" parameter invalid	Enter valid parameter value.
DF	80	E1	39[4]	"Counting low limit" parameter invalid	Enter valid parameter value.

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	3A[4]	"Count direction for synchronization" parameter invalid	Enter valid parameter value.
DF	80	E1	F0	Reserved bit is not set to 0.	Set reserved bit to 0.

[1] Only for "Counting" operating mode

[2] Only for "Position input for technology object "Motion Control"" operating mode

[3] Only for DQ1 functions "Between comparison value 0 and 1" and "Not between comparison value 0 and 1"

[4] Only for operating mode "Fast Mode"

[5] Not for DQm function "Use by user program" or "Digital output without function"

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual includes module-specific information on wiring, diagnostics and the technical specifications of the technology module.

General information regarding the design and commissioning of the ET 200SP is available in the ET 200SP system manual.

The counting and measuring functions as well as the position input of the TM PosInput 1 technology module are described in more detail in the Counting, measurement and position input (http://support.automation.siemens.com/WW/view/en/59709820) function manual.

Conventions

Please observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Open Source Software

Open-source software is used in the firmware of the product described. Open Source Software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

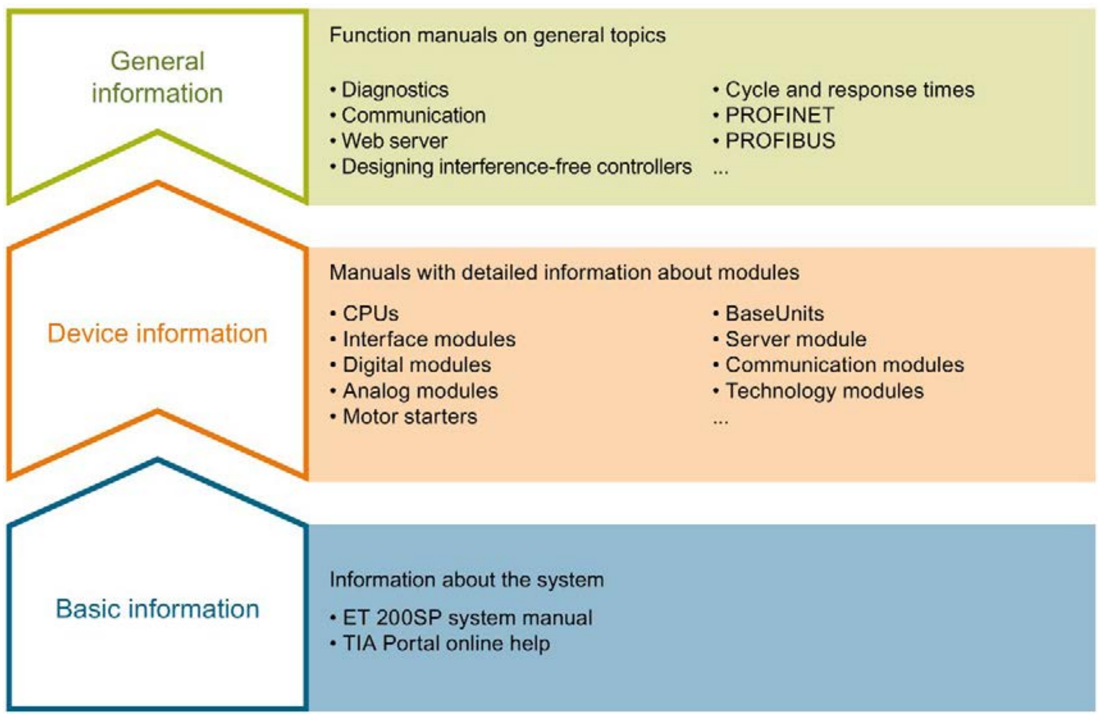
For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information on this on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109740777).

Table of contents

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

⑨ Module type color coding
⑩ Function and firmware version
⑪ Color code for selecting the color-coded labels
⑫ Article number

Figure 2-1 View of the TM PosInput 1 module

Properties

The TM PosInput 1 technology module has the following properties:

- Technical properties
  - One channel
  - Interfaces:

    SSI encoder signals D und C or RS422/TTL encoder signals A, B and N

    24 V encoder supply, short-circuit-proof

    Digital inputs signals DI0 and DI1

    Digital output signals DQ0 and DQ1

    Supply voltage L+
  - Count range: 32 bits
  - Channel-by-channel monitoring of encoder signals for wire break, short-circuit and faulty supply voltage
  - Hardware interrupts configurable
  - Input filters for suppression of interferences at encoder inputs and digital inputs can be configured
- Supported encoder/signal types
  - SSI absolute encoder
  - RS422/TTL incremental encoder with N signal
  - RS422/TTL incremental encoder without N signal
  - RS422/TTL pulse encoder with direction signal
  - RS422/TTL pulse encoder without direction signal
  - RS422/TTL pulse encoder with up/down count signal
- Supported system functions
  - Isochronous mode
  - Firmware update
  - Identification data I&M

The module supports the following functions:

Table 2- 1 Version dependencies of the functions

Function	Firmware version of module	Configurable as of			
		STEP 7 (TIA Portal)	STEP 7	GSD	
				PROFINET IO	PROFIBUS DP
Firmware update	V1.0 or higher	V13	V5.5 SP4	X	—
I&M identification data	V1.0 or higher	V13	V5.5 SP4	X	X
Parameter reassignment in RUN	V1.0 or higher	V13	V5.5 SP4	X	X
Isochronous mode	V1.0 or higher	V13	V5.5 SP4	—	—
Counting/measuring	V1.0 or higher	V13	V5.5 SP4 or V5.5 SP3 with HSP0240 V1.0	X	X
Operating with "Counting and measurement" technology object	V1.0 or higher	V13	—	—	—
Position input for "Motion Control" technology object	V1.0 or higher	V13	—	—	—
Central operation on CPU 151xSP	V1.1 or higher	V13 SP1	—	—	—
Fast Mode	V1.2 or higher	V14 SP1 or V14 with HSP0199	V5.6 or V5.5 SP4 with HSP0240 V5.0	X	X
Operating with "Measuring input" technology object	V1.3 or higher	V15 with HSP0256	—	—	—
Position value range of 32 bits	V1.3 or higher	V15 with HSP0256	—	X	X

Accessories

The following accessories can be used with the module and are not included in the scope of delivery:

- Labeling strip
- Color identification labels
- Reference identification labels
- Shield connector

A BaseUnit of the A0 type is required to operate the technology module. You can find an overview of the BaseUnits that you can use with the technology module in the product information for the documentation of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/73021864).

For detailed information on the installation procedure, refer to the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2 Functions

2.2.1 Acquisition of encoder signals

2.2.1.1 Position input with SSI absolute encoder

You can use the TM PosInput 1 technology module with an SSI absolute encoder for position input. The technology module reads the position via a synchronous, serial interface from the SSI absolute encoder and sends it to the controller.

You can switch the digital outputs of the technology module exactly at defined position values, independently of the user program. Position input with an SSI absolute encoder does not involve gate control.

Gray-dual conversion

Gray-code and dual-code SSI absolute encoders are supported.

Range for position value

You can specify a frame length of 10 bits to 40 bits for the SSI absolute encoder. The configurable bit numbers of the LSB and the MSB of the position value in the frame define the value range. The technology module can read in a position value with a maximum length of 32 bits and transfer it to the controller.

Complete SSI frame

Instead of having a measured variable returned, you can choose to have the least significant 32 bit of the current unprocessed SSI frame returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface.

Capture (Latch)

You can configure the edge of an external reference signal that triggers saving of the current position value as a Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input

The "Frequency of Capture function" parameter specifies whether the function is executed at each configured edge or only once after each enable.

Measuring input

If you use Position input for Motion Control (Page 19), you can use the "Measuring input" technology object to execute a measuring input function with a hardware digital input.

Hardware interrupts

The technology module can trigger a hardware interrupt in the CPU when a comparison event, zero crossing and/or direction reversal occurs. You can specify which events during operation are to trigger a hardware interrupt.

2.2.1.2 Counting with incremental or pulse encoder

Counting is the detecting and adding up of events. The counters of the technology module detect encoder signals and pulses and evaluate them accordingly. The count direction can be specified using encoder or pulse signals or through the user program.

You can control the counting processes with the digital inputs. In addition, you can read the signal state of the respective digital input via the feedback interface.

You can specify the counter characteristics using the functions described below.

Counting limits

The counting limits define the counter value range used. The counting limits are configurable and can be modified during runtime with the user program.

You can configure the behavior of the counter at the counting limits.

Start value

You can configure a start value within the counting limits. The start value can be modified during runtime with the user program.

Gate control

You can define the time window in which the count signals are acquired with the hardware gate (HW gate) and software gate (SW gate).

Capture (Latch)

You can configure an external reference signal edge that triggers the saving of the current counter value as Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input
- Rising edge of the N signal at the encoder input

The "Frequency of Capture function" parameter specifies whether the function is executed at each configured edge or only once after each enable.

Measuring input

If you use Position input for Motion Control (Page 19), you can use the "Measuring input" technology object to execute a measuring input function with a hardware digital input.

Hardware interrupts

The technology module can trigger a hardware interrupt in the CPU when a comparison event, zero crossing and/or direction reversal occurs. You can specify which events during operation are to trigger a hardware interrupt.

2.2.2 Measured value determination

The following high-accuracy measurement functions are available (accuracy up to 100 ppm):

- Frequency measurement with the unit of hertz
- Period measurement with the unit of seconds
- Velocity measurement with a flexibly adaptable unit
- Complete SSI frame instead of a measured quantity

Update time

You can configure the interval at which the technology module updates the measured values cyclically as the update time.

Gate control for incremental and pulse encoders

You can define the time window in which the count signals are acquired with the hardware gate (HW gate) and software gate (SW gate).

2.2.3 Switching the outputs at comparison values

The available digital outputs DQ0 and DQ1 can be directly activated/switched by the specified comparison values or via the user program. The comparison values are configurable and can be modified during runtime with the user program. This enables very fast reaction times to be achieved.

Comparison values in the Counting/Position input operating mode

In Counting/Position input operating mode you specify two position or counter values as comparison values depending on the encoder. If the current position or counter value meets the configured comparison condition, the corresponding digital output can be set to directly initiate control processes in the process.

Comparison values in the Measuring mode

You define two comparison values in the Measuring mode. If the current measured value meets the configured comparison condition, the corresponding digital output can be set to directly initiate control processes in the process.

2.2.4 Position input for Motion Control

You can use the technology module for position detection for the following axis technology objects of S7-1500 Motion Control :

- TO_PositioningAxis
- TO_SynchronousAxis
- TO_ExternalEncoder

In this operating mode, you can use the measuring input technology object (TO_MeasuringInput) to execute a measuring input function with hardware digital input DI1.

Additional information

You can find a detailed description of the use of Motion Control and its configuration in the following:

- Function manual S7-1500 Motion Control available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59381279)
- Function manual S7-1500T Motion Control available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481326)

2.2.5 Fast Mode

You can use the technology module in Fast Mode for very fast acquisition of counter or position value with compressed functionality. A reduced feedback interface but no control interface is available in Fast Mode. This allows you to use a shorter send clock for the CPU.

2.2.6 Additional functions

Synchronization for incremental and pulse encoder

You can configure the edge of an external reference signal that loads the counter with the specified start value. The following external signals can trigger a synchronization:

- Rising or falling edge of a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input depending on the level of the assigned digital input

The "Frequency of synchronization" parameter specifies whether the function is executed at each configured edge or only once after each enable.

Hysteresis

You can specify a hysteresis for the comparison values within which a digital output will be prevented from switching again.

Diagnostic interrupt

The technology module can trigger diagnostic interrupts. You enable the diagnostic interrupts in the device configuration.

Input filter

To suppress interference, you can configure an input filter for the RS422/TTL encoder inputs and for the digital inputs.

Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables position, counter and measured values to be acquired in a defined system cycle.

Wiring 3

Das TM PosInput 1 is used with a BaseUnit of type A0 (article number 6ES7193-6BPx0-0xA0).

You connect the encoder signals, the digital input and output signals and the encoder supplies to the BaseUnit of the technology module. The supply voltage feed on the light BaseUnit BU...D of the associated potential group supplies the module and the digital outputs, and generates the encoder supply voltage.

BaseUnit

The BaseUnit is not included in the scope of delivery of the module and must be ordered separately.

You can find an overview of the BaseUnits that you can use with the technology module in the product information for the documentation of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/73021864).

You can find information about selecting a suitable BaseUnit in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual and ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) device manual.

You can find information on wiring the BaseUnit, connecting cable shields, etc. in the Connecting section of the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Supply voltage L+/M

You connect the supply voltage to terminals L+ and M on a light BaseUnit. For a dark BaseUnit, the supply voltage of the module to the left is used. An internal protection circuit protects the technology module from reverse polarity of the supply voltage. The technology module monitors whether the supply voltage is connected.

Encoder supply

For supplying the encoders and sensors connected to the digital inputs, the technology module provides a 24 V DC supply voltage at output 24VDC (terminal 15) with reference to M (terminals 14 and 16). The voltage is monitored for short-circuit and overload.

Digital inputs DI0 and DI1

The digital inputs are used for gate control, synchronization and the Capture function.

The digital inputs are not isolated from each other.

Input delay for digital inputs

In order to suppress noise you can configure an input delay for the digital inputs.

Note

If you select the "None" or "0.05 ms" option, you must use shielded cables for connection of the digital inputs.

Digital outputs DQ0 and DQ1

The digital outputs are not isolated from each other.

The digital outputs are 24 V sourcing outputs in reference to M and can carry a rated load current of 0.5 A. They are protected against overload and short-circuit.

Relays and contactors can be directly connected without an external protective circuit. You can find information on the maximum possible operating frequencies and the inductive loads connected to the digital outputs in section Technical specifications (Page 109).

3.1 SSI encoder signals

SSI encoder signals

The TM PosInput 1 can process SSI encoder signals. These are designated with data and clock and use the RS422 signal standard.

An RS422 encoder signal uses a pair of wires and the information is transmitted as differential voltage. This ensures interference-free transmission of RS422 encoder signals even with high frequencies over long distances. The RS422 wire pairs must be twisted together in the cable.

The SSI encoder signals data and clock are connected via the D and C terminals. The N terminals remain unconnected. The inputs are not isolated from each other. The inputs are isolated from the backplane bus.

Pin assignment of the BaseUnit

The table below shows the pin assignment, using the BaseUnit BU15-P16+A0+2B as an example.

Table 3- 1 Pin assignment of the BaseUnit BU15-P16+A0+2B

Designation	Signal name		View	Signal name		Designation
SSI data signal +D	+A/**D**	1		2	DI0	Digital input DI0
SSI data signal -D	-A/**D**	3		4	DI1	Digital input DI1
SSI clock signal +C	+B/**C**	5		6	—	—
SSI clock signal -C	-B/**C**	7		8	DQ0	Digital output DQ0
—	+N	9		10	DQ1	Digital output DQ1
—	-N	11		12	—	—
—	—	13		14	M	Ground for encoder supply, digital inputs and digital outputs
Encoder supply 24 V DC	24VDC	15		16	M	
Supply voltage DC 24 V	L+				M	Ground for supply voltage

Block diagram

You must ground the shields of the cables between encoder and technology module both through the shield terminal on the BaseUnit (shield bracket and terminal) and also on the encoder.

The figure below shows the block diagram of the technology module with one connected SSI absolute encoder.

⑦ SSI absolute encoder
⑧ Twisted in pairs

Figure 3-1 Block diagram with SSI absolute encoder

3.2 RS422 encoder signals

RS422 encoder signals/count signals

The TM PosInput 1 can process encoder signals that use the RS422 signal standard. These counting encoder signals are designated with the letters A, B and N.

An RS422 encoder signal uses a pair of wires and the counter information is transmitted as differential voltage. This ensures interference-free transmission of RS422 encoder signals even with high frequencies over long distances. The RS422 wire pairs must be twisted together in the cable.

You can connect the following encoder types:

- RS422 incremental encoder with N signal:

  The encoder signals A, B and N are connected using the correspondingly marked terminals. A and B are the two incremental signals phase-shifted by 90°. N is the zero mark signal that supplies one pulse per revolution.

- RS422 incremental encoder without N signal:

  The encoder signals A and B are connected using the correspondingly marked terminals. A and B are the two incremental signals phase-shifted by 90°. The N terminals remain unconnected.

- RS422 pulse encoder without direction signal:

  The counting signal is connected to the A terminals. The count direction can be specified via the control interface. The B and N terminals remain unconnected.

- RS422 pulse encoder with direction signal:

  The counting signal is connected to the A terminals. The direction signal is connected to the B terminals. Counting down takes place at a high level of the direction signal. The N terminals remain unconnected.

- RS422 pulse encoder with up/down count signal

  The up counting signal is connected to the A terminals. The down counting signal is connected to the B terminals. The N terminals remain unconnected.

The inputs are not isolated from each other. The inputs are isolated from the backplane bus.

Note

The RS422 signal standard offers greater interference immunity than the TTL signal standard. If your incremental encoder or pulse encoder supports the RS422 **and** the TTL signal standard, we recommend using the RS422 signal standard.

Pin assignment of the BaseUnit

The table below shows the pin assignment, using the BaseUnit BU15-P16+A0+2B as an example.

Table 3- 2 Pin assignment of theBaseUnit BU15-P16+A0+2B

3.3 TTL encoder signals

TTL encoder signals/counting signals

The TM PosInput 1 can process encoder signals that use the TTL signal standard. The counting encoder signals are designated with the letters A, B and N. An encoder signal with TTL standard uses a single cable.

You can connect the following encoder types:

- TTL incremental encoder with N signal:

  The encoder signals A, B and N are connected using the correspondingly marked terminals. A and B are the two incremental signals phase-shifted by 90°. N is the zero mark signal that supplies one pulse per revolution.

- TTL incremental encoder without N signal:

  The encoder signals A and B are connected using the correspondingly marked terminals. A and B are the two incremental signals phase-shifted by 90°. The N terminal remains unconnected.

- TTL pulse encoder without direction signal:

  The counting signal is connected to the A terminal. The count direction can be specified via the control interface. The B and N terminals remain unconnected.

- TTL pulse encoder with direction signal:

  The counting signal is connected to the A terminal. The direction signal is connected to the B terminal. Counting down takes place at a high level of the direction signal. The N terminal remains unconnected.

- TTL pulse encoder with up/down counting signal

  The up counting signal is connected to the A terminal. The down counting signal is connected to the B terminal. The N terminal remains unconnected.

The inputs are not isolated from each other. The inputs are isolated from the backplane bus.

Note

The RS422 signal standard offers greater interference immunity than the TTL signal standard. If your incremental encoder or pulse encoder supports the RS422 **and** the TTL signal standard, we recommend using the RS422 signal standard.

4 Configuring/address space

4.1 Operating with "Counting and measurement" technology object

4.1.1 Configuring

Introduction

You configure the technology module and assign its parameters with STEP 7 (TIA Portal).

The technology object is used to control and monitor the functions of the technology module.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM PosInput 1	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter setting with High_Speed_Counter or SSI_Absolute_Encoder technology object	For incremental/pulse encoder: High_Speed_Counter instruction For SSI absolute encoder: SSI_Absolute_Encoder instruction
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM PosInput 1		

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

4.1.2 Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module to CPU STOP in the device configuration with the basic parameters.

Table 4- 1 Reaction of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the position value is read in. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the "At comparison value for a pulse duration" function is set at CPU STOP, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

4.1.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 118).

You set the parameters of the module as follows in this operating mode:

1. Insert the module from the hardware catalog under "Technology modules".
2. Set the device configuration in the hardware configuration.
   "Operating with "Counting and measurement" technology object" must be set as the operating mode.
3. Insert the High_Speed_Counter or SSI_Absolute_Encoder technology object from the project tree in folder "Technology objects > Add new object > Counting and measurement".
   You can find information on configuring with a technology object in function manual Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820).
4. Open the configuration of the respective technology object, e.g. using the Configuration button  in the respective instruction for the technology object.
5. Set the parameters of the technology object.
6. Download the project to the CPU.

4.1.3.1 Parameters (SSI absolute encoder)

Parameters of the TM PosInput 1 with SSI absolute encoder

The following parameter settings are possible in the hardware configuration:

Table 4- 2 Settable parameters and their default setting (SSI absolute encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark Ba-seUnit)	No	Module
Reaction to CPU STOP	• Output substitute value • Keep last value • Continue operation	Output substitute value	Yes	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diagnos-tic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Direc-tion reversal	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Com-parison event for DQ0 occurred	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Com-parison event for DQ1 occurred	• Deactivated • Activated	Deactivated	Yes	Channel

The following parameter settings are possible in the technology object:

Table 4- 3 Settable parameters and their default setting (SSI absolute encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Frame length	10 bits...40 bits	13 bits	Yes	Channel
Code type	• Gray • Dual	Gray	Yes	Channel
Transmission rate	• 125 kHz • 250 kHz • 500 kHz • 1 MHz • 1.5 MHz • 2 MHz	125 kHz	Yes	Channel
Monoflop time	• Automatically • 16 µs • 32 µs • 48 µs • 64 µs	Automatically	Yes	Channel
Parity	• None • Even • Odd	None	Yes	Channel
Bit number LSB of the position value	0...38	0	Yes	Channel
Bit number MSB of the position value	1...39	12	Yes	Channel
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Set function of DI	• Capture • Digital input without function	DI0, DI1: Digital input without function	Yes	Channel
Input delay for digital inputs	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Edge selection for DI	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Frequency of Capture function	• Once • Periodic	Once	Yes	Channel
Comparison value 0	-2147483648...2147483647	0	Yes	Channel
Comparison value 1	-2147483648...2147483647	10	Yes	Channel
Operating mode	• Use position value (SSI absolute value) as reference • Use measured value as reference	Use position value (SSI absolute value) as reference	No	Channel
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between comparison value and high limit	Yes	Channel
Count direction of DQ function	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10]	0...65535	5000 (corresponds to 0.5 s)	Yes	Channel
Substitute value for DQ0	• 0 • 1	0	Yes	Channel
Substitute value for DQ1	• 0 • 1	0	Yes	Channel
Hysteresis (in increments)	0...255	0	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Measured variable	• Frequency • Period • Velocity • Complete SSI frame	Frequency	Yes	Channel
Update time [ms] of meas-uring function	0...25000	10	Yes	Channel
Time base for velocity measurement	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit	1...65535	1	Yes	Channel

NOTICE

Too high an encoder speed can supply the wrong rotation direction

If an SSI absolute encoder rotates so fast that more than half the value range is covered within one module cycle[1], the velocity and rotation direction are no longer calculated correctly. As a result, the following may function incorrectly:

- DQ functions
- Feedback bits EVENT_OFLW, EVENT_UFLW, EVENT_ZERO, EVENT_CMP0, EVENT_CMP1 and STS_DIR

[1] Non-isochronous mode: 500 µs; isochronous mode: PROFINET cycle time

Note

If you use an SSI absolute encoder whose value range does not correspond to a power of 2, the calculated velocity measurement can be incorrect at the moment of the overflow.

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection in sections Basic parameters and Configuring the SSI_Absolute_Encoder available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.1.3.2 Parameters (incremental or pulse encoder)

Parameters of the TM PosInput 1 with incremental or pulse encoder

The following parameter settings are possible in the hardware configuration:

Table 4- 4 Settable parameters and their default setting (incremental or pulse encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	No	Module
Reaction to CPU STOP	• Output substitute value • Keep last value • Continue operation	Output substitute value	Yes	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diagnos-tic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Syn-chronization of the counter by an external signal	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate start	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate stop	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Over-flow (high counting limit violated)	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware inter-rupt:Underflow (low count-ing limit violated)	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Direc-tion reversal	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Hardware interrupt: Com-parison event for DQ0 occurred	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Com-parison event for DQ1 occurred	• Deactivated • Activated	Deactivated	Yes	Channel

The following parameter settings are possible in the technology object:

Table 4- 5 Settable parameters and their default setting (incremental or pulse encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Filter frequency for counter inputs	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz • 500 kHz • 1 MHz	1 MHz	Yes	Channel
Interface standard	• RS422, symmetrical • TTL (5 V), asymmetrical	RS422, symmet-rical	Yes	Channel
Reaction to signal N	• No reaction to signal N • Synchronization at signal N • Capture at signal N	No reaction to signal N	Yes	Channel
Frequency of synchronization	• Once • Periodic	Once	Yes	Channel
Frequency of Capture func-tion	• Once • Periodic	Once	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope HSP for STEP 7 (TIA Portal)
Counting high limit	-2147483648...2147483647	2147483647	Yes	Channel
Start value	-2147483648...2147483647	0	Yes	Channel
Counting low limit	-2147483648...2147483647	-2147483648	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue counting	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at sig-nal N • Capture • Digital input without function	• DI0: Gate start/stop (lev-el-triggered) • DI1: Digital input without function	Yes	Channel

Edge selection for DI	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Select level for DI	• Active with high level • Active with low level	Active with high level	Yes	Channel
Behavior of counter value after Capture with DI	• Continue counting • Set to start value and continue counting	Continue counting	Yes	Channel
Comparison value 0	-2147483648...2147483647	0	Yes	Channel
Comparison value 1	-2147483648...2147483647	10	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal)
Operating mode	• Use count value as reference • Use measured value as reference	Use count value as reference	No	Channel
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between compari-son value and high limit	Yes	Channel
Count direction of DQ func-tion	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10]	0...65535	5000 (corre-sponds to 0.5 s)	Yes	Channel
Substitute value for DQ0	• 0 • 1	0	Yes	Channel
Substitute value for DQ1	• 0 • 1	0	Yes	Channel
Hysteresis (in increments)	0...255	0	Yes	Channel
Measured variable	• Frequency • Period • Velocity	Frequency	Yes	Channel
Update time [ms] of meas-uring function	0...25000	10	Yes	Channel
Time base for velocity measurement	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit	1...65535	1	Yes	Channel

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection in sections Basic parameters and Configuring the High_Speed_Counter available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.1.4 Address space

Address space of the technology module

Table 4- 6 Size of input and output addresses of the TM PosInput 1 when operating with "Counting and measurement" technology object

	Inputs	Outputs
Range	16 bytes	12 bytes

The control and feedback interface is compatible with manual operation (Page 53) and is controlled by the High_Speed_Counter or SSI_Absolute_Encoder instruction.

4.1.5 Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables position, counter and measured values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode. The High_Speed_Counter or SSI_Absolute_Encoder instruction is called in the assigned OB.

The update time for the measured value is synchronized with the system cycle in a suitable ratio and, if necessary, adapted in length. If you set "0", the measured value is updated once per system cycle.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the position or counter value and the measured value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the following parameter can affect the isochronous mode parameters of the sync domain.

- Filter frequency
- Frame length
- Transmission rate
- Monoflop time
- Parity

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change one or more of the indicated parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.2 Position input for "Motion Control" technology object

4.2.1 Configuring

Introduction

You configure the technology module and assign its parameters with STEP 7 (TIA Portal).

The technology object is used to control and monitor the functions of the technology module.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM PosInput 1	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter setting with axis and measuring input technology objects	Motion Control instructions
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM PosInput 1		

Additional information

You can find a detailed description of the use of Motion Control and its configuration in the following:

- Function manual S7-1500 Motion Control available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/59381279)
- Function manual S7-1500T Motion Control available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481326)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Motion Control > Motion Control (S7-1200, S7-1500)"

You can find a description of configuring the technology module for position detection in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

4.2.2 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available.

You set the parameters of the module as follows in this operating mode:

1. Insert the module from the hardware catalog under "Technology modules".
2. Set the device configuration and the parameters of the module in the hardware configuration.
   "Position input for "Motion Control" technology object" must be set as the operating mode.
3. Insert the axis technology object and, if necessary, the measuring input technology object from the project tree in folder "Technology objects > Add new object > Motion Control".
   You can find information on configuring with axis technology objects in function manual S7-1500T Motion Control
   (https://support.industry.siemens.com/cs/ww/en/view/109481326).
4. Open the configuration of the axis technology object, e.g. using the Configuration button in the respective instruction for the technology object.
5. Set the parameters of the technology objects.
6. Download the project to the CPU.

4.2.2.1 Parameters (SSI absolute encoder)

Parameters of the TM PosInput 1 with SSI absolute encoder

The following parameter settings are possible:

Table 4- 7 Settable parameters and their default setting (SSI absolute encoder)

Parameter	Value range	Default setting	Scope
			HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark Ba-seUnit)	Module
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Channel
Frame length	10 bits...40 bits	13 bits	Channel
Code type	• Gray • Dual	Gray	Channel

Parameter	Value range	Default setting	Scope HSP for STEP 7 (TIA Portal)
Transmission rate	• 125 kHz • 250 kHz • 500 kHz • 1 MHz • 1.5 MHz • 2 MHz	125 kHz	Channel
Monoflop time	• Automatically • 16 µs • 32 µs • 48 µs • 64 µs	Automatically	Channel
Parity	• None • Even • Odd	None	Channel
Bit number LSB of the position value	0...38	0	Channel
Bit number MSB of the position value	1...39	12	Channel
Measuring input	DI1	DI1	Channel
Steps per revolution	1...65535	1	Channel
Number of revolutions[1]	is calculated automatically (read-only)	—	Channel
Reference speed	6.00...210000.00 U/min	3000.00 U/min	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Channel
Enable additional diagnostic interrupts	• Deactivated • Activated	Deactivated	Channel

1 STEP 7 (TIA Portal) V15.1 or higher

NOTICE

Too high an encoder speed can falsify a position value

The function of an axis technology object is based on the assumption that an SSI absolute encoder never changes by more than half the value range within one module cycle[1].

Ensure that this condition is always met when configuring your system.

1 Non-isochronous mode: 500 µs; isochronous mode: PROFINET cycle time

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, section Module parameters (position input for Motion Control) available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.2.2.2 Parameters (incremental or pulse encoder)

Parameters of the TM PosInput 1 with incremental or pulse encoder

The following parameter settings are possible:

Table 4- 8 Settable parameters and their default setting (incremental or pulse encoder)

Parameter	Value range	Default setting	Scope
			HSP for STEP 7 (TIA Portal)
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	Module
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Channel
Invert direction (counter inputs)	• Deactivated • Activated	Deactivated	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Channel
Filter frequency for counter inputs	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz • 500 kHz • 1 MHz	1 MHz	Channel
Interface standard	• RS422, symmetrical • TTL (5 V), asymmetrical	RS422, symmetrical	Channel

Parameter	Value range	Default setting	Scope
			HSP for STEP 7 (TIA Portal)
Signal selection for reference mark 0	• DI0 • Signal N of incremental encoder	DI0	Channel
Measuring input	DI1	DI1	Channel
Increments per revolution / steps per revolution	1...65535	1	Channel
Reference speed	6.00...210000.00 U/min	3000.00 U/min	Channel
Enable diagnostic interrupt on wire break	• Deactivated • Activated	Deactivated	Channel
Enable additional diagnostic interrupts	• Deactivated • Activated	Deactivated	Channel

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, section Module parameters (position input for Motion Control) available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.2.3 Address space

Address space of the technology module

Table 4- 9 Size of input and output addresses of the TM PosInput 1 with position input for "Motion Control" technology object

	Inputs	Outputs
Range	16 bytes	4 bytes

4.2.4 Isochronous mode

The technology module supports the "Isochronous mode" system function. Position and counter values can be acquired in a fixed system cycle with this system function.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "MC-Servo" in this operating mode. Isochronous mode is needed when using the output cam and cam track technology objects. When the measuring input technology is used in combination with hardware digital input DI1, isochronous mode is not needed.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the position or counter value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the following parameter can affect the isochronous mode parameters of the sync domain.

- Filter frequency
- Frame length
- Transmission rate
- Monoflop time
- Parity

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change one or more of the indicated parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.3 Manual operation (without technology object)

4.3.1 Configuring

Introduction

You configure the technology module and assign its parameters with the configuration software.

The functions of the technology module are controlled and checked by the user program via the control and feedback interface.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	Direct access to control and feedback interface in the I/O data
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation with an S7-300/400 CPU	• S7-300/400 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter setting with HSP (up to firmware version V1.2) or GSD file	
Distributed operation with an S7-1200 CPU	• S7-1200 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation in a third-party system	• Third-party automation system • ET 200SP distributed I/O system • TM PosInput 1	Third-party configuration software: Device configuration and parameter setting with GSD file	

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

STEP 7 (TIA Portal)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

STEP 7

The Hardware Support Packages (HSP) supports the technology module up to firmware version V1.2. You can find the HSP for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/23183356)

GSD file

You can find the respective GSD file for the ET 200SP distributed I/O system for download on the Internet:

- GSD file for PROFINET IO (http://support.automation.siemens.com/WW/view/en/57138621)
- GSD file for PROFIBUS DP (http://support.automation.siemens.com/WW/view/en/73016883)

4.3.2 Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module to CPU STOP in the device configuration with the basic parameters.

Table 4- 10 Reaction of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the position value is read in. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the "At comparison value for a pulse duration" function is set at CPU STOP, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

4.3.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 118).

You set the parameters of the module as follows in this operating mode:

Parameter setting using...	Basic procedure
Hardware configuration in STEP 7 (TIA Portal)	1. Insert the module from the hardware catalog under "Technology modules". 2. Set the device configuration and the parameters of the module in the hardware configuration. "Manual operation (without technology object)" must be set as the operating mode. 3. Download the project to the CPU.
Hardware configuration in STEP 7 with HSP	1. Install the appropriate HSP file. You will then find the module in the hardware catalog under "ET 200SP". 2. Set the device configuration and the parameters in the hardware configuration. 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFINET IO	1. Install the current PROFINET GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFINET IO > I/O". 2. Set the parameters in the hardware configuration. You can find information on the respective dependencies of the parameters in function manual Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820). 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFIBUS DP	1. Install the current PROFIBUS GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFIBUS DP > I/O". 2. Set the parameters in the hardware configuration. You can find information on the respective dependencies of the parameters in function manual Counting, Measurement and Position Detection (http://support.automation.siemens.com/WW/view/en/59709820). The parameters marked with [1] in the following tables are not configurable in the PROFIBUS GSD file. 3. Download the project to the CPU. The parameters marked with [1] in the following tables are downloaded with their default setting. 4. If necessary, set the parameters marked with [1] in the user program using data record 128.

4.3.3.1 Parameters (SSI absolute encoder)

Parameters of the TM PosInput 1 with SSI absolute encoder

The following parameter settings are possible:

Table 4- 11 Settable parameters and their default setting (SSI absolute encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the poten-tial group of the left module (dark BaseUnit)	No	Module
Operating mode[3]	• Position input • Measuring	Position input	No	Channel
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substi-tute value	Yes	Channel
Substitute value for DQ[1]	• 0 • 1	DQ0, DQ1: 0	Yes	Channel
Enable diagnostic inter-rupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diag-nostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Direction reversal[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Comparison event for DQ0 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Comparison event for DQ1 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Invert direction[1] (position value)	• Deactivated • Activated	Deactivated	Yes	Channel
Frame length	10 bits...40 bits	13 bits	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Code type	• Gray • Dual	Gray	Yes	Channel
Transmission rate	• 125 kHz • 250 kHz • 500 kHz • 1 MHz • 1.5 MHz • 2 MHz	125 kHz	Yes	Channel
Monoflop time[1]	• Automatically • 16 µs • 32 µs • 48 µs • 64 µs	Automatically	Yes	Channel
Parity	• None • Even • Odd	None	Yes	Channel
Bit number LSB of the position value	0...38	0	Yes	Channel
Bit number MSB of the position value	1...39	12	Yes	Channel
Set function of DI	• Capture • Digital input without function	DI0, DI1: Digital input without function	Yes	Channel
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Edge selection for DI[1]	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Frequency of Capture function[1,4]	• Once • Periodic	Once	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between com-parison value and high limit	Yes	Channel
Comparison value 0[1]	-2147483648...2147483647	0	Yes	Channel
Comparison value 1[1]	-2147483648...2147483647	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both direc-tions	Yes	Channel
Pulse duration [ms/10][1]	0...65535	5000 (corre-sponds to 0.5 s)	Yes	Channel
Hysteresis (in incre-ments)[1]	0...255	0	Yes	Channel
Measured variable	• Frequency • Period • Velocity • Complete SSI frame	Frequency	Yes	Channel
Update time [ms] of the measuring function[1]	0...25000	10	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Time base for velocity measurement[1]	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit[1]	1...65535	1	Yes	Channel

[1] Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

[2] When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

[3] When configuring with HSP for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

[4] Not available with HSP for STEP 7

NOTICE

Too high an encoder speed can supply the wrong rotation direction

If an SSI absolute encoder rotates so fast that more than half the value range is covered within one module cycle[1], the velocity and rotation direction are no longer calculated correctly. As a result, the following may function incorrectly:

- DQ functions
- Feedback bits EVENT_OFLW, EVENT_UFLW, EVENT_ZERO, EVENT_CMP0, EVENT_CMP1 and STS_DIR

[1] Non-isochronous mode: 500 μs; isochronous mode: PROFINET cycle time

Note

If you use an SSI absolute encoder whose value range does not correspond to a power of 2, the calculated velocity measurement can be incorrect at the moment of the overflow.

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, sections Basic parameters and Manual operation available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.3.3.2 Parameters (incremental or pulse encoder)

Parameters of the TM PosInput 1 with incremental or pulse encoder

The following parameter settings are possible:

Table 4- 12 Settable parameters and their default setting (incremental or pulse encoder)

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the potential group of the left module (dark BaseUnit)	No	Module
Operating mode[3]	• Counting • Measuring	Counting	No	Channel
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substitute value	Yes	Channel
Substitute value for DQ0[1]	• 0 • 1	0	Yes	Channel
Substitute value for DQ1[1]	• 0 • 1	0	Yes	Channel
Enable diagnostic interrupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diagnostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate start[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Gate stop[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Overflow (high counting limit violated)[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt:Underflow (low counting limit violated)[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Direction reversal[1]	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Hardware interrupt: Comparison event for DQ0 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Comparison event for DQ1 occurred[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Zero crossing[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: New Capture value available[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Hardware interrupt: Synchronization of the counter by an external signal[1]	• Deactivated • Activated	Deactivated	Yes	Channel
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel
Filter frequency for counter inputs[1]	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz • 500 kHz • 1 MHz	1 MHz	Yes	Channel
Invert direction (counter inputs)[1]	• Deactivated • Activated	Deactivated	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Reaction to signal N[1]	• No reaction to signal N • Synchronization at signal N • Capture at signal N	No reaction to signal N	Yes	Channel
Frequency of synchronization[1]	• Once • Periodic	Once	Yes	Channel
Frequency of Capture function[1,4]	• Once • Periodic	Once	Yes	Channel
Interface standard	• RS422, symmetrical • TTL (5 V), asymmetrical	RS422, sym-metrical	Yes	Channel
Counting high limit[1]	-2147483648...2147483647	2147483647	Yes	Channel
Start value[1]	-2147483648...2147483647	0	Yes	Channel
Counting low limit[1]	-2147483648...2147483647	-2147483648	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue count-ing	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at sig-nal N • Capture • Digital input without function	• DI0: Gate start/stop (level-triggered) • DI1: Digital input with-out function	Yes	Channel
Select level for DI[1]	• Active with high level • Active with low level	Active with high level	Yes	Channel
Edge selection for DI[1]	• At rising edge • At falling edge • At rising and falling edge	At rising edge	Yes	Channel
Behavior of counter value after Capture with DI [1]	• Continue counting • Set to start value and continue counting	Continue count-ing	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Set output	• Use by user program • Between comparison value and high limit / measured value >= comparison value • Between comparison value and low limit / measured value <= comparison value • At comparison value for a pulse duration • After set command from CPU until comparison value • Between comparison value 0 and 1 • Not between comparison value 0 and 1	DQ0, DQ1: Between comparison value and high limit	Yes	Channel
Comparison value 0[1]	-2147483648...2147483647	0	Yes	Channel
Comparison value 1[1]	-2147483648...2147483647	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10][1]	0...65535	5000 (corresponds to 0.5 s)	Yes	Channel
Hysteresis (in increments)[1]	0...255	0	Yes	Channel
Measured variable	• Frequency • Period • Velocity	Frequency	Yes	Channel
Update time [ms] of the measuring function[1]	0...25000	10	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Time base for velocity measurement[1]	• 1 ms • 10 ms • 100 ms • 1 s • 60 s	60 s	Yes	Channel
Increments per unit[1]	1...65535	1	Yes	Channel

[1] Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

[2] When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

[3] When configuring with HSP for STEP 7 or with a GSD file, you determine the operating mode when you select the module name.

[4] Not available with HSP for STEP 7

Explanation of parameters

You can find a detailed description of the parameters in function manual Counting, Measurement and Position Detection, sections Basic parameters and Manual operation available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820).

4.3.4 Address space

Address space of the technology module

Table 4- 13 Size of input and output addresses of the TM PosInput 1 with manual operation

	Inputs	Outputs
Range	16 bytes	12 bytes

4.3.5 Control and feedback interface

Note

The control and feedback interface is compatible with the control and feedback interface of the TM PosInput 2, TM Count 2x24V and TM Count 1x24V technology modules of the S7-1500 automation system.

4.3.5.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface

The following table shows the assignment of the control interface:

Byte offset from start address ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0…3	SLOT_0: DINT or REAL: Load value (meaning of the value is specified in LD_SLOT_0) Value range: –2147483648 to 2147483647_D or 80000000 to $7FFFFFFF_H$							
4…7	SLOT_1: DINT or REAL: Load value (meaning of the value is specified in LD_SLOT_1) Value range: –2147483648 to 2147483647_D or 80000000 to $7FFFFFFF_H$							

Byte offset from start address ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
8	LD_SLOT_1				LD_SLOT_0			
9	EN_ CAPTURE	EN_ SYNC_DN	EN_ SYNC_UP	SET_DQ1	SET_DQ0	TM_ CTRL_DQ1	TM_ CTRL_DQ0	SW_GATE
10	SET_DIR	Reserved					RES_ EVENT	RES_ ERROR
11	Reserved							

Explanations

Control bit/value	Explanations
EN_CAPTURE	Use this bit to enable the Capture function. Resetting this bit resets a set EVENT_CAP in the feedback interface.
EN_SYNC_DN	Use this bit to enable the synchronization of the counter when counting in downward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
EN_SYNC_UP	Use this bit to enable the synchronization of the counter when counting in upward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
LD_SLOT_m	Use this load request to specify the meaning of the value in SLOT_m: • 0000 means: No action, idle • 0001 means: Load counter value (for incremental or pulse encoder) • 0010 not permitted • 0011 means: Load start value (for incremental or pulse encoder) • 0100 means: Load comparison value 0 • 0101 means: Load comparison value 1 • 0110 means: Load counting low limit (for incremental or pulse encoder) • 0111 means: Load counting high limit (for incremental or pulse encoder) • 1000 to 1111 not permitted The technology module executes the respective action as soon as LD_SLOT_m changes. If values are loaded simultaneously using LD_SLOT_0 and LD_SLOT_1, the value from SLOT_0 is internally applied first and then the value from SLOT_1 . This can produce unex-pected intermediate states.
RES_EVENT	Use this bit to trigger the reset of the saved events in the EVENT_ZERO, EVENT_OFLW, EVENT_UFLW, EVENT_CMP0, EVENT_CMP1 feedback bits.
Reserved	Reserve bits must be set to 0.
RES_ERROR	Use this bit to trigger the reset of the saved error states LD_ERROR and ENC_ERROR .
SET_DIR	Use this bit to specify the count direction for signal type "Pulse (A)". • 0 means: Up • 1 means: Down

Control bit/value	Explanations
SET_DQ0	Use this bit to set digital output DQ0 when TM_CTRL_DQ0 is set to 0. In the case of the function "After set command from CPU until comparison value", SET_DQ0 is effective regardless of TM_CTRL_DQ0 as long as the counter value is not equal to the comparison value.
SET_DQ1	Use this bit to set digital output DQ1 when TM_CTRL_DQ1 is set to 0. In the case of the function "After set command from CPU until comparison value", SET_DQ1 is effective regardless of TM_CTRL_DQ1 as long as the counter value is not equal to the comparison value.
SW_GATE	Use this bit to open and close the software gate when using an incremental encoder or pulse encoder. Together, the software gate and the hardware gate form the internal gate. The technology module only counts when the internal gate is open. • 0 means: Software gate closed • 1 means: Software gate open The digital inputs of the technology module externally control the hardware gate. The hardware gate can be activated by parameter assignment. The software gate cannot be deactivated.
TM_CTRL_DQ0	Use this bit to enable the technological function of digital output DQ0. • 0 means: SET_DQ0 defines the state of DQ0 • 1 means: assigned function defines the state of DQ0
TM_CTRL_DQ1	Use this bit to enable the technological function of digital output DQ1. • 0 means: SET_DQ1 defines the state of DQ1 • 1 means: assigned function defines the state of DQ1

4.3.5.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

<table>
<tr><th>Byte offset from start address ↓</th><th>Bit 7</th><th>Bit 6</th><th>Bit 5</th><th>Bit 4</th><th>Bit 3</th><th>Bit 2</th><th>Bit 1</th><th>Bit 0</th></tr>
<tr><td>0…3</td><td colspan="8">COUNT_VALUE:
DINT: Current counter value or position value</td></tr>
<tr><td>4…7</td><td colspan="8">CAPTURED_VALUE:
DINT: The last acquired Capture value</td></tr>
<tr><td>8...11</td><td colspan="8">MEASURED_VALUE:
REAL: Current measured value or DWORD: Complete SSI frame</td></tr>
<tr><td>12</td><td colspan="5">Reserved</td><td>LD_ERROR</td><td>ENC_ ERROR</td><td>POWER_ ERROR</td></tr>
<tr><td>13</td><td colspan="2">Reserved</td><td>STS_SW_ GATE</td><td>STS_ READY</td><td>LD_STS_ SLOT_1</td><td>LD_STS_ SLOT_0</td><td>RES_EVEN T_ACK</td><td>Reserved</td></tr>
<tr><td>14</td><td>Reserved</td><td>STS_DI1</td><td>STS_DI0</td><td>STS_DQ1</td><td>STS_DQ0</td><td>STS_GATE</td><td>STS_CNT</td><td>STS_DIR</td></tr>
<tr><td>15</td><td>STS_M_ INTERVAL</td><td>EVENT_ CAP</td><td>EVENT_ SYNC</td><td>EVENT_ CMP1</td><td>EVENT_ CMP0</td><td>EVENT_ OFLW</td><td>EVENT_ UFLW</td><td>EVENT_ ZERO</td></tr>
</table>

Note

Validity of the position value

The position value of an SSI absolute encoder is valid when STS_READY is set to 1 and ENC_ERROR is set to 0. STS_READY is set to 0 while the module starts up.

Explanations

Feedback bit/value	Explanations
CAPTURED_VALUE	This DINT value indicates the last acquired Capture value. The following external signals can trigger the Capture function: • Rising or falling edge of a digital input • Both edges of a digital input The "Frequency of Capture function" parameter specifies whether the function is executed at each configured edge or only once after each enable.
COUNT_VALUE	This DINT value indicates the current counter value or position value. If you use an SSI absolute encoder with a position value length up to 31 bits, the position value is treated as unsigned and as a positive value and can assume values between 0 and $2^{(MSB-LSB+1)}$-1. If you use an SSI absolute encoder with a position value length of 32 bits, the MSB of the position value corresponds to the sign and the position value can assume values between –2147483648 and 2147483647. If you use a 32-bit position value for the comparison function, the position value is interpreted as DINT.
ENC_ERROR	This bit indicates that one of the following errors has occurred at the encoder signals (retentive) for the respective technology module: • Invalid transition of A/B signals (with incremental encoder) • RS422/TTL error • SSI encoder error or SSI frame error (with SSI absolute encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the manual for the respective technology module. The bit is reset once you have acknowledged the error with RES_ERROR .
EVENT_CAP	This bit indicates that a Capture event has occurred and a counter value has been saved in CAPTURED_VALUE . You reset the status by resetting EN_CAPTURE .
EVENT_CMP0	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ0 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP0 is not set.
EVENT_CMP1	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ1 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP1 is not set.
EVENT_OFLW	This bit indicates the saved status that the counter value had an overflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_SYNC	When an incremental or pulse encoder is used, this bit indicates the saved status that the counter was loaded with the start value by an external reference signal (synchronization). You reset the status by resetting EN_SYNC_UP or EN_SYNC_DN .
EVENT_UFLW	This bit indicates the saved status that the counter value had an underflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_ZERO	This bit indicates the saved status that the counter value or position value had a zero crossing. You reset the status by acknowledgment with RES_EVENT. When the "Zero crossing" hardware interrupt is enabled, for system-related reasons it can also be triggered if "0" is outside the configured value range.

Feedback bit/value	Explanations
LD_ERROR	This bit indicates that an error occurred (latching) during loading via the control interface. The loaded values were not applied. When using an incremental or pulse encoder, one of the following conditions is not fulfilled: • Low counting limit <= counter value <= high counting limit • Low counting limit <= start value <= high counting limit • Low counting limit <= comparison value 0/1 <= high counting limit When using an SSI absolute encoder, one of the following conditions is not fulfilled: • 0 <= position value <= maximum position value • 0 <= comparison value 0/1 <= maximum position value The bit is reset once you have acknowledged the error with RES_ERROR .
LD_STS_SLOT_0	This bit indicates by a status change (toggling) that the load request for SLOT_0 (LD_SLOT_0) was detected and performed.
LD_STS_SLOT_1	This bit indicates by a status change (toggling) that the load request for SLOT_1 (LD_SLOT_1) was detected and performed.
MEASURED_VALUE	This value indicates the current measured value with data type REAL or the complete SSI frame with data type DWORD: • Frequency: The mean frequency is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the unit of hertz. • Period: The mean period is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the unit of seconds. • Velocity: The mean velocity is calculated from the time profile of the count pulses or position value changes in one measurement interval and returned as a floating-point number in the configured unit. • Complete SSI frame: Instead of a measured quantity, the least significant 32 bits of the unprocessed current SSI frame are returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface. The measured values are returned as a signed value. The sign indicates whether the counter value or position value went up or down in the relevant time interval. The update time is asynchronous to the opening of the internal gate, i.e. the update time is not started when the gate opens. After the internal gate closes, the last calculated measured value continues to be returned.
POWER_ERROR	This bit indicates that supply voltage L+ is too low. If you have enabled the diagnostic interrupts (Page 103), the diagnostic interrupt "Load voltage missing" is triggered at a supply voltage error. When supply voltage L+ is available at a sufficient level once again, POWER_ERROR is automatically set to 0.
RES_EVENT_ACK	This bit indicates that the reset of event bit EVENT_SYNC, EVENT_CMP0, EVENT_CMP1, EVENT_OFLW, EVENT_UFLW, EVENT_ZERO is active.
Reserved	Reserved bits are set to 0.
STS_CNT	This bit indicates that at least one count pulse or a position value change has occurred in the last ca. 0.5 s.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.

Feedback bit/value	Explanations
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. • 0 means: Down • 1 means: Up
STS_DQ0	This bit indicates the status of digital output DQ0.
STS_DQ1	This bit indicates the status of digital output DQ1.
STS_GATE	This bit indicates the status of the internal gate when using an incremental or pulse encoder. • 0 means: Gate closed • 1 means: Gate open Note: In order for the counting logic including the gate control to operate correctly, the startup of the technology module must finish correctly at least once with a connected incremental or pulse encoder (STS_READY auf 1). If a connected encoder is not yet ready during the startup, the function of feedback bit STS_GATE is delayed until the encoder for the technology module is available. When the technology module starts up without a connected encoder, the startup does not finish correctly and STS_READY as well as STS_GATE remain set to 0. As soon as an encoder is connected, the startup finishes and STS_GATE functions correctly. An encoder error after a finished startup has no effect on STS_GATE.
STS_M_INTERVAL	This bit indicates that at least one count pulse or a position value change was detected in the previous measurement interval.
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.
STS_SW_GATE	This bit indicates the status of the software gate. • 0 means: Gate closed • 1 means: Gate open

4.3.6 Isochronous mode

The technology module supports the "Isochronous mode" system function. This system function enables position, counter and measured values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode. The input and output data are processed in the assigned OB.

The update time for the measured value is synchronized with the system cycle in a suitable ratio and, if necessary, adapted in length. If you set "0", the measured value is updated once per system cycle.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. At the time the input data is read in (T_i), the position or counter value and the measured value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the following parameter can affect the isochronous mode parameters of the sync domain.

- Filter frequency
- Frame length
- Transmission rate
- Monoflop time
- Parity

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change one or more of the indicated parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

4.4 Fast Mode

You can use the technology module in Fast Mode for very fast acquisition of counter or position value with compressed functionality. A reduced feedback interface but no control interface is available in Fast Mode. This allows you to use a shorter send clock for the CPU.

The scope of functions of the technology module has the following additional restrictions in Fast Mode:

- Parameter change in RUN only possible with data record 128
- Count/position value range: 25 bits
- No measured value available
- No software gate available
- No complete SSI frame available
- No Capture function available
- No hardware interrupts available
- Combined error message (feedback bit) that is acknowledged automatically

4.4.1 Configuring

Introduction

You configure the technology module and assign its parameters with the configuration software.

The functions of the technology module are controlled and checked by the user program via the feedback interface.

System environment

The technology module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central operation with a CPU 151xSP	• S7-1500 automation system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	Direct access to feedback interface in the I/O data
Distributed operation with an S7-1500 CPU	• S7-1500 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation with an S7-300/400 CPU	• S7-300/400 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter setting with HSP (up to firmware version V1.2) or GSD file	
Distributed operation with an S7-1200 CPU	• S7-1200 automation system • ET 200SP distributed I/O system • TM PosInput 1	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration	
Distributed operation in a third-party system	• Third-party automation system • ET 200SP distributed I/O system • TM PosInput 1	Third-party configuration software: Device configuration and parameter setting with GSD file	

Additional information

You can find a detailed description of the counting and measurement functions and their configuration in the following:

- Function manual Counting, Measurement and Position Detection available for download on the Internet (http://support.automation.siemens.com/WW/view/en/59709820)
- Information system of STEP 7 (TIA Portal) under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

Hardware Support Packages (HSP)

STEP 7 (TIA Portal)

If firmware version V1.3 of the module is not yet integrated in your TIA Portal Version V15, you can integrate a corresponding module using HSP0256.

You can find the Hardware Support Packages (HSP) for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

You can also access this download from the menu bar of STEP 7 (TIA Portal): "Options > Support packages > Download from the Internet".

STEP 7

The Hardware Support Packages (HSP) supports the technology module up to firmware version V1.2. You can find the HSP for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/23183356)

GSD file

You can find the respective GSD file for the ET 200SP distributed I/O system for download on the Internet:

- GSD file for PROFINET IO (http://support.automation.siemens.com/WW/view/en/73016883)
- GSD file for PROFIBUS DP (http://support.automation.siemens.com/WW/view/en/57138621)

4.4.2 Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module to CPU STOP in the device configuration with the basic parameters.

Table 4- 14 Reaction of technology module to CPU STOP

Option	Meaning
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the position value is read in. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the "At comparison value for a pulse duration" function is set at CPU STOP, the digital output is reset after the pulse duration elapses. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

4.4.3 Parameter setting

You specify the properties of the technology module using various parameters. Depending on the settings, not all parameters are available. When parameters are assigned in the user program, the parameters are transferred to the module with the "WRREC" instruction and data record 128 (Page 118).

You set the parameters of the module as follows in this operating mode:

Parameter setting using...	Basic procedure
Hardware configuration in STEP 7 (TIA Portal)	1. Insert the module from the hardware catalog under "Technology modules". 2. Set the device configuration and the parameters of the module in the hardware configuration. "Fast Mode" must be set as the operating mode. 3. Download the project to the CPU.
Hardware configuration in STEP 7 with HSP	1. Install the appropriate HSP file. You will then find the module in the hardware catalog under "ET 200SP". 2. Set the device configuration and the parameters in the hardware configuration. 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFINET IO	1. Install the current PROFINET GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFINET IO > I/O". 2. Set the parameters in the hardware configuration. 3. Download the project to the CPU.
Hardware configuration with GSD file for distributed operation on PROFIBUS DP	1. Install the current PROFIBUS GSD file. You will then find the module in the hardware catalog under "Other field devices > PROFIBUS DP > I/O". 2. Set the parameters in the hardware configuration. The parameters marked with [1] in the following tables are not configurable in the PROFIBUS GSD file. 3. Download the project to the CPU. The parameters marked with [1] in the following tables are downloaded with their default setting. 4. If necessary, set the parameters marked with [1] in the user program using data record 128.

4.4.3.1 Parameters (SSI absolute encoder)

Parameters of the TM PosInput 1 with SSI absolute encoder

The following parameter settings are possible:

Table 4- 15 Settable parameters and their default setting (SSI absolute encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the poten-tial group of the left module (dark BaseUnit)	No	Module
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substi-tute value	Yes	Channel
Substitute value for DQ[1]	• 0 • 1	DQ0, DQ1: 0	Yes	Channel
Enable diagnostic inter-rupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diag-nostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Invert direction[1] (position value)	• Deactivated • Activated	Deactivated	Yes	Channel
Frame length	10 bits...40 bits	13 bits	Yes	Channel
Code type	• Gray • Dual	Gray	Yes	Channel
Transmission rate	• 125 kHz • 250 kHz • 500 kHz • 1 MHz • 1.5 MHz • 2 MHz	125 kHz	Yes	Channel
Monoflop time[1]	• Automatically • 16 µs • 32 µs • 48 µs • 64 µs	Automatically	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Parity	• None • Even • Odd	None	Yes	Channel
Bit number LSB of the position value	0...38	0	Yes	Channel
Bit number MSB of the position value	1...39	12	Yes	Channel
Set function of DI	Digital input without function	Digital input without function	Yes	Channel
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Set output	• Between comparison value and high limit • Between comparison value and low limit • At comparison value for a pulse duration • Digital output without function	Digital output without function	Yes	Channel
Comparison value 0[1]	0...33554431	0	Yes	Channel
Comparison value 1[1]	0...33554431	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both directions	Yes	Channel
Pulse duration [ms/10][1]	0...65535	5000 (corresponds to 0.5 s)	Yes	Channel
Hysteresis (in increments)[1]	0...255	0	Yes	Channel

1 Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

2 When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

NOTICE

Too high an encoder speed can supply the wrong rotation direction

If an SSI absolute encoder rotates so fast that more than half the value range is covered within one module cycle[1], the velocity and rotation direction are no longer calculated correctly. As a result, the following may function incorrectly:

- DQ functions
- Feedback bit STS_DIR

[1] Non-isochronous mode: 500 µs; isochronous mode: PROFINET cycle time

4.4.3.2 Parameters (incremental or pulse encoder)

Parameters of the TM PosInput 1 with incremental or pulse encoder

The following parameter settings are possible:

Table 4- 16 Settable parameters and their default setting (incremental or pulse encoder)

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Potential group	• Use the potential group of the left module (dark BaseUnit) • Enable new potential group (light BaseUnit)	Use the poten-tial group of the left module (dark BaseUnit)	No	Module
Reaction to CPU STOP[1]	• Output substitute value • Keep last value • Continue operation	Output substi-tute value	Yes	Channel
Substitute value for DQ0[1]	• 0 • 1	0	Yes	Channel
Substitute value for DQ1[1]	• 0 • 1	0	Yes	Channel
Enable diagnostic inter-rupt on wire break[2]	• Deactivated • Activated	Deactivated	Yes	Channel
Enable additional diag-nostic interrupts	• Deactivated • Activated	Deactivated	Yes	Channel
Signal type	• Pulse (A) • Pulse (A) and direction (B) • Count up (A), count down (B) • Incremental encoder (A, B phase-shifted) • Incremental encoder (A, B, N)	Pulse (A) and direction (B)	Yes	Channel
Invert direction[1] (counter inputs)	• Deactivated • Activated	Deactivated	Yes	Channel
Signal evaluation for counter inputs	• Single • Double • Quadruple	Single	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Filter frequency for counter inputs[1]	• 100 Hz • 200 Hz • 500 Hz • 1 kHz • 2 kHz • 5 kHz • 10 kHz • 20 kHz • 50 kHz • 100 kHz • 200 kHz • 500 kHz • 1 MHz	1 MHz	Yes	Channel
Reaction to signal N[1]	• No reaction to signal N • Synchronization at signal N	No reaction to signal N	Yes	Channel
Interface standard	• RS422, symmetrical • TTL (5 V), asymmetrical	RS422, sym-metrical	Yes	Channel
Counting high limit[1]	1...33554431	33554431	Yes	Channel
Start value[1]	0...33554431	0	Yes	Channel
Counting low limit[1]	0...33554430	0	Yes	Channel
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue count-ing	Yes	Channel
Reset when counting limit is violated	• To opposite counting limit • To start value	To opposite counting limit	Yes	Channel
Reaction to gate start	• Set to start value • Continue with current value	Continue with current value	Yes	Channel
Set function of DI	• Gate start/stop (level-triggered) • Gate start (edge-triggered) • Gate stop (edge-triggered) • Synchronization • Enable synchronization at sig-nal N • Digital input without function	Digital input without function	Yes	Channel

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Input delay for digital inputs[1]	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms	Yes	Channel
Select level for DI[1]	• Active with high level • Active with low level	Active with high level	Yes	Channel
Edge selection for DI[1]	• At rising edge • At falling edge	At rising edge	Yes	Channel
Frequency of synchronization[1]	• Once • Periodic	Once	Yes	Channel
Count direction for synchronization	• Up • Down • In both directions	Up	Yes	Channel
Set output	• Between comparison value and high limit • Between comparison value and low limit • At comparison value for a pulse duration • Between comparison value 0 and 1 • Digital output without function	DQ0, DQ1: Digital output without function	Yes	Channel
Comparison value 0[1]	0...33554431	0	Yes	Channel
Comparison value 1[1]	0...33554431	10	Yes	Channel
Count direction of DQ function[1]	• Up • Down • In both directions	In both directions	Yes	Channel

Parameter	Value range	Default setting	Parameter reassign-ment in RUN	Scope
				HSP for STEP 7 (TIA Portal); HSP for STEP 7; GSD file
Pulse duration [ms/10][1]	0...65535	5000 (corre-sponds to 0.5 s)	Yes	Channel
Hysteresis (in incre-ments)[1]	0...255	0	Yes	Channel

1 Because the number of parameters is limited to a maximum of 244 bytes per station in the PROFIBUS GSD configuration, the possible parameter assignments are limited. The parameters are preassigned default settings in the module. If your PROFIBUS master supports the "Write/read data record" function, you can set these parameters using data record 128.

2 When a GSD file is used, this diagnostic interrupt is enabled with the "Enable additional diagnostic interrupts" parameter and is then not separately configurable.

4.4.3.3 Explanation of parameters

Potential group

A potential group consists of a group of directly adjacent I/O modules within an ET 200SP station that are supplied from a common supply voltage.

A potential group begins with a light BaseUnit, which feeds the required supply voltage for all modules of the potential group. The light BaseUnit interrupts the three self-configuring voltage bars P1, P2 and AUX to the neighboring modules on the left.

All other I/O modules of this potential group are plugged into dark BaseUnits. They take on the potentials of the self-configuring busbars P1, P2 and AUX from the neighboring modules on the left.

A potential group ends with the dark BaseUnit, which is followed by a light BaseUnit or server module in the station configuration.

Signal type

You can select from the following signal types:

Signal type	Meaning
Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.
Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.
Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.
Pulse (A)	A pulse encoder (signal A) without direction signal is connected.
Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.
Absolute encoder (SSI)	An SSI absolute encoder with signals D and C is connected.

Invert direction

You can invert the counting direction to adapt it to the process.

The inverting of the direction is configurable and active for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Signal evaluation

With the parameter assignment of the signal evaluation, you specify which edges of the signals are counted.

You can select from the following options:

Signal evaluation	Meaning
Single	The edges of signal A are evaluated during a low level of signal B.
Double	Each edge of signal A is evaluated.
Quadruple	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counting inputs A, B and N.

The selected filter frequency is based on a pulse/break ratio of between around 40:60 and around 60:40. This results in a specific minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Filter frequency	Minimum pulse/break time
100 Hz	4.0ms
200 Hz	2.0 ms
500 Hz	800 μs
1 kHz	400 μs
2 kHz	200 μs
5 kHz	80 μs
10 kHz	40 μs
20 kHz	20 μs
50 kHz	8.0 μs
100 kHz	4.0 μs
200 kHz	2.0 μs
500 kHz	0.8 μs
1 MHz	0.4 μs

Reaction to signal N

You use this parameter to specify which reaction to signal N is triggered.

You can select from the following options:

Option	Meaning
No reaction to signal N	The counter is not affected by signal N.
Synchronization at signal N	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.

Note

You can only select the reaction to signal N if you have selected the "Incremental encoder (A, B, N)" signal type.

Note

If you select "Synchronization at signal N", you can choose the "Enable synchronization at signal N" function for a digital input.

Frequency of synchronization

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Count direction of the synchronization

You use this parameter to specify the count direction for which the following functions are enabled:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
In both directions	Synchronization takes place regardless of the count direction.
Up	Synchronization only takes place when the counter is counting up.
Down	Synchronization only takes place when the counter is counting down.

Interface standard

You use this parameter to specify whether the encoder supplies symmetrical signals (RS422) or asymmetrical signals (TTL).

You can select from the following options:

Interface standard	Meaning
RS422, symmetrical	The encoder supplies symmetrical signals according to the RS422 standard.
TTL (5 V), asymmetrical	The encoder supplies asymmetrical 5 V signals according to the TTL standard.

Note

The RS422 standard provides greater interference immunity than the TTL standard. If your incremental or pulse encoder supports the RS422- **and** TTL standards, we recommend using the RS422 standard.

Counting high limit

With the parameter assignment of the counting high limit, you limit the counting range. You can enter a value up to 33554431 (2^{25}-1). You must enter a value above the counting low limit.

Counting low limit

With the parameter assignment of the counting low limit, you limit the counting range. You can enter a value starting with 0. You must enter a value below the counting high limit.

Start value

With the parameter assignment of the start value, you specify the value at which counting is begun and is to continue in the case of defined events. You must enter a value at or within the counting limits.

Reaction to violation of a counting limit

You can configure the following reaction to violation of a counting limit:

Reaction	Meaning
Stop counting	After violation of a counting limit, counting is stopped and the internal gate is closed. To restart counting, you must close and reopen the SW gate or HW gate, if necessary.
Continue counting	Counting is continued with the start value or at the opposite counting limit depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit	The counter value is set to the opposite counting limit in each case.

Reaction to gate start

You can configure the following reaction to gate start:

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value	When the gate is opened, counting is continued with the last counter value.

Note

The parameter is only effective when you have configured a HW gate.

Set function of DI

With the parameter assignment of a digital input, you specify which function the digital input triggers when switched.

You can select from the following options:

Function of a digital input	Meaning
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the HW gate.
Gate start (edge-triggered)	The configured edge at the respective digital input opens the HW gate.
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the HW gate.
Synchronization	The configured edge at the respective digital input sets the counter to the start value.
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N.
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal status of the digital input via the feedback interface.

Note

Each function, except "Digital input without function", can be used only once per counter and can no longer be selected for the other digital inputs in each case.

Input delay

You use this parameter to suppress signal noise at the digital inputs. Changes to the signal are only detected if they remain stable for longer than the configured input delay time.

Note

If you select the "None" or "0.05 ms" option, you must use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be configured for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You use this parameter to specify the edge of the digital input at which the configured function is triggered.

You can select from the following options depending on the function selected:

- At rising edge
- At falling edge

The parameter can be configured for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options:

Function of a digital output	Meaning
Between comparison value and high limit	The respective digital output is active if: Comparison value <= counter value <= counting high limit
Between comparison value and low limit	The respective digital output is active if: Low limit <= counter value <= comparison value
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= counter value <= comparison value 1
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the counter value corresponds to the comparison value.
Digital output without function	The respective digital output is set to 0 irrespective of the reaction to CPU STOP.

Note

You can only set the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Digital output without function" function for digital output DQ0.

Comparison value 0

With the parameter assignment of the comparison value, you specify the counter value or position value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than or equal to the counting low limit. If you use the DQ function "Between comparison value 0 and 1", comparison value 0 must be less than comparison value 1.

Comparison value 1

With the parameter assignment of the comparison value, you specify the counter value or position value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is less than or equal to the counting high limit. If you use the DQ function "Between comparison value 0 and 1", comparison value 0 must be less than comparison value 1.

Count direction

You use this parameter to specify the count direction for which the selected functions is valid:

You can select from the following options:

Count direction	Meaning
In both directions	The comparison and switching of the respective digital output takes places regardless of the count direction or whether the position value increases or decreases
Up	The comparison and switching of the respective digital output only takes place when the counter counts up or the position value increases.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down or the position value decreases.

The parameter can be configured for the following functions:

- Between comparison value 0 and 1
- At comparison value for a pulse duration

Pulse duration

With the parameter assignment of the pulse duration for the "At comparison value for a pulse duration" function, you specify how many milliseconds the respective digital output is active.

If you enter "0" and the counter value corresponds to the respective comparison value, the digital output is active until the next count pulse.

Hysteresis (in increments)

With the parameter assignment of the hysteresis, you specify a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again before the counter value or position value has left this range.

An encoder can stop at a certain position, and slight movements can cause the counter value or position value to fluctuate around this position. If a comparison value or counting limit is within the fluctuation range and a hysteresis is not used, the associated digital output will switch on and off with corresponding frequency. The hysteresis prevents these unwanted switching actions.

Regardless of the hysteresis value, the hysteresis range ends at the low or counting high limit. If you enter "0", the hysteresis is turned off.

Invert direction

You use this parameter to invert the values supplied by the SSI absolute encoder. This allows you to adapt the detected direction of the encoder to the direction of rotation of the motor.

Note

This parameter acts only on the range from the LSB to the MSB of the position value in the frame.

Frame length

With the parameter assignment of the frame length, you specify the number of bits of an SSI frame of the SSI absolute encoder used. You can find the frame length of your SSI absolute encoder in the data sheet of the encoder. Special bits are also included in the frame length. A parity bit does not count in the frame length.

Code type

With the parameter assignment of the code type, you specify whether the encoder supplies Dual code or Gray code.

You can select from the following options:

Code type	Meaning
Gray	The position value supplied by the SSI absolute encoder in Gray code is converted to Dual code.
Dual	The value supplied by the SSI absolute encoder is not converted.

Transmission rate

With the parameter assignment of the transmission rate, you specify the data transmission rate between the technology module and SSI absolute encoder.

The maximum transmission rate depends on the cable length and the technical specifications of the SSI absolute encoder. For additional information, refer to the description of the encoder.

Monoflop time

With the parameter assignment of the monoflop time, you specify the idle time between two SSI frames.

The configured monoflop time must be at least equal to the monoflop time of the SSI absolute encoder used. You can find this value in the technical specifications of the SSI absolute encoder.

Note

If you select the "Automatically" option, the monoflop time automatically adapts to the encoder used.

In isochronous mode, the "Automatically" option corresponds to a monoflop time of 64 µs. If the monoflop time of the utilized SSI absolute encoder is less than 64 µs, you can select the value of the encoder to achieve faster isochronous times.

Parity

With the parameter assignment of the parity, you specify whether the SSI absolute encoder transfers a parity bit.

If, for example, a 25-bit encoder with parity is configured, the technology module reads 26 bits. A parity error is signaled in the feedback interface using bit EXT_F.

Bit number LSB of the position value

You use this parameter to specify the bit number of the LSB (least significant bit) of the position value in the frame of the SSI absolute encoder. In this way, you limit the range in the frame that supplies the position value.

The value must be less than the bit number of the MSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

Note

If you have selected "Gray" as the code type, only the range from the LSB to the MSB of the position value is converted to Dual code.

Bit number MSB of the position value

You use this parameter to specify the bit number of the MSB (most significant bit) of the position value in the frame of the SSI absolute encoder. In this way, you limit the range in the frame that supplies the position value.

The value must be less than the frame length and greater than the bit number of the LSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 32.

Note

If you have selected "Gray" as the code type, only the range from the LSB to the MSB of the position value is converted to Dual code.

4.4.4 Address space

Address space of the technology module

Table 4- 17 Size of input and output addresses of the TM PosInput 1 with Fast Mode

	Inputs	Outputs
Range	4 bytes	0 bytes

4.4.5 Assignment of the feedback interface

The user program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Byte offset from start address ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	LS	STS_ READY	Reserved	EXT_F	STS_DI0	STS_DIR	STS_DI1	COUNT_ VALUE
1	COUNT_VALUE: DINT: Current counter value or position value							
2								
3								

Explanations

Feedback bit/value	Explanations
COUNT_VALUE	This value returns the current counter value or position value in the first 25 bits of a DINT value.
EXT_F	This bit indicates that one of the following errors has occurred at the encoder signals for the technology module: • Load voltage missing • Invalid transition of A/B signals (with incremental encoder) • RS422/TTL error • SSI encoder error or SSI frame error (with SSI absolute encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the section Diagnostic alarms (Page 103). The bit is reset automatically as soon as an error no longer exists.
LS	As a life sign, this bit indicates by a status change (toggling) that isochronous mode is functioning and the module has updated the feedback interface in the respective bus cycle. In non-isochronous mode, this bit is set to 0.
Reserved	Reserved bits are set to 0.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. 0 means: Down 1 means: Up
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.

4.4.6 Isochronous mode

The technology module supports the "Isochronous mode" system function. Position and counter values can be acquired in a fixed system cycle with this system function.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A status change of a digital input immediately triggers the specified reaction of the technology module and the change of the status bit of the digital input in the feedback interface.

This operating mode is especially well-suited for short send clocks of the CPU starting from 125 µs, because only input data is used.

Use an OB of type "Synchronous Cycle" (e.g. OB61) in this operating mode.

Data processing

At the time the input data is read in (T_i), the position or counter value as well as status bits are acquired and made available in the feedback interface for retrieval in the current bus cycle.

Isochronous mode parameters

In isochronous mode, the following parameter can affect the isochronous mode parameters of the sync domain.

- Filter frequency
- Frame length
- Transmission rate
- Monoflop time
- Parity

Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change one or more of the indicated parameters in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

Additional information

You can find a detailed description of isochronous mode in the following:

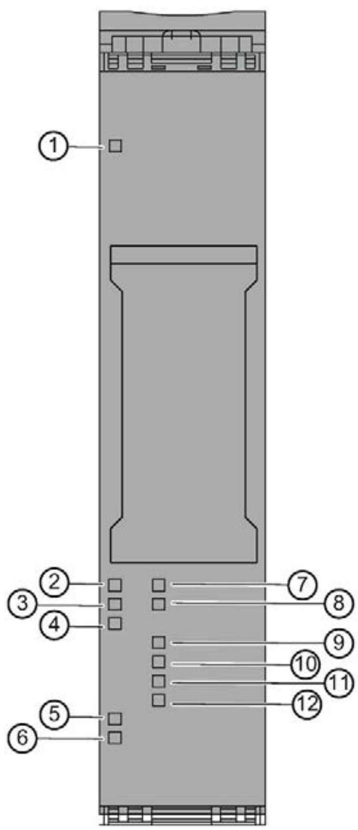
- Function manual Isochronous Mode (STEP 7 (TIA Portal) V15.1 or higher) available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109755401)
- Function manual PROFINET with STEP 7 available for download on the Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856)

Interrupts/diagnostic messages 5

5.1 Status and error display

LEDs

The following figure shows you the LED displays (status and error displays) of TM PosInput 1.



①	DIAG (green/red)	⑦	Status DI0 (green)
②	Status A/D (green)	⑧	Status DI1 (green)
③	Status B/C (green)	⑨	Status DQ0 (green)
④	Status N (green)	⑩	Status DQ1 (green)
⑤	24VDC (green)	⑪	Status UP (green)
⑥	PWR (green)	⑫	Status DN (green)

Figure 5-1 LED displays of the TM PosInput 1

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in section Diagnostic alarms (Page 103).

Table 5- 1 Status and error displays DIAG

LED DIAG	Meaning	Remedy
Off	Backplane bus supply of the ET 200SP not OK	Check the supply voltage or turn it on at the interface module.
Flashes	Technology module parameters not set	---
On	Technology module parameters set and no module diagnostics	
Flashes	Technology module parameters set and module diagnostics (at least one error is present)	Evaluate the diagnostic alarms and eliminate the error.

Table 5- 2 PWR/24VDC status displays

LEDs		Meaning	Remedy
PWR	24VDC		
Off	Off	Supply voltage L+ missing	• Check the supply voltage. • Check the BaseUnit type and the wiring of the BaseUnit.
On	On	Supply voltage L+ is present and OK	---
On	Off	Short-circuit or overload at the encoder supply or supply voltage too low	• Check the encoder wiring. • Check the loads connected to the encoder supply. • Check the supply voltage.

Channel LEDs

The A, B, N and DIm LEDs indicate the current level of the associated signals. The LEDs of the DQm digital outputs indicate the desired state.

The flashing frequency of the channel LEDs is limited to approximately 12 Hz. If higher frequencies are present, the channel LEDs will flash at 12 Hz instead of indicating the current status.

If you are using an SSI absolute encoder, the LEDs D and C light up green during the transmission of encoder frames. The LEDs D and C are off when an error has occurred.

Table 5- 3 Status displays A/B/N/DIm/DQm

LEDs A/B/N/DIm/DQm	Meaning
□ Off	Counter input/digital input/digital output at 0 level
■ On	Counter input/digital input/digital output at 1 level

Table 5- 4 Status displays UP/DN

LEDs		Meaning
UP	DN	
□ Off	□ Off	No count pulse has been detected for the last 0.5 s.
■ On	□ Off	The last count pulse has incremented the counter and took place no more than 0.5 s ago.
□ Off	■ On	The last count pulse has decremented the counter and took place no more than 0.5 s ago.

5.2 Diagnostic alarms

Enabling of diagnostic interrupts

You enable the diagnostic interrupts in the device configuration with the basic parameters.

The technology module can trigger the following diagnostic interrupts:

Table 5- 5 Possible diagnostic interrupts

Diagnostic interrupt	Monitoring
• Parameter error • Hardware interrupt lost[1] • Channel/component temporarily unavailable • Internal error • Watchdog tripped. Module is defective.	Monitoring is always active. A diagnostic interrupt is triggered each time an error is detected.
• RS422/TTL error	Monitoring is always active. When an error is detected, a diagnostic interrupt is only triggered if "Enable diagnostic interrupt on wire break" is activated in the device configuration.
• Error • Load voltage missing • Short-circuit / overload at external encoder supply • Error at digital outputs • Supply voltage error[2] • SSI encoder error • Invalid transition of A/B signals • Overtemperature	Monitoring is always active. When an error is detected, a diagnostic interrupt is only triggered if "Enable additional diagnostic interrupts" is activated in the device configuration.

[1] Not available in "Position input for "Motion Control"" technology object" and "Fast Mode" operating modes

[2] No longer available as of module version V1.3. This case is then taken into account by diagnostic interrupt "Load voltage missing".

Reactions to a diagnostic interrupt

The following happens when an event occurs that triggers a diagnostic interrupt:

- The DIAG LED flashes red.

  When you have eliminated all errors, the DIAG LED stops flashing red and turns green.
- The S7-1500 CPU interrupts the processing of the user program. The diagnostic interrupt OB (e.g. OB 82) is called. The event that triggered the interrupt is entered in the start information of the diagnostic interrupt OB.
- The S7-1500 CPU remains in RUN even if no diagnostic interrupt OB is present in the CPU. The technology module continues working unchanged if this is possible despite the error.

You can obtain detailed information on the error event in the error organization block with instruction "RALRM" (Read additional alarm information), in the information system of STEP 7 and in function manual Diagnostics (https://support.industry.siemens.com/cs/ww/en/view/59192926), section "System diagnostics in user program".

If the module is being operated as a distributed module in an ET 200SP system with PROFIBUS DP, you have the option of reading out diagnostic data with the RDREC or RD_REC instruction using data record 0 and 1. You can find the structure of the data records in the manual for the IM 155-6 DP HF interface module available for download on the Internet (https://support.industry.siemens.com/cs/ww/de/view/73098660).

Diagnostic alarms

The display of diagnostics is in plain text in STEP 7 (TIA Portal) in the online and diagnostics view. You can evaluate the error codes with the user program.

The following diagnostics can be signaled:

Table 5- 6 Diagnostic alarms, their meaning and remedies

Diagnostic alarm	Error code	Meaning	Remedy
Error	9_H	• Internal module error occurred • Possible cause: Technology module defective	Replace technology module
Parameter error	10_H	• The received parameter data record is invalid • The configured BaseUnit is not the used BaseUnit	• Check parameter data record • Check BaseUnit
Load voltage missing	11_H	• Missing or insufficient supply voltage L+ • Wiring of supply voltage L+ faulty • Possible cause: BaseUnit type incorrect	• Check BaseUnit type • Check supply voltage L+ on the BaseUnit • Check wiring of supply voltage L+ • Check total consumption of the load group

Diagnostic alarm	Error code	Meaning	Remedy
Hardware interrupt lost	16_H	• Module cannot issue interrupt because a preceding interrupt has not yet been processed • Possible cause: Too many hardware interrupts in too short a time	• Change interrupt processing in the CPU and re-assign technology module parameters correspondingly • Check frequency of interrupts from the process
Channel/component temporarily unavailable	$1F_H$	Firmware update in progress or update was aborted. The module reads no process values in this state.	• Wait for firmware update • If firmware update aborts: – Check minimum firmware version required – Check supply voltage – Repeat firmware update
Internal error	100_H	Technology module defective	Replace technology module
Watchdog tripped. Module is defective.	103_H	Firmware error	Run firmware update
		Technology module defective	Replace technology module
Short-circuit / overload at external encoder supply	$10E_H$	• Error at encoder supply • Possible causes: – Short circuit – Overload	• Check encoder wiring • Check consumers connected to encoder supply
Error at digital outputs	$10F_H$	• Error at digital outputs (LED display DQm lit red) • Possible causes: – Short circuit – Overload	• Check wiring at the digital outputs • Check consumers connected to the digital outputs
Supply voltage error[1]	110_H	• Error at supply voltage L+ • Possible causes: – Low voltage – Wiring of supply voltage L+ faulty	• Check supply voltage L+ • Check wiring of supply voltage L+ on the BaseUnit • Check total consumption of the load group
Invalid transition of A/B signals	500_H	• Time profile of signals A and B of the incremental encoder does not meet certain requirements (relative phase shift of the two signals is too small) • Possible causes: – Signal frequency too high – Encoder faulty – Process wiring faulty	• Check process wiring • Check encoder/sensor • Check parameter assignment

Diagnostic alarm	Error code	Meaning	Remedy
RS422/TTL error	502_H	• Error at connection of the RS 422, TTL encoder or SSI absolute encoder • Possible causes: – Wire break – No encoder connected – Cable too long – Short circuit – Overload – External voltage – Overtemperature – Parameter assignment error	• Check process wiring • Check encoder/sensor • Check parameter assignment
SSI encoder error	503_H	• Error at SSI absolute encoder connection • Possible causes: – Wire break – Cable too long – Frame error (error of the start bit or stop bit) – Parity error – Parameter assignment error	• Check process wiring • Check SSI absolute encoder • Check parameter assignment
Overtemperature	506_H	• Module temperature is too high • Possible causes: – Short-circuit or overload at the digital outputs or output of the encoder supply – Ambient temperature outside specifications – Contamination in the module prevents cooling	• Check process wiring • Improve cooling • Check connected loads

[1] No longer available as of module version V1.3. This case is then taken into account by diagnostic interrupt "Load voltage missing".

5.3 Hardware interrupts

Introduction

For the technology module, you can configure which events are to trigger a hardware interrupt during operation.

What is a hardware interrupt?

The technology module will trigger a hardware interrupt as configured in response to specific events/states. When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the assigned hardware interrupt OB. The event that triggered the interrupt is entered in the start information of the assigned hardware interrupt OB by the CPU.

Lost hardware interrupt

If an event occurs that is to trigger a hardware interrupt and the preceding event has not yet been processed, another hardware interrupt cannot be triggered. The hardware interrupt is lost and the diagnostic interrupt "Lost hardware interrupt" is triggered.

Enabling of hardware interrupts

A hardware interrupt is triggered when the condition for the change of the respective status or event bit in the feedback interface is met.

You enable the hardware interrupts in the device configuration with the basic parameters. You can configure hardware interrupts to be triggered for the following event types:

- Opening of internal gate (gate start)[1]
- Closing of internal gate (gate stop)[1]
- Overflow (counting high limit violated)[1]
- Underflow (counting low limit violated)[1]
- Comparison event for DQ0 has occurred
- Comparison event for DQ1 has occurred
- Zero crossing[4]
- New Capture value available[2]
- Synchronization of the counter by an external signal[1]
- Direction reversal[3]

[1] Not for SSI absolute encoder

[2] Only configurable in Counting / Position input operating mode

[3] Feedback bit STS_DIR is preassigned with "0". If the first counter value change occurs in the *downwards direction* directly after switching on the technology module, no hardware interrupt is triggered.

[4] When the hardware interrupt is enabled, for system-related reasons it can also be triggered if "0" is outside the configured value range.

You can activate any combination of events to trigger hardware interrupts.

You can obtain detailed information on the event in the hardware interrupt organization block with instruction "RALRM" (Read additional alarm information) and in the information system of STEP 7.

Which event has triggered the hardware interrupt is entered in the start information of the organization block. The following figure shows the assignment to the bits of the local data double word 8.

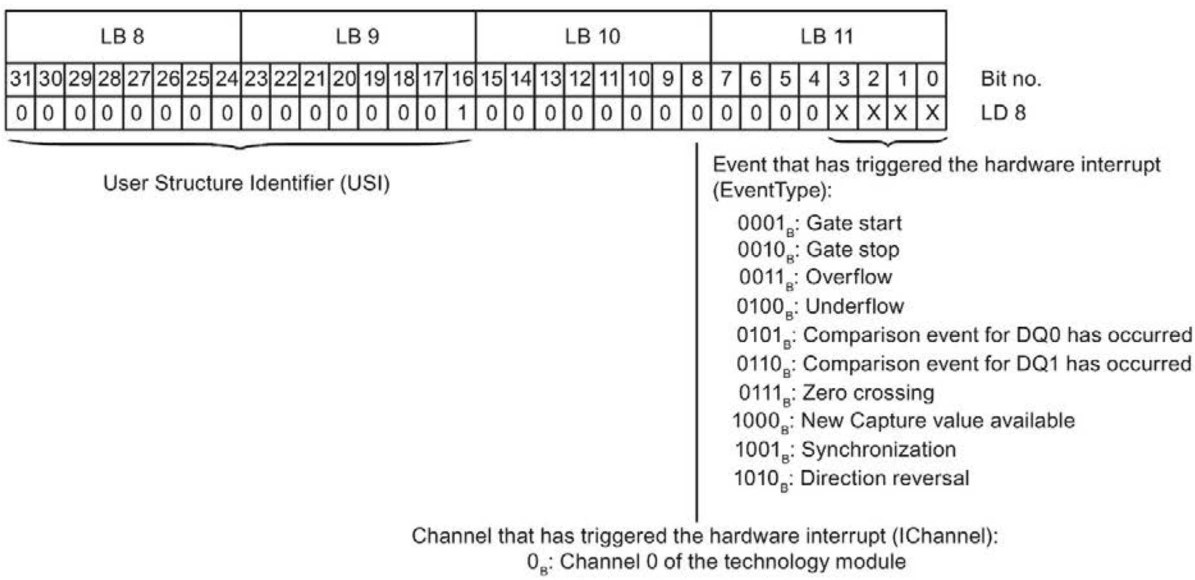


Figure 5-2 Start information of the organization block

6 Technical specifications

Article number	6ES7138-6BA00-0BA0
General information	
Product type designation	TM PosInput 1
Firmware version	V1.3
• FW update possible	Yes
usable BaseUnits	BU type A0
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V13 (FW V1.0), V14 (V1.2), V15 (FW V1.3) / V13 (FW V1.0), V14 SP1 (V1.2)
• STEP 7 configurable/integrated as of version	As of V5.5 SP3, only up to FW V1.2
• PROFIBUS as of GSD version/GSD revision	GSD Revision 5
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Supply voltage	
Load voltage L+	
• Rated value (DC)	24 V
• permissible range, lower limit (DC)	19.2 V
• permissible range, upper limit (DC)	28.8 V
• Reverse polarity protection	Yes
Input current	
Current consumption, max.	75 mA; without load
Encoder supply	
Number of outputs	1
24 V encoder supply	
• 24 V	Yes; L+ (-0.8 V)
• Short-circuit protection	Yes; electronic/thermal
• Output current, max.	300 mA
Power loss	
Power loss, typ.	1.9 W
Address area	
Occupied address area	
• Inputs	16 byte; 4 bytes in Fast mode
• Outputs	12 byte; 4 bytes for Motion Control, 0 bytes for Fast mode

Article number	6ES7138-6BA00-0BA0
Digital inputs	
Number of digital inputs	2
Digital inputs, parameterizable	Yes
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Digital input functions, parameterizable	
• Gate start/stop	Yes; only for pulse and incremental encoders
• Capture	Yes
• Synchronization	Yes; only for pulse and incremental encoders
• Freely usable digital input	Yes
Input voltage	
• Rated value (DC)	24 V
• for signal "0"	-5 ... +5 V
• for signal "1"	+11 to +30V
• permissible voltage at input, min.	-30 V; -5 V continuous, -30 V brief reverse polarity protection
• permissible voltage at input, max.	30 V
Input current	
• for signal "1", typ.	2.5 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms
– at "0" to "1", min.	6 µs; for parameterization "none"
– at "1" to "0", min.	6 µs; for parameterization "none"
for counter/technological functions	
– parameterizable	Yes
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m

Article number	6ES7138-6BA00-0BA0
Digital outputs	
Type of digital output	Transistor
Number of digital outputs	2
Short-circuit protection	Yes; electronic/thermal
• Response threshold, typ.	1 A
Limitation of inductive shutdown voltage to	L+ (-33 V)
Controlling a digital input	Yes
Digital output functions, parameterizable	
• Switching tripped by comparison values	Yes
• Freely usable digital output	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A; Per digital output
• on lamp load, max.	5 W
Load resistance range	
• lower limit	48 Ω
• upper limit	12 kΩ
Output voltage	
• for signal "1", min.	23.2 V; L+ (-0.8 V)
Output current	
• for signal "1" rated value	0.5 A; Per digital output
• for signal "1" permissible range, max.	0.6 A; Per digital output
• for signal "1" minimum load current	2 mA
• for signal "0" residual current, max.	0.5 mA
Output delay with resistive load	
• "0" to "1", max.	50 µs
• "1" to "0", max.	50 µs
Switching frequency	
• with resistive load, max.	10 kHz
• with inductive load, max.	0.5 Hz; Acc. to IEC 60947-5-1, DC-13; observe derating curve
• on lamp load, max.	10 Hz
Total current of the outputs	
• Current per module, max.	1 A
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	600 m

Article number	6ES7138-6BA00-0BA0
Encoder signals, incremental encoder (symmetrical)	
• Input voltage	RS 422
• Input frequency, max.	1 MHz
• Counting frequency, max.	4 MHz; with quadruple evaluation
• Cable length, shielded, max.	32 m; at 1 MHz
• Signal filter, parameterizable	Yes
• Incremental encoder with A/B tracks, 90° phase offset	Yes
• Incremental encoder with A/B tracks, 90° phase offset and zero track	Yes
• Pulse encoder	Yes
• Pulse encoder with direction	Yes
• Pulse encoder with one impulse signal per count direction	Yes
Encoder signals, incremental encoder (asymmetrical)	
• Input voltage	5 V TTL (push-pull encoders only)
• Input frequency, max.	1 MHz
• Counting frequency, max.	4 MHz; with quadruple evaluation
• Signal filter, parameterizable	Yes
• Incremental encoder with A/B tracks, 90° phase offset	Yes
• Incremental encoder with A/B tracks, 90° phase offset and zero track	Yes
• Pulse encoder	Yes
• Pulse encoder with direction	Yes
• Pulse encoder with one impulse signal per count direction	Yes
Encoder signals, absolute encoder (SSI)	
• Input signal	to RS-422
• Telegram length, parameterizable	10 ... 40 bit
• Clock frequency, max.	2 MHz; 125 kHz, 250 kHz, 500 kHz, 1 MHz, 1.5 MHz or 2 MHz
• Binary code	Yes
• Gray code	Yes
• Cable length, shielded, max.	320 m; Cable length, RS-422 SSI absolute encoders, Siemens type 6FX2001-5, 24 V supply: 125 kHz, 320 meters shielded, max.; 250 kHz, 160 meters shielded, max.; 500 kHz, 60 meters shielded, max.; 1 MHz, 20 meters shielded, max. 1.5 MHz, 10 meters shielded, max.; 2 MHz, 8 meters shielded, max.

Article number	6ES7138-6BA00-0BA0
• Parity bit, parameterizable	Yes
• Monoflop time	16, 32, 48, 64 µs & automatic
• Multiturn	Yes
• Singleturn	Yes
Interface types	
• TTL 5 V	Yes; push-pull encoders only
• RS 422	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Interrupts/diagnostics/status information	
Substitute values connectable	Yes; Parameterizable
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• A/B transition error at incremental encoder	Yes
• Telegram error at SSI encoder	Yes
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for module diagnostics	Yes; green/red DIAG LED
• Status indicator backward counting (green)	Yes
• Status indicator forward counting (green)	Yes

Article number	6ES7138-6BA00-0BA0
Integrated Functions	
Number of counters	1
Counting frequency (counter) max.	4 MHz; with quadruple evaluation
Counting functions	
• Can be used with TO High_Speed_Counter	Yes; only for pulse and incremental encoders
• Continuous counting	Yes
• Counter response parameterizable	Yes
• Hardware gate via digital input	Yes
• Software gate	Yes
• Event-controlled stop	Yes
• Synchronization via digital input	Yes
• Counting range, parameterizable	Yes
Comparator	
– Number of comparators	2
– Direction dependency	Yes
– Can be changed from user program	Yes
Position detection	
• Incremental acquisition	Yes
• Absolute acquisition	Yes
• Suitable for S7-1500 Motion Control	Yes
Measuring functions	
• Measuring time, parameterizable	Yes
• Dynamic measurement period adjustment	Yes
• Number of thresholds, parameterizable	2
Measuring range	
– Frequency measurement, min.	0.04 Hz
– Frequency measurement, max.	4 MHz
– Cycle duration measurement, min.	0.25 µs
– Cycle duration measurement, max.	25 s
Accuracy	
– Frequency measurement	100 ppm; depending on measuring interval and signal evaluation
– Cycle duration measurement	100 ppm; depending on measuring interval and signal evaluation
– Velocity measurement	100 ppm; depending on measuring interval and signal evaluation

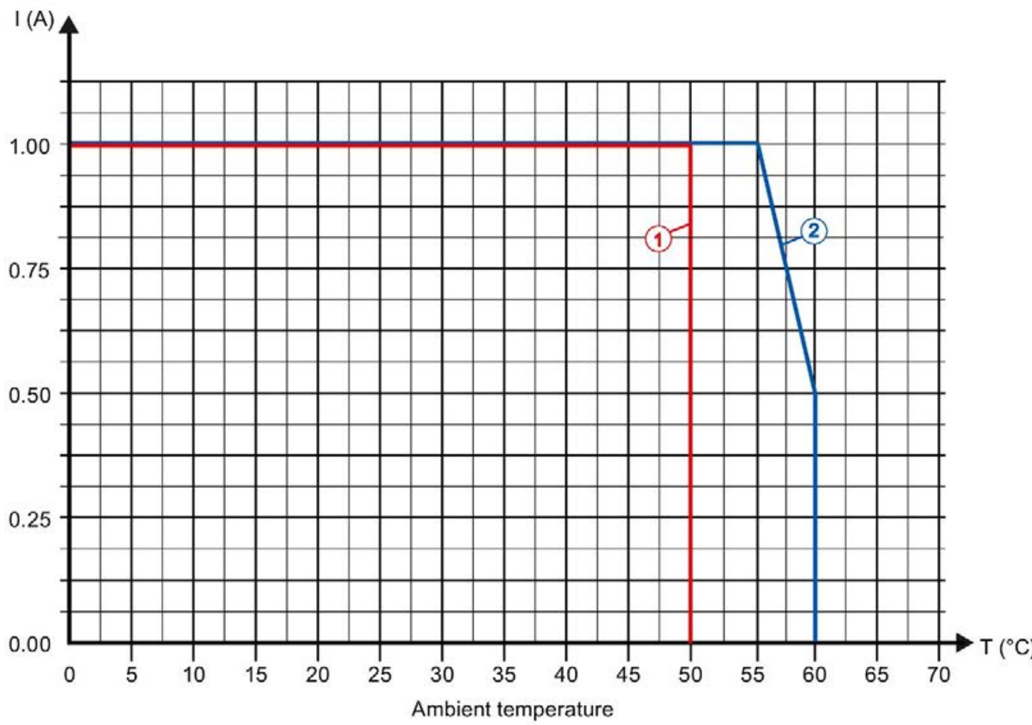
Article number	6ES7138-6BA00-0BA0
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C; Observe derating
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C; Observe derating
Decentralized operation	
to SIMATIC S7-300	Yes
to SIMATIC S7-400	Yes
to SIMATIC S7-1200	Yes
to SIMATIC S7-1500	Yes
to standard PROFIBUS master	Yes
to standard PROFINET controller	Yes
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	45 g

Derating information for total current of outputs

If the digital outputs of the TM PosInput 1 are operated with resistive or inductive loads, you should derate the total current of the loads at the digital outputs of the technology module. The total current is the sum of the load currents at all digital outputs of the module (without encoder supply).

The following derating curve shows the load capacity of the digital outputs depending on the ambient temperature and mounting position under the following conditions:

- Load resistance: 48 Ω (IEC 947-5-1)

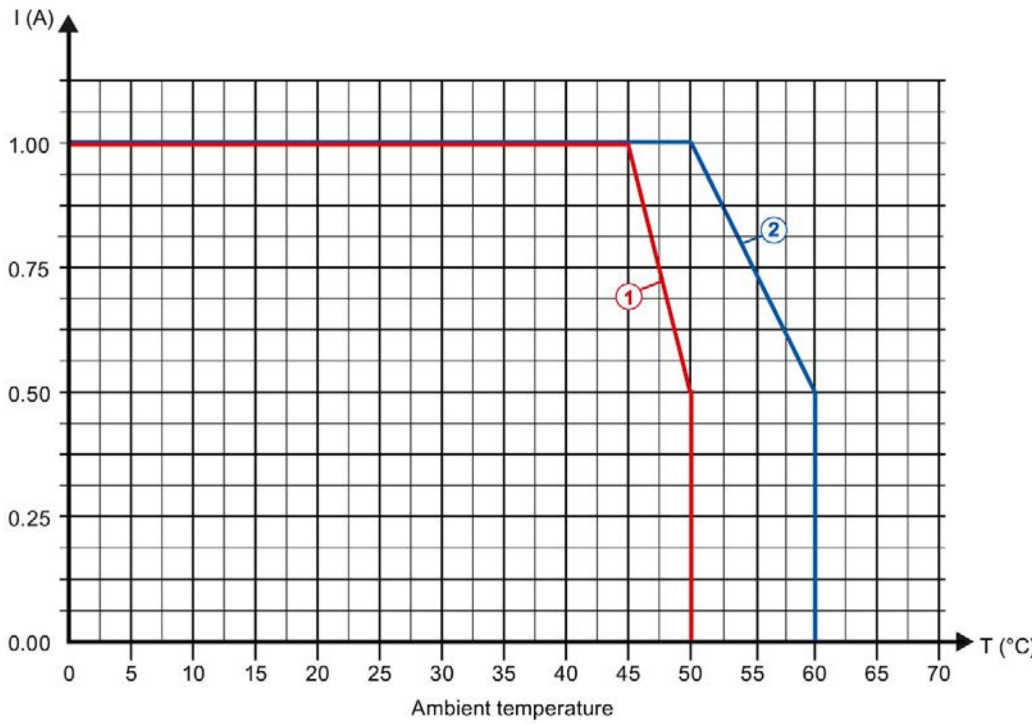


① Vertical installation of the system
② Horizontal installation of the system

Figure 6-1 Total current depending on ambient temperature and mounting position for resistive loads

The following derating curve shows the load capacity of the digital outputs depending on the ambient temperature and mounting position under the following conditions:

- Maximum switching frequency at digital outputs of 0.5 Hz
- Load resistance: 48 Ω (IEC 947-5-1)
- Load inductance: 1150 mH (IEC 947-5-1)



① Vertical installation of the system
② Horizontal installation of the system

Figure 6-2 Total current depending on ambient temperature and mounting position for inductive loads

---

Note

If the switching frequency is greater than 0.5 Hz or there is greater inductance at the digital outputs, the total current must be reduced further.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Parameter data record A

A.1 Parameter assignment and structure of parameter data record

You have the option of reassigning module parameters with the user program while the CPU is in RUN. The parameters are transferred to the module using data record 128, e.g. with the WRREC instruction.

If an error occurs while transferring or validating parameters with the WRREC instruction, the module continues operating with the existing parameter assignment. A corresponding error code is then written to the STATUS output parameter. If no errors occur, the STATUS output parameter contains the length of the actually transferred data.

You can find a description of the WRREC instruction and the error codes in section Parameter validation error (Page 130) or in the online help of STEP 7 (TIA Portal).

Structure of data record 128 for operation with technology object and manual operation

The following table shows you the structure of data record 128 for TM PosInput 1 for operation with technology object and manual operation without technology object. The values in byte 0 to byte 3 are fixed and must not be changed. The value in byte 4 can only be changed by means of new parameter assignment and not in RUN mode of the CPU.

Note

After each writing of data record 128, the module is set to its startup state and the counter value is set to the start value. If "Continue operation" is set for Reaction to CPU STOP, the module is then only set to its startup state when data record 128 has been changed.

Table A- 1 Data record 128: Operating modes "Operating with "Counting and measurement" technology object", "Manual operation (without technology object)"

49	Reserved[2]		Frame length[4]: 10 to 40_D: Value range					
50	Reserved[2]		Bit number LSB of the position value: 0 to 38_D: Value range					
51	Reserved[2]		Bit number MSB of the position value: 0 to 39_D: Value range					

1 You activate the respective parameter by setting the associated bit to 1.

2 Reserved bits must be set to 0

3 For signal type "Absolute encoder (SSI)", the following applies: Reserved[2]

4 In isochronous mode, the parameter can affect the isochronous mode parameters of the sync domain. Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameter in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

5 Applies to: Set function of DI = 001_B; 010_B; 011_B; 101_B

Structure of the data record 128 in Fast Mode

The following table shows you the structure of data record 128 for TM PosInput 1 for Fast Mode. The values in byte 0 to byte 3 are fixed and must not be changed.

Table A- 2 Parameter data record 128: Fast Mode operating mode

49...51	**Parameters for SSI absolute encoder**							
49	Reserved[2]		Frame length[4]: 10 to 40_D: Value range					
50	Reserved[2]		Bit number LSB of the position value: 0 to 38_D: Value range					
51	Reserved[2]		Bit number MSB of the position value: 1 to 39_D: Value range					

1 You activate the respective parameter by setting the associated bit to 1.

2 Reserved bits must be set to 0.

3 For signal type "Absolute encoder (SSI)", the following applies: Reserved[2]

4 In isochronous mode, the parameter can affect the isochronous mode parameters of the sync domain. Because the isochronous mode parameters are not checked in RUN, overflows can occur if you change the parameter in RUN. To prevent overflows, select the option with the largest time required in the offline parameter assignment.

5 Applies to: Set function of DI = 001_B; 010_B; 011_B

A.2 Parameter validation error

If you make the parameter settings in STEP 7 (TIA Portal) or in STEP 7 , the parameter values are checked before they are transferred to the technology module. This process prevents parameter errors.

In other use cases, the technology module checks the transferred parameter data record. If the technology module finds invalid or inconsistent parameter values, it outputs an error code (see below). The new parameter data record is rejected in this case, and work continues with the current parameter values until a valid parameter data record has been transferred.

WRREC

When the CPU is in RUN, you can change the parameter data record with the instruction WRREC (Write Record). In case of errors, the WRREC instruction returns corresponding error codes in the STATUS parameter.

Example:

Let us assume that an invalid value, for example 9, is written to the module for the operating mode with WRREC. As a consequence, the module rejects the entire parameter data record. You can recognize this by evaluating the STATUS output parameter of the WRREC instruction. The STATUS output parameter is output as an ARRAY[1..4] of BYTE data with the value 16#DF80E111:

Example of WRREC STATUS data	Address	Meaning
DF_H	STATUS[1]	Error when writing a data record via PROFINET IO (IEC 61158-6)
80_H	STATUS[2]	Error when reading or writing a data record via PROFINET IO (IEC 61158-6)
$E1_H$	STATUS[3]	Module-specific error
11_H	STATUS[4]	Error code from the table below: The "Operating mode" parameter has an invalid value.

Error codes

The following table shows the module-specific error codes and their meaning for parameter data record 128.

Table A- 3 Error codes for parameter validation (incremental or pulse encoder)

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	**Byte 1**	**Byte 2**	**Byte 3**		
DF	80	B0	00	Data record number unknown	Enter valid number for data record.
DF	80	B1	01	Length of data record incorrect	Enter valid value for data record length.
DF	80	B2	00	Slot invalid or not accessible	• Check whether module is inserted or removed. • Check assigned values for parameters of the WRREC instruction.
DF	80	E0	01	Wrong version	• Check byte 0. • Enter valid values.
DF	80	E0	02	Error in the header information	• Check byte 1. • Correct the length of the parameter blocks.
DF	80	E1	00	Parameter invalid: No detailed information available	Check all parameter values.
DF	80	E1	11	"Operating mode" parameter invalid	Enter valid parameter value.
DF	80	E1	12	"Reaction to CPU STOP" parameter invalid	Enter valid parameter value.
DF	80	E1	13	"Signal type" parameter invalid	Enter valid parameter value.
DF	80	E1	14	"Sensor type" parameter invalid	Enter valid parameter value.
DF	80	E1	15	"Filter frequency" parameter invalid	Enter valid parameter value.
DF	80	E1	16	"Reaction to signal N" parameter invalid	Enter valid parameter value.
DF	80	E1	17	"Set function of DI" parameter invalid	Enter valid parameter value.
DF	80	E1	18	"Set function of DI" parameter configured the same for DI0 and DI1.	Enter different parameter values for DI0 and DI1.
DF	80	E1	19	• "Edge selection" parameter invalid • "Gate start (edge-triggered)" configured as function for DIm and "At rising and falling edge" • "Gate stop (edge-triggered)" configured as function for DIm and "At rising and falling edge" • "Synchronization" configured as function for DIm and "At rising and falling edge"	• Enter valid parameter value. • Only configure "Gate start (edge-triggered)" as function for DIm together with "At rising edge" or "At falling edge". • Only configure "Gate stop (edge-triggered)" as function for DIm together with "At rising edge" or "At falling edge". • Only configure "Synchronization" as function for DIm together with "At rising edge" or "At falling edge".

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	1A	"Input delay" parameter invalid	Enter valid parameter value.
DF	80	E1	1B	"Set output" parameter invalid	Enter valid parameter value.
DF	80	E1	1C	"Count direction" parameter invalid	Enter valid parameter value.
DF	80	E1	1D	"Reset when counting limit is violated" parameter invalid	Enter valid parameter value.
DF	80	E1	1E	"Reaction to violation of a counting limit" parameter invalid	Enter valid parameter value.
DF	80	E1	20	"Reaction to gate start" parameter invalid	Enter valid parameter value.
DF	80	E1	21[1,5]	• Low counting limit > comparison value 0 • Low counting limit > comparison value 1	• Low counting limit < comparison value 0 • Low counting limit < comparison value 1
DF	80	E1	22[1,5]	• Counting high limit < comparison value 0 • Counting high limit < comparison value 1	• High counting limit > comparison value 0 • High counting limit > comparison value 1
DF	80	E1	23	• "Start value" parameter invalid • "Low counting limit" parameter invalid	Enter valid parameter value: Start value > low counting limit
DF	80	E1	24	• "Start value" parameter invalid • "High counting limit" parameter invalid	Enter valid parameter value: Start value < high counting limit
DF	80	E1	25	"Update time" parameter invalid	Enter parameter value from range 0 to 25000000_D.
DF	80	E1	26[2]	"Reference speed" parameter invalid	Enter parameter value from range 6.00 to 210000.00_D.
DF	80	E1	27	"Measured variable" parameter invalid	Enter valid parameter value.
DF	80	E1	28	"Time base for velocity measurement" parameter invalid	Enter valid parameter value.
DF	80	E1	29	"Increments per unit" parameter invalid	Enter valid parameter value.
DF	80	E1	2A	• "High counting limit" parameter invalid • "Low counting limit" parameter invalid	Enter valid parameter value: Low counting limit < high counting limit
DF	80	E1	2B[3]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value: Comparison value 0 < comparison value 1
DF	80	E1	2C	"Signal evaluation" parameter invalid	Enter valid parameter value.
DF	80	E1	2D	• "Between comparison value 0 and 1" configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ0 • "Between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0	• Configure "Between comparison value 0 and 1" only for DQ1 • "Not between comparison value 0 and 1" configured only for DQ1 • Only configure "Between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0 • Only configure "Not between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	2E	"Capture" configured for DIm in "Measuring" operating mode	Do not configure "Capture" for DIm in "Measuring" operating mode
DF	80	E1	36[4]	"Counting high limit" parameter invalid	Enter valid parameter value.
DF	80	E1	37[4,5]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value.
DF	80	E1	38[4]	"Start value" parameter invalid	Enter valid parameter value.
DF	80	E1	39[4]	"Counting low limit" parameter invalid	Enter valid parameter value.
DF	80	E1	3A[4]	"Count direction for synchronization" parameter invalid	Enter valid parameter value.
DF	80	E1	F0	Reserved bit is not set to 0.	Set reserved bit to 0.

1 Only for "Counting" operating mode

2 Only for "Position input for technology object "Motion Control"" operating mode

3 Only for DQ1 functions "Between comparison value 0 and 1" and "Not between comparison value 0 and 1"

4 Only for operating mode "Fast Mode"

5 Not for DQm function "Use by user program" or "Digital output without function"

The following table shows the module-specific error codes and their meaning for parameter data record 128 when using an SSI absolute encoder.

Table A- 4 Error codes for parameter validation (SSI absolute encoder)

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	B0	00	Data record number unknown	Enter valid number for data record.
DF	80	B1	01	Length of data record incorrect	Enter valid value for data record length.
DF	80	B2	00	Slot invalid or not accessible	• Check whether module is inserted or removed. • Check assigned values for parameters of the WRREC instruction.
DF	80	E0	01	Wrong version	• Check byte 0. • Enter valid values.
DF	80	E0	02	Error in the header information	• Check byte 1. • Correct the length of the parameter blocks.
DF	80	E1	00	Parameter invalid: No detailed information available	Check all parameter values.
DF	80	E1	11	"Operating mode" parameter invalid	Enter valid parameter value.
DF	80	E1	12	"Reaction to CPU STOP" parameter invalid	Enter valid parameter value.
DF	80	E1	13	"Signal type" parameter invalid	Enter valid parameter value.
DF	80	E1	18	"Set function of DI" parameter configured the same for DI0 and DI1.	Enter different parameter values for DI0 and DI1.
DF	80	E1	19	• "Edge selection" parameter invalid	Enter valid parameter value.
DF	80	E1	1A	"Input delay" parameter invalid	Enter valid parameter value.
DF	80	E1	1B	"Set output" parameter invalid	Enter valid parameter value.
DF	80	E1	1C	"Count direction" parameter invalid	Enter valid parameter value.
DF	80	E1	25	"Update time" parameter invalid	Enter parameter value from range 0 to 25000000_D.
DF	80	E1	26[1]	"Reference speed" parameter invalid	Enter parameter value from range 6.00 to 210000.00_D.
DF	80	E1	27	"Measured variable" parameter invalid	Enter valid parameter value.
DF	80	E1	28	"Time base for velocity measurement" parameter invalid	Enter valid parameter value.
DF	80	E1	29	"Increments per unit" parameter invalid	Enter valid parameter value.
DF	80	E1	2B[2]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value: Comparison value 0 < comparison value 1

Error code in STATUS parameter (hexadecimal)				Meaning	Remedy
Byte 0	Byte 1	Byte 2	Byte 3		
DF	80	E1	2D	• "Between comparison value 0 and 1" configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ0 • "Between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0 • "Not between comparison value 0 and 1" configured for DQ1, but "Use by user program" not configured for DQ0	• Configure "Between comparison value 0 and 1" only for DQ1 • "Not between comparison value 0 and 1" configured only for DQ1 • Only configure "Between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0 • Only configure "Not between comparison value 0 and 1" for DQ1 when "Use by user program" is configured for DQ0
DF	80	E1	2E	"Capture" configured for DIm in "Measuring" operating mode	Do not configure "Capture" for DIm in "Measuring" operating mode
DF	80	E1	2F	"Set function of DI" parameter invalid	Enter valid parameter value.
DF	80	E1	30	"Monoflop time" parameter invalid	Enter valid parameter value.
DF	80	E1	31	"Transmission rate" parameter invalid	Enter valid parameter value.
DF	80	E1	32	"Parity" parameter invalid	Enter valid parameter value.
DF	80	E1	33	"Frame length" parameter invalid	Enter valid parameter value.
DF	80	E1	34	• Bit number LSB of the position value < 0 • Bit number LSB of the position value > Bit number MSB of the position value • (Bit number MSB of the position value) – (Bit number LSB of the position value) >= 31 • Bit number MSB of the position value > Frame length	• Bit number LSB of the position value >= 0 • Bit number LSB of the position value < Bit number MSB of the position value • (Bit number MSB of the position value) – (Bit number LSB of the position value) < 32 • Bit number MSB of the position value <= Frame length
DF	80	E1	35	"0" configured for "Pulse duration" parameter	Enter valid parameter value.
DF	80	E1	37[3]	• "Comparison value 0" parameter invalid • "Comparison value 1" parameter invalid	Enter valid parameter value.
DF	80	E1	F0	Reserved bit is not set to 0.	Set reserved bit to 0.

[1] Only for "Position input for "Motion Control"" technology object" operating mode

[2] Only for DQ1 functions "Between comparison value 0 and 1" and "Not between comparison value 0 and 1"

[3] Only for "Fast Mode" operating mode; not for DQm function "Digital output without function"

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

This manual includes module-specific information on wiring, diagnostics and the technical specifications of the technology module.

General information regarding the design and commissioning of the ET 200SP is available in the ET 200SP system manual.

The "Time-based IO" technology supported by the TM Timer DIDQ 10x24V technology module is described in detail in the function manual High-precision input/output with Time-based IO (http://support.automation.siemens.com/WW/view/en/82527590).

Conventions

Please observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Open Source Software

Open-source software is used in the firmware of the product described. Open Source Software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information relating to this in the appendix.

Table of contents

1 Documentation guide

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the ET 200SP and S7-1500 systems consists of the respective system manuals, function manuals and device manuals.

The STEP 7 information system (TIA Portal) also helps you to configure and program your automation system.

Overview of the documentation for TM Timer DIDQ 10x24V technology module

The following table lists further documentation that you will need when using the TM Timer DIDQ 10x24V technology module.

Table 1- 1 Documentation for TM Timer DIDQ 10x24V technology module

Product overview 2

2.1 Properties

Article number

6ES7138-6CG00-0BA0

View of the module

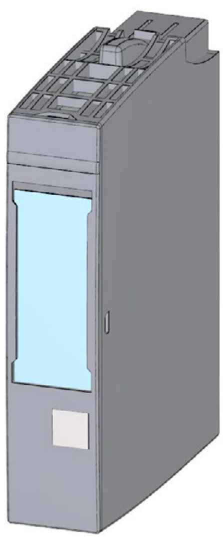

Figure 2-1 View of the TM Timer DIDQ 10x24V module

Properties

The TM Timer DIDQ 10x24V technology module has the following properties:

- Technical properties
  - 4 Digital inputs and 6 digital outputs
  - Rated output voltage 24V DC
  - Rated output current 0.5 A or 0.1 A (high-speed operation) per digital output
  - 24 V encoder supply output, short-circuit proof
  - Configurable substitute values (per digital output)
  - Configurable diagnostics
  - Configurable input filters for suppression of interference at digital inputs
- Supported encoder/signal types for digital inputs
  - 24 V incremental encoder with A and B signals
  - 24 V pulse encoder with one signal
- Supported functions
  - Time stamp function for inputs and outputs (resolution 1 μs)
  - Counting (counting range 32-bit)
  - Oversampling for inputs and outputs
  - Pulse width modulation
- Supported system functions
  - Isochronous mode
  - Firmware Update
  - Identification data I&M

Accessories

The following accessories can be used with the module and are not included in the product package:

- Labeling strip
- Color identification labels
- Reference identification labels
- Shield connector

A BaseUnit of the A0 type is required to operate the technology module. For an overview of the BaseUnits to be used with the technology module, refer to the product information on the documentation for the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/73021864).

For detailed information on the installation procedure, refer to the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.2 Functions

2.2.1 Detection of the input signals

You can configure up to four digital inputs with the technology module. You can evaluate the signals at the digital inputs for the following functions:

Time stamp detection (Timer DI)

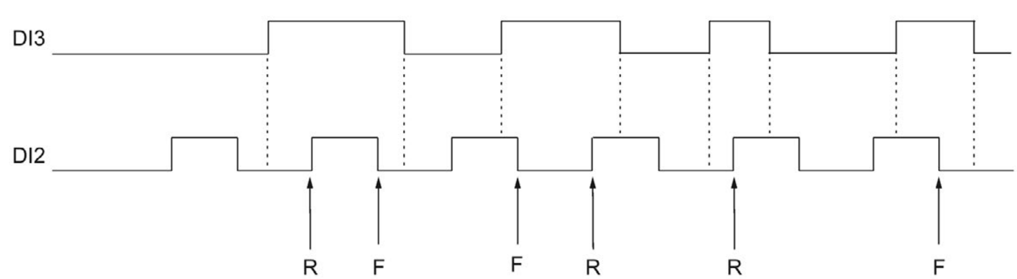
The technology module can detect an associated time stamp for an edge at a digital input. The time stamp indicates when the edge was detected in relation to a time base. These time stamps can be used, for example, to calculate a time difference.

The time stamp is based on the "Time-based IO" technology supported by the technology module and requires isochronous mode.

Hardware enable (HW enable)

You can configure a hardware enable by a digital input for the detection of time stamps. A hardware enable defines the time window in which the time stamps are acquired. You can override the hardware enable via the control interface (Page 27) with the respective SETEN bit.

The figure below shows an example for the detection of time stamps at rising and falling edges with enable of the DI2 through the high level of the DI3:



R Associated time stamp detected at rising DI2-edge

F Associated time stamp detected at falling DI2 edge

Counting

Counting refers to the recording and adding up of events. You can configure up to three counters for the technology module. You can use an incremental encoder as well as a pulse encoder at the digital inputs. The two phase-shifted signals from an incremental encoder are evaluated four times. Only the rising or falling edges are counted with the signal of a pulse encoder.

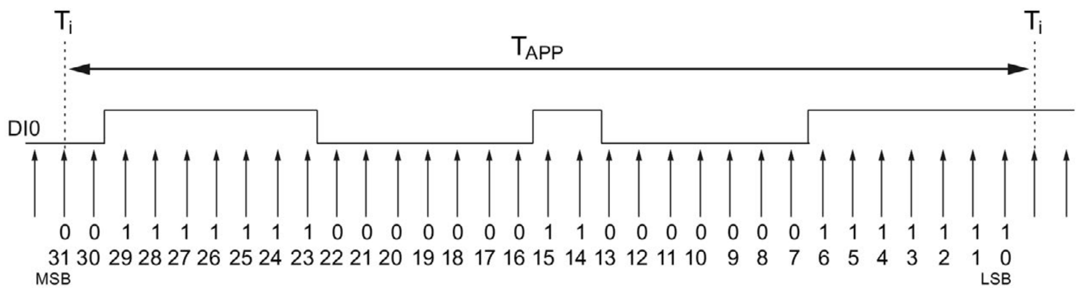
A counter starts at 0, goes up to 2^{32}-1 and starts again at 0 (overflow). The technology module can also count down if an incremental encoder is used. The counter value is returned in the feedback interface (Page 30) as a 32-bit value for each digital input.

Oversampling

The Oversampling function is used by the technology module to detect the status of the respective digital input for each application cycle (for example, OB61) at 32 points in time at regular intervals. The 32 states are returned together in the feedback interface (Page 30) as a 32-bit value.

Oversampling requires isochronous mode. If the OB of the type "Synchronous Cycle" works with a clock different than the send clock, you must use the TIO_SYNC instruction.

The figure below shows an example for Oversampling of DI0:



T_{APP} Application cycle

MSB Most significant bit

LSB Least significant bit

2.2.2 Switching the outputs

You can configure up to six digital outputs for the technology module. You can configure the following functions for switching the digital outputs:

Time-controlled switching (Timer DQ)

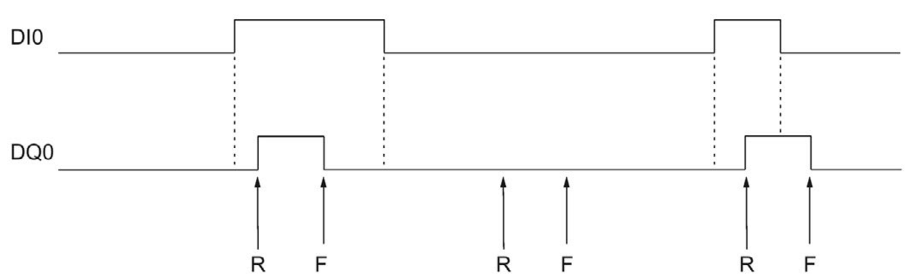
The use of time stamps enables reproducibility of controlled operations with very accurate time. Using this function, the technology module outputs edges at the respective digital output at precisely defined points in time. For example, you can implement a defined reaction time between input and output in conjunction with a digital input.

The Timer function is based on Time-based IO and requires isochronous mode.

Hardware enable (HW enable)

You can configure a hardware enable by means of a digital input for a Timer digital output. A hardware enable defines the time window in which the respective digital output can be set. The resetting of the digital output is independent of the hardware enable. You can override the hardware enable via the control interface (Page 27) with the respective SETEN bit.

The figure below shows an example for the output of rising and falling edges with enable of the DQ0 through the high level of the DI0:



R Specified time of a rising DQ0-edge

F Specified time of a falling DQ0-edge

Pulse width modulation (PWM)

The Pulse width modulation function enables you to specify the time period in the hardware configuration and the pulse-pause ratio in the control interface (Page 27) for the respective digital output. The setpoint for the pulse-pause ratio is a percentage and is evaluated with an accuracy of about 3%.

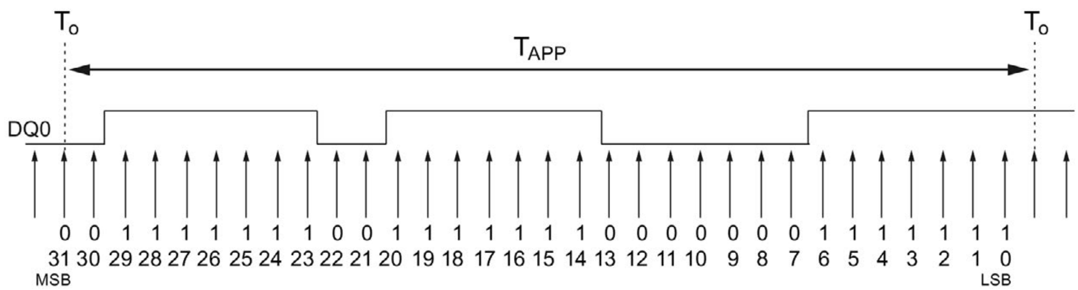
Oversampling

The Oversampling function is used by the technology module to output 32 states at regular intervals for each application cycle (for example, OB61). This allows up to 32 edges at the respective digital output per application cycle.

The 32 states are sent via the control interface (Page 27) as a 32-bit string for the respective digital output to the technology module.

Oversampling requires isochronous mode. If the OB of the type "Synchronous Cycle" works with a clock different than the send clock, you must use the TIO_SYNC instruction.

The figure below shows an example for Oversampling of DQ0:



T_{APP} Application cycle
MSB Most significant bit
LSB Least significant bit

Note

When you use the Oversampling function, make sure that the combination of application cycle and the 32-bit output sequence do not result in an output frequency which exceeds the maximum switching frequency for the digital outputs.

2.2.3 Additional functions

Isochronous mode

The technology module supports the system function "isochronous mode" in distributed mode on PROFINET. This system function is required for the following functions of the technology module:

- Time stamp detection (Timer DI)
- Time-controlled switching (Timer DQ)
- Oversampling of digital input
- Oversampling of digital output

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized.

Data processing

The time stamp, counter values and Oversampling bit string as well as status bits are detected at the time T_i and made available in the feedback interface for retrieval in the current bus cycle. The output of the current Oversampling bit stings is started at the time T_o.

Diagnostic interrupt

The technology module can trigger a diagnostic interrupt (Page 36), among other things, if no supply voltage is available or if there is an error at the digital outputs.

Input filter

To suppress interferences, you can configure an input filter for the digital inputs.

Distributed application

You can use the technology module in a distributed system by means of an interface module in the ET 200SP distributed I/O device. The following applications are possible:

- Distributed operation in an S7-1500 system
- Distributed operation in an S7-300/400 system

Centralized application

You can use the technology module centrally in the ET 200SP distributed I/O system.

Connecting 3

3.1 Pin assignment

The TM Timer DIDQ 10x24V is used with a BaseUnit of the A0 type.

The encoder signals, the digital input and output signals and the encoder supply are connected to the BaseUnit of the technology module. The supply voltage feed on the light BaseUnit BU...D of the associated potential group supplies the module and the digital outputs, and generates the encoder supply voltage.

BaseUnit

The BaseUnit is not included in the product package of the module and must be ordered separately.

For an overview of the BaseUnits to be used with the technology module, refer to the product information on the documentation for the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/73021864).

You can find information about selecting a suitable BaseUnit in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual and ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) device manual.

You can find information on wiring the BaseUnit, connecting cable shields, etc. in the Connecting section of the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

Pin assignment of the BaseUnit

The table below shows the pin assignment, using the BaseUnit BU15-P16+A0+2B as an example.

Table 3- 1 Pin assignment of the BaseUnit BU15-P16+A0+2B

<table>
<tr><th>Designation</th><th colspan="2">Signal name</th><th>View</th><th colspan="2">Signal name</th><th>Designation</th></tr>

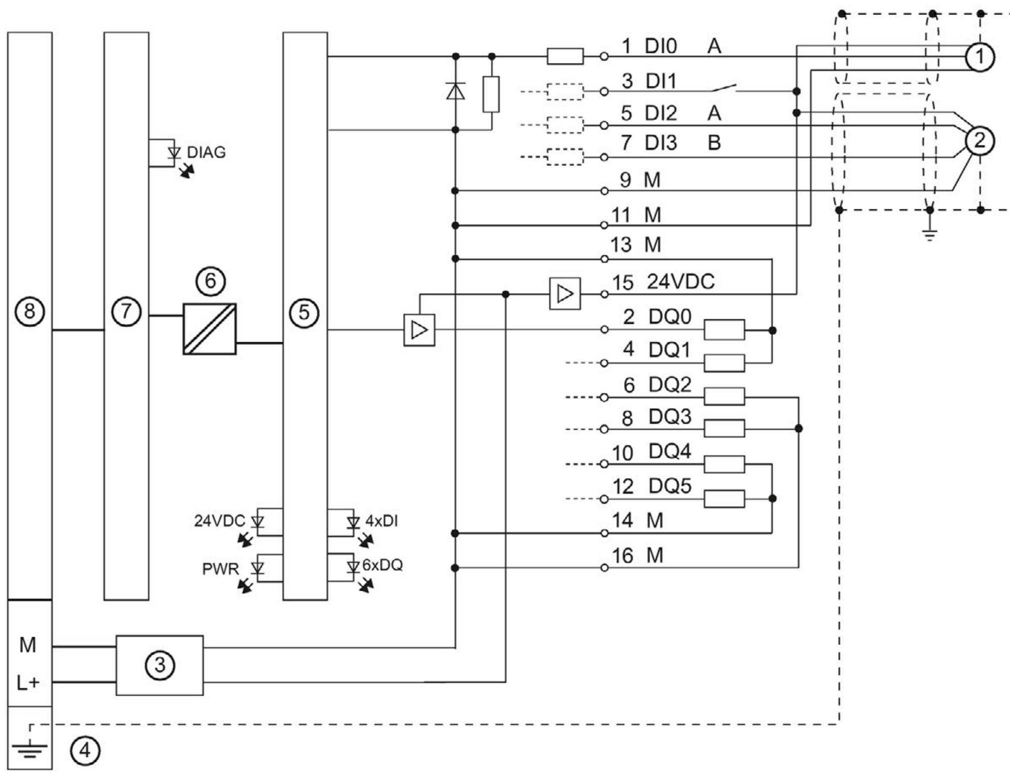
</table>

Block diagram

When you connect encoders you must, depending on the configured input delay and potential effect of interference, ground the shields of the cables between encoder and technology module both through the shield connection on the BaseUnit (shield connection element and terminal) and at the encoder.

The figure below shows the block diagram of the technology module to which an incremental encoder and a pulse encoder are connected.



① Pulse encoder with signal A
② Incremental encoder with A and B signals
③ Input filter for supply voltage
④ Shield connection on the BaseUnit
⑤ Technology
⑥ Electrical isolation
⑦ Backplane bus interface module of the technology module
⑧ Backplane bus

Figure 3-1 Block diagram with incremental encoder and pulse encoder

L+/M supply voltage

Connect the supply voltage (DC 24V) to the L+ and M connections. An internal protective circuit protects the technology module against damage due to reversed polarity of the supply voltage. Unexpected conditions can occur at the digital outputs with reversed polarity of the supply voltage. The technology module monitors the connection of the supply voltage.

24VDC encoder supply

To supply the encoders and sensors at the digital inputs, the technology module supplies the DC 24V supply voltage at the 24VDC output with reference to M. Voltage is supplied from the L+/M supply voltage and monitored for short-circuits and overload.

Digital inputs DI0 to DI3

You can use four digital inputs. The technology module can evaluate the edges at the digital inputs for the following functions:

Table 3- 2 Evaluation of the signals at the digital inputs

Evaluation of the signals for ...	Usable digital inputs			
	DI0	DI1	DI2	DI3
Time stamp detection	✓	✓	✓	✓
Hardware enable for time stamp detection	—	—	—	✓
Hardware enable for time-controlled switching	✓	✓	✓	—
Counting with incremental encoder with signals A and B	—	—	✓	✓
Counting with pulse encoder with signal A	✓	✓	✓	—
Oversampling	✓	✓	✓	✓

When you use the counting function, you can connect the following encoder types with 24 V signals to the digital inputs:

- Incremental encoder with signals A and B:

  Signals A and B are connected via the connections of the digital inputs DI2 and DI3. Signals A and B are the two incremental signals phase-shifted by 90°.

- Pulse encoder / sensor with signal A:

  Signal A is connected via the connection of the digital input DI0, DI1 or DI2.

The digital inputs are not electrically isolated from each other or from the digital outputs. The digital inputs are electrically isolated from the backplane bus.

Input filters for digital inputs

You can configure an input filter for each digital input to suppress interference. Signals with a pulse duration below the configured input delay are suppressed.

You can specify the following values for the input delay:

- None
  (input delay of 4 μs, minimum pulse width of 3 μs)
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms

The input delay has the following effect on the functions of the signal evaluation at the digital inputs:

Table 3- 3 Influence of the input delay

Function	Influence of the input delay
Time stamp detection	The detected time stamp is moved by the input delay.
Counting	The counter value that was valid at time T_i minus the input delay is returned.
Oversampling	The detected states are moved together by the input delay.

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs. To increase the accuracy of the time stamp function, we recommend the use of shielded cables even for longer input delays. The use of shielded cables limits the jitter to maximum of 1 μs.

Digital outputs DQ0 to DQ5

You can use six digital outputs. The digital outputs can be switched directly at defined points in time or via the user program. Alternatively, you can output pulse width modulation or Oversampling at the respective digital output.

The digital outputs are not electrically isolated from each other or from the digital inputs. The digital outputs are electrically isolated from the backplane bus.

You can use each of the digital outputs as a high-speed output or as a sourcing output:

- High-speed output (default):
  The digital output works as fast push-pull switch and can carry a rated load current of 0.1 A. A push-pull switch is alternately switched to DC 24 V and ground. This makes for very steep edges.
- Sourcing output:
  The digital output works as 24 V sourcing output in reference to M and can carry a rated load current of 0.5 A.

The digital outputs are protected from overload and short-circuit.

NOTICE

Overtemperature from unsuitable loads

A high-speed output generates edges that are very steep. This creates very powerful charge reversals for the connected load, which can overheat the load at very high switching frequencies.

The connected load must therefore be approved for high input frequencies.

Note

If you use a digital output as sourcing output, the switch-off response / switch-off edge depends on the load. Thus, it is possible that very short pulses cannot be output correctly.

Note

Relays and contactors can be connected direct without external circuitry.

Configuring/address space

4

4.1 Configuring

Introduction

The technology module is configured and assigned parameters with the configuration software.

The technology module functions are controlled and monitored by the user program.

System environment

The technology module can be used in the following system environments:

Table 4- 1 Applications of the technology module with PROFINET IO

Applications	Components required	Configuration software	In the user program
Distributed operation in an S7-1500 system	• S7-1500 automation system • ET 200SP distributed I/O system • TM Timer DIDQ 10x24V	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN)	Time stamp functions: TIO instructions TIO_SYNC, TIO_DI and TIO_DQ Counting, PWM and Oversampling: Direct access to the control and feedback interface (Page 27) of the TM Timer DIDQ 10x24V in the I/O data
Central operation in an S7-1500 system	• S7-1500 automation system • ET 200SP distributed I/O system • TM Timer DIDQ 10x24V	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN)	Counting and PWM: Direct access to the control and feedback interface of the TM Timer DIDQ 10x24V in the I/O data
Distributed operation in an S7-300/400 system	• S7-300/400 automation system • ET 200SP distributed I/O system • TM Timer DIDQ 10x24V	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN) STEP 7: Device configuration and parameter settings with HSP	Time stamp functions*, counting, PWM and Oversampling: Direct access to the control and feedback interface (Page 27) of the TM Timer DIDQ 10x24V in the I/O data

* on request

Additional information

You can find a detailed description of the time stamp functions and their configuration with the TIO instructions TIO_SYNC, TIO_DI and TIO_DQ in:

- High-precision input/output with Time-based IO function manual available as download on the Internet (http://support.automation.siemens.com/WW/view/en/82527590)
- In the STEP 7 (TIA Portal) information system under "Using technology functions > Counting, measurement and position input > Counting, measurement and position input (S7-1500)"

4.2 Reaction to CPU STOP

You set the response of the technology module to CPU STOP for each channel in the basic parameters.

Table 4- 2 Response of the technology module to CPU STOP depending on parameter assignment

Reaction to CPU STOP	Meaning
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: If you are using counters, the counter values are set to 0 and the digital outputs switch according to the parameter assignment and the setpoints.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. The last valid period duration with the last valid pulse-pause ratio is output for a configured pulse width modulation until the next STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: If you are using counters, the counter values are set to 0 and the digital outputs switch according to the parameter assignment and the setpoints.

4.3 Address space

Address space of the technology module

Table 4- 3 Range of the input addresses and output addresses of the TM Timer DIDQ 10x24V

	Inputs	Outputs
Range	26 bytes	32 bytes

Additional information

A description on how to use the control and feedback interface of TM Timer DIDQ 10x24V can be found in the chapter Control and feedback interface (Page 27).

4.4 Parameters

You can use various parameters to define the properties of the technology module in the hardware configuration. Depending on the settings, not all parameters are available. You can change the parameter assignment in the user program using data record 128 (Page 46).

If you use STEP 7 (TIA Portal), you can find the module in the Hardware catalog under "Technology modules". If you use STEP 7, you can find the module following installation of the corresponding HSP file in the Hardware catalog.

Parameters of the TM Timer DIDQ 10x24V

You can configure the following parameters:

Table 4- 4 Configurable parameters and their defaults

Parameter	Value range	Default setting
Basic parameters		
PWM period for the digital outputs	• 10 ms • 5 ms • 2 ms • 1 ms • 0.5 ms • 0.2 ms	10 ms
Reaction to CPU STOP	• Output substitute value • Keep last value	Output substitute value
Enable diagnostic interrupts	• Disabled • Enabled	Disabled
Channel parameters		
Configuration DQ/DI group (DQ0/DI0 or DQ1/DI1)	• Timer DQ with enable input • Use input/output individually	Timer DQ with enable input
Operating mode of the digital output	• Timer DQ • Oversampling • Pulse width modulation PWM	Timer DQ
Substitute value for the digital output	• 0 • 1	0
High-speed output (0.1 A)	• Disabled • Enabled	Enabled
Invert input or output signal	• Disabled • Enabled	Disabled
HW enable by the digital input	• Level-triggered • Edge-triggered	Level-triggered

Parameter	Value range	Default setting
Level selection for HW enable	• Active with high level • Active with low level	Active with high level
Configuration DQ/DI group (DQ2/DI2/DI3)	• Incremental encoder (A, B phase-shifted) • Timer-DI2 with enable input DI3 • Timer DQ2 with enable input DI2 • Use inputs individually	Incremental encoder (A, B phase-shifted)
Invert counting direction (incremental encoder)	• Disabled • Enabled	Disabled
Operating mode of the digital input	• Counter • Timer-DI • Oversampling	Timer-DI
Input delay for the digital input	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms	0.1 ms
Signal evaluation for counters	• At rising edge • At falling edge	At rising edge

4.5 Control and feedback interface

Direct access to the control and feedback interface on the PROFINET is not necessary for distributed operation in a S7-1500 system to use the time stamp functions. The TIO instructions TIO_SYNC, TIO_DI and TIO_DQ are available for this case. You can find a detailed description of the use of the TIO instructions in the High-precision input/output with Time-based IO function manual available as download on the Internet (http://support.automation.siemens.com/WW/view/en/82527590).

Additional information on using the control and feedback interface is available in the section Configuring (Page 22).

4.5.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface

The following table shows control interface assignment:

Table 4- 5 Control interface of the technology module

Offset to the start address	Parameter	Meaning
Byte 0	—	Bits 6 to 7: Reserved; bits must be set to 0
	SET_DQ (DQ0 ... DQ5)	Bit 5: Set DQ5
		Bit 4: Set DQ4
		Bit 3: Set DQ3
		Bit 2: Set DQ2
		Bit 1: Set DQ1
		Bit 0: Set DQ0
Byte 1	SETEN (DI0 ... DI3, DQ0 ... DQ3)	Bit 7: Override hardware enable for DQ3
		Bit 6: Override hardware enable for DQ2
		Bit 5: Override hardware enable for DQ1
		Bit 4: Override hardware enable for DQ0
		Bit 3: Override hardware enable for DI3
		Bit 2: Override hardware enable for DI2
		Bit 1: Override hardware enable for DI1
		Bit 0: Override hardware enable for DI0
Byte 2	SETEN (DQ4 ... DQ5)	Bits 2 to 7: Reserved; bits must be set to 0
		Bits 0 to 1: Override hardware enable for DQ4 to DQ5

<table>

</table>

Notes on the control bits

Control bit	Notes
SEL (DIm)	This value is supplied by the TIO instruction TIO_DI.
SET_DQm	You can use this bit to set the DQm digital output in the DQ operating mode "Timer DQ".
SETEN (DIm/DQm)	You can use this bit to override the hardware enable that is configured for a digital input DIm or digital output DQm.
STW	This value is controlled by the TIO instruction TIO_SYNC. Detailed information is available on request.
TEC_OUT (DQm)	If you use the time stamp function for the respective digital output DQm, the TIO instruction TIO_DQ returns the two output time stamps for the module in this value. If you use the Oversampling function for the respective digital output DQm, you specify the 32 states with this value. If you use pulse width modulation for the respective digital output DQm, you specify the pulse-pause ratio with this value as percentage. The following overview shows how the technology module evaluates the specified percentage.

Pulse-pause ratio for PWM

You specify the setpoint for the pulse-pause ratio as a percentage. The technology module outputs the following pulse-pause ratio in each case:

Setpoint in %	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23
Output value in %	0		3.13			6.25			9.38			12.50				15.63			18.75			21.88		

24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51

Additional information

Detailed information about the time stamp function is available from Technical Supporton request.

4.5.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Table 4- 6 Feedback interface of the technology module

<table>
<tr><th>Offset to the start address</th><th>Parameter</th><th colspan="3">Meaning</th></tr>
<tr><td rowspan="5">Byte 0</td><td rowspan="5">STS_DI
(DI0 ... DI3)</td><td colspan="3">Bits 4 to 7: Reserved</td></tr>
<tr><td colspan="3">Bit 3: Status DI3</td></tr>

		SYNC	Bit 8: Module is synchronized with the user program
		Channel address	Bits 4 to 7 and 9: Number of the respective DI or DQ
		Channel mode	Bits 0 to 3: Operating mode of the respective DI or DQ

Notes on the feedback bits

Table 4- 7 Feedback bits with notes

Feedback bit	Notes
STS_DI (DIm)	This bit indicates the status of respective digital input DIm.
EN (DIm/DQm)	This bit indicates that • The respective digital input is active as Timer DI and, if required, is enabled, or • The respective digital output is active as Timer DQ and, if required, is enabled. For digital inputs and digital outputs with the operating modes "Counter", "Oversampling", "Pulse Width Modulation PWM" and for level-controlled hardware enable, this bit is permanently "0".
Layout Property	This value is a module-specific constant and used by the TIO instructions for the recognition of the technology module.
LEC (DIm)	This value indicates the number of edges at the respective digital input DIm for which no time stamp could be stored. The module can count a maximum of seven edges per application cycle. The counter is reset with each new application cycle.
QI (DIm)	This bit indicates that an error has occurred at the respective digital input. 0 means: Supply voltage L+ not present or too low. 1 means: Supply voltage is present and OK If the diagnostic interrupts are enabled, a diagnostic interrupt is triggered when there is a problem with the L+ supply voltage. Refer to the section Diagnostic alarms (Page 37) for details on the diagnostic interrupts.

Feedback bit	Notes
QI (DQm)	This bit indicates that an error has occurred at the respective digital output. 0 means: Short-circuit, overload or overtemperature 1 means: Supply voltage is present and OK If the diagnostic interrupts are enabled, a diagnostic interrupt is triggered when there is a fault at the digital output. Refer to the section Diagnostic alarms (Page 37) for details on the diagnostic interrupts.
TEC_IN (DIm)	If you use the time stamp function for the respective digital input DIm, this value returns the two input time stamps for the module. The input time stamps are read by the TIO instruction TIO_DI and converted to the TIO_Time. If you use the counting function for the respective digital input DIm, this value returns the current counter value. If you use the Oversampling function for the respective digital input DIm, this value returns the 32 states of the Dlm.
ZSW	This value is controlled by the technology module and is used for communication with the TIO instruction TIO_SYNC.

Additional information

Detailed information about the time stamp function is available from Technical Support on request.

Interrupts/diagnostic messages 5

5.1 Status and error displays

LEDs

The figure below shows the LEDs (status and error displays) of the TM Timer DIDQ 10x24V.

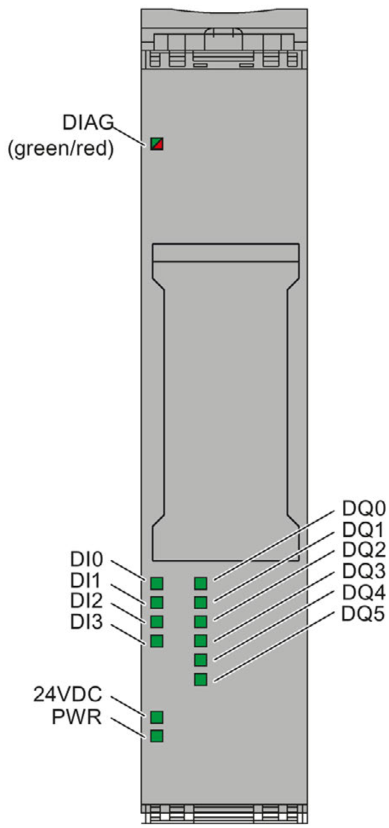

Figure 5-1 LEDs of the TM Timer DIDQ 10x24V

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the section Diagnostic alarms (Page 37).

Table 5- 1 Status and error displays DIAG

LED DIAG	Meaning	To correct or avoid errors
Off	Backplane bus supply of the ET 200SP not OK	Check or switch on the supply voltage on the interface module or on the CPU.
Flashes	Technology module not configured	—
On	Technology module configured but no module diagnostics	
Flashes	Technology module configured and module diagnostics (at least one error pending)	Evaluate the diagnostic alarms and eliminate the error.

Table 5- 2 PWR/24VDC status displays

LEDs		Meaning	To correct or avoid errors
PWR	24VDC		
Off	Off	No supply voltage	• Check the supply voltage. • Check the BaseUnit type and the wiring of the BaseUnit.
On	On	Supply voltage is present and OK	—
On	Off	Short-circuit or overload at the encoder supply or supply voltage too low	• Check the encoder wiring. • Check the loads connected to the encoder supply. • Check the supply voltage.

ChannelLEDs

TheDIm LEDs indicate the current level of the associated signals. The LEDs of the digital outputs DQm indicate the desired state.

The flashing frequency of the channel LEDs is limited to approximately 14 Hz. If higher frequencies are present, the channel LEDs will flash at 14 Hz instead of indicating the current status.

Table 5- 3 Status displays DIm/DQm

LEDs DIm/DQm	Meaning
□ Off	Digital input / digital output at 0 level
■ On	Digital input / digital output at 1 level

5.2 Trigger a diagnostic interrupt

Enabling the diagnostic interrupts

You enable the diagnostic interrupts at the basic parameters.

The technology module can trigger the following diagnostic interrupts:

Table 5- 4 Possible diagnostic interrupts

Diagnostic interrupt	Monitoring
• Internal error • Watchdog tripped. Module is defective.	Monitoring is always active. A diagnostic interrupt is triggered each time an error is detected.
• Error • Load voltage missing • Module temporarily unavailable • Short-circuit or overload at encoder supply • Error at the digital outputs • Supply voltage error • Overtemperature	Monitoring is always active. A detected error only triggers a diagnostic interrupt if "Enable diagnostic interrupts" has been enabled in the device parameters. The diagnostic interrupts are not enabled in the default setting.

Reactions to a diagnostic interrupt

The following happens when an event occurs that triggers a diagnostic interrupt:

- The DIAG LED flashes red.

  Once you have remedied the error, the DIAG LED goes out.
- The S7-1500 CPU interrupts processing of the user program. The diagnostic interrupt OB (e.g. OB 82) is called. The event that triggered the interrupt is entered in the start information of the diagnostic interrupt OB.
- The S7-1500 CPU remains in RUN even if no diagnostic interrupt OB is present in the CPU. The technology module continues working unchanged if this is possible despite the error.

Detailed information on the error event is available with the instruction "RALRM" (read additional interrupt information).

5.3 Diagnostic alarms

Diagnostic alarms

If a diagnostic alarm is pending, the DIAG LED flashes red.

The diagnostics are displayed as plain text in STEP 7 (TIA Portal) in the online and diagnostics view. You can evaluate the error codes with the user program.

The technology module only has one channel as far as diagnostics is concerned. Channel number "0" is therefore displayed for each diagnostic with a few exceptions.

The following diagnostics can be signaled:

Table 5- 5 Diagnostic alarms, their meaning and remedies

Diagnostic alarm	Error code	Meaning	To correct or avoid errors
Error	9_H	• Internal module error occurred • Possible cause: Technology module defective	Replace technology module
Load voltage missing*	11_H	• No technology module L+ supply voltage • Possible cause: BaseUnit type wrong	• Check BaseUnit type • Check the wiring of the supply voltage L+ on the BaseUnit
Module temporarily unavailable*	$1F_H$	• No normal operation of the technology module possible • Possible cause: Technology module is performing a firmware update	Wait until technology module is available again
Internal error	100_H	Technology module defective	Replace technology module
Watchdog tripped. Module is defective.	103_H	Firmware error	Run firmware update
		Technology module defective	Replace technology module
Short-circuit or overload at encoder supply	$10E_H$	• Error at encoder supply • Possible causes: – Short-circuit – Overload	• Check encoder wiring • Check consumers connected to encoder supply
Error at the digital outputs	$10F_H$	• Error at the digital outputs • Possible causes: – Short-circuit – Overload	• Check wiring at the digital outputs • Check consumers connected to the digital outputs

Diagnostic alarm	Error code	Meaning	To correct or avoid errors
Supply voltage error*	110_H	• Error at supply voltage L+ • Possible causes: – Low voltage – Wiring of L+ supply voltage defective	• Check the L+ supply voltage • Check the wiring of the supply voltage L+ on the BaseUnit
Overtemperature	506_H	• Short-circuit or overload at the digital outputs or outputs of the encoder supplies • Ambient temperature outside specifica-tions	• Check process wiring • Improve cooling • Check connected loads

* This diagnostic alarm is displayed with the channel number "32768".

	6ES7138-6CG00-0BA0
Product type designation	TM Timer DIDQ 10x24V
General information	
BaseUnits that can be used	BU type A0
Product function	
I&M data	Yes; I&M 0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 Update 3
STEP 7 can be configured/integrated as of version	V5.5 SP3 / -
Supply voltage	
Load voltage L+	
Rated value (DC)	24 V
Low limit of valid range (DC)	19.2 V
High limit of valid range (DC)	28.8 V
Reverse polarity protection	Yes; against destruction
Input current	
Current consumption, max.	50 mA; without load
Encoder supply	
Number of outputs	1
24 V encoder supply	
24 V	Yes; L+ (-0.8 V)
Short-circuit protection	Yes
Output current, max.	500 mA; note derating
Power loss	
Power loss, typ.	1.5 W
Address area	
Occupied address area	
Inputs	26 bytes
Outputs	32 bytes
Digital inputs	
Number of inputs	4
Digital inputs, configurable	Yes
Input characteristics to IEC 61131, Type 3	Yes

	6ES7138-6CG00-0BA0
Digital input functions, configurable	
Digital input with time stamp	Yes
• Number, max.	4
Counter	Yes
• Number, max.	3
Counter for incremental encoder	Yes
• Number, max.	1
Digital input with oversampling	Yes
• Number, max.	4
Hardware enable for digital input	Yes
• Number, max.	1
Hardware enable for digital output	Yes
• Number, max.	3
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For signal "0"	-30 V to +5 V
For signal "1"	+11 V to +30 V
Permitted voltage at input, min.	-30 V
Permitted voltage at input, max.	30 V
Input current	
for signal "1", typ.	2.5 mA
Input delay (at rated value of input voltage)	
Minimum pulse width for program reaction	3 µs; with parameter assignment "none"
For standard inputs	
• Configurable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 ms)
• at "0" to "1", min.	4 µs
• at "1" to "0", min.	4 µs
Cable length	
Cable length shielded, max.	1000 m; depending on sensor, cable quality and edge slope
Cable length unshielded, max.	600 m; depending on sensor, cable quality and edge slope

	6ES7138-6CG00-0BA0
Digital outputs	
Type of digital output	Transistor
Number of outputs	6
M switching	Yes; with high-speed output
Sourcing	Yes
Digital outputs, configurable	Yes
Short-circuit protection	Yes; electronic/thermal
• Response threshold, typ.	1.7 A with standard output; 0.5 A with high-speed output
Limiting of inductive shutdown voltage to	-0.8 V
Control of a digital input	Yes
Digital output functions, configurable	
Digital output with time stamp	Yes
• Number, max.	6
PWM output	Yes
• Number, max.	6
Digital output with oversampling	Yes
• Number, max.	6
Output switching capacity	
With resistive load, max.	0.5 A; 0.1 A with high-speed output
With lamp load, max.	5 W; 1 W with high-speed output
Load resistance range	
Low limit	48 Ω; 240 Ohm with high-speed output
High limit	12 kΩ
Output voltage	
Type of output voltage	DC
for signal "0", max.	1 V; with high-speed output
for signal "1", min.	23.2 V; L+ (-0.8 V)
Output current	
for signal "1" rated value	0.5 A; 0.1 A with high-speed output, note derating
for signal "1" permissible range, max.	0.6 A; 0.12 A with high-speed output, note derating
for signal "1" minimum load current	2 mA
for signal "0" residual current, max.	0.5 mA
Output delay with resistive load	
"0" to "1", max.	1 μs; for high-speed output, 5 μs with standard output
"1" to "0", max.	1 μs; for high-speed output, 6 μs with standard output

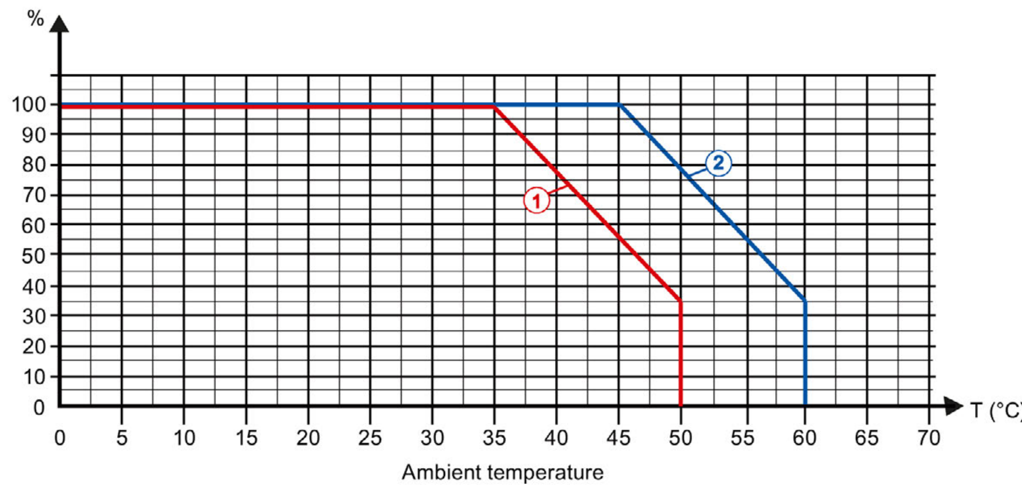
	6ES7138-6CG00-0BA0
Switching frequency	
With resistive load, max.	10 kHz
With lamp load, max.	10 Hz
Total current of outputs	
Max. current per module	3.5 A; note derating
Cable length	
Cable length shielded, max.	1000 m; depending on load and cable quality
Cable length unshielded, max.	600 m; depending on load and cable quality
Encoders	
Supported encoders	
Incremental encoder (asymmetric)	Yes
24 V initiator	Yes
2-wire sensor	Yes
• Permitted quiescent current (2-wire sensor), max.	1.5 mA
Encoder signals, incremental encoders (asymmetrical)	
Input voltage	24 V
Input frequency, max.	50 kHz
Counting frequency, max.	200 kHz; with quadruple evaluation
Cable length shielded, max.	600 m; depends on input frequency, encoder and cable quality; max. 200 m with 50 kHz
Incremental encoder with A/B tracks, phase-shifted by 90°	Yes
Pulse encoder	Yes
24 V encoder signal	
• Permitted voltage at input, min.	-30 V
• Permitted voltage at input, max.	30 V
Interface hardware	
Input characteristics to IEC 61131, Type 3	Yes
Isochronous mode	
Isochronous mode (application synchronized until terminal)	Yes
Bus cycle time (TDP), min.	375 μs
Jitter, max.	1 μs
Interrupts/diagnostics/status information	
Activation of substitute values	Yes
Interrupts	
Diagnostic interrupt	Yes
Diagnostic alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Short-circuit	Yes

	6ES7138-6CG00-0BA0
LED diagnostics display	
Monitoring of supply voltage (PWR LED)	Yes, green PWR LED
For module diagnostics	Yes; green / red DIAG LED
Integrated functions	
Number of counters	3
Counting frequency (counters), max.	200 kHz; with quadruple evaluation
Counting functions	
Continuous counting	Yes
Electrical isolation	
Electrical isolation channels	
Between the channels and the backplane bus	Yes
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC (basic isolation)
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Operating temperature	
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C; note derating
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C; note derating
Distributed operation	
At SIMATIC S7-300	Yes
At SIMATIC S7-400	Yes
At SIMATIC S7-1500	Yes
Dimensions	
Width	15 mm
Weights	
Weight, approx.	45 g

Derating information for standardized total current of outputs

If the digital outputs of the TM Timer DIDQ 10x24V are operated with resistive loads, you should derate the standardized total current of the loads at the outputs of the technology module. The standardized total current is the standardized total of the mean output currents at all digital outputs and encoder supply related to its nominal current in each case.

The following derating curve shows the load capacity of the digital outputs depending on the ambient temperature and mounting position:



① Vertical installation of the system

② Horizontal installation of the system

Figure 6-1 Standardized total current depending on ambient temperature and mounting position for resistive loads

---

Note

In the following cases, the voltage at the digital inputs and the load current supply L+ must not exceed DC 24 V + 5 %:

- When the system is mounted vertically, as of an ambient temperature of 35 °C
- When the system is mounted horizontally, as of an ambient temperature of 45 °C

Example

The following example shows the calculation of the standardized total current:

Table 6- 1 Calculation of the standardized total current

Digital output	High-speed output (0.1 A)	Output current		
		Nominal value according to parameter assignment	Mean value	Mean value in relation to the nominal value
DQ0	Yes	0.1 A	0.05 A	50 %
DQ1	Yes	0.1 A	0.08 A	80 %
DQ2	No	0.5 A	0.5 A	100 %
DQ3	No	0.5 A	0.1 A	20 %
DQ4	Yes	0.1 A	0.01 A	10 %
DQ5	No	0.5 A	0.15 A	30 %
Encoder supply	—	0.5 A	0.2 A	40 %
Total				330 %
Standardized total current = total / number of outputs = 330 % / 7 outputs				**47 %**

With a standardized total current of 47 % and horizontal mounting of the system, the ambient temperature according to the derating curve may amount to a maximum of approx. 57 °C.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Parameter data record

A

You may edit the module parameters in RUN. The WRREC instruction is used to transfer the parameters to the module using data record 128.

If errors occur during the transfer or validation of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. A corresponding error code is then written to the STATUS output parameter. If no errors occur, the STATUS output parameter contains the length of the actually transferred data.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help (TIA Portal).

Structure of data record

The following table shows you the structure of data record 128 for TM Timer DIDQ 10x24V. The values in byte 0 to byte 3 are fixed and may not be changed.

Table A- 1 Parameter data record 128

Bit → / Byte ↓	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

1) You enable a specific parameter by setting the corresponding bit to 1.

2) Must be set to 0.

Counting

The following table shows the properties for counting that you can set in the channel parameters of the respective digital input:

Operating mode for counting	**Usable digital inputs**	**"Invert input signal" set to...**	
		0	**1**
Counter (0011_B)	• DI0 • DI1 • DI2	Counting of **rising** edges	Counting of **falling** edges
Incremental encoder (A, B phase-shifted) (0100_B)	DI2 with DI3 (all bits of the channel parameters for DI3 are set to 0)	Counting direction **not inverted**	Counting direction **inverted**

Hardware enable (HW enable)

You can use a hardware enable by an enable input for the operating modes "Timer DI" and "Timer DQ". You set a hardware enable with bit 4 of the respective channel parameter.

You can set a hardware enable for the following inputs and outputs:

Digital input / digital output	**Hardware enable by digital input...**
DI2	DI3
DQ0	DI0
DQ1	DI1
DQ2	DI2

You set a hardware enable with the channel parameters of the enable input "Operating mode" and "Invert" signal input:

Operating mode	**"Invert input signal" set to...**	
	0	**1**
Oversampling (0010_B)	Hardware enable by **High** level	Hardware enable by **Low** level
Timer DI (0000_B)	When using the SIMOTION control system only	

Input filter

The following overview shows the input filters that can be set for specific operating modes of a digital input:

Table A- 2 Setting options for the input filter

Operating mode of the digital input	Type of input filter	Assignable values
• Timer DI (0000_B) • Oversampling (0010_B)	Input delay	• None • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms
• Counter (0011_B) • Incremental encoder (A, B phase-shifted) (0100_B)	Filter frequency	50 kHz (cannot be changed)

Open Source Software B

For Resellers: In order to avoid infringements of the license conditions by the reseller or the buyer, the instructions and license conditions provided here must be passed on to the buyers.

License Conditions and Disclaimers for Open Source Software and other licensing software

The Open Source software listed below is used in unmodified form or in a form we have modified as well as other license software listed below in the "digital modules, analog modules, technology modules, communication modules and power supply modules of the SIMATIC S7-1500, ET 200SP" Copyright Siemens AG, 2013-2014 (hereinafter referred to as "Product").

Liability for Open Source Software

The Open Source software is provided free of charge. We are liable for the Product including the Open Source software contained in it pursuant to the license conditions applicable to the Product. We explicitly reject any liability for the use of Open Source software beyond the program sequence intended for the Product. Furthermore, any liability for defects resulting from modifications to the Open Source software is excluded.

We do not provide any technical support for the Product if it has been modified.

Please read the license conditions and copyright information of Open Source software as well as other licensing software:

Open Source Software: GNU GCC libstdc++ / libsupc++ - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software GNU GCC libstdc++ / libsupc++ - 4.4.1

License conditions:

1 License

There are two licenses affecting GNU libstdc++: one for the code, and one for the documentation.

There is a license section in the FAQ regarding common questions. If you have more questions, ask the FSF or the gcc mailing list.
The Code: GPL

The source code is distributed under the GNU General Public License version 3, with the addition under section 7 of an exception described in the “GCC Runtime Library Exception, version 3.1” as follows (or see the file COPYING.RUNTIME):

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyleft.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyleft requirements of the license of GCC.

Hopefully that text is self-explanatory. If it isn't, you need to speak to your lawyer, or the Free Software Foundation.
The Documentation: GPL, FDL

The documentation shipped with the library and made available over the web, excluding the pages generated from source comments, are copyrighted by the Free Software Foundation, and placed under the GNU Free Documentation License version 1.2. There are no Front-Cover Texts, no Back-Cover Texts, and no Invariant Sections.

For documentation generated by doxygen or other automated tools via processing source code comments and markup, the original source code license applies to the generated files. Thus, the doxygen documents are licensed GPL.

If you plan on making copies of the documentation, please let us know. We can probably offer suggestions.

9 GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future
versions of the GNU General Public License can be used, that proxy's
public statement of acceptance of a version permanently authorizes you
to choose that version for the Program.

Later license versions may give you additional or different
permissions. However, no additional obligations are imposed on any
author or copyright holder as a result of your choosing to follow a
later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY
APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE
COPYRIGHT
HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT
WARRANTY
OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED
TO,
THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A
PARTICULAR
PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE
PROGRAM
IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE
COST OF
ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN
WRITING
WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR
CONVEYS
THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES,
INCLUDING ANY
GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT
OF THE
USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO
LOSS OF
DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY
YOU OR THIRD
PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER
PROGRAMS),
EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE
POSSIBILITY OF
SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school,
if any, to sign a "copyright disclaimer" for the program, if necessary.
For more information on this, and how to apply and follow the GNU GPL, see
<http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program
into proprietary programs. If your program is a subroutine library, you
may consider it more useful to permit linking proprietary applications with
the library. If this is what you want to do, use the GNU Lesser General
Public License instead of this License. But first, please read
<http://www.gnu.org/philosophy/why-not-lgpl.html>.

Open Source Software: libgcc - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software libgcc - 4.4.1

License conditions:

1 GCC is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 3, or (at your option) any later version.
GCC is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.
Under Section 7 of GPL version 3, you are granted additional permissions described in the GCC Runtime Library Exception, version 3.1, as published by the Free Software Foundation.
You should have received a copy of the GNU General Public License and a copy of the GCC Runtime Library Exception along with this program; see the files COPYING3 and COPYING.RUNTIME respectively. If not, see <http://www.gnu.org/licenses/>.

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc. <http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyleft.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyleft requirements of the license of GCC.

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.
TERMS AND CONDITIONS

0. Definitions.

“This License” refers to version 3 of the GNU General Public License.

“Copyright” also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

“The Program” refers to any copyrightable work licensed under this License. Each licensee is addressed as “you”. “Licensees” and “recipients” may be individuals or organizations.

To “modify” a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a “modified version” of the earlier work or a work “based on” the earlier work.

A “covered work” means either the unmodified Program or a work based on the Program.

To “propagate” a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To “convey” a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays “Appropriate Legal Notices” to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The “source code” for a work means the preferred form of the work for making modifications to it. “Object code” means any non-source form of a work.

A “Standard Interface” means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The “System Libraries” of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A “Major Component”, in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The “Corresponding Source” for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to “keep intact all notices”.
c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.
b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.
c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.
e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A “User Product” is either (1) a “consumer product”, which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, “normally used” refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

“Installation Information” for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's “contributor version”.

A contributor's “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. “Knowingly relying” means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is “discriminatory” if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS
How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an “about box”.

You should also get your employer (if you work as a programmer) or school, if any, to sign a “copyright disclaimer” for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

2 This configure script is free software; the Free Software Foundation gives unlimited permission to copy, distribute and modify it.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual includes module-specific information on wiring, diagnostics and the technical specifications of the technology module.

General information regarding the design and commissioning of the ET 200SP is available in the ET 200SP system manual.

Conventions

Please observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product, and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (https://support.industry.siemens.com/cs/?lc=en-US).

Open source software

Open source software is used in the firmware of the product described. Open source software is provided free of charge. We are liable for the product described, including the open source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the license conditions and copyright notices. Please read the information relating to this in the "Open Source Software (Page 142)" appendix.

Introduction

This modular documentation of a SIMATIC product covers automation system topics.

The complete documentation for the ET 200SP system consists of the respective system manuals, function manuals, and device manuals.

The STEP 7 information system (TIA Portal online Help) also helps you configure and program your automation system.

Overview of the documentation for TM Pulse 2x24V technology module

The following table lists further documentation that you will need when using the TM Pulse 2x24V technology module.

Table 1- 1 Documentation for TM Pulse 2x24V technology module

View of the module

Figure 2-1 View of the TM Pulse 2x24V module

Properties

The TM Pulse 2x24V technology module has the following properties:

- 2 pulse output channels with up to 2 A output current per channel
  - One-channel operation: The two channels are merged together into one logical channel and are connected in parallel to generate pulse signals with up to 4 A output current.
  - Two-channel operation: The two channels can work independently of each other.
- Programmable pulse timing.

<table>
<tr><th rowspan="2">Pulse timing</th><th colspan="2">Minimum</th><th colspan="2">Maximum</th></tr>
<tr><th>High-speed disabled</th><th>High-speed enabled</th><th>High-speed disabled</th><th>High-speed enabled</th></tr>

<tr><td>Period duration</td><td>100 μs</td><td>10 μs</td></tr>
<tr><td>On-delay</td><td colspan="2" rowspan="2">0 μs</td></tr>
<tr><td>Off-delay</td></tr>
<tr><td>Frequency</td><td colspan="2">0.02 Hz</td><td>10 kHz</td><td>100 kHz</td></tr>
</table>

[1] A smaller value is possible but not guaranteed for Pulse train, PWM, On/Off-delay, and DC motor modes

Parallel mode	Maximum pulse output current	
	High-speed disabled	High-speed enabled
Disabled	2 A (two channels)	100 mA (two channels)
Enabled	4 A (one channel)	Not allowed

- You can configure DI0.0 (Channel 0) and DI1.0 (Channel 1) digital inputs as hardware enable inputs that start the output pulse sequence, or as inputs directly usable by your program and independent of the pulse generation. In DC motor mode, you can stop the motor by using the digital inputs for external stop control.
- If you configure one channel 4 A operation, the two output channels are connected in parallel. Only Channel 0 is parameterized to control the parallel connection and only DI0.0 is available as a digital input/hardware enable.
- Each channel's digital output provides two load connections:
  - All modes except DC motor mode use a single unipolar output connection (DQn.A).
  - In DC motor, connect a load between the bipolar output connections (DQn.A and DQn.B). For example, a channel output can drive a DC motor in both directions by reversing the voltage polarity. Note that not all functions are available in DC motor mode; for example, current measurement and current control are not allowed.
- Digital outputs have integrated protection diodes to prevent voltage overstress due to inductive kickback. No external protection diodes are required for inductive loads.

Operating modes

- Pulse output: output a single pulse with variable pulse duration and On-delay.
- Pulse width modulation (PWM):
  - Output a frequency with a defined period duration and variable ratio of pulse width to period duration (duty cycle).
  - PWM can vary current in the driven loads. You can use PWM mode to control temperature in a heating resistor or the force from a coil in a proportional valve.
- Pulse train: output a train of pulses with an assigned pulse quantity, period duration, ratio of pulse width to period duration (duty cycle), and On-delay.
- On/Off-delay: the pulse output follows the signal at the DIn.0 digital input after an assigned On-delay and Off-delay.
- Frequency output: output pulses at a variable frequency with a fixed pulse width to pulse period duty cycle of 50%.
- DC motor: drive a motor in both directions with a bipolar PWM output. You can assign a digital input as an "External stop" signal, for the motor.

Functions

- Sequence counter: count completed output sequences and provide a feedback signal. The sequence counter can count short output sequences that are too fast for your program to monitor. For example, the counter is useful when the output sequence is faster than your program's cycle time and the output sequence is triggered by the DI digital input. The sequence counter is limited to 4 bits (count range 0 to 15).
- The sequence counter is available only for:
  - Pulse output and Pulse train modes.
    Without hardware enable, the counter is set to 1 after completion of the output sequence.
    With hardware enable, the counter is incremented after every completed output sequence.
  - On/Off-delay mode.
    The counter is incremented with each positive and negative edge at the DQn.A digital output.
- Current measurement: for Pulse train and PWM modes.
- Current control: PID loop control for proportional current control in PWM mode.
- Dithering: superimpose a dither signal on the PWM output to prevent valve sticking and improve proportional valve control.
- Direct control of the digital output by your control program.

- Programmable output response to CPU/master STOP condition.
- Error detection and diagnostics:
  - Missing or under voltage L+ supply voltage
  - Short-circuit/overload of a digital output
  - Short-circuit/under voltage of a sensor power supply
  - Over temperature error
  - Parameterization fault
  - Module/firmware error

Configuration

TM Pulse 2x24V configuration software options:

- TIA Portal V13 + SP1 with HSP 0131 (Hardware Support Package from the Internet)
- STEP 7 version V5.5 + SP4 with HSP 0240
- GSD file links:
  - PROFIBUS GSD files (https://support.industry.siemens.com/cs/document/73016883?dti=0&lc=en-US)
  - PROFINET GSD files (https://support.industry.siemens.com/cs/document/57138621?dti=0&lc=en-US)

Firmware update

Firmware updates can be downloaded to the memory of the TM Pulse 2x24V module by means of the STEP 7 TIA Portal software or the HW Config software.

Accessories

The following accessories can be used with the module and are not included in the product package:

- Labeling strip
- Color identification labels
- Reference identification labels

A BaseUnit of the B1 type is required to operate the technology module. For an overview of the BaseUnits to be used with the technology module, refer to the product information on the documentation for the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/document/73021864?dti=0&lc=en-US).

For detailed information on the installation procedure, refer to the system manual for the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/document/58649293?dti=0&lc=en-US).

Modes and Functions 3

3.1 Overview

Modes and functions

The TM Pulse 2x24V has two channels. You can assign a different mode for each channel.

Configuration of the operating mode is made using the TIA Portal or HW Config.

You can select one of six operating modes:

- Pulse output (single pulse)
- PWM
- Pulse train
- On/Off-delay
- Frequency output
- DC motor (PWM: forward and reverse rotation)

In addition to the operating mode, the TM Pulse 2x24V has the following functions:

- If enabled, the high-speed output option lets you generate a 1.5 µs minimum pulse duration at a current of 100 mA and a non-high-speed mode (high-speed mode disabled) with a minimum pulse duration of 10 µs and a maximum current of 2 A (two channels) or 4 A (one channel).
- The Sequence counter counts completed output sequences and provides a feedback signal.
- Current measurement for PWM and Pulse train modes
- Current control for the output current in PWM mode
- Dithering: superimpose a dithering signal on the PWM output to improve proportional valve control.
- You can directly control digital outputs with your control program, with separate control for each channel.
- Parallel connection of both channels creates one logical channel that can drive a 4 A output current.
- You can configure the response to CPU/master STOP. The outputs are put in the state that you assign for the control program STOP condition.

- The TM Pulse 2x24V provides module diagnostics and channel error detection.

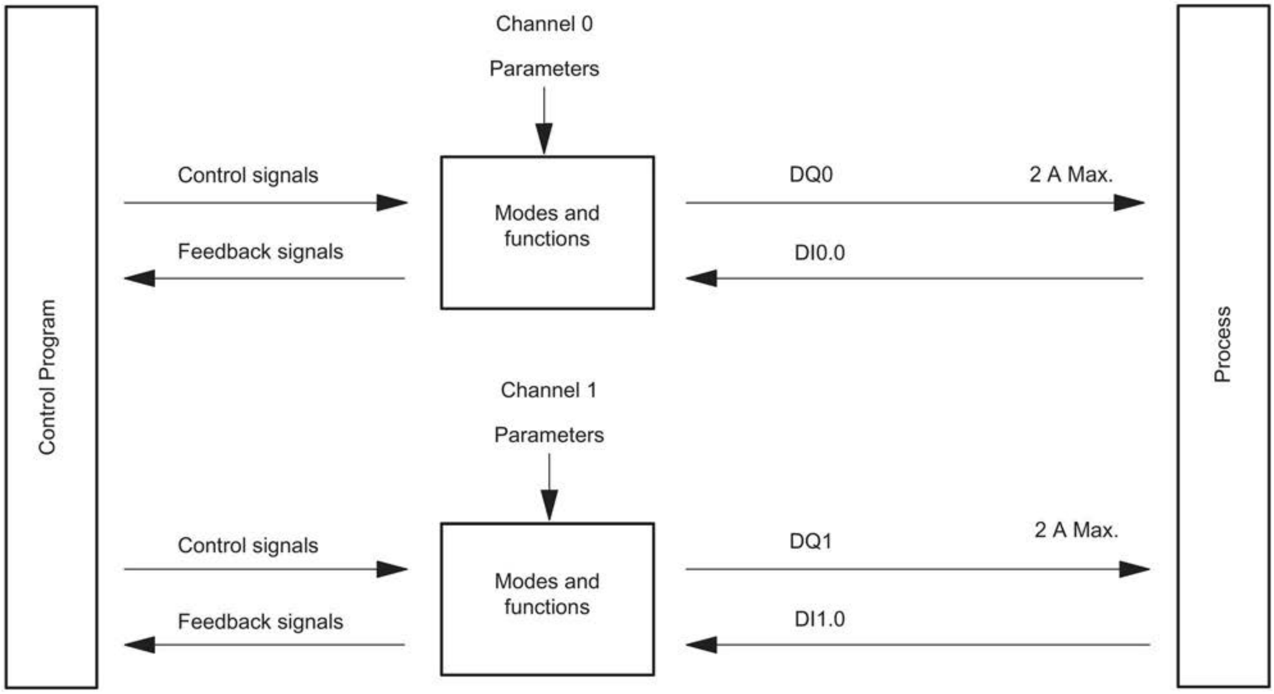

Figure 3-1 Dual channel operation

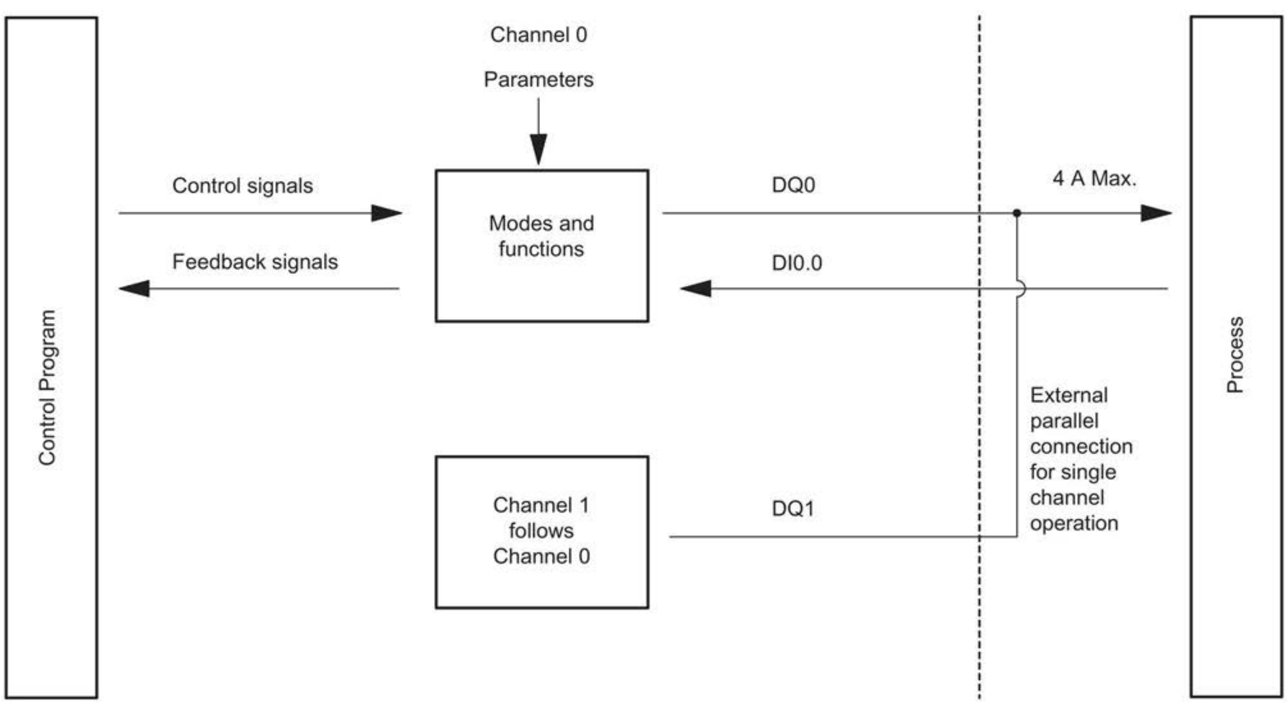

Figure 3-2 Single channel operation

Interfaces to the control program and the process under control

The TM Pulse 2x24V has the following I/O BaseUnit pin connections to the process under control:

Channel 0:

- DI0.0 (digital input 0)
- DQ0.A and DQ0.B (digital output 0)
  – Two connections are provided for each channel output (DQ0.A and DQ0.B). Load wiring depends on a channel's mode assignment.

Channel 1:

- DI1.0 (digital input 1)
- DQ1.A and DQ1.B (digital output 1)

You can find a table of configuration parameters in the "Parameter assignment and structure of the parameter data records (Page 138)" section.

You can modify and monitor the modes and functions with your control program using control and feedback signals. These parameters are listed in the "Control and feedback interface (Page 110)" section.

You will find the following in the "Modes and functions" section:

- Operation descriptions
- The relevant parameters
- The relevant control and feedback signals

The "Description of operations" for modes and functions applies to both channels. The terms DIn.0, DQn.A, and DQn.B are used in descriptions that are true for both channels.

3.2 Pulse output (single pulse) mode

Definition

After the assigned On-delay time expires, the TM Pulse 2x24V outputs a pulse at the DQn.A digital output (output sequence) for the pulse duration that you set.

Pulse diagram

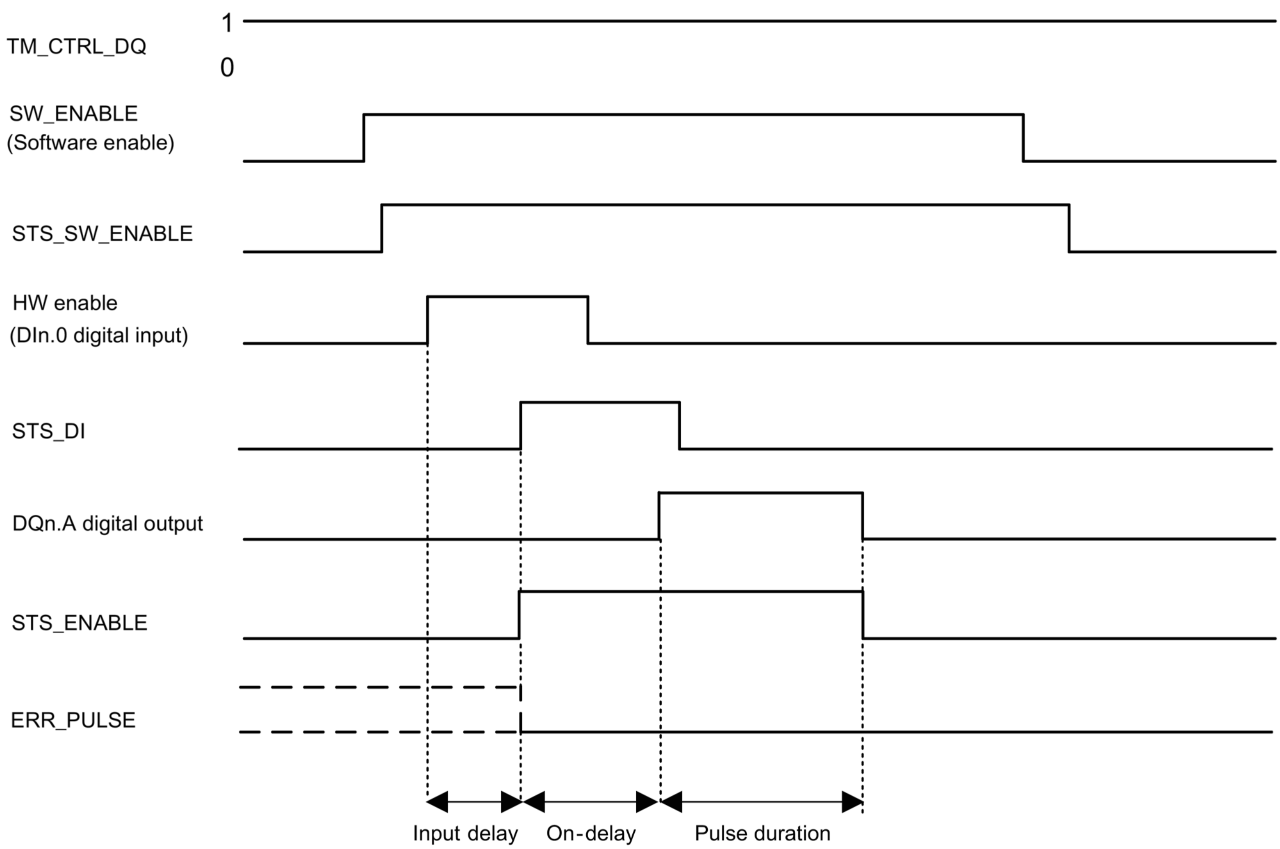

Figure 3-3 Pulse output mode output sequence using optional HW enable signal to start the output sequence

The timing diagram above has the "Function DI" parameter set to "HW enable". The other option is to set "Function DI" to "Input". If the "Function DI" parameter is set to "Input", then the On-delay phase starts at the rising edge of SW_ENABLE.

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates that a software enable is pending in the TM Pulse 2x24V.

You can also set the DIn.0 digital input of a TM Pulse 2x24V channel to be a hardware enable (HW enable) with the "Function DI" parameter. The input delay (noise filter) of the hardware enable can be set using the "Input delay" parameter.

If you want to use the hardware enable, it has to be combined with the software enable. When the software enable has been enabled, the output sequence starts at the first positive edge of the hardware enable. Further positive edges of the hardware enable during the current output sequence are ignored. When the HW enable goes high (positive edge) and remains high for the input delay time, the On-delay is started and the STS_ENABLE is set. After the On-delay expires, the pulse is output with the assigned pulse duration. The output sequence finishes with the end of the pulse and STS_ENABLE is cleared.

If you reduce the pulse duration to a time that has already expired, then the ERR_PULSE signal indicates a pulse output error and the output sequence stops. To resume the pulse output, you must restart the output sequence after an ERR_PULSE error occurs. The next time the output sequence starts, TM Pulse 2x24V clears the ERR_PULSE feedback bit.

Note

TM_CTRL_DQ technology module output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A outputs.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQn.A/DQn.B outputs directly with the SET_DQA/SET_DQB control bits.

Canceling the output sequence

Disabling the software enable (SW_ENABLE = 1 → 0) cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A digital output are immediately reset to 0.

You must restart the output sequence to begin new pulse output.

Truth Table

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	DQn.A digital output (when TM_CTRL_DQ = 1)	STS_ENABLE	Output Sequence
1	HW_ENABLE	0 → 1 and remains 1 during the input delay. Only active for the first positive edge, additional positive edges are ignored and no start occurs.	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0 → 1	Input	Not used	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0	HW_ENABLE or Input	Any status	0	0	Terminate
1	HW_ENABLE or Input	Any status	0, if On-delay is not expired or if the pulse duration is expired. 1, if On-delay is expired and pulse duration is not expired.		-
0 → 1	HW_ENABLE	0	0	0	-

Setting and changing the pulse duration

Your control program can set the pulse duration directly with the control interface field OUTPUT_VALUE as a DWord number value in microseconds:

- High-speed output enabled, from 2 μs to 85,000,000 μs
- High-speed output disabled, from 10 μs to 85,000,000 μs

If you change the pulse duration when an output sequence is running, the pulse time already elapsed is subtracted from the new pulse duration and the pulse output continues.

Reducing the pulse duration

If you have reduced the pulse duration to a time that is less than the pulse time already elapsed, then the output sequence is terminated. STS_ENABLE and the DQn.A digital output are cleared, and the ERR_PULSE status bit is set. At the next output sequence, the ERR_PULSE status bit is cleared.

Setting and changing the On-delay

- **Permanent update**

  The On-delay can be controlled permanently using the control interface. The MODE_SLOT bit has to be 1 (permanent-update); LD_SLOT must have the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the control interface field SLOT.

- **Single Update**

  Set the On-delay as a value between 0 μs and 85,000,000 μs in the configuration parameters. Alternatively, you can do a single update using the control interface. MODE_SLOT has to be 0 (single-update); LD_SLOT has to have the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the control interface field SLOT.

If you change the On-delay value during the output sequence, then the new On-delay is activated on the next output sequence.

For more details about the use of the SLOT value, see SLOT parameter handling (Page 113)

Using the Sequence counter

The Sequence counter counts completed pulse output sequences and provides the count value variable SEQ_CNT in the feedback interface. The sequence counter can count short output sequences that are too fast to be monitored by your program. See Sequence counter (Page 75) for details.

Isochronous mode

General information is available in Function: Isochronous mode (Page 86).

Isochronous mode does not have any influence on the functionality of Pulse output operating mode.

If you want to synchronize the output sequence with T_o , then set the Function DI parameter to "Input" and the Pulse output sequence starts at T_o.

Pulse output parameters

Pulse output parameter	Meaning	Value Range	Default
Mode	0 = Set the Pulse output operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC Motor	1
High-speed output [1]	The output supports higher frequencies at smaller loads when enabled.	0 = Disabled 1 = Enabled	Disabled
Function DI	You can use the DIn.0 digital input as an input or as a hardware enable. The signal at DIn.0 is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	0 = Input 1 = HW enable	Input
Input delay	DIn.0: a digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 μs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
On-delay	The time from the start of the output sequence to the output of the pulse. You can change the On-delay in your control program using the SLOT parameter.	0 μs to 85,000,000 μs	0 μs

[1] Only if the module is configured as "2 channels (2 A)"

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

Note: All bytes and bits not described in the table above are reserved and should be 0.

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1[1]			
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	**Bit 0**	Indicates under voltage on the Power supply. Note that the bit is not set if the voltage is not present.
			0	PWR is not under voltage
			1	PWR is detected, but under voltage
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	**Bit 1**	Indicates a short-circuit or overload on the output 24 V DC. You must set the RES_ERROR (control interface) to reset this error.
			0	No short-circuit on 24 V DC
			1	Short-circuit on 24 V DC
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	**Bit 2**	Indicates an error while loading a value using the field SLOT (only in "single-update" SLOT mode).
			0	No load error pending.
			1	Load error pending: you must set the RES_ERROR (control interface) to reset this error and be able to use the SLOT again.
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE	**Bit 3**	Indicates a pulse output error.
			0	No pulse output error
			1	Pulse output error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.B. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B or an attempt to set both DQs manually using SET_DQA, SET_DQB, and TM_CTRL_DQ. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B, or attempt to set both DQn.A and DQn.B
Byte 0: Bit 6	Byte 8: Bit 6	ERR_OUT_VAL	**Bit 6**	Indicates that an invalid value is detected in OUTPUT_VALUE.
			0	OUTPUT_VALUE is valid.
			1	OUTPUT_VALUE is not valid. This bit is reset automatically when a valid value is read by the module.
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	**Bit 7**	Indicates that an invalid value is detected in SLOT (only in "perma-nent-update" SLOT mode).
			0	SLOT value is valid.
			0 → 1	SLOT value is not valid. This bit is reset automatically when a valid value is read by the module.
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT	**Bit 2**	Toggle acknowledge bit for each action of the SLOT in "single-update" SLOT mode. Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY	**Bit 4**	Indicates the module is ready and parameterized.
			0	Module is not parameterized
			1	Module is parameterized
Byte 1: Bit 5	Byte 9: Bit 5	STS_SW_ENABLE	**Bit 5**	Indicates the status of SW_ENABLE (control interface).
			0	SW_ENABLE cleared
			1	SW_ENABLE set
Byte 2: Bit 0	Byte 8: Bit 0	STS_ENABLE	**Bit 0**	Indicates an output sequence is running.
			0	Output sequence not running
			1	Output sequence running

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1[1]			
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	0 on DQn.A digital output
			1	1 on DQn.A digital output
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	0 on DQn.B digital output
			1	1 on DQn.B digital output
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI	**Bit 3**	Indicates the signal level at the DIn.0 digital input.
			0	0 on DIn.0 digital input
			1	1 on DIn.0 digital input
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT	Sequence counter is incremented after completion of an output sequence	
			With SW_ENABLE: 0 to 1	
			With HW enable: 0 to 15	
Word 3	Word 7	Reserved	Read as 0	

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

Note: All bytes and bits not described in the table above are reserved and are read as 0.

Input and output signals for Pulse output mode

Input and output signals	Meaning	Value range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
HW enable	You can select the HW enable with the "Function DI" parameter and select the input delay with the "Input delay" parameter. The signal at DIn.0 is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	0 = HW enable cleared 1 = HW enable issued 0 → 1 = Start of the output sequence after the input delay, dependent on the software enable (SW_ENABLE)	3	4
Output signal				
Pulse at the DQn.A digital output	A pulse is output at the DQn.A digital output for the set pulse duration.	0 = no pulse 1 = pulse	9	10

See also Pin assignment and load/sensor wiring (Page 91)

3.3 Pulse width modulation (PWM) mode

Definition

You control the pulse width duty cycle with the control interface field OUTPUT_VALUE. The TM Pulse 2x24V generates continuous pulses based on this value. The OUTPUT_VALUE control interface field determines the duty cycle (pulse duration/period duration) for PWM. The period duration can be adjusted.

After expiration of the assigned On-delay, the DQn.A output pulses begin (output sequence).

In PWM mode, you can enable current control using the internal PID loop function to control the output load current. When the current control option is enabled, the TM Pulse 2x24V control of the duty cycle and the OUTPUT_VALUE control interface field is used to assign the target current as the ratio of target current/reference current.

Pulse diagram

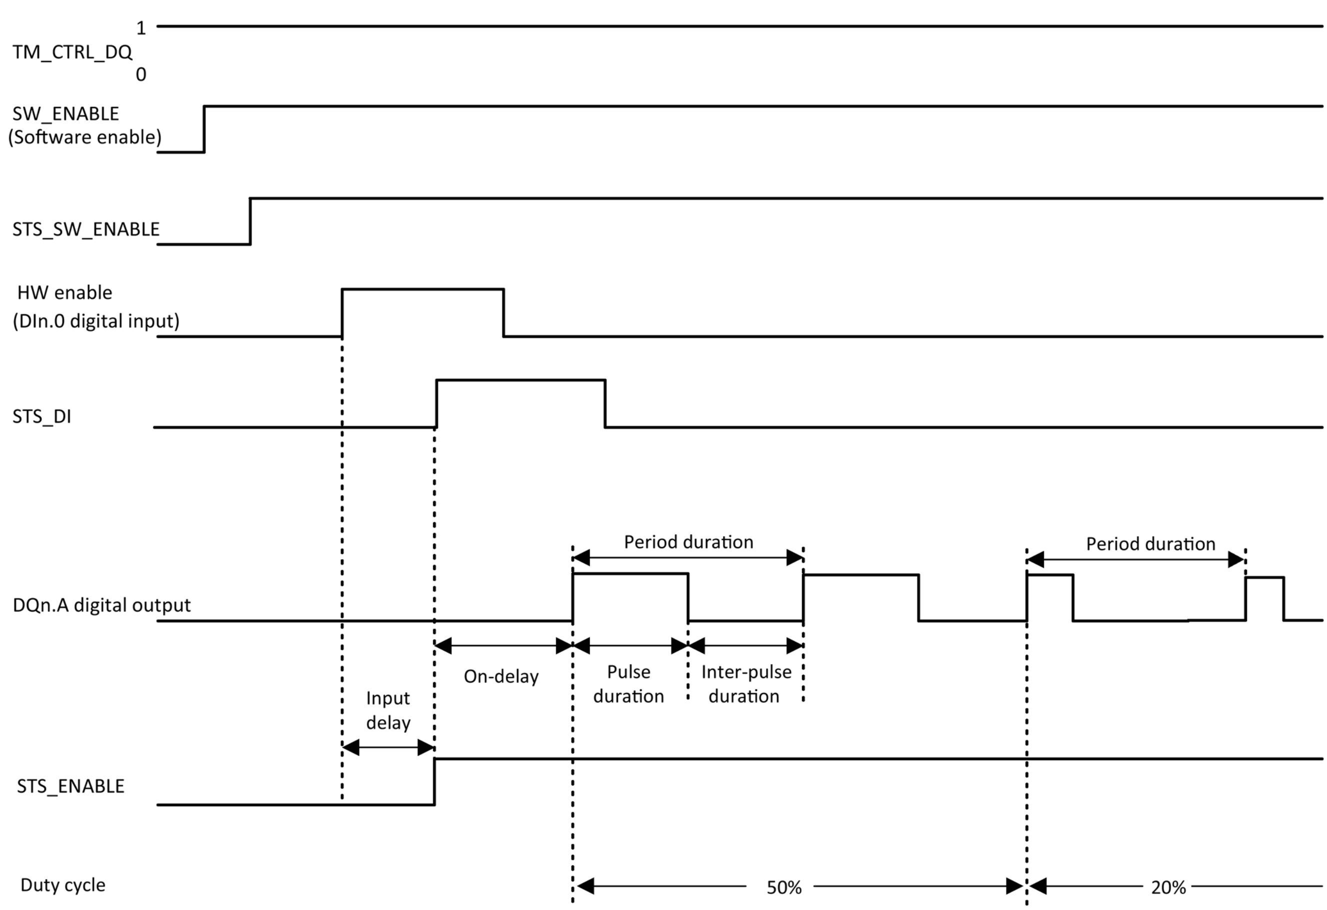

Figure 3-4 PWM output sequence

The timing diagram above has the "Function DI" parameter set to "HW_ENABLE". The other option is to set "Function DI" to "Input". If the "Function DI" parameter is set to "Input", then the On-delay phase starts at the rising edge of SW_ENABLE.

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates the software enable pending at the TM Pulse 2x24V.

You can also assign the DIn.0 digital input of the TM Pulse 2x24V as a HW enable with the "Function DI" parameter. The input delay (noise filter) of the hardware enable can be set using the parameter "Input Delay".

If you want to use the hardware enable, it has to be combined with the software enable. When the software enable has been enabled, the output sequence starts at the first positive edge of the hardware enable. Further positive edges of the hardware enable during the current output sequence are ignored by the TM Pulse 2x24V. The hardware enable option is not supported for isochronous mode.

When the enable is issued (positive edge) and remains high for the input delay time, the On-delay is started and the STS_ENABLE set. The PWM pulse train is output on expiration of the On-delay. The output sequence runs continuously as long as SW_ENABLE is set.

Note

Technology Module TM_CTRL output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A outputs.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQn.A/DQn.B outputs directly with the SET_DQA/SET_DQB control bits.

Canceling the output sequence

Disabling the software enable (SW_ENABLE = 1 → 0) cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A digital output are immediately reset to 0.

You must restart the output sequence to begin new pulse output.

Truth table

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	Digital output DQn.A (when TM_CTRL_DQ = 1)	STS_ENABLE	Output sequence
1	HW_ENABLE	0 → 1 and remains 1 during the input delay. Only active for the first positive edge, additional positive edges are ignored and no start occurs.	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0 → 1	Input	Not used	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0	HW_ENABLE or Input	Any state	0	0	Terminate

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	Digital output DQn.A (when TM_CTRL_DQ = 1)	STS_ENABLE	Output sequence
1	HW_ENABLE or Input	Any state	0, if On-delay is not expired or you are in the interpulse time 1, if On-delay is expired and during the pulse duration		-
0 → 1	HW_ENABLE	0	0	0	-

Minimum pulse duration and minimum interpulse duration

The minimum pulse duration and minimum interpulse duration are superimposed on the proportional output characteristic.

You assign the minimum pulse duration and minimum interpulse duration using the "Minimum pulse duration" parameter; they always have the same value.

- A pulse duration calculated by the TM Pulse 2x24V that is shorter than the minimum pulse duration is suppressed.
- A pulse duration calculated by the TM Pulse 2x24V that is longer than the period duration minus the minimum interpulse duration is set to the period duration value (duty cycle 1,000‰).

Note

PWM current control and minimum pulse duration

If current control is activated by the current control bit in the parametrization record, then the parametrized minimum pulse duration and minimum interpulse period are ignored.

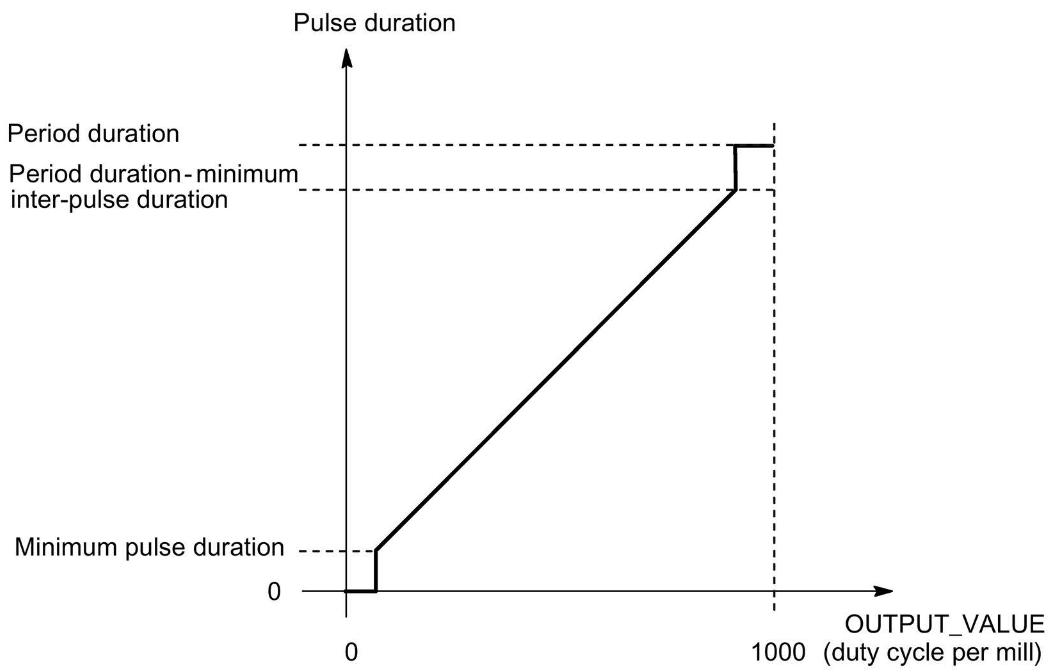

Figure 3-5 Modulation of the Pulse duration

Note

If Dithering is activated without current control, then the minimum pulse duration and minimum inter-pulse period are used by the module. In this case, the superimposed Dithering is reduced so the effective pulse duration fits in the allowed range.

Setting and changing the pulse duty cycle

OUTPUT_VALUE assigns the duty cycle for the current period duration. You select the range of the OUTPUT_VALUE control interface field with the "Output format" parameter.

- "Per 100 (%)" output format: Value range between 0 and 100
  Pulse duration = (OUTPUT_VALUE/100) x period duration.
- "Per 1,000 (‰)" output format: Value range between 0 and 1,000
  Pulse duration = (OUTPUT_VALUE/1,000) x period duration.
- "Per 10,000" output format: Value range between 0 and 10,000
  Pulse duration = (OUTPUT_VALUE/10,000) x period duration.
- "S7 analog output" output format: Value range between 0 and 27,648
  Pulse duration = (OUTPUT_VALUE/27,648) x period duration.

You assign OUTPUT_VALUE directly with your control program. A new OUTPUT_VALUE is applied at the next rising edge of the output.

When the current control option is enabled, the TM Pulse 2x24V module takes control of the duty cycle and the OUTPUT_VALUE control interface field is used to assign the target current as a ratio of target current/reference current. See the Current control (Page 78) function for details.

Setting and changing the period duration

- Permanent update
  The period duration is controlled permanently using the control interface. The MODE_SLOT bit has to be set ("1" means permanent update); LD_SLOT has to have the value 1 ("1" means Period duration).
  Set the period value in the field SLOT. The unit is always microseconds.
  – High-speed output **enabled**: between 10 μs and 85,000,000 μs in the field SLOT.
  – High- speed output **disabled**: between 100 μs and 85,000,000 μs in the field SLOT.
- Single Update
  Set the period duration in the configuration parameters. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared ("0" means single-update); LD_SLOT has to have the value 1 ('1' means Period duration). Set the period duration value in the field SLOT. The unit is always microseconds.
  – High-speed output **enabled**: between 10 μs and 85,000,000 μs in the parameters.
  – High-speed output **disabled**: between 100 μs and 85,000,000 μs in the parameters.

The new period duration is applied with the next rising edge of the output.

For more details about SLOT parameter handling, see "Slot parameter handling (control interface) (Page 113)".

Isochronous mode

General information is available in the "Function: Isochronous mode (Page 86)" topic.

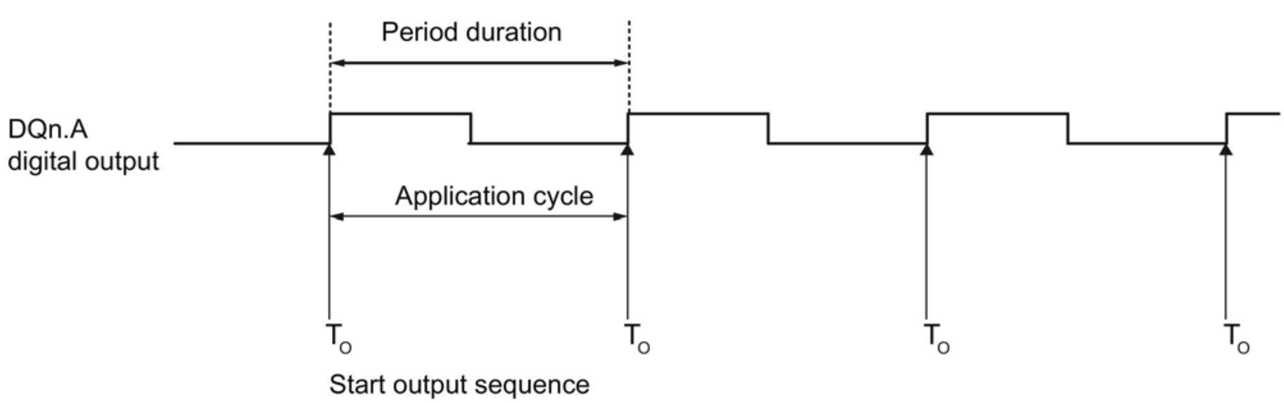
In isochronous mode, the output sequence is synchronized with the moment T_O. The period duration is coordinated to the application cycle (the synchronous cycle, a multiple of the PROFINET cycle). It is possible that your assigned period duration cannot be implemented exactly. The configured value of the period duration is adjusted by the TM Pulse 2x24V to the application cycle based on a calculation algorithm. The calculation is performed to minimize the difference between the assigned and calculated period duration. In the most unfavorable case, the deviation amounts to half the application cycle. The table below shows examples.

Application cycle T_{CAC} [1]	**Assigned period duration** $T_{Setpoint}$	T_{CAC} \ T_{Actual}	**Calculated actual period duration** T_{Actual} [1]	
10 ms (10000 µs)	5000 µs	2:1	5000 µs	
10 ms (10000 µs)	2000 µs	5:1	2000 µs	
10 ms (10000 µs)	3000 µs	3:1	3333 µs	Next possible value is used as actual value
10 ms (10000 µs)	1800 µs	6:1	1666 µs	Next possible value is used as actual value
10 ms (10000 µs)	6000 µs	2:1	5000 µs	Next possible value is used as actual value
10 ms (10000 µs)	12000 µs	1:1	10000 µs	Next possible value is used as actual value
10 ms (10000 µs)	16000 µs	1:2	20000 µs	Next possible value is used as actual value
10 ms (10000 µs)	26000 µs	1:3	30000 µs	Next possible value is used as actual value

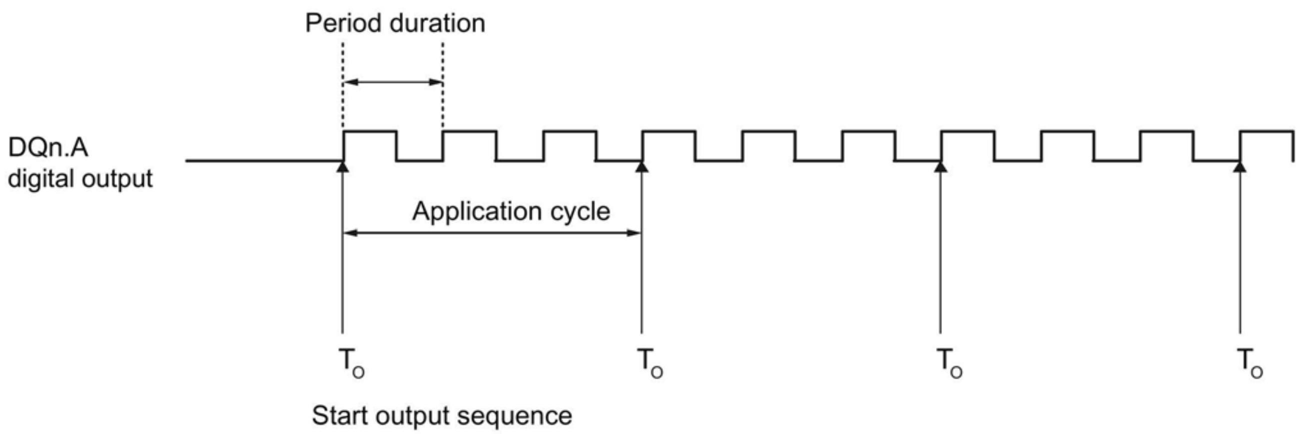
[1] The calculated actual period duration and the application cycle time always have an integer ratio (1:1, 1:2, 1:3, ..., 2:1, 3:1, ...) rounded down to the next possible value.

The timing between the digital output and the application cycle is shown below. The DQ duty cycle (On/Off) ratio is shown in the examples at 50%.

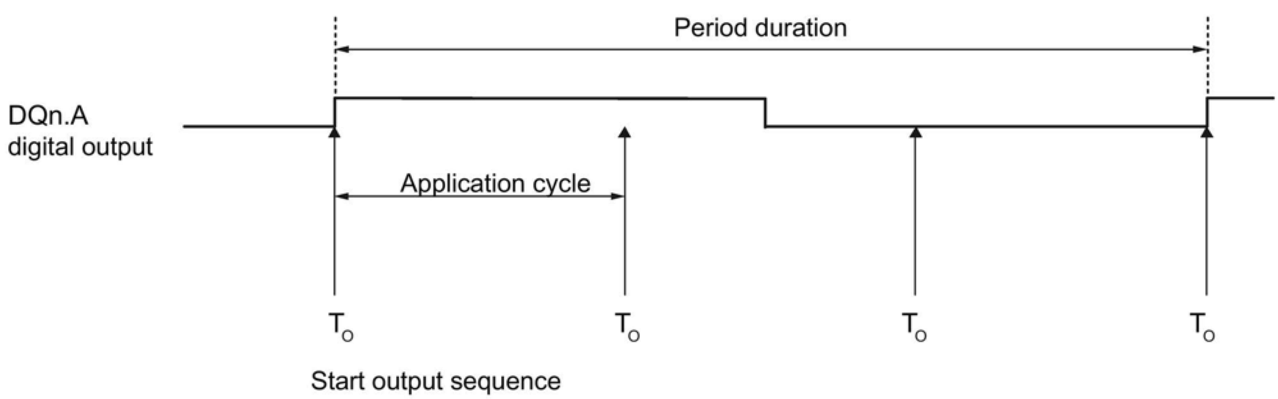
- Example 1: The period duration 10000 µs is equal to the application cycle time 10 ms (10000 µs).



- Example 2: The period duration 3333 μs is less than the application cycle time 10 ms (10000 μs).



- Example 3: The period duration 30000 μs is greater than the application cycle time 10 ms (10000 μs)



Note

Isochronous PWM operation

On-delay is not used by the module (always considered as zero) and the parameter "Function DI" is always "Input". Only the software-enable SW_ENABLE 0 → 1 is used to start the output sequence.

Setting the minimum pulse duration and minimum inter-pulse duration

You assign the minimum pulse duration and the minimum inter-pulse duration as a DWord number value between 0 and 85,000,000 µs using the "Minimum pulse duration" channel parameter configuration.

The unit is always microseconds. This value can only be changed using the configuration parameter record.

Setting and changing the On-delay

- Permanent update
  The On-delay can be controlled permanently using the control interface. The MODE_SLOT bit has to be set (permanent update); LD_SLOT must have the value 2 (for On-delay). Set the On-delay as a value between 0 µs and 85,000,000 µs in the field SLOT. The unit is always microseconds.
- Single update
  Set the On-delay as a value between 0 µs and 85,000,000 µs in the configuration parameters. The unit is always microseconds. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared (single-update); LD_SLOT must have the value 2 (for On-delay). Set the On-delay as a value between 0 µs and 85,000,000 µs in the field SLOT.

If you change the On-delay value during the output sequence, then the new On-delay is activated at the next output sequence. For more details about the use of the SLOT parameter see SLOT parameter handling (Page 113).

Current measurement

Current measurement is available in PWM mode. Your control program can use current measurement for control and diagnostic purposes.

For more information, refer to Function: Current measurement (Page 76).

Current control

Current measurement is available in PWM mode. Your control program can use current measurement for control and diagnostic purposes.

For more information, refer to Function: Current control (Page 78).

Parameters of PWM operating mode

Parameter	Meaning	Value range	Default
Operating mode	1 = Set the PWM operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC Motor	1
High-speed output [1]	The output supports higher frequencies.	0 = disabled 1 = enabled	Disabled
Function DI	You can use the DIn.0 digital input as an input or as a hardware enable. The signal at DIn.0 is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	0 = Input 1 = HW enable	Input
Output format	Defines the format of the ratio value (duty cycle).	0 = S7 analog format 1 = Per 100 (%) 2 = per 1,000 3 = Per 10,000	Per 100 (%)
Input delay	DIn.0 digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 µs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
Minimum pulse duration	Minimum pulse duration and minimum inter-pulse duration.	0 µs and 85,000,000 µs	0 µs
Period	Period duration of the output pulse cycle in µs. You can change the period duration in your control program with the control interface SLOT field.	• High-speed output disabled 100 µs to 85,000,000 µs • High-speed output enabled 10 µs to 85,000,000 µs	2,000,000 µs
On-delay	The time from the start of the output sequence to the output of the pulses. You can change the On-delay in your control program with the control interface SLOT field.	0 µs and 85,000,000 µs	0 µs

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

Control interface Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 9: Bit 4	Byte 21: Bit 4	SET_DQB	**Bit 4**	Controls the value of the digital output DQn.B, if TM_CTRL_DQ = 0 and if SET_DQA is cleared.
			0	0 on DQn.B
			1	1 on DQn.B
Byte 10: Bit 0	Byte 22: Bit 0	RES_ERROR	**Bit 0**	Reset pending errors (ERR_LD, ERR_DQA, ERR_DQB, and ERR_24V).
			0	Reset of errors is not active
			1	Reset of errors is active

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note: All bytes and bits not described in the table above are reserved and should be 0.

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	**Bit 0**	Indicates under voltage on the Power supply. Note that the bit is not set if the voltage is not present.
			0	PWR is not under voltage
			1	PWR is detected, but under voltage
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	**Bit 1**	Indicates a short-circuit or overload on the output 24 V DC. You must set the RES_ERROR (control interface), to reset this error.
			0	No short-circuit on 24 V DC
			1	Short-circuit on 24 V DC
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	**Bit 2**	Indicates an error while loading a value using the field SLOT (only in "single-update" SLOT-mode).
			0	No load error pending
			1	Load error pending: you must set the RES_ERROR (control interface) to reset this error and be able to use SLOT again.
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.A. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B or an attempt to set both DQn.A and DQn.B manually using SET_DQA, SET_DB, and TM_CTRL_DQ. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B, or attempt to set both DQn.A and DQn.B
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	**Bit 7**	Indicates that an invalid value is detected in SLOT (only in "perma-nent-update" SLOT-mode).
			0	SLOT value is valid
			0 → 1	SLOT value is not valid
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT	**Bit 2**	Toggle acknowledge bit for each action of SLOT in "single-update" SLOT-mode. Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY	**Bit 4**	Indicates the module is ready and parameterized.
			0	Module is not parameterized
			1	Module is parameterized

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 1: Bit 5	Byte 9: Bit 5	STS_SW_ENABLE	**Bit 5**	Indicates the status of SW_ENABLE (control interface).
			0	SW_ENABLE cleared
			1	SW_ENABLE set
Byte 2: Bit 0	Byte 8: Bit 0	STS_ENABLE	**Bit 0**	Indicates an output sequence is running.
			0	Output sequence not running
			1	Output sequence running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	0 on DQn.A digital output
			1	1 on DQn.A digital output
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	0 on DQn.B digital output
			1	1 on DQn.B digital output
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI	**Bit 3**	Indicates the signal level at the DIn.0 digital input.
			0	0 on DIn.0 digital input
			1	1 on DIn.0 digital input
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT	Sequence counter = 0. The sequence counter is not used in pulse width modulation mode.	
Word 2	Word 6	MEASURED_CURRENT	S7 Analog format positive value 0 to 32,767: • 2 Ampere channel output: Full scale value 27,648; means 2,000 mA • 4 Ampere channel output: Full scale value 27,648; means 4,000 mA • 32,767 means no valid current measurement available; for example, during the very first PWM period.	
Word 3	Word 7	Reserved	Read as 0	

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note: All bytes and bits not described in the table above are reserved and are read as 0.

Input and output signals for PWM operating mode

Input and output signal	Meaning	Value range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
HW enable Note: HW enable not supported for PWM in isochronous mod	You can select the HW enable with the "Function DI" parameter and select the input delay with the "Input delay" parameter. The signal at the DIn.0 digital input is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	0 = HW enable cleared 1 = HW enable issued 0 → 1 = Start of the output sequence after the input delay; dependent on the software enable (SW_ENABLE)	3	4
Output signal				
Pulse at the DQn.A digital output	A pulse is output at the DQn.A digital output for the set duty cycle and period duration.	0 = no pulse 1 = pulse	9	10

See also Pin assignment and load/sensor wiring (Page 91)

3.4 Pulse train mode

Definition

On expiration of the assigned On-delay, the TM Pulse 2x24V outputs the number of pulses you assigned as a pulse train (output sequence). The period duration and pulse duration can be adjusted.

Pulse diagram

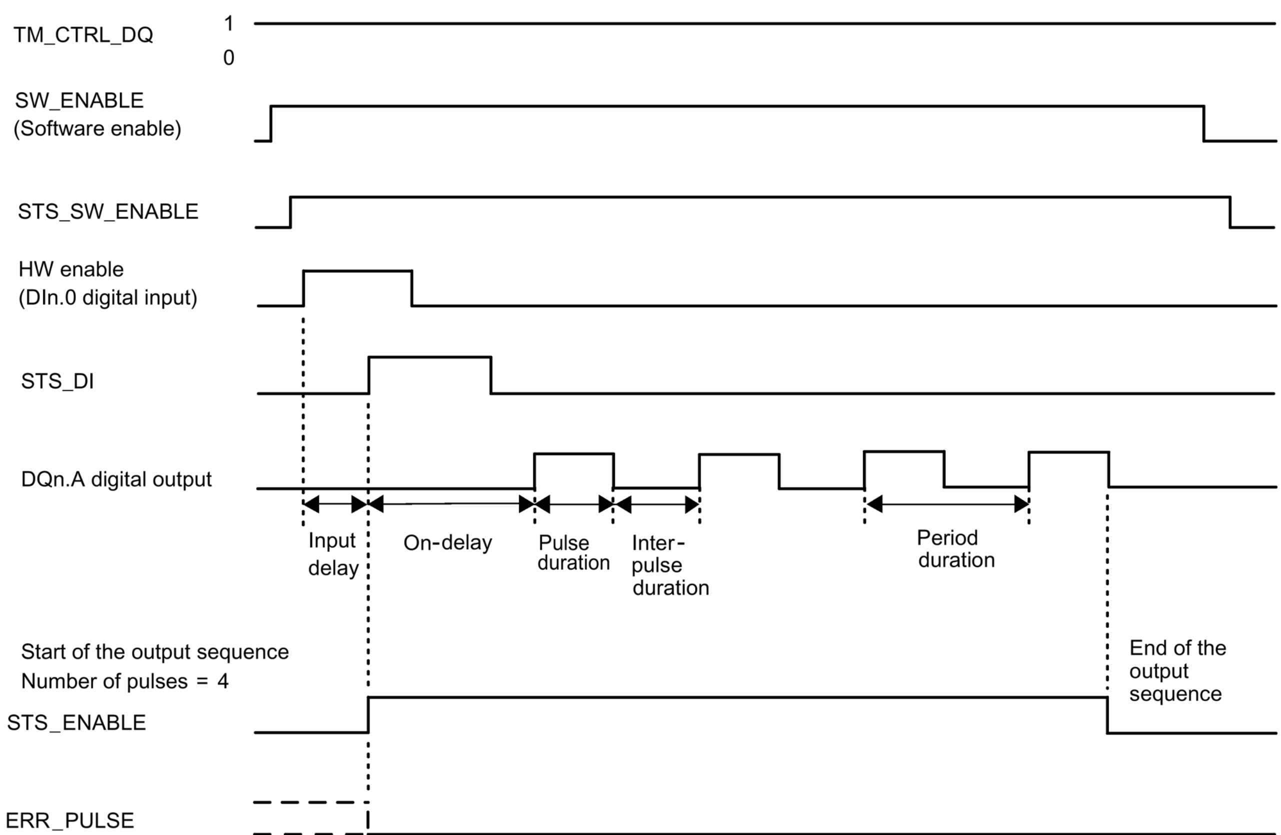

Figure 3-6 Output sequence of the pulse train

The timing diagram above has the "Function DI" parameter set to "HW enable". The other option is to set "Function DI" to "Input". If the "Function DI" parameter is set to "Input", then the On-delay phase starts at the rising edge of SW_ENABLE.

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates the software enable pending at the TM Pulse 2x24V.

You can also set the DIn.0 digital input of the TM Pulse 2x24V as a HW enable with the "Function DI" parameter. The input delay of the hardware enable can be set using the parameter "Input Delay".

If you want to use the hardware enable, it has to be combined with the software enable. When SW_ENABLE has been enabled, the output sequence starts at the first positive edge of the hardware enable. Further positive edges of the hardware enable during the current output sequence are ignored by the TM Pulse 2x24V. When the software enable has been issued, a positive edge of the hardware enable (detected after the input delay) starts the next output sequence.

When the enable is issued (positive edge) and remains high for the input delay (noise filter) time, the On-delay is started and STS_ENABLE is set. On expiration of the On-delay, the pulse train is output with the assigned pulse duration. The output sequence finishes with the end of the pulse and STS_ENABLE is cleared.

If you change the number of pulses during the output sequence to a value that has already been reached in the sequence, then the bit ERR_PULSE indicates a pulse output error

The next time the output sequence starts, the TM Pulse 2x24V clears the ERR_PULSE feedback bit.

Note

TM_CTRL_DQ technology module output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A output.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQn.A/DQn.B outputs directly with the SET_DQA/SET_DQB control bits.

Canceling the output sequence

Disabling the software enable (SW_ENABLE = 1 → 0) during the On-delay or pulse train cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A digital output are immediately reset to 0.

You must restart the output sequence to begin a new pulse output.

Truth table

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	Digital output DQn.1 (when TM_CTRL_DQ = 1)	STS_ENABLE	Output sequence
1	HW_ENABLE	0 → 1 and remains 1 during the input delay. Only active for the first positive edge, additional positive edges are ignored and no start occurs.	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0 → 1	Input	Not used	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0	HW_ENABLE or Input	Any status	0	0	Cancel
1	HW_ENABLE or Input	Any status	0, if On-delay is not expired or you are in the inter-pulse time or the output sequence is over 1, if On-delay is expired and during the pulse duration		-
0 → 1	HW_ENABLE	0	0	0	-

Setting and changing the number of pulses

Your control program can set the pulse count directly with the control interface parameter OUTPUT_VALUE.

Set the number of pulses directly as a DWord number value between 1 to 4,294,967,295 (2^{32}-1).

If you change the number of pulses, the new value takes effect immediately whether the On-delay is expired or not.

- If the new number of pulses has not yet been reached in the current output sequence, then the new number of pulses will be used in the current output sequence.
- If the number of pulses is reduced to a number that is less than the current number of pulses already output, then the output sequence is terminated, STS_ENABLE and the DQn.A digital output are cleared, ERR_PULSE is set. At the next start of an output sequence, ERR_PULSE is cleared.
- If the number of pulses is zero the output sequence is terminated, STS_ENABLE and the DQn.A digital output are cleared, and ERR_PULSE is set. At the next start of an output sequence, ERR_PULSE is cleared.

Setting and changing the period duration

- Permanent update
  The period duration can be controlled permanently using the control interface. The MODE_SLOT bit has to be set ('1' means permanent update); LD_SLOT has to have the value 1 (for Period duration). Set the period duration as a DWord number value of microseconds in the parameter field SLOT.
  - High-speed output **enabled** (see parameters): between 10 μs and 85,000,000 μs.
  - High-speed output **disabled** (see parameters): between 100 μs and 85,000,000 μs.
- Single update
  Set the period duration in the configuration parameters. Alternatively, you can do a single update using the control interface. MODE_SLOT has to be 0 (single-update); LD_SLOT has to have the value 1 (for Period duration). Set the period duration as a DWord number value of microseconds in the parameter field SLOT.
  - High-speed output **enabled** (see parameters): between 10 μs and 85,000,000 μs.
  - High-speed output **disabled** (see parameters): between 100 μs and 85,000,000 μs.

Setting and changing the On-delay

- Permanent update
  The On-delay can be controlled permanently using the control interface. MODE_SLOT bit has to be set ('1' means permanent update); LD_SLOT must be the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the parameter field SLOT.
- Single update
  Set the On-delay as a value between 0 μs and 85,000,000 μs in the configuration parameters. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared ("0" means single update); LD_SLOT must be the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the field SLOT.
- If you change the On-delay value during the output sequence, then the new On-delay is activated at the next output sequence.

For more details about the use of the SLOT parameter, see the SLOT parameter handling (Page 113).

Setting and changing the duty cycle

The range of the duty cycle parameter is selected using the "Output format" parameter. The TM Pulse 2x24V uses this assigned duty cycle value to calculate the pulse duration. If the number value you assign exceeds the upper limit, then a duty cycle of 100% of the period duration is used and this action does not cause an error.

- Output format "Per 100 (%)": Value range 0 to 100
  - Pulse duration = (duty cycle/100) x period duration.
- Output format "Per 1000": Value range 0 to 1,000
  - Pulse duration = (duty cycle/1,000) x period duration.
- Output format "Per 10000": Value range 0 to 10,000
  - Pulse duration = (duty cycle/10,000) x period duration.
- Output format "S7 analog output": Value range 0 to 27,648
  - Pulse duration = (duty cycle/27,648) x period duration.

Update the duty cycle

- Permanent update
  The duty cycle can be controlled permanently using the control interface. MODE_SLOT bit has to be set ("1" means permanent update); LD_SLOT must be the value 4 (for duty cycle). Set the duty cycle as a value in the control interface field SLOT. The unit depends on the assigned output format.
- Single update
  Set the duty cycle in the configuration parameters. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared ("0" means single update); LD_SLOT must be the value 4 (for duty cycle). Set the duty cycle as a value in the control interface field SLOT.
- The unit depends on the assigned output format. If you change the duty cycle value during the output sequence, then the new duty cycle is activated at the next output sequence.

For more details about the use of the SLOT parameter, see SLOT parameter handling (Page 113).

Isochronous mode

General information is available in Function: Isochronous mode (Page 86).

Isochronous mode does not have any influence on the functionality of Pulse train operating mode.

If you want to synchronize the output sequence with T_o , then set the Function DI parameter to "Input" and the Pulse train output sequence starts at T_o.

Current measurement

Current measurement is available in Pulse train mode. Your control program can use current measurement for control and diagnostic purposes.

For more information, refer to Function: Current measurement (Page 76).

Parameters for Pulse train operating mode

Parameter	Meaning	Value range	Default
Operating mode	2 = Set the "Pulse train" operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC motor	1
High-speed output [1]	The output supports higher frequencies (see pulse duration range).	0 = disabled 1 = enabled	Disabled
Function DI	You can use the DIn.0 digital input as an input or as a hardware enable. The signal at DIn.0 is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	• Input • HW enable	Input
Output format	Defines the format of the duty cycle ratio value.	0 = S7 analog format 1 = Per 100 (%) 2 = Per 1,000 3 = Per 10,000	Per 100 (%)
Input delay	DIn.0 digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 μs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
Period	Period duration of the output sequence: You can change the period duration in your control program using the control interface field SLOT.	• High-speed output disabled 100 μs to 85,000,000 μs • High-speed output enabled 10 μs to 85,000,000 μs	2,000,000 μs

Parameter	Meaning	Value range	Default
On-delay	The time from the start of the output sequence to the output of the pulse train. You can change the On-delay in your control program using the SLOT parameter.	0 µs to 85,000,000 µs	0 µs
Duty-cycle	The pulse duration results from the duty cycle and the period duration. The format of the duty cycle is determined by the parameter "Output format". You can change the duty-cycle in your control program using the control interface field SLOT.	Output format: minimum to maximum • Per 100: 0 to 100 • Per 1000: 0 to 1,000 • Per 10000: 0 to 10,000 • S7 analog output: 0 to 27,648	50%

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

Note: All bytes and bits not described in the table above are reserved and should be 0.

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	**Bit 0**	Indicates under voltage on the Power supply. Note that the bit is not set if the voltage is not present.
			0	PWR is not under voltage
			1	PWR is detected, but under voltage
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	**Bit 1**	Indicates a short-circuit or overload on the output 24 V DC. You must set the RES_ERROR (control interface) to reset this error.
			0	No short-circuit on 24 V DC
			1	Short-circuit on 24 V DC
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	**Bit 2**	Indicates an error while loading a value using the field SLOT (only in "single-update" SLOT-mode).
			0	No load error pending
			1	Load error pending: you must set the RES_ERROR (control interface) to reset this error and be able to use the SLOT again.
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE	**Bit 3**	Indicates a pulse output error.
			0	No pulse output error
			1	Pulse output error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.A. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B or an attempt to set both DQs manually using SET_DQA, SET_DQB, and TM_CTRL_DQ. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B, or attempt to set both DQn.A and DQn.B
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	**Bit 7**	Indicates that an invalid value is detected in SLOT (only in "permanent-update" SLOT-mode).
			0	SLOT value is valid
			1	SLOT value is not valid
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT	**Bit 2**	Toggle acknowledge bit for each action of the SLOT in "single-update" SLOT-mode. Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY	**Bit 4**	Indicates the module is ready and parameterized.
			0	Module is not parameterized
			1	Module is parameterized
Byte 1: Bit 5	Byte 9: Bit 5	STS_SW_ENABLE	**Bit 5**	Indicates the status of SW_ENABLE (control interface).
			0	SW_ENABLE cleared
			1	SW_ENABLE set
Byte 2: Bit 0	Byte 8: Bit 0	STS_ENABLE	**Bit 0**	Indicates an output sequence is running.
			0	Output sequence not running
			1	Output sequence running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	0 at the DQn.A digital output
			1	1 at the DQn.A digital output

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	**Channel 1** [1]			
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	0 at the DQn.B digital output
			1	1 at the DQn.B digital output
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI	**Bit 3**	Indicates the signal level at the DIn.0 digital input.
			0	Signal 0 at the DIn.0 digital input
			1	Signal 1 at the DIn.0 digital input
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT	Sequence counter: is incremented after completion of an output sequence.	
			With SW_ENABLE: 0 to 1	
			With HW enable: 0 to 15	
Word 2	Word 6	MEASURED_CURRENT	S7 Analog format positive value 0 to 32,767: • 2 Ampere output: Full scale value 27,648, means 2,000 mA • 4 Ampere output: Full scale value 27,648, means 4,000 mA • 32,767 means no valid current measurement available; for example, during the very first period	
Word 3	Word 7	Reserved	Read as 0

Note: All bytes and bits not described in the table above are reserved and are read as 0.

Input and output signals for Pulse train operating mode

Input and output signal	Meaning	Value range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
HW enable	You can select the HW enable with the "Function DI" parameter and select the input delay with the "Input delay" parameter. The signal of the DIn.0 digital input is interpreted by the TM Pulse 2x24V, after filtering by the input delay, as the start of the output sequence.	0 = HW enable cleared 1 = HW enable issued 0 → 1 = Start of the output sequence; dependent on the software enable (SW_ENABLE)	3	4
Output Signal				
Pulse train at the DQn.A digital output	Pulses are output at the DQn.A digital output for the set pulse duration.	0 = no pulse 1 = pulse	9	10

See also Pin assignment and load/sensor wiring (Page 91)

3.5 On/Off-delay mode

Definition

The signal pending at the TM Pulse 2x24V DIn.0 digital input is output with an assigned On/Off-delay at the DQn.A digital output.

Pulse diagram

SW_ENABLE is set, while DIn.0 digital input = 0:

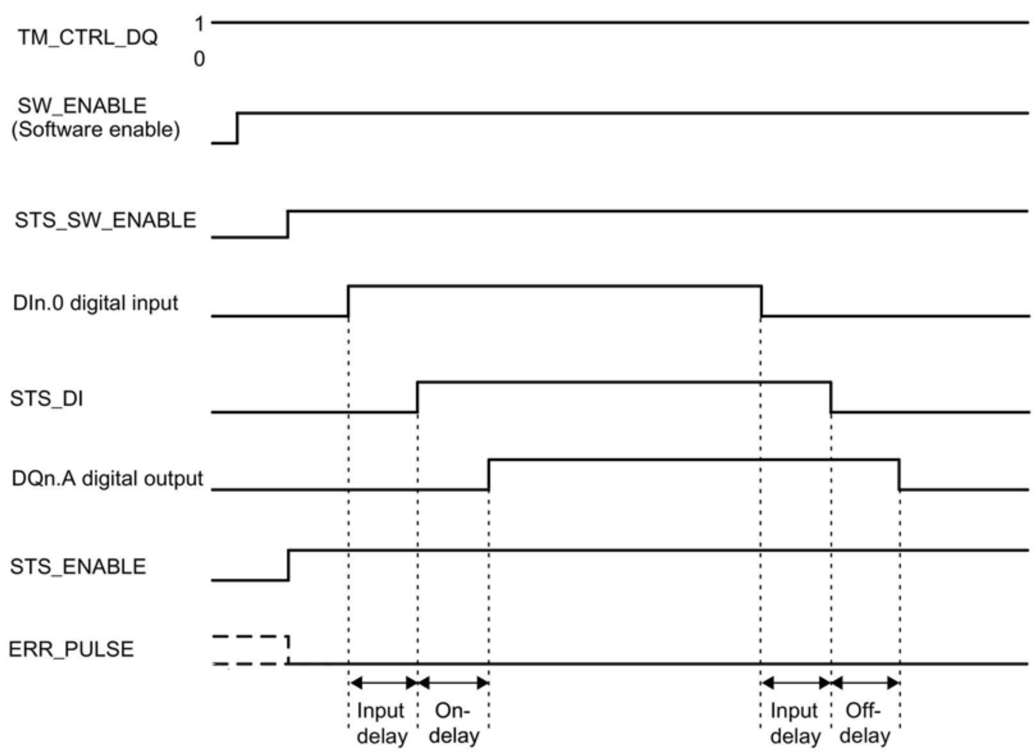

Figure 3-7 Output sequence On/Off-delay (at the start DIn.0 digital input = 0)

SW_ENABLE is set, while DIn.0 digital input = 1:

If SW_ENABLE is set while DIn.0 digital input = 1, the first edge of a digital input (falling edge) is ignored.

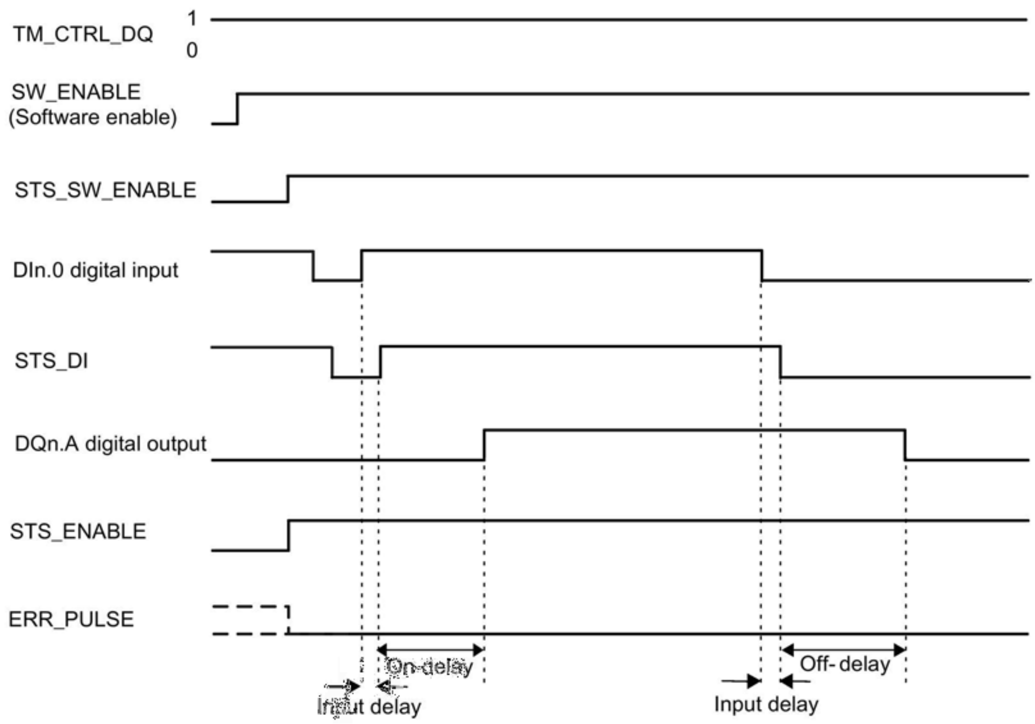

Figure 3-8 Output sequence On/Off-delay (at the start DIn.0 digital input = 1)

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates the software enable pending at the TM Pulse 2x24V.

- When the DIn.0 digital input goes high (positive edge) and remains high for the input delay time, the On-delay is started. After the On-delay expires, the DQn.A digital output is set.
- When the DIn.0 digital input goes low for the input delay time, the Off-delay is started. After the Off-delay expires, the DQn.A digital output is cleared.
- If the TM Pulse 2x24V recognizes a pulse duration or inter-pulse duration at the DIn.0 digital input shorter than the input delay time, then the input is ignored and the DQn.A digital output is unchanged.
- If the TM Pulse 2x24V recognizes a pulse duration or inter-pulse duration at the DIn.0 digital input longer than the input delay time, but too short to produce the parameterized pulse duration or inter-pulse duration, then the ERR_PULSE bit is set and the DQn.A digital output is unchanged.
- At the next edge of the DIn.0 digital input, the TM Pulse 2x24V clears the ERR_PULSE feedback bit

Note

TM_CTRL_DQ technology module output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A output.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQn.A/DQn.B outputs directly with the SET_DQA/SET_DQB control bits.

Canceling the output sequence

Disabling the software enable (SW_ENABLE = 1 → 0) during the On-delay or pulse cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A digital output are immediately reset to 0.

You must restart the output sequence to begin new pulse output.

Truth Table

Software enable SW_ENABLE	DIn.0 digital input	DQn.A digital output (when TM_CTRL_DQ = 1)	STS_ENABLE	Output sequence
1	0 → 1 and remains 1 during the input delay	0, if On-delay > 0 1, if On-delay = 0	1	Start
1	1 → 0	1, if Off-delay > 0 0, if Off-delay = 0	1	Start
0	Any status	0	0	Cancel
1	Any status	0, if On-delay is not expired or if Off-delay is expired 1, if On-delay is expired and Off-delay is not expired	1	-
0 → 1	0	0	1	-

Minimum pulse duration/minimum interpulse duration of the DQn.A digital output

The minimum pulse duration/minimum interpulse duration of the DQn.A digital output is 1.5 µs (high-speed active) and 10 µs (high-speed inactive). Note that lower values are possible but not guaranteed because this is hardware dependent.

Make sure you take this into consideration when you set the On/Off-delay and the pulse duration/interpulse duration of the DIn.0 digital input. Otherwise, the response at the DQn.A digital output is not guaranteed.

The pulse duration of the DIn.0 digital input is too short

Case 1: The DIn.0 pulse duration < input delay time: The DIn.0 pulse is filtered out and ignored (no error occurs).

Case 2: The TM Pulse 2x24V detects a DIn.0 pulse duration that is too short if: DIn.0 pulse duration + Off-delay time ≤ On-delay (error is set)

Case 3: The TM Pulse 2x24V detects a DIn.0 pulse duration that is too short if: DIn.0 pulse duration + Off-delay time + minimum DQ pulse duration < On-delay time (error is set) .

Response of the TM Pulse 2x24V to a pulse duration that is too short:

- ERR_PULSE is set.
- The current On-delay is cleared.
- The Off-delay is not started.
- The signal level at the DQn.A digital output remains at 0.

ERR_PULSE is cleared at the next positive edge on the DIn.0 digital input.

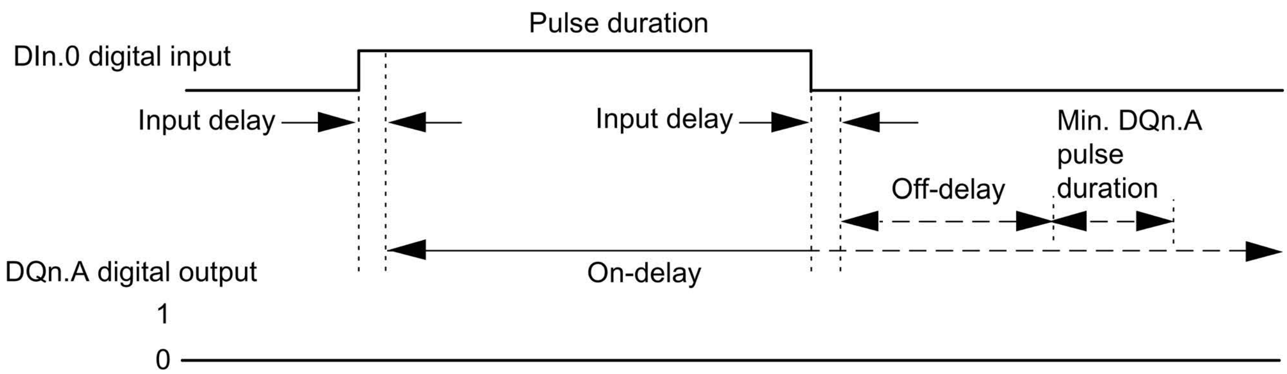

Figure 3-9 DIn.0 pulse duration too short

The interpulse duration of the DIn.0 digital input is too short

The TM Pulse 2x24V detects an interpulse duration that is too short on the positive edge on the DIn.0 digital input if:

Interpulse duration + On-delay ≤ Off-delay.

- Case 1: Interpulse duration < input delay time: The DIn.0 input interpulse is filtered out and ignored (no error occurs).
- Case 2: Interpulse duration + On-delay time ≤ Off-delay time (error is set).
- Case 3: Interpulse duration + On-delay time < Off-delay time + minimum inter-pulse duration (error is set).

Response of the TM Pulse 2x24V to an interpulse duration that is too short:

- ERR_PULSE is set.
- The current Off-delay is cleared.
- The On-delay is not started.
- The signal level at the DQn.A digital output remains at 1.

ERR_PULSE is cleared with the next negative edge on the DIn.0 digital input.

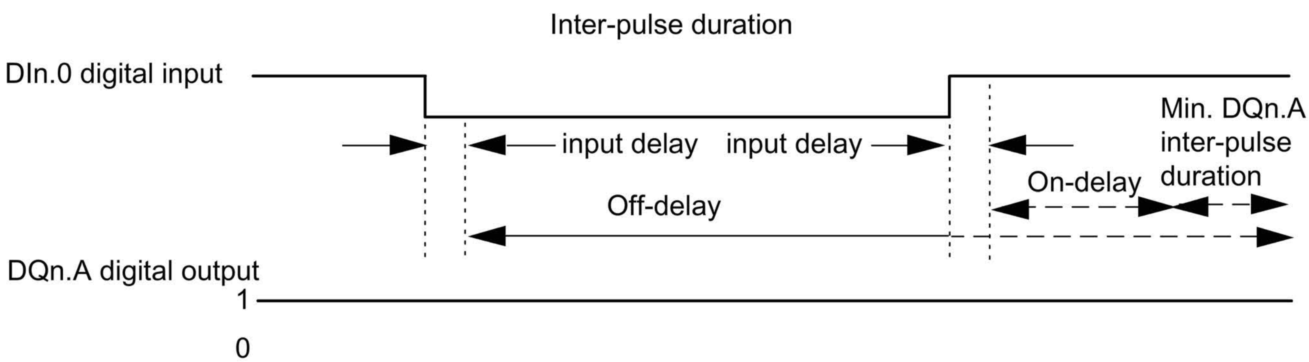

Figure 3-10 DIn.0 inter-pulse duration too short

Retriggering the current On-delay

The TM Pulse 2x24V starts a new On-delay on the positive edge on the DIn.0 digital input if:

On-delay > pulse duration + inter-pulse duration

This clears the current Off-delay.

The DQn.A digital output is only set if signal level 1 is present on the DIn.0 digital input longer than the On-delay. This enables you to filter rapid pulses.

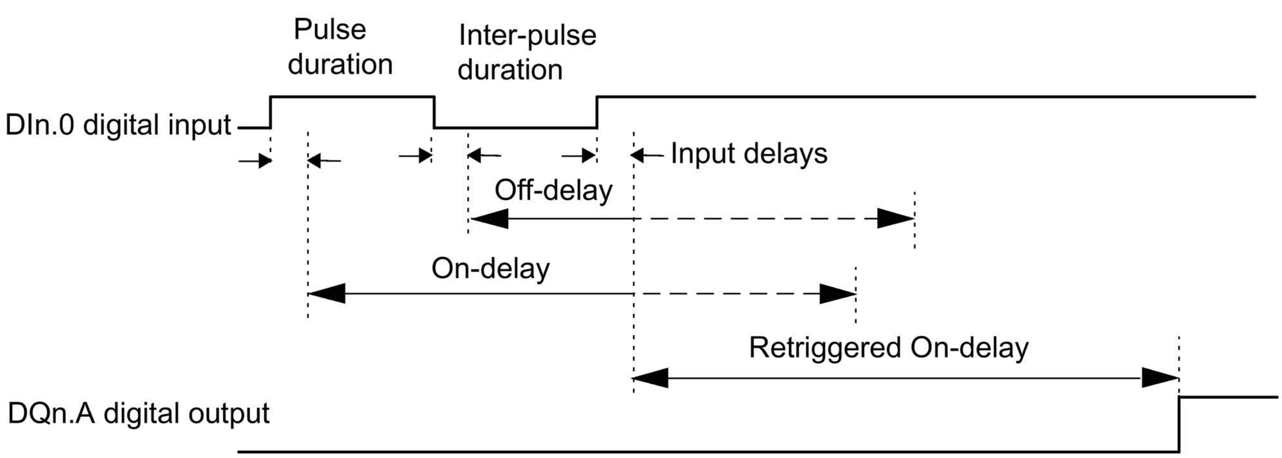

Figure 3-11 DIn.0 retriggering the current On-delay

Retriggering the current Off-delay

The TM Pulse 2x24V starts a new Off-delay on the negative edge on the DIn.0 digital input if:

Off-delay > pulse duration + inter-pulse duration

The DQn.A digital output is only cleared if signal level 0 is present on the Dn.0I digital input longer than the Off-delay.

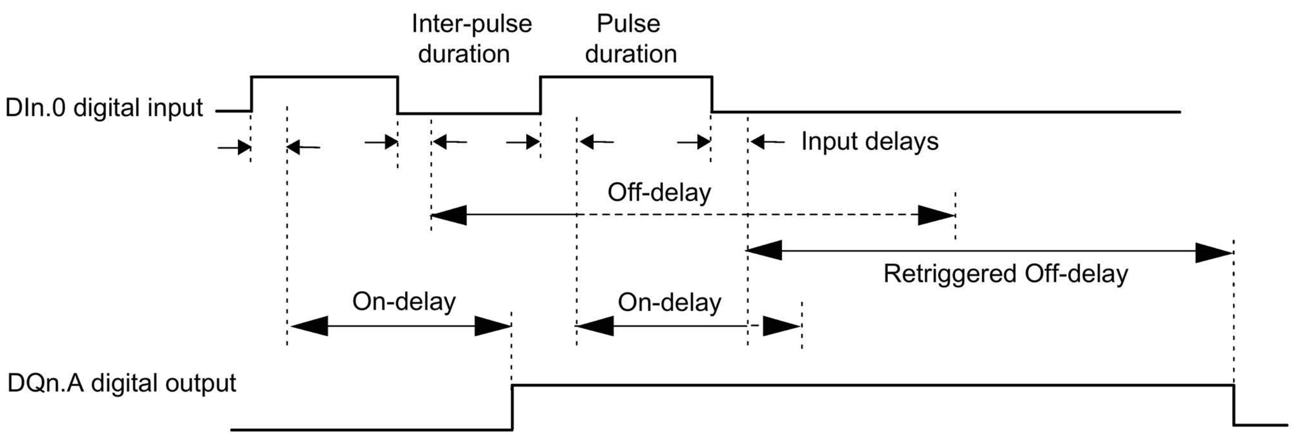

Figure 3-12 Retriggering the current Off-delay

Setting and changing the OUTPUT_VALUE (On-delay)

- You set the On-delay OUTPUT_VALUE directly using your control program to assign a value.
- The unit is always microseconds. Possible range: between 0 μs and 85,000,000 μs. If an invalid value is assigned by your program, the module will send back error ERR_OUT_VAL in the feedback interface and continue using the last valid value.
- The new On-delay value is activated with the next positive edge on the DIn.0 digital input.

Setting and changing the Off-delay

- Permanent update
  The Off-delay can be controlled permanently using the control interface. MODE_SLOT bit has to be set (permanent update); LD_SLOT must be the value 3 (for Off-delay). Set the Off-delay as a value between 0 μs and 85,000,000 μs in the field SLOT. The unit is always microseconds.
- Single update
  Set the Off-delay as a value between 0 μs and 85,000,000 μs in the configuration parameters. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared (single-update); LD_SLOT must be the value 3 (for Off-delay). Set the Off-delay as a value between 0 μs and 85,000,000 μs in the field SLOT.

If you change the Off-delay value during the output sequence, the new Off-delay is activated at the next negative edge on the DIn.0 digital input.
For more details about the use of the SLOT parameter, see SLOT parameter handling (Page 113).

Isochronous mode

General information is available in Function: Isochronous mode (Page 86).

Isochronous mode does not have any influence on the functionality of On/Off-delay operating mode.

Parameters for On/Off-delay operating mode

Parameter	Meaning	Value Range	Default
Mode	3 = Set the "On/Off-delay" operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC-Motor	1
High Speed Output [1]	The output supports higher frequencies.	0 = disabled 1 = enabled	Disabled
Function DI	You can only use the DIn.0 digital input as an input.	0 = Input 1 = reserved (do not use)	Input
Input Delay	DI digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 μs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
Off-delay	The time from the falling edge of the DIn.0 digital input to the falling edge of the DQn.A. You can change the Off-delay in your control program using the SLOT parameter.	0 μs to 85,000,000 μs	0 μs

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note: All bytes and bits not described in the table above are reserved and should be 0.

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	**Bit 0**	Indicates under voltage on the Power supply. Note that the bit is not set if the voltage is not present.
			0	PWR is not under voltage.
			1	PWR is detected, but under voltage.
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	**Bit 1**	Indicates a short-circuit or overload on the output 24 V DC. You must set the RES_ERROR (control interface), to reset this error and be able to use the SLOT again.
			0	No short-circuit on 24 V DC
			1	Short-circuit on 24 V DC
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	**Bit 2**	Indicates an error while loading a value using the field SLOT (only in "single-update" SLOT-mode).
			0	No load error pending.
			1	Load error pending: you must set the RES_ERROR (control interface) to reset this error and be able to use the SLOT again.
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE	**Bit 3**	Indicates a pulse output error.
			0	No pulse output error
			1	Pulse output error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.A. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B or an attempt to set both DQn.A and DQn.B manually using SET_DQA, SET_DB, and TM_CTRL_DQ. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B or attempt to set both DQn.A and DQn.B
Byte 0: Bit 6	Byte 8: Bit 6	ERR_OUT_VAL	**Bit 6**	Indicates that an invalid value is detected in OUTPUT_VALUE.
			0	OUTPUT_VALUE is valid
			1	OUTPUT_VALUE is not valid
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	**Bit 7**	Indicates that an invalid value is detected in SLOT (only in "permanent-update" SLOT-mode).
			0	SLOT value is valid
			0 → 1	SLOT value is not valid
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT	**Bit 2**	Toggle acknowledge bit for each action of the SLOT in "single-update" SLOT-mode. Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY	**Bit 4**	Indicates the module is ready and parameterized.
			0	Module is not parameterized
			1	Module is parameterized
Byte 1: Bit 5	Byte 9: Bit 5	STS_SW_ENABLE	**Bit 5**	Indicates the status of SW_ENABLE (control interface).
			0	SW_ENABLE cleared
			1	SW_ENABLE set

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1 [1]			
Byte 2: Bit 0	Byte 8: Bit 0	STS_ENABLE	**Bit 0**	Indicates an output sequence is running.
			0	Pulse output is not running
			1	Pulse output is running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	0 at the DQn.A digital output
			1	1 at the DQn.A digital output
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	0 at the DQn.B digital output
			1	1 at the DQn.B digital output
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI	**Bit 3**	Indicates the signal level at the DIn.0 digital input.
			0	0 at the DIn.0 digital input
			1	1 at the DIn.0 digital input
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT	Counts rising and falling edges of DQn.A output	
Word 3	Word 7	Reserved	Read as 0

Note: All bytes and bits not described in the table above are reserved and are read as 0.

Input and output signals for On/Off-delay operating mode

Input and Output Signals	Meaning	Value Range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
DIn.0 Digital input	The signal of the DIn.0 digital input is output with an On/Off-delay on DQn.A digital output.	0 = no pulse 1 = pulse	3	4
Output signal				
Pulse at the DQn.A digital output	The signal of the DIn.0 digital input is output with an On/Off-delay on the DQn.A digital output.	0 = no signal 1 = signal	9	10

See also Pin assignment and load/sensor wiring (Page 91)

3.6 Frequency output mode

Definition

This mode allows you to assign a frequency value at high frequencies more precisely than PWM period and Period duration.

A square wave signal with an assigned frequency and a constant duty cycle of 50% is produced at the digital output of the TM Pulse 2x24V.

The output sequence is started after expiration of the configured On-delay on the DQn.A digital output.

Pulse diagram

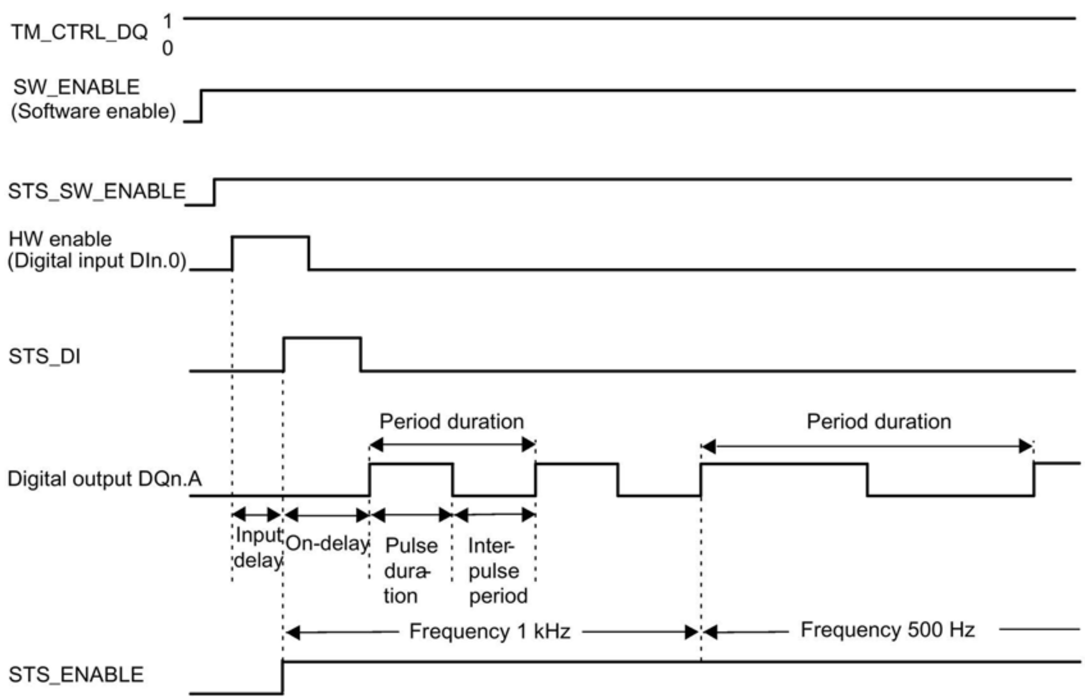

Figure 3-13 Frequency output - output sequence

The timing diagram above has the "Function DI" parameter set to "HW enable". The other option is to set "Function DI" to "Input". If the "Function DI" parameter is set to "Input", then the On-delay phase starts at the rising edge of SW_ENABLE.

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates the software enable pending at the TM Pulse 2x24V.

You can also set the DIn.0 digital input of the TM Pulse 2x24V as a HW enable with the "Function DI" parameter.

If you want to use the hardware enable, it has to be combined with the software enable. When SW_ENABLE has been enabled, the output sequence starts at the first positive edge of the hardware enable. Further positive edges of the hardware enable during the current output sequence are ignored by the TM Pulse 2x24V.

When the enable is issued (positive edge) and remains high for the time of the input delay (noise filter), the On-delay is started and the STS_ENABLE set. The frequency sequence is output on expiration of the On-delay. The output sequence runs continuously as long as SW_ENABLE is set.

Note

TM_CTRL_DQ technology module output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A output.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQn.A/DQn.B outputs directly with the SET_DQA/SET_DQB control bits.

Canceling the output sequence

Disabling the software enable (SW_ENABLE = 1 → 0) during the On-delay or frequency output cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A digital output are immediately reset to 0.

You must restart the output sequence to begin new pulse output.

Truth table

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	DQn.A digital output (when TM_CTRL_DQ = 1)	STS_ENABLE	Output sequence
1	HW_ENABLE	0 → 1 and remains 1 during the input delay. Only active for the first positive edge, additional positive edges are ignored and no start occurs.	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0 → 1	Input	Not used	0, if On-delay > 0 1, if On-delay = 0	0 → 1	Start
0	HW_ENABLE or Input	Any status	0	0	Cancel
1	HW_ENABLE or Input	Any status	0, if On-delay is not expired or you are in the inter-pulse time 1, if On-delay is expired and during the pulse duration		-
0 → 1	HW_ENABLE	0	0	0	-

Setting and changing the output value (Frequency)

You set the OUTPUT_VALUE directly using your control program in the control interface. The value is in real format and the unit is always "Hz". The possible range is dependent on the parameter "High Speed Output" as follows:

- High Speed Output disabled
  - Frequency (OUTPUT_VALUE): 0.02 Hz to 10,000 Hz
- High Speed Output enabled
  - Frequency (OUTPUT_VALUE): 0.02 Hz to 100,000 Hz

The new frequency value is applied at the next rising edge of the output.

Output frequency accuracy

The configured output frequency is output with an accuracy of +/- 100 ppm at the DQn.A digital output.

Setting and changing the On-delay

- Permanent update
  The On-delay can be controlled permanently using the control interface. MODE_SLOT bit has to be set (permanent-update); LD_SLOT must be the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the field SLOT. The unit is always microseconds.
- Single update
  Set the On-delay as a value between 0 μs and 85,000,000 μs in the configuration parameters, the unit is always microseconds. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared (single-update); LD_SLOT must be the value 2 (for On-Delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the field SLOT.

If you change the On-delay value during the output sequence, the new On-delay is activated at the next output sequence.

For more details about the use of the SLOT parameter, see Slot parameter handling (Page 113).

Isochronous mode

General information is available in the "Function: Isochronous mode (Page 86)" topic.

Isochronous mode does not have any influence on the functionality of Frequency output operating mode.

If you want to synchronize the output sequence with T_o, then set the Function DI parameter to "Input" and the frequency output sequence starts at T_o.

Parameters of Frequency output operating mode

Parameter	Meaning	Value range	Default
Mode	4 = Set the Frequency output operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC Motor	1
High Speed Output [1]	The output supports higher frequencies.	0 = disabled 1 = enabled	Disabled
Function DI	You can use the DIn.0 digital input as an input or as a hardware enable.	0 = Input 1 = HW enable	Input
Input delay	DIn.0 digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 μs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
On-delay	The time from the start of the output sequence to the output of the pulses. You can change the On-delay in your control program using SLOT parameter.	0 μs to 85,000,000 μs	0 μs

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)".

Input and output signals for Frequency output operating mode

Input and Output Signals	Meaning	Value Range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
HW enable	You can select the HW enable with the "Function DI" parameter and select the input delay with the "Input delay" parameter. The signal of the DIn.0 digital input is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	0 = HW enable cleared 1 = HW enable issued 0 → 1 = Start of the output sequence after the input delay; dependent on the software enable (SW_ENABLE)	3	4
Output signal				
Pulse at the DQn.A digital output	A pulse is output at the DQn.A digital output for the assigned frequency.	0 = no pulse 1 = pulse	9	10

See also Pin assignment and load/sensor wiring (Page 91)

3.7 DC motor mode

Definition

Each channel has an A and a B output for connection to your DC motor load. The bipolar output switch and pulse width modulation lets your assign rotation direction and output voltage duty cycle.

You can use the two channels for 2 A per channel maximum or use a parallel connection that provides a single channel 4 A maximum.

Two channel motor load connection:

- Channel 0: motor connected between DQ0.A and DQ0.B
- Channel 1: motor connected between DQ1.A and DQ1.B

Single channel motor load connection

- 4 A Channel 0: motor connected between DQ0.A and DQ0.B.
  DQ0.A and DQ1.A are connected together; DQ0.B and DQ1.B are connected together.

For more details concerning the connection, see the Connecting chapter (Page 91)of this manual.

Motor rotate

Rotation direction

- Forward during high phase of the PWM signal: DQn.A is 1 and DQn.B is 0.
- Backward during high phase of the PWM signal: DQn.A is 0 and DQn.B is 1.
- Forward/Backward during low phase of the PWM signal: DQn.A is 0 and DQn.B is 0.

Motor stop

The motor can be stopped using an external signal connected to the DIn.0 digital input or using the signal SW_ENABLE in the control interface. Configure the "Function DI" accordingly.

Function DI setting:

- "HW enable" starts the motor on the rising edge of DI and stops the motor on the falling edge of DI.
- "External stop" starts the motor on the rising edge on SW_ENABLE and stops the motor on the rising edge on DI, or the falling edge of SW_ENABLE.
- "Input" starts the motor on the rising edge of SW_ENABLE and stops the motor on the falling edge of SW_ENABLE (DI has no effect on the control of the motor).

You control the output pulse width duty cycle with the control interface field OUTPUT_VALUE. The TM Pulse 2x24V generates continuous pulses based on this value. The OUTPUT_VALUE determines the duty cycle (pulse duration/period duration) within a period for pulse width modulation. The period duration can be adjusted.

After expiration of the assigned On-delay, the DQn.A and DQn.B output pulses begin (output sequence).

High-speed mode, current measurement, and current control are not available in DC motor mode.

Starting the output sequence

Your control program must issue the enable for the output sequence, using the software enable (SW_ENABLE 0 → 1).

The STS_SW_ENABLE feedback bit indicates the software enable pending at the TM Pulse 2x24V.

You can also assign the DIn.0 digital input of the TM Pulse 2x24V as a HW enable with the "Function DI" parameter. The input delay (noise filter) of the hardware enable can be set using the parameter "Input Delay".

If you want to use the hardware enable, it has to be combined with the software enable. When SW_ENABLE has been enabled, the output sequence starts at the first positive edge of the hardware enable. Further positive edges of the hardware enable during the current output sequence are ignored by the TM Pulse 2x24V. The hardware enable option is not supported for isochronous mode.

When the enable is issued (positive edge) and remains high for the input delay time, the On-delay is started and the STS_ENABLE set. The PWM pulse train is output on expiration of the On-delay. The output sequence runs continuously as long as SW_ENABLE is set.

Canceling the output sequence

- Using the SW_ENABLE signal: Disabling the software enable (SW_ENABLE = 1→0) cancels the current output sequence and the last period duration is not completed. STS_ENABLE and the DQn.A and DQn.B digital outputs are immediately set to 1 (motor stop).

You must restart the output sequence to begin new pulse output.

- Using the digital input DIn.0:
  - If "Function DI" is parameterized as "HW_ENABLE": a falling edge on DIn.0 will stop the output sequence with the same behavior as using the SW_ENABLE.
  - If "Function DI" is parameterized as "External stop": a rising edge on DIn.0 will stop the sequence with the same behavior as using the SW_ENABLE.

Truth table

Software enable SW_ENABLE	Function DI parameter	Hardware enable (DIn.0 digital input)	Digital output DQn.A and DQn.B	STS_ENABLE	Output sequence
1	HW_ENABLE	0 → 1 and remains 1 during the input delay. Only active for the first positive edge, additional positive edges are ignored and no start occurs.	If On-delay > 0: DQn.A: 0 DQn.B: 0 If On-delay = 0: Forward: DQn.A: 1 DQn.B: 0 Backward: DQn.A: 0 DQn.B: 1	0 → 1	Start
0 → 1	Input or External stop	Any state	If On-delay > 0 DQn.A: 0 DQn.B: 0 If On-delay = 0 Forward: DQn.A: 1 DQn.B: 0 Backward: DQn.A: 0 DQn.B: 1	0 → 1	Start
0	HW_ENABLE or Input or External stop	Any state	DQn.A: Tri-state DQn.B: Tri-state	0	Cancel
1	Input	Any state	If On-delay is not expired or during interpulse time: DQn.A: 0 DQn.B: 0 If On-delay is expired and during the pulse duration: Forward: DQn.A: 1 DQn.B: 0 Backward: DQn.A: 0 DQn.B: 1		-
1	HW_ENABLE	0	DQn.A: Tri-state DQn.B: Tri-state	1 → 0	Stop
1	External stop	0 → 1	DQn.A: Tri-state DQn.B: Tri-state	1 → 0	Stop
0 → 1	HW_ENABLE	0	DQn.A: Tri-state DQn.B: Tri-state	0	-

Setting and changing the pulse duty cycle and rotation direction

OUTPUT_VALUE assigns the duty cycle and the direction for the current period duration.

OUTPUT_VALUE is given as an S7 analog value, the sign gives the direction of the motor rotation ("+" means forward, "-" means backwards). The possible range is -27648 to +27648.

Only the two least significant bytes of OUTPUT_VALUE are used, the two other bytes are ignored. A value of the two least significant bytes higher than +27648 will be interpreted as a value of +27648 (100% forward). A value of the two least significant bytes below -27648 will be interpreted as a value of -27648 (100% backward).

Before changing the rotation direction, it is recommended that the OUTPUT_VALUE is first set to 0 long enough, to first stop the motor. Note that the TM Pulse 2x24V module does not override our duty cycle assignment in order to protect the motor. If a ramp-up or ramp-down is required by the motor, this ramp has to be implemented in the automation program and transmitted to the module by controlling the value of the field OUTPUT_VALUE accordingly.

- "S7 analog output" output format: Value range between -27,648 and +27,648. The sign determines the motor rotation direction.
- Pulse duration = (OUTPUT_VALUE/27,648) x period duration.

You assign OUTPUT_VALUE directly with your control program. A new OUTPUT_VALUE is applied at the next rising edge of the output.

Setting and changing the period duration

- Permanent update
  The period duration is controlled permanently using the control interface. The MODE_SLOT bit has to be set ("1" means permanent update); LD_SLOT has to have the value 1 ("1" means Period duration).
  Set the period duration value in the field SLOT between 100 µs and 85,000,000 µs.
- Single update
  Set the period duration in the configuration parameters. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared ("0" means single-update); LD_SLOT has to have the value 1 ('1' means Period duration).
  Set the period duration value in the field SLOT between 100 µs and 85,000,000 µs.

The new period duration is applied with the next rising edge of the output.

For more details about SLOT parameter handling, see "Slot parameter handling (control interface)".

Isochronous mode

General information is available in the "Function: Isochronous mode" topic.

In isochronous mode, the output sequence is synchronized with the moment T_O. The period duration is coordinated to the application cycle (the synchronous cycle, a multiple of the PROFINET cycle). The behavior in the DC-motor mode is the same than the behavior in the operating mode PWM. Please refer to the corresponding chapter in this manual. Only the differences are listed below:

- During the "pulse duration phase" (high phase), the status of the outputs is as follows:
  - In forward direction: DQn.A is 1 and DQn.B is 0
  - In backward direction: DQn.A is 0 and DQn.B is 1
- During the "interpulse duration phase" (low phase), the status of the outputs is as follows:
  - DQn.A is 0 and DQn.B is 0
- The parameter "Function DI" can be parameterized as "External stop" in isochronous mode to use the rising edges on the DIn.0 to stop the motor. Note that if "Function DI" is parameterized as "HW_ENABLE" in isochronous mode which is not supported, it will be interpreted as "External stop" by the TM Pulse 2x24V module.

Setting and changing the On-delay

- Permanent update
  The On-delay can be controlled permanently using the control interface. The MODE_SLOT bit has to be set (permanent update); LD_SLOT must have the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the field SLOT. The unit is always microseconds.
- Single update
  Set the On-delay as a value between 0 μs and 85,000,000 μs in the configuration parameters. The unit is always microseconds. Alternatively, perform a single update using the control interface. MODE_SLOT has to be cleared (single-update); LD_SLOT must have the value 2 (for On-delay). Set the On-delay as a value between 0 μs and 85,000,000 μs in the field SLOT.

If you change the On-delay value during the output sequence, then the new On-delay is activated at the next output sequence. For more details about the use of the SLOT parameter see SLOT parameter handling.

Parameters for DC motor operating mode

Parameter	Meaning	Value range	Default
Operating mode	5 = Set the DC motor operating mode.	0 = Pulse output 1 = Pulse width modulation 2 = Pulse train 3 = On/Off-delay 4 = Frequency output 5 = DC Motor	1
Function DI	You can use the DIn.0 digital input as an input, for HW_ENABLE, or External stop signal. The signal at DIn.0 is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay. If HW_ENABLE is used in non-isochronous mode, a rising edge on DIn.0 starts the output sequence (If SW_ENABLE is set) and a falling edge on DIn.0 stops the output sequence. If HW_ENABLE is used in isochronous mode, it will be interpreted by the module as External stop. If External Stop is used, the output sequence starts with the rising edge of SW_ENABLE and stops with the rising edge of DIn.0.	0 = Input 1 = HW enable 2 = External stop	Input
Output format	Defines the format of the ratio value (duty cycle).	0 = S7 analog format	S7 analog format
Input delay	DIn.0 digital input must be stable over the delay time (signal noise suppression).	0 = Off (4 μs) 1 = 0.05 ms 2 = 0.1 ms 3 = 0.4 ms 4 = 0.8 ms 5 = 1.6 ms 6 = 3.2 ms 7 = 12.8 ms 8 = 20 ms	0.1 ms
Period	Period duration of the output pulse cycle in μs. You can change the period duration in your control program with the control interface SLOT field.	100 μs to 85,000,000 μs	1000 μs
On-delay	The time from the start of the output sequence to the output of the pulses. You can change the On-delay in your control program with the control interface SLOT field.	0 μs to 85,000,000 us	0 μs

Control and feedback signals for DC motor mode

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note: All bytes and bits not described in the table above are reserved and should be 0.

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	**Channel 1** [1]			
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	**Bit 0**	Indicates under voltage on the Power supply. Note that the bit is not set if the voltage is not present.
			0	PWR is not under voltage
			1	PWR is detected, but under voltage
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	**Bit 1**	Indicates a short-circuit or overload on the output 24 V DC. You must set the RES_ERROR (control interface), to reset this error.
			0	No short-circuit on 24 V DC
			1	Short-circuit on 24 V DC
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	**Bit 2**	Indicates an error while loading a value using the field SLOT (only in "single-update" SLOT-mode).
			0	No load error pending
			1	Load error pending: you must set the RES_ERROR (control interface) to reset this error and be able to use SLOT again.
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.A. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	**Bit 7**	Indicates that an invalid value is detected in SLOT (only in "permanent-update" SLOT-mode).
			0	SLOT value is valid
			0 → 1	SLOT value is not valid
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT	**Bit 2**	Toggle acknowledge bit for each action of SLOT in "single-update" SLOT-mode. Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY	**Bit 4**	Indicates the module is ready and parameterized.
			0	Module is not parameterized
			1	Module is parameterized
Byte 1: Bit 5	Byte 9: Bit 5	STS_SW_ENABLE	**Bit 5**	Indicates the status of SW_ENABLE (control interface).
			0	SW_ENABLE cleared
			1	SW_ENABLE set
Byte 2: Bit 0	Byte 8: Bit 0	STS_ENABLE	**Bit 0**	Indicates an output sequence is running.
			0	Output sequence not running
			1	Output sequence running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	0 on DQn.A digital output
			1	1 on DQn.A digital output
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	0 on DQn.B digital output
			1	1 on DQn.B digital output

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	**Channel 1** [1]			
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI	**Bit 3**	Indicates the signal level at the DIn.0 digital input.
			0	0 on DIn.0 digital input
			1	1 on DIn.0 digital input
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT	Sequence counter = 0. The sequence counter is not used in PWM mode.	
Word 3	Word 7	Reserved	Read as 0	

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note: All bytes and bits not described in the table above are reserved and are read as 0.

Input and output signals for DC motor operating mode

Input and output signal	Meaning	Value range	Channel 0 BaseUnit pin number	Channel 1 BaseUnit pin number
Input signal				
HW enable /External stop Note: HW enable not supported for PWM in isochronous mode	You can select the interpretation of the digital input signal on the output sequence with the "Function DI" parameter and select the input delay with the "Input delay" parameter. The signal at the DIn.0 digital input is interpreted by the TM Pulse 2x24V, after noise filtering by the input delay, as the start of the output sequence.	Function DI = "HW_ENABLE": 0 = HW enable cleared 1 = HW enable issued 0→1 = Start of the output sequence after the input delay, dependent on the software enable (SW_ENABLE) 1→0 = Stop of the output sequence after the input delay, dependent on the software enable (SW_ENABLE). Function DI = External stop: 0→1 = Stop of the output sequence after the input delay; dependent on the software enable (SW_ENABLE)	3	4
Output signal				
Pulse at the DQn.A and DQn.B digital outputs	A pulse is output at the DQn.A and DQn.B digital outputs for the assigned duty cycle and period duration.	**No pulse or interpulse period:** DQn.A is 0 V and DQn.B is 0 V **Pulse duration in forward direction:** DQn.A is 24 V and DQn.B is 0 V **Pulse duration in backward direction:** DQn.A is 0 V and DQn.B is 24 V	9 (DQ0.A) 11 (DQ0.B)	10 (DQ1.A) 12 (DQ1.B)

See also Pin assignment and load/sensor wiring

3.8 Function: High-speed output

High-speed mode improves the signal timing of the DQ digital outputs. The switching edges have less delay, variation, jitter, and smaller rise/fall times.

High-speed mode is designed to produce more precise timing for pulse signals, but provides less maximum load current.

High-speed output is only available in dual channel operation; it is not available in single channel operation.

You can use the STEP 7 (TIA Portal) or STEP 7 hardware configuration to select "High-speed output (0.1 A)" option for each channel separately. Also, you can change the parameter assignment at runtime with your program using data record 128 (Page 138).

STEP 7 (TIA Portal) and STEP 7 assist you during parameter assignment, by disabling keyboard input for invalid parameters and range checking your value assignments. Depending on previous parameter selections, other options will be disabled. For example, if you select the single channel operation (the parallel connection of the two output channels), then the parameter options for Channel 1 and high-speed output are disabled.

High-speed output option is available for these operation modes:

- Pulse output
- PWM
- Pulse train
- On/Off-delay
- Frequency output

High-speed output is not available in DC motor mode.

High-speed output option

<table>
<tr><th rowspan="2">Pulse timing</th><th colspan="2">Minimum</th><th colspan="2">Maximum</th></tr>
<tr><th>High-speed disabled</th><th>High-speed enabled</th><th>High-speed disabled</th><th>High-speed enabled</th></tr>
<tr><td>Pulse duration</td><td>10 µs</td><td>1.5 µs</td><td colspan="2" rowspan="4">85,000,000 µs</td></tr>
<tr><td>Period duration</td><td>100 µs</td><td>10 µs</td></tr>
<tr><td>On-delay</td><td colspan="2" rowspan="2">0 µs</td></tr>
<tr><td>Off-delay</td></tr>
<tr><td>Frequency</td><td colspan="2">0.02 Hz</td><td>10 kHz</td><td>100 kHz</td></tr>
</table>

High-speed output load current

Parallel mode (single channel operation)	Maximum pulse output load current	
	High-speed disabled	High-speed enabled
Disabled	2 A (Two channels)	100 mA (Two channels)
Enabled	4 A (One channel)	Not allowed

3.9 Function: Sequence counter

The TM Pulse 2x24V has a sequence counter for each channel that counts completed output sequences. Successfully completed and unsuccessfully completed output sequences are counted.
You can monitor the completion of an output sequence with the sequence counter SEQ_CNT variable in the feedback interface (Page 115).

The counter has a width of 4 bits. After a count overflow, the counter jumps back to 0.

Function of the sequence counter

The sequence counter has the following function in the individual operating modes:

- Pulse output and pulse train
  - Function DI configuration is set to "Input": the counter is set to 1 after completion of the output sequence (range 0 to 1).
  - Function DI configuration is set to "HW enable": the counter is incremented after every completed output sequence (range 0 to 15).
- On/Off-delay
  - The counter is incremented, with each edge (positive and negative) at the DQ output (range 0 to 15).
- PWM, frequency output, and DC motor
  - The counter does not have any function.

When the software enable (SW_ENABLE = 0) occurs, the counter is reset to 0.

Application options

The sequence counter can be used for:

- Detecting (counting) very short pulse sequences
- Counting of output sequences controlled with the hardware enable

3.10 Function: Current measurement

Principle of operation

Your program logic can use load current measurements with a control loop for proportional control of the energy transferred to an inductive or resistive load. The current measurements are provided in the feedback interface (Page 115) MEASURED_CURRENT value in SIMATIC S7 analog value format.

Current measurement is possible:

- For PWM and Pulse train operating modes and if the high-speed output option is inactive
  - When there is no pulse output (at STS_ENABLE = 0), 7FFFH is supplied as the measured value.
  - The measured value is valid at (STS_ENABLE = 1) after the first period duration. The returned current measurement value is a mean value of measured values sampled over the duration of at least one period. If Dithering is active, then the mean value is sampled over the duration of the entire Dither period.

Current measurement is not possible and returns a MEASURED_CURRENT value of 0:

- For all other operating modes or if the high-speed output option is active.

Note

In order for the current measurement to work correctly, do not connect a freewheeling diode (snubber/suppressor diode) to the output load.

Measuring range and measured value

- **Channel configuration is 2 channels (2 A)** (the parallel channel connection is deactivated).
  - A measured mean current of 2 A corresponds to the SIMATIC S7 analog value of 27,648 ($6C00_H$).
  - Measurements of current are possible up to a SIMATIC S7 analog value of 32,511 ($7EFF_H$) which corresponds to a current of 2.37 A.
  - Currents exceeding 2 A may only occur briefly.
- **Channel configuration is 1 channel (4 A)** (the parallel channel connection is activated).
  - A measured mean current of 4 A corresponds to the SIMATIC S7 analog value of 27,648.
  - Measurements of current are possible up to a SIMATIC S7 analog value of 32,511 which corresponds to a current of 4.74 A.
  - Currents exceeding 4 A may only occur briefly.

Output current limit diagnostic message

If diagnostics are enabled and the module is in PWM or PTO mode, then an over current diagnostic error will be reported when the module senses the current to be higher 2.37 A (4.74 A in single channel mode).

Current measurement accuracy

Current measurement accuracy is ±2% of the full scale 27,648 measuring range

- ±40 mA in dual channel mode
- ±80 mA in single channel mode

The current measurement accuracy degrades above 3 kHz pulse frequency to -2% +5% accuracy, when driving resistive loads at a frequency of 10 kHz.

Note

2% current measurement accuracy is only possible, if the period duration is not changed during the measurement process.

3.11 Function: Current control

Current control (PWM mode only)

In PWM mode, the TM Pulse 2x24V module can use a proportional-integral-derivative (PID) algorithm to control output current. The target value of the current (set point) is determined by your program and the module controls the duty cycle of the PWM output to follow the set point, with a response that is based on the assigned PID parameters.

The set point and the measured value of the load current are compared by the PID controller. If the resulting difference (error) is outside a symmetrical dead band, a reaction is calculated by adding the selected proportional, integral and/or derivative parts. The manipulated value is limited by the defined high/low limits and finally the output pulse duration time (duty cycle) is modified, depending on the PWM period duration.

Assign the reference current value to the current measured in the channel's DQn.A output load when the output is continuously in the high (On) state.

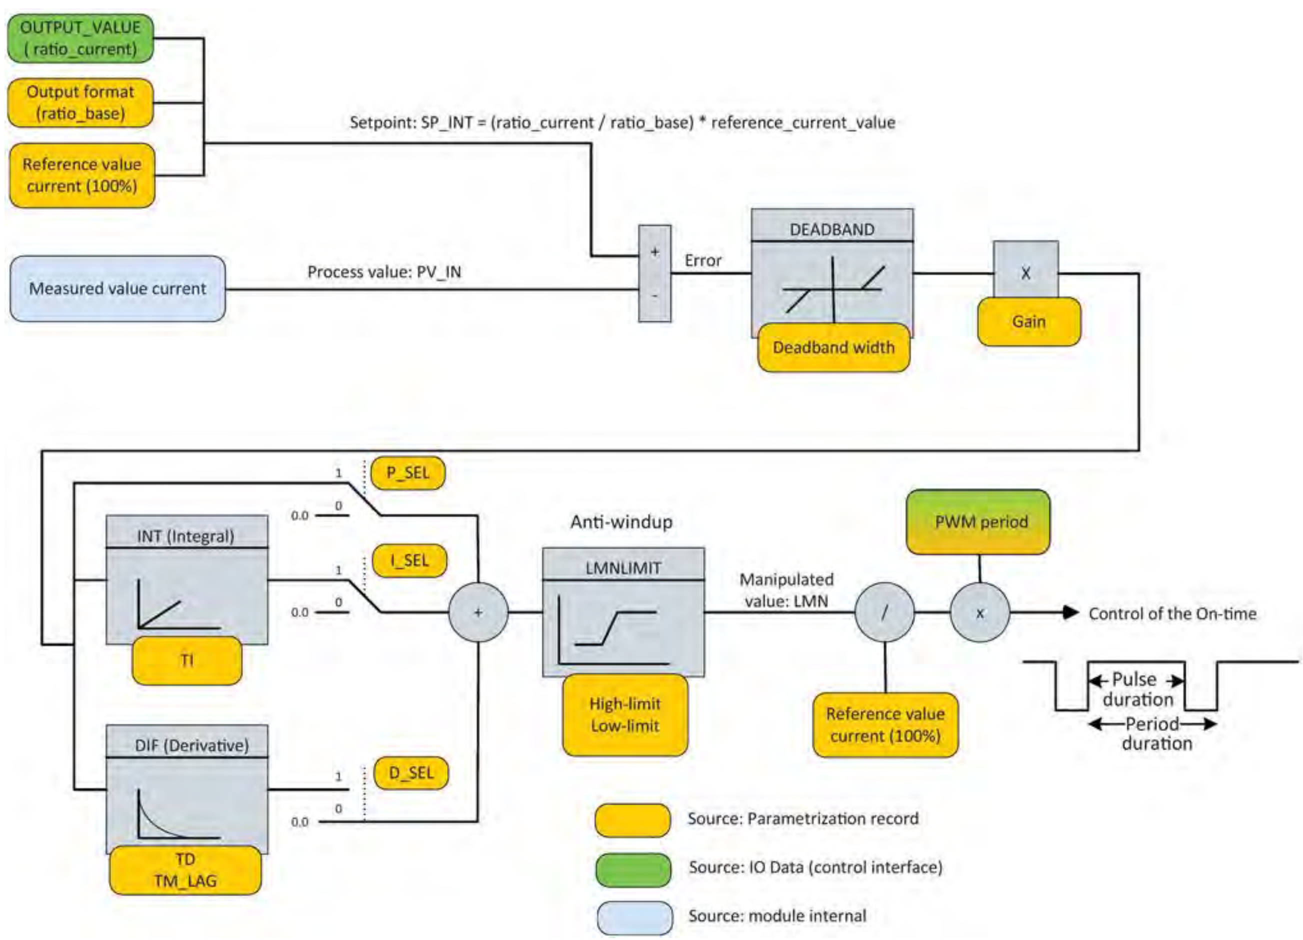

Figure 3-14 Current control PID function

For more information about this PID control method, refer to the CONT_C instruction topic in TIA Portal online help.

Setting up current control

In order to use the current control feature, the module must be parametrized correctly and the set point (target value of the current) must to be controlled by the user program. In addition, your program can also read the limit-reached flags.

PID parameters

The PID parameters can be set in TIA Portal device configuration or by your program writing parametrization record (record 128) in the module. See the parametrization record description (Page 138) for details.

- **Current Control**: "1" activates the PID controller. Limitations: Current control can only be activated if the selected mode of operation is PWM and the high-speed output is disabled.
  All the following parameters have no effect, if current control is disabled.
- **P_Sel, I_Sel, D_Sel**: defines the PID control calculation. The proportional, integral, and derivative parts can be enabled ("1") or disabled ("0") in the device configuration.
- **Reference value current (mA)**: The reference value is used to define the maximum set point and the high and low limits of the controlled current. Typically, the maximum current can be measured in PWM mode with current control disabled and a duty cycle set to 100%. The value measured can be set as a reference for the current control. The maximum value is 4000 mA for single channel operation (parallel channel connection enabled) and 2000 mA per channel for dual channel operation (parallel connection disabled).
- **Dead band width (µA)**: A dead band is applied to the output current deviation from the set point current. The "Dead band width" is half of the size of the dead band. The dead band is symmetrical: For example, if the dead band width = 1500 µA, then the dead band is from -1500 µA to +1500 µA .
- **High limit (S7 analog value)**: The manipulated value is always restricted to a high limit and low limit. The "High limit" parameter assigns the high limit in S7 analog format, relative to the reference value current. A value higher or equal than 27648 means 100% of the reference value current. The High limit value must be higher than the Low limit.

  High limit example:

  – The reference current is set to 1000 mA which should be the load current measured with 100% duty cycle.

  – If the high limit is 20000, this means the maximum current the controller will drive is 20000/27648 * 1000 mA = 723.4 mA that is equivalent to a duty cycle of 72.34%.

  – If the controller calculates a control value higher than 72.34%, it will drive 72.34% and never go higher than that value.

- **Low limit (S7 analog value):** The manipulated value is always restricted to a high limit and low limit. The "Low limit" parameter assigns the low limit in S7 analog format, relative to the reference value of the current. A value higher or equal to 27648 is not allowed. The Low limit value must be lower than the High limit.
  Low limit example:
  – The reference current is set to 1000 mA which should be the load current measured with 100% duty cycle.
  – If the low limit is 100, this means the minimum current the controller will drive is 100/27648 * 1000 mA = 3.6 mA that is equivalent to a duty cycle of 0.36%.
  – If the controller calculates a control value below 0.36%, it will drive 0.36% and never go lower than that value.
- **Gain:** The proportional gain parameter assigns the amplification factor for the P part of the PID algorithm.
- **TI (s)**: The integration time parameter determines the time interval of the integral action. If TI is smaller than the controller cycle time, TI will be set internally to the controller cycle time.
- **TD (s)**: The derivative time parameter determines the time interval of the derivative action. If TD is smaller than the controller cycle time, TI will be set internally to the controller cycle time.
- **TM_LAG (s)**: Time lag of the derivative action. The algorithm of the D-action contains a delay of TM_LAG. If TM_LAG is smaller than half the controller cycle time, TI will be set internally to half the controller cycle time.

Set point control

Your program controls the target value of the output current by setting the control interface field OUTPUT_VALUE. The output format is selected in the parametrization record (see parameter "output format"). For example, if the output format "per 100" is selected, writing the value 60 in OUTPUT_VALUE means the target current value is 60% of the reference current value (see parameter "reference value current").

Limit reached flags

The limit reached flags are available in the feedback interface.

QLMN_HLM: "1" means the manipulated value is at the high limit.

QLMN_LLM: "1" means the manipulated value is at the low limit.

For more information about the PID control parameters, refer to the CONT_C instruction topic in TIA portal online help.

Controller cycle time

The internal controller cycle time depends on the configured automation system and on the PWM period. The controller cannot control the current faster than the parametrized PWM period, as the measured current is averaged over an entire PWM period.

If Dithering is active simultaneously with current control, the PID controller uses the Dither period duration as the internal controller cycle time.

Resetting the PID current controller

The internal data of the current controller are reset in the following cases:

- SW_ENABLE (see control interface) is low.
- A new parametrization record is sent to the module.

TM Pulse 2x24V feedback interface (Page 115)

3.12 Function: Dither PWM output

Dither overview

The Dither function creates a vibration in a proportional valve when the desired valve position is controlled with current supplied from the PWM output. The vibration is induced by superimposing the dither current fluctuation around the target current, in a PWM output load (valve coil).

The dither vibration improves the accuracy and linearity of proportional control valves. You can enable and configure the Dither function to minimize valve control problems caused by static friction, stiction, and hysteresis.

Dither parameters

The dither parameters can be set in the TIA Portal device configuration or in the parameterization record (record 128) sent by the program to the module. See the Parameterization record (Page 138) description for details. Some dither parameters can be changed during operation by using the slot mechanism in the control interface for calibration purposes. It is recommended to restart the PWM output sequence after such a parameter change.

- **Dither**: "1" enables the dither feature. In addition to enabling "Dither" in the module's PWM configuration, you must set the DITHER bit in the Control interface (Page 110) to start the Dither signal.
- **Dither amplitude (‰)**: Assign the amplitude ratio of the superimposed dither signal in a per mill ratio. The allowed range is 0 to 500‰ duty cycle. If a higher value is assigned, then 500‰ is used by the module.

  For example: if the dither amplitude is set to 100‰ and the duty cycle in PWM mode is set to 50%, then the effective duty cycle of the signal will vary periodically between 40% and 60%.

  The dither amplitude is adapted (reduced) dynamically by the module if the calculated effective duty cycle is higher than 100% or lower than 0%, so that the dither signal remains symmetrical.

  For example, if the dither amplitude is set to 100‰ and the duty cycle in PWM mode is set to 95%, the effective duty cycle of the signal will vary periodically between 90% and 100%. The dither amplitude is always corrected to remain symmetrical. The dither amplitude will return to the assigned value, as soon as the output signal allows enough duty cycle margin for the superimposed Dither duty cycle variation to be symmetrical.

- **Dither period (µs)**: Assign the period duration in microseconds for the superimposed dither signal. The allowed range is from (4 x PWM period) to 100,000 µs. Also, the Dither period must be greater than 2 ms. If a value less than 2 ms or less than (4 x PWM period) is parametrized, then an error occurs (see parameter validation (Page 120) for ERR_SLOT_VAL and ERR_LD). If a Dither period higher than 100 ms is assigned, the module will use the value 100 ms. The Dither period used by the module can only be an even multiple of the PWM period. The module will use the nearest possible value to the assigned Dither period.
- **Dither ramps**: The dither ramp parameter is one double-word made of two different words. The low word is the dither ramp-up time and the high word is the dither ramp-down time.
  - **Dither ramp-up time (ms):** Assign the time in milliseconds for the duty cycle to rise from 0% to 100%. The allowed range is 0 ms to 30,000 ms. If a higher value is assigned, then 30,000 ms is used by the module.
    The effective ramp-up time is dependent on the dither amplitude and the nominal value of the duty cycle.
    For example: if your nominal value of the duty cycle is 50% and the dither amplitude is 100‰, the effective duty cycle will vary between 40% and 60%, the ramp-up time from 50% to 60% will be 100‰ x Dither ramp-up time.
  - **Dither ramp-down time (ms):** Assign the time in milliseconds for the duty cycle to fall from 100% to 0%. The allowed range is 0 ms to 30,000 ms. If a higher value is assigned, then 30,000 ms is used by the module.
    The effective ramp-down time is dependent on the Dither amplitude and the nominal value of the duty cycle.
    For example: if your nominal value of the duty cycle is 50% and the dither amplitude is 100‰, the effective duty cycle will vary between 40% and 60%, the ramp-down time from 50% to 40% will be 100‰ x Dither ramp-down time.

Note

Changing parameters during Dither output

If the PWM period is changed during operation using the slot mechanism, so that the dither period is less than (4 x PWM period), then dither current is deactivated and feedback bit STS_DITHER = 0, until a valid combination of Dither and PWM periods is assigned.

If you change parameter values using the SLOT mechanism during dither output, then you should restart the output sequence.

Note

PWM with dithering in isochronous mode

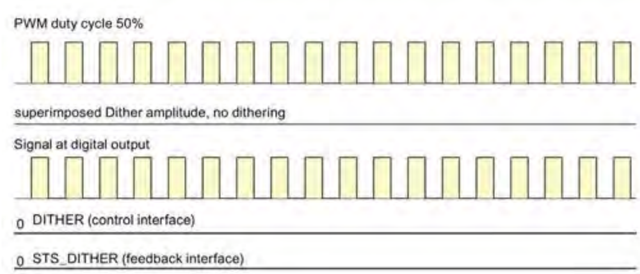
For best results, set the dither period duration to an integral even-numbered multiple of the application cycle.

Example: If the application cycle is 1ms, then the minimal optimal dither period is 2ms. The next optimal values are 4ms, 6ms, ...

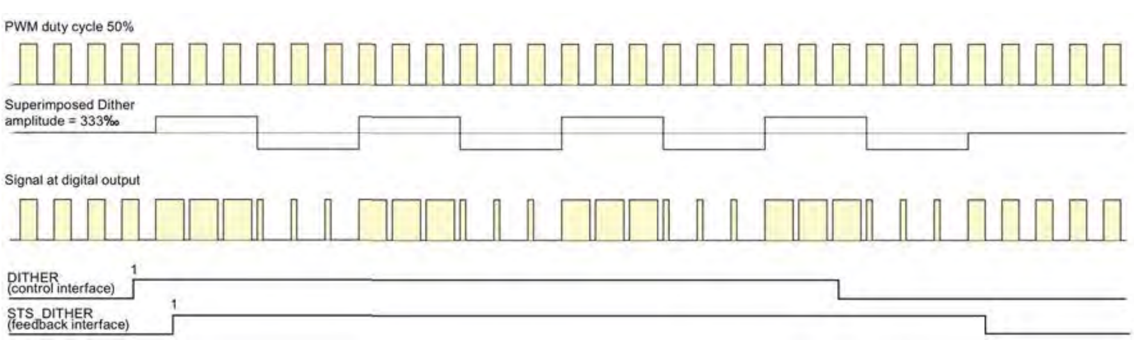
Dither starting and stopping

The ramp-up of the dither current starts as soon as the bit DITHER is set in the control interface and the current Dither period has ended and a new Dither period starts. The feedback interface provides an acknowledge bit STS_DITHER in the feedback interface that goes high when the ramp-up phase is started (by setting the DITHER bit when the output sequence is running) and goes low when the ramp-down phase is over or the output sequence is stopped. The ramp-down starts when the bit DITHER is cleared in the control interface and the current Dither period has ended and a new Dither period starts.

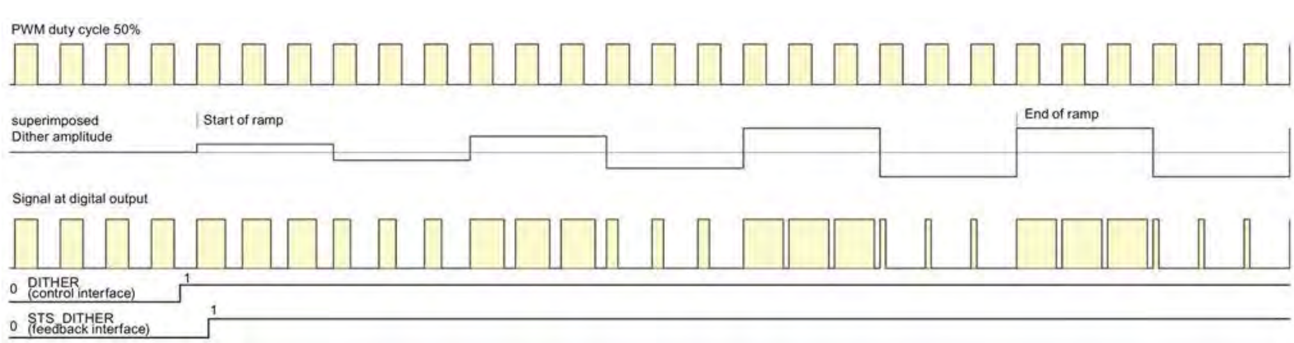
Example 1: No dither (Dither bit = 0)



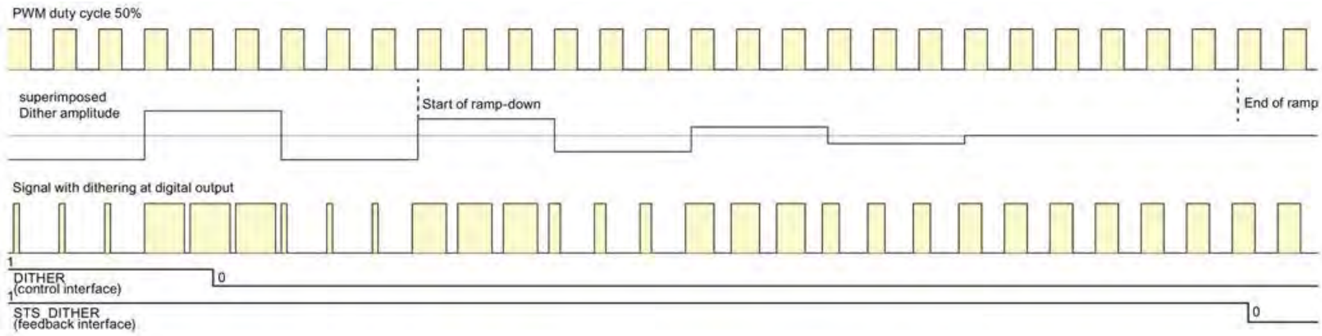
Example 2: Dither with no ramp (Dither period = 6 x PWM period)



Example 3: Dither with ramp-up



Example 4: Dither with ramp-down



3.13 Function: Isochronous mode

Note

For basic information on isochronous mode, refer to the SIMATIC PROFINET with STEP 7 (https://support.industry.siemens.com/cs/mdm/49948856?c=73850691339&t=1&s=PROFINET in STEP 7&lc=en-US) manual.

Requirements

You will require the following for the TM Pulse 2x24V in isochronous mode:

- A CPU that supports isochronous mode
- An IM (interface module) that supports isochronous mode
- Engineering software, such as TIA portal or STEP 7, to parameterize isochronous mode

Response of the TM Pulse 2x24V

Depending on the system parameter assignment, the TM Pulse 2x24V works in either non-isochronous or isochronous mode.

In isochronous mode

- The output sequences are started at the moment T_O, when only the software enable is used.
- Data communication between the PROFINET controller and TM Pulse 2x24V is isochronous to the cycle.
- All 12 bytes of a channel's control interface are consistent (24 bytes for both channels).
- All 8 bytes of a channel's feedback interface are consistent (16 bytes for both channels).
- In the PWM operating mode, the period duration is synchronized to the application cycle time (PROFINET). See the PWM chapter (Page 25) for details.

3.14 Function: Direct control of DQ digital outputs

Definition

You can directly set the TM Pulse 2x24V DQ digital outputs with your control program. Select the DQ direct control function, by clearing the Technology Module output control bit (TM_CTRL_DQ = 0), in the control interface.

Direct control of a digital output can support you when commissioning an automation control system.

If you select direct control of the DQ during a pulse output sequence, the sequence will continue to run in the background, so that when the module gets control again (by setting TM_CTRL_DQ = 1), the output sequence continues.

You assign the state of a digital output DQn.A and DQn.B with the SET_DQA and SET_DQB control bits.

You cannot use the Direct control function to set both DQn.A and DQn.B outputs high on the same channel. If an attempt to do so occurs, then error ERR_DQB is set in the feedback interface and only the DQn.A output is set high.

When you set TM_CTRL_DQ = 1, you deselect the direct control of digital output function. If the output sequence is still running (STS_ENABLE still active), then the TM Pulse 2x24V module regains control of a channel's DQn.A and DQn.B outputs.

Note

TM_CTRL_DQ technology module output control signal

- If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQn.A and DQn.B outputs. DQn.B is always 0 except in DC motor mode.
- If TM_CTRL_DQ = 0, then the CPU has control and your program can set DQ outputs directly with the SET_DQA/SET_DQB control bits. In DC motor mode, it is not possible to control the DQn.A and DQn.B outputs manually; TM_CTRL_DQ, SET_DQA, and SET_DQB have no effect.

Pulse diagram

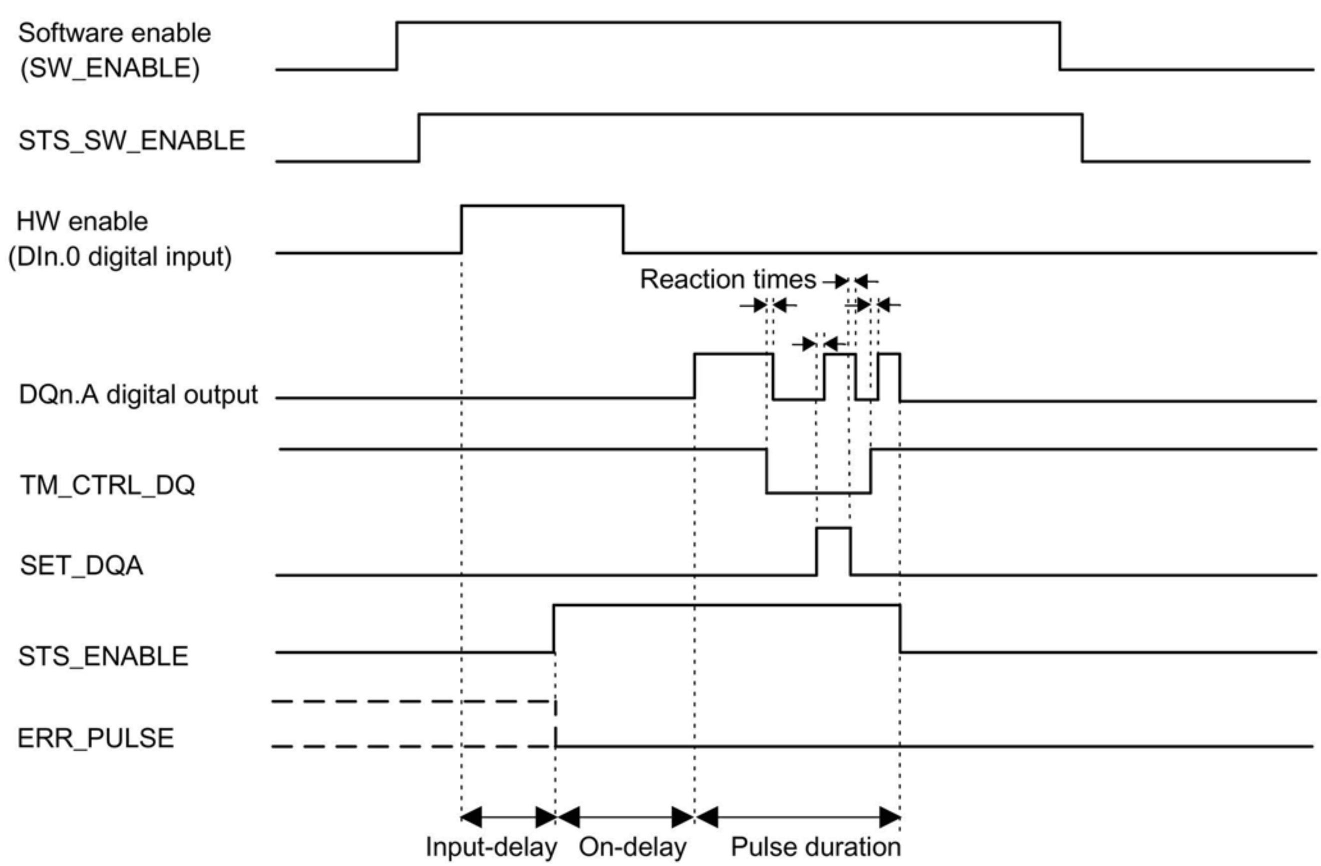


Figure 3-15 Direct control of DQ timing during Pulse output mode

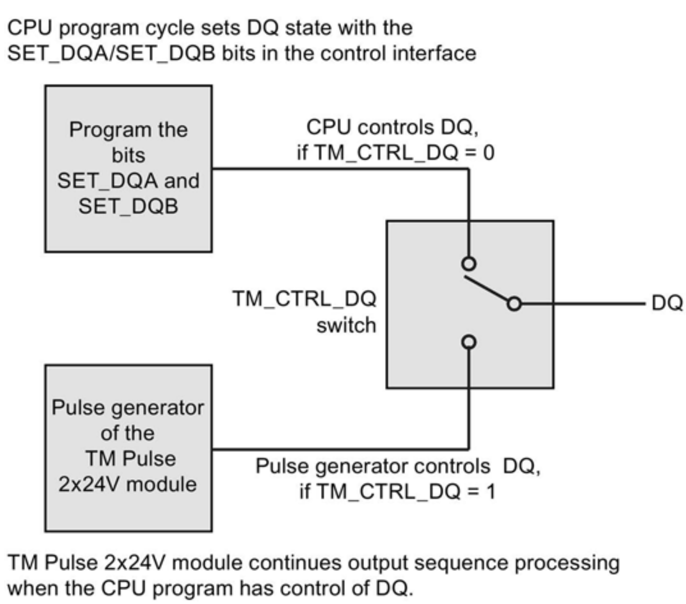

Figure 3-16 TM_CTRL_DQ output switch

Control and feedback signals

Control interface Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1			
Byte 9: Bit 0	Byte 21: Bit 0	SW_ENABLE	**Bit 0**	Software enable: Start and terminate the output sequence.
			0	Output canceled.
			0 → 1 1	Starts output sequence on positive edge; may be dependent on the hardware enable.
Byte 9: Bit 1	Byte 21: Bit 1	TM_CTRL_DQ	**Bit 1**	Set DQ output source: Selects either PLC program or module's output sequence.
			0	DQn.A and DQn.B are controlled by the PLC program using SET_DQA and SET_DQB.
			1	DQn.A is controlled by the module's pulse output sequence.
Byte 9: Bit 3	Byte 21: Bit 3	SET_DQA	**Bit 3**	Controls the value of the digital output DQn.A, if TM_CTRL_DQ is cleared.
			0	0V on DQn.A
			1	24V on DQn.A
Byte 9: Bit 4	Byte 21: Bit 4	SET_DQB	**Bit 4**	Controls the value of the digital output DQn.B, if TM_CTRL_DQ is cleared and if SET_DQA is cleared.
			0	0V on DQn.B
			1	24V on DQn.B

Feedback interface: Offset to the start address		Parameter	Meaning	
Channel 0	Channel 1			
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	**Bit 4**	Indicates a short-circuit on the output DQn.A. You must set RES_ERROR (control interface) to reset this error.
			0	No short- circuit on DQn.A
			1	Short-circuit on DQn.A
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	**Bit 5**	Indicates a short-circuit on the output DQn.B or an attempt to set both DQn.A and DQn.B manually using SET_DQA,SET_DB, and TM_CTRL_DQ. You must set RES_ERROR (control interface) to reset this error.
			0	No short-circuit on DQn.B
			1	Short-circuit on DQn.B or attempt to set both DQn.A and DQn.B
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA	**Bit 1**	Indicates the signal level at the DQn.A digital output.
			0	Signal 0 at the DQn.A digital output
			1	Signal 1 at the DQn.A digital output
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB	**Bit 2**	Indicates the signal level at the DQn.B digital output.
			0	Signal 0 at the DQn.B digital output
			1	Signal 1 at the DQn.B digital output

States of DQ bits				
TM_CTRL_DQ	SET_DQA	SET_DQB	Reaction at DQn.A	Reaction at DQn.B
0	0	0	0	0
0	1	0	1	0
0	1	1	1	0 (ERR_DQB is set)
0	0	1	0	1
1	Don't care	Don't care	State controlled by pulse processing	State controlled by pulse processing

Note

Setting both DQn.A and DQn.B to the 1 state not allowed

You cannot set both DQn.A and DQn.B to 1 at the same time. If SET_DQA and SET_DQB are set high and TM_CTRL_DQ is low, only output DQn.A will go high and an error bit ERR_DQB is set in the feedback interface. This error must be acknowledged in the control interface by using the RES_ERROR bit.

4 Connecting

4.1 Pin assignment, sensor, load, and power wiring

The TM Pulse 2x24V must use the B1 type BaseUnit.

Digital inputs, digital outputs, 24 V DC sensor power outputs and an external 24 V DC power source are connected to the BaseUnit of the technology module.

BaseUnit

The BaseUnit is not included in the TM Pulse 2x24V product package and must be ordered separately.

For an overview of the BaseUnits to be used with the technology module, refer to the product information on the documentation for the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/73021864).

You can find information about selecting a suitable BaseUnit in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual and ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) device manual.

Pin assignment of the BaseUnit

The table below shows the pin assignment, using the BaseUnit BU20-P12+A0+4B (6ES7193-6BP20-0BB1). For this BaseUnit, the TM Pulse module's L+ pins are always isolated from adjacent modules. The L+ voltage from adjacent modules are connected together through a bypass in the BaseUnit.

Table 4- 1 Pin assignment of the BaseUnit BU20-P12+A0+4B

Designation	Pin name		View	Pin name		Designation
24 V DC supply output for sensor power	24VDC	1		2	24VDC	24VDC supply output for sensor power
Channel 0 digital input	DI0.0	3		4	DI1.0	Channel 1 digital input
Channel 0 ground for digital inputs	M	5		6	M	Channel 1 ground for digital inputs
Channel 0 ground for digital outputs	M	7		8	M	Channel1 ground for digital outputs
Channel 0 digital output A	DQ0.A	9		10	DQ1.A	Channel 1 digital output A
Channel 0 digital output B	DQ0.B	11		12	DQ1.B	Channel 1 digital output B
External 24VDC supply input for digital output and sensor power	L+	13		14	M	Ground for supply voltage
External 24VDC supply input for digital output and sensor power. Pins 13 and 15 are connected internally.	L+	15		16	M	Ground for supply voltage Pins 14 and 16 are connected internally.

24 V DC sensor power output

To power digital input sensors, the technology module supplies 24 V DC with reference to M. The 24 V DC supply is monitored for short-circuits and overload conditions.

L+ external power supply

Connect an external 24 V DC power to the L+ and M connections to supply power for the TM Pulse 2x24V module, output loads, and sensors. An internal protection circuit protects the technology module against damage due to reversed polarity of the supply voltage.

Unexpected conditions can occur at the digital outputs when L+ is connected to the supply voltage and M is disconnected from the supply voltage return, due to a wire break. The technology module monitors the connection of the supply voltage.

WARNING

Supply voltage M connections

Connect both the M potential pins to the power supply return with separate wires. If one wire breaks, then the other wire maintains the electrical connection from M to the power supply return

If the electrical connection between the M potential and the power supply return is broken, then unexpected conditions can occur and the digital outputs may go high even though your program is not setting a high state.

Note

L+ and M isolation on TM Pulse 2x24V module using BaseUnit type B1

The L+ and M connections on the type B1 BaseUnit are electrically isolated, from adjacent BaseUnits plugged in on the left-side or right-side. The L+ and M power bus passes through the type B1 BaseUnit (with no connections) and extends the power bus to connect left-side and right-side BaseUnits.

DI0.0 and DI1.0 digital inputs

The digital inputs are not electrically isolated from each other or from the digital outputs. The digital inputs are electrically isolated from the ET 200SP system bus.

When you connect input signals, depending on the configured input delay and the potential effect of interference, ground the shield on both ends of a cable that connects sensor to BaseUnit pin.

Note

Electromagnetic interference shielding for inputs

Input connections on the type B1 BaseUnit used by the TM Pulse 2x24V module do not have shield ground connections. You must connect cable shields to electrical ground at the DIN rail or the system cabinet.

Input noise filter for digital inputs

You can configure an input delay for each digital input to suppress interference. Signals must have a steady state during the configured input delay before a signal is accepted as a valid input state.

You can assign the following values for the input delay:

- Off (means input delay of 4 μs and requires a minimum pulse width of 3 μs)
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

The input delay that you assign affects the detection time of input signals. The detected state change is always offset in time by the assigned input delay time.

Note

For input delay settings of "Off" or "0.05 ms" and longer wire lengths, use shielded cables at digital input connections. Shielding improves input response accuracy.

Digital outputs of channel 0 (DQ0.A, DQ0.B) and channel 1 (DQ1.A, DQ1.B)

- The digital outputs are not electrically isolated from each other or from the digital inputs. The digital outputs are electrically isolated from the ET 200SP system bus.
- The digital outputs are protected from overload and short-circuit.
- DQ0.B and DQ1.B are only used in DC motor mode or directly controlled by a SET_DQB bit in the control interface.
- Digital outputs have integrated protection diodes to prevent voltage overstress due to inductive kickback. No external protection diodes are required for inductive loads.

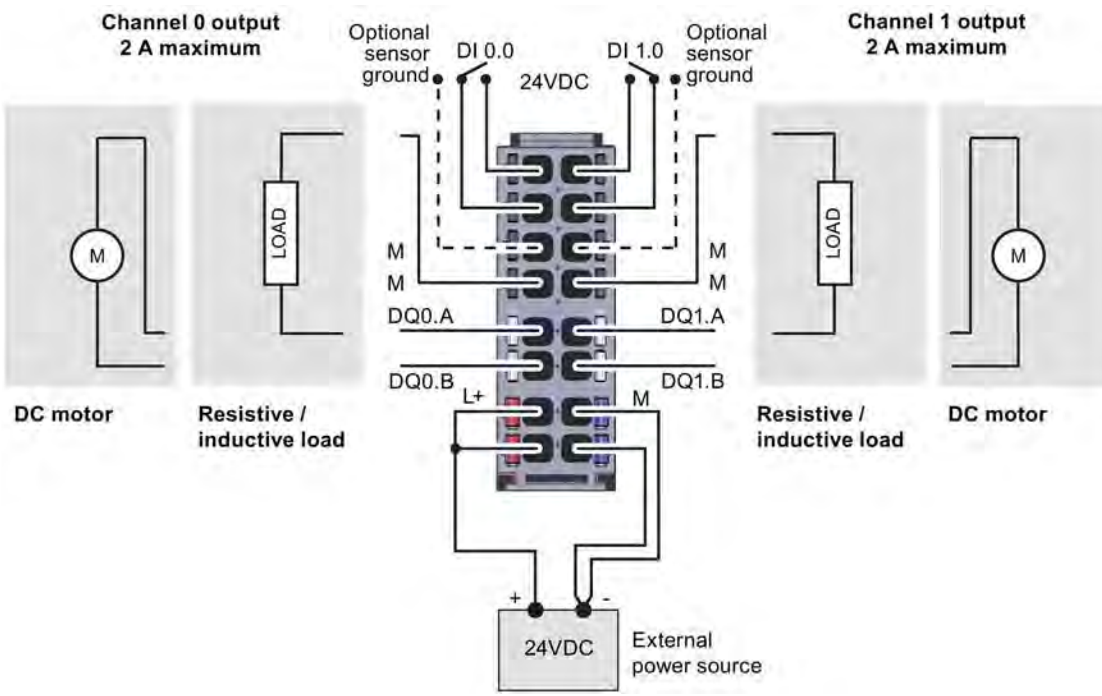

Figure 4-1 Dual channel wiring

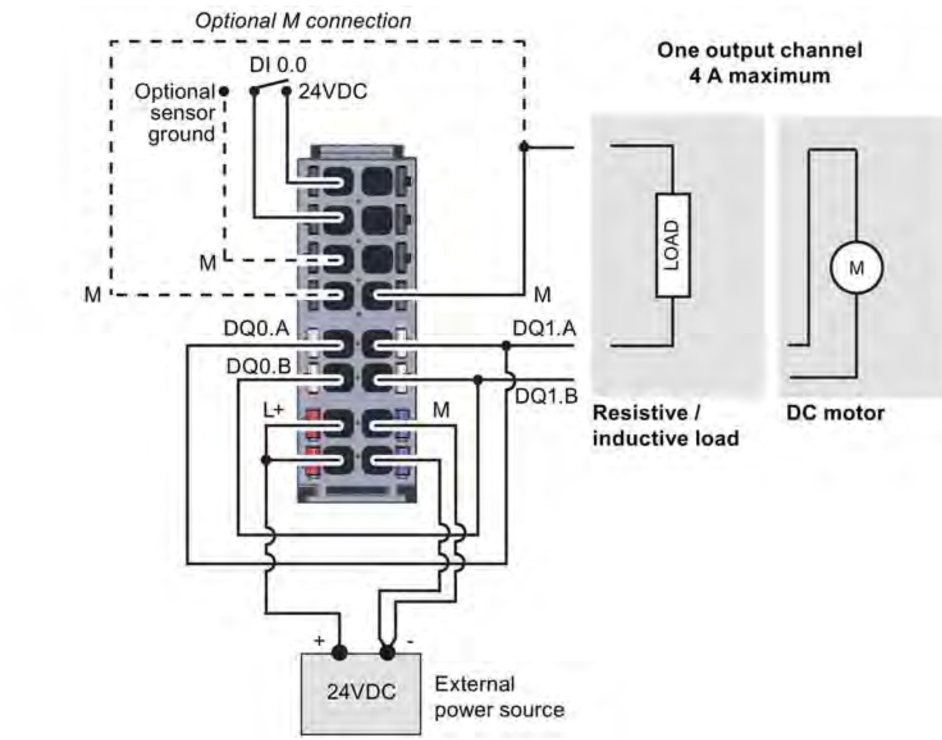

Figure 4-2 Single channel with parallel connection wiring

> **WARNING**
>
> **Supply voltage M connections**
>
> Connect both the M potential pins to the power supply return with separate wires. If one wire breaks, then the other wire maintains the electrical connection from M to the power supply return
>
> If the electrical connection between the M potential and the power supply return is broken, then unexpected conditions can occur at the digital outputs.

Note

Load wiring resistance

In single channel mode with parallel connected wiring, the wires from DQ0.A and DQ1.A must have equal resistance (length and size) for proper current sharing between the two outputs. Also, the wiring for DQ0.B and DQ1.B must have equal resistance when using DC motor mode.

Maximum current is limited and current measurement errors occur if the wiring does not have equal resistance.

Note

Excessive temperature from unsuitable loads

A high-speed output generates edges that are very steep. This creates very powerful charge reversals for the connected load, which can overheat the load at very high switching frequencies.

The connected load must therefore be approved for high input frequencies. See Function: High-speed output (Page 74) topic for details.

Note

The digital output switch-off response / switch-off edge depends on the load. Thus, it is possible that very short pulses cannot be output correctly.

Note

Relays and contactors can be connected direct without external circuitry.

Configuring 5

5.1 Configuration software

Introduction

The TM Pulse 2x24V module is configured and assigned parameters with the configuration software.

The module's pulse output sequences are controlled and monitored by your program.

System environment

The technology module can be used in the following system environments:

Table 5- 1 Applications of the technology module with PROFINET I/O

Applications	Components required	Configuration software	In your program
Decentralized operation in an S7-1500 system	• S7-1500 automation system • ET 200SP decentralized I/O system • TM Pulse 2x24v	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN)	Direct access to the control and feedback interface (Page 110) of the TM Pulse 2x24V in the I/O data
Centralized or decentralized operation in an ET 200SP system	• ET 200SP automation system • TM Pulse 2x24v	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN)	Direct access to the control and feedback interface of the TM Pulse 2x24V in the I/O data
Decentralized operation in an S7-300/400 system	• S7-300/400 automation system • ET 200SP decentralized I/O system • TM Pulse 2x24V	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN) STEP 7: Device configuration and parameter settings with HSP	Direct access to the control and feedback interface of the TM Pulse 2x24V in the I/O data
Decentralized operation in a PROFINET controller or PROFIBUS master	PROFINET controller • ET 200SP decentralized I/O system • TM Pulse 2x24V	Engineering system with GSD file	Direct access to the control and feedback interface of the TM Pulse 2x24V in the I/O data

5.2 Configuration overview

You can use the STEP 7 (TIA Portal) or STEP 7 hardware configuration to set these parameters. Also, you can change the parameter assignment at runtime with your program using data record 128.

STEP 7 (TIA Portal) and STEP 7 assist you during parameter assignment by disabling keyboard input for invalid parameters and range checking your value assignments. Depending on previous parameter selections, other options will be disabled. For example, if you select the one channel operation (the parallel connection of the two output channels), then the parameter options for channel two and high-speed output are disabled.

When you make a runtime parameter assignment that uses the WRREC (Write Record) instruction to modify data record 128, you must ensure that you do not attempt to write an invalid record data. WRREC execution with invalid data fails and returns error code. For example, if you are using one channel operation and include parameter data for two channels, then the record length is too long and WRREC execution fails. In addition, you must follow the parameter validation rules (Page 120).

If you use STEP 7 (TIA Portal), you can find the module in the Hardware catalog under "Technology Modules". If you use STEP 7, you can find the module following installation of the corresponding HSP file in the Hardware catalog.

STEP 7 has two entries for Technology Module - Pulse output, with one entry for "TM Pulse 2x24V 2x2A" and one entry for "TM Pulse 2x24V 1x4A.

The following table shows how a channel's "Parameter" group is affected by mode selection.

Table 5- 2 Channel parameters and mode selection: ✓ means the parameter is available for configuration

Channel "Parameter" group	Pulse output mode	PWM mode	Pulse train mode	On/Off delay mode	Frequency output mode	DC motor mode
[1] High-speed output (.1 A)	✓	✓	✓	✓	✓	
HW enable option on DIn.0 input	✓	✓ [3]	✓		✓	✓ [3]
Input delay	✓	✓	✓	✓	✓	✓
Output format	✓	✓	✓	✓	✓	✓
Minimum pulse duration		✓ [4]				
Period duration		✓	✓			✓
On delay	✓	✓ [3]	✓		✓	✓ [3]
Off delay				✓		
Duty cycle			✓			
[2] Current control		✓				
Activate P (Proportional)		✓				
Activate I (Integral)		✓				
Activate D (Derivative)		✓				
Reference value current		✓				
Dead band width		✓				
High limit S7 analog		✓				
Low limit S7 analog		✓				
Gain		✓				
Integration time		✓				
Derivative action time		✓				

Channel "Parameter" group	Pulse output mode	PWM mode	Pulse train mode	On/Off delay mode	Frequency output mode	DC motor mode
Time lag		✓				
Dithering		✓				
Dither ramp up time		✓				
Dither ramp down time		✓				
Dither amplitude		✓				
Dither period		✓				

[1] High speed output is not available for the one channel (4 A) configuration that uses a parallel connection of the two (2 A) channels.

[2] In PWM mode, you can enable either High-speed or Current control, but not both options at once.

[3] Parameter is disabled in isochronous mode.

[4] Parameter is disabled when current control is active

5.3 Required I/O address space

Address space of the technology module

Table 5- 3 TM Pulse 2x24V I/O address space usage

Function	Bytes per channel	Total I/O bytes Single channel (4 A)	Total I/O bytes Dual channel (2 A)
Program control of module operation	12 output bytes (Q addresses)	12 output bytes	24 output bytes
Feedback module status to control program	8 input bytes (I addresses)	8 input bytes	16 input bytes

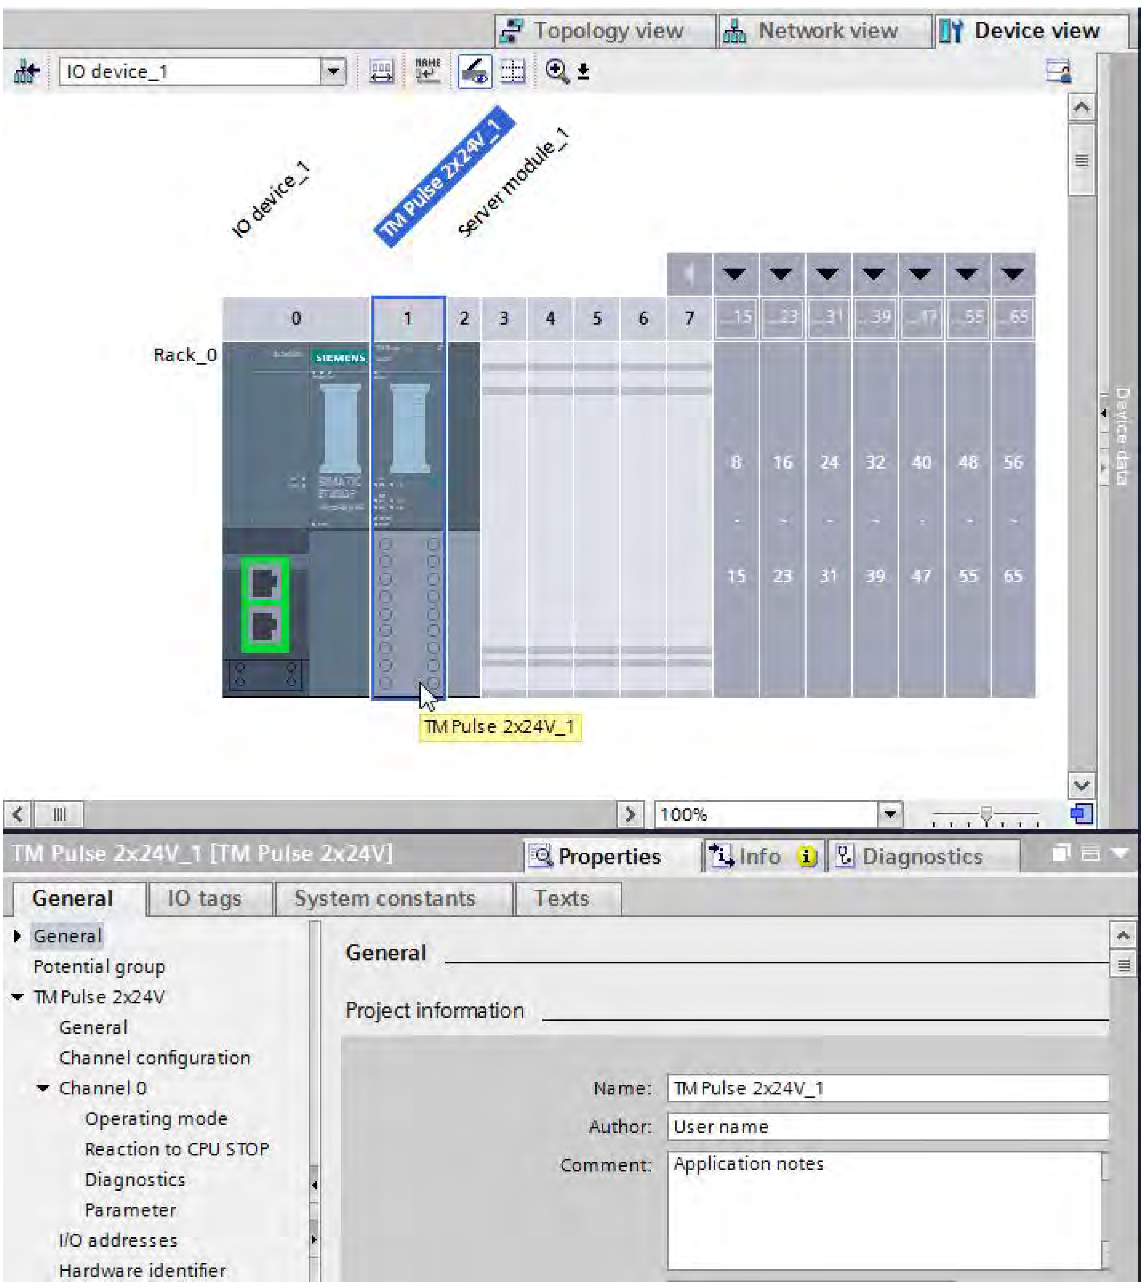
Additional information

A description on how to use the control and feedback interface of TM Pulse 2x24V can be found in the chapter Program control and feedback interface (Page 110).

5.4 TIA portal Device configuration

5.4.1 TIA Portal Device configuration

Drag the TM Pulse 2x24V module from the hardware catalog and drop it in a rack image. The example rack below uses the TM Pulse 2x24V module in a decentralized I/O system where it is possible to enable and configure isochronous mode. When you click on the TM Pulse 2x24V image in a rack, a blue line highlights the module and you can set parameters that appear on the Properties tab.



5.4.2 General information

Enter the general project and identification & maintenance information.

5.4.3 Potential group

The Potential group parameters are disabled for the type B1 BaseUnit used by the TM Pulse 2x24V. The TM Pulse 2x24V module is isolated from the other BaseUnit potential groups on the right and on the left of the TM Pulse 2x24V module. Therefore, the TM Pulse 2x24V requires an external supply.

5.4.4 Channel configuration: (4 A) single or (2 A) dual channel operation

Select the channel configuration:

- Two separate channels with 2 ampere maximum output current per channel. The high-speed option (100mA maximum current) is allowed.
- One logical channel where the two output channels connected in parallel to provide 4 ampere maximum output current. The high-speed option is not allowed.

1 channel (4 A) operation

If the "1 channel (4 A)" option is selected, then the TM Pulse 2x24V operates as a single-channel module. All parameter assignments and operations using the control interface must use Channel 0 addresses. Feedback signals are only provided for Channel 0.

The control and feedback interface is reduced to only one channel. Channel 1 cannot be configured or operated.

The current measurement adds the measured values of both channels together. This results in a measuring range up to 4 A.

The measured value of the current is supplied as a SIMATIC S7 analog value in the feedback interface. A current of 4 A corresponds to the SIMATIC S7 analog value of 27,648.

See also Pin assignment and load/sensor wiring (Page 91)

5.4.5 Channel parameters

5.4.5.1 Operating mode

Select an operating mode.

- Pulse output (single pulse)
- Pulse width modulation PWM
- Pulse train
- On/Off-delay
- Frequency output
- DC motor

5.4.5.2 Reaction to CPU STOP

You can configure the reaction of the TM Pulse 2x24V to the failure of a higher-level controller differently for each channel.

Table 5- 4 Reaction to CPU/Master STOP options for all modes except DC motor

Response to CPU/master STOP	Channel-specific response and status of the TM Pulse 2x24V
DQ substitute a value	• Output of the channel-specific, substitute value that you assigned. • STS_ENABLE goes to the 0 state. • Terminate the current output sequence.
Continue working mode	The current output sequence is continued.

Reaction to CPU/Master STOP options for DC motor mode

For DC motor mode, there are no configuration options for the reaction to CPU STOP. The outputs always behave as follows.

Both DQs (DQn.A and Dn.B) go to tri-state (high impedance state) when the CPU goes to STOP.

Substitute values

If you select the "DQ substitute a value" option as a reaction to CPU STOP, then you must configure the substitute value (0 or 1) for the DQn.A and DQn.B outputs.

Each channel has two outputs (A and B). A resistive or inductive load is wired to a channel's A output, so you must assign a substitute value to the DQn.A output. A reversible direction DC motor load is wired to a channel's A and B outputs, so you must assign substitute values to the DQn.A and DQn.B outputs.

You cannot set both substitute values of one channel to the high state (DQn.A and DQn.B). If you do so, an error code is returned to the parameterization attempt. See the Parameter validation errors (Page 120) topic for details.

Startup

To start a new output sequence after CPU/master STOP with STS_SW_ENABLE set, first reset SW_ENABLE. Keep SW_ENABLE reset until STS_SW_ENABLE is also reset.

If the "Continue working mode" option is used, then during a change from CPU-/Master-STOP to RUN (startup), the CPU/Master cannot clear the outputs.

Possible solution: In the part of your program that is executed during startup, set the "Software enable" (SW_ENABLE = 1) control bit.

Modified parameter assignment

The status assumed by the TM Pulse 2x24V at CPU/master STOP remains even in the case of parameter assignment or configuration of the ET 200SP station. This occurs, for example, at POWER ON of the CPU/master, or the IM 155-6, or at the resumption of DP transfer.

In "Continue working mode", however, and after loading changed parameters or configuration of the ET 200SP station to the CPU/master, the TM Pulse 2x24V terminates the process. As a result, the TM Pulse 2x24V does the following:

- Resets the DQ digital output.
- Resets STS_ENABLE
- Terminates the current output sequence.

5.4.5.3 Diagnostics

Module monitoring is always active. A detected error only triggers a diagnostic alarm if the diagnostics type is enabled in the Diagnostics check boxes.

TM Pulse 2x24V diagnostics

Diagnostic type	TM Pulse 2x24V module error	Default option
Group diagnostics	• Supply voltage error • Short-circuit on 24 V DC sensor supply	Disabled
Diagnostics DQA	Short-circuit of DQn.A digital output	Disabled
Diagnostics DQB	Short-circuit of DQn.B digital output	Disabled

When a TM Pulse 2x24V error event triggers a diagnostic alarm, the following happens:

- The DIAG light flashes red when a diagnostics alarm is pending. Once you have remedied the error, the DIAG light goes out.
- The diagnostics are displayed as plain text in the STEP 7 (TIA Portal) online and diagnostics view.
- Options for the reaction of a CPU running your control program
  - CPU goes to STOP and interrupts processing of your program. The diagnostic interrupt OB (for example, OB 82) is called. The event that triggered the interrupt is written in the start information of the diagnostic interrupt OB.
  - CPU remains in RUN even if no diagnostic interrupt OB is present in the CPU. The technology module continues working unchanged if this is possible, while the error exists.
- Detailed information on the error event is available through execution of the RALRM (read alarm information) program instruction.

Note

Error message details

The Diagnostics information provided through OB 82 and RALRM does not indicate which channel has an error.

The alternative error information provided by the feedback interface ERR_xxx bits does indicate which channel has an error.

See also Error detection and diagnostics (Page 122)

5.4.5.4 Parameter (Channel parameters)

The different operating modes restrict the configuration to a subset of these parameters and options.

Channel parameters

High-speed output

- Enabled
  - High-speed (0.1 A) option single channel output limit is 0.1 A.
  - 1 channel (4 A) parallel channel connection is not possible.
  - PWM mode current control is not possible.
- Disabled
  - Single channel output limit is 2 A

Function DI (digital input)

- Input: DIn.0 functions as a digital input
- HW enable: DIn.0 functions as a Hardware enable for the pulse output sequence.
  The HW enable option is available for these modes.
  - Pulse output
  - PWM (not available for isochronous mode)
  - Pulse train
  - Frequency output
  - DC motor (not available for isochronous mode)
- External stop (DC motor only)

See also Function: High-speed output (Page 74)

Input delay

A digital input state change must remain stable over the input delay time, before the state change is accepted and processed. The input delay time provides noise filtering for the input wiring.

- Off (4 μs)
- 0.05 ms
- 0.1 ms (default value)
- 0.4 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Output format

Set the format and value range for ratio variables like duty cycle.

Output format options	Value range
• S7 analog output	0 to 27,648 -27648 to 27648 (in DC motor mode)
• Per 100	0 to 100
• Per 1000	0 to 1000
• Per 10000	0 to 10000

Minimum pulse duration

Assign the minimum pulse duration that you allow in µs.

Period duration

Assign the period duration in µs.

Actual period duration

This read-only field is displayed only when isochronous mode is enabled. The period duration value that is displayed is the actual isochronous compatible period duration that is calculated from the value you entered in the Period duration parameter.

On-delay

Assign the On-delay in µs

Pulse timing	Minimum		Maximum	
	High-speed disabled	High-speed enabled	High-speed disabled	High-speed enabled
Pulse duration	10 µs	1.5 µs	85,000,000 µs	
Period duration	100 µs	10 µs		
On-delay	0 µs	0 µs		

Dither parameters

- Dither ramp-up time: 0 ms to 30,000 ms.
- Dither ramp-down time: 0 ms to 30,000 ms.
- Dither amplitude: 0 to 500‰
- Dither period: From (4 x PWM period) to 100,000 µs. Also, the Dither period must be greater than 2 ms.

Current control

- Enabled
- Disabled

Current control parameters

If current control is enabled, then the following parameters are available for modification.

- **Activate P**: Enable/disable the proportional part in the PID algorithm
- **Activate I**: Enable/disable the integral part in the PID algorithm
- **Activate D**: Enable/disable the derivative part in the PID algorithm
- **Reference value current**: The reference value is used to define the maximum set point and the high and low limits of the controlled current. Typically, the maximum current can be measured in PWM mode with current control disabled and a duty cycle set to 100%. The value measured can be set as a reference for the current control. The maximum value is 4000mA for single channel operation (parallel channel connection enabled) and 2000mA per channel for dual channel operation (parallel connection disabled).
- **Deadband width**: A dead band is applied to the output current deviation from the set point current. The "Deadband width" determines the size of the dead band. The dead band is symmetrical: Actual dead band value range = -Deadband width to +Deadband width.
- **High limit S7 analog**: The manipulated value is always restricted to a high limit and low limit. The "High limit" parameter assigns the high limit in S7 analog format, relative to the reference value current. A value higher or equal than 27648 means 100% of the reference value current. The High limit value must be higher than the Low limit.
- **Low limit S7 analog**: The manipulated value is always restricted to a high limit and low limit. The "Low limit" parameter assigns the low limit in S7 analog format, relative to the reference value of the current. A value higher or equal than 27648 is not allowed. The Low limit value must be lower than the High limit.
- **Gain**: The proportional gain parameter assigns the amplification factor for the P part of the PID algorithm.
- **Integration time**: The proportional gain parameter assigns the amplification factor for the P part of the PID algorithm.
- **Derivative action time**: The derivative time parameter determines the time interval of the derivative action. If TD is smaller than the controller cycle time, TI will be set internally to the controller cycle time.
- **Time lag**: Time lag of the derivative action. The algorithm of the D-action contains a delay of TM_LAG. If TM_LAG is smaller than half the controller cycle time, TI will be set internally to half the controller cycle time.

5.4.6 I/O addresses

You can assign the base addresses for the control interface (12 output Q byte addresses/channel) and the feedback interface (8 input I byte addresses/channel). Your program logic uses the values stored in these addresses to control the TM Pulse 2x24V output and read feedback signals from the module.

I/O addresses

Output addresses

Start address: Assign a starting address to 12 bytes (Q addresses) for a channel's control interface.

End address: The control interface end address is a calculated read-only field.

Input addresses

Start address: Assign a starting address to 8 bytes (I addresses) for a channel's feedback interface.

End address: The feedback interface end address is a calculated read-only field.

Isochronous mode

The Isochronous mode checkbox is only displayed if your system hardware supports isochronous mode.

Organization block

Accept the default OB assignment or select a different OB. If isochronous mode is enabled and the Organization block (OB 61) "Synchronous cycle" is assigned, then TM Pulse 2x24V PWM operation in a decentralized I/O system becomes coordinated with bus master PROFINET cycles.

In isochronous mode, the PWM output sequence is synchronized with the moment T_o. The period duration is coordinated to the application cycle (the synchronous cycle, a multiple of the PROFINET cycle).

Process image

Accept the default assignment or assign a different Process image partition.

6 Program control and feedback interface

6.1 TM Pulse 2x24V control interface

Your program uses this interface to control the behavior of the technology module.

Control interface

The following table shows control interface assignment for one channel:

Bit → / Byte ↓	7	6	5	4	3	2	1	0
00	OUTPUT_VALUE							
01								
02								
03								
04	SLOT							
05								
06								
07								
08	Reserved 1)			MODE_SLOT	LD_SLOT			
09	Reserved 1)		DITHER	SET_DQB	SET_DQA	Reserved 1)	TM_CTRL_DQ	SW_ENABLE
10	Reserved 1)							RES_ERROR
11	Reserved 1)							

1) Must be set to 0

Control interface parameters

Two use cases are possible while using TM Pulse 2x24V module.

Case 1: Only the main parameter OUTPUT_VALUE is controlled every program scan cycle by your program logic. All the other parameters required for the output sequence are fixed.

Case 2: The main parameter OUTPUT_VALUE and another parameter SLOT are controlled every program scan cycle by your program logic. All other parameters required for the output sequence are fixed.

Other parameters required for the output sequence are defined prior to the start of an output sequence using one of two possible methods.

- TIA portal device configuration, STEP 7 hardware configuration, or WRREC execution modifies the parameterization data record.
- Use the Control interface in single-update mode and before switching to the permanent-update mode (case 2 only) with the assigned LD_SLOT value selecting the control parameter.

OUTPUT_VALUE

The interpretation of the value in OUTPUT_VALUE depends on the mode setting. The OUTPUT_VALUE is always updated. If an invalid value is detected (outside the allowed range), then the error flag ERR_OUT_VAL is set until a valid value is detected. During the error condition, the invalid value is ignored and the module continues with the last valid OUTPUT_VALUE.

Note that PWM ratio values are not checked. If a ratio value is higher than the format allows, then a ratio of 100% is used by the module.

When the PWM current control option is activated, the TM Pulse 2x24V module takes control of the duty cycle and the OUTPUT_VALUE control interface field is used to assign the target current as a ratio of target current/reference current.

Mode	OUTPUT_VALUE meaning	Data type
Pulse output	Pulse duration High-speed disabled: 10 μs to 85,000,000 μs High-speed enabled: 2 μs to 85,000,000 μs	UDInt
PWM	Current control disabled: Duty cycle Current control enabled: Ratio current	UDInt: Only 2 least significant bytes are used For channel 0: bytes 2 and 3 For channel 1: bytes 14 and 15
Pulse train	Number of pulses	UDInt
On/Off delay	On-delay in microseconds	UDInt
Frequency output	Frequency in Hz	Real
DC motor	Duty cycle	DInt: Only 2 least significant bytes are used For channel 0: bytes 2 and 3 For channel 1: bytes 14 and 15

SLOT, MODE_SLOT, and LD_SLOT

The TM Pulse 2x24V module has a SLOT field in the control interface for each channel that allows several parameters to be single-updated, or one parameter to be permanently controlled (in addition to OUTPUT_VALUE). The interaction of SLOT, MODE_SLOT, and LD_SLOT is described in the SLOT parameter handling (Page 113) topic.

SW_ENABLE

If 0 → 1, then activate the output sequence. For some output modes, you can configure HW_ENABLE (hardware enable) to combine with SW_ENABLE (software enable) and trigger an output sequence with a hardware signal.

TM_CTRL_DQ

- If 1, then outputs are controlled by the module and produce the pulse sequences.
- If 0, then the outputs are controlled directly by your program through SET_DQA and SET_DQB assignments
  Note: This bit has no effect in DC motor mode

SET_DQA

- If 1, then set the output A to 1, when TM_CTRL_DQ is inactive.
- If 0, then set the output A to 0, when TM_CTRL_DQ is inactive.
  Note: This bit has no effect in DC motor mode.

SET_DQB

- If 1, then set output B to 1, when TM_CTRL_DQ is inactive and SET_DQA is 0.
- If 0, then set the output B to 0, when TM_CTRL_DQ is inactive.
  Note: This bit has no effect in DC motor mode

DITHER

- Activates the start (rising edge on DITHER) of the dithering function and begins dithering ramp-up, if a ramp-up is configured.
- Activates the end (falling edge on DITHER) of the superimposed dithering and begins dithering ramp-down, if a ramp-down is configured.

RES_ERROR

Resets the error flags ERR_LD, ERR_DQA, ERR_DQB, and ERR_24V in the feedback interface.

Parameter data record (Page 138)

6.2 SLOT parameter handling (control interface)

SLOT and MODE_SLOT

SLOT has the following modes.

- **Single-update mode** (MODE_SLOT = 0)
  Use this mode if some parameters have to be changed sometimes, prior to starting the output sequence. Using the SLOT parameter is an alternative to sending a new parameterization record to the module. A pulse operation change made with the SLOT parameter does not reset the module. A pulse operation change made by sending a new parameterization record does reset the module.
  - The value in SLOT is used each time the value in LD_SLOT changes.
  - An acknowledge bit is toggled in the feedback interface STS_LD_SLOT.
  - The interpretation of the SLOT is defined by the value of LD_SLOT (see the following table).
  - If the LD_SLOT value is invalid, a parameter error is triggered ERR_LD, and the user has to reset the error using the RES_ERROR control bit to reactivate SLOT.
  - The changes done in this mode can be read back from the module in the parameterization record.
  - The changes done in this mode are not permanently stored in the CPU. A restart of the CPU resets the parameters to the values specified in the hardware configuration.
- **Permanent-update mode** (MODE_SLOT = 1)
  Use this mode, if in addition to the main controlled parameter, another parameter has to be controlled continuously by the program.
  - The value in SLOT is transferred each module cycle.
  - No acknowledge bit is available.
  - The interpretation of SLOT is defined by the value of LD_SLOT (see the following table).
  - If the value in SLOT is not valid, then the error ERR_SLOT_VAL occurs. The error is automatically reset once a valid value is loaded. Note that the ratio values are not checked, if the value is higher than the format allows, a ratio of 100% will be used by the module.
  - Using this mode, the value is not updated in the parameterization record. If LD_SLOT is changed in this mode, the last valid value controlled previously is retained.
  - The permanent update mode can be stopped by setting LD_SLOT to 0 and MODE_SLOT to 0. By stopping permanent update mode, changes made to parameters during permanent update mode are retained.

Interpretation of SLOT parameter value

The value written to the SLOT parameter is interpreted as shown in the following table, depending on the LD_SLOT value and operating mode.

LD_SLOT	SLOT value meaning	Valid modes for SLOT value use	SLOT Data type
0	No action / idle state	All modes	
1	Period duration	PWM Pulse train DC motor	UDInt
2	On-delay	Pulse output PWM Pulse train Frequency output DC motor	UDInt
3	Off-delay	On/Off-delay	UDInt
4	Duty cycle (On-ratio)	Pulse train	UDInt: Only 2 least significant bytes are used. For channel 0: bytes 6 and 7 For channel 1: bytes 18 and 19
5	Dither ramp (includes ramp-up time and ramp-down time)	PWM	UDInt
6	Dither amplitude	PWM	UDInt
7	Dither period	PWM	UDInt

6.3 TM Pulse 2x24V feedback interface

Your program receives current values and status information from the technology module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface for one channel

Bit → / Byte ↓	7	6	5	4	3	2	1	0
00	ERR_SLOT_ VAL	ERR_OUT_ VAL	ERR_DQB	ERR_DQA	ERR_PULSE	ERR_LD	ERR_24V	ERR_PWR
01	Reserved		STS_SW_ ENABLE	STS_READY	Reserved	STS_LD_SLO T	Reserved	
02	Reserved			STS_DITHER	STS_DI	STS_DQB	STS_DQA	STS_ENABLE
03	Reserved				SEQ_CNT			
04	MEASURED_CURRENT							
05								
06	Reserved						QLMN_HLM	QLMN_LLM
07	Reserved							

Feedback parameters

Table 6- 1 Status feedback

Feedback parameter	Meaning	Value range
STS_READY	Module is parameterized correctly, running, and delivering valid data.	0: Not ready 1: Ready
STS_SW_ENABLE	Current state of the software enable	0: SW_ENABLE is not active 1: Recognized SW_ENABLE
STS_LD_SLOT	Toggle acknowledge bit for each action of the SLOT in single-update SLOT-mode.	Each toggle of this bit indicates a suc-cessful LD_SLOT action.
STS_ENABLE	Output sequence is active.	0: No output sequence running 1: Output sequence running
STS_DQA	State of digital output DQn.A	0: DQn.A is not active 1: DQn.A is active
STS_DQB	State of digital output DQn.B	0: DQn.B is not active 1: DQn.B is active
STS_DI	DIn.0: State of digital input	0: DIn.0 is not active 1: DIn.0 is active
STS_DITHER	Dithering state	0: Dithering inactive 1: Dithering active with ramp-up phase started and ramp-down not complete.
SEQ_CNT	Counts completed output sequences	0 to 15

Feedback parameter	Meaning	Value range
MEASURED_CURRENT	S7 analog value	0 to 32,767 27,648 means 4 A for "1 channel (4 A)" 27,648 means 2 A for "2 channels (2 A)"
QLMN_LLM	The low limit of the manipulated value has been reached.	0: Low limit not reached 1: Low limit reached
QLMN_HLM	The high limit of the manipulated value has been reached.	0: High limit not reached 1: High limit reached

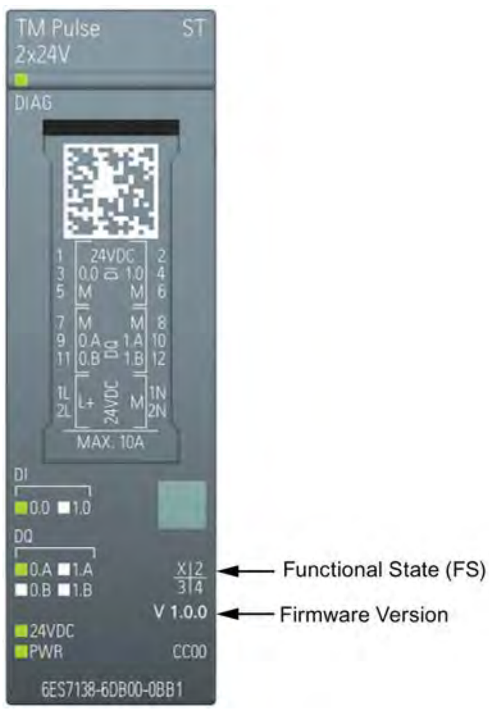
Table 6- 2 Error feedback

Feedback parameter	Meaning	Value range
ERR_PWR	24 V DC present, but is not in the correct range.	0: No error 1: Error
ERR_24V	Short-circuit/overload, in the 24 V DC sensor supply output.	0: No error 1: Error
ERR_LD	Error while loading a parameter value using single-update mode.	0: No error 1: Error
ERR_PULSE	Pulse duration reduced to smaller than the minimum allowed value during operation.	0: No error 1: Error
ERR_DQA	Short-circuit/overload on the digital output DQn.A detected	0: No error 1: Error
ERR_DQB	Short-circuit/overload on the digital output DQn.B or attempt to manually set both DQn.A and DQn.B high.	0: No error 1: Error
ERR_OUT_VAL	The value in OUTPUT_VALUE is not valid.	0: No error 1: Error
ERR_SLOT_VAL	The value in SLOT is not valid where MODE_SLOT = 1 (permanent update)	0: No error 1: Error

7 Interrupts/diagnostic messages

7.1 Status and error displays

TM Pulse 2x24V front view



LED status display

The following tables explain the meaning of the status and error displays. Refer to Error correction and diagnostics (Page 122) for details.

Table 7- 1 DIAG LED

DIAG LED	Meaning	To correct or avoid errors
Off	Backplane bus supply of the ET 200SP not OK	Check or switch On the supply voltage of the head station. Ensure the TM Pulse2x24V is correctly inserted in the BaseUnit.
Flashes green	Technology Module not configured	
On green	Technology Module configured and no module error exists	
Flashes red	Technology Module configured and module diagnostics (at least one error pending) Note:	Evaluate the diagnostic alarms and eliminate the error.

Note

The DIAG LED only shows an error if the Diagnostic alarm is activated during device configuration. By default, the Diagnostic alarm is not activated.

Table 7- 2 PWR and 24 V DC LED status

LEDs		Meaning	To correct or avoid errors
PWR	24 V DC		
Off	Off	No supply voltage	• Check the external 24 V DC power supply voltage connected between L+ and M.
On green	On green	Supply voltage is present and OK	
On green	Off	Short-circuit or overload at the sensor supply or supply voltage too low	• Check sensor wiring. • Check the loads connected to the sensor supply. • Check the supply voltage.

Channel status LEDs

The LEDs for DI digital inputs and DQ digital outputs indicate the digital state of the associated channel signals.
The LEDs of the digital outputs DQ indicate the desired state.

- DIn.0 digital inputs
  - 0.0 - Channel 0 input
  - 1.0 - Channel 1 input
- DQn.A and DQn.B digital outputs
  - 0.A and 0.B - Channel 0 outputs
  - 1.A and 1.B - Channel 1 outputs

The flashing frequency of the channel LEDs is limited to approximately 12 Hz. If higher frequencies are present, the channel LEDs will flash at 12 Hz instead of indicating the actual status.

Table 7- 3 Status displays DI digital inputs and DQ digital outputs

LED status	Meaning
□ Off	Digital input / digital output is at 0 level.
■ On green	Digital input / digital output is at 1 level.

7.2 Parameter validation errors

If the TM Pulse 2x24V parameter record is modified with an incorrect parameter value, then the module returns the error codes shown in the following table.

During TIA Portal Device configuration, parameter values are verified before transfer to the module. This prevents parameter errors during the static TIA Portal Device configuration.

You can modify the parameter data record during runtime with the WRREC (Write Record) program instruction.

For example, an illegal mode value is written to the module by WRREC execution. After execution the WRREC STATUS output is an ARRAY[1..4] of BYTE data with the value 16#DF80E111.

Example WRREC STATUS data	Address	Meaning
DF_H	STATUS[1]	Write data record error
80_H	STATUS[2]	Error according to IEC 61158-6
$E1_H$	STATUS[3]	Module specific error
11_H	STATUS[4]	Module error code from row 1 in the following table: Mode parameter has an incorrect reserved value.

Error code	Parameter	Validation criteria	Mode
11_H	Mode	Reserved value	All modes
12_H	Reaction to CPU STOP	Reserved value	All modes
$1A_H$	Input delay	Reserved value	All modes
$1B_H$	Period duration	Greater than maximum	PWM Pulse train DC motor
$1C_H$	On-delay	Greater than maximum	Pulse output PWM Frequency output DC motor
$1D_H$	Minimum pulse duration	Greater than maximum	PWM
$1E_H$	Off-delay	Greater than maximum	On/Off-delay
20_H	Reference value current	Greater than maximum	PWM
21_H	Period duration	Lower than minimum	PWM Pulse train DC motor
22_H	Dithering	Not disabled	Pulse output Pulse train On/Off-delay Frequency output DC motor
23_H	High-speed output	Not disabled	DC motor All modes with parallel connection
24_H	Current control	Not disabled	Pulse output Pulse train On/Off-delay Frequency output DC motor
25_H	Current control and high-speed output	Both enabled	PWM

Error code	Parameter	Validation criteria	Mode
26_H	Function DI	HW enable activated	On/Off-delay
27_H	Low limit and High limit	High limit <= Low limit	PWM with current control
28_H	Dithering period	Period is lower than 4 times the PWM period or lower than 2 ms.	PWM with dithering
29_H	Substitue values DQA and DQB	Substitute values DQA and DQB are both 1.	All modes

7.3 Error detection and diagnostics

Feedback interface ERR bits

Your program can access power supply error and output load status directly, through a channel's feedback interface.

Channel 0 address	Channel 1 address	Feedback bit	Meaning	Value range
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR	Indicates under voltage on the power supply. Note that the bit is not set, if the voltage is not present.	0 = PWR is not in under voltage 1 = PWR is detected but in under voltage
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V	Indicates a short-circuit or under voltage condition on the 24V sensor power supply.	0 = 24 V DC sensor supply working normally 1 = 24 V DC sensor supply short-circuit or under voltage
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD	Indicates an error occurred when loading a parameter value through the SLOT field using the single-update method.	0 = No SLOT single-update error 1 = SLOT single-update error
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE	Indicates a pulse output error in the Pulse output, On/Off-delay, and Pulse train modes	0 = No pulse output error 1 = Pulse output error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA	Indicates a short-circuit or overload of DQn.A digital output.	0 = No DQn.A digital output short-circuit or overload 1 = DQn.A digital output short-circuit or overload
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB	Indicates a short-circuit, overload of DQn.B digital output. Also, indicates an attempt to set one channel's DQn.A and DQn.B to the high state (using SET_DQA, SET_DQB, and TM_CTRL_DQ).	0 = No DQn.B digital output short-circuit or overload 1 = DQn.B digital output short-circuit, overload, or attempt to set DQn.A and DQn.B high.
Byte 0: Bit 6	Byte 8: Bit 6	ERR_OUT_VAL	Indicates the value in OUTPUT_VALUE is not valid	0 = No OUTPUT_VALUE error 1 = Error in OUTPUT_VALUE
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL	The value in SLOT is not valid (when MODE_SLOT = permanent update)	0 = No SLOT value error 1 = SLOT value error

Note

If an output short-circuit occurs, the digital output is able to briefly supply a current substantially higher than the rated value.

Diagnostic alarms

When a TM Pulse 2x24V error event triggers a diagnostic alarm, the following happens:

- The DIAG light flashes red when a diagnostics alarm is pending. Once you have remedied the error, the DIAG light changes to green.
- The diagnostics are displayed as plain text in the STEP 7 (TIA Portal) online and diagnostics view.
- Options for the reaction of a CPU running your control program
  - CPU goes to STOP and interrupts processing of the user program. The diagnostic interrupt OB (for example, OB 82) is called. The event that triggered the interrupt is written in the start information of the diagnostic interrupt OB.
  - CPU remains in RUN even if no diagnostic interrupt in present in the CPU. The technology module continues working unchanged if this is possible, while the error exists.
- Detailed information on the error event is available through execution of the RALRM (read alarm information) program instruction

Diagnostic configuration options

If a short-circuit or overload occurs on the 24 V DC sensor supply or digital output, the TM Pulse 2x24V generates a diagnostic message for the connected CPU/master. During the TM Pulse 2x24V device configuration, you must enable a channel's Group diagnostics and Diagnostics DQA / Diagnostics DQB parameters to enable the corresponding diagnostic messages.

See also TIA portal Diagnostics configuration (Page 105)

Configuration parameter	**Meaning**	**Default**
Group diagnostics	When Group diagnostics is enabled, the TM Pulse 2x24V generates a diagnostic message for the CPU/master in the following cases: • Supply voltage error • Short-circuit on 24 V DC sensor supply • Over-temperature	Disabled
Diagnostics DQA	The TM Pulse 2x24V detects a short-circuit/overload on the DQn.A digital output when Diagnostics DQA is enabled.	Enabled
Diagnostics DQB	The TM Pulse 2x24V detects a short-circuit/overload of the DQn.B digital output when Diagnostics DQB is enabled.	Enabled

Diagnostic alarms

Diagnostic alarm	Error Code	Meaning	To correct or avoid errors
Class A diagnostics (cannot be deactivated by user)			
Internal error	100_H	Technology Module is defective	Replace Technology Module
Watchdog tripped	103_H	Firmware Error, Technology Module is defective.	Run firmware update. If the problem remains, replace Technology Module.
Parametrization Fault	010_H	Possible causes: • The received parametrization record is not valid. • The configured BaseUnit is not the actual BaseUnit.	• Check the parametrization record. • Check the BaseUnit.
Module temporarily not available	$01F_H$	Possible causes: • Firmware-update is currently running. • Firmware-update has been interrupted.	• Wait for the end of the firmware update • Retry firmware update
Class B diagnostics (can be deactivated by user)			
No supply voltage	011_H	No L+ supply voltage for the technology module	Connect L+ supply voltage to the Technology Module.
Short-circuit or overload at the 24 V DC sensor supply	$10E_H$	Error on 24 V DC sensor supply Possible causes: • Short-circuit • Overload	• Correct wiring to 24 V DC. • Check loads connected to 24 V DC.
Error at the digital outputs	$10F_H$	Error at the digital outputs Possible causes: • Short-circuit • Overload	• Correct wiring at the digital outputs. • Check loads connected to the digital outputs.
Supply voltage error	110_H	Error at L+ supply voltage Possible causes: • Low voltage • Wiring of L+ supply voltage defective	• Check the L+ supply voltage. • Check the wiring of L+ supply voltage.
Over temperature	506_H	Possible causes: • Short-circuit or overload at the digital outputs • Ambient temperature outside specifications	• Correct process wiring • Improve cooling • Check connected loads

Technical specifications 8

	6ES7138-6DB00-0BB1
Product type designation	TM Pulse 2x24 V
General information	
Firmware version	V1.0
• FW update possible	Yes
usable BaseUnits	BU type B1
Color code for module-specific color identification plate	CC40
Product function	
I&M data	Yes; I&M 0
Isochronous mode	Yes
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
PROFIBUS as of GSD version/GSD revision	GSD Revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.31
Supply voltage	
Load voltage L+	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19,2 V
permissible range, upper limit (DC)	28,8 V
Short-circuit protection	Yes
Reverse polarity protection	Yes; against destruction
Input current	
Current consumption, max.	70 mA; without load
Encoder supply	
Number of outputs	2; A common 24V encoder supply for both chan-nels
24 V encoder supply	
24 V	Yes; L+ (-0.8 V)
Short-circuit protection	Yes; per module, electronic
Output current, max.	300 mA
Power loss	
Power loss, typ.	1,7 W

	6ES7138-6DB00-0BB1
Address area	
Occupied address area	
Inputs	16 byte; 8 per channel
Outputs	24 byte; 12 per channel
Digital inputs	
Number of digital inputs	2; 1 per channel
Digital inputs, parameterizable	Yes
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Digital input functions, parameterizable	
Freely usable digital input	Yes
HW enable for digital output	Yes
Input voltage	
Type of input voltage	DC
Rated value (DC)	24 V
for signal "0"	-30 to +5V
for signal "1"	+11 to +30V
permissible voltage at input, min.	-30 V
permissible voltage at input, max.	30 V
Input current	
for signal "1", typ.	2,5 mA
Input delay (for rated value of input voltage)	
for standard inputs	
• parameterizable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms
• at "0" to "1", min.	4 µs; for parameterization "none"
• at "1" to "0", min.	4 µs; for parameterization "none"
Cable length	
shielded, max.	1000 m; Depending on load and cable quality
unshielded, max.	600 m; Depending on load and cable quality
Digital outputs	
Type of digital output	P- and M-switching
Number of digital outputs	2; 1 per channel
Current-sinking	Yes
Current-sourcing	Yes
Digital outputs, parameterizable	Yes
Short-circuit protection	Yes; electronic/thermal
• Response threshold, typ.	6.8 A with Standard output, 2 A with High Speed output

	6ES7138-6DB00-0BB1
Limitation of inductive shutdown voltage to	-0.8 V
Controlling a digital input	Yes
Accuracy of pulse duration	±100 ppm ±0.5 µs with High Speed output, ±100 ±100 ppm ±9 µs with Standard output
minimum pulse duration	1,5 µs; With High Speed output, 10 µs with Standard output
Digital output functions, parameterizable	
Freely usable digital output	Yes
PWM output	Yes
• Number, max.	2; 1 per channel
• Cycle duration, parameterizable	Yes; Max. 85 s
• ON period, min.	0 %
• ON period, max.	100 %
• Resolution of the duty cycle	0,0036 %; For S7 analog format, min. 20 ns
Connection of a proportional valve	Yes
Dithering	Yes
• Frequency adjustable	Yes
• Amplitude adjustable	Yes
Current measurement	Yes
Current control	Yes
Connection of a DC motor	Yes
ON-delay	Yes
OFF-delay	Yes
Frequency output	Yes
Pulse train	Yes
Pulse output	Yes
Switching capacity of the outputs	
with resistive load, max.	2 A
on lamp load, max.	10 W; 1 W with High Speed output
Load resistance range	
lower limit	12 Ω; 240 ohm with High Speed output
upper limit	12 kΩ
Output voltage	
Type of output voltage	DC
for signal "0", max.	1 V
for signal "1", min.	23,2 V; L+ (-0.8 V)
Output current	
for signal "1" rated value	2 A; 0.1 A with High Speed output, observe derat-ing

	6ES7138-6DB00-0BB1
Output delay with resistive load	
"0" to "1", typ.	0 μs; With High Speed output, 4.5 μs with Standard output
"0" to "1", max.	0,8 μs; With High Speed output, 9 μs with Standard output
"1" to "0", typ.	0 μs; With High Speed output, 4.5 μs with Standard output
"1" to "0", max.	0,8 μs; With High Speed output, 9 μs with Standard output
Parallel switching of 2 outputs	
for uprating	Yes
Switching frequency	
with resistive load, max.	100 kHz; With High Speed output, 10 kHz with standard output
with inductive load, max.	100 kHz; With High Speed output, 10 kHz with standard output
on lamp load, max.	10 Hz
Total current of the outputs	
Current per channel, max.	2 A
Current per group, max.	4 A
Current per module, max.	4 A
Cable length	
shielded, max.	1000 m; Depending on load and cable quality
unshielded, max.	600 m; Depending on load and cable quality
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Bus cycle time (TDP), min.	250 μs; with 1 channel configuration, 375 μs with 2 channel configuration
Jitter, max.	1 μs; typically ±
Interrupts/diagnostics/status information	
Substitute values connectable	Yes; Parameterizable
Alarms	
Diagnostic alarm	Yes
Diagnostic messages	
Diagnostics	Yes
Monitoring the supply voltage	Yes
Short-circuit	Yes
Diagnostics indication LED	
Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
Channel status display	Yes
for module diagnostics	Yes; green/red DIAG LED

	6ES7138-6DB00-0BB1
Potential separation	
Potential separation digital inputs	
between the channels and backplane bus	Yes
Potential separation digital outputs	
between the channels and backplane bus	Yes
Potential separation channels	
between the channels	No
between the channels and backplane bus	Yes
Permissible potential difference	
between different circuits	75 V DC/60 V AC (base isolation)
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
horizontal installation, max.	60 °C; Observe derating
vertical installation, max.	50 °C; Observe derating
Decentralized operation	
to SIMATIC S7-300	Yes
to SIMATIC S7-400	Yes
to SIMATIC S7-1200	Yes
to SIMATIC S7-1500	Yes
to standard PROFIBUS master	Yes
to standard PROFINET controller	Yes
Dimensions	
Width	20 mm
Weights	
Weight, approx.	50 g

Ambient temperature output current derating information

Use the following graphs to find the maximum output current, when operating at higher loads and temperatures.

The output current derating for single channel (4 A) is twice (2x) the derating of the dual channel (2 A per channel) values shown in the derating graphs.

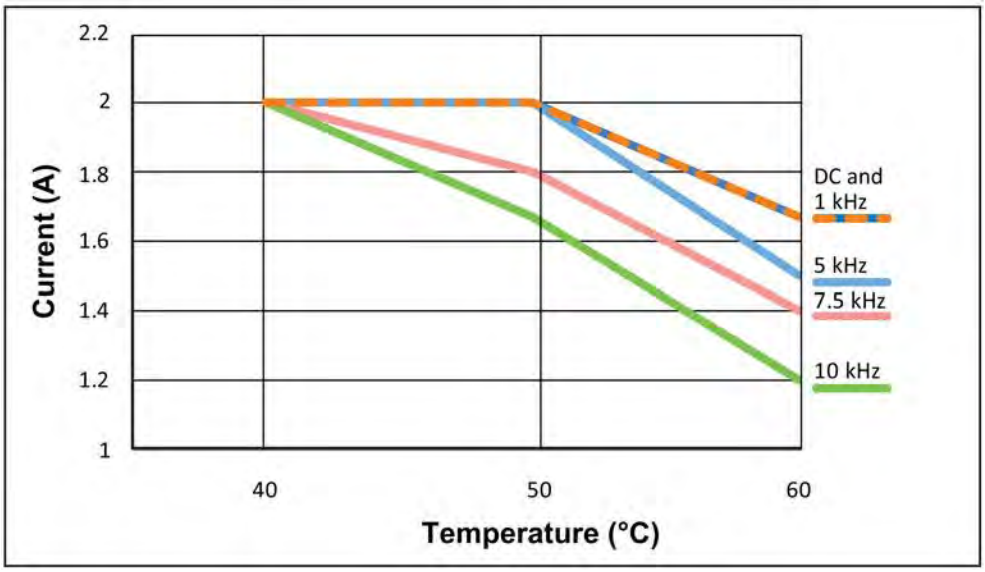


Figure 8-1 Maximum output current temperature derating for DC and 90%/10% duty cycle

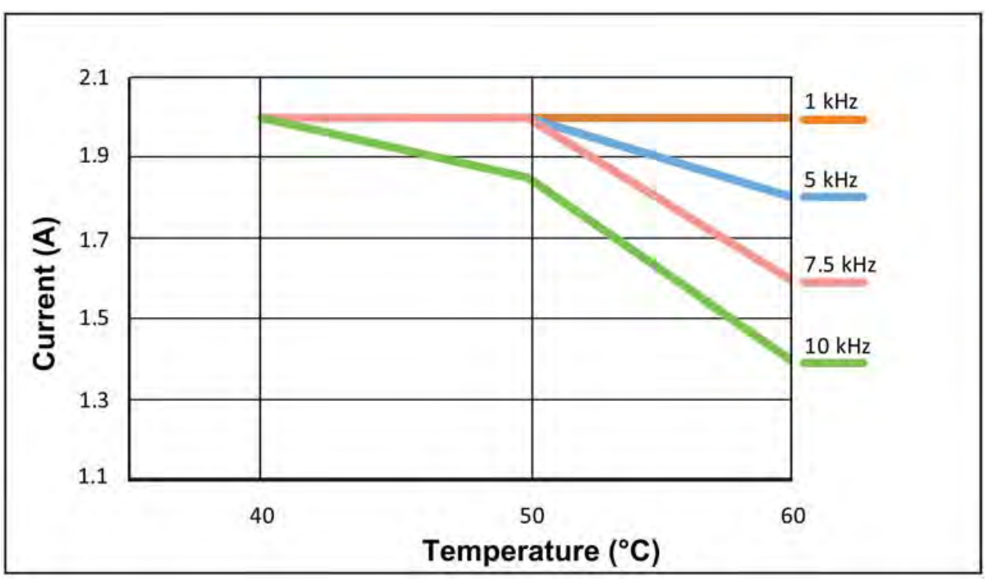

Figure 8-2 Maximum output current temperature derating for 50% duty cycle

BaseUnit technical specifications

Refer to the user manual for ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

8.1 Programming reference

Control interface: 2 channels, 24 output bytes (Q addresses)

CPU input address		Description
Channel 0	Channel 1[1]	
DWord 0	DWord 12	Depending on the mode: • Pulse output mode: Pulse duration in µs • PWM mode: Duty cycle On-ratio (Number range set by Output format configuration) – "Per 100": 0 to 100 – "Per 1000": 0 to 1,000 – "Per 10000": 0 to 10,000 – "S7 analog output": 0 to 27,648 • PWM mode with current control: Target current is assigned as a ratio of target current/reference current • Pulse train mode: Number of pulses to output as a DWord number value between 1 to 4,294,967,295 (2^{32}-1) • On/Off-delay mode: Off-delay in µs • Frequency output mode: Output frequency in Hz
DWord 4	DWord 16	SLOT value: Behavior depends on operating mode, MODE_SLOT(1 bit), and LD_SLOT (four bits).
Byte 8: Bits 0 to 3	Byte 20: Bits 0 to 3	LD_SLOT value controls interpretation of SLOT value. • 0 = No action / idle state • 1 = Period duration µs (PWM, Pulse train, and DC motor) • 2 = On-delay µs (Pulse output, PWM, Pulse train, Frequency output, and DC motor) • 3 = Off-delay µs (On/Off-delay) • 4 = Duty cycle On-ratio (Pulse train) • 5 = Dither ramp-up time and ramp-down time (PWM) • 6 = Dither amplitude (PWM) • 7 = Dither period (PWM)
Byte 8: Bit 4	Byte 20: Bit 4	MODE_SLOT value controls the SLOT update process. • 0 = single update (SLOT changed sometimes, prior to output sequence) • 1= permanent update (SLOT controlled continuously)

CPU input address		Description
Channel 0	Channel 1[1]	
Byte 9: Bit 0	Byte 21: Bit 0	SW_ENABLE: Transition from 0 → 1 and remaining 1 during the input delay starts the output sequence. Only active for the first positive edge, additional positive edges are ignored and no start occurs.
Byte 9: Bit 1	Byte 21: Bit 1	TM_CTRL_DQ: Set DQ output source: Selects either CPU program or module's output sequence. • 0 = DQn.A and DQn.B are controlled by the CPU (in your program) using the SET_DQA and SET_DQB control bits. • 1 = DQn.A and DQn.B are controlled by the module's output sequence.
Byte 9: Bit 2	Byte 21: Bit 2	SET_DQA: Controls the value of the digital output DQn.A, if TM_CTRL_DQ = 0 • 0 = 0V on DQn.A • 1 = 24V on DQn.A
Byte 9: Bit 3	Byte 21: Bit 3	SET_DQB: Controls the value of the digital output DQn.B, if TM_CTRL_DQ = 0 • 0 = 0V on DQn.B • 1 = 24V on DQn.B
Byte 10: Bit 0	Byte 22: Bit 0	RES_ERROR: Reset pending errors (ERR_LD, ERR_DQA, ERR_DQB, and ERR_24V). • 0 = Reset of errors is not active. • 1 = Reset of errors is active.

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Feedback Interface: 2 channels, 16 input bytes (I addresses)

CPU output address		Description
Channel 0	Channel 1[1]	
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR: 1 = 24 V DC present, but is not in the correct range. 0 = no error
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V: 1 = Short-circuit/overload, in the 24 V DC sensor supply output. 0 = no error
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD: 1 = Error while loading a parameter value using single-update mode. 0 = no error
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE: 1 = Pulse duration reduced to smaller than the minimum allowed during operation. 0 = No error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA: 1 = Short-circuit/overload on the digital output DQn.A. 0 = no error
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB: 1 = Short-circuit/overload on the digital output DQn.B or attempt to set both DQn.A and DQn.B to high. 0 = no error
Byte 0: Bit 6	Byte 8: Bit 6	ERR_OUT_VAL: 1 = The value in OUTPUT_VALUE is not valid. 0 = no error
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL: 1 = The value in SLOT is not valid where MODE_SLOT = 1 (permanent update). 0 = no error
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT: Toggle acknowledge bit for each action of the SLOT in single-update SLOT-mode Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY: 1 = Module is parameterized correctly, running, and delivering valid data. 0 = not ready
Byte 1: Bit 5	Byte 9: Bit 5	ST_SW_ENABLE: 1 = SW_ENABLE active. 0 = SW_ENABLE not active
Byte 2: Bit 0	Byte 10: Bit 0	STS_ENABLE: 1 = Output sequence running. 0 = No output sequence running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA: 1 = DQn.A output active. 0 = DQn.A output not active.
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB: 1 = DQn.B output active. 0 = DQn.B output not active.
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI: 1 = DIn.0 digital input active. 0 = DIn.0 digital input not active.

CPU output address		Description
Channel 0	Channel 1[1]	
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT: Sequence counter: Is incremented after completion of an output sequence (Range 0 to 15)
Word 4	Word 12	MEASURED_CURRENT: Current measurement uses a SIMATIC S7 analog value. Full-scale value depends on module configuration, as 2 channel (2 A) or 1 channel (4 A). • 2 channel (2 A): 0 to 32767 corresponds with 0 to 2.4 A • 1 channel (4 A): 0 to 32767 corresponds with 0 to 4.8 A
Byte 6: Bit 0	Byte 14: Bit 0	QLMN_LLM: The low limit of the manipulated value has been reached.
Byte 6: Bit 1	Byte 14: Bit 1	QLMN_HLM: The high limit of the manipulated value has been reached.

1 Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note

If the TM Pulse 2x24V external supply voltage is interrupted, then, 16#00000000 is returned as feedback value (substitute value).

Controlling the different operating modes

You select an output channel's operating mode during device configuration. Configuration data is stored in parameter data record 128.
The following table shows the program variables that the different operating modes use.

Program control variable	Notes
Software enable	
SW_ENABLE	Transition from 0 → 1 and remaining 1 during the input delay starts the output sequence. Only active for the first positive edge, additional positive edges are ignored and no start occurs. You must always issue the software enable in your control program. If you don't use a HW enable, the output sequence will be started by the positive edge of the software enable. If you reset the software enable, the current output sequence will be terminated.
Direct control of the digital output	
TM_CTRL_DQ	• If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQ outputs. • If TM_CTRL_DQ = 0, then the CPU has control and your program can set outputs DQn.A and DQn.B directly with the SET_DQA and SET_DQB control bits
SET_DQA SET_DQB	These control bits set/reset a channel's DQn.A and DQn.B outputs while TM_CTRL_DQ = 0. Note: You cannot set a channel's DQn.A and DQn.B to high at the same time. Otherwise, error ERR_DQB is set and only DQn.A is set high.
Pulse output operating mode	
Pulse duration	Assign the pulse duration directly with the control interface parameter OUTPUT_VALUE, as a DWord number value in µs.
On-delay	The time from the start of the output sequence to the start of the DQ output pulse. Assign the On-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.

Program control variable	Notes
PWM operating mode	
Duty cycle or Target current (current control enabled)	**Current control disabled**: PWM: OUTPUT_VALUE assigns the duty cycle (On/Off ratio) for the current period duration. You select the range of the OUTPUT_VALUE control interface field with the "Output format" configuration. • Output format "Per 100 (%)": Value range between 0 and 100 Pulse duration = (OUTPUT_VALUE/100) x period duration. • Output format "Per 1,000": Value range between 0 and 1,000 Pulse duration = (OUTPUT_VALUE/1,000) x period duration. • Output format "Per 10,000": Value range between 0 and 10,000 Pulse duration = (OUTPUT_VALUE/10,000) x period duration. • "S7 analog output" output format: Value range between 0 and 27,648 Pulse duration = (OUTPUT_VALUE/27,648) x period duration. **Current control enabled:** OUTPUT_VALUE assigns the target current as a ratio of target current/reference current. The reference current value is used to define the maximum set point and the high and low limits of the controlled current. Typically, the maximum current can be measured in PWM mode with current control disabled and a duty cycle set to 100%. The value measured can be set as a reference for the current control. The maximum value is 4000 mA for single channel operation (parallel channel connection enabled) and 2000 mA per channel for dual channel operation (parallel connection disabled).
Period duration	The Period duration of an output PWM cycle. Assign the period duration value in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 1. When you assign the period duration, take into account the minimum pulse duration configuration and the response time of the control element connected to the DQ digital output.
On-delay	The time from the start of the output sequence to the start of the DQ output pulse. Assign the On-delay in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
Pulse train operating mode	
Number of pulses	Number of pulses that are output at the DQ digital output on expiration of the On-delay. Your control program can set the pulse count directly with the control interface parameter (OUTPUT_VALUE). Set the number of pulses directly as a DWord number value between 0 to 4,294,967,295 (2^{32}-1).
Period duration	The Period duration of an output pulse cycle. Assign the period duration in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 1. When you assign the period duration take into account the minimum pulse duration configuration and the response time of the control element connected to the DQ digital output.
Duty cycle	Assign the duty cycle with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 4. The range of the duty cycle parameter is selected using the "Output format" configuration. If the number value you assign exceeds the upper limit, then a duty cycle of 100% of the period duration is used and this action does not cause an error. • Output format "Per 100 (%)": Value range 0 to 100 Pulse duration = (duty cycle/100) x period duration. • Output format "Per 1000": Value range 0 to 1,000 Pulse duration = (duty cycle/1,000) x period duration. • Output format "Per 10000": Value range 0 to 10,000 Pulse duration = (duty cycle/10,000) x period duration. • Output format "S7 analog output": Value range 0 to 27,648 Pulse duration = (duty cycle/27,648) x period duration.

Program control variable	Notes
On/Off-delay operating mode	
On-delay	The time between a positive edge of the DIn.0 digital input and DQn.A digital output (DQ follows DI state). Assign the On-delay in μs directly using the OUTPUT_VALUE control interface field.
Off-delay	The time between a negative edge of the DIn.0 digital input and its output on the DQn.A digital output (DQ follows DI state). Assign the Off-delay in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 3.
Frequency output operating mode	
Output frequency	Frequency output at the digital output DQ. Assign the frequency in real format as Hz using the OUTPUT_VALUE control interface field. The possible range is dependent on the "High Speed Output" configuration. • High Speed Output disabled Frequency (OUTPUT_VALUE): 0.02 Hz to 10,000 Hz • High Speed Output enabled Frequency (OUTPUT_VALUE): 0.02Hz to 100,000Hz
On-delay	The time from the start of the output sequence to the output of the frequency. Assign the On-delay in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
DC motor operating mode	
OUTPUT_VALUE	The OUTPUT_VALUE determines the duty cycle (pulse duration/period duration ratio) within a period (PWM). The period duration can be adjusted. The new output value is applied at the next rising edge of the output. The sign indicates direction of rotation (positive for forward) and (negative for backward). S7 analog output format: value range is -27,648 to +27,648 DInt data type: Only 2 least significant bytes are used For channel 0: bytes 2 and 3 For channel 1: bytes 14 and 15
On-delay	The time from the start of the output sequence to the output of the frequency. Assign the On-delay in μs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
If "Function DI" is parameterized as "External stop":	A rising edge on DIn.0 will stop the output sequence and stop the DC motor.

Device configuration (Assignments stored in parameter data record 128)

Parameters	Value Range	Default
Channel configuration	• 2 channels (2 A) • 1 channel (4 A)	2 channels (2 A)
Channel (0 and 1)		
Reaction to CPU STOP	• Continue working mode • DQ substitute a value	DQ substitute a value
Substitute value DQA	0 or 1	0
Substitute value DQB	0 or 1	0
Group diagnostics	Disable/enable	Disabled
Diagnostics DQA		Disabled
Diagnostics DQB		Disabled
Operating mode	• Pulse output • PWM • Pulse train • On/Off-delay • Frequency output • DC motor	PWM
High-speed output (0.1 A)	Disable/enable	Disabled
Current control (for PWM mode only)	Disable/enable	Disabled
Function DI HW enable option available for Pulse output, Pulse train, Frequency output and DC motor modes.	• Input • HW enable • External stop (DC motor only)	Input
Activate P	P-SEL: Add Proportional term for current control	Enabled
Activate I	I-SEL: Add Integral term for current control	Enabled
Activate D	D-SEL: Add Derivative term for current control	Disabled
Input delay	• Off (4μs) • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms
Output format: PWM and Pulse train modes DC motor mode, (only S7 analog output format is possible)	• S7 analog output format • Per 100 • Per 1000 • Per 10000	Per 100

Parameters	Value Range			Default
Output format (in the "Frequency output" operating mode)	1 Hz			1 Hz
Dithering (PWM mode only): Superimpose dithering waveform on PWM output sequence.	Disable/enable			Disabled
	Minimum		Maximum	
	High-speed **disabled**	High-speed **enabled**		
DWord: Minimum pulse duration for PWM and DC motor modes	10 µs	1.5 µs	85,000,000 µs	0
DWord: Period duration for PWM, Pulse train, and DC motor modes	100 µs	10 µs		2,000,000 µs
DWord: On-delay for all modes except On/Off-delay	0 µs	0 µs		0
DWord: Value depends on mode				
PWM: Dither ramp	Low word: Dither ramp-up time 0 to 30000 ms High word: Dither ramp-down 0 to 30000 ms			0 ms 0 ms
Pulse train: Duty cycle	S7 analog output format: 0 to 27648			13824 (50%)
	Per 100 format: 0 to100			50 (50%)
	Per 1000 format: 0 to 1000			500 (50%)
	Per 10000 format: 0 to 10000			5000 (50%)
On/Off delay: Off delay	0 to 85,000,000 µs			0
DWord: Dither amplitude for PWM only	0 to 500 ‰ (per mill)			50 ‰
DWord: Dither period for PWM only	From (4 times the PWM period µs) to 100000 µs (must be higher than 2000 µs)			50000 µs
Word: Reference value current for PWM with current control only	• 0 mA to 2000 mA for "2 channels (2 A)" operation • 0 mA to 4000 mA for "1 channel (4 A)" operation to 4000 mA for "1 channel (4 A)" operation			0 mA
Word: Dead band width (µA) for current control	0 µA to 65535 µA			0 µA
Word: High current limit for current control	S7-analog value relative to the reference value current: Range is 1 to 65535 (>= 27648 means 100%)			27648
Word: Low current limit for current control	S7-analog value relative to the reference value current: Range 0 to 27647 (Low limit must be less than the High limit)			0
Gain for current control	Real value (DWord size)			2.0 s
TI: Integration time (s) for current control	Real value (DWord size)			20.0 s
TD: Derivative action time (s) for current control	Real value (DWord size)			10 .0 s
TM LAG: Time lag of the derivative action (s)	Real value (DWord size)			2.0 s

Parameter data record A

The TM Pulse 2x24V parameter data record is modified and stored for you by the TIA portal when you perform a Device configuration, successful configuration block compilation, and download a new configuration block to the system hardware.

You may also directly edit the module parameters with the CPU in RUN mode. The WRREC instruction is used to transfer parameters to the module using data record 128.

If errors occur during the transfer or validation of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. A corresponding error code is then written to the STATUS output parameter. If no errors occur, the STATUS output parameter contains the length of the data actually transferred.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help (TIA Portal).

Structure of data record 128

The following table shows you the structure of data record 128 for the TM Pulse 2x24V. The values in byte 0 to byte 3 are fixed and may not be changed. Default values are indicated in bold font.

- A total of 108 bytes (4 header bytes + 2(52 channel bytes) is required for the 2 channel configuration (parallel connection disabled).
- A total of 56 byes (4 header bytes + 52 channel bytes) is required for the 1 channel configuration (parallel connection enabled).
- Bytes 4 to 55 are the channel 0 parameters
- Bytes 56 to 107 are the channel 1 parameters.
- Channel 1 parameters use the same data structure as channel 0. Add a 52 byte offset to the channel 0 byte numbers, to determine the channel 1 byte numbers.

Table A- 1 Header and channel 0 basic configuration

Bit → / Byte ↓	7	6	5	4	3	2	1	0
0 to 3	**Header**							
0	Reserved[1]		Major version = 0		Minor version = 1			
1	Channel parameter data length = 52 bytes

Table A- 2 Channel 0 Word, DWord, and Real values configuration

Byte	Channel 0 mode and variable usage	Value range
8 to 11	**Minimum pulse duration DWord**	
	PWM (only if current-control is inactive)	Minimum pulse duration: Default value = **0 µs**
	Pulse output, Pulse train, On/Off-delay, and Frequency output	Reserved
12 to 15	**Period duration DWord**	
	PWM, Pulse train	Period duration: High-speed disabled: 100 µs to 85,000,000 µs High-speed enabled: 10 µs to 85,000,000 µs Default value = **2,000,000 µs**
	DC motor	Period duration: 100 µs to 85,000,000 µs Default value = 1000 µs
	Pulse output, On/Off-delay, and Frequency output	Reserved
16 to19	**On-delay DWord**	
	Pulse output, PWM, Pulse Train, Frequency output, and DC motor	On-delay: **0 µs** to 85,000,000 µs
	On/Off-delay	Reserved
20 to 23	**Value DWord**	
	PWM	Dithering ramp times (2 bytes each): • Ramp-up time (low word): **0 ms** to 30,000 ms • Ramp-down time (high word): **0 ms** to 30,000 ms
	Pulse train	Duty cycle %: 0 to 27648, Default = **50** (50%)
	On/Off-delay	Off-delay: **0 µs** to 85,000,000 µs
	Pulse output, Frequency output, and DC motor	Reserved

Byte	Channel 0 mode and variable usage	Value range
24 to 27	**Dither amplitude DWord**	
	PWM	Dither amplitude (per mil): 0 to 500 the default value is **50**.
	Pulse output, Pulse train, On/Off-delay, Frequency output, and DC motor	Reserved
28 to 31	**Dither period DWord**	
	PWM	Dither period: Valid from ((4 x PWM period) AND (> 2000)) µs to 100,000 µs. The default value is **50,000 µs**.
	Pulse output, Pulse train, On/Off-delay, Frequency output, and DC motor	Reserved
32 to 55	**PWM mode only: Current control parameters**	
32 to 33	Reference value current (mA)	Word size: **0 mA** to 2000 mA for "2 channels (2 A)" operation **0 mA** to 4000 mA for "1 channel (4 A)" operation
34 to 35	Dead band width (µA)	Word size: **0 µA** to 65535 µA
36 to 37	High limit - S7-analog value relative to the reference value current	Word size: 1 to 65535 (**>= 27648** means 100%)
38 to 39	Low limit - S7-analog value relative to the reference value current	Word size: **0** to 27647 (because Low limit must be less than the High limit)
40 to 43	Gain	Real (DWord size): Default value = **2.0 s**
44 to 47	TI: Integration time (s)	Real (DWord size): Default value = **20.0 s**
48 to 51	TD: Derivative action time (s)	Real (DWord size): Default value = **10.0 s**
52 to 55	TM LAG: Time lag of the derivative action (s)	Real (DWord size): Default value = **2.0 s**

For Resellers: In order to avoid infringements of the license conditions by the reseller or the buyer, the instructions and license conditions provided here must be passed on to the buyers.

License Conditions and Disclaimers for Open Source Software and other licensing software

The Open Source software listed below is used in unmodified form or in a form we have modified as well as other license software listed below in the "digital modules, analog modules, technology modules, communication modules and power supply modules of the SIMATIC S7-1500, ET 200MP", ET 200SP Copyright Siemens AG, 2013-2014 (hereinafter referred to as "Product").

Liability for Open Source Software

The Open Source software is provided free of charge. We are liable for the Product including the Open Source software contained in it pursuant to the license conditions applicable to the Product. We explicitly reject any liability for the use of Open Source software beyond the program sequence intended for the Product. Furthermore, any liability for defects resulting from modifications to the Open Source software is excluded.

We do not provide any technical support for the Product if it has been modified.

Please read the license conditions and copyright information of Open Source software as well as other licensing software:

Open Source Software: GNU GCC libstdc++ / libsupc++ - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software GNU GCC libstdc++ / libsupc++ - 4.4.1

License conditions:

1 License

There are two licenses affecting GNU libstdc++: one for the code, and one for the documentation.

There is a license section in the FAQ regarding common questions. If you have more questions, ask the FSF or the gcc mailing list.
The Code: GPL

The source code is distributed under the GNU General Public License version 3, with the addition under section 7 of an exception described in the "GCC Runtime Library Exception, version 3.1" as follows (or see the file COPYING.RUNTIME):

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyright.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyright requirements of the license of GCC.

Hopefully that text is self-explanatory. If it isn't, you need to speak to your lawyer, or the Free Software Foundation.
The Documentation: GPL, FDL

The documentation shipped with the library and made available over the web, excluding the pages generated from source comments, are copyrighted by the Free Software Foundation, and placed under the GNU Free Documentation License version 1.2. There are no Front-Cover Texts, no Back-Cover Texts, and no Invariant Sections.

For documentation generated by doxygen or other automated tools via processing source code comments and markup, the original source code license applies to the generated files. Thus, the doxygen documents are licensed GPL.

If you plan on making copies of the documentation, please let us know. We can probably offer suggestions.

notice is preserved.

9 GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyright license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future
versions of the GNU General Public License can be used, that proxy's
public statement of acceptance of a version permanently authorizes you
to choose that version for the Program.

Later license versions may give you additional or different
permissions. However, no additional obligations are imposed on any
author or copyright holder as a result of your choosing to follow a
later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY
APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE
COPYRIGHT
HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT
WARRANTY
OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED
TO,
THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A
PARTICULAR
PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE
PROGRAM
IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE
COST OF
ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN
WRITING
WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR
CONVEYS
THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES,
INCLUDING ANY
GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT
OF THE
USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO
LOSS OF
DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY
YOU OR THIRD
PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER
PROGRAMS),
EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE
POSSIBILITY OF
SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

Open Source Software: libgcc - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software libgcc - 4.4.1

License conditions:

1 GCC is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 3, or (at your option) any later version.
GCC is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.
Under Section 7 of GPL version 3, you are granted additional permissions described in the GCC Runtime Library Exception, version 3.1, as published by the Free Software Foundation.
You should have received a copy of the GNU General Public License and a copy of the GCC Runtime Library Exception along with this program; see the files COPYING3 and COPYING.RUNTIME respectively. If not, see <http://www.gnu.org/licenses/>.

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc. <http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyright.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyright requirements of the license of GCC.

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Preamble

The GNU General Public License is a free, copyright license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.
TERMS AND CONDITIONS

0. Definitions.

“This License refers to version 3 of the GNU General Public License.

“Copyright also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

“The Program refers to any copyrightable work licensed under this License. Each licensee is addressed as “you”. “Licensees” and “recipients” may be individuals or organizations.

To “modify” a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a “modified version” of the earlier work or a work “based on” the earlier work.

A “covered work” means either the unmodified Program or a work based on the Program.

To “propagate” a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To “convey” a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays “Appropriate Legal Notices” to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The “source code” for a work means the preferred form of the work for making modifications to it. “Object code” means any non-source form of a work.

A “Standard Interface” means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The “System Libraries” of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A “Major Component”, in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The “Corresponding Source” for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to “keep intact all notices”.
c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.
b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.
c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.
e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A “User Product” is either (1) a “consumer product”, which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, “normally used” refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

“Installation Information” for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's “contributor version”.

A contributor's “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. “Knowingly relying” means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is “discriminatory” if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS
How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an “about box”.

You should also get your employer (if you work as a programmer) or school, if any, to sign a “copyright disclaimer” for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

2 This configure script is free software; the Free Software Foundation
gives unlimited permission to copy, distribute and modify it.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Table of contents

Introduction

1

1.1 Purpose of this documentation

These instructions contain all information required to commission and use the device. Read the instructions carefully prior to installation and commissioning. In order to use the device correctly, first review its principle of operation.

The instructions are aimed at persons mechanically installing the device, connecting it electronically, configuring the parameters and commissioning it, as well as service and maintenance engineers.

CAUTION
To prevent injury, read the manual before use.

1.2 Document history

The most important changes in the documentation when compared with the respective previous edition are given in the following table.

Manual edition	Note
09/2018	• Section "Safety instructions (Page 13)" revised • Section "Mounting (Page 21)" revised • Section "Scale parameters and functions (Page 57)" revised – DR 3 (Page 57): "Limit frequency of low-pass filter 2" and "Order no. low pass filter 2" new • Data types renamed as follows: FLOAT --> REAL USHORT --> UINT SHORT --> INT LONG --> DINT CHAR --> STRING
09/2017	• "Introduction" section and Safety instructions (Page 13): revised • Section Connection of Siebert display via RS485 (Page 32): Graphic enhanced • Section Automatic calibration (without calibration weight) (Page 47): revised • Section Scale parameters and functions (Page 57): – Calibration procedure (Page 64): revised – DR 3 (Page 57) and DR 6 (Page 70): revised – DR 10 (Page 74): New "Selection of sampling rate" tag – DR 14 (Page 79): revised – DR 32 (Page 85): revised • Section Technology error message list (Page 93): revised • Section Communication in SIMATIC S7-300/400/1200/1500 (Page 97): revised • Section Reliability (Page 114): new • Section Approvals (Page 114): RoHS new

1.3 Product compatibility

The following table describes compatibility between manual edition, device revision, and the engineering system.

Manual edition	Comment	Device revision	Engineering system
09/2018	New characteristics	FW: 1.3.0 HW: FS 1 or higher	STEP 7 TIA Portal V14 or higher
09/2017	New characteristics	FW: 1.2.0 HW: until FS 3	STEP 7 TIA Portal V14 or higher

1.4 Checking the consignment

1. Check the packaging and the delivered items for visible damage.
2. Report any claims for damages immediately to the shipping company.
3. Retain damaged parts for clarification.
4. Check the scope of delivery by comparing your order to the shipping documents for correctness and completeness.

> **WARNING**
>
> **Using a damaged or incomplete device**
>
> Risk of explosion in hazardous areas.
>
> - Do not use damaged or incomplete devices.

1.5 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines, and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit:

http://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under

http://www.siemens.com/industrialsecurity.

1.6 Transportation and storage

To guarantee sufficient protection during transport and storage, observe the following:

- Keep the original packaging for subsequent transportation.
- Devices/replacement parts should be returned in their original packaging.
- If the original packaging is no longer available, ensure that all shipments are properly packaged to provide sufficient protection during transport. Siemens cannot assume liability for any costs associated with transportation damages.

NOTICE
Insufficient protection during storage The packaging only provides limited protection against moisture and infiltration. • Provide additional packaging as necessary.

Special conditions for storage and transportation of the device are listed in Technical specifications (Page 109).

1.7 Basic knowledge required

Knowledge of weighing technology as well as general knowledge of the SIMATIC system including the TIA Portal are necessary in order to understand the manual.

Safety instructions 2

2.1 General safety instructions

⚠ WARNING
Non-compliance with warning notes or non-qualified handling of the system
Failure to observe the warning notes or handling of the device/system by non-qualified personnel can result in serious injury or damage to property. This means only qualified personnel are permitted to handle this device/system.

⚠ WARNING
Permission for installation in machines
Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Machinery Directive 89/392/EEC.

Note

The specifications of the manual for the SIMATIC ET 200SP system apply for configuration, installation and commissioning in the SIMATIC environment. This chapter includes additional information on hardware configuration, installation and preparation for operation of the SIWAREX WP321.

The safety notes must be observed.

Note

The device was developed, manufactured, tested and documented in compliance with the relevant safety standards. The device does usually not pose any risks of material damage or personal injury.

Safety notices when using the device according to Hazardous Locations (HazLoc)

If you use the device under HazLoc conditions you must also keep to the following safety notices in addition to the general safety notices for protection against explosion:

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

This equipment is suitable for use in Class I, Division 2, Groups A, B, C and D or non-hazardous locations only.

Description 3

3.1 Product overview

SIWAREX WP321 is a versatile and flexible weighing module that can be operated as a static weighing instrument.

The electronic weighing system can be used in SIMATIC ET 200SP and uses all features of a modern automation system, such as integrated communication, operation and monitoring, the diagnostics system as well as the configuration tools in the TIA Portal or SIMATIC STEP, WinCC flexible and PCS7.

3.2 Area of application

The electronic weighing system described here is the perfect solution for applications in which signals from weighing or force sensors are acquired and processed. The SIWAREX WP321 is a very accurate electronic weighing system with high measuring speed.

It can be used in almost all industrial weighing applications not requiring official calibration. Use in potentially explosive atmospheres (with Ex interface SIWAREX IS) it's also possible.

3.3 System integration in SIMATIC

The electronic weighing system described here is a technology module for SIMATIC ET 200SP. It can be used as desired in the configuration of the automation solution, including the weighing application. You can create optimal solutions for small and medium-sized plants by combining the suitable SIMATIC modules. You can create customized or industry-specific solutions in no time with the help of the configuration package available under the "Ready for use" application for SIMATIC.

Solutions are possible with S7-300, S7-1200 as well as S7-1500 CPUs. TIA Portal, Step 7 Classic or PCS7 can be used as the configuration software.

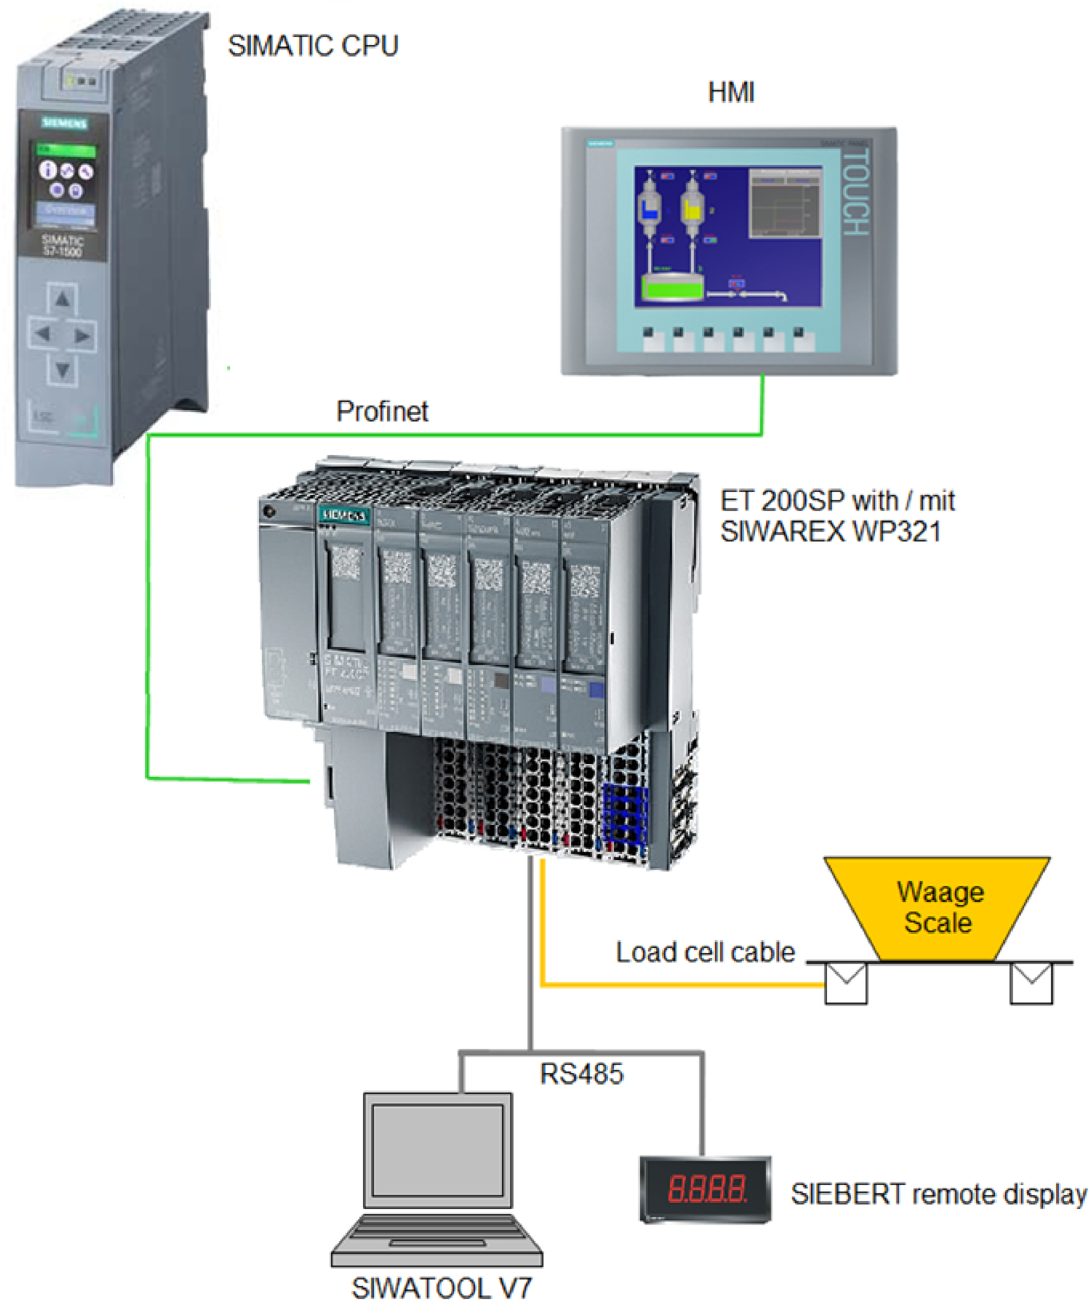

Figure 3-1 System overview

3.4 Customer benefits

The electronic weighing system described here is characterized by decisive advantages:

- Uniform design technology and consistent communication in SIMATIC ET 200SP
- Parameter assignment by means of an operator panel, STEP7 user program or PC
- Uniform configuration option in the SIMATIC TIA Portal, SIMATIC STEP7 or PCS7

- Measuring of weight with a resolution of up to +/- 2 million parts
- High accuracy 0.05%
- High measuring rate of 100/120/600 Hz
- Limit monitoring
- Flexible adaptation to varying requirements
- Easy calibration of the scales using the SIWATOOL program
- Automatic calibration is possible without the need for calibration weights
- Module replacement is possible without recalibrating the scales
- Use in Ex Zone 2 / ATEX approval
- Intrinsically safe load cell supply for Ex Zone 1 (SIWAREX IS option)
- Diagnostics functions

3.5 Scope of delivery

The scope of supply consists of the SIWAREX WP321 weighing module. Required accessories → Accessories (Page 117)

Note

The SIWAREX WP321 configuration package is required for configuration of the SIWAREX WP321 electronic weighing system → Accessories (Page 117). The configuration package is not included in the scope of delivery of the module.

Application planning

4

4.1 Functions

The primary task of the electronic weighing system is the measurement and registration of the current weight value. The integration in SIMATIC gives you the option to process the weight value directly in the PLC (**P**rogrammabel**L**ogic **C**ontroller).

The SIWAREX WP321 is calibrated at the factory. This allows for automatic calibration of the scale without the need for calibration weights and replacement of modules without the need for recalibrating the scale.

A PC for setting the parameters of the electronic weighing system can be connected via the RS485 interface.

The SIWAREX WP321 electronic weighing system can also be used in potentially explosive atmospheres (Zone 2). The load cells are supplied intrinsically safe in Zone 1 applications when you use the optional Ex interface SIWAREX IS.

4.2 Parameter assignment options

4.2.1 Parameter assignment with the PC

You can set the scale parameters with the convenience of the familiar Windows interface by using the "SIWATOOL" PC parameter assignment software.

You can use the program for commissioning the scale without any knowledge of automation technology. When servicing is required, you can analyze and test the processes in the scale independently of the automation system or Operator Panel with the help of the PC. You can read out the diagnostic buffer from the SIWAREX module to assist you in the event analysis.

The figure below illustrates the structure of the individual program windows.

Figure 4-1 SIWATOOL overview

SIWATOOL does not only offer support when you set the scale but also when you analyze the diagnostic buffer that can be saved after being read out of the module together with the parameters. The display of the current scale status can be configured.

You can switch between several languages in the program.

You require an RS485/USB converter (see Accessories (Page 117)).

4.2.2 Parameter assignment with the SIMATIC Panel

SIWAREX WP321 parameters can be assigned using a SIMATIC Panel connected to the SIMATIC CPU. The "Ready-for-use" application software is used for this.

Mounting 5

5.1 Safety notices for installation

Safety notices

When installing the device, keep to the safety notices listed below.

WARNING
If a device is operated in an ambient temperature of more than 50 °C, the temperature of the device housing may be higher than 70 °C. The device must therefore be installed so that it is only accessible to service personnel or users that are aware of the reason for restricted access and the required safety measures at an ambient temperature higher than 50 °C.

WARNING
If the device is installed in a cabinet, the inner temperature of the cabinet corresponds to the ambient temperature of the device.

Safety notices on use in hazardous areas

General safety notices relating to protection against explosion

WARNING
EXPLOSION HAZARD
Replacing components may impair suitability for Class 1, Division 2 or Zone 2.

WARNING
Substitution of components may impair suitability of the equipment.

5.2 Safety information according to FM and UL

Safety information for use according to FM and UL

If you use the device under FM conditions you must also keep to the following safety notices in addition to the general safety notices for protection against explosion:

⚠ WARNING
Substitution of components may impair suitability for Division 2.

⚠ WARNING
Do not remove or replace while circuit is live when a flammable or combustible atmosphere is present.

⚠ WARNING
Explosion hazard
Do not disconnect equipment when a flammable or combustible atmosphere is present.

⚠ WARNING
EXPLOSION HAZARD
The device is designed for operation in closed housing or control cabinet. The inner service temperature of the enclosure/control cabinet corresponds to the ambient temperature of the module. Use cables with a maximum permitted operating temperature of at least 20 °C higher than the maximum ambient temperature.

5.3 Installation guideline

When assembling the SIMATIC components together with the electronic weighing system described here, the setup, installation and wiring guidelines for the SIMATIC ET 200SP must be observed (see system manual "SIMATIC ET 200SP, ET 200SP distributed I/O system", order no.: A5E03576848).

This manual describes additional installation and wiring aspects specific to the electronic weighing system.

5.4 EMC-compliant setup

5.4.1 Introduction

The electronic weighing system described here was developed for use in industrial environments and complies with high EMC requirements. It ensures safe operation even in harsh environmental conditions. Nevertheless, you should still carry out EMC planning before installing your devices in order to determine any sources of interference and include them in your considerations.

EMC

EMC (electromagnetic compatibility) describes the capability of electrical equipment to operate without errors in a given electromagnetic environment, without being subject to external influence and without influencing external devices in any way.

5.4.2 Possible effects of interference

Electromagnetic interferences can influence the electronic weighing system described here in various ways:

- Electromagnetic fields having a direct influence on the system
- Interferences transported by communication cables
- Interferences having an effect via process cables
- Interferences entering the system via the power supply and/or protective ground

Interferences can impair the fault-free functioning of the electronic weighing system.

5.4.3 Coupling mechanisms

Depending on the propagation medium (conducted or non-conducted) and the distance between the interference source and the device, interferences can enter the faulty device through four different coupling mechanisms:

- Electrical coupling
- Capacitive coupling
- Inductive coupling
- Radiation coupling

5.4.4 Five basic rules for securing EMC

Observe these five basic rules to secure EMC.

Rule 1: Large area grounding contact

- When installing the devices, make sure that the surfaces of inactive metal parts are properly bonded to chassis ground (see following sections).
- Bond all inactive metal parts to chassis ground, ensuring large area and low-impedance contact (large cross-sections).
- When using screw connections on varnished or anodized metal parts, support contact with special contact washers or remove the protective insulating finish on the points of contact.

- Wherever possible, avoid the use of aluminum parts for ground bonding. Aluminum oxidizes very easily and is therefore less suitable for ground bonding.
- Provide a central connection between chassis ground and the ground/protective conductor system.

Rule 2: Proper cable routing

- Organize your wiring system into cable groups (high-voltage/power supply/signal/measurement/data cables).
- Always route high-voltage and data cables in separate ducts or in separate bundles.
- Install the measurement cables as close as possible to grounded surfaces (e.g. supporting beans, metal rails, steel cabinet walls).

Rule 3: Fixing the cable shielding

- Ensure proper fixation of the cable shielding.
- Always use shielded data cables. Always connect both ends of the data cable shielding to ground on a large area.
- Keep unshielded cable ends as short as possible.
- Always use metal/metalized connector housings only for shielded data cables.

Rule 4: Special EMC measures

- All inductors that are to be controlled should be connected with suppressors.
- For cabinet lighting in the immediate range of your controller, use interference suppressed fluorescent lamps.

Rule 5: Homogeneous reference potential

- Create a homogeneous reference potential and ground all electrical equipment.
- Use sufficiently dimensioned equipotential bonding conductors if potential differences exist or are expected between your system components. Equipotential bonding is absolutely mandatory for applications in hazardous areas.

5.5 Mounting on the SIMATIC ET 200SP

The electronic weighing system described here is a module of the SIMATIC ET 200SP series and can be directly connected to the automation system's bus system. The 15 mm wide module has very low installation and cabling requirements.

The module is snapped onto the ET 200SP base unit (BU). You must use base units of type A0 (→ Accessories (Page 117)).

The load cells, power supply and serial interfaces are connected via the terminal box.

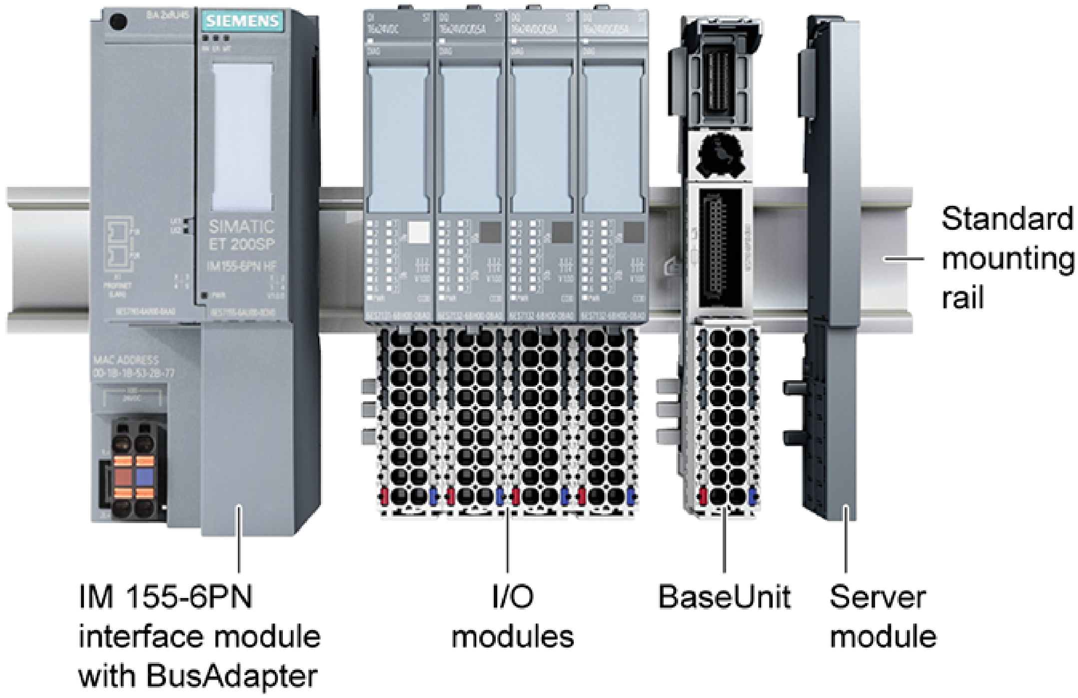

Figure 5-1 Installation of the I/O or SIWAREX modules

5.6 Configuration of the hardware in SIMATIC

A station has a maximum width of 1 m, and you can use up to 64 modules depending on the type of PN head-end, or up to 15 modules with the Profibus version. Observe the system conditions when planning the configuration.

Each SIWAREX electronic weighing system requires 16 bytes of the I/O area. Address assignment is carried out in the TIA Portal or in the SIMATIC Manager during hardware configuration.

Connecting 6

All external connections are made via the terminal box.

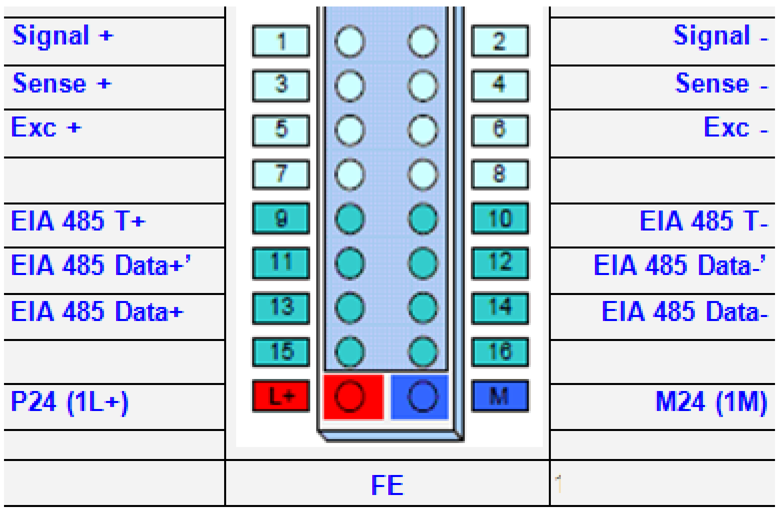

Figure 6-1 SIWAREX WP321 process terminals on the base unit

6.1 24 V connection

The 24 V DC supply voltage is connected by means of the corresponding terminals on the base unit.

Table 6-1 Connection of the 24 V supply

Labeling	Function
L +	+24 V voltage supply
M	Ground voltage supply

6.2 Connecting the load cells

Pickups can be connected to the SIWAREX WP321 electronic weighing system which are equipped with strain gauges (full bridge) and meet the following requirements.

- Characteristic value 1 to 4 mV/V
- A supply voltage of 5 V is permitted

The power supply for the load cells is 4.85 V.

The following condition must be met in order to check the maximum possible number of load cells which can be connected to a WP321:

- Scale operation without Ex interface: (input resistance of load cell) / (number of load cells) > 40 Ohm
- Scale operation without Ex interface: (input resistance of load cell) / (number of load cells) > 50 Ohm

Connection with 4-wire or 6-wire system

The connection versions are shown in the following two figures.

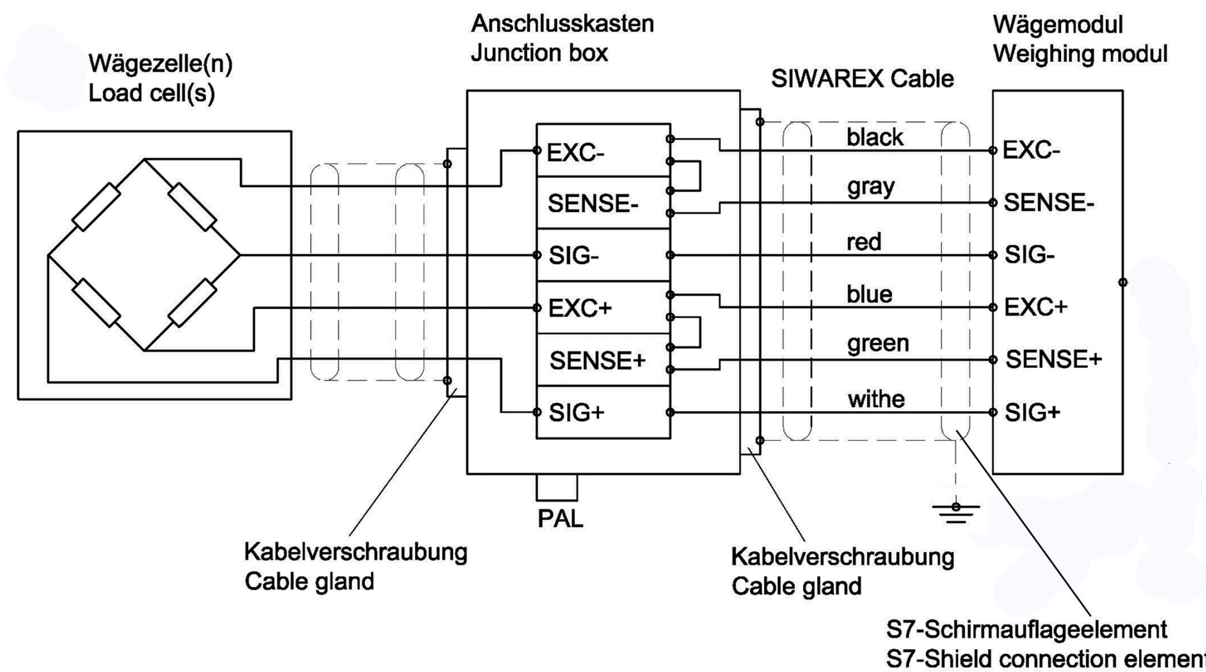

Figure 6-2 Connection of DMS load cell with 4-wire system

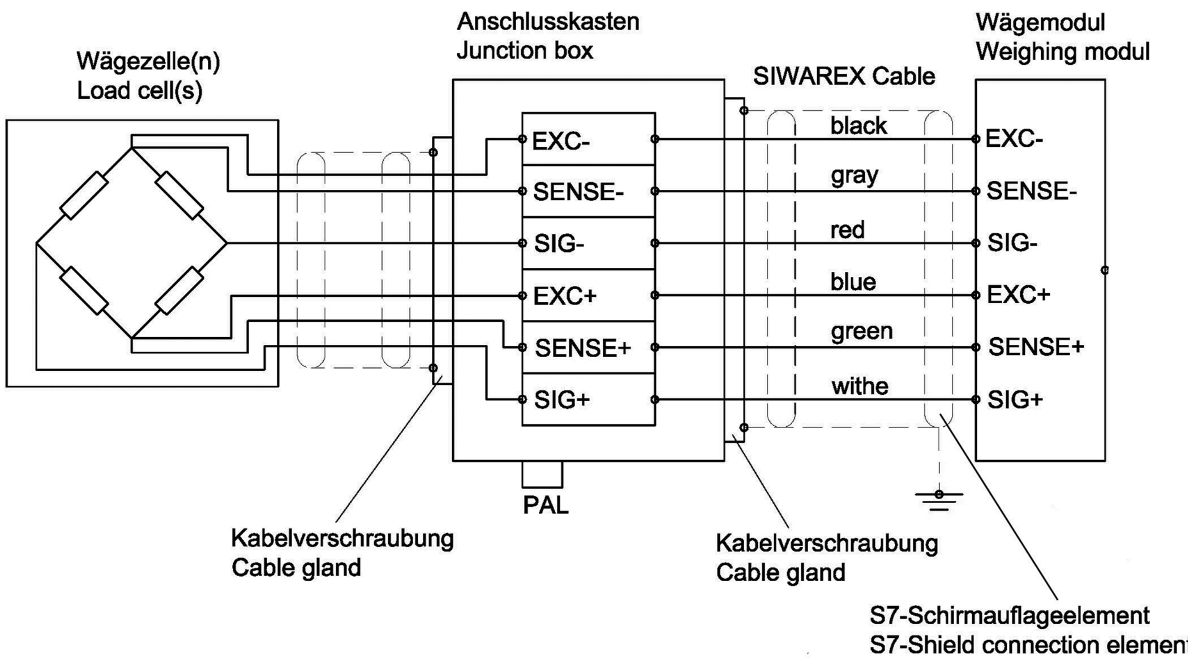

Figure 6-3 Connection of load cell with 6-wire system

Observe the following rules for connection of analog (DMS) load cells

1. The use of a junction box (SIWAREX JB junction box) is required when more than one load cell is connected (the load cells must be connected in parallel). If the distance of a load cell to the SIWAREX WP321 or the junction box is greater than the available length of the load cell connection cable, use the SIWAREX EB extension box.
2. The cable shield is always applied at the cable gland of the junction box (SIWAREX JB) or the extension box. If there is a risk of equipotential bonding through the cable shield, connect a equipotential equalization conductor parallel to the load cell cable.

3. Twisted wire pairs that are also shielded are required for the specified cables:
   – Sensor cable (+) and (-)
   – Measuring voltage cable (+) and (-)
   – Supply voltage cable (+) and (-)

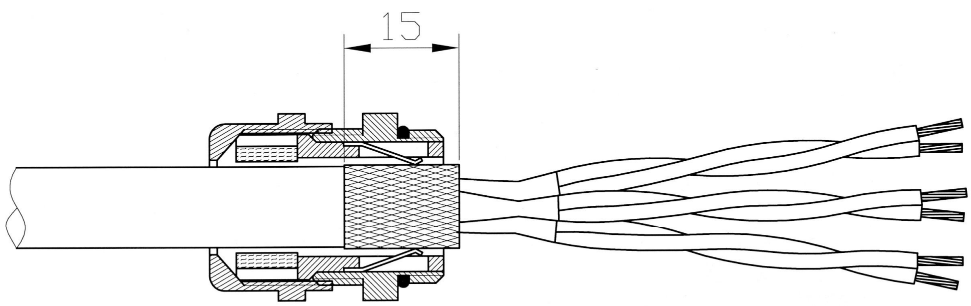

Figure 6-4 Shielding in the screw gland

   We recommended that you use the cables listed in chapter Accessories (Page 117).

4. The shield must be applied to the ground in close proximity to the SIWAREX WP321. The maximum distance between the SIWAREX WP321 and the load cell is relevant when you use the recommended cables.

Labeling	Function	Connection pin
Sig-	Measurement cable load cell -	2
Sig+	Measurement cable load cell -	1
Sen-	Sensor cable load cell -	4
Sen+	Sensor cable load cell +	3
Exc-	Supply load cell -	6
Exc+	Supply load cell +	5

6.3 Shield connection

Make sure you observe the correct design of the shield support for the shielded cables. It is the only way to ensure immunity of the system.

A cable is shielded to attenuate the effects of magnetic, electrical and electromagnetic interference on the cable. Interference currents on cable shielding are diverted to ground by conductive isolation rails. To avoid interference as a result of these currents, it is imperative to provide a low-impedance connection to the ground.

Only use cables equipped with a shielding braid. Shielding density must be at least 80%.

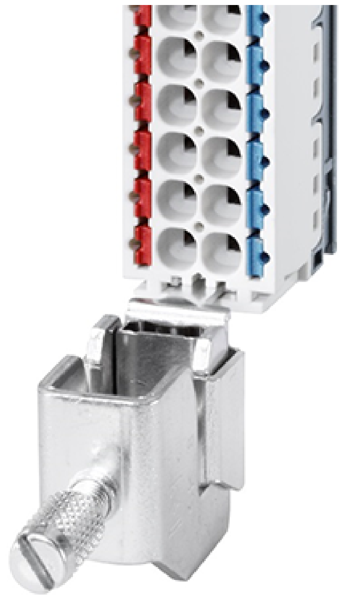

Figure 6-5 Shield connection and shield terminal

6.4 Connection of RS485 serial interface

The following devices can be connected to the serial interface:

- Siebert display type S102 (connections: see chapter Connection of Siebert display via RS485 (Page 32))
- PC with RS485/USB converter (see accessories) for use of SIWATOOL

Table 6-2 Termination of RS485 serial interface

Labeling	Function	Connection pin
RS485: T+	RS485 termination +: Is used at the physical end of the bus for inserting termination jumpers	9
RS485: T-	RS485 termination -: Is used at the physical end of the bus for inserting termination jumpers	10
RS485: D+'	RS485 data line +': Is used at the physical end of the bus for inserting termination jumpers and in between for looping through the bus cables	11
RS485: D-'	RS485 data line -': Is used at the physical end of the bus for inserting termination jumpers and in between for looping through the bus cables	12
RS485: D+	RS485 data cable +	13
RS485: D-	RS485 data cable -	14

If a SIWAREX WP321 module is connected to SIWATOOL or a Siebert display, insert wire jumpers between the T+ and D+' terminals and between the T- and D-' terminals.

6.5 Connection of Siebert display via RS485

A Siebert display S102 with the order no. S102-W6/14/0R-000/0B-SM can be connected to the RS485 interface of the weighing module. Connect a 24 V DC supply to the Siebert display. Connect the latter to the RS485 interface of the weighing module as shown in the figure below.

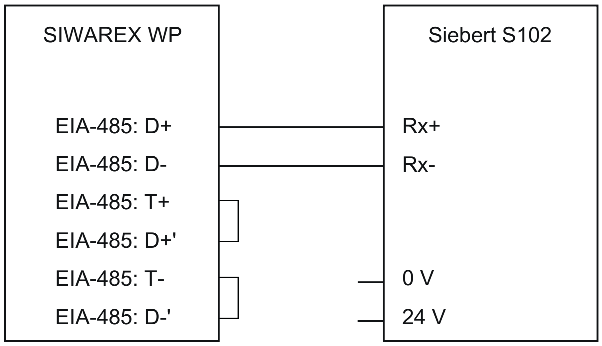

Figure 6-6 Connection of Siebert display S102

The RS485 interface in the DR 13 of the SIWAREX WP is set as follows:

- RS485 protocol: Siebert display S102
- Baud rate: 9600 bps
- Character parity: Even

The S102 is set as follows:

Table 6-3 Settings of Siebert display S102

<table>
<tr><th>Menu item</th><th>Setting</th><th colspan="2">Meaning</th></tr>

Commissioning 7

Commissioning essentially comprises:

- Checking the scale construction
- Specifying the parameters
- Calibration
- Verifying the envisaged functionality

7.1 Factory-set parameters

The electronic weighing system described here is provided with factory-set parameters. The parameters have been provided for a typical 100 kg scale based on three load cells. Parameters which can be entered in % or time are preset in such a way that they provide good results for most applications.

With these default parameters, commissioning can be carried out in 5 minutes (see chapter 5-minute quick start with the operator panel and the Ready-for-Use software (Page 34)).

7.2 Commissioning tools

Commission the electronic weighing system using the following alternatives:

- Touch panel und SIWAREX WP321 function block in S7-300/400/1200 or 1500
  A free example project is available for download online at TIA Portal project "Ready-for-use" for SIWAREX WP321 (https://support.industry.siemens.com/cs/ww/en/view/94109373).
- Commissioning with SIWATOOL V7
  SIWATOOL V7 is included in the WP configuration package available for purchase, Accessories (Page 117). To communicate between SIWAREX WP and SIWATOOL V7, use an additional interface converter USB/RS485.

Use SIWATOOL V7 to commission the scale without SIMATIC expertise with a standard PC. Backup files can also be created and loaded. In the event of a fault, additional SIWATOOL diagnostics functions enable fast analysis of the cause.

7.3 5-minute quick start with the operator panel and the Ready-for-Use software

7.3.1 Start

The 5 minutes of quick start is performed in this example with a TP700 Comfort Panel connected directly to the electronic weighing system. The Panel communicates directly over MODBUS TCP/IP or via the SIMATIC S7-1200 CPU.

To carry out the quick start, select the "1.0 Setup" function in the main menu and then "1.2 Quick Start". You will be guided through the individual tasks for setting the most important parameters.

The remaining parameters are factory-set in such a way that they can be used in most cases without any changes.

You can download the HMI software used below as free TIA Portal project "Ready-for-use" for SIWAREX WP321 (https://support.industry.siemens.com/cs/ww/en/view/94109373).

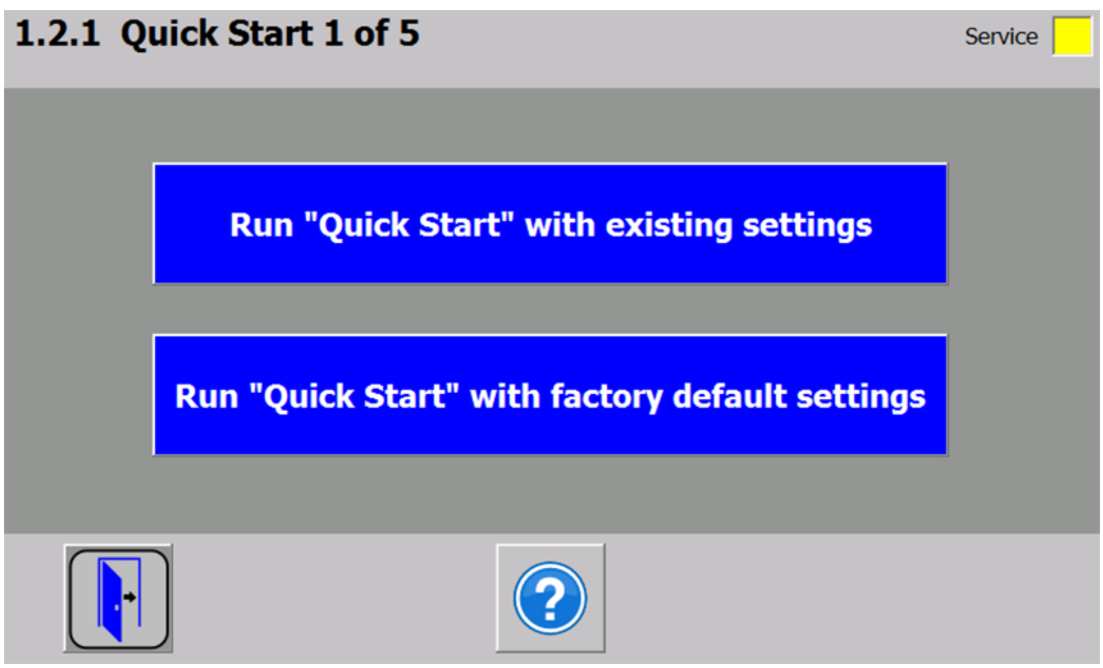

Figure 7-1 Quick start step 1

7.3.2 Factory setting of the parameters

The quick start is based on the factory setting of the parameters. Therefore, the previous parameter settings must be reset prior to the quick setup. Service mode must be switched on first. Resetting to the factory setting can then be carried out.

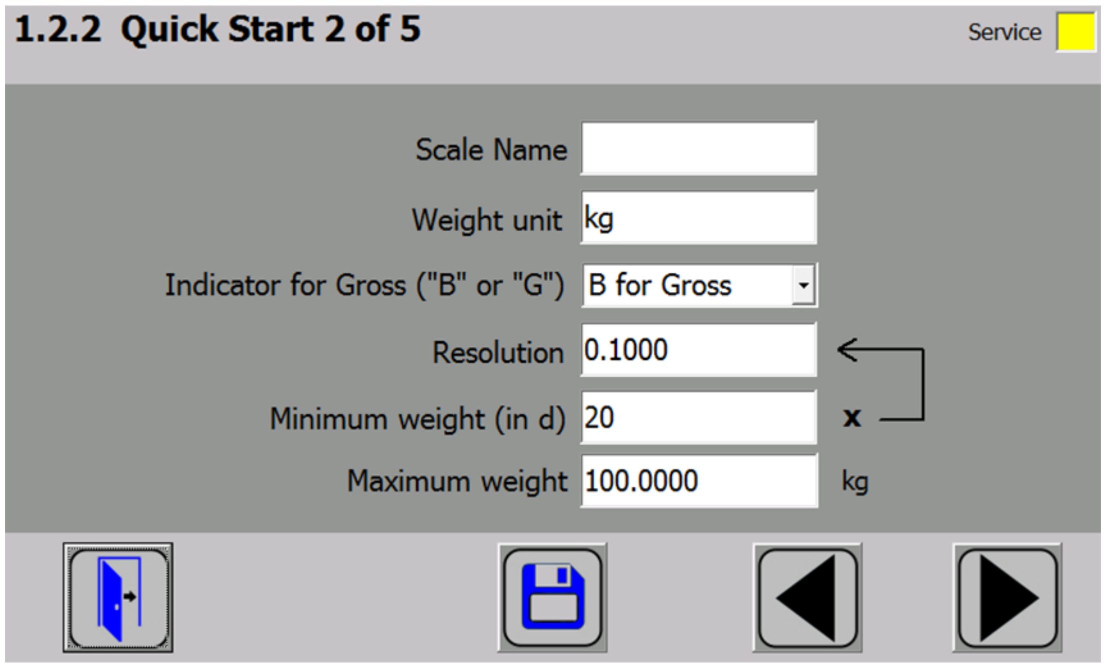

Figure 7-2 Quick start step 2

7.3.3 Selecting the calibration method

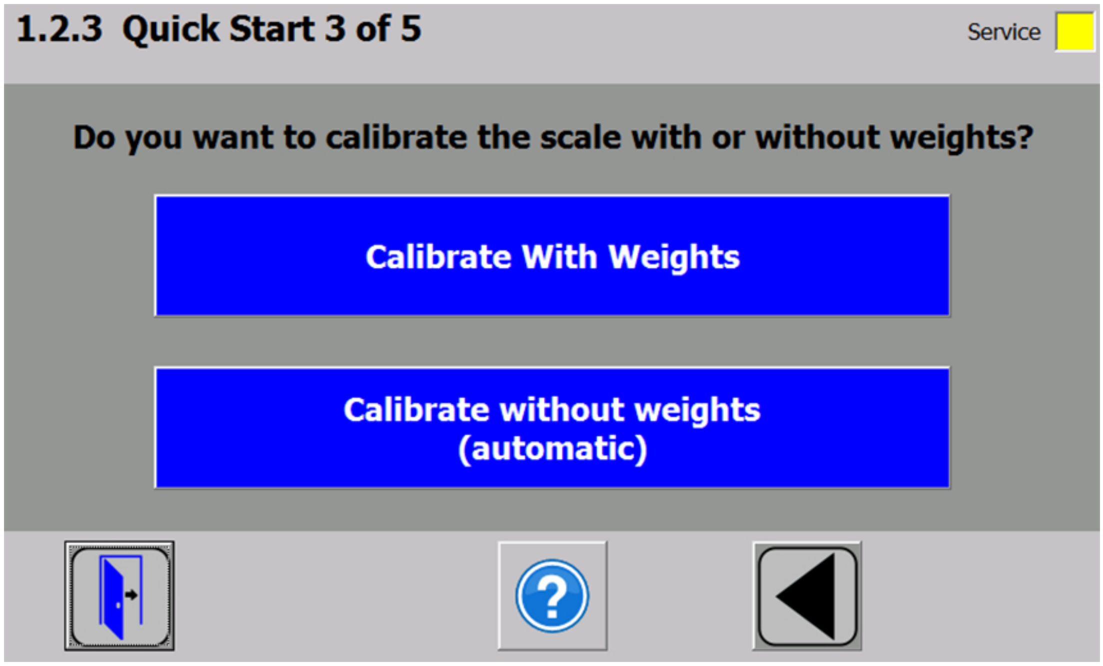

Figure 7-3 Quick start step 3

The module can always be calibrated in two different ways:

- Using reference weights: in the case of a calibration with weights, mechanical influences of the scale construction are also partially taken into account.
- Without weights, using the technical specifications of the connected load cell(s): in the case of automatic calibration, the accuracy of the scale is influenced by the mechanical properties to a greater extent than with calibration using reference weights.

With both methods, make sure that the mechanical properties of the scale are flawless prior to calibration.

7.3.4 Defining the calibration weights

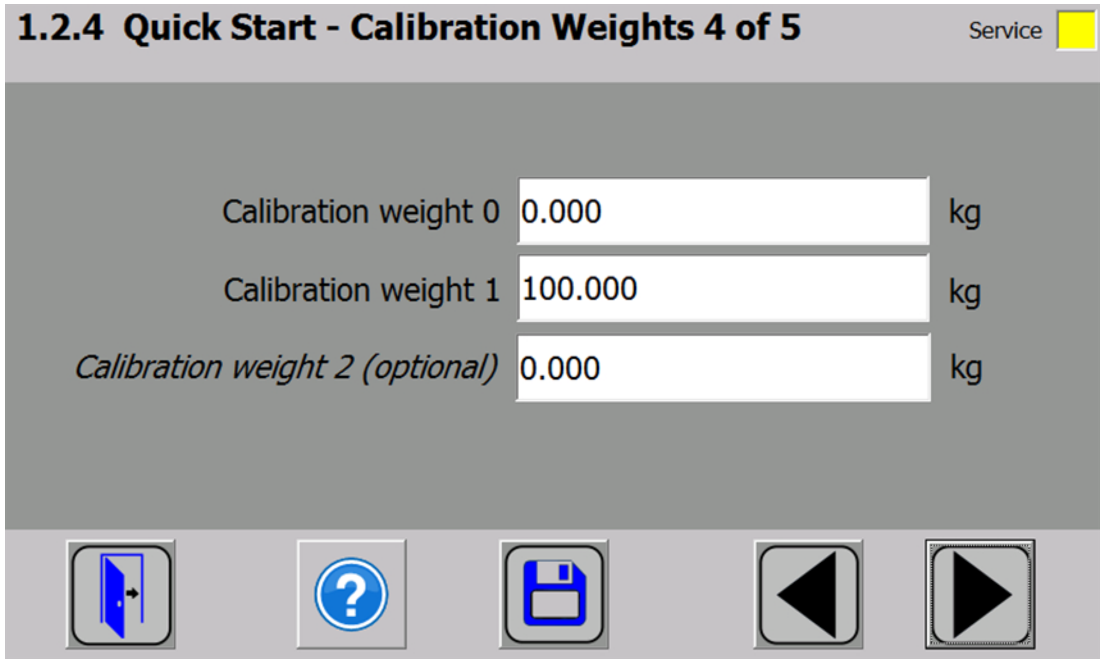

Figure 7-4 Quick start step 4a

In step 4 you enter the calibration weights which are to be positioned on the scale during the calibration. If the scale is not empty and the current contents are known, you can define an "Calibration weight 0" with the current contents of the scale. With an empty scale, this parameter remains as 0 kg. "Calibration weight 1" usually defines the first reference point of the scale characteristic. A further reference point ("Calibration weight 2") can also be set in addition. This is optional, and may not be necessary depending on the mechanical properties of the scale.

Note that the interval between the calibration weights must be at least 2% of the nominal load of the scale. With a 1 000 kg scale, a calibration weight of at least 20 kg must therefore be used.

7.3.5 Setting calibration points

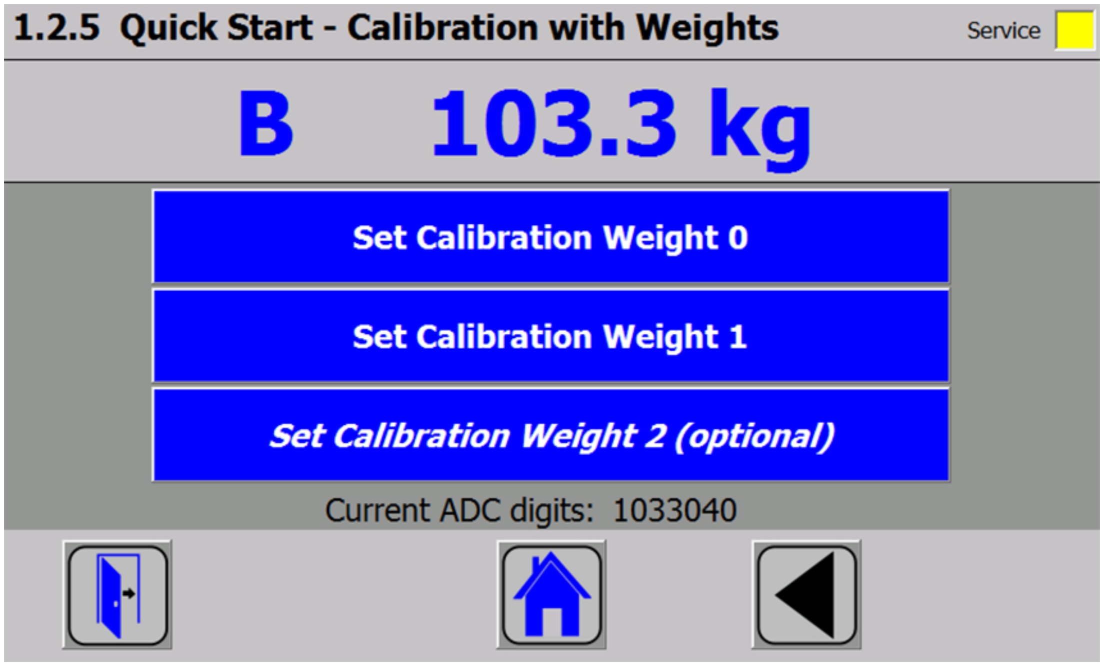

Figure 7-5 Quick start step 5a

Carry out the calibration commands at the end of the quick start:

1. Carry out the "Set calibration weight 0" command. The "Calibration weight 0" defined in step 4 is now visible in the display.
2. Place the "Calibration weight 1" defined in step 4 on the scale construction, and execute the "Set calibration weight 1" command.
3. If an "Calibration weight 2" was selected:
   Place "Calibration weight 2" defined in step 4 on the scale construction, and execute the "Set calibration weight 2" command.
4. Calibration of the scale is now complete. Return to the start screen by clicking on the house icon.

7.3.6 Calibrating the scale automatically

The scale can also be calibrated without weights. To do this, it is necessary to enter data specific to the load cells. In addition, it is essential that the scale is empty.

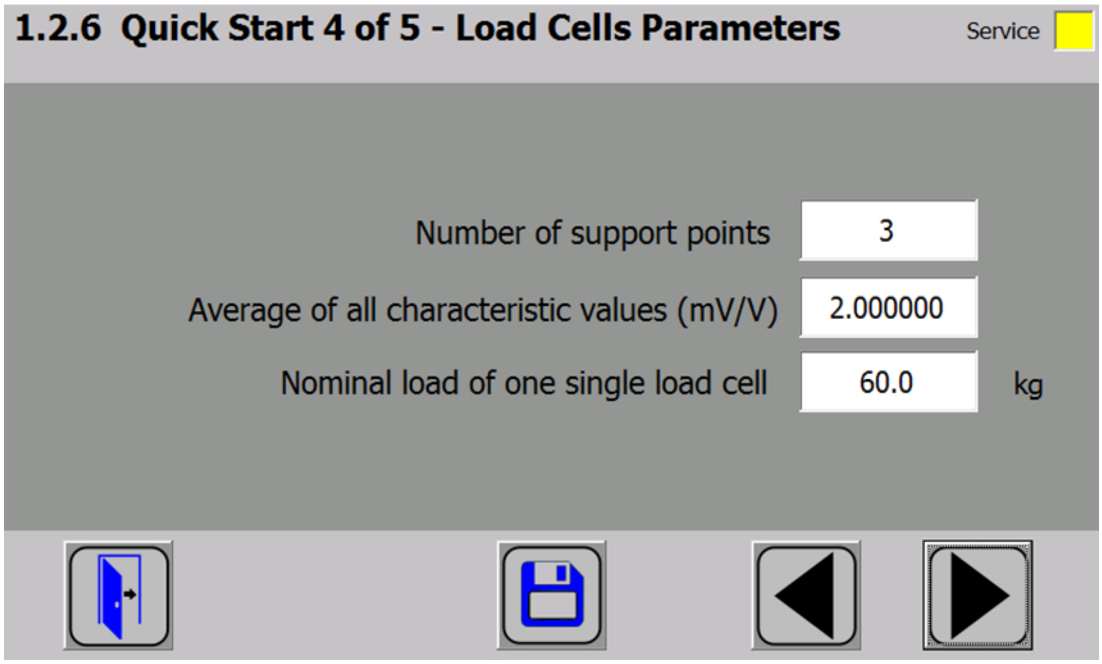

Figure 7-6 Quick start step 4b

The number of points of support corresponds with a silo, for example, to the number of clamps or feet of the silo. A quadratic platform scale with a load cell at each corner has 4 support points. The characteristic values of the individual load cells are required to calculate the average characteristic value of the cells.

The equation for the calculation is as follows:
(characteristic of cell 1 + characteristic of cell 2 + characteristic of cell n) / n

If the exact characteristic values are unknown, it is permissible to also use rounded-off numbers (e.g. 1.0 mV/V, 2.0 mV/V). The nominal load of an individual load cell (not the nominal load of the complete scale!) must subsequently be defined.

7.3.7 Performing the automatic calibration

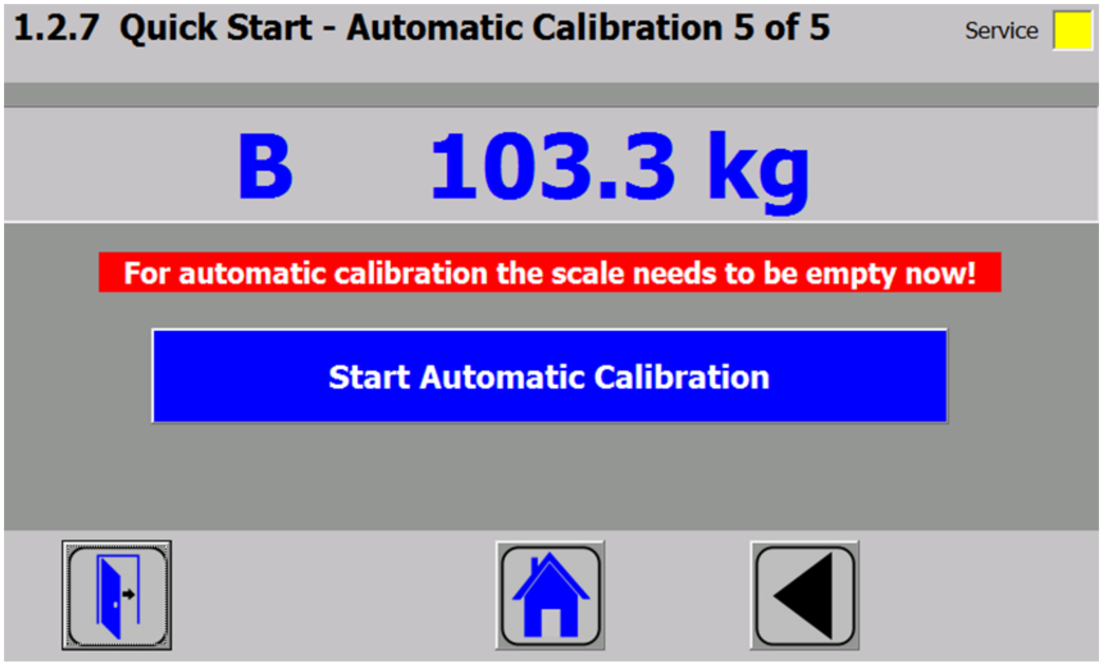

Figure 7-7 Quick start step 5b

Subsequently enter the "Perform automatic calibration" command with the scale empty. The scale is calibrated directly, and clicking on the house icon returns you to the start screen.

7.3.8 Checking the scale following calibration

If the scale is only used for company-internal purposes, a simple check is sufficient.

Perform the following steps:

1. The scale is unloaded and shows "0 kg".
2. Place a known reference weight on the scale.
   Check the displayed value.
3. If a second known reference weight is available, place it on the scale in addition.
   Check whether the scale displays the sum of the reference weights.
4. Remove the reference weights from the scale.
   Check that the display is "0 kg" again.

7.4 Fast commissioning (Quick Start) with SIWATOOL

7.4.1 Service with the SIWATOOL program

You can use the SIWATOOL program to commission the scale independent of the SIMATIC automation system. The program is included in the configuration package.

Install the SIWATOOL program (SIWATOOL folder) on your PC for commissioning.

The SIWATOOL program is described in the sectionService with the SIWATOOL program (Page 52).

You require an RS485-USB converter from Siemens in order to connect the PC to the SIWAREX (see section Accessories (Page 117)). You can then connect the RS485 interface of the SIWAREX to the USB port of the PC.

- Close the RS485-USB converter proposed by Siemens (see section Accessories (Page 117)) at the base unit of SIWAREX WP321 as follows:

RS485-USB converter	Base unit of SIWAREX WP321
Terminal A	Terminal 13 (D+)
Terminal B	Terminal 14 (D-)
Terminal X	-
-	Bridge between terminals 9 (T+) and 11 (D+‘)
-	Bridge between terminals 10 (T-) and 12 (D-‘)

7.4.2 Establish communication to SIWAREX WP321

- After starting the SIWATOOL program, select the SIWAREX WP321 from the "Device selection" window.

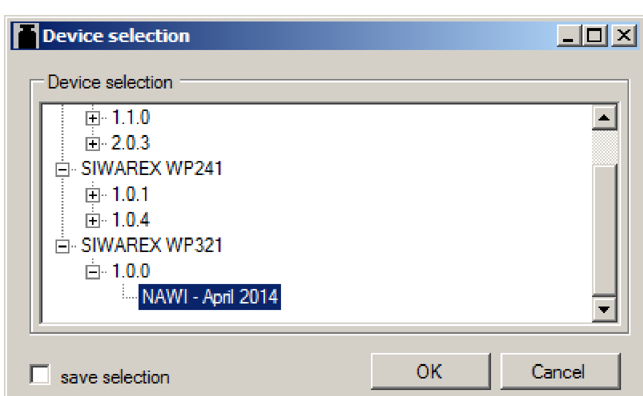

Figure 7-8 SIWATOOL: Device selection window

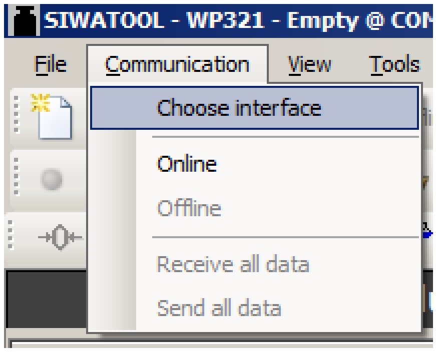
- Select the menu command "Communication" > "Choose interface".



- Select the COM port of your PC used for the RS485-USB converter (for example: COM3).

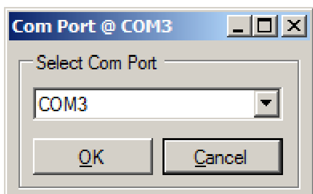


Figure 7-9 SIWATOOL: Select Com port window

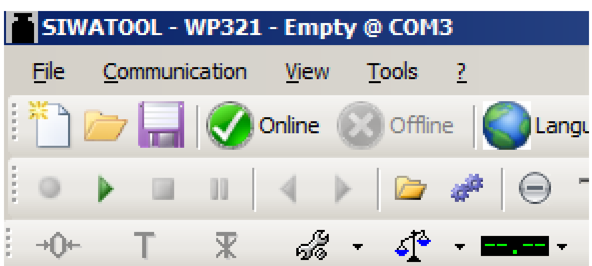
- Click on the "Online" button



⇒ The communication to SIWAREX WP321 is established.

7.4.3 Calibration

7.4.3.1 Selecting the calibration method

You can calibrate the SIWAREX module in two different ways:

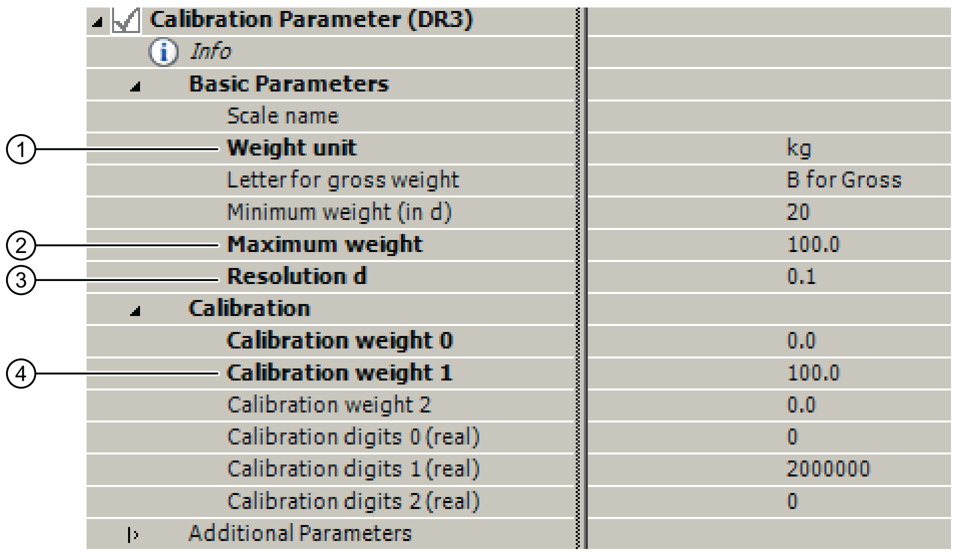
- Calibration with calibration weight (Page 43) When calibrating with calibration weights, mechanical influences of the scale construction are also taken into account.
- Automatic calibration (without calibration weight) (Page 47) When calibrating without calibration weights, the technical specifications of the connected load cell(s) are taken into account. With automatic calibration, the accuracy of the scale depends on the mechanical properties of the scale.

With both methods, make sure that the mechanical properties of the scale are flawless prior to calibration.

7.4.3.2 Calibration with calibration weight

Define calibration parameters

- Enter the marked and described calibration parameters.



① The defined weight unit applies to all weight specifications. You can specify a string with up to 4 digits as the weight unit, e.g.: t, kg, lbs.

② Exceeding the maximum weight (= maximum material to be weighed) is indicated in DS30, status 1-2, at parameter "Max 9e". If the maximum weight is exceeded, this bit is set to TRUE.

③ The resolution d is used for the weight display in the SIWATOOL program. You can set the resolution d in accordance with EN 45501 (0.0001 to 50).

④ Calibration weight 1 and its corresponding calibration digits define the characteristic curve of the scale.
Use a minimum calibration weight as calibration weight 1, with a load cell characteristic value of:

- 1 mV/V: 4 % of the total rated load of all load cells
- 2 mV/V: 2 % of the total rated load of all load cells
- 4 mV/V: 1 % of the total rated load of all load cells

Example

Number of load cells: 3

Nominal load of one single load cell: 100 kg

Load cell characteristic value: 2 mV/V

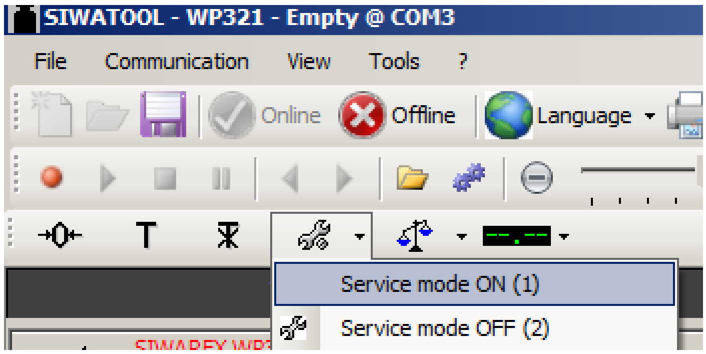
Use the following **minimum calibration weight** for calibration:

2 % x 3 x 100 kg = 6 kg

Figure 7-10 SIWATOOL: Calibration parameters for calibration with calibration weight

Send calibration parameters

- Send the calibration parameters set on your PC to SIWAREX.
- Select "Service mode on" in the Service menu. The calibration parameter (DR3) can only be sent and the calibration commands executed with service mode switched on.



⇒ After switching on service mode, the following red wrench icon is displayed in the SIWATOOL next to the weight value.

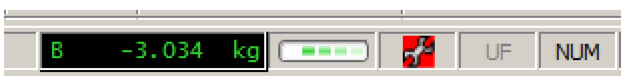


Figure 7-11 SIWATOOL: Symbol for service mode

NOTICE
Parameters overwritten It is not possible to send or receive individual parameters within a data record. The complete data record must initially be received for every change to parameters within it. The desired parameter can then be edited and the data record sent again. If not all the data can be received from the scale before the parameter change, the active offline parameters in the scale can be overwritten by the "Send data record" function. Therefore, proceed as follows: 1. Select the "Receive data record" function. 2. Change the parameters. 3. Select the "Send data record" function.

- Right-click on "Calibration parameter (DR3)" and select "Send data record".

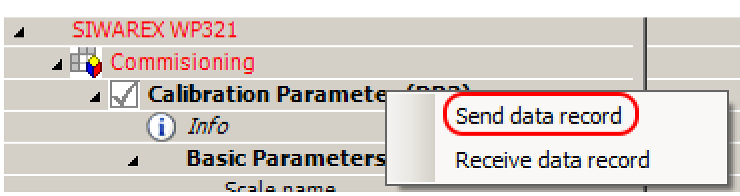

Figure 7-12 SIWATOOL calibration parameters: Send data record

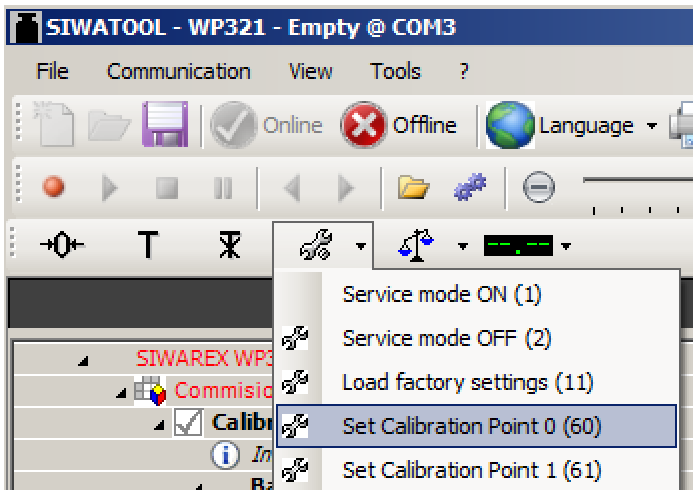
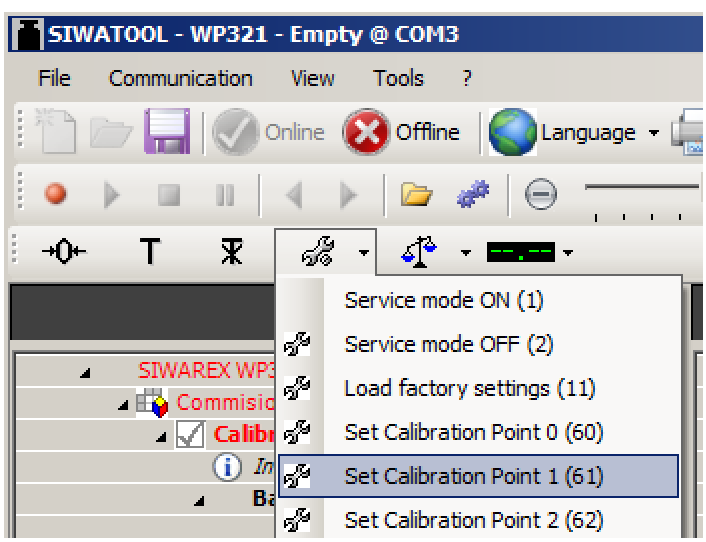
⇒ All parameter settings in DR3 are identical between PC and SIWAREX. All calibration parameters (DR3) are shown in black.

Assign calibration weight

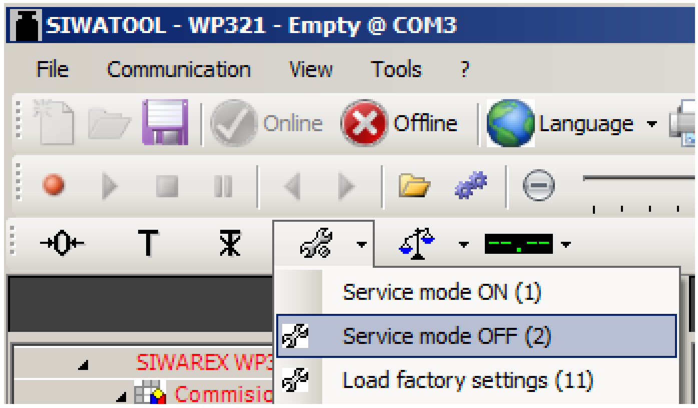
- After sending the calibration parameters to SIWAREX, select "Set Calibration Point 0" in the Service menu with an empty scale. Empty scale means only the mechanical dead load (e.g. empty container) rests on the load cells.



- Place the previously defined "Calibration weight 1" on the scale
- Select "Set Calibration Point 1" in the Service menu.



- Select "Service mode off" in the Service menu.



⇒ The calibration is finished and the correct weight value is now displayed in the SIWATOOL program.

Receiving calibration parameters

During the calibration, the SIWAREX internally changes its calibration digits. This means that SIWATOOL now has obsolete parameter values. Obsolete calibration parameters are marked in red.

The calibration parameter (DR3) must be read back in order once again obtain the calibration digits in the SIWATOOL which are consistent with the SIWAREX.

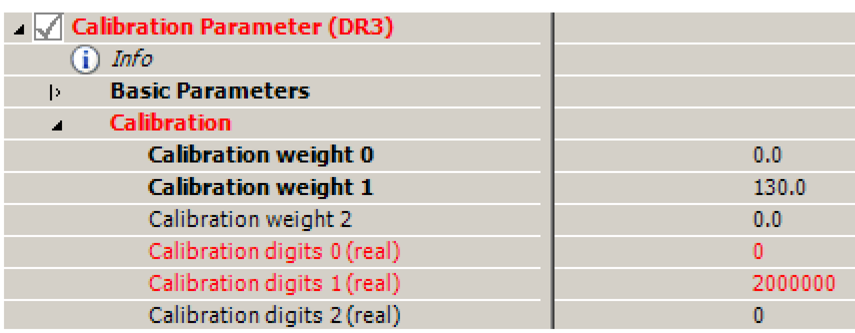


Figure 7-13 SIWATOOL: Obsolete calibration parameters

- Right-click on "Calibration parameter (DR3)" and select "Receive data record".

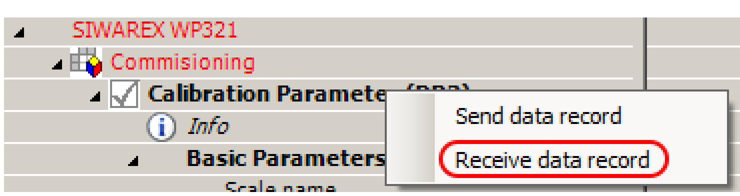

Figure 7-14 SIWATOOL calibration parameters: Receive data record

Checking the scale following calibration

If the scale is to be used for business purposes only, check it as follows:

1. The scale is unloaded and the display shows "0 kg".
2. Place one or more known test weights on the scale. To check other weight points of the scale in addition to the calibration weight, do not use the calibration weight.
3. Check the displayed weight value in the SIWATOOL program.
4. Remove the test weights from the scale.
5. Check that the display of the scale is 0 kg again.

7.4.3.3 Automatic calibration (without calibration weight)

The scale can also be calibrated without a weight. To do this, the parameters marked in bold in DR3 / basic parameters are checked or entered, and the data specific to the load cells are specified in DR10.

Requirement:

The scale is empty.

Procedure

- Enter the marked and described calibration parameters.

	Calibration Parameter (DR3)		
	Info		
	Basic Parameters		
	Scale name		
①	**Weight unit**	kg	kg
	Gross indicator	B for Gross	B for Gross
	Minimum weight (in d)	20	20
②	**Maximum weight**	100.0	100.0
③	**Resolution d**	0.1	0.1
	Calibration		
④	**Calibration weight 0**	0.0	0.0

① The defined weight unit applies to all weight specifications. You can specify a string with up to 4 digits as the weight unit, e.g.: t, kg, lbs.

② Exceeding the maximum weight (= maximum material to be weighed) is indicated in DS30, status 1-2, at parameter "Max 9e". If the maximum weight is exceeded, this bit is set to TRUE.

③ The resolution d is used for the weight display in the SIWATOOL program. You can set the resolution d in accordance with EN 45501 (0.0001 to 50).

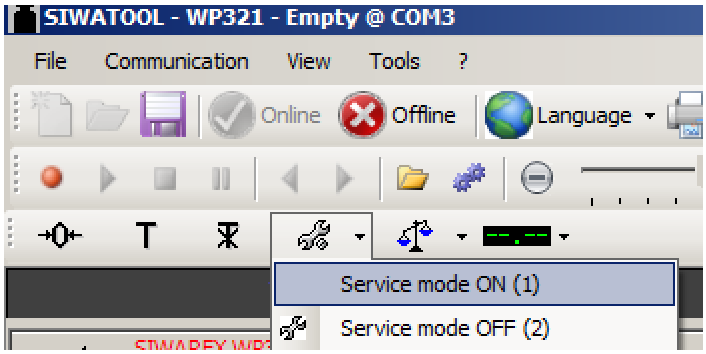
④ If the scale is not empty during automatic calibration, but the material weight on the scale is known (e.g. after conversion to SIWAREX WP321), the known material weight can be specified as calibration weight 0. This means the material weight is taken into account during automatic calibration.

NOTE: If the specified material weight is incorrect (old electronic weighing system was not calibrated correctly, for example), the weighing result of SIWAREX WP321 will be distorted or incorrect!

Figure 7-15 SIWATOOL: Calibration parameters for automatic calibration (without calibration weight)

Send calibration parameters

- Send the calibration parameters set on your PC to SIWAREX.
- Select "Service mode on" in the Service menu. The calibration parameter (DR3) can only be sent and the calibration commands executed with service mode switched on.



⇒ After switching on service mode, the following red wrench icon is displayed in the SIWATOOL next to the weight value.

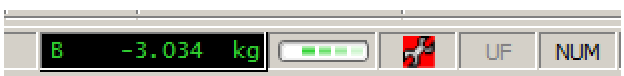


Figure 7-16 SIWATOOL: Symbol for service mode

NOTICE
Parameters overwritten It is not possible to send or receive individual parameters within a data record. The complete data record must initially be received for every change to parameters within it. The desired parameter can then be edited and the data record sent again. If not all the data can be received from the scale before the parameter change, the active offline parameters in the scale can be overwritten by the "Send data record" function. Therefore, proceed as follows: 1. Select the "Receive data record" function. 2. Change the parameters. 3. Select the "Send data record" function.

- Right-click on "Calibration parameter (DR3)" and select "Send data record".

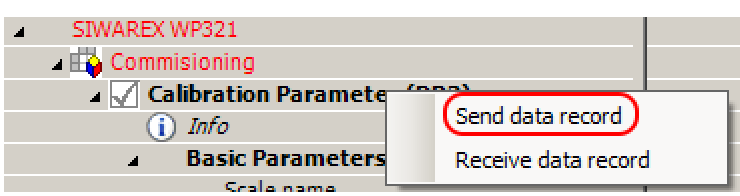

Figure 7-17 SIWATOOL calibration parameters: Send data record

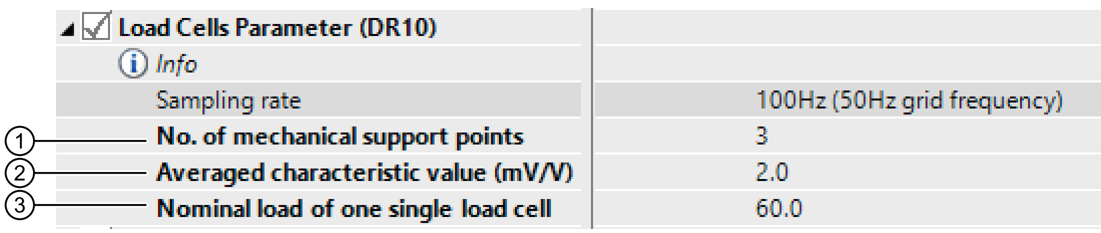
⇒ All parameter settings in DR3 are identical between PC and SIWAREX. All calibration parameters (DR3) are shown in black.

Defining load cell parameters

- Enter the marked and described load cell parameters (DR10) in DS10.



① The No. of mechanical support points corresponds with a silo, for example, to the number of clamps or feet of the silo. A quadratic platform scale with a load cell at each corner has four support points.

② Averaged characteristic value (mV/V) This parameter is the mean value of the characteristic values of all connected load cells (for example, Identifier = 2.018 mV/V). You can obtain the exact characteristic value of a load cell from its test report or read it directly at the load cell. If the characteristic values of the individual load cells are unknown, you can assume the value "1.0" for 1 mV/V load cells, the value "2.0" for 2 mV/V load cells, etc.

③ Specify the Nominal load of one single load cell.

Figure 7-18 SIWATOOL load cell parameters (DR10)

- Right-click on "Load cells parameter (DR10)" and select "Send data record".

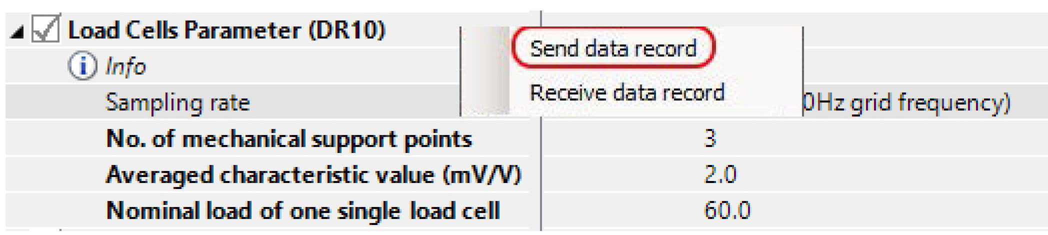


Figure 7-19 SIWATOOL load cell parameters: Send data record

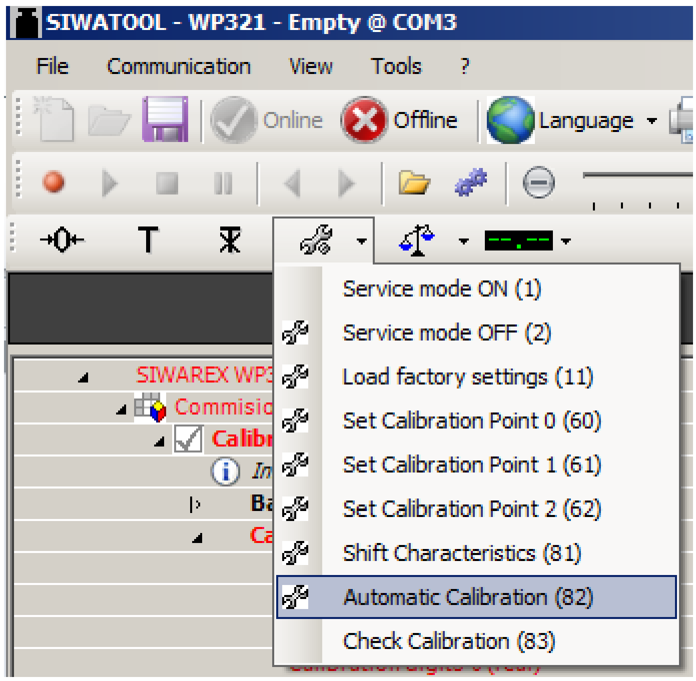
⇒ All parameter settings in DR10 are identical between PC and SIWAREX. All load cell parameters (DR10) are shown in black.

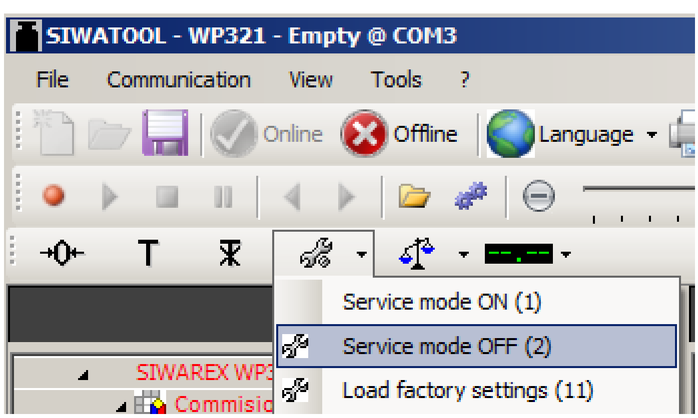
NOTICE
Parameters overwritten
It is not possible to send or receive individual parameters within a data record. The complete data record must initially be received for every change to parameters within it. The desired parameter can then be edited and the data record sent again. If not all the data can be received from the scale before the parameter change, the active offline parameters in the scale can be overwritten by the "Send data record" function. Therefore, proceed as follows: 1. Select the "Receive data record" function. 2. Change the parameters. 3. Select the "Send data record" function.

Run automatic calibration

- After sending the calibration parameters to SIWAREX, select "Automatic calibration" in the Service menu with an empty scale. Empty scale means only the mechanical dead load (e.g. empty container) rests on the load cells.



- Select "Service mode off" in the Service menu.



⇒ The calibration is finished and the correct weight value is now displayed in the SIWATOOL program.

Receiving calibration parameters

During the calibration, the SIWAREX internally changes its calibration digits. This means that SIWATOOL now has obsolete parameter values. Obsolete calibration parameters are marked in red.

The calibration parameter (DR3) must be read back in order once again obtain the calibration digits in the SIWATOOL which are consistent with the SIWAREX.

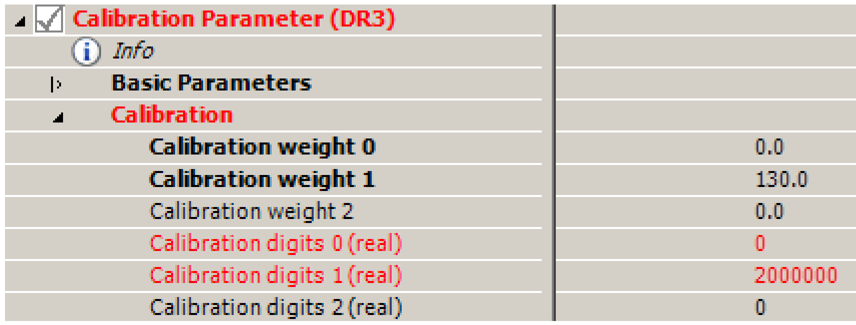


Figure 7-20 SIWATOOL: Obsolete calibration parameters

- Right-click on "Calibration parameter (DR3)" and select "Receive data record".

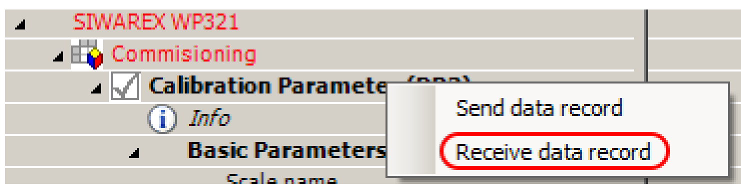

Figure 7-21 SIWATOOL calibration parameters: Receive data record

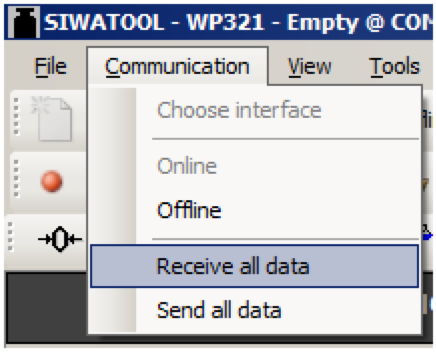
Checking the scale following calibration

If the scale is to be used for business purposes only, check it as follows:

1. The scale is unloaded and the display shows "0 kg".
2. Place one or more known test weights on the scale. To check other weight points of the scale in addition to the calibration weight, do not use the calibration weight.
3. Check the displayed weight value in the SIWATOOL program.
4. Remove the test weights from the scale.
5. Check that the display of the scale is 0 kg again.

7.4.4 Receive all data

- Activate the "Receive all data" function in the "Communication" menu.



⇒ All parameters can be saved as a backup file on the hard disk. If a module is replaced, the backup file can be downloaded to the new module within a few seconds. The new module is right back to the calibrated state - without repeated calibration.

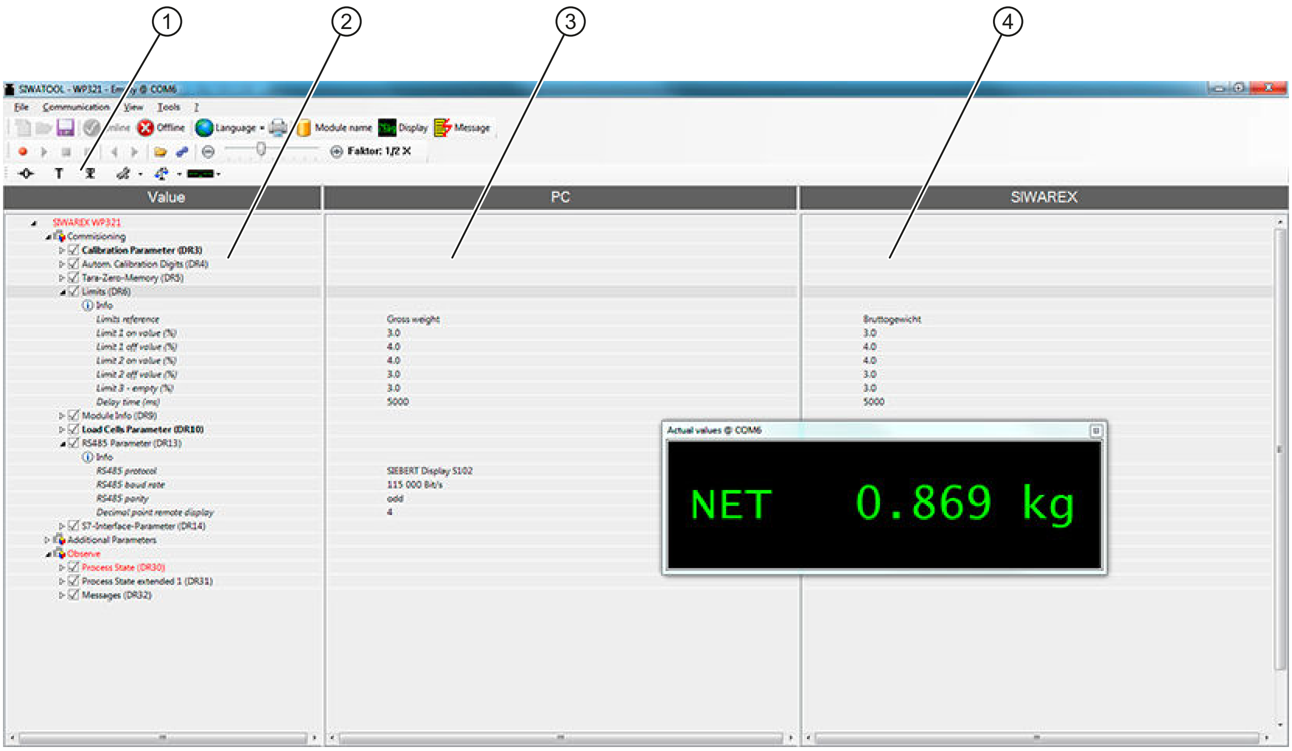
7.5 Service with the SIWATOOL program

You can use the SIWATOOL program to commission the scale independently of the SIMATIC automation system. You require an RS485/USB converter in order to connect the PC to the SIWAREX (see section Accessories (Page 117)). You can then connect the RS485 interface of the SIWAREX to the USB port of the PC.

The SIWATOOL program is included in the configuration package.

Install SIWATOOL for commissioning (part of the SIWAREX WP321 configuration package, see section Accessories (Page 117)) on your PC.

7.5.1 Windows and functions of SIWATOOL



①	Control elements for SIWATOOL and operation of the scale	③	Offline values of the SIWAREX module
②	Parameter list of the SIWATOOL module	④	Online values of the connected SIWAREX module

Figure 7-22 Layout of the SIWATOOL user interface

For sending, receiving and transferring, select the corresponding data record and call the command list with a right mouse click.

The complete data record (all parameters of the data record) is always transferred, not just individual parameters.

Parameters marked in bold are relevant for typical application cases.

7.5.2 Offline parameter assignment

All scale parameters can be edited and saved without an electronic weighing system.

This reduces the setup time. You can thus prepare the parameters for several scales in your office, and subsequently transfer them to the electronic weighing system during setup.

Data from one scale currently in operation can be exported and used to set up another scale.

7.5.3 Online parameter assignment

To switch to online mode, connect the PC to the SIWAREX module via an RS485/USB converter. Set the appropriate interface in the communication menu.

You can change all parameters in the SIWAREX module in online mode. The message window shows the current contents of the message buffer of the SIWAREX module. The current process values are displayed in the "Online" column.

For test purposes, you can send various commands to the SIWAREX module. Differences between the online/offline data are marked in red by SIWATOOL. This affects both the associated data record and the individual parameter.

In order to archive data, all data can be exported from the SIWAREX module and saved as a file or printed.

Note

You can edit all data in the SIWAREX module in online mode. The changes are not automatically imported to the corresponding scale data block in the SIMATIC CPU.

To download the data to the SIWAREX module, select the data record with a right mouse click and send it explicitly to the SIWAREX module.

Online parameter trends can be recorded and played back using the recorder function located at the top right-hand edge of SIWATOOL. You can use the "Configure recorder" button to select the data records to be recorded and to set the save parameters. The playback speed can be set using a slider.

7.5.4 Available help options

SIWATOOL offers various help options for operation:

- Info card
  You can select the "Info" item directly underneath the individual data records in the navigation tree. This info card explains how the data record influences the scale behavior.
- Tooltip
  If you move the mouse over a button or parameter, a corresponding help text is displayed.
- Help
  Click on the menu option "Help" to call up the SIWATOOL help. The Help can be opened separately.

7.5.5 Entering parameters with SIWATOOL

There is a defined procedure for handling parameters. The current parameters in the SIWAREX module are displayed in the right-hand window, while the parameter values on the PC are displayed in the left-hand window. The new parameter value is entered first in the left-hand window. If several parameters of the data record are to be changed, they are entered consecutively. The data record is subsequently selected in the tree view and sent to the SIWAREX modules using the right mouse button.

Parameters are always changed as complete data records, rather than individually.

8 Scale parameters and functions

8.1 Parameters and functions

All parameters are set to default values in the factory. You can restore the configuration to factory settings using the "Load factory settings" command.

The scales are ready for operation with the default parameter settings. You do not need to re-enter all parameters. The advantage of this solution is that you can decide the default values to be retain and the parameters that need to be adapted for your application.

All parameters are divided into data records (DR). The data records are organized in steps (tasks) to be implemented during commissioning or during the process.

The scale functions governed by the parameters are also described in the parameter description below.

First, the parameters of a given data record are displayed in a table. The detailed parameter description for the parameters of this data record then follows.

When it receives new parameters, the SIWAREX module runs a validation check. In the event of a parameter assignment error, the data record is not applied (not saved) by the SIWAREX module and a data/operator error is reported.

8.2 DR 2 command code

DR 2 is a special data record used to transfer commands to the SIWAREX module by SIWATOOL.

8.3 DR 3 calibration parameters

The calibration parameters need to be checked and if necessary modified for all scales.

The scale is basically defined by calibration parameters and calibration operation.

Procedure

- Check all parameters and modify them as required.
- Transfer the DR 3 data record from SIWATOOL to the scale.
- Calibrate the scale.
- Transfer the DR 3 data record from the scale to SIWATOOL.

Table 8-1 Assignment of data record 3

Variable	Note	Type	Length (bytes)	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	3	-	-
Length	Data record length information	UINT	2	r	124	-	-
Application	Information on which application the DR belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	65 635
Scale name header	Maximum length and actual length of string for scale name	UBYTE[2]	2	rw	12,12	-	-
Scale name (Page 60)	Scale name specified by user	STRING[12]	12	rw	" "	-	-
Weight unit header	Maximum length and actual length of string for weight unit (for example, g, kg, t, ...)	UBYTE[2]	2	rw	04,04	-	-
Unit of weight (Page 60)[1)]	Weight unit	STRING[4]	4	rw	"kg••"	-	-
Gross identifier header	Maximum length and actual length of string for weight unit	UBYTE[2]	2	rw	02,02	-	-

1) Parameter for calculation of calibration points

8.3.1 Scale name

You can select any name, but it may not exceed 12 characters. You can enter any designation.

8.3.2 Unit of weight

A string with up to four digits can be specified as the unit of weight, e.g.: t, kg, lbs. The defined unit of weight applies to all weight specifications. Entries are not be converted if the unit of weight has changed. Entries must be left-aligned.

8.3.3 Gross identifier

The gross identifier specifies the letter, B (for brutto) or G (for gross), to be used in the display for gross weights.

8.3.4 Maximum weighing range

The weight can only be used with the defined scale interval below the maximum weight (+ 9 d, d = scale interval). The maximum weight is defined during commissioning. Exceeding the maximum weight is indicated in the status (DR30).

The maximum weight depends on the number and type of load cells used.

8.3.5 Calibration weights 0, 1, 2 and calibration digits 0, 1, 2

The calibration weights and corresponding calibration digits define the characteristic curve of the scales. A detailed description can be found in section Calibration procedure (Page 64).

8.3.6 Scale interval

The scale interval for the weighing range can be defined in accordance with EN 45501 (0.0001 to 50).

8.3.7 Automatic zero adjustment

If required, you can carry out semi-automatic zeroing of the scale using the "Zeroing" command.

The automatic adjustment sets the scale to zero without a further command in the event of slow zero drifting. Slow drift is assumed if the OIML R76 criteria are met.

Note

If this function is enabled, the scale may eventually read zero after a slow drift even if they are fully loaded. The function can, however, be limited by specifying a maximum and minimum weight for zeroing.

8.3.8 Decimal places for process values

This parameter is used to specify the number of decimal places to which the process values are to be rounded. This value decouples the main display of the weight values from the values used in the control software.

8.3.9 Maximum tare load

The weighing module accepts any external tare specification which is less than the maximum tare load (percentage of maximum weighing range). Tare commands are also accepted provided that the current gross weight is less than the configured maximum tare load.

8.3.10 Maximum negative zeroing limit

Zeroing defines the current weight of the scales as zero.

You can limit the effect of the zeroing function. The limitation is based not on the current gross weight, but rather on the weight which the scales would display had there been no zeroing (time of scale calibration).

8.3.11 Maximum positive zeroing limit

You can limit the effect of the zeroing function. The limitation is based not on the current weight, but rather on the weight which the scales would display had there been no zeroing (time of scale calibration).

8.3.12 Standstill range

Standstill monitoring checks whether the scales are correctly balanced. Scale standstill is registered if the weight changes by less than a specified fluctuation in d (standstill value) over a specified time (standstill time). Standstill monitoring is used in static scale mode (commands: zeroing, taring). The diagram below illustrates how standstill monitoring works.

The current weight can only be registered in legal trade applications if standstill is reached.

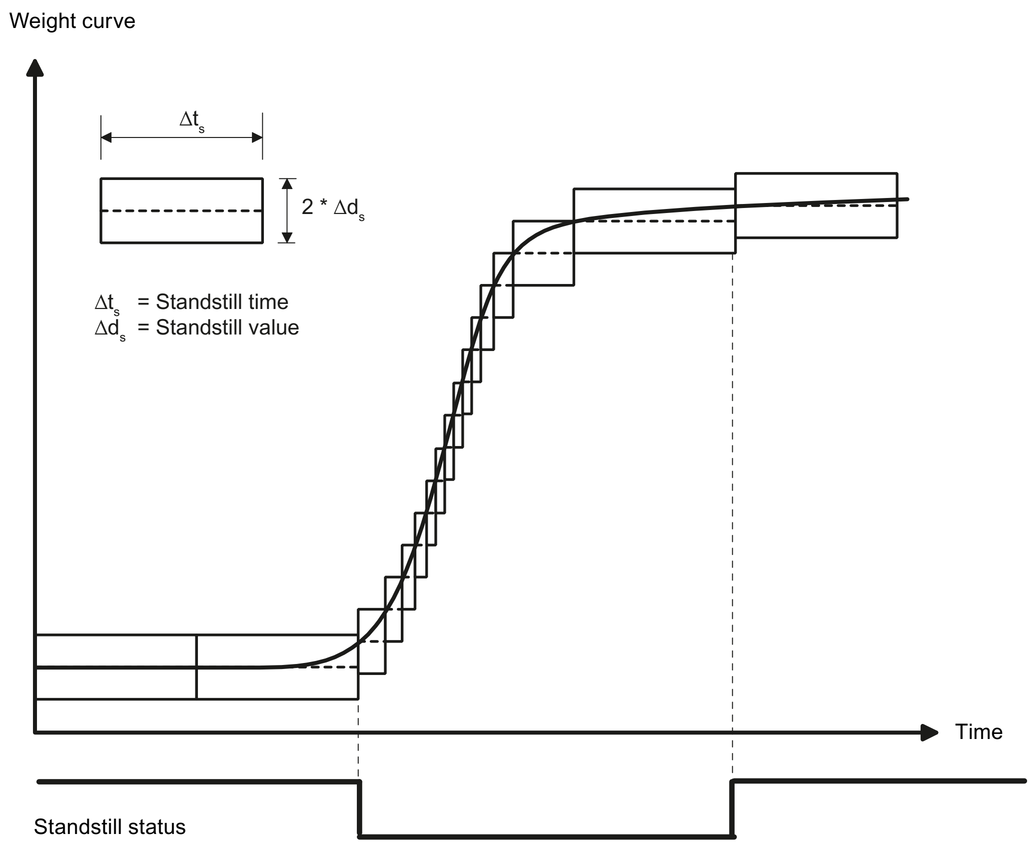

Figure 8-1 Standstill monitoring

8.3.13 Standstill time

Standstill monitoring checks whether the scales are correctly balanced. Scale standstill is registered if the weight changes by less than a specified fluctuation in d (standstill value) over a specified time (standstill time). Standstill monitoring is used in static scale mode (with the following commands: zeroing, taring).

8.3.14 Standstill waiting time

Standstill waiting time is a maximum waiting time for standstill on execution of a command which depends on standstill (taring, zeroing). A technology message is generated if the command cannot be executed during the standstill waiting time because there is no standstill.

If the standstill waiting time is equal to zero, a command requiring standstill is rejected immediately if there is no standstill.

8.3.15 Low-pass filter limit frequency

There is a critically damped low-pass filter for suppressing faults. The diagram below shows the step response of the filter (f_g = 2 Hz). The entry "0" means that the filter is switched off. The setting range of the limit frequency is 0.01 to 50.0 Hz.

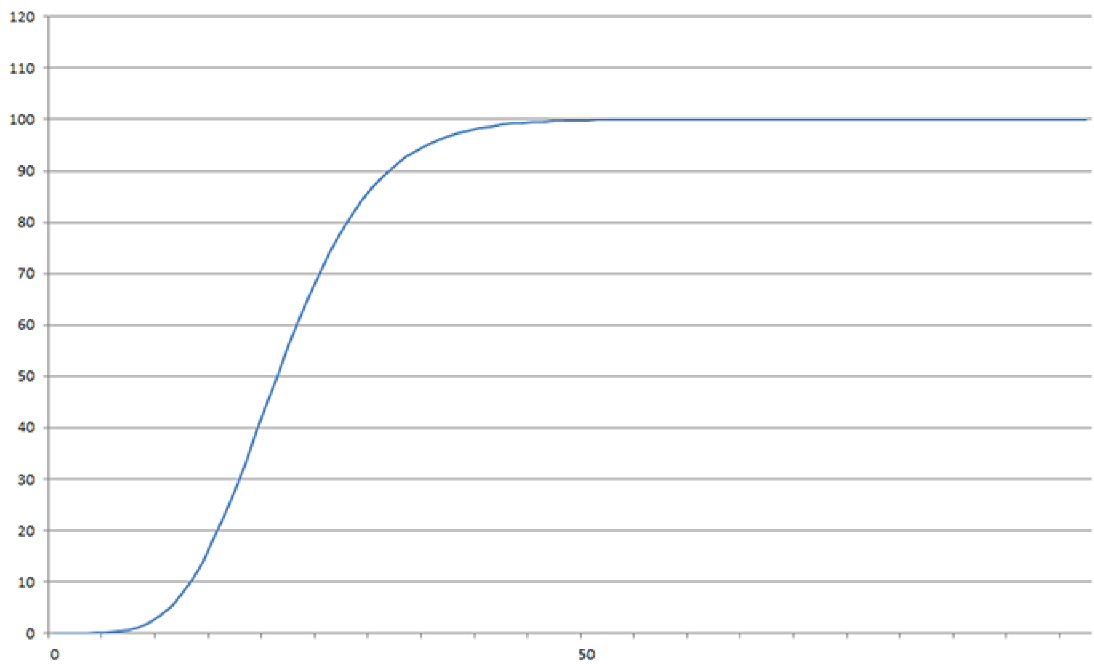

Figure 8-2 Step response of the digital low-pass filter when f_g = 2 Hz

When you define the limit frequency, it is extremely important for the suppression of faults. Defining the limit frequency defines the "speed" of the scale's response to changes in the measured value.

A value of 5 Hz, for example, results in a relatively rapid response to a change in weight. A value of 0.5 Hz, for example, makes the scale "slower".

Note

Process values filtered with low-pass filter 1 are available at the SIMATIC I/O (DR 14) and in the DR 30. Process values filtered with low-pass filter 2 can only be set to the SIMATIC I/O with the corresponding selection in DR 14.

8.3.16 Low-pass filter number

The number of the filter defines the effect of damping. The values 2 and 4 can be set. The higher the selected filter number, the higher the effect.

8.3.17 Mean value filter depth

The mean value filter is used to steady the weight against random interference. The weight is the mean value of n (n = max. 250) weights which are recorded by the weighing module every 10 ms, e.g. when n = 10, the mean of 10 weights is calculated. Every 10 ms, the oldest value is discarded and the newest value included in the calculation.

8.4 Calibration procedure

8.4.1 Calibration with calibration weights

The incoming analog measured value from the load cells is converted into a digital value in an analog-to-digital converter. A weight is calculated using this digital value. This weight is then used by all weighing module functions for messages and for determining the status.

The characteristic curve of the measuring system must be defined before the weight can be calculated from the digital value. In the simplest case, the characteristic curve is defined with points 0 and 1. The first working point (point 0) is defined by the empty scale (no load) at their own weight. The load cells return a voltage measurement to the weighing module as a result of the weight of the scales themselves. Following analog-to-digital conversion of the measured voltage, the zero point is assigned to the digital value (calibration digits for the zero point).

If the scales are loaded with a defined standard weight (e.g. 50% of the measuring range), the new digital value returned by the analog-to-digital converter is assigned the standard weight.

The characteristic curve can also be determined with a third point, which must be higher than point 1.

Make sure that the difference between two calibration weights is at least 40 000 digits, as the calibration command may otherwise be rejected.

The calibration procedure involves the following steps:

- Activation of service mode using the "Service mode on" command.
- Define the calibration weight and other parameters of the DR 3 data record.
- Transfer the DR 3 data record to the scales.
- Trigger "Adjustment weight 0 valid" for empty scales.
- Load the scale with the defined standard weight.
- Trigger "Adjustment weight 1 valid".
- Transfer data record DR 3 from the scale to SIWATOOL and save the data on a data medium.

You must follow the correct calibration sequence with increasing calibration weights.

Example

Zero point = 0.0 kg (always)	equals 326348 digits
Calibration weight 1 = 100 kg	equals 1324765 digits

Load cell characteristic value	Calibration digit 1 (ca.) when rated load is
1 mV/V	500 000
2 mV/V	1 000 000
4 mV/V	2 000 000

This defines the characteristic curve and the scale can now calculate weights for the full measuring range.

The diagram below illustrates the relationship between calibration digits and the calibration weight.

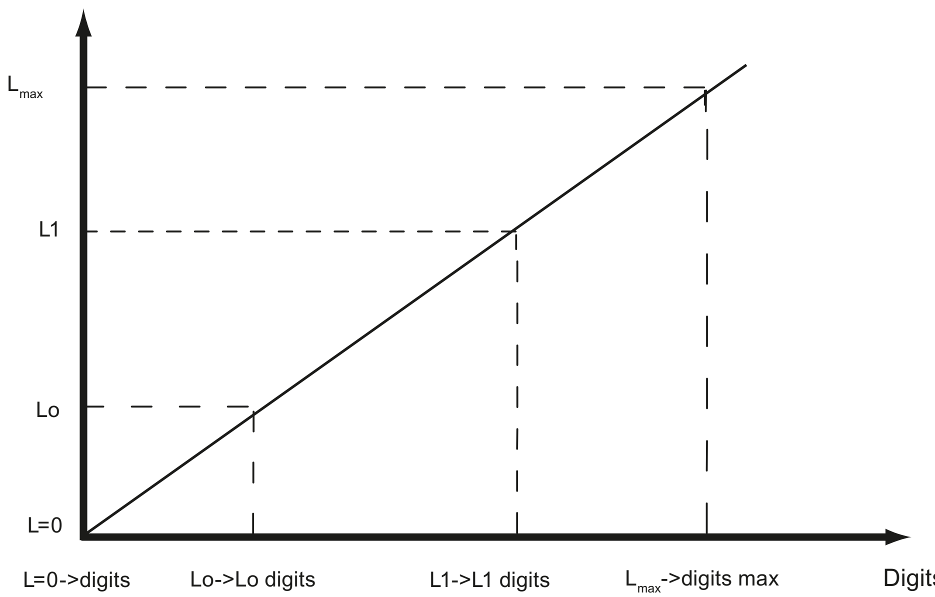

Figure 8-3 Calibration digits and calibration weight

Load	Comment	Load	Digits
L=0	Load cells empty		Approx. 0
Lo	Calibration weight 0 "Zero point"	0 kg	e.g. 70 682 for calibration point 0
L1	Calibration weight 1	e.g. 60 kg	e.g. 308 452 for calibration digits 1
L_{max}	Rated load of the load cell(s)	e.g. 100 kg	1 000 000
L_{max} +10 %	Rated weight + approximately 10%	e.g. approximately 110 kg	1 090 000

You do not need to perform calibration if the calibration digits and the calibration weights are known to the weighing module described here. They are simply sent to SIWAREX by data record DR 3 and the scale is ready for use immediately.

The SIWATOOL program facilitates rapid calibration.

Following commissioning and calibration, all data records must be read from the weighing module and saved as a scale file.

Identical scales can be put into operation immediately. Connect the PC to the new scale and enable the "Send all data records" function in service mode. This transfers the parameters for calibration weights and calibration digits, and the characteristic curve is determined immediately. The same applies when you change a weighing module.

Note

Two working points are usually sufficient for determining the scale's characteristic curve. An additional working point is only required for non-linear systems.

Specification of negative calibration points is not possible. However, the characteristic can also be used in the negative range down to -2 000 000 digits. To achieve this, the characteristic curve generated in the positive range is extended into the negative range.

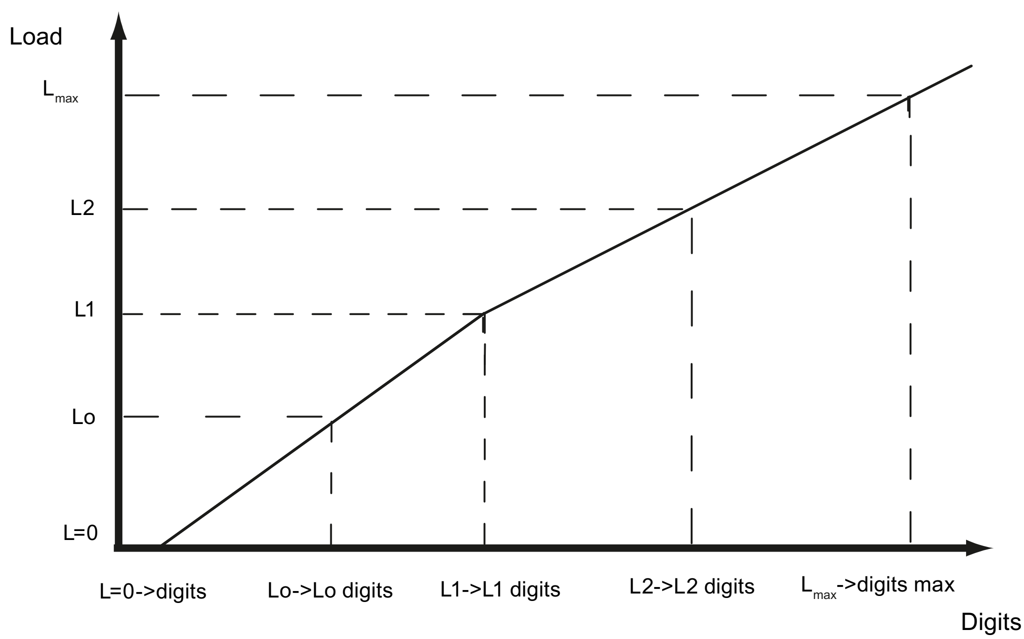

Figure 8-4 Linearizing the scale's characteristic curve

Load	Comment	Load	Digits
L=0	Load cells empty		Approx. 0
Lo	Calibration weight 0 "Zero point"	0 kg	e.g. 76 082 for calibration point 0
L1	Calibration weight 1	e.g. 60 kg	e.g. 386 452 for calibration digits 1
L2	Calibration weight 2	e.g. 80 kg	e.g. 451 367 for calibration digits 2
L_{max}	Rated load of the load cell(s)	e.g. 100 kg	1 000 000
L_{max} +10 %	Rated weight + approximately 10%	e.g. approximately 110 kg	1 090 000

8.4.2 Automatic calibration

Scales can be rapidly commissioned with automatic calibration. The accuracy of the scale greatly depends on the entered parameters and the mechanical properties of the scale. However, you achieve the best level of accuracy for the scales by using calibration weights.

During initial commissioning with automatic calibration, you must reset the module using the "Load factory settings" command.

Subsequently specify the basic parameters in DR 3 and the load cell parameters in data record 10. See also the section: Automatic calibration (without calibration weight) (Page 47). Command 82 "Perform automatic calibration" then uses this data and the currently applied dead load to calculate the characteristic curve of the scale. The characteristic curve is active immediately.

Note

The characteristic curve data in data record 3 active prior to execution of command 82 is directly overwritten.

Automatic calibration requires the following criteria:

- Correct mechanical installation of the scale
- Scale is empty (only mechanical installation (= dead load) present on the cells) or the material weight in/on the scale is known (e.g. after conversion to WP321).
- Load cells are evenly loaded
- There are no shunt circuits

8.5 DR 4 Output of calculated calibration digits

Date record DR 4 outputs the digits calculated from automatic scale calibration.

This data record cannot be sent to the scale.

Table 8-2 Assignment of data record 4

Variable	Note	Type	L	Rw	Default	Min.	Max.

8.5.1 Calibration digits 0, 1, 2 (calculated)

The calculation is based on the parameters from DR 3 and DR 10 identified by bold font and is activated by the command no. 82.

8.6 DR 5 zeroing memory

Data record DR 5 displays the current values in the tare memory and the zeroing memory.

Procedure

- Check all parameters
- Transfer the data record to the scale

Table 8-3 Assignment of data record 5

Variable	Note	Type	L	Rw	Default	Min.	Max.

Reserve 1	Reserve	INT	2	rw	0	-	-
Reserve 2	Reserve	UINT	2	rw	0	-	-
Reserve 3	Reserve	REAL	4	rw	0	-	-

8.6.1 Effective tare weight - from specification

A tare weight can be specified in data record DR 15. You activate the specified tare weight with a command (see command 1013). From this point on, the activated tare weight is factored into the weight calculations. The "Delete tare" command deactivates the active tare weight. This does not delete the specification in data record DR 15.

8.6.2 Effective tare weight (semi-automatic)

The corresponding command (see command 1011) applies the current gross weight as the active tare weight. From this point on, the activated tare weight is factored into the weight calculations. The "Delete tare" command deactivates the active tare weight.

8.6.3 Zero weight (semi-automatic)

The zero weight command (see command 1001) entered by the user sets the current gross weight to "Zero" provided it is within the defined zero setting limits. The current gross weight is saved as the zero weight. The zeroing weight must be within the specified range (usually +3 / -1 % of the set zero point).

8.6.4 Current zero tracking weight

The current zero tracking weight is recorded in this parameter if automatic zero tracking is activated.

8.6.5 Dead load

The characteristic curve of the scales is determined during calibration. When there is no load, the main display returns "0". The dead load is the weight of the empty scales, i.e. the weight of the scales themselves.

8.7 DR 6 limit value settings

The switch-on and switch-off values for the limits are configured in data record DR 6.

Procedure

- Check all parameters and modify them as required
- Transfer the data record to the scale

Table 8-4 Assignment of data record 6

Reserve	Reserve	UINT	2	rw	0	-	-
Reserve	Reserve	UINT	2	rw	0	-	-
Reserve	Reserve	REAL	4	rw	0	-	-

8.7.1 Limit reference

Value	Limit values relate to
0	Gross weight in % of max. weighing range
1	Net weight in % of max. weighing range
2	Absolute gross weight
3	Absolute net weight

The limit value "Empty" always relates to gross weight zero.

8.7.2 Limit value 1 ON, limit value 2 ON, limit value 1 OFF, limit value 2 OFF

The switch-on and switch-off points can be specified separately for each limit as a percentage of the measuring range or as absolutely values (based on "Limit reference" parameter setting). This allows both minimum and maximum value violation monitoring with hysteresis. A delay time for switch-on and switch-off can also be specified. Either the current net weight or the current gross weight can be selected as the reference value for limits 1 and 2. Negative limits are only possible with input of absolute values. Negative limits as percentage are rejected.

Maximum value monitoring is implemented with the following specifications:

- Switch-on value > switch-off value

Minimum value monitoring is implemented with the following specification:

- Switch-on value < switch-off value

The diagram below illustrates the function of limit values 1 and 2.

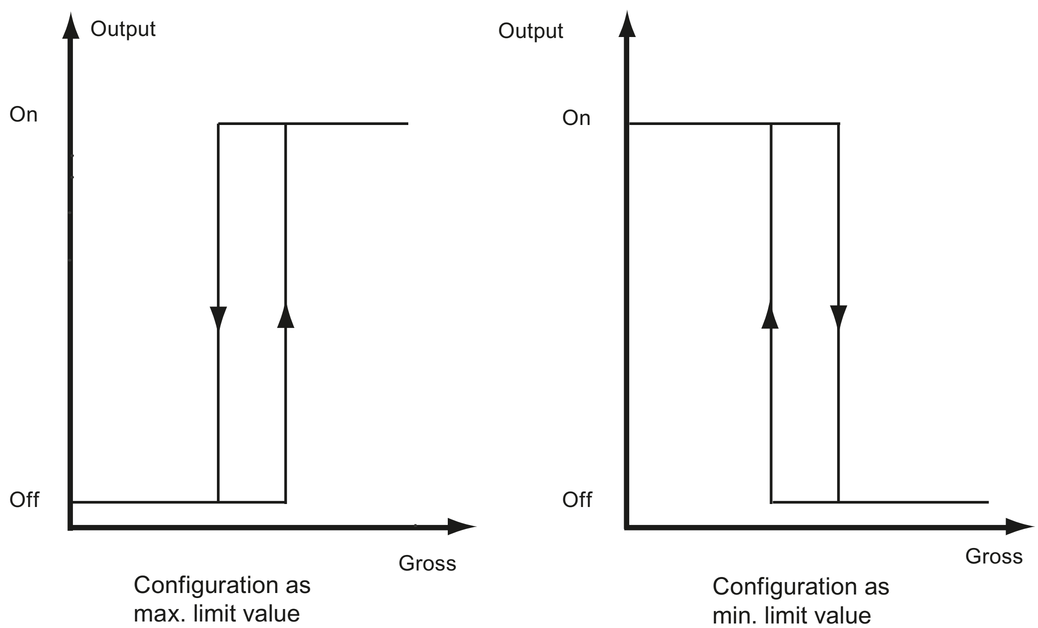

Figure 8-5 Limit value configuration

8.7.3 Limit value "Empty" ON

The value for the empty range is a limit value below which the weighing module registers and returns the status "empty". The values are entered as a percentage of the measuring range. The "Empty" limit always refers to the current gross weight in the scale.

The setting, whether absolute or a percentage, also affects the "Empty" limit.

8.7.4 Delay time for limits

If the weight reaches the specified switch value, a delay time (defined in ms) is launched. Once the delay time is over, the limit switch changes status provided the weight still reaches the specified switch value.

This delay time applies to the switch-on and switch-off values 1 and 2 and to the switch-on limit for the empty value. The empty value does not have a switch-off delay.

8.8 DR 9 module information

No entries can be made in data record DR 9. This data record provides information on the inner workings of the SIWAREX module. This information is used to identify the module at the manufacturer plant (e.g. in the event of repairs). The entries in the data record are of no importance to the user for operation.

Table 8-5 Assignment of data record 9

8.9 DR 10 load cell parameters

The parameters of the analog load cells must be checked prior to the automatic calibration and modified if necessary. Only the parameters identified by bold font and asterisk (*) need be entered.

Procedure

- Check the parameters and modify them as required
- Transfer the data record to the scale
- Adjust the scales

Table 8-6 Assignment of data record 10

[1)] Parameter for calculation of calibration points with theoretical calibration

8.9.1 Selection of the sampling rate

For better suppression of interferences, set the measuring rate and the line frequency as follows:

Measuring rate	Line frequency
100 Hz	50 Hz (parameter code 0)
120 Hz	60 Hz (parameter code 1)

Interferences can be caused by the power supply grid.

For fast measurements, you can select a measuring rate of 600 Hz (parameter code 2) as of firmware V1.2.0.

The setting has an effect on the frequency response of the signal path.

The following diagrams show the frequency response:

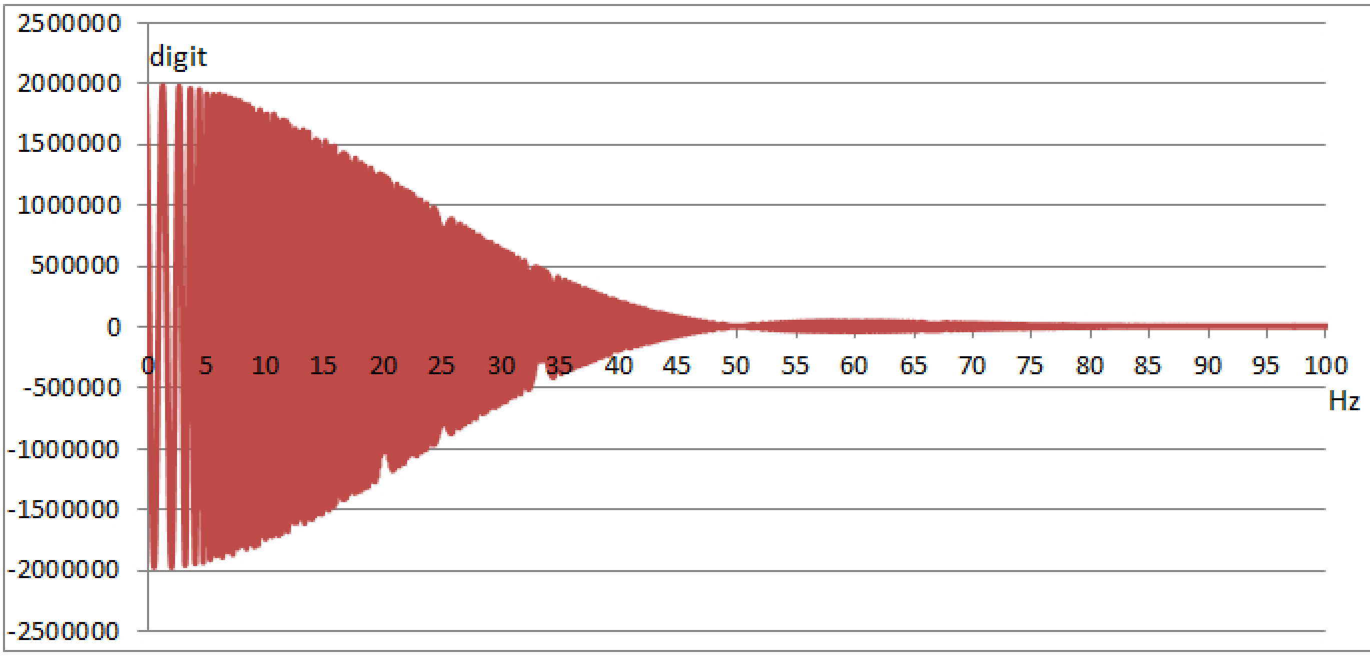

Figure 8-6 Signal behavior SIWAREX WP321: Sampling rate 50 Hz (unfiltered)

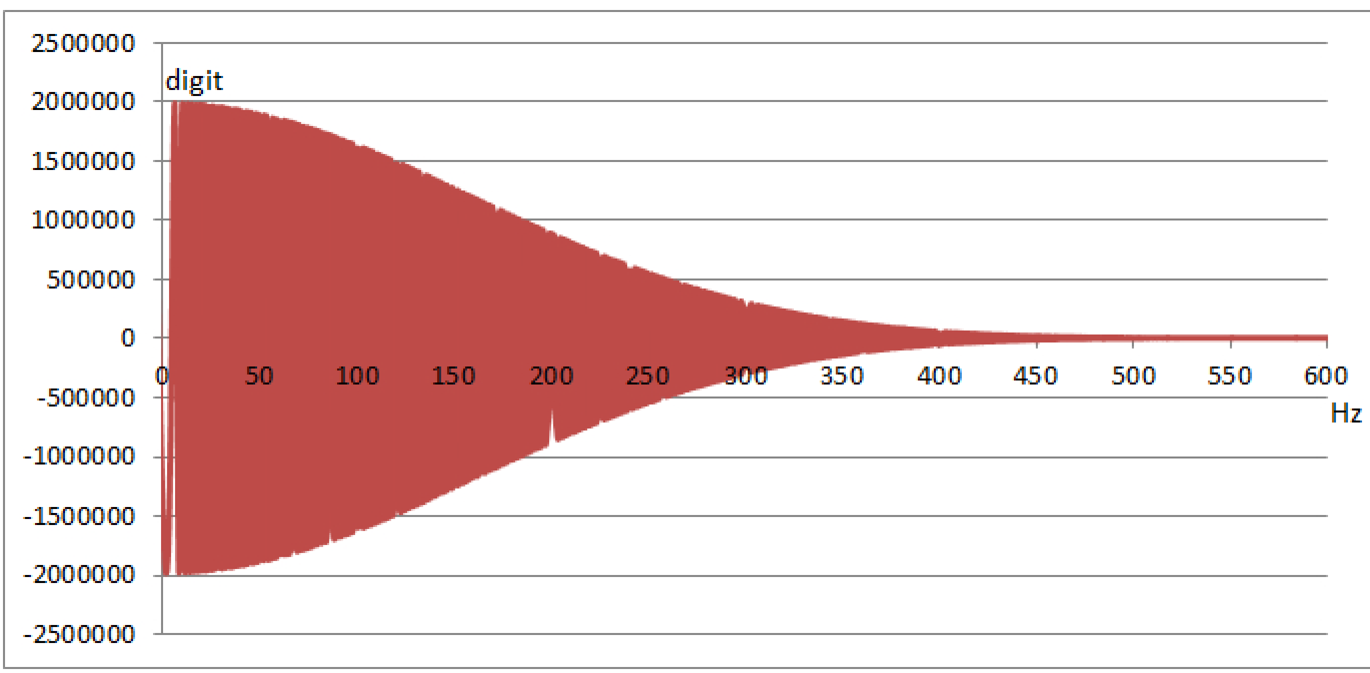

Figure 8-7 Signal behavior SIWAREX WP321: Sampling rate 600 Hz (unfiltered)

8.9.2 Number of support points

If no anchor points are used, the number of support points is equal to the number of load cells.

If anchor points are used in addition to load cells, the number of support points is equal to the total number of load cells and fixed support points.

8.9.3 Load cell characteristic value

The load cell characteristic value is required to correctly interpret the output voltage from the load cell. This specification is also necessary for determining load cell overload. The exact value can be entered if the measurement log for the load cell is available. The mean value can be entered if there is more than one load cell.

Example

Characteristic value = 2.018 mV/V

8.9.4 Rated load of a load cell

The rated load of a load cell is required for checking the maximum weighing range of the scales. The rated load is entered in the specified units of weight.

8.10 DR 13 RS485 parameters

The parameters which define the response of the RS485 interface are specified in data record DR 13. If the interface is not used, the default values can be retained.

Procedure

- Check the parameters and modify them as required
- Transfer the data record to the scale

Reserve	Reserve	REAL	4	rw	0	-	-

8.10.1 RS485 protocol

This parameter defines the protocol for communication via the RS485 interface. The SIWATOOL program does not require any presettings.

Value	Protocol
0	No communication/protocol
2	SIEBERT display

8.10.2 RS485 baud rate

This parameter defines the baud rate for the RS485 interface.

Value	Baud rate
0	9 600 bps
1	19 200 bps
2	38 400 bps
3	57 600 bps
4	115 000 bps

8.10.3 RS485 character parity

This parameter defines the character parity for the RS485 interface.

Value	Character parity
0	Even (for digital load cells from Mettler-Toledo)
1	Odd (for digital load cells from Wipotec)

8.10.4 Decimal place for Siebert indicator

A fixed decimal place must be specified if a Siebert indicator is used. The following values are permitted: 0 ... 4

8.11 DR 14 SIMATIC interface parameters

The parameters which define the response of the SIMATIC interface are specified in data record DR 14. It is possible to define the process values to be output on the basis of the I/O area.

Procedure

- Check the parameters and modify them as required
- Transfer the data record to the scale

Table 8-8 Assignment of data record 14

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	14	-	-
Length	Data record length information	UINT	2	r	16	-	-
Application	Information on which application the DR belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	65 635
Selection of process value 1, 2 (Page 80)	Code for the selection of the process variable to be updated	UINT	2	rw	4	0	10
Selection of process value 1, 2 (Page 80)	Code for the selection of the process variable to be updated	UINT	2	rw	3	0	10
Reserve 1	Reserve	INT	2	rw	0	0	-
Reserve 2	Reserve	UINT	2	rw	0	0	-

8.11.1 Selection of process value 1, 2

Read the current process values to the SIMATIC CPU with the DR 30 and DR 31 data records and the FB SIWA function block. The transfer of a larger data record is based on "acyclic services". It may take several SIMATIC CPU cycles and therefore have a negative effect on system performance.

The I/O interface of the SIWAREX module is the best option if a process value is to be rapidly transferred to the SIMATIC CPU as soon as it is created in the SIWAREX module. Data is applied cyclically by FB321 and provided as a tag in the scales data block.

The relevant code from the table below must be entered to define the tag for output via the I/O interface.

Table 8-9 Selection table for process value 1,2

Process value	Decimal code	From DR	Format
No process selected	0	-	-
Gross process (after low-pass filter 1)	1	30	REAL
Net process (after low-pass filter 1)	2	30	REAL
Tare process	3	30	REAL
G/N weight (after low-pass filter 1)	4	30	REAL
G/N weight_x10	5	30	REAL
Unfiltered digit value	9	31	DINT
filtered digit value (after low-pass filter 1)	10	31	DINT
Refresh counter	12	30	UINT
Async. Error bits (32-bit): bits 0..15: operator error Bits 16..31: technology error	15	32	DINT
Gross process (after low-pass filter 2)	7	-	REAL
Net process (after low-pass filter 2)	8	-	REAL
Filtered digit value (after low-pass filter 2)	11	-	DINT

8.12 DR 15 manual tare specification

Data recorder DR 15 is used for an external specification of a tare weight.

Procedure

- Enter the tare weight
- Transfer the data record to the scale
- Enable the tare weight using command 1013

Table 8-10 Assignment of data record 15

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	15	-	-
Length	Data record length information	UINT	2	r	16	-	-
Application	Information about which application the DR belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	65635
Specification of tare weight (Page 81)	Tare specification memory (manual tare value)	REAL	4	rw	0	0	Depends on specification in DR 3
Reserve	Reserve	REAL	4	rw	0	0	-

8.12.1 Specification of tare weight

You can enter a tare weight. If a tare weight is to be applied, it must be enabled with the corresponding command. The tare weight must not exceed the maximum tare load specified in data record DR 3.

8.13 DR 30 current process values

Current states and process values in the scales can be monitored using process values and advanced process values from data record DR 31. Monitoring selected data during commissioning is extremely useful as it helps you to optimize parameters.

Procedure

- Read data record DR 30 cyclically or on a time-triggered basis
- Display/analyze the required tags

It is not always necessary to cyclically read data record DR 30. If the relevant process tags have already been selected in data record DR 14 (→ DR 14 SIMATIC interface parameters

(Page 79)), they are immediately transferred via the I/O interface. In this case, these tags and all status bits and messages are accessible without data record communication.

Table 8-11 Assignment of data record 30

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	30	-	-
Length	Data record length information	UINT	2	r	44	-	-
Application	Information on which application the data record belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	255
1/4d zero	Set if gross is less than ± 0.25e	BIT	2	r	0	-	-
9e max	Set if the weight has exceeded the gross weighing range by more than 9 display steps (d)	BIT	0	r	0	-	-
Tared	Set if tare memory is not equal to zero	BIT	0	r	0	-	-
Manual tare set (pT)	Set if the tare memory is assigned an external specified value	BIT	0	r	0	-	-
Reserve		BIT	0	r	0	-	-
Waiting for standstill	Set if module is waiting for standstill to execute command	BIT	0	r	0	-	-
Standstill	Set if standstill condition is met	BIT	0	r	0	-	-
Reserve		BIT	0	r	0	-	-
Empty	Set if "Empty" condition is met	BIT	0	r	0	-	-
Limit value 1	Limit value 1 has responded	BIT	0	r	0	-	-
Limit value 2	Limit value 2 has responded	BIT	0	r	0	-	-
Reserve (5 bits)		BIT	0	r	0	-	-
DS32 error status change	Is set interface-specific with each DS32 change	BIT	2	r	0	-	-
Reserved (7 bits)		BIT	0	r	0	-	-
Calibrated	SIWAREX is calibrated	BIT	0	r	0	-	-
Service mode	Service mode is enabled	BIT	0	r	0	-	-
Reserve (3 bits)		BIT	0	r	0	-	-
SIMATIC connection inactive	Set if no connection to the SIMATIC exists on the part of the application	BIT	0	r	0	-	-
Startup	Startup has taken place (is deleted again after 5 seconds)	BIT	0	r	0	-	-
Fault status	Operating fault	BIT	0	r	0	-	-

Variable	Note	Type	L	Rw	Default	Min.	Max.
Gross process weight (Page 83)	Gross weight (process value)	REAL	4	r	0	-	-
Net process weight (Page 83)	Net weight (process value)	REAL	4	r	0	-	-
Tare process weight (Page 83)	Tare weight (process value)	REAL	4	r	0	-	-
Gross / net weight (Page 84)	Gross or net weight	REAL	4	r	0	-	-
Gross / net weight with increased resolution (x 10) (Page 84)	Legal trade G/N weight with 10x resolution	REAL	4	r	0	-	-
Refresh counter for process values (Page 84)	Cycle counter incremented by 1 if weight values have been changed	UINT	2	r	0	-	-
Operating time (hours)	Total operating time of the module (hours)	UINT	2	r	0	-	-
Operating time (minutes)	Total operating time of the module (minutes)	UINT	2	r	0	-	-
Reserve 3	Reserve	REAL	4	r	0	-	-

8.13.1 Gross process weight

The current gross weight. Values are rounded as specified in data record DR 3 with the "Decimal places for process values" (Page 61) parameter.

8.13.2 Net process weight

The current net weight. Values are rounded as specified in data record DR 3 with the "Decimal places for process values" (Page 61) parameter.

8.13.3 Tare process weight

The current tare weight. Values are rounded as specified in data record DR 3 with the "Decimal places for process values" (Page 61) parameter.

8.13.4 Gross / net weight

The current weight for the main display. The resolution corresponds to the scale interval (Page 61) specified in data record DR 3.

8.13.5 Gross / net weight with increased resolution (x 10)

The current weight for the main display in higher resolution. The resolution corresponds to the scale interval specified in data record DR 3 x 10.

8.13.6 Tare weight

The current tare weight (scale interval from DR 3). The resolution corresponds to the scale interval specified in data record DR 3.

8.13.7 Refresh counter for process values

Measured values are calculated every 10 ms in the SIWAREX module. A counter is incremented by 1 each time. Once the counter reaches the value 65536, it starts again from zero. The counter can be used as a time stamp for data record DR 30.

8.14 DR 31 advanced current process values

Current states and process values in the scales can be monitored using advanced process values and process values (DR 30). This data is not required for standard operation of the scales.

Monitoring selected data during trial operation is extremely useful as it helps you to optimize parameters.

Procedure

- Read data record DR 31
- Display/analyze the required tags

Table 8-12 Assignment of data record 31

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	31	-	-
Length	Data record length information	UINT	2	r	24	-	-
Application	Information about which application the data record belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	65635

Variable	Note	Type	L	Rw	Default	Min.	Max.
Unfiltered digit value (Page 85)	Unfiltered digit value of AD converters / digital load cells	DINT	4	r	0	-	-
Filtered digit value (Page 85)	Filtered digit value of AD converters or digital load cells after dig. filter 1	DINT	4	r	0	-	-
Reserve 1		INT	2	r	0	-100	100
Refresh counter for process values (Page 85)	Refresh counter incremented by 1 if weight values have been changed	UINT	2	r	0	-	-
Reserve 2		REAL	4	r	0	-	-

8.14.1 Unfiltered digit value

The unfiltered digit value is the internal measured value immediately before filtering.

8.14.2 Filtered digit value

The filtered digit value is the internal measured value immediately after filtering.

8.14.3 Refresh counter for process values

Measured values are calculated every 10 ms in the SIWAREX module. A counter is incremented by 1 each time. Once the counter reaches the value 65536, it starts again from zero. The counter can be used as a time stamp for data record DR 31.

8.15 DR 32 Message display

Data record 32 indicates all pending message bits. The bit "Error status changed" is present in the status bits of the DR30. If this bit is set, the message area of the DR32 has been changed.

The DR32 indicates which message has been newly added or deleted. The data record is automatically read by the SIMATIC FB in the event of an error. Following successful reading, the status bit is reset in DR30.

Table 8-13 Assignment of data record 32

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	32	-	-
Length	Data record length information	UINT	2	r	26	-	-

Variable	Note	Type	L	Rw	De-fault	Min.	Max.
Application	Information about which application the data record belongs to	UINT	2	r	101	-	-
Version identi-fier	Information on the current data record version	UINT	2	r	1	1	65635
1000	Operator error	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
1104	Undervoltage	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
1105	Overload	BIT		r	0	0	1
1106	Underload	BIT		r	0	0	1
1002	RAM error	BIT		r	0	0	1
1102	ADC error	BIT		r	0	0	1
1005	Hardware interrupt lost	BIT		r	0	0	1
1003	Checksum error data	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
1004	Checksum error program	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
1001	RESET / restart following error (watch-dog)	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
2000	Technology error	BIT		r	0	0	1
2001	Taring or zeroing timeout	BIT		r	0	0	1
Reserve (3 bits)	-	BIT		r	0	0	1
2005	Cold restart after voltage recovery	BIT		r	0	0	1
Reserve (10 bits)		BIT		r	0	0	1
5000	Data or operating error exists	BIT		r	0	0	1
5001	Command code or data record unknown	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
5003	Leaving calibration mode not possible	BIT		r	0	0	1
5004	Command or data transmission only available in service mode	BIT		r	0	0	1
5005	Command or data transmission not pos-sible because service mode is active	BIT		r	0	0	1
5006	Command or data transmission not pos-sible because BUSY	BIT		r	0	0	1
5007	Command or data transmission not pos-sible because module is faulty or ODIS is active	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1

Variable	Note	Type	L	Rw	Default	Min.	Max.
5101	Command is not permissible in this operating state	BIT		r	0	0	1
5102	Command not possible because not at standstill	BIT		r	0	0	1
5104	Command not possible because range is exceeded	BIT		r	0	0	1
5105	Load cell parameter not plausible	BIT		r	0	0	1
Reserve		BIT		r	0	0	1
5107	Shifting characteristic not possible	BIT		r	0	0	1
7000	Permitted number range violated	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
7002	Specifications of string lengths not plausible	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
7006	Command only possible in test field	BIT		r	0	0	1
7007	The calibration weights or calibration digits are not plausible	BIT		r	0	0	1
7008	Zeroing/zero setting or tare parameter not plausible	BIT		r	0	0	1
7009	Standstill range / standstill wait time not plausible	BIT		r	0	0	1
7010	Scale interval / rounding not plausible	BIT		r	0	0	1
7011	Filter parameter not plausible	BIT		r	0	0	1
7014	Time input not plausible	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
Reserve	-	BIT		r	0	0	1
7019	RS485 parameter error	BIT		r	0	0	1
Reserve	-	UINT	2	r	0	-	-
Reserve	-	UINT	2	r	0	-	-
Reserve	-	UINT	2	r	0	-	-

8.15.1 Error bytes 0 to 7

In these areas, messages are represented by bits. A set bit means that the corresponding message is activated. The message bit is set following a data or operator error and automatically reset approximately 3 seconds later.
Message bits are analyzed by the operator panel message system.

The data/operator errors (error numbers 1xxx) are present in the first two bytes. These are followed by two bytes with technology errors (error numbers 2xxx) and six bytes with data and operator errors (error numbers 5xxx and 7xxx).

8.16 DR 34 ASCII main display value

The ASCII weight corresponds to the value on the main display of the scales and can be used for a supplementary display as well as the main display.

Table 8-14 Assignment of data record 34

Variable	Note	Type	L	Rw	Default	Min.	Max.
Data record number	Contains no. of data record	UINT	2	r	34	-	-
Length	Data record length information	UINT	2	r	26	-	-
Application	Information about which application the DR belongs to	UINT	2	r	201	-	-
Version identifier	Information on the current data record version	UINT	2	r	1	1	65635
ASCII display string header	Maximum length and actual length of string	UBYTE[2]	2	r	16,2	-	-
Content of main display as ACII string (Page 88)	For display of the weight value and other current values (see below)	STRING[16]	16	r	" "	-	-

8.16.1 Content of main display as ACII string

The following values can be displayed:

Variable	Command
Switch on increased resolution	701
Current tare weight	705
Gross/net display	710
Net process value	714
Gross process value	715
Serial number	871
Firmware version	875

Below are some display examples. Commands are used to toggle the display values.

The values to be displayed are suppressed if a fault is present.

	Value designation N: Net, B/G: Gross, T: Tare, pT: Preset tare, S: Sum, ...		Blank	Display value									Unit of weight (from DR 3)
Weight (Tare ≠ 0)	N	•	•	•	•	•	2	2	0	,	5	0	•kg•
Neg. weight (Tare = 0)	B	•	•	•	•	•	•	-	0	,	0	3	•t••

	Value designation		Blank	Display value									Unit of weight (from DR 3)
	N: Net, B/G: Gross, T: Tare, pT: Preset tare, S: Sum, ...												
Weight in increased resolution	•	•	•	•	•	•	1	0	,	0	0	3	HIGH
Operator error	B	•	•	•	•	•	•	l	r	r	o	r	****
Tare display activated (pt)	p	T	•	•	•	•	•	5	0	,	5	0	•kg•
Tare display activated	T	•	•	•	•	•	•	5	0	,	5	0	•kg•

Messages 9

9.1 Message types

The messages in the electronic weighing system described here are divided into three types.

System status messages

System status messages can be generated spontaneously at any time by an unexpected event. They include internal and external hardware problems which can occur spontaneously during weighing.

Data and operating errors

The data and operating errors are always a response to a command due to a plausibility check.

These are data errors if a plausibility error has been detected in a data packet which was sent to the module and receipt of the packet has been rejected by the module.

These are operating errors if the module cannot execute the sent command in its current operating state.

Technology errors

Technology errors occur spontaneously due to the process flow of a weighing.

Status bits, on the other hand, are not messages. The status displays describe the status of the scale during normal operation and can be monitored or evaluated at any time.

9.2 Message paths

You can read out the messages using different paths. You define the path for forwarding and processing of messages during configuration.

The messages are processed for two basic purposes:

- For display or recording on an operator panel for the operator
- For linking in the control software to control specific reactions in the process.

The following message paths are possible:

- Output of the message buffer to the SIWATOOL program (takes place automatically)
- Output by means of function block as bit field in Scale data block
- Certain operating errors can be transmitted as diagnostic interrupts to the SIMATIC CPU and evaluated by OB82

9.3 Evaluating messages with the help of SIWATOOL

The electronic weighing system has a message buffer that can hold up to 10 entries. If the number of messages in the message buffer exceeds 10, the oldest entry is overwritten. The message buffer can be read out at any time with the help of SIWATOOL (menu item "Read out all data records") and saved together with the scale parameters. This facilitates the detection, analysis and correction of errors in the system.

9.4 Detecting messages with the help of FB SIWA

All messages of the SIWAREX module can be completely detected and processed in the controller with the help of the SIWAREX WP321 function block. The messages can be evaluated directly in a signaling system by means of a bit signaling area in the scale data block. The message texts are stored in the signaling system. The message text is output when a bit becomes "1".

9.5 Message list

The message list is an overview of all messages that the SIWAREX module can generate. A message can be quickly identified by the message code (number).

9.5.1 System status message list

Operator error (code 1000 to 1999)	Error code	Description and remedy
1000 operating error exists	1000	Group message, at least one operating error exists.
1001 Watchdog	1001	Watchdog, error is displayed for at least 10 seconds. A serious error has occurred in the function of SIWAREX, e.g. program error, severe electromagnetic influence on device, etc. Contact the SIWAREX Support if the error occurs multiple times.
1002 RAM error	1002	RAM error. An error has occurred in the memory; the memory content is no longer correct. The module must be switched off. If the error occurs again, SIWAREX is defective.
1003 Checksum incorrect parameter	1003	Checksum error at parameter. Critical error because the parameters are no longer safe.
1004 Checksum incorrect program	1004	Checksum error program code. Critical error because the program is no longer safe.
1102 ADU error	1102	AD converter error when reading in the measured value. If the error occurs again, make sure that the EMC recommendations are observed (chapter EMC-compliant setup (Page 22)).
1104 Undervoltage	1104	Undervoltage at sensor cables
1105 Overload	1105	Overload of scale (ca. 110%)
1106 Underload	1106	Underload of scale (ca. -10%)

9.5.2 Technology error message list

Technology error (code 2000 to 4999)	Error code	Description and remedy
2000 Technology error exists	2000	Group message, at least one technology error exists
2001 Taring/zeroing timeout	2001	Taring of scale or set to zero is not possible because a standstill was not reached during the standstill time. The command was discarded.
2005 Reboot after power reset	2005	Reboot after voltage recovery or FW update

9.5.3 Data and operating errors message list

Data and command errors (code 5000 to 8999)	Error code	Description and remedy
5000 Data or comand error exists	5000	Group error, a bit is set in the data and operating error bits
5001 Data record or comand unknown	5001	Command code or data record is not known with current application
5003 Cannot exit service mode	5003	Cannot exit service mode; calibration incomplete
5004 Command or data transfer only permitted in service mode	5004	Activation of service mode is required to execute command or transmit data
5005 Command or data transmission not possible because service mode is active	5005	Command can currently not be executed because service mode is active
5006 Command or data transfer not possible while BUSY	5006	Command can currently not be executed because module is BUSY (data record or command transmission already active, …)
5007 Command or data transmission not possible because module is faulty or SIMATIC CPU stop	5007	Command can currently not be executed because of a problem or SIMATIC CPU stop
5101 Command is not permissible in this operating state	5101	Command is not permissible in the current operating state
5102 Comand not possible while not standstill	5102	Scale command (set to zero, tare, log, …) cannot be executed because standstill is missing.
5104 Command not possible while limit exceeded	5104	Command (e.g. set to zero, tare, calibrate command) cannot be executed because the permitted range has been exceeded.
5105 Load cell parameters not plausible	5105	Load cell parameters in data record DR 10(a) or data record DR 11(d) not plausible (number, supporting points, load specifications, etc.).
5107 Calibration charcteristic shift not possible	5107	Characteristic cannot be moved due to possibility of range violation.
7000 Permitted number range violated	7000	The permitted number range, such as for weight values, was violated.
7002 Length of ASCII string not plausible	7002	The string header in a specified string variable is not plausible.
7007 Calibration weights / Calibration digits not plausible	7007	Specifications for calibration weights or digits in data record DR 3 are incorrect (minimum distance, reversal of incline).
7008 Zeroing or tare parameter not plausible	7008	The specifications (data record DR 3) or tare specifications (data record DR 15) are not plausible.
7009 Standstill range / standstill wait time	7009	Standstill range or standstill wait time are not plausible.

Data and command errors (code 5000 to 8999)	Error code	Description and remedy
7010 Scale interval / rounding	7010	Resolution or selection for rounding to decimal places is not plausible.
7011 Filter parameters	7011	Specification of filter parameters is not plausible.

9.5.4 Messages by LEDs on the module

The LEDs on the front of the SIWAREX module signal the following status and error messages.

Item	Color	Labeling	Function
Line 1			
H1	red	**DIAG**	System fault
H2	Green		Ready
H11	yellow		Limit 1 responded
H12	yellow		Service mode
H13	yellow		Limit 2 responded
H14			Not used
H15	yellow	**{E}**	Empty message
H16			Not used
H17	Green		Standstill triggered
H18			Not used
H19	Green	**0**	¼ d zero status
H20			Not used
H21		**Max**	Weighing range exceeded
H22			Not used
H23	Green	**LC**	Load cell(s) ready for operation (LED off = load cells faulty)
H24			Not used
H25	yellow	**Rx/Tx**	EIA-RS485 communication active
H26			Not used
H40	Green	**PRW**	Status of local 24 V supply

10 Command lists

The commands for the electronic weighing system described here can be transmitted by several interfaces:

- From the operator panel via the controller to the SIWAREX module
- From SIWATOOL direct to the SIWAREX module

A data or command error is signaled if a command cannot be executed or if the sent data record is rejected.

Command code	Command	Description	Service
1... 99	**Service commands**		
1	Service mode On	Turn on service mode	x
2	Service mode Off	Turn off service mode	x
11	Load factory setting	The command resets the SIWAREX to the "Ex factory" status: - All parameters and saved data are loaded with the default values. - All message buffers are reset.	x
60	Set Calibration Point 0	Set Calibration Point 0 / save values for calibration point 0.	x
61	Set Calibration Point 1	Set Calibration Point 1 / save values for calibration point 1.	x
62	Set Calibration Point 2	Set Calibration Point 2 / save values for calibration point 2.	x
81	Characteristic shift	Move calibration characteristic. The command defines the current weight of the scale as the new zero point (0 kg) and shifts the complete characteristic without changing the gradient. The command can be used, for example, in order to compensate parts used for mounting calibration weights on the scale at the end of the calibration.	x
82	Perform automatic calibration	Calculating the scale characteristic curve with reference to the load cell from data record 10. The calculated characteristic curve is entered directly in data record 3 and 4, and thus activated immediately after executing the command.	x
83	Perform calibration check	The command calculates the theoretical digital values in relation to the calibration weights using the load cell parameters from data record 10 and the adjustment weights 0, 1 and 2 from data record 3. The output of these theoretical digits is made in data record 4. The function can be used to check the plausibility of adjustment digits in data record 3, which have been determined in a legal-for-trade calibration.	
700 … 899	**HMI display switching**		

Command code	Command	Description	Service
701	Increased resolution	Activate increased resolution on main display (x 10)	x
705	Display current tare weight	Display current tare weight on main display	x
710	Activate standard display	Activate standard display gross/net	x

1013	Tare specification valid	Activate specification of tare weight	x
1016	S7 tare specification valid	Activate specification of S7 tare weight	

The following commands can be triggered in the scale data block SCALE_DB in the area CMD1 to CMD3:

Table 10-1 Command groups of the SIWAREX WP321

Command group	Description
1 ... 99	Commands are forwarded from the FB_SIWA via data record DR 2 to the module (scale commands, weighing commands, log commands). The meaning of the commands corresponds to the command list.
2000 + X	Reading of a data record, X corresponds to the data record number. Example: Data record 3 transmitted by SIWAREX module to the SIMATIC CPU → 2000 + 3 = command code 2003
4000 + X	Writing of a data record, X corresponds to the data record number. Example: Data record 3 transmitted by SIMATIC CPU to the SIWAREX module → 4000 + 3 = command code 4003
7001	Read all data records from SIWAREX into CPU (only for SIMATIC FB)
7002	Write all data records 3, 4, 5, 6, 10, 13, 14 and 15 from CPU into SIWAREX (module must be in service mode, only for SIMATIC FB)

Additional information on transmission of commands from the control program by means of the SIMATIC interface is available in chapter Communication in SIMATIC S7-300/400/1200/1500 (Page 97).

Communication in SIMATIC S7-300/400/1200/1500 11

11.1 General information

A SIWAREX WP321 occupies 16 bytes each in the I/O areas of the CPU. Communication between SIWAREX and SIMATIC CPU is supported by the FB.

Table 11-1 Memory requirements of the function block

	FB 1, WP321DR
Read weight and status	YES
Send commands	YES
Send parameters	YES
Main memory requirements in CPU	11 600 byte + n x 1 232 byte
Load memory requirements in CPU	138 788 byte + n x 28 470 byte

n = number of WP321 modules

The function block described above including HMI configuring can be downloaded as a predefined example project ("Ready-for-use") from the Siemens Customer Support.

11.2 Structure of the program "Ready for use"

There is one program for Step 7 Classic and another for TIA Portal. The two programs each consist of two parts:

- STEP 7 software for the SIMATIC CPU
- WinCC project (integrated in SIMATIC Manager)

All messages are saved as bit information. The message system can thus directly access the bit fields and display the message texts.

11.3 Advantages of task sharing

The weight is calculated in the SIWAREX module like in a separate electronic weighing system. However, thanks to integration in SIMATIC, it is possible to directly transfer the weight value to the PLC program. This results in sensible sharing of tasks: the weighing functions are performed in the SIWAREX module, while interlocking and signal linking are performed in the PLC.

SIWAREX "Ready for use" takes over the task of a standardized program in the SIMATIC S7.

An FB handle several tasks:

- It controls communication between the SIMATIC CPU and the SIWAREX module
- It transfers commands and adjustment values to the SIWAREX module according to the process trend
- It prepares the scale data for visualization

11.4 Hardware configuration of the electronic weighing system

The SIWAREX WP321 module can be found in the directory PLC/SIMATIC S7-1200/ technology modules/weighing modules of the hardware catalog.

The following basic properties of the module are defined during hardware configuration in the TIA Portal. Note that the SIWAREX WP321 module is always completely in the process image of the CPU.

- Installation location of the module
- Address in I/O area
- Diagnostics interrupts
- Hardware interrupts
- I&M (Identification & Maintenance) data

The electronic weighing system occupies 16 bytes in the input/output area.

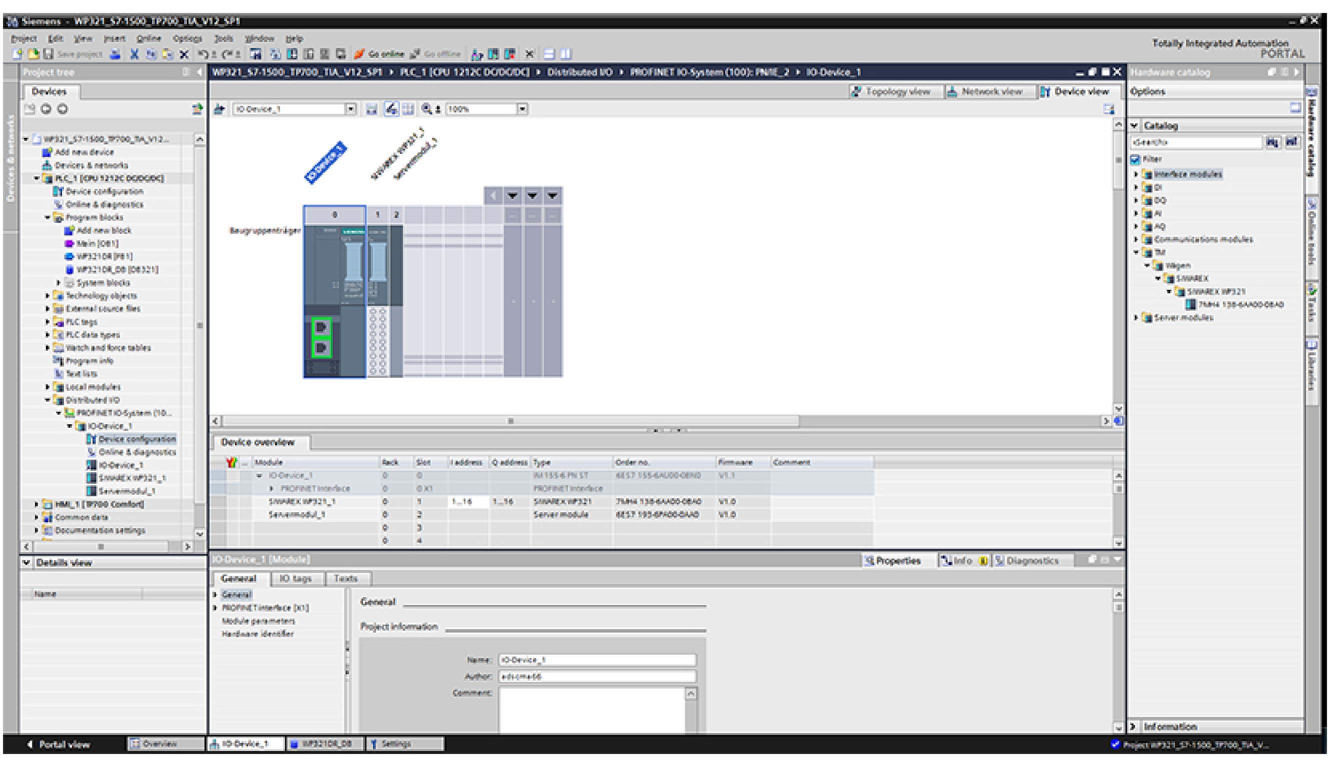

Figure 11-1 Hardware configuration in the TIA Portal

TIA Portal automatically assigns a separate I/O start address and a HW ID for every SIWAREX present in the project. These two parameters are relevant for calling the function block, and can be obtained from the properties of the respective module.

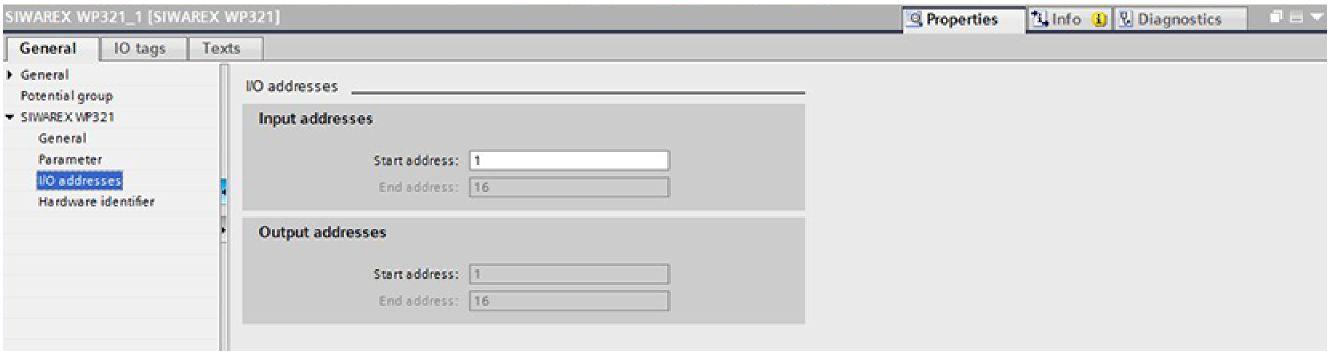

Figure 11-2 Start address of module in TIA Portal

Diagnostics interrupts can be optionally enabled or deactivated in the module properties. The configuration scope for diagnostics and hardware interrupts depends on the SIMATIC CPU used (S7-300, S7-400, S7-1200 or S7-1500) → Diagnostics interrupts (Page 105) and Hardware interrupts (Page 106)

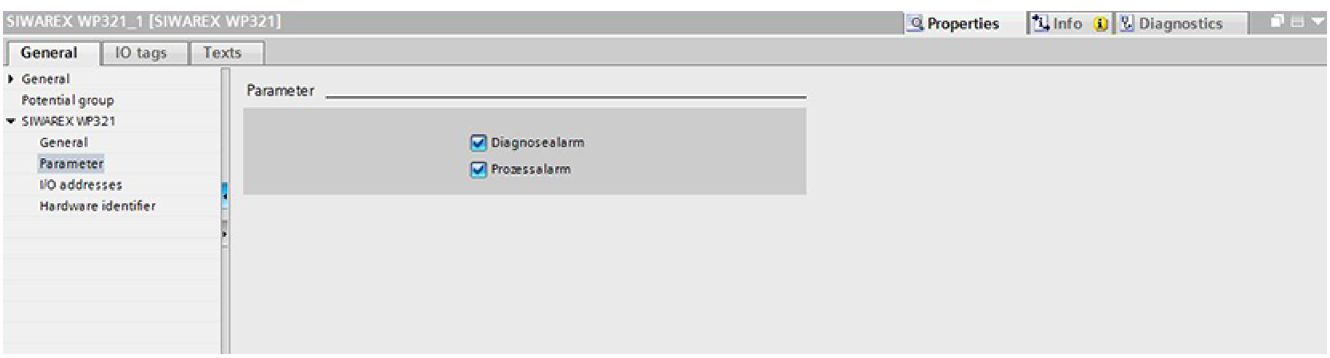

Figure 11-3 Configuration of interrupts in TIA Portal

Figure 11-4 HW ID of module in TIA Portal (up to TIA Portal V14)

11.5 Calling of function block

This description is based on use of the WP321DR block with data record communication and the following data:

- **Start address** SIWAREX WP321: 1 (see → Hardware configuration of the electronic weighing system (Page 98))
- **HW ID** SIWAREX WP321: 280 (see → Hardware configuration of the electronic weighing system (Page 98))
- **Instance data block number** of SIWAREX WP321 function block: DB321

The function block can be integrated at the desired position in the user program using drag and drop. Calling of the FB must be carried out cyclically in the control program.

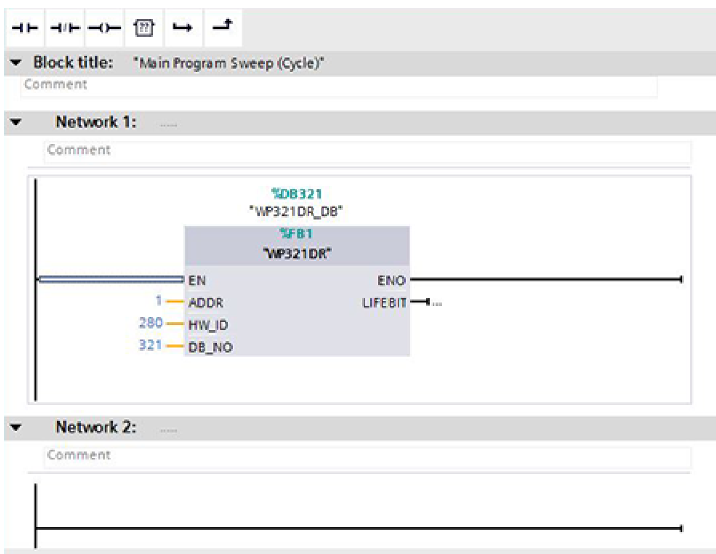

Figure 11-5 Calling WP321 DR block (V1.x and V2.x) in the user program

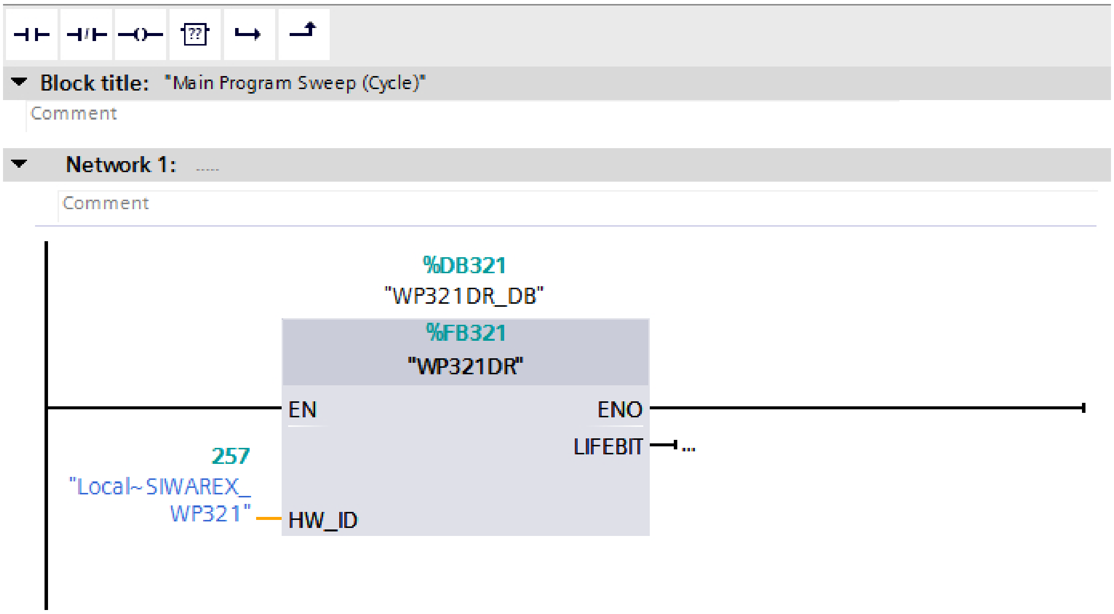

Figure 11-6 Calling WP321 DR block (V3.x) in the user program

Function block parameter	Description
ADDR	Start address WP321 (see → Hardware configuration of the electronic weighing system (Page 98))
HW_ID	HW ID WP321 (see → Hardware configuration of the electronic weighing system (Page 98))
DB_NO	Number of FB-internal instance DB
LIFEBIT	Optional status bit can be used to monitor communication

The generated instance DB (WP321 in this case) contains all data records of the WP321 as well as all parameters required to exchange data between CPU and weighing module.

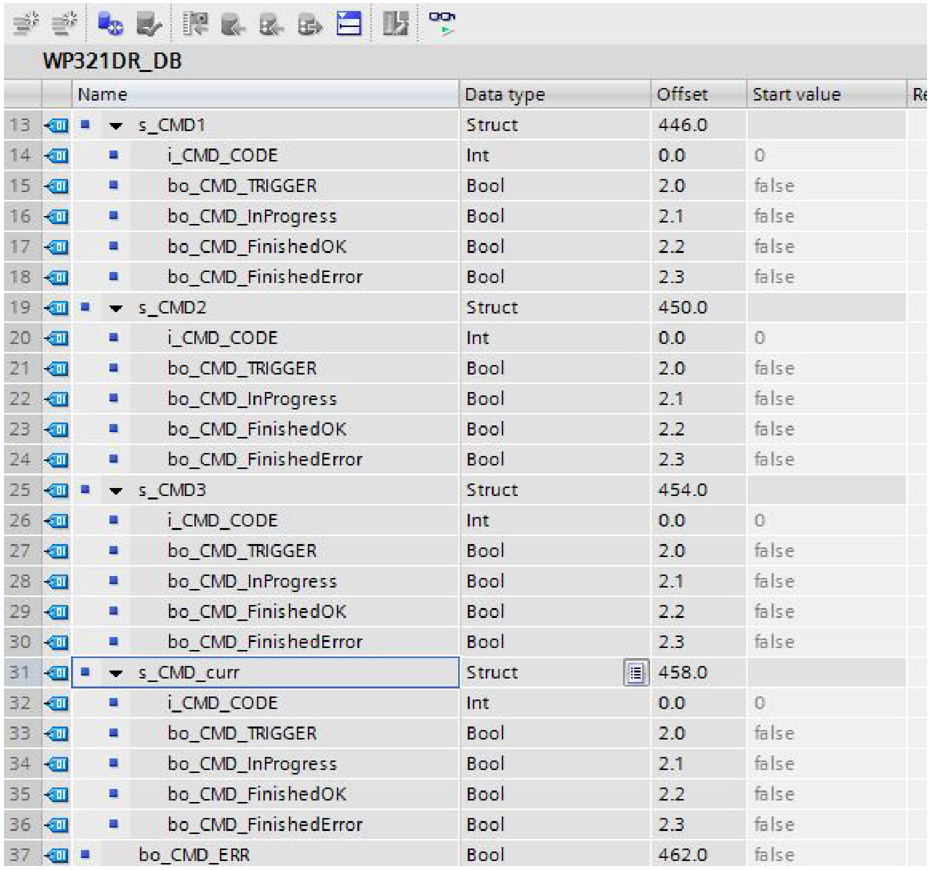
A separate FB call must be made in the user program for each weighing module. In this manner, each scale receives its own instance DB which provides the respective scale parameters. The input and output parameters of the FB must be matched to the respective WP321 for each call.

11.6 Working with the function block

Data records in SIWAREX weighing modules

All parameters in SIWAREX weighing modules are structured in data records. These data records must be considered as connected packages and can only be respectively read into the CPU or written to the SIWAREX as complete packages. Reading or writing of a single parameter within a data record is not possible. You can find a description of all data records and their parameters in chapter → Scale parameters and functions (Page 57).

Reading and writing of data records is performed using special command codes which can be sent with three command mailboxes handled according to priority within the instance DB:



WP321DR_DB

	Name	Data type	Offset	Start value	Re
13	s_CMD1	Struct	446.0		
14	i_CMD_CODE	Int	0.0	0	
15	bo_CMD_TRIGGER	Bool	2.0	false	
16	bo_CMD_InProgress	Bool	2.1	false	
17	bo_CMD_FinishedOK	Bool	2.2	false	
18	bo_CMD_FinishedError	Bool	2.3	false	
19	s_CMD2	Struct	450.0		
20	i_CMD_CODE	Int	0.0	0	
21	bo_CMD_TRIGGER	Bool	2.0	false	
22	bo_CMD_InProgress	Bool	2.1	false	
23	bo_CMD_FinishedOK	Bool	2.2	false	
24	bo_CMD_FinishedError	Bool	2.3	false	
25	s_CMD3	Struct	454.0		
26	i_CMD_CODE	Int	0.0	0	
27	bo_CMD_TRIGGER	Bool	2.0	false	
28	bo_CMD_InProgress	Bool	2.1	false	
29	bo_CMD_FinishedOK	Bool	2.2	false	
30	bo_CMD_FinishedError	Bool	2.3	false	
31	s_CMD_curr	Struct	458.0		
32	i_CMD_CODE	Int	0.0	0	
33	bo_CMD_TRIGGER	Bool	2.0	false	
34	bo_CMD_InProgress	Bool	2.1	false	
35	bo_CMD_FinishedOK	Bool	2.2	false	
36	bo_CMD_FinishedError	Bool	2.3	false	
37	bo_CMD_ERR	Bool	462.0	false	

Figure 11-7 CMD command mailboxes

As shown in the graphics, a command mailbox always consists of a command code (Int) and four bits (Bool). A command is set by entering the desired command code in the "i_CMD_CODE" parameter and setting the respective command trigger "bo_CMD_TRIGGER". The status bits "bo_CMD_InProgress" (command being processed), "bo_CMD_FinishedOk" (command finished without errors) and "bo_CMD_FinishedError" (command rejected or finished with error) can be evaluated in the user program.

In addition, the three command mailboxes are managed and processed according to priority. CMD1 has the highest priority, CMD3 has the lowest priority. If all three command mailboxes are triggered simultaneously by the user program, for example, the function block initially processes CMD1, then CMD2, and finally CMD3. Cyclic triggering of command mailbox 3 is also interrupted by intermediate sending of a command in mailbox 2 or 1 for processing of the respective command.

Note

Cyclic triggering of the CMD1 command mailbox makes it impossible to send commands in mailbox 2 or 3.

A summary of all existing command codes can be found in chapter →Command lists (Page 95).

The following equation for generation of a corresponding command code applies to the reading of data records from the SIWAREX to the data block:

Command code = 2000 + X (X = desired data record number)

The following equation for generation of a corresponding command code applies to the writing of data records from the data block to the SIWAREX:

Command code = 4000 + X (X = desired data record number)

Example

The following example clarifies the actions with command mailboxes and data records:

"Calibration weight" is to be set to a value of 60.5 by the CPU. Since "Calibration weight" is a parameter of data record 3 (see chapter → Scale parameters and functions (Page 57)), service mode must first be activated. This is possible using command code "1" (see chapter → Command lists (Page 95)).

The variable "i_CMD_CODE" must therefore be assigned the value "1" and the associated "bo_CMD_TRIGGER" set to TRUE. Subsequently, the module is directly in service mode (DIAG LED flashes green):

i_CMD_CODE = 1

bo_CMD_TRIGGER = TRUE

Since only complete data records can be read or written, it is recommendable to now read data record 3 into the CPU. This is carried out using command code 2003 (see chapter → Command lists (Page 95)):

i_CMD_CODE = 2003

bo_CMD_TRIGGER = TRUE

All current data from data record 3 are now present in the data block. The calibration weight is then set as desired to a value of 60.5:

CALIBRATION_WEIGHT = 60.5

The modified data record 3 must now be written into the SIWAREX again. This is carried out using command code 4003 (see chapter → Command lists (Page 95)):

i_CMD_CODE = 4003

bo_CMD_TRIGGER = TRUE

The new calibration weight is now present in the SIWAREX and can be used. Service mode for the module should subsequently be switched off again using the command "2".

This procedure for reading and writing data records or parameters is identical for all data records.

11.7 I/O interface of function block

The following scale parameters are available cyclically in the data block in the controller without special reading of data records or can be sent to the scale without sending of data records:

Table 11-2 I/O data of the function block

Parameter (read)	Meaning
SCALE_STATUS_1 (UINT)	Bytes 0 & 1 of the scale status (→ DR 30 current process values (Page 81))
SCALE_STATUS_2 (UINT)	Bytes 2 & 3 of the scale status (→ DR 30 current process values (Page 81))
Process value 1	Selection → Selection of process value 1, 2 (Page 80)
Process value 2	Selection → Selection of process value 1, 2 (Page 80)
Parameter (write)	
S7 tare specification	Specified value for tare weight. The value is applied by using the "Tare specification valid (1016)" command.

11.8 Error codes of function block

Table 11-3 Statuses/errors when working with the function block

Error bit	Error description
bo_ApplIDError	Address module does not match the function block
bo_ApplIDDRError	Data record does not match the inserted module
bo_SFBError	Runtime error during transmission of data record
bo_RdPerError	Reading of I/O data failed
bo_LifeBitError	SIWAREX no longer responds
bo_StartUpError	Command was sent although StartUp is still TRUE
bo_WrongFW	Data record version does not match the firmware
bo_InvalidCMD	An invalid command code was sent
bo_DataOperationError	Synchronous data operation error has occurred
bo_StartUp	Startup synchronization of module running
bo_InvalidHW_ID	An invalid hardware ID was created at the function block call ("HW_ID" input).

Note

If execution of the function block is faulty, the variables shown do not correspond to the actual status in the module.

11.9 Diagnostics messages

The DIAG LED flashes red when a diagnostics message is present. Diagnostics messages are displayed as plain text in STEP 7 (TIA Portal) by means of online and diagnostics views. You can evaluate the error codes by means of the user program.

The following diagnostics messages can be signaled:

Table 11-4 Diagnostics messages

Diagnostics message	Error code	Meaning	Remedy
Fault	9H	Internal module fault, defective	Replace technology module
Load voltage missing	11H	L+ for technology module missing	Check supply voltage on BaseUnit
Hardware interrupt lost	16H	Technology module cannot send an interrupt because the previous interrupt has not yet been processed	Change interrupt processing in the CPU, change technology module parameter settings.
Module temporarily not available	1FH	Normal operation of module not possible because, for example, a FW update is being carried out.	Wait until the module assumes normal operation.
Undervoltage	02H	Undervoltage of sense lines	Voltage drop up to the load cell is too large. Find out why.
Load high	07H	Upper limit for sensor voltage exceeded	Eliminate scale overload
Underload	08H	Lower limit for sensor voltage fallen below	Check mechanics of the scale, check the wiring of the sensor.
Checksum error in parameter	0DH	The checksum for the integrity of the parameters is incorrect	Download factory setting of the parameters.
Checksum error program	0EH	The checksum for the integrity of the parameters is incorrect	Download firmware again, replace module

11.10 Diagnostics interrupts

The enable for triggering of diagnostics interrupts is possible for all SIMATIC CPUs (S7-300, S7-400, S7-1200, S7-1500) and is assigned in the device configuration.

The diagnostics interrupts can be evaluated to detect fault events in the SIMATIC CPU.

Fault events (operating faults) are signaled by a diagnostics interrupt to the S7 CPU if the diagnostics interrupt is enabled (in the HW Config). You can evaluate the diagnostics messages using the local data of OB82. Contrary to the S7-1200 and S7-1500, the CPUs of the S7-300 and S7-400 systems enter the stop status following a diagnostics interrupt if the OB82 is not loaded.

You can find detailed information with the "RALARM" instruction (read interrupt status).

11.11 Hardware interrupts

You can configure which events during operation are to trigger a hardware interrupt for the SIWAREX module. Based on the configuration, the SIWAREX module triggers a hardware interrupt for specific events/limits. When a hardware interrupt occurs, the CPU interrupts execution of the user program and processes the associated hardware interrupt OB. The event that triggered the interrupt is entered by the CPU into the start information of the associated hardware interrupt OB.

Activation of the hardware interrupts

For the device configuration of the SIWAREX module, activate the hardware interrupts in the TIA Portal under "Parameters".

Lost hardware interrupt

When an event that triggers a hardware interrupt occurs and a previous event of the same kind has not yet been processed, no further hardware interrupt is triggered. The hardware interrupt is lost. This may lead to the "Hardware interrupt lost" diagnostics interrupt, depending on the parameterization.

No hardware interrupts are activated by default. One result of triggering a hardware interrupt is that the following two variables are entered in the start information of the associated hardware interrupt OB:

- EventType: One byte with a set bit
- IChannel: Number of the channel that triggered the hardware interrupt

Table 11-5 Table of event bits

Hardware interrupt	Event type bit
Limit 1 OFF → ON 0	0
Limit 1 ON → OFF 1	1
Limit 2 OFF → ON 2	2
Limit 2 ON → OFF 3	3

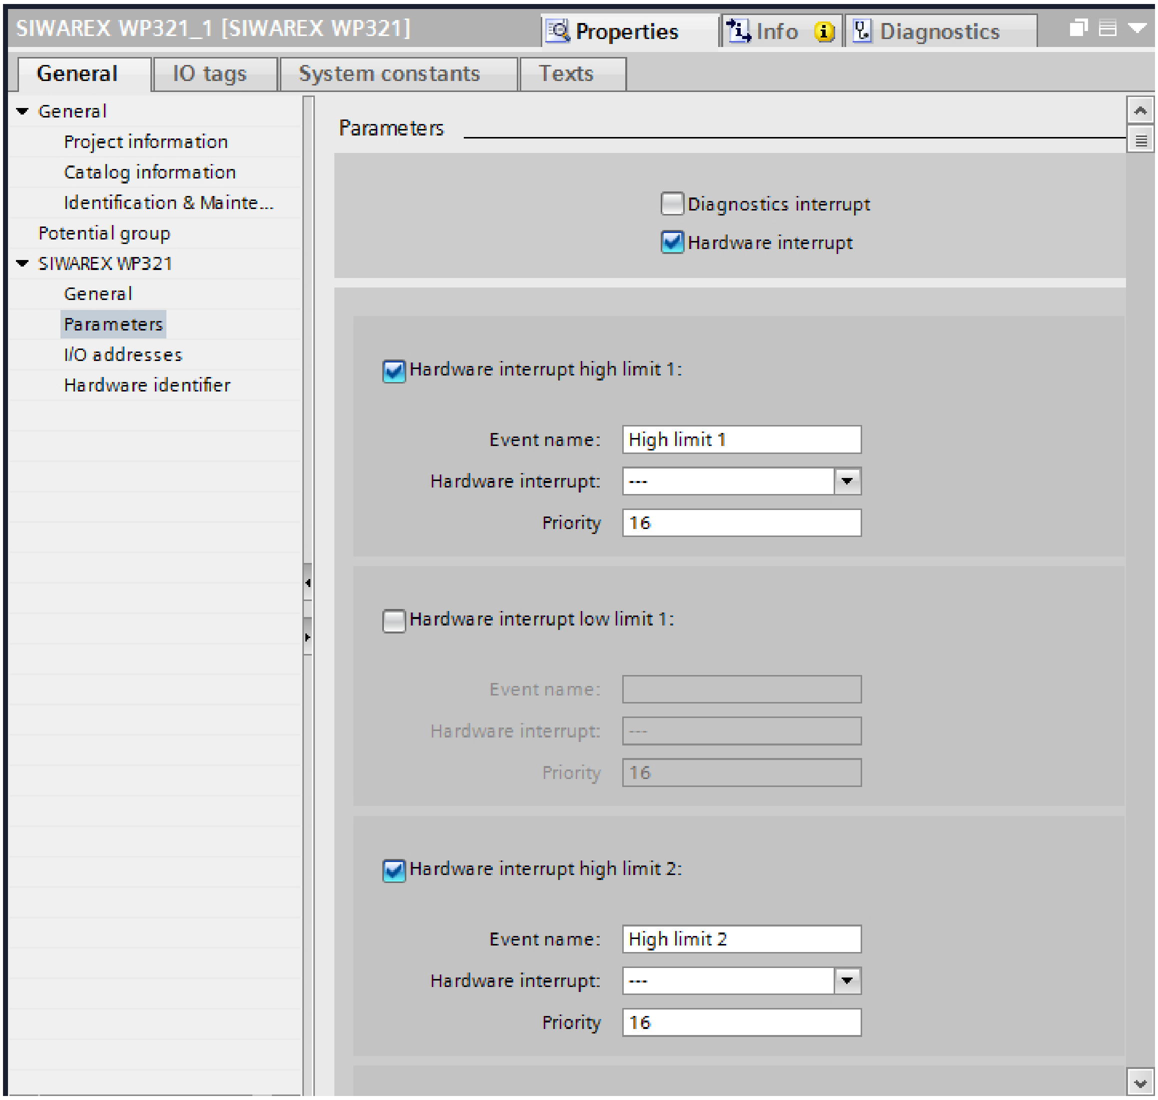


Figure 11-8 Configuration of hardware interrupts for S7-1500

Technical specifications 12

12.1 Technical specifications

24 V power supply

Note

A protective extra-low voltage (to EN 60204-1) is to be ensured by system power supply.

Rated voltage	24 V DC
Static low / high limits	19.2 V DC / 28.8 V DC
Dynamic low / high limits	18.5 V DC / 30.2 V DC
Non-periodic overvoltages	35 V DC for 500 ms with a recovery time of 50 s
Maximum current consumption	100 mA with 24 V DC
Typical power consumption of the module	2 W

Power supply from SIMATIC S7 backplane bus

Power consumption from SIMATIC S7 backplane bus	Typically 20 mA

Analog load cell interface connection

Error limit to DIN1319-1 at 20 °C +10 K	≤ 0.05% v.E.[1)]
Accuracy according to OIML R76 (no approval for measurements requiring verification)	
• Class	III and IV
• Resolution (d=e)	3000d
• Error percentage pi	0.4
• Step voltage	0.5 μV/e
Accuracy delivery state[2)]	typ. 0.1% v.E.
Sampling rate	100/120/600 Hz (depending on parameterization)
Input signal resolution	± 2 000 000 (for cells with 4 mV/V)
Measuring range	± 4 mV/V
Common mode voltage range	0.25 to 4.75 V
DMS supply[3)]	4.85 V DC ±2 %
Short-circuit and overload protection	Yes
Connection	6-wire
Sensor voltage monitoring	≤ 4 V
min. DMS input resistance	

• without Ex-i interface SIWAREX IS	40 Ω
• with Ex-i interface SIWAREX IS	50 Ω
min. DMS output resistance	4 100 Ω
Temperature coefficient range	≤ ± 5 ppm/K v. E.
Temperature coefficient zero point	≤ ± 0.1 μV/K
Linearity error	≤ 0.01%
Measured value filtering	Low pass
Electrical isolation	500 V AC
50 Hz / 60 Hz noise suppression CMRR	> 80 dB
Input resistance	
• Signal cable	typ. $4*10^6$ Ω
• Sensor cable	typ. $2*10^6$ Ω

1) Relative accuracy! (Absolute accuracy is only achieved by calibration on-site with calibration standard)
2) Accuracy for module replacement or theoretical calibration decisive
3) Value valid at sensor; voltage drops on cables are compensated up to 5 V

Cable length

Maximum cable length	500 m with SIWAREX cable, → Accessories (Page 117).

RS485 interface

Standard	EIA-485
Baud rate	up to 115 kbps*
Data bits	7 or 8
Parity	even | odd | none
Stop bits	1 or 2
Terminating resistors (can be activated)	390 Ω / 220 Ω / 390 Ω
Electrical isolation	500 V AC
Transfer protocol	ASCII for remote display from Siebert
Cable length	≤ 115 kbps max. 1 000 m (fieldbus cable 2-wire, shielded, e.g. 6XV1830-0EH10)

Dimensions and weights

Dimensions	
• Width	15 mm
• Weight, approx.	31 g

Mechanical requirements and data

Testing	Standards	Test values
Vibrational load during operation	IEC 61131-2 IEC 60068-2-6 Test Fc	• 5 to 8.4 Hz: 3.5 mm out. • 8.4 to 150 Hz: 9.8 m/s² (=1G)
Shock load during operation	IEC 61131-2 IEC 60068-2-27 Test Ea	• 150 m/s² (approx. 15 g), half sine
Vibration load during transport	IEC 60068-2-6 Test Fc	• 5 to 8.4 Hz: 3.5 mm out. • 8.4 Hz to 500 Hz: 9.8 m/s²
Shock load during transport	IEC 60068-2-27: Test Ea	• 250 m/s² (25G), half sine
Free fall	IEC 61131-2 IEC 60068-2-31: Test Ec, procedure 1	• In product packaging: 300 mm drop height • In shipping package: 1.0 m drop height

12.2 Electrical, EMC and climatic requirements

Electrical protection and safety requirements

Fulfilled requirement	Standards	Comments
Safety regulations	IEC 61010-1 IEC 61131-2; UL 508 CSA C22.2 No.142 IEC 61010-2-201 FM3611	
Protection class	IEC 61140	Module is operated with protective extra-low voltage. The protective conductor connection serves only a functional earth to dissipate interference currents
IP rating	IP 20 to IEC 60529	• Protection against contact with standard probe • Protection against solid bodies with diameters greater than 12.5 mm • No special protection against water

Fulfilled requirement	Standards	Comments
Air gaps and creepage distances	IEC 60664 IEC 61131-2 IEC 61010-1 UL 508 CSA C22.2 No. 145 EN 50156-1	• Overvoltage category II • Pollution degree 2
Isolation stability	IEC 61131-2 CSA C22.2, No. 142 UL508	Test voltage: 500 V AC or 707 V DC

Electromagnetic compatibility

1) An external protection element has to be installed to meet the requirement (e.g.: Blitzductor VT AD24V, Dehn&Söhne)

2) Not applicable for shielded cables and symmetric ports

NOTICE
Radio interference is possible This is a device of class A. The device may cause radio interference in residential areas. Implement appropriate measures (e.g.: use in 8MC cabinets) to prevent radio interference.

Ambient conditions

The use of SIWAREX WP321 is intended under the following conditions in SIMATIC ET 200SP.

Table 12-3 Operating conditions to IEC 60721

Mode	IEC60721-3-3 • Class 3M3, stationary use, weather-proofed	
Storage/transport	IEC 60721-3-2 class 2M2 without precipitation	
Contaminant concentration	SO_2: < 0.5 ppm H_2S: < 0.1 ppm;	RH < 60%, no condensation

Table 12-4 Climatic requirements

Comments	Ambient conditions	Application areas
Operating temperature:		
• Horizontal installation in S7	-25 ... +60 °C	The S7 standard modules may not be operated at temperatures below 0 °C.
• Vertical installation in S7	-25 ... +50 °C	
Storage and transport temperature	-40 ... +85 °C	
Relative humidity	5 ... 95 %	No condensation; corresponds to relative humidity (RH) stress level 2 to DIN IEC 61131-2
Air pressure during operation	IEC 60068-2-13	1 080 ... 795 hPa (operation) (-1 000 ... +2 000 m above sea level)
Air pressure during transport and storage	IEC 60068-2-13	1 080 to 660 hPa (storage) (-1 000 to +3 500 m above sea level)

12.3 Reliability

Mean Time Between Failure (MTBF)

The MTBF calculation results in the following value:

Table 12-5 MTBF

Electronic Weighing System	MTBF in years
SIWAREX WP321	107 years @TA = 40 °C

12.4 Approvals

NOTICE

Safety guidelines for applications in hazardous areas

For applications in hazardous areas, read the safety instructions in the document "Product Information - Use of SIWAREX Modules in a Zone 2 Hazardous Area (https://support.industry.siemens.com/cs/ww/en/)".

Note

The current approvals for your device can be found on the nameplate.

ESD guidelines

B

B.1 ESD Guidelines

Definition of ESD

All electronic modules are equipped with large-scale integrated ICs or components. Due to their design, these electronic elements are highly sensitive to overvoltage, and thus to any electrostatic discharge.

The electrostatic sensitive components/modules are commonly referred to as ESD devices. This is also the international abbreviation for such devices.

ESD modules are identified by the following symbol:

NOTICE
ESD devices can be destroyed by voltages well below the threshold of human perception. These static voltages develop when you touch a component or electrical connection of a device without having drained the static charges present on your body. The electrostatic discharge current may lead to latent failure of a module, that is, this damage may not be significant immediately, but in operation may cause malfunction.

Electrostatic charging

Anyone who is not connected to the electrical potential of their surroundings can be electrostatically charged.

The figure below shows the maximum electrostatic voltage which may build up on a person coming into contact with the materials indicated. These values correspond to IEC 801-2 specifications.

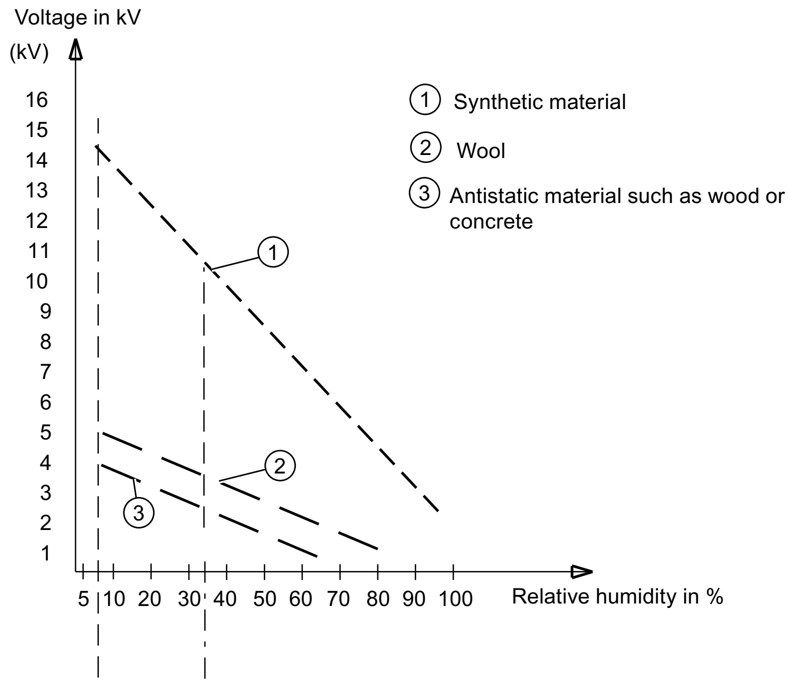

Figure B-1 Electrostatic voltages which an operator can be subjected to

Basic protective measures against electrostatic discharge

- Ensure good equipotential bonding:
  When handling electrostatic sensitive devices, ensure that your body, the workplace and packaging are grounded. This prevents electrostatic charge.
- Avoid direct contact:
  As a general rule, only touch electrostatic sensitive devices when this is unavoidable (e.g. during maintenance work). Handle the modules without touching any chip pins or PCB traces. In this way, the discharged energy can not affect the sensitive devices.
  Discharge your body before you start taking any measurements on a module. Do so by touching grounded metallic parts. Always use grounded measuring instruments.

List of abbreviations

C

C.1 List of abbreviations

ASCII	American Standard Code for Information Interchange
B	Gross weight
CPU	Central processor, in this case SIMATIC CPU
DB	Data block
FB	SIMATIC S7 function block
HMI	Human machine interface (e.g. SIMATIC Operator Panel)
HW	Hardware
NAWI	Non-automatic weighing instrument
NAW	Non-automatic scales
OIML	Organisation Internationale de Metrologie Legale
OP	Operator Panel (SIMATIC)
PC	Personal computer
pT	Preset tare (predefined tare weight with manual taring)
RAM	Random access memory
PLC	Programmable logic controller
STEP 7	Programming device software for SIMATIC S7
T	Tare weight
TM	Technology module
TP	Touch Panel (SIMATIC)
UDT	Universal Data Type (S7)
WRP	Write protection
LC	Load cell(s)
NR	Numerical range

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

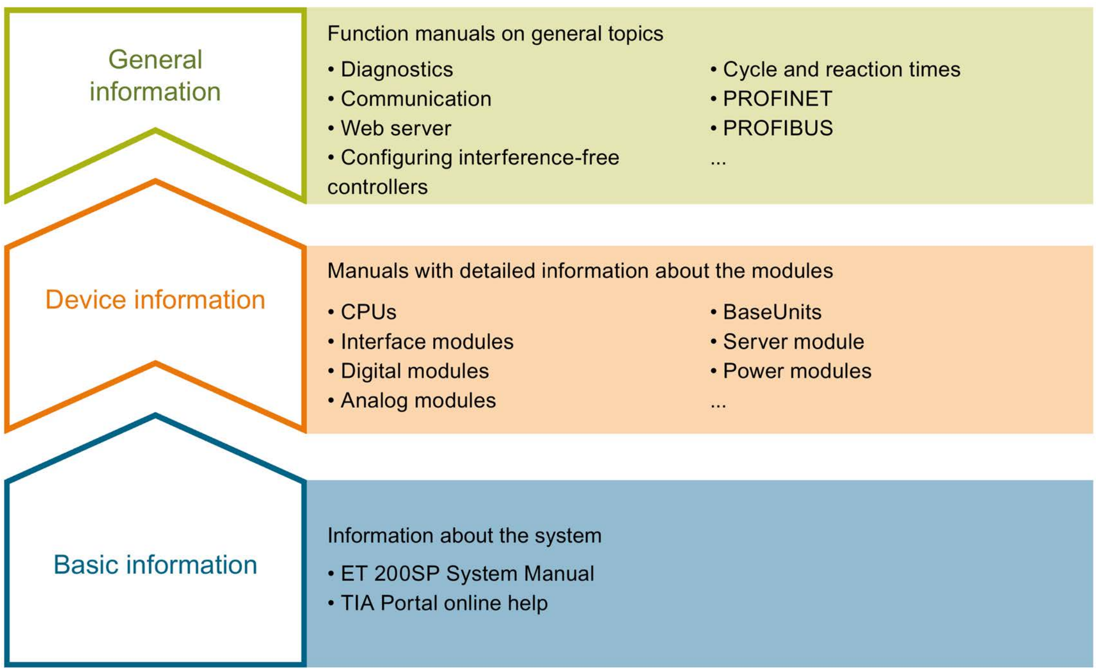
To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

ET 200SP Documentation Guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview 2

2.1 Properties

Article number

6ES7545-5DA00-0AB0

View of the module

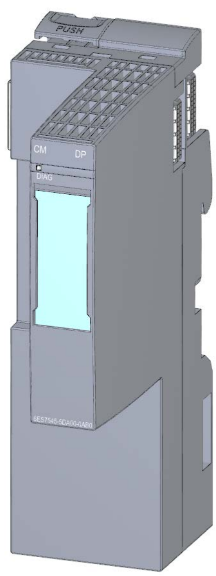


Figure 2-1 View of the CM DP communication module

Properties

The communication module CM DP can be used with the ET 200SP CPUs. You insert the communication module to the right next to the CPU.

The communication module has the following properties:

- Technical properties
  - Connects the CPU of the ET 200SP distributed I/O system with PROFIBUS DP
  - Bus connection via RS485 interface
- Supported functions
  - Operation as DP master or DP slave
  - Enable/disable DP slave
  - Diagnostics requirements
  - Identify the bus topology in a DP master system
  - Identification data I&M 0
  - Time-of-day synchronization
  - Line diagnostics
  - S7 services

Supported communication services

The communication module supports the following communication services:

- PROFIBUS DP-Master, as of STEP 7 V13, Update 3
  - PROFIBUS DP according to IEC 61158 and 61784 DPV1, DP master for DP slaves according to PROFIBUS DP and DPV1 standard
- PROFIBUS DP slave, as of STEP 7 V13, SP1
  - PROFIBUS DP according to IEC 61158 and 61784 DPV1, DP slave and I-slave

---

Note

DP master or DP slave

Note however: The CM DP only supports alternative operation as DP master or DP slave.

Maximum configuration as DP Master

Table 2- 1 General characteristics of DP mode

Feature	Explanation/values
Number of operable DP slaves	125
Max. size of the input area over all DP slaves	8 KB
Max. size of the output area via all DP slaves	8 KB
Maximum number of inputs per DP slave	244 bytes
Maximum number of outputs per DP slave	244 bytes
Max. size of the consistency area for a module	128 bytes

Note

Setting the PROFIBUS DP address on the communication module CM DP

The communication module CM DP does not have a DIP switch. You set the PROFIBUS DP address via STEP 7 (TIA Portal). You can find more information on this topic in the STEP 7 online help.

Accessories

A detailed list of the available accessories can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

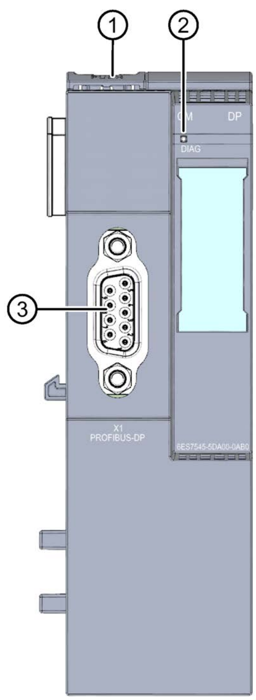
Additional information

You can obtain detailed information on the topic of PROFIBUS in the function manual PROFIBUS (http://support.automation.siemens.com/WW/view/de/59193579/0/en)

2.2 Operating and display elements

Operating and connection elements

The following figure shows the operating and connection elements of the CM DP communication module.



① Mounting rail release
② DIAG LED
③ DP interface

Figure 2-2 Operating and display elements of the communication module CM DP

Wiring

3

3.1 Pin assignment

PROFIBUS DP with RS485 interface

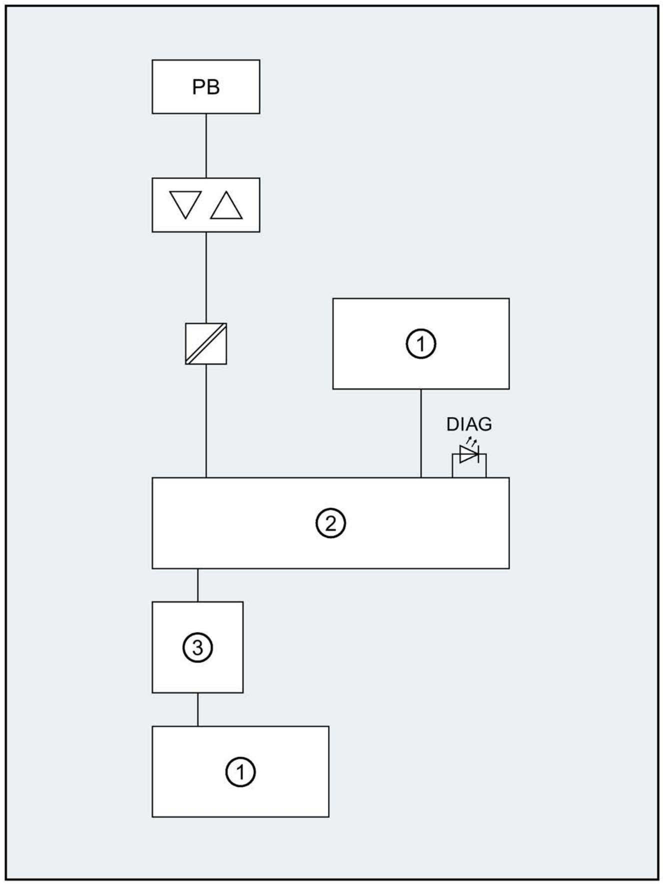
The following table shows the signal names and the designations of the pin assignment for the PROFIBUS DP interface.

Table 3- 1 Pin assignment PROFIBUS DP with RS485 interface

View	Signal name		Designation
	1	-	-
	2	-	-
	3	RxD/TxD-P	Data line B
	4	RTS	Request To Send
	5	M5V2	DP data reference potential (from station)
	6	P5V2	Supply plus (from station)
	7	-	-
	8	RxD/TxD-N	Data line A
	9	-	-

3.2 Block diagram

The following figure shows the block diagram of the CM DP communication module.



①	Backplane bus	PB	PROFIBUS interface
②	ET 200SP PROFIBUS interface and backplane bus transmission	DIAG	LED diagnostics (green/red)
③	Internal power supply		

Figure 3-1 Block diagram of the CM DP

Programming 4

Instructions

Pre-written instructions are available as an interface in your STEP 7 user program for communication services.

Table 4- 1 Instructions for PROFIBUS DP

Instructions	Meaning when used with CM DP	
	DP master	DP slave (I-slave)
DPSYC_FR	Synchronize DP slaves/Freeze inputs (SYNC/FREEZE instruction)	-
DPNRM_DG	Read diagnostics data of a DP slave	-
DP_TOPOL	Determine topology for DP master system	-
WRREC	Write data record of a DP slave	-
RDREC	Read data record of a DP slave	-
GETIO	Read process image of a DP standard slave	Read process image
SETIO	Transfer process image of a DP standard slave	Transfer process image
GETIO_PART	Read process image area of a DP standard slave	Read process image area
SETIO_PART	Transfer process image area of a DP standard slave	Transfer process image area
D_ACT_DP	Enable/disable DP slaves	-
DPRD_DAT	Read consistent data of a module (user data)	
DPWR_DAT	Write consistent data of a module	
RALRM	Event-driven reading of alarm information (diagnostics, pull/plug, hardware interrupt) as well as DPV1-specific interrupts (update, status, vendor-specific interrupt)	Event-driven reading of interrupt information (diagnostic interrupt)

Read the documentation for the instructions in the STEP 7 online help

Calling instructions for distributed I/O

Multiple calls are required for the instructions of the distributed I/O.

The duration of the call processing is dependent on the load, bus cycle time and transmission rate. Timeouts may occur if these instructions are called in a loop within a cycle.

Exceptions:

- Only one call is necessary for the RALRM instruction "Receive interrupt".

Program blocks for DPV1 (according to PNO standard) [1):

- "Read data record from a DP slave" RDREC instruction is functionally equivalent to SFC59 (write record)
- "Write data record to a DP slave" WRREC instruction is functionally equivalent to SFC58 (read record)
- "Read interrupt information from a DP slave" RALRM instruction call is made within an interrupt OB

[1)] PNO: PROFIBUS user organization

Diagnostics, error and system alarms 5

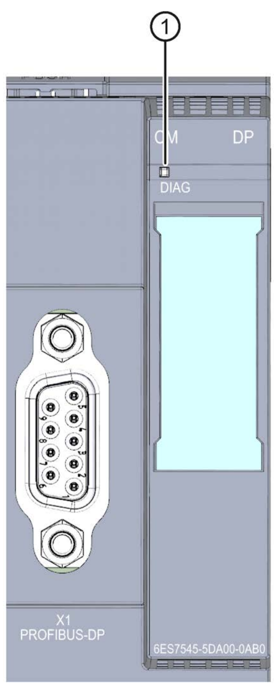
5.1 Status and error displays

Introduction

Diagnostics by means of LEDs is an initial tool for error localization. In order to localize errors still further, you usually evaluate the display of the module status in STEP 7 or the diagnostics buffer of the CPU. The buffer contains plain text information on the error that has occurred. For example, you will find the number of the relevant error OB in the plain text information.

LED display

The figure below shows the LED display on the CM DP communication module.



① DIAG (green/red)

Figure 5-1 LED display on the CM DP communication module

Meaning of the DIAG LED display on the communication module

The CM DP communication module has an LED for monitoring the diagnostics.

DIAG LED

Table 5- 1 DIAG LED fault display

DIAG LED	Meaning
Flashes	Module parameters not assigned
On	Module parameters assigned and no diagnostics
Flashes	Diagnostics of subordinate modules (as of firmware version V1.7)

Additional information

You can find more information on diagnostics in the Diagnostics function manual (http://support.automation.siemens.com/WW/view/de/59192926/0/en) for diagnostic options that are available for SIMATIC systems S7-1500, ET 200MP, ET 200SP and ET 200AL.

5.2 DP slave diagnostics

DP V1 slave: Diagnostic interrupt

Transmission of diagnostic data is made as a diagnostic interrupt. Diagnostic interrupts must be acknowledged by the DP master.

Supported diagnostic functions

The CM DP supports the following blocks of the DP diagnostics:

- Standard diagnostics (6 bytes)
- Identifier-related diagnostics (2...17 bytes depending on the number of configured transfer areas)
- Module status (5...35 bytes depending on the number of configured transfer areas)
- Diagnostic interrupt (8 bytes, if any)

User program (DP master)

The "DPNRM_DG" instruction is used to read the diagnostic data of a DP slave (DP single diagnostics) in the DP master.

The diagnostic interrupts for DP V1 slaves are periodically evaluated in the user program of the master via the "RALRM" instruction.

You can find the required parameter assignment for the instruction in the STEP 7 online help.

The following is a structural overview of the diagnostic data.

Overview of standard diagnostics

Standard diagnostics	
Byte	**Meaning**
0	Station status 1
1	Station status 2
2	Station status 3
3	Master address
4...5	Manufacturer ID of the slave

Overview of device-specific diagnostics

The device-specific diagnostics data depends on the protocol variant in which the DP slave is operated:

- **DP-V1 slave**

Table 5- 2 Overview of device-specific diagnostics of the CM DP for DP V1 slaves

<table>
<tr><th colspan="3">Device-specific diagnostics</th></tr>
<tr><th>Byte</th><th colspan="2">Meaning</th></tr>
<tr><td>0</td><td colspan="2">Header</td></tr>
<tr><td>1</td><td>Variant
Interrupt type</td><td>Variant
Status type</td></tr>
<tr><td>2</td><td colspan="2">Slot number</td></tr>
<tr><td>3</td><td>Variant
Interrupt specifier</td><td>Variant
Status specifier</td></tr>
<tr><td>4...62</td><td colspan="2">Module-specific diagnostic data</td></tr>
</table>

5.3 Standard diagnostics

Standard diagnostics

The coding of the standard diagnostic bytes is explained below.

Byte 0: Station status 1

Table 5- 3 Structure of station status byte 1

Bit no.	Name	Explanation
7	Master_Lock	The DP slave was configured by a different DP master. The DP slave can only be accessed read-only by the DP master configured as productive. This bit is set by the DP master when its bus address does not match the configured address.
6	Parameter_Fault	The most recently received parameter frame was corrupt or not permitted. This bit is set by the DP slave. Remedy: Check the parameter assignment with respect to invalid parameters.
5	Invalid_Slave_Response	This bit is set by the DP master if an implausible response has been received by the DP slave.
4	Service_Not_Supported	This bit is set by the DP master if a function is called by the master that is not supported by the DP slave. Remedy: Disable the parameter assignment of the required function at the master.
3	Ext_Diag	This bit is set by the slave. • Bit =1: Diagnostic data is available in the diagnostic area specific to the slave. The diagnostic data can be evaluated in the user program of the master. • Bit =0: A status message can be available in the diagnostic area specific to the slave. The status message can be evaluated in the user program of the master.
2	Slave_Config_Check_Fault	The configuration data sent by the DP master is rejected by the DP slave. Cause: Configuration error. Remedy: Change the configuration.
1	Station_Not_Ready	The DP slave is not yet ready for productive data exchange. This is a temporary condition and cannot be influenced by the DP master.
0	Station_Non_Existent	The DP slave is not responding on the bus. This bit is set by the DP master 1 (the slave permanently sets this bit to 0). If the bit is set, the diagnostic bits contain the status of the last diagnostic alarm or the initial value.

Byte 1: Station status 2

Table 5- 4 Structure of station status byte 2

Bit no.	Name	Explanation
7	Deactivated	The DP slave was shown as inactive in the local parameter set and will not be cyclically queried.
6	Reserved	- Reserved -
5	Sync_Mode	The DP slave is in SYNC mode. The bit is set by the slave.
4	Freeze_Mode	The DP slave is in FREEZE mode. The bit is set by the slave.
3	Watchdog_On	The watchdog is activated on the DP slave. The bit is set by the slave.
2	Status_From_Slave	Bit =1: The diagnostics comes from the DP slave. The bit is permanently set by the slave to 1.
1	Static_Diag	Static diagnostics If the DP slave sets this bit, the DP master must fetch the diagnostic data from the DP slave until the DP slave resets this bit. The DP slave sets this bit, for example, if it cannot perform data transfer.
0	Parameter_Request	The DP slave sets this bit when it has to be re-parameterized and configured. If bit 0 and bit 1 are both set, bit 0 has the higher priority.

Byte 2: Station status 3

Table 5- 5 Structure of station status byte 3

Bit no.	Name	Explanation
7	Ext_Data_Overflow	If this bit is set, there is more diagnostic information than is specified in the diagnostics data. This data cannot be viewed.
6...0	Reserved	- Reserved -

Byte 3: Master address

The address of the DP master that has configured this DP slave is entered in the "Master_Add" byte.

If the DP slave was not configured by a DP master, the DP slave sets address 255 in this byte.

Bytes 4 and 5: Manufacturer ID of the slave ("Ident_Number")

The manufacturer ID ("Ident_Number") for the DP slave type is entered in the bytes 4 and 5. This identifier can be used to identify the slave.

The most significant part of the value is in byte 5.

5.4 Device-specific diagnostics with DP-V1

Device-specific diagnostics

The device-specific diagnostics of DP V1 slaves is available in two variants:

- Interrupt type
- Status type

The two variants differ in the coding of byte 1, bit 7 of the device-specific diagnostic data. The distinction is component-specific.

Byte 0: Header

The two most significant bits have the value 00. This identifies the "Module-specific diagnostic data" block as a whole (see bytes 4...62).

The remaining six bits indicate the length of the data block including byte 0.

Byte 1: "Interrupt type" variant

Table 5- 6 Structure of byte 1 of the device-specific diagnostics ("Interrupt type" variant)

Bit no.	Meaning	
7	Value	Meaning
	0	**Interrupt**
6...0	**Alarm_Type**	
	0	- Reserved -
	1	Diagnostic interrupt
	2	Process interrupt
	3	Pull interrupt
	4	Plug interrupt
	5	Status interrupt
	6	Update interrupt
	7...31	- Reserved -
	32...126	Manufacturer-specific
	127	- Reserved -

Older status interrupts can be overwritten by newer ones when status interrupts occur in rapid succession.

Byte 1: "Status type" variant

Table 5- 7 Structure of byte 1 of the device-specific diagnostics ("Status type" variant)

Bit no.	Meaning	
7	Value	Meaning
	1	**Status message**
6...0	**Status_Type**	
	0	- Reserved -
	1	Status message
	2	Module_Status (see also bytes 4...62)
	3...31	- Reserved -
	32...126	Vendor-specific
	127	- Reserved -

Byte 2: Slot number

Slot number (1...n) of the slave module

0 is the placeholder for the overall device.

Byte 3: "Interrupt specifier" variant

Table 5- 8 Structure of byte 3 of the device-specific diagnostics ("Interrupt specifier" variant)

Bit no.	Meaning	
7...3	Seq_No	Unique identification of an alarm message
2	Add_Ack	If this bit is set, the DP V1 master indicates that this interrupt expects an acknowledgment in the form of a WRITE job.
1...0	Alarm_Specifier	
	0	No further distinction
	1	Interrupt appears, slot is disrupted The slot generates an interrupt due to an error.
	2	Interrupt disappears, slot is OK The slot generates an interrupt and indicates that there is no other error.
	3	Interrupt disappears, slot is still disrupted The slot generates an interrupt and indicates that errors remain.

Byte 3: "Status specifier" variant

Table 5- 9 Structure of byte 3 of the device-specific diagnostics ("Status specifier" variant)

Bit no.	Meaning	
7...2	- Reserved -	
1...0	Status_Specifier	
	0	No further distinction
	1	Status appears
	2	Status disappears
	3	- Reserved -

Bytes 4...62: Module-specific diagnostic data: General coding

This byte contains data with module-specific information that is described in the respective module documentation. The particular module is identified by the slot (byte 2).

Bytes 4...62: Module-specific diagnostics for "Status type" and "Modul_Status"

In the case of the "Status type" variant of device-specific diagnostics from DP V1 slaves (see byte 1, bit 7) and the "Module_Status" setting (see byte 1, bits 0...6) two status bits are provided here for each slot (= module). Unneeded bits are set to 0.

Table 5- 10 Structure of the bytes for the module-specific diagnostic data

Byte	Bit assignment							
Bit	7	6	5	4	3	2	1	0
4	Module status 4		Module status 3		Module status 2		Module status 1	
5	Module status 8		Module status 7		Module status 6		Module status 5	
...	...		...		...		...	
62	Module status 236		Module status 235		Module status 234		Module status 233	

The respective status bits are coded as follows:

Table 5- 11 Meaning of the values of the status bits

Value	Meaning
00	Data valid
01	Data invalid - error (e.g. short-circuit)
10	Data invalid - wrong module
11	Data invalid - no module plugged

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation provides important information on installing, wiring and commissioning the ET 200SP point-to-point communications module.

This device manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Conventions

This documentation contains figures of the described device. The figures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

Note

A note contain important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Note on IT security

Siemens offers IT security mechanisms for its automation and drive product portfolio in order to support the safe operation of the plant/machine. We recommend that you inform yourself regularly on the IT security developments regarding your products. You can find information on this on the Internet (http://support.automation.siemens.com).

You can register for a product-specific newsletter here.

For the safe operation of a plant/machine, however, it is also necessary to integrate the automation components into an overall IT security concept for the entire plant/machine, which corresponds to the state-of-the-art IT technology. You can find information on this on the Internet (http://www.siemens.com/industrialsecurity).

Products used from other manufacturers should also be taken into account here.

Copyright notice for the open-source software used

Open-source software is used in the firmware of the product described. The open-source software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the following copyright notices.

Documentation guide 1

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-1500 and ET 200SP automation systems consists of system manuals, function manuals and manuals.

The STEP 7 information system (Online Help) also helps you configure and program your automation system.

Overview of the documentation provided for the CM PtP communication module (ET 200SP)

The following table lists additional references that you will need when using the CM PtP communication module.

Table 1- 1 Documentation for the CM PtP communication module

SIMATIC Manuals

All current manuals for the SIMATIC products are available for download free of charge on the Internet (http://www.siemens.com/automation/service&support).

2 Product overview

2.1 Properties

Order number

6ES7137-6AA00-0BA0

View of the module

Figure 2-1 View of CM PtP (without BaseUnit)

Properties

The communication module has the following properties:

- Technical properties
  - RS232 interface (via BaseUnit)
  - RS422/485 interface (via BaseUnit)
  - short-circuit proof
  - electrically disconnected
  - Protocols: 3964(R), Modbus master (RTU), Modbus slave (RTU), Freeport and USS with instructions
- Supported system functions
  - Firmware update
  - Identification data I&M0
  - Parameter re-assignment in CPU RUN mode (using instructions)
  - Diagnostic interrupts

Additional information

Additional information on the properties of the CM PtP can be found in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).

You can find additional information on the design of the ET 200SP and the associated modules in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

2.2 Accessories

ET 200SP accessories

Accessories and spare parts for ET 200SP can be found in the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Online catalog

Additional order numbers for ET 200SP can be found on the Internet (http://www.siemens.com/industrymall) in the online catalog and online ordering system.

2.3 Functions

Introduction

The communication module allows you to exchange data between your own and other programmable controllers or computers by means of a point-to-point connection, and to connect various devices from a variety of manufacturers.

Functionality of the CM PtP

The CM PtP communication module offers the following functionality:

- RS232 and RS422/485 interface
- Data transmission rate: 300 to 115200 bps
- Maximum frame length: 2 kbyte
- Transmission protocols: Freeport, 3964(R) and Modbus

Note

The USS protocol can be implemented with instructions included in STEP 7 (TIA Portal).

Hardware components of a point-to-point connection

You require certain hardware components for a point-to-point connection with the CM PtP.

Components	Function
Automation system	... contains the CPU and PROFINET interface, and the central I/O, if applicable, and executes the user program.
ET 200SP Distributed I/O System	... contains the distributed I/O.
Interface module (IM)	... connects the distributed I/O system ET 200SP to PROFINET IO and supports all ET 200SP I/O modules.
CM PtP communication module	... communicates with a communication partner (point-to-point) by means of the interface.
BaseUnit (6ES7193-6BP00-0xA0)	... connects the communication module with the I/O system and the supply voltage.
Server module	... completes the setup of the ET 200SP

System environment

The communication module can be used in the following system environments:

Applications	Components required	Configuration
Distributed operation in an S7-1500 system	• CPU 151x • IM 155-6 • CM PtP • Power supply (optional)	STEP 7 (TIA Portal)
Distributed operation in an S7-300/400 system	• CPU 31x / CPU 41x • IM 155-6 • CM PtP • BaseUnit	STEP 7 (TIA Portal) STEP 7 with integration of a GSD file
Distributed operation in a third-party automation system	• Third-party automation system • IM 155-6 • CM PtP	GSD file imported to/installed in the engineering system [1)]

[1)] Information on using the communication module in a third-party system is available in the programming and operating manual CM PtP operation with PROFINET controller (http://support.automation.siemens.com/WW/view/en/59062563).

Additional information

Information on configuration and programming of the CM PtP communications module is available in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) and in the information system of the TIA Portal.

2.4 Properties of the interfaces

Interfaces of the CM PtP

The CM PtP has the following interfaces, which are connected by means of the associated BaseUnit (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment):

- RS232 interface
- RS422/485 interface

2.4.1 Properties of the RS232 interface

Definition - RS232 interface

The RS232 interface is a voltage interface used for serial data transmission.

Properties - RS232 interface

The RS232 interface has the following properties and meets the following requirements:

Type	Voltage interface
BaseUnit terminals	Terminals connected to the electronics module (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment)
RS232 signals	TXD, RXD, RTS, CTS, DTR, DSR, RI, DCD, GND; all signals isolated against the backplane bus and load voltage
Max. data transmission rate	115.2 kbps
max. cable length	15 m, cable type LIYCY 9 x 0.14
Standard	DIN 66020, DIN 66259, EIA-RS 232C, CCITT V.24/V.28

RS232 signals

The table below shows the meaning of the individual RS232 accompanying signals.

Table 2- 1 Signals of the RS232 interface

Signal	Designation	Meaning
TXD	Transmit Data	Transmit data; transmit cable logically held to "1" by communication module in idle state.
RXD	Receive Data	Receive data; receive cable logically held to "1" by communication partner in idle state.
RTS	Request To Send	Request to send RTS set to "ON": Communication module ready to send; signals to the communication partner that there is data ready to send RTS set to "OFF": Communication module does not send
CTS	Clear To Send	Clear to send CTS set to "ON": Signals "clear to send" to the communication partner CTS set to "OFF": Signals "Not clear to send" to the communication partner
DTR	Data Terminal Ready	DTR set to "ON": Communications module switched on, ready for operation DTR set to "OFF": Communications module not switched on, not ready for operation
DSR	Data Set Ready	DSR set to "ON": Communication partner signals "ready for operation" DSR set to "OFF": Communication partner not switched on, not ready for operation
RI	Ring Indicator	Incoming call when connecting a modem
DCD	Data Carrier Detect	Carrier signal when connecting a modem. The communication partner signals with a high level that it detects incoming data on the cable.

2.4.2 Properties of the RS422/485 interface

Definition - RS422/485 interface

The RS422/485 (X27) interface is a differential voltage interface for serial data transmission.

Properties - RS422/485 interface

The RS422/485 (X27) interface has the following properties and meets the following requirements:

Type	Differential voltage interface
BaseUnit terminals	Terminals connected to the electronics module (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment)
RS422 signals:	T (A), R (A), T (B), R (B), GND; all signals are isolated against the backplane bus and the load voltage
RS485 signals:	R/T (A), R/T (B), GND; all signals isolated against backplane bus and load voltage
Max. data transmission rate:	115.2 kbps
Max. cable length:	1200 m; cable type LIYCY 3 x 2 x 0.14. T(A)/T(B) and R(A)/R(B) twisted in pairs.
Standard:	DIN 66259 Parts 1 and 3, EIA-RS422/485, CCITT V.11

Connecting 3

3.1 RS232 and RS422/485 interface of the communication module

Pin assignment

Table 3- 1 RS232 connection

Terminal assignment of the communication module BaseUnit	Pin	Designation	Input/output	Meaning
	1	TXD Transmit Data	Output	Transmit data
	2	RXD Receive Data	Input	Receive data
	3	RTS Request To Send	Output	Request to send
	4	CTS Clear To Send	Input	Clear to send
	5	DTR Data Terminal Ready	Output	Data terminal ready
	6	DSR Data Set Ready	Input	Data set ready
	7	DCD Data Carrier Detect	Input	Received signal level
	8	RI Ring Indicator	Input	Incoming call
	9+10	PE Ground	-	GND functional ground (isolated)
Front view				

Table 3- 2 RS422/485 connection

Terminal assignment of the communication module BaseUnit	Pin	Designation	Input/output	Meaning
	11	T (A) -	Output	Send data (four-wire mode)
	12	R (A) - T(A)/R(A)	Input Input/output	Receive data (four-wire mode) Receive/send data (two-wire mode)
	13	T (B) +	Output	Send data (four-wire mode)
	14	R (B) + T(B)/R(B)	Input Input/output	Receive data (four-wire mode) Receive/send data (two-wire mode)
	15+16	PE Ground	-	GND functional ground (isolated)
Front view				

Note

Ensure the power supply is disconnected before you wire the communication module.

Additional information

Information on connecting the modules can be found in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Installation guidelines

To take into consideration

The general installation guidelines must be taken into consideration (see function manual EMC/EMI compatible installation of control systems (http://support.automation.siemens.com/WW/view/en/59193566)).

The cable shield must be installed on a grounding rail to maintain the EMC values (electromagnetic compatibility).

Parameters/address space 4

4.1 Parameter assignment

Introduction

You configure and assign the parameters of the communication module with STEP 7 (TIA Portal V12 or later) or with STEP 7 with integration of a GSD file.

Additional information

The device manual of the communication module is supplemented by the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) and the TIA Portal information system.

There you will find information on the following topics:

- Operating modes
- Receive buffer
- Data flow control
- Transmission integrity
- Data transmission - protocol specific
- Programming/configuring in STEP 7 (TIA Portal)
- Module-specific instructions
- Diagnostics

4.2 Reaction to CPU STOP

Ongoing transmissions are aborted when the higher-level control (CPU) goes to STOP.

Frames in the receive buffer are retained. With a corresponding configuration in the properties dialog of the communication module, you can automatically clear the receive buffer on the communication module during CPU startup.

4.3 Address space

Address space of the communication module

The input addresses of the communications module total 8 bytes. The input addresses are automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal). Output addresses are not required.

Hardware identification (not freely configurable)

The hardware identification (HW ID) is automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal).

The hardware ID is issued along with the diagnostic messages to localize the module. In addition, the HW identification is required for S7-1500 at the communication instructions in order to identify the communication module. For S7-300/400, the communication module is identified by the start address of the input data.

Programming 5

Overview of the instructions

Communication between the CPU, the communication module and a communication partner takes place by means of special instructions and protocols that support the corresponding communication modules. The instructions process the exchange of data between the CPU and the communication module. They must be called cyclically from the user program. Data transmission takes place asynchronously across several cycles.

The transmission protocols are implemented on the communication module. The protocol is used to adapt the interface of the communication module to the interface of the communication partner.

Instruction	Meaning
Port_Config	You use the Port_Config instruction to dynamically assign basic interface parameters.
Send_Config	You use the Send_Config (send configuration) instruction to dynamically assign serial send parameters of a protocol.
Receive_Config	You use the Receive_Config (receive configuration) instruction to dynamically assign serial receive parameters of a protocol.
P3964_Config	You use the P3964_Config (protocol configuration) instruction to dynamically assign the parameters of the 3964(R) procedure.
Send_P2P	You use the Send_P2P instruction to send data to a communication partner.
Receive_P2P	You use the Receive_P2P instruction to receive data from a communication partner.
Receive_Reset	You use the Receive_Reset instruction to delete the receive buffer of the communication module.
Signal_Get	You use the Signal_Get instruction to read the RS232 accompanying signals.
Signal_Set	You use the Signal_Set instruction to set the RS232 accompanying signals.
Get_Features	You use the Get_Features instruction to read expanded functions supported by the communication module.
Set_Features	You use the Set_Features instruction to set expanded functions supported by the communication module.
USS_Port_Scan	You use the USS_Port_Scan instruction to communicate using the USS.
USS_Drive_Control	You use the USS_Drive_Control instruction to exchange data with a drive.
USS_Read_Param	You use the USS_Read_Param instruction to read parameters from the drive.
USS_Write_Param	You use the USS_Write_Param instruction to change parameters in the drive.
Modbus_Comm_Load	The instruction Modbus_Comm_Load allows you to configure the port of the communication module for Modbus RTU.

Instruction	Meaning
Modbus_Master	The instruction Modbus_Master allows you to communicate as Modbus master by means of the PtP port.
Modbus_Slave	The instruction Modbus_Slave allows you to communicate as Modbus slave by means of the PtP port.

The instructions are part of STEP 7 (TIA Portal). The instructions are available in the "Instructions" task card under Communication > Communication processor.

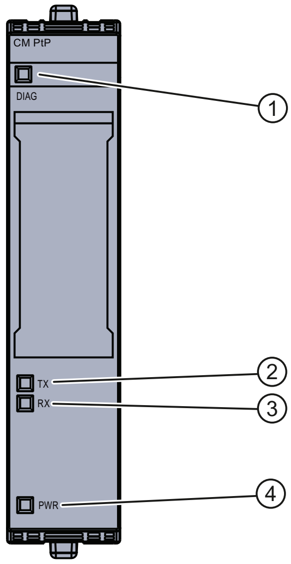
Additional information

Additional information on programming the communication modules can be found in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).

Error and system messages 6

LED displays of the communication module

The figure below shows the LED displays of the CM PtP communication module.



① LED display DIAG
② LED display TX
③ LED display RX
④ LED display PWR

Figure 6-1 View of CM PtP (without BaseUnit)

Meaning of DIAG LED display

LED DIAG	Meaning	Solution
On	CM configured and ready for operation	---
Flashes	CM in startup, parameters not assigned yet	---
Flashes	Error information; diagnostic interrupt (break)	Evaluate the diagnostics data and eliminate the error. [1)]

1) Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual

Meaning of the TXD/RXD LED displays

LED		Meaning	Solution
TX	RX		
Flashes	Off	Interface is transmitting	---
Off	Flashes	Interface is receiving	---

Meaning of PWR LED display

LED PWR	Meaning	Solution
On	Power ON (supply voltage present)	---
Off	Power OFF (supply voltage missing)	Check the voltage supply of the load group

Additional information

Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual.

7 Technical specifications

Technical specifications of the CM PtP communication module

	6ES7137-6AA00-0BA0
Product type designation	ET 200SP CM PtP
General information	
• I&M data	Yes: I&M 0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V12.0 / V12.0
STEP 7 can be configured/integrated as of version	V5.5 SP2 or higher with a GSD file
PROFIBUS as of GSD version/GSD revision	- / -
PROFINET as of GSD version/GSD revision	V2.3
Installation type/mounting	
• Rail mounting possible	Yes; standard - DIN rail
Supply voltage	
Voltage type of supply voltage	24 V DC
• Rated value (DC)	24 V
• Low limit of valid range (DC)	19.2 V
• High limit of valid range (DC)	28.8 V
• Reverse polarity protection	Yes
Input current	
• Current consumption (rated value)	29 mA
Power loss	
• Power loss, typ.	0.7 W

• Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes
• Wire break	Yes
Diagnostics display LED	
• Monitoring of supply voltage	Yes; green PWR-LED
• For module diagnostics	Yes; green/red DIAG-LED
• Receive RxD	Yes; green LED
• Send TxD	Yes; green LED
Electrical isolation	
• between backplane bus and interface	Yes
Permitted potential difference	
Between the different circuits	75 V DC / 60 V AC (Basic insulation)
Insulation	
Insulation tested with	707 V DC (Type Test)
Ambient conditions	
Operating temperature	
• Horizontal installation, min.	0 °C
• Horizontal installation, max.	60 °C
• Vertical installation, min.	0 °C
• Vertical installation, max.	50 °C
Distributed operation	
• At SIMATIC S7-300	Yes
• At SIMATIC S7-400	Yes
• At SIMATIC S7-1200	No
• At SIMATIC S7-1500	Yes
• At Standard Profinet Controller	Yes

	6ES7137-6AA00-0BA0
Dimensions	
• Width	15 mm
• Height	73 mm
• Depth	58 mm
Weights	
• Weight, approx.	30 g

Additional general technical specifications for SIMATIC ET 200SP can be found in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

Dimensional drawing

A

In this appendix, you will find the dimensional drawing of the communication module, inserted into a BaseUnit and mounted on a DIN rail. You have to consider the dimensions during installation in control cabinets, control rooms, etc (BaseUnit: 6ES7193-6BP00-0xA0).

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Validity of this manual

This document contains information on the following modules:

- CP 1542SP-1
  Article number **6GK7542-6UX00-0XE0**
  Hardware version 1
  Firmware version V2.0
  Communications processor for connecting a SIMATIC ET 200SP CPU to Industrial Ethernet
- CP 1542SP-1 IRC
  Article number **6GK7542-6VX00-0XE0**
  Hardware version 1
  Firmware version V2.0
  Communications processor for connecting a SIMATIC ET 200SP CPU via Industrial Ethernet to a control room (TCSB, ST7, DNP3, IEC 60870-5-104)
- CP 1543SP-1
  Article number **6GK7543-6WX00-0XE0**
  Hardware version 1
  Firmware version V2.0
  Communications processor for connecting a SIMATIC ET 200SP CPU to Industrial Ethernet, Security

Figure 1 CP 1542SP-1 with plugged in BusAdapter (here BA 2xRJ45)

On the front of the module at the right edge, the hardware version is printed as a placeholder "X". If the printed text is, for example, "X 2 3 4", "X" would be the placeholder for hardware product version 1.

Directly below, you will find the firmware version of the CP as it shipped.

The MAC address is printed on the front at the bottom left, above the connectors for the power supply:

- 00:1B:1B:xx:xx:01 (interface)

- 00:1B:1B:xx:xx:02 (port X1P1)
- 00:1B:1B:xx:xx:03 (port X1P2)

Product names, terms and abbreviations/acronyms

Below you will find abbreviations and product names used often in this manual.

- **CP / module / device**

  When the property being described is valid in the current context for all three CP types or if the CP type being used is clear from the context, these terms will be used instead of the full product name.

  If information in the running text applies only to a certain CP type. the full module name is specified.
- **TCSB**

  Control center software "TeleControl Server Basic"
- **Telecontrol server**

  PC with installed software "TeleControl Server Basic"
- **ES**

  Engineering station - PC with the STEP 7 project

Purpose of the manual

This manual describes the properties of this module and supports you when installing and commissioning it.

The required configuration steps are described as an overview and there are explanations of the relationship between firmware functions and configuration.

You will also find information about the diagnostics options of the device.

Required experience

To install, commission and operate the CP, you require experience in the following areas:

- Automation engineering
- Setting up the SIMATIC ET 200SP
- SIMATIC STEP 7 Professional

New in this issue

- New firmware version with the following new functions, among others:

  New functions for the CP 1542SP-1 IRC:

  - SINAUT ST7 telecontrol protocol
  - Remote maintenance via SINEMA Remote Connect
  - Extended CP diagnostics

New functions for the CP 1543SP-1:

  – Remote maintenance via SINEMA Remote Connect
  – Configurable e-mails
  – Extended CP diagnostics

- Editorial revision

Replaced edition

Edition 01/2017

Current manual release on the Internet

You will also find the current version of this manual on the Internet pages of Siemens Industry Online Support under at the following addresses:

- CP 1542SP-1 / CP 1543SP-1
  Link: (https://support.industry.siemens.com/cs/ww/en/ps/22144/man)
- CP 1542SP-1 IRC
  Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/man)

Cross references

In this manual there are often cross references to other sections.

To be able to return to the initial page after jumping to a cross reference, some PDF readers support the command <Alt>+<Left arrow>.

Sources of information and other documentation

You will find an overview of further reading and references in the Appendix of this manual.

License conditions

Note

Open source software

Read the license conditions for open source software carefully before using the product.

You will find license conditions in the following document on the supplied data medium:

- OSS_CP-ET200SP_99.pdf

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For additional information on industrial security measures that may be implemented, please visit
Link: (http://www.siemens.com/industrialsecurity)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under
Link: (http://www.siemens.com/industrialsecurity)

Firmware

The firmware is signed and encrypted. This ensures that only firmware created by Siemens can be downloaded to the device.

Recycling and disposal

The product is low in pollutants, can be recycled and meets the requirements of the WEEE directive 2012/19/EU "Waste Electrical and Electronic Equipment".

Do not dispose of the product at public disposal sites. For environmentally friendly recycling and the disposal of your old device contact a certified disposal company for electronic scrap or your Siemens contact.

Keep to the local regulations.

You will find information on returning the product on the Internet pages of Siemens Industry Online Support:
Link: (https://support.industry.siemens.com/cs/ww/en/view/109479891)

SIMATIC NET glossary

Explanations of many of the specialist terms used in this documentation can be found in the SIMATIC NET glossary.

You will find the SIMATIC NET glossary here:

- SIMATIC NET Manual Collection or product DVD

  The DVD ships with certain SIMATIC NET products.

- On the Internet under the following address:

  Link: (https://support.industry.siemens.com/cs/ww/en/view/50305045)

Training, Service & Support

You will find information on training, service and support in the multilanguage document "DC_support_99.pdf" on the Internet pages of Siemens Industry Online Support:

Link: (https://support.industry.siemens.com/cs/ww/en/view/38652101)

Table of contents

1 Application and functions

1.1 Components of the product

The following components are supplied with the product:

- CP 154xSP-1
- Plug for the socket of the power supply (24VDC) of the CP
- DVD with documentation and license texts

A BusAdapter for the Ethernet connection of the CP does not ship with the product.

1.2 Application

Application of the CP variants

The CP is used to connect the ET 200SP to Industrial Ethernet via a copper cable or fiber-optic cable. It can be used as an additional Ethernet interface of the CPU for S7 communication.

For the Ethernet connection, the CP requires a BusAdapter. The BusAdapter is not supplied with the CP. For information on the compatible BusAdapters, refer to the section BusAdapter (Page 163).

The three CP types are intended for the following communication tasks:

- **CP 1542SP-1**

  The CP 1542SP-1 allows the ET 200SP a further Ethernet connection.
- **CP 1543SP-1**

  The CP 1543SP-1 has Security functions for network security, such as a firewall and VPN. This makes protected access to the ET 200SP possible.
- **CP 1542SP-1 IRC**

  The CP 1542SP-1 IRC supports telecontrol communication for connecting the ET 200SP CPU to a control center. One of the following telecontrol protocols can be used as an alternative:

  – TeleControl Basic

    For connection of the ET 200SP CPU to a control center with telecontrol server (TCSB)

  – ST7

    For connection of the ET 200SP CPU to a control center with SINAUT ST7

  – DNP3

    For connection of the ET 200SP CPU to DNP3 master

  – IEC 60870-5-104

    For connection of the ET 200SP CPU to IEC master

1.3 Communications services

Communications services

The following communications services are supported:

- **S7 communication and PG/OP communication with the following functions:**
  - PUT/GET as client and server for data exchange with S7 stations
  - USEND/URCV for uncoordinated data exchange with a remote partner
  - BSEND/BRCV for exchanging large volumes of data with a partner
  - PG functions
  - Operator control and monitoring functions (HMI)

  For S7 communication, the CP requires a fixed IP address.
- **S7 routing**
  - Routing of S7 connections via the backplane bus and the CPU to other S7 stations
- **SINEMA Remote Connect (SINEMA RC)**

  As of firmware version V2.0, the following CP types support SINEMA RC with software version V1.3:
  - CP 1542SP-1 IRC
  - CP 1543SP-1

  See section Connection to SINEMA RC (Page 19).

  For the manual, see /9/ (Page 169).
- **Open User Communication (OUC)**

  OUC via program blocks with the following protocols:
  - TCP/IP
  - ISO-on-TCP
  - UDP

  The CP 1543SP-1 supports Secure OUC.

  You will find the program blocks supported by the three CP types in the section Program blocks (Page 137).
- **E-mail using program blocks**
- **HTTP / HTTPS**

  Via HTTP / HTTPS you can access the Web server of the CPU.

For telecontrol communication of the CP 1542SP-1 IRC, see section Telecontrol communication of the CP 1542SP-1 IRC (Page 14).

For information on the Security functions of the CP 1543SP-1, refer to the section Security functions (CP 1542SP-1 IRC, CP 1543SP-1) (Page 16).

1.4 Other services and properties

Further services and properties of the CP

- **IP configuration**
  - Address types

    The CP supports IP addresses according to IPv4 and IPv6.
  - Addressing

    The IP address, the subnet mask and the address of a gateway can be set manually in the configuration. As an alternative, the IP address can be obtained using program blocks.
  - DHCP: As an alternative, the IP address can be obtained from a DHCP server.
  - DCP (Discovery and Configuration Protocol) is supported.
- **Time-of-day synchronization**
  - NTP

    The CP can synchronize its time of day via NTP.

    Only CP 1543SP-1: If the Security functions are enabled, the secure method NTP (secure) can be used.
  - Time from partner (only CP 1542SP-1 IRC)

    If telecontrol communication is enabled, the CP can also obtain its time of day via from the communications partner.

    UTC time is used for TeleControl Basic and DNP3.

    The local time of the partner PC is used for ST7 and IEC.

    The time of day of the CP can be read by the CPU using a PLC tag. For information on the format of the time stamp of the data frames, refer to the section Datapoint types (Page 86).

  For more detailed information, refer to section Time-of-day synchronization (Page 53).
- **SNMP**

  As SNMP agent, the CP supports queries via SNMPv1.

  The CP 1543SP-1 also supports SNMPv3.

  For more detailed information, refer to section SNMP (Page 55).
- **E-mail**

  The CP 1542SP-1 IRC and CP 1543SP-1 support sending e-mails.

1.5 Telecontrol communication of the CP 1542SP-1 IRC

Telecontrol protocols

In addition to the communications services named above, the CP 1542SP-1 IRC supports the following telecontrol protocols for communication with a master station:

- **TeleControl Basic ***

  Proprietary protocol for telecontrol applications. The IP-based protocol is used to connect the CP to the application TCSB.

  TCSB is installed on a PC in the master station, the telecontrol server. Via the OPC-DA or OPC-UA server of TCSB, an OPC client can access the process data of the CP.

  TCSb is supported as of the following version: V3.0 + SP3

  For the TCSB manual, see /4/ (Page 168).

- **ST7**

  Proprietary protocol for telecontrol applications in the SINAUT ST7 system. The protocol is used to connect the CP to ST7 control centers.

  The SINAUT ST7 supports the following functions, among others:

  – Communication with the master station

  – Communication with other stations

  – MSC transmission protocol

    Under SINAUT S7, the CP uses the following variants of the MSC transmission protocol on OSI layer 3:

    - MSC (default setting)

    - MSCsec when security requirements are higher ("Security" activated)

  – Communication using mobile wireless

    Communication via a mobile wireless network combined with the Internet is made possible by a SCALANCE M router. The SCALANCE M product series provides various VPN routers with IPsec, encryption software and their own firewall.

    You will find a list of routers in the appendix Router SCALANCE M (Page 165).

- **DNP3 ***

  The CP functions as a DNP3 station (Outstation).

  Communication is based on the DNP3 SPECIFICATION Version 2.11 (2007/2009).

  You will find a detailed overview of the attributes and properties of the DNP3 protocol that are supported by the CP in the DNP3 device profile; see
  Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/man)

  You will find the supported object groups and variations in the section Datapoint types (Page 86).

  Communications partner (DNP3) can be:

  – SIMATIC PCS 7 TeleControl

  – SIMATIC WinCC TeleControl

  – SIMATIC WinCC OA

  – A TIM module with DNP3 capability (TIM 3V IE DNP3 / TIM 4R IE DNP3)

    For the manual of the TIM module see /6/ (Page 168).

  – Third-party systems that support the DNP3 specification named above.

- **IEC 60870-5-104 ***

  The CP functions as a substation (slave).

  Communication is based on the specification IEC 60870-5 Part 104 (2006).

  You will find a detailed overview of the attributes and properties of the IEC specification that are supported by the CP in the IEC device profile; see
  Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/man)

  You will find the supported IEC type identifiers as in the section Datapoint types (Page 86).

  Communications partner (IEC master) can be:

  – SIMATIC PCS 7 TeleControl

  – SIMATIC WinCC TeleControl

  – SIMATIC WinCC OA

  – Third-party systems that support the IEC specification named above.

***** Optional telecontrol via SINEMA Remote Connect; see section Connection to SINEMA RC (Page 19).

Further properties of the CP 1542SP-1 IRC

- **Data point configuration**

  The process values are configured as data points for the communication.

  No program blocks need to be programmed for the CP 1542SP-1 IRC to transfer user data between the station and communications partner.

  The data areas in the memory of the CPU intended for communication with the partner are configured for the specific data points in the CP. Each data point addresses a PLC tag or element in a data block of the CPU.

  The data points can be processed individually in the control system.

- **Messages / e-mail**

  With configurable events in the process image of the CPU, the CP 1542SP-1 IRC can send messages as e-mails. The data sent by e-mail is configured using PLC tags.

- **Send buffer**

  CP 1542SP-1 IRC saves the values of data points configured as an event in the send buffer. It transmits the data from the send buffer spontaneously or bundled to the communications partner.

  The data is not saved retentively. It is lost in the event of a power failure.

- **Analog value processing**

  Analog values can be preprocessed on the CP 1542SP-1 IRC according to various methods.

1.6 Security functions (CP 1542SP-1 IRC, CP 1543SP-1)

Security functions are available for the following CP types:

- CP 1543SP-1
- CP 1542SP-1 IRC

The security functions are enabled in the configuration of the CP.

For information on the security functions of Open User Communication, refer to the section Program blocks (Page 137).

Note

Recommendation for critical security plants

Refer to the information in the section Security recommendations (Page 47).

CP 1543SP-1

With Industrial Ethernet Security, individual devices, automation cells or network segments of an Ethernet network can be protected. The data transfer via the CP 1543SP-1 can be protected from the following attacks by a combination of different security measures:

- Data espionage
- Data manipulation
- Unauthorized access

Secure underlying networks can be operated via additional Ethernet/PROFINET interfaces of the CPU.

As a result of using the CP, as a security module, the following security functions are accessible to the ET 200SP station on the interface to the Ethernet network:

- **Firewall**

  The firewall protects the device with:

  – IP firewall with stateful packet inspection (layer 3 and 4)

  – Firewall also for "non-IP" Ethernet frames according to IEEE 802.3 (layer 2)

  – Limitation of the transmission speed to restrict flooding and DoS attacks ("Define IP packet filter rules")

- **Certificates**

  Certificates are used for the secure authentication of the communications partners.

- **VPN**

  The following alternatives can be used:

  – Secured communication via IPsec tunnels

    VPN communication allows the establishment of secure IPsec tunnels for communication with one or more security modules. The CP can be grouped together with other modules to form VPN groups during configuration. IPsec tunnels are created between all security modules of a VPN group.

  – Remote maintenance via SINEMA Remote Connect

    It is not necessary and not possible to create a VPN group for communication via a SINEMA RC server. The SINEMA RC Server manages the communication between the devices and the security mechanisms (OpenVPN).

    For information on communication via SINEMA Remote Connect, see section Telecontrol via SINEMA RC (Page 60).

- **Logging**

  Sending of events can be enabled for monitoring. The events can be read out using STEP 7 or sent to a Syslog server.

- **Encrypted e-mails**

  For secure transfer of information with encrypted e-mails, you can use the following as an alternative:

  – SSL/TLS

  – STARTTLS

  For information on the configuration, see section E-mail configuration (Page 123).

- **NTP (secure)**

  For secure transfer during time-of-day synchronization

- **SNMPv3**

  For secure transmission of network analysis information safe from eavesdropping

For information on configuring the security functions, refer to the section Security (Page 117).

You will find further information on the functionality and configuration of the security functions in the information system of STEP 7 and in the manual /5/ (Page 168).

CP 1542SP-1 IRC

The CP supports the following security functions:

- **Encrypted e-mails**

  For secure transfer of information with encrypted e-mails, you can use the following as an alternative:

  – SSL/TLS

  – STARTTLS

  For information on the configuration, see section E-mail configuration (Page 123).

- **Certificates**

  Certificates are used for the secure authentication of the communications partners.

- **Secure telecontrol communication**

The telecontrol protocols provide the following Security functions:

- **TeleControl Basic**

  As an integrated security function, the telecontrol protocol encrypts the data for transfer between the CP and telecontrol server. The interval for the key exchange between the CP and telecontrol server can be set.

  The telecontrol password is used to authenticate the CP on the telecontrol server.

  If the security functions are enabled, the CP can process telecontrol communication via SINEMA Remote Connect.

- **SINAUT ST7**

  The transmission protocols that can be used by the CP for telecontrol communication via the ST7 protocol support the following security functions:

  – MSC

    The MSC protocol supports authentication of the communications partners and simple encryption of data. A user name and a password are included in the encryption. A tunnel is established between the MSC station and MSC master station.

  – MSCsec

    In addition to MSC, with MSCsec, the shared automatically generated key is renewed between the communications partners at configurable intervals.

- **DNP3**

  The CP supports authentication according to the "Secure Authentication V5" specification.

  If the security functions are enabled, the CP can process telecontrol communication via SINEMA Remote Connect.

- **IEC 60870-5-104**

  If the security functions are enabled, the CP can process telecontrol communication via SINEMA Remote Connect.

For information on communication via SINEMA Remote Connect, see section Connection to SINEMA RC (Page 19).

1.7 Connection to SINEMA RC

Communication via SINEMA Remote Connect is supported by:

- CP 1543SP-1
- CP 1542SP-1 IRC

Communication via SINEMA Remote Connect (SINEMA RC)

The "SINEMA RC Server" application provides end-to-end connection management of distributed networks via the Internet. This also includes secure remote access to lower-level stations. Communication between SINEMA RC Server and the remote devices takes place via a VPN tunnel with consideration of the stored access rights.

SINEMA RC uses OpenVPN for encryption of the data. The center of the communication is SINEMA RC Server via which communication runs between the subscribers and that manages the configuration of the communications system.

SCALANCE M routers, which you can use for the connection, also support OpenVPN and connection to SINEMA Remote Connect.

For the CP firmware version required for communication via SINEMA RC see section Communications services (Page 12).

The CP can also handle telecontrol communication via the SINEMA RC server.

Parameter groups

You configure communication via SINEMA RC and telecontrol communication via SINEMA RC in two parameter groups:

- Communication via SINEMA RC:

  > "Security > VPN"

- Telecontrol communication via SINEMA RC:

  > "Communication types"

  For information on the supported protocols and configuration, see section Telecontrol via SINEMA RC (Page 60).

Applications

The following application options of the CP result from the combination of the parameters for telecontrol communication and SINEMA RC:

- (1) No telecontrol and no SINEMA RC (CP for network separation only)
- (2) CP only for remote maintenance via SINEMA RC
- (3) CP for telecontrol communication only
- (4) CP uses telecontrol communication, but SINEMA RC only for remote maintenance.
- (5) CP uses SINEMA RC for telecontrol communication and remote maintenance.

The table provides an overview of the applications with the respective parameter settings.

- "On" means that the parameter is activated.
- "Off" means that the parameter is deactivated.

Table 1- 1 Use cases and parameters to be activated

Use case	**Parameter settings** (Parameters abbreviated) *		
	SRC	**TC**	**TC-SRC**
(1)	Off	Off	Off
(2)	On	Off	Off
(3)	Off	On	Off
(4)	On	On	Off
(5)	On	On	On

***** Explanation of the parameter abbreviations:

SRC - Security > VPN (activated) > "VPN connection type":
"Automatic OpenVPN configuration via SINEMA Remote Connect Server"

TC - Communication types > Telecontrol communication enabled

TC-SRC - Communication types >
"Activate telecontrol communication via SINEMA Remote Connect"

1.8 Configuration limits and performance data

Number of CPs per station

In each ET 200SP station, up to three special modules can be plugged in and configured; this allows a maximum of two CP 154xSP-1 modules.

For details of the permitted special modules and the slot rules, refer to section Installing the CP (Page 40).

Connection resources

Connection resources - valid for all CP variants

Number of connections via Industrial Ethernet, maximum of 32 in total, of which:

- S7: Max. 16
- TCP/IP: Max. 32
- ISO-on-TCP: Max. 32
- UDP: Max. 32

Also:

- Online connections of the engineering station (STEP 7): Max. 2
- TCP connections for HTTP

  For HTTP access upp to 12 TCP connection resources are available that are used by one or more Web browsers to display data of the CP.
- PG/OP connections (HMI): In total maximum of 16,
  of which:
  - Connection resources for PG connections: Max. 16
  - Connection resources for OP connections: Max. 16

CP 1543SP-1

Security functions of the CP 1543SP-1

- **VPN tunnel (IPsec)**

  A maximum of four **IPsec** tunnels can be established for secure communication with other security modules.

- **Firewall rules**

  The maximum number of firewall rules in advanced firewall mode is limited to 256. The firewall rules are divided up as follows:

  – Maximum 226 rules with individual addresses

  – Maximum 30 rules with address ranges or network addresses
  (e.g. 140.90.120.1 - 140.90.120.20 or 140.90.120.0/16)

  – Maximum 128 rules with limitation of the transmission speed ("Bandwidth limitation")

- **E-mail (via message editor)**

  Up to 10 e-mails to be sent can be configured.

  Maximum number of characters that can be transferred per e-mail: 256 ASCII characters including any value sent at the same time

CP 1542SP-1 IRC

Telecontrol functions of the CP 1542SP-1 IRC

- **Telecontrol connections**

  – TeleControl Basic

  A connection can be established to a single or redundant telecontrol server.

  – SINAUT ST7

  The CP can establish up to eight ST7 connections, of which maximum:

  - 8 individual connections with partners

  - 4 redundant connections with partners

  - 8 connections for inter-station communication between ST7 stations

  - A combination of the three options

  – DNP3 / IEC 60870-5-104

  Connections to up to four single or redundant masters can be established.

- **E-mail (via message editor)**

  Up to 10 e-mails to be sent can be configured.

  Maximum number of characters that can be transferred per e-mail: 256 ASCII characters including any value sent at the same time

- **Frame memory (send buffer)**

  The CP has a frame memory (send buffer) for the values of data points configured as an event.

  The volume of the send buffer is divided equally among all configured communications partners. The size of the send buffer can be configured in STEP 7, refer to the section Communication with the CPU (Page 70).

  The maximum size of the send buffer with the respective remote control protocol is:

  – TeleControl Basic

    64000 events

  – SINAUT ST7

    32000 events

  – DNP3

    100000 events

  – IEC 60870-5-104

    100000 events

  You will find details of how the send buffer works such as storing events as well as the options for transferring the data in the section Process image, type of transmission, event classes (Page 97).

- **Data points**

  The data to be transferred by the CP is assigned to various data points in the STEP 7 configuration. The size of the user data per data point depends on the data type of the relevant data point. You will find details in the section Data point configuration (Page 79).

  The maximum number of configurable data points is 500.

1.9 Requirements for use

1.9.1 Hardware requirements

Bus adapter

To connect to the Ethernet network, the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

The CP supports the following BusAdapter:

- BA 2xRJ45
- BA 2xFC
- BA 2xSCRJ
- BA SCRJ/RJ45
- BA SCRJ/FC

You can find further details on the BusAdapters in the appendix BusAdapter (Page 163) and the manual /3/ (Page 168).

CPUs and other components of the ET 200SP

The CP supports operation in stations that contain one of the following CPUs:

- CPU 1510SP-1 PN

  Article number: 6ES7510-1DJ01-0AB0
- CPU 1510SP F-1 PN

  Article number: 6ES7510-1SJ01-0AB0
- CPU 1512SP-1 PN

  Article number: 6ES7512-1DK01-0AB0
- CPU 1512SP F-1 PN

  Article number: 6ES7512-1SK01-0AB0

Further parts and modules that are also required to set up the ET 200SP station, such as rails, I/O modules or cabling are not listed here. See also /3/ (Page 168) for information on this.

Components of the communications partner

Components required by the communications partners of the CP 1542SP-1 IRC are not listed here. You will find references to other products (e.g. TCSB) in the list of references in the appendix of the manual.

1.9.2 Software requirements

Configuration software

To configure the entire functionality of the CP firmware version described in this document, the following configuration tool is required:

- STEP 7 Professional V15

Software for online functions

To use the online functions, the following software is required:

- STEP 7 in the version specified above.

CPU firmware

To use the CP, a CPU 151xSP with a firmware version ≥ V2.0 is required.

1.10 Configuration examples

Below you will find configuration examples for the use of the three CP types.

CP 1542SP-1 - Network separation

The CP is used in the ET 200SP to operate lower-level networks separately or to achieve separation from the higher-level network.

The ET 200SP can be expanded flexibly with further Ethernet interfaces via the CP. The network separation allows the setting up of identical machines with the same IP address. The CP takes over the communication and relieves the CPU.

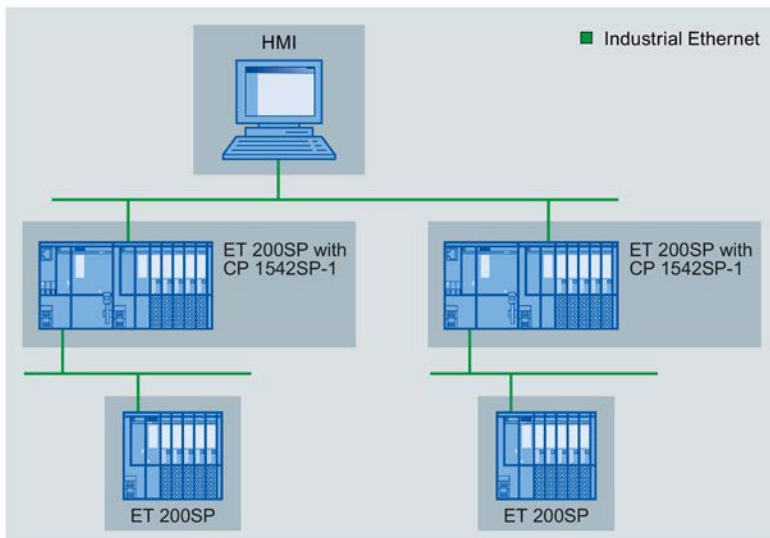

Figure 1-1 Configuration example of an ET 200SP with CP 1542SP-1

CP 1543SP-1 - Cell protection with security functions

The CP communicates encrypted with communications partners in the connected network. The firewall monitors the access to the ET 200SP and therefore protects lower-level networks. This avoids data loss, disruptions of production and damage to machines.

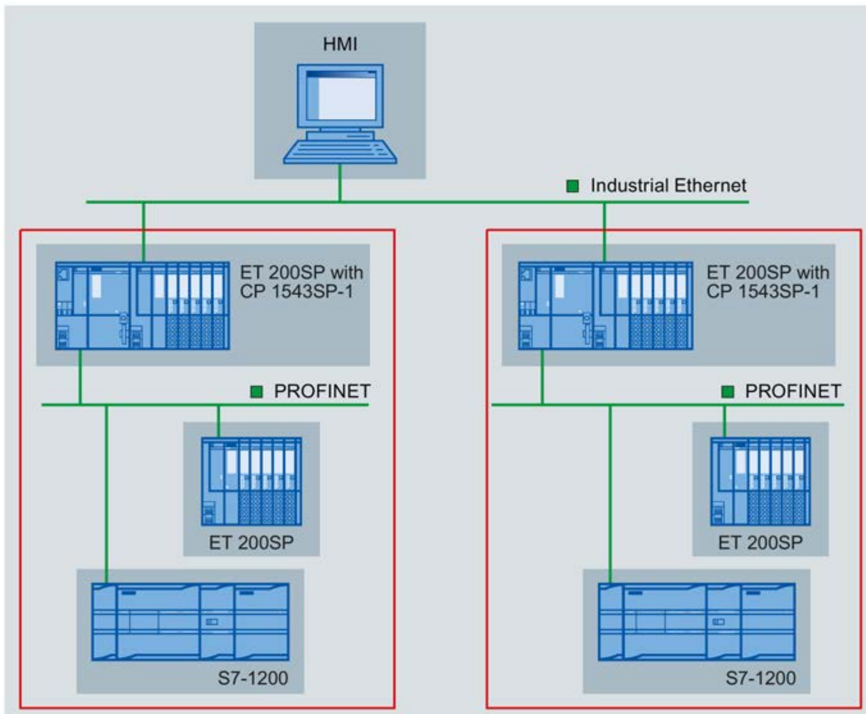

Figure 1-2 Configuration example of an ET 200SP with CP 1543SP-1

CP 1542SP-1 IRC - Connection to control centers

By using the CP the ET 200SP can be used as a remote terminal unit. The following protocols can be used for telecontrol communication:

- TeleControl Basic
- SINAUT ST7
- IEC 60870-5-104
- DNP3

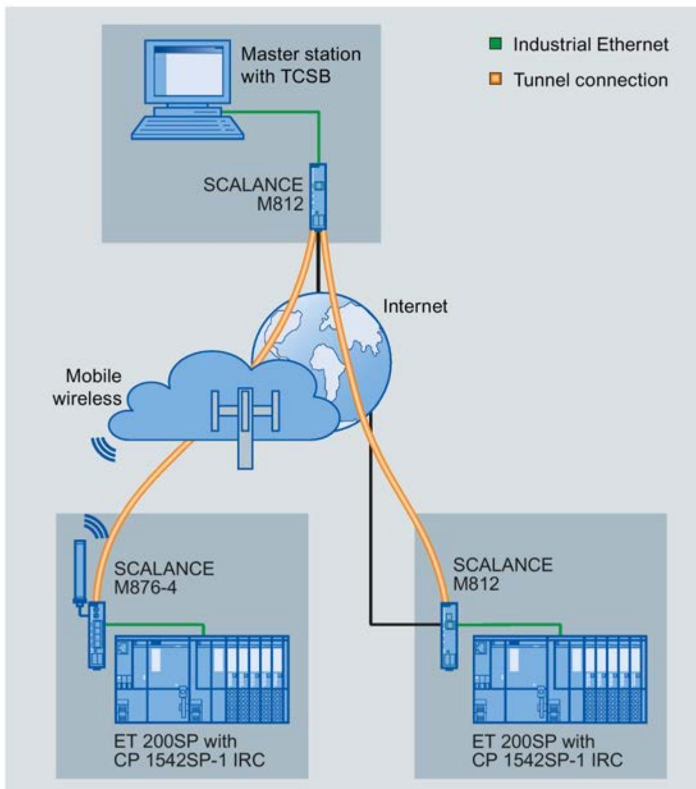

Figure 1-3 Configuration example of an ET 200SP with CP 1542SP-1 IRC; protocol: TeleControl Basic

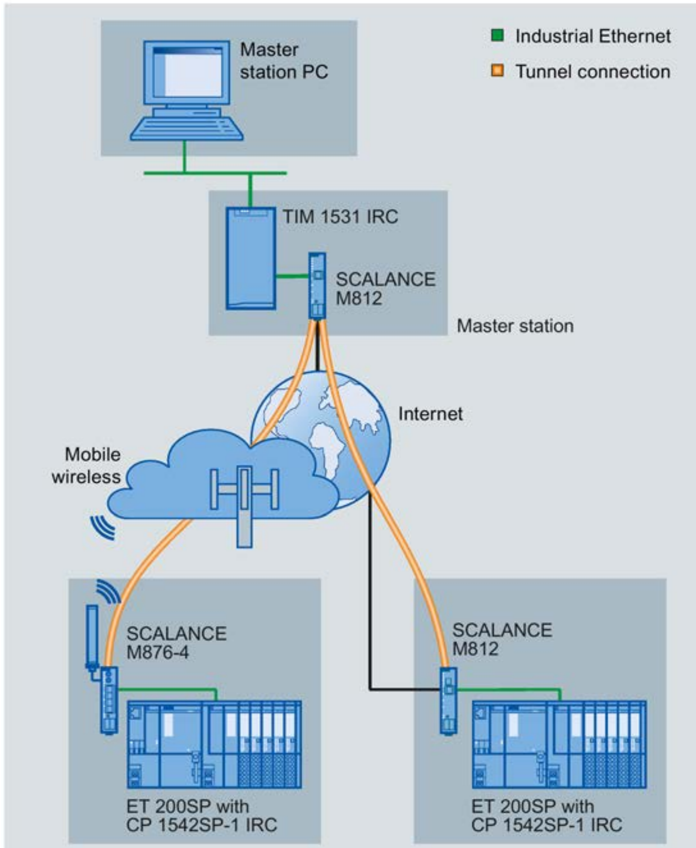

Figure 1-4 Configuration example of an ET 200SP with CP 1542SP-1 IRC; protocol: ST7

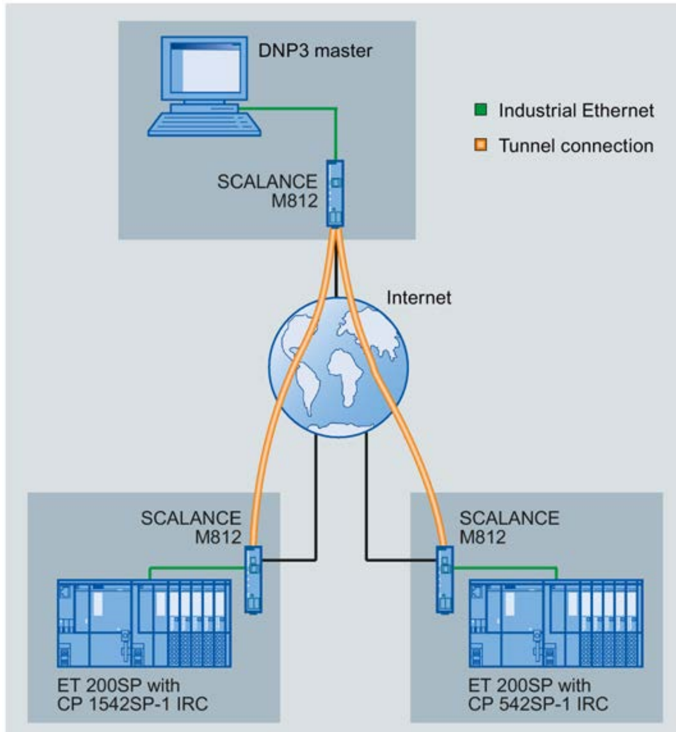

Figure 1-5 Configuration example of an ET 200SP with CP 1542SP-1 IRC; protocol: DNP3

A configuration with which the protocol IEC 60870-5-104 is used could look similar.

Telecontrol via SINEMA Remote Connect

The following figure shows a configuration in which the CP 1542SP-1 IRC communicates with the master station via a SINEMA Remote Connect Server. In this example, the CP uses the protocol IEC 60870-5-104.

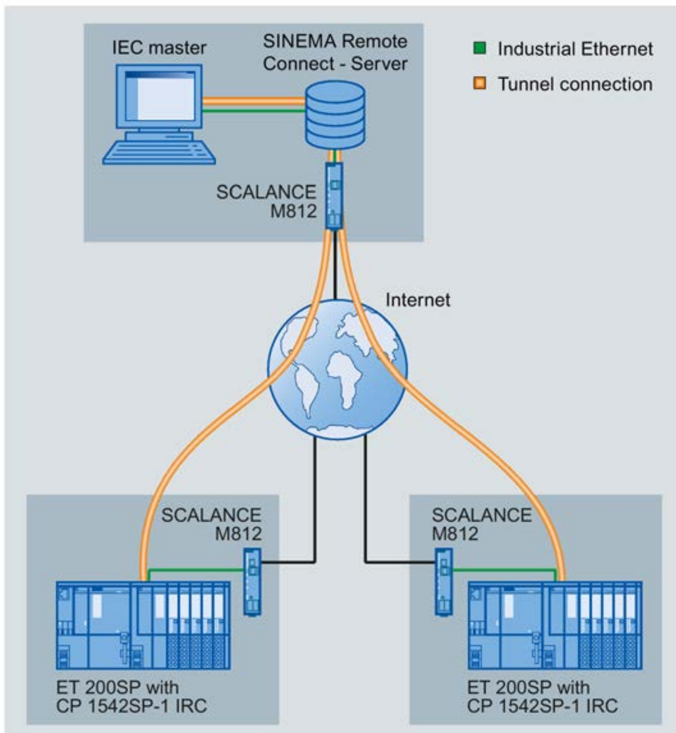

Figure 1-6 Configuration example of an ET 200SP with CP 1542SP-1 IRC for telecontrol communication via SINEMA RC

Remote maintenance with SINEMA RC

The following figure shows the connection of different stations with Security CP to an engineering station via SINEMA Remote Connect - Server.

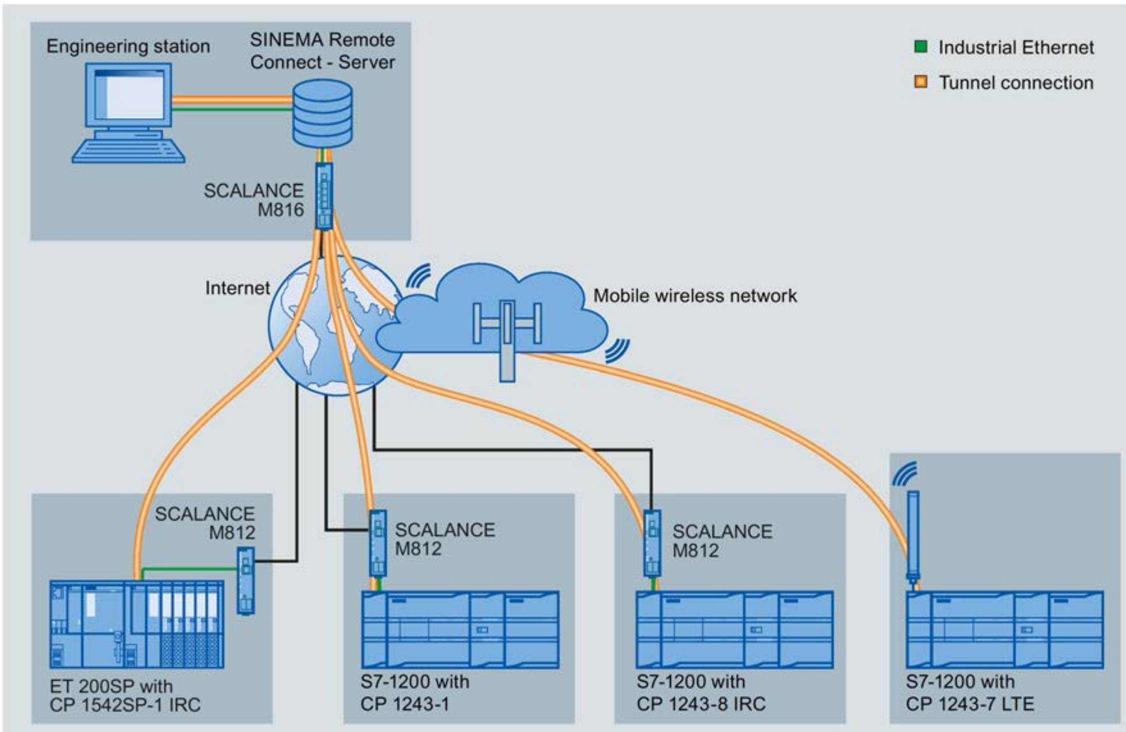

Figure 1-7 Connection of stations to engineering station via SINEMA RC

LEDs and connectors

2

2.1 LEDs

Meaning of the LED displays of the CP

The CP has the following light emitting diodes (LEDs) on the front:

LED name	Meaning
PWR	Power supply
RN	Operating mode
ER	Error
MT	Maintenance

Table 2- 1 Legend for the following tables

Symbol	🟢 🟡 🔴	⚪	🟢✹ 🟡✹ 🔴✹	-
Meaning / LED status	ON (LED lit)	OFF	LED flashes	Any

Table 2- 2 Meaning of the LED displays of the CP

PWR (green)	RN (green)	ER (red)	MT (yellow)	Meaning
⚪	⚪	⚪	⚪	No supply voltage on the CP or supply voltage too low
🟢	🟢	🔴	🟡	CP startup
🟢	🟢	⚪	⚪	CP in RUN mode
🟢	-	🔴✹	⚪	Error. LED display with the following events: • Duplicate IP address • Bus adapter not plugged in or pulled • No telecontrol connection (CP 1542SP-1 IRC)
🟢	🟢✹	🔴✹	🟡✹	Error: CP defective
🟢	🟢✹	⚪	⚪	Missing configuration data
🟢	🟢	⚪	🟡✹	Firmware update running
🟢	🟢	⚪	🟡	There is a maintenance request from the CP. Example: • End of the firmware update

LEDs of the bus adapter

Every port of a bus adapter has an LED "LKx" that informs about the connection status with Ethernet and the frame traffic of the port.

Table 2- 3 Meaning of the LED displays of the bus adapters

LK (green)	Meaning
	No Ethernet connection. Possible causes: • No physical connection to the network • Port disabled in the configuration
	LED flashing test
	There is an Ethernet connection between the port and communications partner.

2.2 Power supply

External power supply required

The connector for the external 24 VDC power supply is located on the front of the CP.

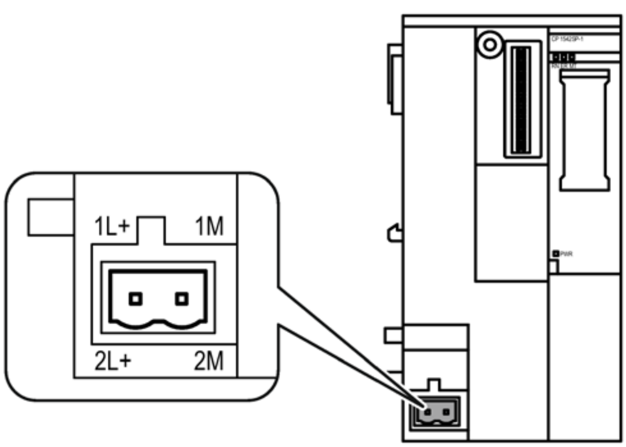

Figure 2-1 Power supply of the CP

Connector X80 is intended for connection to a single or redundant power supply. The power supply is connected to the CP with the supplied plug-in terminal block. The terminal block is plugged in to the socket X80 of the CP.

For information on installing and connecting up, refer to the sections Installing the CP (Page 40) and Connecting the CP (Page 44).

Reverse polarity protection

The plug-in terminal block for connector X80 is designed so that it can only be plugged in in one position. This provides constructional reverse polarity protection.

The connector X80 also has electronic reverse polarity protection.

You will find further data on the power supply in section Technical specifications (Page 155).

2.3 Connector for the BusAdapter

Operation of the device only with BusAdapter

For connecting to Ethernet the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

The slot is on the front of the device:

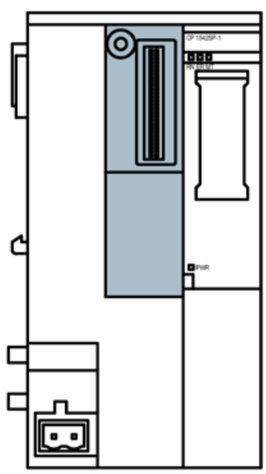

Figure 2-2 Front of the CP, the slot for the bus adapter is marked gray.

You will find the bus adapters supported by the CP in section BusAdapter (Page 163).

For information on installing and connecting up, refer to the sections Installing the CP (Page 40) and Connecting the CP (Page 44).

You will find the pinout of the Ethernet interface in section BusAdapter (Page 163). You will find further technical specifications of the bus adapter in the manual /3/ (Page 168).

3 Installation, wiring, commissioning

3.1 Important notes on using the device

Safety notices on the use of the device

Note the following safety notices when setting up and operating the device and during all associated work such as installation, connecting up or replacing the device.

Overvoltage protection

NOTICE
Protection of the external power supply If power is supplied to the module or station over longer power cables or networks, the coupling in of strong electromagnetic pulses onto the power supply cables is possible. This can be caused, for example by lightning strikes or switching of higher loads. The connector of the external power supply is not protected from strong electromagnetic pulses. To protect it, an external overvoltage protection module is necessary. The requirements of EN61000-4-5, surge immunity tests on power supply lines, are met only when a suitable protective element is used. A suitable device is, for example, the Dehn Blitzductor BVT AVD 24, article number 918 422 or a comparable protective element. Manufacturer: DEHN+SOEHNE GmbH+Co.KG Hans Dehn Str.1 Postfach 1640 D-92306 Neumarkt, Germany

3.1.1 Notes on use in hazardous areas

WARNING
EXPLOSION HAZARD Do not open the device when the supply voltage is turned on.

WARNING
The device may only be operated in an environment with pollution degree 1 or 2 (see IEC 60664-1).

⚠ WARNING
The equipment is designed for operation with Safety Extra-Low Voltage (SELV) by a Limited Power Source (LPS). This means that only SELV / LPS complying with IEC 60950-1 / EN 60950-1 / VDE 0805-1 must be connected to the power supply terminals, or the power supply unit for the equipment power supply must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70). If the equipment is connected to a redundant power supply (two separate power supplies), both must meet these requirements.

⚠ WARNING
EXPLOSION HAZARD Do not connect or disconnect cables to or from the device when a flammable or combustible atmosphere is present.

⚠ WARNING
EXPLOSION HAZARD Replacing components may impair suitability for Class 1, Division 2 or Zone 2.

⚠ WARNING
When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or a suitable enclosure.

⚠ WARNING
DIN rail In the ATEX and IECEx area of application only the Siemens DIN rail 6ES5 710-8MA11 may be used to mount the modules.

3.1.2 Notes on use in hazardous areas according to ATEX / IECEx

⚠ WARNING
Requirements for the cabinet/enclosure To comply with EU Directive 94/9 (ATEX95), the enclosure or cabinet must meet the requirements of at least IP54 in compliance with EN 60529.

WARNING

Cable

If the cable or conduit entry point exceeds 70 °C or the branching point of conductors exceeds 80 °C, special precautions must be taken. If the equipment is operated in an air ambient in excess of 50 °C, only use cables with admitted maximum operating temperature of at least 80 °C.

WARNING

Take measures to prevent transient voltage surges of more than 40% of the rated voltage. This is the case if you only operate devices with SELV (safety extra-low voltage).

3.1.3 Notes on use in hazardous areas according to UL HazLoc

WARNING

EXPLOSION HAZARD

You may only connect or disconnect cables carrying electricity when the power supply is switched off or when the device is in an area without inflammable gas concentrations.

This equipment is suitable for use in Class I, Division 2, Groups A, B, C and D or non-hazardous locations only.

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

3.1.4 General notices on use in hazardous areas according to FM

WARNING

EXPLOSION HAZARD

You may only connect or disconnect cables carrying electricity when the power supply is switched off or when the device is in an area without inflammable gas concentrations.

This equipment is suitable for use in Class I, Division 2, Groups A, B, C and D or non-hazardous locations only.

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

⚠ WARNING
EXPLOSION HAZARD
The equipment is intended to be installed within an ultimate enclosure. The inner service temperature of the enclosure corresponds to the ambient temperature of the module. Use installation wiring connections with admitted maximum operating temperature of at least 30 ºC higher than maximum ambient temperature.

3.2 Installing the CP

NOTICE
Install and remove the CP only when the power is off.
Switch off the power supply of the ET 200SP and the CP before you install or remove modules. Installing and removing modules with the power supply on can lead to damage to the modules and to loss of data.

Note

Note the installation guidelines

When installing and connecting up the CP note the instructions in the manual /3/ (Page 168).

NOTICE
Installation location - Dependency of the temperature range
The module must be installed so that its upper and lower ventilation slits are not covered, allowing adequate ventilation. Above and below the modules, there must be a clearance of 25 mm to allow air to circulate and prevent overheating. Note the dependency of the permitted temperature range on the installation location: • Horizontal installation of the rack (DIN rail) means vertical position of the CP. • Vertical installation of the rack (DIN rail) means horizontal position of the CP. You will find the permitted temperature ranges in the section Technical specifications (Page 155).

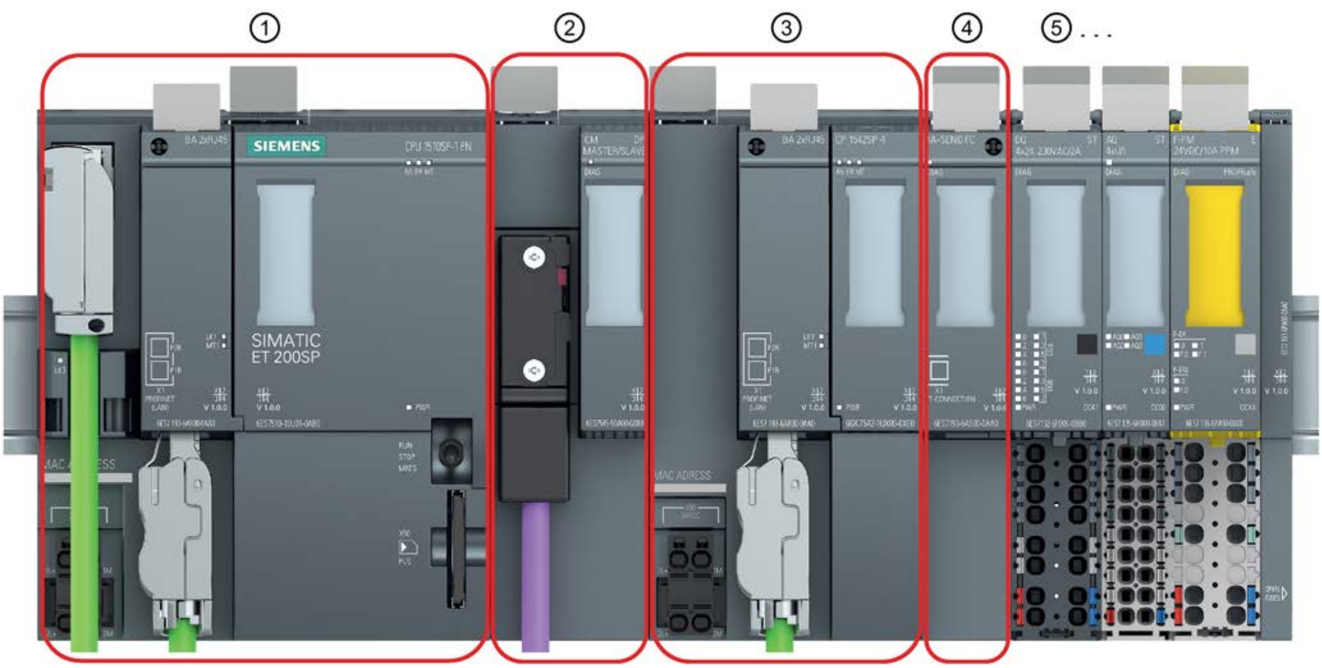
Installation of the rack	Installation position of the CP
Horizontal installation of the rack	
Installation of the rack	Installation position of the CP
Vertical installation of the rack	
Slot rules

The CPU always occupies slot 1. In an ET 200SP you can plug in up to three of the following modules in slots 2 ... 4 (see figure) to the right of the CPU:

- CMs
- CPs
- BusAdapter Send

Of these three modules, up to two CP 154xSP-1 modules can be plugged in. These two CPs can be of the same type or different.

The CM DP can only be plugged in directly next to the CPU.



① Slot 1 - only permitted for the CPU.

② Slot 2 - for CM / CP / BusAdapter Send *
If you use a PROFIBUS CM, you must plug this in directly beside the CPU in slot 1.

③ Slot 3 - for CM / CP / BusAdapter Send *

④ Slot 4 - for CM / CP / BusAdapter Send *

⑤ Slot 5 ff for IO modules

* If you use a BusAdapter Send, this must be plugged in to the slot directly beside the IO modules.

Figure 3-1 Slots of the ET 200SP

Installation on a DIN rail

Note

Protecting the modules from slipping on the DIN rail

If you install the modules in an area with mechanical load, use suitable clamping devices at both ends of the device group to secure the modules on the DIN rail, e.g. Siemens and retainer 8WA1808.

The end retainers prevent the modules separating under mechanical load.

When using the device in the areas of application ATEX or IECEx, note the information on the DIN rai in section Notes on use in hazardous areas (Page 37).

The ET 200SP system is suitable for installation on a mounting rail according to EN 60715 (35 × 7.5 mm or 35 × 15 mm)

1. Hang the CPU / the interface module on the mounting rail.
2. Tilt the CPU / the interface module to the back until the mounting rail release audibly locks in place.
3. Hang the CP to the right next to the CPU.
4. Tilt the CP to the back until the mounting rail release audibly locks in place.
5. Move the CP to the left until it audibly locks in place in the CPU.
6. Mount the other base units and modules accordingly.

   See manual /3/ (Page 168) for information on this.

Plugging in the bus adapter

NOTICE
Touching the plug-in contacts
Do not touch the plug-in contacts when no bus adapter is plugged in.

1. Connect the appropriate cable to the bus adapter if you use a bus adapter with optical or direct electrical or optical connection (without plug).
2. Plug the bus adapter into the slot of the CP.

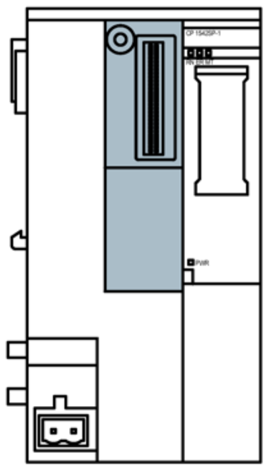


Figure 3-2 Front of the CP, the slot for the bus adapter is marked gray.

3. Screw the bus adapter to the CP.

   The securing screw is located at the top left on the front of the bus adapter.

   To do this use a screwdriver with 3 to 3.5 mm blade width or a suitable Torx screwdriver (T15).

   The maximum tightening torque is 0.25 Nm.
4. Plug the connector of the connecting cable into the socket of the bus adapter if you use a bus adapter with plug.

For information on plugging in the bus adapter and fitting cables see also the manual /3/ (Page 168).

Removal from the DIN rail

Follow the steps below to remove a CP from the DIN rail:

1. Turn off the power supply to the entire station including the CP and CPU.
2. Activate the mounting rail release of the modules to be moved (CPU, CPs) and move them parallel to the left until they are released from the remaining module group (free space approx. 16 mm).

   Press the locking slide marked "PUSH" on the top of a module down to be able to move the module in the DIN rail.
3. Activate the mounting rail release on the CP and move it to the right until it is released from the CPU (free space approx. 8 mm).
4. While holding the mounting rail release on the CP, swing the CP out of the mounting rail.

3.3 Connecting the CP

Order of the work

NOTICE
Connection only with power off
Connect the CP only when the power is off. Refer to the information in the system manual, see /2/ (Page 168).

The bus adapter is already connected to the relevant cable, see section Installing the CP (Page 40).

1. Connect the external power supply to the terminal block of connector X80.

   Use the same power supply as the CPU.
2. Turn the power supply on only after the CP has been completely wired and connected.

Power supply at connector X80

You will find the location of the connector X80 four the power supply to the CP in section Power supply (Page 34). There, you will also find notes on reverse polarity protection..

The 2-terminal plug-in terminal block has the following pin assignment for the socket:

Terminal	Assignment
1L+ / 2L+	24 VDC
1M / 2M	Ground

The two terminals 1L+/L2+ and 1M/2m of the terminal block are each bridged internally so that you can connect either a single or a redundant power supply.

Connectable cable cross-section

- Without wire end ferrule 0.2 .. 2.5 mm^2 / AWG 24 .. 13
- With wire end ferrule 0.25 .. 1.5 mm^2 / AWG 24 .. 16
- With TWIN wire end ferrule: 0.5 .. 1.0 mm^2 / AWG 20 .. 17

You will find information about the power consumption and further technical details of the connectors in section Technical specifications (Page 155).

3.4 Commissioning the CP

Requirement: Configuration prior to commissioning

A prerequisite for full commissioning of the module is the completeness of the STEP 7 project data.

Commissioning the module

The remaining steps in commissioning involve downloading the STEP 7 project data.

The STEP 7 project data of the CP is transferred when you load to the station. To load the station, connect the engineering station on which the project data is located to the CPU.

You will find more detailed information on loading in the following sections of the STEP 7 information system:

Note

Time synchronization for telecontrol via SINEMA RC

When using SINEMA Remote Connect for telecontrol communication, set the CPU time manually during commissioning; see note in section Telecontrol via SINEMA RC (Page 60).

Configuration

4

4.1 Security recommendations

Observe the following security recommendations to prevent unauthorized access to the system.

Note

Security functions of the CP types

Depending on the supported function, the following notes do not apply to every CP type described in this manual.

General

- You should make regular checks to make sure that the device meets these recommendations and other internal security guidelines if applicable.
- Evaluate your plant as a whole in terms of security. Use a cell protection concept with suitable products.
- Do not connect the device directly to the Internet. Operate the device within a protected network area.
- Keep the firmware up to date. Check regularly for security updates of the firmware and use them.
- Check regularly for new features on the Siemens Internet pages.
  - You can find information on Industrial Security here:
    Link: (http://www.siemens.com/industrialsecurity)
  - You can find information on security in industrial communication here:
    Link: (http://w3.siemens.com/mcms/industrial-communication/en/ie/industrial-ethernet-security/Seiten/industrial-security.aspx)
  - You can find a publication on the topic of network security (6ZB5530-1AP02-0BA5) here:
    Link:
    (http://w3app.siemens.com/mcms/infocenter/content/en/Pages/order_form.aspx?nodeKey=key_518693&infotype=brochures)
    Enter the following filter: 6ZB5530

Physical access

Restrict physical access to the device to qualified personnel.

Network attachment

Do not connect the PC directly to the Internet. If a connection from the CP to the Internet is required, arrange for suitable protection before the CP, for example a SCALANCE S with firewall or use the CP 1543SP-1.

Security functions of the product

Use the options for security settings in the configuration of the product. These includes among others:

- Protection levels

  Configure a protection level of the CPU.

  You will find information on this in the information system of STEP 7.
- Disabling the bus adapter ports

  In the configuration disable a port of the bus adapter being used that is not required.
- Security function of the communication
  - Enable the security functions of the CP and set up the firewall.

    If you connect to public networks, you should use the firewall. Think about the services you want to allow access to the station via public networks. By limiting the "transmission speed" via IP packet filter rules in the firewall, you make use of the possibility of restricting flooding and DoS attacks.
  - Use the secure protocol variants NTP (secure) and SNMPv3.
  - Use the security functions of the telecontrol protocols, e.g. the DNP3 security options.
  - Use the secure Open User Communication (Secure OUC) via the appropriate program blocks.
  - Leave access to the Web server of the CPU (CPU configuration) and to the Web server of the CP disabled.
- Protection of the passwords for access to program blocks

  Protect the passwords stored in data blocks for the program blocks from being viewed. You will find information on the procedure in the STEP 7 information system in the topic "Know-how protection".
- Logging function

  Enable the function in the security configuration and check the logged events regularly for unauthorized access.

Passwords

- Define rules for the use of devices and assignment of passwords.
- Regularly update the passwords to increase security.
- Only use passwords with a high password strength. Avoid weak passwords for example "password1", "123456789" or similar.

- Make sure that all passwords are protected and inaccessible to unauthorized personnel.

  See also the preceding section for information on this.
- Do not use one password for different users and systems.

Protocols

Secure and non-secure protocols

- Only activate protocols that you require to use the system.
- Use secure protocols when access to the device is not prevented by physical protection measures.

  The NTP protocol provides a secure alternative with NTP (secure).

Table: Meaning of the column titles and entries

The following table provides you with an overview of the open ports on this device.

- **Protocol / function**

  Protocols that the device supports.
- **Port number (protocol)**

  Port number assigned to the protocol.
- **Default of the port**
  - Open

    The port is open at the start of the configuration.
  - Closed

    The port is closed at the start of the configuration.
- **Port status**
  - Open

    The port is always open and cannot be closed.
  - Open after configuration

    The port is open if it has been configured.
  - Open (login, when configured)

    As default the port is open. After configuring the port, the communications partner needs to log in.
  - Closed after configuration

    The port is closed because the CP is always client for this service.
- **Authentication**

  Specifies whether or not the protocol authenticates the communications partner during access.

Table 4- 1 Server ports

Protocol / function	Port number (protocol)	Default of the port	Port status	Authentication
DHCP	68 (UDP)	Closed	Open after configuration (while the CP obtains a new address)	No
S7 and online connections	102 (TCP)	Open	Open after configuration *	No
Online diagnostics (CP 1543SP-1)	8448 (TCP)	Closed	Open after configuration	No
Communication via SINEMA RC (CP 1542SP-1 IRC / CP 1543SP-1)	8448 (TCP)	Closed	Open after configuration	Yes
DNP3	20000 (TCP/UDP) can be set	Closed	Open after configuration	Yes, when security is enabled.
IEC 60870-5-104	2404 (TCP) can be set	Closed	Open after configuration	No
HTTP	80 (TCP)	Closed	Open after configuration	Yes
HTTPS	443 (TCP)	Closed	Open after configuration	Yes
SNMP	161 (UDP)	Open	Open after configuration	Yes (with SNMPv3)

***** For information on avoiding opening the port during diagnostics, see section Online security diagnostics via port 8448 (CP 1542SP-1 IRC, CP 1543SP-1) (Page 144).

Ports of communications partners and routers

Make sure that you enable the required client ports in the corresponding firewall on the communications partners of the CP and in intermediary routers.

These can be:

- TeleControl Basic / 55097 (TCP) - can be set
- ST7 with MSC protocol / 26382 (TCP) - can be set
- DHCP / 67, 68 (UDP)
- SMTP / 25 (TCP)
- STARTTLS / 587 (TCP)
- SSL/TLS / 465 (TCP)
- NTP / 123 (UDP)
- DNS / 53 (UDP)
- SINEMA RC Auto-configuration / 443 (TCP) - can be set
- SINEMA RC and OpenVPN / 1194 (UDP) - can be set in SINEMA RC

4.2 Configuration in STEP 7

Configuration in STEP 7

You configure the modules and networks in SIMATIC STEP 7. You will find the required version in the section Software requirements (Page 24). You can configure a maximum of two CP 154xSP-1 for an ET 200SP.

You will find comprehensive information on configuration in the Information system of STEP 7 and in the following sections.

Overview of configuration of the CP

Follow the steps below when configuring:

1. Create a STEP 7 project.
2. Insert the required SIMATIC stations from the following catalog directory:

   Controller > SIMATIC ET200 CPU > ET 200SP CPU
3. Insert the CPs and the input and output modules from the following catalog directory into the stations.

   Distributed I/O > ET 200SP
4. Create an Ethernet network.
5. Connect the stations to the Ethernet subnet.
6. Configure the inserted CPs.

   When the device view of the CP is open, you can find the BusAdapters in a separate catalog directory.
7. Optional: Create the program blocks for the Open User Communication.
8. Save and compile the project.

Here you will find information on individual parameter groups in the following sections. You will find information on parameters not described in this manual in the information system of STEP 7.

Details on the parameters of the telecontrol communication of the CP 1542SP-1 IRC can be found in the section Telecontrol (CP 1542SP-1 IRC) (Page 56).

Details on the parameters of the security functions can be found in the section Security (Page 117).

Loading and saving the configuration data

When you load the station, the project data of the station including the configuration data of the CP is stored on the CPU. You will find information on loading the station in the STEP 7 information system.

4.3 Ethernet interface

Configure the generally available parameters just as for every other Ethernet interface:

- General data (name etc.)
- Addresses and possibly routers
- Port settings
- Access to the Web server

See also

Changing the IP parameters during runtime (Page 139)

4.3.1 IPv6

Configuring the Ethernet addresses

If you configure additional IPv6 addresses ("Manual configuration" option), make sure that the two addresses belong to different subnets.

Note

Communication via IPv6

If you want to use IPv6 addresses and connect the CP to the Internet, make sure that the router connected to the Internet and the providers of the Internet services used (e.g. e-mail) also support IPv6 addresses.

You will find information on configuration in the STEP 7 information system.

4.3.2 Advanced options

Protocol-specific transmission settings of the CP 1542SP-1 IRC

For information on the protocol-specific parameter groups, see section Ethernet interface (X1) > Advanced options (Page 61).

BA ... (BusAdapter)

Here, you configure the settings of the network connection via the BusAdapter that you configured in the device view of the CP. BusAdapter "BA 2xRJ45" is used by default.

If you do not use both ports of the BusAdapter, you can disable one of the two ports.

4.4 DNS configuration

DNS server

A DNS server may be required when the module itself, a communications partner, or for example an e-mail server should be reachable via the host name (FQDN).

If you specify the address of a device as FQDN, you need to configure a DNS server. In this case, the IP address of the device is determined via the configured DNS server.

4.5 Time-of-day synchronization

You will find the parameter group for time-of-day synchronization in the following location:

- CP 1542SP-1

  At the Ethernet interface
- CP 1543SP-1

  If the security functions are enabled, under "Security"
- CP 1542SP-1 IRC

  Depending on the telecontrol protocol:
  - TeleControl Basic / DNP3 / IEC

    At the Ethernet interface
  - ST7

    Under the parameter group "Communication with the CPU"

Procedure for time-of-day synchronization

Note

Recommendation for setting the time

With Ethernet connections, synchronization with an external clock is recommended at intervals of approximately 10 seconds. This achieves as small a deviation as possible between the internal time and the UTC time.

With telecontrol functions, particularly in the case of transmission via mobile wireless networks, a larger update interval is usually pertinent.

Note

Consistent time-of-day synchronization via NTP / NTP (secure)

Both the CPU and CP can have the time of day synchronized using NTP.

If you enable time-of-day synchronization for both modules, use the same NTP server, if possible, in order to retain a consistent time of day within the station.

Forwarding time of day is only supported by CP 1542SP-1 IRC.

The time-of-day synchronization procedures of the respective CP types are described below.

CP 1542SP-1

- **NTP**

  You configure the addresses of the NTP server(s), the synchronization interval and the "Accept time from non-synchronized NTP servers" option.

CP 1543SP-1

Note

Ensuring a valid time of day

If you use security functions, a valid time of day is extremely important. It is recommended to use the NTP (secure) method.

- **NTP**

  See above for information on parameters.

- **NTP (secure)**

  The secure method NTP (secure) uses authentication with symmetrical keys according to the hash algorithms MD5 or SHA-1.

  In the global security settings, you can create and manage additional NTP servers also of the type NTP (secure).

CP 1542SP-1 IRC

The configurable procedures depend on the Telecontrol protocol used.

TeleControl Basic / DNP3 / IEC

- **NTP**

  See above for information on parameters.

- **Time from partner**

  The CP sets its clock using the time of day that it receives with the data transferred by the communications partner.

ST7

With the ST7 protocol, the time source can be selected:

- **None**

  The time of the CP is not synchronized.

- **From NTP server**

  See above for information on parameters.

- **From WAN**

  The CP obtains its time via the WAN network to which it is connected.

  A prerequisite for CP clock synchronization is that a suitable time-of-day master forwards the time of day to the WAN network.

Forwarding time of day

The CP 1542SP-1 IRC provides the CPU with the option of taking its time of day from the CP using a PLC tag. See section Communication with the CPU (Page 70) for information on this.

Note

No time-of-day synchronization of the CPU when the time is taken from the CP

When the CPU takes the time from the CP using a PLC tag, disable the CPU's own time-of-day synchronization.

Observe the special note when using telecontrol via SINEMA RC; see section Telecontrol via SINEMA RC (Page 60).

4.6 SNMP

"SNMP" parameter group

- **"Enable SNMP"** parameter group

  Releases the function of the SNMP agent on the CP.

Note

If the security functions are enabled for the CP 1543SP-1 you will find the parameter group "SNMP" in "Security".

Scope of performance of the CPs

The CPs support the following SNMP version:

- **CP 1542SP-1, CP 1542SP-1 IRC**
  - SNMPv1
- **CP 1543SP-1**
  - SNMPv1
  - SNMPv3 (with activated Security functions)

Traps are not supported by the CP.

You will find detailed information about the supported functions in the section Diagnostics with SNMP (Page 144).

4.7 Telecontrol (CP 1542SP-1 IRC)

Telecontrol-specific parameter groups of the CP 1542SP-1 IRC

In this section, you will find only the description of the specific parameter groups of the CP 1542SP-1 IRC for telecontrol communication.

You can find some parameter groups in the section Security (Page 117).

Data points

Configured data points are required to transfer the process data and for some options of the parameter groups "Partner stations" and "Communication with the CPU".

The data areas in the memory of the CPU intended for communication with the partner are configured for the specific data points in the CP. Each data point addresses a PLC tag or element in a data block of the CPU.

For more detailed information, refer to section Data points (Page 79).

4.7.1 Address and authentication information

Address and authentication information of the telecontrol protocols

Depending on the telecontrol protocol used, the communications partners require the following address and authentication information that needs to be configured:

- **TeleControl Basic**

  The telecontrol server requires:

  – Project number

  – Station number

  – Telecontrol password (for authentication)

  You will find the parameters in the parameter group "Security > CP identification".

  – IP address (in the "Ethernet interface“ parameter group)

  Since the CP always establishes the connection to the telecontrol server, the IP address of the CP does not need to be configured in TCSB.

- **ST7**

  The subscriber number is unique as addressing parameter for every ST7 subscriber in a STEP 7 project. The following subscribers require a subscriber number:

  – Communications module (TIM, CP)

    Configuration in the "Subscriber numbers" parameter group

  – CPU

    The local CPU that is assigned to the CP receives a subscriber number as the end point of an ST7 connection.

    Configuration in the "Subscriber numbers" parameter group

  – Application of the master station PC

    The ST7 application that you configure in the PC station of the master station.

    Configuration in the telecontrol connection: "Network data" editor > "Telecontrol" tab.

  When the MSC protocol is used, the ST7 master station requires a unique user name and a unique password from each MSC station. You will find the parameters in the parameter group "Security > MSC identification".

- **DNP3 / IEC**

  The master requires:

  – Station address (parameter group "Ethernet interface > CP identification")

  – IP address and port number of the CP ("Ethernet interface" parameter group)

Address information required by the CP

You will find information about the address information of the communications partner required by the CP in section Partner stations (Page 65).

Addressing the data

The process data to be transferred is configured as data points.

4.7.2 Communication types

The parameter group does not exist for the CP 1542SP-1, since the communications services supported by this CP are always enabled.

In this parameter group, you enable the communication types you want to use for the particular CP..

To minimize the risk of unauthorized access to the station via Ethernet, you need to enable the communications services that the CP will execute individually.

You can leave all options disabled if you do not need them, for example if you only use the CP for Open User Communication.

The Open User Communication does not exist in the parameter group because these communications services are not configured but programmed using program blocks.

"Communication types" parameter group

Note

Full telecontrol functionality only with enabled security functions

For the following functions, you need to enable the security functions:

- Sending e-mails using the telecontrol functions (message editor)
- Use of the "TeleControl Basic" (general) protocol
- Use of the DNP3 security functions (Secure Authentication)
- Use of certificates
- Use of remote maintenance via SINEMA Remote Connect

- **Enable telecontrol communication**

  Only with the CP 1542SP-1 IRC

  Enables telecontrol communication on the CP. The following protocols can be used as alternatives:

  – **TeleControl Basic ***

    Enables communication with the telecontrol server.

  – **ST7**

    Enables telecontrol communication via the ST7 protocol.

  – **DNP3 ***

    Enables communication with up to four DNP3 masters.

  – **IEC 60870-5-104 ***

    Enables communication with up to four IEC masters.

  ***** For information on telecontrol communication via SINEMA Remote Connect, see section Telecontrol via SINEMA RC (Page 60).

  Note

  Loss of configuration data when changing the telecontrol protocol

  If you change the protocol on a configured module, protocol-specific configuration data is lost. This includes the following:

  - Partner configuration
  - Data point configuration
  - Configured messages (e-mails)
  - Configured time-of-day synchronization

- **Enable online functions**

  Enables access to the CPU for the online functions via the CP (diagnostics, loading project data etc.). If the function is enabled, the engineering station can access the CPU via the CP.

  If the option is disabled, you have no access to the CPU via the CP with the online functions. Online diagnostics of the CPU with a direct connection to the interface of the CPU however remains possible.

- **Enabling S7 communication**

  Enables the functions of S7 communication with a SIMATIC S7, S7 routing and PG routing on the CP.

  If you configure S7 connections to the relevant station, and these run via the CP, you will need to enable this option.

4.7.3 SINAUT ST7 PG routing

PG routing between telecontrol modules

PG routing is supported between the modules listed in the table and via the specified media.

A requirement for the CPs is that the options "S7 communication" and "Online functions" are enabled in the "Communication types" parameter group.

Module Medium (protocol)	TIM 1531 IRC	TIM 4R-IE	TIM 3V-IE / TIM 3V-IE Advanced	CP 1243-8 IRC	CP 1542SP-1 IRC
TIM 1531 IRC	Ethernet (S7) Ethernet (MSC) RS-232	Ethernet (S7) Ethernet (MSC) -	Ethernet (S7) Ethernet (MSC) -	Ethernet (S7)	Ethernet (S7)
TIM 4R-IE	Ethernet (S7) Ethernet (MSC) -	Ethernet (S7) Ethernet (MSC) RS-232	Ethernet (S7) Ethernet (MSC) RS-232	-	-
TIM 3V-IE	Ethernet (S7) Ethernet (MSC) -	Ethernet (S7) Ethernet (MSC) RS-232	Ethernet (S7) Ethernet (MSC) RS-232	-	-
CP 1243-8 IRC	Ethernet (S7)	-	-	-	-
CP 1542SP-1 IRC	Ethernet (S7)	-	-	-	-

"RS-232" means communication via dedicated line or dialup network.

See the performance data and the configuration limits for the number of supported connections.

4.7.4 Telecontrol via SINEMA RC

For information on possible applications of communication via SINEMA Remote Connect, see section Connection to SINEMA RC (Page 19).

Requirements

Configure the SINEMA Remote Connect - Server before configuring the CP (not in STEP 7). The CP and the communication partner of the CP must be configured in the SINEMA RC Server.

Supported telecontrol protocols

The following protocols support communication via SINEMA Remote Connect:

- TeleControl Basic
- DNP3
- IEC 60870-5-104

Configuration of the telecontrol communication via SINEMA Remote Connect

Follow the steps below when configuring the CP for use of telecontrol communication via SINEMA RC:

1. In the "Communication types" parameter group activate telecontrol communication and select the protocol.

   The option for communication via SINEMA RC is not yet visible.
2. Change to the "Security" parameter group and enable the security functions.

   (In the "Communication types" parameter group the SINEMA RC option appears disabled and grayed out)
3. Open the "Security > VPN" parameter group and enable VPN.
4. For the parameter "VPN connection type" select the option "Automatic OpenVPN configuration via SINEMA Remote Connect Server" if this is not preset.

   (In the "Communication types" parameter group the SINEMA RC option becomes usable.)
5. Change to the "Communication types" parameter group and enable the option "Telecontrol communication via SINEMA Remote Connect".
6. Create the remaining configuration of the SINEMA RC connection of the CP under "Security > VPN".

   For information on the configuration, see section SINEMA Remote Connect (Page 128).

Manual setting the time of day during commissioning

Note

Time synchronization for telecontrol via SINEMA RC

When using SINEMA Remote Connect for telecontrol communication, the communication module needs the current time for authentication on the SINEMA RC Server. The module receives the time from the CPU or from an NTP server before the connection is established for the first time.

Recommendation:

During commissioning, set the time of the CPU manually at least once using the STEP 7 online functions. This is necessary especially if you have configured the "Time from partner" option for the time synchronization. In this way, you ensure that the CPU has a valid time of day when the station starts up and that the CP can exchange the required certificates with the SINEMA RC Server.

4.7.5 Ethernet interface > CP identification

DNP3 / IEC

- Station address

  The master requires the station address as address information from every CP in the DNP3 or IEC network.

4.7.6 Ethernet interface (X1) > Advanced options

MSC protocol settings (ST7)

The parameter group is available only when using the ST7 protocol and for one MSC master station.

You configure the user name and password for the authentication with the MSC protocol in the security functions.

TCP connection monitoring

The settings made here apply to all TCP connections of the CP.

Special feature with the protocols TeleControl Basic, DNP3 and IEC:
With these three protocols, you have the option of overwriting the value configured here for individual communications partners; see below.

- **TCP connection monitoring time**

  If there is no data traffic within the connection monitoring time, the CP sends a keepalive to the communications partner.

  Permitted range: 1 ... 65535 s. Default setting: 180

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations", compare section Partner stations (Page 65). The function can only be disabled by entering 0 (zero) for the partners.

- **TCP keepalive monitoring time**

  After sending a keepalive, the CP expects a reply from the communications partner within the keepalive monitoring time. If the CP does not receive a reply within the configured time, it terminates the connection.

  Permitted range: 1 ... 65535 s. Default setting: 10

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations". The function can only be disabled by entering 0 (zero) for the partners.

Transmission settings - TeleControl Basic

- **Connection establishment delay**

  Basic value for the wait time until the next connection establishment following an unsuccessful attempt to establish a connection. After every 3 attempts, the basic value is doubled up to a maximum of 900 s.

  Permitted range: 10 ... 300. Default setting: 10

  Example: The basic value 20 results in the following wait times: 3 x 20 s, 3 x 40 s, 3 x 80 s etc. up to max. 3 x 900 s.

- **Send monitoring time**

  Time (seconds) for the arrival of the acknowledgment from the communications partner (Telecontrol server) after sending spontaneous frames. The time is started after sending an unsolicited frame. If no acknowledgement has been received from the partner when the connection monitoring time elapses, the frame is repeated up to three times. After three unsuccessful attempts, the connection is terminated and re-established.

  Permitted range: 1 ... 65535. Default setting: 5

- **Key exchange interval**

  Here, you enter the interval in hours after which the key is exchanged again between the CP and the communications partner (TCSB V3). The key is a security function of the telecontrol protocol used by the CP and TCSB V3.

  Permitted range: 0 ... 65535. Default setting: 8

  If you enter 0 (zero), the function is disabled.

Transmission settings - ST7

- **Send conditional spontaneous frames as blocks**

  Specifies the form in which data is sent with the Transmission mode "Conditional spontaneous":

  – Option enabled

    Transfer as individual data frames

  – Option disabled

    Several data frames as block

  The transmission mode (Spontaneous / Conditional spontaneous) of the data to be sent is set in the "Trigger" tab of the data point. With this option, you specify whether data of events is sent immediately or following a delay.

- **Max. allowed disruption time**

  Tolerance time (s) for a detected connection disruption

  If there is still a disruption on the connection when the set time has elapsed, the disruption is signaled to all connection partners of the disrupted station.

  Default setting: 0. Permitted range: 0...255. If you enter 0 (zero), the function is disabled.

Transmission settings - DNP3

You will find information on the permitted ranges of the functions and defaults in the tooltips of STEP 7.

- **Disturbance bit**

  The disturbance bit can be used as bit 1.6 (IIN1.6) of the "Internal Indication Bytes" to indicate to the master when the CPU is in STOP mode.

- **Max. time between Select and Operate**
- **Frame repetitions**
- **Connection confirmation**
- **Connection monitoring time**
- **Transfer mode "Unsolicited"**
- **Max. number of unsolicited frames**
- **Monitoring time for unsolicited frames**
- **Buffer for class 1 / 2 / 3 events**

  Here, for each of the three event classes you specify the number of events after which the stored events are sent to the communications partner.

  Permitted range: 1 ... 255.

- **Delay time class 1 / 2 / 3 events**

  Here, for each of the three event classes you specify the maximum time in seconds the events can be stored in the send buffer before they are sent to the communications partner.

  Permitted range: 0 ... 255.

  If you enter 0 (zero), the function is disabled.

You will find details of how the send buffer works (storing and sending events) as well as the options for transferring data in the section Process image, type of transmission, event classes (Page 97).

Transmission settings - IEC

Note

Settings on the master

When configuring the monitoring times t_1 and t_2 make sure that you make the corresponding settings on the master so that there are no unwanted error messages or connection aborts.

You will find information on the permitted ranges of the functions and defaults in the tooltips of STEP 7.

- **Max. time between Select and Operate**
- **Monitoring time for connection establishment (t_0)**
- **Frame monitoring time (t_1)**

  Monitoring time for the acknowledgement of frames sent by the CP by the communications partner. The monitoring time applies to all frames sent by the CP in I, S and U format.

  If the partner does not send an acknowledgment during the monitoring time, the CP terminates the connection to the partner.

- **Monitoring time for S and U frames (t_2)**

  Monitoring time for the acknowledgment of data frames of the master by the CP.

  After receiving data from the master, the CP acknowledges the received data alternatively:

  – If the CP sends data to the master itself within t_2, it acknowledges the data frames received from the master during t_2 at the same time along with the sent data frame (I format).

  – The CP sends an acknowledgment frame (S format) to the master at the latest when t_2 elapses.

  The value of t_2 should be less than that of t_1.

- **Idle time for test frames (t_3)**

  Monitoring time during which the CP has not received any frames from the master.

  When t_3 elapses, the CP sends a test/control frame (U format) to the master.

  This parameter is intended for longer times without data traffic.

- **Difference between send sequence number N(S) and receive sequence number N(R)**

  Maximum number of unacknowledged data frames (I-APDUs) as maximum difference between send sequence number N(S) and receive sequence number N(R).

  When k is reached and t_1 has not yet elapsed, the CP does not send any frames until all the frames sent have been acknowledged by the master.

  When k is reached and t_1 has elapsed, the TCP connection is terminated.

- **Max. number of unacknowledged data frames**

  Maximum number of received data frames (I-APDUs), after which the oldest frame received from the master must be acknowledged.

Acknowledgment mechanism for the IEC protocol

With each sent data frame, the CP sends a continuous send sequence number. The data frame remains initially stored in the send buffer.

When it receives the data frame, the master sends the send sequence number from this or (if several frames are received) the last frame as an acknowledgement to the CP. The CP saves the send sequence number returned by the master as a receive sequence number and uses it as an acknowledgement.

Frames whose send sequence number is equal to or lower than the current receive sequence number are evaluated as having been successfully transferred and are deleted from the send buffer of the CP.

Recommendations of the specification:

- w should not be higher than 2/3 of k.
- Recommended value for k: 12
- Recommended value for w: 8

4.7.7 Partner stations

4.7.7.1 Partner configuration

The STEP 7 configuration of the communications partners of the CP (telecontrol server, DNP3 or IEC master) and the connections to the partners is not possible and not necessary.

Address information of the communications partners

For the communications partners of the CP, the following information is required during the configuration of the CP:

- TeleControl Basic
  - Partner IP address

    See section AUTOHOTSPOT for information on this.
  - Partner port (port number of the listener port of TCSB)
- DNP3 / IEC
  - Master station address

    Station address specified on the master

    With the IEC protocol the Master station address is not evaluated.
  - Partner IP address

    IP address of the master

    For the addressing of redundant partners, see section Addressing of single and redundant communications partners (Page 69).
  - Partner port

"Partner stations" (only with DNP3 / IEC)

- **Listener port**

  CP's own listener port

"Telecontrol server" / "Partner"

- **Activate partner**

  Enable the option to be able to use the partners configured later for the communication.

  In "TeleControl Basic" the telecontrol server is always enabled as a partner.
- **Partner number**

  The partner number is always signed by STEP 7.
- **Station address / Master station address**

  The station address of the telecontrol server is assigned automatically by the system if telecontrol communication is enabled.

"Connection to partner"

You will find information on the permitted ranges and defaults in the tooltips of STEP 7.

- **Partner IP address**

  IP address or host name (FQDN) of the telecontrol server. This can, for example, also be the FQDN of a DynDNS service.

- **Connection monitoring**

  When the function is enabled, the connection to the communications partner is monitored by sending keepalive frames.

  The TCP connection monitoring time is set for all TCP connections of the CP in the parameter group of the Ethernet interface, see also the section Ethernet interface (X1) > Advanced options (Page 61). These settings apply to all TCP connections of the CP.

  Here in the parameter group "Partner stations" the globally set monitoring time can also be set separately for this partner. The value set here overwrites the global value for this partner that was set in the "Ethernet interface (X1) > Advanced options > TCP connection monitoring" parameter group.

- **TCP connection monitoring time**

  Only with TCP: If there is no data traffic within the connection monitoring time, the CP sends a keepalive to the communications partner.

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations" and this overwrites the global value for this partner that was set in the parameter group "Ethernet interface".

  The function can be disabled by entering 0 (zero) for the individual partners.

- **TCP keepalive monitoring time**

  Only with TCP: After sending a keepalive, the CP expects a reply from the communications partner within the keepalive monitoring time. If the CP does not receive a reply within the configured time, it terminates the connection.

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations".

  The function can be disabled by entering 0 (zero) for the individual partners.

- **Connection mode**

  In the "Permanent" connection mode, there is a permanent connection to the communications partner.

- **Connection establishment**

  Specifies the communications partner that establishes the connection (always the CP).

- **Partner port**

  Port number of the communications partner

"Connection to redundant partner" (only with DNP3 / IEC)

- **Redundancy mode**

  Enable the option if the communications partner is a redundant master.

For information on the other parameters see above.

"Advanced settings"

- **Partner monitoring time (only with DNP3 / IEC)**

  If the CP does not receive a sign of life from the communications partner within the configured time, the CP interprets this as a fault/error on the partner. If you enter 0, the function is deactivated.

- **Report partner status (connection to partner)**

  If the function is enabled, the CP signals the status of the connection to the communications partner to the CPU.

  – Bit 0 of "PLC tag for partner status" (data type WORD) is set to 1 if the partner can be reached.

  – Bit 1 is set to 1 if all the paths to the remote partner are OK (useful with redundant paths).

  – Bits 2-3 indicate the status of the send buffer (frame memory).
  The following values are possible:

    - 0: Send buffer OK

    - 1: Send buffer threatening to overflow (more than 80 % full).

    - 3: Send buffer has overflowed (fill level 100 % reached).

    As soon as the fill level drops below 50%, bits 2 and 3 are reset to 0.

  Bits 4 to 15 of the PLC tags are not used and do not need to be evaluated in the program.

DNP3-specific settings

- **DNP3 level**

  DNP3 conformity level supported by the partner.

- **Event transmission mode**

  Mode with which the frames in the send buffer of the CP (events) are transferred:

  – Chronological transfer of individual frames

    or

  – Block-by-block transfer of the frames of a data point

4.7.7.2 Addressing of single and redundant communications partners

Addressing the telecontrol server

- **Addressing of a single telecontrol server**

  Configure the IP address of the telecontrol server or the DSL router when connecting via the Internet.

  When using a DynDNS service with the host name (FQDN) can be specified.

- **Addressing of the TCSB redundancy group by the stations using one IP address**

  In the LAN in the master station to which the TCSB server PCs and the DSL router (e.g. SCALANCE M) are connected, the Network Load Balancing (NLB) of the computer operating system will assign a common virtual IP address to the two server PCs.

  This IP address is configured depending on the network setup:

  – If a CP without a DSL router is connected, the virtual address assigned by the NLB must be configured in the CP as the IP address of the telecontrol server.

  – If a DSL router is used, only one IP address will be configured to address the redundant telecontrol server in the stations, the public address of the DSL router.

    Set the port forwarding (TCP) on the DSL router so that the public IP address (external network) is led to the virtual IP address of the TCSB server PCs (internal network). Only the public IP address is reachable from the Internet. The station does not therefore receive any information telling it which of the two computers of the redundancy group it is connected to.

Addressing redundant DNP3 or IEC masters

For each master specify the master station address and the IP address being used.

4.7.7.3 Partner for inter-station communication

Only when using the "TeleControl Basic" protocol

Inter-station communication

In this table, you specify the S7 stations and CPs with which the current station will use inter-station communication. Connections for inter-station communication run via the telecontrol server.

Partner

The partner number is assigned by the system. It is required during data point configuration to assign data points to their communications partners.

For inter-station communication, the partner is addressed with the parameters "Project", "Station" and "Slot".

Project

Here, enter the project number of the CP in the partner station. (Parameter group "Security > CP identification" on the partner)

Station

Here, enter the station number of the CP in the partner station. (Parameter group "Security > CP identification" on the partner)

Slot

Here, enter the slot number of the CP in the partner station via which the connection will be established.

Frame memory

Activate the option for enabling inter-station communication.

The frames are stored in the send buffer (frame memory) of the CP if the connection is disturbed. Note that the capacity of the frame memory is shared by all communications partners.

Access ID

The access ID displayed here is formed from the hexadecimal values of project number, station number and slot. The parameter of the type DWORD is allocated as follows:

- Bits 0 - 7: Slot
- Bits 8 - 20: Station number
- Bits 21 - 31: Project number

4.7.8 Communication with the CPU

4.7.8.1 Communication with the CPU

Communication with the CPU

Using the first three parameters you specify the CPU access by the CP in the CPU scan cycle. You will find the structure of the CPU scan cycle in the section Read cycle (Page 100).

The fourth parameter "Frame memory size" decides the size of the send buffer on the CP for frames of data points that are configured as an event.

- **Cycle pause time**

  Wait time between two scan cycles of the CPU memory area
- **Max. number of write jobs**

  Maximum number of write jobs to the CPU memory area within a CPU scan cycle
- **Max. number of read jobs**

  Maximum number of low-priority read jobs from the CPU memory area within a CPU scan cycle.
- **Frame memory size**

  Here, you set the size of the frame memory for events (send buffer).

  The size of the frame memory is divided equally among all configured communications partners. You will find the size of the frame memory in the section Configuration limits and performance data (Page 21).

  You will find details of how the send buffer works (storing and sending events) as well as the options for transferring data in the section Process image, type of transmission, event classes (Page 97).

Watchdog bit

- **CP monitoring**

  Via the watchdog bit the CPU can be informed of the status of the telecontrol communication of the CP.

CP time of day

- **CP time to CPU**

  Using this function, the CP can make its time of day available to the CPU.

  You will find details in the STEP 7 information system.

4.7.8.2 CP diagnostics

CP diagnostics

With the parameter group, you have the option of reading out advanced diagnostics data from the CP using PLC tags.

- **Enable advanced CP diagnostics**

  Enable the option to be able to use advanced CP diagnostics.

  If the option is enabled, at least the "Diagnostics trigger tag" must be configured.

  The following PLC tags for the individual items of diagnostics data can be enabled selectively.

- **Diagnostics trigger tag**

  If the PLC tag (BOOL) from the user program of the CPU is set to 1, the CP updates the values of the PLC tags that can then be configured for the advanced diagnostics.

  After writing the current values to the following PLC tags, the CP sets the "Diagnostics trigger tag" to 0 signaling the CPU that the updated values can be read from the PLC tags.

  Note

  Fast setting of the diagnostics trigger variable

  Triggers must not be set faster than a minimum interval of 500 milliseconds.

- **Frame memory overflow warning**

  PLC tag (data type byte) for the send buffer overflow pre-warning. Bit 0 is set to 1 in the following situations:

  – TeleControl Basic / DNP3 / IEC: The fill level of the send buffer has reached 80%.

  – ST7 : The fill level of the send buffer has reached 90%.

- **Frame memory size**

  PLC tag (data type DWord) for the occupation of the send buffer. The number of saved frames is displayed.

- **Current IP address**

  PLC tag (data type String) for the current IP address of the CP.

- **Date of last successful logon to TCSB**

  Only for TeleControl Basic

  PLC tag (data type DTL) for the date on which the CP last logged in to the telecontrol server.

- **Date of last unsuccessful logon to TCSB**

  Only for TeleControl Basic

  PLC tag (data type DTL) for the date on which the CP was last unable to log in to the telecontrol server.

- **TeleService status**

  Only for TeleControl Basic

  The PLC tag (BOOL) indicates whether a TeleService session is active:

  – 0 = No TeleService session active

  – 1 = TeleService session active
- **VPN IPsec status**

  Connection to SINEMA Remote Connect

  The PLC tag (BOOL) indicates whether an OpenVPN tunnel to SINEMA RC is established:

  – 0 = No tunnel established

  – 1 = Tunnel established

4.7.9 Subscriber numbers

Subscriber numbers

Here you assign the subscriber numbers of the CPU and the CP.

The subscriber number is unique for every subscriber in an ST7 network. For the meaning of the subscriber numbers, see section Address and authentication information (Page 56).

- CPU subscriber number

  Subscriber number of the local CPU of the station
- CP subscriber number

  Subscriber number of the CP

4.7.10 Security (CP 1542SP-1 IRC)

For information on the parameters, see section Security parameters of the CP 1542SP-1 IRC (Page 118).

4.7.11 Creating telecontrol connections for the ST7 communication

Single and redundant connections

For ST7 communication of a communication module, you need to create at least one telecontrol connection in the "Network data" editor.

If two subscribers can be reached via different networks, to establish path redundancy for modules with multiple ST7 capable interfaces you create a maximum of two connections between the two subscribers. You specify redundant connections in the "Connection path" table (see below).

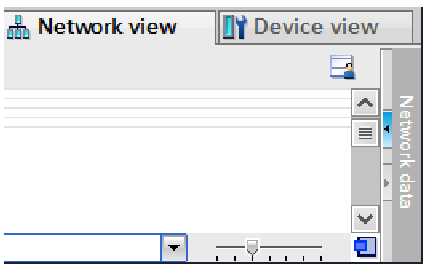
Not all communication modules have serial interfaces or only one Ethernet port with ST7 capability. These modules cannot use redundant paths.

Opening the editor "Network data" > "Telecontrol" tab

To open the editor, follow the steps below:

1. Open the network view of the project.

   On the right you will find the collapsed "Network data" editor.

2. Open the "Network data" editor using the arrow symbol.

   The editor is displayed with several tabs, on the left the "Network overview" tab.

3. Expand the editor until the "Telecontrol" tab appears.

   In this tab you configure the telecontrol connections.

Creating telecontrol connections for the ST7 communication of the module

For communication between two ST7 subscribers, you require a telecontrol connection. To create the connection, follow the steps below:

1. In the "Starting point" box, click on a free row in the "Telecontrol" tab.

   The drop-down list shows the configurable starting points that can use the ST7 protocol:

   – S7 stations: Assigned CPU

   – PC stations: Application (e.g. ST7cc / ST7sc)

   For connections between an application on the master station PC and an S7 station, always select the application as the starting point because it can only be selected in the list of starting points.

2. Select the starting point of the connection by double-clicking.

   The connection will then be included in the list of telecontrol connections.

   The name of the connection is preset, but you can change it.

3. Now in the "Endpoint" box select the connection partner from the drop-down list.

Boxes with a missing or bad configuration are shown on a red background, in the example the representation "TC_Connection_3".

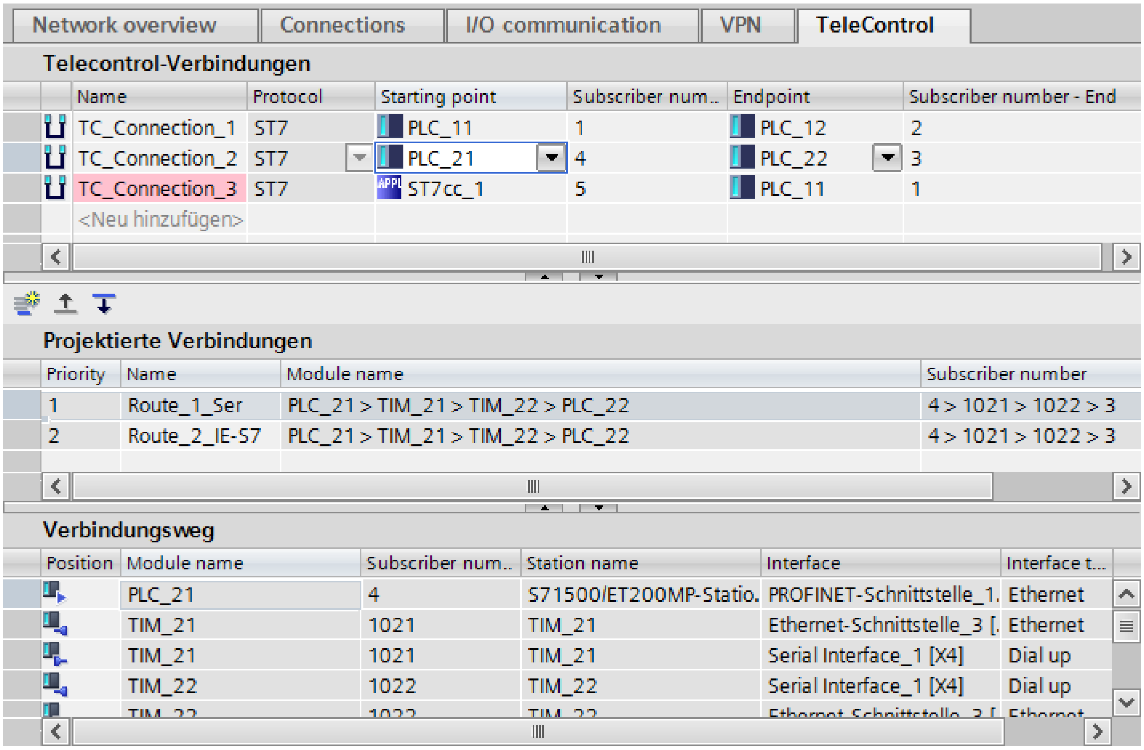


Figure 4-1 "Network data" editor, "Telecontrol" tab

Specification of the connection sequence

Then specify the connection sequence of the created telecontrol connection.

1. Above the second table "Configured connection paths" click the paths symbol .

   The dialog "Add connection paths" opens and the possible connection path are searched for.

2. Select one of the possible connection paths in the top table.

   The connection path(s) are shown with details in the second table.

   – If several connections are displayed in the upper table, you can select one or two redundant connections.

   – If no connection is displayed in the upper table, there is a configuration error in the corresponding stations or networks.

     In this case, close the dialog with the "Close" button and complete the configration.

3. If you want to choose the selected connection path as a "configured connection" click on "Add".

   "Information" in the lower part of the dialog shows whether the connection was added or it is already configured.

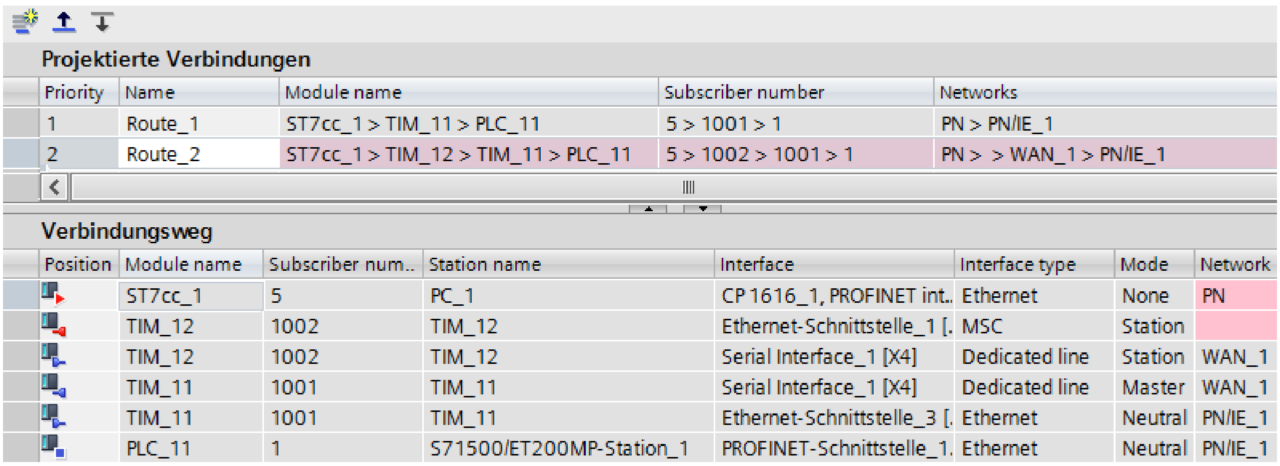
4. Close the dialog with the "Close" button if the configured connections correspond to the demands of the project.

   The connection details of every configured connection are displayed in the lower table "Connection path".

The "Configured connection paths" and "Connection path" tables

"Configured connection paths" table

This table shows the configured connections (connection paths) of a telecontrol connection.



Projektierte Verbindungen

Priority	Name	Module name	Subscriber number	Networks
1	Route_1	ST7cc_1 > TIM_11 > PLC_11	5 > 1001 > 1	PN > PN/IE_1
2	Route_2	ST7cc_1 > TIM_12 > TIM_11 > PLC_11	5 > 1002 > 1001 > 1	PN > > WAN_1 > PN/IE_1

Verbindungsweg

Position	Module name	Subscriber num..	Station name	Interface	Interface type	Mode	Network
	ST7cc_1	5	PC_1	CP 1616_1, PROFINET int..	Ethernet	None	PN
	TIM_12	1002	TIM_12	Ethernet-Schnittstelle_1 [..	MSC	Station	
	TIM_12	1002	TIM_12	Serial Interface_1 [X4]	Dedicated line	Station	WAN_1
	TIM_11	1001	TIM_11	Serial Interface_1 [X4]	Dedicated line	Master	WAN_1
	TIM_11	1001	TIM_11	Ethernet-Schnittstelle_3 [..	Ethernet	Neutral	PN/IE_1
	PLC_11	1	S71500/ET200MP-Station_1	PROFINET-Schnittstelle_1..	Ethernet	Neutral	PN/IE_1

Figure 4-2 Redundant connection with incorrectly configured connection path (Route_2)

Connections shown on a red background are invalid.

In the example the PC station was connected via the PC CP to the MSC network between TIM_11 and TIM_12 which is not allowed.

"Connection path" table

When checking the configured connections. the "Connection path" table supports you.

For every configured connection, the detailed connection path is shown here.

The "Position" column shows a station symbol with a symbol for the connection point (starting point, node, endpoint). Based on the color of the symbols for the connection endpoint you can recognize connections that are not permitted.

- Blue symbols for the connection point: Valid connections
- Red symbols for the connection point: Invalid connections

Bad connections

In the example the connection path "Route_2" was originally created from the application "ST7cc_1" (PC_1) via the MSC network to TIM_12. This continued via the dedicated line network from TIM_12 to TIM_11.

A connection path from the application via an MSC network or via modules with ST7 capability is not permitted.

The connection of the PC station to the MSC network was deleted in the meantime, so that the connection points "ST7cc_1" and "TIM_12" are invalid and their symbols are red.

Redundant telecontrol connections

When different networks between two subscribers have been created in the network configuration the different connection paths are shown in the "Add connection paths" table.

If you only want to use one connection, select only this connection in the table and click "Add".

If you only want to establish a redundant connection, select two connection paths in the table and click "Add". You specify the main and substitute paths between the subscribers after closing the dialog using the "Configured connections" table.

Main and substitute path of a redundant connection

When you have created two connection paths for a telecontrol connection, the first of the two is the main path and the second the substitute path. This is displayed in the "Priority" column of the "Configured connections" table.

You can change the priority of the two connection paths later, i.e. the specification of the main and substitute path. The arrow keys serve this purpose: ↥ ↧

Delete invalid or redundant connections

If you have non-permitted or unwanted redundant connections you need to delete one connection. Follow the steps outlined below:

1. To delete a connection in the table "Configured connections", select the connection you do not need.
2. Delete the connection using the shortcut menu "Delete".

Rules for connection configuration

Note the following rules for connection configuration:

- A connection via an inconsistent network is invalid. Examples:
  - Subscriber with incompatible modems
  - Incompatible settings of two modems in a connection
  - Incompatible settings between modem and network parameters
  - Connections via nodes that are not configured as node stations.
- Two connections to one partner (endpoint) via the same interface of a module (start point) are not permitted.
- An MSC connection can only run via the first Ethernet interface [X1] of a TIM or via the serial interface of a module with the setting "IP-based".
- Connections between a PC application and a module can only be of the Network type "Neutral" (S7 connections).
- For connections between a redundant PC application and a module, you need to create two connections.

  For a redundant ST7cc control center, in STEP 7 create two PC stations each with an ST7cc application (see below).

  Only in this way can you configure a connection from each application.
- A connection via a network in which two MD3 modems communicate with each other and that are configured with 1200 bps / half duplex / AT mode is invalid.

Connections to redundant control centers and other properties

If you select a connection in the table "Telecontrol connections" at the top in the "Network data" editor, three parameter groups are displayed in the "Properties" tab of the Inspector window. Here you can check and, if necessary, correct the connection configuration and configure the following properties:

- **General**

  Here, you will find the basic properties of a telecontrol connection.

  You can change the subscriber number of the connection starting point and endpoint. This affects the configuration data of the subscriber.

- **Redundant ST7cc/sc**

  If you use a redundant control center in your project (e.g. ST7cc or ST7sc), you must first create two PC stations with CP and application and connect these to the communication module via Ethernet.

  Then you create a telecontrol connection from the application of a PC station (start point) and the communication module (end point).

  Only afterwards do you create the connection to the second application in the redundancy group in this telecontrol connection.

  – Add redundant ST7cc/cc partner

    Activate the option for the selected telecontrol connection between application and module.

  – Redundant application

    Select the second application from the "Redundant application" drop-down list.

- **Destination subscriber properties**

  The parameter group relates to the destination subscriber that was configured as the endpoint of the connection.

  – **General request supervision time**

    This is the maximum time that may be required by a destination subscriber (communication module capable of ST7) to respond fully to a general request (GR).

    If the GR response has not arrived completely at the requesting partner when the supervision time has expired, a message is entered in the diagnostics buffer of the module.

    The general request supervision time is 900 seconds.

  – **Frames to destination subscriber with time stamp**

    Regardless of the configuration all frames are sent to the destination subscriber with a time stamp.

4.7.12 Data points

4.7.12.1 Data point configuration

Data point-related communication with the CPU

No program blocks need to be programmed for telecontrol modules with data point configuration to transfer user data between the station and communications partner.

The data areas in the memory of the CPU intended for communication with the communications partner are configured data point-related on the module. Each data point is linked to a PLC tag or the tag of a data block.

Requirement: Created PLC tags and/or data blocks (DBs)

PLC tags or DBs must first be created on the CPU to allow configuration of the data points.

The PLC tags for data point configuration can be created in the standard tag table or in a user-defined tag table. All PLC tags intended to be used for data point configuration must have the attribute "Visible in HMI".

Address areas of the PLC tags are input, output or bit memory areas on the CPU.

Note

Number of PLC tags

Remember the maximum possible number of PLC tags the can be used for data point configuration in the section Configuration limits and performance data (Page 21).

The formats and S7 data types of the PLC tags that are compatible with the protocol-specific data point types of the module can be found in the section Datapoint types (Page 86).

Access to the memory areas of the CPU

The values of the PLC tags or DBs referenced by the data points are read and transferred to the communications partner by the module.

Data received from the communications partner is written by the module to the CPU via the PLC tags or DBs.

Configuring the data points and messages in STEP 7

You configure the data points in STEP 7 in the data point and message editor. You can open both editors alternatively as follows:

- Selecting the communication module

  Shortcut menu "Open the data point and messages editor"

- Via the project navigation:

  Project > directory of the relevant station > Local modules > required communication module

  By double-clicking on the entry, the data point or message editor opens.

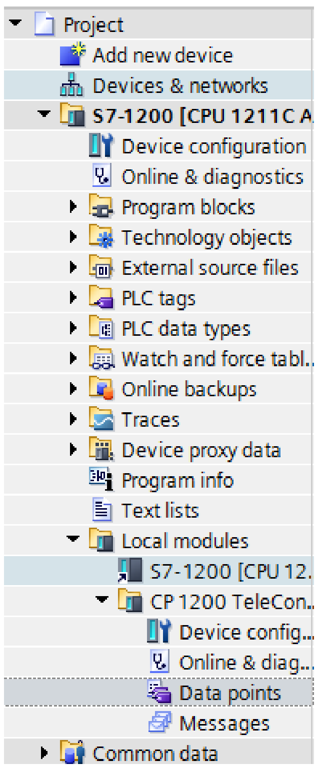


Figure 4-3 Configuring data points and messages

After opening the editor window using the two entries to the right above the table, you can switch over between the data point and message editor.

Figure 4-4 Switching over between the two editors

Creating obects

With the data point or message editor open, create a new object (data point / message) by double clicking "<Add object>" in the first table row with the grayed out entry.

A preset name is written in the cell. You can change the name to suit your purposes but it must be unique within the module.

		Name	PLC tag
1		DataPoint	"Tag_1-BI"
2		DataPoint_1	"Tag_2-BQ"
3		DataPoint_2	"Tag_1-BI"

Figure 4-5 Data point table

You configure the remaining properties of every object using the drop-down lists of the other table columns and using the parameter boxes shown at the bottom of the screen.

Assigning data points to their data source

After creating it, you assign a new data point to its data source. Depending on the data type of the data point a PLC tag can serve as the data source.

For the assignment you have the following options:

- Click on the table symbol in the cell of the "PLC tag" column.

  All configured PLC tags and the tags of the created data blocks are displayed. Select the required data source with the mouse or keyboard.

- Click the symbol .

  A selection list of the configured PLC Tags and the blocks is displayed. From the relevant table, select the required data source.

- In the name box of the PLC tag, enter part of the name of the required data source.

  All configured PLC tags and tags of the data blocks whose names contain the letters you have entered are displayed.

  
  Select the required data source.

Note

Assignment of parameter values to PLC tags

The mechanisms described here also apply when you need to assign the value of a parameter to a PLC tag. The input boxes fro the PLC tag (e.g.: PLC tag for partner status support the functions described here for selecting the PLC tag.

Arranging and copying objects

As with many other programs in the data point or message editor you can also arrange the columns, sort the table according to your requirements and copy and insert objects.

- Arrange columns

  If you click on a column header with the left mouse button pressed, you can move the column.

- Sorting objects

  If you click briefly with the left mouse button on a column header, you can sort the objects of the table in ascending or descending order according to the entries in this column. The sorting is indicated by an arrow in the column header.

  After sorting in descending order of a column the sorting can be turned off by clicking on the column header again.

- Adapting the column width

  You can reach this function with the following actions:

  – Using the shortcut menu that opens when you click on a column header with the right mouse key.

    "Optimize width", "Optimize width of all columns"

  – If you move the cursor close to the limit of a column header, the following symbol appears:

    
    When it does, click immediately on the column header. The column width adapts itself to the broadest entry in this column.

- Showing / hiding columns

  You call this function using the shortcut menu that opens when you click on a column header with the right mouse key.

- Copying, pasting, cutting and deleting objects

  If you click in a parameter box of an object in the table with the right mouse key, you can use the functions named with the shortcut menu (copy, paste, cut, delete).

  You can paste cut or copied objects within the table or in the first free row below the table.

Exporting and importing data points

To simplify the engineering of larger plants, you can export the data points of a configured module and import them into other modules in the project. This is an advantage particularly in projects with many identical or similar stations or data point modules.

The export / import function is available when you select the module for example in the network or device view and select the relevant shortcut menu.

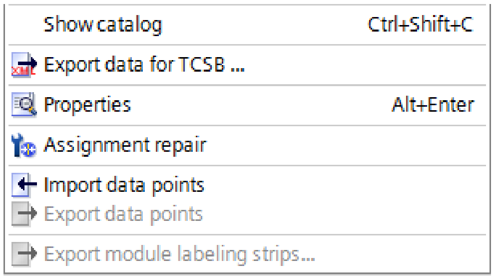

Figure 4-6 Shortcut menu of the module

When it is exported the data point information of a module is written to a CSV file.

Export

When you call the export function, the export dialog opens. Here, you select the module or modules of the project whose data point information needs to be exported. When necessary, you can export the data points of all modules of the project together.

In the export dialog, you can select the storage location in the file directory. When you export the data of a module you can also change the preset file name.

When you export from several modules, the files are formed with preset names made up of the station name and module name.

The file itself contains the following information in addition to the data point information:

- Module name
- Module type
- CPU name
- CPU type

Editing the export files

You can edit the data point information in an exported CSV file. This allows you to use this file as a configuration template for many other stations.

If you have a project with many stations of the same type, you can copy the CSV file with the data points of a fully configured module for other as yet unconfigured stations and adapt individual parameters to the particular station. This saves you having to configure the data points for every module in STEP 7. Instead, you simply import the copied and adapted CSV file to the other modules of the same type. When you import this file into another module, the changed parameter values of the CSV file are adopted in the data point configuration of this module.

The lines of the CSV file have the following content:

- Line 1: ,Name,Type,

  This line must not be changed.

- Line 2: PLC,<CPU name>, <CPU type>,

  Meaning: PLC (designation of the station class), CPU name, CPU type

  Only the elements <CPU name> and <CPU type> may be changed.

  The CPU type must correspond exactly to the name of the CPU in the catalog.

- Line 3: Module,<module name>,<module type>,

  Meaning: Module (Designation of the module class), module type, module name

  Only the elements <module name> and <module type> may be changed.

  Be careful when changing the module names if you want to import data points into several modules (see below).

  The module type must correspond exactly to the name of the module in the catalog.

- Line 4: Parameter names (English) of the data points

  This line must not be changed.

- Lines 5..n: Values of the parameters according to line 4 of the individual data points

  You can change the parameter values for the particular station.

Importing into a module

Before importing the data points make sure that the PLC tags required for the data points have been created.

Note that when you import a CSV file all the data points existing on the module will be deleted and replaced by the imported data points.

Select a module and select the import function from the shortcut menu of the module. The import dialog opens in which you select the required CSV file in the file directory.

If the information on the assignment of the individual data points to the relevant PLC tags matches the assignment in the original module, the data points will be assigned to the corresponding PLC tags.

When you import data points into a module, but some required PLC tags have not yet been created in the CPU, the corresponding data point information cannot be assigned. In this case, you can subsequently create missing PLC tags and them assign them the imported data point information. The "Assignment repair" function is available for this (see below).

If the names of the PLC tags in the module into which the import is made have different names than in the module that exported, the corresponding data points cannot be assigned to your PLC tags.

Importing into several modules

You can import the data points from several modules into the modules of a different project. To do this in the import dialog select all the required CSV files with the control key.

Before importing the data points, make sure that the respective stations have been created with CPUs of the same name, modules of the same name and PLC tags of the same name.

When you import the corresponding stations of the project are searched for based on the module names in the CSV files. If a target station does not exist in the project or the module has a different name, the import of the particular CSV file will be ignored.

Restrictions for the import of data points

In the following situations the import of data points will be aborted:

- An attribute required by the module is missing in the CSV file to be imported.

  Example: If a data point to be imported uses a time trigger, the import will be aborted if no time-of-day synchronization was configured for the module.
- The telecontrol protocol used by the module differs from that of the original module.

Only when importing into several modules:

- The import is aborted when a module or CPU name is different from the data in the CSV file.

Note:
Modules with the same telecontrol protocol are compatible with each other:

- TeleControl Basic

  All SIMATIC NET modules with the TeleControl Basic protocol:

  CP 1243-1, CP 1242-7 GPRS V2, CP 1243-7 LTE, CP 1542SP-1 IRC
- ST7

  CP 1243-8 IRC, CP 1542SP-1 IRC, ST7 TIM
- DNP3

  CP 1243-1, CP 1243-8 IRC, TIM modules capable of DNP3
- IEC

  CP 1243-1, CP 1243-8 IRC

Data points can be imported and exported between compatible modules.

Assignment repair

If you have named the PLC tags in a station into which you want to import differently from the station from which the CSV file was exported, the assignment between data point and PLC tag is lost when you import.

You then have the option to either rename the existing PLC tags appropriately or add missing PLC tags. You can then repair the assignment between unassigned data points and PLC tags. This function is available either via the shortcut menu of the module (see above) or with the following icon to the upper left in the data point editor: 

If a PLC tag with a matching name is found for a data point by the repair function, the assignment is restored. However the data type of the tag is not checked.

After the assignment repair make sure that you check whether the newly assigned PLC tags are correct.

Character set for data point names

When you create a data point, a preset name "DataPoint_n" is adopted. In the data point table and in the "General" tab of the data point you can change the name of the data point.

When assigning names only ASCII characters from the band 0x20 ... 0x7e (no. 32-126) may be used with the exceptions listed below.

Forbidden characters:

- . ' [ ] / \ |
  period, apostrophe, square brackets, slash, back slash, vertical line (pipe)

4.7.12.2 Datapoint types

Supported data point types of the CP 1542SP-1 IRC

During the configuration of the user data to be transferred by the CP 1542SP-1 IRC, each data point is assigned a protocol-specific data point type. The data point types along with the compatible S7 data types are listed below. They are grouped according to format (memory requirements).

Note

Effect of the change of arrays for data points

If an array is modified later, the data point must be recreated.

TeleControl Basic: Data point types

Table 4- 2 Supported data point types and compatible S7 data types

Format (memory requirements)	Data point type	Direction	S7 data types	Operand area
Bit	Digital input	in	Bool	I, Q, M, DB
	Digital output	in	Bool	Q, M, DB
Byte	Digital input	in	Byte, Char, USInt	I, Q, M, DB
	Digital output	out	Byte, Char, USInt	Q, M, DB
Integer with sign (16 bits)	Analog input	in	Int	I, Q, M, DB
	Analog output	out	Int	Q, M, DB
Counter (16 bits)	Counter input	in	Word, UInt	I, Q, M, DB
Integer with sign (32 bits)	Analog input	in	DInt	Q, M, DB
	Analog output	out	DInt	Q, M, DB
Counter (32 bits)	Counter input	in	UDInt, DWord	I, Q, M, DB
Floating-point number with sign (32 bits)	Analog input	in	Real	Q, M, DB
	Analog output	out	Real	Q, M, DB
Floating-point number with sign (64 bits)	Analog input	out	LReal	Q, M, DB
	Analog output	out	LReal	Q, M, DB
Block of data (1 .. 64 bytes)	Data	in / out	ARRAY [1)]	DB
	Data	in / out	ARRAY [1)]	DB

[1)] For the possible formats of the ARRAY data type, refer to the following section.

Block of data (ARRAY)

With the ARRAY data type, contiguous memory areas up to a size of 64 bytes can be transferred. The following S7 data types are compatible components of ARRAY:

- Byte, USInt (total of up to 64 per data block)
- Char (total of up to 64 per data block)
- Int, UInt, Word (total of up to 32 per data block)
- DInt, UDInt, DWord (total of up to 16 per data block)

Time stamp in UTC format

Time stamps are output by the OPC server applications in UTC format (48 bits) and contain milliseconds.

Data point types of the "ST7" protocol

The direction of the data transfer is specified in the "Data point type" column:

- Monitoring direction

  The objects (right column) for the monitoring direction have the abbreviation "_S".
- Control direction

  The objects (right column) for the control direction have the abbreviation "_R".

Table 4- 3 Supported data point types and compatible S7 data types

Format (memory requirements)	Data point type	S7 data type	Operand area	Number of data points per object	Object
Bit	Digital input	Bool	I, Q, M, DB	8	Bin08X_S
	Digital output	Bool	Q, M, DB	8	Bin08X_R
Byte	Digital input	Byte, USInt	I, Q, M, DB	4	Bin04B_S
	Digital output	Byte, USInt	Q, M, DB	4	Bin04B_R
	Command output	Byte, USInt	Q, M, DB	1	Cmd01B_R
Integer with sign (16 bits)	Analog input	Int	I, M, DB	4	Ana04W_S
	Mean value input	Int	I, M, DB	4	Mean04W_S
	Analog output	Int	Q, M, DB	4	Ana04W_R
	Mean value output	Int	Q, M, DB	4	Mean04W_R
	Setpoint output [1]	Int	Q, M, DB	1	Set01W_R
Counter (16 bits)	Counter input	UInt, Word	I, Q, M, DB	1	Cnt01D_S
	Counter input	UInt, Word	I, Q, M, DB	4	Cnt04D_S
Floating-point number (32 bits)	Analog input	Real	M, DB	4	Ana04R_S
	Analog output	Real	Q, M, DB	4	Ana04R_R
Block of data (4 .. 48 bytes)	Data input	ARRAY [1...12] of DInt / UDInt / DWord / Real [2]	DB	12	Dat12D_S
	Data output		DB	12	Dat12D_R
	Parameter output [1]		DB	12	Par12D_R

[1] See below, section "1: Mirroring back"

[3] See below, section "2: Block of data"

1: Mirroring back

The mirroring back function using the "Value monitoring" parameter can be configured for the following data point types:

- Setpoint Output
- Parameter Output

The local values of the data points of this type can be monitored for changes and the changes transferred to the master with the "Value monitoring" function.

A change to a local value can be caused by, for example, manual operator input on site.

To allow the value resulting from local events or interventions to be transferred to the master station, a mirroring back channel is generated for the relevant data point with the "Value monitoring" function via which the locally changed value is mirrored back.

Remember that to use the mirror back function, you need to interconnect the local values in the controller with the relevant PLC tag of the data point.

2: Block of data

With the ARRAY data type, blocks of data from contiguous memory areas up to a size of 4 .. 48 bytes can be transferred.

Compatible components of ARRAY are DInt, UDint, DWord or Real. The components within an array must be of the same type.

Format of the time stamp

For information on the format of the time stamp, see section Time stamp of the "ST7" protocol (Page 92).

Data point types of the "DNP3" protocol

Table 4- 4 Supported data point types, DNP3 object groups, variants and compatible S7 data types

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types		Operand area
				CP	TIM	
Bit	Binary Input	**1** [1, 2]	in	Bool	Bool	I, Q, M, DB

	Analog Output Event [4]	**42** [6, 8]	out	LReal	-	Q, M, DB
Block of data (1...64 bytes) [5]	Octet String / Octet String Output	**110** [-]	in, out	[5]	[5]	DB
	Octet String Event [5]	**111** [-]	in, out	[5]	[5]	DB

1) This object group can be configured in the Data point editor of STEP 7 using the substitute object group 12.

2) This object group can be configured in the Data point editor of STEP 7 using the substitute object group 20.

3) This object group can be configured in the Data point editor of STEP 7 using the substitute object group 22.

4) This object group can be configured in the Data point editor of STEP 7 using the substitute object group 41.

5) With these data point types, contiguous memory areas up to a size of 64 bytes can be transferred. All S7 data types with a size between 1 and 64 bytes are compatible.

Explanation of the table footnotes 1), 2), 3), 4): Configuring data points using substitute object groups

The initial data point types of the following object groups can be configured using the substitute object groups listed above:

- 10 [2]
- 11 [1, 2]
- 21 [1, 2, 5, 6]
- 23 [1, 2, 5, 6]
- 40 [1, 2, 3]
- 42 [1, 2, 4, 5, 6, 7, 8]

To configure in the DNP3 CP, use the specified substitute object group.

Assign each data point on the master using the configurable data point index in STEP 7. The data point of the DNP3 CP is then assigned to the corresponding data point on the master.

Example of configuring the data point Binary Output (10 [2])
The data point is configured as follows:
On the DNP3 CP as Binary Command (12 [1])
On the master as Binary Output (10 [2])

With the data point types Binary Output Event (11) and Analog Output Event (42), you also need to enable mirroring back; refer to the next section.

Configuration of mirroring back for output events (object groups 11 and 42)

You first create the data point types Binary Output Event (object group 11) and Analog Output Event (object group 42) as described above as data points of the object groups 12 or 41.

The local values of these two object groups can be monitored for changes and the changes transferred to the master. A change to a local value can be caused by, for example, manual operator input on site.

To allow the value resulting from local events or interventions to be transferred to the master, the data point in question requires a channel for mirroring back. You configure this mirroring back function using the "Value monitoring" option in data point configuration, "General" tab.

Remember that to use the mirror back function, you need to interconnect the local values in the controller with the relevant PLC tag of the data point.

Time stamp of the data with the DNP3 protocol in UTC format

Time stamps are transferred in UTC format (48 bits) and contain milliseconds.

Data point types of the "IEC 60870-5" protocol

Table 4- 5 Supported data point types, IEC types and compatible S7 data types

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
Bit	Single-point information	<1>	in	Bool	I, Q, M, DB
	Single-point information with time tag CP56Time2a [1)]	<30>	in	Bool	I, Q, M, DB
	Single command	<45>	out	Bool	Q, M, DB
	Single command with time tag CP56Time2a [1)]	<58>	out	Bool	Q, M, DB
Byte	Step position information	<5>	in	Byte, USInt	I, Q, M, DB
	Step position information with time tag CP56Time2a [1)]	<32>	in	Byte, USInt	I, Q, M, DB
Integer (16 bits)	Measured value, normalized value	<9>	in	Int	I, Q, M, DB
	Measured value, normalized value with time tag CP56Time2a [1)]	<34>	in	Int	I, Q, M, DB
	Measured value, scaled value	<11>	in	Int	I, Q, M, DB
	Measured value, scaled value with time tag CP56Time2a [1)]	<35>	in	Int	I, Q, M, DB
	Set point command, normalised value	<48>	out	Int	Q, M, DB
	Set point command, scaled value	<49>	out	Int	Q, M, DB
	Set point command, normalised value with time tag CP56Time2a [1)]	<61>	out	Int	Q, M, DB
	Set point command, scaled value with time tag CP56Time2a [1)]	<62>	out	Int	Q, M, DB
Integer (32 bits)	Bitstring of 32 bits	<7>	in	UDInt, DWord	I, Q, M, DB
	Bitstring of 32 bits with time tag CP56Time2a [1)]	<33>	in	UDInt, DWord	I, Q, M, DB
	Integrated totals	<15>	in	UDInt, DWord	I, Q, M, DB
	Integrated totals with time tag CP56Time2a [1)]	<37>	in	UDInt, DWord	I, Q, M, DB
	Bitstring of 32 bits	<51>	out	UDInt, DWord	Q, M, DB
	Bitstring of 32 bits with time tag CP56Time2a - control direction [1)]	<64>	out	UDInt, DWord	Q, M, DB
Floating-point number (32 bits)	Measured value, short floating point number	<13>	in	Real	Q, M, DB
	Measured value, short floating point number with time tag CP56Time2a [1)]	<36>	in	Real	Q, M, DB
	Set point command, short floating point number	<50>	out	Real	Q, M, DB
	Set point command, short floating point with time tag CP56Time2a [1)]	<63>	out	Real	Q, M, DB
Block of data (1...2 Bit) [2)]	Double-point information	<3>	in	[2)]	DB
	Double-point information with time tag CP56Time2a [1)]	<31>	in	[2)]	DB
	Double command	<46>	out	[2)]	DB

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
	Regulating step command	<47>	out	2)	DB
	Double command with time tag CP56Time2a 1) 2)	<59>	out	2)	DB
	Regulating step command with time tag CP56Time2a 1) 2)	<60>	out	2)	DB
Block of data (1...32 Bit) 3)	Bitstring of 32 bits 3)	<7>	in	3)	DB
	Bitstring of 32 bits with time tag CP56Time2a 1) 3)	<33>	in	3)	DB
	Bitstring of 32 bits 3)	<51>	out	3)	DB
	Bitstring of 32 bits with time tag CP56Time2a - control direction 1) 3)	<64>	out	3)	DB

1) For the format of the time stamp, see the following section.

2) For these data point types, create a data block with an array of precisely 2 bool.

3) With these data point types, contiguous memory areas up to a size of 32 bits can be transferred. Only the S7 Bool data type is compatible.

Time stamp of the data with the IEC protocol

Time stamps are transferred according to the IEC specification in the "CP56Time2a" format. Note that only the first 3 bytes for milliseconds and minutes are transferred.

4.7.12.3 Time stamp of the "ST7" protocol

Time stamp of the ST7 frames

The values of the data points are transferred by the communications moduel with a time stamp, see also section Creating telecontrol connections for the ST7 communication (Page 73), subsection "Connections to redundant control centers and other properties".

Format of the time stamp

The ST7 time stamp is coded in BCD format. The exception is the half byte (nibble) with the time status.

The structure of 8 bytes is assigned as follows:

Table 4- 6 Assignment of the structure of the time stamp

Byte no.	Content	
	High nibble	**Low nibble**
0	Year * 10	Year * 1
1	Month * 10	Month * 1
2	Day * 10	Day * 1
3	Hour * 10	Hour * 1
4	Minute * 10	Minute * 1
5	Second * 10	Second * 1
6	Millisecond * 100	Millisecond * 10
7	Millisecond * 1	Time status

Table 4- 7 The assignment of the half byte "time status" (low nibble of byte 7)

Bit No.	Value	Meaning
0	0	Time is invalid
	1	Time is valid
1	0	Standard time
	1	Daylight saving time
2		*Not used*
3		*Not used*

4.7.12.4 Status IDs of the data points

Status IDs of data points

The status IDs od the data points listed below are transferred for each data point in each frame. They differ slightly in the three protocol types.

For the meaning of the status bits, see below. The "Meaning" (2nd table row) relates to the "bit status" (3rd table row).

Generation of events if a data point status changes

With data points that were configured as an event, the change to the status bit of the status identifiers described below also leads to an event being generated.

Example: If the value of the status "RESTART" of a data point configured as an event changes form 1 (value not yet updated) to 0 (value updated) when the station starts up, this causes an event to be generated.

Status IDs - TeleControl Basic

The status bits are converted to the OPC quality code as follows by TCSB.

- Quality = BAD, If:

  NON_EXISTENT or OVER_RANGE = 1
- Quality = UNCERTAIN, If:

  RESTART or CARRY or SB = 1
- Quality = GOOD, If:

  Bits 1, 2, 3, 5 and 6 = 0

Table 4- 8 Bit assignment of status byte 0

Bit	7	6	5	4	3	2	1	0
Flag name	-	NON_ EXISTENT	SB	LOCAL_ FORCED	CARRY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	Data point does not exist or S7 address unreachable	Substitute value	*(Bit is not set)*	Counted value over-flow before reading the value	Limit value of the ana-log value prepro-cessing overshot / undershot	Value not yet updated after start	Value is valid, CPU in RUN
Bit status	*(always 0)*	1	1	*(irrelevant)*	1	1	1	1

Status IDs - TeleControl Basic

The status IDs can be evaluated by the master. They correspond to the following elements of the specification:

OBJECT FLAGS - DNP3 Specification, Volume 6, Data Object Library - Part 1

Table 4- 9 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	-	LOCAL_ FORCED	DISCONTI NUITY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	-	-	Local opera-tor control	Counted value over-flow before reading the value	Limit value of the analog value prepro-cessing over-shot / undershot	Value not updated after start	Value is invalid
Bit status	*(always 0)*	*(always 0)*	*(always 0)*	1	1	1	1	1

Status IDs - IEC

The status IDs can be evaluated by the master. They correspond to the following elements of the specification:

Quality descriptor - IEC 60870 Part 5-101

Table 4- 10 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	SB substituted	-	CY carry	OV overflow	NT not topical	IV invalid
Meaning	-	-	Substitute value	-	Counted value over-flow before reading the value	Value range exceeded, analog value	Value not updated	Value is valid
Bit status	*(always 0)*	*(always 0)*	1	*(always 0)*	1	1	1	0

4.7.12.5 "General" tab

"General" tab

Not all of the following parameters are supported by all protocols.

General parameters

- **Data point index**

  With the TeleControl Basic, DNP3 and IEC protocols, the index is an addressing parameter for a data point. Below you will find the rules for configuring in the section Configuration of the data point index (Page 96).

  In ST7 a data point is addressed by the object number and the channel (see below).

- **Type of transmission**

  The type of transmission determines whether the value of the data point is only saved in the image memory or also in the send buffer of the CP. See section Process image, type of transmission, event classes (Page 97) for information on this.

- **Read cycle**

  Prioritizes the reading or writing of the data point value in the scan cycle of the CPU; see section Read cycle (Page 100).

  The fast cycle is suitable for data to be acquired quickly (alarms, contact changeover messages) and ST7 data points for the 1-out-of-n check. They are read in every cycle.

DNP3- and IEC-specific parameters

- **Value monitoring**

  If the option is enabled, the value of the PLC tag of the output data point is monitored for changes.

  If the value of the PLC tag is changed, for example by manual operator input on site, an event is generated and the changed value is transferred to the communications partner (mirrored back).

  Remember that to use the mirror back function, you need to interconnect the local values in the controller with the PLC tag of the data point.

- **Response to general request**

  Enables the data point for the response to a general request. If the function is disabled, the value of the data point is not sent to the communications partner following a general request.

- **Assignment to group request**

  Assigns the data point to a station group for group requests. If a group request is sent to this group by the master, the value of the data point is sent to the master.

ST7-specific parameters

- **High priority**

  If the option is enabled, the transfer has higher priority (important process data). The values of the data point are transferred before those of lower priority data points.

- **Object number**

  The object number must be unique and the maximum permitted number of data points per SINAUT object must not be exceeded. Refer to the column "Number of data points per SINAUT object" in the section Datapoint types (Page 86).

- **Object channel**

  The object channel is the channel of the corresponding SINAUT object.

- **Partner object number**

  Object number of the data point on the partner

  Per object number, you need to specify a unique object number of the communications partner.

  This must result in unique pairs of "Object number" and "Partner object number".

4.7.12.6 Configuration of the data point index

Configuration of the data point index

Below you will find the rules for configuring the data point index for the various protocols.

TeleControl Basic

Within a CP, the indexes of the data point classes must comply with the following rules:

- Input

  The index of an input data point must be unique throughout all data point types (digital inputs, analog inputs etc.).

- Output

  The index of an output data point must be unique throughout all data point types (digital inputs, analog inputs etc.).

Note

Index for data points with inter-station communication

Note that for inter-station communication with a CP in another S7 station, the indexes of the two corresponding data points (data point pair) must be identical on the sending and receiving CP.

For information on the configuration, see section Partner stations (Page 116).

DNP3

On a CP, data point indexes must be unique within each of the following object groups:

- Binary Input / Binary Input Event
- Binary Output / Binary Command
- Counter / Counter Event
- Analog Input / Analog Input Event
- Analog Output
- Octet String / Octet String Event

Indexes of two data points in different object groups can be identical.

IEC

The data point indexes must be unique in a CP.

Data point indexes assigned twice are indicated as errors in the consistency check and prevent the project being compiled.

4.7.12.7 Process image, type of transmission, event classes

Saving the data point values

The values of data points are generally stored in the image memory of the CP.

Events are also stored in the send buffer and can be transferred unsolicited.

Data points are configured as a static value or as an event using the "Type of transmission" parameter (see below).

The image memory, the process image of the CP

The image memory is the process image of the communications module. All the current values of the configured data points are stored in the image memory. New values of a data point overwrite the last stored value in the image memory.

The values are only transferred under the following conditions:

- After a query by the communications partner; see "Transfer after call" in the "Types of transmission" section below.
- Along with a data frame from the send buffer that needs to be transferred immediately.

The send buffer

The send buffer of the CP is the memory for the individual values of data points that are configured as an event. The maximum number is divided equally among all configured and enabled communications partners. You configure the size of the send buffer with the parameter "Frame memory size", see the section Communication with the CPU (Page 70).

If the connection to a communications partner is interrupted, the individual values of the events are retained in the buffer. When the connection returns, the buffered values are sent. The frame memory operates chronologically; in other words, the oldest data is sent first (FIFO principle).

If a data frame was transferred to the communications partner, the transferred data is deleted from the send buffer.

If data cannot be transferred for a longer period of time and the send buffer is threatening to overflow, the protocol-dependent response is as follows:

- Telecontrol Basic, ST7

  The forced image mode

  If the send buffer reaches a certain fill level, the module changes to the forced image mode. The fill level for changing to the forced image mode is:

  – Telecontrol Basic: 80% occupation of the send buffer

  – ST7: 90% occupation of the send buffer

  New values of data points configured as an event are no longer added to the send buffer in forced image mode. Rather, they overwrite older existing values in the image memory.

  When the connection to the communications partner returns, the module changes back to the send buffer mode as soon as the fill level of the send buffer has fallen below 50%.

- DNP3 / IEC

  If the fill level of the send buffer reaches 100%, no more values are saved until the fill level falls below 100% again.

Static values and events

The following relationship exists between the memory areas of the CP and the "Type of transmission":

- **Static value (no event)**

  Static values are entered in the image memory (process image of the CP).

  With DNP3 and IEC, static values correspond to the following classes:

  – DNP3: Class 0

  – IEC: Class 2

- **Event**

  The values of data points configured as an event are also entered in the image memory.

  The values of events are entered in the send buffer of the communications module in addition.

  With DNP3 and IEC, events correspond to the following classes:

  – DNP3: Class 1 / 2 / 3

  – IEC: Class 1

A data point is configured as a static value or as an event using the "Type of transmission" parameter (see below).

Type of transmission

The following types of transmission are possible:

- **Transfer after call (class 0)**

  The current value of the data point is entered as static value in the image memory of the CP. New values of a data point overwrite the last stored value in the image memory.

  After being called by the communications partner, the current value at the time is transferred.

- **Triggered (events)**

  The values of data points configured as an event are entered in the image memory and also in the send buffer of the CP.

  The values of events are saved in the following situations:

  – The configured trigger conditions are fulfilled (data point configuration > "Trigger" tab, see below)

  – The value of a status bit of the status identifiers of the data point changes; see also the section Status IDs of the data points (Page 93).

    Example:
    When the value of a data point configured as an event is updated during startup of the station by reading the CPU data for the first time, the status "RESTART" of this data point changes (bit status change 1 → 0). This leads to the generation of an event.

  Events can be transmitted spontaneously; see below (Time of transmission).

Event classes with the "Triggered" type of transmission

Depending on the protocol used the following event classes are available:

- **TeleControl Basic / ST7**

  – **Every value triggered**

    Each value change is entered in the send buffer in chronological order.

  – **Current value triggered**

    Only the last, current value is entered in the send buffer. It overwrites the value stored there previously.

- **DNP3**

  The evaluation of the following classification must be handled by the master.

  – **Event class 1**

    Class according to DNP3 protocol: Class 1

    Each value change is entered in the send buffer in chronological order.

  – **Event class 2**

    Class according to DNP3 protocol: Class 2

    Each value change is entered in the send buffer in chronological order.

  – **Event class 3**

    Class according to DNP3 protocol: Class 3

    Only the current value at the time the trigger condition is met is entered in the send buffer and overwrites the last value stored there.

- **IEC**

  Both of the following event classes correspond to the user data class 1 of the IEC protocol

  – **Every value triggered**

    Each value change is entered in the send buffer in chronological order.

  – **Current value triggered**

    Only the current value at the time the trigger condition is met is entered in the send buffer and overwrites the last value stored there.

For the possible trigger types, see section "Trigger“ tab (Page 102).

4.7.12.8 Read cycle

Priority of the data points

The cyclic reading of the values of input data points from their assigned PLC tags on the CPU can be prioritized.

Less important input data points do not need to be read in every CPU scan cycle. Important input data points, on the other hand, can be prioritized for updating in every CPU scan cycle.

You can prioritize the data points in STEP 7 in the data point configuration in the "General" tab with the "Read cycle" parameter. There you will find the two following options for input data points:

- Fast cycle
- Normal cycle

The data points are read according to the method described below.

Structure of the CPU scan cycle

The cycle (including the pause) with which the CP scans the memory area of the CPU is made up of the following phases:

- **High-priority read jobs**

  The values of input data points with the scan priority "High-priority" are read in every scan cycle.

- **Low priority read jobs**

  Some of the values of input data points with the scan priority "Low-priority" are read in every scan cycle.

  The number of values read per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of read jobs" parameter. The values that exceed this value and can therefore not be read in one cycle are then read in the next or one of the following cycles.

- **Write jobs**

  In every cycle, the values of a certain number of unsolicited write jobs are written to the CPU. The number of values written per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of write jobs" parameter. The values whose number exceeds this value are then written in the next or one of the following cycles.

- **Cycle pause time**

  This is the waiting time between two scan cycles. It is used to reserve adequate time for other processes that access the CPU via the backplane bus of the station.

4.7.12.9 ST7 objects

Objects of TD7 software

The telecontrol communication of modules that use the SINAUT ST7 telecontrol protocol is handled by the TD7 software.

The data to be transferred is configured with SINAUT objects.

Data objects

The sending and receiving of process data is configured with the aid of standardized data objects. According to the two transmission directions, these are divided into:

- **Send objects (.._S)**

  Data objects for acquiring and sending data

  Their names have the ending "_S" (send).

- **Receive objects (.._R)**

  The data objects for receiving and outputting data

  Their names have the ending "_R" (receive).

The data objects are available in the Data point editor and are configured for the communication between the partners.

Object channels

The send and receive channels of the data objects are responsible for the processing of an individual process value, for example for processing and sending an analog value or receiving and outputting a command byte.

Each data object contains one or more send or receive channels. The number and type of send and receive channels per data object cannot be modified. The data object "Ana04W_S", for example, has 4 send channels of the type "send analog value".

If objects have multiple channels of the same type, not all channels need to be activated if they are not required.

4.7.12.10 "Trigger“ tab

Trigger

Data points are configured as a static value or as an event using the "Type of transmission" parameter:

Saving the value of a data point configured as an event

Saving the value of a data point configured as an event in the send buffer (frame memory) can be triggered by various trigger types:

- **Threshold value trigger**

  The value of the data point is saved when this reaches a certain threshold. The threshold is calculated as the difference compared with the last stored value, refer to the section Threshold value trigger (Page 103).
- **Time trigger**

  The value of the data point is saved at configurable intervals or at a specific time of day.
- **Event trigger (Trigger tag)**

  The value of the data point is saved when a configurable trigger signal is fired. For the trigger signal, the edge change (0 → 1) of a trigger tag is evaluated that is set by the user program. When necessary, a separate trigger tag can be configured for each data point.

  Resetting the trigger tag in the bit memory area / DB:

  If the memory area of a trigger tag is in the bit memory or in a data block, the CP resets the trigger variable itself to 0 (zero) as soon as the value of the data point has been transferred. This can take up to 500 milliseconds.

Note

Fast setting of triggers

Triggers must not be set faster than a minimum interval of 500 milliseconds. This also applies to hardware triggers (input area).

Note

Hardware trigger

You need to reset hardware triggers via the user program.

Time of transmission of a triggered data point (event)

With the DNP3 and IEC protocols, the spontaneous transmission of events depends on whether spontaneous sending or asymmetric communication is possible in the network. With DNP3, spontaneous sending of the module over the "Transmission mode" parameter can be enabled in the transfer settings of the Ethernet interface.

With the TeleControl Basic and ST7 protocols, you define the time using the "Transmission mode" parameter.

Transmission mode

You determine whether TeleControl Basic and ST7 values are sent immediately or following a delay with the transmission mode of a data point ("Trigger" tab):

- Spontaneous (unsolicited - direct transfer)

  The value is transferred immediately.
- Conditional spontaneous (buffered transfer)

  The value is transferred only when one of the following conditions is fulfilled:
  - The communications partner queries the station.
  - The value of another event with the transmission mode "Spontaneous" is transferred.
  - The fill level of the send buffer has reached 80% (TeleControl Basic) or 90% (ST7) of its maximum capacity.

4.7.12.11 Threshold value trigger

Note

Threshold value trigger: Calculation only after "Analog value preprocessing"

Note that the analog value preprocessing is performed before the check for a configured threshold value and before calculating the threshold value.

This affects the value that is configured for the threshold value trigger.

Note

No Threshold value trigger if Mean value generation is configured

If mean value generation is configured, no threshold value trigger can be configured for the analog value event involved.

For the time sequence of the analog value preprocessing refer to the section Analog value preprocessing (Page 105).

Threshold value trigger

Function

If the process value deviates by the amount of the threshold value, the process value is saved.

Two methods are used to calculate the threshold value deviation:

- **Absolute method**

  With binary and counter values as well as with analog values with configured mean value generation, the absolute method is used to calculate the threshold value deviation.

- **Integrative method**

  With analog values without configured mean value generation, the integrating method is used to calculate the threshold value deviation.

  In the integration threshold value calculation, it is not the absolute value of the deviation of the process value from the last stored value that is evaluated but rather the integrated deviation.

Absolute method

For each binary value a check is made to determine whether the current (possibly smoothed) value is outside the threshold value band. The current threshold value band results from the last saved value and the amount of the configured threshold value:

- Upper limit of the threshold value band: Last saved value + threshold value
- Lower limit of the threshold value band: Last saved value - threshold value

As soon as the process value reaches the upper or lower limit of the threshold value band, the value is saved. The newly saved value serves as the basis for calculating the new threshold value band.

Integrative method

The integration threshold value calculation works with a cyclic comparison of the integrated current value with the last stored value. The calculation cycle in which the two values are compared is 500 milliseconds.
(Note: The calculation cycle must not be confused with the scan cycle of the CPU memory areas).

The deviations of the current process value are totaled in each calculation cycle. The trigger is set only when the totaled value reaches the configured value of the threshold value trigger and a new process value is entered in the send buffer.

The method is explained based on the following example in which a threshold value of 2.0 is configured.

Table 4- 11 Example of the integration calculation of a threshold value configured with 2.0

Time [s] (calculation cycle)	Process value stored in the send buffer	Current process value	Absolute deviation from the stored value	Integrated deviation
0	**20.0**	**20.0**	0	0
0.5		20.3	+0.3	0.3
1.0		19.8	-0.2	0.1
1.5		20.2	+0.2	0.3
2.0		20.5	+0.5	0.8
2.5		20.3	+0.3	1.1
3.0		20.4	+0.4	1.5
3.5	**20.5**	**20.5**	+0.5	**2.0**
4.0		20.4	-0.1	-0.1
4.5		20.1	-0.4	-0.5
5.0		19.9	-0.6	-1.1
5.5		20.1	-0.4	-1.5
6.0	**19.9**	**19.9**	-0.6	**-2.1**

With the changes in the process value shown in the example, the threshold value trigger configured with 2.0 fires twice:

- At the time 3.5 s: The value of the integrated deviation is at 2.0. The new process value stored in the send buffer is 20.5.
- At the time 6.0 s: The value of the integrated deviation is at 2.1. The new process value stored in the send buffer is 19.9.

In this example, if a deviation of the process value of approximately 0.5 should fire the trigger, then with the behavior of the process value shown here a threshold value of approximately 1.5 ... 2.5 would need to be configured.

4.7.12.12 Analog value preprocessing

CPs with data point configuration support analog value preprocessing. For analog value data points, some or all of the functions described below can be configured.

Requirements and restrictions

You will find the requirements for the configuration of the preprocessing options and restrictions in the section relating to the particular function.

Note

Restrictions due to configured triggers

The analog value preprocessing options "Error suppression time", "Limit value calculation" and "Smoothing" are not performed if no threshold value trigger is configured for the relevant data point. In these cases, the read process value of the data point is entered in the image memory of the CP before the preprocessing cycle of the threshold value calculation (500 ms) elapses.

Sequence of the analog value preprocessing options

The values of analog inputs configured as an event are processed on the CPU according to the following scheme:

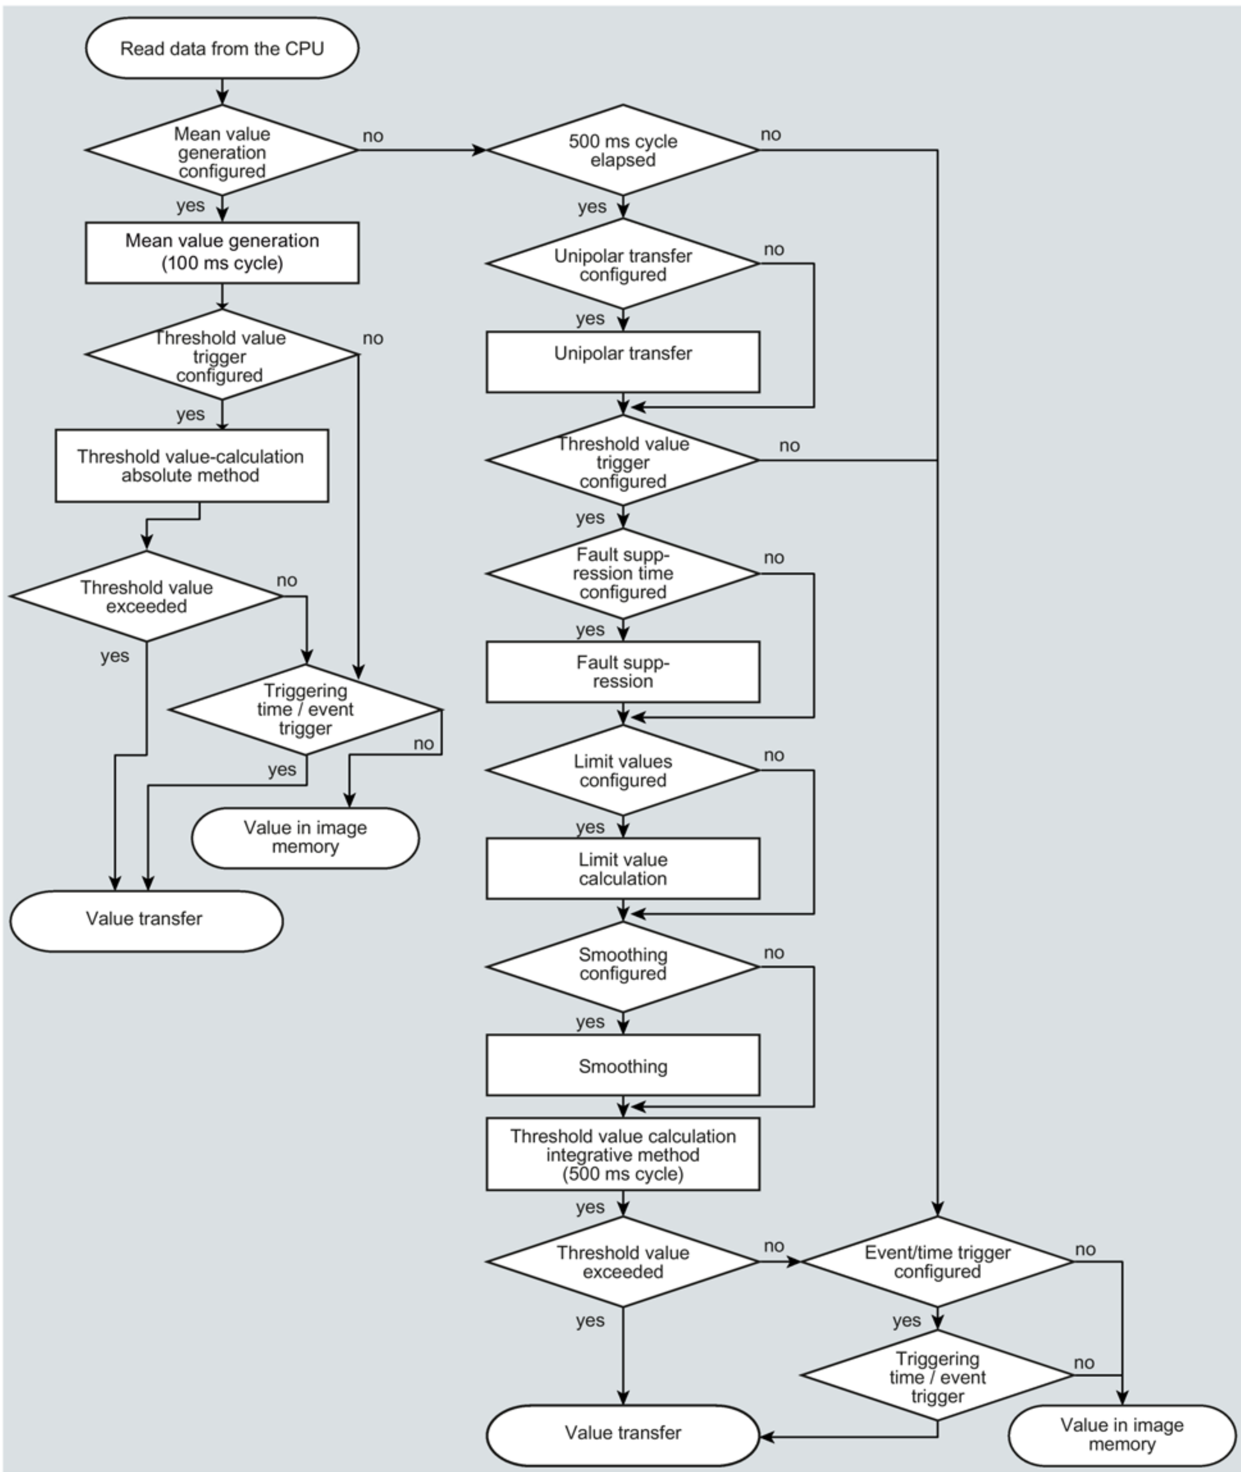

Figure 4-7 Sequence of the analog value preprocessing

The 500 millisecond cycle is started by the integrative threshold value calculation. In this cycle, the values are saved even when the following preprocessing options are enabled:

- Unipolar transfer
- Fault suppression time
- Limit value calculation
- Smoothing

Mean value generation

Note

Restricted preprocessing options if mean value generation is configured

If you configure mean value generation for an analog value event, the following preprocessing options are not available:

- Unipolar transfer
- Fault suppression time
- Smoothing

Function

With this parameter, acquired analog values are transferred as mean values.

If mean value generation is active, it makes sense to configure a time trigger..

The current values of an analog data point are read in a 100 millisecond cycle and totaled. The number of read values per time unit depends on the read cycle of the CPU and the CPU scan cycle of the CP.

The mean value is calculated from the accumulated values as soon as the transfer is triggered by a trigger. Following this, the accumulation starts again so that the next mean value can be calculated.

The mean value can also be calculated if the transmission of the analog value message is triggered by a request from the communications partner. The duration of the mean value calculation period is then the time from the last transmission (for example triggered by the trigger) to the time of the request. Once again, the accumulation restarts so that the next mean value can be calculated.

Input modules: Overflow range / underflow range

As soon as a value is acquired in the overflow or underflow range, mean value generation is stopped. The value 32767 / $7FFF_h$ or -32768 / 8000_h is saved as an invalid mean value for the current mean value calculation period and sent with the next message.

The calculation of a new mean value is then started. If the analog value remains in the overflow or underflow range, one of the two values named is again saved as an invalid mean value and sent when the next message is triggered.

Note

Fault suppression time > 0 configured

If you have configured an error suppression time and then enable mean value generation, the value of the error suppression time is grayed out but no longer used. If mean value generation is enabled, the error suppression time is set to 0 (zero) internally.

Unipolar transfer

Restrictions

Unipolar transfer cannot be configured at the same time as mean value generation. Enabling unipolar transfer has no effect when mean value generation is activated.

Function

With unipolar transfer, negative values are corrected to zero. This can be desirable if values from the underrange should not be transferred as real measured values.

Exception: With process data from input modules, the value -32768 / 8000_h for wire break of a live zero input is transferred.

With a software input, on the other hand, all values lower than zero are corrected to zero.

Fault suppression time

Requirements for the function

Configuration of the threshold trigger for this data point

Restrictions

The fault suppression time cannot be configured at the same time as mean value generation. A configured value has no effect when mean value generation is activated.

Function

A typical use case for this parameter is the suppression of peak current values when starting up powerful motors that would otherwise be signaled to the control center as a disruption.

The transmission of an analog value in the overflow ($7FFF_h$) or underflow range (8000_h) is suppressed for the specified time. The value $7FFF_H$ or 8000_H is only sent after the fault suppression time has elapsed, if it is still pending.

If the value returns to the measuring range before the fault suppression time elapses, the current value is transferred.

Input modules

The suppression is adjusted to analog values that are acquired directly by the S7 analog input modules as raw values. These modules return the specified values for the overflow or underflow range for all input ranges (also for live zero inputs).

An analog value in the overflow range (32767 / $7FFF_h$) or underflow range (-32768 / 8000_h) is not transferred for the duration of the fault suppression time. This also applies to live zero inputs. The value in the overflow/underflow range is only sent after the fault suppression time has elapsed, if it is still pending.

Recommendation for finished values that were preprocessed by the CPU:

If the CPU makes preprocessed finished values available in bit memory or in a data block, suppression is only possible or useful if these finished values also adopt the values listed above 32767 / $7FFF_h$ or -32768 / 8000_h in the overflow or underflow range. If this is not the case, the parameter should not be configured for preprocessed values.

For finished values preprocess in the CPU, the limits for the overflow and underflow can be freely assigned.

Smoothing factor

Requirements for the function

Configuration of the threshold trigger for this data point

Restrictions

The smoothing factor cannot be configured at the same time as mean value generation. A configured value has no effect when mean value generation is activated.

Function

Analog values that fluctuate quickly can be evened out using the smoothing function.

The smoothing factors are calculated according to the following formula as with S7 analog input modules.

$$y_n = \frac{x_n + (k-1)\ y_{n-1}}{k}$$

where
y_n = smoothed value in the current cycle n
y_{n-1} = smoothed value in the previous cycle n-1
x_n = acquired value in the current cycle n
k = smoothing factor

The following values can be configured for the module as the smoothing factor.

- 1 = No smoothing
- 4 = Weak smoothing
- 32 = Medium smoothing
- 64 = Strong smoothing

Set limit value 'low' / Set limit value 'high'

Requirements for the function

- Configuration of the threshold trigger for this data point
- PLC tag in the bit memory operand area or data area

  The analog value data point must be linked to a PLC tag in the bit memory or data area (data block). For PLC tags of hardware modules (input operand area) limit value configuration is not possible.

The configuration of limit values is pointless for measured values that have already been preprocessed on the CPU.

Function

In these two input boxes, you can set a limit value in the direction of the start of the measuring range or in the direction of the end of the measuring range. You can also evaluate the limit values, for example as the start or end of the measuring range.

Status identifier "OVER_RANGE"

If a limit value is overshot or undershot, the status identifier "OVER_RANGE" of the data point is set. This status identifiers are described in the section Status IDs of the data points (Page 93).

The "OVER_RANGE" bit of the status identifier of the data point is set as follows when the relevant analog value is transferred:

- Limit value 'high':
  – If the limit value is exceeded: OVER_RANGE = 1
  – If the value then falls below the limit value: OVER_RANGE = 0
- Limit value 'low':
  – If the value falls below the limit value: OVER_RANGE = 1
  – If the value then exceeds the limit value: OVER_RANGE = 0

Configuration of the limit value

The limit value is configured as a whole decimal number. The range of values is based on the range of values of the raw value of analog input modules.

Range	Raw value (16 bits) of the PLC tag		Module output [mA]			Measuring range [%]
	Decimal	Hexadecimal	0 .. 20 (unipolar)	-20 .. +20 (bipolar)	4 .. 20 (life zero)	
Overflow	32767	7FFF	> 23.515	> 23.515	> 22.810	> 117.593
Overrange	32511 ... 27649	7EFF ... 6C01	23.515 ... 20.001	23.515 ... 20.001	22.810 ... 20.001	117.593 ... 100.004
Nominal range (unipolar / life zero)	27648 ... 0	6C00 ... 0000	20 ... 0		20 ... 4	100 ... 0

Range	Raw value (16 bits) of the PLC tag		Module output [mA]			Measuring range [%]
	Decimal	Hexadecimal	0 .. 20 (unipolar)	-20 .. +20 (bipolar)	4 .. 20 (life zero)	
Nominal range (bipolar)	27648 ... 0 ... -27648	6C00 ... 0000 9400		20 ... 0 ... -20		100 ... 0 ... -100
Underrange (unipolar / life zero)	-1 ... -4864	FFFF ... ED00	-0.001 ... -3.518		3.999 ... 1.185	-0.004 ... -17.59
Underrange (bipolar)	-27649 ... -32512	93FF ... 8100		-20.001 ... -23.516		-100.004 ... -117.593
Undershoot / wire break	-32768	8000	< -3.518		< 1.185	< -17.593

Note

Evaluation of the value even when the option is disabled

If you enable one or both options and configure a value and then disable the option later, the grayed out value is nevertheless evaluated.

To disable the two options, delete the previously configured values limit values from the input boxes and then disable the relevant option.

Recommendation for quickly fluctuating analog values:

If the analog value fluctuates quickly, it may be useful to smooth the analog value first if limit values are configured.

4.7.12.13 Command output

Processing options of command outputs

Parameters

Special output options can be enabled for command outputs in stations which process commands from a central station or a master. The two output options can be enabled alternatively:

- **LATCH_ON/OFF**

  The function permanently latches a command output to the value 0 or 1.

  Note:
  The latched value is only canceled by a new command. Alternatively, the command can be reset by the user program.

- **PULSE_ON/OFF**

  The function evaluates the number and length of the signals (pulses) of commands from a master station.

Data point types

The output options can be configured dependent on the protocol for the following data point types:

- ST7

  Command output (Cmd01B_R)

- IEC

  Single command

- DNP3

  Binary Command Output

Reference to specifications

The output options correspond to the following parts of the specification:

- IEC

  Qualifier of command - IEC 60870-5-101, Part 1

- DNP3

  Control Code, Operation Type field (OP Type) - Volume 6, Part 2, Objects

Protocol-dependent processing

ST7

- LATCH_ON/OFF

  The function latches the value of a command as described above.

- PULSE_ON/OFF

  The function evaluates the "command output time" for a single pulse (see below).

IEC

- LATCH_ON/OFF

  The function latches the value of a command as described above.

- PULSE_ON/OFF

  The function is coded by the master via a "Qualifier of command". The following codings are evaluated by the communication module in the station:

  – QU (Type 1.1) <1> short pulse duration

    Corresponding parameter for the module: "Short pulse duration"

  – QU (Type 1.1) <2> long pulse duration

    Corresponding parameter for the module: "Long pulse duration"

  – S/E (Type 6) <0> execute

    Corresponding parameter for the module: "Command execution mode"

  – S/E (Type 6) <1> select

    Corresponding parameter for the module: "Command execution mode"

  For parameter assignment see below.

DNP3

The two functions are encoded by the master via the control code of the object.

- LATCH_ON/OFF

  The function latches the value of a command as described above.

- PULSE_ON/OFF

  The function evaluates the number of pulses and duration.

  The master sends a "Control Code" to the station with the "PULSE_ON" function with information on the "Count", "On-time" and "Off-time". The data point of the communication module in the station evaluates this information via the parameters "Max. pulse duration", "Pulse duration replacement time" and "Max. number of pulses".

The following encodings of the control code are evaluated by the data point:

Table 4- 12 DNP3 Control Codes

Receipt of:			Reaction of data point upon activation of:	
Control Code	**Trip-Close Code**	**Operation Type field**	**PULSE_ON / OFF**	**LATCH_ON / OFF**
0x01	NUL	PULSE_ON	**The output is set to 1 for the "Max. pulse duration".**	The command is rejected.
0x03	NUL	LATCH_ON	The command is rejected.	**The output is set permanently to 1.**
0x04	NUL	LATCH_OFF	The command is rejected.	**The output is set permanently to 0.**
0x41	CLOSE	PULSE_ON	**The output is set permanently to 1.**	The command is rejected.
0x81	TRIP	PULSE_ON	**The output is set permanently to 0.**	The command is rejected.

The clear field (CR) is not evaluated.

The count field is always = 1.

Parameter

Name:	**Max. number of pulses**
Range of values:	• DNP3: 0 ... 255 • ST7 and IEC: Fixed assignment with "1"
Default:	1
Explanation:	Monitors the number of pulses sent by the master (Count). If the number of pulses received from the master exceeds the value configured here, the command is discarded. If 0 (zero) is set, the monitoring is disabled.

Name:	**Max. pulse duration (s)** (DNP3 only)
Range of values:	0 ... 65535
Default:	0
Explanation:	Monitors the pulse duration transmitted by the master with the command (On-time). If the pulse duration sent by the master exceeds the value configured here, the command is discarded by the communication module if no "Pulse duration replacement time" has been configured. When the "Max. pulse duration" is exceeded and "Pulse duration replacement time" is configured, the pulse duration sent by the master is checked for the "Pulse duration replacement time". If the value is 0 (zero), no "Max. pulse duration" is checked.

Name:	**Pulse duration replacement time (s)** (DNP3 only)
Range of values:	0 ... 65535
Default:	0
Explanation:	Replacement value for the pulse duration If the pulse duration received from the master exceeds the value configured in “Max pulse duration“. If the value is 0 (zero), no replacement value is used. If the ""Max. pulse duration" and "Pulse duration replacement time" are both configured with zero, each command is discarded.

Name:	**Short pulse duration (s)** (IEC only)
Range of values:	0 ... 65535
Default:	0

Explanation:	Commands from the master with the Qualifier of command = <1> (short pulse duration) are output by the communication module for the duration configured here. If "Short pulse duration" is configured with the value 0 (zero), commands are discarded by the module with the Qualifier of command of <1>.

Name:	**Long pulse duration (s)** (IEC only)
Range of values:	0 ... 65535
Default:	0
Explanation:	Commands from the master with the Qualifier of command = <2> (long pulse duration) are output by the communication module for the duration configured here. If "Long pulse duration" is configured with the value 0 (zero), commands are discarded by the module with the Qualifier of command of <2>.

Name:	**Command output time (s)** (ST7 only)
Range of values:	0 ... 65535
Default:	0
Explanation:	Period for which the command is output. The duration is valid for all 8 channels of the SINAUT object. When the time expires, the output is automatically reset. With zero, a set command output is not automatically reset. In this case, you need to reset the output via the user program.

Name:	**Command execution mode** (IEC only)
Range of values:	• Execute directly • Select and operate

Default: Execute directly

Explanation:

- Execute directly

  The command is transferred immediately to the CPU.
- Select and operate

  (select and execute)

  The command is transferred to the communication module after selection in the master station.

  The communication module acknowledges receipt of the selection ASDU with the Qualifier "S/E (Type 6) <1> select".

  After receiving the acknowledgment the master sends the execute command with the Qualifier "S/E (Type 6) <1> execute". Only then does the communication module transfer the command to the CPU.

4.7.12.14 Partner stations

Partner of the data point

Enable the partner or partners with which the selected data point will exchange data using the check box:

You can configure or change the partners in the overview table or in the "Partner stations" tab of the CP. The data is applied in the data point editor.

With the TeleControl Basic protocol, you can choose between the telecontrol server or a partner for inter-station communication (S7 station) as partner.

With the ST7 protocol, only those partners to which a telecontrol connection was configured can be selected.

Enabling the partner for data points - TeleControl Basic

Enable the partner with which the selected data point will exchange data.

A communications can be configured. The telecontrol server and an S7 station cannot be selected as the partner for a data point at the same time.

The communications partner may be:

- The telecontrol server

  Since the telecontrol server is always enabled as a communications partner of the CP, it is adopted as default in this tab.

  The option "Telecontrol server enabled" is selected and grayed out.
- An S7 station

  The station must be reachable via the "TeleControl Basic" protocol.

  You specify the communications partners of the CP in the "Partner stations" parameter group.

Activate one of the two options.

- **Telecontrol server enabled**

  Only the telecontrol server is a communications partner of the data point.
- **Partner for inter-station communication**

  Only the S7 station is a communications partner of the data point.

Partner number (inter-station communication)

Specify the partner CP for inter-station communication for the selected data point by selecting the required partner from the drop-down list. The access ID of the relevant partner is shown in brackets.

The partners you specified in the "Partner stations" > "Partner for inter-station communication" can be selected.

Data point index

Index of the corresponding data point on the communications partner.

Note:

- The data pair of the sending and receiving CP must have an identical data point index. A receiving data point of CP 2 corresponds to a sending data point of CP 1 with the same data point index.
- For the opposite communications direction, a second pair of data points must be created: A sending data point of CP 2 corresponds to the receiving data point of CP 1. Once again, both have an identical data point index.

4.8 Security

The parameters and their configurability depend on the CP type and the telecontrol protocol used.

For information on individual functions, see section Application and functions (Page 11).

To be able to configure the security functions, you need to create a security user; see section Security user (Page 117).

4.8.1 Security user

Creating a security user

You need the relevant configuration rights to be able to configure security functions. For this purpose, you need to create at least one security user with the corresponding rights.

Navigate to the global security settings > "User and roles" > "Users" tab.

1. Create a user with the associated parameters such as authentication mode, session duration, etc.
2. Assign this user the role "NET Standard" or "NET Administrator" in the area below "Assigned roles".

After logging on, this user can make the necessary settings in the STEP 7 project.

In the future, continue to log on as this user when working on security parameters.

4.8.2 Security parameters of the CP 1542SP-1 IRC

4.8.2.1 CP identification

TeleControl Basic

- Project number

  The project number is the same for all telecontrol CPs in a STEP 7 project. TCSB evaluates project numbers from 1 ... 2000. If you change the project number, this parameter is changed for all CPs in the STEP 7 project.
- Station number

  For each station with a telecontrol CP, an individual station number is configured. TCSB evaluates station numbers from 1 ... 8000.
- Telecontrol password

  Password for the authentication of the CP on the telecontrol server. 8 ... 29 characters of the ASCII character set 0x20...0x7e. The password can be the same for all CPs of the STEP 7 project.

  The same password is configured in the "TCSB" application for this station.

4.8.2.2 MSC authentication

MSC authentication - Ethernet interface

When using the ST7 protocol, the authentication data for the "MSC / MSCsec" protocol must be configured for the CP as MSC station.

Parameter

- **User name**

  User name for communication using MSC
- **Password**

  Password for communication using MSC

The user name and password must be different for every MSC station in the network.

4.8.2.3 DNP3 security options

Authentication and key exchange with the DNP3 protocol

If the Security functions are enabled, the master and station (CP) authenticate themselves with a secret key, the pre-shared key.

With the help of the common pre-shared key, after the first connection establishment between master and DNP CP session keys are agreed that are then renewed cyclically. Renewal of the session keys is normally initiated by the master. The criteria for renewing the key are specified in the following parameters.

- Authentication requests before key exchange
- Key exchange interval

As soon as one of these conditions is met, the session key is renewed.

DNP3 security options

- **Enable DNP3 security options**

  Method with which the CP authenticates itself to the master.

  – Disabled

    Non-secure authentication. If this option is selected the CP logs on only using its station address.

  – Enabled

    Secure authentication. If this option is selected, the CP and master use the DNP3 Security mechanisms. The parameters are configured as follows.

- **IKE mode**

  Selection of the mode for key exchange (IKE)

  – The Main Mode is the default mode.

  – The Aggressive Mode is somewhat faster but transfers the identity unencrypted.

- **Security statistics**

  Specifies whether the statistics of security events are sent to the master. Security events are authentication requests to the CP. If the option is enabled, authentication requests with date, time and result are saved on the CP and sent to the master for further evaluation.

- **SHA-1 interlock**

  Setting to select whether the CP may use the secure hash algorithm SHA-1 if "SHA-256" was configured as the Secure hash algorithm and the master does not support SHA-256. Meaning of the options:

  – SHA-1 mode allowed

    The CP can use SHA-1 if the master does not support SHA-256.

  – SHA-1 mode not allowed

    The CP may not use SHA-1.

    Note: If the master does not support SHA-256, no connection will be established if this option is selected.

- **Secure hash algorithm**

  Selection of the Secure Hash Algorithm (SHA). Possible selections:

  – SHA-1

  – SHA-256

- **Key wrap algorithm**

  Selection of the Advanced Encryption Standard (AES). Possible selections:

  – AES-128

  – AES-256

- **Key length**

  Length of the pre-shared key in bytes

  The following lengths are used depending on the key wrap algorithm.

  – For AES-128: 16 bytes

  – For AES-256: 32 bytes

- Max. number of key exchange requests

  The function is disabled.

- **Authentication requests before key exchange**

  Maximum number of authentication requests of the CP with the master before the session key is renewed.

  If you enter 0 (zero), the function is deactivated and the session key is renewed only depending on the key exchange interval.

  Recommendation: Set the number for the CP twice as high as for the master.

- **Key exchange interval**

  Period after which the session key is exchanged again between the CP and the master.

  If you enter 0 (zero), the function is deactivated and the key will never be renewed.

  The interval must be matched up on both communications partners.

- **Authentication timeout**

  Maximum waiting (seconds) time for the response from the master to an authentication request of the CP.

  Exceeding the wait time is evaluated as an error by the CP. In this case, the CP generates a Security event and sends this to the master.

  Range of values: 1 ... 65535

- **Pre-shared key**

  The pre-shared key of the CP must be identical to the pre-shared key that the master uses.

  The key must have the key length configured above (2 characters per byte).

  The pre-shared key can be configured in two ways:

  – Manual configuration

    Enter the pre-shared key manually as a hexadecimal value.

  – Import as file

    Import the pre-shared key from the file system of the engineering station if the pre-shared key was generated by the master or another system.

4.8.3 Firewall

4.8.3.1 Pre-check of messages by the MAC firewall.

Each incoming or outgoing frame initially runs through the MAC firewall (layer 2). If the frame is discarded at this level, it will not be checked by the IP firewall (layer 3). This means that with suitable MAC firewall rules, IP communication can be restricted or blocked.

4.8.3.2 Settings for online security diagnostics and downloading to station with the firewall activated

Setting the firewall for online functions

With the security functions enabled, follow the steps outlined below:

1. In the global security settings (see project tree), select the entry "Firewall > Services > Define services for IP rules".
2. Select the "ICMP" tab.
3. Insert a new entry of the type "Echo Reply" and another of the type "Echo Request".
4. Now select the CP in the S7 station.
5. Enable the advanced firewall mode in the local security settings of the CP in the "Security > Firewall" parameter group.
6. Open the "IP rules" parameter group.

7. In the table, insert a new IP rule for the previously created global services as follows:
   – Action: Allow; "From external -> To station " with the globally created "Echo request" service
   – Action: Allow; "From station -> to external" with the globally created "Echo reply" service
8. For the IP rule for the Echo Request, enter the IP address of the engineering station in "Source IP address". This ensures that only ICMP frames (ping) from your engineering station can pass through the firewall.

4.8.3.3 Notation for the source IP address (advanced firewall mode)

If you specify an address range for the source IP address in the advanced firewall settings of the CP, make sure that the notation is correct:

- Separate the two IP addresses only using a hyphen.

  Correct: 192.168.10.0-192.168.10.255
- Do not enter any other characters between the two IP addresses.

  Incorrect: 192.168.10.0 - 192.168.10.255

If you enter the range incorrectly, the firewall rule will not be used.

4.8.3.4 Firewall settings for S7 connections via a VPN tunnel

IP rules in advanced firewall mode

If you set up configured connections (S7, OUC) with a VPN tunnel between the CP and a communications partner, you will need to adapt the local firewall settings of the CP:

In advanced firewall mode ("Security > Firewall > IP rules") select the action "Allow*" for both communications directions of the VPN tunnel.

4.8.4 Log settings - Filtering of the system events

Communications problems if the value for system events is set too high

If the value for filtering the system events is set too high, you may not be able to achieve the maximum performance for the communication. The high number of output error messages can delay or prevent the processing of the communications connections.

In "Security > Log settings > Configure system events", set the "Level:" parameter to the value "3 (Error)" to ensure the reliable establishment of the communications connections.

4.8.5 E-mail configuration

Requirements and necessary information

Note the following requirements in the CP configuration for the transfer of e-mails:

- The security functions are enabled.
- The time of the CP is synchronized.

For the configuration, you require the data of the SMTP server and the user account:

- Server address, port number, user name, password, e-mail address of the sender (CP)

E-mail configuration

- **No configuration**

  As default, the sending of e-mails is disabled.
- **Activate SMTP**

  Enable this option if you want to use the sending of unencrypted e-mails via SMTP port 25.
- **Enable SSL/TLS**

  If your e-mail service provider only supports encrypted transfer, enable this option. Select the protocol via the port number:

  – Port no. 587

    When using STARTTLS the CP sends encrypted e-mails.

  – Port no. 465

    When using SSL/TLS (SMTPS) the CP sends encrypted e-mails.

  Ask your e.mail service provider which option is supported.

  If you want to use an Internet connection with an IPv6 infrastructure, note the information in the section IPv6 (Page 52).

4.8.6 VPN

4.8.6.1 VPN (Virtual Private Network)

VPN - IPsec

Virtual Private Network (VPN) is a technology for secure transportation of confidential data in public IP networks, for example the Internet. With VPN, a secure connection (IPsec tunnel) is set up and operated between two secure IT systems or networks via a non-secure network.

The IPsec tunnel forwards all data even from protocols of higher layers (HTTP, FTP, etc.).

The data traffic between two network components is transported unrestricted through another network. This allows entire networks to be connected together via a neighboring or intermediate network.

Properties

- VPN forms a logical subnet that is embedded in a neighboring (assigned) network. VPN uses the usual addressing mechanisms of the assigned network, however in terms of the data, it transports its own frames and therefore operates independent of the rest of this network.
- VPN allows communication of the VPN partners with the assigned network.
- VPN is based on tunnel technology and can be individually configured.
- Communication between the VPN partners is protected from eavesdropping or manipulation by using passwords, public keys or a digital certificate (authentication).

Areas of application

- Local area networks can be connected together securely via the Internet ("site-to-site" connection).
- Secure access to a company network ("end-to-site" connection)
- Secure access to a server ("end-to-end" connection)
- Communication between two servers without being accessible to third parties (end-to-end or host-to-host connection)
- Ensuring information security in networked automation systems
- Securing the computer systems including the associated data communication within an automation network or secure remote access via the Internet
- Secure remote access from a PC/programming device to automation devices or networks protected by security modules via public networks.

Cell protection concept

With Industrial Ethernet Security, individual devices or network segments of an Ethernet network can be protected:

- Access to individual devices and network segments protected by security modules is allowed.
- Secure connections via non-secure network structures becomes possible.

Due to the combination of different security measures such as firewall, NAT/NAPT routers and VPN via IPsec tunnels, security modules protect against the following:

- Data espionage
- Data manipulation
- Unwanted access

4.8.6.2 Creating a VPN tunnel for S7 communication between stations

Requirements

To allow a VPN tunnel to be created for S7 communication between two S7 stations or between an S7 station and an engineering station with a security CP (for example CP 1628), the following requirements must be met:

- The two stations have been configured.
- The CPs in both stations must support the security functions.
- The Ethernet interfaces of the two stations must be networked.

Note

Communication also possible via an IP router

Communication between the two stations is also possible via an IP router. To use this communications path, however, you need to make further settings.

Procedure

To create a VPN tunnel, you need to work through the following steps:

1. Creating a security user

   If the security user has already been created: Log on as this user.
2. Enable the "Activate security features" option
3. Creating the VPN group and assigning security modules
4. Configure the properties of the VPN group
5. Configure local VPN properties of the two CPs

You will find a detailed description of the individual steps in the following paragraphs of this section.

Enable security functions

After logon, enable the "Activate security features" option on both CPs under "Security".

You now have the security functions available for both CPs.

Creating the VPN group and assigning security modules

1. In the global security settings, navigate to "VPN groups" > "Add new VPN group".
2. Double-click on the entry "Add new VPN group", to create a VPN group.

   Result: A new VPN group is displayed below the selected entry.

3. Double-click on the "VPN groups" > "Assign module to a VPN group" entry.
4. Assign the security modules between which VPN tunnels will be established to the VPN group.

Note

Current date and current time on the CP for VPN connections

To establish a VPN connection and for the associated recognition of the certificates to be exchanged, the current date and the current time are required on both stations.

Configure the properties of the VPN group

1. Double-click on the newly created VPN group.

   Result: The properties of the VPN group are displayed under "Authentication".
2. Enter a name for the VPN group. Configure the settings of the VPN group in the properties.

   These properties define the default settings of the VPN group that you can change at any time.

Note

Specifying the VPN properties of the CPs

You specify the VPN properties of the CPs in the "Security" > "Firewall" > "VPN" parameter group of the relevant module.

Result

You have created a VPN tunnel. The firewalls of the CPs are activated automatically: The "Activate firewall" check box is selected by default when you create a VPN group. You cannot disable the option.

Download the configuration to all modules that belong to the VPN group.

4.8.6.3 VPN communication with SOFTNET Security Client (engineering station)

VPN tunnel communication works only if the internal node is disabled

Under certain circumstances the establishment of VPN tunnel communication between SOFTNET Security ClientSOFTNET Security Client and the CP fails.

SOFTNET Security Client also attempts to establish VPN tunnel communication to a lower-level internal node. This communication establishment to a non-existing node prevents the required communication being established to the CP.

To establish successful VPN tunnel communication to the CP, you need to disable the internal node.

Use the procedure for disabling the node as explained below only if the described problem occurs.

Disable the node in the SOFTNET Security Client tunnel overview:

1. Remove the checkmark in the "Enable active learning" check box.

   The lower-level node initially disappears from the tunnel list.
2. In the tunnel list, select the required connection to the CP.
3. With the right mouse button, select "Enable all members" in the shortcut menu.

   The lower-level node appears again temporarily in the tunnel list.
4. Select the lower-level node in the tunnel list.
5. With the right mouse button, select "Delete entry" in the shortcut menu.

Result: The lower-level node is now fully disabled. VPN tunnel communication to the CP can be established.

4.8.6.4 Establishment of VPN tunnel communication between the CP and SCALANCE M

Create a VPN tunnel between the CP and a SCALANCE M router as described for the stations.

VPN tunnel communication will only be established if you have selected the check box "Perfect Forward Secrecy" in the global security settings of the created VPN group ("VPN groups > Authentication").

If the check box is not selected, the CP rejects establishment of the tunnel.

4.8.6.5 CP as passive subscriber of VPN connections

Setting permission for VPN connection establishment with passive subscribers

If the CP is connected to another VPN subscriber via a gateway, you need to set the permission for VPN connection establishment to "Responder".

This is the case in the following typical configuration:

VPN subscriber (active) ⇔ gateway (dyn. IP address) ⇔ Internet ⇔ gateway (fixed IP address) ⇔ CP (passive)

Configure the permission for VPN connection establishment for the CP as a passive subscriber as follows:

1. In STEP 7, go to the devices and network view.
2. Select the CP.
3. Open the parameter group "VPN“ in the local security settings.
4. For each VPN connection with the CP as a passive VPN subscriber, change the default setting "Initiator/Responder" to the setting "Responder".

4.8.6.6 SINEMA Remote Connect

Remote maintenance with SINEMA Remote Connect (SINEMA RC)

The application "SINEMA Remote Connect" (SINEMA RC) is available for remote maintenance purposes.

SINEMA RC uses OpenVPN for encryption of the data. The center of the communication is SINEMA RC Server via which communication runs between the subscribers and that manages the configuration of the communications system.

Preparatory steps

Execute the following steps before start configuring the SINEMA RC connection of the module in STEP 7. They are the prerequisite for a consistent STEP 7 project.

- Configuration of SINEMA Remote Connect - Server

  Configure SINEMA RC - Server as necessary (not in STEP 7). The communication module and its communication partners must be configured in the SINEMA RC Server.

- Exporting the CA certificate (optional)

  If you want to use the server certificate as authentication method of the communication module during connection establishment, export the CA certificate from SINEMA RC - Server. Then import the CA certificate from SINEMA RC - Server to the engineering station.

  Alternatively, you can use the fingerprint of the server certificate as authentication method of the communication module.

Note

Recommended authentication method:

The recommended authentication method is the one using the CA certificate. The certificate is valid for 10 years.

The fingerprint, on the other hand, is derived from the server certificate. Its validity may be significantly shorter.

Configuration of SINEMA Remote Connect

Importing your own certificate

1. Navigate to the parameter group "Security > Certificate manager".
2. Open the certificate selection with a double-click on the first free table row of the local certificate manager.
3. Select the CA certificate of SINEMA RC - Server.

Then navigate to the parameter group "Security > VPN".

VPN > General

1. Activate VPN
2. For the parameter "VPN connection type", select the option "Automatic OpenVPN configuration via SINEMA Remote Connect Server" if you wish to use communication via SINEMA Remote Connect.

   If you select "Internet Key Exchange (IKE) ...", you can use communication via IPsec tunnels.

SINEMA Remote Connect Server

Enter the address and port number of the server.

Server Verification

Here you select the authentication method of the communication module during connection establishment.

- CA Certificate

  Under "CA certificate" select the CA certificate from SINEMA RC - Server that was previously imported and activated in the local certificate manager.

  The module generally checks the CA certificate of the server and its validity period. The two options cannot be changed.
- Fingerprint

  When you select this authentication method, you enter the fingerprint of the server certificate of SINEMA RC - Server.

Authentication

- Device ID

  Enter the device ID generated for the module in SINEMA RC.
- Device password

  Enter the device password of the module configured in SINEMA RC.

  Max. number of characters: 127

Optional settings

The connection establishment is configured in the "Security > VPN > Optional settings" parameter group with the parameter "Connection type".

- **Update interval**

  With this parameter you set the interval at which the CP queries the configuration on the SINEMA RC Server.

  Note that with the setting 0 (zero) changes to the configuration of the SINEMA RC Server may result in the CP no longer being capable of establishing a connection to the SINEMA RC Server.

- **"Connection type"**

  The two options of the parameter have the following effect on the connection establishment:

  – Auto

    The module establishes a connection to the SINEMA RCServer. The OpenVPN connection is retained until the connection parameters are changed by the SINEMA Remote Connect Server. If the connection is interrupted, the CP automatically re-establishes the connection.

    If the connection parameters are changed by the SINEMA Remote Connect Server, the CP requests the new connection data after the update interval configured above has elapsed.

  – PLC trigger

    The option is intended for sporadic communication of the module via the SINEMA RC Server.

    You can use this option when you want to establish temporary connections between the module and a PC. The temporary connections are established via a PLC tag and can be used in servicing situations, for example.

- **PLC tag for connection establishment**

  If the option "PLC trigger" is selected, the module establishes a connection when the PLC tag (Bool) changes to the value 1. During operation the PLC tag can be set when necessary, for example using an HMI panel.

  When the PLC tag is reset to 0, the connection is terminated again.

4.8.7 SNMP

SNMP

You will find the range of functions of the device for SNMP in the section Diagnostics with SNMP (Page 144).

If the security functions are enabled, you have the following selection and setting options.

SNMP

- **"Enable SNMP"**

  If the option is enabled, communication via SNMP is released on the device. As default, SNMPv1 is enabled.

  If the option is disabled, queries from SNMP clients are not replied to either via SNMPv1 or via SNMPv3.

- **"Use SNMPv1"**

  Enables the use of SNMPv1 for the device. For information on the configuration of the required community strings see below (SNMPv1).

- **"Use SNMPv3"**

  Enables the use of SNMPv3 for the device. For information on the configuration of the required algorithms see below (SNMPv3).

SNMPv1

The community strings need to be sent along with queries to the device via SNMPv1.

Note the use of lowercase letters with the preset community strings!

- **"Reading community string"**

  The string is required for read access.

  Leave the preset string "public" or configure a string.

- **"Allow write access"**

  If the option is enabled write access to the device is released and the corresponding community string can be edited.

- **"Writing community string"**

  The string is required for write access and can also be used for read access.

  Leave the preset string "private" or configure a string.

Note

Security of the access

For security reasons, change the preset and generally known strings "public" and "private".

SNMPv3

The algorithms need to be configured for encrypted access to the device via SNMPv3.

- **"Authentication algorithm"**

  Select the authentication method to be used from the drop-down list.

- **"Encryption algorithm"**

  Select the encryption method to be used from the drop-down list.

User management

In the user management that you will find in the global security settings, assign the various users their role.

Below the properties of the roles you can see the rights list of the particular role, for example the various types of access using SNMP. For new roles, you can freely configure individual rights.

You will find information on users, roles and the password policy in the information system of STEP 7.

4.8.8 Certificate manager

If the security functions are enabled, the certificates for all security modules involved are generated in the STEP 7 project, for example to allow communication via VPN connections.

Certificates generated by STEP 7 such as SSL certificates or VPN group certificates are automatically assigned to the corresponding modules and do not need to be assigned using the local security settings.

The local certificate manager

Certificates that were imported via the certificate manager in the global security settings are not automatically assigned to the corresponding modules. Imported certificates must be included in the list of trustworthy partner certificates manually via the "Certificate manager" entry in the local security settings. When assigning a CA certificate the module is also assigned the certificates derived from it.

Adding certificates

Via the local certificate manager, assign certificates of the partners to the CP for certain services, e.g. secure sending of e-mails.

1. To do this, click the table cell "Add new".
2. Click on the button on a white background "...".
3. In the certificate list that opens, you can either add a new certificate using the "Add" button or select an existing certificate of the project using the check mark symbol.

   You can recognize the properties of the displayed certificates in the global certificate manager.

Certificates for the CP 1542SP-1 IRC

Requirement in the global security settings

For the secure sending of e-mails, import the certificate of the e-mail service provider into the certificate manager.

Assign the certificate in the CP configuration

Select the following certificate in the CP configuration:

- Table "Trustworthy client certificates":

  The certificate of the e-mail service provider

Certificates for the CP 1543SP-1

Before certificates can be referenced in the program blocks for Secure Communication, these certificates must be assigned to the Security module as device certificates via the local certificate manager.

Requirement in the global security settings

To be able to assign the CP certificate of a communications partner, you need to first import the certificates of the partner in the global certificate manager (Global security settings).

To make the assigned certificate known to the partner module, this certificate must be entered in the list of trustworthy partner certificates after import.

Assign the certificates in the CP configuration

Select the following certificates in the CP configuration:

- Table "Device certificates":

  The device certificate of the CP generated by STEP 7

- Table "Certificates of the partner devices":

  The imported certificate of the partner

4.9 Messages (e-mail)

Validity

The function is supported by:

- CP 1542SP-1 IRC
- CP 1543SP-1

Configuring e-mails

If important events occur, the CP can send e-mails to communications partners.

Note

E-mails via the message editor

The following information applies to e-mails configured with the message editor.

Sending e-mails via OUC program blocks is not affected.

For information on opening the message editor, see section Data point configuration (Page 79).

Requirements

Note the following requirements in the CP configuration for the transfer of e-mails:

- The security functions are enabled.
- The time of the CP is synchronized.
- Configuring the "E-mail configuration" parameter group (see "Security" parameter group)

You require the recipient addresses to configure the messages.

Trigger: Triggering e-mail transfer

Using the "Trigger" parameter group in the message table, you configure which of the following events triggers the sending of the e-mail:

- CPU changes to STOP.
- CPU changes to RUN.
- The connection to the partner is interrupted.
- The connection to the partner is re-established.
- The trigger signal of a PLC tag is sent.

  For the trigger signal to send the e-mail, the edge change (0 → 1) of a trigger bit is evaluated that is set by the user program. When necessary, a separate trigger bit can be configured for each e-mail.

  If the memory area of the trigger bit is in the bit memory or in a data block, the trigger bit is reset to zero (FALSE) when the e-mail is sent. For other memory areas, you need to reset the trigger bit with the user program.

With the "TeleControl Basic" protocol, the following events can be configured as the trigger of an e-mail:

- Connection establishment to the partner has failed.
- A TeleService session has started.
- A TeleService session has ended.

Enable identifier for processing status

If this option is enabled in STEP 7, a status is output on the CP that provides information about the processing status of the sent message. The status is written to a PLC tag of the type DWORD or UDInt. Select this tag via the "PLC tag for processing status" box.

If there are problems delivering messages, you can determine the status, for example via the Web server of the CPU, by displaying the value of the PLC tag there.

For information on the significance of the individual statuses, see section Processing status of the telecontrol e-mails (Page 149).

Include value: Transfer the value of a PLC tag with a message

If you enable the option "Include value" in the "Trigger" parameter group, the CP sends a value for the placeholder $$ from the memory area of the CPU in the message. To do this enter "$$" as a placeholder for the value to be sent in the message text.

Select a PLC tag whose value will be integrated in the message. The value is entered in the message text instead of the placeholder $$.

$$ can be a placeholder for data point types with a simple data type up to a size of 32 bits.

5 Program blocks

5.1 Program blocks for OUC

Program blocks for Open User Communication (OUC)

Connections of Open User Communication are not configured.

For TCP / UDP / ISO-on-TCP communication via Ethernet, the blocks of Open User Communication (OUC) listed below are used. For this, create a suitable program blocks. You will find details on the program blocks in the information system of STEP 7.

Note

Program block versions

Note that in STEP 7 you cannot use different versions of a program block in a station.

Program blocks

Together with the three CP types, the following OUC blocks with the specified minimum version are available to the CPU:

- **TSEND_C V3.0 / TRCV_C V3.0**

  Compact blocks for:

  – Connection establishment/termination and sending data

  – Connection establishment/termination and receiving data

As an alternative, use:

- **TCON V4.0 / TDISCON V2.1**

  Connection establishment / connection termination

- **TUSEND V4.0 / TURCV V4.0**

  Sending and receiving data via UDP

- **TSEND V4.0 / TRCV V4.0**

  Sending and receiving data via TCP or ISOonTCP

- **TMAIL_C V4.0**

  Sending e-mails

  To transfer encrypted e-mails with this block, the precise time of day is required on the CP. Configure the time-of-day synchronization.

For changing configuration data of the CP during runtime:

- T_CONFIG V1.0

  Program-controlled configuration of the IP parameters

  See section Changing the IP parameters during runtime (Page 139) for information on this.

The program block can be found in STEP 7 in the "Instructions > Communication > Open User Communication" window.

Connection descriptions in system data types (SDTs)

For the connection description, the blocks listed above use the parameter CONNECT (or MAIL_ADDR_PARAM with TMAIL_C). The connection description is stored in a data block whose structure is specified by the system data type (SDT).

Creating an SDT for the data blocks

Create the SDT required for every connection description as a data block (global DB).

The SDT type is not created by selecting an entry from the "Data type" drop-down list in the declaration table of the block, but by entering the name manually in the "Data type" box, for example "TCON_IP_V4". The corresponding SDT is then created with its parameters.

SDTs

Depending on the CP-specific security functions, the three CP types support the following SDTs:

- SDTs for all three CP types
  - TCON_IP_V4

    For transferring data via TCP or UDP
  - TADDR_Param

    For transferring data via UDP
  - TCON_IP_RFC

    For transferring data via ISO-on-TCP (direct communication between two SIMATIC S7 stations)
  - TMail_V4

    For transferring e-mails addressing the e-mail server using an IPv4 address
  - TMail_V6

    For transferring e-mails addressing the e-mail server using an IPv6 address
  - TMail_FQDN

    For transferring e-mails addressing the e-mail server using its name (FQDN)

- SDT for CP 1542SP-1 IRC and CP 1543SP-1
  - TMail_V4_SEC

    For secure transfer of e-mails addressing the e-mail server using an IPv4 address
  - TMail_V6_SEC

    For secure transfer of e-mails addressing the e-mail server using an IPv6 address
  - TMail_QDN_SEC

    For secure transfer of e-mails addressing the e-mail server using the host name
- SDT only for CP 1543SP-1
  - TCON_IP_V4_SEC

    For the secure transfer of data via TCP

You will find the description of the SDTs with their parameters in the STEP 7 information system under the relevant name of the SDT.

Connection establishment and termination

Connections are established using the program block TCON. Note that a separate program block TCON must be called for each connection.

A separate connection must be established for each communications partner even if identical blocks of data are being sent.

After a successful transfer of the data, a connection can be terminated. A connection is also terminated by calling "TDISCON".

Note

Connection abort

If an existing connection is aborted by the communications partner or due to disturbances on the network, the connection must also be terminated by calling TDISCON. Make sure that you take this into account in your programming.

5.2 Changing the IP parameters during runtime

Changing the IP address during runtime

As of STEP 7 V14, you can change the following address parameters of the CP programatically during runtime with T_CONFIG:

- IP address
- Subnet mask
- Router address

Note

Changing the IP parameters with a dynamic IP address

Note the effects of program-controlled changes to the IP parameters if the CP obtains a dynamic IP address from the Internet service provider: In this case, the CP can no longer be reached by communications partners.

Note

Requirement in the CP configuration

To be able to change the IP parameters programatically, the option "IP address is set directly at the device" must be enabled in the configuration of the IP address of the Ethernet interface of the CP.

Program blocks

Program-controlled changing of the IP parameters is supported by program blocks. The program blocks access address data stored in a suitable system data type (SDT).

Apart from the address parameters of the CP, with T_CONFIG the address parameters of DNS servers (IF_CONF_DNS) and NTP servers (IF_CONF_NTP) can also be changed program controlled.

The following program blocks and system data types can be used:

- **T_CONFIG**

  Together with the following SDTs:

  – IF_CONF_V4

  – IF_CONF_V6

  – IF_CONF_NTP

  – IF_CONF_DNS

You can find detailed information on the blocks and SDTs in the STEP 7 information system.

5.3 MODBUS blocks

MODBUS (TCP)

All three CP types support the program blocks for MODBUS (TCP) for the S7-1500-CPU as of V4.0:

- MB_CLIENT
- MB_SERVER

You can find detailed information in the STEP 7 information system.

Diagnostics and maintenance 6

6.1 Diagnostics options

The following diagnostics options are available.

LEDs of the module

For information on the LED displays, refer to the section LEDs (Page 33).

STEP 7: The "Diagnostics" tab in the Inspector window

Here, you can obtain the following information about the online status of the selected module.

STEP 7: Diagnostics functions in the "Online > Online and diagnostics" menu

Using the online functions, you can read diagnostics information from the CP from an engineering station on which the project with the CP is stored.

If you want to operate online diagnostics with the station via the CP, you need to select the type of communication "Enable online functions"; see section Communication types (Page 57).

"Diagnostics" group

The diagnostics pages are divided into the following groups:

- **General**

  This group displays general information on the module.

- **Diagnostic status**

  This group displays status information of the module from the view of the CPU.

  – Device-specific events

    Information on internal module events are displayed for modules with security or telecontrol functions.

- **Ethernet interface**

  Address and statistical information

- **Industrial Remote Communication**

  For the CP 1542SP-1 IRC, you receive telecontrol-specific information here. The group has the following diagnostics pages:

  – Partner

    Information about the address settings of the partner, connection statistics, configuration data of the partner and other diagnostics information.

  – Data point list

    Various information on the data points such as configuration data, value, connection status etc.

  – Protocol diagnostics

    With the button "Enable protocol trace", the frames received and sent by the module are logged for several seconds.

    With the function "Disable protocol trace", the logging is stopped and the data is written to a log file.

    With the function "Save", you can save the log file on the engineering station and then analyze it.

- **Time of day**

  Information on the time on the device

- **Security**

  This group is available for modules with security functions.

  For CP 1542SP-1 IRC, only the parameter groups "Status" and "SINEMA RC - Automatic VPN configuration" are available.

  – Status

    This diagnostics page displays the most important security settings, the time of day, and data relating to the configuration.

  – System log

    You can start logging system entries on this diagnostics page if a connection to a SCALANCE S module is established. You can save the entries.

  – Audit log

    You can start logging the log data of the module on this diagnostics page. You can save the entries.

  – Communication status

    This diagnostics page shows the states of the known security modules of the VPN groups, their endpoints and the tunnel properties.

  – SINEMA RC - automatic VPN configuration

    This diagnostics page shows the status of the automatic OpenVPN configuration and the OpenVPN connections.

"Functions" group

- **Firmware update**

  For a description, see section Downloading firmware (Page 151).

- **Assign IP address**
- **Assign PROFINET device name**
- **Save service data**

  The function is used for logging of internal module processes in situations in which you cannot eliminate unexpected or unwanted behavior of the module yourself.

  The log file is created with the "Save service data" button. The data is saved in a file with the format "*.dmp" that can be evaluated by the Siemens hotline.

Web server of the CPU

Via the CP you can access the Web server of the CPU and the information available there. For access, refer to the section Web server of the CPU (Page 147).

SNMP

For information on the functions, refer to the section Diagnostics with SNMP (Page 144).

Diagnostics e-mail

Validity: CP 1542SP-1 IRC / CP 1543SP-1

The two CPs can send a diagnostics e-mail if configurable events occur, for example a partner cannot be reached or CPU STOP.

The configuration is described in section Messages (e-mail) (Page 133).

Telecontrol diagnostics

Validity: CP 1542SP-1 IRC

- Partner status

  The CP can signal the status of the connection to the communications partner to the CPU via a PLC tag.

  For information on the configuration, see section Partner configuration (Page 65).

- CP diagnostics

  The CP can store extended diagnostic data in PLC tags.

  For information on the configuration, see section CP diagnostics (Page 72).

You can display the states of the PLC tags via the Web server of the CPU or via a watch table, for example.

6.2 Online security diagnostics via port 8448 (CP 1542SP-1 IRC, CP 1543SP-1)

Security diagnostics without opening port 102

If you want to perform security diagnostics without opening port 102, follow the steps below:

1. Select the CP in STEP 7.
2. Open the "Online & diagnostics" shortcut menu.
3. In the parameter group "Security" click the "Connect online" button.

In this way you perform the security diagnostics via port 8448.

See also

Settings for online security diagnostics and downloading to station with the firewall activated (Page 121)

6.3 Diagnostics with SNMP

Requirement

The requirement for using SNMP is the enabling of the function in the configuration, see section SNMP (Page 55).

SNMP (Simple Network Management Protocol)

SNMP is a protocol for diagnostics and managing networks and nodes in the network. To transmit data, SNMP uses the connectionless UDP protocol.

The information on the properties of SNMP-compliant devices is entered in MIB files (MIB = Management Information Base).

You will find detailed information on SNMP and the Siemens Automation MIB in the manual /7/ (Page 169).

Scope of performance of the CPs

The CPs support the following SNMP version:

- **CP 1542SP-1, CP 1542SP-1 IRC**
  - SNMPv1
- **CP 1543SP-1**
  - SNMPv1
  - SNMPv3 (with activated Security functions)

  For information on configuring SNMPv3, see section SNMP (Page 130).

Traps are not supported by the CP.

Supported MIBs in SNMPv1

The CPs support the following MIBs:

- **MIB II (acc. to RFC1213)**

  The CP supports the following groups of MIB objects:
  - System
  - Interfaces
  - IP
  - ICMP
  - TCP
  - UDP
  - SNMP
- **LLDP MIB**
- **Siemens Automation MIB**

  Note the rights for writing to the MIB objects, see the next section (SNMPv3).

Supported MIB objects in SNMPv3

If SNMPv3 is enabled, the CP returns the contents of the following MIB objects:

- **MIB II (acc. to RFC1213)**

  The CP supports the following groups of MIB objects:

  – System

  – Interfaces

    The "Interfaces" MIB object provides status information about the CP interfaces.

  – IP (IPv4/IPv6)

  – ICMP

  – TCP

  – UDP

  – SNMP

  The following groups of the standard MIB II are not supported:

  – Adress Translation (AT)

  – EGP

  – Transmission

- **LLDP MIB**
- **Siemens Automation MIB**

  Note that write access is permitted only for the following MIB objects of the "System" group:

  – sysContact

  – sysLocation

  – sysName

    A set sysName is sent as the host name using DHCP option 12 to the DHCP server to register with a DNS server.

  For all other MIB objects and groups, only read access is possible for security reasons.

Access rights using community names (SNMPv1)

TCP uses the following community strings to control the permissions for access to the SNMP agent:

Table 6- 1 Access rights in the SNMP agent

Type of access	Community string *)
Read access	public
Read and write access	private

*) Note the use of lowercase letters!

6.4 Web server of the CPU

The Web server of the CPU

The CPU has a Web server which you can access from an engineering station using HTTP/HTTPS via the CP.

The Web server of the CPU provides a wide variety of functions for diagnostics and service purposes, for example, loading firmware files. You will find detailed information in the system manual /2/ (Page 168) and in the information system of STEP 7 in the topic and under the heading "Web server".

Requirements for access to the Web server

Permitted web browsers

You will find the Web browsers supported on the engineering station for access to the Web server of the CPU in the STEP 7 information system under the heading "Web server".

Requirements in the CPU configuration

1. Open the corresponding project on the engineering station.
2. Select the CPU of the station involved in STEP 7.
3. Select the "Web server" entry.
4. In the parameter group "General", select the "Enable Web server for this interface" option.
5. In the user management create a user with suitable rights on the CPU.

   To load firmware you need to assign this user the right to perform firmware updates in the access level.

   The user name and password are required later for access.
6. Configuration of the option "Allow access only using HTTPS" in the parameter group "General"

   Depending on whether you want to access the Web server using HTTP or HTTPS, the configuration of the parameter differs:

   – "Allow access only using HTTPS" enabled

     Connection establishment is possible only using HTTPS.

   – "Allow access only using HTTPS" disabled

     Connection establishment is possible using HTTP and HTTPS.

Additional requirements in the configuration of the CP 1543SP-1

Activate the firewall in the "Security" parameter group.

Depending on the protocol used you need to make the following further settings in the parameter group of the firewall "From external to station".

- With connection establishment using HTTP
  - Enable the "Allow HTTP" option.
  - Enable the "Allow HTTPS" option
    Reason: There is a switch to HTTPs after authentication on the Web server.
- With connection establishment using HTTPS
  - Disable the "Allow HTTP" option
  - Enable the "Allow HTTPS" option.

Establishing a connection to the Web server

Follow the steps below to connect to the Web server of the CPU from the engineering station.

These two variants are described in the following sections.

Connection establishment with HTTP

1. Connect the PC on which the new firmware file is located to the CP via the Ethernet interface.
2. Enter the address of the CP in the address box of your web browser:
   http://<IP address>
3. Press the Enter key.

   The start page of the Web server opens.
4. Click on the "Download certificate" entry at the top right of the window.

   The "Certificate" dialog opens.
5. Download the certificate to your PC by clicking the "Install certificate ..." button.

   The certificate is loaded on your PC.

   You will find information on downloading a certificate in the help of your Web browser and in the STEP 7 information system under the keyword "Certificates for Web server".

When the connection has changed to the secure mode HTTPS ("https://<IP address>/..." in the address box of the Web server), you can work with the Web server to, for example, download a firmware file (see the following section).

If you terminate the connection to the Web server, the next time you can log in with the Web server without downloading the certificate using HTTP.

Connection establishment with HTTPS

1. Connect the PC on which the new firmware is located to the CP or CPU via the Ethernet interface.
2. Enter the address of the CP in the address box of your web browser:
   https://<IP address>
3. Press the Enter key.

   The start page of the Web server opens.

You can work with the Web server.

Downloading firmware files via the Web server of the CPU

Requirement: The new firmware file is stored on your engineering station.

1. Log in on the start page of the Web server.
2. After logging in, select the entry "Module status" in the navigation panel of the Web server.
3. Select the CP in the module list.
4. Select the "Firmware" tab lower down in the window.
5. Browse for the firmware file on your PC using the "Browse..." button and download the file to the station using the "Run update" button.

Refer to the information on the duration of the firmware update in the section Downloading firmware (Page 151).

6.5 Processing status of the telecontrol e-mails

Configuration of the processing status of telecontrol e-mails (CP 1542SP-1 IRC)

The following status identifiers apply to e-mails configured with the message editor of the CP 1542SP-1 IRC, see also section Messages (e-mail) (Page 133).

E-mails sent via program blocks of Open User Communication return a different status via the block (see block help).

Processing status of the telecontrol e-mails

The meaning of the status of the "PLC tag for processing status" is as follows:

Table 6- 2 Meaning of the status ID output in hexadecimal format

Status	Meaning
0000	Transfer completed free of errors
82xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.
8401	No channel available. Possible cause: There is already an e-mail connection via the CP. A second connection cannot be set up at the same time.
8403	No TCP/IP connection could be established to the SMTP server.
8405	The SMTP server has denied the login request.
8406	An internal SSL error or a problem with the structure of the certificate was detected by the SMTP client.
8407	Request to use SSL was denied.
8408	The client could not obtain a socket for creating a TCP/IP connection to the mail server.
8409	It is not possible to write via the connection. Possible cause: The communications partner reset the connection or the connection aborted.
8410	It is not possible to read via the connection. Possible cause: The communications partner terminated the connection or the connection was aborted.
8411	Sending the e-mail failed. Cause: There was not enough memory space for sending.
8412	The configured DNS server could not resolve specified domain name.
8413	Due to an internal error in the DNS subsystem, the domain name could not be resolved.
8414	An empty character string was specified as the domain name.
8415	An internal error occurred in the cURL module. Execution was aborted.
8416	An internal error occurred in the SMTP module. Execution was aborted.
8417	Requests to SMTP on a channel already being used or invalid channel ID. Execution was aborted.
8418	Sending the e-mail was aborted. Possible cause: Execution time exceeded.
8419	The channel was interrupted and cannot be used before the connection is terminated.
8420	Certificate chain from the server could not be verified with the root certificate of the CP.
8421	Internal error occurred. Execution was stopped.
8450	Action not executed: Mailbox not available / unreachable. Try again later.
84xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.
8500	Syntax error: Command unknown. This also includes the error of having a command chain that is too long. The cause may be that the e-mail server does not support the LOGIN authentication method. Try sending e-mails without authentication (no user name).
8501	Syntax error. Check the following configuration data: Alarm configuration > E-mail data (Content): • Recipient address ("To" or "Cc").
8502	Syntax error. Check the following configuration data: Alarm configuration > E-mail data (Content): • Email address (sender)

Status	Meaning
8535	SMTP authentication incomplete. Check the "User name" and "Password" parameters in the CP configuration.
8550	SMTP server cannot be reached. You have no access rights. Check the following configuration data: • CP configuration > E-mail configuration: – User name – Password – Email address (sender) • Alarm configuration > E-mail data (Content): – Recipient address ("To" or "Cc").
8554	Transfer failed
85xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.

6.6 Downloading firmware

New firmware versions of the CP

If a new firmware version is available for the CP, you will find this on the Internet pages of Siemens Industry Online Support:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/22144/dl)

Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/dl)

There are three different ways of loading a new firmware file on the CP:

- Saving the firmware file on the memory card of the CPU

  You will find a description of the procedure for loading on the memory card of the CPU on the Internet page of Industry Online Support shown above.
- Loading the firmware with the online functions of STEP 7 via Ethernet / Internet

  You will find the description below.
- Downloading the firmware via the Web server of the CPU

  You will find the description in the section Web server of the CPU (Page 147).

Note

Duration of the firmware update

Downloading a new firmware file can take several minutes.

Note that the procedure takes longer the larger the station due to I/O modules.

Always wait until the completion of the firmware update can be recognized from the LEDs (LED pattern "Maintenance demanded" - End of the firmware update).

Loading the firmware with the online functions of STEP 7 via Ethernet / Internet

Requirements:

- The CP or the CPU can be reached via the IP address.
- The engineering station and the CP are located in the same subnet.
- The new firmware file is stored on your engineering station.
- The engineering station is connected to the network.
- The relevant STEP 7 project is open on the engineering station.

Procedure:

1. Select the CP or the CPU of the station whose CP you want to update with new firmware.
2. Enable the online functions using the "Connect online" icon.
3. In the "Connect online" dialog, select the Ethernet interface in the "Type of PG/PC interface" list box.
4. Select the slot of the CP or the CPU.

   Both methods are possible.
5. Click on "Start search" to search for the module in the network and to specify the connection path.

   When the module is found it is displayed in the table.
6. Connect using the "Connect" button.

   The "Connect online" wizard guides you through the remaining steps in installation.
7. In the network view, select the CP and select the "Online & Diagnostics" shortcut menu (right mouse button).
8. In the navigation panel of the Online & Diagnostics view, select the entry "Functions > Firmware update".
9. Using the "Browse" button (parameter group "Firmware loader"), search for the new firmware file in the file system of the engineering station.
10. Start the firmware download with the "Start update" button when the correct version of the signed firmware is displayed in the "Status" output box.

You will find further information on the online functions in the STEP 7 information system.

6.7 Module replacement

CAUTION
Read the system manual "SIMATIC ET 200SP Distributed I/O System"
Prior to installation, connecting up and commissioning, read the relevant sections in the system manual "SIMATIC ET 200SP Distributed I/O System" refer to the documentation in the Appendix.
When installing and connecting up, keep to the procedures described in the system manual "SIMATIC ET 200SP Distributed I/O System".
Make sure that the power supply is turned off when installing/uninstalling the devices.

Module replacement

The STEP -7 project data of the CP is stored on the local CPU. If there is a fault on the device, this allows simple replacement of the CP without needing to download the project data to the station again.

When the station starts up again, the new CP reads the project data from the CPU.

Technical specifications

Dimensions (W x H x D)	60 x 117 x 74 mm
Installation options	DIN rail (35 mm)
Mean Time Between Failures (MTBF)	
• At + 40 °C • At + 60 °C	• 56.87 years • 24.78 years
Product functions	You will find additional properties and performance data in the section Application and functions (Page 11).

Approvals

A

Approvals issued

Note

Issued approvals on the type plate of the device

The specified approvals apply only when the corresponding mark is printed on the product. You can check which of the following approvals have been granted for your product by the markings on the type plate.

Scope of validity of the approvals

The approvals listed below are valid for the CP.

The tests required for the approvals were performed with a plugged-in bus adapter.

The bus adapters have their own approvals, that are not listed here.

EC declaration of conformity

The CP meets the requirements and safety objectives of the following EU directives and it complies with the harmonized European standards (EN) for programmable logic controllers which are published in the official documentation of the European Union.

- **2014/34/EU (ATEX explosion protection directive)**

  Directive of the European Parliament and the Council of 26 Febrary 2014 on the approximation of the laws of the Member States concerning equipment and protective systems intended for use in potentially explosive atmospheres, official journal of the EU L96, 29/03/2014, pages. 309-356

- **2014/30/EU (EMC)**

  EMC directive of the European Parliament and of the Council of February 26, 2014 on the approximation of the laws of the member states relating to electromagnetic compatibility.; official journal of the EU L96, 29/03/2014, pages. 79-106

- **2011/65/EU (RoHS)**

  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment, official journal of the EC L174, 01/07/2011, page 88-110

The EC Declaration of Conformity is available for all responsible authorities at:

Siemens Aktiengesellschaft
Division Process Industries and Drives
Process Automation
DE-76181 Karlsruhe
Germany

You will find the EC Declaration of Conformity on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/)

> Certificate type: "EC declaration of conformity"

IECEx

The CP meet the requirements of explosion protection according to IECEx.

IECEx classification: Ex nA IIC T4 Gc

IECEx certificate: IECEx DEK 14.0025X

The CP meets the requirements of the following standards:

- IEC 60079-0

  Hazardous areas - Part 0: Equipment - General requirements

- EN 60079-15

  Explosive atmospheres - Part 15: Equipment protection by type of protection 'n'

You can see the current versions of the standards in the IECEx certificate that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/)

The conditions must be met for the safe deployment of the CP according to the section Notes on use in hazardous areas according to ATEX / IECEx (Page 38).

You should also note the information in the document "Use of subassemblies/modules in a Zone 2 Hazardous Area" that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/view/78381013)

ATEX

The CP meets the requirements of the EC directive 2014/34/EU "Equipment and Protective Devices for Use in Potentially Explosive Atmospheres".

Applied standards:

- EN 60079-0

  Hazardous areas - Part 0: Equipment - General requirements

- EN 60079-15

  Explosive atmospheres - Part 15: Equipment protection by type of protection 'n'

The current versions of the standards can be seen in the EC Declaration of Conformity, see above.

ATEX approval: II 3 G Ex nA IIC T4 Gc

Test number: KEMA 07ATEX0145 X

Observe the conditions for safe usage of the CP according to the section Notes on use in hazardous areas according to ATEX / IECEx (Page 38).

You should also note the information in the document "Use of subassemblies/modules in a Zone 2 Hazardous Area" that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/view/78381013)

EMC

The CP meets the requirements of the EC Directive 2014/30/EU "Electromagnetic Compatibility" (EMC directive).

Applied standards:

- EN 61000-6-4

  Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
- EN 61000-6-2

  Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments

RoHS

The CP meets the requirements of the EC directive 2011/65/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

Applied standard:

- EN 50581:2012

c(UL)us

Applied standards:

- Underwriters Laboratories, Inc.: UL 61010-1 (Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 1: General Requirements)
- IEC/UL 61010-2-201 (Safety requirements for electrical equipment for measurement, control and laboratory use. Particular requirements for control equipment)
- Canadian Standards Association: CSA C22.2 No. 142 (Process Control Equipment)

Report / UL file: E85972 (NRAG, NRAG7)

cULus Hazardous (Classified) Locations

HAZ. LOC.

Underwriters Laboratories, Inc.: CULUS Listed E223122 IND. CONT. EQ. FOR HAZ. LOC.

Applied standards:

- ANSI ISA 12.12.01
- CSA C22.2 No. 213-M1987

APPROVED for Use in:

- Cl. 1, Div. 2, GP. A, B, C, D T4
- Cl. 1, Zone 2, GP. IIC T4

Ta: Refer to the temperature class on the type plate of the CP

Report / UL file: E223122 (NRAG, NRAG7)

Observe the conditions for safe usage of the CP according to the section Notes on use in hazardous areas according to UL HazLoc (Page 39).

FM

Factory Mutual Approval Standard Class Number 3600, 3611, 3810, ANSI/ISA-61010-1

Equipment rating:
Class I, Division 2, Group A, B, C, D, Temperature Class T4, Ta = 60 °C
Class I, Zone 2, Group IIC, Temperature Class T4, Ta = 60 °C

Ta: Refer to the temperature class on the type plate of the CP

Observe the conditions for safe usage of the CP according to the section General notices on use in hazardous areas according to FM (Page 39).

Australia - RCM

The CP meets the requirements of the AS/NZS 2064 standards (Class A).

Marking for the customs union

EAC (Eurasian Conformity)

Customs union of Russia, Belarus and Kazakhstan

Declaration of the conformity according to the technical regulations of the customs union (TR CU)

MSIP 요구사항 - For Korea only

Registration Number: MSIP REI S7M ET200SP

A급 기기(업무용 방송통신기자재)

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정 외의 지역에서 사용하는것을 목적으로 합니다.

Current approvals

SIMATIC NET products are regularly submitted to the relevant authorities and approval centers for approvals relating to specific markets and applications.

If you require a list of the current approvals for individual devices, consult your Siemens contact or check the Internet pages of Siemens Industry Online Support:

Link: (http://support.automation.siemens.com/WW/view/en/45605894)

B

Dimension drawings

All dimensions in the dimension drawings are in millimeters.

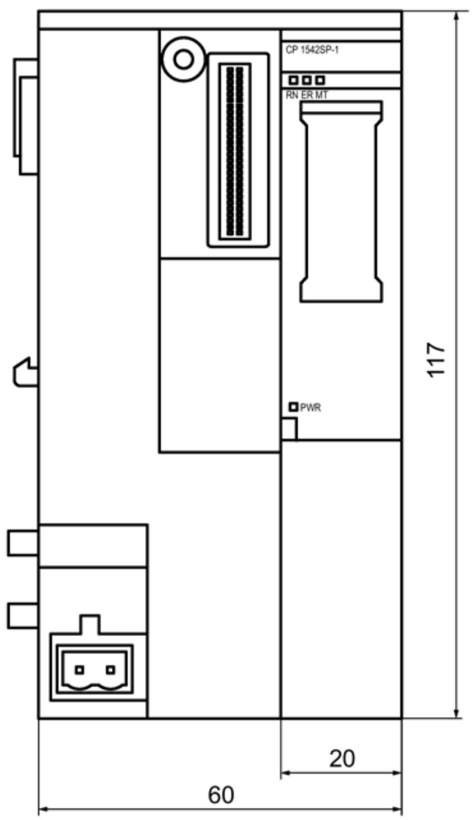

Figure B-1 Front view of the CP

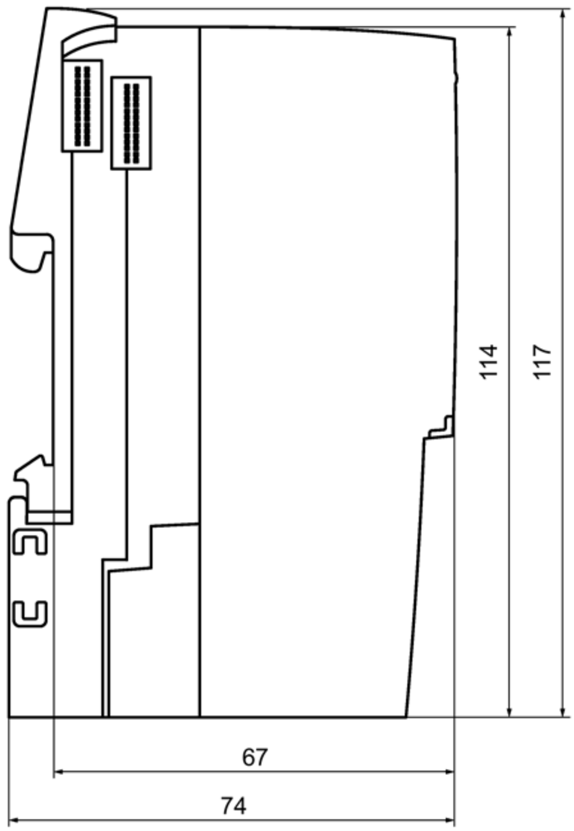

Figure B-2 Side view (left) of the CP

Accessories C

C.1 BusAdapter

Compatible BusAdapter

To connect to the Ethernet network, the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

Figure C-1 Example of a bus adapter, here BA SCRJ/RJ45

The CP supports the following bus adapters:

- BA 2×RJ45

  PROFINET bus adapter with the following connectors:

  – 2 x Ethernet jack RJ-45

  Article number: 6ES7193-6AR00-0AA0
- BA 2xFC

  PROFINET bus adapter with the following connectors:

  – 2 x direct connection of the bus cable (FastConnect)

  Article number: 6ES7193-6AF00-0AA0
- BA 2xSCRJ

  PROFINET bus adapter with the following connectors:

  – 2 x fiber-optic cable POF/PCF

  Article number: 6ES7193-6AP00-0AA0

- BA SCRJ/RJ45

  PROFINET bus adapter, media converter FO - copper with the following connectors:
  - 1 x fiber-optic cable POF/PCF
  - 1 x Ethernet jack RJ-45

  Article number: 6ES7193-6AP20-0AA0
- BA SCRJ/FC

  PROFINET bus adapter, media converter FO - copper with the following connectors:
  - 1 x fiber-optic cable POF/PCF
  - 1 x direct connection of the bus cable (FastConnect)

  Article number: 6ES7193-6AP40-0AA0

You will find further details in the manual /2/ (Page 168) and in the Siemens Industry Mall in Link: (https://mall.industry.siemens.com).

Pinout of the Ethernet interface

The table below shows the pin assignment of the Ethernet interface. The pin assignment corresponds to the Ethernet standard 802.3-2005, 100BASE-TX version.

Table C- 1 Pin assignment of the Ethernet interface

<table>
<tr><th>View of the RJ-45 jack</th><th>Pin</th><th>Signal name</th><th>Assignment</th></tr>
<tr><td rowspan="8"></td><td>1</td><td>TD</td><td>Transmit Data +</td></tr>
<tr><td>2</td><td>TD_N</td><td>Transmit Data -</td></tr>
<tr><td>3</td><td>RD</td><td>Receive Data +</td></tr>
<tr><td>4</td><td>GND</td><td>Ground</td></tr>
<tr><td>5</td><td>GND</td><td>Ground</td></tr>
<tr><td>6</td><td>RD_N</td><td>Receive Data -</td></tr>
<tr><td>7</td><td>GND</td><td>Ground</td></tr>
<tr><td>8</td><td>GND</td><td>Ground</td></tr>
</table>

C.2 Router SCALANCE M

Routers for IP-based communication

To connect a communications module to IP-based infrastructure networks, the following routers are available:

- SCALANCE M812

  ADSL router for wired IP communication via the Internet, VPN, firewall, NAT, 1 RJ-45 Ethernet interface,1 digital input, 1 digital output, ADSL2T or ADSL2+

  – ADSL2T (analog phone connection - Annex A)
    Article number: 6GK5812-1AA00-2AA2

  – ADSL2+ (ISDN connection - Annex B)
    Article number: 6GK5812-1BA00-2AA2

- SCALANCE M816

  ADSL router for wired IP communication via the Internet, VPN, firewall, NAT, 1 RJ-45 Ethernet interface with 4-port switch,1 digital input, 1 digital output, ADSL2T or ADSL2+

  – ADSL2T (analog phone connection - Annex A)
    Article number: 6GK5816-1AA00-2AA2

  – ADSL2+ (ISDN connection - Annex B)
    Article number: 6GK5816-1BA00-2AA2

- SCALANCE M826-2

  SHDSL router for IP communication via 2- and 4-wire cables, ITU-T standard G.991.2 / SHDSL.biz, SHDSL topology: Point-to point, bonding, line bridge mode; routing mode with VPN, firewall, NAT, 1 Ethernet interface with 4-port switch, 1 digital input, 1 digital output
  Article number 6GK5826-2AB00-2AB2

- SCALANCE M874-2

  2.5G router for wireless IP communication via 2.5G mobile phone, VPN, firewall, NAT, 1 RJ45 Ethernet interface with 2-port switch, SMA antenna connector, 1 digital input, 1 digital output
  Article number: 6GK5874-2AA00-2AA2

- SCALANCE M874-3

  3G router for wireless IP communication via 3G mobile phone HSPA+, VPN, firewall, NAT, 1 RJ45 Ethernet interface with 2-port switch, SMA antenna connector, 1 digital input, 1 digital output
  Article number: 6GK5874-3AA00-2AA2

- SCALANCE M876-3

  3G router for wireless IP communication via 3G mobile phone HSPA+/EV-DO, VPN, firewall, NAT, 1 RJ45 Ethernet interface with 4-port switch, SMA antenna connector, antenna diversity,1 digital input, 1 digital output
  Note network provider approvals!

  – International version
    Article number: 6GK5876-3AA02-2BA2
  – Version for Korea
    Article number: 6GK5876-3AA02-2EA2

- SCALANCE M876-4

  4G router for wireless IP communication via LTE mobile phone, VPN, firewall, NAT, 1 RJ45 Ethernet interface with 4-port switch, 2 SMA antenna connectors, MIMO technology, 1 digital input, 1 digital output

  – Version for Europe
    Article number: 6GK5876-4AA00-2BA2
  – Version for North America
    Article number: 6GK5876-4AA00-2DA2

Information on the devices can be found on the Internet pages of Siemens Industry Online Support:
Link: (https://support.industry.siemens.com/cs/ww/en/ps/15982)

D Documentation references

Where to find Siemens documentation

- Article numbers

  You will find the article numbers for the Siemens products of relevance here in the following catalogs:

  – SIMATIC NET - Industrial Communication / Industrial Identification, catalog IK PI

  – SIMATIC - Products for Totally Integrated Automation and Micro Automation, catalog ST 70

  You can request the catalogs and additional information from your Siemens representative. You will also find the product information in the Siemens Industry Mall at the following address:

  Link: (https://mall.industry.siemens.com)

- Manuals on the Internet

  You will find SIMATIC NET manuals on the Internet pages of Siemens Industry Online Support:

  Link: (https://support.industry.siemens.com/cs/ww/en/ps/15247/man)

  Go to the required product in the product tree and make the following settings:

  Entry type “Manuals”

- Manuals on the data medium

  You will find manuals of SIMATIC NET products on the data medium that ships with many of the SIMATIC NET products.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual. It describes functions that generally affect the ET 200SP distributed I/O system.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

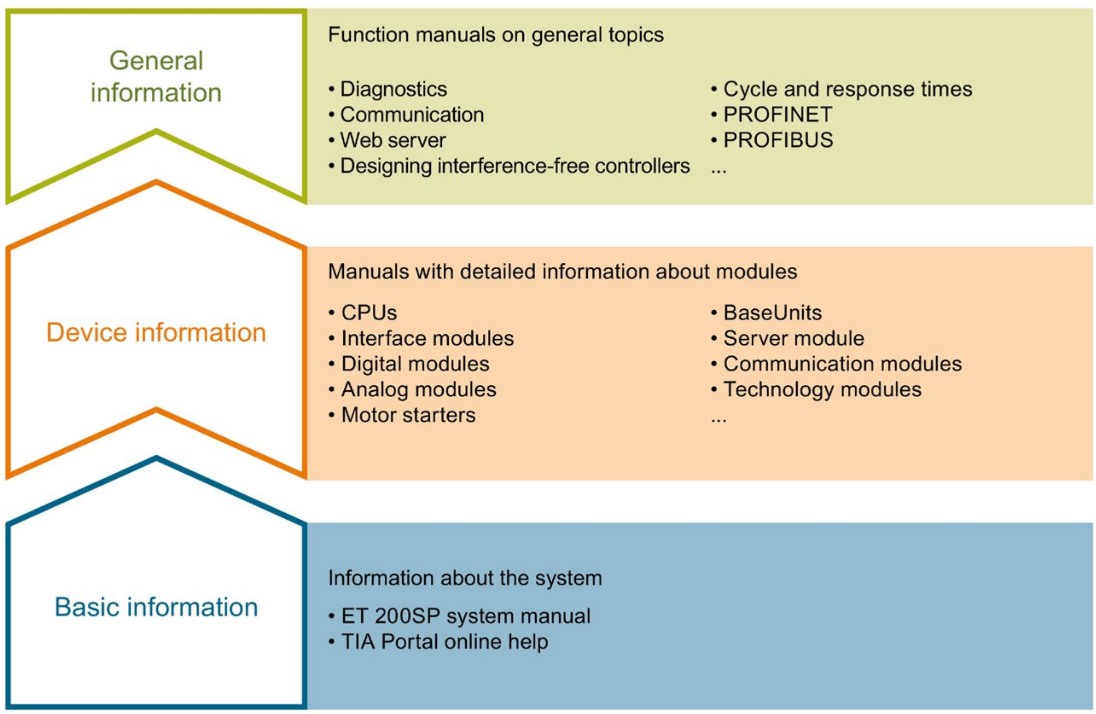
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Table of contents

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 2-1 View of the IO-Link Master CM 4xIO-Link communication module

Properties

The module has the following technical properties:

- IO-Link master according to IO-Link specification V1.1
- Serial communication module with 4 ports (channels)
- Data transmission rate COM1 (4.8 kbaud), COM2 (38.4 kbaud), COM3 (230.4 kbaud)
- SIO mode (standard IO mode)
- Suitable for connecting up to 4 IO-Link devices (3-wire connection) or 4 standard actuators or encoders
- Programmable diagnostics function by port
- Automatic backup of the master and device parameters via electronic coding element

The module supports the following functions:

Table 2- 1 Version dependencies of the module functions

Function	Firmware version of the module
Firmware update	V1.0 or higher
Identification and maintenance data (I&M)	V1.0 or higher
PROFIenergy	V1.0 or higher
IO-Link port configuration with S7-PCT	V1.0 or higher
Module replacement with automatic data recovery without engineering for IO-Link master and IO-Link device	V1.0 or higher
Time-based IO (time stamping)	V2.0 or higher
Variable address range of I/O data with up to 32-byte inputs and 32-byte outputs	V2.0 or higher
Variable address range of I/O data with up to 144-byte inputs and 128-byte outputs	V2.1 or higher
IO-Link port configuration without S7-PCT	V2.2 or higher
Master Backup with function block IO_LINK_MASTER	V2.2 or higher
PortQualifierInformation (PQI)	V2.2 or higher

The module can be used with the following engineering tools:

Table 2- 2 Engineering tools depending on the firmware version of the module

Firmware version of the module	S7-PCT	STEP 7 (TIA Portal)	STEP 7 V5.5	GSD file
V1.0 (in PROFINET station)	V3.0 or higher	V12 SP1 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V1.0.3 (in PROFIBUS station)	V3.1 or higher	V13 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V2.0	V3.2 or higher	As of V13 (Time-based IO only with CPU S7-1500)	As of V5.5 SP3 with HSP0231 as of V1.0 (without Time-based IO)	X (without time-based IO)
V2.1	As of V3.3 and SupportedModules.xml V1.2	As of V13 SP1 with HSP0136 as of V1.0 (Time-based IO only with CPU S7-1500)	As of V5.5 SP4 with HSP0231 as of V4.0 (without Time-based IO)	X (without time-based IO)
V2.2	V3.5 or higher	V15 or higher (without time-based IO)	V5.5 SP4 or higher with HSP0231, V4.1 or higher (without time-based IO)	X (without time-based IO)

Accessories/spare parts

The following accessories / replacement parts are available for the module and are not included in the scope of delivery:

- Labeling strips
- Color-coded labels
- Reference identification label
- Electronic coding element type H

See also

You can find more information on accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual in the Accessories/Spare parts section.

2.2 Functions

IO-Link is a point-to-point connection between a master and a device. Both conventional and intelligent sensors/actuators can be used as devices at the IO-Link via unshielded standard cables using proven 3-wire technology. IO-Link is backward compatible with conventional digital sensors and actuators. The circuit state and data channel are designed in proven 24 V DC technology.

Reference

Additional information can be found in the IO-Link System (http://support.automation.siemens.com/WW/view/en/65949252) function manual.

2.3 Replacement of the IO-Link Master CM 4xIO-Link communication module with an electronic coding element type H

If you remove the communication module from the BaseUnit, part of the electronic coding element remains in the BaseUnit. The parameters of the IO-Link Master CM 4xIO-Link and of the IO-Link devices are stored in this part. A newly inserted (but not yet configured) IO-Link master takes over the parameters from the electronic coding element.

CAUTION
Removal and insertion Plugging in the IO-Link Master CM 4xIO-Link communication module when the load is switched on can result in dangerous conditions in your plant. The ET 200SP distributed I/O system may be damaged as a result. The IO-Link Master CM 4xIO-Link communication module should only be plugged in or pulled out when the load is switched off.

Master Backup

In addition to saving the parameters in the electronic coding element, you can back up the parameters of your module, firmware version V2.2 or higher, with the function block "IO_LINK_MASTER".

The "IO_LINK_MASTER" function block is used to read all relevant IO-Link device and IO-Link master parameters. These can be stored retentively at a central location, such as in a data block in the IO controller.

The status of the IO-Link devices or IO-Link ports stored in the IO-Link master can be restored with the "IO_LINK_MASTER" function block.
As a result, the IO-Link ports and the IO-Link master are configured with the values stored in the master backup.

A typical application is restoring the parameters after replacement of the IO-Link master.

Note

Availability

Note that the Master Backup function is available only for IO-Link devices that are specified for the IO-Link Standard as of V1.1.

You will find further information on the Master Backup functions in section "Master backup" of chapter "Integration into the automation system" of the IO-Link System (https://support.industry.siemens.com/cs/ww/en/view/65949252) function manual.

Reference

For more information on the topic of "Coding element", refer to the Changing the type of an I/O module chapter of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.4 Time-based IO

Time-based IO ensures that signals are output with a precisely defined response time. A combination of inputs and outputs allows, for example, passing products to be measured precisely or liquids to be dosed optimally.

As of firmware version V2.0.0, the IO-Link master supports the Time-based IO function. You configure the connected IO-Link devices with time stamp functionality as normal with the SIMATIC S7 Port Configuration Tool (S7-PCT). In the "Ports" tab in S7-PCT, set the necessary parameters in the "Operating mode" section:

- IO-Link_Time_based_IO_IN
- IO-Link_Time_based_IO_OUT
- IO-Link_Time_based_IO_INOUT

The Time-based IO function can be used for IO-Link master with 32 bytes I/O data. Larger I/O data ranges are not supported by Time-based IO.

Note

Time stamp function

The time stamp function requires defined address assignment (mapping).

If the address area you require is already occupied, you must modify the user data arrangement of the IO-Link devices in the address space of the IO-Link master.

The "High-precision input/output with Time-based IO" function manual describes how to move user data in the address space.

Reference

You can find more information about Time-based IO in the High-precision input/output with Time-based IO (http://support.automation.siemens.com/WW/view/en/82527590) function manual.

2.5 Reset communication module to factory settings

Effects of resetting to the factory settings

Use the "Reset to factory settings" function to restore the parameter assignments of your IO-Link Master CM 4xIO-Link communication module made with S7-PCT to the factory state.

After a "Reset to factory settings", the parameters of the IO-Link Master CM 4xIO-Link communication module are assigned as follows:

- The ports are in DI mode
- The ports are mapped to the relative addresses 0.0 ... 0.3
- The PortQualifier is disabled
- I&M data 1 to 3 is deleted
- The electronic coding element (if it exists) is deleted

Note

The device parameters are deleted and the factory state is restored.

You should reset a removed IO-Link Master CM 4xIO-Link communication module to the factory settings before you place it in storage.

Procedure

To perform a "Reset to factory settings", proceed as described in the S7-PCT online help.

Connecting 3

3.1 Wiring and block diagram

This section includes the block diagram of the communication module IO-Link Master CM 4xIO-Link with the terminal assignments for 3-wire and 5-wire connection of IO-Link devices or 2-wire and 3-wire connection in DI or DQ operating mode.

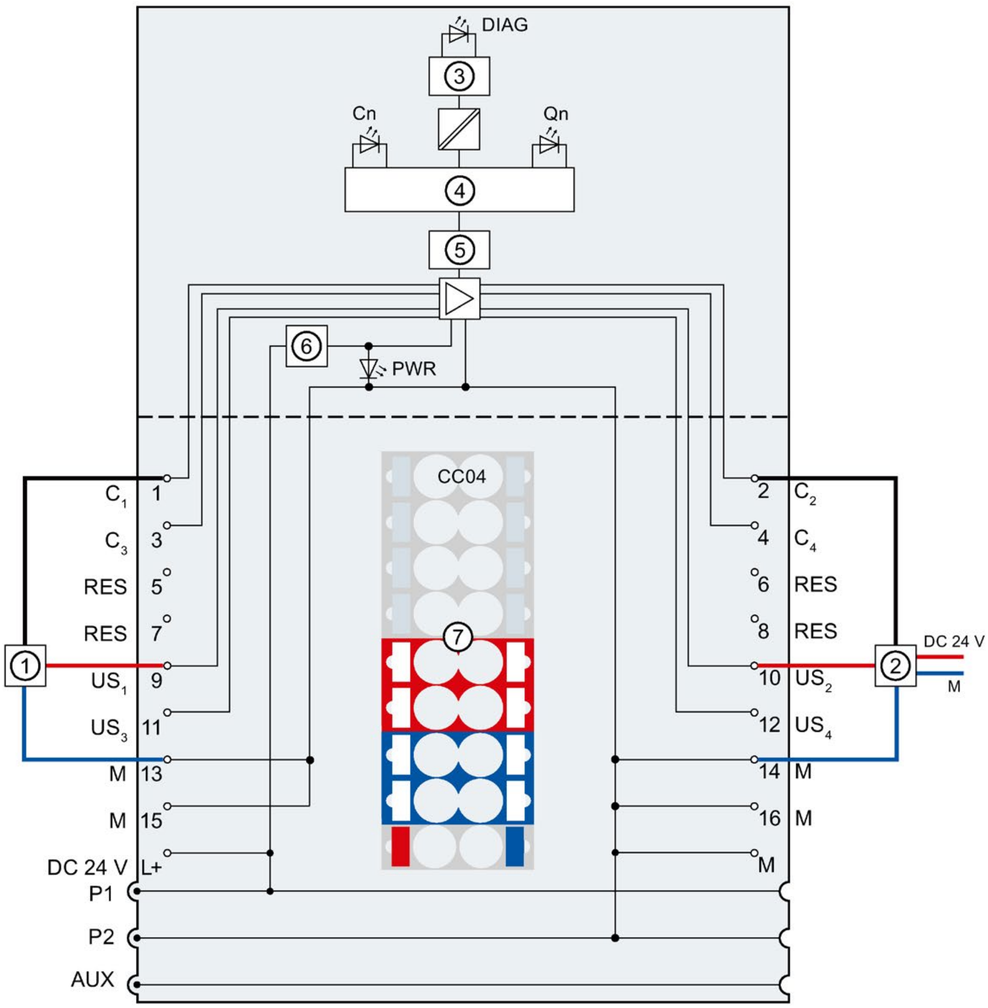
You can use and combine the different wiring options for all channels.

You can find information on wiring the BaseUnit in the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

NOTICE
Internal encoder supply
Use only the supply voltage (US_n/M) made available by the IO-Link Master CM 4xIO-Link communication module to supply the IO-Link device (L+/L-).

Wiring: 3-wire and 5-wire connection of IO-Link devices

The following figure shows an example of the terminal assignment of the communication module IO-Link Master CM 4xIO-Link on the BaseUnit BU type A0 without AUX terminals (3-wire and 5-wire connection of IO-Link devices).

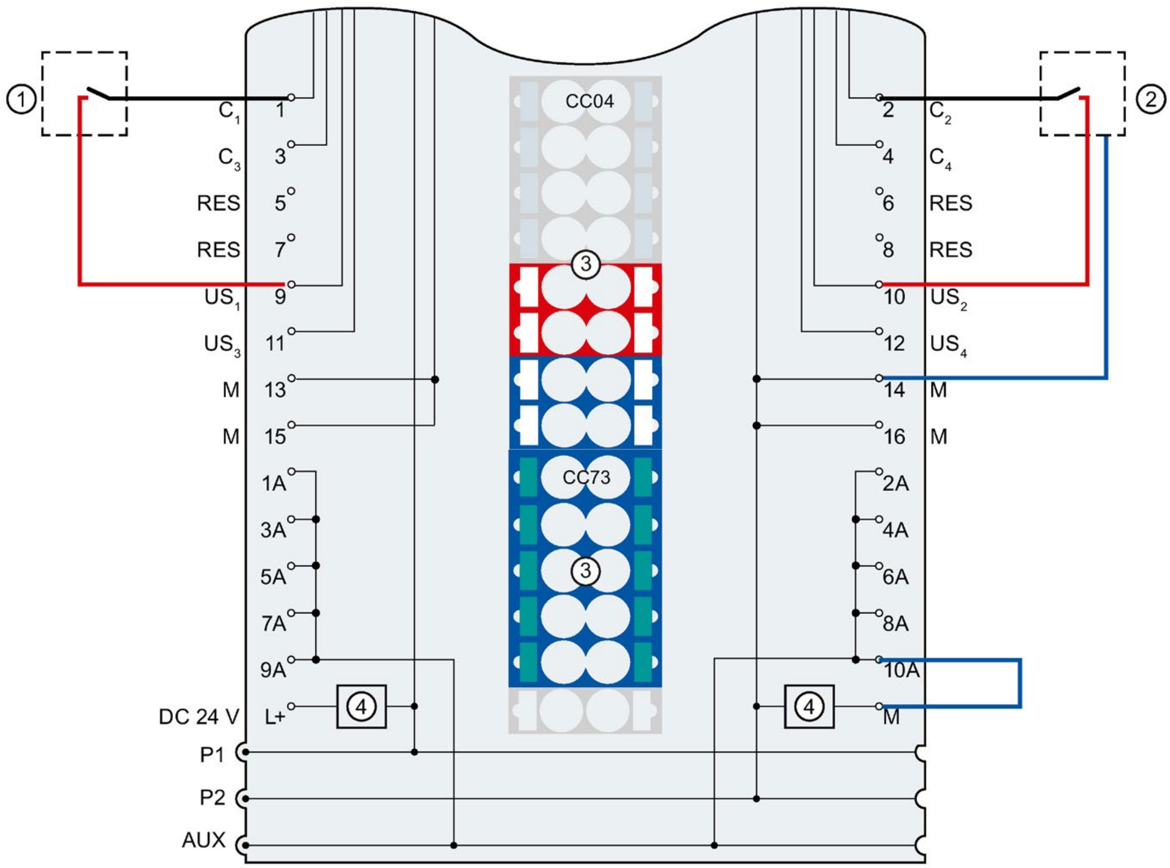


①	3-wire connection	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
②	5-wire connection	C_n	Communication signal, DI, DQ
③	Backplane bus interface	RES	Reserved, must not be assigned
④	Microprocessor	US_n	Supply voltage (positive)
⑤	IO-Link circuitry	DIAG	Error or diagnostics LED (green, red)
⑥	Polarity reversal protection	Cn	LED port status IO-Link mode (green)
⑦	Color-coded label with color code CC04 (optional)	Qn	LED port status SIO mode
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)	Fn	LED port error
M	Ground	PWR	Power LED (green)

Figure 3-1 Block diagram and terminal assignment for 3-wire and 5-wire connection of IO-Link devices

Wiring: 2-wire and 3-wire connection in DI operating mode

The following figure shows an example of the terminal assignment of the communication module IO-Link Master CM 4xIO-Link on the BaseUnit BU type A0 with AUX terminals (2-wire and 3-wire connection) in DI operating mode.

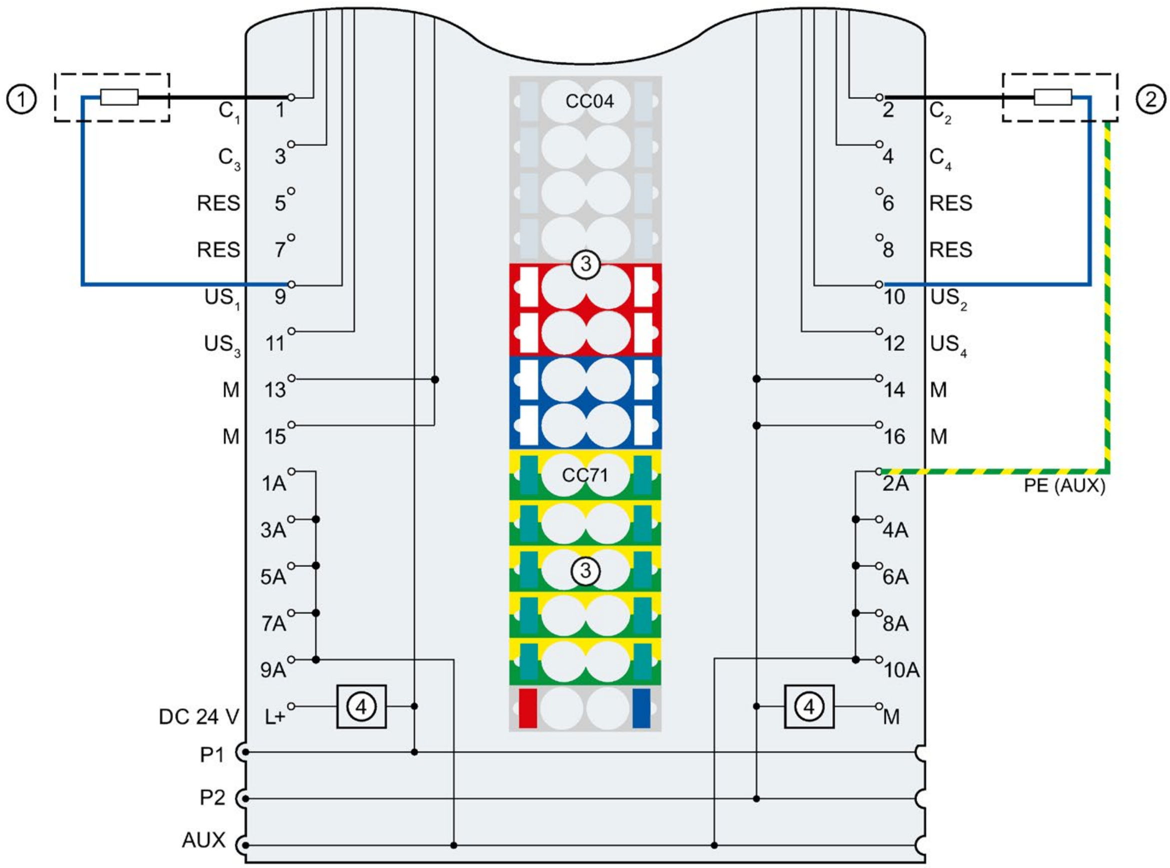


①	2-wire connection	1 A to 10 A	AUX terminals
②	3-wire connection	PE (AUX)	Protective conductor connection
③	Color-coded labels with color code CC04 and CC73 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Filter connection supply voltage (only when light-colored BaseUnit is present)	C_n	Communication signal, DI, DQ
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)	RES	Reserved, must not be assigned
M	Ground	US_n	Supply voltage (positive)

Figure 3-2 Terminal assignment for 2-wire and 3-wire connection in DI operating mode

Wiring: 2-wire and 3-wire connection in DQ operating mode

The following figure shows an example of the terminal assignment of the communication module IO-Link Master CM 4xIO-Link on the BaseUnit BU type A0 with AUX terminals (2-wire and 3-wire connection) in DQ operating mode.



①	2-wire connection	1 A to 10 A	AUX terminals
②	3-wire connection	PE (AUX)	Protective conductor connection
③	Color-coded labels with color code CC04 and CC71 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
④	Filter connection supply voltage (only when light-colored BaseUnit is present)	C_n	Communication signal, DI, DQ
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)	RES	Reserved, must not be assigned
M	Ground	US_n	Supply voltage (positive)

Figure 3-3 Terminal assignment for 2-wire and 3-wire connection in DQ operating mode

4 Parameters/address space

4.1 Parameters

Parameters (GSD file)

The following table shows the general parameters for the IO-Link Master CM 4xIO-Link communication module.

Table 4- 1 General parameters (GSD file)

Parameters	Value range	Default	Configuration in RUN	Efficiency range
Diagnostics				
Diagnostics: No supply voltage L+	• disable • enable	disable	Yes	Module
Diagnostics port 1	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 2	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 3	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 4	• disable • enable	disable	Yes	Port (channel)
Potential group	• Use potential group of the left module (dark-colored BaseUnit) • Enable new potential group (light-colored BaseUnit)	Use potential group of the left module (dark-colored BaseUnit)	No	Module
Master parameter				
PortQualifier Information (PQI)	• Disable • Enable	Enable	No	Module
Port configuration without P7-PCT	• Disable • Enable	Disable	No	Module

The following table shows the port parameters for the IO-Link Master CM 4xIO-Link communication module.

Table 4- 2 Port parameter (GSD file)

Parameters	Value range	Default
Port configuration		
Operating mode	• IO-Link Autostart • IO-Link manual • DI • DQ • Deactivated	IO-Link Autostart
Length of input data	depending on the selected I/O type*	depending on the selected I/O type*
Length of output data	depending on the selected I/O type*	depending on the selected I/O type*
VendorID**	Manufacturer ID of the connected IO-Link devices	0
DeviceID**	Device ID of the connected IO-Link devices	0
Test level / Data storage**	• Identical type (V1.0) without Backup&Restore • Type-compatible (V1.1) without Backup&Restore • Type-compatible (V1.1) with Backup&Restore • Type-compatible (V1.1) with Restore	Type-compatible (V1.1) with Backup&Restore

* Ensure that you do not exceed the maximum length of the input and output data for all ports.
Example:
You have selected the configuration 32I/32O. You have assigned 16 bytes of input data to the first port.
You can still assign a total of 16 bytes of input data to the remaining three ports.

** Only effective if you use the "IO-Link Manual" port mode.

Reference

Additional information on the VendorID and DeviceID can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109748852).

4.2 Declaration of parameters

Diagnostics: No supply voltage L+

Enabling the diagnostic alarm for missing or insufficient supply voltage L+.

Diagnostics port

This parameter allows the enabling of the diagnostics for the selected port.
The possible diagnostics are dependent on the IO-Link device used. Additional information about the diagnostic interrupts can be found in the description of the utilized IO-Link device.

Potential group

With the "Potential group" parameter, you specify whether the module is inserted on a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the dark-colored BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

PortQualifierInformation

This parameter enables the PortQualifierInformation (PQI).
The PQI provides information on the port and IO-Link device status.

Port configuration without P7-PCT

This parameter enables the port configuration without S7-PCT for the module.

Operating mode

This parameter specifies in which mode the selected port is to be operated.
You can select from the following options:

- IO-Link Autostart
- IO-Link manual
- DI
- DQ
- Deactivated

IO-Link Autostart

The connected IO-Link device starts automatically (Plug&Play functionality). The IO-Link device is immediately available to you and operational.

IO-Link manual

The connected IO-Link devices are **not** started automatically.
You must store the VendorID and DeviceID of the connected IO-Link devices in STEP 7.
In addition, you can select the test level for the data storage:

- Identical type (V1.0) without Backup&Restore
- Type-compatible (V1.1) without Backup&Restore
- Type-compatible (V1.1) with Backup&Restore
- Type-compatible (V1.1) with Restore

The VendorID and DeviceID can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109748852).

DI

The port operates as standard digital input.

DQ

The port operates as standard digital output.

Deactivated

The port is deactivated.

4.3 Address space

Configuration options of the communication module IO-Link Master CM 4xIO-Link

The size of the input and output addresses of the IO-Link Master CM 4xIO-Link communication module with firmware version V1.0 is 32 bytes in each case. As of firmware version V2.0, the modules support a variable address space for I/O data.

As of firmware version V2.2, you can configure the port directly in STEP 7.

The following table provides an overview of the configuration options of the supported address areas for I/O data:

Module configuration/ supported address space for I/O data	IO-Link master with firmware V1.0	IO-Link master with firmware V2.0	IO-Link master with firmware V2.1	IO-Link master with firmware V2.2
1 byte input/1 byte output		X	X	
2-byte inputs/2-byte outputs		X	X	
4-byte inputs/4-byte outputs				X*
8-byte inputs/0-byte outputs				X
8-byte inputs/8-byte outputs		X	X	X
12-byte inputs/8-byte outputs				X
12-byte inputs/12-byte outputs				
16-byte inputs/16-byte outputs		X	X	X
20-byte inputs/16-byte outputs				X
32-byte inputs/32-byte outputs	X	X	X	X
36-byte inputs/32-byte outputs				X
64-byte inputs/64-byte outputs			X	X
68-byte inputs/64-byte outputs				X
144-byte inputs**/128-byte outputs			X	X

* No PortQualifierInformation is transferred with this configuration.

** The 144-byte input address range covers additional quality information (PortQualifier) in addition to the 128-byte process data.

Note

Use of the IO-Link Master CM 4xIO-Link with I/O data > 32 bytes

IM 155-6 PN HF/ST interface modules with firmware versions up to V3.0 only support I/O data up to 32 bytes. If you are using IO-Link Master CM 4xIO-Link with I/O data > 32 bytes, you need the IM 155-6 PN HF/ST interface module with firmware version as of V3.1.

Port configuration

With a IO-Link Master CM 4xIO-Link as of firmware version V2.2, you can commission the IO-Link port of the IO-Link master and the connected IO-Link devices in two different ways:

- Port configuration without S7-PCT
- Port configuration with S7-PCT

Port configuration without S7-PCT

Requirements

You have activated the "Port configuration without S7-PCT" check box in the configuration of the IO-Link master in STEP 7.

Procedure

You configure the IO-Link master directly in STEP 7:

- Activate the diagnostics
- Configuration of the I/O data lengths for each port
- Activate the PortQualifierInformation (PQI)
- Port mode:
  - Operation in "IO-Link Autostart" mode (default)
  - Operation in "IO-Link Manual" mode
  - Operated as DI
  - Operated as DQ
  - Deactivated

Port configuration with S7-PCT

Requirements

You have **de**activated the "Port configuration without S7-PCT" check box in the configuration of the IO-Link master in STEP 7.

Procedure

You configure the IO-Link master with the Port Configuration Tool S7-PCT, V3.2 or higher.

PortQualifierInformation (PQI)

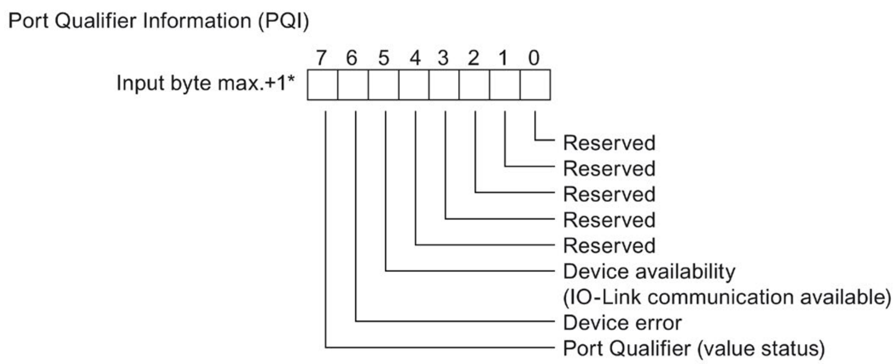
You can activate the PortQualifierInfortion (PQI) for your IO-Link master, firmware version V2.2 or higher.

Note

PortQualifierInformation (PQI)

If you have activated the PortQualifierInformation (PQI), these are always transferred with the size 1 byte together with the input data of the IO-Link device.

The following figure shows the structure of the PQI byte.
Activate a parameter by setting the corresponding bit to "1".



* The PQI byte is always located after the last input byte of the port. Depending on the configuration, the PQI byte is therefore located in the process image of the inputs at byte 2, 3, 4, 5, 8, 9, 16, 17, 32 or 33.

Figure 4-1 Structure of the PQI byte

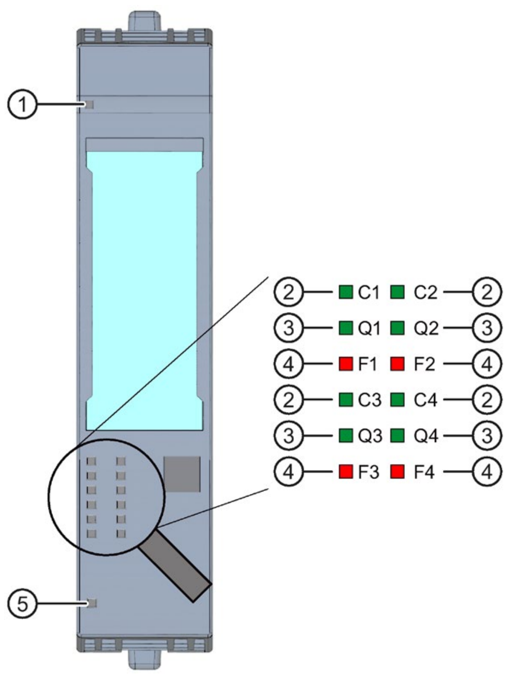
Diagnostic alarms 5

5.1 Status and error displays

LED display



①	Diagnostics (DIAG)	(green/red)
②	Port status / IO-Link status (Cn)	(green)
③	Channel status in SIO mode (Qn)	(green)
④	Port error (Fn)	(red)
⑤	Supply voltage L+ (PWR)	(green)

n - Channel number

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the Diagnostic alarms (Page 31) chapter.

LED DIAG

Table 5- 1 DIAG LED fault display

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module is not configured
On	Module parameterized and no module diagnostics
Flashes	Module parameterized and module diagnostics

Cn LEDs

Table 5- 2 Status displays of C1, C2, C3 and C4 LEDs

C1, C2, C3 or C4	Meaning
Off	Port disabled or in SIO mode
Flashes	Port in IO-Link mode, device not connected or port not connected with the configured device
On	Port in IO-Link mode, device not connected

Qn LEDs

Table 5- 3 Status displays of Q1, Q2, Q3 and Q4 LEDs

Q1, Q2, Q3 or Q4	Meaning
Off	Process signal = 0 in SIO mode, deactivated or in IO-Link mode
On	Process signal = 1 in SIO mode

Fn LEDs

Table 5- 4 F1, F2, F3 and F4 LED error displays

F1, F2, F3 or F4	Meaning
□ Off	No error
■ On	Error

LED PWR

Table 5- 5 Status display of the PWR LED

PWR	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ present

5.2 Diagnostic alarms

For each diagnostics event, a diagnostic alarm is issued and the DIAG LED flashes red on the communication module. You can read out the diagnostics alarms, for example, in the diagnostics buffer of the CPU. You can evaluate the error codes with the user program.

Table 5- 6 Error types

Diagnostic alarm	Error code	Meaning (IO-Link error code)	IO-Link master	IO-Link device
Short-circuit	1_H	• Short-circuit in the process cables on the IO-Link device (1804_H)	X	
		• Short-circuit on IO device (7710_H)		X
Undervoltage	2_H	• Supply voltage too low (5111_H, 5112_H)		X
Overvoltage	3_H	• Supply voltage too high (5110_H)		X
Overheating	5_H	• Temperature exceeded on master (1805_H)	X	
		• Temperature exceeded on device (4000_H, 4210_H)		X
Wire break	6_H	• No IO-Link device connected • There is a break in the signal line to the IO-Link device • IO-Link device cannot communicate due to another error (1800_H)	X	
Overflow	7_H	• Process tag range exceeded ($8C10_H$) • Measuring range exceeded ($8C20_H$)		X
Underflow	8_H	• Process tag range too low ($8C30_H$)		X
Error	9_H	• All IO-Link error codes which are not listed here are mapped to this PROFIBUS DP error		X
Configuration error	10_H	• Incorrect device (1802_H) • Vendor ID and Device ID not defined (1817_H) • Process data length of the IO-Link device exceeded (1818_H) • No cycle time configured (1819_H) • Cannot configure IO-Link master (1882_H, 1883_H) • Storage error (1886_H) • Process data length exceeded (1887_H) • PQI not supported (1889_H)	X	
		• Device was not configured correctly (6320_H, 6321_H, 6350_H)		X
Supply voltage missing	11_H	• L+ supply voltage for device missing (1806_H) • L+ supply voltage for device too low (<20 V) (1807_H)	X	
Defective fuse	12_H	• Fuse on device is defective (5101_H)		X
Safety shutdown	19_H	• Serious error (master has to be replaced) (1880_H)	X	
External fault	$1A_H$	• Error in data storage (1809_H, $180A_H$, $180B_H$, $180C_H$, $180D_H$) • More than 6 errors are pending simultaneously on the IO-Link device (1808_H) • Consistency error in electronic coding element (1885_H) • Process data length exceeded (1887_H)	X	

6 Technical specifications

Technical specifications of the IO-Link Master CM 4xIO-Link communication module

Article number	6ES7137-6BD00-0BA0
General information	
Product type designation	CM 4 x IO-Link ST, PU 1
Firmware version	V2.2
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC04
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	STEP 7 V15 or higher
• STEP 7 configurable/integrated as of version	STEP 7 V5.5 or higher
• PROFIBUS as of GSD version/GSD revision	One GSD file each, Revision 3 and 5 and higher
• PROFINET as of GSD version/GSD revision	GSDML V2.3
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V; 20.5 V if IO-Link is used, as the supply voltage for IO-Link devices has to be at least 20 V at the master.
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	45 mA; without load
Encoder supply	
Number of outputs	4
Output current	
• Rated value	200 mA; Per channel
24 V encoder supply	
• Short-circuit protection	Yes

Article number	6ES7137-6BD00-0BA0
Power loss	
Power loss, typ.	1 W
Digital outputs	
Cable length	
• unshielded, max.	20 m; Also applies for shielded cables
IO-Link	
Number of ports	4
• of which simultaneously controllable	4
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	Yes
Transmission rate	4.8 kBaud (COM1); 38.4 kBaud (COM2), 230.4 kBaud (COM3)
Cycle time, min.	2 ms; dynamic, depending on user data length
Size of process data, input per port	32 byte; max.
Size of process data, input per module	144 byte; max.
Size of process data, output per port	32 byte; max.
Size of process data, output per module	128 byte; max.
Memory size for device parameter	2 kbyte; for each port
Master backup	Yes
Configuration without S7-PCT	Yes
Cable length unshielded, max.	20 m
Operating modes	
• IO-Link	Yes
• DI	Yes
• DQ	Yes; max. 100 mA per channel
Time Based IO	
– TIO IO-Link IN	No; Only for PROFINET and configuration as version with FW V2.0 or V2.1
– TIO IO-Link OUT	No; Only for PROFINET and configuration as version with FW V2.0 or V2.1
– TIO IO-Link IN/OUT	No; Only for PROFINET and configuration as version with FW V2.0 or V2.1
Connection of IO-Link devices	
• Port type A	Yes
• Port type B	Yes; 24 V DC via external terminal
• via three-wire connection	Yes
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	No; Only for PROFINET and configuration as version with FW V2.0 or V2.1

Article number	6ES7137-6BD00-0BA0
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes; The port diagnosis is available in the IO-Link mode only.
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• Group error	Yes
Diagnostics indication LED	
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; one green LED for channel status Qn (SIO mode) and port status Cn (IO-Link mode) per channel
• for channel diagnostics	Yes; red Fn LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Overview of the response time

The following figure shows the response time for IO-Link without Time-based IO.

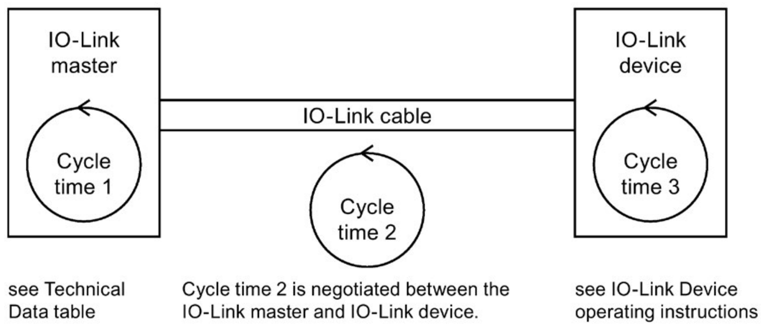


Figure 6-1 Cycle time for IO-Link without Time-based IO

Dimensional drawing

See manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

Parameter data record

A

A.1 Parameter assignment and structure of parameter data set

The data record of the module has an identical structure, regardless of whether you configure the module with PROFIBUS DP or PROFINET IO. With data record 128, you can reconfigure the module in your user program regardless of your programming.

The following describes the structure of data record 128 as of firmware version V2.2.

Configuration in the user program

You can configure the modules in runtime.

Changing parameters in RUN

The "WRREC" instruction is used to transfer the parameters to the module using data record 128. The parameters set in STEP 7 are not changed in the CPU, which means that the parameters set in STEP 7 will be valid again after a restart.

Output parameter STATUS

If errors occur when transmitting parameters with the "WRREC" instruction, the module continues operation with the previous parameter assignment. The STATUS output parameter contains a corresponding error code.

You will find a description of the "WRREC" instruction and the error codes in the STEP 7 online help.

Error message

The module always checks all the values of the transferred data record. Only if all the values were transferred without errors does the module apply the values from the data record.

The instruction WRREC for writing data records returns corresponding error codes when errors occur in the parameter STATUS.

The following table shows the module-specific error codes and their meaning for the parameter data record 128:

Table A- 1 Error message

Error code	Meaning
$80B1_H$	Error in data length
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Structure of data record 128

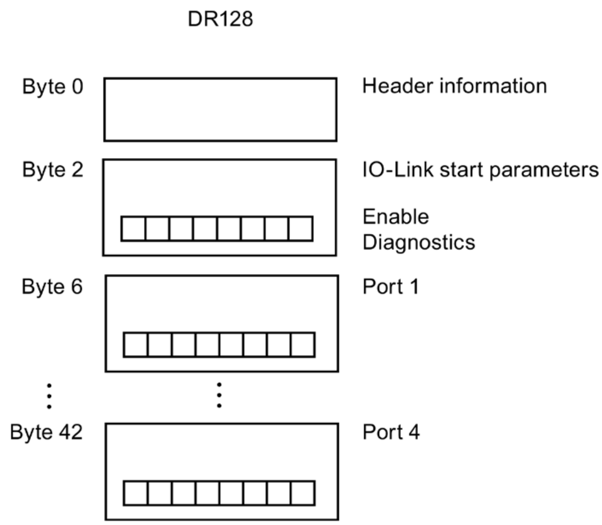

Figure A-1 Structure of data record 128

Header information

The figure below shows the structure of the header information.

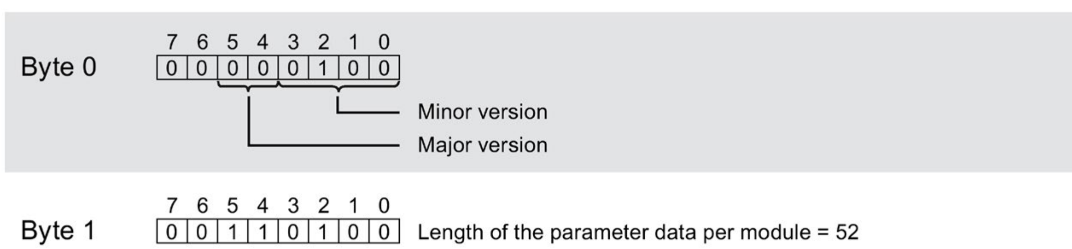

Figure A-2 Header information

IO-Link start parameters

The following figure shows the structure of the IO-Link start parameter.
Activate a parameter by setting the corresponding bit to "1".

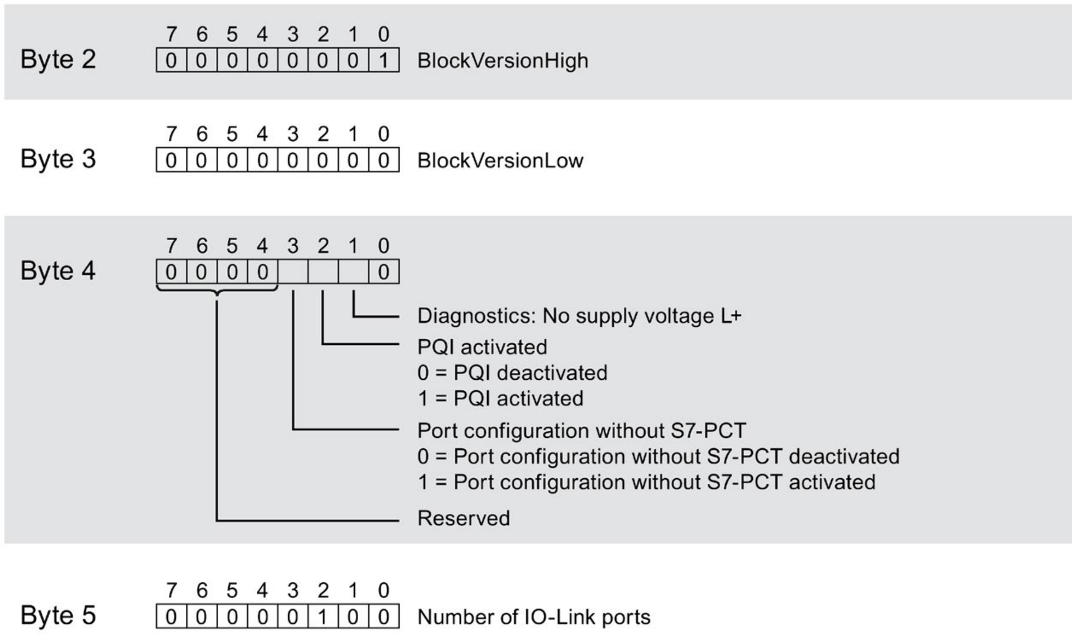

Figure A-3 IO-Link start parameters

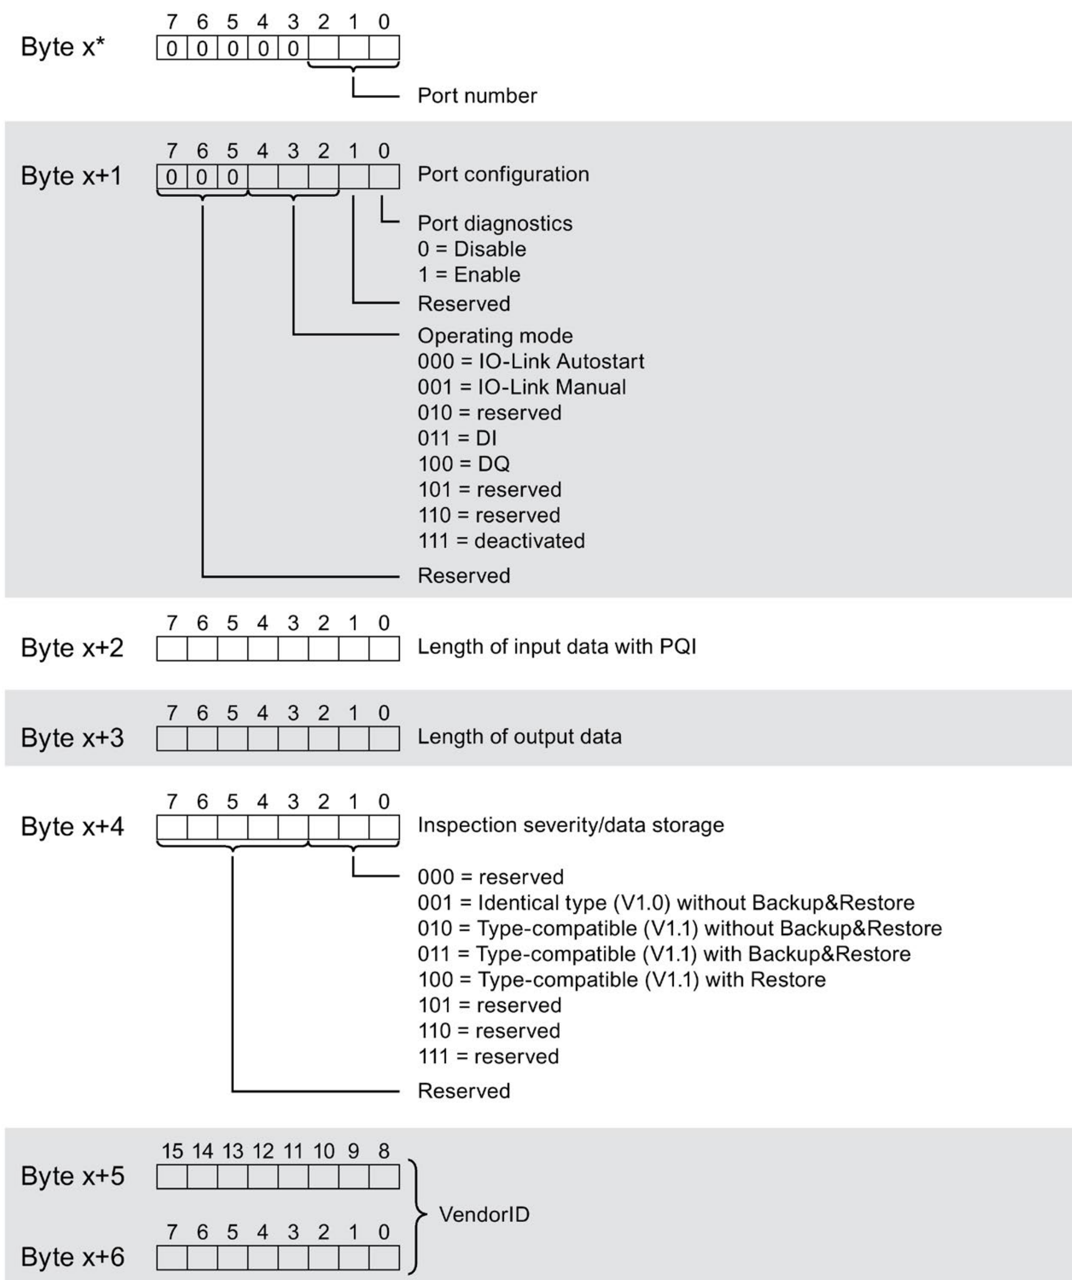
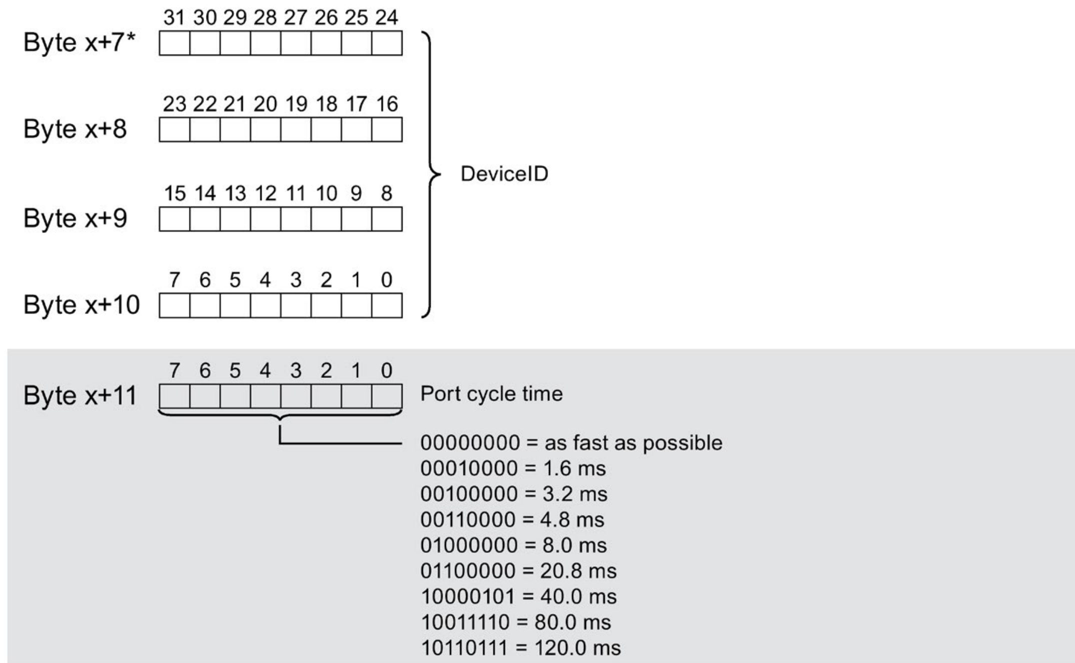
Port parameter

The following figure shows an extract from the structure of the port parameter. Activate a parameter by setting the corresponding bit to "1".

If you have selected IO-Link Manual operating mode, you must enter the Vendor ID (byte x+5 and x+6) and Device ID (byte x+7 to x+10) yourself.
You can find the Vendor ID and Device ID in the IODD of the IO-Link device being used.



* x = 6 + ((port number-1) x 12); port numbers = 1 to 4.



* x = 6 + ((port number-1) x 12); port numbers = 1 to 4.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Foreword

Purpose of the documentation

This device manual supplements the "ET 200SP Distributed I/O System" System Manual. Functions that pertain generally to the ET 200SP can be found in the "ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)" System Manual.

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

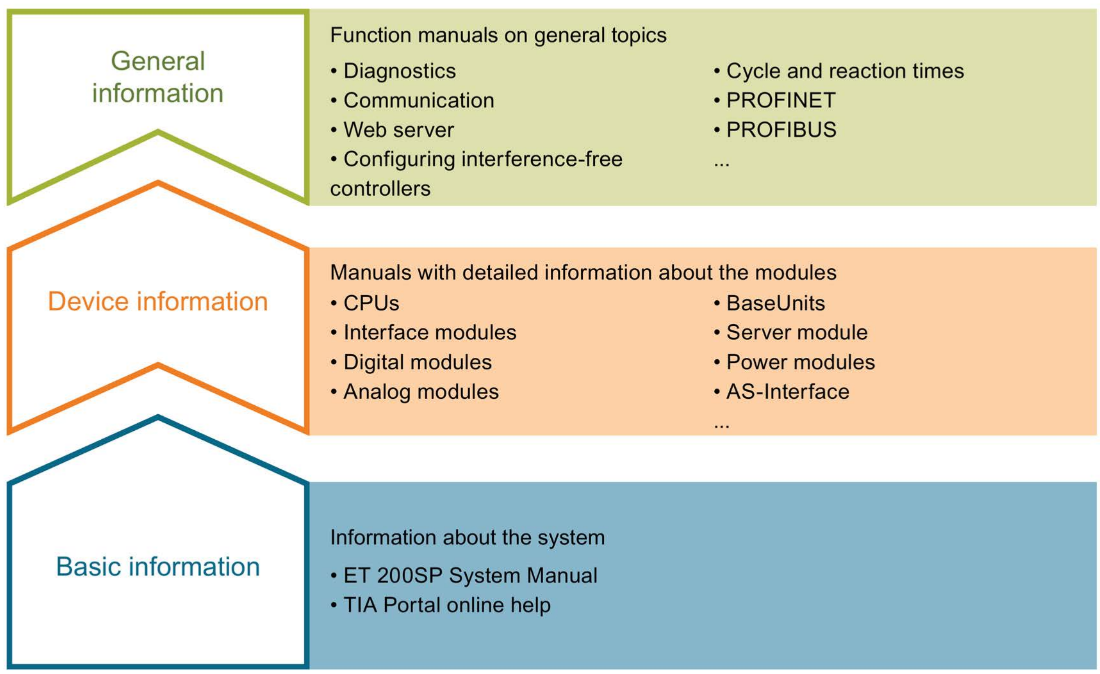
Table of contents

1 Documentation guide

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

The documentation for the SIMATIC ET 200SP distributed I/O system is subdivided into three areas.

This enables you to access the required content quickly.



Basic information

The System Manual describes configuration, assembly, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The *STEP 7* online help supports you with configuration and programming.

Device information

Manuals contain a compact description of the module-specific information, such as properties, connection diagrams, characteristics and technical specifications.

General information

The Function Manuals contain detailed descriptions on topics relating to the SIMATIC ET 200SP environment, such as configuring diagnostics, communications, web servers and controllers for problem-free operation.

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

Documentation for the ET 200SP distributed I/O system with the CM AS-i master ST

2 Safety instructions

Important safety instructions

> ⚠ **WARNING**
>
> **Failure to observe this information may result in death, severe injury, and serious property damage.**
>
> For use in Pollution Degree 2 Environment.

> ⚠ **WARNING**
>
> **Failure to observe this information may result in death, severe injury, and serious property damage.**
>
> When used in hazardous hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or a suitable enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 in compliance with EN 60529.

> ⚠ **WARNING**
>
> **Explosion Hazard; failure to observe this information may result in death, severe injury, and serious property damage.**
>
> Do not disconnect equipment when a flammable or combustible atmosphere is present.

> ⚠ **WARNING**
>
> **Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.**
>
> Do not disconnect while circuit is live unless area is known to be non-hazardous.

> ⚠ **WARNING**
>
> **Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.**
>
> Substitution of components may impair suitability for class I, division 2 or zone 2.

> ⚠ **WARNING**
>
> **Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.**
>
> Do not open when energized.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

The equipment is designed for operation with Safety Extra-Low Voltage (SELV) by a Limited Power Source (LPS).

This means that only SELV / LPS complying with IEC 60950-1, EN 60950-1, VDE 0805-1 must be connected to the power supply terminals.

The power supply unit for the equipment power supply must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 40 %. This criteria is fulfilled if supples are derived from SELV (Safety Extra-Low Voltage) only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Division 2, Groups A, B, C, and D or non-hazardous locations only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

Product overview 3

3.1 Characteristics of the CM AS-i Master ST

Article number

3RK7137-6SA00-0BC1

Brief introduction to AS-Interface

AS-Interface or Actuator-Sensor-Interface (AS-i for short) is a fieldbus system for industrial use that is used to transmit digital and analog signals between a controller and machine or process in real-time. The system can be used for standard signals as well as for safety-related signals.

AS-Interface is designed to connect actuators and sensors to the controller as easily, flexibly and efficiently as possible.

The system consists of an AS-i master and up to 62 AS-i slaves that are simply plugged onto the yellow AS-i flat ribbon cable at any point or connected via terminals. The AS-i cable can be up to 100 m long with free choice of topology. A length of up to 200 m is possible with an additional extension plug. The system can be extended beyond that through the use of repeaters.

In addition, an AS-i power supply unit is connected to the cable such that the slaves and their connected sensors are supplied with operating voltage without additional cabling. Actuators are usually supplied with voltage by means of a 24 V cable, because they generally need more power than sensors.

A typical digital AS-i slave has up to 4 inputs and 4 outputs. The slaves are installed directly in the plant as close as possible to the sensors or actuators so that the connecting cables can be kept very short. The insulation displacement method is the preferred method for connection to the AS-i flat ribbon cable so that assembly can be completed without errors in the least amount of time. For safety-related signals, safety slaves and modules are available for safety-related processing of signals. In addition, analog slaves and complete switchgear with integrated AS-i slave are offered.

The default voltage fed in from the AS-i power supply unit is 30 V DC. As a result, sensors with a rated voltage of 24 V can be used without any problems despite the voltage drop on a longer AS-i cable. Because the AS-i cable transmits both operating DC voltage and modulated communication signals, the AS-i power supply unit contains a data decoupling unit for separating the two voltage waveforms.

A standard power supply can be used in place of the easy-to-use AS-i power supply if the AS-i cable is connected via a separate data decoupling module. When a standard power supply with 24 V DC is used, it must be ensured that the connected AS-i components and sensors are designed for operation with the corresponding lower voltage.

You will find further information on the Internet at: AS-Interface (http://www.siemens.com/as-interface).

Use of the module

The CM AS-i Master ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The CM AS-i Master ST features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The CM AS-i Master ST can be plugged into C0-type BaseUnits (BU).

You can plug several CM AS-i Master ST modules into one SIMATIC ET 200SP station. Each CM AS-i Master with firmware version V1.0 occupies 32 bytes of I/O address space. From firmware version V1.1 onwards, the CM AS-i Master ST supports up to 288 bytes of I/O address space. The number of possible AS-i master modules depends on the maximum address space of the utilized Interface Module (IM) of the ET 200SP or the utilized ET 200SP CPU.

In a SIMATIC ET 200SP station with an IM 155-6 PN ST standard interface module and a maximum address space of 256 bytes, up to eight CM AS-i Master ST modules can be plugged in (when the I/O address space is configured as 32 bytes).

Significantly more modules can be plugged into a SIMATIC ET 200SP station with High Feature Interface Module IM 156-6 PN HF and a maximum address space of 1440 bytes.

If the ET 200SP contains other modules, the available address space is reduced and the maximum number of AS-i master modules is reduced accordingly. The maximum number of modules can be increased by shortening the I/O address space of the CM AS-i Master ST module.

For further information, see the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/84133942).

The CM AS-i Master ST module can generally be combined with all ET 200SP interface modules. Any exceptions to this are documented in the delivery release product announcement(s) of the interface module.

The CM AS-i Master ST module (Firmware V1.1 and higher) can generally be combined with all ET 200SP CPU modules (Firmware V1.8 and higher). Any exceptions to this are documented in the delivery release product announcement(s) for a CPU module.

The interface modules und CPU modules differ, among other things, in terms of the maximum number of I/O modules, the length of the I/O process image in the station and the length of the I/O process image for each I/O module. The technical specifications of the interface modules and CPU modules can limit the selection of possible parameters of the CM AS-i Master ST module. Note, in particular, that the length of the I/O process image of the CM AS-i Master ST module must be selected in such a way that the maximum length of the I/O process image of the interface module or CPU module is not exceeded.

View of the module

Figure 3-1 View of the CM AS-i Master ST

Properties

- Technical properties
  - AS-i master acc. to AS-Interface Specification 3.0
  - Transmission of digital I/O values to cyclic process image
  - Transmission of analog I/O values in the cyclic process image (Firmware V1.1 and higher) or via acyclic data record communication.
  - Configuration button can be connected to terminals
- Supported functions
  - I&M identification data
  - Firmware update
  - Configuration of the AS-i master and AS-i slaves via data records (Read / Write or command interface)

The module can be used with the following engineering versions:

Table 3- 1 Version dependence of the CM AS-i Master ST engineering versions

Firmware version of the module	*STEP 7* (TIA portal)	*STEP 7* V5.5	GSD file
V1.0	V12 and higher	V5.5 SP3 HF5 and higher	X
V1.1	V13 SP1 and higher	V5.5 SP3 HF5 and higher	X

For additional information, see product announcement for: CM AS-i Master ST (https://support.industry.siemens.com/cs/ww/en/view/72865595)

Table 3- 2 Version dependence of the CM AS-i Master ST functions

Function	Firmware version of the module
Configuring in *STEP 7* (TIA Portal) V12 and higher	V1.0 and higher
GSD file (PROFIBUS)	V1.0 and higher
GSD file (PROFINET)	V1.0 and higher
Access via command data records	V1.0 and higher
Structure of the process image: 32 bytes	V1.0 and higher
Transmission of digital I/O values in the cyclic process image	V1.0 and higher
Transmission of analog I/O values via data record transfer	V1.0 and higher
Firmware update	V1.0 and higher
Duplicate address detection	V1.0 and higher
Automatic address programming with manual writing of the ID1 code	V1.0 and higher
Write ID1 code to AS-i address "0"	V1.0 and higher
Configuring in *STEP 7* (TIA Portal) V13 SP1 and higher	V1.1 and higher
Status information for all slaves of the AS-i master system (TIA Portal)	V1.1 and higher
Detailed, device-specific diagnostics (TIA Portal)	V1.1 and higher
Configuring in *STEP 7* V5.5 and higher	V1.1 and higher
Option handling	V1.1 and higher
Proxy slave	V1.1 and higher
Structure of the process image: Up to 288 bytes, adjustable length	V1.1 and higher
Transmission of analog I/O values via process data	V1.1 and higher
Variable address area for I/O data	V1.1 and higher
Automatic address programming with automatic writing of the ID1 code	V1.1 and higher
AS-i slave_ID1_write_with_target_address	V1.1 and higher
Automatic duplicate address detection for AS-i voltage of either 24 V or 30 V	V1.1 and higher

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

3.2 Operating modes of the CM AS-i Master ST

The AS-i master has two operating modes:

- "Configuration mode"
- "Protected operation"

"Configuration mode"

"Configuration mode" can be used for commissioning an AS-i installation. You can also use "configuration mode" for productive operation. The AS-i bus configuration is not defined in this case. This means that error messages for a change of bus configuration are not possible.

You switch the AS-i master from "protected operation" to "configuration mode" in *STEP 7*. The "CM" LED (Configuration Mode) then lights up green.

In "configuration mode", the AS-i master can exchange data with every AS-i slave that is connected to the AS-i cable. This does not apply to AS-i slaves with the address "0". The AS-i master immediately detects and activates newly added AS-i slaves and includes them in cyclic data exchange. The digital process data of the connected AS-i slaves are stored according to a fixed scheme in the process image starting from a configurable start address. See "Special characteristics of AS-i Safety slaves (Page 55)". The digital process image for the inputs of non-existent slaves is filled with the substitute value "0". Analog process data can only be accessed by means of data record communication.

In "configuration mode", configuration errors of AS-i slaves are not signaled to the higher-level station via an alarm and are not indicated by the "DIAG" LED.

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. In case of changes to the bus configuration, error messages are automatically generated if diagnostics is enabled. See "Parameter assignment/addressing (Page 43)".

You can configure in one of the following ways:

- Configuration of the AS i slaves in the *STEP 7* project (Configuration of the AS-i slaves in STEP 7 (Page 31))
- Applying the slave configuration with the online "ACTUAL → CONF" function in *STEP 7* (Applying the slave configuration (Page 38))
- Calling the command interface in the SIMATIC user program with the following commands:
  – No. 07: Store_Actual_Configuration (Page 114)
  – No. BA: Write_overall_configuration (Page 131)
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 34))

If you have configured the AS-i slave in the *STEP 7* project, the changeover to "protected operation" occurs automatically.

Changeover between "configuration mode" and "protected operation"

You can change between "configuration mode" and "protection operation" in one of the following ways:

- By switching the operating mode using the "Online functions in the TIA Portal (Page 37)".
- By calling the command interface in the user program of SIMATIC with command "No. 0C: Set_Operation_Mode (Page 119)".
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 34)).

Changeover is not possible if the AS-i slaves have been configured in the *STEP 7* project and the CPU is in RUN operating mode.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Following a firmware update, mark the current firmware version on the housing of the CM AS-i Master ST.

Current firmware updates are available on the Internet for download (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Pay careful attention to the information on performing the firmware update contained in the download entry.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs are off

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

LED behavior after a successfully completed firmware update

When the TIA Portal is used, an error-free firmware update is indicated by the message that the firmware was successfully transferred.

Note

Confirming a message after an error-free firmware update

You must confirm the message using the button before you continue. Without confirmation, the LED status remains unchanged so that the firmware update is incomplete and must be repeated.

When *STEP 7* V5.5 (classic) is used, there is no concluding message and the LED status changes autonomously.

If the firmware is updated without errors, the LED status is updated:

- DIAG flashes red until the AS-i voltage is switched off and back on again
- PWR is lit green
- Remaining AS-i LEDs are lit

WARNING

Required intermediate step for firmware update of a CM AS-i Master ST with FW V1.0 using an ET 200SP CPU.

Failure to perform this step causes the CM AS-i Master ST to become permanently inoperable.

If you want to perform an update to a higher firmware version for a CM AS-i Master ST module with FW V1.0 and are using an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), you must always perform the following intermediate step:

After the update of the LED status, the CM AS-i master ST module must be removed from the ET 200SP BaseUnit. Instead of removing the module, it is also sufficient to switch off the AS-i voltage and the 24 V voltage of the ET 200SP. A TIA Portal error message appears approximately one minute after the module has been removed indicating that online access to the module is no longer possible. Confirm the error message. Then plug the module onto the BaseUnit again or switch the voltages back on.

Now repeat the firmware update. In this case, the intermediate step described here can be skipped.

The intermediate step is not required for:

- Firmware update of a CM AS-i Master ST module with active FW V1.1 or higher
- Use of an ET 200SP configuration with a PROFINET interface module (IM) and PROFINET connection to a released SIMATIC CPU
- Use of an ET 200SP configuration with a PROFIBUS interface module (IM) and PROFIBUS connection to a released SIMATIC CPU.

Note

For operation of the CM AS-i Master ST module in an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), the following minimum requirements of the firmware and software versions apply:

- CM AS-i Master ST with FW V1.1 or higher, and
- ET 200SP CPU with FW V1.8 or higher (CPU 1510SP-1 PN, CPU 1510SP F-1 PN, CPU 1512SP-1 PN, CPU 1512SP F-1 PN, Open Controller CPU 1515SP PC)
- Configuration with *STEP 7* V13 SP 1 Update 4 or higher

Note

Restart after a firmware update

Following a firmware update, the AS-i voltage must be switched off and back on again in order for the new firmware to be activated.

Wait for the LED status to update before performing the restart. Otherwise the firmware update is not complete and must be repeated.

LED behavior in the event of an error during a firmware update

If an error occurs during the firmware update, the LEDs assume the following status:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs indicate the status of the AS-i and are not relevant here.

In this case, switch the AS-i voltage off and back on again and repeat the firmware update.

Connection 4

4.1 Terminal assignment

Requirements

For connecting, you require a BaseUnit:

- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other I/O module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

Exception:

BaseUnits with power busbars without connection to the terminals of the plug-in I/O module can be used within a BaseUnit group for AS-i. These BaseUnits include the following dark BaseUnits with 20 mm width:

- BU20-P12+A0+4B (BU type B1)
- BU20-P12+A0+0B (BU type D0)
- BU20-P8+A4+0B (BU type F0)

NOTICE
Make sure that external voltage from adjacent BaseUnits cannot under any circumstances be connected to the AS-i modules.

⚠ WARNING
Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition **Failure to observe this information may result in death, severe injury, and serious property damage.** Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in Section "Schematic circuit diagram (Page 27)", "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

General terminal assignment

Table 4- 1 Terminal assignment of the CM AS-i Master ST

Terminal	Assignment	Description
1	SET1	Connection of the "SET" button (optional),
2	SET2	see "Configuration of the AS-i slaves using the "SET" button (Page 34)"
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L 1)	ASI+	Connection of the AS-i cable, positive polarity
1N, 2N 1)	ASI-	Connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "SET" button

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This enables you to apply the ACTUAL configuration of the connected AS-i slaves as the CONFIGURED configuration. This function is activated by closing the button contact on the SET1 and SET2 terminals.

The maximum cable length between the terminal and "SET" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

See also

"ET 200SP Distributed I/O System" System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en)

"ET 200SP BaseUnits" Manual (http://support.automation.siemens.com/WW/view/en/59753521/0/en)

4.2 Schematic circuit diagram

Schematic circuit diagram

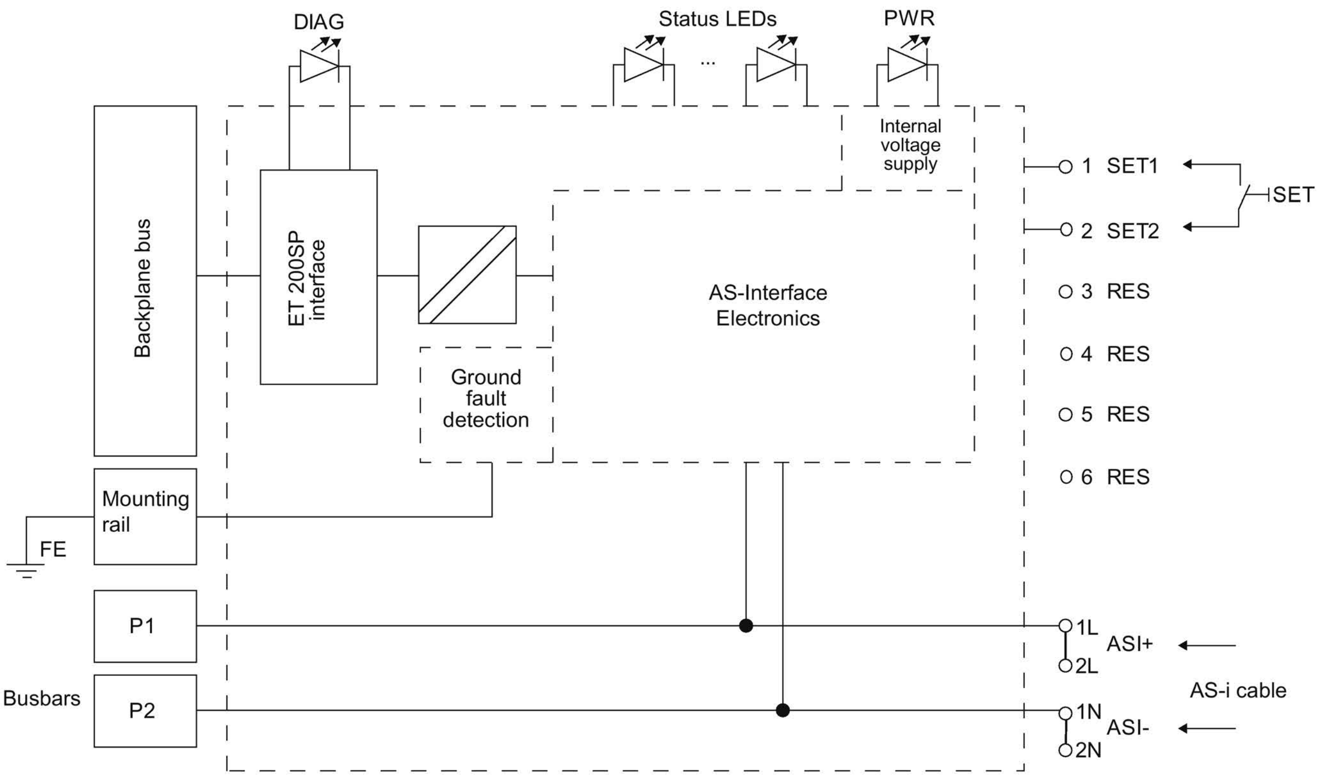

Figure 4-1 Circuit diagram of the CM AS-i Master ST

1L, 2L are connected through in the BaseUnit.

1N, 2N are connected through in the BaseUnit.

Connection to power busbars

The following are connected via the CM AS-i Master ST:

- 1L and power busbar P1
- 1N and power busbar P2

The maximum permitted current here is 4 A. For a conducted current of 4 A, the reduced ambient temperature range applies:

- Max. 55 °C for a horizontally mounted rail
- Max. 50 °C for a vertically mounted rail

If safety-related signals are to be processed on the AS-i cable, you can arrange a dark BaseUnit type C1 to the right of the light BaseUnit type C0 with the CM AS-i Master ST module and plug a safety-related F-CM AS-i Safety ST module onto this dark BaseUnit. The AS-i cable is continued from the light BaseUnit to the dark BaseUnit via the power busbars so that the F-CM AS-i Safety ST module is connected to the AS-i network of the master without additional wiring.

It is not permitted to transmit the AS-i voltage from the connecting terminals on the front of the dark BaseUnit because a current draw of this type may cause an overload in the modules.

Connect the AS-i cable with AS-i power supply unit and AS-i slaves only to terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the light BaseUnit.

You can find additional information on safety-related processing in the "Fail-safe module F-CM AS-i Safety ST (https://support.industry.siemens.com/cs/ww/en/view/90265988)" manual.

Power supply units supported for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to max. 40 V in the event of a fault

The Siemens power supply units for AS-Interface meet these requirements (see operating instructions of the power supply unit).

Use an AS-Interface power supply unit (with integrated data decoupling) or a combination of a standard power supply unit and a data decoupling module.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/42806066)

Power supply

The CM AS-i Master ST is fully powered from the AS-i voltage. Only the internal backplane bus interface for the ET 200SP station (including the DIAG LED) is powered from the operating voltage of the ET 200SP station.

If the operating voltage of the ET 200SP station fails, the communication between the AS-i master and AS-i slaves continues without interruption, in which case the outputs of the AS-i slave are reset to zero.

Configuring

5

5.1 Requirements

Introduction

You configure the ET 200SP station and its CM AS-i Master ST and assign their parameters using *STEP 7* or the configuration software of another manufacturer.

Configuring the CM AS-i Master ST

Configuring in *STEP 7* or another configuration software is required in order to use the CM AS-i Master ST in an ET 200SP. A distinction is made here between the necessary basic configuration of the AS-i master and the optional configuration of the AS-i slaves.

You can configure the module using *STEP 7* or with a GSD file. Version dependencies:

Table 3-1 Version dependence of the CM AS-i Master ST engineering versions (Page 17)

Note

CM AS-i Master ST in the hardware catalog of *STEP 7*

If the CM AS-i Master ST module in the applicable firmware version is not listed in the hardware catalog of *STEP 7*, you will need a "Hardware Support Package". You can install this HSP from the Internet using the corresponding function in *STEP 7*.

Further information can be found in the documentation and in the online help for *STEP 7*.

Installing the HSP in *STEP 7* V5.5 (classic)	"HW Config" > "Options" menu > "Install HW Updates"
Installing the HSP in *STEP 7* V13 (TIA Portal):	"Options" menu > "Support packages"

You can find additional information on the HSP and download it in Internet (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Download the GSD file from the internet:

PROFINET GSD file (https://support.industry.siemens.com/cs/ww/en/view/57138621)

PROFIBUS GSD file (https://support.industry.siemens.com/cs/ww/en/view/73016883)

Observe the *STEP 7* online help or the documentation of the configuration software manufacturer.

Configuring the AS-i system requires two steps:

1. Basic configuration of the AS-i master (Basic configuration of the CM AS-i Master ST (Page 30))
2. Configuration of the AS-i slaves

Configuring the AS-i slaves includes defining the slave modules and, if necessary, assigning the slave operating parameters.

See also

Configuration of the AS-i slaves in STEP 7 (Page 31)

Configuration of the AS-i slaves using the "SET" button (Page 34)

Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 36)

Configuration of the AS-i slaves using the PLC program (Page 36)

Characteristics of the CM AS-i Master ST (Page 15)

5.2 Basic configuration of the CM AS-i Master ST

The following is carried out as a result of the basic configuration:

- The AS-i master is made known with the system.
- The length of the cyclic process image is made known (length can be set in FW V1.1 and higher).
- The operating parameters of the AS-i master are assigned.

Procedure

The basic configuration is performed by inserting the AS-i master module into the project of the configuration software.

Change the operating parameters according to their use. You will find information on operating parameters in the Sections:

- Parameters (Page 43)
- Explanation of the parameters (Page 44)

Should the need arise, you can change the size of the process image to be transferred as follows:

- In *STEP 7* in the "Properties" dialog of the AS-i master
- When the GSD file is used, by selecting the respective module variant from the GSD selection list

Further information on the process image:

- Address space (Page 44)

See also

Configuration of the AS-i slaves in STEP 7 (Page 31)

5.3 Configuration of the AS-i slaves

5.3.1 Configuration of the AS-i slaves in STEP 7

During configuration of the AS-i slaves, you specify the stations that the AS-i master is to communicate with in *STEP 7*.

Configuration in *STEP 7* provides the following advantages:

- AS-i slaves are displayed graphically in the network view along with their AS-i addresses (*STEP 7* (TIA Portal)) or displayed as a list (*STEP 7* V5.5 and higher).
- The assigned I/O addresses of an AS-i slave are displayed in the Properties window of the AS-i slave.
- The slave parameters can be configured in the *STEP 7* user interface.
- The configuration of the slaves is stored in the *STEP 7* project, which makes documentation easier.
- The configuration data is stored in the PLC and transferred automatically when the AS-i master is replaced.
- During power-up, the AS-i master switches automatically to "protected operation".
- The diagnostic status of the slave is displayed in *STEP 7* (TIA portal) in the network view as a symbol (currently only in combination with S7-300 / S7-400 CPU).

Note

If you do not configure any AS-i slaves in *STEP 7* or if you configure using a GSD file, AS-Interface uses the CONFIGURED configuration saved in the AS-i master. The following sections describe how you can create the CONFIGURED configuration:

- Configuration of the AS-i slaves using the "SET" button (Page 34)
- Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 36)

  This does not apply when configuring with a GSD file.
- Configuration of the AS-i slaves using the PLC program (Page 36)

Procedure

You activate configuration of the AS-i slaves in *STEP 7* as follows:

- In *STEP 7* (TIA Portal): by connecting at least one AS-i slave to the AS-i master over an AS-i network in the network view.
- In *STEP 7* V5.5: by inserting at least one AS-i slave in the configuration table of the AS-i master (FW V1.1 and higher).

When the AS-i slaves are configured in *STEP 7*, configuration is not possible using the "SET" button, via the online function or the PLC program.

This configuration switches the AS-i master automatically to "protected operation".

Option 1: Selection from the hardware catalog

To configure the AS-i slaves, open the hardware catalog in *STEP 7*.

STEP 7 (TIA Portal):

In *STEP 7* (TIA Portal), you will find the AS-i slaves under "Field devices".

1. Select a module from the hardware catalog.
2. Drag the module to the network view.
3. Connect the AS-i interface of the module (yellow square in the slave symbol) to the AS-i interface of the AS-i master (yellow square in the master) or directly to the yellow line of the AS-i subnet. When a connection is made to the AS-i subnet, a free AS-i address is automatically assigned in the configuration.

   You can change this AS-i address in the properties dialog of the AS-i slave in the "AS-Interface" area.

STEP 7 V5.5:

1. Open the "Object properties" dialog of the CM AS-i Master ST in the ET 200SP. To do so, select "Object properties" in the shortcut menu.
2. Click the "Slave configuration" tab (FW V1.1 and higher) in the "Properties..." dialog of the CM AS-i Master ST (FW V1.1 and higher) to open it.
3. Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.
4. Click the "Select" button to open the "Slave selection dialog".
5. Select a slave in this dialog.

   Alternatively: Select a slave from the "Module" list box.

Option 2: Reading out an existing AS-i configuration

If an AS-i cable with AS-i slaves is connected to the AS-i master, you can transfer the connected slaves to the configuration of *STEP 7*. The connected AS-i slaves must have addresses other than "0".

Procedure:

1. Switch on the AS-i voltage.
2. Compile the project and download it to the station.
3. *STEP 7* (TIA Portal):
   – Right click the AS-i master.
   – Select "Hardware detection" in the shortcut menu.

   STEP 7 V5.5:
   – Select the ET 200SP.
   – Open the "Properties" dialog of the CM AS-i Master ST by double-clicking the slot of the CM AS-i Master ST, for example.
   – Change to the "Options AS-i slaves" tab.
   – Click the "Upload to PG" button.

4. The detected slaves are applied as universal slaves in the project.

   Note

   Automatic reading out of article numbers is not possible.

   Slave addresses already present in the project are not overwritten. If you want to transfer a slave address that is already present, you must delete the existing slave in the hardware detection before the readout.
5. You can now edit the slaves applied to the project as if you had taken them directly from the hardware catalog.

The following basic types are available:

- Siemens AS-i slave
- Universal slave with the following forms:
  - AS-i F Slave Universal for safety-related applications
  - AS-i Standard Slave Universal, for configuring with standard address or extended address (A/B slaves)
  - Universal AS-i Proxy Slave

The article numbers for the slaves are only saved in the offline project. Comparison of the article numbers in the offline project with those of the slaves on the AS-i cable is not performed. The AS-i master uses the configuration data of the slave profile (IO.ID.ID2) and ID1 code of the AS-i slave for comparison of the actual status with the configured status.

Configuring the properties of Siemens AS-i slaves

When you use an AS-i slave from Siemens, you select the slave directly from the hardware catalog.

This selection offers the following properties:

- The device type is represented in *STEP 7* (TIA Portal) using an image.
- The meaning of the slave parameters is displayed as text.
- The underlying slave profile is already set. The IO, ID and ID2 identifiers do not need to be entered.

Parameter bits that are irrelevant for the Siemens slave are set to the default value "1". They cannot be changed.

The ID1 code is preassigned according to the factory setting of the Siemens slave. If you change the ID1 code of the slave, you must also change the setting in the slave configuration.

See also the command "No. D1: AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address) (Page 160)".

Configuring the properties of universal AS-i slaves

When configuring with the universal AS-i slave or universal AS-i F slave, you must make the following settings:

- Profile identification of the AS-i slave (IO, ID, ID2)
- Parameters of the AS-i slave

You will find the profile identification, the ID1 code, and the meaning of the AS-i slave parameters in the documentation for the AS-i slave.

The I/O assignment of the slave is shown, depending on the specified profile identification, in the "Configuration" section.

See also

Applying the slave configuration (Page 38)

No. 07: Store_Actual_Configuration (Page 114)

5.3.2 Configuration of the AS-i slaves using the "SET" button

Functional principle

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This supports the teaching procedure for the connected AS-i slaves. This function is activated by closing the button contact on the SET1 and SET2 terminals.

Behavior in "configuration mode" and in "protected operation"

Table 5- 1 "Configuration mode"/"Protected operation"

Mode of the CM AS-i Master ST	Behavior of the "CM" LED
"Configuration mode"	The "CM" LED lights up.
"Protected operation"	The "CM" LED does not light up.

When the AS-i master is in "configuration mode", the AS-i master is configured automatically when the "SET" button is pressed. Configuration is carried out as follows:

1. The CM AS-i Master ST saves the AS-i slave configuration present on the AS-i cable as the CONF configuration in non-volatile memory.
2. The AS-i master then switches over to "protected operation".

If the AS-i master is in "protected operation", it will switch to "configuration mode" when the "SET" button is pressed.

The "SET" button is only activated when the CPU is in "STOP" state or after disconnecting the bus from the IM module of the ET 200SP.

Requirements

Ensure the following states exist:

1. The CPU is in "STOP" state or the bus is disconnected from the IM module of the ET 200SP.
2. The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
3. No AS-i slave with address 0 is connected to AS-Interface. The AS-i slaves have unique addresses that differ from one another.

Procedure

1. Check whether the AS-i master is in "configuration mode". (The "CM" LED lights up.)

   If the "CM" LED does not light up, switch the AS-i master to "configuration mode" by pressing the "SET" button once.
2. Press the "SET" button. This configures the AS-i master. In so doing, the ACTUAL configuration detected is saved as the CONF configuration in non-volatile memory in the CM AS-i Master ST. At the same time, the AS-i master switches over to "protected operation". The "CM" LED goes out.

Note

Parameter setting when configuring with the "SET" button

If no AS-i slaves are connected, all internal lists are set to default values. In particular, the following are set: all AS-i parameters = F_{Hex} and bit "AutoAdress_Enable = 1".

When configuring is performed using the "SET" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the No. 00: Set_Permanent_Parameter (Page 107) command.

Note

The existing configuration can be overwritten using the "SET" button

Note regarding the CM AS-i Master ST:

A configuration of AS-i slaves specified using *STEP 7* and downloaded to the S7 station is transferred to the AS-i master again during S7 station start-up or after station recovery of the head module. Any configuration implemented using the "SET" button will be overwritten.

When configuring with the "SET" button, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 42)"). The AS-i voltage must be present.

See also

Terminal assignment (Page 25)

5.3.3 Configuration of the AS-i slaves via the control panel in the TIA Portal

You can also execute the functionality of the "SET" button described in Section "Configuration of the AS-i slaves using the "SET" button (Page 34)" via the control panel in *STEP 7*.

When configuring the AS-i slaves over the control panel in TIA Portal, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 42)"). The AS-i voltage must be present.

5.3.4 Configuration of the AS-i slaves using the PLC program

You can use the PLC program to completely define the configuration of the AS-i slaves.

The command interface of the AS-i master is available for this. You use the No. BA: Write_overall_configuration (Page 131) command to specify the CONF configuration of the AS-i slaves in the AS-i master, similarly as when configuring the slave in the TIA Portal.

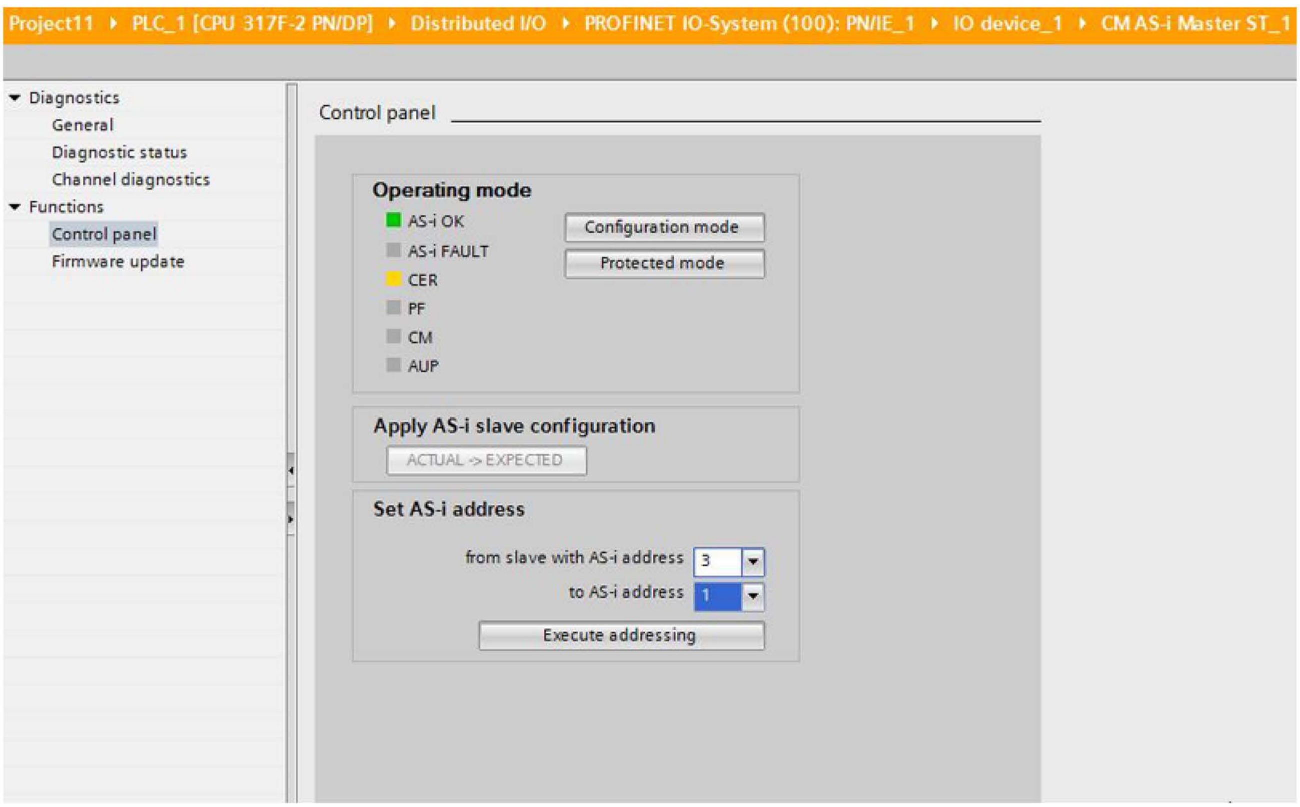
The No. 07: Store_Actual_Configuration (Page 114) command allows you to save the ACTUAL configuration as the CONF configuration in the AS-i master, similarly as when using the "SET" button for this.

5.4 Online functions in the TIA Portal

5.4.1 Switching from one operating mode to another

In *STEP 7* "Online" > "Diagnostics", you can switch between "protected operation" and "configuration mode" under "Functions". There are two buttons:

- "Configuration mode"
- "Protected operation"



The LEDs on the AS-i master and in *STEP 7* indicate the current operating mode of the AS-i master. You will find additional information in Section "Meaning of the LEDs (Page 64)".

The operating mode can only be switched when the CPU is in "STOP" state.

Note

Online functions

The online functions can only be performed when at least the basic configuration has been completed and the configuration has been loaded into the ET 200SP station.

5.4.2 Applying the slave configuration

Application

This step is only necessary if AS-i slaves have not been configured in *STEP 7* and the configuration of the AS-i slaves is not performed using the "SET" button.

If AS-i slaves have already been configured in *STEP 7* and the slave configuration has been downloaded to the AS-i master, the system deactivates the function for applying the slave configuration. It is then no longer possible for this function to be called.

Requirements

The following requirements must be satisfied to do this:

- The CPU is in "STOP" state.
- The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
- No AS-i slave with address 0 is connected to AS-Interface. The AS-i slaves have unique addresses that differ from one another.
- The AS-i master is in "configuration mode".

Applying the slave configuration

The "ACTUAL → CONF" button in the "Online" > "Diagnostics" window can be used to apply the configuration of slaves connected to the master.

The following data of the AS-i slaves is saved in non-volatile memory in the AS-i master:

- AS-i addresses
- The slave profile for each AS-i slave: IO code, ID code, ID2 code
- ID1 code for each AS-i slave

It is not possible to apply the slave configuration via the "ACTUAL -> CONF" button if AS-i slaves have already been configured in *STEP 7* and downloaded to the AS-i master or if the CPU is in "RUN" state. You reactivate the function "ACTUAL → CONF" by reloading the AS-i master in *STEP 7* with the basic configuration only - that is, without configured AS-i slaves.

Note

Parameter setting when applying the slave configuration

When configuring is performed using the "ACTUAL→CONF" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the No. 00: Set_Permanent_Parameter (Page 107) command.

5.4.3 Setting the address of an AS-i slave

In the "Online" > "Diagnostics" window, you can assign a new address to an AS-i slave using a selection menu and the "Execute addressing" button. Only free AS-i addresses are available here.

5.5 Variable configuration

Option handling and proxy slaves can be combined.

5.5.1 Option handling

A machine consists of a basic configuration and several expansion stages. The overall configuration is configured in the *STEP 7* project. The slaves that belong to an expansion stage are configured as optional slaves. When the system is commissioned, the user program (PLC) defines which expansion stages are installed. The configuration in *STEP 7* remains unchanged.

You can use option handling to activate and deactivate AS-i slaves that you have defined in HW Config in the user program during operation.

You configure the AS-i slaves in the AS-i master as described in Section "Configuration of the AS-i slaves in STEP 7 (Page 31)":

1. Activate option handling.

   STEP 7 (TIA Portal):

   – Select "Options > Option handling" in the slave properties dialog.

   – Select the "Option handling" check box.

   STEP 7 V5.5:

   – Select the "Slave configuration" tab in the "Properties..." dialog of the CM AS-i Master ST.

   – Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.

   – Select the "Option handling" check box.

   This activates the option handling for this slave.

2. Activate the slave using the user program (PLC).

   You can also deactivate the slave in the user program.

The AS-i master treats an optional slave that is not activated like a slave that is not configured. The AS-i master treats an activated optional slave like a slave that is configured without option handling.

Procedure

1. Define the AS-i slaves in *STEP 7* (TIA Portal) > Network view or in *STEP 7* V5.5 > "HW Config".
2. Specify whether option handling is enabled for each AS-i slave.
3. In the user program, you can activate or deactivate AS-i slaves for which option handling is activated during runtime. To do this, a combination of 2 bits must be set or reset in data record DS 131.

Note

Option handling and safe AS-i slaves

When data record DS 131 is written to the CM AS-i Master ST module, the signals of the safety-related slaves on the same bus are reset. Before transferring the option data record DS 131, ensure that the system is in an operating state in which a safety signal reset will not adversely affect the course of operation. Before restarting, error acknowledgement or reintegration must be performed for the safe AS-i inputs and, where applicable, the safe AS-i outputs. The correct procedure for the fail-safe evaluation system used must be observed.

DS 131 Read status of option handling (Page 41)

No. D0: Set_Configuration_Online (Page 159)

5.5.1.1 DS 131 Activate/deactivate optional slaves

Description

By writing this data record, you activate or deactivate slaves configured as optional on the AS-i bus.

Table 5- 2 Structure of DS 131 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2 … 9	List of slaves to be activated							
	Bit = 0	No action						
	Bit = 1	The slave will be activated.						
10 ... 17	List of slaves to be deactivated							
	Bit = 0	The slave will not be deactivated.						
	Bit = 1	The slave will be deactivated.						

Note

Identical entries in each list

If a "1" is entered for an AS-i slave in both lists, the slave will be deactivated.

Note

Activated/deactivated status of the optional slaves

The activated/deactivated status of the optional slaves is stored in non-volatile memory of the master and is retained even if a new configuration is downloaded to the master. The status of an optional slave is set to deactivated if the slave is not set as optional in a configuration.

If a configuration contains slaves without option handling, the status stored internally in the master for these slaves is reset (bit = 0).

Address space (Page 44)

Option handling (Page 39)

5.5.1.2 DS 131 Read status of option handling

Description

The current status of the slaves configured as optional is returned by reading this data record.

Table 5- 3 Structure of DS 131 read

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2 … 9	List of activated, optional slaves							
	Bit = 0	The optional slave is deactivated or the optional slave is not an optional slave.						
	Bit = 1	The optional slave is activated.						
10 … 17	List of configured, optional slaves							
	Bit = 0	The slave is not configured as an optional slave or it is not contained in the configuration.						
	Bit = 1	The slave is configured as an optional slave.						

If a slave is configured as not optional, then the associated bit in the list of activated optional slaves in the non-volatile memory of the master is reset to the value 0.

Option handling (Page 39)

5.5.2 AS-i proxy slave

Description

A proxy slave is used to represent any given slave. This means you define the I/O addresses in the PLC program in advance. You define the slave itself at runtime.

Procedure

- Configure a proxy slave in "*STEP 7* > HW Config" with the associated digital and / or analog I/O addresses. You can then use these I/O addresses in the user program to access the data of the proxy slave once you have defined the slave profile at runtime.

  To do this, select the proxy slave from the universal AS-i slaves in the hardware catalog.
- At runtime, specify in the PLC program which slave type should be operated under this address.
- You define the slave profile of the proxy slave by changing the overall configuration ("No. D0: Set_Configuration_Online (Page 159)" command). In this case, the AS-i branch is not reset.
- The slave type defined in the user program is retained in the CM AS-i Master ST module, even after the power supply has been switched off.
- The slave type of a proxy slave defined in the user program is retained in the CM AS-i Master ST module, even after the hardware configuration has been reloaded into the station.

Applications

- Variable machine configurations that can be changed at runtime.
- Flexible expansion of the system in the future, without the need to specify the actual type of slave beforehand.

6 Parameter assignment/addressing

6.1 Parameters

Parameters of the AS-i master

Table 6- 1 Assignable parameters and their default setting (GSD file)

Parameters	Value range	Default
Diagnostic interrupt in case of errors in AS-i configuration	• Enable • Disable	Enable
Diagnostic interrupt in case of AS-i cable fault	• Enable • Disable	Enable
Automatic address programming	• Enable • Disable	Enable
Ground-fault monitoring activated	• Enable • Disable	Enable
Automatic ID1 code assignment (Firmware V1.1 and higher)	• Enable • Disable	Disable
Duplicate address detection[1)]	• Enable for AS-i voltage 24 V • Enable for AS-i voltage 30 V • Disable	Disable

1) This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.2 Explanation of the parameters

Diagnostic interrupt if AS-i configuration error:

With this parameter, you specify whether AS-i configuration errors will be signaled to the higher-level system. The following are signaled as a configuration error:

- A surplus slave
- A missing slave
- A slave of the wrong type

Diagnostic interrupt if AS-i cable fault:

This parameter is used to specify whether faults concerning the AS-i cable should be reported to the higher-level system. Possible AS-i cable faults are:

- Ground fault
- Insufficient AS-i voltage
- Peripheral fault of an AS-i slave

Automatic address programming:

When a defective AS-i slave is being replaced, you use this parameter to specify whether the configured AS-i address will be automatically assigned to the new device.

For details on this functionality, see Section "Replacing a defective AS-i slave / automatic address programming (Page 74)"

Ground-fault monitoring activated:

This parameter is used to specify whether ground faults on the AS-i cable should be detected by the AS-i master. Deactivate this setting if you are using an external unit for ground fault detection.

Automatic ID1 code assignment:

When you activate this parameter, in the case of automatic address programming the ID1 code of a slave is written to the value specified during configuring.

Duplicate address detection:

The duplicate address detection function can identify inadvertent duplicate addressing. When you activate it, you must select the AS-i line voltage in use.

This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.3 Address space

The assignment of the address space is described in the following Section:

Data exchange between the user program and AS-i slaves (Page 45)

7 Data exchange between the user program and AS-i slaves

7.1 Access to AS-Interface

The distributed I/O system communicates with the AS-i slaves via the CM AS-i Master ST. The AS-i communication objects are mapped onto a continuous data area for input and output data.

What's new in firmware V1.1 and higher

The following options are available as of firmware V1.1:

- You can design the process image flexibly according to your needs.
- You can reduce the length of the reserved I/O area (depending on the configuration software version).

Designing the process image flexibly.

You can design the process image in the following way:

- Reduce or increase the process image (default length 32 bytes):
  - If the AS-i slaves are configured in STEP 7: the length can be set in steps in the range 4 ... 288 bytes. In this case, the maximum length of the process image depends on the ET 200SP interface module (IM) or ET 200SP CPU used.
  - If the AS-i slaves are not configured in STEP 7 length can be set to 16 or 32 bytes
- Variable division of the process image if AS-i slaves are configured in STEP 7:
  - Analog values and digital values can be mapped in one process image.
  - The slave address is not bound to a specific position in the process image.
  - The number of bits per slave can vary. For example, the digital input data of the slave at address 1 can be one bit long and the analog data of the slave at address 5 can be two bytes long.

Length of the reserved I/O area can be reduced

If your configuration contains fewer AS-i slaves, you may reduce the length of the reserved I/O area (depending on the configuration software version). This reduces the volume of data to be transmitted on PROFIBUS or PROFINET.

You set the length of the I/O area in *STEP 7* (TIA Portal) in the properties of the AS-i master. This does not change the assignment of the slave address to the offset.

This means: When the length is reduced, the higher AS-i bus addresses can no longer be addressed.

Address overview

In the Properties dialog box of module CM AS-i master ST under "I/O Addresses", you can call up an address overview in which the I/O addresses are assigned to the AS-i slaves (as of TIA Portal V14 SP1 extended for any configuration)

7.2 Transmitting AS-i digital values

A missing or failed digital slave results in the substitute value 0 in the input data. In the output direction, the non-assigned values have no effect.

Refer to the information about display of transparent values / digital values in Section Accessing AS-i analog data via the process image (Page 58).

7.2.1 I/O addresses when configuring AS-i slaves in STEP 7

Process image transmission time

The time it takes to transmit a process image depends on its size:

- If the length of the process image is set to up to 32 bytes, the I/O data in the ET 200SP station are transmitted within 1 backplane bus cycle. This setting results in the shortest transmission time on the backplane bus.
- If the length of the process image is set to more than 32 bytes, the I/O data of the CM AS-i master°ST in the ET 200SP station are transmitted in several consecutive backplane bus cycles. Data consistency is maintained from the point of view of the IM or the CPU. Division into several backplane bus cycles is performed automatically by the ET 200SP system. The number of required backplane bus cycles is automatically determined and depends on the set length of the process image. In this case, the maximum length of the process image depends on the ET 200SP interface module (IM) or ET 200SP CPU used. For more detailed information, see the technical data of the IM or CPU.

CM AS-i Master ST with configured AS-i slaves

If you configure the AS-i slaves as described in Section "Configuration of the AS-i slaves in STEP 7 (Page 31)", you will set the I/O addresses of the slaves using the Properties dialog box of the AS-i slave. The I/O address can be set individually in the area of the defined process image of the AS-i master. The input/output bits x.4 to x.7 in the first byte of the process image of the AS-i°master cannot be used for AS-i slaves. The process image can contain input/output data of digital and analog slaves. The bit length of a slave depends on the configured profile.

If the option "Reserve 4 bits length" is activated, 4 input bits and 4 output bits will be reserved for the slave. In this case, the real I/O data of the AS-i slave fall within the 4 bit range as described in Table 7-6 "Standard assignment table for inputs/outputs of digital AS-i slaves" in SectionI/O addresses without configuration of the AS-i slaves in STEP 7 (Page 50).

Arrangement of the AS-i slaves in the process image (Sort)

In TIA Portal V14 SP1 and higher, the arrangement of the AS-i slaves in the process image can be sorted automatically. 3 options are offered in the Properties of the AS-i master under "I/O Addresses > Arrangement":

- Sort - CLASSIC:
  The digital inputs/outputs of the slaves are sorted into the process image as described in Table 7-1 "Bit assignment per digital slave (CLASSIC sorting)", starting from the set start address of module CM AS-i master ST. CLASSIC sorting is the same as that described in SectionI/O addresses without configuration of the AS-i slaves in STEP 7 (Page 50).
  After the digital inputs/outputs, the analog inputs/outputs are sorted into the process image. The status information (EFD, CM, CFGOK, DIAG) is displayed if the option "Process image for status information" (FW V1.1 and higher) is activated, see Table 7-3 "Overview of status information".
- Sort - LINEAR:
  The digital inputs/outputs of the slaves are sorted into the process image as described in Table 7-2 "Bit assignment per digital slave (LINEAR sorting)": The digital inputs/outputs of the slaves with a standard address or A address are mapped in bits 0 ... 3, whereas the digital inputs/outputs of the slaves with a B address are mapped in bits 4 ... 7.
  After the digital inputs/outputs, the analog inputs/outputs are sorted into the process image. The status information (EFD, CM, CFGOK, DIAG) is displayed if the option "Process image for status information" (FW V1.1 and higher) is activated, see Table 7-3 "Overview of status information".
- Packing:
  Address usage for the inputs/outputs of the slaves is optimized, i.e. all gaps are eliminated and the length of the I/O area is adapted. You can see the selected I/O addresses directly in the address overview of the I/O addresses in the configuration of the CM AS-i master ST.

Status information in input process image

To provide a quick summary diagnosis, the following status information can optionally be transferred to a selectable address in the input process image (FW V1.1 and higher).

Table 7- 3 Overview of status information

EFD	0 = No ground fault detected 1 = Ground fault detected
CM	0 = Master in protected operation 1 = Master in configuration mode
CFGOK	0 = Configuration not OK or slave exists with address 0 1 = Configuration OK
DIAG	0 = No diagnostics pending 1 = Diagnostics pending. This information is set for the following events: -The AS-i master is in "offline" mode. - The AS-i voltage is not OK. - Multiple addressing was detected. - An I/O error was detected. - A configuration error was detected. - A slave with address 0 exists.

7.2.2 I/O addresses without configuration of the AS-i slaves in STEP 7

I/O addresses of the slaves in the process image

If you configure according to Sections "Configuration of the AS-i slaves using the "SET" button (Page 34)" to "Configuration of the AS-i slaves using the PLC program (Page 36)", the I/O addresses of digital slaves in the process image of the AS-i master are located at a fixed position according to the following table. The I/O data of analog slaves can be accessed via a data record.

Input data and output data of the AS-i slaves are exchanged with the controller via an I/O area of 16 or 32 bytes. As a result, the digital values of up to 62 AS-i slaves are transmitted. In doing so, 4 bits are assigned to each digital slave. The offset for accessing this data depends on the AS-i address of the AS-i slave.

In a project in which the AS-i slaves are not configured in STEP 7, the standard length of the process image is 32 bytes. In firmware V1.1 and higher, the length can be set to 16 or 32 bytes.

In an I/O address area of 16 bytes, you can only assign standard addresses or A addresses for slaves. In an I/O address area of 32 bytes, you can also assign B addresses for slaves.

Table 7- 4 Bit assignment per digital slave

Byte number 1)		Bit 7 … 4				Bit 3 … 0			
		Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0

		Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0

1) n = Start address

Status information for process image with 32 bytes

For a process image that is 32 bytes long, the following information is transferred in byte n+16 (FW V1.1 and higher):

Table 7- 5 Status information in byte n+16 for a process image that is 32 bytes long:

Bit 7: EFD	0 = No ground fault detected 1 = Ground fault detected
Bit 6: CM	0 = Master in protected operation 1 = Master in configuration mode
Bit 5: CFGOK	0 = Configuration not OK or slave exists with address 0 1 = Configuration OK
Bit 4: DIAG	0 = No diagnostics pending 1 = Diagnostics pending. This information is set for the following events: -The AS-i master is in "offline" mode. - The AS-i voltage is not OK. - Multiple addressing was detected. - An I/O error was detected. - A configuration error was detected. - A slave with address 0 exists.

The status information provides a quick summary diagnosis.

If a process image is 16 bytes long, only the first 16 bytes (byte n to byte n+15) are transferred.

Bit assignment of the process image

In a project in which the AS-i slaves are not configured in STEP 7, 4 bits of digital input data and 4 bits of digital output data are assigned to the process image. I/O bits that are not assigned by the slave contain the substitute value 0. The assignment of the process image depends on the AS-i slave type. For digital slaves with up to 4-bit inputs and 4-bit outputs, the following standard assignment table applies:

Table 7- 6 Standard assignment table for inputs/outputs of digital AS-i slaves

IO code	Number	Input process image				Output process image			
(Hex value)	Inputs/ outputs	Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0
0	4 DI	IN 3	IN 2	IN 1	IN 0	-	-	-	-

E	3 DI / 4 DQ	IN 2	IN 1	IN 0	-	OUT 3	OUT 2	OUT 1	OUT 0

Information about the table:

DI: Digital input
DQ: Digital output

The actual numbering of the inputs/outputs of the AS-i slaves depends on the manufacturer of the slave.

In the case of slaves with extended addressing (A/B slaves), column "Bit 3" of the output process image is not assigned data. Exception: In the case of slaves with profile IO.ID.ID2 = 7.A.7, "Bit 3" of the output process image is also assigned.

In particular, the table does not apply to slaves of Combined Transaction Type (CTT) with profiles 6.0, 7.3, 7.4, 7.5.5, 7.A.5, 7.A.8, 7.A.9, 7.A.A, B.A.5 (IO.ID or IO.ID.ID2), see data sheet of slave. For assignment of safety slaves (profile 0.B and 7.B), see Section 7.2.3 "Special characteristics of AS-i Safety Slaves".

Configuration example

The following graphic shows an example of addressing 4 digital slaves. In the example, you configure the start addresses n = 40 for the I/O data in *STEP 7*.

The bits with a gray background are relevant for the user program. The bits with a white background are not relevant for the user program, because AS-i slave bits are not assigned here.

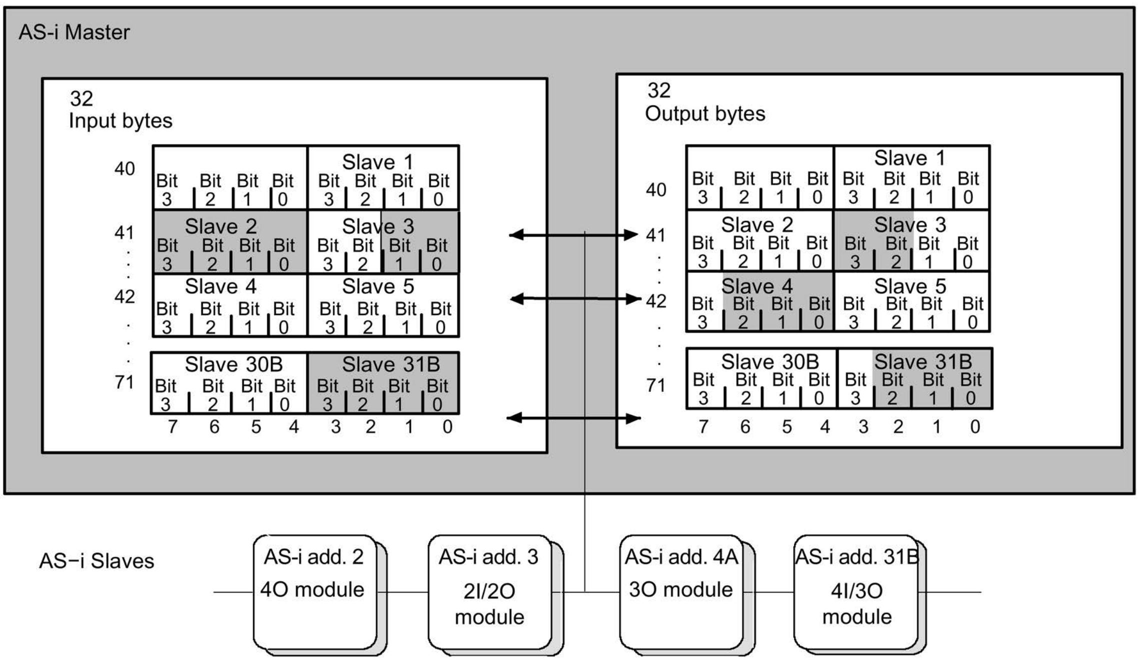

Figure 7-1 Example of addressing 4 digital slaves

The AS-i slave with address 3 and with two inputs and two outputs, referred to as a 2I/2O module, occupies bits 0 and 1 in input byte 41 and bits 2 and 3 in output byte 41 in the graphic, for example.

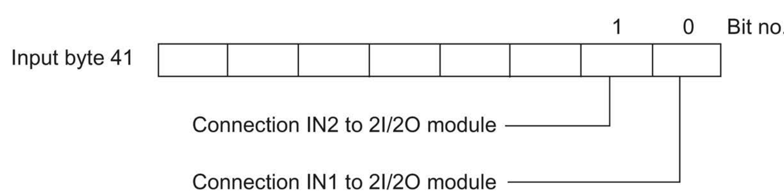

Figure 7-2 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the input bytes for slave with address 3

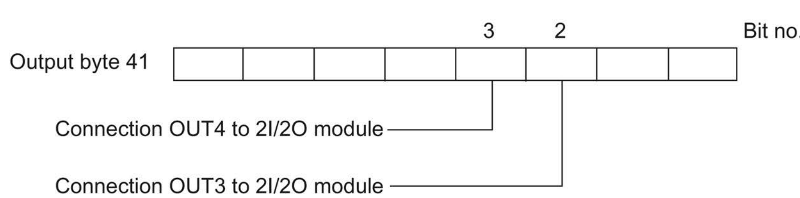

Figure 7-3 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the output bytes for slave with address 3

7.2.3 Special characteristics of AS-i Safety slaves

The AS-i master performs a non-safe evaluation for the data of safe input slaves. The evaluation is represented in the process image of a Safety input slave as follows:

Table 7- 7 Input process image of a Safety input slave

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	All contacts are open.
0	0	0	1	F-IN1 is closed.
0	1	0	0	F-IN2 is closed.
0	1	0	1	F-IN1 and F-IN2 are closed.

In addition, the AS-i master evaluates in a non-safe manner how a safe AS-i output is to be addressed. The information is in the input process image of the standard controller:

Table 7- 8 Input process image of the control unit for a safe AS-i output.

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	The safe AS-i output is controlled with status OFF position.
1	1	1	1	The safe AS-i output is controlled with status ON position.

Note

This involves a non-safe evaluation of the safe signals for diagnostic purposes.

Non-safe evaluation must not be used for safety-related switching.

List of abbreviations (Page 173)

7.3 AS-i analog values and transparent / digital values more than 4 bits in length are transferred

The following information only applies to AS-i slaves whose data is stored as analog values or as transparent or digital values more than 4 bits in length.

Note

The CM AS-i Master ST does not support the transmission of analog values in accordance with AS-i Slave Profile 7.1 / 7.2. Transmission of analog values must be implemented in the software for these slaves.

Analog interface between the CPU and the CM AS-i Master ST

In the user program, you use the process image (Firmware V1.1 and higher) or data records to access I/O data of analog slaves.

For more detailed information, refer to Section "Accessing AS-i analog data via the process image (Page 58)".

Representation of the analog values or the transparent values

The analog values are to be interpreted as 16-bit values in two's complement.

The transparent/digital values must be interpreted as two independent bytes.

In the case of AS-i slave profiles for transparent/digital data, the AS-i master passes through the data of the AS-i slave to the controller without interpreting the content.

For universal AS-i slaves, the following is displayed in the "Configuration" field in *STEP 7*:

- Information about the number of channels
- Information about the resolution
- Information about the data frame of transparent I/O data

In the documentation for the respective AS-i slave, you will find further information about:

- Value range
- Measuring range
- Accuracy of analog slaves
- Meaning of transparent data

Special cases in analog value transfer

- In the input direction, the AS-i master sends a substitute value in the event of a slave failure or AS-i communication error:
  - For slaves with analog transmission, the AS-i master always supplies the substitute value $7FFF_H$, if the slave fails after power-up of the master.

    "Transparent" mode exception:

    For slaves according to the following profiles, the AS-i master supplies the substitute value 0000_H:

    7.3.0 to 7.3.3 (Type CTT1, output slave 16 DO in "Transparent" mode)

    7.3.8 to 7.3.A (Type CTT1, input slave 16 DI in "Transparent" mode)

    7.A.A (CTT3, 8 DI / 8 DO slave with A/B address)

    7.A.8 (ID1 = 3, 4, 5) (Type CTT4, max. 16 DI slave with A/B address)

    7.A.5, 7.5.5 and B.A.5, if you have transparent input (Type CTT2)

    6.0.x where x = 2 … 7 (Type CTT5, in "Transparent" mode)
- In the output direction, the AS-i master sends logic "0" to all slaves in the event of a failure or in "STOP" state.
- If the AS-i master or the communication between the AS-i master and PLC fails, data record access to the analog values or transparent/digital input values is not possible. Note that the analog input values and transparent/digital input values are not updated in your user program in this case, and ensure a substitute value processing via the program.

NOTICE
Behavior in the event of a slave failure If the slave fails prior to or during the power-up of the AS-i master, the substitute value $7FFF_H$ may also be supplied. That is, the input bits of these transparent or digital slaves have the substitute value 1. For this reason, check whether the diagnostic data of these slaves indicate a slave failure and, if required, ensure an appropriate substitute value processing via the program.

Special characteristics of combined transaction type slaves

When using slaves in accordance with CTT 1 to 5, all or some I/O bits are used for special transfer functions in the process image for AS-i digital values. For further details, please refer to the documentation of the respective AS-i slave.

The following applies to these protocol bits:

- In the input direction, the AS-i master sets the value "0".
- In the output direction, the AS-i master ignores the bits.

7.3.1 Accessing AS-i analog data via the process image

If you assigned I/O addresses to the analog slaves when configuring, you can access the AS-i analog values with word commands (Firmware V1.1 and higher).

Analog and transparent I/O addresses for configured AS-i slaves

The analog and transparent I/O addresses of an AS-i slave can be freely assigned within the overall process image of the CM AS-i Master ST. This is regardless of the size of the process image. If you only require a few analog inputs and outputs in the process image and want to save space, you can change the length of the I/O data of an AS-i slave. If the set length is less than the actual length of the I/O data of the AS-i slaves, you cannot access the data at addresses greater than the set length via the process image. You can also deactivate the process image for analog inputs/outputs. Please also see the description of the options "Sorting" and "Packing" in Section I/O addresses when configuring AS-i slaves in STEP 7 (Page 46).

Access to analog I/O data is also possible via data records independent of the process image. You can find more detailed information on this in Section "Accessing AS-i analog data via acyclic services (Page 58)".

7.3.2 Accessing AS-i analog data via acyclic services

Representation of the analog values in the data records

Analog values are transferred in the data records numbered from 140 to 147.

- You access the analog input values using system functions for reading data records.
- You output analog values using system functions for writing data records.

In combination with SIMATIC S7, system function blocks SFB 52 "RDREC" and SFB 53 "WRREC" enable this.

Access to analog data via acyclic services can also be selected, for example, if there is a need to save I/O address space in SIMATIC S7.

NOTICE
Simultaneous write access via cyclic and acyclic services not possible
Simultaneous write access to analog data of a slave is not permissible with different process values either via cyclic or acyclic services. If both services are used the analog output values that are output via cyclic and acyclic services to the same slave address must be synchronized with each other via the user program.

You can use data record lengths ranging from 2 bytes to 240 bytes for each data record number. For each slave address, an area of 8 bytes is available to address 4 analog channels.

The table below shows which data record is used by each AS-i slave to transfer the analog values. The subsequent table shows the assignment of analog values to the respective analog slaves.

The tables are applicable to analog inputs and analog outputs.

Table 7- 9 Access to analog values via data records

AS-I address of the slave	Start addresses for analog values in the data record							
	DS 140	DS 141	DS 142	DS 143	DS 144	DS 145	DS 146	DS 147
1	0	—	—	—	—	—	—	—
2	8	—	—	—	—	—	—	—
3	16	—	—	—	—	—	—	—
4	24	—	—	—	—	—	—	—
5	32	0	—	—	—	—	—	—
6	40	8	—	—	—	—	—	—
7	48	16	—	—	—	—	—	—
8	56	24	—	—	—	—	—	—
9	64	32	0	—	—	—	—	—
10	72	40	8	—	—	—	—	—
11	80	48	16	—	—	—	—	—
12	88	56	24	—	—	—	—	—
13	96	64	32	0	—	—	—	—
14	104	72	40	8	—	—	—	—
15	112	80	48	16	—	—	—	—
16	120	88	56	24	—	—	—	—
17	128	96	64	32	0	—	—	—
18	136	104	72	40	8	—	—	—
19	144	112	80	48	16	—	—	—
20	152	120	88	56	24	—	—	—
21	160	128	96	64	32	0	—	—
22	168	136	104	72	40	8	—	—
23	176	144	112	80	48	16	—	—
24	184	152	120	88	56	24	—	—
25	192	160	128	96	64	32	0	—
26	200	168	136	104	72	40	8	—
27	208	176	144	112	80	48	16	—
28	216	184	152	120	88	56	24	—
29	224	192	160	128	96	64	32	0
30	232	200	168	136	104	72	40	8
31	—	208	176	144	112	80	48	16

Examples / notes on reading this table:

The subsequent table shows the assignment of analog values to the respective analog slaves.

For additional information, refer to the operating instructions of the slaves.

Table 7- 10 Address range for the analog values of an AS-i slave

Byte no. (start address + offset)	Analog value channel
Start address + 0	Channel 1 / high byte
Start address + 1	Channel 1 / low byte
Start address + 2	Channel 2 / high byte
Start address + 3	Channel 2 / low byte
Start address + 4	Channel 3 / high byte
Start address + 5	Channel 3 / low byte
Start address + 6	Channel 4 / high byte
Start address + 7	Channel 4 / low byte

Analog A/B slaves with 2 channels only reserve half the address range. A slaves occupy bytes 0 to 3 and B slaves bytes 4 to 7.

Examples of the configuration:

1. Configuration:

   Analog slaves have the AS-i addresses 1 to 6.

   You use data record 140 and enter 48 as data record length.

2. Configuration:

   1 analog slave with AS-i address 7 is used.

   You use data record 141 and enter 24 as data record length. Only bytes 16 to 23 are relevant.

3. Configuration:

   The full address range for 31 analog slaves is used.

   You use data record 140 and enter 224 as data record length. You can then address analog slaves 1 to 28.

   For the remaining analog slaves 29 to 31, you use data record 147 in a second job and enter 24 as data record length.

4. Configuration:

   Analog slaves have the addresses 29 to 31.

   You use data record 147 and enter 24 as data record length.

Mixed access:

- Configuration:

  You want to access slaves 1 to 12 using I/O commands and slaves 13 to 31 using data records.

  You use data record 143 for slaves 13 to 31.

Alarms, faults and system events 8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the AS-i master:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Online presentation of the network and device view
  - Diagnostic buffer
- Alarm messages in user program
- Creation of user-specific web pages via the web server of a connected SIMATIC controller

You will find information on the LEDs in Section "Meaning of the LEDs (Page 64)".

The diagnostic possibilities in *STEP 7* and in the user program are described in the following sections.

8.2 Diagnostics in STEP 7

Diagnostics in STEP 7

For diagnostics of the AS-i master and the AS-i slave, use the "Go online" function to switch *STEP 7* to "Online" status.

If you have configured AS-i slaves in *STEP 7*, the diagnostic information about slaves can be displayed in *STEP 7*.

The diagnostics of the AS-i slaves in STEP 7 V13 SP1 (TIA Portal) are not displayed via the online network view function. The information of the AS-i master is displayed symbolically in the device view. The status of these devices will also be displayed to the right of the device in the project navigation by means of a symbol. For an explanation of the different status symbols, please refer to the relevant tool tip.

STEP 7 offers several possibilities for requesting the diagnostic information of the AS-i master:

- Special diagnostic symbols indicate the status of the AS-i master in the network view of the device configuration. Red symbols signal an error, and green symbols indicate that the devices are OK.
- In *STEP 7* V13 SP1 (TIA Portal), you can call up information about the status of the AS-i master and AS-i slaves. To do so, open the diagnostics as follows:
  - Select the AS-i master.
  - Select "Online & diagnostics" in the shortcut menu.
  - In the "Online & diagnostics" view, select "Detailed diagnostics > Error overview".

    Here you see the current status of every AS-i slave address.

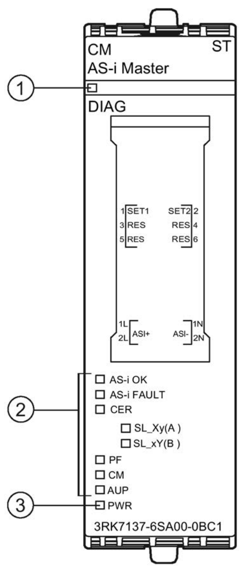
  To analyze sporadic errors, you can read out the error counter for the AS-i network.

  Diagnostics are also available in *STEP 7* V5.5 HSP 2092 V3.0 and higher.
- The control panel of the AS-i master can also be called up in this display. This shows the status of the LEDs.
- All the relevant events are stored in the diagnostic buffer of the CPU. You can display the diagnostic buffer in the "Online & Diagnostics" window for a selected CPU.

8.3 LED statuses

8.3.1 Arrangement of the LEDs on the CM AS-i Master ST

Introduction



① DIAG (green/red)

② Status LEDs (AS-Interface)

③ PWR (green)

Figure 8-1 Arrangement of the LEDs on the CM AS-i Master ST

8.3.2 Meaning of the LEDs

Meaning of the LEDs

The tables below explain the status and fault indications. Remedies for the diagnostic messages are in Section "Diagnostic messages (Page 69)".

"PWR" LED

Table 8- 1 Meaning of the "PWR" LED

PWR	Meaning
☐ OFF	The AS-i voltage is not provided (terminals L+, M).
■ Green ON	The AS-i voltage is provided (terminals L+, M).

"DIAG" LED

Table 8- 2 Meaning of the DIAG LED

DIAG	Meaning
☐ OFF	The supply voltage for the interface module of the ET 200SP is not provided.
✲ Green flashes	The AS-i master parameters have not been assigned.
■ Green ON	The AS-i master parameters have been assigned and are error-free. No diagnostic message of the AS-i master is pending.
✲ Red flashes	The AS-i master parameters have been assigned and the AS-i master signals diagnostic errors for the AS-i master or an AS-i slave or an active firmware update.

"AS-i OK" LED

Table 8- 3 Meaning of the AS-i OK LED

AS-i OK	Meaning
OFF	An error has occurred (see AS-i FAULT LED) or the AS-i master is offline. This means: No I/O data exchange is taking place, e.g., during power-up.
Green ON	The AS-i bus is fault-free. I/O data exchange takes place.

"AS-i FAULT" LED

Table 8- 4 Meaning of the AS-i FAULT LED

AS-i FAULT	Meaning
Red OFF	No AS-i cable faults have occurred. The AS-i master is in "Offline" mode.
Red ON	The AS-i bus has failed, e.g. the supply voltage for AS-Interface is too low, ground fault.
* Red "flashes"	A fault has occurred, e.g. a duplicate address or parameterization error has been detected.

"PF" LED

This LED indicates peripheral faults.

Table 8- 5 Meaning of the "PF" LED

PF	Meaning
□ Red OFF	No peripheral fault is being signaled.
■ Red ON	At least one AS-i slave is signaling a peripheral fault. Refer to the operating instructions for the respective slave for the meaning of the peripheral fault, e.g., overload at the standard outputs and/or overload of the sensor power supply of the standard inputs.

Firmware update (Page 21)

"CER" LED

This LED indicates configuration errors. It lights when the slave configuration detected on the AS-i cable does not match the CONFIGURED configuration in the AS-i master.

Table 8- 6 Meaning of the "CER" LED

CER	Meaning
□ Yellow OFF	No AS-i configuration error.
■ Yellow ON	Failure of an AS-i slave: • A configured AS-i slave is not present on the AS-i cable. • An excess slave not configured beforehand is present on the AS-i cable. • A connected slave has different configuration data (IO, ID, ID1, ID2) than the slave configured in the AS-i master. • A slave with address "0" is in "Configuration mode" on the AS-i bus.

"CM" LED

This LED indicates the operating status (Configuration Mode).

Table 8- 7 Meaning of the "CM" LED

CM	Meaning
□ Green OFF	The AS-i master is in "protected operation".
■ Green ON	The AS-i master is in "configuration mode".
✲ Green flashes	During a firmware update: Errors have occurred during the firmware update.

"AUP" LED

This LED indicates whether automatic address programming is possible or not.

Table 8- 8 Meaning of the "AUP" LED

AUP	Meaning
□ Green OFF	Automatic address programming is not possible. This LED is always off in configuration mode.
■ Green ON	When the AS-i master is in "protected operation", this LED indicates that automatic address programming of an AS-i slave is possible. Automatic address programming makes it easier to replace a defective AS-i slave on the AS-i cable. For more detailed information, refer to Section "Replacing a defective AS-i slave / automatic address programming (Page 74)".

"SL_Xy(A)" and "SL_xY(B)" LEDs

These LEDs indicate the slave addresses to which an error is signaled. The following states are taken into account:

- The slave has failed.
- The slave is an excess slave.
- The slave type is incorrect.
- Double addressing detected.

The following diagram shows the indication sequence:

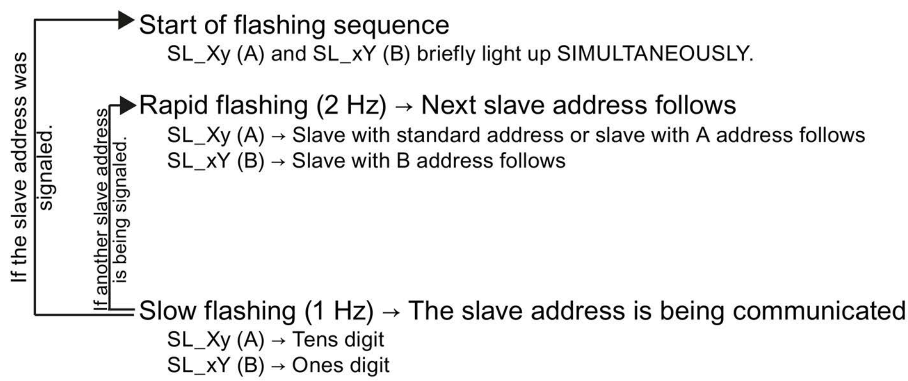


Figure 8-2 Indication sequence

Example: Slave 15 and 21B have failed

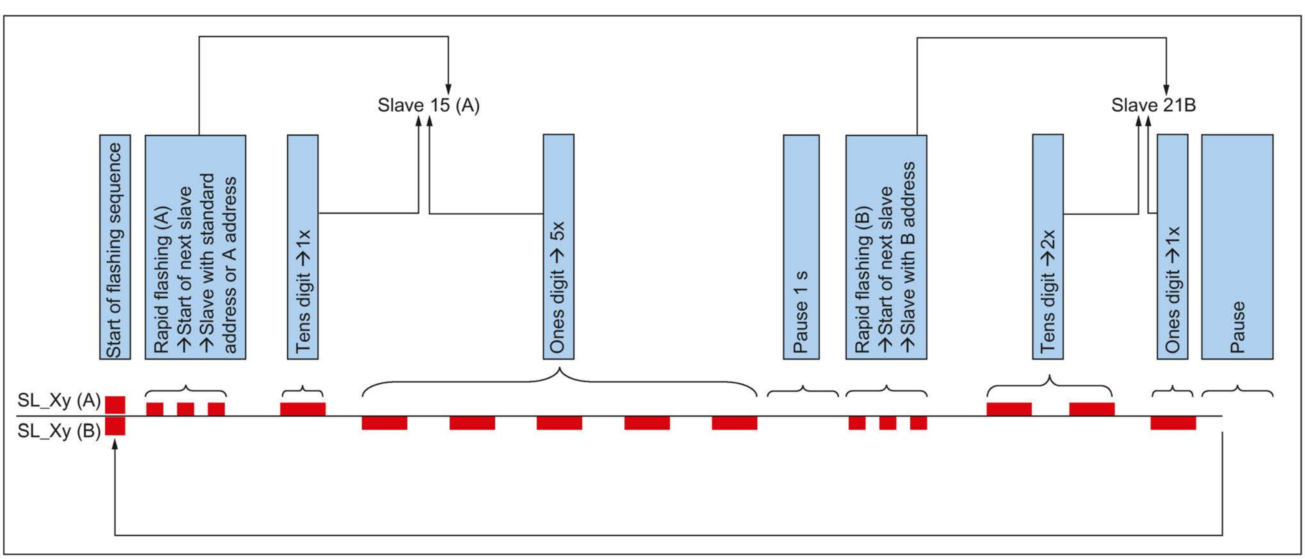

Figure 8-3 Example: Slave 15 and 21B have failed

8.4 Diagnostic messages

8.4.1 Alarms

The AS-i master sends a diagnostic interrupt request to the CPU in the following situations:

- The AS-i master has detected a problem, e.g. failure of a slave (incoming event).
- The problem was rectified or no longer exists (outgoing event).

If there is no OB 82 in the user program, a CPU of the S7-300 / S7-400 product range will switch to "STOP".

If an OB 82 exists, the operating system responds to an incoming event by calling the OB 82. The S7 CPU then interrupts the cyclic user program and enters the event in the system diagnostic buffer as a "Module fault" message.

Some diagnostic information is made available to the user in the local data of the OB 82, e.g.: Which module triggered the interrupt? What type of error has occurred?

Following execution of the OB 82, the S7 CPU continues the cyclic program from the point of interruption.

When parameterizing the CM AS-i Master ST, you can specify whether and in what cases a diagnostics interrupt should be triggered.

See Section "Parameter assignment/addressing (Page 43)"

See Section "Fault indications/fault remedies (Page 80)" for a list of possible error cases.

8.4.2 Possible response to the diagnostic interrupt

Diagnostic events of the AS-i master and all AS-i slaves are signaled by means of OB82, e.g. No voltage on AS-Interface, peripheral fault

---

Note

Diagnostic buffer

Please note that OB 82 is only called for the first error event. If an error caused by an AS-i slave is already active, subsequent AS-i slave errors will only be noted in the diagnostic buffer of the CPU.

The cause of the interrupt can be determined by reading out data records with diagnostic data during execution of the OB 82 block or during cyclic program execution. See Section "Data records for diagnostics (Page 82)".

8.4.3 Error messages

AS-i-specific faults

The following AS-i-specific faults are possible:

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0400_H	1024	AS-i slave failed	An AS-i slave on an A address or a slave with standard address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • There is a break in the cable • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators
0401_H	1025	AS-i slave on B address failed	An AS-i slave on a B address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • The cable is interrupted. • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators

<table>
<tr><th rowspan="2">Channel / Fault type</th><th colspan="2">Fault</th><th rowspan="2">Cause</th><th rowspan="2">Remedial measures</th></tr>
<tr><th>No.</th><th>Message</th></tr>
<tr><td>0402H</td><td>1026</td><td>Peripheral fault in AS-i slave</td><td>An AS-i slave on an A address or a slave with a standard address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave.
Possible cause:
• An overload at the output of a digital slave or an overload at the actuator
• Measuring range exceeded for analog input slaves
• Overload of the sensor supply at the input slave (only for some slave types)
• Group fault message for M200D motor starters</td><td>Note the information in the manual for the AS-i slave.
Check:
• Slave
• Overload
• Connected sensors and actuators</td></tr>
<tr><td>0403H</td><td>1027</td><td>Peripheral fault in AS-i slave on B address</td><td>An AS-i slave on a "B" address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave.
Possible cause:
• An overload at the output of a digital slave or an overload at the actuator
• Measuring range exceeded for analog input slaves
• Overload of the sensor supply at the input slave (only for some slave types)
• Group fault message for M200D motor starters</td><td>Note the information in the manual for the AS-i slave.
Check:
• Slave
• Overload
• Connected sensors and actuators</td></tr>
<tr><td>0404H</td><td>1028</td><td>AS-i address used multiple times</td><td>Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a standard address or A address. The channel number of the message shows the address of the affected AS-i slave.</td><td>Change the addresses of the AS-i slaves to addresses that are unique in the network.</td></tr>
<tr><td>0405H</td><td>1029</td><td>AS-i B address used multiple times</td><td>Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a B address. The channel number of the message shows the address of the affected AS-i slave.</td><td>Change the addresses of the AS-i slaves to addresses that are unique in the network.</td></tr>
</table>

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0406_H	1030	No or erroneous voltage on the AS-i cable	The AS-i master has detected insufficient voltage on the AS-i cable. Data exchange on the AS-Interface has been stopped.	Check: • Voltage • Polarity on AS-i cable • Power supply
0407_H	1031	AS-i configuration error (CER)	The ACTUAL configuration of the AS-i slaves on the AS-i cable differs from the CONFIGURED configuration saved in the AS-i master. Possible causes of short-term failures: • High levels of electromagnetic interference are affecting the AS-i installation. Other possible causes: • The functional ground connection to the AS-i power supply unit or AS-i data decoupling module is not connected to ground potential. • Protected operation: A configured slave has failed or there is an excess slave on the bus. • Configuration mode: A slave with address "0" has been detected on the bus.	Check: • AS-i slave failure • Overload • Excess slave • Incorrect address • Incorrect slave type • EMC environment Remove the electromagnetic interference.
0408_H	1032	Ground fault on AS-i cable	A ground fault is present between AS-i+ and ground or between AS-i- and ground. Possible consequences: • Disruption of communication • Slave failure • Configuration error • Hazard as a result of secondary faults	Check: • Insulation fault on AS-i cable • Sensor/actuator cable Ensure that the ground fault is rectified.
$040A_H$	1034	Excess AS-i slave	There is an unconfigured AS-i slave with a default address or an A address on the AS-i bus. The channel number of the message shows the address of the affected AS-i slave.	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.
$040B_H$	1035	Excess AS-i slave at B address	On the AS-i bus there is an unconfigured AS-i slave with a B address. The channel number of the message indicates the B address of the affected AS-i slave	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
$040C_H$	1036	Incorrect AS-i slave	On the AS-i bus there is an incorrect AS-i slave with a default address or an A address. The channel number of the message shows the address of the AS-i slave involved.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.
$040D_H$	1037	Incorrect AS-i slave at B address	There is an incorrect AS-i slave with a B address on the AS-i bus. The channel number indicates the B address of the affected slave.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.

8.5 Replacing a defective AS-i slave / automatic address programming

Automatic address programming after failure of one or more AS-i slaves - replacement of AS-i slave

The "Automatic address programming" function allows you to easily replace defective AS-i slaves.

Note

Automatic address programming

Automatic address programming is only possible if the AS-i master is operating in "protected operation" and **one or more** AS-i slaves have failed.

If several AS-i slaves have failed, you must uniquely identify the failed slaves in the configuration using the slave profile:

- IO code
- ID code
- ID2 code
- ID1 code

The automatic address programming function also supports slaves with the "CTT5" profile (multi-address slaves) and AS-i devices that contain multiple internal slave addresses. This requires each internal slave to have different identifications (IO code, ID code, ID2 code, and ID1 code).

Note

The automatic address programming function does not work if two identical slaves have failed.

Examples of devices with multiple internal slave addresses which support automatic address programming:

- Module K60 with 8DI/2DO (3RK2400-1HQ00-0AA3)
- Motor Starter M200D AS-i Standard (3RK1325-...).

If no address has yet been assigned to these devices (delivery state), only **one** address "0" is visible on the bus. The device automatically suppresses the other internal "0" addresses.

Note

Exceptions

The automatic address programming function is not available for the following devices, because the identifications of each internal slave are identical (IO code, ID code, ID2 code, and ID1 code).

- Module K60 with 8 DI (3RK1200-0DQ00-0AA3, 3RK2200-0DQ00-0AA3, 3RK2200-1DQ00-1AA3)
- Safety-related module K45 with 4 F-DI (3RK1205-0CQ00-0AA3).

Detection of a defective AS-i slave

An illuminated "AUP" LED signals the following in "protected operation":

- Slave failure was detected:
  - Exactly **one** slave has failed, or
  - A device containing multiple different slaves has failed, **or**
  - Multiple slaves or devices have failed, each of the failed slaves having a different configuration
- Automatic address programming by the AS-i master is possible.

If an AS-i slave fails, the AS-i master indicates the address of the failed slave via the "SL_Xy (A)" and "SL_xY (B)" LEDs.

If a device with multiple internal slave addresses fails, the AS-i master indicates the failure of multiple slaves.

Replacement of a defective AS-i slave

- Replace the defective AS-i slave with an **identical** AS-i slave with address "0" (setting in delivery state).
- Replace the defective AS-I device containing multiple internal slave addresses with an identical AS-i device with address "0" on all internal slaves (setting in delivery state).

Note

Replacement of a defective AS-i slave

Only one address "0" may be configured on the bus at any one time. If you want to replace several slaves or devices, you must replace them one after the other with the AS-i master switched on.

For the new slave or device, the AS-i master programs the address or addresses of the original failed device.

The LEDs "AUP" and "CER" go out once all slaves have been correctly replaced.

8.6 Duplicate address detection

To ensure that the AS-Interface system functions correctly, all the AS-i slaves must have a unique AS-i address on the bus.

If the same AS-i address is assigned to one or more slaves, this incorrect assignment is referred to herein as a duplicate address.

Note

For slaves without cyclic data communication, the duplicate address detection function of the CM AS-i master ST cannot be executed.

Duplicate addresses where slave types are different and where the states at the inputs are different.

As part of standard operation, the AS-i master monitors the data exchange for errors and thus often excludes slaves with a duplicate address automatically from the cyclic data exchange. This is the case for duplicate addresses in which the slave types are different (profile identification IO code, ID code, ID2 code, and ID1 code) and duplicate addresses for slaves having a different status at their inputs.

In "protected operation", this fault condition is displayed on the AS-i master as a configuration error with the relevant AS-i address and the affected slaves detect a communication error.

Duplicate addresses where the slave types are identical and where the states at the inputs are identical or there are no inputs.

The duplicate address detection function of the CM AS-i Master ST also detects cases of slaves with duplicate address in which the cyclic data exchange is not excluded by standard mechanisms. Such cases include duplicate addresses in which the slave types are identical (profile identification, IO code, ID code, ID2 code, and ID1 code) and in which the slaves either have the same status at their inputs or have no inputs (output slaves).

When a duplicate address is detected, the AS-i master signals a duplicate address error and automatically resets the output data of the address concerned to "0" so that the outputs of the affected slaves are switched off. Communication with the affected slaves is not interrupted, i.e. the slaves do not signal a communication error.

Note

System behavior according to AS-i specification

If you connect a slave with duplicate address to the AS-i cable while the bus is operating, the added slave is initially excluded from cyclic data communication and its LEDs indicate a communication error. According to the specification, the AS-i master does not activate an AS-i slave until its address is recognized as a new address on the bus, e.g., when a power-up of the bus takes place. If the bus contains an active slave, no further automatic slave activation occurs on the same address during operation, even if an additional slave with the same address (duplicate address) is added.

However, manual activation of the the slave can be initiated via the command interface by writing parameters to the slave address.

For physical reasons, the duplicate address detection function of the CM AS-i Master ST cannot detect a duplicate address during cyclic data exchange in every configuration. Therefore, like for any AS-i system, it is essential to ensure when assigning AS-i addresses that each AS-i slave contains a unique AS-i address on the bus, e.g., by using addressing device 3RK1904-32AB02.

The duplicate address detection function can assist in identifying inadvertent duplicate addressing.

The duplicate address detection of the CM AS-i Master ST from firmware V1.1 and higher has been optimized for an AS-i cable length up to 100 m without branches.

The duplicate address detection function of firmware V1.0 is designed for shorter cable lengths.

The duplicate address detection function can be used in the specified and additional configurations, but it cannot be guaranteed that duplicate addresses will be uniquely detected in every case.

For configurations with an AS-i repeater, the duplicate address detection function does not work due to the separation of the cable into multiple segments.

Enabling the duplicate address detection function

For the CM AS-i master ST with firmware V1.1 and higher, the duplicate address detection function is activated in the configuration via HW Config or the GSD setting. After a start or restart of the CM AS-i Master ST V1.1 and higher, the setting is accepted from HW Config or the GSD setting.

For the CM AS-i master ST with firmware V1.0 and higher, the duplicate address detection function is deactivated when the AS-i master is switched on and can be set by writing data record DS 100, see Section "DS 100 Switch duplicate address detection on/off (Page 171)". The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST V1.0, the duplicate address detection function must be activated via the user program, if required.

Function description

The duplicate address detection function assists you in identifying inadvertent duplicate addressing.

When commissioning the AS-i system, check that duplicate address detection can be used for the AS-i configuration used.

- Install the complete AS-i system and ensure that the specified addresses of the slaves are correct and unique.
- Enable the duplicate address detection function. In firmware V1.1 and higher, you can do this for AS-i voltages of either 24 V or 30 V.
- Check whether the CM AS-i Master ST signals a duplicate address in spite of correct slave address assignment. If a duplicate address is signaled on the AS-i master even though the bus configuration is correct, this means that duplicate address detection cannot be used for this bus configuration. Should this occur, disable the duplicate address detection function.
- Note that when the duplicate address detection function is enabled, the presence of a duplicate address may not be detected, depending on the bus configuration.

Note

The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST, duplicate address detection must be activated again via the user program, if required.

The CM AS-i Master ST signals a detected duplicate address as follows:

- The "CER" LED lights up to indicate a configuration error.
- The "SL_Xy (A)" and "SL_xY (B)" LEDs signal the AS-i address concerned.
- The message "AS-i address used multiple times" is output.

To rectify the fault, check and change the address of the affected AS-i slave, e.g. using the addressing unit. Via the online function of *STEP 7* it is not possible to change the AS-i address of an individual slave if there are multiple slaves with the same address on the AS-i cable.

8.7 Diagnosis via the web server

Web server functionality

Many SIMATIC controllers provide integrated web server functionality. This enables access via a web browser to the data of the CPU and its connected components, e.g. the AS-i master.

A *STEP 7* library is available as a download for diagnosing the AS-i master via a web browser. It presents the most important diagnostic information in a clear overview. The package is based on the concept of user-defined web pages. You can obtain the package from the Siemens Service & Support Portal under the following link:

Service and support portal (http://support.automation.siemens.com/WW/view/en/50897766)

8.8 Fault indications/fault remedies

Fault indications/remedies for faults on the CM AS-i Master ST

Below are possible fault indications during operation of the AS-i master and potential remedial measures.

Table 8- 9 Fault indications and remedies for faults on the AS-i Master

Fault	Possible cause	Remedy
"AS-i fault" LED lights up red	The current consumption of the AS-i slaves is too high. Result: Voltage on the AS-i cable is too low.	Check the current consumption of the AS-i slaves.
	No voltage is present on the AS-i cable or the voltage is too low.	Check the connection with the AS-i power supply unit.
	Short-circuit on the AS-i cable	Check the AS-i cable and the connected AS-i slaves.
"DIAG" LED not lit	There is no supply over the communications bus.	Check whether the module is inserted correctly.
"DIAG" LED flashes green, but does not switch to constant green light	The AS-i master is not configured.	Configure the AS-i master in *STEP 7*.
"CER" LED is lit.	A configured AS-i slave has failed. • Evaluate the slave indication.	Replace the defective AS-i slave or configure the AS-i master again if the AS-i slave is not required.
	A non-configured AS-i slave was connected to the AS-i cable.	Remove the AS-i slave or configure the AS-i master again.
	An AS-i slave has been connected whose configuration data, e.g., IO code, ID codes, does not match the values of the configured AS-i slave.	Check whether an incorrect AS-i slave has been connected. Configure the AS-i master again, if necessary.
"CER" LED flashes erratically , i.e. a configured AS-i slave fails sporadically.	Loose connection	Check the connections of the AS-i slaves.
	Injection of interference on the AS-i cable.	Check that the grounding of the AS-i master and routing of the AS-i cable are correct. Check whether the shield of the AS-i power supply unit is connected correctly.
	The connected sensor is causing an overload.	Check the sensor and the sensor cable for damage.
The AS-i master does not switch from "configuration mode" to "protected operation".	An AS-i slave with address 0 is connected to the AS-i cable. The AS-i master is unable to switch to "protected operation" as long as this slave is connected.	Remove the AS-i slave with address 0 or set the correct address using the AS-i addressing device.
In *STEP 7* it is not possible to switch between "configuration mode" and "protected operation"	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.

Fault	Possible cause	Remedy
The AS-i master does not switch from "protected operation" to "configuration mode".	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.
Automatic address programming does not take place.	The configuration data, e.g., IO code, ID code, ID2 code, and ID1 code, of the replaced AS-i slave does not match the values of the original slave.	Check that the correct replacement slave was used. Compare the manufacturer's information with regard to configuration data. If the original slave is to be replaced by a different type, assign the address with the AS-i addressing device and configure the AS-i master again.
	Replaced AS-i slave does not have the address "0".	Set the address of the replaced slave with the AS-i addressing device.
	Replaced AS-i slave is not correctly connected or is defective.	Check the connections of the slave. Replace the slave, if necessary.
	The AS-i master is in "configuration mode".	Program the address of the new AS-i slave with the AS-i addressing device or via the command interface of the AS-i master.
	Several slaves with the same profile have failed.	Program the addresses of the new AS-i slaves with the AS-i addressing device.
No LEDs are lit, except possibly for the "DIAG" LED	The AS-i voltage is missing.	
"PF" LED is lit	One or more AS-i slaves signal a fault in the connected I/O.	Check the I/O components connected to the AS-i slaves and the cabling for wire break or short-circuit.

Reference

You will find further information about the LEDs on the AS-i master in Section "Meaning of the LEDs (Page 64)".

8.9 Data records for diagnostics

8.9.1 DS 92 Diagnostic data record (FW V1.1 and higher)

The operating status of the AS-i master, the connected AS-i network and the AS-i slave is stored as diagnostic data record DS 92 in the CM AS-i Master ST module.

Description

This data record provides information about the status of an AS-i network.

Table 8- 10 Structure of diagnostic data record DS 92, read

Byte	Description

7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of bit information in bytes 2 and 3:

MA30V	= 0	Multiple address detection for AS-i 30 V is deactivated.
	= 1	Multiple address detection for AS-i 30 V is activated.
MA24V	= 0	Multiple address detection for Power24V is deactivated.
	= 1	Multiple address detection for Power24V is activated.
MADDR	= 0	No multiple addresses detected on the AS-i°cable.
	= 1	Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.
PF	= 0	No I/O errors detected.
	= 1	I/O errors detected.
CER	= 0	No AS-i configuration errors detected.
	= 1	AS-i configuration errors detected.
EFD	0 =	No ground fault detected
	1 =	Ground fault detected
CM	0 =	Master in protected operation
	1 =	Master in configuration mode
CFGOK	0 =	Configuration not OK or slave exists with address 0.
	1 =	Configuration OK
DIAG	0 =	No diagnostics pending
	1 =	Diagnostics pending. It is set when: • The AS-i master is in "offline" mode. • The AS-i voltage is not OK. • Multiple addresses were detected. • An I/O error was detected. • A configuration error was detected. • A slave with address 0 exists.

AS-i master flags:

Flag	Bit	Name of the bit	Meaning
Flag_1	0	`Config_OK`	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
	1	`LDS.0`	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
	2	`Auto_Address_Assign`	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves is connected to AS-Interface.
	3	`Auto_Address_Available`	The flag is set when automatic address programming is performed as soon as a slave with a valid configuration is connected at address zero.
	4	`Configuration_Active`	The flag is set in "configuration mode" and reset in "protected operation".
	5	`Normal_Operation_Active`	The flag is set when the AS-i master is in "protected operation".
	6	`APF`	The flag is set when the voltage on the AS-i cable is too low, or a power down was detected during data transmission. (AS-i Power Fail)
	7	`Offline_Ready`	The flag is set if the offline phase is active.
Flag_2	0	`Periphery_OK`	The flag is set if none of the AS-i slaves signal a peripheral fault. All bits in the LPF are zero.
	1	`Data_Exchange_Active`	Controlling: When the flag is set, data transfer starts between the master and slave.
	2	`Off_Line`	Controlling: When the flag is set, the device is switched "OFFLINE" or is "Offline".
	3	`AUTO_ADDR_ENABLE`	The flag is set when automatic address programming is enabled by the user.
	4	`GROUND FAULT`	The flag is set if a ground fault has been detected on the AS-i cable.
	5	`EEPROM_OK`	The flag is set if the test of the internal EEPROM was successful.
	6	`EFD_Disable`	The flag indicates whether ground fault detection is switched on (BIT = 0) or off (BIT = 1).
	7	Reserved	--

8.9.2 DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher)

Meaning

This data record reads out error counters that pertain to the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The count starts again each time the device is powered up.

Table 8- 11 Meaning of error counter

Count value / Information	Meaning
AS-i Power Fail	The count value is incremented when the AS-i power supply drops to a value that is too low.
Ground fault	The count value is increased when a ground fault has been detected on the AS-i cable.
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave message frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Process data transmission is not interrupted in this case.
Erroneous slave message frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Process data transmission is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Process data transmission is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 12 Structure of the data record

Byte	Meaning	
0	Reserved	High byte
1		Low byte
2	Summation counter: AS-i Power Fail	High byte
3		Low byte
4	Summation counter: Ground fault	High byte
5		Low byte
6	Summation counter: Slave failure	High word, high byte
7		High word, low byte
8		Low word, high byte
9		Low word, low byte
10	Summation counter: Missing slave frame	High word, high byte

7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of the status bits

MADDR	= 0	No multiple addressing detected on the AS-i°cable.
	= 1	Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.

8.9.3 DS 97 Read and reset AS-i master error counters (FW V1.1 and higher)

Description

This data record functions in the same manner as the "DS 96 Read AS-i slave error counters" data record. After the DS 97 data record is read, all error counters in the AS-i master are reset to "0".

The structure of the DS 97 data record is identical to the structure of the DS 96 data record. For an explanation of the error counter see Section "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)".

8.9.4 DS 150 to DS 153 Read AS-i error counters

These data records read the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153.

Error counter

The CM AS-i Master ST module manages several counters internally which log the number of master frames sent and the number of different error occurrences.

These counter values can be read out using data records DS 150 to DS 153:

- DS 150 contains counter values for slave addresses 1(A) to 16(A).
- DS 151 contains counter values for slave addresses 16(A) to 31(A).
- DS 152 contains counter values for slave addresses 1B to 16B
- DS 153 contains counter values for slave addresses 16B to 31B

Each data record also contains the total count of master frames sent. To determine a relative error rate, divide the count of error occurrences by the number of master frames sent.

The bus system allows the automatic sending of repeat message frames. This ensures that the process data is reliably transferred between master and slave in the industrial environment, even in the case of brief interruptions in transmission, e.g. due to switching operations. If the fault limit value is exceeded, or the slave is not functioning correctly due to a defect, communication to the slave cannot be performed within the defined time period. In this case, transmission of the process data is interrupted. The master signals failure of the slave address and tries to establish communication again.

Under error-free conditions, one master frame is sent to every available slave address for cyclic data transfer per AS-i bus cycle. The addressed slave responds with a corresponding slave frame. Depending on the configuration of the bus, between 1 and 31 slaves are addressed in each AS-i bus cycle. This results in a maximum bus cycle time of 5 ms. When two slaves with extended addressing have the same numerical address, but one is the A address and one the B address, these two slaves are automatically addressed in two consecutive bus cycles. It can be assumed that around 64 000 master frames are sent per second.

Table 8- 13 Meaning of error counter

Count value / Information	Meaning
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Transmission of process data is not interrupted in this case.
Erroneous slave frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Transmission of process data is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Transmission of process data is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 14 Slave address structure of the counters

Byte	Counter	
0	Counter: Slave failure	High byte
1		Low byte
2	Counter: Missing slave frame	High byte
3		Low byte
4	Counter: Erroneous slave frame	High byte
5		Low byte
6	Counter: I/O fault	High byte
7		Low byte
8	Counter: Protocol error	High byte
9		Low byte
10	Counter: Erroneous master frame	High byte
11		Low byte

The counters are integer values (2 bytes).

Table 8- 15 Master frame structure of the counters

Byte	Meaning	
0	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)	High word, high byte
1		High word, low byte
2		Low word, high byte
3		Low word, low byte
4	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)	High word, high byte
5		High word, low byte
6		Low word, high byte
7		Low word, low byte
8	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word, high byte
9		High word, low byte
10		Low word, high byte
11		Low word, low byte

The counters are integer values (4 bytes).

8.9.4.1 DS 150 Read AS-i slave error counters 1/1A to 16/16A

8.9.5 DS 154 Delete AS-i error counters (from FW V1.1)

Description

When writing this data record all the error counters are reset.

The content of the data record has to be filled with zero values.

Table 8- 20 Structure of DS 154 write

Byte	Meaning
0	0
1	0
2	0
3	0

Using the command interface 9

9.1 Introduction

You control the behavior of the AS-i master in your user program entirely through the command interface.

This chapter contains the information you need for accessing the command interface of the CM AS-i Master ST.

9.2 Command interface with SIMATIC S7

Instruction "ASI_CTRL"

The instruction "ASI_CTRL" is available for controlling the command interface. You will find this instruction in *STEP 7* in the task card "Instructions" under "Advanced instructions" > "Distributed I/O" > "Others" > "ASI".

For detailed instructions on using the instruction "ASI_CTRL", see: ASI_CTRL (http://support.automation.siemens.com/WW/view/en/51678777).

9.3 Command interface with controllers of other manufacturers

Functional principle

AS-i commands are read and written via the acyclic services of PROFINET/PROFIBUS. You use the "Read_data_record" and "Write_data_record" (data record 2) services in the user program of the IO controller/DP master for this.

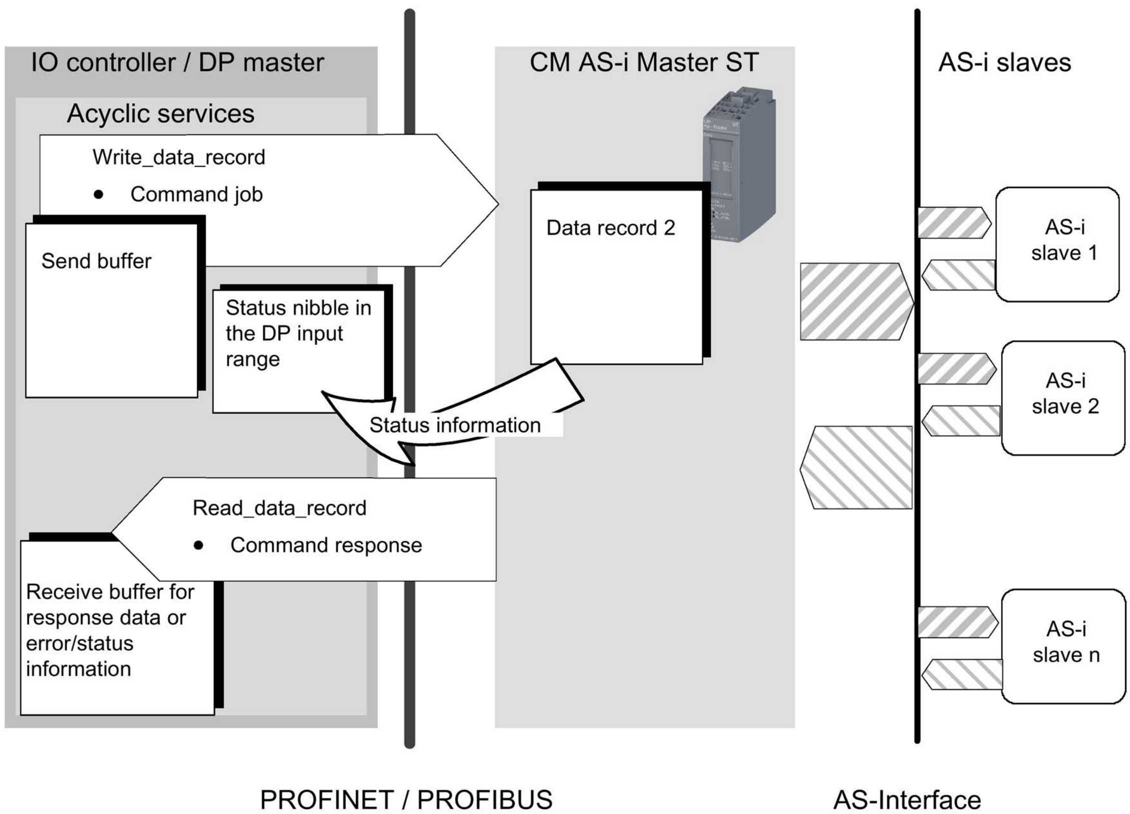

Figure 9-1 Functional principle

Job parameters

You assign parameters for the "Read_data_record" and "Write_data_record" jobs. The following parameters control the issuance of the commands:

- Index:

  Defines the data record number = 2
- Length:
  - With "Write_data_record", you specify the length of the send data depending on the command.
  - With "Read_data_record", the CM AS-i Master ST signals the length of the receive data via the status nibble.

Command processing in the user program

Structure the command processing in the user program as follows:

1. Specify the command call (Page 103) in a send buffer in the user program.
2. Send this data record call to the CM AS-i Master ST with Write_data_record (data record 2).
3. Then, query the status of the command processing in the input range for digital values (cyclic services). The status information is stored in the first byte reserved for it (byte 0) in bits 4 to 7 of the input range (status nibble).
4. Different reactions occur depending on the result of the status evaluation. You can find these in the following sequence chart. Details on the meaning of the status nibble can be found in the "Coding of the status nibble" table.

   To complete the command processing, you must always issue a Read_data_record (data record 2) job either to obtain further information or to apply the response data.

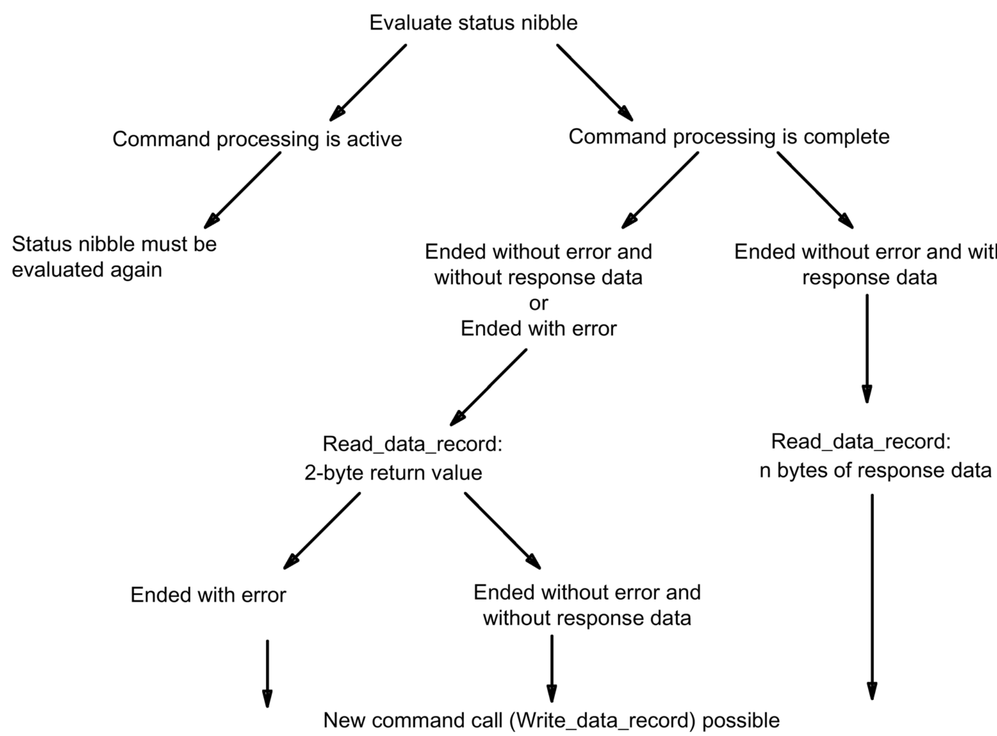

Figure 9-2 Flowchart

Table 9- 1 Coding of the status nibble

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	Bit 6	Bit 5	Bit 4	
1	0	0	0	Startup detection 1: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	1	0	Startup detection 2: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	0	0	Reserved for SIMATIC S7 use FB ASI_CTRL Initiation of a command by the user program is possible.
0	0	1	0	The command processing is active Initiation of a command by the user program is not possible.
0	0	0	1	Command processing has ended. An asynchronous read access can be used to retrieve a **2-byte** return value from the AS-i master. Two cases are distinguished here: • The return value is 0: A command without response data has been ended without errors. • The return value is a value **other than 0**: The command has been ended **with error** (see "Return value in response buffer" table). Initiation of a new command by the user program is possible.
0	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **1 byte** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **4 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **14 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **16 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **32 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	
1	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **56 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **221 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	0	Job processing is complete. The response data or return value of the previous job has already been read by the user. Initiation of a new command by the user program is possible.

Example

The table below indicates the behavior of the status nibble display as a result of the device status and the command processing in the user program:

	Action	Response in the status nibble
1.	Switching on the AS-i voltage of the CM AS-i Master ST.	1110_B … 1000_B … 1110_B …
2.	The user program transfers a command (e.g., Write_parameter) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly, dependent on command)
3.	The AS-i master ends the command. The user program can read the return value	0001_B
4.	The user program reads the 2 byte return value with an asynchronous read access.	0100_B
5.	... Further program processing ...	…
6.	The user program transfers a command (e.g., Read_expanded_lists_and_flags) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly, dependent on command)
7.	The AS-i master ends the command without errors. The user program can read the response data.	1011_B
8.	The user program reads 32 bytes of response data with an asynchronous read access.	1011_B

Return value

Processing errors are itemized in the return value of the response buffer, if necessary. An error indication exists when "ended without error and without response data or ended with error" is displayed in the status nibble (coding: 0001_H).

Table 9- 2 Return value in the response buffer

STATUS	Meaning
0000_H	**Job completed without errors**
8381_H	The AS-i slave address is incorrect.
8382_H	The AS-i slave is not activated (not in LAS).
8383_H	Error on the AS-Interface
8384_H	The command is not permitted in the current state of the AS-i master.
8385_H	An AS-i slave with address 0 exists.
8386_H	The AS-i slave has impermissible configuration data (IO, ID, ID2, or ID1 code).
$83A1_H$	The referenced AS-i slave was not found on the AS-Interface.
$83A2_H$	An AS-i slave with address 0 exists.
$83A3_H$	An AS-i slave with the new address already exists on the AS-Interface.
$83A4_H$	The AS-i slave address cannot be deleted.
$83A5_H$	The AS-i slave address cannot be set.
$83A6_H$	The AS-i slave address cannot be permanently saved.
$83A7_H$	Error while reading the ID1 code
$83A8_H$	The destination address is not plausible: e.g. a B slave address is used for a standard slave.
$83B1_H$	A length error occurred during the string transfer in accordance with Profile 7.4.
$83B2_H$	A protocol error occurred during the string transfer in accordance with Profile 7.4.
$83C0_H$	The AS-i slave has an invalid profile, e.g. the standard slave or A slave is configured at a B address.
$83C1_H$	The standard slave cannot be configured, because the B address is already assigned.
$83F8_H$	The job number or the job parameter is not known.
$83F9_H$	The AS-i master has detected an EEPROM error.

Note

Errors that occur during processing of acyclic services and are reported via call parameters, such as "Return Value", can be found in the documentation of the relevant programming interface.

9.4 Description of the AS-i commands

Overview

The commands that the user program can issue to the CM AS-i Master ST are described below. With these commands, the AS-i master makes available the complete functionality of the M4 master profile of the AS-i master specification.

Note

Adaptations when using existing user programs

Please observe the following adaptations when using existing user programs:

For some commands of the CM AS-i Master ST, the command numbers have been changed and the data structures belonging to the command have been optimized compared to other AS-i masters (e.g., DP/AS-i LINK Advanced).

The following table provides an overview of the modified command numbers:

Command name	Coding for DP/AS-i LINK Advanced	Coding for CM AS-i Master ST
No. A5: Set_Permanent_Configuration (Page 112)	25_H	$A5_H$
No. A6: Get_Permanent_Configuration (Page 113)	26_H	$A6_H$
No. A8: Read_Actual_Configuration (Page 115)	28_H	$A8_H$
No. A9: Set_LPS (Page 116)	29_H	$A9_H$
No. B0: Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 122)	30_H	$B0_H$
No. B9: Read_overall_configuration (Page 125)	39_H	$B9_H$
No. BA: Write_overall_configuration (Page 131)	$3A_H$	BA_H
No. BE: Get_LPF (Page 147)	$3E_H$	BE_H
No. CA: Read_Error_Counter (Page 152)	$4A_H$	CA_H
No. CB: Read_and_Delete_AS-i-Master_Error_Counter (Page 155)	$4B_H$	CB_H
No. CC: Read_AS-i_error_counter (Page 156)	$4C_H$	CC_H
No. CD: Read_and_delete_AS-i_Slave_error_counter (Page 157)	$4D_H$	CD_H

The following table lists the commands that can be executed with the CM AS-i Master ST.

Table 9- 3 AS-i commands

Name	Parameters	Return value	Coding
No. 00: Set_Permanent_Parameter (Page 107)	Slave address, parameter	—	00_H
No. 01: GET_Permanent_Parameter (Page 108)	Slave address	Parameter	01_H
No. 02: Write_Parameter (Page 109)	Slave address, parameter	Optional: Parameter echo	02_H

General structure of the send buffer

The basic structure of the send buffer for commands is shown below.

The length of the job data depends on the respective command. Some commands do not require any job data. In this case, the send buffer only has one byte (byte 0).

Table 9- 4 Basic structure of the send buffer for commands

Byte	Meaning
0	Number of the command
1	Job data
…	Job data

General structure of the receive buffer

The basic structure of the receive buffer for commands is shown below. The length of the response data depends on the respective command.

Some commands do not supply any response data. In this case, there is no receive buffer.

Table 9- 5 Basic structure of the receive buffer

Byte	Meaning
0	Response data
1	Response data
…	Response data

General operating state of the AS-i slave address

If an AS-i slave must be addressed in a command or in a response, it must be addressed as follows:

Table 9- 6 Structure of the AS-i slave address

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	Select bit	Slave address				

The Select bit for the selection of the slave type is specified as follows:

- Select bit = 0

  AS-i slave with standard-address (0 to 31) or AS-i slave with extended address in address area A (1A to 31A)
- Select bit = 1:

  AS-i slave with extended address in address area B (1B to 31B)

9.4.1 No. 00: Set_Permanent_Parameter

Meaning

This command configures a parameter value for the specified AS-i slave in the AS-i master. The value is stored in the non-volatile EEPROM of the CM AS-i Master ST. The parameter value is additionally forwarded to the addressed AS-i slave.

However, the "parameter echo" of the AS-i slave cannot be read out with this command (see No. 02: Write_Parameter (Page 109) command).

Note

Use of other Siemens AS-i masters

Other Siemens AS-i masters do not transfer the configured parameters to the AS-i slave immediately.

For AS-i slaves that meet the AS-i standard slave profile 7.4, this command is not permitted. For these slaves, the AS-i master itself administers the parameter assignment of the AS-i slave. In this case, the configured parameters are always equal to F_H.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

Structure of the job data in the send buffer

Table 9- 7 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: 00_H			
1	Slave address			
2	0		Parameters	

9.4.2 No. 01: GET_Permanent_Parameter

Significance

This command reads a slave-specific parameter value that has been saved in EEPROM of the CM AS-i Master ST.

Structure of the job data in the send buffer

Table 9- 8 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 01_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 9 Structure of the reply data in the receive buffer

<table>
<tr><th rowspan="2">Byte</th><th colspan="4">Significance</th></tr>
<tr><th>Bit 7</th><th>Bit 4</th><th>Bit 3</th><th>Bit 0</th></tr>
<tr><td>0</td><td colspan="2">0</td><td colspan="2">Configured parameters</td></tr>
</table>

9.4.3 No. 02: Write_Parameter

Meaning of the command

The command transfers an AS-i slave parameter value. The AS-i master subsequently makes a parameter call to the addressed AS-i slave and passes the parameter value to the AS-i slave in this call. The slave sends the parameter echo as receipt acknowledgment to the master. The value of the parameter echo is sent in the reply data of the command.

The parameter value is only stored in the volatile memory of the AS-i master and is not transferred to the EEPROM as a configured parameter!

The AS-i slave can provide any parameter echo value. As a general rule, the returned parameter echo value is not a "mirror image" of the parameter value that is sent by the master to the slave. If necessary, refer to the documentation of the AS-i slave to ascertain whether the echo value has a special meaning.

This command is not permissible for AS-i slaves that meet AS-i slave standard profile 7.4. For these slaves, the AS-i master itself administers the AS-i slave parameter assignment.

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameter echo	

9.4.4 No. 03: Read_Parameter

Meaning

This command returns the parameter value (ACT parameter) active in the slave.

The returned parameter value corresponds to the value that was transferred from the master to the slave in the last parameter call. Because read-back of the parameter value from the AS-i slave is not possible according to the AS-i specification, the master stores the parameter values of all slaves internally in a volatile memory as "ACT parameters". The command reads out the ACT parameter value from the memory, so that the command is executed without a query from the AS-i slave.

You must not confuse this value with the parameter echo that the AS-i slave supplies as reply to Write_Parameter.

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameters	

9.4.5 No. 04: Store_Actual_Parameters

Meaning

This command overwrites the configured parameters stored in the EEPROM with the current ACTUAL parameters stored in volatile memory of the AS-i slave. As a result, the ACTUAL parameters in the non-volatile memory of the master are stored as the configuration definition for the next time the slaves are powered up.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that meet AS-i slave standard profile 7.4. The configured parameters for these AS-i slaves are always equal to F_H.

Structure of the job data in the send buffer

Table 9- 14 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 04_H

9.4.6 No. A5: Set_Permanent_Configuration

Meaning

With this command, the following configuration data are configured for the addressed AS-i slave:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses these configuration data as the specified expected configuration data for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

If the addressed AS-i slave does not support ID code 1 or ID code 2, the value F_H must be specified for this in the command.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

3	ID1 code		ID2 code	

9.4.7 No. A6: Get_Permanent_Configuration

Meaning

The configuration data (configured CONF data) of an addressed AS-i slave stored on the EEPROM of the AS-i master are read with this command:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

Structure of the job data in the send buffer

0	IO code		ID code	
1	ID1 code		ID2 code	
2	0			
3	0			

9.4.8 No. 07: Store_Actual_Configuration

Meaning

The following ACTUAL configuration data of all AS-i slaves is obtained from the AS-i master:

- Slave profile (IO, ID, ID2 codes)
- ID1 code

This command saves the obtained ACTUAL configuration data as CONF configuration data in the non-volatile EEPROM. The List of activated AS-i slaves (LAS) is also loaded into the List of configured AS-i slaves (LPS).

When this command is executed, the AS-i master switches to the offline phase and then switches back to "protected operation". The AS-i master restarts.

This command is not executed in "protected operation".

The slave parameter values in volatile memory of the AS-i master and the content of the non-volatile memory for the parameters are not changed. The "Set_Permanent_Parameter" command must be executed, if necessary.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 18 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 07_H

9.4.9 No. A8: Read_Actual_Configuration

Meaning

This command reads the following configuration data of an addressed AS-i slave obtained from the AS-i master on the AS-Interface:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

0	IO code		ID code	
1	ID1 code		ID2 code	
2	Reserved			
3	Reserved			

9.4.10 No. A9: Set_LPS

Meaning

This command transfers the list of configured AS-i slaves for non-volatile storage in the EEPROM of the master.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

9	Slave 31B	Slave 30B	Slave 29B	Slave 28B	Slave 27B	Slave 26B	Slave 25B	Slave 24B

The bits have the following meanings in the LPS data:

0: AS-i slave is not configured

1: AS-i slave is configured

9.4.11 No. 0A: SET_Offline_Mode

Meaning

This command switches between online and offline mode.

Online mode is the normal mode for the AS-i master. The following jobs are processed in online mode:

1. In the data exchange phase, the fields of the output data are transferred to the slave outputs for all AS-i slaves of the LAS. In error-free transmission, the addressed AS-i slaves transfer the values of the slave inputs to the master.
2. In the loading phase, a search is conducted for the existing AS-i slaves. Newly added AS-i slaves are inserted in the LDS or LAS.
3. In the management phase, jobs forwarded by the user, such as writing parameters, are executed.

In offline mode, the AS-i master only processes jobs from the user. Jobs that immediately activate an AS-i slave are rejected with an error. Cyclic data exchange is not performed with the AS-i slaves.

The bit OFFLINE=TRUE is not stored permanently. This means that after startup or restart, the AS-i master is in online mode again.

Structure of the job data in the send buffer

Table 9- 22 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0A_H$		
1	0		Mode 0 = Online 1 = Offline

9.4.12 No. 08: Set_Auto_Address_Enable

Meaning

This command enables or disables the "Automatic address programming" function.

The bit AUTO_ADDR_ENABLE is stored in non-volatile memory. It is retained even after startup or warm restart of the AS-i master.

Structure of the job data in the send buffer

Table 9- 23 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0B_H$		
1	0		Value for AUTO_ADDR_ENABLE 1 = Automatic address programming enabled 0 = Automatic address programming disabled

9.4.13 No. 0C: Set_Operation_Mode

Meaning

This command chooses between "configuration mode" and "protected operation".

In **"protected operation"**, only the AS-i slaves that are flagged in the LPS and whose CONFIGURED and ACTUAL configurations match are activated. This is the case when the I/O code and the ID codes of the detected AS-i slaves are identical to the configured values.

In **"configuration mode"**, all the detected AS-i slaves are activated - with the exception of AS-i slave "0". This also applies to AS-i slaves that differ in their CONFIGURED and ACTUAL configurations.

The "OPERATING MODE" bit is saved in **non-volatile** memory. As a result, this bit is retained in the event of startup or restart.

On switching from "configuration mode" to "protected operation", the AS-i master restarts. It enters the offline phase and then switches to online mode.

Note

AS-i slave with address 0 prevents switchover to "protected operation"

If an AS-i slave with address 0 is present on the AS-i bus, the AS-i master cannot switch from "configuration mode" to "protected operation".

Structure of the job data in the send buffer

Table 9- 24 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0C_H$		
1	0		Operating mode 0 = "Protected operation" 1 = "Configuration mode"

9.4.14 No. 0D: Change_AS-i-Slave_Address

Meaning of the command

This command changes the AS-i slave address of an AS-i slave.

This command is used predominantly for adding a new AS-i slave with the default address "0". In this case, the address is changed from "AS-i slave address, old" = 0 to "AS-i slave address, new".

The change is only executed if the following conditions are met:

1. An AS-i slave with "AS-i slave address, old" must exist.
2. If "AS-i address, old" is not equal to "0", an AS-i slave with the address "0" must not be connected at the same time.
3. "AS-i slave address, new" must have a valid value.
4. An AS-i slave with "AS-i slave address, new" must not already exist.

Note

When changing the AS-i slave address, the AS-i slave is not reset. The output data of the AS-i slave are retained until the slave resets its data automatically by internal time watchdog monitoring or the slave receives new data at the new address.

Today's AS-i slaves mostly feature watchdog monitoring that reset the internal I/O data of the slave when cyclic communication with the AS-i master is interrupted. Check the technical data of the slave to find out whether it features watchdog monitoring.

Structure of the job data in the send buffer

Table 9- 25 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $0D_H$
1	Slave address, old
2	Slave address, new

9.4.15 No. 0F: Read_Status

Meaning

This command reads the status register for the addressed AS-i slave. Generally, this command is not required because the slave status is automatically managed by the AS-i master. The following functions are available for detecting an I/O fault: alarm message, read diagnostic data sets, execution of command "Get_LPS, Get_LAS, Get_LDS, Get_Flags" command number B0 hex.

The flags of the status register have the following meaning depending on the type of the AS-i slave:

Table 9- 26 Meaning of the flags of the status register depending on the type of the AS-i slave

Status bit	AS-i slave according to AS-i specification V2.0	AS-i slave AS-i specification V2.1 and higher
S0	**Address volatile**	**Address/ID code volatile**
	This flag is set if • The internal routine of the AS-i slave for permanent storage of the AS-i slave address is running. This can last up to 15 ms and must not be interrupted by another addressing call. • The internal address comparison of the AS-i slave determines that the permanently saved address is not identical to the entry in the address register.	
S1	**Parity error detected** This flag is set if the AS-i slave has detected a parity error in a receive frame since the last "Read and delete status" job.	**Peripheral fault detected** An AS-i slave can set this flag if it detects a fault, e.g. wire break, on the connected I/O.
S2	**End bit error detected** This flag is set if the AS-i slave has detected an end bit error in a message frame since the last "Read and delete status" job.	Reserved
S3	**Read error in non-volatile memory (EEPROM)** This bit is set if the AS-i slave has discovered a read error when reading the non-volatile memory.

Meaning of the bits in Byte 0 to 23

- Bit = 0:

  The AS-i slave is **not** activated, detected or configured.
- Bit = 1:

  The AS-i slave **is** activated, detected or configured.

Table 9- 31 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit	Meaning		Bit	Meaning
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

Table 9- 32 Meaning of the flags

Flag	Meaning
Config_OK	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
LDS.0	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
Auto_Address_Assign	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves are connected to AS-Interface.
Auto_Address_Available	The flag is set if automatic address programming can be performed. This means that one AS-i slave has failed.
Configuration_Active	The flag is set in "configuration mode" and reset in "protected operation".
Normal_Operation_Active	The flag is set when the AS-i master is in "protected operation".
APF	The flag is set when the voltage on the AS-i cable is too low (AS-i Power Fail).
Offline_Ready	The flag is set if the offline phase is active.
Periphery_OK	The flag is set if none of the AS-i slaves signal a peripheral fault.
Data_Exchange_Active	The "Data_Exchange_Active" flag is set when cyclic data exchange is in "protected operation".
Off_Line	The flag is set if the "OFFLINE" operating status is to be adopted or has already been adopted.
AUTO_ADDR_ENABLE	The flag indicates whether automatic address programming is disabled (BIT = 0) or enabled (BIT = 1) by the user.
Earth_Fault	The flag is set if a ground fault has been detected on the AS-i cable.
EEPROM_OK	The flag is set if the test of the internal EEPROM was successful.
EFD Disable	The flag indicates whether ground fault detection is enabled (BIT = 0) or disabled (BIT = 1) by the user.

9.4.17 No. B9: Read_overall_configuration

Meaning

This command reads the following data from the AS-i master:

- List of activated AS-i slaves (LAS).

  It specifies which of the connected AS-i slaves are activated
- The current configuration data for the connected AS-i slaves:
  - IO code
  - ID code
  - ID1 code
  - ID2 code
- The current parameters of the AS-i slaves (ACTUAL parameters)
- The current status of the AS-i master (Flag 1, Flag 2)

After commissioning, you can use this command, for example, to determine the configuration of the stations connected to the AS-i cable. You can modify this read-in configuration data if required and store it as the CONFIGURED configuration in the AS-i master with the "Write_overall_configuration" command.

No. BA: Write_overall_configuration (Page 131)

171	Flag 2							
172 … 218	Reserved							

Table 9- 35 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit number	Meaning		Bit number	Meaning
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

For the meanings of flags, refer to Chapter:

No. B0: Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 122)

9.4.18 No. BA: Write_overall_configuration

Meaning

This command transfers the desired overall configuration of AS-Interface to the AS-i master and saves it as the CONFIGURED configuration in the non-volatile EEPROM. This configures the AS-i master.

When this command is executed, the AS-i master changes to the offline phase and then switches back over to "normal operation". The AS-i master restarts.

The "Protected operation" or "Configuration mode" operating mode of the AS-i master after execution of the command is determined by the "Configuration_Active" flag (see Table "Structure of Flag 1 and Flag 2").

This command is permissible both in "Protected operation" and "Configuration mode.

Note

Configuration data are overwritten

If you configure the AS-i slaves using *STEP 7*, there is normally no need to use the command described here. If you have configured proxy slaves, you can specify the configuration data of the proxy slaves with this command. To avoid the offline changeover, the configuration data of the proxy slaves can be specified preferentially with the "No. D0: Set_Configuration_Online (Page 159)" command.

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring the AS-i master using the "SET" button or configuring using *STEP 7*.

Specifically, the following data are transferred:

- List of configured AS-i slaves

  This specifies which AS-i slaves are permitted to be activated by the AS-i master in "protected operation".
- List of configuration data.

  This specifies the ID codes and the IO code that the connected AS-i slaves must have.
- The list of the AS-i slave parameters that have been configured in the AS-i master and stored in non-volatile memory. These parameters are transferred to the AS-i slaves when the AS-i master starts up.
- The flags that determine the operating state of the AS-i master after startup.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that comply with standard profile 7.4. For slaves in accordance with standard profile 7.4, the AS-i master ignores the parameter values specified in the command.

NOTICE
Note the size of the I/O image If you have configured the AS-i slaves in *STEP 7*, the size of the I/O image of the individual slaves is defined using *STEP 7*. When using this command, ensure that the I/O image of the individual slaves corresponds to the slaves configured using the command. If the size of the I/O image does not match, only the lower-order data will be transferred. The data that do not fit into the image are truncated or are filled with substitute value "0" in the case of digital values and with substitute value 7FFF (Hex) in the case of analog values.

Structure of the job data in the send buffer

Table 9- 37 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit number	**Meaning**		**Bit number**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	**AUTO_ADDR_ENABLE** 1)
4	**Configuration_Active** 1)		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

1) The "Configuration_Active" and "AUTO_ADDR_ENABLE" flags change the operating mode of the AS-i master. The values of the remaining flags are insignificant for the command "Set_LPS, Set_PCD, Set_PP, Set_Flags" and cannot be modified in the AS-i master by this call.

Configuration_Active	"0" means: After the command has been executed, the AS-i master will switch to "protected operation". "1" means: The AS-i master runs in "configuration mode" after completion of the job.
AUTO_ADDR_ENABLE	"0" means: Automatic address programming is disabled. "1" means: Automatic address programming is enabled.

For the meanings of flags, refer to Chapter:

No. B0: Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 122)

9.4.19 No. 3C: Set_PI

Meaning

This command passes parameter values for all AS-i°slaves to the AS-i master. The AS-i master only sends a parameter call to the slaves whose parameter value passed in the command deviates from the ACTUAL parameter value of the slave. If all parameter values passed in the command are identical to the current parameter values (ACT parameters) of the AS-i slaves, no parameters are passed from the AS-i master to the AS-i slaves.

Control via the function code

The response of the command can be set using the value of the "function code" in byte 1 of the job data (firmware V1.1.16 and higher)

- As of firmware V1.1.16, the function code is defined for values 0, 1, and 2.
- For firmware versions up to and including V1.1.15, the function code is only defined for the value 0.

Other values are not permissible.

The function code determines the response of the command as described below.

The new parameter values are transferred via 3 subfunctions in byte 1 with different responses.

Function code = 0:

The passed parameter values are stored in the non-volatile EEPROM of the CM AS-i master ST.

If the passed parameter value of at least one AS-i slave differs from the parameter value previously active in the slave, the AS-i master powers up on the AS-i bus (offline-online transition). This resets and restarts all slaves with the parameter values currently stored in the EEPROM.

If there are no changes in the passed parameter values, the master does not power up.

Function code = 1 (firmware V1.1.16 and higher):

The passed parameter values are only stored in the volatile memory of the CM AS-i master ST module, i.e. the EEPROM remains unchanged.

For every AS-i slave, the AS-i master checks whether the passed parameter value differs from the parameter value previously active in the slave (ACT parameter). If it does differ, the AS-i master calls a parameter from that AS-i slave and returns a new parameter value.

The AS-i master does not call a parameter from the AS-i slave if the passed parameter value is identical to the parameter value previously active in the slave.

The AS-i master does not perform a power-up on the AS-i bus.

The command is considered completed without errors when the parameter values have been passed to the master. Subsequently, the parameters are passed to the slaves in parameter calls with no time monitoring.

Function code = 2 (firmware V1.1.16 and higher):

The passed parameter values are stored in the non-volatile EEPROM of the CM AS-i master ST.

For every AS-i slave, the AS-i master checks whether the passed parameter value differs from the parameter value previously active in the slave (ACT parameter). If it does differ, the AS-i master calls a parameter from that AS-i slave and returns a new parameter value.

The AS-i master does not call a parameter from the AS-i slave if the passed parameter value is identical to the parameter value previously active in the slave.

The AS-i master does not perform a power-up on the AS-i bus.

The command is considered completed without errors when the parameter values have been passed to the master. Subsequently, the parameters are passed to the slaves in parameter calls with no time monitoring.

Note

Limited number of write accesses to an EEPROM

If function code = 0 and function code = 2, the EEPROM is written to. Because the number of write accesses to an EEPROM is in principle limited (100 000 write accesses), these function codes should not be used in cyclic mode. Write access always means the actual change of a value in the EEPROM.

33	Parameter value slave 30B				Parameter value slave 31B			

9.4.20 No. 33: AS-i Parameter Echolist

Meaning

This command returns the parameter echo values of all AS-i slaves. The parameter echo of an AS-i slave originates in the last parameter call that was sent to this AS-i slave. The AS-i slave can provide any parameter echo value. As a general rule, the returned parameter echo value is not a "mirror image" of the parameter value that is sent by the master to the slave. If necessary, refer to the documentation of the AS-i slave to ascertain whether the echo value has a special meaning.

9.4.21 No. 44: Read_Write_CTT2_String

Meaning

This command sends a CTT2 request according to the AS-i slave profile "CombinedTransactionType2" to the AS-i master with a byte string. The master forwards the string bytes to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 222 bytes to the AS-i master. The AS-i master calculates the actual number of string bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The addressed AS-i slave answers the CTT2 request with a CTT2 response. The AS-i master communicates this response as a byte string in the receive buffer. The strings are transmitted by the AS-i master with the response.

The structure of the CTT2 request or CTT2 response (code, index, etc.) starts with string byte 1 in each case. You will find details about this in the respective AS-i slave description.

Note

While transmission of the strings is being executed on AS-i, there is no cyclic data transfer with the addressed AS-i slave. The type of protocol used means that transfer of up to 200 bytes can take up to half a minute.

0	Reserved		IO code	

9.4.28 No. BE: Get_LPF

Meaning

This command reads the list of I/O faults (periphery faults) (LPF) signaled by the AS-i slaves from the AS-i master. The AS-i master updates the LPF cyclically. Refer to the description of the AS-i slave to learn whether the slave can detect a fault in the connected I/O, e.g. wire break, and when it signals the fault.

8 … 13	Reserved							

The bits have the following meanings in the LPF data:

Bit = 0: The slave signals no I/O fault.

Bit = 1: The slave signals I/O fault.

9.4.29 No. 40: Write_Parameter_String

Meaning

This command sends a parameter string in accordance with AS-i slave profile 7.4 to the AS-i master. The master forwards the parameter string to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 223 bytes to the AS-i master. The AS-i master calculates the actual number of parameter bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The AS-i master does not evaluate any other information in the parameter string. It transfers this to the AS-i slave transparently. While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 56 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 40_H
1	Slave address
2	Number of parameter bytes
3	Parameter string byte 1
4	Parameter string byte 2
…	…
n + 1	Parameter string byte n - 1
n + 2	Parameter string byte n

Maximum value for n = 220

9.4.30 No. 41: Read_String

Meaning

This command causes the AS-i slave to read a parameter string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer.

The AS-i master supplies up to 221 bytes of response data. The AS-i master signals the actual number of parameter bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a parameter string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the job program.

While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Byte	Meaning
0	Number of parameter bytes
1	Parameter string byte 1
2	Parameter string byte 2
…	…
n - 1	Parameter string byte n - 1
n	Parameter string byte n

Maximum value for n = 220

9.4.31 No. 42: Read_String

Meaning

This command causes the AS-i slave to read an identification string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of ID bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends an ID string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

As long as the transmission of the identification string is running, there is no transfer of user/analog data with the addressed AS-i slave.

Note

In a deviation from normal procedure, this command also transfers the bytes that contain the bits "Follows" and "Valid".

For further details, refer to AS-i slave profile 7.4

Structure of the job data in the send buffer

Byte	Meaning
0	Number of ID bytes
1	ID string byte 1
2	ID string byte 2
…	…
n - 1	ID string byte n - 1
n	ID string byte n

Maximum value for n = 220

9.4.32 No. 43: Read_String

Significance

This command causes the AS-i slave to read a diagnostics string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of diagnostics bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a diagnostics string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

While transmission of the diagnostics string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 61 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 43_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 62 Structure of the reply data in the receive buffer

Byte	Significance
0	Number of diagnostics bytes
1	Diagnostic string byte 1
2	Diagnostic string byte 2
…	…
n - 1	Diagnostic string byte n - 1
n	Diagnostic string byte n

Maximum value for n = 220

9.4.33 No. CA: Read_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)" for reading out the error counters. The Read_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out error counters that concern the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The counting starts over each time the device is powered up.

For the meaning of the error counters, refer to Table "Table 8-11 Meaning of error counter (Page 86)".

Structure of the job data in the send buffer

Table 9- 63 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CA_H

Structure of the responses in the receive buffer

Table 9- 64 Structure of the data record

Byte	Meaning	
0	Summation counter: AS-i Power Fail	High byte
1		Low byte
2	Summation counter: Ground fault	High byte
3		Low byte
4	Summation counter: Slave failure	High word, high byte
5		High word, low byte
6		Low word, high byte
7		Low word, low byte
8	Summation counter: Missing slave frame	High word, high byte
9		High word, low byte
10		Low word, high byte
11		Low word, low byte

Byte	Meaning		
12	Summation counter: Erroneous slave frame		High word, high byte
13			High word, low byte
14			Low word, high byte
15			Low word, low byte
16	Summation counter: Slave peripheral fault		High word, high byte
17			High word, low byte
18			Low word, high byte
19			Low word, low byte
20	Summation counter: Slave protocol error (for slaves according to CTT1 ... CTT5)		High word, high byte
21			High word, low byte
22			Low word, high byte
23			Low word, low byte
24	Summation counter: Erroneous master frame		High word, high byte
25			High word, low byte
26			Low word, high byte
27			Low word, low byte
28 … 35	List of count values > 0 (see Table "Structure of bit fields")		
	Bit = 0	Count value = 0 for all error counters of the AS-i address	
	Bit = 1	Count value > 0 for at least one error counter of the AS-i address	
36	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)		High word, high byte
37			High word, low byte
38			Low word, high byte
39			Low word, low byte
40	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)		High word, high byte
41			High word, low byte
42			Low word, high byte
43			Low word, low byte
